psi to [2] MPa [300] psi gage. The flowmeter electronics must be scaled and rescaled in the field when application data changes. The flowmeter must be designed for installation in pipe sizes of 75 mm 3 inches and larger to accommodate maximum probe insertion depths up to 1.1 m 44 inches. The retractor assembly must have a rotor depth gage having graduations of 2.5 mm 0.1 inches to determine exact position of turbine rotor in the pipe. The meter retractor assembly and the turbine rotor assembly must be constructed of [Series 300 stainless steel] with [polytetrafluoroethylene (PTFE)] seals. The meter retractor assembly must be designed to protect the turbine rotor during insertion into the pipeline. Retraction of the turbine rotor must be accomplished by using a hand wheel and must enable insertion and removal of the meter without system shutdown. The retractor assembly must include an isolation valve providing a means of removal of the meter from service to allow for field maintenance and field replacement of the rotor assembly or parts. The turbine rotor must have an over range operating capacity of 150 percent of maximum flow for up to 5 seconds. The rotor must be calibrated at the factory in an actual flow of similar fluid over the flow range performed on test equipment with accuracy traceable to the National Institute of Standards and Technology (NIST). A copy of the calibration test data, including all of the physical parameters under which the calibration tests were performed, must be submitted with each turbine rotor. Calibration test data must be analyzed to determine the rotor's arithmetic average "K" factor, the best line fit and the plus or minus deviation from these figures. Turbine flowmeter accuracy must be plus or minus 1 percent of reading for a minimum turndown ratio of 1:1 through a maximum turndown ratio of 50:1. Repeatability must be plus or minus 0.25 percent of reading. Accuracy of the transmitter must be plus or minus 0.25 percent over the calibrated span. The turbine rotor response time from minimum to maximum flow must be less than 10 milliseconds. The flowmeter must include one of the following: dry contact pulse outputs, 4-20mA, 0-10Vdc or 0-5Vdc outputs.

### 2.4.4.13 Ultrasonic Flowmeter

**NOTE:** Doppler meters rely on reflectors in the flowing liquid. To obtain reliable measurements attention must be given to the lower limits for concentrations and sizes of solids or bubbles. The flow must also be rapid enough to keep these materials in suspension. One manufacturer gives values of 1.8 m/s 6 ft/s for solids and 0.75 m/s 2.5 ft/s for small bubbles. To perform within their stated specifications, some Doppler meters require a minimum Reynolds number of 4,000.

Transit-time meters rely on an ultrasonic signal's completely traversing the pipe, so the path must be relatively free of solids and air or gas bubbles. To perform within stated specifications, one type of transit-time meter requires a minimum Reynolds number of 10,000.
installation hardware and transducer cables. Ultrasonic transducers must be optimized for the specific pipe and process conditions for the application. The flow meter accuracy must plus or minus 1 percent of rate from 0.3 to 12 meters/sec 0 to 40 ft/sec. The flowmeter must include one of the following: dry contact pulse outputs, 4-20mA, 0-10Vdc or 0-5Vdc output.

2.4.4.14 Variable Area Flow Indicator

Indicator must have an accuracy of plus or minus [5] [ ] percent of full scale. The body must be clear acrylic plastic with [brass] [stainless steel] end fittings. The float must be [glass] [or] [stainless steel]. The metering tube must be tapered and must be provided with a direct reading flow scale engraved on the meter body.

2.4.4.15 Venturi Tube

Venturi tube must be made of cast iron or cast steel and must have an accuracy of plus or minus [1] percent of full flow. The throat section must be lined with austenitic stainless steel. Thermal expansion characteristics of the lining must be the same as that of the throat casting material. The surface of the throat lining must be machined to a plus or minus 1.2 micron 50 mils finish, including the short curvature leading from the converging entrance section into the throat. The metering tube must be rated for continuous duty service at minimum pressure of [700] [_____] kPa [100] [_____] psi gage.

2.4.4.16 Vortex Shedding Flowmeter

The accuracy must be within plus or minus [0.8] [_____] percent of the actual volumetric flow. Steam meters must contain density compensation by direct measurement of temperature. Mass flow inferred from specified steam pressure are not acceptable. The flow meter body must be made of austenitic stainless steel and include a weather tight NEMA 4X electronics enclosure. Flowmeter must be rated for continuous duty service at minimum pressure of [700] [_____] kPa [100] [_____] psi gage. The vortex shedding flowmeter body must not require removal from the piping in order to replace the shedding sensor.

2.4.5 Level Instrumentation

******************************************************************************
NOTE: Indicate the location and the NFPA hazard classification on the drawings. Hazard classification of sumps and tank interiors frequently differ from the general area hazard classification. Include a schedule of level sensing elements with operating range requirements. Tabulation of devices is to be included on the drawings. Component identifiers are to be coordinated with the drawings. Use the Instrument Society of America (ISA) suggested alphanumeric system for development of discrete device numbering.
******************************************************************************

Pressure taps must incorporate appropriate snubbers. Relays and housing must be intrinsically safe or explosion proof as required by the NFPA hazard rating for compatibility with the contents of the tank or sump. [The
controller must be provided with a minimum of three alarm lights. The first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light must indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input. The controller must be provided with a minimum of three sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input. The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a 4-20 mA output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost.

2.4.5.1 Bubble Type Level Sensor

Bubble type liquid level sensor must be of the hydrostatic balance type, operating from compressed air. Each gauging system must contain the following: an air set including [compressor] [or] [connection to plant air], compressed air pressure regulating valve, air filter and moisture trap; a sight feed bubbler with built-in adjusting needle valve; a tank entry gland with air supply and equalized pilot signal connections; a [13 mm 1/2 inch] [standard weight 316 stainless steel] [schedule 80 carbon steel] dip tube; a direct reading circular gauge [300 mm 12 inch] calibrated for the connected tank and tank liquid; connections to the circular gauge and to the pressure transducer for zero setting and calibration check; a connecting bubbler supply and equalized pilot signal [copper] [aluminum] [stainless] tubing with minimum field made joints; and a pressure transmitter mounted at the top of the dip tube, selected to correspond to the range required to gauge the connected tank. Instrument air lines must be trace heated if there is a frost risk with an air flowrate of [28 L/H][1.0 SCFH].

2.4.5.2 Capacitance Type Level Sensor

Liquid level sensor must produce a signal that is proportional to the measured level. Sensor must be capacitance type. Sensor must [work with conductive material] [work with non-conductive material] [be proximity or non-contact type]. The transmitter must have non-interacting zero and span adjustments, and must have an accuracy of plus or minus [0.1] [_____] percent of calibrated span. Assemblies must include wall bracket or mounting plate, austenitic stainless steel rods, stainless steel bolts and corrosion resistant housing.

2.4.5.3 Conductivity Switch

The switch must detect the presence of a fluid by measuring the electrical resistance between a sensor and a ground electrode. Electrodes must be constructed of [316 stainless steel] [Hastelloy] [titanium]. Electrodes must be fully clad using [polyolefin] [polytetrafluoroethylene (PTFE)]. The conductivity switch must be capable of [1] [2] [3] [4] separate level set points. The switch must [be provided with] [use the container as] a ground electrode. Electrode lengths must be as necessary, based on the application and to meet the requirements of the control sequence. A relay
switching point must be provided for each sensor. Contacts must be rated for a maximum of 240 VAC, 5 A. Switch must have a maximum response time of 2 seconds. Assembly must be [flange mounted] [NPT thread (male)] [including surface mounting bracket] and suitable for the indicated environment.

2.4.5.4 Displacement Type Level Switch

Liquid level switch must be displacement type, having a minimum of two tandem floats with each float independently activating a set of Form C contacts at two different level settings. Each switch must have an adjustable differential band. The mounting connections must be threaded, flanged or surface mounted to suit the application. All surfaces in contact with the tank contents must be austenitic stainless steel. The switch enclosure must be explosion proof for use in a hazardous environment, complete with a sealed water tight junction box, terminal block, and mounting plate. Each set of contacts must be snap action, dry contact type with one normally open and one normally closed, contact rated in accordance with NEMA ICS 1. The switch must be actuated by a magnetically equipped stainless steel displacer. Repetitive accuracy must be plus or minus 6 mm 1/4 inch of actual displacer setting.

2.4.5.5 Mercury Float Switch

Float switch assemblies for use in liquid systems must consist of wall bracket or mounting plate, galvanized steel rods, stainless steel bolts, explosion proof and corrosion resistant housing, and intrinsically safe relays. Each switch must consist of two normally open mercury switches, encapsulated in epoxy resin. The float casing must be polypropylene. The switch cable must be oil resistant neoprene or PVC cable with 4 No. 18 gauge stranded copper conductors, rated for 600 Volt application.

2.4.5.6 Reed Switch

Switch must consist of a transmitter tube with a reed strip located inside. The tube length must have sufficient length to permit adjustment of switch actuation within process parameters [extend the full height of the tank]. A float containing a permanent magnet must fit over the transmitter tube and must move up and down with the liquid level. The transmitter tube and sliding float assembly must be as required for the application as shown on the drawings. Wetted parts must be [_____], [316 stainless steel], [PVC], [polypropylene], or [polytetrafluoroethylene (PTFE)] suitable for the installed service indicated. Assembly must be [flange mounted] [NPT thread (male)] [include surface mounting bracket]. Maximum switching power must be [15 Watts], maximum switching current [1 amp], maximum carrying current [200Vdc], breakdown voltage [300Vdc], and initial contact resistance [0.10 ohms]. Maximum operating time must be [0.50 msec].

2.4.5.7 Non-Contact Ultrasonic Level Sensor

The sensor must be microprocessor based and must provide continuous, non-contact level measurement of liquids and solids utilizing microwave pulsed time of flight measurement method. [Sensor must have pushbutton calibration and LCD display.] The sensor must operate in a frequency band approved for industrial use. The sensor must be capable of measuring in a range of 0 to [7] [1] [_____] m 0 to [20] [3] [_____] feet with an accuracy of plus or minus [.25] [_____] percent of full scale and repeatability [± 0.125" 3mm]. The sensor must be capable of distinguishing between real
echoes, reflections and background noise. The sensor must automatically compensate for temperature changes. The sensor must be capable of operating in a temperature range from minus [25] [_____] degrees C to [40] [50] [_____] degrees C minus [15] [_____] degrees F to [105] [120] [_____] degrees F. Assembly must be [flange mounted] [NPT thread (male)] [include surface mounting bracket] of sufficient size to eliminate echoing and suitable for the installed environment indicated. Mounting assembly must be suitable for service without requiring entry or drainage of the [vessel] [sump] where level is being measured.

2.4.5.8 Leak Detection

Double walled containment system leak detectors must use electrodes mounted in the interstices of double walled containment systems with a minimum time delay of [0.5] [_____] seconds. Leak detectors for open systems must be mounted at slab or floor level with either a minimum time delay of [0.5] [_____] seconds or a minimum built-in-vertical adjustment of [3] [_____] mm [1/8] [_____] inch to prevent activation due to high humidity. Detector must have a contact rating of 1.0 amps resistive or 200 mA inductive at 28 VDC. Leak detector panel must indicate the location and detector causing the alarmed state. The indicator must be manual reset type. A framed, non-fading half-size as-built location map in laminated plastic must be provided for the cable leak detection system in double containment piping systems indicating the as installed system configuration; sensing string layout must be furnished. Marks in meters feet along the length of pipeline interstitial cable must be provided as references to locate leaks.

2.4.6 Pressure Instrumentation

**************************************************************************
NOTE: Indicate on the drawings where visual indication of the measured pressure is required. Include a schedule of pressure sensing elements with operating range requirements. Include a tabulation of devices drawings. Component identifiers are to be coordinated with the drawings using the Instrument Society of America (ISA) suggested alphanumeric system for development of discrete device numbering.
**************************************************************************

Pressure taps must incorporate appropriate snubbers.

2.4.6.1 Pressure Controller

The controller must be provided with a minimum of three [alarm lights. The first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light must indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input] [sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input]. The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a [4-20 mA] [_____]
output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost. Pressures must be controlled to within plus or minus [5] [_____] percent of design pressures.

2.4.6.2 Pressure Sensor and Transducer

The sensing element must be either [capsule] [diaphragm] [bellows] [Bourdon tube] [solid state] type. The pressure transducer must withstand up to 150 percent of rated pressure, with an accuracy of plus or minus [1.0] [_____] percent of full scale selected to put the design range of the measured pressure in the middle third of the transducer's range. Pressure must be measured in [kPa psi] gage with a range, plus or minus [10] [_____] percent of design range and must be furnished with [display] [display and printout] to the nearest [1.0] [_____] kPa [0.145] [_____] psi. The transmitter output error must not exceed [0.1] [_____] percent of calibrated span.

2.4.6.3 Pressure Switch

Sensors must be [diaphragm] [Bourdon tube] [solid state] and must be constructed of [brass] [316 stainless steel] [____]. Pressure switch must have a repetitive accuracy of plus or minus [5.0] [_____] percent of the operating range and must withstand up to [150] [_____] percent of rated pressure.

Switch actuation set point must be adjustable over the operating pressure range with a differential adjustment span of [20] [_____] to [40] [_____] percent of the range of the switch. The switch must have Form C snap-action contacts rated in accordance with NEMA ICS 1.

2.4.6.4 Differential Pressure

The sensor/transmitter assembly accuracy must be plus or minus [1] [_____] percent of full scale. The over pressure rating must be a minimum of [150] [_____] percent of the operating pressure. Transmitter must be suitable for installation with the low pressure connection removed.

2.4.6.5 Differential Pressure Switch

Provide differential pressure switches with a user-adjustable setpoint that are sized for the application such that the setpoint is between 25 percent and 75 percent of the full range. The over pressure rating must be a minimum of 150 percent of the highest design pressure of either input to the sensor. The switch must have two sets of contacts and each contact must have a rating greater than it's connected load. Contacts must open or close upon rise of pressure above the setpoint or drop of pressure below the setpoint as indicated. Each switch must have taps for sensing lines for connection of pressure fittings designed to sense fluid pressure. [For measuring air, gas or vapor stream differential pressure, these fittings must be of the angled-tip type with tips pointing into the air stream.] The adjustable differential range must be a maximum of [0.037] [0.125] [_____] kPa [0.15] [0.5] [_____] inches water at the low end to a minimum of [0.087] [1.49] [_____] kPa [0.35] [6.0] [_____] inches water at the high end. Two Form C contacts rated in accordance with NEMA ICS 1 must be provided.

SECTION 40 60 00 Page 28
2.4.6.6 Pneumatic to Electric (PE) Switch

2.4.7 Temperature Instrumentation

**************************************************************************
NOTE: Component identifiers are to be coordinated with the drawings using the Instrument Society of America (ISA) suggested alphanumeric system for development of discrete device numbering.
**************************************************************************

Temperature sensors may be provided without transmitters. Where transmitters are used, the range must be the smallest available from the manufacturer and suitable for the application such that the range encompasses the expected range of temperatures to be measured. The end-to-end accuracy includes the combined effect of sensitivity, hysteresis, linearity and repeatability between the measured variable and the end user interface (graphic presentation) including transmitters if used.

2.4.7.1 Temperature Controller

The controller must be provided with a minimum of [three] alarm lights. [The first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light must indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input]. Also [3] sets of dry contacts rated in accordance with NEMA ICS 1. [The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input]. The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a [4-20 mAdc] [_____] output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost.

2.4.7.2 Fluid Temperature Range

**************************************************************************
NOTE: Include a schedule of temperature sensing elements with operating range requirements. The following includes sample tables to assist in defining the exposure and service requirements. Alternatively, tabulation of devices may be included on the drawings. Include a table on the drawings with the following headings:
All devices must be suitable for process temperatures, which define the exposure of the element, and are described in the table on the drawings. Mercury must not be used in thermometers.

2.4.7.2.1 Type A Bimetal Thermometer

Direct reading, hermetically sealed, suitable for external adjustment. Accurate within 1 percent of full range. Stainless steel construction. Complete with thermowell. Thermometers must have either 230 mm 9 inch long scales or 90 mm 3.5 inch diameter dials, with insertion, immersion, or averaging elements.

2.4.7.2.2 Type B Remote Reading Gas/Vapor Thermometer

Direct reading, [stainless steel] [aluminum] [phenolic] case designed for panel mounting, complete with armor cable, bulb and ancillary components for complete system. Motionless design, resistant to shock and vibration and free from error created by elevation. Provided with gas operated molecular sieve. Accurate within 1 percent over full range.

2.4.7.2.3 Type C Resistance Temperature Detector (RTD)

RTD must be [platinum] [copper] [______], with an accuracy of plus or minus [0.1] [______] percent at 0 degrees C 32 degrees F. RTD must be encapsulated in [epoxy,] [stainless steel Series 300,] [anodized aluminum,] [copper].

2.4.7.3 Continuous Averaging RTD

NOTE: Indicate on the drawings where averaging temperature probes are required.

Continuous averaging RTD must have an accuracy of plus or minus [0.5] [2] [_____] degrees C [0.9] [3.6] [_____] degrees F at the reference temperature, and must be of sufficient length to ensure that the resistance represents an average over the cross-section in which it is installed. The sensor must have a bendable copper sheath.

2.4.7.4 Infrared Temperature Sensor

Infrared temperature sensor must be encapsulated in series 300 stainless steel or anodized aluminum. Sensor must have an accuracy of plus or minus 1 percent of temperature measured or 1.4 degrees C 2.5 degrees F, whichever is less.

2.4.7.5 Temperature Switch

NOTE: Include a table on the drawings with the following headings:
All devices must be suitable for process temperatures, which define the exposure of the element, and as described in the table shown on the drawings. Temperature switch must have a repetitive accuracy of plus or minus [1] percent of the operating ranges shown. Switch actuation must be adjustable over the operating temperature range. The switch must have Form C snap action contacts, rated in accordance with NEMA ICS 1.

2.4.7.6 Thermocouple

**NOTE: Thermocouples should not be used for measuring temperatures below 260 degrees C 500 degrees F.**

Thermocouple must be factory assembled with Series 300 stainless steel sheathing. Wiring insulation must be magnesium oxide. Minimum insulation resistance wire to wire or wire to sheath must be 1.5 megohm at 500 V dc. Thermocouple must be [Type E,] [Type K,] [Type J,] [or] [Type R]. Thermocouple error must not exceed that specified in IEC 60584-1. All wire/cable from thermocouple to transmitter must be of the type necessary to match the thermocouple used. Transmitter selected must match the type of thermocouple provided. The transmitter must include automatic cold junction reference compensation with span and offset adjustments, and upscale open thermocouple detection.

2.4.7.7 Thermowell

Thermowell must be monel, brass, or copper for use in water lines; wrought iron for measuring flue gases; and austenitic stainless steel for other applications. Calibrated thermowells must be provided with threaded plug and chain, 50 mm 2 inch lagging neck and inside diameter insertion neck as required for the application. The thermowell must include a connection box, sized to accommodate the temperature sensing devise.

2.4.8 Process Analytical Instrumentation

**NOTE: Add requirements for additional site specific measurements, including span and accuracy for any application not included in this specification.**

Probes must be easily removable without interrupting service. Sampling pumps must be included where necessary or applicable to the sensing device. For sensors integral to the electronic controller the sample may be drawn directly into the sensor or may be drawn through a sample tube. For sensors remotely located the sample may be drawn through a sample tube. Outdoor sample tubes must be heat traced. Sensor and controller construction must be suitable for operation in the monitored medium. Systems requiring automated zero and calibration gas or reagents must be provided with [_____] days supply of calibration gas or reagent. The controller must be provided with a minimum of three [alarm lights. The
first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light shall indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input. [sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input]. The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a [4-20 mA] output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost.

2.4.8.1 Ammonia Gas

The sensor must be capable of monitoring ammonia in the range of [0] [_____] to [100] [_____] mg/L with an accuracy of plus or minus [1] [_____] percent of full scale reading. The sensor response time must be [90] [_____] percent in a maximum of [20] [_____] seconds.

2.4.8.2 Calorimeter (Heat Capacity/Fuel Value)

Calorimeter must be a self-contained device capable of measuring the heat capacity of a sample. The colorimeter must measure the heat released from the sample by igniting the sample reading use of multiple temperature sensors. The sensor must be capable of detecting methane in the range of [0] [_____] to [100] [_____] ppmv with an accuracy of plus or minus [1] [_____] percent of full scale reading.

2.4.8.3 Carbon Dioxide

Continuous emissions monitoring systems (CEMS) for measuring CO2 must be provided with installed back-up devices. The CEMS must comply with 40 CFR 60, Appendix B, Performance Specification 2 and the QA/QC requirements of 40 CFR 60, Appendix F. Calculation of emission rates must be in conformance with 40 CFR 60, Appendix A, Reference Method 19. Provide photometric type CO2 sensors with integral transducers and linear output. Carbon dioxide (CO2) sensors must measure CO2 concentrations between [0 to 2000] parts per million (ppm) using non-dispersive infrared (NDIR) technology with an accuracy of plus or minus [50 ppm] and a maximum response time of 1 minute. The sensor must be rated for operation at ambient air temperatures within the range of 0 to 50 degrees C 32 to 122 degrees F and relative humidity within the range of 20 to 95 percent (non-condensing). The sensor must not exceed a maximum drift of 2 percent by volume a year. The sensor chamber must be manufactured with a non-corrosive material that does not affect carbon dioxide sample concentration. Sensors must be designed to protect the sensing element from dust accumulation and mechanical damage. The sensor must have a calibration interval no less than 5 years.

2.4.8.4 Carbon Monoxide - CO

Continuous emissions monitoring systems (CEMS) for measuring CO must be provided with installed back-up devices. The CEMS must comply with 40 CFR 60, Appendix B, Performance Specification 4 and the QA/QC
requirements of 40 CFR 60, Appendix F. Calculation of emission rates must be in conformance with 40 CFR 60, Appendix A, Reference Method 19. Carbon monoxide analyzer must consist of an infrared light source in a weather proof steel enclosure for duct or stack mounting. An optical detector/analyser in a similar enclosure, suitable for duct or stack mounting must be provided. Both assemblies must include internal blower systems to keep optical windows free of dust and ash at all times. The third component of the analyzer must be the electronics cabinet. Automatic flue gas temperature compensation and manual/automatic zeroing devices must be provided. Unit must read parts per million (ppm) of carbon monoxide in the range of [0] to [100] ppm and the response time must be less than 3 seconds to 90 percent value. Unit measurement range must not exceed specified range by more than 50 percent. Repeatability must be plus or minus 1 percent of full scale with an accuracy of plus or minus 1 percent of full scale.

2.4.8.5 Chlorine Gas

**************************************************************************
NOTE: Follow Chlorine Institute Recommendations.
**************************************************************************

All parts of the chlorine measurement system, including the sensors, transmitters, controllers and peripheral devices, that may come in contact with chlorine or a chlorine-filled environment must be constructed of materials suitable for this application. The chlorine sensor must provide continuous monitoring of the chlorine concentration. The detector must measure concentrations of chlorine in air with a range of [0 to 10 ppm] [with a repeatability of plus or minus [1] percent of full scale] and an accuracy of plus or minus 2 percent of full scale. The Chlorine Detector transmitter must be housed in a non-corrosive NEMA 250 Type 4X enclosure. Detector must include a local panel with adjustable alarm trip level, local audio and visual alarm with silence function. The sensor response time must be [90] percent in a maximum of [30] seconds.

2.4.8.6 Chlorine in Liquid

**************************************************************************
NOTE: Follow Chlorine Institute recommendations.
**************************************************************************

All parts of the chlorine measurement system, including the sensors, transmitters, controllers and peripheral devices, that may come in contact with chlorine or a chlorine-filled environment must be constructed of materials suitable for this application. Residual chlorine sensor must continuously monitor the chlorine residual. The sensor must be capable of detecting chlorine in the range of [0] to [1] [5] [10] [20] [_____] mg/L with an accuracy of plus or minus [1] percent of full scale reading. The sensor response time must be [90] percent in a maximum of [60] seconds.

2.4.8.7 Combustible Gas

Combustible gas sensor must be provided with a means to collect representative continuous samples and measure for the presence of explosive vapors. Measuring range must be from [0] percent of the lower explosive limit (LEL) to 100 percent of the [lower explosive limit (LEL)] [upper explosive limit (UEL)]. Response time must be less than [10] [_____] seconds to indicate [50] percent LEL when exposed to [100]
[_____] percent LEL. Drift must be less than [3] [_____] percent per year. The sensor must have a minimum operational life of [1] [_____] year. The system must be provided with [_____] days of zero and calibration gas.

2.4.8.8 Calorimetric Analyzer

**************************************************************************
NOTE: Limit the range to improve the sensitivity.
Substitute the appropriate analyzer name and range in the first sentence. The remainder of the paragraph applies to any of the following:

<table>
<thead>
<tr>
<th>Analyzer</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phenolphthalein Alkalinity</td>
<td>0 to [50] [100] mg/L</td>

</table>

**************************************************************************

[Hardness] [_____] analyzer must be suitable for range of [0] [_____] to [_____] mg/L as [Calcium Carbonate (CaCO3) equivalent] [______].

Calorimetric analyzer must be an on-line continuous reading process instrument using a colorimeter that compensates for moderate changes in the light source, the sample cell condition, sample turbidity and background color. Analyzer must include sampling pumps, reagent storage and dispenser as well as colorimeter and colorimeter cell. System must be self-cleaning. Analyzer must require no more than weekly instrument standardization. Repeatability and reproducibility must be plus or minus [10] percent of the alarm trip value on 1 and 2 mg/L range and plus or minus 4 percent of alarm trip value on the remaining ranges. Reagent requirements must be no greater than 1 L each of indicator and buffer every two months for continuous operation.

2.4.8.9 Flame Ionization Detector (FID)

**************************************************************************
NOTE: A version with non-methane (NMOC) measurement capability is available when regulations require it.
**************************************************************************

A continuous flame ionization detector (FID) must be installed on a pumped sampling line to measure the total hydrocarbon (THC) content. The analyzer must have been configured at the factory for either H2, H2/He, or H2 and nitrogen fuel and calibrated for propane or methane equivalence.
accuracy (includes calibration gas, response factor, and sample mix accuracies) must be not less than [_____] [4 ppmv] [± 3 percent of full scale] as methane. Repeatability must be [± 1%] maximum. Range and span must be continuously variable. Zero stability must be [± 1% in 30 days], span stability must be [±5% in 1 year]. Linearity must be within 1% of full scale. Outputs must include one 4-20mA and [6] relays for [warning, danger, fault, horn, calibration-in-progress, and service needed]. Detector response time must be [1.2 seconds] or less.

2.4.8.10 Hydrogen Sulfide Gas

**************************************************************************
NOTE: OSHA has established a permissible exposure limit (PEL) of 10 ppm. 10-20 ppm is the borderline concentration for eye irritation. 20 ppm is the acceptable ceiling concentration established by OSHA. 50 ppm is the acceptable maximum peak above the ceiling concentration for an 8 hour shift, with a maximum duration of 10 minutes.
**************************************************************************

The hydrogen sulfide sensor must be rated for continuous monitoring of the hydrogen sulfide level in the range from [0] [_____] to [20] [50] [100] [_____] ppmv with an accuracy of plus or minus [1] [_____] percent of full scale reading. The sensor response time must be a maximum of [30] [_____] seconds with full scale gas applied according to ISA 92.00.01. Repeatability must be ± 2ppm or 10% of the applied gas, whichever is greater. The sensor must have a calibration, calibration check, and setup modes.

2.4.8.11 Oxides of Nitrogen (NOx) Gas

Continuous emissions monitoring systems (CEMS) for measuring NOx must be provided with installed back-up devices. The CEMS must comply with 40 CFR 60, Appendix B, Performance Specification 3 and the QA/QC requirements of 40 CFR 60, Appendix F. Calculation of emission rates must be in conformance with 40 CFR 60, Appendix A, Reference Method 19. Monitor must be designed to verify compliance with standards for NOx normalized to a 3 percent oxygen basis and must have a range of from [0] [_____] to [100] [_____] ppmv. Sensor must be accurate to plus or minus [5] [_____] ppmv. Sensor must be complete with automatic zero and span calibration using a timed calibration gas system, and must require no periodic calibration.

2.4.8.12 Oxygen Gas

Continuous emissions monitoring systems (CEMS) for measuring O2 must be provided with installed back-up devices. The CEMS must comply with 40 CFR 60, Appendix B, Performance Specification 2 and the QA/QC requirements of 40 CFR 60, Appendix F. Calculation of emission rates must be in conformance with 40 CFR 60, Appendix A, Reference Method 19. Oxygen in air must be monitored by an oxygen sensor and electronic controller. The oxygen sensor must be rated for continuous monitoring of the oxygen level in air in the range of [0] [_____] to [20] [25] [30] [_____] percent with an accuracy of plus or minus [1] [_____] percent of full scale reading at constant temperature and pressure and plus or minus [5] percent of full scale reading over operating temperature range. The sensor response time must be [90] [_____] percent in a maximum of [5] [_____] seconds. The controller must have automatic zeroing and must require no normal maintenance or periodic recalibration.
2.4.8.13  Oxygen Dissolved

The dissolved oxygen sensor must provide continuous measure of dissolved oxygen. Wetted materials must be [stainless steel,] [PVC] or glass. Sensor must be rated for continuous use to a depth of [15] [_____] m [50] [_____] feet and must be automatically temperature compensating over the temperature range. Sensor must be capable of measuring dissolved oxygen level of from [0] [_____] to [15] [_____] ppmv. The sensor must have an accuracy of plus or minus [1] [_____] percent of full scale reading, repeatability of [±0.05] and response time of [25 sec to 63%] of final reading at 25°C 77°F.

2.4.8.14  Oxygen Reduction Potential (ORP)

The sensor must be [submersible] [flow-through] type. Sensor must have a redox potential range of plus or minus [500] [_____] mV and must have an accuracy of plus or minus [1] percent of sensor span. The sensor must automatically compensate for temperature over the temperature range. The sensor body must be [PVC, CPVC, Liquid Crystal Polymer (LCP) or epoxy] and suitable for installation in the environment.

2.4.8.15  Ozone (O3) Gas

**************************************************************************
NOTE: The standard instrument provides the range 0-1,000 ppmv (parts per million by volume) an alternate display of ozone concentration is in millipascals.
**************************************************************************

Ozone in air must be monitored by an ozone gas sensor and electronic controller. The sensor must be capable of detecting ozone in the range of [0] [_____] to [1,000] [_____] ppmv with an accuracy of plus or minus [1] [_____] percent of the full scale reading. The sensor response time must be [90] [_____] percent in a maximum of [60] [_____] seconds.

2.4.8.16  Ozone (O3) in Water

The dissolved ozone sensor must provide continuous measurement of dissolved ozone level from [0] [_____] to [5] [_____] mg/L. The sensor must automatically compensate for temperature over the temperature range. The sensor must have an accuracy of plus or minus [1] [_____] percent of the full scale reading. [System must include variable area flow meter and needle valve to regulate rate of sample flow through sensor unit.] [Sensor must be suitable for direct submersion.]

2.4.8.17  pH Monitoring

**************************************************************************
NOTE: Limit the range to improve the sensitivity.
**************************************************************************

The sensor must be [submersible] [or] [flow-through] type. [Sensor must be a differential type]. Sensor must have a range of [1] [4] [5] [5.5] [_____.], pH units to [8.5] [9] [11] [14] [_____.]. pH units and must have an accuracy of plus or minus [0.1] [0.01] [_____.] pH unit. The sensor must automatically compensate for temperature over the temperature range. The sensor body must be PVC, CPVC or epoxy.
2.4.8.18  VOC Detector

**************************************************************************
NOTE:  Show sampling points on the drawings.
**************************************************************************

Detector must be either photoionization or Gas Sensitive Semiconductor type. Contaminant and background concentrations are [as follows:] [______]. Detector must be provided with a means to collect representative continuous samples and measure for the presence of volatile organic compounds (VOCs). Sampling points are as indicated on the drawings. The system must be provided with automated zero and calibration gas system as well as a [4-20ma] [relay controller] output.

2.4.8.19  Total Dissolved Solids (TDS)

The TDS sensor must measure the specific conductance using a conductivity sensor, displaying the total dissolved solids value in [milligrams per liter (mg/L) of dissolved NaCl equivalent] [microhms (microSiemens) per centimeter (uS/cm)] and transmitting an analog signal for remote processing. System must be industrial grade, [contacting][tandoridal] and suitable for measurement of conductivity in a solution [by insertion of the sensing element into the pipeline, using a hot tap assembly] [including a variable area flow meter and needle valve to regulate rate of sample flow through sensor unit]. Sensor assembly must be suitable for periodic removal for adjustment and cleaning without requiring shut down of the process. Sensor must be suitable for range of [0] [_____] to [10,000] [_____] [milligrams per liter (mg/L) of dissolved NaCl equivalent] [microhms per centimeter (uS/cm)]. Range must be field verified for the application and adjusted as required. Sensing element must be constructed of [316 stainless steel] [_____] and glass, including temperature element, and be capable of continuous operation. Sensing element must be unaffected by color in the fluid, pressure, and rate of flow. Sensor must have automatic temperature compensation and must require no normal maintenance or periodic recalibration.

2.4.8.20  Water Turbidity

System must be complete and include indicating meter, sensing element and a transmitter. System must be industrial grade and suitable for measurement of turbidity by [insertion of the sensing element into the pipeline, using a hot tap assembly] [direct submersion of the sensing element into the vessel or flow channel]. Sensor assembly must be suitable for periodic removal for adjustment and cleaning without requiring shutdown of the process. Sensor must be suitable for range from [0] [_____] to [2] [20] [200] Nephelometric turbidity units (NTU). The accuracy must be plus or minus [2] [_____] percent of full scale reading. Range must be field verified for the application and adjusted as required. Sensing element must be constructed of [316 stainless steel] [_____] and glass. Sensing element must be unaffected by color in the fluid, pressure, temperature and rate of flow. Sensor must have automatic zeroing and must require no normal maintenance or periodic recalibration. Sensor must have [active and] passive anti-fouling mechanisms.

2.4.9  Electrical Instrumentation

Electrical power measurements with a range for the specific application, plus or minus [1.0] [_____] percent of range (display and print to nearest
kWh and kW). Electrical measurements with a range for the specific application plus or minus [1.0] percent of range (display and print to nearest [0.1] for volts and amperes, and to the nearest [0.01]

2.4.9.1 Hour Meter

Hour meter must provide a totalized readout of the number of hours of operation for the equipment monitored. Meter must provide readout with a minimum of [5] digits including [1] decimal places. The display must be non-resettable. The meter must be driven by a [24] VAC synchronous motor.

2.4.9.2 Watt-Hour Meter

Watt-hour meters must be in accordance with Section 23 09 13 INSTRUMENTATION AND CONTROL DEVICES FOR HVAC.

2.4.10 Limit Switch

**************************************************************************
NOTE: See NEMA ICS 5 Part 9 for application guidelines. To increase the number of operations during the life of the contact, select contacts with make and break values much higher than those applied
**************************************************************************

Limit switch must be [rotary/lever] type, contacts must be heavy duty and rated A600 or N600. Enclosure must be metal. The actuating head must vary based upon the application.

2.4.11 Absolute Rotary Encoder

The absolute rotary encoder must retain the count upon loss of power without use of battery or alternate power source. The encoder must increase the count when turning in the direction which causes [the gate to raise] and must decrease the count in the opposite direction. The encoder must be capable of counting at least [4,096] data points per revolution and counting revolutions.[tracking the full range of operation.] The output signal must be [synchronous serial interface (SSI)] [Common Industrial Protocol (CIP)] [______]. Draw wire string encoder type of absolute rotary encoder must not be used in outdoor settings.

2.4.12 Linear Displacement Position Sensor

The linear displacement position sensor must be a magnetostrictive position sensor capable of 0.02% accuracy or better along the entire hydraulic cylinder stroke length. The sensor must measure the full stroke of the hydraulic cylinder. The sensor must be capable of 4-20mA analog output with an update cycle of at most 10ms. The sensor module and rod must meet IP 67 standards. The sensor must mount to the hydraulic cylinder by threaded flange and be constructed to integrate with the hydraulic cylinder.

2.4.13 Emergency Stop

Emergency stop pushbutton must have red mushroom actuator and yellow background. Actuator must be self-latching and manually reset. Provide contacts that are NEMA ICS A600 and directly opened. Pushbutton must meet NFPA 79 SECTION 10.7.
2.5 **COMPRESSED AIR STATIONS**

**************************************************************************
NOTE: If the process control system does not utilize pneumatic devices, the air compressor and accessories should be deleted.
**************************************************************************

Submit instrumentation compressed-air station schematic diagram showing equipment utilized, including compressor with motor output and voltage; starter; isolators; manual bypasses; tubing sizes; drain piping and drain traps; reducing valves; air-dryer; and data on manufacturer’s names and model numbers, mounting, access, and clearance requirements. Include in the air-compressor and air-dryer data calculations of the air consumption of pneumatic control valves and of other process control system devices to be connected to the compressed-air station; the number of starts per hour, the running time for the unit selected; and the compressed air-supply dewpoint temperature at **552 kPa 80 psig**.

2.5.1 Air Compressor Assembly

The air compressor must be a high-pressure compressing unit with electric motor. The compressor must be equipped with a motor with totally enclosed belt guard, an operating-pressure switch, safety relief valves, gauges, intake filter and intake silencer and combination type magnetic starter with under voltage protection and thermal overload protection for each phase, and must be supported by a steel base mounted on an air storage tank. The air compressor must provide the compressed air required for control operation while operating not more than one-third of the time. The tank must be of sufficient volume so that no more than six compressor starts per hour are required with the starting pressure switch differential set at **140 kPa 20 psi** gage. The air storage tank must be fabricated for a working pressure of not less than **1380 kPa 200 psi** gage and constructed and certified in accordance with **ASME BPVC SEC VIII D1**. The tank must be provided with an automatic condensate drain trap with manual override feature. [A second (duplex arrangement) compressor of capacity equal to the primary compressor must be provided, with interlocked control to provide automatic changeover upon malfunction or failure of either compressor. A manual selector switch must be provided to index the lead compressor including the automatic changeover.]

2.5.2 Compressed Air Station Specialties

2.5.2.1 Refrigerated Dryer, Filters and Pressure Regulator

A refrigerated dryer must be provided in the air outlet line of the air storage tank. The dryer must be of the size required for the full delivery capacity of the compressor. The air must be dried at a pressure of not less than **483 kPa 70 psi** gage to a temperature not greater than 2 degrees C 35 degrees F. The dryer must be provided with an automatic condensate drain trap with manual override feature. The refrigerant used in the dryer must be one of the fluorocarbon gases. A 5 micron prefilter and coalescing-type oil removal filter with shut-off valves must be provided in the dryer discharge. Each filter bowl must be rated for **1034 kPa 150 psi** gage maximum working pressure. A pressure regulator with high side and low side pressure gauges and a safety valve must be provided downstream of the filter. Pressure regulators of the relieving type must not be used.
2.5.2.2 Coalescing Filter

A coalescing prefilter, together with an automatic drain valve, must be provided for removal of liquids. The flow through the prefilter must be from inside to outside and reduce an entrained quantity of 50 ppmv oil to 0.0013 ppmv effluent liquid oil and water and remove all particulates greater than 0.6 micron absolute. The prefilter housing (bowl) must be fitted with a drain port to eliminate collected liquids and provide sufficient sump volume to prevent liquid re-entrainment, and an automatic drain valve with adjustable cycle and drain times. Prefilter pressure drop must be less than \(21 \text{kPa}\) \(3 \text{psi}\) saturated. A particulate after filter, outside to inside flow, designed to remove desiccant fines must be provided. The after filter cartridge must have a particulate removal rating of 0.5 micron absolute. Both prefilter and after filter housings must allow for service of elements without removing the entire assembly from the system. Filter life must be stated and guaranteed by the vendor.

2.5.2.3 Flexible Pipe Connections

The flexible pipe connectors must be designed for 1034 kPa \(150 \text{ psi}\) gage and 121 degrees C \(250 \text{ degrees F}\) service and must be constructed of rubber, polytetrafluoroethylene (PTFE) resin or braided corrosion-resistant steel, bronze, monel or galvanized steel. The connectors must be suitable for the service intended and may have threaded or soldered ends. The length of the connectors must be as recommended by the manufacturer for the service intended.

2.5.2.4 Vibration Isolation Units

The vibration isolation units must be standard products with published loading ratings and must be single rubber-in-shear, double rubber-in-shear or spring type.

2.5.2.5 Compressed Air Piping

Control air delivered to the system must conform to ISA 7.0.01. Air lines for pneumatic controls must be seamless copper tubing or nonmetallic tubing. Nonmetallic tubing must be compounded from polyethylene. Air lines concealed in walls must be hard-drawn copper tubing or nonmetallic tubing in rigid conduit. Terminal single lines must be hard-drawn copper tubing except when the run is less than 300 mm \(12 \text{ inches}\) in length, flexible polyethylene may be used. Nonmetallic tubing will not be used for applications where the tubing could be subjected to a temperature exceeding 55 degrees C \(130 \text{ degrees F}\). Fittings for nonmetallic tubing must be for instrument service and may be brass or acetyl resin of the compression or barbed push-on type. Tubing must be as follows:

a. Copper tubing must conform to ASTM B88M ASTM B88 and must have sweat fittings and valves. Exposed tubing must be hard drawn in exposed areas and hard-drawn or annealed in concealed areas. Only tool made bends must be used. Fittings for copper tubing must be brass or copper solder joint type except at connections to the apparatus, where fittings must be brass compression type. Grooved mechanical joints and fittings must be designed for not less than \(862 \text{kPa}\) \(125 \text{ psig}\) service and must be the product of the same manufacturer. Grooved fittings and mechanical coupling housing must be ductile conforming to ASTM A536. Gaskets for use in grooved joints must be molded synthetic polymer of pressure responsive design and must conform to ASTM D2000 for circulating medium up to 110 degrees C \(230 \text{ degrees F}\). Grooved joints
must conform to AWWA C606. Tubing must be rack mounted where multiple tubes run in parallel. Multiple tubes may be bundled when concealed.

b. Tubing must be flame resistant, multiple polyethylene tubing in an extruded PVC protective sheath, or unsheathed polyethylene tubing in rigid metal, intermediate metal, or electrical metallic tubing conduit for areas where tubing is exposed. Tubing must have barbed fittings and valves, and must conform to the following: Burst pressure must be 3.8 MPa 550 psi gage at 24 degrees C 75 degrees F to 1.2 MPa 175 psi gage at 66 degrees C 150 degrees F, minimum. Stress crack resistance in accordance with ASTM D1693 must be 200 hours, minimum. Tensile strength in accordance with ASTM D638 must be 14 MPa 2000 psi, minimum. Average density in accordance with ASTM D792 must be 920 kg/m3. Average flow rate in accordance with ASTM D1238 must be 0.30 decigram per minute.

c. Plastic tubing must have the burning characteristics of linear low density polyethylene tubing, must be self extinguishing when tested in accordance with ASTM D635, must have UL 94 V-2 flammability classification, and must withstand stress cracking when tested in accordance with ASTM D1693. Polyethylene tubing must not be used for smoke removal systems.

2.5.3 Barrier Jacket

Provide plastic tubing bundles mylar barrier and flame retardant polyethylene jacket. Each tube must be numbered.

2.6 PROGRAMMABLE LOGIC CONTROLLER (PLC)

**************************************************************************
NOTE: Typically, either modular or loop type PLCs will be used throughout the process control system. The designer must determine which is best suited for the application and delete the paragraph pertaining to the type that will not be used. If it is determined that the use of both types is necessary, the drawings will indicate where each type will be used and both types will be included in the edited specification.
**************************************************************************

2.6.1 PLC General Requirements

PLCs must be micro-processor based, capable of receiving binary and analog inputs and, through programming, must be able to control binary and analog output functions, perform data handling operations and communicate with external devices. PLCs must meet the requirements of Class A computing devices, and must be labeled as set forth in 47 CFR 15 and must be able to withstand conducted susceptibility test as outlined in NEMA ICS 1, NEMA ICS 2, NEMA ICS 3, [and] [or] IEEE C37.90.1. PLCs must function properly at temperatures between 0 and 50 degrees C 32 and 122 degrees F at 5 to 95 percent relative humidity non-condensing and must tolerate storage temperatures between minus 40 and plus 60 degrees C 40 and plus 140 degrees F at 5 to 95 percent relative humidity non-condensing.

2.6.2 Modular PLC

PLCs must be based on a modular, field expandable design allowing the
system to be tailored to the process control application. The system must be expandable through the use of additional hardware and/or user software. As a minimum, the PLC must include a mounting backplane, power supply module, central processing unit (CPU) module, communications module, and input/output (I/O) module. The modules must be grouped together in a mounting rack or cabinet. The mounting rack backplane must provide the communications mechanism to fully integrate the individual modules located within the rack. Modules other than I/O modules must plug directly into the backplane. The use of wire connectors between modules will not be allowed except for expansion of the system to include multiple backplanes. The rack size must be as needed to hold the equipment necessary while performing the required control functions. [The system configuration must allow for the removal and/or installation of modules under power.]

2.6.2.1 Central Processing Unit (CPU) Module

The CPU module must be a self contained, microprocessor based unit that provides time of day, scanning, application program execution, storage of application programs, storage of numerical values related to the application process and logic, I/O bus traffic control, peripheral and external device communications and self diagnostics. The scan time must be [250 milliseconds] or better including spare I/O channels.

2.6.2.2 Communications Module

The communications module must allow peer-to-peer communication with other PLCs and must allow the PLC to communicate with the central station, or workstation. The communication module must utilize the manufacturer's standard communication architecture and protocol, ethernet architecture and protocol or a combination of these. The communication module must allow programming of the PLC to be done locally through the use of a laptop computer[ or from the central station or remote workstation].

2.6.2.3 Power Supply Module

One or more power supply modules must be provided as necessary to power other modules installed in the same cabinet. Power supply modules must plug directly into the backplane. Auxiliary power supplies may be used to supply power to remote cabinets or modules.

a. Power supply modules must use [AC] [DC] power with a nominal voltage of [120 VAC] [220 VAC] [24 VDC] [48 VDC] [125VDC] plus or minus 5 percent. The power supply module must monitor the incoming line voltage level and must provide over current and over voltage protection. If the voltage level is detected as being out of range the power supply module must continue to provide power for an adequate amount of time to allow for a safe and orderly shutdown. Power supply modules must be capable of withstanding a power loss for a minimum of 20 milliseconds while still remaining in operation and providing adequate power to all connected modules.

b. Each power supply module must be provided with an on-off switch integral to the module. If the manufacturer's standard power supply module is not provided with an on-off switch, a miniature toggle type switch must be installed near the PLC and must be clearly labeled as to its function..

c. Provide power supply modules with an indicating light which must be lit when the module is operating properly.
2.6.2.4 Input/Output (I/O) Modules

Modules must be self contained, microprocessor based units that provide an interface to field devices. The modules must be located in the same cabinet as the other PLC components. Each module must contain visual indication to display the on-off status of individual inputs or outputs. Each I/O must be protected against reversal of polarity of the signal. Analog inputs and analog outputs must have 'open, short and out of range circuit' detection. It must be configurable per channel.

2.6.3 Loop PLC

PLCs must be single or multiple loop controllers depending on the process control system requirements. Controllers must be self contained and must include a central processing unit (CPU), program memory, power supply, input/output capability, [network communications capability] and display/keyboard. The controller must have a scaleable process variable for each loop. Controller must have proportional, integral and derivative (PID) control logic. Analog outputs must be configured as direct acting or reverse acting. The controller must have keyboard, display, auto/manual selection for control of each loop output, remote setpoint, adjustment/local setpoint adjustment selection with adjustable high-end and low-end limits, ratio and bias adjustment on remote setpoint input, [operator-initiated self-tune/manual-tune selection] [and anti-reset wind-up feature]. Controller must power analog output loops to 20 mAdc when connected to a load of 600 ohms.

2.6.3.1 Central Processing Unit (CPU)

The central processing unit must be microprocessor based and must provide time of day, scanning, application program (ladder rung logic) execution, storage of application programs, storage of numerical values related to the applications process and logic, I/O bus traffic control, peripheral and external device communications and self diagnostics.

2.6.3.2 Power Requirements

Each controller must be powered by [AC] [DC] power with a nominal voltage of [120 VAC] [220 VAC] [24 VDC] [48 VDC] [125VDC]. Power consumption must not exceed 25 watts. Controller must provide electrical noise isolation between the AC power line and the process variable inputs, remote setpoint inputs and output signals of not less than 100 dB at 60 Hertz common mode rejection ratio and not less than 60 dB at 60 hertz normal-mode rejection ratio.

2.6.3.3 On-Off Switch

Each controller must be provided with an integral on-off switch. If the controller is not provided with a manufacturers standard on-off switch, a miniature toggle type switch must be installed near the controller and must be clearly labeled as to its function.

2.6.3.4 Parameter Input and Display

Enter and display control parameters directly, in the correct engineering units, through a series of keystrokes on a front panel display with decimal point and polarity indication. Provide display [in metric English units] [in metric or English units as selected by the operator].
2.6.3.5 Self Tuning

NOTE: If the process control system does not utilize analog control, or if self tuning is not needed delete this bracketed section as it limits the number of vendors.

Provide controllers with self-tuning operation which applies to proportional, integral and derivative modes of control and modify the mode constants as required. Self-tuning must only be in operation when selected from the front panel.

2.6.3.6 Manual Tuning

Controllers must be provided with manual tuning operation which must apply to proportional, integral and derivative modes of control, by means of individually adjustable mode constants. These adjustments must be set for the appropriate value if a particular control mode action is required or to zero if that particular mode is not desired. The proportional mode constant must be adjustable from 0 to 200 percent of the input signal range. The integral mode constant must be adjustable from 0 to 20 repeats per minute. The derivative mode constant must be adjustable from 0 to [5] minutes.

2.6.4 Program Storage/Memory Requirements

The CPU must utilize the manufacturer's standard non-volatile memory for the operating system. The controller must have electronically readable and writeable non volatile memory (EPROM, EEPROM, or Flash PROM) [battery backup volatile memory. Must be possible to change battery with power on] for storage of user programs. The user programs must be loaded through the controller keypad, central station or through the use of a laptop computer. The CPU memory capacity must be based on the system's control requirements. The memory capacity must be sized such that, when the system is completely programmed and functional, no more than 50 percent of the memory allocated for these purposes is used.

2.6.5 Input/Output Characteristics

Each controller must allow for analog input, analog output, binary input and binary output. The number and type of inputs and outputs for the system must be as shown on the drawings and must comply with the sequence of control. The system capacity must include a minimum of 20 percent spare input and output points (no less than two points) for each point type provided. During normal operation, a malfunction in any input/output channel must affect the operation of that channel only and must not affect the operation of the CPU or any other channel. All input circuits must have a minimum optical isolation of 1500 VRMS and must be filtered to guard against high voltage transients from the externally connected devices. All output circuits must have a minimum optical isolation of 1500 VRMS and must be filtered to guard against high voltage transients from the externally connected devices.

2.6.5.1 Analog Inputs

Analog input circuits must be available in [+/-10V] [+/-5V] [0-10V] [0-5V]
2.6.5.2 Binary Inputs

Binary input circuits must be available in [5 volt TTL] [10-30 VDC] [18-26 VDC] [79-132 VDC] [79-132 VAC].

2.6.5.3 Analog Outputs

Analog output circuits must be available in [+/-10V] [4-20 mA].

2.6.5.4 Binary Outputs

Binary output circuits must be available in [5 volt TTL] [10-30 VDC] [18-26 VDC] [79-132 VAC].

2.6.5.5 Pulse Inputs

Pulse inputs must be able to detect a pulse of [x milliseconds] or less.

2.6.6 Wiring Connections

Wiring connections must be heavy duty, self lifting, pressure type screw terminals to provide easy wire insertion and secure connections. The terminals must accept two #14 AWG wires. A hinged protective cover must be provided over the wiring connections. The cover must have write-on areas for identification of the external circuits.

2.6.7 On-Off Switch

Each controller must be provided with an integral on-off power switch. If the controller is not provided with a manufacturer's standard on-off switch, a miniature toggle type switch must be installed in the control panel near the controller and must be clearly labeled as to its function.

2.6.8 Diagnostics

Each PLC must have diagnostic routines implemented in firmware. The CPU must continuously perform self-diagnostic routines that will provide information on the configuration and status of the CPU, memory, communications and input/output. The diagnostic routines must be regularly performed during normal system operation. A portion of the scan time of the controller must be dedicated to performing these housekeeping functions. In addition, a more extensive diagnostic routine must be performed at power up and during normal system shutdown. The CPU must log input/output and system faults in fault tables which must be accessible for display. When a fault affects input/output or communications modules the CPU must shut down only the hardware affected and continue operation by utilizing the healthy system components. All faults must be announced at [the PLC] [and] [the central station]. Diagnostic software must be useable in conjunction with the portable tester. The following diagnostics must be performed:

a. Analog Inputs: Sensor out of range, open or shorted loop, analog-to-digital converter check

b. Analog Outputs: Open or shorted loop

c. Configuration: Check compatibility and availability of selected I/O
2.6.9 Accuracy

Provide controllers with an accuracy of plus or minus [0.25] percent of input span.

[2.6.10 Primary/Secondary PLC]

**************************************************************************
NOTE: Determine if the system is critical enough to require a Primary/Secondary PLC arrangement. This is a significant cost addition and makes the system more complex.
**************************************************************************

The Primary/Secondary PLCs must have redundancy built into the process control system by having two systems (power supply and CPU) either of which is capable of controlling the system. Data must be transferred from the primary processor to the secondary processor each logic cycle. [The I/O scan must be transferred from the PLC currently in charge to the other at the end of each logic execution and the logic must be executed.] [The data must be transferred via asynchronous transfer where the primary processor has two separate microprocessors embedded in its circuitry and at the end of logic execution all data must be passed to the second microprocessor and the second microprocessor must handle all transfer tasks while the first executes the next program scan.] The Primary must perform the execution of the outputs unless a fault is detected in which case execution of the outputs is performed by the Secondary. Switchover must be automatic and indication of the switchover must be displayed on the Central Operator Workstation.

2.7 PLC SOFTWARE

Furnish all PLC software described in this specification as part of the complete control system.

2.7.1 Operating System

**************************************************************************
NOTE: If loading of control logic is allowed from the central station this presents a security risk.
**************************************************************************

Each PLC must be provided with the manufacturer's standard operating system software package. The PLC must maintain a point database in its memory that includes all parameters, constraints and the latest value or status of all points connected to the PLC. Execution of the PLC application programs must use the data in memory resident files. The operating system must support a full compliment of process control functions. It must be possible to define these functions using a mix of ladder logic diagrams, function blocks, sequential function charts and text programming. Programming methods and interactions must be based on IEC 61131-3. A combination of the programming methods must be possible within a single controller. The operating system must allow loading of control logic locally [or from the central station in which case it must require a password to do so] and data files from the portable tester. It must also
support data entry and diagnostics using an operator interface panel attached directly to the PLC. Each PLC must be capable of operating in stand alone mode.

2.7.1.1 Startup

The PLC must have startup software that causes automatic commencement of operation without human intervention, including startup of all connected I/O functions. A PLC restart program based on detection of power failure at the PLC must be included in the PLC software. The restart program must include start time delays between successive commands to prevent demand surges or overload trips.

2.7.1.2 Failure Mode

Upon failure for any reason, each PLC must perform an orderly shutdown. Systems which are not Primary/Secondary must force all PLC outputs to a predetermined (failure mode) state, consistent with the failure modes shown and the associated control device. Primary/Secondary systems must transfer I/O scan and control to the PLC not currently failed.

2.7.2 Functions

The controller operating system must be able to scan inputs, control outputs, and read and write to its internal memory in order to perform the required control as indicated in the sequence of control on the drawings. The controller must periodically perform self diagnostics to verify that it is functioning properly. [If the system is set up as a Primary/Secondary system the system must attempt to switch to the other PLC upon sensing a fault in the currently controlling PLC.]

2.7.2.1 Analog Monitoring

Measure and transmit all analog values including calculated analog points.

2.7.2.2 Logic (Virtual)

Logic (virtual) points must be software points entered in the point database which are not directly associated with a physical I/O function. Logic (virtual) points must be analog or binary points created by calculation from any combination of binary and analog points, or other data having all the properties of real points, including alarms, without the associated hardware. Logic (virtual) points must be defined or calculated and entered into the database. The calculated analog point must have point identification in the same format as any other analog point.

2.7.2.3 State Variables

If an analog point represents more than two (up to 8) specific states, each state must be nameable. For example, a level sensor must be displayed at its measured engineering units plus a state variable with named states usable in programs or for display such as low alarm/low/normal/high/high alarm.

2.7.2.4 Analog Totalization

**************************************************************************
NOTE: If the analog totalization is to be performed at the central station and is not to be
done at the PLC, this requirement will be deleted.

**************************************************************************

Any analog point must be operator assignable to the totalization program. Up to eight analog values must be totalized within a selectable time period.

2.7.3 Alarm Processing

**************************************************************************

NOTE: If the alarm processing function is to be performed at the central station and is not to be done at the PLC, this requirement will be deleted.

**************************************************************************

Each PLC must have alarm processing software for AI, DI, and PA alarms for all real and virtual points connected to that PLC.

2.7.3.1 Binary Alarms

Binary alarms are those abnormal conditions indicated by BIs as specified and shown. The system must automatically suppress analog alarm reporting associated with a binary point when that point is turned off.

2.7.3.2 Analog Alarms

Analog alarms are those conditions higher or lower than a defined value, as measured by an AI. Analog readings must be compared to predefined high and low limits, and alarmed each time a value enters or returns from a limit condition. Unique high and low limits must be assigned to each analog point in the system. In control point adjustment (CPA) applications, key the limit to a finite deviation traveling with the setpoint. The system must automatically suppress analog alarm reporting associated with an analog point when that analog point is turned off.

2.7.3.3 Pulse Accumulator (PA) Alarms

Pulse accumulator alarms are those conditions calculated from totalized values of accumulator inputs or PA input rates that are outside defined limits as specified and shown. PA totalized values must be compared to predefined limits and alarmed each time a value enters a limit condition. Unique limits must be assigned to each PA point in the system.

2.7.4 Constraints

2.7.4.1 Equipment Constraints Definitions

Each control point in the database must have PLC resident constraints defined and entered by the Contractor, including as applicable: maximum starts (cycles) per hour; minimum off time; minimum on time; high limit (value in engineering units); and low limit (value in engineering units).

2.7.4.2 Constraints Checks

All control devices connected to the system must have the PLC constraints checked and passed before each command is issued. Each command point must have unique constraints assigned. High and low "reasonableness" values or one differential "rate-of-change" value must be assigned to each AI. Each individual point must be capable of being selectively disabled by the
operator from the central station.

2.7.5 Control Sequences and Control Loops

**************************************************************************
NOTE: Sequences to be implemented will be developed by the designer to meet site requirements. The designer will define allowable process control loop accuracies as a part of the sequences. Control sequences and database tables will be shown on the drawings.
**************************************************************************

Specific functions to be implemented are defined in individual system control sequences and database tables shown on the drawings, and must include, as applicable, the following functions: PI control must provide proportional control and proportional plus integral control; two position control must provide control for a two state device by comparing a set point against a process variable and an established dead band; floating point control must exercise control when an error signal exceeds a selected dead band, and must maintain control until the error is within the dead band limits; signal selection must allow the selection of the highest or lowest analog value from a group of analog values as the basis of control and must include the ability to cascade analog values so that large numbers of inputs can be reduced to one or two outputs; signal averaging must allow the mathematical calculation of the average analog value from a group of analog values as the basis of control and must include the ability to "weight" the individual analog values so that the function output can be biased as necessary to achieve proper control; reset function must develop an AO based on up to two AIs and one operator specified reset schedule.

2.7.6 Command Priorities

A scheme of priority levels must be provided to prevent interaction of a command of low priority with a command of higher priority. Override commands entered by the operator must have higher priority than those emanating from applications programs.

2.7.7 Resident Application Software

**************************************************************************
NOTE: The data base and settings tables will be incorporated into the contract package. Specify only those applications programs to be implemented at time of acceptance. Do not specify a program unless sensors and controls required to implement it are included in the design package.
**************************************************************************

Provide resident applications programs developed in accordance with paragraph GRAPHICAL PROGRAMMING to achieve the sequences of operation, parameters, constraints, and interlocks necessary to provide control of the process systems connected to the process control system. All application programs must be resident in the PLC and must execute in the PLC, and must coordinate with each other, to ensure that no conflicts or contentions remain unresolved.
2.7.7.1 Program Inputs and Outputs

Use program inputs listed for each application program to calculate the required program outputs. Where specific program inputs are not available, a "default" value or virtual point appropriate for the equipment being controlled and the proposed sequence of operation must be provided to replace the missing input, thus allowing the application program to operate.

2.7.7.2 Failure Mode

**************************************************************************
NOTE: Assure that the appropriate failure modes are identified on the drawings.
**************************************************************************

In the event of a PLC failure, the controlled equipment must continue to function in the failure mode shown on the drawings. Systems that are Primary/Secondary must transfer control to the non-failed system.

2.8 CONTROL PANELS

**************************************************************************
NOTE: For locations or equipment that will be powered by an uninterruptible power supply (UPS) during a commercial power outage, the control panel must be included on the UPS.

Include in the design package requirements for sufficient ventilation, heating or air conditioning to ensure that the control panel internal temperature and humidity will be maintained within the PLCs operational parameters when exposed to the temperature and humidity indicated in paragraph SITE ENVIRONMENTAL CONDITIONS. Include allowance for any solar gain. If the requirements for ventilation, heating and air conditioning are not necessary, they will be deleted.
**************************************************************************

2.8.1 Components

2.8.1.1 Enclosures

The enclosure for each control panel must conform to the requirements of NEMA 250 for the types specified. Finish color must be the manufacturer's standard, unless otherwise indicated. Enclosures for installation in mechanical equipment rooms must be Type [1] [4] [12]; those for installation in clean, dry indoor occupied space may be Type 1; other locations must be as otherwise specified or shown. Enclosures for equipment installed outdoors must be Type 4 or as shown. Enclosures for installation in a corrosive environment must be Type 4X and must be constructed of [stainless steel] [fiberglass] [polymer plastic]. Painted steel must not be allowed for use in a corrosive environment. Enclosure must be provided with a single, continuously hinged exterior door with print pocket, 3-point latching mechanism and key lock and a single, continuously hinged interior door.
2.8.1.2 Controllers

Provide controllers in accordance with paragraph Programmable Logic Controller (PLC).

2.8.1.3 Standard Indicator Light

Indicator lights showing on, off, stand-by, automatic, manual depending on the application must comply with NEMA ICS 1, NEMA ICS 2 and UL 508A. Lights must be heavy duty, round and must mount in a 22.5 mm 0.875 inch mounting hole. Indicator lights must be LED type and must operate at 120 VAC or 24 VDC. Long life bulbs must be used. Indicator light must be provided with a legend plate labeled as shown on the drawings. Lens color must be as indicated on the drawings. Lights must be push to test (lamp) type.

2.8.1.4 Selector Switches

**************************************************************************
** NOTE: Indicate on the drawings where key operated switches are required. **
**************************************************************************

Selector switches must comply with NEMA ICS 1, NEMA ICS 2 and UL 508A. Selector switches must be heavy duty, round and must mount in a 22.5 mm 0.875 inch mounting hole. The number of positions must be as indicated on the drawings. Switches must be [illuminated] [non-illuminated] [as indicated of the drawings]. Switches must be rated for 600 volts, 10 amperes continuous. Selector switches must be provided with a legend plate labeled as shown on the drawings. Where indicated or required, dual auxiliary contacts must be provided for the automatic position to provide position sensing at the central station or workstation. Auxiliary contacts must be rated for 120 VAC, 1A as a minimum. Where indicated on the drawings, switches must be key operated. All keys must be identical.

2.8.1.5 Push Buttons

Push buttons must comply with NEMA ICS 1, NEMA ICS 2 and UL 508A. Push buttons must be heavy duty, round and must mount in a 22.5 mm 0.875 inch mounting hole. The number and type of contacts must be as indicated on the drawings or required by the Sequence of Control. Push buttons must be rated for 600 volts, 10 amperes continuous. Push buttons must be provided with a legend plate labeled as shown on the drawings.

2.8.1.6 Relays

Relays must comply with NEMA ICS 5 and derated for altitude above 1,500 m. Relays must be [single-pole, single-throw (SPST)] [single-pole, double-throw (SPDT)] [double-pole, single throw (DPST)] [double-pole, double-throw (DPDT)] [as required by the Sequence of Control]. Relay coil must be [120 VAC] [24 VDC] and must be provided with matching mounting socket. Power consumption must not be greater than 3 watts. Coils must have a minimum current rating of [___] amps and minimum voltage rating of [___] volts. Contacts must have a minimum current rating of [___] amps and minimum voltage rating of [___] volts.

2.8.1.7 Terminal Blocks

Terminal blocks must comply with NEMA ICS 4 and UL 1059. Terminal blocks
for conductors exiting control panels must be two-way type with double
terminals, one for internal wiring connections and the other for external
wiring connections. Terminal blocks must be made of bakelite or other
suitable insulating material with full deep barriers between each pair of
terminals. A terminal identification strip must form part of the terminal
block and each terminal must be identified by a number in accordance with
the numbering scheme on the approved wiring diagrams.

2.8.1.8 Alarm Horns

Alarm horns must be provided where indicated on the drawings. Horns must
be vibrating type and must comply with UL 508A. Horns must provide 100 dB
at 10 feet. Exterior mounted horns must be weather proof by design or must
be mounted in a weather proof enclosure that does not reduce the
effectiveness of the horn.

2.8.2 Panel Assembly

Control panels must be factory assembled and shipped to the jobsite as a
single unit. Panels must be fabricated as indicated and devices must be
mounted as shown or required. Each panel must be fabricated as a
bottom-entry connection point for process control system electrical power,
[process control system main air source,] process control system wiring,
[control air pneumatic tubing,] [communications system wiring to [other
control panels] [operators workstation]].

2.8.3 Electrical Requirements

Each panel must be powered by a dedicated [120 volts ac] [208 volts ac]
[125VDC] circuit, with a fuse, [10 amp] [____] [sized as recommended by the
equipment manufacturer], and a disconnect switch located inside the panel.
Wiring must terminate inside the panel on terminal blocks. Electrical
work must be as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM
and as shown on the drawings.

2.8.4 Power Line Conditioner

Each control panel must be provided with a power line conditioner to
provide both voltage regulation and noise rejection. The power line
conditioner must be of the ferro-resonant design, with no moving parts and
no tap switching, while electrically isolating the secondary from the power
line side. The power line conditioner must be sized for 125 percent of the
actual connected kva load. Characteristics of the power line conditioner
must be as follows:

2.8.4.1 85 Percent Load

At 85 percent load, the output voltage must not deviate by more than plus
or minus 1 percent of nominal voltage when the input voltage fluctuates
between minus 20 percent to plus 10 percent of nominal voltage.

2.8.4.2 Load Changes

During load changes of zero to full load, the output voltage must not
deviate by more than plus or minus 3 percent of nominal voltage. Full
correction of load switching disturbances must be accomplished within 5
cycles, and 95 percent correction must be accomplished within 2 cycles of
the onset of the disturbance.
2.8.5  Grounding

Control panel enclosures must be equipped with a solid copper ground bus or equivalent. The ground bus must be securely anchored to the enclosure so as to effectively ground the entire structure. Clamp-type terminals sized large enough to carry the maximum expected current must be provided on the ground bus for grounding cables. Where a definite circuit ground is required, a single wire not less than #10 AWG must run independently to the panel ground bus and must be fastened to the ground bus with a bolted terminal lug. Cases of instruments, relays and other devices must be effectively grounded through the enclosures steel structure unless otherwise indicated. Insulated wiring having a continuous rated current of not less than the circuit fuse rating must be used for grounding. Grounding terminals of power receptacles must be solidly grounded to the panel enclosure.

2.8.6  Convenience Outlet

**************************************************************************
NOTE: Coordinate with electrical drawings to provide power for control panel convenience outlet and other required accessories.
**************************************************************************

A 120 volt ac, 20 amp, ground fault interruption (GFI) type duplex convenience outlet must be provided inside the panel. The outlet circuit must be separate from the panel power circuit.

2.8.7  Panel Interior Light

[Where indicated,] [Each] control panel[s] must be provided with a [60 watt incandescent] [40 watt fluorescent] [15 watt LED] light. The light must be operated by a manual on-off switch mounted on the interior door of the enclosure. The light must be powered by the same circuit as the convenience outlet.

2.8.8  Ventilation System

[Where indicated,] [Each] control panel[s] must be provided with two single phase, 120 volt ac ventilation fans. Each fan must supply a minimum of 50 L/s 100 cfm of ventilation air through the enclosure. Each fan must be provided with a line voltage thermostat. Thermostat setpoints must be adjustable in a range of 21 to 60 degrees C 70 to 140 degrees F as a minimum. Each supply and exhaust grille must contain a filter that is easily removed for cleaning or replacement.

2.8.9  Heating System

[Where indicated,] [Each] control panel(s) must be provided with a thermostatically controlled electric heater capable of maintaining an enclosure temperature of [2] [_____] degrees C [35] [_____] degrees F when continuously exposed to an ambient temperature of [_____] degrees C degrees F.

2.8.10  Air Conditioning System

[Where indicated,] [Each] control panel[s] must be provided with a mechanical refrigeration air conditioning system. The system must be capable of maintaining a temperature of [38] [_____] degrees C [100]
degrees F inside the enclosure with all equipment in the panel operating and while continuously exposed to [full sunlight and] an ambient air temperature of [_____] degrees C degrees F. The compressor and condenser must be located outside the control panel enclosure. Provisions must be made to remove condensate from the control panel and to protect all devices within the enclosure from condensate.

2.9 COMPUTER HARDWARE

**************************************************************************
NOTE: The designer must edit the following paragraph to require only the computer equipment that is necessary based on the requirements and complexity of the process control system. Must Verify that the location for the equipment will be provided with climate controls to provide a suitable environment for the equipment.
**************************************************************************

For computer hardware furnished under this specification provide standard products of a single manufacturer which advertises service in all 48 contiguous states, and provide only model currently in production. Except for PCI-E cards installed into expansion slots provided in a desktop or server computer in order to meet the requirements of this specification, do not modify computer hardware from the manufacturer configuration.

[2.9.1 Server Hardware]

**************************************************************************
NOTE: Coordinate with the project site to determine if the server(s) will be contractor supplied or Government Furnished. If contractor supplied, coordinate with the Project Site's NEC (IT group) and include the site's 'standard' server redundancy requirements. Note that computer technology changes quickly and these requirements should be edited to reflect current products. Default requirements (current as of 2012) have been provided in brackets.
**************************************************************************

Computer Server Hardware (server) [will be furnished by the Government] [must be a desktop or server computer meeting the following minimum requirements:]

2.9.1.1 Processor

[____][Quad-core processor designed for server applications. Processor speed must be at least 50 percent of the speed of the fastest Intel server processor commercially available].

2.9.1.2 Random Access Memory (RAM)

[____][300 percent of the recommended requirements of the software to be installed on the server[and no less than 24GB].]

2.9.1.3 Communications Ports

[____][Four USB 3 3.0 3.1 ports.]
2.9.1.4 Hard Drives

2.9.1.4.1 Internal Hard Drives

[___][Solid State Hard drives with SATA-3 Controller providing at least [2TB][___] usable disk space. Hard drives must use RAID (Redundant Array of Inexpensive Disks) at levels 1 or 5 (RAID-1 or RAID-5).]

2.9.1.5 Optical Drive

[___][Blue-Ray burner drive.]

2.9.1.6 Video Output

[___][32-bit color at a minimum resolution of 1920 by 1080 at a minimum refresh rate of 70 Hz and a DVI or display port output.]

2.9.1.7 Network Interface

[[___]][[Two] integrated 1000Base-T Ethernet with RJ45 connector.]

2.9.1.8 Monitor

[___][Widescreen flat panel LCD monitor sized as indicated but no less than 24 inch nominal with a minimum resolution of 1920 by 1080 pixels and a minimum refresh rate of 70Hz.]

2.9.1.9 Keyboard

[___][101 key wired USB keyboard having a minimum 64 character standard ASCII character set based on ANSI INCITS 154.]

2.9.1.10 Mouse

[___][2-button wired USB optical scroll mouse with a minimum resolution of 400 dots per inch.]

2.9.1.11 Power Supplies

[___][Hot-swappable redundant power supplies.]

2.9.2 Workstation Hardware (Desktop and Laptop)

************************************************************************************************************
NOTE: Coordinate with the project site to determine if the workstation(s) will be contractor supplied or Government Furnished, or a mix where some workstations are Gov't furnished and others are contractor supplied:

"Replace Brackets" instructions

1) Government furnished only : Keep first bracketed text and remove the [as indicated].

2) Contractor supplied only: Keep the second bracketed text.
3) Combination of Government furnished and Contractor supplied: Keep all bracketed text. When keeping bracketed text (Contractor supplied or combination of Government and Contractor supplied) note that computer technology changes quickly and these requirements should be edited to reflect current products. Default requirements (current as of 2012) have been provided in brackets.

**************************************************************************

[The Government will provide the] [Provide a standard desktop computer or a laptop meeting the following minimum requirements for the] Computer Workstation Hardware (workstation) [as indicated].

2.9.2.1 Processor
2.9.2.1.1 Desktop

Quad-core processor designed for desktop applications. Processor speed must be at least 75 percent of the speed of the fastest Intel desktop processor commercially available.

2.9.2.1.2 Laptop

Quad-core processor designed for laptop applications. Processor speed must be at least 50 percent of the speed of the fastest Intel laptop processor commercially available.

2.9.2.2 Random Access Memory (RAM)

[____][300 percent of the recommended requirements of the software to be installed on the server[ and no less than 16GB].]

2.9.2.3 Communications Ports
2.9.2.3.1 Desktop

[____][Six USB ports.]

2.9.2.3.2 Laptop

[____][Two USB ports, plus a PCMCIA card slot or an additional USB port, plus an integral RS-232 serial port or an additional USB port and a USB to RS-232 serial adapter.]

2.9.2.4 Hard Drive and Controller
2.9.2.4.1 Desktop

[____][[1.5TB][____] or larger with a SATA-3 controller.]  

2.9.2.4.2 Laptop

[____][[250GB][____] or larger solid state drive.]

2.9.2.5 Optical Drive

[____][Blue-Ray drive]
2.9.2.6 Video Output

2.9.2.6.1 Desktop

[___][32-bit color with dual monitor support minimum resolutions of 3840 by 2160 at minimum refresh rates of 70 Hz and dual DVI or display port outputs.]

2.9.2.6.2 Laptop

[___][32-bit color with a minimum resolution of 3840 by 2160 at minimum refresh rates of 70 Hz and VGA or HDMI output.]

2.9.2.7 Network Interface

2.9.2.7.1 Desktop

[___][Integrated 1000Base-T Ethernet with RJ45 connector.]

2.9.2.7.2 Laptop

[___][Integrated 1000Base-T Ethernet with RJ45 connector.]

2.9.2.8 Monitor

2.9.2.8.1 Desktop

[___][Dual widescreen flat panel LCD monitors sized as indicated but no less than 600 mm 24 inch nominal with minimum resolutions of 3840 by 2160 pixels and a minimum refresh rate of 70Hz.]

2.9.2.8.2 Laptop

[___][LCD Screen sized as indicated but no less than 325 mm 13 inch nominal with a maximum supported resolution of no less than 3840 by 2160 pixels.]

2.9.2.9 Keyboard

2.9.2.9.1 Desktop

[___][101 key wired USB keyboard having a minimum 64 character standard ASCII character set based on ANSI INCITS 154]

2.9.2.9.2 Laptop

[___][Standard laptop keyboard.]

2.9.2.10 Mouse

2.9.2.10.1 Desktop

[___][2-button wired USB optical scroll mouse with a minimum resolution of 400 dots per inch.]

2.9.2.10.2 Laptop

[___][Integrated touch-pad plus a 2-button wired USB optical scroll mouse with a minimum resolution of 400 dots per inch.]
2.9.2.11 Printers

Provide [local or network] printers as indicated. Provide local printers which have a USB interface. Provide network printers which have a 100Base-T or faster interface with an RJ45 connection.

2.9.2.11.1 Alarm Printer

Provide alarm printers which use sprocket-fed fanfold paper with adjustable sprockets for paper width up to 280 mm 11 inches. Alarm printers must have programmable control of top-of-form. [Provide floor stands with paper racks for alarm printers.]

2.9.2.11.2 Laser Printer

Provide laser printers as indicated meeting the following minimum requirements:

- Resolution 600 by 600 dots per inch
- Printing Time 10 pages per minute
- Data Buffer Size 16 Megabytes
- Media Type Paper and transparency film
- Media Size ANSI A( 216 by 279 mm 8.5 by 11 inches) or 11 by 17 inches [Color] and other sizes as indicated
- Paper Cassette 250 sheet capacity

2.9.3 Uninterruptible Power Supply (UPS)

A self contained UPS suitable for installation and operation at the Server and Workstation must be provided. The unit[s] must be sized to provide a minimum of 10 minutes of operation of the central station [and operator's workstation] computer. The UPS must incorporate surge suppression, noise filtering (normal and common mode) short circuit protection and voltage regulation (brownout and overvoltage protection). UPS must be complete with all necessary power supplies, transformers, batteries, and accessories and must include visual indication of normal power operation, UPS operation, abnormal operation and visual and audible indication of low battery power. The UPS must comply with the Federal Communications Commission Standard 15J part A for radio noise emissions.

2.9.4 Communication and Programming Device

A hand-held communication [and programming ]device must be provided. The communication [and programming ]device must connect to the PLC directly for readout of variables, override, control, servicing, troubleshooting and adjustment of control parameters. The device must be provided with all necessary cables, connectors and adapters to allow connection to the PLC. The device must communicate in English language for inquiry, reporting [and programming] purposes.

2.10 TOUCHSCREEN HMI

Human Machine Interface (HMI) display screens must be supplied to provide an interface to the PLC. The touch screens must be compatible with the specific PLC being furnished. Locate touch screens in the cabinets as shown in the Contract Drawings. The touch screens must provide maintenance information and indication of the systems. The touch screens must be [15"] [ ] panel mount with a minimum resolution of 1024x768. Provide operator
interface as shown on the Contract Drawings or approved equal.

2.10.1 TOUCHSCREEN HMI Display Layout

Develop HMI control and supervision display layouts complying with the minimum requirements of the Control Narrative in the Contract Drawings. Submit for approval prior to implementation.

2.11 MONITORING AND CONTROL SOFTWARE

**************************************************************************
NOTE: The designer should edit this paragraph, as needed, to require only the central station software that is necessary based on the requirements and complexity of the process control system. Where no information is available on future expansion, require a minimum expansion capability of 50 percent. Where specific expansion requirement information is available, it must be used to determine the expansion capability requirements.
**************************************************************************

Provide a single software package which implements the Scheduling, Alarming, Trending, Graphical System Display, and System Display Editor functionality. Other specified M&C functionality may be implemented in the same software package or in additional software packages. The monitoring and control software must provide the communication, programming and control capabilities necessary to support all specified points and functions, plus a minimum expansion of 50% percent of the current number of points, complete with their point database. The monitoring and control station must be online at all times and must perform all required functions as specified. Where multiple modules are used the modules must be capable of sharing data and operating together seamlessly. [Software must be a client-server software package with a graphical user interface (GUI) using web-browser based clients. ]The system must support multiple user operation with multiple tasks for each user and must support operation and management of all peripheral devices.

2.11.1 M&C Software Update Licensing

**************************************************************************
NOTE: The installation may procure its own software update licensing or contract and thus need less than 5 years. Alternatively the installation may require longer than five years (although this will likely increase the costs significantly). Coordinate with the installation to determine if they have any specific requirement; if they don't then keep the 5 year requirement.
**************************************************************************

In addition to all other licensing requirements, provide M&C Software licensing which includes licensing of the following software updates for a period [of no less than 5 years][____]:

a. Security and bug-fix patches issued by the M&C Software manufacturer.

b. Security patches to address any vulnerability identified in the National Vulnerability Database at http://nvd.nist.gov with a Common
Vulnerability Scoring System (CVSS) severity rating of MEDIUM or higher.

2.11.2 Graphical Operations

2.11.2.1 Graphical User Interface

**************************************************************************
NOTE: Standalone or web based are designer options.
**************************************************************************

The central station must be provided with a mouse driven, graphical user interface.

2.11.2.2 Display Information

The central station must display information necessary to support all requirements specified, including: operator commands; alarm notification; reports; system graphics as specified and as shown, incorporating dynamic data; and curve plotting.

2.11.2.3 System Graphics Implementation

System graphics displays must be hierarchical displays which integrate dynamic data into the display. System graphics must reflect actual system configuration. Each system schematic must be included as a separate display. Different colors, textures, and use of inverted video must be used for various components and dynamic data. The displays must include standard and/or custom symbols. A library of callable display symbols containing symbols for all necessary equipment and control devices must be furnished. Symbols must conform to ISA 101.01 where applicable. Data associated with a display must be updated within 5 seconds of the binary status change or the analog change in excess of the analog change differential. Any dynamic data which is not current, due to PLC communications failure, PLC failure, or point out of service, must be highlighted or flagged.

2.11.2.4 Display Editor

The display editor must enable the user to create, modify, save and delete displays and symbols. Within the display there must by dynamic fields with the function of linking the dynamic fields with the database and must be executed automatically as the last step of the database generation and modification procedure.

2.11.2.5 Graphical Programming

The system must include a graphical programming function which must be used to create all control sequences utilized in the control panels. This function must reside in the central station to create, modify, and test software for control panel resident programs. The graphical programming function must provide programming elements to be connected together to create a logic diagram. The diagram must be compilable to produce executable code for the control panel. The graphical programming function must include elements necessary to create logic diagrams that represent sequences of operation. Program elements must be able to be combined into a custom template which can then be used as a standard function. Program checkout and debug facilities must include display of dynamic and/or simulated system variables and points on the programming screens. The user must be able to fix or force values of variables to enable program
checkout during debugging. The programming must allow for the use of the portable tester for loading files directly into the control panel, uploading of existing control panel programming and database information and downloading of control panel programming and database information.

2.11.2.6 System Menus and Displays

The user must be able to call up the following displays by dedicated function key, pull down menu or by icon and must be able to page forward and backward on linked multiple page displays. The system menu and index displays must also contain icons which can be used to call up subsequent displays.

a. System Menu (list of all graphics and menus).

b. Index (list of all PLCs).

c. Alarm Summary (list of all uncleared alarms).

d. Abnormal Summary (list of all devices not in normal state; keeps track of alarm conditions which have been cleared).

e. Data Communications Summary (listing of availability for each communication channel, by statistically processing the number of transmission errors, outages, and other abnormal conditions for each channel).

2.11.2.7 Hard-Copy Screen Request

The central station must be able to obtain a hard copy of the monitor display being viewed. This must be an exact "snapshot" of the data and device symbols shown on the selected monitor.

2.11.3 Command Software

The software must provide for defining and selecting points, parameters, graphics, report generation, and all other functions associated with operation. The operator commands must be usable from central station computer and workstation keyboards with individual operator passwords as specified.

2.11.3.1 Command Input

Command menus must utilize full words and acronyms selected to allow operators to use the system without extensive training or data processing backgrounds. The system must prompt the operator.

2.11.3.2 Command Input Errors

The system must supervise operator inputs to ensure they are correct for proper execution. Provide operator input assistance whenever a command cannot be executed because of operator input errors.

2.11.3.3 Special Functions

The system must support the following special functions by using a mouse, in addition to all other commands specified:
2.11.3.3.1 Help

Produce a display of all commands available to the operator. The help command, followed by a specific command, must produce context sensitive listing with a short explanation of the purpose, use, and system reaction to that command.

2.11.3.3.2 Start/Enable

Manually start equipment and enable monitoring and control of points.

2.11.3.3.3 Stop/Disable

Manually stop equipment and disable monitoring and control components.

2.11.3.3.4 Display Diagram

Display diagrams of specific utility systems or other systems.

2.11.3.3.5 Diagram Development

Facilitate development of diagrams of specific utility systems or other systems.

2.11.3.3.6 Auto/Override

Override automatic operation of a point or return a point to automatic operation.

2.11.3.3.7 Print Report

Allow the operator to print reports.

2.11.3.3.8 Confirm Action

Allow the operator to confirm that the desired command sequence has been correctly entered and is to be executed.

2.11.3.3.9 Cancel Action

Perform the opposite function of the confirm action, at any time prior to executing confirm action.

2.11.3.3.10 Memo Pad

Allow the operator to create, store and retrieve pop-up notes.

2.11.3.4 Operator's Commands

The operator's commands must provide the means for entry of control and monitoring commands, and for retrieval of information. The operator's commands must perform such tasks as requesting a display of any binary, analog, or accumulator point, or any group of related points, startup and shutdown selected systems or devices, modifying

2.11.3.5 Level of Addressing

**************************************************************************

NOTE: When specifying level of addressing for
identification, delete Area or Facility where not required.

Provide four levels of addressing for identification as follows:

2.11.3.5.1 Point
The individual sensor or control device within a unit.

2.11.3.5.2 Unit
The unit that a point is associated with, such as a blower.

2.11.3.5.3 Sub-System
The sub-system that a point is located in or near.

2.11.3.5.4 System
The system that a sub-system is located in or near.

2.11.3.6 System Access Control
A minimum of [_____] passwords must be usable with the process control system software. The system must maintain an ASCII disk file logging all operators logged onto the system, alarm acknowledgments, commands issued and all database modifications for each password. Each password must be definable as to the functions that the operator can perform.

2.11.4 Alarms
Provide M&C Software meeting the following minimum requirements for alarms:

a. The M&C software must be capable of generating alarms by comparing the value of any point from any connected system to user-configurable limits and must notify an operator of the occurrence of an alarm condition. The process control system alarm history must be stored and must be recallable by the operator using the report generator. Alarm messages must take precedence over other functions. A minimum of the most recent [25] [_____] system alarms must be directly available at the central station computer. Operator acknowledgment of one alarm must not be considered as acknowledgment of any other alarm nor must it inhibit reporting of subsequent alarms. Alarm data to be displayed and stored must include: identification of the alarm; date and time to the nearest second of occurrence; device or sensor type; limit exceeded (if analog); engineering units; current value or status; alarm class; and alarm messages.

b. The M&C software must support at least two alarm priority levels: critical and informational. Critical alarms must remain in alarm until acknowledged by an operator and the alarm condition no longer exists; informational alarms must remain in alarm until the alarm condition no longer exists or until the alarm is acknowledged.

c. The creation, modification, and handling (routing) of alarms must be fully accessible and fully adjustable from the graphical user interface.

d. Alarm Data. Alarm data to be displayed and stored must include:
1) Identification of alarm including building, system (or sub-system), and device name.

2) Date and time to the nearest second of occurrence.

3) Alarm type:

4) Unreliable: Indicates that the source device has failed due to the sensing device or alarm parameter being out-of-range or bad data.

5) High Alarm.

6) Low Alarm.

7) Current value or status of the alarm point, including engineering units.

8) Alarm limits, including engineering units.

9) Alarm priority.

10) Alarm Message: A unique message with a field of at least 60 characters. Assignment of messages to an alarm must be an operator editable function.

11) Acknowledgement status of the alarm including the time, date and user of acknowledgement.

2.11.4.1 Binary Alarms

Binary alarms must be subject to immediate reporting, within the alarm response time, at the central station.

2.11.4.2 Analog Alarms

These alarms must be subject to immediate reporting, within the alarm response time, at the central station. The control panel analog readings must be compared to predefined high and low limits, and alarmed to the central station each time a value enters or returns from a limit condition. The program must automatically change the high or low limits, or both, of any analog point, based on time scheduled operations as specified, allowing for a time interval before the new alarm limit becomes effective. For those applications where setpoint adjustments are made, the alarm limit must be keyed to a finite deviation traveling with the setpoint.

2.11.4.3 Alarm Messages

A unique message with a field of 60 characters must be provided for each alarm. Assignment of messages to a point must be an operator editable function. Secondary messages must be assignable by the operator for printing to provide further information, such as telephone lists or maintenance functions, and must be editable by the operator.

2.11.4.4 Alarm Classes

Classes of alarms, which will be identified for each item, include class 1 and class 2 alarm conditions. Class 1 (Critical) must include display, print, and audible alarm at occurrence and at return-to-normal. Acknowledgment of class 1 alarms by the operator must be required at
occurrence and at return-to-normal. Class 2 (Informational) must include display, print, and audible alarm at occurrence and at return-to-normal. No acknowledgment of class 2 alarms is required unless otherwise shown.

2.11.5 Pop-up Note Function

A pop-up note function must be included with the workstation, providing the operator a capability of noting any data which may be associated with alarms or with any other event. A note created by an operator must be automatically called up when any other workstation calls up the associated point, alarm, or alarm summary. The pop-up note function must also support free form entry of data which can be used by any workstation operators as general reminders or instructions.

2.11.6 Real Time Clock Synchronization

**************************************************************************
NOTE: If real time clock synchronization is not required, this paragraph will be deleted.
**************************************************************************

The system must synchronize each central station computer, real time clock, within one second and at least once per day automatically, without operator intervention and without requiring system shutdown. The central station computer must automatically initiate a call once per day to the NIST clock to obtain the correct time and date and update the real time clock. The central station computer must generate a report showing the time difference.

2.11.7 System Reaction

Under system normal heavy load, no more than [10] [_____] seconds must lapse from the time a binary status alarm or analog alarm occurs at a PLC until the change is displayed at the central station [and operator's workstation]. The total system response time from initiation of a control action command to display of the resulting status change must not exceed [20] [_____] seconds under system normal heavy load conditions, assuming a zero response time for operation of the PLC's control device. The alarm printer must continue to print out all occurrences, including time of occurrence, to the nearest second. All system normal heavy load conditions must be introduced to the system via AIs and DIs.

2.11.7.1 Occurrence

System normal heavy load conditions are defined as the occurrence throughout the system of a total of three status changes, three binary alarms, three analog high or low limit alarms, and three analog quantity changes within the high and low limits during a single 1-second interval. This number of similar occurrences must repeat on a continuous basis during successive 1-second intervals for a period of 2 minutes.

2.11.7.2 Location

System normal heavy load conditions, as specified, must have 50 percent of the changes and alarms, including no less than one of each type, occurring at a single PLC with the remaining changes and alarms distributed among the remaining PLCs.
2.11.8  Report Generator

Software must be provided to generate and format standard and custom reports for displaying, printing, and storing on disk. Reports must use database values and parameters, values calculated using the real time static database or historical data base; with the reports subsequently stored on hard disk or zip drive. Dynamic operation of the system must not be interrupted to generate a report. The report must contain the time and date when the sample was taken, and the time and date when the report was printed. The software must allow for automatic and manual generation of reports. For automatic reports an operator must be able to specify the time the initial report is to be generated, the time interval between reports, end of period, and the output format for the report. Manual report generation must allow for the operator to request at any time the output of any report.

2.11.8.1  Periodic Automatic Report

The system must allow for specifying, modifying, or inhibiting the report to be generated, the time the initial report is to be generated, the time interval between reports, end of period, and the output peripheral.

2.11.8.2  Request Report Mode

The system must allow for the operator to request, at any time, an immediate printout of any report.

2.11.9  Data Interchange

Software must be provided to format and store on a government approved removable hard drive the data, trends, profiles, reports and logs as specified in a defined, standard format such as ASCII text or DIF for export and further processing by other software and/or computer systems.

2.11.10  Control Panel and DTS Circuit Alarms

The system must supervise each control panel, I/O function and DTS circuit for alarm reporting, including: control panel not responding; control panel responding (return to normal); control panel to central station DTS circuit high error rate; control panel to control panel DTS circuit high error rate; control panel/central station real time clock error more than 15 seconds (adjustable); control panel intrusion alarm; control panel offline; control panel online (return to normal); control panel failure (self-diagnostics); point not responding to command; and point change of state without command.

2.11.11  Central Station Database

The central station database must be stored on disk and in memory. The static database must be downloadable as required to control panels in the system.

2.11.11.1  Database Definition Process

Software must be provided to define and modify each point in the database using operator commands. The definition must include all physical parameters and constraints associated with each point. Each database item must be callable for display or printing, including EEPROM, ROM and RAM resident data. Each point must be defined and entered into central station
2.11.11.2 Dynamic Database

The dynamic database includes those variables which change with time or conditions including all DIs, AIs, PAs, and virtual (logic) points.

2.11.11.3 Dynamic Database Update

Update the dynamic database from the field, allowing the operator to select update times from 0.1 seconds to 2.0 seconds.

2.11.11.4 Static Database

The static database includes those fixed parameters and constraints from all PLCs which define the characteristics of the system and I/O functions such as alarm limits, start/stop times, point names, PLC channel addresses, and sensor spans.

2.11.11.5 Central Station Static Database Update

A copy of each control panels static database must be updated automatically once per day, each time an authorized change is submitted or upon demand from the central station database.

2.11.11.6 Workstation Access to Dynamic Data

Any workstation with proper access password and connected to the central station via the BTS must have access to the central station's dynamic data. Display of data must commence within 5 seconds.

2.11.12 Historical Data Storage and Retrieval

A historical data storage and retrieval function must be provided at the central station to collect and store dynamic data. This function must be in addition to other data storage requirements. The function must have the capability to collect and store alarm status changes, point values, events and operator commands, and system responses. The storage function must also have the capability to collect and store multiple sets of analog data at pre-specified sampling rates. This function must have the capability to retain historical data on hard disk for pre-specified time periods, up to forty five days using last day roll over, for short-term analysis, and then output the data to a solid state drive in a SQL database for long-term retention. The operator must also be able to selectively recall short-term data stored on hard disk. Retrieval and printing of the contents of any selected historical data file must be available using the data retrieval and report generation program. The output of the report generation program must be capable of being viewed on the screen, printed in a report, or stored.

2.11.13 Trending

Provide M&C software capable of creating, modifying, uploading and archiving Point properties and performing real-time display of point properties with a minimum trending rate of 100 points per second.

a. The M&C Software must include a graphical display for trend configuration, creation and deletion accessible through the graphical user interface. Each trend must be user-configurable for:
(1) Point to trend.

(2) Sampling interval: adjustable between 1 second and 1 hour.

(3) Start and Stop Time of Trend: Start and stop times determined by one or more of the following methods:

(a) Start time and stop time

(b) Start time and duration

(c) Start time and number of samples

b. The M&C software must be capable of displaying and printing a graphical representation of each trend, and of multiple trended points on the same graph. The software must be capable of saving trend logs to a file. If the file format is not plain ASCII text in a Comma-Separated-Value (CSV) format, provide a means to export or convert the file to plain ASCII text in a CSV format.

2.11.14 Analog Monitoring

The system must measure, transmit, and display analog values, including calculated analog points. Differential measurements must be displayed as positive or negative values with respect to their reference points shown. An analog change in value is defined as a change exceeding a preset differential value as specified. Each analog change in value must be operator selectable and settable to provide for a minimum reporting change in value of one-half the specified end-to-end accuracy of the measured variable. Displays and reports must express analog values in proper engineering units with sign. Provide [128] [____] different sets of engineering unit conversions. Each engineering conversion unit must include range, span, and conversion equation.

2.11.15 Analog Totalization

Any analog or calculated point must be operator assignable to the totalization program. The analog totalization time period must be defined uniquely for each point. At the end of the period, totals must be stored on disk for future reference. Totalization must then restart from zero for the next time period. The program must keep track of the peak and total value measured during the current period and for the previous period. The operator must be able to initiate a summary of totalization information on a point, unit, sub-system or system. The operator must be able to set or reset each totalized value individually. The operator must be able to define, modify, or delete the time period online.

2.11.16 LAN Software

A network operating system must be supplied as part of the LAN software. The network operating system must support network device access to the central station. The system must provide workstation access to the central station as a virtual terminal. The network must provide network access to shared peripherals. The LAN software must provide for transparent communication with any node on the system. The LAN software must support the following:
2.11.16.1 Access Control

Access control to the central station computer and workstations. Operators must be able to perform all specified functions, given the proper passwords, including database definition/modification, graphic creation/modification, and trending.

2.11.16.2 Other Functions and Configurations

2.11.17 Virus Protection Software

**************************************************************************

NOTE: Coordinate with the project site to determine if the Virus Protection Software will be contractor supplied or Government Furnished.

**************************************************************************

[Provide Virus Protection Software consisting of the project site's standard virus protection software complete with a virus definition update subscription] [Virus Protection Software will be furnished by the Government].

2.11.18 Disk Imaging (Backup) Software

**************************************************************************

NOTE: Coordinate with the project site to determine if the Disk Imaging (Backup) Software will be contractor supplied or Government Furnished.

**************************************************************************

[Provide Disk imaging (backup) software capable of performing a bare-metal restore (imaging and restoring to a new blank hard drive such that restoration of the image is sufficient to restore system operation to the imaged state without the need for re-installation of software).] [Provide Disk imaging (backup) software consisting of the project site's standard disk imaging software.] [Disk imaging (backup) software will be furnished by the Government].

2.12 DATA COMMUNICATION REQUIREMENTS

**************************************************************************

NOTE: The designer will edit the following paragraph as needed to require only the data communications requirements that are necessary based on the requirements and complexity of the control system. A communications system layout or block diagram must be provided on the drawings to clearly show the communications system configuration requirements.

**************************************************************************

Process control system data communications must support the specified functions and process control system configuration shown on the drawings.

2.12.1 Central Station/Workstation

Each workstation must be able to communicate with the central station as a virtual terminal. The workstation must be able to initiate uploads or downloads of programs and resident data, including parameters of connected
systems PLCs and devices, constraints and programs in the central station.

2.12.2 Central Station/PLC

The central station must be able to initiate an upload or download of PLC data programs.

2.12.3 Communication

**************************************************************************
NOTE: Indicate on the communications system layout diagram, on the drawings, where modem communication is required. Coordinate this with the central station/workstation computer requirements.
**************************************************************************

Communication with other computer systems must be accomplished using an Ethernet communications port. The central station or workstation must be able to initiate upload or download of data files.

2.12.4 Error Detection and Retransmission

Error detection and retransmission must comply with current Ethernet standards.

2.13 FACTORY TEST

**************************************************************************
NOTE: Evaluate the need for factory tests. Take into account the size of the system, the complexity of the system, the devices that comprise the system as well as other pertinent information. If a factory test is deemed necessary, the factory test requirements below must be tailored to the process control system to be tested. If any factory test is deemed unnecessary, delete it from the following paragraphs.
**************************************************************************

The process control system must be tested at the factory prior to shipment. Written notification of planned testing must be given to the Government at least 21 days prior to testing, and in no case must notice be given until after the Contractor has received written Government approval of the test procedures.

2.13.1 Factory Test Setup

**************************************************************************
NOTE: Items not applicable to the factory test should be deleted.
**************************************************************************

Assemble and integrate the factory test setup as specified to prove that performance of the system satisfies all requirements of this project, including system communications requirements in accordance with the approved test procedures. The factory test must take place during regular daytime working hours on weekdays. Equipment used must be the same equipment that is to be delivered to the site. The factory test setup must include the following:
### Factory Test

<table>

#### 2.13.2 Factory Test Procedure

Test procedures must define the tests required to ensure that the system meets technical, operational, and performance requirements. The test procedures must define location of tests, milestones for the tests, and identify simulation programs, equipment, personnel, facilities, and supplies required. Provide for testing all process control system capabilities and functions specified and shown. Cover actual equipment and sequences to be used for the specified project and include detailed instructions for test setup, execution, and evaluation of test results. The test reports must document results of the tests. Surge testing need not be conducted acceptable documented proof can be provided that such testing has been satisfactorily demonstrated to the Government with identical surge protection applied. The procedures must include the following:

<table>
<thead>
<tr>

</table>
2.13.3 Factory Test Report

Submit original copies of data produced during the factory test, including results of each demonstration procedure within 7 days after completion of each test. Arrange the report so that commands, responses, and data acquired are correlated to allow logical interpretation of the data.

PART 3 EXECUTION

******************************
NOTE: Determine the applicability and need for a Factory Test and remove the Factory Test requirements if a Factory Test is not needed.
******************************

3.1 FACTORY TEST

******************************
NOTE: Include the reference to section 25 08 10
UTILITY MONITORING AND CONTROL SYSTEM TESTING if appropriate. Otherwise indicate another basis for the Factory Test Procedures.
******************************

Perform factory testing of the System as specified. The Contractor is responsible for providing personnel, equipment, instrumentation, and supplies necessary to perform required testing. Provide written notification of planned testing to the Government at least 21 days prior to testing, and do not give this notice until after receiving written Government approval of the specific Factory Test Procedures. Provide Factory Test Procedures which define the tests required to ensure that the system meets technical, operational, and performance specifications. Within the Procedures define location of tests, milestones for the tests, and identify simulation programs, equipment, personnel, facilities, and supplies required. Provide procedures which test all capabilities and
functions specified and indicated. Perform the Factory Test using equipment and software of the same manufacturer, model and revision as will be used for the specified project. Include detailed instructions for test setup, execution, and evaluation of test results in the Procedures. Upon completion of the test, prepare a Factory Test Report, documenting the results of the Test, and submit it as specified. This report must be approved before any equipment is shipped.

Perform the Factory Test and provide Factory Test Submittals as shown in TABLE II. FACTORY TEST SEQUENCING.

### 3.2 EQUIPMENT INSTALLATION REQUIREMENTS

#### 3.2.1 Installation

Install system components and appurtenances in accordance with the manufacturer's instructions and provide necessary interconnections, services, and adjustments required for a complete and operable system. Adjust or replace devices not conforming to the required accuracies. Replace factory sealed devices, rather than adjusting. Installation, adjustment, and operation of the equipment specified must be supervised by a manufacturer's representative experienced in the installing, adjusting, and testing of the equipment.

a. Install instrumentation and communication equipment and cable grounding as necessary to preclude ground loops, noise, and surges from adversely affecting system operation.

b. Install wiring in exposed areas, including low voltage wiring, in [metallic raceways] [EMT conduit] [rigid conduit] as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Wiring in air plenum areas installed without conduit must be plenum-rated in accordance with NFPA 70.

c. Submit detail drawings containing complete piping, wiring, schematic, flow diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Piping and Instrumentation (P&ID) drawings (prepared using industry recognized device symbols, clearly defined and describing piping designations to define the service and materials of individual pipe segments and instrument tags employing Instrument Society of America suggested identifiers). Include in the Drawings, as appropriate: product specific catalog cuts; a drawing index; a list of symbols; a series of drawings for each process control system using abbreviations,
symbols, nomenclature and identifiers as shown; valve schedules; compressed instrument air station schematics and ASME air storage tank certificates for each type and make of compressed instrument air station.

3.2.1.1 Isolation, Penetrations and Clearance from Equipment

Dielectric isolation must be provided where dissimilar metals are used for connection and support. Penetrations through and mounting holes in the building exteriors must be made watertight. Holes in concrete, brick, steel and wood walls must be drilled or core drilled with proper equipment; conduits installed through openings must be sealed with materials which are compatible with existing materials. Openings must be sealed with materials which meet the requirements of NFPA 70 and Section 07 84 00 FIRESTOPPING. Installation must provide clearance for control-system maintenance. Process control system installation must not interfere with the clearance requirements for mechanical and electrical system maintenance.

3.2.1.2 Device Mounting

Devices must be installed in accordance with manufacturers' recommendations and as shown. Control devices to be installed in piping must be provided with required gaskets, flanges, thermal compounds, insulation, piping, fittings, and manual valves for shutoff, equalization, purging, and calibration. Any deviations must be documented and submitted to the Government for approval prior to mounting. Damaged insulation must be replaced or repaired after devices are installed to match existing work. Damaged galvanized surfaces must be repaired by touching up with zinc paint.

3.2.1.3 Pneumatic Tubing

Tubing must be concealed in finished areas. Tubing may be run exposed in unfinished areas, such as mechanical equipment rooms. For tubing to be enclosed in concrete, rigid metal or intermediate metal conduit must be provided. Tubing must be installed parallel or perpendicular to building walls throughout. Maximum spacing between tubing supports must be 1.5 m 5 feet. Each tubing system must be tested pneumatically at 1.5 times the working pressure for 24 hours, with a maximum pressure drop of $0.15 \text{ kPa} \ [1.0 \text{ psig}]$ with compressed air supply turned off. Joint leaks must be corrected by remaking the joint. Caulking of joints will not be permitted. Tubing and two insulated copper phone wires for installation checkout may be run in the same conduit. Tubing and electrical power conductors must not be run in the same conduit; however, control circuit conductors may be run in the same conduit as polyethylene tubing.

3.2.1.4 Grooved Mechanical Joints

Grooves must be prepared according to the coupling manufacturer's instructions. Grooved fittings, couplings, and grooving tools must be the products of the same manufacturer. Pipe and groove dimensions must comply with the tolerances specified by the coupling manufacturer. The diameter of grooves made in the field must be measured using a "go/no-go" gauge, vernier or dial caliper, narrow-land micrometer, or other method specifically approved by the coupling manufacturer for the intended application. Groove width and dimension of groove from end of pipe must be measured and recorded.
3.2.2 Sequences of Operation

Study the operation and sequence of local equipment controls, as a part of the conditions report, and note any deviations from the described sequences of operation on the contract drawings. Perform necessary adjustments to make the equipment operate in an optimum manner and must fully document changes made.

3.3 INSTALLATION OF EQUIPMENT

Install equipment as specified, as shown and as required in the manufacturer's instructions for a complete and fully operational control system.

3.3.1 Control Panels

Control panels must be located as indicated on the drawings. Devices located in the control panels must be as shown on the drawings or as needed to provide the indicated control sequences.

3.3.2 Flow Measuring Device

Fluid flow instruments must be installed in accordance with manufacturer's recommendations, unless otherwise indicated in the specification. The minimum straight unobstructed piping for the flowmeter installation must be 10.0 pipe diameters upstream and 5.0 pipe diameters downstream. Meters for gases and vapors must be installed in vertical piping, and meters for liquids must be installed in horizontal piping, unless otherwise recommended by the manufacturer or indicated in the specifications.

3.3.2.1 Flow Nozzle

Flow nozzles flanges must be installed so that the pressure taps are in a horizontal plane with the centerline of the pipe. Flow nozzles must be installed for ease of accessibility for periodic maintenance. Differential pressure sensors must be installed as close to the flow nozzle as possible.

3.3.2.2 Flow Switch

Flow switches must be installed in such a manner as to minimize disturbance of the flow of fluid while maintaining reliable operation of the switch.

3.3.2.3 Magnetic Flowmeter

**************************************************************************
NOTE: Locating magnetic flowmeters near large electric motors or transformers should be avoided.
**************************************************************************

Meter must be installed in vertical piping so that the flow tube remains full of the process fluid under all operating conditions. A minimum of ten pipe diameters straight run upstream of the flowmeter and five pipe diameters straight run downstream of the flowmeter must be provided. The flowmeter and piping system must be grounded to earth ground.

3.3.2.4 Natural Gas or Propane Flowmeter

Install meters in accordance with ASME B31.8. Permanent gas meters must be installed with provisions for isolation and removal for calibration and
maintenance, and must be suitable for operation in conjunction with an energy monitoring and control system.

3.3.2.5 Orifice Plates

Orifice plates must be installed for ease of accessibility for periodic maintenance. Differential pressure sensors must be as close to the orifice plates as possible. Orifice plates for liquid measurement must be located in horizontal pipe runs with the orifice plate flanges installed so that the pressure taps are in the horizontal plane with the centerline of the pipe. For liquid, the differential pressure transmitter must be installed below the orifice taps. For gas measurement, the orifice plate flanges must be installed so that the pressure taps are 45 degrees or more above the horizontal plane with the centerline of the pipe. For gas measurement the required differential pressure transmitter must be physically installed above the orifice taps.

3.3.2.6 Paddle Flowmeter

Meter must be installed using manufacturer's published procedures. Installers must be trained for such installations in the pipes encountered. Provide certificates demonstrating installer's qualifications.

3.3.2.7 Annular Pitot Tubes

Annular pitot tubes must be installed so that the total head pressure ports are set-in-line with the pipe axis upstream and the static port facing downstream. The total head pressure ports must extend diametrically across the entire pipe. Annular pitot tubes must not be used where the flow is pulsating or where pipe vibration is allowed.

3.3.2.8 Positive Displacement Flow Meters

Flow meters must be installed horizontally, and aligned correctly in the direction of flow.

3.3.2.9 Turbine Meters

Turbine meters must be installed so that the sensor is located in the center of the fluid flow pipe on the main axis. Turbine meters must be installed without interruption to service. Install a welded flanged riser of appropriate pipe line rating, with a full opening valve bolted to it. Sensor must be located in accordance with the manufacturer's instructions for the specified flow rates and installation conditions. Reduced diameter pipe sections must be provided as necessary to achieve required flow velocities. Meters must be installed using the hot-tap method with tools recommended by the manufacturer. The minimum straight unobstructed piping for the flow meter installation must be 10 pipe diameters upstream and 5 pipe diameters downstream. The meter must be installed in a horizontal section unless manufacturer specifically allows otherwise.

3.3.2.10 Ultrasonic Flowmeter

Meter must be installed using manufacturer's published procedures for installation. Installers must be trained for such installations in the pipes encountered. Provide certificates demonstrating installer's qualifications.
3.3.2.11 Variable Area Flowmeter

Meters must be installed in a vertical piping section with full flow through the meter.

3.3.2.12 Venturi Flowmeter

The flowmeter must be installed with its top above the pipeline in horizontal pipe run installations. The direction of flow must be upward in vertical pipe run installations. The flowmeter must be aligned to the direction of the flow and must be rigidly mounted and vibration free. The minimum straight unobstructed piping for the flow meter installation must be 10 pipe diameters upstream and 5 pipe diameters downstream.

3.3.2.13 Vortex Shedding Flowmeters

The flowmeter must be installed with its top above the pipeline in horizontal pipe run installations. The direction of flow must be upward in vertical pipe run installations. The flowmeter must be aligned to the direction of the flow and must be rigidly mounted and vibration free. The minimum straight unobstructed piping for the flow meter installation must be 10 pipe diameters upstream and 5 pipe diameters downstream.

3.3.3 Level Instruments

3.3.3.1 Liquid Level Sensor (Bubble Type)

The air pressure regulating valve, air filter, moisture trap, air flow adjustment valve, level gauge, air isolation valve and pressure transducer must be mounted on a panel where indicated on the drawings. The level gauge must be labeled to identify the tank being measured. The isolation valve must be located in the air supply line upstream of the moisture trap, air filter and pressure regulator. The air inlet line to the dip tube and the dip tube must be mounted to a flange at the top of the tank. The dip tube must extend to the bottom of the tank, leaving the manufacturer's recommended clearance between the dip tube and tank bottom. The dip tube material must be compatible with the tank contents. The pressure regulating valve must be adjusted to the outlet pressure recommended by the manufacturer. Where exposed, the air supply line to the tank and from the tank to the level gauge and pressure transducer must be protected from damage.

3.3.3.2 Capacitance Liquid Level Sensors

The sensing probes must be located close to, and parallel with, the tank or sump wall.

3.3.3.3 Conductivity Level Switch

Level switches must be installed vertically and in accordance with the manufacturer's instructions. Switches must be accessible for maintenance and calibration. In applications where switches cannot be directly mounted to a tank by the threaded or flanged connection, a mounting bracket must be provided for connection to the inside tank wall, maintaining the minimum recommended distance from the tank fill opening.

3.3.3.4 Displacement Type Liquid Level Switch

Level switches must be installed in accordance with the manufacturer's
instructions. Switches must be accessible for maintenance and calibration. In applications where switches cannot be directly mounted to a tank by the threaded or flanged connection, a mounting bracket must be provided for connection to the inside tank wall.

3.3.3.5 Mercury Float Switches

Switches must be mounted in accordance with manufacturer's published instructions. Procedures must be those used for equipment in hazardous locations.

3.3.3.6 Ultrasonic Level Sensor

Sensor must be installed vertically in the top of the tank and in accordance with the manufacturer's instructions. Switches must be accessible for maintenance and calibration. In applications where switches cannot be directly mounted to a tank by the threaded or flanged connection, a mounting bracket must be provided for connection to the inside tank wall. Sensor must be positioned to maximize the return echo signal and minimize vessel obstructions in the sensors line of sight. The minimum recommended distance from the tank fill opening and from the side of the tank must be maintained.

3.3.4 Pressure Instruments

**************************************************************************
NOTE: Do not use differential pressure switches on liquid pumps. Gage pressure switches are better suited for liquid application. Indicate by appropriate icon on the drawings where the switches are to be located and which type is to be used.
**************************************************************************

Pressure sensors and pressure transducers must be verified by calibration. All pressure taps must incorporate appropriate snubbers. Pressure sensors and pressure switches must have valves for isolation, venting, and taps for calibration. Pressure switches and pressure transducers installed on liquid or steam lines must have drains. Pressure transducers, differential pressure sensors and differential pressure switches must have nulling valves. Pressure switches must be adjusted to the proper setpoint and must be verified by calibration. Switch contact ratings and duty must be selected for the application.

3.3.5 Temperature Instrument Installation

3.3.5.1 RTD

[When the RTD is installed in pipe or is susceptible to corrosion or vibration, the] [Each] RTD must be installed in a thermowell. Thermowells must be filled with conductive heat transfer fluid prior to installation of the RTD in the thermowell. RTDs used for space temperature sensing must include a housing suitable for wall mounting. RTDs used for outside air sensing must have an instrument shelter or sun shield as shown to minimize solar effects, and must be mounted to minimize building effects. RTD assemblies must be readily accessible and installed to allow easy replacement.
3.3.5.2 Temperature Switches

Temperature switches must be installed as specified for RTDs. Temperature switches must be adjusted to the proper setpoint and must be verified by calibration. Switch contact ratings and duty must be selected for the application.

3.3.5.3 Thermometers and Temperature Sensing Elements

Thermometers and temperature sensing elements installed in liquid systems must be installed in thermowells.

3.3.5.4 Thermocouples

Each thermocouple must be installed in a protective tube or in a thermowell. Thermocouples must be insulated from ambient temperature effects. Thermocouple wires must not be installed in the same conduits as power wiring. Thermocouples must not be used for measuring temperatures below 260 degrees C 500 degrees F. Type E thermocouples may be used when the atmosphere is chemically reducing environment. Type K thermocouples may be used when the atmosphere is a chemically oxidizing environment.

3.3.6 Process Analytical Instrumentation

3.3.6.1 Ammonia Monitor

The controller must be located as shown on the drawings. The ammonia sensor must be mounted as recommended by the manufacturer. The location of the sensor must be representative of the area to be monitored and must allow access to the sensor for periodic calibration. The sensor must be located in a dry area or must be protected from moisture without restricting the flow of ammonia gas to the sensor.

3.3.6.2 Carbon Dioxide Measurement

The controller must be located in the control panel or other location as shown on the drawings. Where a sample tube is used, the size and maximum length of sample tubing must be as recommended by the manufacturer. Sample tubing must not be crimped or kinked.

3.3.6.3 Carbon Monoxide Measurement

Carbon monoxide controller and sensor must be located as shown on the drawings or as recommended by the manufacturer. The location must be representative of the area to be monitored. Installation must be in accordance with the manufacturer's instructions.

3.3.6.4 Chlorine in Air

The controller must be located in the control panel or other location as shown on the drawings. Where a sample tube is used, the size and maximum length must be a recommended by the manufacturer. The sample tube must not be crimped or kinked. The location of the [controller] [sample tube inlet] must be near the bottom of the area to be monitored.

3.3.6.5 Chlorine in Water

The controller must be located in the control panel or other location as shown on the drawings. The chlorine sensor must be immersed in the fluid
being monitored using an assembly that will allow removal of the sensor from the water. The sensors must be located in an area of continuous flow.

3.3.6.6 Combustible Gas Sensor

The sensor and transmitter must be located as shown or the drawings or as recommended by the manufacturer. The location of the sensor must be representative of the area to be monitored and must allow access to the sensor for periodic replacement.

3.3.6.7 Hydrogen Sulfide

The controller must be located as shown on the drawings or as recommended by the manufacturer. Where a sample tube is used, the tube size and maximum length must be recommended by the manufacturer. The sample tube must not be crimped or kinked. The location of the controller/sample tube inlet must be representative of the area to be monitored.

3.3.6.8 NOx Monitor

The controller must be mounted in the control panel or as otherwise shown. Sensor must be located in the flue as shown and in accordance with the manufacturer's recommendation. Installation must prevent all leakage of flue gases at the sensor.

3.3.6.9 Oxygen and Ozone in Air Monitor

The controller must be mounted in the control panel or as otherwise shown on the drawings. The oxygen sensor must be located in accordance with the manufacturer's recommendations and as shown on the drawings. High and low alarm settings must be set as required by the sequence of control. Settings must be verified through the use of a manufacturer's standard calibration kit.

3.3.6.10 Dissolved Oxygen

The dissolved oxygen sensor must be immersed in the fluid to be monitored using manufacturer's mounting assembly. The sensor must be located in an area of continuous fluid flow. [The transmitter must be located remote from the sensor.] The transmitter and wiring connections must be in a weathertight enclosure. [The transmitter must be mounted to allow the digital readout to be easily viewed.]

3.3.6.11 PH and ORP Sensor

Pipe mounted flow sensor must be located in a threaded tee or fitting to allow removal from the pipe. Submersible sensor must be completely immersed in the fluid being monitored using an ensemble that will allow for removal of the sensor from the fluid for replacement. The sensor must be located in an area of continuous flow. The transmitter must be located [at the sensor] [remote from the sensor]. [The transmitter must be mounted to allow the digital readout to be easily viewed].

3.3.6.12 Total Dissolved Solids

The sensor must be [pipe] [tank] [submersible] type as indicated on the drawings. [Pipe mounted sensor must be mounted in a threaded tee or fitting to allow removal of the sensor.] [Tank mounted sensor must be mounted in a threaded fitting to allow removal of the sensor.] [Submersible
sensor must be mounted in an assembly that will allow removal of the sensor from the fluid for replacement.] The transmitter must be located [at the sensor] [remote from the sensor]. The transmitter and wiring connections must be located in a weathertight enclosure.

3.3.7 Instrument Shelters

Instrument shelters must be installed in the location shown with the bottom 1.2 meter 4.0 feet above the supporting surface using legs and secured rigidly to minimize vibrations from winds. Instrument shelters must be oriented with door facing North. Instruments located in shelters must be mounted in the 3-dimensional center of the open space of the shelter.

3.3.8 Electric Power Devices

3.3.8.1 Potential and Current Transformers

Install potential and current transformers in enclosures unless otherwise shown. Current transformer leads must be shorted when they are not connected to the measurement circuits.

3.3.8.2 Hour Meters

Meters must be located in the control panel or as otherwise shown. Power to the meter must be connected to the motor starter auxiliary contacts for pumps, blowers and other motor driven devices. For devices without motor starters, the meter must be connected in parallel with the load. Where the meter voltage differs from the metered devices voltage, transformer must be provided as necessary.

3.3.8.3 Watt-hour Meters

Install watt-hour meters and transducers in enclosures unless otherwise shown.

3.3.8.4 Transducers

Transducers must be wired in accordance with the manufacturer's instructions, and installed in enclosures.

3.3.8.5 Current Sensing Relays and Current Transducers for Motors

When used to sense meter/fan/pump status, current sensing relays must be used for applications under 4 kW 5 hp. Applications over 4 kW 5 hp must use a current transducer.

3.3.9 Output Devices

Output devices (transducers, relays, contactors, or other devices) which are not an integral part of the control panel, must be mounted in an enclosure mounted adjacent to the control panel, unless otherwise shown. Where H-O-A and/or override switches on the drawings or required by the control sequence, the switches must be installed so that the process control system controls the function through the automatic position and other controls work through the hand position.

3.3.10 Enclosures

All enclosure penetrations must be from the bottom of the enclosure, and
must be sealed to preclude entry of water using a silicone rubber sealant.

3.3.11 Transformers

Transformers for control voltages below 120 VAC must be fed from the nearest power panel or motor control center, using circuits provided for the purpose. Provide a disconnect switch on the primary side and a fuse on the secondary side. Transformers must be enclosed in a steel cabinet with conduit connections.

3.4 WIRE, CABLE AND CONNECTING HARDWARE

3.4.1 LAN Cables and Connecting Hardware

LAN cables and connecting hardware must be installed in accordance with Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM and Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP).

3.4.2 Metering and Sensor Wiring

Metering and sensor wiring must be installed in accordance with the requirements of ANSI C12.1, NFPA 70, Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.4.2.1 Power Line Surge Protection

Control panels must be protected from power line surges. Protection must meet the requirements of IEEE C62.41.1 and IEEE C62.41.2. Fuses must not be used for surge protection.

3.4.2.2 Sensor and Control Wiring Surge Protection

Digital and analog inputs must be protected against surges induced on control and sensor wiring installed outdoors and as shown. Fuses must not be used for surge protection. Test the inputs and outputs in both the normal and common mode using the following two waveforms: The first waveform must be 10 microseconds by 1000 microseconds with a peak voltage of 1500 volts and a peak current of 60 amperes. The second waveform must be 8 microseconds by 20 microseconds with a peak voltage of 1000 volts and a peak current of 500 amperes. Submit certified test results for surge protection.

3.5 SOFTWARE INSTALLATION

Load software required for an operational process control system, including databases (for points specified and shown), operational parameters, and system, command, and application programs. Adjust, tune, debug, and commission all software and parameters for controlled systems to assure proper operation in accordance with the sequences of operation and database tables.

3.6 CONTROL DRAWINGS

3.6.1 Control

Control drawings, [framed, non-fading half-size in laminated plastic] [reproducible, with corresponding CADD files] [___], must be provided for equipment furnished and for interfaces to equipment at each respective
equipment location. Condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system manually must be prepared in typed form, [framed as specified for the instrumentation and control diagrams] [reproducible, with corresponding word processor files] [____] and posted beside the diagrams. Diagrams and instructions must be submitted prior to posting. The framed instructions must be posted before acceptance testing of the system.

3.6.2 Contractor Design Drawings

Contractor Design Drawings as a single complete package: [____] hard copies and [____] copies in electronic form. As a minimum they must include wiring, logic, and layout. Submit hardcopy drawings on [ISO A1 841 by 594 mm 34 by 22 inches][or][A3 420 by 297 mm 17 by 11 inches] sheets, and electronic drawings in PDF and in [AutoCAD][Microstation][Bentley BIM V8][Autodesk Revit 2013] format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule. Contractor Design Drawings must be approved prior to any fabrication.

3.6.2.1 Draft As-Built

Draft As-Built Drawings as a single complete package: [____] hard copies and [____] copies in electronic form. Submit hardcopy drawings on [ISO A1 841 by 594 mm 34 by 22 inches][or][A3 420 by 297 mm 17 by 11 inches] sheets, and electronic drawings in PDF and in [AutoCAD][Microstation][Bentley BIM V8][Autodesk Revit 2013] format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule.

3.6.2.2 Final As-Built

Final As-Built Drawings as a single complete package: [____] hard copies and [____] copies in electronic form. Submit hardcopy drawings on [ISO A1 841 by 594 mm 34 by 22 inches][or][A3 420 by 297 mm 17 by 11 inches] sheets, and electronic drawings in PDF and in [AutoCAD][Microstation][Bentley BIM V8][Autodesk Revit 2013] format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule.

3.6.3 Points Schedule

**************************************************************************
NOTE: Template Points Schedules in electronic format for use with this section are available in online at:
**************************************************************************

Provide a Points Schedule in tabular form for each system, with the indicated columns and with each row representing a hardware point, network point or configuration point in the system.

a. When a Points Schedule was included in the Contract Drawing package, use the same fields as the Contract Drawing with updated information in...
addition to the indicated fields.

b. When Point Schedules are included in the contract package, items requiring contractor verification or input have been shown in angle brackets ('<', and '>'), such as <___> for a required entry or <value> for a value requiring confirmation. Complete all items in brackets as well as any blank cells. Do not modify values which are not in brackets without approval. Points Schedule Columns must include:

3.6.3.1 Point Name

The abbreviated name for the point using the indicated naming convention.

3.6.3.2 Description

A brief functional description of the point such as "Supply Air Temperature".

3.6.3.3 DDC Hardware Identifier

The Unique DDC Hardware Identifier shown on the DDC Hardware Schedule and used across all drawings for the DDC Hardware containing the point.

3.6.3.4 Settings

The value and units of any setpoints, configured setpoints, configuration parameters, and settings related to each point.

3.6.3.5 Range

The range of values, including units, associated with the point, including but not limited to setpoint adjustment range, a sensor measurement range, or the status of a safety.

3.6.3.6 Input or Output (I/O) Type

The type of input or output signal associated with the point. Use the following abbreviations for entries in this column:

a. AI: The value comes from a hardware (physical) Analog Input
b. AO: The value is output as a hardware (physical) Analog Output
c. BI: The value comes from a hardware (physical) Binary Input
d. BO: The value is output as a hardware (physical) Binary Output
e. PULSE: The value comes from a hardware (physical) Pulse Accumulator Input
f. NET-IN: The value is provided from the network (generally from another device). Use this entry only when the value is received from another device as part of scheduling or as part of a sequence of operation, not when the value is received on the network for supervisory functions such as trending, alarming, override or display at a user interface.
g. NET-OUT: The value is provided to another controller over the network.
Use this entry only when the value is transmitted to another device as part of scheduling or as part of a sequence of operation, not when the value is transmitted on the network for supervisory functions such as trending, alarming, override or display at a user interface.

3.6.3.7 Network Data Exchange Information

(Gets Data From, Sends Data To) Provide the DDC Hardware Identifier of other DDC Hardware the point is shared with.

3.6.3.8 Override Information

For each point requiring an Override, indicate if the Object for the point is Commandable.

3.6.3.9 Trend Object Information

For each point requiring a trend, indicate if the trend is Local or Remote. For remote trends provide the DDC Hardware Identifier for the device performing the trend.

3.6.3.10 Alarm Information

Indicate the Alarm Generation Type.

3.7 FIELD TESTING AND ADJUSTING EQUIPMENT

Provide personnel, equipment, instrumentation, and supplies necessary to perform site testing. The Government will witness the PVT, and written permission must be obtained from the Government before proceeding with the testing. Original copies of data produced, including results of each test procedure, during PVT must be turned over to the Government at the conclusion of each phase of testing prior to Government approval of the test. The test procedures must cover actual equipment and functions specified for the project.

3.7.1 Testing, Adjusting and Commissioning

**************************************************************************
NOTE: Delete reference to a factory test if no factory test is to be required.
**************************************************************************

After successful completion of the factory test as specified, the Contractor will be authorized to proceed with the installation of the system equipment, hardware, and software. Once the installation has been completed, tested, adjusted, and commissioned each control loop and system in accordance with NIST SP 250 and must verify proper operation of each item in the sequences of operation, including hardware and software. Calibrate field equipment, including control devices, adjust control parameters and logic (virtual) points including control loop setpoints, gain constants, constraints, and verify data communications before the system is placed online. Test installed ground rods as specified in IEEE 142 and submit certification stating that the test was performed in accordance with IEEE 142. Calibrate each instrumentation device connected to the process control system control network by making a comparison between the reading at the device and the display at the workstation, using a standard at least twice as accurate as the device to be calibrated. Check each control point within the process control system control network.
by making a comparison between the control command at the central station and field-controlled device. Deliver trend logs/graphs of all points showing to the Government that stable control has been achieved. Points on common systems must be trended simultaneously. One log must be provided showing concurrent samples taken once a minute for a total of [4] [___] hours. One log must be provided showing concurrent samples taken once every 30 minutes, for a total of [24] [___] hours. Verify operation of systems in the specified failure modes upon Process control system network failure or loss of power, and verify that systems return to process control system control automatically upon a resumption of process control system network operation or return of power. Deliver a report describing results of functional tests, diagnostics, calibrations and commissioning procedures including written certification to the Government that the installed complete system has been calibrated, tested, adjusted and commissioned and is ready to begin the PVT. The report must also include a copy of the approved PVT procedure.

3.7.2 Performance Verification Test (PVT)

Submit test procedures for the PVT. The test procedure must describe all tests to be performed and other pertinent information such as specialized test equipment required and the length of the PVT. The test procedures must explain, in detail, step-by-step actions and the expected results, to demonstrate compliance with all the requirements of the drawings and this specification. The test procedure must be site specific and based on the inputs and outputs, required calculated points and the sequence of control. Refer to the actions and expected results to demonstrate that the process control system performs in accordance with the sequence of control. Include a list of the equipment to be used during the testing plus manufacturer's name, model number, equipment function, the date of the latest calibration and the results of the latest calibration.

Demonstrate that the completed Process control system complies with the contract requirements. All physical and functional requirements of the project including communication requirements must be demonstrated and shown. Demonstrate that each system operates as required in the sequence of operation. The PVT as specified must not be started until after receipt of written permission by the Government, based on the written report including certification of successful completion of testing, adjusting and commissioning as specified, and upon successful completion of training as specified. Upon successful completion of the PVT, furnish test reports and other documentation.

3.7.3 Endurance Test

Use the endurance test to demonstrate the overall system reliability of the completed system. The endurance test must be conducted in phases. The endurance test must not be started until the Government notifies the Contractor in writing that the PVT is satisfactorily completed, training as specified has been completed, outstanding deficiencies have been satisfactorily corrected, and that the Contractor has permission to start the endurance test. Provide an operator to man the system [8 hours per day during daytime operations, including weekends and holidays,] [during Phase I endurance testing, in addition to any Government personnel that may be made available.] The Government may terminate testing at any time when the system fails to perform as specified. Upon termination of testing by the Government or by the Contractor, commence an assessment period as described for Phase II. Upon successful completion of the endurance test, deliver test reports and other documentation, as specified, to the
3.7.3.1 Phase I (Testing)

**************************************************************************

NOTE: The designer will determine the required Phase I testing period. The testing period should be based on the system size and complexity.
**************************************************************************

The test must be conducted 24 hours per day, 7 days per week, for [_____] consecutive calendar days, including holidays, and the system must operate as specified. Make no repairs during this phase of testing unless authorized by the Government in writing.

3.7.3.2 Phase II (Assessment)

After the conclusion of Phase I, identify failures, determine causes of failures, repair failures, and deliver a written report to the Government. The report must explain in detail the nature of each failure, corrective action taken, results of tests performed, and must recommend the point at which testing should be resumed. After delivering the written report, convene a test review meeting at the job site to present the results and recommendations to the Government. The meeting must not be scheduled earlier than 5 business days after receipt of the report by the Government. As a part of this test review meeting, demonstrate that failures have been corrected by performing appropriate portions of the performance verification test. [The Government reserves the right to cancel the test review meeting if no failures or deficiencies occur during the Phase I testing. If the Government chooses to do so, the Contractor will be notified in writing.] Based on the Contractor's report and the test review meeting, the Government will determine if retesting is necessary and the restart point. The Government reserves the right to require that the Phase I test be totally or partially rerun. Do not commence any required retesting until after receipt of written notification by the Government. After the conclusion of any retesting which the Government may require, the Phase II assessment must be repeated as if Phase I had just been completed.

3.7.3.3 Exclusions

The Contractor will not be held responsible for failures resulting from the following: Outage of the main power supply in excess of the capability of any backup power source, provided that the automatic initiation of all backup sources was accomplished and that automatic shutdown and restart of the process control system performed as specified. Failure of a Government furnished communications link, provided that the PLC automatically and correctly operates in the stand-alone mode as specified, and that the failure was not due to Contractor furnished equipment, installation, or software. Failure of existing Government owned equipment, provided that the failure was not due to Contractor furnished equipment, installation, or software.

3.8 FIELD TRAINING

**************************************************************************

NOTE: The number of hours required to instruct a Government representative in operation and maintenance of the system will depend on the complexity of the system specified. Designer is to
establish the number of hours of each type
(preliminary, additional maintenance, specialized,
flow meter, and specialized sensor) of training
based on equipment manufacturer recommendations,
system complexity and consultation with the
installation.

Field training oriented to the specific system must be provided for
designated personnel. Furnish a copy of the training manual for each
trainee plus [two] [_____] additional copies. Manuals must include an
agenda, the defined objectives for each lesson, and a detailed description
of the subject matter for each lesson. Furnish audiovisual equipment and
other training supplies and materials. Copies of the audiovisuals must be
delivered with the printed training manuals. The Government reserves the
right to videotape training sessions for later use. A training day is
defined as 8 hours of classroom instruction, excluding lunchtime, Monday
through Friday, during the daytime shift in effect at the training
facility. Submit the training manual and schedule to receive approval from
the Government at least 30 days before the training.

3.8.1 Preliminary Operator Training

Prior to the start of field testing, preliminary operator training must be
taught at the project site for [___] consecutive training [days] [hours].
Upon completion of this course, each student, using appropriate
documentation, should be able to perform elementary operations with
guidance and describe the general hardware architecture and functionality
of the system. This course must include: general system architecture;
functional operation of the system, including workstations; operator
commands; application programs, control sequences, and control loops;
database entry and modification; reports generation; alarm reporting;
diagnostics; and historical files.

3.8.2 Additional Operator Training

Following the field testing, additional classroom training for operators
must be taught for [___] consecutive training days; individual instruction
sessions of [4] [___] -hour periods in the morning (or afternoon) of the
same weekday for [___] consecutive weeks and an additional [___] day
classroom session for answering operator questions. Individual instruction
must consist of "hands-on" training under the constant monitoring of the
instructor. Classroom training must include instruction on the specific
hardware configuration of the installed process control system and specific
instructions for operating the installed system. Schedule activities
during this period so that the specified amount of time on the equipment
will be available for each student. The final session will address
specific topics that the students need to discuss and to answer questions
concerning the operation of the system. Upon completion of the course, the
students should be fully proficient in system operation and have no
unanswered questions regarding operation of the installed process control
system. Each student should be able to start the system, operate the
system, recover the system after a failure and describe the specific
hardware architecture and operation of the system and be fully proficient
in all system operations. Report the skill level of each student at the
end of this course.
3.8.3 Maintenance Training

**************************************************************************

NOTE: Edit training requirements to the systems.
**************************************************************************

Following the [endurance test] [_____] a minimum period of [one] [_____] training [days][hours] must be provided by a factory representative or a qualified Contractor trainer for [five] [_____] designated personnel on maintenance of the equipment. The training must include: physical layout of each piece of hardware, calibration procedures, preventive maintenance procedures, schedules, troubleshooting, diagnostic procedures and repair instructions.

3.8.4 Specialized Training

**************************************************************************

NOTE: Coordinate with specifications for the unit processes, adding or deleting parts.
**************************************************************************

Following the maintenance training, a minimum period of [five] [_____] total training day(s) must be provided by a factory representative or a qualified Contractor trainer for [ten] [_____] people on the input devices.

3.8.4.1 Flow Meter Training

Each type of flow meter, to include calibration, maintenance and testing of flow elements and transducers.

3.8.4.2 Specialized Sensor Training

Provide training on each type of specialized sensor such as [chlorine,] [turbidity,] [pH,] [NOx,] [_____] to include calibration, maintenance and testing of sensing elements and transducers for [five] people.

3.9 OPERATION AND MAINTENANCE DATA REQUIREMENTS

Outline the step-by-step procedures required for system startup, operation and shutdown. Include in the instructions layout, wiring and control diagrams of the system as installed, the manufacturer's name, model number, service manual, parts list and a brief description of all equipment and their basic operating features. List routine maintenance procedures, possible breakdowns and repairs and troubleshooting guides.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for top running overhead electric traveling (OET) cranes with top running bridges and trolleys, Crane Manufacturers Association of America (CMAA) 70 service class A, B, C, D, E, and F and with capacities less than 27 metric ton 30 ton 27,000 kg 60,000 pounds, suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments.

This guide specification incorporates the design criteria and requirements identified in NAVCRANECEN INSTRUCTION 11450.2A (December 2018).

This guide specification includes tailoring options for NAVFAC, pounds (per NAVFAC P-307), and tons. The NAVFAC tailoring option also includes requirements specific to the Navy and Marine Corps. Crane procurements for the Navy and Marine Corps must select the NAVFAC tailoring option.

Crane tailoring options are included for the Air Force, outdoor, ordnance/explosives handling, or hazardous (explosive) environments. Only one unique specialized application tailoring option should be selected at a time, however multiple can be used with additional specific project editing in the resulting sections. "General Purpose Service" is the default crane condition and that tailoring option should be selected if the crane is not to be used in any specialized applications. When "Maximum Anti-Spark" protection is required, the "Minimum Anti-Spark" tailoring option MUST ALSO be selected as the maximum requirements are in addition to the minimum requirements.

Selection or deselection of a tailoring option (select view-tailoring options) will include or
exclude that option in the section. Specific project editing is still required for the resulting section.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************
**************************************************************************

Use this guide specification to specify cranes that are procured as part of a building construction contract for such applications as machine shops, warehouses, and other areas, including those that do require specialized weight handling equipment.

Explanations of CMAA service classifications A through E are covered in the notes portion of the "Classification" sub-section of "OET Design Criteria". The minimum allowable classification for Ordnance/Explosive Handling is CMAA service class D. Navy Crane Center minimum requirement is CMAA service class C.

Forward all procurement of OET systems at Naval Shore based activities with rated capacities of 9000 kg 20,000 pounds or greater or for use in specialized applications (e.g. ordnance handling, molten metal handling, special purpose service as defined in NAVSEA Publication 0989-030-7000, hazardous/explosive area environments, or precision handling operations requiring complex or synchronized lifting capacity) to: Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000. (See NAVCRANECEINSTRUCTION 11450.1C of 11 JULY 2019).

**************************************************************************
**************************************************************************

NOTE: This specification covers cranes with top-running bridge and trolley, multiple-girder, with CMAA 70 service class of A through E.

Control types and systems may be specified as follows:
1. Remote, Cab, or Pendant Crane Controls or a combination of the three can be provided.

2. Alternating current (AC) control systems must be specified. The vast majority of new cranes are AC powered and AC controlled.

Terminology: - refer to DEFINITIONS in this specification.

a. Top-running bridge is a bridge which travels on the top surface of rails of a fixed runway structure.

b. Top-running Trolley is a trolley which travels on the top surfaces of rails of the bridge girder(s).

c. Ordnance/Explosives Handling – Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Minimum requirement of CMAA service class D.

d. Hazardous (Explosive) Environments – Cranes operating in hazardous environments as defined by the cognizant activity safety office shall be equipped with electrical safety features that meet NEC Article 500. The activity safety office shall identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design. Materials for mechanical components shall be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

d.1. Minimum Anti-Spark Protection applies when only the load block enters the hazardous area.

d.2. Maximum Anti-Spark Protection applies when the hazardous area envelops the entire crane.

**************************************************************************
**************************************************************************

NOTE: The RFP must provide the relevant dimensions and load data for the crane. See "Crane Inquiry Data Sheet" in CMAA 70 section 6.1 or see "Crane Information Form for Over Head Electric Traveling Cranes(s)" pages 6 and 7 at the following Navy Crane Center link:

**************************************************************************
**************************************************************************

NOTE: Show the following information on the project drawings:
1. Complete details of plan, elevations and sections of crane, including building clearances.
3. Runway rail size.
4. Runway girder size.
5. Channel cap size.
7. Electrical junction box location (including mounting height).

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

a. Bridge Crane: That part of an overhead crane system consisting of girder(s), end trucks, end ties, walkway, and drive mechanism which carries the trolley(s) and travels along the runway rails parallel to the runway.

b. Crane Runway: The track system along which the crane operates horizontally, including track hangar rods, track connection devices, and runway structural supports.

c. Dead Loads: The loads on a structure which remain in a fixed position relative to the structure.

d. Girder: The principal horizontal beam of the crane bridge. It is supported by the crane end trucks.

e. Lifted Load: The load consisting of the rated load and the weight of lifting devices attached to the crane such as the load block, bucket, or other supplemental devices.
f. Pendant: A control for a hoist and a crane. The pendant hangs from the hoist or the crane by a cable at a height that is easy for the operator to reach.

g. Rated Load: The maximum working load suspended under the load hook.

h. Standard Commercial Cataloged Product: A product which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing" on the manufacturer's published product data sheets. These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

i. Top Running Crane: An electric overhead traveling crane that runs on rails on top of support girders.

j. Trolley Load: Weight of the trolley and its associated equipment carried by the trolley wheels.

k. Operating Environments:

(1) General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as General Purpose Service if they are operating in routine environments.

(2) Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Minimum requirement of CMAA service class D.

(3) Hazardous (Explosive) Environments: Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NEC Article 500. The activity safety office will identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and shall list these in this section. Choose materials for mechanical components to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

(a) Minimum Anti-Spark Protection is used when only the load block enters the explosive area.

(b) Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane.

1.3 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Remove the following sentence if the runway rail is not to be installed as a part of the crane procurement. If rail is to be installed, ensure Section 05 12 00 STRUCTURAL STEEL is included in the Request for Proposal (RFP).
The requirements for the crane runway system and rail supporting structures are specified in Section 05 12 00 STRUCTURAL STEEL, and must conform to AISC 360.

1.3.1  Crane Design Criteria

NOTE: Clearly show the area of hook coverage, runway dimensions, rail size, hook vertical travel, clear hook height, and lifting capacity on drawings.

Cranes will operate in the given spaces and match the runway dimensions and rails indicated. Hook coverage, hook vertical travel, clear hook height, lifting capacity, and load test weight must not be less than that indicated.

1.3.1.1  General

NOTE: Add number of cranes, building name, and crane rated load capacity in kilograms pounds.

Include the following: Number of cranes [____], located in building identified as [____], with the capacity expressed in [____] metric tons tons kilograms pounds, for each overhead electric traveling (OET) crane. Also clearly locate and identify each multiple girder hoist and system components.

1.3.1.2  Classification

NOTE: For NAVFAC, specify CMAA service class C or higher. For Ordnance/Explosives Handling specify CMAA service class D or higher.

NOTE: Refer to NFPA 70 for environmental requirements. Make a selection from the following CMAA 70 service classifications:

Class A (Standby or Infrequent Service): This service covers cranes which may be used in installations such as powerhouses, public utilities, turbine rooms, motor rooms and transformer stations where precise handling of equipment at slow speeds with long, idle periods between lifts are required. Capacity loads may be handled for initial installation of equipment and for infrequent maintenance.

Class B (Light Service): This service covers cranes which may be used in repair shops, light assembly operations, service buildings, and light warehousing where service requirements are light and the speed is slow. Loads may vary from no load to occasional...
full rated loads with 2 to 5 lifts per hour, averaging 3 m 10 feet per lift.

Class C (Moderate Service): This service covers cranes which may be used in machine shops of paper mill machine rooms, where service requirements are moderate. In this type of service, the crane will handle loads which average 50 percent of the rated capacity with 5 to 10 lifts per hour, averaging 4.5 m 15 feet, not over 50 percent of the lift at rated capacity.

Class D (Heavy-Duty): This service covers cranes which may be used in heavy machine shop, foundries, fabricating plants, steel warehouses, container yards, lumber mills, and standard duty bucket and magnet operations where heavy-duty production is required. In this type of service, loads approaching 50 percent of the rated capacity will be handled constantly during the working period. High speeds are desirable for this type of service with 10 to 20 lifts per hour averaging 4.5 m 15 feet, not over 65 percent of the lifts at rated capacity. This service is the minimum requirement for Ordnance/Explosive Handling.

Class E (Severe Service): This type of service requires a crane capable of handling loads approaching rated capacity throughout its life. Applications may include magnet, bucket, magnet/bucket combination cranes for scrap yards, cement mills, lumber mills, fertilizer plants, and container handling with 20 or more lifts per hour at or near the rated capacity.

Class F (Continuous Severe Service): This type of service requires a crane capable of handling loads approaching rated capacity continuously under severe service conditions throughout its life. Applications may include custom designed specialty cranes essential to performing the critical work tasks affecting the total production facility. These cranes must provide the highest reliability with special attention to ease of maintenance features.

**************************************************************************
**************************************************************************

NOTE: Operating Environments

General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as General Purpose Service if they are operating in routine environments. Cranes operating in non-routine environments or unique, dedicated service should meet the requirements of one of the below Specialized Applications:
Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Minimum requirement of CMAA service class D.

Hazardous (Explosive) Environments: Cranes operating in hazardous environments as defined by the cognizant activity safety office shall be equipped with electrical safety features that meet NEC Article 500. The activity safety office shall identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and shall list these in this section. Materials for mechanical components shall be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

a. Minimum Anti-Spark Protection is used when only the load block enters the explosive area.

b. Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane.

**************************************************************************

Provide top running overhead electric traveling (OET) multiple girder crane[s] conforming to CMAA 70 service class [A] [B] [C] [D] [E] [F] for operation in an [indoor] [outdoor] environment, [general purpose] [ordnance handling] [hazardous area] service, meeting the requirements of ASME B30.2, with an ambient temperature range of [_____] to [_____] degrees Celsius [Fahrenheit]. This crane must operate in an NEC Class [____], Division [____], Group [____] hazardous area. Hazardous protection is required for the [full height of the crane] [18 inches above ground level] [____]. The crane span must be [_____] meters feet with a vertical lift of [_____] meters feet and as specified herein.

The crane must be [pendant controlled] [radio controlled] [cab controlled] and operate in the spaces and within the loading conditions indicated.[ The pendant controller must be mounted on a separate festooned cable system from the trolley power supply.] The crane must operate on [____]-volts AC, [60] [50] [_____] Hz, [single] [three] phase power source. Maximum crane wheel loads (without impact) due to dead, trolley, and lifted loads, with the trolley in any position, must not cause a more severe loading condition in the runway support structure than that produced by the design wheel loads and spacing indicated.

1.3.1.3 Rated Capacity and Speeds

**************************************************************************

NOTE: Specify the rated speed under full load for the main hoist, auxiliary hoist (if specified), bridge, and trolley.

1. Hoist: Select hoist speed which conforms to the recommendations of CMAA 70 or ASME tables, based on capacity.
2. **Trolley**: Trolley travel speed must conform to the recommendations of CMAA 70, based on capacity.

3. **Bridge**: Bridge travel speed must conform to the suggested speeds per minute for floor controlled cranes as stipulated in CMAA 70.

**************************************************************************

Provide crane with rated capacity of [_____] metric tons tons kilograms pounds.

Provide auxiliary hoist with [_____] metric tons tons kilograms pounds capacity. Lower load block or assembly of hook, swivel bearing sheaves, pins, and frame suspended by the hoisting ropes are not considered part of the rated capacity.

Rated (maximum) speeds plus or minus 10 percent (in meters/second) (feet/min) for the main hoist, auxiliary hoist, bridge, and trolley at the rated load are specified in the table below. The minimum speed must not exceed the values listed. Values in the table are for a fully loaded crane. Using overspeed, the hoist function must be capable of [_____] when not loaded.]
1.4 VERIFICATION OF DIMENSIONS

The Contractor is responsible for the coordination and proper relation of their work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Manufacturer Qualification

Overhead Electric Traveling Crane must be designed and manufactured by a company with a minimum of 10 years of specialized experience in designing and manufacturing the type of overhead crane required to meet requirements of the Contract Documents. Crane design shall be accomplished by, or directly supervised by, a registered professional engineer (PE). PE licensing must be by a board or agency authorized to license and register professional engineers. The PE may be a Contractor's regular employee or a consultant. The PE's review and attestation of specification compliance and professional responsibility must be signified by his or her PE original seal and dated signature on the final drawings. The professional engineers must only undertake and perform work under this contract in the branch(s) of engineering in which they are licensed.

1.6.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing, and documentation. Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane.
1.6.2.1 Inspection of Steel Castings

Visually inspect [and test] load-carrying steel castings [using the magnetic-particle inspection method] [using ultrasonic testing]. [Reference allowable degree of discontinuities to ASTM E125, and relationship to service loads and stresses, critical configuration, location and type.] All load bearing components, couplings, shafts, and gears, in the hoist drive train must be rolled or forged steel, except brake drums which may be ductile iron. Methods of repairing the discontinuities is subject to review by the Contracting Officer.

1.6.2.2 Inspection of Hook Assembly

Inspect hook [by a magnetic-particle type inspection] [and X-rayed] [and tested ultrasonically] prior to delivery. Furnish documentation of hook inspection to Contracting Officer prior to field operational testing. As part of the acceptance standard, linear indications [greater than 1/16 inch] are not allowed. Welding repairs of hook are not permitted. A hook showing linear indications, damage or deformation is not acceptable and must be replaced immediately.

[1.6.2.2.1 Hook Non-Destructive Test (NDT)

Magnetic-particle inspect the hook over the entire area in accordance with ASTM A275/A275M. Acceptance standard is no defects. A defect is defined as a linear indication that is greater than [3 mm 1/8 inch] [1.5 mm 1/16 inch] long. For hooks of non-magnetic material, NDT will be liquid penetrant (PT) method in accordance with ASTM E1417/E1417M. For PT testing of hooks containing stainless steels, titanium, or nickel based alloys, total halogens and Sulphur used in the NDT process must be controlled as specified in T9074-AS-GIB-010/271.

Inspect each hook and shank over the entire surface area by magnetic particle inspection.

a. Procedure: Conduct magnetic particle inspection in accordance with ASTM A275/A275M with the following restrictions: Do not use DC yokes (including switchable AC/DC yokes used in the DC mode) or permanent magnet yokes. Do not use automatic powder blowers or any other form of forced air other than from a hand-held bulb for the application or removal of dry magnetic particles. Remove arc strikes. Equipment ammeters must have an accuracy of plus or minus 5 percent of full scale.
b. Acceptance Criteria: Defects found on the hook will result in rejection of defective items for use on furnished hoist. For this inspection, a defect is defined as a linear indication for which the largest dimension is greater than 1.5 mm (1/16 inch).

c. Test Report: Submit a test report of the magnetic particle inspection of each hook provided to the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The NDT procedures including technique sheets specific to the types, shapes, and size of the parts being examined must adequately describe the orientation of the hooks within the magnetizing equipment. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheet, and certification to the Contracting Officer with the test report.

1.6.2.3 Hook Proof Test

**************************************************************************

NOTE: Hook proof tests are required for custom designed or non-ferrous (bronze or stainless steel) hooks. Bronze/stainless steel hooks are generally associated with minimum hazardous area requirements.
**************************************************************************

Proof test the load hook per ASME B30.10. Perform the proof test prior to Hook NDT.

1.6.3 Certificates

All certifications must be dated and bear the original signature (above the printed name) of the authorized representative of the Contractor or the manufacturer of the items or equipment being certified. Each certification will clearly identify the crane, the drives, components, and location (as applicable) to which it applies:

a. Submit a Wire Ropes Certification with the wire rope manufacturer's certification that the rope meets the published breaking strength or the actual breaking strength of a sample taken from the reel and tested. Certification is to be traceable to the hoist, crane, and reel.

b. Submit a Crane Runway System Certificate stating that the new crane will operate properly on the runway; if the crane(s) cannot operate without restriction, the Contractor must indicate crane limitations.

c. Submit a Hazardous Material Certificate that the crane does not contain hazardous material including asbestos, lead, cadmium, chromium, PCBs, or elemental mercury. Products required for the designing and manufacturing of cranes must not contain the prohibited materials.

d. Submit a Loss of Power Test Certificate stating that a test may be
performed in which power is removed from the crane while the hoist, bridge, and trolley are in operation.

e. Submit a Certificate of the Coupling Alignment Verification Record.

f. Submit an Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus 0 minus 5 percent) of rated load.

g. Submit an Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus [0] [_____] minus [5] [_____] percent) of rated load.

h. Submit a Certificate of the Brake Adjustment Record. Provide a brake adjustment record and installation/maintenance manuals for each brake on the crane. Each brake measurement must have a tolerance traceable to the associated brake manual or documentation provided by the brake manufacturer, location of measurements, and the actual brake setting. Changes made to settings of the brake, at any time, will void the record.

i. Submit a Certificate of Compliance with Listed Standards

j. Provide a Contractor Hazardous Environment Certificate stating that the new crane and all associated components excluding the hoist are designed for operation in the hazardous environment specified in the Classification section.

k. The Contractor shall provide a Public Domain Software Certificate declaring that public domain software (e.g., freeware, shareware) is not used in the system.

l. The Contractor shall provide a certificate stating that all Software and Services that are not required for operation and/or maintenance of the product have been removed. The software/services to be removed are identified in paragraph SOFTWARE AND SERVICES.

1.6.4 Drawings: Overhead Electric Traveling Crane

a. Submit drawings showing the general arrangement of all components in plan, elevation, and end views. Show all major features of the crane including: hook approaches on all four sides, clearances and principal dimensions, assemblies of hoist, trolley and bridge drives, motor nameplate data, overcurrent protective device ratings, and electrical schematic drawings. Include weights and centers of gravity of major components. Provide maximum wheel loads (without impact) and spacing imparted to the crane runway system track beams. Indicate the crane speeds along the runway, the trolley speeds along the bridge girder, and the hoist lifting speeds; all speeds indicated are speeds with hoist loaded with rated crane capacity load.

b. Submit shop drawings of all fabricated components. Shop drawing quality must be equivalent to the contract drawings accompanying this solicitation. Drawings must be reviewed, signed, and sealed by a registered professional engineer.

c. Provide integral schedule of crane components on each drawing. The schedule must provide a cross reference between manufacturer data and shop drawings. Components listed on the schedule of crane components
must include total quantity, description, original manufacturer, and part number. Distributing agents will not be acceptable in lieu of the original manufacturer.

d. Provide control system and network drawings. Network diagram must show equipment locations, names, models, and IP addresses on network communications schematic for all Programmable Logic Controllers (PLCs), Remote Terminal Unit (RTU), Supervisory Controller, and Other Network-Capable Devices. In addition, the drawings shall consist of all software block, flow, and ladder diagrams.

1.6.5 Design Data: Load and Sizing Calculations

**************************************************************************
NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys.
**************************************************************************

Submit complete list of equipment and materials, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Submit calculations reviewed, signed, and sealed by a registered professional engineer verifying the load cases, sizing of the bridge girders, end trucks, travel drives, brake selections, and overcurrent protection for motors, controllers, and branch circuits. Provide a list of all codes and standards, design assumptions, equations, specified efficiencies, limits, factors of safety, component ratings, and sources of values used. Include free body diagrams or sketches of each load case. [Include seismic analysis of crane.]

1.6.6 Welding Qualifications and Procedures

Welding must be in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep and not exceed those specified in AWS D14.1/D14.1M and CMAA 70. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M.

1.7 CRANE SAFETY

**************************************************************************
NOTE: Add ASME HST-4 if commercial hoist/trolley unit will be used.
**************************************************************************

[1.7.1 Nuclear Safety Analysis

**************************************************************************
NOTE: Certification is required for cranes handling nuclear materials. Results from the Safety Analysis will be utilized by the Using Agency as a basis for bridge crane certification. Delete this paragraph
if the crane is not required to handle nuclear materials.

This section is not applicable to NAVFAC projects. The Navy Crane Center must be involved with the procurement and overhaul of all NAVY cranes that handle Nuclear material as identified in the forward notes section of this specification.

Nuclear certification, testing, and rules of construction must be in accordance with 29 CFR 1910.147 and ASME NOG-1. Air Force Nuclear certified hoists must meet requirements of AFMAN 91-118. Submit analysis and test reports to Contracting Officer for approval.

PART 2   PRODUCTS

2.1   MATERIALS

2.1.1   General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment. Material will be free from defects and imperfections that might affect the serviceability and appearance of the finished product. All material must be new and unused.

2.1.2   Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two bridge identification plates, one for each side of the bridge. Provide noncorrosive metal identification plates with letters which are easily read from the floor, showing a separate number such as BC-1, BC-2, for each bridge crane.

2.1.3   Capacity Marking

Mark the rated capacity in metric ton, ton, kilograms, pounds units on each side of the crane on the bridge girders. Capacity marks must be large enough to be clearly visible from the floor. The markings must be positioned to be visible at the operator's position after the crane has been installed.[ Provide additional markings in operator's cab.]

2.1.4   Safety Warnings

Affix labels in a readable position to each lift block or control station in accordance with ASME B30.2. Submit safety warnings, diagrams and other instructions suitably framed and protected for display as indicated by the Contracting Officer as follows:

Design and locate the word "WARNING" or other legend to bring the label to the attention of the operator. Provide durable type warning labels and display the following information concerning safe-operating procedures: Cautionary language against lifting more than the rated load; operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; operating damaged or malfunctioning hoist; operating a rope hoist with a rope that is not properly seated in its hoist.
drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

2.2 Structural Requirements

Structural requirements must be in accordance with CMAA 70, Section 3. Structural steel materials must conform to the standards permitted in CMAA 70 and AISC 360.

2.2.1 Structural Connections

High-strength bolted structural connections must be designed and installed in accordance with RCSC A348. Bolts must be of ASTM F3125/F3125M Grade A325/A325M or Grade A490/A490M material. Galvanized bolts are not acceptable.

Welded connections must be performed in accordance with AWS D14.1/D14.1M. Allowable stress values must comply with CMAA 70.

2.2.2 Bridge Girder or Girders

**************************************************************************
NOTE: Suggest specifying welded structural steel box girders for CMAA 70 Class C, D, or E with a capacity greater than 18 metric tons 20 tons 16330 kg 36,000 pounds or a span greater than 12 m 40 feet.
**************************************************************************

Provide [welded structural steel box section] [wide flange beam, standard I-Beam, or section fabricated from rolled plates and shapes] bridge girders. If the ends of bridge girders are notched to fit over the end trucks, the notches must be reinforced with vertical diaphragms and horizontal stiffeners.

2.2.3 Bridge Rails

Provide bridge rails, crane girders and other sections that are straight and true. Make all rail joints flush and true without misalignment of running treads and design to minimize vibration. The gap between adjacent rail ends and the vertical misalignment of running treads shall not exceed 0.794 mm 1/32 inch. Solid stock (e.g. square bar, roundstock) is not permitted as bridge rail. Center bridge rail on top flange or position bridge rail over girder web for torsion box girders. Fasten rail to girder with welded clips. Position rail clips in pairs and at not more than 36 inches on center. Bolt bridge rail joints using standard joint bars. Stagger and position rail joints directly over girder diaphragms. Provide a positive stop at bridge rail ends to prevent creep.

2.2.4 End Ties and Bridge Girder End Connections

**************************************************************************
NOTE: Specify end ties for cranes with more than 4 wheels. Specify welded structural steel box sections for CMAA 70 Class C, D, or E with a capacity greater than 18 metric tons 20 tons 18000 kg 40,000 pounds or a span greater than 12 m 40 feet.
**************************************************************************

If equalizing end trucks are used, provide rigid end ties between girders
to form a frame that is rigid about the vertical and horizontal axes. If compensating end trucks are used, provide end ties which are rigid about the vertical axis but relatively flexible about the horizontal axis to permit partial rocking motion for wheel load compensation. Provide full depth diaphragms at girder connections and jacking points. Provide horizontal gusset plates at the elevation of top and bottom end tie flanges for connection to girder ends. Make end connections with high-strength bolts in accordance with the Structural Connections section of this specification. Use tapered alignment pins to maintain original shop alignment between bridge girders and end ties/trucks.

2.2.5 End Trucks

Provide [rotating] [fixed axle] type end trucks fabricated from structural steel plate to provide a rigid box section structure. Center wheels between the webs of the box section. Configure bridge and trolley trucks with a feature that limits load movement to 25.4 mm 1 inch in the event of wheel or shaft failure. Provide jacking pads for removal of wheel assemblies. Wheel axle bearing seats must be designed such that wheel and axle bearing assembly can be removed with not more than 76 mm 3 inches of jacking.

[2.2.6 Trolley Frame

Provide trolley frame as a one-piece structural steel weldment. Provide pads for the use of jacks or wedges when changing truck wheels. Make all trolley yokes and load bars of drop forged, cast or rolled steel.[ Equip trolley with permanent lifting attachments.]

]2.2.7 End Stops and Bumpers

Fit bridge girders with structural steel end stops. Locate stops to permit maximum trolley travel. Fit bridge end trucks and trolley frames with shock-absorbing bumpers capable of decelerating and stopping the bridge and trolley within the limits stated by 29 CFR 1910 and CMAA 70. Bumpers must fully engage end stops. Mount bumpers so that there is no direct shear on mounting bolts (if any) upon impact. Bumpers must provide adequate clearance between the crane and surrounding structure when compressed to preclude damaging equipment. Ensure bridge and trolley bumper retention in accordance with ASME B30.2. When more than one crane is located and operated on the same runway, bumpers shall be provided on their adjacent ends or on one end of one crane. Fit the other end of the end-truck with a structural steel stop to engage the bumpers of the adjacent crane. Ensure bridge bumpers are properly aligned with runway end stops. Metal to metal contact at the bumper to end stop connection is not permitted.

[2.2.8 Footwalks

******************************************************************************
NOTE: A footwalk is recommended unless: the crane can be safely serviced by another means or where lack of clearance would prohibit one.
******************************************************************************

Set the location and construction of footwalks conforming to ASME B30.2 and 29 CFR 1910. A structural platform is required on the drive girder side of the crane. The length of the drive side footwalk shall be [adequate to provide access to the trolley and provide sufficient room for mounting control cabinets] [along the entire length of the bridge]. Provide
checkered steel flooring for platform. To give access to the opposite side of the trolley, bridge conductors, or other equipment, mount a footwalk [twice the length of the trolley] [the full length of the girder] on the opposite side of the crane. Provide a cross-over footwalk over an end tie between the two girder footwalks. Mate the drive side footwalk with the crane access platform. Footwalks must be free of exposed hazardous moving parts and electrical components that may injure personnel and not require the use of safety harnesses or other extraordinary means.

][2.2.9 Operator's Cab

**************************************************************************
NOTE: Applicable if a cab is specified, otherwise delete paragraph. Specify enclosed cab for outdoor use. Open cab may be used indoors. Enclosed cabs can be provided with a heating and air conditioning unit according to environmental conditions. Specify the location of cab and the direction the operator should face.
**************************************************************************

[2.2.9.1 Design

Design and construct operator's cab in accordance with CMAA 70 and ASME B30.2. Locate cab access to facilitate entry and exit by crane operator. Provide space for a carbon-dioxide, dry chemical, or equivalent hand fire extinguisher. In addition to the operator's seat, the cab must have a seat for a back-up operator.

][2.2.9.2 Cab Construction

Provide [fixed cab mounted on bridge] [trolley mounted cab] of the [open] [enclosed] type for [indoor] [outdoor] use, and designed to provide a clear view of the operating floor and hook for the operator.[ Provide cab with a suitable [heating] [heating and air conditioning] unit]. Locate cab on the [_____] of the [bridge] [trolley] with the operator facing [______].[ Provide [sliding] [fixed] windows of laminated safety type glass.]

][2.2.10 Additional Provisions for Outside Service

**************************************************************************
NOTE: This paragraph is applicable for outdoor cranes only.
**************************************************************************

Seal weld structural members on outdoor cranes. Provide crane bridges with parking brakes which will sufficiently hold the crane against a wind pressure of 2404 Pa 5 psf for in-service conditions. Provide crane bridges with manually-operated pin locks at each rail, designed to securely anchor the crane against a wind pressure of 1.44 kPa 30 psf for out-of-service conditions. Design members to prevent the collection of water on crane.

[2.2.11 Seismic Forces

**************************************************************************
NOTE: Seismic forces must be considered in the design of the cranes with a component importance factor of greater than 1.0 and in facilities with a Seismic Design Category of D, E, or F per ASCE 7-16
**************************************************************************
Perform a seismic analysis as a part of the design of the crane in accordance with ASCE 7-16 or ASME NOG-1. The seismic analysis must be included in the CMAA 70 extraordinary load case (Case 3). For project locations beyond the scope of ASCE 7-16, a widely accepted design standard may be used for seismic analysis.

2.3 MECHANICAL REQUIREMENTS

NOTE: For ordnance handling further material restrictions exist.

a. Provide steel shafts, gears, keys, and couplings. Cast iron and aluminum used to support components of the hoist power transmission train must be ductile. Gray cast iron load bearing parts are prohibited.

b. All bearings, except those subject only to small rocker motion, must be anti-friction type. All connections subject only to small rocking motion are to be fitted with bushings or thrust washers in the pivot pin bore, as applicable. Bronze bushings must have provisions for grease lubrication.

c. All mechanical components must be accurately aligned and positively secured to maintain the alignment. Parts must not be forced into position to obtain apparent alignment.

2.3.1 Hoists

NOTE: For ordnance handling CMAA class D is required and, if used, packaged hoists must be HST-4 Duty Class H4 or better.

For ordnance handling custom hoist shafts must have a fatigue design factor of 1.5.

Provide hoist conforming to ASME B30.2 and CMAA 70 service class [A] [B] [C] [D] [E] [F] or better, double reeved, except as modified and supplemented in this section.[ Standard commercial hoist and trolley units (packaged hoists), if used, must meet ASME HST-4 Duty Class [H1] [H2] [H3] [H4] or better.] For custom hoist shafts, the fatigue design factor must be a minimum of 1.5.

2.3.2 Drives

2.3.2.1 Bridge Drives

NOTE: If the span is less than 12 m 40 feet and the application is CMAA Class "A" or "B", then A-1 drive may be included as an option. Outdoor drive wheel
UFGS

The following paragraphs contain tailoring for NAVFAC. For text tailored to Minimum Anti-Spark requirements, remove conflicting requirements (i.e. load block cannot simultaneously be steel and anti-sparking or steel hook meeting ASTM A668 cannot also be non-sparking).

For Ordnance Handling: The insulated link(s) are required unless the following conditions are met:
1. There is no threat of a lightning strike during operations;
2. There is no chance for contact with overhead power lines;
3. RF emissions control is in effect regardless of the HERO classification of the ordnance being held.

The load block must be constructed of steel non-sparking materials and designed to prevent steel-to-steel contact of moving parts. The block must be fully enclosed, concealing the sheaves and wire ropes, except for wire rope slots and drain holes. The block must be clearly marked with the capacity in kilograms pounds on both sides. The load block sheaves must be constructed of non-sparking materials. [An insulated link must be provided on each hook block per the requirements of NAVSEA OP-5.] Standard commercial blocks may be used at their published ratings when their published design factors are 5.0 or greater.

Provide an unpainted single barbed forged steel hook complying with ASTM A668/A668M. Provide an unpainted single barbed hook of non-sparking material with a minimum material longitudinal elongation of 16 percent in 2 inches. Bronze clad hooks are prohibited. Hook dimensions must be as shown on the drawings. Fit hook with a safety latch designed to preclude

Provide [either A-1 or] [A-4] bridge drive arrangement as specified in CMAA 70 consisting of a single electric motor mechanically connected through gear reduction and drive shafts to the drive wheels or separate drive motors at each end of bridge. Outdoor cranes must have half of the total wheels driven.

Acceleration and deceleration must meet the requirements specified in this section. Gears must conform to applicable AGMA standards. Provide oil tight fully enclosed gear reducers with pressure or splash type lubrication. Bridge travel limit switches are optional.

2.3.2.2 Trolley Drives

Provide complete trolley drive arrangement with a minimum of two wheels driven by an integral electric motor. Drive mechanism must run in totally enclosed oil bath. Limit switches are optional for drive mechanism. Acceleration and deceleration controls must meet requirements specified in this section.

2.3.3 Load Blocks and Hooks
inadvertent displacement of slings from the hook saddle. The hook and hook nut must be removable without unreeving of the hoist. Provide hook nut with a removable type set screw or other similar fastener, installed in a plane parallel to the longitudinal axis of the hook shank. Do not weld hook nut. Uniquely mark the hook in a permanent fashion that is traceable to the NDT certification. The hook nut must be of non-sparking materials. Hook must be free to rotate through 360 degrees when supporting the test load up to 125 percent of the rated capacity. Provide only hooks which are designed and commercially rated in accordance with CMAA and conforming to ASME B30.10 and CMAA 70. Upper hooks of hook suspended hoists shall be of non-sparking materials.

2.3.4 Wire Ropes

**************************************************************************
NOTE: For NAVFAC, add tailored paragraph section.
For minimum anti-spark protection, add tailored paragraph section.
**************************************************************************

a. Wire ropes must conform to ASTM A1023/A1023M and be tested as required by ASTM A931. The wire rope must be in a double reeved configuration and equalized with a sheave. Provide wire rope with a minimum design factor of [5 to 1] [_____ to 1] based on the load experienced at rated capacity and minimum breaking strength of the wire rope.

b. Provide hoisting ropes with improved plow steel, extra improved plow steel, or extra-extra improved plow steel, regular lay, bright, and uncoated with an independent wire rope, wire strand, or otherwise, steel core. Hot-dipped galvanized wire rope is not permitted.

c. Provide stainless steel construction hoist ropes.

d. Maximum hoisting rope fleet angles must be 4 degrees for drums and 4.75 degrees for sheaves. Hoisting rope end connections, other than drum connections, must be speltered sockets with forged steel terminals or swaged fittings installed in a fashion that provides 100 percent of the breaking strength of the wire rope. Provide proof of Wire Rope breaking strength. Wedge sockets or aluminum swages are not permitted on wire rope end connections.

2.3.5 Sheaves

**************************************************************************
NOTE: Select 16 rope diameters for CMAA service class A or B, 18 rope diameters for class C, 20 rope diameters for class D, 24 rope diameters for class E, or 30 rope diameters for class F.
**************************************************************************

**************************************************************************
NOTE: For NAVFAC, add additional requirements in the tailored paragraph section.
**************************************************************************

Provide steel sheaves. Minimum pitch diameters must be [16] [18] [20] [24] times the rope diameter for running sheaves, and no less than 12 times the rope diameter for equalizer sheaves. Sheave surfaces which contact wire
rope are not to be painted.

The sheaves must be heat treated to a minimum hardness of 320 Brinell Hardness Number (BHN) in the wire rope contact area, have a groove depth not less than 1.5 times the hoisting rope diameter, with a throat angle of 30 to 40 degrees.

2.3.6 Hoist Drum

**************************************************************************
NOTE: Select 16 rope diameters for CMAA service class A or B, 18 rope diameters for class C, 20 rope diameters for class D, 24 rope diameters for class E, or 30 rope diameters for class F.
**************************************************************************

Provide drum made of steel. Design the drum such that all hoisting rope is wound in a single layer and so that not less than two dead wraps of hoisting rope remain on each anchorage when the hook is in its extreme low position. Drum grooving must be machined right and left hand beginning at the ends and grooving toward the center of the drum. Minimum drum groove depth must be 0.375 times the rope diameter. Minimum drum groove pitch must be either 1.14 times the rope diameter or the rope diameter plus 3 mm 1/8 inch, whichever is smaller. Minimum drum pitch diameter must be [16] [18] [20] [24] times the rope diameter. Do not paint, coat, or galvanize the surface of the drum which comes in contact with wire rope.

For wire rope drums installed directly onto the output shaft of the hoist speed reducer without an intermediate flexible coupling, the drum to shaft connection must be a barrel coupling.

2.3.7 Gearing

Provide gearing of the enclosed gear reducers type. Provide steel spur, helical, or herringbone type gears and pinions only. Gearing must conform to ANSI/AGMA 2001 and AGMA 908. Internal and external gear dimensional tolerances must conform to the applicable AGMA standard for tooth geometry and tolerances. Open-type gearing is not acceptable, except for final drives.

2.3.7.1 Gear Reducers

**************************************************************************
NOTE: For CMAA service class D, enclosed gearing must be selected for "Mill Duty" service.
For NAVFAC, CMAA service class C enclosed gearing must be selected for "Industrial Duty".
**************************************************************************

Gear reducers must be [integral components of standard hoists or hoist/trolley units of manufacturers regularly engaged in the design and manufacture of hoists or hoist/trolley units for Class A, B, or C cranes][standard items of manufacturers regularly engaged in the design and manufacture of gear reducers for Class D and E cranes]. Gear reducers must be designed, manufactured, and rated in accordance with ANSI/AGMA 6113 (ANSI/AGMA 6013) (for trolley drives only), as applicable. Except for final reduction, the gear reduction units must be fully enclosed in oil-tight housing. [Enclosed gearing must be selected for ["Industrial Duty"] ["Mill Duty"].] Gearing must be designed to AGMA standards and operate in an oil
bath. Operation must be smooth and quiet.

2.3.7.2 Open Gearing

Provide all gears and pinions with adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2015-1 Accuracy Grade A8 or better. Open gears must be enclosed with safety guards provided with openings with covers for inspection and access for grease lubrication.

2.3.8 Wheels

**************************************************************************
NOTE: For maximum anti-spark protection, add the tailored words. Remove any conflicting items (i.e. wheels cannot be non-sparking and steel). Remove the 320 BHN sentence since the wheels will not be steel.
**************************************************************************

Provide double flanged, straight tread trolley and bridge travel wheels of rolled-to-shape or roll-forged steel. Provide double flanged, straight tread trolley and bridge travel wheels of non-sparking materials with sufficient diameter and hardness to meet allowable wheel loads. The rim, flanges, and wheel tread must be hardened to not less than 320 Brinell Hardness Number (BHN). Wheel sizing and flange-to-rail head clearances must be in accordance with CMAA 70 recommendations.

2.3.9 Bridge and Trolley Travel Brakes

Provide bridge and trolley drives with electro-mechanical brakes or non-freecoasting mechanical drive capable of stopping the motion of the bridge or trolley within a distance in feet equal to 10 percent of the full load speed in feet per minute when traveling at full speed with a full load. The brakes must have a minimum torque rating per CMAA 70 according to the applicable environment, but not sized larger than 150 percent of the motor torque. Brakes must have an externally accessible means to manually release the brake. The brakes must be equipped with a manual self-return to ON brake release and designed to permit inspection and adjustment without disassembly of the brake.

2.3.10 Hoist Brakes

**************************************************************************
NOTE: Each hoist must have, at a minimum, two brakes. Two electro-mechanical brakes are recommended.
**************************************************************************

Consider the Controls section under ELECTRICAL REQUIREMENTS. If a variable frequency drive (VFD) is selected for use, the brake configuration must reflect the type of VFD selected (open loop vs closed loop).

If closed loop controls are selected, brake configuration must be two electro-mechanical/thruster type brakes.

If open loop controls are selected, brake configuration must be one...
electro-mechanical/thruster type brake and one mechanical load brake.

If not using a VFD, and electromatic controls are selected, the brake configuration can be the manufacturer's option as long as there are a minimum of two holding brakes provided.

Cranes with two electro-mechanical/thruster holding brakes must have a time delay between the setting of the primary and secondary brakes.

Service brakes which slow down and stop the load must be adjustable down to 50 percent of their torque rating. Holding brakes which hold the load after the variable frequency drive (VFD) slows down and stops the brake are not required to be adjustable.

Additional tailoring options are provided for NAVFAC cranes.

******************************************************************************

a. Equip hoist with a minimum of two holding brakes, each with a minimum torque rating of 125 percent of the rated load hoisting torque. Provide a brake configuration with [one electro-mechanical or thruster brake and one mechanical load brake that stops and holds 125 percent of the hoist's rated load and does not require the load to be raised before being lowered.] [two electro-mechanical or thruster brakes.][A mechanical load brake may be utilized in lieu of one of the hoist holding brakes provided it stops and holds 125 percent of the hoist's rated load and does not require the load to be raised before being lowered].

b. For cranes with two electro-mechanical or thruster brakes, designate each brake as primary or secondary with the primary brake being the brake mounted closer to the motor. Provide the primary brake with a non-time delayed setting and secondary brake with an adjustable setting time delay, set between one to three seconds after the primary brake in any stopping condition. Do not use an uninterruptible power supply (UPS) to create the secondary brake time delay.

c. Electro-mechanical or thruster brake [must be adjustable to 50 percent of its rated capacity, and ]must have an externally accessible means of manual release. On drives where the brakes are utilized as holding brakes only, torque adjustment is not required. The brakes must be equipped with a manual self-return to ON brake release and designed to permit inspection and adjustment without disassembly of the brake.

2.3.11 Couplings

******************************************************************************

NOTE: This section is tailored to NAVFAC.
******************************************************************************

Chain and continuous sleeve type couplings must not be used. Spline couplings are acceptable as installed on c, d, or p-face assemblies. Conventional couplings must not be loaded in the radial direction. Brake wheel or brake disc couplings (if used) must be compatible with the
required coupling type. Flexible couplings must not be relied upon to compensate for inaccurate alignment. Ends of coupled shafts must be aligned within the recommended installation criteria of the coupling manufacturer.

[2.3.12 Drip Pans

**************************************************************************

**NOTE:** Drip pans may be added for general purpose service or any other type of crane specialized service, if there is an additional requirement to prevent lubrication from falling to the floor or lifted load. Modify the section as needed to specific the desired drip pans.

**************************************************************************

a. The crane must be designed to preclude leakage of lubricants onto the lifted loads or the floor. Equipment or components, which cannot be made leak-proof, must be fitted with unpainted corrosion resistant steel drip pans or must have the foundations seal welded to create a dam. Drip pans that utilize liquid sealant to prevent leakage of lubricants are not permitted.

b. The drip pans must be sized to hold the entire gear case fluid capacity, installed under all drive machinery, designed to permit easy removal of collected lubricant. A trolley floor designed to contain any lubricant drips may be used as fluid containment for any equipment that is mounted on it.

c. Provide drip pans fitted around the shank of the hook and extending outward to encompass all possible points of lubrication drips from the load block or wire rope. The drip pans must be easily removable without disassembly of the hook or load block and cannot interfere with the crane structure during testing of the upper limits.

]2.4 ELECTRICAL REQUIREMENTS

2.4.1 Motors

**************************************************************************

**NOTE:** Inverter duty motors are required for open loop variable frequency drives (VFD). Vector duty motors are required for closed loop variable frequency drives (VFD).

Select two speed motors for bridge and trolley drives if magnetic controls are specified in paragraph CONTROLS; select single speed motors if electronic controls are specified in paragraph CONTROLS.

**************************************************************************

Motors must meet all applicable requirements of NEMA MG 1 and UL 1004-1. All motors must have a minimum of a 60 minute duty rating and be Totally Enclosed Non Ventilated (TENV), Totally Enclosed Fan Cooled (TEFC), or Totally Enclosed Blower Cooled (TEBC).[ Provide inverter duty motors for Open Loop Variable Frequency Drives (VFD).[ Provide vector duty motors for Closed Loop VFDs.][ Provide [two] [single] speed AC squirrel cage induction type motors for the bridge and trolley drives.][ Provide two speed, AC squirrel cage induction type motor for the hoist.] Provide
motors with a minimum of Class F insulation. Provide motor overload protection utilizing a thermal sensitive device embedded in its windings. Provide motors painted to manufacturer's standard for "wash-down" service. Motors located outdoors must be furnished with anti-condensation heaters that remain energized when the mainline contactor is deenergized.

2.4.2 Controls

NOTE: Use the first three paragraphs to select electronic variable frequency drive controls for either the hoist, bridge or trolley. With VFD controls the hoist can be configured as open loop or closed loop (flux vector). Open loop is more cost effective and requires a mechanical load brake while closed loop control offers better load control and requires hoist motors with encoders for position feedback. Ensure the Hoist Brakes section of this specification reflect the type of controls chosen. Use the fourth, fifth, and sixth paragraphs to select one or two speed control for the hoist, bridge, or trolley. Selections can be made using a combination of electronic controls and one or two speed motor controls for the various functions.

When the two-speed bridge and trolley motor is specified, the slow speed will be 1/3 to 1/4 of rated travel speed. Reduced voltage starting, acceleration, and deceleration, serve to reduce the acceleration rate that is normal for squirrel-cage motors. Squirrel-cage motors with two-speed magnetic controls provide satisfactory results with slow bridge and trolley speeds, and should be specified when short travel distances are involved and where fine positioning is not required.

For faster bridge and trolley speeds or finer positioning requirements, specify electronic controls.

Various VFD manufacturers offer an option to overspeed the hoist to a value over 60Hz (usually 120Hz). This allows the operator to position the hoist at faster speeds when it is not loaded. When selecting this feature list the maximum no load speed in section "Rated Capacity and Speeds".

[ a. Provide static reversing, variable frequency drives (VFD) for the [bridge,[ trolley] [and] [hoist] electric controls.[ Provide static reversing, VFD, speed regulated, closed loop, flux vector electric controls for the hoist[s]. For feedback, provide hoist motors with encoders. The hoist controller must enable the drive motor to develop full torque continuously at zero speed. The hoist secondary brake shall be controlled separate from the primary and connected to different output (within the drive) from the primary brake.] VFD controllers must meet NEMA ICS 8, Part 8 and at a minimum, provide under-voltage protection, electronic instantaneous over current protection, DC bus over voltage protection, and be able to withstand
output line to line shorts without component failure. Select bridge and trolley drives such that the continuous rating of the controller is not less than the calculated motor full load current based on CMAA 70 5.2.9.1.1.1 and NEC Table 430.250. Select hoist drives such that the continuous rating of the controller is not less than 130 percent of the calculated motor full load current based on CMAA 70 5.2.9.1.1.1 and NEC Table 430.250. All hoist drives must have a motor over-torque limit to lock out the hoist and prevent gross overload of the associated hoist. Provide dynamic braking for each electric drive that is sized per VFD manufacturer's requirements. Submit VFD Control Parameter Settings.

b. Provide speed control which is infinitely variable for each function, controlled via [radio control system][ and ][pendant pushbutton station][ and ][cab control station]. Provide controls designed such that the maximum speed of each function will be limited to 25 percent of rated speed when a slow speed switch is actuated on the controller[s]. Energize a yellow/amber light/indicator while in slow speed mode.

c. The hoist control system may utilize overspeed up to 120hz, unloaded only, if the drivetrain equipment has all been balanced and is rated for the resulting speed.

d. The [hoist][,] [trolley][,] and [bridge] brakes must set after the associated controller decelerates the drive motor to a controlled stop. The hoist, trolley, and bridge controllers must be sized to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 125 percent of rated load on the hook. The hoist controller must prove torque before release of the brakes and enable the drive motor to develop full torque continuously at zero speed. Motors must operate smoothly at all speeds without torque pulsations, and must only be energized within the frequency range of 50-60 Hz at rated speed.

e. Provide [one][two]-speed magnetic controls for the [bridge drive][,] [trolley drive][,][ and ][hoist] drive. Controllers must meet the requirements of NEMA ICS 8. Ensure that an energized drive motor initially rotates only in the direction selected by the operator by activating the corresponding direction; i.e., is not overhauled. For AC squirrel cage motor controllers, the requirements of NEMA ICS 2, Part 2, for general-purpose controllers, must be met.

f. Provide the bridge and trolley motor control systems with a drift point between OFF and the first speed control point in each direction.

g. The use of definite purpose contactors is prohibited. If IEC contactors are used, the application cannot exceed the contactor manufacturer's AC3 ratings for the contactor at a minimum.

h. On hoist function roll-up must be less than 1/8 inch measured at the hook block and roll-back must not occur over the entire load range.

i. Use of Uninterruptable Power Supplies (UPS) is prohibited. Feed control circuits from a single phase, air cooled, double wound transformer with a grounded metal screen between the primary and secondary windings of the transformer.

j. Provide a main line contactor. Energization of the main line contactor must be controlled by the POWER-OFF/POWER-ON switch/pushbutton on all
controllers. Upon actuation of the POWER-OFF pushbutton; power to all drive motors, brakes, and controls must be removed. The mainline contactor must not be able to be energize while the POWER-OFF pushbutton is actuated. The POWER-OFF pushbutton circuitry must be independent of all controls or any other electronic devices.

2.4.3 Protection

Protection must not be less than that required by NEMA ICS 8, CMAA 70, NFPA 70, UL 1004-1, UL 1449, UL 489, UL 50, UL 943, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306 and all applicable provisions of 29 CFR 1910. Provide enclosed type circuit breaker readily accessible to the crane operator for crane disconnect. Provide an On/Off button that removes power from the motors, brakes and control circuit on all operator control stations[ and ][ or ] [radio controllers]. Provide for lockout/tagout of all hazardous energy sources.

2.4.4 Resistors

Provide resistors with natural convection cooling sized as recommended by the VFD OEM and fabricated of corrosion resistant metal; the use of "wire wound" type resistors is prohibited for segments of 8 ohms or less. Mount resistors in substantial, ventilated enclosures constructed entirely of non-combustible materials. When mounted outdoors provide stainless steel resistor enclosures. Provide resistors with terminals fitted in the coolest position in the enclosure.

[2.4.5 Transients and Harmonics Protection

***********************************************************************
NOTE: The following items are required only for VFD Controls.
***********************************************************************

a. Provide contactors and relays with appropriate Metal Oxide Varistors (MOV) or resistor-capacitor (R-C) surge absorbers installed across the respective coil.

b. Provide transient protection for electronic drive controllers that is either internal to the drive or via an MOV connected line-to-ground close to the line terminals of the drive.

c. Provide line reactors rated for continuous duty operation based upon the motor nameplate amperes. With motors of 50 horsepower or greater, harmonics protection must be provided by an isolations transformer or as recommended by the VFD OEM. For a drive motor branch circuit that exceeds 150 feet in length, a reactor must also be connected in series with the controller load (output) terminals to provide standing wave protection or as otherwise recommended by the VFD or motor OEM.

]2.4.6 Limit Switches

a. Limit switches must be rated for the NEC Hazardous Classifications specified in the Classification section of this specification.

b. Provide primary upper and lower geared limit switches. Geared limits must allow reversing direction to back out of the limit without resetting. The lower limit switch must be set such that there are a minimum of two wraps of rope on the hoist drum.
c. Provide a backup mechanical hook block activated upper limit switch wired independent of the directional controllers and the primary upper limit switch that removes power from the hoist motor, hoist brake and hoist controls conforming to NEMA ICS 5. The backup limit must require hoist resetting prior to operation of the hoist in any direction.

[ d. Travel limit switches must be provided for the [bridge] and [trolley] motion to slow the crane to [25 percent] of its rated speed [10] feet before the bridge end stops and [5] feet from the trolley end stops. Limit switches must be mounted rigidly in a manner so as to protect the switch from misalignment or damage. The target/trip arm must be large enough to provide interception given a misalignment were to occur.

]2.4.7 Operator Controls

---------------------------------------------------------------
NOTE: Available operator controls are operator's cab, pendant, and radio control. Cranes can also be set-up to be controlled by two separate systems.
For cranes with one set of controls use paragraph 1. For cranes with two sets of controls use paragraph 2. In such a case some type of interlock must exist to prevent control from both systems simultaneously.

The pendant can be suspended from the trolley or an independent festooned messenger track system. The festooned system allows the operator to have maximum separation from the load. When this is a requirement include PENDANT CONDUCTOR SYSTEM section of this specification.

When specifying a radio control system, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANE CENINST 11450.2:
1. What type of batteries? Rechargeable?
2. Are spare batteries needed? How many?
3. Are spare remote control units required? How many?
4. Is a battery charger required?
5. Type of transmitter unit.
6. Is a belt/harness required for the remote control?

When specifying a cab operated crane, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANE CENINST 11450.2:
1. Where would the user like the operator controls/indicators to be located (master switches, push buttons, key switches, lights)? See paragraphs LEFT-HAND OPERATOR CONTROL PANEL and RIGHT-HAND OPERATOR CONTROL PANEL under CAB CONTROL STATION.
2. Specific details on controllers can be listed.

---------------------------------------------------------------
[a. Provide crane equipped with a [pendant pushbutton station] [cab control station] [radio control system].

][b. Provide crane equipped with both a [pendant pushbutton station] [cab control station] [radio control system] (see paragraph PENDANT PUSHBUTTON STATION) and a [pendant pushbutton station] [cab control station] [radio control system] (see paragraph RADIO CONTROL SYSTEM). Provide a selector switch to allow the use of only one of the two available control stations [in the operator's cab] [on the pendant controller].

c. If VFD controls are not provided, provide directional contactors with both mechanical and electrical interlocks.

d. Operator controls must be rated for the NEC Hazardous Classifications specified in the Classification section of this specification.

[2.4.7.1 Pendant Pushbutton Station

**************************************************************************

NOTE: Pendants can be suspended from either the trolley or an independent conductor system that is independent of the trolley (recommended). If cost is a concern and maximum separation of the operator from the load is not a requirement, suspending the pendant from the trolley is the best option. Otherwise specify a pendant conductor system by including paragraph PENDANT CONDUCTOR SYSTEM and suspending the pendant from "an independent festooned messenger track system."

**************************************************************************

The cranes must be controlled from a pendant pushbutton station suspended from [the trolley] [an independent festooned messenger track system, operating the length of the bridge]. Provide multiconductor flexible cords for pendant pushbutton stations with No. 16 AWG minimum conductors. Provide a method of strain relief to protect the electrical conductors from damage. Locate the pendant pushbutton station [1200 mm 4 feet] [_____] above the finished floor. Pushbutton pendant station must have its elements legibly marked and arranged vertically, in order, in accordance with CMMA 70.[ Provide [one speed] [two speed] [3-step infinitely variable] [2-step infinitely variable] pendant pushbuttons for control of the [hoist] [bridge] [and] [trolley].] Provide pendant pushbuttons for control that spring return to the OFF position. Voltage in the pendant pushbutton station must not exceed 150 Volts AC or 300 Volts DC.[ Provide a maintained two-position selector switch for slow speed selection.] The pendant must be rated for the NEC Hazardous Classifications specified in the Crane Design Criteria "Classification" Section.

[2.4.7.1.1 Pendant Conductor System

Provide a festoon type pendant conductor system. The festoon cables must be flat cables suspended from carriers riding on an I-beam or C-track. The pendant controller must be capable of traveling the entire length of the bridge and move independently of the trolley. Festoon loops must not extend below the high hook position.
]][2.4.7.2  Radio Control System

Provide each system with a [belly box] [handheld] [_____] type portable transmitter unit [and an identical back-up transmitter unit].[ Provide each transmitter with an adjustable belt or harness to support it when worn by the operator]. Only one transmitter at a time can control the crane and there must be no interference from one crane's controller affecting operation of the other cranes in the building. Each transmitter must include: individual [infinitely variable spring return joystick motion control levers] [push button controls] for each hoist, trolley, and bridge; a maintained contact, keyed switch, marked ON-OFF, for portable transmitter unit power; indication of Battery Power, and indication of Transmitting Status; a red emergency STOP mushroom pushbutton; [and ]a floodlight on/off pushbutton[ and a maintained slow speed selector switch]. The transmitters and all controls must each be clearly and permanently labeled with functionality and direction. Directions for controllers must be in accordance with CMAA 70 recommendations. The remote radio control system must be designed to meet the requirements of NEMA ICS 8, Part 9 and ECMA 15. Each radio remote control lever must be in the OFF position before the associated crane function can begin. The system frequency must be within the unlicensed FCC Part 15 range. Each control unit must maintain a continuous status signal to the associated receiver during operation. There must be no significant loss in systems efficiency and function at the end of eight hours of continuous battery use. Provide a contact monitoring board with the crane radio system receiver.

][2.4.7.3  Cab Control Station

All crane motions/functions must be able to be controlled from an integral operator's control chair.[ Provide three master switches integrated into the chair, two on the left side and one on the right side.][ All master switches must be of the single axis type operating in the forward/reverse direction.][ Provide all master switches with infinitely variable speed control to the particular function.] Directional contacts must be utilized to ensure proper motions are executed. Provide all master switches with a detent neutral position. All master switch operating handles must be in the OFF position before any initial crane function can begin. Provide all master switches with dead man controls. All controllers must be clearly and permanently labeled for proper function and direction. Provide pushbuttons that are guarded to prevent accidental activation, except for the STOP/POWER OFF pushbutton.[ Directions for controller movement must be in the general direction of movement of load and in accordance with CMAA 70 recommendations. The two left side master switches must control the bridge function (outermost stick) and the trolley function (innermost stick). The right master switch must control the Main hoist.]

][2.4.7.3.1  Left-Hand Operator Control Panel

Identified as follows:

NAMEPLATE: Description - Function.

a.  POWER ON:  Blue momentary pushbutton – Energizes the mainline contactor as long as all joysticks are in the OFF position.

b.  POWER OFF:  Push-pull type, red mushroom head pushbutton – Emergency Stop / De-energizes the mainline contactor.
2.4.7.3.2 Right-Hand Operator Control Panel

Identified as follows:

NAMEPLATE (SECOND LINE OF NAMEPLATE): Description – Function.

   a. SPEED RANGE (MICRO – NORMAL): Two-position selector switch – Toggles between the micro and normal drive operations.

   b. HORN: Black momentary pushbutton – Sounds the warning horn mounted outside of the operator's cab.

   c. FLOODLIGHTS: Two-position selector switch – Toggles the floodlights On/Off.

]]2.4.8 Electrification Systems

**************************************************************************
NOTE: Various methods may be used to transfer power from the runway to the crane (Runway Conductor System) and then again to the trolley (Bridge Conductor system). Typically, the Runway Conductor System is a set of conductor bars on the runway and collector shoes on the crane. Bridge Conductor system is typically a set of festoon cables.

Site conditions and environment might require the design to deviate from the norm. Hazardous locations will need to be designed with either a cable reel or festoon system.
**************************************************************************

2.4.8.1 Runway Conductor System

[ a. Provide a rigid runway Conductor Bar System for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. UV resistant. Steel (non-stainless) conductor bars are prohibited. The crane must be grounded through the runway electrification system. The grounded conductors must be a minimum of 70 square millimeters. Provide runway conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. If there is any way the hook block or wire rope can swing into the runway electrification, provide a guard installed to prevent contact.

   b. Provide two Collector Shoes (tandem design) for each conductor; each collector shoe must be rated for not less than the overcurrent protective device for the runway conductor system, so as to provide redundancy.

][c. Provide a Festoon System for the runway conductor system utilizing cables suspended from carriers riding on an I-beam or C-track for the crane, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. Conductors must be fabricated from copper. The crane is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG. Provide conductors sized for
simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][d. Provide a Cable Reel System for the runway conductor system, including all necessary cables and hardware to connect the cable reel to the floor level fused disconnect switch. The cable reel must have three power conductors and an equipment grounding conductor. The crane is required to be grounded through this conductor system. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The grounded conductors must be a minimum of 2/0 AWG.

][e. Provide a totally enclosed flexible cable tray electrification system (cable chain) for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. The cable chain must have three power conductors and an equipment grounding conductor. The conductors must be selected so as to be of the longest length without splices. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The crane is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG.

2.4.8.2 Bridge Conductor System

[a. Provide Festoon System for the bridge conductor system utilizing cables suspended from carriers riding on an I-beam or C-track. Conductors must be fabricated from copper. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][b. Provide a Cable Reel System for the bridge conductor system. The cable reel must have three power conductors, an equipment grounding conductor, and all necessary control cables. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley must be grounded through the cable reel connection and all conductors must be of copper construction. The grounded conductors must be a minimum of 2/0 AWG.

][c. Provide a totally enclosed flexible cable tray electrification system (cable chain) for the bridge conductor system. The cable chain must have three power conductors, an equipment grounding conductor, and all necessary control cables. The conductors must be selected so as to be of the longest length without splices and must be copper. A minimum of 20 percent of the control circuit conductors in the flexible cable tray system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG.

2.4.9 Capacity Overload Protective Device [and Load Indicating Device]

******************************************************************************
NOTE: Overload protection on a crane is required and is provided by two types of systems: Capacity
Overload Protection and Over-Torque Limit.

The Over-Torque Limit only applies to cranes with VFD controls. It is a parameter setting in the drive and is typically set at 150 percent. Cranes with magnetic controls do not have this feature. Delete third paragraph if VFD controls are not specified.

Capacity Overload Protection is usually adjustable. If adjustable, it needs to be set at less than the crane's minimum test load. This protection can take the form of one of the following devices:
1. Clutch – Not adjustable and is common on package hoists.
2. Load Limit Switch – Installed on the wire rope and measures deflection. Does not require a break in the wire rope and is simply clamped onto the wire. Typically used on smaller hoists that have magnetic controls.
3. VFD Drive Overload Protection – Similar to the Over-Torque Limit, but is set at a lower setting. Adjusted via parameters within the drive.
4. Separate Load Indicating Device – This involves the installation of a load cell and a digital readout that displays weight. The load cell is usually bolted onto the end of the wire rope or is installed as a pin in one of the sheaves.

a. Provide a capacity overload protective device for all hoist systems [using VFD drive capacity overload protection (separate from torque limiting feature of the VFD)] [using the load indicating device (LID) described in the next paragraph]. Set hoist capacity overload protection at [______]. Hoist capacity overload protection must be adjustable between 80 and 150 percent of hoist capacity. Provide a keyed override or other means to disable the hoist capacity overload protection when performing a load test.[ If a non-adjustable slip clutch is utilized, the OEM factory setting is acceptable and must be identified.]

[ b. Provide an LID for the [main] [ and ] [auxiliary] hoist[s].[ Provide [a display] [displays] installed on the underside of the bridge of each crane to provide load information from the load indicating system, to be displayed in kilograms pounds, for [both] the [main][ and ] [auxiliary] hoist[s].][ Provide [a display] [displays] installed in the cab of each crane to provide alarm circuits and continual load readout information from the load indicating system, to be displayed in kilograms pounds, for [both] the [main][ and ] [auxiliary] hoist[s].] The display[s] must be large enough so that the operator can read the load value[s] [from the ground level] [while seated in the operator's cab]. The load indicating system capacity is to be compatible with the maximum test load for each hoist. The accuracy of the load indicating system is to be such that the indicated load is not less than 100 percent of the actual load, and not more than 110 percent of the actual load. The load indicating system must be configured with a set point for an overload limit. Provide Tare (zero) functionality at each operator's station for [the] [each] load indicating system. Any load bearing components used in the LID system must be steel, have a minimum
design factor of 5 to 1 based on ultimate tensile strength and a hardness not to exceed HRC 40. Precipitation hardened stainless steel load bearing elements must be aged hardened at a minimum temperature of 1025 degrees F.

][c. Initially, set the torque limiting capability of the VFD (that is separate from the capacity overload protective device) to 150 percent of the motor torque (amperage) necessary to hoist 100 percent load. It may be adjusted up only to avoid nuisance trips and adjusted down if possible while still avoiding nuisance trips.

]2.4.10 Enclosures

**************************************************************************

NOTE: Select classification of control panels, controls, and brakes based on the environmental conditions in which the crane will be installed:
1. Choose one of the following for an indoor installation: 1, 2, or 12.
2. Choose one of the following for an outdoor installation: 3, 4X, or 8.
3. Choose one of the following for a Class I Hazardous installation: 7 (indoor) or 8 (indoor/outdoor).
4. Choose one of the following for a Class II Hazardous installation: 9 (indoor).

Other enclosure types exist that might be a better alternative for a particular installation. If necessary, refer to NEMA 250.
**************************************************************************

a. Provide enclosures for control panels, controls, and brakes in accordance with NEMA 250 and NEMA ICS 6, Classification Type [1 indoor, general purpose] [12 indoor without knockouts, general purpose] [2 indoor, drip-proof] [3 outdoor, dust-tight, rain-tight, sleet-resistant] [4X outdoor] [7 indoor Class I hazardous] [9 indoor Class II hazardous] [8 indoor/outdoor Class I hazardous][____]. Provide enclosures with listed drains to prevent accumulation of water within the enclosure. There must not be any condensation inside the control panels. If anti-condensation heaters are provided, these heaters must remain energized when the main line contactor is deenergized.

b. Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.

c. Gaskets of enclosures and fixtures, and joints and contact surfaces of hazardous/explosive enclosures must be kept free of any paint to prevent damage during removal and reinstallation of gaskets of enclosures.

[2.4.11 Warning Devices

**************************************************************************

NOTE: A warning horn or light is required for all radio controlled cranes and recommended for all others.

SECTION 41 22 13.14 Page 44
[Provide a warning horn that is operable from a push button at the [pendant pushbutton] [radio control] station.][ Provide a warning [strobe] [rotating beacon] that is illuminated at all times during movement of the hoist, trolley, or bridge function.]

[2.4.12  Floodlights[ and Walkway Illumination]

**************************************************************************
NOTE: Outdoor cranes require exterior footwalks, ladders, and stairs to be illuminated to 5 foot-candles.
**************************************************************************

Provide evenly spaced floodlights along the bridge. Select floodlights to provide an illumination level of 40 foot-candles at three feet above the finished floor. All lights must be vibration resistant and designed to prevent any material from falling from the fixture. Switch the floodlights from the [pendant pushbutton] [radio controlled] station.

[ Exterior] footwalks, ladders and stairs must be illuminated to 5 foot-candles.

[2.4.13  Indicator Lights

Provide Indicator Lights mounted in an enclosure on the bottom of the bridge with lights sized and positioned to be visible from the ground. The lights must be the dual-lamp type. Provide a white light to indicate that power is available on the load side of the crane disconnect and a blue light to indicate that the main contactor is energized. Light voltage must be 115 VAC. Provide nameplates that are legible from ground level. The nameplates must read, in their respective order, "POWER AVAILABLE" and "CRANE ENERGIZED". The POWER AVAILABLE light must be supplied by a separate, fused transformer for its energization.

[2.4.14  Wind Speed Indicating System

Provide a wind speed indicating device. The transmitter must be mounted on the highest unobstructed location.

[2.4.15  Electrical Outlets

Provide a minimum of [one] [_____] 120 VAC duplex outlet[s] on the crane, mounted [on] [in] the [outside of the control panel(s)] [trolley] [cab] [______]. The circuit(s) supplying receptacles must incorporate ground-fault circuit-interrupter protection for personnel and be protected by a circuit breaker with a minimum rating of [15] [20] amps.

[2.4.16  Cyber Security of Control Systems

**************************************************************************
NOTE: Cyber Security of Control Systems requirements are tailored to NAVFAC.
**************************************************************************

**************************************************************************
NOTE: SECNAVINST 5400.15 designates NAVFAC as the functional technical authority for WHE. NAVFAC is
designated as Functional Security Control Assessor (FSCA) and the Functional Authorizing Official (FAO) for Ashore Control Systems in their domain; therefore, this includes WHE control systems. WHE control system owners are responsible for the Information System Security Engineer (ISSE) functions and producing artifacts (documentation) for review by the FSCA and FAO.

All new and electrically overhauled cranes shall implement the following cybersecurity requirements as applicable to the control system architecture (i.e., networked drives, non-networked drives, and any wireless applications) so that supporting artifacts and considerations are available for the implementation of the RMF process.

*************************************************************************

a. Provide the following for PLC, RTU, Supervisory Controller, or other network-capable (whether networked or not upon delivery) control devices as applicable:

   (1) Hardware list (Hardware list must include the following for each device):
       (a) Manufacturer
       (b) Model
       (c) Location
       (d) Key technical ratings (e.g. memory)
       (e) Serial number
       (f) MAC addresses
       (g) IP addresses

   (2) Software List (Software list must include the following for each device):
       (a) Manufacturer
       (b) Version/subversion
       (c) Location/device
       (d) Used network ports/protocols/services

   (3) List and discussion of all security features of Contractor hardware and software.

b. For every PLC, RTU, Supervisory Controller, or other network-capable control devices (whether networked or not upon delivery), deliver the following on CD/DVD:

   (1) Original firmware
   (2) Original firmware hash
   (3) SOP for application of firmware updates/patches
   (4) POC or website for firmware updates/patches
   (5) Count of interfaces and types
   (6) Protocols in use, per interface
   (7) Configuration file
   (8) SOP for configuration

2.4.16.1 Control System and Network

*************************************************************************

NOTE: Select options a. & b. if a standalone laptop
[ a. Provide a rugged laptop type workstation (computer) complete with all compatible software (including software licenses), redundant physical back-up copies on CD/DVD of the installed software, and all necessary cables and special connectors to allow crane software to be troubleshoot, checked and upgraded, and for the data recorder to be accessed and information retrieved. Equip the workstation with a CD/DVD drive and the associated CD/DVD burning software. The workstation must also be equipped with USB ports (2.0 and 3.0), an Ethernet port, and a serial port. Delivering the software on a USB (flash drive) device is prohibited.

b. The laptops must be designed for an industrial environment and must be shock resistant and weatherproof as a minimum. Provide the laptop with a built-in CD/DVD reader with the capability to burn CDs and DVDs including associated software to burn CDs and DVDs.

c. The Contractor must provide all equipment, including software and hardware, necessary for testing, installation, and communicating/troubleshooting all systems provided with the crane (e.g. engine/generator, control system, LID, etc.). The Contractor must provide all crane specific operational software files (e.g. ladder logic, functional block programming, etc.) for their associated systems (e.g. control systems, LID, engine generator, etc.).

d. A single common networked design must not be used for the control systems. A network for an individual function may be used as long as a failure of the network does not affect any other function/network except as defined for specific safety interlocks (e.g. LMI system). A common crane network may be used in a monitoring mode for recording faults and trending and is encouraged. Failure of the monitoring system must not affect crane functions.

e. All provided hardware and software must be currently marketed products, not currently scheduled for end of life or obsolescence, to ensure system sustainability.

f. Ensure there is no remote access capability enabled as remote access capabilities are prohibited. Physically disable or remove all modem/network devices not required for operational purposes.

2.4.16.2 Software and Services

a. Remove all Software and Services not required for operation and/or maintenance of the product. If removal is not technically feasible, then disable software not required for the operation and/or maintenance of the product. Configure the product to allow the ability to re-enable ports and/or services if they are disabled by software. The removal of software or services may not impede the primary function of the product. If software that is not required cannot be removed or disabled, document a specific explanation and provide risk mitigating recommendations and/or specific technical justification. The software/service to be removed and/or disabled includes, but is not limited to:

(1) Cameras
(2) Games

(3) Device drivers for product components not procured/delivered

(4) Messaging services (e.g., email, instant messenger, peer-to-peer file sharing)

(5) Source code

(6) Software compilers in user workstations and servers

(7) Software compilers for programming languages that are not used in the control system

(8) Unused networking and communications protocols

(9) Unused administrative utilities, diagnostics, network management, and system management functions

(10) Backups of files, databases, and programs used only during system development

(11) All unused data and configuration files

(12) Remove and/or disable, through software, physical disconnection, or engineered barriers, all services and/or ports in the procured product not required for normal operation, emergency operations, or troubleshooting. This includes communication ports and physical input/output ports (e.g., USB docking ports, video ports, and serial ports).

b. Provide documentation showing all disabled ports, connectors, and interfaces for all network-capable devices. In addition, the documentation shall provide summary documentation of the procured product's security features and security-focused instructions on product maintenance, support, and reconfiguration of default settings.

c. For the evaluation status of hardware and software, the Contractor must provide information on Common Criteria or National Information Assurance Partnership (NIAP) or Federal Information Processing Standards (FIPS) evaluation status of hardware and software.

2.4.16.3 Access Control

a. The Contractor must configure each component of the procured product to operate using the principle of least privilege. This includes operating system permissions, file access, user accounts, application-to-application communications, and energy delivery system services.

b. Provide user accounts with configurable access and permissions associated with one or more organizationally defined user role(s), where roles are used.

c. Provide a system administration mechanism for changing user(s') role (e.g., group) associations.

d. The Contractor must document control system access control options by defining access and security permissions, user accounts, and
applications with associated roles.

e. Provide recommended methods for the Acquirer to prevent unauthorized changes to the Basic Input/Output System (BIOS) and other firmware. If it is not technically feasible to protect the BIOS to reduce the risk of unauthorized changes, the Contractor must document this case and provide mitigation recommendations.

2.4.16.4 Control System Account Management

The Contractor must document all accounts (including, but not limited to, generic and/or default) that need to be active for proper operation of the procured product.

Remove or disable any accounts that are not needed for normal or maintenance operations, emergency, or troubleshooting of the energy delivery system.

2.4.16.5 Session Management

The Contractor may not allow multiple concurrent logins using the same authentication credentials, allow applications to retain login information between sessions, provide any auto-fill functionality during login, or allow anonymous logins.

Provide account-based and group-based configurable session-based logout and timeout settings (e.g., alarms and human-machine interfaces).

2.4.16.6 Authentication/Password Policy and Management

Provide a configurable account password management system that allows for, but is not limited to, the following:

a. Changes to passwords (including default passwords)

b. Selection of password length

c. Frequency of change

d. Setting of required password complexity

e. Number of login attempts prior to lockout

f. Inactive session logout

g. Screen lock by application

h. Comparison to a library of forbidden strings

i. Derivative use of the user name

j. Denial of repeated or recycled use of the same password

The Contractor must time stamp log files.

2.4.16.7 Logging and Auditing

Provide logging capabilities that cover the following events, at a minimum (as appropriate to their function):
a. Information requests and server responses
b. Successful and unsuccessful authentication and access attempts
c. Account changes
d. Privileged use
e. Application start-up and shutdown
f. Application failures
g. Major application configuration changes

2.4.16.8 Heartbeat Signals

The Contractor must identify heartbeat signals or protocols and recommend which should be included in network monitoring. At a minimum, a last gasp report from a dying component or equivalent shall be included in network monitoring.

The Supplier must provide packet definitions of the heartbeat signals and examples of the heartbeat traffic if the signals are included in network monitoring.

2.4.16.9 Patch Management and Updates

The Contractor must verify that procured products (including third-party hardware, software, firmware, and services) have appropriate updates and patches installed prior to delivery.

Provide documentation of the patch management program and update process (including third-party hardware, software, and firmware). This documentation must include resources and technical capabilities to sustain this program and process. Provide the Contractor's method or a recommendation for how the integrity of the patch is validated by the Acquirer as well as the Supplier's approach and capability to remediate newly reported zero-day vulnerabilities.

2.4.16.10 Malware Detection and Protection

a. The Contractor is required to implement at least one of the following:

   (1) Provide a host-based malware detection capability that quarantines (instead of automatically deleting) suspected infected files. Provide an updating scheme for malware signatures. The Contractor must test and confirm compatibility of malware detection application patches and upgrades.

   (2) If the Contractor is not providing the host-based malware detection capability, the Contractor must suggest malware detection products to be used and provide guidance on malware detection and configuration settings that will work with Contractor products.

b. The Contractor must validate that cybersecurity services running on the procured product (e.g., virus checking and malware detection) do not conflict with other such services running on the procured product.
c. For malware detection and protection, the Contractor must provide, or specify how to implement, the capability to automatically scan any removable media that is introduced to the product being acquired.

2.4.16.11 Physical Security

Provide lockable or locking enclosures or rooms for energy delivery systems and system components (e.g., servers, clients, and networking hardware) and for the systems used to manage and control physical access (e.g., servers, lock controllers, and alarm control panels). Provide a method for tamper detection on lockable or locking enclosures. If a physical security and monitoring system is used, tamper detection must be compatible. The Contractor must ensure that physical security features do not hamper the crane system operations. Provide the tools and instructions for making changes to locks, locking codes, keycards, and any other keyed entrances.

2.4.16.12 Wireless Technology

For wireless technology provisions, the Contractor must document:

a. Specific protocols and other detailed information required for wireless devices to communicate with the control network, including other wireless equipment that can communicate with the Contractor-supplied devices.

b. Use, capabilities, and limits for the wireless devices.

c. Power and frequency requirements of the wireless devices (e.g., microwave devices meet the frequency requirements of Generic Requirements [GR]-63 Network Equipment Building System [NEBS] and GR-1089).

d. Range of the wireless devices and verify that the range of communications is minimized to both meet the needs of the Acquirer's proposed deployment and reduce the possibility of signal interception from outside the designated security perimeter.

e. Wireless technology and associated devices compliance with standard operational and security requirements specified in applicable wireless standard(s) or specification(s) (e.g., applicable IEEE standards, such as 802.11).

f. Configuration control options that enable varying of the security level of the devices.

2.4.16.13 Control System Inventory

Provide the complete control system inventory. The Control System Inventory must include the following attributes, in tabular format, as applicable:
2.5 PAINTING SYSTEM

**************************************************************************
NOTE: Three-coat zinc primer/epoxy/polyurethane system is provided for mild to severe atmospheric, indoor and outdoor cranes. For cranes in abnormal environments including exposure to chemicals or in immersion service, a system designed for that environment should be used. Other systems may suffice for milder environments.
**************************************************************************

a. Remove all grease, oil, and surface debris by solvent wiping or detergent/water scrubbing, prior to blast cleaning. Prepare surfaces to be coated by abrasive blasting to SSPC SP 6/NACE No.3, Commercial Blast Cleaning, or in accordance with the coating manufacturer's requirements, whichever is more stringent.

b. Use a painting system appropriate for the conditions provided in the Crane Design Criteria section. Paint exposed portions of the crane using a [three] [_____]-coat system as follows: [zinc-rich primer consisting of a minimum of 85 percent zinc by weight in the dry film, an anticorrosive epoxy intermediate coat, and an aliphatic polyurethane top coat] [______]. All paint products must be supplied by a single manufacturer and free of chromates, lead, and mercury. Apply each coat
in accordance with manufacturer's instructions and requirements. Ensure each coat is smooth, even, and free of runs, sags, orange peel, and other defects. Desired color of finish coat is [brilliant yellow] [____]. Submit product data for painting system.

c. Coat faying surfaces of bolted connections per RCSC A348, but do not apply finish paint.

d. Paint the load block [brilliant yellow] [____] with black diagonal striping. Paint, coatings, or galvanizing on the following items or areas is not acceptable: hoist wire ropes, hooks, hook nuts, running bearing surfaces (including sheaves and wheel treads), grease fittings, or other items not normally painted.

e. Factory paint electrical and mechanical equipment in accordance with the manufacturer's best standard practice (for the specified environment), except that electrical equipment doors, which expose current-carrying electrical conductors when opened, must be orange.

2.6 IDENTIFICATION PLATES

Furnish and install identification plates. Provide non-corrosive metal identification plates with clearly legible permanent lettering giving the manufacturer's name, model number, serial number, capacity in both kilogram and pound units printed in different colors, and other essential information or identification.

2.6.1 Markings on Crane, Trolley, and Hook

To avoid operation of the crane in the wrong direction, affix the appropriate directions (NORTH, SOUTH, EAST, and WEST) with arrows on the bottom of the girder where they can be easily seen by the operator and from the loading point. Provide labels on the controls with corresponding directional (NORTH, SOUTH, EAST, and WEST) markings. Markings shall agree with the markings on controller. Do not indicate directional arrows on controller.

Mark the hook rated capacity in kilograms pounds on both sides of the hoist load block.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

3.2 SHOP ASSEMBLY AND TESTS

Shop assemble major components as completely as possible, except for reeving of drums and sheaves. Functionally test the crane system at the construction facility prior to shipment. The Government reserves the right to inspect the crane for compliance with this specification and to witness the functionality tests. Notify the Contracting Officer [14] [____] days
prior to starting testing operations.

3.3 ERECTION AND INSTALLATION

Perform the entire crane erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's representative.

3.3.1 Mechanical Alignment

Align motors, couplings, brakes, gear boxes and drive components in accordance with manufacturer's instructions. Complete the Coupling Alignment Verification Record.

3.3.2 Electrical Adjustments

Adjust control system in accordance with manufacturer's instructions. Store a copy of all Control Parameter Settings (PLC, VFD). Provide the final alignment data on the Complete Schematic Wiring Diagram, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents. Provide the test conditions such as ambient temperature, motor load, date performed and person performing the alignment as part of the Operational Tests report.

3.3.3 Field Welding

Perform welding indoors, where possible. Surface of parts to be welded must be free from rust, scale, paint, grease or other foreign matter. Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M. Perform welding of girders and beams conforming to AWS D14.1/D14.1M.

3.3.4 Field Painting

Perform painting indoors, where possible. Field painting (including touch-up) must conform to the requirements of the coating manufacturer and as specified in PAINTING SYSTEM.

3.4 FIELD QUALITY CONTROL

3.4.1 Post-Erection Inspection

[After erection, the Contractor[, the Activity Crane Inspector/Test Director,] and the Contracting Officer must jointly inspect the crane bridge and hoist systems and components to determine compliance with specifications and approved submittals. Notify the Contracting Officer [_____] days before the inspection. ]Provide a report of the inspection indicating the crane is considered ready for operational tests.

3.4.2 Operational Tests

**************************************************************************
NOTE: Determine if Government furnished certified test weights are available at the site. If not they must be provided by the Contractor.
**************************************************************************

Check the clearance envelope of the entire crane prior to picking or
traversing any load to ensure there are no obstructions. Test the systems in service to determine that each component of the system operates as specified, is properly installed and adjusted, and is free from defects in material, manufacture, installation, and workmanship. Rectify all deficiencies disclosed by testing and retest the system or component to prove the crane is operational. The Contractor must furnish test weights, operating personnel, instruments, and other apparatus necessary to conduct field tests on each crane. Solid weights must be measured using calibrated equipment traceable to National Institute of Standards and Technology (NIST) with a minimum accuracy of plus or minus two percent.

3.4.2.1 No-Load Test

Raise and lower each hook through the full range of normal travel at rated speed for three complete cycles. Raise and lower each hook, testing other speeds of the crane. Verify proper operation of hoist limit switches. Operate the bridge and trolley in each direction the full distance between end stops. Operate through the entire speed range and verify proper brake operation. Verify correct operation of all indication and ancillary devices.

3.4.3 Test Data

Record test data on appropriate test record forms suitable for retention for the life of the crane. Record operating and startup current measurements for hoist, trolley, and bridge motors using appropriate instrumentation (i.e., clamp-on ammeters). Compare recorded values with design specifications or manufacturer's recommended values; abnormal differences (i.e., greater than 10 percent from manufacturer's or design values) must be justified or appropriate adjustments performed. In addition, note, investigate, and correct any high temperatures or abnormal operation of any equipment or machinery. Record hoist, trolley, and bridge speeds during each test cycle.

3.4.4 Hook Tram Measurement

Establish a throat dimension base measurement by installing two tram points and measuring the distance between these tram points (plus or minus 0.4 mm 1/64 inch). Record this base dimension. Measure the distance between tram points before and after load test. An increase in the throat opening from the base measurement is cause for rejection.

3.4.5 Load Tests

**************************************************************************
NOTE: The following paragraph contains NAVY Tailoring. The NAVY requires a load test of 125 percent (plus 0 minus 5) of the rated load.
**************************************************************************

Perform the following tests for each hoist, as specified below.

Test loads used in this section are defined as the following:

Wire rope run-in load: 25 - 50 percent of rated load.

Rated load test: [100 percent (plus 0 minus 10)] [100 percent (plus [_____] minus [_____]]) of rated load.
Overload test: \[125 \text{ percent (plus 0 minus 5)}\] \[125 \text{ percent (plus 0 minus 5)}\] of rated load.

3.4.5.1 Wire Rope Run-In

The primary purpose of this procedure is to exercise the newly installed wire rope.

Place the load on the hook. Start at ground level and hoist up to one foot below upper limit at slow speed. Hoist down to lower limit at slow speed. Repeat hoisting and lowering of the load for approximately 10 hoisting cycles, increasing the speed for each cycle. During this test, the capacity overload lockout should not activate.

3.4.5.2 Rated Load Test

3.4.5.2.1 Hoist

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees to check bearing operation with no binding. Observe lowering that may occur which indicates a weakness in the structure or malfunction of hoisting components or brakes. Verify that maximum beam and girder deflections do not exceed CMAA 70 design limits.

For hoists with primary and secondary holding brakes, raise the test load and release the secondary holding brake while testing the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage secondary holding brake and release the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage the primary holding brake. Recheck proper operation of time delay and ensure smooth positive stopping.

b. Hoist Mechanical Load Brake (if present): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

c. Raise and lower test load through the full lift range and visually observe smooth control and acceleration between points. Completely stop the machinery at least once in each direction to ensure proper brake operation.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.2.2 Trolley

Operate the trolley (if space is available) the full distance of the bridge rails in each direction with a test load on the hook. Check proper
functioning through the range of speeds. Verify proper brake action.

3.4.5.2.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway (if space is available) in one direction with the trolley at the far end of the bridge, and in the opposite direction with the trolley at the opposite end of the bridge. Use extreme caution. Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

3.4.5.2.4 Trolley Loss of Power Test

With a test load of 100 percent of rated load, raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of trolley travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the trolley stops and that the brake sets properly. Measure the distance required for the trolley to stop.

3.4.5.2.5 Bridge Loss of Power Test

With a test load of 100 percent of rated load, raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of bridge travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the bridge stops and that the brake sets properly. Measure the distance required for the bridge to stop.

3.4.5.3 Overload Test

3.4.5.3.1 Hoist

Disconnect or adjust the overload limit device to allow the hoist to lift the test load. Verify proper operation of the overload limit device after it is reconnected.

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees to check bearing operation with no binding. Observe lowering that may occur which indicates a weakness in the structure or malfunction of hoisting components or brakes.

For hoists with primary and secondary holding brakes, raise the test load and release the secondary holding brake while testing the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage secondary holding brake and release the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage the primary holding brake. Recheck proper operation of time delay and ensure smooth positive stopping.
b. Raise and lower test load and visually observe smooth control. Stop the load during raising and lowering to verify that the brakes hold the load.

c. Hoist Load Brake (if present): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.3.2 Trolley

Operate the trolley the full distance of the bridge rails in each direction with a test load on the hook (one cycle) through the range of speeds. Verify proper brake action.

3.4.5.3.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway in one direction with the trolley at the extreme end of the bridge, and in the opposite direction with the trolley at the opposite extreme end of the bridge (one cycle). Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on-site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [two] [_____] hard copies of operation and [two] [_____] hard copies of maintenance manuals for the equipment furnished along with an electronic copy (PDF) of each on a Compact Disc. Provide one complete set prior to performance testing and final copies upon acceptance. Provide operation manuals that detail the step-by-step procedures required for system startup, operation and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, including weekly, monthly, semi-annual, and annual required maintenance items, possible breakdowns and repairs, and troubleshooting guides. Also include as-built drawings, piping and equipment layout, design calculations, Control Parameter Settings and printouts of any software, and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course.
[3.7 FIELD TRAINING

**************************************************************************
NOTE: Training is recommended, but not required.
**************************************************************************
Conduct a training course for [_____] operating and maintenance staff[ and provide a copy of the training material to each participant]. Provide a training period consisting of a total of [_____] hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and [____].

][3.8 FINAL ACCEPTANCE

**************************************************************************
NOTE: Use this paragraph as written for projects where the crane is the principal construction element, or represents a very significant portion of the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.
**************************************************************************

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on wire rope, hook, and electrical collector bars.

-- End of Section Table of Contents --
NOTE: This guide specification covers requirements for top running and under running single girder electric traveling (OET) cranes with under running trolleys and hoists, Crane Manufacturers Association of America (CMAA) 74 Class A, B, C and D suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments. Crane capacities less than 23 metric ton (25 ton) 23,000 kg 50,000 pounds. For NAVY, crane capacities in this specification should be limited to 9,100 kg 20,000 pounds for administrative purposes.

Single girder under running crane configuration is not recommended for spans greater than 12 meters 40 feet or capacities greater than 9,100 kg 20,000 pounds. Utilize multiple single girder spans or see Section 41 22 13.14 BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING for top running double girder configurations more appropriate at longer spans and higher capacities. Contact Navy Crane Center for more information (Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000).

This guide specification incorporates the design criteria and requirements identified in NAVCRANECEINSTRUCTION 11450.2A (December 2018).

This guide specification includes tailoring options for NAVFAC, pounds (per NAVFAC P-307), and tons. The NAVFAC tailoring option also includes requirements specific to the Navy and Marine Corps. Crane procurements for the Navy and Marine Corps must select the NAVFAC tailoring option.

Crane tailoring options are included for the Air Force, outdoor, ordnance/explosives handling, or hazardous (explosive) environments. Only one unique
specialized application tailoring option should be selected at a time, however multiple can be used with additional specific project editing in the resulting sections. "General Purpose Service" is the default crane condition unless an alternate specialized tailoring option is selected. When "Maximum Anti-Spark" protection is required, the "Minimum Anti-Spark" tailoring option MUST ALSO be selected as the maximum requirements are in addition to the minimum requirements.

Selection or deselection of a tailoring option (select view-tailoring options) will include or exclude that option in the section. Specific project editing is still required for the resulting section.

**************************************************************************
NOTE: Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************
NOTE: Use this guide specification to specify cranes that are procured as part of a building construction contract for such applications as machine shops, warehouses, and other areas that do require specialized weight handling equipment.

Explanations of CMAA service classifications A through D are covered in the "Notes" portion of paragraph CRANE DESIGN CRITERIA, sub-paragraph CLASSIFICATION. The minimum allowable classification for Ordnance/Explosive Handling is CMAA service class D. Navy Crane Center minimum requirement is CMAA service class C.

Forward all procurement of OET systems at Naval Shore based activities with rated capacities of 9000 kg 20,000 pounds or greater or for use in specialized applications (e.g., ordnance handling, molten metal handling, special purpose service as defined in NAVSEA Publication 0989-030-7000, hazardous/explosive area environments, or precision
handling operations requiring complex or
synchronized lifting capacity) to: Naval Facilities
Engineering Systems Command, Navy Crane Center,
Building 491, Norfolk Naval Shipyard, Portsmouth,
Va., 23709-5000.  (See NAVCRANECEINSTRUCTION
11450.1C of 11 JULY 2019).

******************************************************************************
******************************************************************************
NOTE: This specification covers cranes with top running or under running bridge and under running trolley and hoist, single girder, with CMAA 74 service class of A through D.

Control types and systems may be specified as follows:

1. Remote or Pendant Crane Controls or a combination of the two can be provided.

2. Alternating current (AC) control systems must be specified. The vast majority of new cranes are AC powered and AC controlled.

******************************************************************************
******************************************************************************
NOTE: The RFP must provide the relevant dimensions and load data for the crane. See "Crane Inquiry Data Sheet" in CMAA 74 section 6.1 or see "Crane Information Form for Under running Cranes(s)" pages 5 and 6 at the following Navy Crane Center link:

https://ncc.navfac.navy.mil/Popular-Links/DOWNLOADS/

Projects that are routed through Navy Crane Center should be accompanied by a completed Crane Information Form (CIF) per the above link.

******************************************************************************
******************************************************************************
NOTE: Show the following information, as a minimum, on the project drawings:

1. Complete details of plan, elevations, and sections of crane.

2. Runway track system (if installed), including span and size of girder, runway rail size, channel cap size, size and location of crane stops, and building clearances.

3. Electrical junction box location (including mounting height).

*******************************************************************************
PART 1  GENERAL

1.1  REFERENCES

**************************************************************************
NOTE:  This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

a. Crane Bridge: That part of an overhead crane system consisting of a girder, end trucks, walkway, and drive mechanism which carries the trolley(s) and travels along the runway rails parallel to the runway.

b. Crane Runway: The track system along which the crane operates horizontally, including track hangar rods, track connection devices, and runway structural supports.

c. Dead Loads: The weight of all effective parts of the bridge structure, the machinery parts, and the fixed equipment supported by the structure.

d. Crane Bridge Girder: The principal horizontal beam of the crane bridge structure. It is supported by the crane end trucks. Typically for single girder cranes the trolley mounted hoist is suspended from the girder below the crane. For double girder cranes, the trolley is typically run on top of the bridge girder and the hoist is mounted on top of the trolley.

e. Insulated Link: A component normally installed between the hook and the lifting wire rope or lower load block, or below the hook to prevent the flow of electrical energy. Insulated links are primarily used when there is the possibility radio frequency energy collecting on the weight handling equipment structure. Insulated links are used extensively in the handling of ordnance.

f. Lifted Load: The load consisting of the rated load and the weight of lifting devices attached to the crane such as the load block, bucket, or other supplemental devices.

g. Original Equipment Manufacturer (OEM): the Company that produced the part or original equipment.

h. Packaged Hoist: A commercially designed and mass produced hoist characterized by the motor, gearing, brake(s), and drum contained in a single package often connected by the use of c, d, or p-face flanges.

i. Patented Track: A generic term referring to track built in accordance with MHI MH27.1 utilizing a composite track section incorporating a proprietary bottom flange shape. For this crane system, it is provided for the crane bridge girder and also the crane runway track, if under running.

j. Pendant: A control for a hoist and a crane. The pendant hangs from the hoist or the crane by a cable at a height that is easy for the operator to reach.

k. Rated Load: The maximum working load suspended under the load hook.

l. Standard Commercial Cataloged Product: A product which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this
section is defined as "appearing on the manufacturer's published product data sheets. These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

m. Top Running Crane: An overhead electric traveling crane that is supported by end trucks which run on top of supporting rails.

n. Trolley Load: The weight of the trolley and its associated equipment carried by the trolley wheels.

o. Under running (Underhung) Crane: An electric overhead traveling crane that is supported by crane end trucks suspended below the crane runway. The load is supported by hanging from the lower flange of a beam or patented track.

1.3 SYSTEM DESCRIPTION

******************************************************************************
NOTE: Remove the following sentence if the runway rail is not to be installed as a part of the crane procurement. If rail is to be installed, ensure Section 05 12 00 STRUCTURAL STEEL is included in the Request for Proposal (RFP).

Top running runway beam and runway crane rail are typically provided by the facility. Under running runway rail is typically provided by the crane contractor. See also CRANE BRIDGE GIRDER.
******************************************************************************

[ The requirements for the structures supporting the crane runway are specified in Section 05 12 00 STRUCTURAL STEEL, and must conform to AISC 360. ]

}1.3.1 Crane Design Criteria

******************************************************************************
NOTE: Cranes installed outside the United States are still required to meet the features and characteristics specified.

When necessary, the design may be able to use the host nation's consensus standards in lieu of US standards. An equivalency study may be requested from the contractor to justify use of the international standard.
******************************************************************************

******************************************************************************
NOTE: Clearly show the area of hook coverage, runway dimensions, rail size, hook vertical travel, clear hook height, and lifting capacity on drawings.
******************************************************************************

Cranes will operate in the given spaces and match the runway dimensions and rails indicated. Hook coverage, hook lift, clearances, lifting capacity, and load test weight must not be less than that indicated. Provide loaded hook coverage to the maximum extent possible.
1.3.1.1 General

**************************************************************************
NOTE: For NAVY, crane capacity should be limited to 9,100 kg 20,000 pounds, since Navy Crane Center is required to be contacted for cranes with higher capacities.
**************************************************************************

**************************************************************************
NOTE: Add number of cranes, building name, bay, and crane rated load capacity in metric tons tons.
**************************************************************************

**************************************************************************
NOTE: For NAVFAC projects, capacity markings MUST be expressed in pounds unless the crane is located in Europe or Asia.
**************************************************************************

Include the following: Number of cranes [____], located in building identified as [____], [bay [____],] with the capacity expressed in [____] metric tons tons, for each crane. Also clearly locate and identify each hoist and system components.

1.3.1.2 Classification

**************************************************************************
NOTE: The need for single or double girder design is influenced by the capacity, span, and runway type.
**************************************************************************

For under running bridge girders (with runway suspended from the facility ceiling):
1. Recommend a single bridge girder for total spans less than 12 meters 40 feet.
   a. If the total span is more than 12 meters 40 feet recommend two or more bridge girder spans of equal length.

2. For total spans more than 12 meters 40 feet or capacity more than 9,100 kg 20,000 pounds, an alternative option is two separate bridge girders for use with an underhung trolley/hoist.
   a. Double girder designs are unique for this type of application and are not covered under this specification.

For top running bridge girders:
Recommend a single bridge girder for total spans less than 12 meters 40 feet for use with an underhung trolley/hoist. Multiple bridge girder spans is not an option for top running girders.
   a. For total spans more than 12 meters 40 feet or capacity more than 9,100 kg 20,000 pounds, recommend two separate bridge girders for use with a top running trolley/hoist. For this configuration, see Section 41 22 13.14 BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING.
**************************************************************************
NOTE: For NAVFAC, specify CMAA service class C or higher. For Ordnance/Explosives Handling, specify CMAA service class D.

NOTE: Make a selection from the following CMAA 74 service classifications:

Class A (Standby or Infrequent Service): This service covers cranes which may be used in installations such as powerhouses, public utilities, turbine rooms, motor rooms and transformer stations where precise handling of equipment at slow speeds with long, idle periods between lifts are required. Capacity loads may be handled for initial installation of equipment and for infrequent maintenance.

Class B (Light Service): This service covers cranes which may be used in repair shops, light assembly operations, service buildings, and light warehousing, where service requirements are light and the speed is slow. Loads may vary from no load to occasional full rated loads with 2 to 5 lifts per hour, averaging 3 m 10 feet per lift.

Class C (Moderate Service): This service covers cranes which may be used in moderate service requirements such as machine shops of paper mill machine rooms. In this type of service, the crane will handle loads which average 50 percent of the rated capacity with 5 to 10 lifts per hour, averaging 4.5 m 15 feet, not over 50 percent of the lift at rated capacity.

Class D (Heavy-Duty): This service covers cranes which may be used in heavy machine shop, foundries, fabricating plants, steel warehouses, container yards, or lumber mills and standard duty bucket and magnet operations where heavy-duty production is required. In this type of service, loads approaching 50 percent of the rated capacity will be handled constantly during the working period. High speeds are desirable for this type of service with 10 to 20 lifts per hour averaging 4.5 m 15 feet, not over 65 percent of the lifts at rated capacity. This service is the minimum requirement for Ordnance/Explosive Handling.

NOTE: Operating Environments

(1) General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as
General Purpose Service if they are operating in routine environments.

(2) Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Minimum requirement of CMMA service class D.

(3) Hazardous (Explosive) Environments: Locations where fire or explosion hazards may exist due to flammable gases, flammable liquid-produced vapors, combustible liquid-produced vapors, combustible dusts, or ignitable fibers/flyings. Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NFPA 70 Article 500. The activity safety office must identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

(a) Minimum Anti-Spark Protection is used when only the load block and pendant enter the explosive area. Anti-spark protection is required for the pendant controller, hook, hook block, and wire rope.

(b) Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane. In addition to the minimum anti-spark protections, the entire crane and runway components must also be protected against sparking.

**************************************************************************
**************************************************************************
NOTE: Hazardous Area Environments

Refer to NFPA 70 National Electric Code (NEC), Article 500 for hazardous area environment requirements and classifications. The determination(s) for hazardous area are made by the facility or project. Some, but not all, of the options are:
Class I, Division 1 or 2, and Group A, B, C, or D.
Class II, Division 1 or 2, and Group E, F, or G.
Class III, Division 1 or 2.

Class I: a location where explosive gases, vapors, or liquids are present.
Class II: a location where explosive or combustible dust is present.
Class III: a location where combustible fibers or flyings are present.
Division I: a location where the hazardous material
is present continuously, long term, or frequently.  
Division II: a location where the hazardous material is not likely to be present or is present only in the short term.  
Groups A, B, C, and D: a location where the hazardous material is a specific gas, liquid, or vapor.  
Groups E, F, and G: a location where the hazardous material is specific dust, fiber, or flyings.

The height of the hazardous area directly affects crane requirements. For areas that encompass the floor and immediate area above the floor, the minimum anti-spark provisions for crane components entering the hazardous area are sufficient (anti-spark measures for the hook, load block, wire rope, and pendant). Minimum anti-spark protection is far more common than maximum anti-spark protection.

For hazardous areas that cover the entire crane envelope (i.e., bridge and trolley), the "maximum hazardous" tailoring option must be selected. This tailoring option adds anti-spark measures for the entire crane, such as electrical enclosures and wheels.

**************************************************************************
NOTE: The bracketed option for separate runways is necessary if ensuring more than one crane is not installed on the same runway for contracts with multiple cranes in the same building, bay, or location.
**************************************************************************

Provide [under running] [top running] single girder electric bridge crane(s), with under running trolley mounted hoist, conforming to MHI MH27.1, CMAA 70, and CMAA 74 service class [C] [D] [A] [B], as applicable. The crane(s) must be designed for operation in an [indoor] [outdoor] environment, [general purpose] [ordnance handling] [hazardous area] service, meeting the requirements of ASME B30.16 and ASME B30.17, with an ambient temperature range of [_____] to [_____] degrees Celsius Fahrenheit. The crane(s) must operate in an NFPA 70 Class [I] [II] [____], Division [2] [1] [____], Group [D] [_____] hazardous area. Hazardous protection is required from the finished floor level up to [1.5 meters 5 feet above ground level] [0.5 meters 1.5 feet above ground level] [full height of the crane] [_____] meters feet above ground level]. The total crane span must be [_____] meters feet with a minimum vertical hook lift of [_____] meters feet and as specified herein. Provide runways for multiple span cranes equally spaced apart.[ Provide separate runways for each crane.]

The crane must be [pendant controlled] [radio controlled] and operate in the spaces and within the loading conditions indicated. Provide a crane, including hooks and hoisting rope or load chain, that is able to clear permanent obstructions in all operating configurations. [The pendant controller must be mounted on a separate festooned cable system from the trolley power supply.] The crane must operate on [_____]-volts AC, [60 Hz] [____], [three] [single] phase power source. Maximum loading on the
facility (without impact) due to dead loads, trolley loads, and lifted loads, with the trolley in any position, must not exceed the allowable wheel loading and wheel spacing of the facility (or not exceed maximum hanger loading for under running cranes).

1.3.1.3 Rated Speeds

******************************************************************************

NOTE: Slow full-load operating speeds invariably provide improved load control and increased productivity.
******************************************************************************

******************************************************************************

NOTE: Specify the maximum rated speed under full load for the main hoist, bridge, and trolley.

1. Hoist speeds must conform to the recommendations of CMAA 74 or ASME tables. Trolley travel speed must conform to the recommendations of CMAA 74. A table of suggested hoisting and travel speeds can be found at the end of section 6 in CMAA 74.

2. Bridge travel speed must not exceed the maximum speed that the floor walking, crane pendant control operator can comfortably negotiate in a work area, approximately 750 mm/s 150 ft/min, and as recommended in CMAA 74.
******************************************************************************

******************************************************************************

NOTE: Recommend "Medium" rated speeds, where appropriate. Another consideration for operating speeds is the distance travelled per minute (e.g., 20 ft hook lift height corresponds to hook lift speed of 20 fpm). Consider limiting bridge or trolley travel speeds when operation occurs over shorter distances (e.g., for a 50 ft runway, a bridge travel speed of 50 fpm may be more appropriate than the 115 fpm "medium" speed).

Most projects will have a minimum and maximum speed entered. The speeds can be the same whether using two speed motors with magnetic controls or variable frequency drive controls.

Single speed motors will be selected if electronic controls are specified in paragraph CONTROLS. For 1-speed motors, only enter a maximum operating speed.

Two speed motors will be selected if magnetic controls are specified in paragraph CONTROLS. For 2-speed motors, recommend selecting a minimum speed that is 1/4 to 1/3 the maximum speed. Common maximum speed selections:

Wire Rope Hoists IAW ASME HST-4 (fpm): 15, 20, 30, 40
Chain Hoists IAW ASME HST-1 (fpm): 8, 15, 30
Trolley (fpm): 30, 50, 75, 100, 125
Bridge (fpm): 50, 75, 100, 150, 175
Cranes using variable frequency drive controls are more flexible regarding speed selection than magnetic contactor controls.

Provide the crane with rated (maximum) speeds within plus or minus 10 percent (in meters/second feet/min) for the main hoist, bridge, and trolley at the rated load as specified in the table below. The minimum speed must not exceed the values listed.

<table>
<thead>
<tr>
<th>Description</th>
<th>Minimum</th>
<th>Maximum</th>

</tbody>
</table>

The hook lift capacity and speed must be the manufacturer's standard within the limits specified.

[1.3.1.4 Foreign Design Standards and Practices]

- Foreign design standards and engineering practices are acceptable, provided they are accompanied by satisfactory explanation and are shown to meet corresponding U.S. standards and practices, as approved by Navy Crane Center. Design calculations and drawings that use foreign language and nomenclature must be provided with corresponding English equivalents. Metric units may be used for both calculations and shop drawings, but they must include conversions to English units. In the case of calculations, only the initial inputs and final results need to be so converted. Professional training and accreditation of foreign engineers may vary in some aspects from those in the U.S., but they are satisfactory if comparable for the design work in which they engage. Mechanical properties and quality standards of common construction materials of foreign sources supplied in accordance with recognized standards that resemble those of ASTM and other U.S. standards are acceptable, as approved by Navy Crane Center. Typically, foreign welding procedures, materials, standards, and welder qualifications are comparable to those of AWS and are therefore acceptable. Provide all necessary certifications and other data for review and approval prior to start of work. Special attention must be given to ensure the weld sizes are being specified and measured uniformly. Unique constructions and metric sizes not complying with FS RR-W-410, the Wire Rope Users.
Manual, or ASTM A1023/A1023M, may be used on Navy cranes, subject to Navy Crane Center review and approval of the specific applications. In selecting metric wire ropes for installation on new cranes with sheave and hoist drum grooves configured for a specific US wire rope size, the metric diameter must be within the limits of the wire ropes for which the sheave and drum are grooved. When the wire rope is installed on an older crane with sheave and hoist drum grooves configured for a specific U.S. produced wire rope size, the sheave and hoist drum grooving must be considered to ensure a satisfactory match with the wire rope. The capacities or ratings of components produced in foreign countries in compliance with foreign standards, and their installation requirements, must be converted to the English engineering units and verified for specification compliance.

b. Some components from foreign sources are prohibited due to practical considerations - either susceptibility to counterfeiting or maintenance and timely support. Specific examples are:

(1) High-Strength Structural Bolts and Nuts. The use of structural bolts from foreign manufacturers is allowed provided the bolts meet Research Council on Structural Connections (RCSC) Specification for Structural Joints Using High-Strength Bolts (RCSC A348).

(2) Electronic controls of foreign manufacturers are prohibited unless technical support is available in the U.S.

1.4 VERIFICATION OF DIMENSIONS

The Contractor is responsible for the coordination and proper relation of their work to the building structure and to the work of all trades. Coordinate with the crane support structure design, where applicable, to provide the desired crane operating envelope (i.e., hook envelope and hook height). Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

1.5 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office.
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Manufacturer Qualification

Overhead Electric Crane System, including sub-system components manufactured by vendors, must be designed by, or directly supervised by, a registered professional engineer (PE). PE licensing must be by a board or agency authorized to license and register professional engineers. The PE may be a Contractor's regular employee or a consultant. The PE's review and attestation of specification compliance and professional responsibility must be signified by their PE original seal and dated signature on the final drawings. The professional engineers must only undertake and perform work under this contract in the branch(s) of engineering in which they are licensed.

1.6.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing, and documentation.

[1.6.2.1 Hook Proof Test]

**************************************************************************

NOTE: Hook proof tests are required by the NAVY for custom designed or non-ferrous (bronze or stainless steel) hooks. Bronze/stainless steel hooks are generally associated with minimum hazardous area requirements. Hook material selected in LOAD BLOCK AND HOOK.

Outside of hazardous area anti-spark protection, this section will likely not be required for the NAVY. The hooks are required to be standard commercial components (i.e., not custom designed and manufactured).

**************************************************************************

Proof test custom designed or non-ferrous load hooks per ASME B30.10. Perform the proof test prior to Hook NDT.
1.6.2.2 Inspection of Hook Assembly

**************************************************************************

NOTE: For NAVY, carbon steel hooks require magnetic-particle type inspections and non-ferrous hooks (typically anti-spark hooks for hazardous areas) require liquid penetrant type inspection.

NAVY acceptance criterion is no linear indications greater than 1.5 mm 1/16 inch. General recommendation is that linear indications greater than 1.5 mm 1/16 inch not be allowed.

Use of X-ray and ultrasonic inspection is not required for NAVY cranes.

**************************************************************************

Inspect hook [by a magnetic particle type inspection] [by liquid penetrant type inspection] [and X-rayed] [and tested ultrasonically] prior to delivery. Furnish documentation of hook inspection to Contracting Officer prior to field operational testing.

Acceptance standard is no defects. A defect is defined as a linear indication for which the largest dimension is greater than [1.5 mm 1/16 inch] [3 mm 1/8 inch] [_____] long. Welding repairs of hooks are not permitted. A hook showing linear indications, damage, or deformation is not acceptable.

[1.6.2.2.1 Hook Non-Destructive Test (NDT)]

**************************************************************************

NOTE: This section is required for NAVY cranes.

Remove this section if the selecting agency does not require hook non-destructive testing or the necessary non-destructive testing is not IAW NAVY requirements.

For NAVFAC, add tailored paragraphs with additional requirements.

**************************************************************************

For hooks of ferromagnetic materials, magnetic-particle inspect the hook over the entire area in accordance with NAVSEA T9074-AS-GIB-010/271 or ASTM A275/A275M. For hooks of non-magnetic material, NDT must be liquid penetrant (PT) method in accordance with ASTM E1417/E1417M or NAVSEA T9074-AS-GIB-010/271. For PT testing of hooks containing stainless steels, titanium, or nickel based alloys, total halogens and Sulphur used in the NDT process must be controlled as specified in NAVSEA T9074-AS-GIB-010/271.

Inspect each hook and shank over the entire surface area. If NDT cannot be performed on surfaces inside small holes (e.g., hook/nut captivation roll pin holes), visually inspect those surfaces to the maximum extent practical.

a. Procedure for magnetic particle inspection: Conduct magnetic particle inspection in accordance with NAVSEA T9074-AS-GIB-010/271. ASTM A275/A275M may be used with the following restrictions: Do not
use DC yokes (including switchable AC/DC yokes used in the DC mode) or permanent magnet yokes. Do not use automatic powder blowers or any other form of forced air other than from a hand-held bulb for the application or removal of dry magnetic particles. Remove arc strikes. Equipment ammeters must have an accuracy of plus or minus 5 percent of full scale (equipment ammeter accuracy other than that stated is acceptable provided the MT procedure states that a magnetic field indicator is used to establish and verify adequate field strength for all aspects of the inspection.)

b. Acceptance Criteria: Defects found on the hook will result in rejection of defective items for use on furnished hoist.

c. Test Report: Submit a test report of the inspection of each hook to the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The NDT procedures including technique sheets specific to the types, shapes, and size of the parts being examined must adequately describe the orientation of the hooks within the magnetizing equipment, as applicable. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheets, and certification to the Contracting Officer with the test report.

][1.6.2.3 Insulated Link Non-Destructive Test (NDT)

**************************************************************************
NOTE: Insulated link non-destructive test is required when an integral insulated lifting link is installed as selected in the LOAD BLOCK AND HOOK section. The insulating link is typically associated with OUTDOOR ordnance handling cranes. Insulated links integrated with the load block is uncommon, even for ordnance handling cranes.
**************************************************************************

Disassemble the link and connecting stud(s) in conjunction with disassembly of the hook and nut. Perform a visual inspection of the metal link ends for thread damage, wear, and corrosion. Apply a temporary sealing tape over the threaded holes to prevent moisture entry into the link while the link is disassembled. Perform a magnetic particle inspection of the stud in accordance with ASTM A275/A275M or NAVSEA T9074-AS-GIB-010/271. Acceptance criterion is no linear indications greater than 1.5 mm 1/16 inch.

Test Report: Submit a test report of the inspection to the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The NDT procedures including technique sheets specific to the types, shapes, and size of the parts being examined must adequately describe the orientation of the hooks within the magnetizing equipment, as applicable. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheets, and certification to the Contracting Officer with the
1.6.3 Drawings: Overhead Electric Crane System

a. Submit drawings showing the general arrangement of all components in plan, elevation, and end views to demonstrate proper interface with the facility and relation to other cranes on the same rail system, if applicable. Show all major features of the crane including: hook approaches on all four sides, clearances and principal dimensions, hoist, trolley and bridge drives, motor nameplate data, overcurrent protective device ratings, and electrical schematic drawings. Include weights and centers of gravity of major components (e.g., bridge girder(s), trolley/hoist). Indicate on the drawings the wind speed above which the crane must be placed in the stowed position.

b. Submit shop drawings of all fabricated components. Shop drawing quality must be equivalent to the contract drawings accompanying this solicitation. Drawings must be reviewed, signed and sealed by a licensed professional engineer.

c. Provide Bill of Materials for crane components on each drawing. The schedule must provide a cross reference between manufacturer data and shop drawings. Components listed on the schedule of crane components must include total quantity, description, original manufacturer, and part number. Distributing agents will not be acceptable in lieu of the original manufacturer.

d. Provide control system and network drawings. Network diagram must show equipment locations, names, models, and IP addresses on network communications schematic for all Programmable Logic Controllers (PLCs), Remote Terminal Unit (RTU), Supervisory Controller, and Other Network-Capable Devices. In addition, the drawings must consist of all software block, flow, and ladder diagrams.

1.6.4 Design Data: Load and Sizing Calculations

**************************************************************************
NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys. Coordinate seismic analysis requirement with paragraph SEISMIC FORCES.
**************************************************************************

Submit complete list of equipment and materials, including manufacturer's descriptive data, technical literature, and performance charts and curves. Submit calculations reviewed, signed, and sealed by a registered professional engineer verifying the load cases, sizing of the bridge girder(s), end trucks, travel drives, motors, overcurrent protection, and conduit. Provide a list of all codes and standards, design assumptions, equations, specified efficiencies, limits, factors of safety, component ratings, and sources of values used. Include free body diagrams or sketches of each load case. Ensure the crane is designed for the operating wind load case in accordance with CMAA 74 or MHI MH27.1, as appropriate. Determine the wind forces that will cause the outdoor crane to move in a parked condition with the brakes provided. [Include seismic analysis of crane.]
1.6.5 Certificates

All certifications must be dated and bear the original signature (above the printed name) of the authorized representative of the Contractor or the manufacturer of the items or equipment being certified. Submit certifications that clearly identify the crane, the drives, components, and location (as applicable) to which it applies:

[ a. **Wire Rope** Certification with either the wire rope manufacturer's certification that the rope meets the published breaking force, or certification of the actual breaking force of a sample taken from the reel and tested. Show the published breaking force on the wire rope certificate; the actual wire rope breaking force must meet or exceed the published value. Certification must be traceable to the hoist, crane, and reel.

**************************************************************************

**NOTE:** A solid non-sparking wire rope (e.g., stainless steel) is the preference for hazardous areas.

Include the requirement for end user notification if the crane operates in a Division 2 hazardous area (per CLASSIFICATION) and drawn galvanized wire rope is allowed per HOISTING ROPE.

**************************************************************************

[ (1) **Drawn Galvanized Wire Rope End User Notification** from the crane, hoist, or wire rope OEM notifying the end user that the crane is operated in a Division 2 hazardous area as defined by NFPA 70, which is a location where the hazardous material is not likely to be present or is present only in the short term. The wire rope is made of drawn galvanized steel, meaning it is manufactured from sparking materials but provided with a spark resistant outer layer. The outer layer or individual wire strands could become compromised if the wire rope is used in an improper manner or inadequately maintained, which would affect the integrity of the spark-resistant protection. In this scenario, immediate replacement is recommended. The wire rope will need to be evaluated and potentially replaced with a compliant configuration if the hazardous area Division is changed.

]]a. **Load Chain** Certification from either the load chain manufacturer or the hoist manufacturer that the chain samples taken and tested meet the chain manufacturer's designed minimum breaking force, and the load chain has been proof tested with a load at least equivalent to one and a half times the hoist rated load divided by the number of chain parts supporting the load. Certification must be traceable to the crane and hoist.

**************************************************************************

**NOTE:** Insulated link mechanical and electrical proof test certifications are required when an integral insulated lifting link is installed as selected in the LOAD BLOCK AND HOOK section. The insulating link is typically associated with OUTDOOR ordnance handling cranes. Insulated links integrated with the load block are uncommon, even for ordnance handling cranes. Commands typically
prefer to use insulated links in below the hook lifting devices (e.g., rigging gear).

b. Insulated Link Mechanical Proof Test Certification from the insulating lifting link OEM showing that the insulated link was mechanically proof tested in accordance with ASTM F2973.

c. Insulated Link Electrical Proof Test Certification from the insulating lifting link OEM showing that the insulated link was electrically proof tested in accordance with ASTM F2973.

b. Crane Runway Certificate stating that the new crane will operate properly on the runway. For runways provided by Contractor, include statement certifying runway has been aligned in accordance with CMAA 74 or MHI MH27.1, as applicable.

c. Hazardous Material Certificate that the crane does not contain hazardous material including asbestos, lead, cadmium, chromium, PCBs, or elemental mercury. Products required for the designing and manufacturing of cranes must not contain the prohibited materials.

d. Loss of Power Test Certificate stating that a test may be performed in which power is removed during operation without any detrimental effects to the crane.

NOTE: For NAVFAC, the Overload Test Certificate must state that the cranes can be periodically load tested to 125 percent (plus 0 minus 5 percent).
Remove the conflicting Overload Test Certificate which allows for testing at different tolerances.

e. Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus 0 minus 5 percent) of rated load.

Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus [0] [_____] minus [5] [_____] percent) of rated load.

f. Certificate of the Brake Adjustment Record. Provide a brake adjustment record and installation/maintenance manuals for each brake on the crane. Each brake measurement must have a tolerance traceable to the associated brake manual or documentation provided by the brake manufacturer, location of measurements, and the actual brake setting. Changes made to settings of the brake, at any time, will void the record.

g. Contractor Hazardous Environment Certificate stating that the new crane and all associated components including the hoist are designed for operation in the hazardous environment specified in the paragraph CLASSIFICATION.

h. Public Domain Software Certificate declaring that public domain software (e.g., freeware, shareware) is not used in the system.

i. Certificate stating that all Software and Services that are not required for operation and/or maintenance of the product have been removed. The software/services to be removed are identified in
1.6.6  Welding Qualifications and Procedure

Welding must be in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep and not exceed those specified in AWS D14.1/D14.1M, MHI MH27.1 and CMAA 74. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M.

1.7  CRANE SAFETY

[1.7.1 Nuclear Safety Analysis]

**************************************************************************
NOTE: Certification is required for cranes handling nuclear materials. Results from the Safety Analysis will be utilized by the Using Agency as a basis for bridge crane certification. Delete this paragraph if the crane is not required to handle nuclear materials.

This paragraph is not applicable to NAVFAC projects. The Navy Crane Center must be involved with the procurement and overhaul of all NAVY cranes that handle Nuclear material as identified in the forward notes section of this specification.
**************************************************************************

Nuclear certification, testing, and rules of construction must be in accordance with 29 CFR 1910.147 and ASME NUM-1. Air Force Nuclear certified hoists must meet requirements of AFMAN 91-118. Submit analysis and test reports to Contracting Officer for approval.

]PART 2   PRODUCTS

2.1  MATERIALS

2.1.1  General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment. Material will be free from defects and imperfections that might affect the serviceability and appearance of the finished product. All material must be new and unused.

2.1.2  Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two bridge identification plates, one for each side of the bridge. Provide noncorrosive metal identification plates with
letters which are easily read from the floor, showing a separate number such as BC-1, BC-2, for each bridge crane.

2.1.3 Capacity Marking

**************************************************************************
NOTE: NAVFAC requires markings to be indicated in pound units. The kilogram marking option is provided for cranes installed in a foreign country.
**************************************************************************

Mark the rated capacity in pound units [with kilogram units printed in a different color] on each side of the crane on the bridge girder. Capacity marks must be large enough to be clearly visible from the floor. Individual hoist units must have their rated capacity clearly marked on their lower block, and additionally labeled on the hoist body.

2.1.4 Safety Warnings

Affix labels in a readable position to each lift block or control station in accordance with ASME B30.16 and ASME B30.17. Submit safety warnings, diagrams and other instructions suitably framed and protected for display as indicated by the Contracting Officer as follows:

Design and locate the word "WARNING" or other legend to bring the label to the attention of the operator. Provide durable type warning labels and display the following information concerning safe-operating procedures:
Cautionary language against lifting more than the rated load; operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; operating damaged or malfunctioning hoist; operating a rope hoist with a rope that is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

2.2 STRUCTURAL REQUIREMENTS

Structural requirements must be in accordance with CMAA 74 and MHI MH27.1, as applicable. Structural steel materials must conform to the standards permitted in CMAA 74, MHI MH27.1, and AISC 360. Skewing and other applicable lateral loads must be considered in the design.

2.2.1 Structural Connections

High-strength bolted structural connections must be designed and installed in accordance with RCSC A348. Bolts must be of ASTM F3125/F3125M Grade A325/A325M or Grade A490/A490M material. Galvanized bolts are not acceptable.

Welded connections for the crane must be performed in accordance with AWS D14.1/D14.1M. Welded connections to the building must be performed in accordance with AWS D1.1/D1.1M. Allowable stress values must comply with CMAA 74 or MHI MH27.1, as applicable.

2.2.2 Crane Bridge Girder

**************************************************************************
NOTE: Ordnance handling cranes must run on patented track. Tailor requirement to ordnance handling. Remove conflicting or redundant track options.
a. Provide crane bridge girder(s) of [rolled steel shape conforming to CMAA 74] [or] [patented track conforming to MHI MH27.1]. For ordnance handling cranes, provide crane bridge girders of patented track. Intermittent ("skip") welds on bridge girder elements (e.g., web and flange interfaces) are prohibited. If the girder is notched to fit over the end trucks, reinforce the girder ends with vertical and horizontal stiffeners. Splices in the unsupported length of the girder are prohibited.

b. For patented track girder(s), submit manufacturer's standard published tables that verify the crane bridge girder is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the bridge. Patented track girder must be of welded steel construction and fabricated by a manufacturer regularly engaged in the production of this type of beam.

c. Keep splices in the bridge girder(s) to a minimum and splices in high stress locations must be avoided. Make splices with complete joint penetration welds. Field (on-site) welded splices are prohibited.

2.2.3 Bridge End Trucks

NOTE: For cranes in hazardous areas which encompass the entire crane envelope, the drop lugs pose a sparking risk if it is metal-to-metal. Use the maximum anti-spark tailoring option to minimize this sparking risk.

Provide bridge end trucks conforming to ASME B30.17 and CMAA 74 or MHI MH27.1, as applicable. Configure end trucks with a feature that limits end truck movement to 25.4 mm one inch in the event of wheel or shaft failure. Provide drop (safety) stops with contact surfaces of non-sparking materials.

2.2.4 End Stops

Fit the crane bridge girder(s) with structural steel end stops. Locate stops to permit maximum trolley travel. Design end stops in accordance with MHI MH27.1 and ASME B30.17. Provide a system in which the travel wheels do not contact the end stops. End stops must be designed to absorb the maximum kinetic energy and impact force developed by the bumper contact. Provide end stops compatible with trolley bumpers and designed to bolt to the crane bridge girder.

2.2.5 Bumpers

NOTE: The following paragraph contains tailoring for MAXHAZ for cranes located in hazardous areas which encompass the entire crane envelope; the bumper to end stop connection poses a sparking risk if it is metal-to-metal. Use the maximum anti-spark tailoring option to minimize this sparking risk.
Fit bridge end trucks and trolley frames with shock-absorbing bumpers capable of decelerating and stopping the bridge and trolley within the limits stated by ASME B30.17. Ensure bumpers conform to ASME B30.17. Bumpers must fully engage end stops. Mount bumpers so that there is no direct shear on mounting bolts (if any) upon impact. Bumpers must provide adequate clearance between the crane and surrounding structure when compressed to preclude damaging equipment (clearance requirements are defined in MHI MH27.1 or CMAA 74, as applicable, and ASME B30.17). When more than one crane is located and operated on the same runway, bumpers must be provided on their adjacent ends or on one end of one crane. Fit the other end of the end-truck with a structural steel stop to engage the bumpers of the adjacent crane. Ensure bridge bumpers are properly aligned with runway end stops. Metal to metal contact at the bumper to end stop connection is not permitted.

[2.2.6 Crane Runway System]

**************************************************************************
NOTE: For under running cranes, the runway and its support structure is usually supplied by the crane contractor. Use Crane Runway System only if crane contractor is to provide a new runway.

In general, the top running runway rail is outside the scope of this specification as it is typically provided by the facility. The crane must be designed to operate on a rail that meets CMAA 70 alignment criteria.
**************************************************************************
**************************************************************************
NOTE: For top running cranes, bridge end stops are typically provided by the facility and not the crane contractor. The crane contractor does supply end stops for under running cranes, since they typically supply the runway and its support structure.
**************************************************************************

a. Provide the complete runway track suspension system that is required to hang the crane runway track at its indicated location from the structural supports indicated on the drawings. Provide runway and support structure for under running crane of rolled steel shapes conforming to CMAA 74 or patented track girders conforming to MHI MH27.1.

b. For rolled steel shapes, locate splices under structural support members.

c. For patented track girders, perform splices as necessary in accordance with the manufacturer's recommendations and requirements. Align ends of lower T-section to minimize the horizontal gap on the running surface to not greater than 1.5 mm 1/16 inch and not greater than a vertical difference of 0.75 mm 1/32 inch for the wheel running surface alignment for a smooth crossing by the wheels. Splice assemblies must be from the same manufacturer as the patented track and located under structural support members. When runways are suspended, bracing preventing damaging lateral or longitudinal movement is required. Loads transmitted to the building through the suspension must have the review and approval of the building engineer of record (EOR) prior to
installation. Submit manufacturer's standard published tables that verify the crane runway track is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the beams.

d. Runway support structure must be designed, fabricated, and installed such that runway rails meet the alignment tolerances of CMAA 74 or MHI MH27.1, as applicable. Provide means to allow for vertical adjustment of the runway track both before and after the system has been put in operation so that track can be erected and maintained level. Brace runway to restrain the track against damaging lateral and longitudinal movements. Where the runway track is suspended from hanger rods, provide means preventing the hanger rod nuts from backing off the rods. Allowable stress in hanger rods is 20 percent of the minimum specified ultimate strength of the material used.

e. For under running crane runways, design, fabricate, and install new runway end stops in accordance with ASME B30.17 and CMAA 74 or MHI MH27.1, as applicable. End stops must be designed to absorb the maximum kinetic energy and impact force developed by the bumper contact. Provide end stops compatible with end truck bumpers, designed to bolt to the runway support girders, and maximize bridge travel.

][2.2.7  Seismic Forces

**************************************************************************
NOTE: Seismic forces for under running cranes with under running trolley where the trolley is free to swing on the girder (i.e., single girder) are typically considered negligible. If not considered negligible, include the analysis section below. Seismic forces must be considered in the design of the cranes with a component importance factor of greater than 1.0 and in facilities with a Seismic Design Category of D, E, or F per ASCE 7.

Coordinate selection with paragraph DESIGN DATA: LOAD AND SIZING CALCULATIONS
**************************************************************************

Perform a seismic analysis as a part of the design of the crane in accordance with ASCE 7-16. The seismic analysis must be included in the CMAA 74 or MHI MH27.1 extraordinary load case (Case 3), as applicable.

For project locations beyond the scope of ASCE 7-16, a widely accepted design standard may be used for seismic analysis.

][2.2.8  Additional Provisions for Outside Service

**************************************************************************
NOTE: This paragraph is applicable for outdoor cranes only. See also TRAVEL DRIVES and TRAVEL BRAKES.
**************************************************************************

Seal weld structural members on outdoor cranes. Design members to prevent the collection of water on the crane. Provide a means to secure the crane against a wind pressure of 1.44 kPa 30 psf in accordance with ASME B30.17.
2.3 MECHANICAL REQUIREMENTS

****************************************************************************************************************************************
NOTE: For ordnance handling, further material restrictions exist.
****************************************************************************************************************************************
a. Provide steel shafts, gears, and keys, with the exception of worm gears which may be bronze. No three or more bearing shaft configurations are allowed.

b. Cast iron and aluminum used to support components of the hoist power transmission train must be ductile. For the purposes of this specification, "ductile" is defined as having a minimum elongation of 5 percent in 2.00 inches. Gray cast iron load bearing parts are prohibited. Provide hoist speed reducer housings that are steel or ductile/malleable cast iron and hoist electric motor housings that are steel or ductile/malleable cast iron or cast aluminum.

c. Provide steel or ductile/malleable cast iron brake housings of motor mounted disc brakes, brake lining backing plates, shoes and shoe holders. Provide spring-set brake shoe or pad linings of a non-asbestos material.

d. All mechanical components must be accurately aligned and positively secured to maintain the alignment. Parts must not be forced into position to obtain apparent alignment.

e. Provide minimum bearing life in accordance with ASME hoist performance standards and MHI MH27.1 or CMAA 74, as applicable.

f. All "should" statements in CMAA 74, MHI MH27.1, and ASME B30 are considered to be "shall" statements.

2.3.1 Threaded Fasteners

Fasten mechanical connections that are not part of a commercial packaged assembly with SAE J429 Grade 5 fasteners, ASTM F436/F436M washers, and SAE J995 Grade 5 nuts. Lubricate all mechanical fasteners unless otherwise specified by the original component manufacturer.

2.3.2 Hoist

****************************************************************************************************************************************
NOTE: Generally, hoist duty class roughly aligns with CMAA class. An H3 hoist service duty class would typically be specified for a CMAA 74 service class C crane; H4 for service class D. See paragraph CRANE DESIGN CRITERIA, sub-paragraph CLASSIFICATION to identify the CMAA service duty class specified for this crane.

Selecting either electric chain hoists (ASME HST-1) and wire rope hoists (ASME HST-4) is not straightforward or consistent across all scenarios. Generally recommend electric chain hoists for lower lift heights (less than 6 meters 20 feet or lower capacities 4500 kilograms 10,000 pounds. Electric
chain hoists only have the possibility of hoist duty classes H2, H3, or H4.

For ordnance handling, CMAA class D is required and packaged hoists must be Duty Class H4 or better; generally recommend the use of chain hoists (ASME HST-1), if practical.

**************************************************************************

Provide hoist conforming to ASME B30.16, except as modified and supplemented in this section. Packaged hoist and trolley units (packaged hoists) must be [electric chain hoist conforming to ASME HST-1] [double reeved electric wire rope hoist conforming to ASME HST-4] Duty Class [H3] [H4] [H1] [H2]or better and be rated for the operating environment.

Configure trolley such that the trolley frame contacts the trolley stops and prevents the trolley from dropping more than one inch in the event of an axle or wheel failure. Provide drop (safety) stops with contact surfaces of non-sparking materials. Metal to metal contact at the bumper to end stop connection is not permitted.

2.3.2.1 Hoist Brakes

**************************************************************************

NOTE: Each hoist must have, at a minimum, two brakes. For packaged hoists, the most common brake configuration is one electro-mechanical spring set brake and one mechanical load brake (or self-locking worm gear).

Consider the CONTROLS paragraph under ELECTRICAL REQUIREMENTS.

If a variable frequency drive (VFD) is selected for use, the brake configuration must reflect the type of VFD selected (open loop). If open loop controls are selected, brake configuration must be one electro-mechanical brake and one mechanical load brake (or self-locking worm gear).

If not using a VFD, and electromatic controls are selected, the brake configuration must still be one electro-mechanical brake and one mechanical load brake (or self-locking worm gear).

Additional tailoring options are provided for NAVFAC cranes.

**************************************************************************

a. Equip the hoist with two holding brakes, each with a minimum torque rating of 125 percent of the rated load hoisting torque. Provide a brake configuration with one electro-mechanical spring set brake and one mechanical load brake, or self-locking worm gear, that stops and holds 125 percent of the hoist's rated load and does not require the load to be raised before being lowered.

b. Electro-mechanical brakes must have an externally accessible means of manual release. Provide manual-adjusting brakes designed to permit inspection and adjustment without disassembly of the brake. The brakes
must be equipped with a manual self-return to ON brake release; maintained brake releases must reset when power is applied. Double face-mounted brakes are not permitted.

2.3.2.2 Load Block and Hook

NOTE: Some text tailored to NAVFAC.

For text tailored to Minimum Anti-Spark requirements, remove conflicting requirements (i.e., load block cannot simultaneously be steel and anti-sparking or steel hook meeting ASTM A668 cannot also be non-sparking).

NOTE: Where space permits, the NAVY prefers forged carbon steel hooks due to NDT periodicity requirements, however that option is not mandated.

NOTE: In list item 'a.', select the load block option for sheaves and wire ropes for wire rope hoists and or chain hoists select the load block option for load chains.

List item 'c.', requirements for an integrated insulated link, is tailored to ordnance handling as that is the most likely scenario in which this component will be added to protect the load against the flow of electrical energy.

NOTE: For Ordnance Handling, the crane may need to be outfitted with an insulated link. If possible, the more flexible (and cheaper) option is to use an insulated link with the rigging gear (per NAVFAC P-307) when needed for specific lifts. However, an integrated insulated link may be necessary in the load block. Insulated links integrated with the load block are not common. For ordnance handling cranes, integral insulated links are more likely for OUTDOOR applications.

Insulated links must be provided to prevent the flow of electricity from radio frequency (RF) energy from traveling through the wire ropes and metal hook to the item being lifted in accordance with NAVSEA OP 5 Volume 1, Section 10-6.1, unless the following conditions are met:
1. There is no threat of a lightning strike during operations;
2. RF emissions control is in effect regardless of the HERO classifications of the ordnance being handled.
a. Provide a load block constructed of steel. Provide a load block constructed of non-sparking materials. Covering the exposed surfaces of the load block with bronze, stainless steel, or aluminum covers attached with similar fasteners is acceptable. The load block must be designed to prevent metal-to-metal contact of moving parts. The block must be fully enclosed, concealing the sheaves and wire ropes, except for wire rope slots and drain holes. The design must preclude the wire rope from being cut, pinched, crushed, or chafed in case of two-blocking. The design must preclude the load chain from being cut, pinched, crushed, or chafed in case of two-blocking. Provide sprockets constructed of non-sparking metals in the load block. Standard commercial blocks may be used at their published ratings when their published design factors are 5.0 or greater.

b. Provide an unpainted and unplated forged [carbon] steel single barbed hook with a minimum material longitudinal elongation of 16 percent in 2 inches. Provide an unpainted and unplated single barbed hook of non-sparking material. Bronze clad hooks are prohibited. Hooks must conform to the requirements of ASME B30.10. The hook must be a standard commercial product with a published design factor of 5.0 or greater. Fit hook with a safety latch designed to preclude inadvertent displacement of slings from the hook saddle. The hook and hook nut must be removable without unreeling of the hoist. Provide hook nut secured to the hook with a commercial standard removable and reusable means. Do not weld hook nut. When provided, provide shank and nut threads with a Class 1 or 2 fit, per ASME B1.1. Uniquely mark the hook in a permanent fashion that is traceable to the NDT certification. The nut must be marked to match the hook. The hook nut must be of non-sparking materials. Hook must be free to rotate through 360 degrees when supporting the test load up to 125 percent of the rated capacity. Upper hooks of hook suspended hoists must be of non-sparking materials.

c. Provide an insulated lifting link that is integrated with the load block and hook to prevent the flow of electrical energy to the lifted load.

(1) The insulated link must conform with ASTM F2973 and be designed with a minimum safety factor of five times the rated hook load.

(2) Each insulated link must be legibly and permanently marked with its safe working load in pounds.

(3) Provide each insulated link with a unique, legible, and permanent identification mark traceable back to its base tram measurement and nondestructive test (NDT).

(4) Establish tram points across the dielectric structure of the link. Tram reading must be recorded before and after the insulated link proof test. The link will be rejected if the difference in measurement exceeds the base tram measurement by more than one percent. Provide copy of insulated link proof test and NDT.

(5) Cover exposed metal portions of the insulated link with a non-sparking material, such as neoprene or polyurethane.
[2.3.2.3] [Hoisting Rope] [Hoisting Chain]

**************************************************************************
NOTE: Items a and b apply to wire rope and are for wire rope hoists only. In the hoist section, the appropriate packaged hoist must be chosen (ASME HST-4). If a wire rope hoist is chosen, item c (hoisting chain) must be removed from the specification. There is a tailored paragraph b option for wire rope in minimum hazardous areas; if selected, the standard item b wording must be removed.

Item c is optional and only applies to chain hoists. In the hoist section, the appropriate packaged hoist must be chosen (ASME HST-1). If a chain hoist is chosen, paragraphs a and b must be removed from the specification.
**************************************************************************
**************************************************************************
NOTE: For minimum anti-spark protection, add tailored paragraph section for stainless steel wire rope or chain. If stainless steel wire rope is required, remove entire conflicting paragraph requiring improved, extra improved, or extra-extra improved plow steel.
**************************************************************************
**************************************************************************
NOTE: A solid non-sparking wire rope (e.g., stainless steel) is the preference for hazardous areas.

There are some packaged hoist and capacity combinations (e.g., 5 ton capacity) in which the published stainless steel wire rope breaking strength for the given rope diameter cannot meet the prescribed design factors per ASME B30.16. In those instances an alternative wire rope material is necessary. Drawn galvanized wire rope is acceptable in Division 2 hazardous areas provided the crane, hoist, or wire rope OEM provide a notification to the end user with the wire rope certification / submittal. This notification will identify that the wire rope is made of drawn galvanized steel, meaning it is manufactured from sparking materials but provided with a spark resistant outer layer. The outer layer or individual wire strands could become compromised if the wire rope is used in an improper manner or inadequately maintained, which would affect the integrity of the spark-resistant protection.
**************************************************************************
*[ a. Wire rope must comply with ASME B30.30 and FS RR-W-410, ASTM A1023/A1023M, or BS ISO 4309 and have a rope classification appropriate for the usage. Wire ropes must be handled and seized in accordance with ASME B30.30. The wire rope must be in a double reeved]
configuration equalized with a sheave. Select wire rope minimum design factor in accordance with ASME B30.16. Provide proof of Wire Rope breaking force.

b. Provide hoist wire ropes with improved, extra-improved, or extra-extra-improved plow steel (or appropriate ISO grades), pre-formed, regular lay, bright, and uncoated, with an independent wire rope, wire strand, or otherwise, steel core. Hot-dipped galvanized wire rope is not permitted.

b. Wire rope must be spark resistant. Provide stainless steel hoist ropes with an independent wire rope, wire strand, or otherwise, steel core. [Drawn galvanized wire rope is acceptable in Division 2 hazardous areas when provided with a drawn galvanized wire rope end user notification.]

](c. Provide a welded link load chain suitable for powered hoist service with no less than a 5.0 to 1 design factor based on the minimum breaking force of the chain. Provide stainless steel load chain. The chain must be pitched and sized to pass over load sprockets without binding. Provide an equalizing method when the load is supported by more than one part of load chain. Provide the chain with a chain stop or dead end connection to prevent the load chain from running out of the hoist at its fully extended position. Provide chain hoists with 3 m 10 foot lift or more with a load chain bucket.

][2.3.2.4  Drum

**************************************************************************
NOTE: The DRUM and SHEAVE paragraphs apply to wire rope hoists (ASME HST-4). Remove DRUM and SHEAVE paragraphs for chain hoists (ASME HST-1).
**************************************************************************

Provide grooved drum made of steel. Design drum in accordance with ASME B30.16. All hoisting rope is to be wound in a single layer and provided with no less than two dead wraps of hoisting rope remaining at each anchorage when the hook is in its extreme low position.

2.3.2.5  Sheaves

**************************************************************************
NOTE: The DRUM and SHEAVE paragraphs apply to wire rope hoists (ASME HST-4). Remove DRUM and SHEAVE paragraphs for chain hoists (ASME HST-1).
**************************************************************************

**************************************************************************
NOTE: Tailoring option for minimum hazardous to provide sheaves of non-sparking metals in the load block. Steel sheaves in the upper nest may still be provided.
**************************************************************************

Provide steel sheaves. Provide sheaves constructed of non-sparking metals in the load block. Size sheaves in accordance with ASME B30.16 for the minimum pitch diameters of running and equalizer sheaves.
2.3.3 Travel Drives

******************************************************************************
NOTE: Outdoor tailoring option for cranes to have half of the total wheels driven in order to provide adequate holding capability against non-operating wind loads without providing additional wind tie-downs. See also paragraph TRAVEL BRAKES
******************************************************************************

Provide under running travel assemblies with a minimum of one driven wheel on each side of the web and at least one quarter of all wheels driven.

The travel drive arrangement must consist of motor(s) driving through self-contained gear reduction units located at each driven wheel assembly. Gear reducers must be fully enclosed in an oil-tight housing and provided with a convenient means of lubricant level indication and draining. Open-type gearing is not acceptable, except for final drives. Outdoor cranes must have half of the total wheels driven.

2.3.3.1 Trolley Drives

******************************************************************************
NOTE: Trolley limit switches are an optional safety device.

Trolley travel limit switches are used to prevent the crane trolley from contacting the travel end stops at high speed should the crane operator mistakenly forget to slow down. If selected, ensure the appropriate options are chosen in the ELECTRICAL REQUIREMENTS, Limit Switches section.
******************************************************************************

Provide a motor-driven trolley arrangement. Acceleration and deceleration must meet the requirements specified in CMAA 70. [Provide trolley travel limit switches].

2.3.3.2 Bridge Drives

******************************************************************************
NOTE: Bridge limit switches are an optional safety device.

Bridge travel limit switches are used to prevent the crane bridge from contacting the travel end stops at high speed should the crane operator mistakenly forget to slow down. If selected, ensure the appropriate options are chosen in the ELECTRICAL REQUIREMENTS, Limit Switches section.
******************************************************************************

Provide a motor-driven bridge arrangement. Acceleration and deceleration must meet the requirements specified in CMAA 74. [Provide bridge travel limit switches].

2.3.3.2.1 Bridge Travel Gearing

Gearing must conform to ANSI/AGMA 2001 and AGMA 908, with internal and
external gear dimensional tolerances conforming to the applicable AGMA standard for tooth geometry and tolerances.

2.3.3.2.1.1 Bridge Travel Reducer

Gear reducers must be standard commercial products designed, manufactured, and rated in accordance with ANSI/AGMA 6013. Provide cranes with a CMAA service class "C" or higher with the corresponding "Industrial Duty" service factors. The speed reducer input (high speed) gear set must use helical (including double helical and herringbone), spiral bevel, or worm gear tooth forms. Provide torque arms that are not of the threaded rod type. Operation must be smooth and quiet.

2.3.3.2.1.2 Bridge Open Gearing

Provide all gears and pinions with adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2015-1 Accuracy Grade A8 or better. Wherever feasible, open gears must be enclosed with safety guards provided with openings with covers for inspection and access for grease lubrication.

2.3.4 Travel Brakes

**************************************************************************
NOTE: NAVFAC tailoring option for additional travel brake requirements.

Outdoor tailoring option for parking brake requirements. Parking brakes are one of the methods that can technically be used to secure outdoor cranes against high winds, however the requirements of TRAVEL DRIVES pushes the crane manufacturer in this direction. Another option chosen by the crane manufacturer could be rail clamps/anchors.
**************************************************************************

Provide travel drives with an end-mounted electro-mechanical spring set brake conforming to the requirements of CMAA 74 or non-freecoasting mechanical drive capable of stopping the motion of the travel function within a distance in meters feet equal to 10 percent of the full load speed in meters feet per minute when traveling at full speed with a full load. Parking brakes used to secure outdoor bridge cranes in accordance with ASME B30.17 must be sized to secure against a wind pressure of 1.44 kPa 30 psf.

Spring set brakes must be provided with an externally accessible means to manually release the brake. Provide manual-adjusting brakes designed to permit inspection and adjustment without disassembly of the brake. The brakes must be equipped with a manual self-return to ON brake release; maintained brake releases must reset when power is applied. Double face-mounted brakes are not permitted.

2.3.4.1 Trolley Brake

**************************************************************************
NOTE: NAVFAC tailoring option to require electro-mechanical brakes be end-mounted.
**************************************************************************
Provide brakes for underrunning trolleys/carriers sized in accordance with 
ASME B30.17, but not sized larger than 150 percent of the drive motor rated 
torque.

2.3.4.2 Bridge Brake

**************************************************************************
NOTE: NAVFAC tailoring option to require 
electro-mechanical brakes be end-mounted.
**************************************************************************
Provide brakes with a minimum torque rating per CMAA 74 according to the 
applicable environment, but not sized larger than 150 percent of the drive 
motor rated torque.

2.3.5 Wheels

**************************************************************************
NOTE: Wheels are typically steel for top running 
and steel or ductile cast iron for under running.

a. For ordnance handling, underhung wheels must be 
   forged steel.

b. For hazardous areas requirement maximum 
   anti-spark protection, wheels must be made of 
   non-sparking material (e.g., bronze or stainless 
   steel). Remove any conflicting items (i.e., wheels 
   cannot be non-sparking and steel).

c. EXCEPTION: For ordnance handling cranes that 
   also happen to require maximum anti-spark 
   protection, the anti-spark protection is the 
   controlling factor and wheels must be made of 
   non-sparking material (e.g., bronze or stainless 
   steel).
**************************************************************************

a. Top running wheels are to be straight tread, double flanged, and sized 
in accordance with CMAA 74 recommendations for wheel sizing and flange 
to rail head clearances. Wheel material must be forged steel. Provide 
wheels made from non-sparking material. Bronze wheels must have a 
minimum tread hardness of 225 BHN. Hollow stamped and gray cast iron 
wheels may not be used; the use of plate steel is prohibited. Provide 
steel wheels with a minimum tread hardness of 320 BHN.

b. Provide under running wheel sizing and flange-to-rail head clearances 
in accordance with MHI MH27.1 and CMAA 74 recommendations, as 
applicable. The wheels must be compatible with their respective runway 
profile. Wheel material is to be cast or forged steel, or ductile or 
malleable cast iron. Wheels are to be made of forged steel. Provide 
wheels of non-sparking material. Bronze wheels must have sufficient 
size and hardness to withstand the intended loading and use. Hollow 
stamped and gray cast iron wheels may not be used; the use of plate 
steel is prohibited. Minimum tread hardness for underhung wheels 
(non-bronze) that run on patented track is 375 BHN. Minimum tread 
hardness for wheels (non-bronze) running on structural shapes is 320 
BHN.
2.3.6 Drip Pans

**************************************************************************
NOTE: Drip pans may also be added for GPS or any other type of crane service if there is an additional requirement to prevent lubrication from falling to the floor or lifted load. Any portion of this section may be used to support the request of the Activity. Not recommended for outdoor service.

List items a. and b. are generic drip pan requirements for inclusion beneath gearboxes. List item c is less likely to be needed.
**************************************************************************

a. The crane must be designed to preclude leakage of lubricants onto the lifted loads or the floor. Equipment or components, which cannot be made leak-proof, must be fitted with unpainted corrosion resistant steel drip pans or must have the foundations seal welded to create a dam. Drip pans that utilize liquid sealant to prevent leakage of lubricants are not permitted.

b. The drip pans must be sized to hold the entire gear case fluid capacity, installed under all drive machinery, designed to permit easy removal of collected lubricant. A trolley floor designed to contain any lubricant drips may be used as fluid containment for any equipment that is mounted on it.

c. Provide drip pans fitted around the shank of the hook and extending outward to encompass all possible points of lubrication drips from the load block. The drip pans must be easily removable without disassembly of the hook or load block and cannot interfere with the crane structure during testing of the upper limits.

2.4 ELECTRICAL REQUIREMENTS

**************************************************************************
NOTE: List item d., the voltage selected (e.g., 480) must match that provided for the crane in CLASSIFICATION.
**************************************************************************

a. The design, selection, rating, and installation of the electrical portions of the crane and its accessories must conform to the requirements of NEMA ICS 3, NEMA ICS 8, the applicable ASME HST standard, and NFPA 70, and other requirements specified herein.

b. All electrical components must be industrial grade, commercially available and comply with established national or internationally recognized approving organizations such as Underwriters Laboratories (UL) and Canadian Standards Association (CSA). All electrical components installed or operated in hazardous areas including but not limited to enclosures, junction boxes, disconnects, pendant controller, and electrification must be designed and rated for the NFPA 70 Hazardous Classifications specified in the paragraph CLASSIFICATION.

c. All electrical components must be located so they are easily accessible for inspection and maintenance without removing other parts, doors, or door center posts. Electrical equipment and panel wiring must be
installed in a neat and workmanlike manner in accordance with Electrical Construction Standard NECA NEIS 1. Each motion of the crane must be provided with a separate control system or drive. The loss of any one function must not prevent the operation of other unaffected functions. Two independent relays, contactors, drive inputs, or other equivalent components/logic must be utilized for each function to provide directional control such that the failure of a single relay/contactor/component cannot result in motion in an unintended direction.

d. Disconnecting means for cranes must be in accordance with NFPA 70 Article 610.32. A permanent placard must be installed on the face of the main line disconnect that states "WARNING - THIS DOES NOT ISOLATE POWER TO LIGHTING, RECEPTACLES, AND ANCILLARY EQUIPMENT". Additionally, a lighting (ancillary equipment) disconnect must be provided, with lockout feature, as the isolation means for the lighting transformer and lighting circuit breaker panel, which must power the crane's ancillary equipment. It must feed [_____] VAC to the primary side of the transformer directly from the runway conductors via tapping the line side of the main power disconnect. Provide individual disconnects, with lockout feature, capable of being locked in the open position for bridge lights and receptacles.

e. Unless otherwise specified, interconnecting wiring must be of copper stranded construction complying with Table 310.104(A) of NFPA 70. Interconnecting wiring containing asbestos in the insulation or outer covering are prohibited. Aluminum conductors must not be used. Aluminum connectors are allowed if they are rated for use with copper conductors (marked "AL/CU"). All conductors connected to or routed above resistors must have insulation shown in NFPA 70 Table 610.14(a) for 125 degrees C 257 degrees F. For packaged hoists and hoist/trolleys, provide wiring sizes in accordance with NFPA 70 Table 610.14(a). Motor branch circuit conductors not part of a packaged hoist and hoist/trolley must be sized as to have an ampacity not less than 150 percent of the motor full load current rating and to be no smaller than 12 AWG. Conductors must be selected and de-rated based on maximum ambient temperature. Continuous loads such as utility, heating, lighting, and air conditioning must be multiplied by 2.25 to determine ampacity in order to permit application of NFPA 70 610.14 (A) for crane supply conductors. Wire-nuts are not permitted on splices. However, connections for lighting ballasts may be made using wire-nuts (if applicable).

f. Excluding conduit directly connected to dynamic breaking resistors, raceways must maintain a 12-inch clearance between the raceway and dynamic braking resistors. A separate grounding wire, sized in accordance with Section 250.122 of NFPA 70, must be routed with all ungrounded conductors. Only one equipment grounding conductor must be run in each conduit and be the largest size required for any circuit routed in that conduit. All wiring must be numbered or tagged at all connection points. Power conductors which are shielded such that their wire size cannot be easily determined must be labeled as to the conductor size. All unused conduit openings must be plugged.

g. When fiber optic cable is utilized, inspections and performance checks must be accomplished upon completion of on-site installation to ensure cable cleanliness and proper signal integrity. Testing and verification must be conducted by a knowledgeable fiber optics technician using specialized, calibrated equipment. Cables must be
tested for signal loss/attenuation. The fiber optic system must also be tested using an Optical Time Domain Reflectometer (OTDR). Final attenuation and OTDR readings from each fiber optic cable run, including spares, must be documented as a baseline for future reference. All spare fiber optic cables must have protective covers over their ends to maintain cleanliness while not in use. When fiber optic cable is utilized the drive OEM's recommendations for encoders and optical to digital converters must be followed. All system components utilized for this purpose must have known compatibility prior to integration.

h. Power cables and low voltage signal cables may not be mixed in the same conduit.

i. The crane manufacturer must furnish and install all electrical equipment on the crane conforming to NEMA ICS 6, including motors, conforming to NEMA MG 1, electrically released brakes, switches, crane controllers, panels, operating station, wiring system, cables, and crane electrification.

2.4.1 Motors

**************************************************************************
NOTE: Inverter duty motors are required for open loop variable frequency drives (VFD).

Select two speed motors for bridge and trolley drives if magnetic controls are specified in paragraph CONTROLS; select single speed motors if electronic controls are specified in paragraph CONTROLS.

U.S. Navy allows only 60-minute duty rating motors. 30-minute duty rating motors require Navy Crane Center approval. For non-Navy applications, the motor duty rating may be selected to match what is required by the class of HST-1 or HST-4 hoist (such as H1, H2, H3) specified.

**************************************************************************
Motors must meet all applicable requirements of NEMA MG 1 and UL 1004-1. CMAA 70 calculations for motor horsepower shall be used in selecting bridge, trolley, and hoist drive motors. All motors must have a minimum of a [60] [30] [_____] minute duty rating and be Totally Enclosed Non Ventilated (TENV), Totally Enclosed Fan Cooled (TEFC), or Totally Enclosed Blower Cooled (TEBC).[ Provide [two] [single] speed AC squirrel cage induction type motors for the bridge and trolley drives.] [ Provide two speed, AC squirrel cage induction type motor for the hoist.][ Provide inverter duty motors for Open Loop Variable Frequency Drives (VFD).] Provide motors with a minimum of Class F insulation. Provide motor overload protection utilizing a thermal sensitive device embedded in its windings. Provide motors painted to manufacturer's standard for "wash-down" service. Motors located outdoors must be furnished with anti-condensation heaters that remain energized when the mainline contactor is deenergized.

2.4.2 Controls

**************************************************************************
NOTE: If one or two speed point controls are required, recommend magnetic controls. If three or more speed points or infinitely variable speed adjustment is needed, Variable Frequency Drive (VFD) controls are required.

******************************************************************************

NOTE: Use the first two paragraphs to select one or two speed control for the hoist, bridge, or trolley. Selections can be made using a combination of electronic controls and one or two speed motor controls for the various functions. Use the third, fourth, and fifth paragraphs to select electronic variable frequency drive controls for either the hoist, bridge or trolley. With VFD controls the hoist must be configured as open loop. Open loop is more cost effective and requires a mechanical load brake (or self-locking worm gear). Ensure the Hoist Brakes section of this specification reflect the type of controls chosen.

When the two-speed bridge and trolley motor is specified, the slow speed will be 1/3 to 1/4 of rated travel speed. Reduced voltage starting, acceleration, and deceleration, serve to reduce the acceleration rate that is normal for squirrel-cage motors. Squirrel-cage motors with two-speed magnetic controls provide satisfactory results with slow bridge and trolley speeds, and should be specified when short travel distances are involved and where fine positioning is not required.

For faster bridge and trolley speeds or finer positioning requirements, specify electronic controls.

Various VFD manufacturers offer an option to overspeed the hoist to a value over 60Hz (usually 120Hz). This allows the operator to position the hoist at faster speeds when it is not loaded. When selecting this feature list the maximum no load speed in paragraph RATED CAPACITY AND SPEEDS.

******************************************************************************

NOTE: The final paragraph for hoist brake bypass keyswitch is optional for hoists with one electro-mechanical spring set brake and one mechanical load brake. Choose this option if the Activity wants the functionality; the intent for this keyswitch is to allow for easier load testing of all hoist brakes while the crane is installed by bypassing the primary electro-mechanical brake for independent testing of the mechanical load brake.

******************************************************************************

[ a. Provide [one] [two]-speed magnetic controls for the [bridge drive][,] [trolley drive][,] [and] [hoist] drive. Controllers must meet the
requirements of NEMA ICS 8. Ensure that an energized drive motor initially rotates only in the direction selected by the operator by activating the corresponding direction; i.e., is not overhauled. For AC squirrel cage motor controllers, the requirements of NEMA ICS 2, Part 2, for general-purpose controllers, must be met.

b. Provide the bridge and trolley motor control systems with a drift point between OFF and the first speed control point in each direction.

c. Provide static reversing, variable frequency drives (VFD) for the [bridge], [trolley] [and] [hoist] electric controls. Provide static reversing, VFD, speed regulated, closed loop, flux vector electric controls for the hoist[s]. For feedback, provide hoist motors with encoders. The hoist controller must enable the drive motor to develop full torque continuously at zero speed. The hoist secondary brake must be controlled separate from the primary and connected to different output (within the drive) from the primary brake. VFD controllers must meet NEMA ICS 8, Part 8 and at a minimum, provide under-voltage protection, electronic instantaneous over current protection, DC bus over voltage protection, and be able to withstand output line to line shorts without component failure. Select bridge and trolley drives such that the continuous rating of the controller is not less than the calculated motor full load current based on CMAA 70 paragraph 5.2.9.1.1.1 and NFPA 70 Table 430.250. Select hoist drives such that the continuous rating of the controller is not less than 125 percent of the calculated motor full load current based on CMAA 70 paragraph 5.2.9.1.1.1 and NFPA 70 Table 430.250. All hoist drives must have a motor over-torque limit to lock out the hoist and prevent gross overload of the associated hoist. Provide dynamic braking for each electric drive that is sized per VFD manufacturer's requirements. Submit VFD Control Parameter Settings.

d. Provide speed control which is infinitely variable for each function, controlled via [radio control system] [and] [pendant pushbutton station]. Provide controls designed such that the maximum speed of each function will be limited to 25 percent of rated speed when a slow speed switch is actuated on the controller[s]. Energize a yellow/amber light/indicator while in slow speed mode.

e. The [hoist],[,] [trolley],[,] and [bridge] brakes must set after the associated controller decelerates the drive motor to a controlled stop. The hoist, trolley, and bridge, controllers must be sized to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 125 percent of rated load on the hook. The hoist controller must prove torque before release of the brakes and enable the drive motor to develop full torque continuously at zero speed. Motors must operate smoothly at all speeds without torque pulsations and must only be energized within the frequency range of 50-60 Hz at rated speed. The hoist control system may utilize overspeed up to 120hz, unloaded only, if the drivetrain equipment has all been balanced and is rated for the resulting speed.

f. The use of definite purpose contactors is prohibited. If IEC contactors are used, the application cannot exceed the contactor manufacturer's AC3 ratings for the contactor at a minimum.

g. On hoist function roll-up must be less than 1/8 inch measured at the hook block and roll-back must not occur over the entire load range.
h. Use of Uninterruptible Power Supplies (UPS) is prohibited. Feed control circuits from a single phase, air cooled, double wound transformer with a grounded metal screen between the primary and secondary windings of the transformer.

i. Provide a main line contactor. Energization of the main line contactor must be controlled by the POWER-OFF/POWER-ON switch/pushbutton on all controllers. Upon actuation of the POWER-OFF pushbutton; power to all drive motors, brakes, and controls must be removed. The mainline contactor must not be able to be energize while the POWER-OFF pushbutton is actuated. The POWER-OFF pushbutton circuitry must be independent of all controls or any other electronic devices.

j. Provide a spring returned brake bypass keyswitch for each hoist. The switch allows for actuation of the electro-mechanical brake for independent testing of the mechanical load brake. The normal position allows both brakes to work in their normal operating configuration. Label the keyswitch positions as "NORMAL" and "LOAD BRAKE TEST".

]2.4.3 Protection

Protection must not be less than that required by NEMA ICS 3, NEMA ICS 8, CMAA 74, NFPA 70, UL 1004, UL 943, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306 and all applicable provisions of 29 CFR 1910. All protection must be by circuit breakers or fuses. Provide a disconnect switch or enclosed type circuit breaker readily accessible to the crane operator for the crane disconnect. Motor branch circuits must be individually protected by inverse time circuit breakers capable of being locked in the open position. The means for locking must remain in place with or without the lock installed. Motor full load current from NFPA 70 Article 430, Part XIV (Tables) must be used to calculate the circuit breaker size.

Provide disconnecting means on the crane in accordance with NFPA 70 Article 610.32. Provide for lockout/tagout of all hazardous energy sources. Provide product data for all circuit breakers and fuses.

2.4.3.1 Conductors

a. The crane contractor is responsible for ensuring that all conductors from the load side of the existing floor level disconnect to the motor branch circuits have adequate overcurrent protection complying with one of the following:

1. Not be greater than the largest rating or setting of any branch circuit protective device plus the sum of the nameplate rating of all other loads per NFPA 70 Article 610.41(A).

2. Not be greater than the ampacity of all feeder conductors after all ampacity correction factors have been applied.

b. Conductors for brake coils must be protected by fuses or other protective devices. The device must be chosen to protect the brake circuit conductors from ground faults or short circuits.

2.4.4 Resistors

Provide resistors with natural convection cooling sized as recommended by the VFD OEM and fabricated of corrosion resistant metal; the use of "wire
wound" type resistors is prohibited for segments of 8 ohms or less. Mount resistors in substantial, ventilated enclosures constructed entirely of non-combustible materials. When mounted outdoors provide stainless steel resistor enclosures. Provide resistors with terminals fitted in the coolest position in the enclosure.

[2.4.5 Transients and Harmonics Protection]

**************************************************************************
NOTE: The following items are required only for VFD Controls.
**************************************************************************

a. Provide contactors and relays with appropriate Metal Oxide Varistors (MOV) or resistor-capacitor (R-C) surge absorbers installed across the respective coil.

b. Provide transient protection for electronic drive controllers that is either internal to the drive or via an MOV connected line-to-ground close to the line terminals of the drive.

c. Provide line reactors rated for continuous duty operation based upon the motor nameplate amperes. With motors of 50 horsepower or greater, harmonics protection must be provided by an isolations transformer or as recommended by the VFD OEM. For a drive motor branch circuit that exceeds 150 feet in length, a reactor must also be connected in series with the controller load (output) terminals to provide standing wave protection or as otherwise recommended by the VFD or motor OEM.

}2.4.6 Limit Switches

a. Provide primary upper and lower geared limit switches. Geared limits must allow reversing direction to back out of the limit without resetting. The lower limit switch must be set such that there are a minimum of two wraps of rope on the hoist drum.

b. Provide a backup mechanical hook block activated upper limit switch wired independent of the directional controllers and the primary upper limit switch that removes power from the hoist motor, hoist brake and hoist controls conforming to NEMA ICS 5. The backup limit must require hoist resetting prior to operation of the hoist in any direction.

c. For chain hoists, the upper hoist limit switch must be wired to remove all power from the hoist drive motor and brake(s) independent of the microprocessor drive. A two-position spring-returned bypass switch must be provided that allows for resetting of the final limit switch prior to resuming operation. During resetting of the final limit, the hoist must operate in the lowering direction only.

d. Travel limit switches must be provided for the [bridge][ and ][trolley] motion to slow the crane to [25 percent] [_____] of its rated speed [[10] [_____] feet before the bridge end stops][ and ][[5] [_____] feet from the trolley end stops]. Limit switches must be mounted rigidly in a manner so as to protect the switch from misalignment or damage. The target/trip arm must be large enough to provide interception given a misalignment were to occur.

e. Limit switches must be rated for the NFPA 70 Hazardous Classifications specified in the CLASSIFICATION paragraph of this specification.
2.4.7 Operator Controls

**************************************************************************

NOTE: Available operator controls are pendant, and radio control. Cranes can also be set-up to be controlled by two separate systems. For cranes with one set of controls use paragraph 1. For cranes with two sets of controls use paragraph 2. In such a case some type of interlock must exist to prevent control from both systems simultaneously.

The pendant can be suspended from the trolley or an independent festooned messenger track system. The festooned system allows the operator to have maximum separation from the load. When this is a requirement include section Pendant Conductor System section of this specification.

When specifying a radio control system, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANE/CENINST 11450.2:
1. What type of batteries? Rechargeable?
2. Are spare batteries needed? How many?
3. Are spare remote control units required? How many?
4. Is a battery charger required?
5. Type of transmitter unit.
6. Is a belt/harness required for the remote control?

**************************************************************************

[a. Provide crane equipped with a [pendant pushbutton station] [radio control system].

][b. Provide crane equipped with both a pendant pushbutton station and a radio control system. Provide a selector switch to allow the use of only one of the two available control stations on the pendant controller.

] c. If VFD controls are not provided, provide directional contactors with both mechanical and electrical interlocks.

d. "Operator controls must be rated NEMA Type 7 for Class I, or NEMA Type 9 for Class II according to the NFPA 70 Hazardous Classifications specified in the CLASSIFICATION paragraph of this specification."

[2.4.7.1 Pendant Pushbutton Station

The cranes must be controlled from a pendant pushbutton station suspended from [the trolley] [an independent festooned messenger track system, operating the length of the bridge]. Provide multiconductor flexible cords for pendant pushbutton stations with No. 16 AWG minimum conductors. Provide a method of strain relief to protect the electrical conductors from damage. Locate the pendant pushbutton station [1200 mm 4 feet] [_____] above the finished floor. Pushbutton pendant station must have its elements legibly marked and arranged vertically, in order, in accordance with CMAA 74.[ Provide [one speed] [two speed] [3-step infinitely

SECTION 41 22 13.15  Page 50
variable] [2-step infinitely variable] pendant pushbuttons for control of the [hoist][,] [trolley][,] [and] [bridge].] Provide pendant pushbuttons for control that spring return to the OFF position. Voltage in the pendant pushbutton station must not exceed 150 Volts AC or 300 Volts DC.[ Provide a maintained two-position selector switch for slow speed selection.] The pendant must be rated for the NFPA 70 Hazardous Classifications specified in the CRANE DESIGN CRITERIA, sub-paragraph CLASSIFICATION. Provide the pendant pushbutton station with a NEMA Type 7 for Class I, hazardous environments and NEMA Type 9 for Class II, hazardous environments, as classified by NFPA 70.

[2.4.7.1.1 Pendant Conductor System

Provide a festoon type pendant conductor system. The festoon cables must be flat cables suspended from carriers riding on an I-beam or C-track. The pendant controller must be capable of traveling the entire length of the bridge and move independently of the trolley. Festoon loops must not extend below the high hook position.

][2.4.7.1.2 Radio Control System

Provide each system with a [belly box] [handheld] [______] type portable transmitter unit [and an identical back-up transmitter unit].[ Provide each transmitter with an adjustable belt or harness to support it when worn by the operator]. Only one transmitter at a time can control the crane and there must be no interference from one crane's controller affecting operation of the other cranes in the building. Each transmitter must include: individual [infinitely variable spring return joystick motion control levers] [push button controls] for each hoist, trolley, and bridge; a maintained contact, keyed switch, marked ON-OFF, for portable transmitter unit power; indication of Battery Power, and indication of Transmitter Status; a red emergency STOP mushroom pushbutton;[ and ] a floodlight on/off pushbutton[ and a maintained slow speed selector switch]. The transmitters and all controls must each be clearly and permanently labeled with functionality and direction. Directions for controllers must be in accordance with CMAA 74 recommendations. The remote radio control system must be designed to meet the requirements of NEMA ICS 8, Part 9 and ECMA 15. Each radio remote control lever must be in the OFF position before the associated crane function can begin. The system frequency must be within the unlicensed FCC Part 15 range. Each control unit must maintain a continuous status signal to the associated receiver during operation. There must be no significant loss in systems efficiency and function at the end of eight hours of continuous battery use. Provide a contact monitoring board with the crane radio system receiver.

The Contractor must submit the frequency allocation application to the National Telecommunications and Information Administration (NTIA) via EL-CID version 6.1 software found on NTIA.gov. Provide the temporary authorization, and the final approved application when available. The technical section of the application must be completed by the manufacturer of the radio control equipment being furnished under this contract. Verify frequency availability at this activity prior to design approval.

][2.4.8 Electrification Systems

******************************************************************************

NOTE: Various methods may be used to transfer power from the runway to the crane (Runway Conductor System) and then again to the trolley (Bridge...
Conductor system). Typically, the Runway Conductor System is a set of conductor bars on the runway and collector shoes on the crane. The Bridge Conductor system is typically a set of festoon cables.

Site conditions and environment might require the design to deviate from the norm. Hazardous locations will need to be designed with either a cable reel or festoon system.

2.4.8.1 Runway Conductor System

[a. Provide a rigid runway Conductor Bar System for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. UV resistant. Steel (non-stainless) conductor bars are prohibited. The crane must be grounded through the runway electrification system. The grounded conductors must be a minimum of 70 square millimeters. Provide runway conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. If there is any way the hook block or wire rope can swing into the runway electrification, provide a guard installed to prevent contact.

b. Provide two Collector Shoes (tandem design) for each conductor; each collector shoe must be rated for not less than the runway conductor sizing, so as to provide redundancy.

][c. Provide a Festoon System for the runway conductor system utilizing cables suspended from carriers riding on an I-beam or C-track for the crane, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. Conductors must be fabricated from copper. The crane is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG. Provide conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][d. Provide a Cable Reel System for the runway conductor system, including all necessary cables and hardware to connect the cable reel to the floor level fused disconnect switch. The cable reel must have three power conductors and an equipment grounding conductor. The crane is required to be grounded through this conductor system. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The grounded conductors must be a minimum of 2/0 AWG.

][e. Provide a totally enclosed flexible cable tray electrification system (cable chain) for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. The cable chain must have three power conductors and an equipment grounding conductor. The conductors must be selected so as to be of the longest length without splices. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The crane is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG.
2.4.8.2 Bridge Conductor System

[ a. Provide Festoon System for the bridge conductor system utilizing cables suspended from carriers riding on an I-beam or C-track. Conductors must be fabricated from copper. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG. Festooned cable loops must not extend low enough to come into contact with any obstructions.

[b. Provide a Cable Reel System for the bridge conductor system. The cable reel must have an equipment grounding conductor, and all necessary control cables. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley must be grounded through the cable reel connection and all conductors must be of copper construction. The grounded conductors must be a minimum of 2/0 AWG.

[c. Provide a totally enclosed flexible cable tray electrification system (cable chain) for the bridge conductor system. The cable chain must have three power conductors, an equipment grounding conductor, and all necessary control cables. The conductors must be selected so as to be of the longest length without splices and must be copper. A minimum of 20 percent of the control circuit conductors in the flexible cable tray system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. The grounded conductors must be a minimum of 2/0 AWG.

2.4.9 Overload Protection

**************************************************************************

NOTE: Overload protection on a crane is required and is provided by two types of systems: Capacity Overload Protection and Over-Torque Limit.

The Over-Torque Limit only applies to cranes with VFD controls. It is a parameter setting in the drive and is typically set at 150 percent of rated motor torque. Cranes with magnetic controls do not have this feature. Delete third paragraph if VFD controls are not specified.

Capacity Overload Protection is usually adjustable. If adjustable, it needs to be set at less than the crane’s minimum test load; recommend setting at 100 percent of rated capacity or less. This protection can take the form of one of the following devices:

1. Clutch – Not adjustable and is common on package hoists.
2. Load Limit Switch – Installed on the wire rope and measures deflection. Does not require a break in the wire rope and is simply clamped onto the wire. Typically used on smaller hoists that have magnetic controls. Can also be installed as part of the equalizer sheave.
3. VFD Drive Overload Protection – Similar to the Over-Torque Limit, but is set at a lower setting. Adjusted via parameters within the drive.

a. Provide a capacity overload protective device for all hoist systems using VFD drive capacity overload protection (separate from torque limiting feature of the VFD). Set hoist capacity overload protection at [100] percent of rated capacity. Hoist capacity overload protection must be adjustable between 80 and 150 percent of hoist capacity. Provide a keyed override or other means to disable the hoist capacity overload protection when performing a load test. If a slip clutch is used as the overload limiting device, it must comply with all ASME B30.16 requirements. Provide adjustable slip clutches set at or less than the cranes maximum test load. If the slip clutch is non-adjustable, the OEM factory setting is acceptable and must be identified with the Product Data sheets and O&M manual.

b. Initially, set the torque limiting capability of the VFD (that is separate from the capacity overload protective device) to 150 percent of the motor torque (amperage) necessary to hoist 100 percent load. It may be adjusted up only to avoid nuisance trips and adjusted down if possible while still avoiding nuisance trips.

2.4.10 Enclosures

NOTE: Select classification of control panels, controls, and brakes based on the environmental conditions in which the crane will be installed:
1. Choose one of the following for an indoor installation: 1, 2, or 12.
2. Choose one of the following for an outdoor installation: 3, 4X, or 8.
3. Choose one of the following for a Class I Hazardous installation: 7 (indoor) or 8 (indoor/outdoor).
4. Choose one of the following for a Class II Hazardous installation: 9 (indoor).

Other enclosure types exist that might be a better alternative for a particular installation. If necessary, refer to NEMA 250.

a. Provide enclosures for control panels, controls, and brakes in accordance with NEMA 250 and NEMA ICS 6, Classification Type [1 indoor, general purpose] [12 indoor without knockouts, general purpose] [2 indoor, drip-proof] [3 outdoor, dust-tight, rain-tight, sleet-resistant] [4X outdoor] [7 indoor Class I hazardous] [9 indoor Class II hazardous] [8 indoor/outdoor Class I hazardous] [____]. Provide enclosures with listed drains to prevent accumulation of water within the enclosure. There must not be any condensation inside the control panels. If anti-condensation heaters are provided, these heaters must remain energized when the main line contactor is deenergized.

b. Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to
indicate the elapsed number of hours the crane is energized.

c. Gaskets of enclosures and fixtures, and joints and contact surfaces of hazardous/explosive enclosures must be kept free of any paint to prevent damage during removal and reinstallation of gaskets of enclosures.

2.4.11 Warning Devices

**************************************************************************
NOTE: A warning horn or light is required for all radio controlled cranes and recommended for all others.
**************************************************************************

[Provide a warning horn that is operable from a push button at the [pendant pushbutton] [radio control] station.] [Provide a warning [strobe light] [rotating beacon] that is illuminated at all times during movement of the hoist, trolley, or bridge function[, but may be deactivated on the operator control station].]

2.4.12 Floodlights

Provide evenly spaced floodlights along the bridge. Select floodlights to provide an illumination level of 40 foot-candles at three feet above the finished floor. All lights must be vibration resistant and designed to prevent any material from falling from the fixture. Switch the floodlights from the [pendant pushbutton] [radio controlled] station.

2.4.13 Pilot Devices

Provide Indicator Lights mounted in an enclosure on the bottom of the bridge with lights sized and positioned to be visible from the ground. The lights must be the dual-lamp type. Provide a white light to indicate that power is available to the crane and a blue light to indicate that the main contactor is energized. Light voltage must be 115 VAC. Provide nameplates that are legible from ground level. The nameplates must read, in their respective order, "POWER AVAILABLE" and "CRANE ENERGIZED". The POWER AVAILABLE light must be supplied by a separate, fused transformer for its energization.

2.4.14 Wind Speed Indicating System

**************************************************************************
NOTE: This section is tailored to outdoor requirements, as wind speed indicating devices are required on outdoor cranes.
**************************************************************************

Provide a wind speed indicating device in accordance with ASME B30.17, which provides a visible and audible alarm to the crane operator at a predetermined wind speed. The transmitter must be mounted on the highest unobstructed location.

2.4.15 Electrical Outlets

**************************************************************************
NOTE: Electrical outlets are typically provided on trolleys for maintenance purposes on double girder
cranes with top running custom built-up hoists (which typically have walkways). The addition of electrical outlets may not be a standard manufacturer option on packaged hoists and is not recommended for single girder cranes or underhung packaged hoists.

Provide a minimum of [one] [_____] 120 VAC duplex outlet[s] on the crane, mounted [on] [in] the [outside of the control panel(s)] [trolley] [cab] [____]. The circuit(s) supplying receptacles must incorporate ground-fault circuit-interrupter protection for personnel and be protected by a circuit breaker with a minimum rating of [15] [20] amps.

2.4.16 Cyber Security of Control Systems

NOTE: Cyber Security of Control Systems requirements are tailored to NAVFAC. This subpart must be included for NAVFAC, it is not replaced by Division 25 Cybersecurity Section.

NOTE: SECNAVINST 5400.15 designates NAVFAC as the functional technical authority for WHE. NAVFAC is designated as Functional Security Control Assessor (FSCA) and the Functional Authorizing Official (FAO) for Ashore Control Systems in their domain; therefore, this includes WHE control systems. WHE control system owners are responsible for the Information System Security Engineer (ISSE) functions and producing artifacts (documentation) for review by the FSCA and FAO.

All new and electrically overhauled cranes must implement the following cybersecurity requirements as applicable to the control system architecture (i.e., networked drives, non-networked drives, and any wireless applications) so that supporting artifacts and considerations are available for the implementation of the RMF process.

a. Provide the following for PLC, RTU, Supervisory Controller, or other network-capable (whether networked or not upon delivery) control devices as applicable:

(1) Hardware list (Hardware list must include the following for each device):

(a) Manufacturer
(b) Model
(c) Location
(d) Key technical ratings (e.g., memory)
(e) Serial number
(f) MAC addresses
(g) IP addresses

(2) Software List (Software list must include the following for each device):
   (a) Manufacturer
   (b) Version/subversion
   (c) Location/device
   (d) Used network ports/protocols/services

(3) List and discussion of all security features of Contractor hardware and software.

b. For every PLC, RTU, Supervisory Controller, or other network-capable control devices (whether networked or not upon delivery), deliver the following on CD/DVD:
   (1) Original firmware
   (2) Original firmware hash
   (3) SOP for application of firmware updates/patches
   (4) POC or website for firmware updates/patches
   (5) Count of interfaces and types
   (6) Protocols in use, per interface
   (7) Configuration file
   (8) SOP for configuration

2.4.16.1 Control System and Network

**************************************************************************
NOTE: Select options a. & b. if a standalone laptop is required. Recommend including one laptop if the activity regularly performs all crane maintenance.
**************************************************************************

[ a. Provide one rugged laptop type workstation (computer) complete with all compatible software (including software licenses), redundant physical back-up copies on CD/DVD of the installed software, and all necessary cables and special connectors to allow crane software to be troubleshooted, checked and upgraded, and for the data recorder to be accessed and information retrieved. Equip the workstation with a CD/DVD drive and the associated CD/DVD burning software. The workstation must also be equipped with USB ports (2.0 and 3.0), an Ethernet port, and a serial port. Delivering the software on a USB (flash drive) device is prohibited.
b. The laptop must be designed for an industrial environment and must be shock resistant and weatherproof as a minimum. Provide the laptop with a built-in CD/DVD reader with the capability to burn CDs and DVDs including associated software to burn CDs and DVDs.

c. The Contractor must provide all equipment, including software and hardware, necessary for testing, installation, and communicating/troubleshooting all systems provided with the crane (e.g., engine/generator, control system, LID, etc.). The Contractor must provide all crane specific operational software files (e.g., ladder logic, functional block programming, etc.) for their associated systems (e.g., control systems, LID, engine generator, etc.).

d. A single common networked design must not be used for the control systems. A network for an individual function may be used as long as a failure of the network does not affect any other function/network except as defined for specific safety interlocks (e.g., LMI system). A common crane network may be used in a monitoring mode for recording faults and trending and is encouraged. Failure of the monitoring system must not affect crane functions.

e. All provided hardware and software must be currently marketed products, not currently scheduled for end of life or obsolescence, to ensure system sustainability.

f. The control system engineering workstation hardware and operating system must be in conformance to the Common Criteria for IT Security Evaluation (IEC ISO 15408, visit https://www.niap-ccevs.org for more information).

g. Ensure there is no remote access capability enabled as remote access capabilities are prohibited. Physically disable or remove all modem/network devices not required for operational purposes.

2.4.16.2 Software and Services

a. Remove all Software and Services not required for operation and/or maintenance of the product. If removal is not technically feasible, then disable software not required for the operation and/or maintenance of the product. Configure the product to allow the ability to re-enable ports and/or services if they are disabled by software. The removal of software or services may not impede the primary function of the product. If software that is not required cannot be removed or disabled, document a specific explanation and provide risk mitigating recommendations and/or specific technical justification. The software/service to be removed and/or disabled includes, but is not limited to:

(1) Cameras

(2) Games

(3) Device drivers for product components not procured/delivered

(4) Messaging services (e.g., email, instant messenger, peer-to-peer file sharing)

(5) Source code
(6) Software compilers in user workstations and servers

(7) Software compilers for programming languages that are not used in the control system

(8) Unused networking and communications protocols

(9) Unused administrative utilities, diagnostics, network management, and system management functions

(10) Backups of files, databases, and programs used only during system development

(11) All unused data and configuration files

(12) Remove and/or disable, through software, physical disconnection, or engineered barriers, all services and/or ports in the procured product not required for normal operation, emergency operations, or troubleshooting. This includes communication ports and physical input/output ports (e.g., USB docking ports, video ports, and serial ports).

b. Provide documentation showing all disabled ports, connectors, and interfaces for all network-capable devices. In addition, provide summary documentation of the procured product's security features and security-focused instructions on product maintenance, support, and reconfiguration of default settings.

c. For the evaluation status of hardware and software, the Contractor must provide information on Common Criteria (IEC ISO 15408) or National Information Assurance Partnership (NIAP) or Federal Information Processing Standards (FIPS) evaluation status of hardware and software.

2.4.16.3 Access Control

a. The Contractor must configure each component of the procured product to operate using the principle of least privilege. This includes operating system permissions, file access, user accounts, application-to-application communications, and energy delivery system services.

b. Provide user accounts with configurable access and permissions associated with one or more organizationally defined user role(s), where roles are used.

c. Provide a system administration mechanism for changing user(s') role (e.g., group) associations.

d. The Contractor must document control system access control options by defining access and security permissions, user accounts, and applications with associated roles.

e. Provide recommended methods for the Acquirer to prevent unauthorized changes to the Basic Input/Output System (BIOS) and other firmware. If it is not technically feasible to protect the BIOS to reduce the risk of unauthorized changes, the Contractor must document this case and provide mitigation recommendations.
2.4.16.4 Control System Account Management

The Contractor must document all accounts (including, but not limited to, generic and/or default) that need to be active for proper operation of the procured product.

Remove or disable any accounts that are not needed for normal or maintenance operations, emergency, or troubleshooting of the energy delivery system.

2.4.16.5 Session Management

The Contractor may not allow multiple concurrent logins using the same authentication credentials, allow applications to retain login information between sessions, provide any auto-fill functionality during login, or allow anonymous logins.

Provide account-based and group-based configurable session-based logout and timeout settings (e.g., alarms and human-machine interfaces).

2.4.16.6 Authentication/Password Policy and Management

Provide a configurable account password management system that allows for, but is not limited to, the following:

a. Changes to passwords (including default passwords)
b. Selection of password length
c. Frequency of change
d. Setting of required password complexity
e. Number of login attempts prior to lockout
f. Inactive session logout
g. Screen lock by application
h. Comparison to a library of forbidden strings
i. Derivative use of the user name
j. Denial of repeated or recycled use of the same password

The Contractor must time stamp log files.

2.4.16.7 Logging and Auditing

Provide logging capabilities that cover the following events, at a minimum (as appropriate to their function):

a. Information requests and server responses
b. Successful and unsuccessful authentication and access attempts
c. Account changes
d. Privileged use
e. Application start-up and shutdown

f. Application failures

g. Major application configuration changes

2.4.16.8 Heartbeat Signals

The Contractor must identify heartbeat signals or protocols and recommend which should be included in network monitoring. At a minimum, include a last gasp report from a dying component or equivalent.

The Supplier must provide packet definitions of the heartbeat signals and examples of the heartbeat traffic if the signals are included in network monitoring.

2.4.16.9 Patch Management and Updates

The Contractor must verify that procured products (including third-party hardware, software, firmware, and services) have appropriate updates and patches installed prior to delivery.

Provide documentation of the patch management program and update process (including third-party hardware, software, and firmware). This documentation must include resources and technical capabilities to sustain this program and process. Provide the Contractor's method or a recommendation for how the integrity of the patch is validated by the Acquirer as well as the Supplier's approach and capability to remediate newly reported zero-day vulnerabilities.

2.4.16.10 Malware Detection and Protection

a. The Contractor is required to implement at least one of the following:

   (1) Provide a host-based malware detection capability that quarantines (instead of automatically deleting) suspected infected files. Provide an updating scheme for malware signatures. The Contractor must test and confirm compatibility of malware detection application patches and upgrades.

   (2) If the Contractor is not providing the host-based malware detection capability, the Contractor must suggest malware detection products to be used and provide guidance on malware detection and configuration settings that will work with Contractor products.

b. The Contractor must validate that cybersecurity services running on the procured product (e.g., virus checking and malware detection) do not conflict with other such services running on the procured product.

c. For malware detection and protection, the Contractor must provide, or specify how to implement, the capability to automatically scan any removable media that is introduced to the product being acquired.

2.4.16.11 Physical Security

Provide lockable or locking enclosures or rooms for energy delivery systems and system components (e.g., servers, clients, and networking hardware) and
for the systems used to manage and control physical access (e.g., servers, lock controllers, and alarm control panels). Provide a method for tamper detection on lockable or locking enclosures. If a physical security and monitoring system is used, tamper detection must be compatible. The Contractor must ensure that physical security features do not hamper the crane system operations. Provide the tools and instructions for making changes to locks, locking codes, keycards, and any other keyed entrances.

2.4.16.12 Wireless Technology

For wireless technology provisions, the Contractor must document:

a. Specific protocols and other detailed information required for wireless devices to communicate with the control network, including other wireless equipment that can communicate with the Contractor-supplied devices.

b. Use, capabilities, and limits for the wireless devices.

c. Power and frequency requirements of the wireless devices (e.g., microwave devices meet the frequency requirements of Generic Requirements [GR]-63 Network Equipment Building System [NEBS] and GR-1089).

d. Range of the wireless devices and verify that the range of communications is minimized to both meet the needs of the Acquirer's proposed deployment and reduce the possibility of signal interception from outside the designated security perimeter.

e. Wireless technology and associated devices compliance with standard operational and security requirements specified in applicable wireless standard(s) or specification(s) (e.g., applicable IEEE standards, such as 802.11).

f. Configuration control options that enable varying of the security level of the devices.

2.4.16.13 Control System Inventory

Provide the complete control system inventory. The Control System Inventory must include the following attributes, in tabular format, as applicable:

<table>
<thead>
<tr>
<th>General Information</th>
<th>Location Information</th>
<th>Hardware Details</th>
<th>Operating System and Platform</th>
<th>Network Information (Actual Function, not potential function)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique ID</td>
<td>Facility Name</td>
<td>Device Type</td>
<td>Embedded OS (Yes/No)</td>
<td>MAC Address(es)</td>

SECTION 41 22 13.15 Page 62
2.5 PAINTING SYSTEM

**************************************************************************
NOTE: Three-coat zinc primer/epoxy/polyurethane system is provided for mild to severe atmospheric, indoor and outdoor cranes. For cranes in abnormal environments including exposure to chemicals or in immersion service, a system designed for that environment should be used. Other systems may suffice for milder environments.
**************************************************************************

a. Remove all grease, oil, and surface debris by solvent wiping or detergent/water scrubbing, prior to blast cleaning. Prepare surfaces to be coated by abrasive blasting to SSPC SP 6/NACE No.3, Commercial Blast Cleaning, or in accordance with the coating manufacturer's requirements, whichever is more stringent.

b. Use a painting system appropriate for the conditions provided in the Crane Design Criteria section of this specification. Paint exposed portions of the crane [and crane runway system] using a [three] [_____] -coat system as follows: [zinc-rich primer consisting of a minimum of 77 percent zinc by weight in the dry film, an anticorrosive epoxy intermediate coat, and an aliphatic polyurethane top coat] [_____.]. All paint products must be supplied by a single manufacturer and free of chromates, lead, and mercury. Apply each coat in accordance with manufacturer's instructions and requirements. Ensure each coat is smooth, even, and free of runs, sags, orange peel, and other defects. Desired color of finish coat is [brilliant yellow] [_____.]. Submit product data for painting system.

c. Coat faying surfaces of bolted connections per RCSC A348, but do not apply finish paint.

d. Paint the load block [brilliant yellow] [_____] with black diagonal striping.

e. Paint, coatings, or galvanizing on the following items or areas is not acceptable: hoist wire rope or load chain, hooks, hook nuts, sheave
and drum grooves, sprockets, wheel treads, lubrication fittings, nameplates, flange mounting faces, corrosion resistant steel, bronze, or other items not normally painted.

f. Factory paint electrical and mechanical equipment in accordance with the manufacturer's best standard practice for the specified environment.

2.6 IDENTIFICATION PLATES

**************************************************************************
NOTE: NAVFAC P-307 requires the capacity be displayed in pound units. The kilogram marking option is provided for cranes installed in a foreign country.
**************************************************************************

Furnish and install identification plates. Provide non-corrosive metal identification plates with clearly legible permanent lettering giving the manufacturer's name, model number, serial number, capacity in pound units, [with kilogram units printed in a different color,] and other essential information or identification.

2.6.1 Markings on Crane, Trolley, and Hook

**************************************************************************
NOTE: NAVFAC P-307 requires the capacity be displayed in pound units. The kilogram marking option is provided for cranes installed in a foreign country.
**************************************************************************

To avoid operation of the crane in the wrong direction, affix the appropriate directions (NORTH, SOUTH, EAST, and WEST) with arrows on both sides of the bridge and both sides of trolley, as applicable. Markings must be visible by the operator and from the loading point. Labels on the controls must have corresponding directional (NORTH, SOUTH, EAST, and WEST) markings. Markings must agree with the markings on controller. Do not indicate directional arrows on controller.

Mark the hook rated capacity in pound units[, with kilogram units printed in a different color,] on both sides of the hoist load block.

2.7 ELECTRICAL ASSEMBLY

Installation of all electrical wiring, conduit, and components must be performed in accordance with the requirements of NFPA 70. As a minimum, items a. through g. below must be followed:

a. All electrical connections must be installed in accordance with NFPA 70 Articles 110.14 or 430.9, as applicable, or as recommended by the device manufacturer.

b. Crimped terminal lugs, if used, must be properly sized for the wire and installed using the device(s) - e.g., crimping tool and indenter - recommended by the terminal lug manufacturer.

c. All spare conductors must be identified as spare conductors, and must have their ends insulated to preclude accidental contact with energized equipment.
d. Bonding straps and equipment grounding conductors must be connected to engineered ground points, have all paint removed from their termination points, or have tooth lockwashers (star lockwashers) installed, to insure proper grounding of the equipment.

e. Rigid Polyvinyl Chloride conduit may be used to protect festoon cable from physical damage when the cable is run along the footwalk of the crane, provided that only sections of conduit are used.

f. Festoon cable must be installed with suitable strain relief and protected from physical damage in accordance with NFPA 70 Article 610.11(E)(1). This includes damage from chafing against the crane structure and any other type of damage that may be incurred.

g. Fiber optic cable must be installed in accordance with the manufacturer's installation guidelines. However, at a minimum the following guidelines must be adhered to: no sharp bends (bend radii must be greater than 1 inch or as prescribed by the manufacturer), avoid tight loops, no zip ties, and no stretching of cable.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

3.2 SHOP ASSEMBLY AND TESTS

******************************************************************************
NOTE: Shop inspection and testing at the manufacturing facility is typically recommended for specialized applications (e.g., ordnance handling, molten metal handling, special purpose service, hazardous/explosive area environments, precision handling operations requiring complex or synchronized lifting capacity, or custom designs). This section may not be necessary for standard commercial packaged hoists.
******************************************************************************

Shop assemble major components as completely as possible. Reieving of drums and sheaves is not advisable for shop testing, however it is acceptable for packaged hoists. Functionally test the crane system at the construction facility prior to shipment. The Government reserves the right to inspect the crane for compliance with this specification and to witness the functionality tests. Notify the Contracting Officer [14] [_____] days prior to starting testing operations.

3.3 ERECTION AND INSTALLATION

Perform the entire crane system erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's
representative.

3.3.1 Mechanical Alignment

Align motors, couplings, brakes, gear boxes, and drive components in accordance with manufacturer's instructions.

3.3.2 Electrical Adjustments

Adjust control system in accordance with manufacturer's instructions. Store a copy of all Control Parameter Settings (PLC, VFD). Provide the final settings and configurations data on the Complete Schematic Wiring Diagram, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents. Provide the test conditions such as ambient temperature, motor load, date performed and person performing the adjustments as part of the Operational Tests report.

3.3.3 Field Welding

Perform welding indoors, where possible. Surface of parts to be welded must be free from rust, scale, paint, grease, and other foreign matter. Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M.

3.3.4 Field Painting

Perform painting indoors, where possible. Field painting (including touch-up) must conform to the requirements of the coating manufacturer and as specified in paragraph PAINTING SYSTEM.

3.4 FIELD QUALITY CONTROL

3.4.1 Post-Erection Inspection

After erection, the Contractor[, the Activity Crane Inspector/Test Director,] and the Contracting Officer must jointly inspect the crane bridge and hoist systems and components to verify compliance with specifications and approved submittals. Notify the Contracting Officer [14] [_____] days before the inspection. Provide for approval a report of the inspection indicating the crane is considered ready for operational tests.

Document the results of this inspection and submit the post-erection inspection report to the Contracting Officer for approval.

3.4.2 Operational Tests

**************************************************************************************************************************
NOTE: Determine if Government furnished certified test weights are available at the site (recommended). If not, they must be provided by the Contractor. These weights are for acceptance testing and will not be permanently retained by the Government.
**************************************************************************************************************************

Check the clearance envelope of the entire crane prior to picking or traversing any load to ensure there are no obstructions. Test the systems

SECTION 41 22 13.15  Page 66
in service to determine that each component of the system operates as specified, is properly installed and adjusted, and is free from defects in material, manufacture, installation, and workmanship. Rectify all deficiencies disclosed by testing and retest the system or component to prove the crane is operational.[The Contractor must furnish test weights, operating personnel, instruments, and other apparatus necessary to conduct field tests on each crane. Solid weights must be measured using calibrated equipment traceable to National Institute of Standards and Technology (NIST) with a minimum accuracy of plus or minus two percent.]

3.4.2.1 No-Load Test

Raise and lower each hook through the full range of normal travel at rated speed for three complete cycles. Raise and lower each hook, testing other speeds of the crane. Verify proper operation of hoist limit switches. Operate the bridge and trolley in each direction the full distance between end stops and bring bumpers into contact with the end stops. Operate through the entire speed range and verify proper brake operation. Verify correct operation of all indication and ancillary devices.

3.4.3 Test Data

Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane. Record operating and startup current measurements for hoist, trolley, and bridge motors using appropriate instrumentation (i.e., clamp-on ammeters). Compare recorded values with design specifications or manufacturer's recommended values; abnormal differences (i.e., greater than 10 percent from manufacturer's or design values) must be justified or appropriate adjustments performed. In addition, note, investigate, and correct any high temperatures or abnormal operation of any equipment or machinery. Record hoist, trolley, and bridge speeds during each test cycle.

3.4.4 Hook Tram Measurement

Establish a throat dimension base measurement by installing two tram points and measuring the distance between these tram points (plus or minus 0.4 mm 1/64 inch). Record this base dimension. Measure the distance between tram points before and after load test. An increase in the throat opening from the base measurement is cause for rejection.

3.4.5 Load Tests

**************************************************************************
NOTE: For NAVFAC, require a rated load test of 100 percent (plus 0 / minus 10) and an overload test of 125 percent (plus 0 / minus 5) of the rated load.

Wire rope run-in is applicable to wire rope hoists.
**************************************************************************

a. Perform the following tests, as specified below.

b. Test loads used in this section are defined as the following:

Wire rope run-in load (when applicable): 25 - 50 percent of rated load.

Rated load test: 100 percent (plus [0] [_____] minus [10] [_____] of rated load.)

c. Testing of cranes must be done with the use of test weights. The use of dynamometers in lieu of lifting test weights is not permitted. Each test weight for crane tests must be marked with a unique identification number and the weight in pounds. The weight marked must be the actual weight taken from the scale or other measuring device. Solid weights must be measured using calibrated equipment traceable to the National Institute of Standards and Technology (NIST), with a minimum accuracy of plus or minus two percent (i.e., indicated weight must be within plus or minus two percent of actual weight). A list of test weights, with identification numbers and weights, must be retained. The list must include the type and serial number (or other identifier) of the weighing device(s) used to weigh the test weights. Where a lifting attachment supports multiple test weights (e.g., stacked weights or multiple weights suspended from a padeye), the total capacity must be marked on the attachment. All rigging gear must meet OSHA and ASME requirements.

[3.4.5.1 Wire Rope Run-In

**************************************************************************

NOTE: This section is not applicable for hoists with load chain.

**************************************************************************

The primary purpose of this procedure is to exercise the newly installed wire rope.

Place the load on the hook. Start at ground level and hoist up to one foot below upper limit at slow speed. Hoist down to lower limit at slow speed. Repeat hoisting and lowering of the load for approximately 10 hoisting cycles, increasing the speed for each cycle. During this test, the capacity overload lockout should not activate.

]3.4.5.2 Rated Load Test

3.4.5.2.1 Hoist

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees clockwise and counterclockwise to check bearing operation with no binding. Observe for lowering of the load, which may indicate a malfunction of hoisting components or brakes. Verify that maximum beam and girder deflections do not exceed CMAA '74 and MHI MH27.1 design limits, as applicable.

b. Dynamic Load Test: Raise and lower test load through the full lift range and visually observe smooth control and acceleration between points. Completely stop the machinery at least once in each direction to ensure proper brake operation.

c. Hoist Mechanical Load Brake (or Self-locking Worm Gear): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position
d. **Hoist Loss of Power Test:** Raise the test load to approximately 2400 mm (8 feet). While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

### 3.4.5.2.2 Trolley

Operate the trolley (if space is available) the full distance of the bridge rails in each direction with a test load on the hook. Check proper functioning through the range of speeds. Verify proper brake action and stopping distance.

### 3.4.5.2.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway (if space is available) in one direction with the trolley at the far end of the bridge, and in the opposite direction with the trolley at the opposite end of the bridge. Use extreme caution. Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks. Verify proper brake action and stopping distance. Record deficiencies. Secure from testing if deficiencies are found.

### 3.4.5.2.4 Trolley Loss of Power Test

Raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of trolley travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the trolley stops and that the brake sets properly. Measure the distance required for the trolley to stop.

### 3.4.5.2.5 Bridge Loss of Power Test

Raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of bridge travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the bridge stops and that the brake sets properly. Measure the distance required for the bridge to stop.

### 3.4.5.3 Overload Test

#### 3.4.5.3.1 Hoist

Disconnect or adjust the overload limit device to allow the hoist to lift the test load. Verify proper operation of the overload limit device after it is reconnected.

a. **Static Load Test:** With the trolley in the center of the bridge span, raise the test load approximately 300 mm (one foot). Hold the load for 10 minutes. Rotate the load and hook 360 degrees clockwise and counterclockwise to check bearing operation with no binding. Observe for lowering of the load, which may indicate a malfunction of hoisting...
components or brakes.

b. Dynamic Load Test: Raise and lower test load and visually observe smooth control. Stop the load during raising and lowering to verify that the brakes hold the load.

c. Hoist Mechanical Load Brake (or Self-locking Worm Gear): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.3.2 Trolley

Operate the trolley the full distance of the bridge rails in each direction with a test load on the hook (one cycle) through the range of speeds. Verify proper brake action.

3.4.5.3.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway in one direction with the trolley at the extreme end of the bridge, and in the opposite direction with the trolley at the opposite extreme end of the bridge (one cycle). Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on-site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [two] hard copies of operation and [two] hard copies of maintenance manuals for the equipment furnished along with an electronic copy (PDF) of each on a Compact Disc. Provide one complete set prior to performance testing and final copies upon acceptance. Provide operation manuals that detail the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, including weekly, monthly, semi-annual, and annual required maintenance items, possible breakdowns and repairs, and troubleshooting guides. Also include as-built drawings, piping and equipment layout, design calculations, Control Parameter Settings and printouts of any software, and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to
the field training course (as applicable).

[3.7 FIELD TRAINING]

**************************************************************************
NOTE:  Training is recommended, but not required.

Additional items that could be included in the blank: general review of the entire capabilities, limitations, and safety features of the crane.

An optional variable frequency drive (VFD) training is available, should the crane be provided with VFD’s and the command feel the additional training is beneficial.
**************************************************************************

Conduct a training course for [eight] [_____] operating and maintenance staff[ and provide a copy of the training material to each participant]. Provide a training period consisting of a total of [four] [eight] [_____] hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and basic troubleshooting[, and [_____]].

[ Provide a minimum [four] [_____] hour training session on the Variable Frequency Drives (VFDs) discussing maintenance, troubleshooting of fault codes, theory of operation, and adjustment of crane parameters. This training session will be for an audience of approximately [eight] [_____] people.

][3.8 FINAL ACCEPTANCE]

**************************************************************************
NOTE:  Use this paragraph as written for projects where the crane is the principal construction element, or represents a very significant portion of the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.
**************************************************************************

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on wire rope, hook, and electrical collector bars.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for overhead electric traveling (OET) gantry cranes with capacities in excess of 9 tons 10 tons 9072 kg 20,000 pounds capacity but less than 27 metric tons 30 tons 27,000 kg 60,000 pounds, suitable for [indoor][ or outdoor] use in [hazardous][ or non-hazardous] environments.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

Forward all procurement of crane systems at Naval Shore based activities with rated capacities of 9072 kg 20,000 pounds or greater, or for use in specialized applications to: Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000. (See NAVFAC Instruction 11450.1a of 22 January, 1997)
ELECTRIC, TOP RUNNING for top running cranes with top running bridges and trolleys with capacities less than 27 metric ton 30 ton 27,000 kg 60,000 pounds, CMAA 70 Class A, B, C, D, E, or F, suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments.

Use SECTION 41 22 13.15 BRIDGE CRANES, OVERHEAD ELECTRIC, UNDER RUNNING for top running and under running single girder cranes with under running trolleys and hoists, with capacities less than 27 metric ton 30 ton 27,000 kg 60,000 pounds, CMAA 74 Class A, B, C, or D, suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments.

Use SECTION 41 22 23.19 MONORAIL HOISTS (manual, electric, or air-powered).

Types of crane covered, (more than 9.07 tons 10 tons 9072 kg 20000 pounds, but less than 27 tons 30 tons 27215 kg 60000 pounds, including:

Top-running gantry and trolley, single or multiple-girder, with CMAA 70 or CMAA 74 service class of A through E. Control types and systems may be specified as follows:

1. Remote, Cab, or Pendant Crane Controls or a combination of the three can be provided.

2. Alternating current or direct current control systems can be specified.

Crane Terminology: - refer to DEFINITIONS in this specification.

a. Tracks for gantry crane travel may be at the same (gantry) or different (semi-gantry) levels, depending on the leg design and intended purpose. Trolley travel and leg position defines the type of gantry.

b. Top-running Trolley is a trolley which travels on the top surfaces of rails of the gantry girder(s).

c. Types of Gantry Cranes may include; Deck-Leg Gantry, Through-Leg Gantry, Semi-Gantry Deck-Leg, Semi-Gantry Through Leg, Outdoor Storage or Hauling Gantry, and Polar Gantry.

Show the following information, as a minimum, on the project drawings:

1. Complete details of plan, elevations, and sections of Gantry Crane system including data.

[4. Runway girder size (for semi-gantry applications).]

5. Channel cap size.

7. Electrical junction box location (including mounting height).

1.2 DEFINITIONS

a. Crane Bridge: That part of an overhead crane system consisting of girder(s), end trucks, end ties, walkway, and drive mechanism which carries the trolley(s) and travels along the runway rails perpendicular to the gantry runway.

b. Crane Runway: The track system along which the crane operates horizontally, including track, track hangar rods, track connection devices, and runway structural supports.

c. Dead Loads: The loads on a structure which remain in a fixed position relative to the structure.

d. Girder: The principal horizontal beam of the crane gantry. It is supported by the crane end legs. Normally the crane trolley is mounted on top of the girder, and the hoist is suspended from the trolley to below the crane girder; however, the trolley and cab may also be suspended from the girder.

e. Live Load: A load which moves relative to the structure under consideration.

f. Pendant: A control for a hoist and/or a crane. The pendant hangs from the hoist or the crane by a cord at a height that is easy for the operator to reach.
g. Rated Load: For the purpose of this specification the rated load is defined as the maximum working load suspended under the load hook.

h. Standard Commercial Cataloged Product: A product which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing on the manufacturer's published product data sheets. These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

i. Top Running Crane: An electric overhead traveling (OET) crane that runs on rails on top of support beams (bridge girders); or OET with equal or unequal legs supporting a girder, trolley, hoist (and cab) which travels horizontally on legs. The load is supported by the entire cross-section of the beam in bridge cranes. The load is carried by the cross-section of the beam supported by movable legs for a gantry crane, distributing the load to the legs, wheels, and gantry track.

j. Trolley Mounted Hoist: A combined unit consisting of a wheeled trolley that provides horizontal motion along the gantry girder, and a hoist suspended from the trolley, that provides lifting and lowering of a freely suspended load.

k. Under running (Underhung) Crane: An electric overhead traveling crane that is supported by crane end trucks suspended below the crane runway. The load is supported by hanging from the lower flange of a beam.

1.3 SYSTEM DESCRIPTION

The requirements for the crane runway and rail supporting structures are specified in Section 05 12 00 STRUCTURAL STEEL.

[1.3.1 Load and Sizing Calculations

**************************************************************************
NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys.
**************************************************************************

Submit complete list of equipment and materials, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Submit calculations verifying the sizing of the gantry girder, end trucks and travel drives. Include seismic analysis of gantry girder and end trucks.]

]1.3.2 OET Design Criteria

**************************************************************************
NOTE: Clearly show the area of hook coverage, runway dimensions, rail size, hook vertical travel, clear hook height and lifting capacity on drawings.
**************************************************************************

Cranes will operate in the given spaces and match the runway dimensions and
rails indicated. Hook coverage, hook vertical travel, clear hook height, lifting capacity, and load test weight shall not be less than that indicated.

1.3.2.1 General

**************************************************************************
NOTE: Add number of cranes, building name, crane span and rated load capacity expressed in tons pounds. The last sentence may be deleted if only one hoist system is in project.
**************************************************************************

Include the following: Number of cranes [______], located in building identified as [______], the required span, and the rated capacity expressed in [______] metric tons tons kilograms pounds, for each OET. Also clearly locate and identify each multiple girder hoist and system components.

1.3.2.2 Classification

**************************************************************************
NOTE: CMAA 70 covers top running bridge and gantry electric overhead traveling cranes with a duty rating of A, B, C, D, E and F. CMAA 74 covers top running and under running single girder electric traveling cranes utilizing an under running trolley with a duty rating of A, B, C and D. Make a selection from the following CMAA 70 and CMAA 74 service classifications.
**************************************************************************

Class A (Standby or Infrequent Service): This service covers cranes which may be used in installations such as powerhouses, public utilities, turbine rooms, motor rooms and transformer stations where precise handling of equipment at slow speeds with long, idle periods between lifts are required. Capacity loads may be handled for initial installation of equipment and for infrequent maintenance.

Class B (Light Service): This service covers cranes which may be used in repair shops, light assembly operations, service buildings, light warehousing, etc., where service requirements are light and the speed is slow. Loads may vary from no load to occasional full rated loads with 2 to 5 lifts per hour, averaging 3 m 10 feet per lift.

Class C (Moderate Service): This service covers cranes which may be used in machine shops of paper mill machine rooms, etc., where service requirements are moderate. In this type of service the crane will handle loads which average 50 percent of the rated capacity with 5 to 10 lifts per hour, averaging 4.5 m 15 feet, not over 50 percent of the lift at rated capacity.

Class D (Heavy-Duty): This service covers cranes which may be used in heavy machine shop, foundries,
fabricating plants, steel warehouses, container yards, lumber mills, etc., and standard duty bucket and magnet operations where heavy-duty production is required. In this type of service, loads approaching 50 percent of the rated capacity will be handled constantly during the working period. High speeds are desirable for this type of service with 10 to 20 lifts per hour averaging 4.5 m 15 feet, not over 65 percent of the lifts at rated capacity.

Class E (Severe Service): This type of service requires a crane capable of handling loads approaching rated capacity throughout its life. Applications may include magnet, bucket, magnet/bucket combination cranes for scrap yards, cement mills, lumber mills, fertilizer plants, container handling, etc., with 20 or more lifts per hour at or near the rated capacity.

Class F (Continuous Severe Service): This type of service requires a crane capable of handling loads approaching rated capacity continuously under severe service conditions throughout its life. Applications may include custom designed specialty cranes essential to performing the critical work tasks affecting the total production facility. These cranes must provide the highest reliability with special attention to ease of maintenance features.

**************************************************************************
Provide crane designed and constructed to [CMAA 70 Class [____], [____] service][CMAA 74 [Duty Class A][Duty Class B] [Duty Class C] service] requirements for operation in [indoor][outdoor][hazardous][non-hazardous] environment with [multiple girder hoist system][electric chain hoist conforming to ASME HST-1][electric wire rope hoist conforming to ASME HST-4].

1.3.2.3 Rated Capacity and Speeds

NOTE: Auxiliary [monorail hoist][multiple girder hoist] may be specified. VFAC drive should be specified if precise handling and position are required. VFAC drives are normally capable of driving the crane at 5 mm/s 1 fpm or less. Delete reference to VFAC-drive and auxiliary hoist if not applicable.

Delete micro-drive and columns from the table if not applicable.

**************************************************************************
Provide crane conforming to [CMAA 70][CMAA 74] with rated capacity of [_____] metric tons tons kg pounds.[Provide auxiliary hoist with [_____] metric tons tons kg pounds capacity.] Lower load block or assembly of hook, swivel bearing sheaves, pins and frame suspended by the hoisting ropes are not considered part of the rated capacity. Rated speeds (in meters/second fpm) for the hoist,[hoist micro-drive, gantry micro-drive, trolley micro-drive,] gantry and trolley at the rated load are as follows:
<table>
<thead>
<tr>
<th>Description</th>
<th>Minimum</th>
<th>Maximum</th>
<th>Micro-drive</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main Hoist</td>
<td>[_____]</td>
<td>[_____]</td>
<td>[   [____].]</td>

1.4 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
SD-02 Shop Drawings

1.5 QUALITY ASSURANCE

1.5.1 Manufacturer Qualification

Overhead Electric Traveling (OET) Crane(s) shall be designed and manufactured by a company with a minimum of 10 years of specialized experience in designing and manufacturing the type of overhead crane required to meet requirements of the Contract Documents.

1.5.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing and documentation of steel castings, hook assembly and nuclear safety as follows. Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane. Visually inspect and test load-carrying steel castings ASTM A668/A668M using the magnetic-particle inspection method per ASTM A275/A275M. Reference allowable degree of discontinuities to ASTM E125, and relationship to service loads and stresses, critical configuration, location and type. Methods of repairing the discontinuities is subject to review by the Contracting Officer.

1.5.3 Certificates

Submit an Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus 5 to minus 0) 131.25 percent of rated load. Also submit the following certificates:

a. stating that No Hazardous Material, including, but not limited to asbestos, cadmium, chromium, lead, elemental mercury, or PCB’s, is contained within system or components.

b. stating that the system is safe to perform a Loss of Power Test

c. stating that the Crane Runway System conforms to the requirements as specified herein and as specified in Section 05 12 00 STRUCTURAL STEEL.

d. Certificate of Compliance with Listed Standards

e. Provide manufacturer's Wire Ropes Breaking Strength certification that each rope meets the published breaking strength, or actual breaking strengths, of samples taken from reels and tested. Certifications shall be traceable to the crane and to the hoist to which the wire rope is installed. Wire rope must conform to ASTM A1023/A1023M, and ASTM A931.

f. Hook NDT Reports

1.5.4 NDT Vendor Certification

Provide certification that the NDT vendor meets the requirements of ASTM E543. Provide the NDT report to the Government which is traceable to the unique ID number on the hook and nut.

a. Submit for review the NDT vendor's procedures, including technique
sheets specific to the types, shapes, and sizes of the parts being examined (e.g., shank hook, eye hook, duplex hook, eye bar, nut).

b. For the magnetic particle method, adequately describe the procedures for the orientation of the hooks, nuts, or pins with the magnetizing equipment. Procedures shall bear the approval of an independent Level III examiner.

c. Prior to performing any operational testing of the cranes, inspect the hook and hook nut by the magnetic particle method (MT) over their entire surface area[ in accordance with NAVSEA Technical Publication T9074-AS-GIB-010/271]. ASTM A275/A275M may be used with the following restrictions:

1. Do not use DC yokes (including switchable AC/DC yokes used in the DC mode) and permanent magnet yokes;
2. Do not use automatic powder blowers or any other form of forced air other than from a hand-held bulb for the application or removal of dry magnetic particles;
3. Remove all arc strikes;
4. Equipment ammeters shall have an accuracy of plus/minus 5 percent of full scale (equipment ammeter accuracy other than that stated is acceptable provided the MT procedure states that a magnetic field indicator is used to establish and verify adequate field strength for all aspects of the inspection).
5. If NDT cannot be performed on surfaces inside holes, visually inspect those surfaces to the maximum extent practical. Acceptance criterion is "no linear indications greater than 1/16 inch".

1.5.5 Overhead Electric Traveling (OET) Crane(s)

a. Submit shop drawings detailing all OET Design Criteria, showing the general arrangement of all components in plan, elevation, and end views; hook approaches on all four sides, clearances and principal dimensions, assemblies of hoist, trolley and gantry drives, and complete schematic wiring diagram with description of operation, and Runway Electrification System. Include weights of components and maximum gantry wheel loads and spacing.

b. Provide shop drawings whose quality is equivalent to the contract drawings accompanying this solicitation.

c. Provide integral schedule of crane components on each drawing. Provide maximum wheel loads (without impact) and spacing imparted to the crane runway system track beams. Indicate the crane speeds along the runway, the trolley speeds along the gantry girder, and the hoist lifting speeds; all speeds indicated are speeds with hoist loaded with rated crane capacity load.

[1.5.6 Welding Qualifications and Procedures

Perform welding in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures shall specify the Contractor's standard dimensional tolerances for deviation from camber and

### 1.5.7 Safety Requirements

**NOTE:** Certification is required for cranes handling nuclear materials. Results from the Safety Analysis will be utilized by the Using Agency as a basis for gantry crane certification. Delete this paragraph if the crane is not required to handle nuclear materials.

### 1.6 DELIVERY, STORAGE, AND HANDLING

Protect all delivered and stored equipment from the weather, humidity, temperature variations, dirt and dust, and other contaminants.

### 1.7 EXTRA MATERIALS

**NOTE:** The extent to which spare parts are stocked is an economic judgment determined by the user. The impact of downtime expense must be weighed versus the prompt availability and amount of cost allocated to spare parts. Power plant cranes, and similar use cranes receive severe service during the plant construction period, and normal wearing parts should be maintained at the project site.

Submit spare parts data for each different item of material and equipment specified and/or as recommended by the manufacturer, after approval of the detail drawings and not later than [_____] months prior to the date of beneficial occupancy. Include in data a complete list of parts and supplies, with current unit prices and source of supply. Furnish and deliver one set of manufacturer's recommended spare parts to the site. Suitably package the spare parts for long-term protection and storage. Legibly label the packaging to identify the spare parts. Also include a list of the furnished spare parts in the Maintenance manual.

### PART 2 PRODUCTS

#### 2.1 MATERIALS

##### 2.1.1 General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally
functional cranes including necessary ancillary equipment.

2.1.2 Nameplates
Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two gantry identification plates, one for each side of gantry. Provide noncorrosive metal identification plates with letters which are easily read from the floor, showing a separate number such as BC-1, BC-2, for each gantry crane.

2.1.3 Prohibited Use of Asbestos Products
Materials and products required for designing and manufacturing cranes shall not contain asbestos.

2.1.4 Capacity Plates
Two capacity plates indicating the crane capacity in metric tons and tons kilograms pounds are required, one secured to each side of gantry. Fabricate each capacity plate with a steel backing plate and exterior quality/fade-resistant stick-on labels with letters large enough to be easily read from the floor. Place capacity plates in a location visible to pendant operator's position after the crane has been installed.

2.1.5 Safety Warnings
Affix labels in a readable position to each lift block or control pendant in accordance with ASME B30.16, ASME B30.2 and ASME B30.17. Submit safety warnings, diagrams and other framed instructions suitably framed and protected for display as indicated by the Contracting Officer as follows:

a. Design and locate the word "WARNING" or other legend to bring the label to the attention of the operator. Provide durable type warning labels and display the following information concerning safe-operating procedures:

Cautionary language against lifting more than the rated load; operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; operating damaged or malfunctioning hoist; operating a rope hoist with a rope that is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

b. To avoid operation of the crane in the wrong direction, affix the appropriate directions, with arrows, NORTH, SOUTH, EAST and WEST on the bottom of the girder where they can be easily seen by the operator. Labels on the controls shall have corresponding direction (NORTH, SOUTH, etc.). Markings shall agree with the markings on control pendant. Do not indicate directional arrows on control pendant.

2.2 STRUCTURAL MATERIALS

2.2.1 Bolts, Nuts and Washers
2.2.2 Gantry Girder or Girders

**************************************************************************
NOTE: Specify welded structural steel box sections for multiple girder cranes Class C, D, or E with a capacity greater than 18 metric tons 20 tons 16330 kg 36,000 pounds or a span greater than 12 m (40 feet).
**************************************************************************

Provide[ welded structural steel box section][ wide flange beam, standard I-Beam, reinforced beam or section fabricated from rolled plates and shapes ] gantry girders.

2.2.3 Gantry Rails or Bars

**************************************************************************
NOTE: Remove this paragraph for underhung cranes and cranes having a capacity less than 18 metric tons 20 tons 16330 kg 36,000 pounds (many crane manufacturers do not need or want rails or bars).
**************************************************************************

Trolley runway rails, crane girders and other sections shall be straight and true. When loaded with motor driven cranes the deflection of rails shall not exceed 1/888 of the span. Calculate the deflection with the worst case of two loaded gantry cranes located adjacent each other. Make all rail joints flush and true without misalignment of running tread and design to minimize vibration. The gap between adjacent rail ends and the vertical misalignment of running treads shall not exceed 1.588 mm 0.0625 inch. Level the gantry rail to a plus-or-minus 3 mm 1/8 inch at all rail support joints. Fasten upper gantry rail to[ top cover plate][ wide flange] or centered on flange or offset near web plate for welded box sections, complete with welded clips. Bolt gantry rail joints using standard joint bars. Stagger rail joints. Provide a positive stop at gantry rail ends to prevent creep.

2.2.4 End Ties and Gantry Girder End Connections

**************************************************************************
NOTE: Specify end ties for cranes with more than four wheels. Specify welded structural steel box sections for multiple-girder cranes Class C, D, or E with a capacity greater than 18 metric tons 20 tons 16330 kg 36,000 pounds or a span greater than 12 m 40 feet.
**************************************************************************

Use welded steel box sections for end ties. Provide full depth diaphragms at girder connections and jacking points. Provide horizontal gusset plates at the elevation of top and bottom end tie flanges for connection to girder ends. Make end connections with high-strength bolts per AISC 325. Use body-bound bolts fitted in drilled and reamed holes to maintain the crane square.

2.2.5 Gantry End Trucks

Provide[ rotating][ fixed axle] type end trucks fabricated of structural...
tubes or from structural steel to provide a rigid box section structure. Provide jacking pads for removal of wheel assemblies.

[2.2.6] Trolley Frame

**************************************************************************

NOTE: Trolley frame is applicable only to multiple girder cranes.
**************************************************************************

Provide trolley frame consisting of two structural steel side frames or trucks welded together with one or more structural steel load girts to form a one-piece unit. Provide pads for the use of jacks or wedges when changing truck wheels.

[2.2.7] End Stops and Bumpers

**************************************************************************

NOTE: Rubber bumpers dry out with time. Hydraulic type bumpers are more expensive. Using the words shock-absorbing allows the manufacturer to choose. Rubber like materials are not acceptable as an option.
**************************************************************************

Fit crane runways and gantry girders with structural steel end stops. Fit gantry end trucks and trolley frames with shock-absorbing, [spring][ or ] [hydraulic] type bumpers capable of decelerating and stopping the gantry and/or trolley within the limits stated by OSHA and MHI CMAA. Provide trolley end stops of sufficient strength to withstand the impact of a fully loaded trolley moving at 50 percent of maximum rated travel speed. When two gantry cranes are on the same runway, fit one crane with shock-absorbing bumpers on each face of each end-truck, and the other crane shall have shock-absorbing bumpers as per above on one face only of each end-truck which is the opposite face of the adjacent crane. Fit the other face of the end-truck with a structural steel stop to engage the bumpers of the adjacent crane. Provide gantry bumper stops as specified in Section 05 12 00 STRUCTURAL STEEL. Locate stops to permit maximum gantry and trolley travel.

[2.2.8] Footwalks

**************************************************************************

NOTE: Delete the following paragraph if footwalks are not required. Provide footwalk fall protection with guard rails or static line with safety belts.
**************************************************************************

The location and construction of footwalks shall conform to ASME B30.2. A full-length structural platform is required on the driver's side of the gantry. Provide[ checkered steel][ non-slip] flooring for platform, double member handrail and a suitable toe-guard, with 760 mm 30 inch clearance in front of control equipment. Minimum 380 mm 15 inch clearance is required in front of gantry machinery.[ To give access to the opposite side of the trolley, gantry conductors, or other equipment, mount a footwalk a minimum of twice the length of the trolley on the opposite side of the crane. Provide a cross-over footwalk over an end tie between the two girder footwalks.] Mate the drive side footwalk with the crane access platform. Make the length of the drive side footwalk[ adequate to provide access to
the trolley and provide sufficient room for mounting control cabinets] along the entire length of the gantry. Provide safety handrails for footwalks.

2.2.9 Runway Rails

Provide runway rail size as specified in Section 05 12 00 STRUCTURAL STEEL.

[2.2.10 Operator's Cab

******************************************************************************
NOTE: Applicable if a cab is specified, otherwise delete paragraph. Specify enclosed cab for outdoor use. Open cab may be used indoors. Enclosed cabs can be provided with a heating and/or air conditioning unit according to environmental conditions. Specify the location of cab and the direction the operator should face.
******************************************************************************

2.2.10.1 Design

Design and construct operator's cab in accordance with CMAA 70] [CMAA 74] [and ASME B30.2]. Locate cab access to facilitate entry and exit by crane operator. Provide space near cab entrance for storage of a carbon-dioxide, dry chemical, or equivalent hand fire extinguisher.

2.2.10.2 Cab Construction

Provide a [standing] [seated] type [fixed cab mounted on gantry] [trolley mounted cab] of the [enclosed] [open] type for [outdoor] [indoor] use, and designed to provide a clear view of the operating floor and hook for operator. Provide cab with a suitable [heating] [heating and air conditioning] unit. Locate cab on the [___] of the [gantry] [trolley] with the operator facing [____].

2.2.11 Additional Provisions for Outside Service

******************************************************************************
NOTE: This paragraph is applicable for outdoor cranes only.
******************************************************************************

Seal weld structural members on outdoor cranes. Provide crane gantries with parking brakes which will sufficiently hold the crane against a wind pressure of 244 Pa 5 psf for in-service conditions. Provide crane gantries with manually-operated pin locks at each rail, designed to securely anchor the crane against a wind pressure of 1.5 kPa 30 psf for out-of-service conditions.

2.3 MECHANICAL EQUIPMENT

2.3.1 Variable Frequency Drives

2.3.1.1 Gantry Drives

******************************************************************************
NOTE: If the span is less than 12 m 40 feet and the application is CMAA Class "A" or "B", then A-1 drive
may be included as an option. A-1 and A-4 drives are only referenced in CMAA 70, and if selected, delete the reference to CMAA 74.

**************************************************************************

Provide Variable Frequency AC (VFAC) [either the A-1 or A-4] gantry drive arrangement as specified in CMAA 70 or CMAA 74, consisting of a single electric motor mechanically connected through gear reduction and drive shafts to the drive wheels or separate drive motors at each end of gantry. Perform acceleration and deceleration meeting the requirements specified in this section. Gears shall conform to applicable AGMA standards. Provide gear reducers that are oil tight and fully enclosed with pressure or splash type lubrication. Gantry-travel limit-switches are optional.

2.3.1.2 Trolley Drives

Provide complete trolley drive arrangement with a minimum of two wheels driven by an integral electric motor. Drive mechanism shall run in totally enclosed oil bath. Limit switches are optional for drive mechanism. Provide acceleration and deceleration controls meeting the requirements specified in this section.

[2.3.1.3 Micro-Drives]

**************************************************************************

NOTE: Current industry standards use Variable Frequency Alternating Current Drives (VFAC) in lieu of micro-drive motors. The following paragraph is included in this section for instances where the micro-drive motors will not be replaced with newer VFAC drives. If micro-drives are not to be used, delete this paragraph.

Include those motions where a micro-drive is required. If micro-drive is not specified, delete these paragraphs. Micro-drives are generally required when slow speeds are required for an extended amount of time. If precision movement is required for limited time for final positioning of loads, use adjustable frequency or dc variable voltage crane controls instead of micro-drives.

**************************************************************************

Provide the following crane motions with a separate micro-drive: [main hoist,] [auxiliary hoist,] [trolley drive][ and ][gantry drive]. The micro-drives are used to precisely position loads. Provide each micro-drive with an electric motor, gear reducer, magnetic coupling clutch and necessary controls. Connect the output shaft of the reducer to an extension of the primary drive high-speed shafting with a magnetic coupling clutch. Coupling shall normally be disengaged and become engaged only if the micro-drive is required. Provide electrical clutch components, required for proper operation, conforming to the requirements specified in paragraph ELECTRICAL COMPONENTS. Provide magnetic coupling type clutches which engage and disengage the micro-drives from the high speed shafts of the main drive arrangement. The clutch shall be engaged by electromagnet and released by springs. Provide clutch ratings not less than 150 percent of the micro-motor rated torque as amplified by the intervening gearing. Provide clutch enclosures to facilitate easy access for wear inspection of the friction elements and visual examination of the clutch assemblies.
2.3.2 Gearing

Provide enclosed gear reducers type gearing. Gears and pinions shall be spur, helical, or herringbone type only, and be forged, cast or rolled steel. Open-type gearing is not acceptable, except for final drives. Provide gears and pinions with adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2001 Quality Class 6 or better precision per [AGMA ISO 10064-6] [AGMA ISO 17485] [AGMA 2011] [ANSI/AGMA 2015-1].

2.3.2.1 Gear Reducers

Provide gear reducers which are [standard items of manufacturers regularly engaged in the design and manufacture of gear reducers for Class D and E cranes][ or ][integral components of standard hoists or hoist/trolley units of manufacturers regularly engaged in the design and manufacture of hoists or hoist/trolley units for Class A, B or C cranes]. Provide gear reducers designed, manufactured and rated in accordance with ANSI/AGMA 6113 ANSI/AGMA 6013 (for trolley drives only), as applicable. Except for final reduction, provide the gear reduction units with fully enclosed in oil-tight housing. Design gearing to AGMA standards and to operate in an oil bath. Operation shall be smooth and quiet.

2.3.2.2 Open Gearing

Provide gears and pinions possessing adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2001 quality class 6 or better precision per [AGMA ISO 10064-6] [AGMA ISO 17485] [AGMA 2011] [ANSI/AGMA 2015-1]. Enclose open gears with safety guard removable covers over openings for inspection and access for grease lubrication.

2.3.3 Hoist Brakes

a. General: In addition to the requirements of CMAA 70, provide shoe, disc, or conical type brakes with thermal capacity suitable for class and service specified in this section. Shoe, disc, and conical brakes shall be spring-set and electrically-released by a continuously rated direct acting magnet. Provide brakes which are self-aligning and easily adjusted for torque setting and lining wear. Use brake lining material which is asbestos free. Provide cast iron brake wheels conforming to ASTM A159 or the manufacturer's standard high-strength ductile cast-iron brake wheels, provided that the material exhibits wear characteristics in the form of powdered wear particles and is resistant to heat-checking. Provide disc brakes totally enclosed and having multiple discs with stationary releasing magnets. Brake torque shall be easily adjustable over a 2:1 torque range.

b. Gantry Brakes: Provide gantry braking system with a spring-applied and electrically-released single shoe, disc, or conical brake for each gantry drive motor. Braking system which automatically sets when controls are released or power is interrupted. Make provisions to facilitate easy brake adjustment. Provide brakes with a torque rating of at least 50 percent of gantry drive motor rated torque.

2.3.4 Wheels

**************************************************************************

NOTE: Include the second sentence for CMAA 70 class
D and E, cranes; otherwise delete. Include the requirement for trolley wheels only for multiple girder cranes.

Furnish wheels manufactured of rolled or forged steel. Wheel treads and flanges shall be rim toughened to between 320 and 370 Brinell hardness number. Provide double-flanged [gantry][gantry and trolley ]wheels. Trolley and gantry wheels shall have straight treads. Equip wheels with self-aligning double-row spherical roller-bearings of capacity as recommended by bearing manufacturer for design load of trolley or gantry.

2.3.5 Bearings

NOTE: Equalizer sheaves compensate for unequal length, stretch of the hoisting, and swinging of the load block.

All bearings, except those subject to a small rocker motion, shall be anti-friction type. Provide a means for lubrication for bearings not considered lifetime lubricated by the manufacturer. Equip equalizer sheaves with sintered oil-impregnated type bushings in accordance with ASTM B438 or ASTM B439.

2.3.6 Anti-Drip Provisions

Design cranes to preclude leakage of lubricants onto the lifted loads, floor, or external grounds. Fit all equipment and components which cannot be made leak-proof with suitable drip pans. Provide drip pans manufactured of steel and designed to permit removal of collected lubricant.

2.4 ELECTRICAL COMPONENTS

2.4.1 Explosion Proof Requirements

Provide equipment and wiring in locations indicated conforming to NFPA 70 for Class [I] [II] [III], Division [1] [2] hazardous locations. Provide equipment suitable for[ Group [_____]][ operating temperature of [_____] degrees C degrees F]. Provide wiring and equipment in locations indicated of the classes, groups, divisions, and suitable for the operating temperature as specified.

2.4.2 Control Systems

Provide a separate controller for each motor; however, use a duplex controller two motor gantry drives. Provide overload protection in conformance with the requirements of NEMA ICS 2 and mechanically and electrically interlock contactors that are used for starting, stopping, and reversing.
2.4.2.1 Travel Motion Control System

Provide AC inverter duty, totally enclosed non-ventilated (TENV), squirrel cage induction type bridge and trolley drive motors.

2.4.2.2 Drive Control System

Provide static reversing, adjustable frequency controllers conforming to [NEMA ICS 3], [NEMA ICS 8] for the hoist, trolley, and bridge infinitely variable electric drives. Provide dynamic braking. Provide two step infinitely variable speed control for the bridge and trolley functions, controlled via pendant pushbuttons. The trolley, and bridge brakes shall set after associated controller decelerates motor to a controlled stop. Size the bridge and trolley controllers to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 131.25 percent of rated load on the hook and not produce any hook rollback. Drive motors shall run smoothly, without torque pulsations at the lowest speed, and be energized at a frequency not exceeding 60 HZ.

2.4.3 Power Sources

2.4.3.1 System Supply Voltage

Design cranes to be operated from a [_____] volt, three-phase, 60 Hz, alternating current] direct current system power source. Design energy isolating devices for such machine or equipment to accept a lockout device in accordance with NFPA 70.

2.4.3.2 Transformers

*************************************************************************
NOTE: This paragraph is applicable to ac power supplies only.
*************************************************************************

Provide dry type transformers and carry full load continuously at rated voltage and frequency without exceeding an average temperature rise of 115 degrees C above an ambient temperature of 40 degrees C. Provide transformer with totally enclosed case finished with manufacturer's standard coating system. Fully encapsulate transformers, except for those specifically designed for use as an isolation transformer for static power conversion units.

2.4.4 Motors

*************************************************************************
NOTE: Motor heaters are desirable for outdoor cranes, unheated warehouse service cranes, or any other condensing high-humidity application, but specify heaters only if an integral component of the hoist and motor manufacturer. Select a motor from the following types and coordinate with the desired control type.
*************************************************************************

Select industrial motors for CMAA 70, Class A, B, C and D cranes, as follows:
a. For critical load handling, self-excited alternator with electrical load brakes or emergency dynamic braking is preferred.

b. Select crane type motors for ac motors.

c. Select 800 Series dc mill type motors or dc industrial motors for dc motors.

d. If crane and/or industrial type motors are specified, select NEMA MG 1.

Select mill motors for CMAA 70, Class E cranes, as follows:

a. If 800 Series dc mill type motors are specified, select AISLE Std No. 1.

b. Select dc motor type (squirrel cage, wound rotor) for the appropriate control system.

c. Select dc series wound motors for dc constant potential control.

d. Select dc shunt wound for dc variable voltage control.

e. Select ac motor (squirrel cage, wound rotor) for the appropriate control system.

2.4.4.1 General Requirements for Motors

a. Provide motors designed specifically for crane and hoist duty. Provide drain holes at low points near each end; inspection and service covers with gaskets; and hardware which is corrosion-resistant. Provide motors conforming to the requirements of NFPA 70, [NEMA MG 1] and UL 1004-1.

b. Motor heaters shall energize when mainline contactor is de-energized, and water heaters de-energize when mainline contactor is de-energized. Provide motors 15 kW 20 HP and larger with a suitable heater to prevent condensation during long periods of inactivity. Provide motor heater which is an integral component of the hoist and motor manufacturer.

c. Provide one embedded thermal sensitive device in hoist motor windings. Device and associated circuitry shall serve as an alarm activating an amber signal or pilot light visible to control stations when motor temperatures become excessive. Establish set point below the Class B insulation temperature limit. Thermal-sensitive device and associated circuits shall be self-restoring (automatic reset). Two-speed, two-winding motors with a solid-state control are not allowed for creep-speed use.

2.4.4.2 Gantry and Trolley Drive Motors

Provide [ac crane type] [dc industrial type] [800 Series dc mill type] [[single-speed; single-winding] [two-speed; two-winding]] [NEMA design B squirrel cage ac type rated] [wound rotor ac induction type] [ac type
designed for ac adjustable frequency operation] [dc series wound type] [dc shunt-wound type] gantry and trolley drive motors.

2.4.4.3 Motor Enclosures

**************************************************************************

NOTE: Applicable to 1 or 2 speed ac magnetic control of ac squirrel cage motor. If it is not desirable to have the motor immediately reverse direction, include sentence on plugging to allow the motor to stop prior to reversing direction. If excessive load swing cannot be tolerated during the start of the gantry or trolley, include sentence on reduced voltage starting.

a. Select drip-proof enclosure for indoor usage, except in a hazardous atmosphere.

b. Select totally enclosed nonventilated enclosure for outdoor use and indoor use in a hazardous atmosphere.

c. Select totally enclosed fan cooled enclosure for motors operating at rated speed for long periods.

d. Select forced ventilated enclosure for Class E service.

**************************************************************************

Provide motor enclosures which are [totally enclosed, non-ventilated (TENV)] [totally enclosed, fan cooled (TECH)] [totally enclosed, air-over frame (TAO)] [drip-proof] [drip-proof forced ventilation] conforming to NEMA 250.

2.4.4.4 Motor Insulation and Time Rating

**************************************************************************

NOTE: For gantry and trolley motors, select Class F or H insulation based on rated temperature rise of 105 (Class F)/125 (Class H) degrees C by resistance above a 40 degree C ambient for CMAA Class A, B, C cranes and CMAA 74 cranes with ac or dc magnetic control and electrical control braking.

For gantry and trolley motors, select Class F insulation for Duty Class H1, H2, and H3 hoists and CMAA 70 Class A, B, C cranes and CMAA 74 cranes with ac or dc magnetic control.

For all motors, select Class F or H insulation with a rated temperature rise of 105 (Class F)/125 (Class H) degrees C by resistance above a 40 degree C ambient for CMAA 70 Class A, B, C and CMAA 74 cranes with ac or dc static controls.

For all motors, select Class F or H insulation based on a rated temperature rise of 105 (Class F)/125 (Class H) degrees C by resistance above a 40 degree C ambient for CMAA 70 Class D and E cranes.
Delete frame size selection if not needed for the project.

**************************************************************************

Provide motors with [Class F] [Class H] rated insulation based on an [105] [125] degree C motor temperature rise above 40 degrees C ambient, with frame size selection based on continuous ratings.

[2.4.4.5  Micro-Motors]

Micro-motors for gantry [and trolley] drives shall be [direct current industrial type, shunt wound motors] [industrial type, single-speed; single-winding; ac squirrel cage motor] and conform to the requirements of NEMA MG 1. Provide totally enclosed micro-motor, fan cooled (TEFC), with Class F or H insulation. Motor voltage rating shall comply with system supply voltage rating specified.

[2.4.5  Electric Hydraulic Brakes]

[2.4.5.1  Travel Brakes]

**************************************************************************

NOTE: Delete this paragraph if hydraulic braking system is not required.

If electric brakes are used, provide a drift point so the brakes will release after the motor is de-energized, thereby allowing the motion to coast and reduce swing of the load. A drift point can also allow the trolley to center itself over the load before actually starting to lift.

For pendant control cranes and cab controlled cranes where hydraulic braking is not desired, select spring-applied electrically-released brakes.

For cab operated cranes, specify electric-hydraulic brakes for gantry or trolley brakes except in the case of constant speed/speed regulated (at a particular controller setting) type controls.

Limit electric-hydraulic brakes to ac magnetic or secondary saturable reactor and dc magnetic controls for ac wound rotor motors and dc series/compound wound motors respectively. Limit electric-hydraulic brakes to gantry brakes on gantry mounted cabs and trolley brakes for trolley mounted cabs.

Do not specify electric-hydraulic brakes for the following:

a. Single and multi-speed magnetic control of squirrel cage motors.

b. Alternating current adjustable frequency control of squirrel cage motors.

c. Direct current variable voltage control of shunt
wound ac motors.

Provide electric-hydraulic [gantry ] [trolley ] brakes which are dc shunt magnet type equipped with hydraulic actuators manually-operated with a foot-operated master control unit in the operator's cab, and electrically released with the operation of the mainline contactor POWER-OFF pushbutton or power failure. Provide remote control bleeders operable by pushbutton and foot pedal except for power-assisted brake systems. Remote control bleeders shall be complete with pushbutton clearly labeled and located in operator's cab where the operator can easily depress the pushbutton and pump the brake simultaneously. In lieu of the combination electric-hydraulic brakes, separate hydraulic and electric brakes may be provided. Design hydraulic brake system to ensure equal pressure at each brake cylinder.

2.4.5.2 Hoist Brake Time Delay

NOTE: Delete this paragraph if one brake is specified.

Provide one of the hoist holding brakes with a time-delay setting (from 1 to 3 seconds). Initiate the time-delay upon releasing the control pushbutton or returning the master switch to OFF. Operation of mainline POWER-OFF pushbutton or power failure shall result in each hoist brake's setting without any time-delay.

2.4.5.3 Automatic Stop System

Provide fail-safe spring set electrically-controlled brakes when power is interrupted. Release brakes with a mainline contactor POWER-OFF pushbutton or a master switch for the associated drive. Brakes shall automatically stop when there is a power failure. Design electric system to be mechanically released. Provide enclosures for electrical-controlled brake components conforming to NEMA ICS 6 Type [____]. Provide direct current shunt magnetic shoe brakes with an electrical forcing circuit for rapid release of brake. Circuit each shunt coil brake for both conductors to open simultaneously when the brake is de-energized.

2.4.6 Controls

2.4.6.1 Control Panels

NOTE: Control panel heaters are desirable for outdoor cranes, unheated warehouse service cranes or any other condensing high-humidity application.

Alternating current or dc static crane control for outdoor cranes need thermostatically-controlled panel heaters for outdoor panels or any other application which is colder than 0 degrees C. Alternating current or dc static crane control may need both thermostatic control and mainline contactor control.
Fabricate control panels of solid sheet steel designed and constructed to conform to requirements of NEMA ICS 6 Type [____]. [Provide thermostatically-controlled heaters to keep control enclosure temperatures at or above 0 degrees C in each static crane control panel. ][Control panel heaters shall be energized when mainline contactor is de-energized, and be re-energized when mainline contactor is energized to prevent anti-condensation. ]Hinge and equip control panel doors with gaskets and fitted with key-lock handle design, complete with a single key to open all locks. Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.

2.4.6.2 Drift Point

===============================================================================================
NOTE: Provide gantry and trolley directions normally oriented to main compass headings.

Select method of festoon suspension. For multiple girder cranes select underneath footwalk and for single girder cranes select auxiliary girder. If a hoist thermal sensor is specified, include requirement for yellow pilot light. If a micro-drive is specified, include the sentence, "A 2-position [____]."

Pendant handles are required only if pendant is in an explosion area. Monorail cranes do not require an independent track for pendants.

===============================================================================================

Provide trolley and gantry main control systems with a drift point between OFF and first speed control point in each direction or have a separate pushbutton.

[2.4.6.3 Micro-Drive Motor and Clutch Control

Design micro-drive system such that when micro-drive is selected at control station, all main motors are disconnected, and all micro-drive clutches energized. Operation of micro-drive motors shall be from crane control station. Provide micro-motor control systems with single-speed in each direction by means of an electrically-operated, full-magnetic, [reduced ][full ] voltage type starter. Do not apply power to any micro-motor unless all clutches are fully engaged. If a clutch disengages during operation of micro-motors, the mainline contactors shall open and all brakes shall set. Prevent application of power to any main motor with any clutch engaged. Provide a transfer switch at crane control station to allow transfer from either mode of operation to the other only when all brakes have been set for not less than 5 seconds. Provide a single CLUTCH-ENGAGED green pilot light [at the pendant station ][in the cab ] when all clutches are energized; also provide individual CLUTCH ENGAGED pilot lights on drive control panels.

][2.4.7 Cab Control Station

===============================================================================================
NOTE: Delete this and the following four paragraphs if a cab is not required.

===============================================================================================

SECTION 41 22 13.16  Page 32
2.4.7.1 General

**************************************************************************
NOTE: Provide gantry and trolley directions normally oriented to main compass headings. If stepped speeds and/or drift point are specified, include the applicable requirements in this paragraph. Delete auxiliary hoist switch if not necessary for the project.
**************************************************************************

Accomplish crane control by a [gantry-mounted ] [trolley-mounted ] cab control. Provide spring-return to "OFF" for master switch operating handles, with [distinct drift point detents,] [distinct speed-point intents,] and OFF position latching. Provide NEMA Type 1 master switch enclosures. Provide POWER-OFF pushbutton with a red mushroom head and a green or black POWER-ON pushbutton. Provide the following cab master switches:

a. Main Hoist - up/down.
[ b. Aux Hoist - up/down.]
] c. Gantry - [_____] [____].
  d. Trolley - [_____] [____].
  e. POWER-OFF.
  f. POWER-ON.

2.4.7.2 Cab Indications

**************************************************************************
NOTE: If hoist thermal sensor is specified, include requirement for red light. Voltmeter applicable to dc control systems only. If rail clamps are specified, include sentence regarding rail clamp operation and indication. If flood lighting is specified, include requirement for toggle switch.
**************************************************************************

Provide red pilot lights to indicate excessive hoist motor temperature. Provide a white pilot light to indicate that power is available on load side of crane disconnect switch. Provide a blue pilot light to indicate that the main contactor is energized. [Supply a minus 300 to plus 300 Dc voltmeter to monitor the main rectifier output voltage, and provide a selector switch to select the voltage to be monitored.] [Provide a red pilot light to indicate the rail clamps are set.] [Provide a single-toggle switch to operate crane floodlights.] [Provide a single green pilot to indicate all micro-drive clutches are engaged.]

[2.4.7.3 Cab Controls

**************************************************************************
NOTE: Delete this paragraph if combination controls (cab and pendant or cab and radio control) are not used. If it is desirable to raise the pendant out
of the way, include the last sentence. Otherwise, delete.

**************************************************************************

Provide cab with a 2-position key-operated switch to allow transfer of control from cab to [pendant ][radio control ] station and a red pilot light mounted in cab to indicate that the control has been transferred to other station. Selection of one operating station shall lock out the controls of other stations. [ Also provide a 2-position switch to raise and lower the pendant station.]

[2.4.7.4 Cab Heating & Ventilating [& Air-Conditioning]

**************************************************************************

NOTE: If heating or air conditioning of the cab is required, edit this paragraph to specify design requirements; otherwise delete this paragraph. Refer to UFC 3-400-02, "Design: Engineering Weather Data" ambient temperatures for cab heating and air conditioning.

**************************************************************************

Provide thermally-insulated cab with [air-conditioner][ and electric heater]. Provide a filter unit to pressurize the cab with filtered outside air. Provide air filter which is a standard commercial type capable of removing airborne dust and located where it can be readily cleaned or changed. Provide adjustable thermostat to control [air conditioner][ with heater]. The unit shall meet the Energy Efficient requirements of ASHRAE 90.1 - SI ASHRAE 90.1 - IP. Keep the cab interior at 18 degrees C 65 degrees F in winter with [_____] degrees C F ambient temperature and [_____] degrees C F in summer with [_____] degrees C F dry bulb and [_____] degrees C F wet-bulb ambient temperatures. Provide corrosion-resistant material or protection against corrosion for all other hardware and components. Mount motor compressor assembly on vibration isolators.

][2.4.8 Pendant Control Station

**************************************************************************

NOTE: Delete the following paragraphs if pendant control is not specified. If the crane is higher than 18 m 60 feet above the operating floor and the span is greater than 15 m 50 feet, consider including a pendant drive for ease of movement of the pendant if it is not towed by the trolley; otherwise delete this paragraph. Pendant drive speed should be the same as the trolley.

**************************************************************************

[2.4.8.1 General

Provide NEMA Type [1] [3R] [7] [9] [12] pendant control station. Hold physical size of pendant to a minimum. Provide a separate cable of corrosion-resistant chain consisting of minimum 6.4 mm 1/8 inch wire. Attach pendant station to [underside of crane gantry footwalk ][an auxiliary girder ] and hang vertically with bottom of pendant at 1 m 40 inches above floor. Do not support weight of pendant by control cable.
2.4.8.2 Operating Pushbuttons

NOTE: Provide gantry and trolley directions normally oriented to main compass headings. Select method of festoon suspension: For multiple girder cranes select underneath footwalk and for single-girder cranes select auxiliary girder. If a hoist thermal sensor is specified, include requirement for yellow pilot light.

Provide heavy-duty, dust-and-oil-tight type operating pushbuttons with distinctly-felt operating positions which meet requirements of NEMA ICS 2. Pendant control buttons shall be momentary pushbuttons. Provide recessed type pushbuttons (except the POWER-OFF button) to avoid accidental operation. Make diameter of buttons a size which will make operation possible with a thumb while holding the pendant with same hand. Provide nameplates adjacent to each pushbutton. Provide barriers on pendant between various pushbutton functions, except on elements mounted in junction box. In a multi-speed application, provide dual-position pushbuttons that have a definite click-detent position for each speed. Design and manufacture pushbuttons not to hang up in control case. Include with the pendant a separate set of pushbuttons for each motion and for POWER-ON POWER-OFF. Provide the following pushbuttons:

POWER-OFF.
POWER-ON.
Hoist-up.
Hoist-down.
[Gantry]-[____].
[Gantry]-[____].
Trolley-[____].
Trolley-[____].

2.4.8.3 Light Indicators

NOTE: Coordinate requirement for pilot lights and selector switches. Delete micro-drive if not applicable.

Provide pilot lights meeting heavy-duty requirements of NEMA ICS 5. Provide one red pilot light to indicate excessive hoist motor temperature on pendant station. Provide a blue pilot light to indicate that the main contactor is energized, and a white pilot light to indicate that power is available on the load side of crane disconnect switch. Provide a bright red mushroom head for the POWER-OFF pushbutton. Provide a 2-position selector switch to select between normal and micro-drive. Provide a single green pilot light to indicate all [micro-drive] clutches are engaged.]
2.4.8.4 Pendant Drive Control

******************************************************************************
NOTE: If the crane is higher than 18 meters 60 feet above the operating floor and the span is greater than 15 meters 50 feet, consider including a pendant drive for ease of movement of the pendant if it is not towed by the trolley; otherwise delete this paragraph. Pendant drive speed should be the same as the trolley.
******************************************************************************

Provide a 3-position momentary contact spring-return to OFF toggle switch to control the motorized trolley for pendant.

][2.4.8.5 Transfer of Control Stations

Provide pendant with a green pilot light to indicate that control has been transferred to pendant station from cab with key lock-out.

][2.4.9 Radio Remote Control, Infrared Remote Control

******************************************************************************
NOTE: Include this and the following paragraph if radio remote control or infrared remote control is desired; otherwise delete.
******************************************************************************

2.4.9.1 General

Equip crane with a complete digital radio remote-control system to permit full control of crane from a portable wireless transmitter. Provide a system which is the use-proven product of a manufacturer regularly engaged in design and manufacture of crane radio remote-control systems. Provide a "fail-safe" designed system so that the failure of any component or loss of signal will cause all crane motors to stop. The system shall permit complete, independent and simultaneous operation of all crane functions.[ Set system frequency in the 72MHz-76MHz band.][ Frequencies shall conform to FCC Part 15.] Include transfer relays in receiver if crane is also cab or pendant controlled.

2.4.9.2 Transmitter

******************************************************************************
NOTE: Provide gantry and trolley directions normally oriented to main compass headings.
******************************************************************************

Provide portable transmitter complete with an adjustable belt or harness. Crane motion switches shall spring-return to OFF. Provide transmitter with two spare batteries and battery charger to permit continuous operation. Provide a key-lock with the key removable in the OFF position only to control transmitter operation. Provide a blue signal light mounted on crane visible from floor to indicate the main contactor is energized. Make POWER-OFF toggle-switch bright red. Provide the transmitter with the following controls:

Hoist-up/down.
Gantry-[______].
Trolley-[______].
POWER-ON.
POWER-OFF.

2.4.10 Protection

2.4.10.1 Main Line Disconnect

Provide a main line disconnect consisting of a combination circuit breaker (50,000 AIC) and non-reversing starter, starter without overloads (mainline contactor) in NEMA Type [_____] enclosure. Control circuit of mainline disconnect shall cause all crane motions to stop upon mainline undervoltage, overload, control circuit fuse failure, or operation of POWER OFF pushbutton. Equip mainline disconnect with energy isolating devices designed to accept lockout devices.

2.4.10.2 Isolation Transformer

**************************************************************************
NOTE: Specify an isolation transformer and surge protection to protect electronics from external faults. Recommended for dc static control systems.
Applicable to ac power supplied systems only.
**************************************************************************

Provide an SCR drive type isolation transformer specifically designed for cranes, with a continuous rating which will exceed that required of the sum of rated full-load full-speed KVA of hoist plus 50 percent of rated full-load full-speed KVA of trolley and gantry motors plus the rated KVA of controls. Multiply the total KVA by 1.05 (efficiency factor). Connect the isolation transformer to the load side of mainline disconnect of the transformer. Supply crane dc static control electric power distributed on the crane through this isolation transformer.

2.4.10.3 Surge Protection

Provide surge suppressors meeting the requirements of UL 1449. Provide three metal oxide varistors on the line side of each SCR drive isolation transformer to provide transient over-voltage protection.

2.4.10.4 Circuit Breakers

Provide circuit breakers meeting the requirements of UL 489.

2.4.10.5 Overloads

**************************************************************************
NOTE: Select applicable overload protection based on control circuit type.
**************************************************************************

[Provide alternating current circuit overload relays of the ambient compensated, automatic reset, inverse time type located in all phases individual motor circuits. Arrange overload relays to de-energize the
associated motor on an overload condition.] [Provide an automatically reset inverse time-trip running overload relay for each dc motor circuit. Provide an automatically reset instantaneous trip overload relay in each dc motor circuit or for a pair of series-connected motors. Arrange overload relays to de-energize the associated motor on an overload condition.] [Alternating current adjustable frequency-control motor overload-protection shall be electronic and protected by inverse time and current versus output frequency which will allow less current for a given amount of running time when frequency (speed) is lower than rated.] [Provide electronic direct current variable voltage control motor overload-protection.]

2.4.11 Limit-Switches

**************************************************************************

NOTE: Delete reference to micro-drive control system if not applicable.
**************************************************************************

Provide heavy-duty quick-break double-pole double-throw type gear limit switches conforming to NEMA ICS 2. The geared limit-switch interruption of a motion in one direction shall not prevent the opposite motion. Geared limit-switches shall reset automatically. Provide NEMA Type [1] [4] limit switch housings. Provide limit-switches to interrupt power to the primary [and micro-drive ]control systems. Provide a geared limit switch to limit upward travel at an upper limit and a geared limit switch to limit downward travel at a lower limit. Provide also a block activated mechanical limit switch that removes power from the brake, motor and control drive simultaneously.

2.4.11.1 Gantry and Trolley Travel Limit-Switches

Provide runway (track-type) limit-switches for crane gantry and trolley motions to stop the gantry and trolley motions, respectively. Install limit-switch actuators on building and trolley frame to actuate the limit-switches and stop the crane gantry or trolley prior to contacting the trolley frame bumpers. Locate trip mechanism for trolley motion on crane runway to trip the switch before the bumper contacts the stop. Locate trip mechanism for gantry motion on crane runway to trip switch before bumper contacts the stop. When the switch is tripped, permit the switch opposite travel in the direction of stop and to automatically reset.

2.4.11.2 Rail Clamp Limit-Switches

**************************************************************************

NOTE: Include paragraph for outdoor cranes; otherwise delete. Delete reference to micro-drive when not applicable.
**************************************************************************

When rail clamps are set, furnish each rail clamp with a limit-switch designed to interrupt the primary [and micro-drive ]control circuits to gantry drive. Provide a red pilot light at control station to indicate the rail clamps are set.

2.4.12 Wiring

Perform wiring complying with Article 610 of NFPA 70. Number or tag wires at connection points. Make all splices in boxes or panels on terminals boards or standoff insulators. Base motor loop, branch circuit and brake
conductor selection on NFPA 70 for 90 degrees C 194 degrees F conductor rating on indoor cranes, and for 75 degrees C 164 degrees F conductor rating on outdoor cranes. Provide Type SRML conductors in the vicinity of resistors and conductors connected to resistors.

2.4.13 Electrification

2.4.13.1 Main Power Electrification

Main power electrification system shall provide power to crane starter/disconnect circuit breaker.

2.4.13.2 Crane Runway Conductors

**************************************************************************

NOTE: Select covered conductor bar system for:

a. Indoor non-hazardous service
b. Outdoor non-corrosive environment

Select festoon system for:

a. Indoor - hazardous service
b. Outdoor - corrosive (marine) environment

**************************************************************************

[Provide covered conductor bar type crane runway conductor system designed and manufactured to meet UL requirements. Provide rigid or flexible self-closing type protective cover designed to cover all live conductors and shaped to prevent accidental contact with conductors. Provide heavy-duty sliding shoe type collectors compatible with the electrification system. Provide two tandem designed collector heads for each conductor rail to provide redundancy.] [Provide festooned type crane runway conductor system consisting of a support rail, cables, junction boxes, cable cars and accessories. Hardware shall be corrosion-resistant or protected against corrosion. Festoon storage area shall not restrict the crane travel at the ends of runway.]

2.4.13.3 Gantry Span Conductors

Provide festooned type consisting of a support rail, electrical cables, junction boxes, cable cars and accessories] rigid conductor/collector type located within enclosure] gantry span conductor system. Do not allow cable loops to drop below the hook high position. Furnish corrosion resistant, outdoor crane gantry festoon, system hardware.

[2.4.13.4 Pendant Festoon System

**************************************************************************

NOTE: The pendant festoon system is an option to the Designer.

**************************************************************************

Provide pendant festoon system consisting of a support rail, cables, junction boxes, cable cars and accessories. Do not allow cable loops to drop below the hook high position. Provide pendant control car with NEMA Type [1] [3R] [12] junction box. Pendant festoon shall be[ towed by trolley][ independent of trolley motion]. Furnish corrosion resistant, outdoor crane, pendant festoon system hardware.
2.4.13.5 Pendant Drive System

Provide pendant festoon system with a motor-drive system capable of driving the pendant control car at [_____] m/s [fpm]. Control of pendant motor drive shall be from the pendant.

2.4.13.6 Pendant Retraction System

**************************************************************************
NOTE: Select method of pendant retraction if specified; otherwise delete paragraph.**************************************************************************

[Provide pendant control car with an electric-powered cable reel so that the pendant station will retract fully. ][Provide a wire-rope hoist to hoist the pendant station. Pendant and pendant drop-cable shall be retractable to approximately 1/3 of drop cable length. ]Control retraction system from cab.

2.4.14 Special Requirements

2.4.14.1 Warning Horn

**************************************************************************
NOTE: Delete last sentence if not applicable to project.**************************************************************************

Provide a solid-state electronic warning horn on the crane. Accompany any gantry or trolley motion by a continuous series of alternating tones.[ The warning horn shall not sound when the crane is in the micro-drive mode.]

2.4.14.2 Accessory Power

**************************************************************************
NOTE: If lighting, motor or control cabinet heaters or receptacles are specified, include the following paragraph if 460 volt ac is the power source. Select the components requiring power.**************************************************************************

Use three-phase 208Y/120 volt ac power supplied via a circuit breaker and isolation transformer from the line side of the main line disconnect for [lighting,] [heaters,] [and accessory circuits] on the crane. Provide the circuit breaker with a NEMA Type [1] [3R] [12] enclosure. The enclosure shall have provisions to lock the breaker in the OFF position. Provide each circuit breaker pole with individual thermal and magnetic trip elements and the enclosure cover with a button for mechanically tripping the circuit breaker. Supply three-phase 480 volt delta primary and 208Y/120 volt wye secondary general lighting transformer from the accessory circuit breaker and feed a 208Y/120 volt UL listed circuit breaker panelboard and a heater circuit breaker/combination starter. Provide a panelboard to supply branch circuits for utilization of various accessories such as [receptacles,] [lighting,] [panel internal lighting,] [motor heaters and control enclosure which meets NEMA requirements]. Transformer and panelboard shall have the same NEMA classification as the circuit breaker.
2.4.14.3 Receptacles

**************************************************************************
NOTE: Specify receptacles for multiple girder cranes. Specify ground fault protection for outside cranes. Delete requirement for receptacle in cab when not applicable.
**************************************************************************

Provide single-phase, 120-volt 15-amp, grounded, duplex type receptacles complete with metal weather-proof enclosure with self-closing weatherproof receptacle cover. Provide a receptacle on the trolley at each end of the front gantry walkway in the vicinity of gantry travel drive motors and in the cab. Provide several receptacles in the vicinity of the control equipment equally spaced every 3 m 10 feet. Breakers used to protect circuits supplying the receptacles for outside cranes shall incorporate ground fault current interruption feature and meet the requirements of UL 943.

2.4.14.4 Lighting

**************************************************************************
NOTE: Specify lighting for outdoor cranes or in dimly lighted areas.
**************************************************************************

Provide control panels with a 120-volt lamp fixture with an unbreakable lens and switch. Provide floodlights to illuminate the work area under the crane and drum area on crane, controlled from crane control station. Provide metal halide industrial floodlight luminaries. Totally enclose each floodlight, vapor-tight design, gasketed and provided with a heat-resistant and impact-resistant glass lens. Space and attach floodlights to underside of crane to provide uniform lighting.

2.4.14.5 Anti-Condensation Heaters

**************************************************************************
NOTE: Motor heaters recommended for outdoor cranes, unheated warehouse service cranes or any other condensing high-humidity application; if not desired delete this paragraph. Thermostatically-controlled heaters is a designer option.
**************************************************************************

Equip motor and control panels with anti-condensation heaters. Provide thermostatically-controlled heaters in each static-control panel to keep control enclosure temperatures at or above 0 degrees C. Provide NEMA Type [1] [3R] [12] enclosure for circuit breaker combination magnetic starter. Equip magnetic starter with manually-reset overload relays and interlock with the mainline disconnect so that anti-condensation heaters are de-energized when the mainline contactor is energized and the magnetic starter is energized when the mainline contactor is de-energized.

[2.4.14.6 Wind Indication and Alarm

**************************************************************************
NOTE: Specify location of wind alarm station for outdoor cranes, normally mounted near center of the gantry. Provide location of cutout. Delete
**************************************************************************
paragraph if not applicable.

Provide a wind-indicating device with an adjustable alarm trip point. Provide alarm trip with time-delay for wind gusts. Adjustable trip shall actuate an oscillating blue light and bell mounted near [_____] . Provide ability to cut off bell alarm from the[ pendant station][ cab].

2.4.14.7 Electrically-Driven Oil Pump Alarm

NOTE: Delete this paragraph for equipment which does not contain an oil pump.

Provide electrically-driven lubricating pump complete with an audible alarm and red light for indication of pump malfunction. Make location of alarm the factory standard location.

2.4.15 Load-Limit System

NOTE: Specify load sensing if loads approaching the capacity of the crane are to be lifted routinely.

Provide a load-limit visual/audible system for the main hoist to inform the operator that the preset load has been exceeded. Provide a load-limit system consisting of a load-cell, load-sensing electronics, overload indicator lights, overload alarm bell and alarm cut-out switch. Mount load cell to receive the load from equalizing sheave pin or upper block sheave pin. The alarm setpoint shall be adjustable.

2.4.15.1 Load-Sensing Electronics

Provide NEMA Type [1] [3R] [12] enclosures for load sensing electronics. Alarm setpoint shall be adjustable.

2.4.15.2 Alarm and Indicator Light

Provide an overload alarm light to indicate a load greater than the preset maximum. Indicate overload alarm with a red light and clearly labeled "OVERLOAD". Also provide a bell to indicate when an overload condition exists. Make provisions to turn off the bell from[ pendant station][ cab] [____].

2.4.16 Fungus Resistance

NOTE: Specify fungus resistance for cranes in marine or humid environments.

Coat electrical connections such as terminal connections, circuit connections, components and circuit elements with fungus-resistant varnish. Do not treat components and elements which are inherently inert to fungi or hermetically sealed. Do not treat elements whose operation will be adversely affected with the application of varnish.
2.5 ELECTROMAGNETIC INTERFERENCE SUPPRESSION

**************************************************************************
NOTE: Specify EMI suppression if electro-magnetic interference from the crane may be a problem to sensitive electronics in the work area.
**************************************************************************

2.5.1 Shielded Cable

Provide shielded type pendant and festooned cables of braided tinned-copper. Ground each cable shielding with a single connection to equipment grounding conductor.

2.5.2 EMI/RFI Shielded Boxes

2.5.2.1 General

Boxes designed to house electronic and electrical control equipment, instruments, metering equipment, etc., in installations where electromagnetic compatibility and/or system security is required shall protect interior components from stray radio frequency (RF) fields and contain RF signals produced by interior components.

2.5.2.2 Construction

Design Electromagnetic Interference/Radio Frequency Interference (EMI/RFI) shielded boxes to meet UL 50 Type 12 and Type 13. Construct the shielded boxes of [1.519] [1.897] mm [16] [14] gauge steel with seams continuously welded and ground smooth, without holes and knockouts. Cover gasket shall be a combination of woven plated steel mesh and oil-resistant gasket which will provide an EMI/RFI seal as well as an oil-tight, dust-tight and water-tight seal between cover and body. Attach gasket to cover with oil-resistant adhesive. Provide stainless steel cover clamps and screws which are quick and easy to operate on three sides of hinged cover for positive clamping.

2.5.2.3 Attenuation

Design EMI/RFI shielded boxes to provide maximum shielding of electric and magnetic components of radiated RF energy. Provide RF filters to suppress conducted radio frequency in cables and conductors. Provide shielded boxes with attenuation greater than 60 db at 14.5 KHz to greater than 100 db at 1 MHz for magnetic fields and greater than 100 db from 14.5 KHz to 430 MHz for electric fields.

2.5.2.4 Finish

Provide zinc-plated EMI/RFI shielded boxes in accordance with ASTM B633 SC3/Type II to provide corrosion-resistant conductive surfaces for gasket contact area and conduit entries. Match the finish coat with the crane finish.

[2.5.3 Hoist Drum Grounding

**************************************************************************
NOTE: A grounding drum is required for non-sparking environment only (general nuclear or explosive).
**************************************************************************
Provide a copper ring/collector assembly to ground each drum. Provide electrically-bonded ring to drum. Collector shall be stationary and connected to equipment grounding conductor system with a No. 8 AWG copper wire.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field and submit a letter describing the results of this verification including discrepancies to the Contracting Officer and crane manufacturer. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

3.2 ERECTION

Perform the entire crane erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's representative. Provide a written certificate from crane manufacturer indicating the crane is erected in accordance with manufacturer's recommendations before testing the completed installation.

3.2.1 Shop Assembly

Shop assemble major crane components as completely as possible. Match mark disassembled parts and tag electrical connections after complete no-load shop testing. Protect all parts and equipment at site from weather, damage, abuse and loss of identification. Erection procedures shall ensure that the crane is erected without initial stresses, forced or improvised fits, misalignments, nicks of high-strength structural steel components, stress-raising welds and rough burrs. Clean and repaint damaged surfaces after crane is erected. Provide all necessary grease and oil of approved quality and grade for the initial servicing and field test.

3.2.2 Mechanical Alignment

Align motors, couplings, brakes, gear boxes and drive components when reinstalled in accordance with manufacturer's instructions.

3.2.3 Electrical Alignment

Align control system in accordance with manufacturer's instructions. Store a copy of the final alignment data in control panel door, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents and test conditions such as ambient temperature, motor load, date performed and person performing the alignment.

3.2.4 Welding

Qualify or pre-qualify welders, welding operations and welding procedures in accordance with AWS D14.1/D14.1M. Perform welding indoors. Surface of parts to be welded shall be free from rust, scale, paint, grease or other foreign matter. Minimum preheat and interpass temperatures shall conform
to the requirements of AWS D14.1/D14.1M. Perform welding in accordance with written procedures which specify the Contractor's standard dimensional tolerances for deviation from camber and sweep. Such tolerances shall not exceed those specified in accordance with AWS D14.1/D14.1M. Allowable stress ranges shall be in accordance with CMAA 70. Perform welding of girders and beams conforming to AWS D14.1/D14.1M.

3.2.5 Field Painting

**************************************************************************
NOTE: The last sentence will only be required if the gantry crane is in an explosion proof area.
**************************************************************************

Painting required for surfaces not otherwise specified, and finish painting of items only primed at the facility, shall conform to SSPC SP 6/NACE No.3 and as specified in Section 09 90 00 PAINTS AND COATINGS. Paint gantry crane including gantry, trolley, hoist and all attached items in accordance with the manufacturer's standard practice. Paint the complete crane of one color. Paint gantry rail, supports and bracing in accordance with Section 09 90 00 PAINTS AND COATINGS. Do not paint items such as surfaces in contact with the rail wheels, wheel tread, hooks, wire rope, surfaces on the electrical collector bars in contact with the collector shoes and nameplates. Coordinate the requirements of explosion proof cables with cable manufacturer.

3.3 ACCEPTANCE TESTING

3.3.1 General

**************************************************************************
NOTE: This paragraph applies to new construction only. Specify the test weights required. The weights normally required are the rated load, 125 percent of the rated load and 10 percent of the rated load (for the grounding and the acceleration/deceleration test).
**************************************************************************

Provide all personnel necessary to conduct the required testing, including but not limited to, crane operators, riggers, rigging gear and test weights. Perform testing in the presence of Contracting Officer or his designated representative. Notify the Contracting Officer [_____] days prior to testing operations. Operate all equipment and make all necessary corrections and adjustments prior to the testing operations witnessed by Contracting Officer. A representative of the Contractor responsible for procuring and installing hoist equipment shall be present to direct the field testing. Use compact test loads and permit a minimum of 50 percent of vertical lift. Test loads shall be minus 0 percent to plus 5 percent of the required weight, and be verified prior to testing. Test weights required are [____], [____] and [____] kg [____], [____] and [____] pounds. Do not perform operational testing until after building interior has been painted. Furnish [three] [_____] copies of all test reports to Contracting Officer.

3.3.1.1 Test Sequence

Test crane in accordance with applicable paragraphs of this procedure in the sequence provided.
are no interferences.

3.3.1.2 Test Data

Record operating and startup current measurements for coils, hoist, trolley, and gantry motors using the appropriate instrumentation. Record speed measurements as required by facility evaluation tests (normally at 100 percent load). Compare recorded values with design specifications or manufacturer's recommended values. Abnormal differences shall be justified in the remarks and appropriate adjustments performed. Note any high temperatures or abnormal operation of any equipment or machinery, investigate and correct. Record hoist, trolley and gantry speeds during each test cycle.

3.3.1.3 Equipment Monitoring

Monitor improper operation or poor condition of safety devices, electrical components, mechanical equipment and structural assemblies during the load test. Report defects observed to be critical during the testing period immediately to the Contracting Officer and suspend the testing operations until the defects are corrected. During each load test and immediately following each load test, make the following inspections:

a. Inspect for evidence of bending, warping, permanent deformation, cracking or malfunction of structural components.

b. Inspect for evidence of slippage in wire rope sockets and fittings.

c. Check for overheating in brake operation; check for proper stopping. Test all safety devices including emergency stop switches and POWER-OFF pushbuttons and inspect separately to verify proper operation of the brakes. When provided, inspect all safety accessories including warning horn, lighting, gauges, warning lights and accuracy of wind indicating device and alarm.

d. Check for abnormal noise or vibration and overheating in machinery drive components.

e. Check wire rope sheaves and drum spooling for proper reeving and operation, freedom of movement, abnormal noise or vibration.

f. Check electrical drive components for proper operation, freedom from chatter, noise, overheating, and lockout/tag-out devices for energy isolation.

g. Inspect gears for abnormal wear patterns, damage, or inadequate lubrication.

h. Verify that locations of crane capacity plates are visible from pendant operator's position.

[3.3.2 Trolley Travel

**************************************************************************
NOTE: Delete references to micro-drive when not applicable.
**************************************************************************

Operate trolley the full distance of gantry rails exercising all primary
drive [and micro-drive] speed controls in each direction. Verify brake operation in each direction. In slow speed [or micro-drive,] trolley bumpers shall contact trolley stops located on the gantry girders. In slow speed, test the proper operation (interrupt power, automatic reset) of the trolley limit-switches at both limits of trolley motion.

3.3.3 Gantry Travel

**************************************************************************
NOTE: Delete references to micro-drive when not applicable.
**************************************************************************

Operate gantry in each direction the full distance of runway exercising all primary drive [and micro-drive] speed controls. Verify brake operation in each direction. In slow speed the proper operation (interrupt power, automatic reset) of the gantry, test limit-switches at both limits of gantry motion. In slow speed [or micro-drive] the crane gantry bumpers shall contact the runway rail stops.

3.3.4 Gantry Crane Tests

3.3.4.1 Dynamic Load Tests

a. Trolley Dynamic Load Test: While operating the trolley the full distance of gantry rails in each direction with test load on the hook (one cycle), test proper functioning of all primary drive and micro-drive speed control points and proper brake action.

b. Gantry Dynamic Load Test: With test load on hook, operate gantry for the full length of runway in both directions with trolley at each extreme end of gantry. Verify proper functioning of all primary drive and micro-drive speed control points and brake action. Binding of the gantry end trucks indicates a malfunction requiring adjustment.

3.3.4.2 Trolley and Gantry Loss of Power Test

A test load of 100 to 105 percent of rated load shall be raised clear of any obstructions on operating floor. Starting at a safe distance from walls or other obstructions, select a slow speed using the trolley and gantry primary drive. While maintaining a safe distance to obstructions, disconnect the main power source and verify brakes have set and that the equipment stops within the distance recommended by manufacturer.

3.3.5 Overload Tests

After the operational tests, test gantry crane system and all functions of gantry crane at 125 percent of rated load. With the trolley in the center of the bridge span, raise the test load approximately 1 foot and hold the load for 10 minutes. Verify the load does not move. Verify the girder deflection is within specifications.

3.3.6 Acceleration and Deceleration Tests

Test the acceleration and deceleration of gantry and trolley with approximately 10 percent of rated load at lowest possible location of hook. Operate gantry and trolley to run up to high speed and then stop without jarring or swinging the load.
3.3.7 Grounding Test

Test hoist to determine that the hoist, including hook and pendant, are grounded to building during all phases of hoist operation. Test the grounding of gantry and trolley with approximately 10 percent of rated load on hook. Test grounding between hoist hook and the structure's grounding system.

3.3.8 Adjustments and Repairs

Perform adjustments and repairs under the direction of the Contracting Officer at no additional cost to the Government, until satisfactory conditions are maintained, and contract compliance is affected. After adjustments are made to assure correct functioning of the components, repeat pertinent testing.

3.4 SCHEMATIC DIAGRAMS

Store schematic diagrams for equipment where indicated on drawings.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [six] copies of operation and [six] copies of maintenance manuals for the equipment furnished. One complete set prior to performance testing and the remainder upon acceptance. Detail in the operation manuals the step-by-step procedures required for system startup, operation and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Also include piping and equipment layout and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course.

3.7 FIELD TRAINING

Conduct a training course for the operating staff. Provide a training period consisting of a total of hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and [______]. Give Contracting Officer at least 2 weeks advance notice of field training.

3.8 FINAL ACCEPTANCE

**************************************************************************
NOTE: Use this paragraph as written for projects where the crane is the principal construction element, or represents a very significant portion of

SECTION 41 22 13.16 Page 48
the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.

**************************************************************************

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on wire rope, hook and electrical collector bars.

NOTE: This guide specification covers the requirements for procurement, installation and testing of portal crane trackage.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Use this specification in conjunction with the following NAVFAC Standard Drawings that form part of MIL-DTL-82020 and MIL-DTL-29229 and following Definitive Drawings and UFC 4-860-02N, "Design: Trackage ." These are available in inch-pound units only.

NAVFAC NO./TITLE

1404353 "Definitive Drawing – Fabricated Portal Crane Track Switch Throw Linkage"

1404354 "Definitive Drawing – Portal Crane Track Switch Power Mechanism"
Crane track material, especially fittings, frequently require long lead time to become available to the Contractor. Ensure that the lead time required for material specified in this guide specification is considered when project construction time is established.

NOTE: TO DOWNLOAD UFGS GRAPHICS

Go to

NOTE: Show the following information on the project drawings:

1. Existing material to be reused, if required
2. Crane rail system type
3. Crane wheel type
4. Rail curvature geometry
5. Switch throw mechanism
6. Utility line connections for power operated switch throw mechanism
7. Drainage for track fittings and switch throw mechanism housings
8. Rail alignment and gage
9. Rail joint connection types
10. Welding method at each welded joint

Scheduling restraints which impact on the Contractor's time or cost to perform the work, station operations affected by the Contractor's work, and station operations which may affect the performance of the Contractor's work should be addressed in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS. The following is a sample paragraph which may be used in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS, paragraph "Special Scheduling Requirements."

INTERFACE WITH TRACK OPERATIONS: Schedule work to
minimize interference to crane, (train,) and 
vehicular traffic operations. Crane and/or train 
operations will be scheduled to minimize 
interruptions to Contractor’s work. However, 
critical materials must be transported as necessary. 
When it is required to transport critical material 
over trackage where Contractor is working, or to 
utilize portal cranes in work areas, Government will 
notify Contractor at least 5 calendar days, or as 
required, in advance so that he may schedule his 
work accordingly. If necessary, work scheduling for 
the entire project will be discussed during the 
pre-construction conference and present a proposed 
work schedule not later than 5 calendar days (or as 
required) after the pre-construction conference.

PART 1   GENERAL

1.1   REFERENCES

NOTE: This paragraph is used to list the 
publications cited in the text of the guide 
specification. The publications are referred to in 
the text by basic designation only and listed in 
this paragraph by organization, designation, date, 
and title.

Use the Reference Wizard's Check Reference feature 
when you add a Reference Identifier (RID) outside of 
the Section's Reference Article to automatically 
place the reference in the Reference Article. Also 
use the Reference Wizard's Check Reference feature 
to update the issue dates.

References not used in the text will automatically 
be deleted from this section of the project 
specification when you choose to reconcile 
references in the publish print process.

The publications listed below form a part of this specification to the 
extent referenced. The publications are referred to within the text by the 
basic designation only.

AMERICAN RAILWAY ENGINEERING AND MAINTENANCE-OF-WAY ASSOCIATION 
(AREMA)

AREMA Track Plans (2008) Portfolio of Trackwork Plans

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASTM D1763 (2000; R 2013) Epoxy Resins
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE
1.3.1 Welder, Welding Method, and Welder Qualification
   a. Manual Shielded-Arc Welding Method: AWS D1.1/D1.1M, submit certification for each welder stating the type of welding and positions
qualified for, the code and procedure qualified under, date qualified, and the firm and individual certifying the qualification tests.

b. Thermite Welding Method: Welder qualification requirements for thermite welding method are defined in Section 34 11 19.00 20 WELDING CRANE AND RAILROAD RAIL - THERMITE METHOD.

1.3.2 Certifications Required

Submit certifications for standard railway fittings as outlined in AREA Manual and for base plates, grout, and aggregate materials used in crane track support in accordance with requirements specified herein.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver assembled items, and other materials to the job site in an undamaged condition. Handle and store materials to protect against damage before and after delivery. [Prevent distortion of double-tongue switches in transit and storage.]

1.5 EXISTING CONDITIONS

**************************************************************************
NOTE: An additional description of existing conditions may be included in this paragraph. If there is doubt as to foundation location, provide for confirmation by the Contractor. A description of any special conditions, such as any required salvage or reuse of existing crane track components or fittings, may be included in this paragraph.
**************************************************************************

**************************************************************************
NOTE: When existing crane rail trackage is to be removed, use Section 34 11 00 RAILROAD TRACK AND ACCESSORIES, subparts 1.2 38 through 1.2.46 as applicable, or the EFD regional guide specification for removal work. Provide specific requirements for removal of crane rail trackage material. When existing materials are to be reused, list materials here and indicate quantities on project drawings. The designer must determine the appropriateness of reusing existing materials. When it is determined that existing materials to be reused require reconditioning, identify the materials and include reconditioning requirements at the end of Part 2.
This "NOTE" applies to Parts 2 and 3.
**************************************************************************

Confirm existing rail, rail fittings, foundations, and utility locations by means of a field survey. Do not prepare drawings before the completion of field survey and measurements.

Submit details for [casting] [and] [fabrication] of fittings. Include complete dimensioning, alignment data, shop instructions, and a material list indicating description and quantity of components and fasteners for each fitting. Submit drawings for each individual fitting which is adequate to determine the conformance of fittings with project drawings and
as provided for herein. Show details of drainage connections from fittings and housings to drain pipes.

Do not manufacture materials until drawings have been approved.

PART 2 PRODUCTS

2.1 RAIL MATERIALS
Provide new track material [except for existing material approved for reuse. Perform removal work as specified in Section 34 11 00 RAILROAD TRACK AND ACCESSORIES. The following material is existing and may be reused: [_____]].

2.1.1 Crane Rail

2.1.1.1 Rail Section Weight and Hardness

******************************************************************************
NOTE: Requirements for minimum length of closure rail sections do not apply to stub rail sections provided as part of fabricated crane rail fittings.
******************************************************************************

******************************************************************************
NOTE: All references in this section to rail section specify per yard (135-CR) crane rail. The 135-CR section is the most common for new and replacement portal crane track. In some work, rail sections other than 135-CR may be required for crane use. These include heavier rail section or, for connection to older existing installations, use of 60 kilogram 132 pound or other railroad rail may be specified. Make changes where rail sections are required that are different than the 135-CR.
This also applies to subparts 2.1.4 through 2.1.6, and 2.2.1.
******************************************************************************

AREMA Eng Man and ASTM A1. Rails must be [664] [_____] kg per meter [135] [_____] pounds per yard in weight and be control-cooled, [fully heat-treated,] [321 to 388] [250 minimum] Brinell hardness carbon steel referred to herein as [135-CR] [______]. Crane rail hardness must not exceed crane wheel Brinell hardness of [388] [______]. Provide standard 12 m 39 foot rail lengths except for closure rails. Provide closure rails in one or two sections as long as practical, but in no case less than 4 m 13 feet long.

2.1.1.2 Metallurgical Composition

Provide steel crane rail with chemical composition within the following limits:

a. Carbon, percent 0.67 to 0.82

b. Manganese, percent 0.60 to 1.00

c. Phosphorus, percent 0.04 maximum
d. Silicon, percent 0.10 to 0.23  
e. Sulfur, percent 0.04 maximum

2.1.2 Joint Bars

ASTM A49 and AREMA Eng Man, Chapter 4. Provide heat-treated carbon steel six-hole joint bars sized to fit the rail section.

2.1.3 Track Bolts, Nuts, and Washers

AREMA Eng Man, Chapter 4. Provide track bolts not less than 23 mm one inch in diameter.

2.1.4 Rail Clips

**************************************************************************  
NOTE: Rail clips should be used on curves for lateral support. If rail clips are not used provide some form of lateral restraint.  
**************************************************************************

Provide single clips and holders designed for tight fit and sized to match [135-CR] [_____] crane rail section.

2.1.5 [Weldable, Adjustable Rail Clips]

**************************************************************************  
NOTE: Rail clips should be used on curves for lateral support. If rail clips are not used provide some form of lateral restraint.  
**************************************************************************

**************************************************************************  
NOTE: Use weldable, adjustable rail clips if the rail will not be permanently anchored in the pavement. Adjustable rail clips are normally used on overhead electric traveling cranes.  
**************************************************************************

Provide weldable, adjustable rail clips sized for [135-CR] [_____] crane rail section. Provide rail clips made by a manufacturer currently manufacturing crane rail clips. Rail clips must be forged steel which can be welded directly to structural steel. Rail clip bolts must conform to ASTM A325M ASTM A325. Provide rail clips designed for a side thrust of [_____] kg [_____] pounds. Provide rail clips designed to allow rail removal without the removal of the welded portion of the rail clip.

2.1.6 [Impact Pads]

**************************************************************************  
NOTE: Use impact pads where there will be a large number of crane movements or where vibration could cause excessive wear on the crane or rail.  
**************************************************************************

Provide impact pads sized for [135-CR] [_____] crane rail section. Provide pads which are impervious to water, oil, fuels, grease and ultraviolet rays. Provide pads with vulcanized reinforcing and encapsulated in synthetic rubber. The required properties are:

a. Shore hardness: [75 to 85] [_____] to [_____] degrees

c. Ultimate tensile strength (minimum): [17] [_____] MPa [2500] [_____] pounds per square inch

d. Reduction in load per square mm inch (minimum): [30] [_____] percent

e. Temperature range: Minus 7 to 100 degrees C 20 to 212 degrees F

f. Wheel Load: [_____] kg [_____] pounds

g. Crane rail bending stress (maximum): 75 percent of allowable bending

The pads must meet the required properties for a minimum of 1,000,000 wheel passes at the maximum permissible wheel load.

2.1.7 Electrodes

**************************************************************************
NOTE: Welded rail joints are preferred for crane rail except at connections between rail and rail fittings such as switches and frogs where bolted joints are recommended. Indicate on the drawings each joint type (bolted and/or welded). Accomplish welded connections between carbon steel rail and rail fittings fabricated from carbon steel, using either of the methods identified in paragraph "Welded Crane Rail Joints." Determine the welding method(s) to be used and show on project drawings location of each welding method. Welded connections between carbon steel rail and cast manganese steel are not recommended. However, if the activity requires a dissimilar metal welded connection such as this, the cast manganese stub rail end section must be prepared for welding in accordance with Sketch NFGS-14606-1. Use the manual shielded arc welding method in accordance with paragraph "Manual Shielded-arc Welding Method" and electrodes in accordance with paragraph "Electrodes". Thermite method is not acceptable for welding dissimilar metal.
**************************************************************************

Provide AWS low-hydrogen, high-tensile E 14018 or E 14016 electrodes. Utilize electrodes of the smallest practical diameter worked at the lowest compatible current. Coating on low-hydrogen type electrodes must be thoroughly dry when the electrode is used. Use electrodes taken from hermetically sealed packages within one hour of the time the package is opened. Dry electrodes not used within this one hour period and electrodes taken from nonhermetically sealed packages for at least one hour between 370 and 430 degrees C 700 and 800 degrees F before use. Store dried electrodes at temperatures between 110 and 200 degrees C 225 and 400 degrees F until used, or if not stored and not used within one hour after this drying is completed, re-dry before use. [Do not use electrodes which have been wet.] [Hard surfacing rod used on top 3 mm 1/8 inch of railheads must be alloy with the following composition:

a. Carbon, percent 0.4 to 0.6

SECTION 41 22 13.33 Page 12
b. Manganese, percent 4.0  
c. Chromium, percent 18.0 to 21.0  
d. Nickel, percent 9.0 to 10.5  
e. Molybdenum, percent 1.2  
f. Iron, base

Heat railhead to a minimum temperature of 260 degrees C 500 degrees F for a distance of 200 mm 8 inches on each side of the joint before welding overlay.]

2.2 CRANE TRACK FITTINGS

**************************************************************************
NOTE: Two types of crane rail fittings are available:

1. Manganese Steel Castings: Most existing crane track fittings are of this type, which has a superior ability to withstand wear. These castings are, however, costly when custom-manufactured, and require long lead time to order.

2. Fabricated (Build-up) Fittings: Fabricated crane track switches and frogs are alternatives to the conventional cast fittings. They consist of stock rails and a number of steel plates bolted and/or welded together into the required configuration. Due to the use of standard components, many machine shops are capable of producing fabricated fittings, thus reducing cost and lead time. Fabricated fittings are, however, heavier and less wear-resistant than cast fittings.

Military standards as listed in this guide specification are available for both types of fittings and paragraphs are provided for both types. Delete paragraphs referring to inapplicable types of fittings. For further information on use of cast and fabricated fittings contact:

Commander  
Atlantic Division  
Naval Facilities Engineering Systems Command  
Code 15C2  
Bldg. N-26, Room 234  
Norfolk, VA  23511-6287
**************************************************************************

Provide configuration and geometry of fittings as indicated and as specified herein. Substitutions will not be accepted. Fittings include [switches] [and] [frogs] for use with crane wheels indicated.
2.2.1 Four-Rail Portal Crane Track Systems

NOTE: There are two types of portal crane trackage systems in use in the Naval Shore Establishment:

1. Four-Rail System: This system consists of two standard gage (railroad) tracks. The cranes for this system are equipped with single-flanged wheels. Switches and frogs are of the standard railroad type except for some small frog angles, where turntable frogs may be required. For details of two- and four-rail system applications, see UFC 4-860-02N. This guide specification may be used for either two-rail or four-rail crane track systems by deletion of inapplicable paragraphs describing the use of specific types of switches and frogs. For four-rail systems, additional references based on Section 34 11 00 RAILROAD TRACK AND ACCESSORIES for Standard Gage Railroad Track may be used.

2. Two-Rail System: The cranes for this system are equipped with double-flanged wheels. Special double-tongue switchpoints and ramp-type frogs are required for this system. Turntable frogs may also be required for small frog angles.

Crane track switches and frogs for use with single-flanged wheels must conform to applicable requirements of the AREMA Eng Man and AREMA Track Plans, with the following limitations:

[b. Provide turntable frogs.]

2.2.2 Two-Rail Portal Crane Track Systems

Crane track switches and frogs for use with double-flanged wheels must be special fittings meeting the following requirements:

2.2.2.1 Cast Manganese Steel Double-Tongue Switch Points

NOTE: If deviation from the military specification is necessary, include the phrase, "except as specified in paragraph entitled "______." Either specify the deviations in the appropriate paragraph or list together in a new paragraph. This NOTE applies to subparts 2.2.2.1 through 2.2.2.6

MIL-DTL-82020 [, except as specified in paragraph [_____],] for use with double-flanged wheels. Provide manganese steel castings conforming to ASTM A128/A128M. [Provide double-tongue switch points with rail curvature geometry indicated. Variations will not be accepted.] [Confirm switch point dimensions by preparation of full-size patterns before molds for castings are made.] [Provide switch points for use in a single crane track turnout in matched pairs.]
2.2.2.2 Cast Manganese Steel Rigid Ramp-Type Frogs
MIL-DTL-82020 [, except as specified in paragraph [____],] for use with double-flanged crane [and railroad] wheels. Provide manganese steel castings conforming to ASTM A128/A128M. [Provide rigid frogs with frog angle and rail curvature geometry indicated. Variations will not be accepted.] [Cast half-crossings at the intersection of a crane rail and a standard gage railroad track as an integral one- or two-piece unit.]

2.2.2.3 Cast Manganese Steel Turntable Frogs
MIL-DTL-82020 [, except as specified in paragraph [____],] for use with double-flanged crane [and railroad] wheels. Provide manganese steel castings conforming to ASTM A128/A128M. [Provide turntable frogs with frog angle and rail curvature geometry indicated. Variations will not be accepted.]

2.2.2.4 Fabricated Double-Tongue Switch Points
MIL-DTL-29229 [, except as specified in paragraph [____],] for use with double-flanged wheels. [Provide double-tongue switch points with rail curvature geometry indicated. Variations will not be accepted.] [Confirm switch point dimensions by preparation of full-size patterns before fabrication is commenced.] [Provide switch points for use in a single crane track turnout in matched pairs.]

2.2.2.5 Fabricated Rigid Ramp-Type Frogs
MIL-DTL-29229 [, except as specified in paragraph [____],] for use with double-flanged crane [and railroad] wheels. [Provide rigid frogs with frog angle and rail curvature geometry indicated. Variations will not be accepted.]

2.2.2.6 Fabricated Turntable Frogs
MIL-DTL-29229 [, except as specified in paragraph [____],] for use with double-flanged crane [and railroad] wheels. [Provide turntable frogs with frog angle and rail curvature geometry indicated. Variations will not be accepted.]

2.2.2.7 Manually-Operated Switch Throw Mechanisms and Housings

**************************************************************************
NOTE: Manually-operated switch throw mechanisms and housings are commercially available items preferably supplied and pre-tested by the switch manufacturer whenever possible. NAVFAC Definitive Drawing No. 1404353, "Portal Crane Track Switch Throw Linkage," contains definitive details for a manually operated throw mechanism but may not be similar to commercially available units. If paragraph entitled "Power-Operated Switch Throw Mechanism" is used, then paragraph entitled "Manually-Operated Switch Throw Mechanisms and Housings" must be used.

The power throw mechanism utilizes a hydraulic linear actuator of a manufacturer's standard design employing an electric or air-driven motor pump. NAVFAC Definitive Drawing No. 1404354 "Portal Crane Track Switch Power Mechanism" and 1404355 "Portal Crane Track Turntable Frog Power Mechanism" contain definitive details for the layout of a power-operated switch throw mechanism but may not be similar to commercially available designs. The
minimum performance characteristics for the NAVFAC Definitive Design power throw mechanisms are as follows:

**Turntable Frog:**

**Stroke:** 300 mm 12 inches  
**Speed:** 20 mm/s 3/4 inches per second  
**Force:** 5 kN 1200 pounds working: 70 kN 16,000 pounds maximum

**Switch Points:**

**Stroke:** 250 mm 10 inches  
**Speed:** 20 mm/s 3/4 inches per second  
**Force:** 13 kN 3000 pounds working: 187 kN 42,000 pounds maximum

Satisfactory commercially available power throw mechanisms for certain site specific crane rail switches have recently been installed at:

Puget Sound, Naval Shipyard, Bremerton, Washington

The Public Works Departments at that activity may be able to provide additional information pertaining to these units. If paragraph "Power-Operated Switch Throw Mechanism," is used, then paragraph "Manually-Operated Switch Throw Mechanisms and Housings," must be used.

**************************************************************************

a. Provide switch points in a single crane track turnout (including turnouts containing shared railroad tracks) to operate simultaneously by a single throw mechanism.

b. Provide each switch with a manually operated throw mechanism. [Provide switch throw as indicated.] [Provide switch throw designed and fabricated by the manufacturer of the switch point.] Base the design on a [bell crank] [lever] operator principle so that the switch can be readily and easily operated by one person without causing damage to the linkage or component parts.

c. Provide throw mechanism to automatically lock into place at the end of the throw in both operating positions.

d. Provide throw handles which indicate the position of the switch, easily accessible, and visible to the crane operator

e. [Provide visible indicators capable of being seen by the crane operator to indicate position of switch.]

f. Provide throw mechanism of a heavy-duty type for specific use with double-flange wheel crane rail fittings.
g. Provide linkage oriented 90 degrees to the switch tongue.

h. All component parts must be readily accessible to allow for inspection, cleaning, maintenance and easy removal and replacement of parts.

i. Provide turn buckles of the open type to permit inspection to ensure engagement of ends of threaded rods.

j. Provide rods and throw linkage components adequately sized and laterally supported to prevent bending and buckling during operation.

k. Provide box housing frames bolted to base plates and equipped with heavy-duty cover plates designed to fit neatly over the housing frame.

l. [When an unequal throw is required for crane track switch points, achieve throw using mechanical bar linkage and not by use of lost motion spring action.]

m. [Lost motion utilizing a spring system action may be employed to facilitate the operation of a railroad switch used in conjunction with the throw of a crane rail switch.]

2.2.2.8 [Power-Operated Switch Throw Mechanism]

**************************************************************************
NOTE: If deviation from the military specification is necessary, include the phrase, "except as specified in paragraph entitled "______." Either specify the deviations in the appropriate paragraph or list together in a new paragraph.

Manually-operated switch throw mechanisms and housings are commercially available items and should be supplied and pre-tested by the switch manufacturer whenever possible. NAVFAC Definitive Drawing No. 1404353, "Portal Crane Track Switch Throw Linkage," contains definitive details for a manually operated throw mechanism but may not be similar to commercially available units. If paragraph entitled "Power-Operated Switch Throw Mechanism" is used, then paragraph entitled "Manually-Operated Switch Throw Mechanisms and Housings" must be used.
**************************************************************************

Provide power-operated switch throw mechanism with all the features specified for the manually operated switch, except remove the throw handle mechanism (and retain at the site for backup operation) and allow the switch operation to be accomplished with the aid of a hydraulic linear actuator driven by [compressed air] [electric] power. Provide utility line connections to the power unit as indicated. Minimum performance characteristics for [turntable frog] [switch point] are as follows:

a. Stroke: [_____] mm [_____] inches

b. Speed: [_____] mm/s [_____] inches per second

c. Force: [_____] N working [_____] pounds
[d. [____] N [____] pounds maximum]

2.3 DRAINAGE LINES FOR FITTINGS

Provide storm water drains for [turntable frogs,] [double-tongue switch points,] [_____] and [throw mechanism housings] to prevent ponding of water therein. Provide 100 mm 4 inch diameter steel drainage pipe lines conforming to ASTM A53/A53M to drain the fittings and housings as indicated. Slope pipes not less than 2 percent.

2.4 FOUNDATION MATERIALS

2.4.1 Base Plates

ASTM A36/A36M or ASTM A283/A283M. [Provide continuously welded plates, except where existing crane rail base covers the joint between the plates.] [Stagger rail joints and base plate joints.] Shape plates to conform to the configuration of rail curvature and to each special fitting. Minimum width of plates under rails must be 300 mm 12 inches. Minimum length of plates must be 1200 mm 4 feet and maximum length 3000 mm 10 feet. Minimum edge distance for holes as indicated. Provide [28] [_____] mm [1 1/8] [_____] inch diameter anchor bolt holes, field or shop fabricated. Provide grouting holes 50 mm 2 inches in diameter in plates wider than 900 mm 3 feet. Center grout holes, spaced approximately 600 mm 2 feet apart, and locate so as not to interfere with the proper function of the plate.

2.4.2 Anchor Bolts

ASTM A183, square head [25] [_____] mm 1 [_____] inch diameter steel. Provide each bolt with two finished hexagon nuts and one spring washer. Provide bolt threads conforming to ASME B18.2.1, and nuts and threads to ASME B18.2.2. [For bolts fastened to existing grade beams determine lengths in the field after the elevation of the concrete support beams has been determined and the finished profile grade from the drawings has been taken into consideration.] [Minimum length of anchor bolt is [_____] mm [_____] inches.]

2.4.3 Nonmetallic Nonshrink Grout

Provide grout under base plates as indicated. Provide high early strength, nonshrink, nonmetallic grout, with components passing the No. 4 sieve and proportioned so as to provide a 3-day compressive strength of not less than [28] [45] MPa [4,000] [6,500] psi as determined by ASTM C109/C109M, an expansion-to-original length ratio of 0.018 to 0.020 as determined by ASTM C157/C157M. As an option, commercial premixed grout may be used if it meets the strength, workability, nonshrink, and nonmetallic requirements herein specified. When the depth of grouting exceeds 25 mm one inch, the addition of crushed stone, 6 to 10 mm 1/4 inch to 3/8 inch maximum size, to the grout mixture will be allowed. The ratio of grout to crushed stone by weight must be maximum 2:1 or as specified in the manufacturer's instructions. After installation, cure the nonshrink grout a minimum of 3 days in accordance with the curing requirements as recommended by the manufacturer.

2.4.4 Epoxy Grout

ASTM D1763, two component, Grade 1. Provide epoxy grout for cored anchor bolt holes in existing concrete grade beams. Aggregates for epoxy grout must conform to ASTM C144.
2.4.5 Portland Cement Concrete

Provide concrete for flangeways, [grade beams] and [encasements] conforming to Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.5 STANDARD GAGE RAILROAD TRACK

**************************************************************************

NOTE: Use Section 34 11 00 RAILROAD TRACK AND ACCESSORIES and AREMA Eng Man and PTWP for standard gage railroad track intersecting with crane tracks. Provide specification for guardrails as required opposite rigid frogs for use by standard gage wheels. Where guardrail flangeway is for use by crane wheels, provide adequate flangeway width or flare. For a railroad in dual gage with crane track, add references as required for half ties or rail on grade beam foundation.

**************************************************************************

In accordance with Section 34 11 00 RAILROAD TRACK AND ACCESSORIES.

2.6 OIL FOR TRACK FIXTURES

Meet the following requirements:

a. Flash point, minimum: 57 degrees C 135 degrees F.

b. Asphalt, 100 penetration, minimum 45 percent viscosity, saybolt Universal: 54 degrees C 130 degrees F, 240 to 350 seconds

PART 3 EXECUTION

3.1 WORKMANSHIP

Handle fittings, rails, and accessories to avoid kinking or other damage. Maintain tracks in proper grade, alignment, curvature, and gage.

3.2 INSTALLATION OF CRANE TRACK AND FITTINGS

3.2.1 Crane Rails

Install crane rails to the alignment indicated. Install rails atop continuous steel base plates with anchor bolts and rail clips. Do not bend rail in the field, but preform rail to the required radii in a plant prior to installation. [Assemble the entire curved layout with all pieces match-marked.] Completely lay out and mark in the field and have approved by the Contracting Officer before any portion of crane rail alignment is installed. Tolerances are as follows:

a. Horizontal alignment: Place rails within plus or minus 6 mm 1/4 inch of the designed rail centerline alignment indicated.

b. Crane track gage: Provide track gage between railheads within plus or minus 12 mm 1/2 inch of the design gage indicated. Crane rail gage is measured from centerline of rail to centerline of rail.

c. Vertical alignment: Place top of rails within plus or minus 3 mm 1/8
d. Cross-level elevation: Elevation differences between rails must not exceed 3 mm 1/8 inch.

**NOTE:** Regarding the text below, use Section 34 11 00 RAILROAD TRACK AND ACCESSORIES and AREMA Eng Man and PTWP for standard gage railroad track intersecting with crane tracks. Provide specification for guardrails as required opposite rigid frogs for use by standard gage wheels. Where guardrail flangeway is for use by crane wheels, provide adequate flangeway width or flare. For a railroad in dual gage with crane track, add references as required for half ties or rail on grade beam foundation.

e. Where the crane rail also serves as one rail of a standard gage railroad track, gage the railroad rail from the crane rail based on standard gage requirements in accordance with Section 34 11 00 RAILROAD TRACK AND ACCESSORIES.

### 3.2.2 Welded Crane Rail Joints

**NOTE:** Welded rail joints are preferred for crane rail except at connections between rail and rail fittings such as switches and frogs where bolted joints are recommended. The project drawings must indicate each joint type (bolted and/or welded). Welded connections between carbon steel rail and rail fittings fabricated from carbon steel, if desired, may be accomplished using either of the methods identified in paragraph "Welded Crane Rail Joints." Determine the welding method(s) to be used and show location of each welding method on project drawings. Welded connections between carbon steel rail and cast manganese steel are not recommended. However, if the activity requires a dissimilar metal welded connection such as this, the cast manganese stub rail end section must be prepared for welding in accordance with Sketch 14606-1. Use the manual shielded arc welding method in accordance with paragraph "Manual Shielded-arc Welding Method" and electrodes in accordance with paragraph "Electrodes". Thermite method is not acceptable for welding dissimilar metal.

Weld crane rail joints [except those joints at fittings]. The welding together of rails which have been bored for bolted joints is not permitted. Clean rails of foreign substances prior to welding. [Welded compromise joints must be by the thermite method.] Align and weld rail in accordance with the recommendations and specifications of the manufacturer and supplier of the particular welding process used. Do not weld when the rail temperature is lower than that recommended for the welding method used. Use the following method[s].

SECTION 41 22 13.33 Page 20
3.2.2.1 Thermite Method

In accordance with Section 34 11 19.00 20 WELDING CRANE AND RAILROAD RAIL - THERMITE METHOD.

3.2.2.2 Manual Shielded-Arc Welding Method

AWS D1.1/D1.1M and the following:

**************************************************************************
NOTE: Regarding the text below, when manual shielded-arc welding method is specified, prepare rail ends in accordance with Sketch No. NFGS-41 22 13.33-1. Show sketch information on the project drawings.
**************************************************************************

a. Prepare rail end as indicated and as specified herein. Bevel ends of the rails at approximately 35 degrees full bevel on the head, 35 degrees double bevel on the web, and 35 degrees full bevel on the upper side of the base. Retain a narrow "nose" of approximately 2 mm 1/16 inch of original rail-end face across the base and up the web, following beveling operation, to permit proper alignment of rail ends. When beveling with a torch, first preheat each rail end to 260 degrees C 500 degrees F. After torch cutting, grind off scale and oxides. Grind level faces only after preheating. Use proper grinding wheel and speed to avoid grinding "burns" or formation of "hard spots" from localized overheating.

b. Align the beveled rail ends, allowing approximately 3 mm 1/8-inch root clearance, and place a copper shim under the joint opening. Clamp the rails during the welding with up to 6 mm 1/4 inch vertical camber (ends high) in 1200 mm 4 feet, centered over the joint to compensate for contracting distortion.

c. Preheat the joint area to approximately 260 degrees C 500 degrees F for a distance of 150 to 200 mm 6 to 8 inches on each side of the joint using a suitable heat source, such as an oxy-acetylene or propane torch.

d. Initiate arc welding of the joint immediately after preheating in the following sequence: base, web, and head. Weld alternately on both sides of base and web. Do not entrap foreign material, such as slag, in the weld. Grind, chip, or arc-air the root of the initial weld to sound metal before welding is started from the second side. Maintain a 260 degrees C 500 degree F to moderately higher interpass temperature. Proceed with welding until the joint is completed and sufficient metal has been deposited to permit grinding to finish contour in the head area. Provide slight reinforcement of the web and top of the base areas.

e. Postheat the joint area to approximately 370 degrees C 700 degrees F immediately after the welding operation, using the same technique for preheating. After postheating, protect the weld area against rain and snow and cool as slowly as possible by covering with an insulating blanket.

f. Grind the excess deposited weld metal from sides and top of rail head using heavy-duty grinder. Heat area of the weld to at least 290 degrees C 550 degrees F before and during grinding. Grind the area smooth, finishing to within plus or minus 0.5 mm 0.020 inch of original
contour. Use proper grinding wheel, speed, and rate of metal removal to avoid grinding "burns" or formation of "hard spots" from localized overheating. Prevent grinding cracks.

g. Measure temperatures specified by temperature pencils.

3.2.2.3 Electrical Flash-Butt Method

Welding process must conform to applicable provisions of Chapter 4 of AREMA Eng Man.

3.2.3 Bolted Rail Joints

**************************************************************************
NOTE: Welded rail joints are preferred for crane rail except at connections between rail and rail fittings such as switches and frogs where bolted joints are recommended. Indicate on project drawings each joint type (bolted and/or welded). Welded connections between carbon steel rail and rail fittings fabricated from carbon steel, if desired, may be accomplished using either of the methods identified in paragraph "Welded Crane Rail Joints." Determine the welding method(s) to be used and show location of each welding method on drawings. Welded connections between carbon steel rail and cast manganese steel are not recommended. However, if the activity requires a dissimilar metal welded connection such as this, prepare the cast manganese stub rail end section for welding in accordance with Sketch 14606-1. Use the manual shielded arc welding method in accordance with paragraph "Manual Shielded-Arc Welding Method" and electrodes in accordance with paragraph "Electrodes". Thermite method is not acceptable for welding dissimilar metal.
**************************************************************************

[Provide bolted joints at rail connectors.] [Provide bolted rail joints to connect crane rail to crane rail fittings.] Bolted joints will be permitted for connection of crane rail fittings to intersecting railroad rail not for use by cranes. Chamfer rail head at joints in accordance with AREMA Eng Man.

3.2.3.1 Joint Bars

Install joint bars with the full number of bolts, nuts and washers. After track has been tested as provided for herein and before flangeway concrete is poured, check and tighten bolts. The openings between railheads must not deviate more than 3 mm 1/8 inch from the opening recommended for a given temperature. Vertical or horizontal mismatch at joints must not exceed 2 mm 1/16 inch. Joints must conform to applicable AREMA Eng Man. Tighten joint bar bolts to a tension no less than the proof load given in ASTM A183. Perform tightening with a properly calibrated wrench[ or by turn of the nut method].

3.2.3.2 Compromise Joints

Provide bolted [and welded] compromise joints for connection of adjoining
rails or fittings of differing cross sections. Make joints by means of either cast or fabricated compromise bars or welded transition rails. Provide step chairs, as required, at joints of rails of differing height. Provide compromise joints with proper allowance for rail wear. The offset of compromise joints or of either surface or gage alignment must not exceed 3 \( \text{mm} \) 1/8 inch. Rails at compromise joints of rails for double-flanged wheels must have the centerlines of the rails in alignment and provide a smooth surface along the top of rails. Grind edges of the wider of the two rail heads smooth over a minimum transition length of 450 \( \text{mm} \) 18 inches. Heat area to be ground to at least 290 degrees C 550 degrees F before and during grinding. Clad welding is not permitted to achieve transitions for compromise joints. [Align compromise joints of rails for single-flange wheels only along top and gage side of rails.] [Use thermite method to weld compromise joints.]

3.2.4 Anchor Bolts

Provide pairs of anchor bolts for connection of rail clips and crane rails to base plate and supporting grade beam. At crane track fittings, provide separate groups of anchor bolts for connection of fittings to base plate and to supporting grade beam. [Install anchor bolts with epoxy grout specified herein into 50 \( \text{mm} \) 2 inch diameter holes drilled into existing concrete rail support beams.] [Cast anchor bolts into new concrete grade beams.] Tighten anchor bolt nuts to snug tight using the effort of an ordinary man with a 6'-0" spud wrench. Perform tightening with properly calibrated wrenches [or by turn of nut method]. Make longitudinal spacing as indicated.

3.2.5 Base Plates

**************************************************************************
NOTE: Install base plates in accordance with Sketch No. NFGS-41 22 13.33-2. The sketch is based on 61 kilogram 135 pound crane rail and should be modified as required to reflect actual size of crane rail to be installed. Show sketch information on the project drawings.
**************************************************************************

Install as indicated and as specified herein. Install 25 \( \text{mm} \) 1 inch thick base plates to support rail, switches, frogs, and throw mechanism housings. Shape base plates, as necessary, under [switches] [and] [frogs]. Furnish plates with anchor bolt holes located and drilled in field or shop fabricated; use as template for setting anchor bolts. Do not enlarge bolt holes in the field. Do not torch, cut holes. Provide finished plate free of bows, bends, and lips, and cleaned of grease and oil. After installation of rail, vertically align base plates to within plus or minus 3 \( \text{mm} \) 1/8 inch of the profile grade elevation indicated by adjustment of base leveling nut and washer underneath plates. After installation, check to ensure proper grade and alignment of the base plates and install temporary hold-down nuts before grouting with nonshrink grout. After grout has hardened, and with rail clips, crane rail, and fittings in place, tighten anchor bolt nuts to snug tight using the effort of an ordinary man with a 6'-0" spud wrench.
3.2.6 Crane Track Fittings

3.2.6.1 Crane Switches

Install fittings and throw mechanisms atop steel base plates and align vertically by means of leveling nuts as indicated. Connect switch points to adjacent rails by means of [bolted] [welded] joints. [Secure the nuts of bolted joints in place with a cotter pin through the bolt.] Install throw mechanisms complete in housings as indicated. Mechanisms must operate smoothly and reliably and hold the switchpoints in position securely, against motion of crane wheels.

3.2.6.2 Rigid Frogs

Install crane track rigid frogs atop steel base plates and align vertically be means of leveling nuts as indicated. Connect to adjacent crane rails [and railroad rails] by means of [bolted] [welded] joints.

3.2.6.3 Turntable Frogs

Install frog [and throw mechanism] atop steel base plates and align vertically by means of leveling nuts as indicated. Connect fittings to adjacent rails by means of [bolted] [welded] joints. Install throw arm complete in housings as indicated. Mechanism must operate smoothly and reliably, and hold the turntable in position securely, against motion of crane wheels.

3.2.7 Standard Gage Railroad Tracks

Install in accordance with Section 34 11 00 RAILROAD TRACK AND ACCESSORIES.

3.2.8 Oiling Track Fixtures

Swab [track bolts,] [switch points,] [throw mechanisms,] and [joint bars] with oil specified.

3.2.9 Concrete

Install concrete for flangeways [, grade beams] and [encasements] in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.3 CLEANUP

Upon completion of the work, clear job site of equipment, surplus material, and debris. [Dispose of such material [off Government property] [at the site indicated].] [Disposal is as required in Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.]

3.4 FIELD QUALITY CONTROL

3.4.1 Test for Grout

Verify nonmetallic, nonshrink grout strength during placement of grout at daily intervals by molding and testing standard cubes of samples taken at the job site. Take three test cubes each day for grout placed that day. Mold and cure test specimens in accordance with ASTM C109/C109M. Furnish necessary labor, materials, and facilities for molding the samples and for handling and storing the cubes at the site of the work. Transport cubes to the laboratory not sooner than 24 hours after molding. Test specimens for
compressive strength in accordance with ASTM C109/C109M. Grout strength
test evaluation is the average of the strengths of specimens tested at 3
days.

3.4.2 **Visual Inspection**

Inspect rail fittings thoroughly. Inspect for defects that might hinder
satisfactory operation. [Inspect bolted joints for loose bolts and smooth
transitions between rails of different sections.] Inspect each welded
joint thoroughly after removal of the mold and grinding of excess metal.
Correct or replace welds containing surface cracking, slag inclusion, gas
pockets, and lack of fusion. Method of correction must be approved by the
Contracting Officer.

3.4.3 **Ultrasonic Inspection** of Welded Rail Joints

[The Government will inspect each weld ultrasonically following the visual
inspection.] Perform ultrasonic inspection and testing of each weld in
accordance with MIL-STD-1699. Correct or replace defective welds. Clean
rails at testing locations as directed by Contracting Officer. The method
of correction must be approved by Contracting Officer.

3.4.4 **Load Test**

Load test of trackage will be performed by the Government prior to work on
concrete flangeways, encasements, and pavement. The load test is to be
performed after completion of track work, but before rails are covered by
concrete flangeways and encasements. The load test for crane trackage
consists of a portal crane supporting a load designated by the Contracting
Officer traversing new track work. The crane must operate without
difficulty, without binding of crane wheel flanges, or without visible rail
deflection. Vertical movement of the ends of crane [switches] [and]
[turntable frogs] must not exceed 3 mm 1/8 inch during the passage of any
crane. Correct or replace defective welded rail joints, rail, and
fittings. Correct the causes of excess deflections, and retighten anchor
bolts loosened under crane wheel loading.

3.4.5 **Throw Mechanism Operational Test**

Test throw mechanisms for effectiveness, security, integrity, and
reliability in accordance with the operational requirements of the
mechanical and electrical sections of the specifications.

3.4.6 **Retesting**

Retest corrected and replaced items.

3.4.7 **Record Drawing Survey**

**************************************************************************
|
| NOTE: A Record Drawing survey may be required where
| alignment of crane rails, gage reduction, or
| orientation of fittings is expected to be critical
| or problematic. The survey may be performed by
| Contractor, Government, or independent surveyor.
**************************************************************************

**************************************************************************
|
| NOTE: Include bracketed (last) sentence if
**************************************************************************
Contractor is to perform record drawing survey.

At completion of crane track replacement work, and before start of work on concrete flangeways, encasements, and paving, [perform] a record drawing survey of crane track alignment [will be performed by Contracting Officer. Notify Contracting Officer [_____] calendar days in advance of the availability of the crane trackage for conducting the survey. Execution of the survey will require [_____] days for completion]. Deviation of record drawing horizontal crane rail alignment in excess of tolerances specified herein will constitute grounds for rejection of the work. Surveys, in addition to the initial survey made necessary by nonconforming work, are at Contractor's expense. [Provide two sets of full-size contract drawings marked-up to show record drawing conditions. The requirements for these surveys are in addition to the requirements of Division 1 for quality control.]

-- End of Section Table of Contents --
NOTE: This guide specification addresses requirements for under running bridge cranes that are procured as part of a building construction contract for Aircraft Maintenance Hangars. As a result of the installation location, all cranes will meet hazardous area requirements.

This guide specification covers requirements for under running single girder electric traveling (OET) cranes with under running trolleys and hoists, Crane Manufacturers Association of America (CMAA) Class C and D and with capacities up to 9,100 kg 20,000 pounds, suitable for indoor use in hazardous area environments.

This guide specification incorporates the design criteria and requirements identified in NAVCRANEENGINEERING INSTRUCTION 11450.2A (December 2018). Also included are hangar crane requirements identified in UFC 4-211-01 Change 2, 2020. This guide specification does not cover requirements for custom built-up hoists, which would be an abnormal requirement for an aircraft hangar crane. Contact NAVY CRANE CENTER for assistance with this hoist type.

Consider the use of multiple bridge spans for total crane span lengths greater than 12 meters 40 feet or capacities greater than 9,100 kg 20,000 pounds. See Section 41 22 23.19 MONORAIL HOISTS for any aircraft hangar monorail hoists.

NOTE: Forward all procurement of OET systems at Naval Shore based activities with rated capacities of 9000 kg 20,000 pounds or greater or for use in specialized applications (e.g., ordnance handling, molten metal handling, special purpose service as defined in NAVSEA Publication 0989-030-7000,
NOTE: This guide specification includes tailoring options for NAVFAC, pounds (per NAVFAC P-307), and tons. The NAVFAC tailoring option also includes requirements specific to the Navy and Marine Corps. Crane procurements for the Navy and Marine Corps must select the NAVFAC tailoring option.

Crane tailoring options are included for the Army, Air Force, Navy, and maximum hazardous (explosive) environments. The default crane configuration includes additional minimum anti-spark, hazardous area requirements. Maximum anti-spark protection includes requirements that are in addition to the minimum anti-spark requirements.

Selection or deselection of a tailoring option (select view-tailoring options) will include or exclude that option in the section. Specific project editing is still required for the resulting section.

NOTE: Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This specification covers cranes with under running bridge and under running trolley and hoist, single girder, with CMAA 74 service class C or D, with provisions for operation in hazardous areas.

Explanations of CMAA service classifications C and D are covered in the "Notes" portion of paragraph.
CRANE DESIGN CRITERIA, sub-paragraph
CLASSIFICATION. The minimum allowable
classification for hangar cranes is CMAA service
class C.

Explanations of hazardous areas are covered in the
DEFINITIONS paragraph as well as the "Notes" portion
of paragraph CRANE DESIGN CRITERIA, sub-paragraph
CLASSIFICATION. All hangar cranes must meet minimum
anti-spark protection.

Control types and systems may be specified as
follows:

1. Remote or Pendant Crane Controls or a
combination of the two can be provided.

2. Alternating current (AC) control systems must be
specified. The vast majority of new cranes are AC
powered and AC controlled.

**************************************************************************
**************************************************************************
NOTE: The RFP must provide the relevant dimensions
and load data for the crane. See "Crane Inquiry
Data Sheet" in CMAA 74 section 6.1 or see "Crane
Information Form for Underrunning Cranes(s)" pages 5
and 6 at the following Navy Crane Center link:
https://ncc.navfac.navy.mil/Popular-Links/DOWNLOADS/

Projects that are routed through Navy Crane Center
should be accompanied by a completed Crane
Information Form (CIF) per the above link.
**************************************************************************
**************************************************************************
NOTE: Show the following information, as a minimum,
on the project drawings:

1. Complete details of plan, elevations, and
sections of crane.

2. Runway track system (if installed), including
span and size of girder(s), runway rail size,
channel cap size, size and location of crane stops,
and building clearances.

3. Electrical junction box location (including
mounting height).

**************************************************************************

SECTION 41 22 13.55 Page 9
1.2 DEFINITIONS

a. Crane Bridge: That part of an overhead crane system consisting of a girder, end trucks, walkway, and drive mechanism which carries the trolley(s) and travels along the runway rails parallel to the runway.

b. Crane Runway: The track system along which the crane operates horizontally, including track hangar rods, track connection devices, and runway structural supports.

c. Dead Loads: The weight of all effective parts of the bridge structure, the machinery parts, and the fixed equipment supported by the structure.

d. Crane Bridge Girder: The principal horizontal beam of the crane bridge structure. It is supported by the crane end trucks. Typically, for single girder cranes the trolley mounted hoist is suspended from the girder below the crane.

e. Lifted Load: The load consisting of the rated load and the weight of lifting devices attached to the crane such as the load block, bucket, or other supplemental devices.

f. Original Equipment Manufacturer (OEM): the Company that produced the part or original equipment.

g. Packaged Hoist: A commercially designed and mass produced hoist.
characterized by the motor, gearing, brake(s), and drum contained in a single package often connected by the use of c, d, or p-face flanges.

h. Patented Track: A generic term referring to track built in accordance with MHI MH27.1 utilizing a composite track section incorporating a proprietary bottom flange shape. For this crane system, it is provided for the crane bridge girder and also the crane runway track, if under running.

i. Pendant: A control for a hoist and a crane. The pendant hangs from the hoist or the crane by a cable at a height that is easy for the operator to reach.

j. Rated Load: The maximum working load suspended under the load hook.

k. Standard Commercial Cataloged Product: A product which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing on the manufacturer's published product data sheets." These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

l. Trolley Load: The weight of the trolley and its associated equipment carried by the trolley wheels.

m. Under running (Underhung) Crane: An electric overhead traveling crane that is supported by crane end trucks suspended below the crane runway. The load is supported by hanging from the lower flange of a beam or patented track.

1.3 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Remove the following sentence if the runway rail is not to be installed as a part of the crane procurement. If rail is to be installed, ensure Section 05 12 00 STRUCTURAL STEEL is included in the Request for Proposal (RFP).
**************************************************************************

[ The requirements for the structures supporting the crane runway are specified in Section 05 12 00 STRUCTURAL STEEL, and must conform to AISC 360. ]

1.3.1 Crane Design Criteria

**************************************************************************
NOTE: Cranes installed outside the United States are still required to meet the features and characteristics specified.

When necessary, the design may be able to use the host nation's consensus standards in lieu of US standards. An equivalency study may be requested from the contractor to justify use of the international standard.
**************************************************************************
NOTE: Clearly show the area of hook coverage, runway dimensions, rail size, hook vertical travel, clear hook height, and lifting capacity on drawings.

Cranes will operate in the given spaces and match the runway dimensions and rails indicated. Hook coverage, hook lift, clearances, lifting capacity, and load test weight must not be less than that indicated. Provide loaded hook coverage to the maximum extent possible in the Aircraft Maintenance Bay.

1.3.1.1 General

NOTE: Add number of cranes, hangar name, hangar bay location, and crane rated load capacity in metric tons.

NOTE: For NAVFAC projects, capacity markings MUST be expressed in pounds unless the crane is located in Europe or Asia.

Include the following: Number of cranes [____], located in Hangar identified as [____], [bay [____],] with the capacity expressed in [____] metric tons tons, for each crane. Also clearly locate and identify each hoist and system components.

1.3.1.2 Classification

NOTE: Make a selection from the following CMAA 74 service classifications:

Class C (Moderate Service): This service covers cranes which may be used in moderate service requirements such as machine shops of paper mill machine rooms. In this type of service, the crane will handle loads which average 50 percent of the rated capacity with 5 to 10 lifts per hour, averaging 4.5 m 15 feet, not over 50 percent of the lift at rated capacity.

Class D (Heavy-Duty): This service covers cranes which may be used in heavy machine shop, foundries, fabricating plants, steel warehouses, container yards, or lumber mills and standard duty bucket and magnet operations where heavy-duty production is required. In this type of service, loads approaching 50 percent of the rated capacity will be handled constantly during the working period. High speeds are desirable for this type of service with 10 to 20 lifts per hour averaging 4.5 m 15 feet, not over 65 percent of the lifts at rated capacity. This service is the minimum requirement for
**NOTE: Hazardous Area Crane Operating Environments**

The design engineer will have to determine if the hazardous area envelops just the load block and pendant or the entire crane bridge girder and runway. The hazardous area encompassing just the load block and pendant is standard for this specification. If the hazardous area does encompass the entire crane and runway, then the tailoring option for maximum hazardous area protections is required.

Hazardous (Explosive) Environments: Locations where fire or explosion hazards may exist due to flammable gases, flammable liquid-produced vapors, combustible liquid-produced vapors, combustible dusts, or ignitable fibers/flyings. Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NFPA 70 Article 500. The activity safety office must identify the specific Class and Division, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

1. **Minimum Anti-Spark Protection** is used when only the load block enters the explosive area. Anti-spark protection is required for the pendant controller, hook, hook block, and wire rope.

2. **Maximum Anti-Spark Protection** is used when the hazardous area envelops the entire crane. In addition to the minimum anti-spark protections, the entire crane and runway components must also be protected against sparking.

**NOTE: Refer to NFPA 70 National Electric Code (NEC) for environmental requirements.**

Section 500.5 covers classifications of hazardous locations: Classes I, II, and III, along with Divisions 1 and 2. It is unlikely that Classes II or III will be required for Aircraft Hangars.

Section 500.6 covers material groups A, B, C, D, E, F and G.

Section 513 covers specific requirements for
Aircraft Hangars.

**************************************************************************

NOTE: NFPA 70, Section 513 Aircraft Hangars. See also NEC Handbook, Section 513.3, Exhibit 513.1 for visual representation of these requirements.

Pits or Depression: In accordance with NFPA 70, Section 513.3, any pit or depression below the level of the hangar floor must be classified as a Class I, Division 1 or Zone 1 location that extends up to said floor level. Items that may be installed or operated in these areas such as wiring, radio controller, and pendant controller must comply with the requirements of Section 513 of NFPA 70.

Aircraft Maintenance and Storage Hangars: In accordance with NFPA 70, Section 513.3, the hangar is classified as Class 1, Division 2 up to 18 inches above the floor and within 5 feet horizontally from engines and fuel tanks up to 5 feet above the engine or fuel tank enclosure. Items that may be installed or operated in these areas such as wiring, radio controller, and pendant controller must comply with the requirements of Section 513 of NFPA 70.

Aircraft Painting Hangars: In accordance with NFPA 70, Section 513.3, the hangar is classified as Class 1, Division 2 up to 18 inches above the floor and Class I, Division 1 or Class I, Zone 1 within 3 m 10 ft horizontally from aircraft surfaces from the floor to 3 m 10 ft above the aircraft. The area horizontally from aircraft surfaces between 3.0 m and 9.0 m 10 ft and 30 ft from the floor to 9.0 m 30 ft above the aircraft surface must be classified as Class I, Division 2 or Class I, Zone 2. Electrical and mechanical items that are installed or operated in these areas must comply with the requirements of Section 513 of NFPA 70.

**************************************************************************

NOTE: Ensure the correct hazardous area is specified (class, division, and group) for the actual hangar bay.

The first of the options provided is the more likely option for a standard aircraft hangar crane: NEC Class I, Division 2 hazardous area. Another potential option for aircraft hangars: NEC Class 1, Division 1 hazardous area.

Group requirements are dependent on Class and combustible gases/vapors in the hangar. For Class I locations, Groups A, B, C, and D are possible. Group D is typical due to fumes from jet fuel.

The blanks are provided should a slight variance
exist in the hangar bay hazardous classification.

The height of the hazardous area directly affects crane requirements. For areas that encompass the floor and immediate area around the aircraft, the default anti-spark provisions for crane components entering the hazardous area are sufficient (anti-spark measures for the hook, load block, wire rope, and pendant). For hazardous areas that cover the entire crane envelope (i.e., bridge and trolley), the "maximum hazardous" tailoring option must be selected. This tailoring option adds anti-spark measures for the entire crane, such as electrical enclosures and wheels.

**************************************************************************

NOTE: Minimize the lowest overall crane depth for the configuration.

The minimum hook clearance height requirements, (measured from the finished floor elevation to the saddle of the hook at full elevation are referenced in each specific Service's Chapter of UFC 4-211-01.

Cranes may have wire connected controls (pendants) or wireless controls. Coordinate the selection of wire connected controls and wireless controls with the users. When wireless controls are provided, coordinate the frequency of wireless controls with the local frequency manager.

**************************************************************************

NOTE: The bracketed option for separate runways is necessary if ensuring more than one crane is not installed on the same runway for contracts with multiple cranes in the same building, bay, or location.

**************************************************************************

Provide under running, single girder electric bridge crane(s), with under running trolley mounted hoist, conforming to MHI MH27.1, CMAA 70, and CMAA 74 service class [C] [D], as applicable. The crane(s) must be designed for operation in an indoor environment, hazardous area service, meeting the requirements of ASME B30.16 and ASME B30.17, with an ambient temperature range of [_____] to [_____] degrees Celsius Fahrenheit. The crane(s) must operate in an NFPA 70 Class [I] [____], Division [2] [1] [____], Group [D] [____] hazardous area. Hazardous protection is required from the finished floor level up to [1.5 meters 5 feet above wing upper surface and engine enclosures] [3 meters 10 feet above the aircraft] [9 meters 30 feet above the aircraft surface] [_____] meters feet]. The total crane span must be [_____] meters feet with a minimum vertical hook lift of [_____] meters feet and as specified herein. Provide runways for multiple span cranes equally spaced apart.[ Provide separate runways for each crane.]

The crane must be [pendant controlled] [radio controlled] and operate in the spaces and within the loading conditions indicated. Provide a crane,
including hooks and hoisting ropes, that in all operating configurations is able to clear the vertical lift fabric door maintenance catwalk or other obstructions. The pendant controller must be mounted on a separate festooned cable system from the trolley power supply. The crane must operate on [_____]-volts AC, [60 Hz] [____], [three] [single] phase power source. Maximum loading on the facility (without impact) due to dead loads, trolley loads, and lifted loads, with the trolley in any position, must not exceed the allowable wheel loading and wheel spacing of the facility (or not exceed maximum hanger loading for under running cranes).

1.3.1.3 Rated Speeds

**************************************************************************
NOTE: Slow full-load operating speeds invariably provide improved load control and increased productivity.
**************************************************************************
**************************************************************************
NOTE: Specify the maximum rated speed under full load for the main hoist, bridge, and trolley.

1. Hoist speeds must conform to the recommendations of CMAA 74 or ASME tables. Trolley travel speed must conform to the recommendations of CMAA 74. A table of suggested hoisting and travel speeds can be found at the end of section 6 in CMAA 74.

2. Bridge travel speed must not exceed the maximum speed that the floor walking, crane pendent control operator can comfortably negotiate in a work area, approximately 750 mm/s 150 ft/min, and as recommended in CMAA 74.

**************************************************************************
NOTE: Recommend "Medium" rated speeds, where appropriate. Another consideration for operating speeds is the distance travelled per minute (e.g., 20 ft hook lift height corresponds to hook lift speed of 20 fpm). Consider limiting bridge or trolley travel speeds when operation occurs over shorter distances (e.g., for a 50 ft runway, a bridge travel speed of 50 fpm may be more appropriate than the 115 fpm "medium" speed).

Common maximum speed selections:
Wire Rope Hoists IAW ASME HST-4 (fpm): 15, 20, 30, 40
Trolley (fpm): 30, 50, 75, 100, 125
Bridge (fpm): 50, 75, 100, 150, 175

A common minimum speed selection is 1/10th of maximum speed. Cranes using variable frequency drive controls are more flexible regarding speed selection.
**************************************************************************

Provide the crane with rated (maximum) speeds within plus or minus 10 percent (in meters/second feet/min) for the main hoist, bridge, and trolley.
at the rated load as specified in the table below. The minimum speed must not exceed the values listed.

<table>
<thead>
<tr>
<th>Description</th>
<th>Minimum</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main Hoist</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Trolley</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Bridge</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

The hook lift capacity and speed must be the manufacturer's standard within the limits specified.

[1.3.1.4 Foreign Design Standards and Practices]

**************************************************************************
NOTE: This subpart is tailored to NAVFAC. This subpart will NOT typically be included and is to only be used when cranes are procured for international locations (outside of the United States), which could use contractors that design and build equipment for localities under different laws and standards.
**************************************************************************

a. Foreign design standards and engineering practices are acceptable, provided they are accompanied by satisfactory explanation and are shown to meet corresponding U.S. standards and practices, as approved by Navy Crane Center. Design calculations and drawings that use foreign language and nomenclature must be provided with corresponding English equivalents. Metric units may be used for both calculations and shop drawings, but they must include conversions to English units. In the case of calculations, only the initial inputs and final results need to be so converted. Professional training and accreditation of foreign engineers may vary in some aspects from those in the U.S., but they are satisfactory if comparable for the design work in which they engage. Mechanical properties and quality standards of common construction materials of foreign sources supplied in accordance with recognized standards that resemble those of ASTM and other U.S. standards are acceptable, as approved by Navy Crane Center. Typically, foreign welding procedures, materials, standards, and welder qualifications are comparable to those of AWS and are therefore acceptable. Provide all necessary certifications and other data for review and approval prior to start of work. Special attention must be given to ensure the weld sizes are being specified and measured uniformly. Unique constructions and metric sizes not complying with FS RR-W-410, the Wire Rope Users Manual, or ASTM A1023/A1023M, may be used on Navy cranes, subject to Navy Crane Center review and approval of the specific applications. In selecting metric wire ropes for installation on new cranes with sheave and hoist drum grooves configured for a specific US wire rope size, the metric diameter must be within the limits of the wire ropes for which the sheave and drum are grooved. When the wire rope is installed on an older crane with sheave and hoist drum grooves configured for a specific U.S. produced wire rope size, the sheave and hoist drum
grooving must be considered to ensure a satisfactory match with the wire rope. The capacities or ratings of components produced in foreign countries in compliance with foreign standards, and their installation requirements, must be converted to the English engineering units and verified for specification compliance.

b. Some components from foreign sources are prohibited due to practical considerations – either susceptibility to counterfeiting or maintenance and timely support. Specific examples are:

(1) High-Strength Structural Bolts and Nuts. The use of structural bolts from foreign manufacturers is allowed provided the bolts meet Research Council on Structural Connections (RCSC) Specification for Structural Joints Using High-Strength Bolts (RCSC A348).

(2) Electronic controls of foreign manufacturers are prohibited unless technical support is available in the U.S.

1.4 VERIFICATION OF DIMENSIONS

The Contractor is responsible for the coordination and proper relation of their work to the building structure and to the work of all trades. Coordinate with the crane support structure design, where applicable, to provide the desired crane operating envelope (i.e., hook envelope and hook height). Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

1.5 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding
Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Manufacturer Qualification

Overhead Electric Crane System, including sub-system components manufactured by vendors, must be designed by, or directly supervised by, a registered professional engineer (PE). PE licensing must be by a board or agency authorized to license and register professional engineers. The PE may be a Contractor's regular employee or a consultant. The PE's review and attestation of specification compliance and professional responsibility must be signified by their PE original seal and dated signature on the final drawings. The professional engineers must only undertake and perform work under this contract in the branch(s) of engineering in which they are licensed.

1.6.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing, and documentation.

[1.6.2.1 Hook Proof Test

**************************************************************************
NOTE: Hook proof tests are required by the NAVY for custom designed or non-ferrous (bronze or stainless steel) hooks. Bronze/stainless steel hooks are generally associated with the minimum hazardous area requirements, which applies to all cranes specified by this document.
**************************************************************************

Proof test custom designed or non-ferrous load hooks per ASME B30.10. Perform the proof test prior to Hook NDT.

]1.6.2.2 Inspection of Hook Assembly

**************************************************************************
NOTE: For NAVY, crane hooks require liquid penetrant type inspections for non-ferrous hooks with acceptance criterion being no linear indications greater than 1.5 mm 1/16 inch. General recommendation is that linear indications greater than 1.5 mm 1/16 inch not be allowed. Use of X-ray and ultrasonic inspection is not required for NAVY cranes.
**************************************************************************

Inspect hook [by liquid penetrant type inspection] [and X-rayed] [and tested ultrasonically] prior to delivery. Furnish documentation of hook inspection to Contracting Officer prior to field operational testing.

Acceptance standard is no defects. A defect is defined as a linear indication for which the largest dimension is greater than [1.5 mm 1/16 inch ] [3 mm 1/8 inch] [_____] long. Welding repairs of hooks are not permitted. A hook showing linear indications, damage, or deformation is not acceptable.
1.6.2.2.1 Hook Non-Destructive Test (NDT)

**************************************************************************
NOTE: This section is required for NAVY cranes.

Remove this section if the selecting agency does not require hook non-destructive testing or the necessary non-destructive testing is not IAW NAVY requirement.

NOTE: For NAVFAC, add tailored paragraphs with additional requirements.
**************************************************************************

For hooks of non-magnetic material, NDT must be liquid penetrant (PT) method in accordance with ASTM E1417/E1417M or NAVSEA T9074-AS-GIB-010/271.

For PT testing of hooks containing stainless steels, titanium, or nickel based alloys, total halogens and Sulphur used in the NDT process must be controlled as specified in NAVSEA T9074-AS-GIB-010/271.

Inspect each hook and shank over the entire surface area. If NDT cannot be performed on surfaces inside small holes (e.g., hook/nut captivation roll pin holes), visually inspect those surfaces to the maximum extent practical.

a. Acceptance Criteria: Defects found on the hook will result in rejection of defective items for use on furnished hoist.

b. Test Report: Submit a test report of the inspection of each hook provided the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheets, and certification to the Contracting Officer with the test report.

1.6.3 Drawings: Overhead Electric Crane System

a. Submit drawings showing the general arrangement of all components in plan, elevation, and end views to demonstrate proper interface with the facility and relation to other cranes on the same rail system, if applicable. Show all major features of the crane including: hook approaches on all four sides, clearances and principal dimensions, hoist, trolley and bridge drives, motor nameplate data, overcurrent protective device ratings, and electrical schematic drawings. Include weights and centers of gravity of major components (e.g., bridge girder, trolley/hoist).

b. Submit shop drawings of all fabricated components. Shop drawing quality must be equivalent to the contract drawings accompanying this solicitation. Drawings must be reviewed, signed, and sealed by a licensed professional engineer.

c. Provide Bill of Material for crane components on each drawing. The schedule must provide a cross reference between manufacturer data and shop drawings. Components listed on the schedule of crane components must include total quantity, description, original manufacturer, and
part number. Distributing agents will not be acceptable in lieu of the original manufacturer.

d. Provide control system and network drawings. Network diagram must show equipment locations, names, models, and IP addresses on network communications schematic for all Programmable Logic Controllers (PLCs), Remote Terminal Unit (RTU), Supervisory Controller, and Other Network-Capable Devices. In addition, the drawings must consist of all software block, flow, and ladder diagrams.

1.6.4 Design Data: Load and Sizing Calculations

**************************************************************************
NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys. Coordinate seismic analysis requirement with specification section SEISMIC FORCES.
**************************************************************************

Submit complete list of equipment and materials, including manufacturer's descriptive data, technical literature, and performance charts and curves. Submit calculations reviewed, signed, and sealed by a registered professional engineer verifying the load cases, sizing of the bridge girder, end trucks, travel drives, motors, overcurrent protection, and conduit. Provide a list of all codes and standards, design assumptions, equations, specified efficiencies, limits, factors of safety, component ratings, and sources of values used. Include free body diagrams or sketches of each load case. Include seismic analysis of crane.

1.6.5 Certificates

All certifications must be dated and bear the original signature (above the printed name) of the authorized representative of the Contractor or the manufacturer of the items or equipment being certified. Submit certifications that clearly identify the crane, the drives, components, and location (as applicable) to which it applies:

a. Wire Rope Certification with either the wire rope manufacturer's certification that the rope meets the published breaking force, or the actual breaking force of a sample taken from the reel and tested. Show the published breaking force on the wire rope certificate; the actual wire rope breaking force must meet or exceed the published value. Certification must be traceable to the hoist, crane, and reel.

**************************************************************************
NOTE: A solid non-sparking wire rope (e.g., stainless steel) is the preference for hazardous areas.
**************************************************************************

Include the requirement for end user notification if the crane operates in a Division 2 hazardous area (per CLASSIFICATION) and drawn galvanized wire rope is allowed per HOISTING ROPE.

**************************************************************************
** (1) Drawn Galvanized Wire Rope End User Notification from the crane, hoist, or wire rope OEM notifying the end user that the crane is operated in a Division 2 hazardous area as defined by NFPA 70,**
which is a location where the hazardous material is not likely to be present or is present only in the short term. The wire rope is made of drawn galvanized steel, meaning it is manufactured from sparking materials but provided with a spark resistant outer layer. The outer layer or individual wire strands could become compromised if the wire rope is used in an improper manner or inadequately maintained, which would affect the integrity of the spark-resistant protection. In this scenario, immediate replacement is recommended. The wire rope will need to be evaluated and potentially replaced with a compliant configuration if the hazardous area Division is changed.

} b. Crane Runway Certificate stating that the new crane will operate properly on the runway. For runways provided by Contractor, include statement certifying runway has been aligned in accordance with MHI MH27.1.

c. Hazardous Material Certificate that the crane does not contain hazardous material including asbestos, lead, cadmium, chromium, PCBs, or elemental mercury. Products required for the designing and manufacturing of cranes must not contain the prohibited materials.

d. Loss of Power Test Certificate stating that a test may be performed in which power is removed during operation without any detrimental effects to the crane.

**************************************************************************
NOTE: For NAVFAC, the Overload Test Certificate must state that the cranes can be periodically load tested to 125 percent (plus 0 minus 5 percent). Remove the conflicting Overload Test Certificate which allows for testing at different tolerances.
**************************************************************************

e. Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus 0 minus 5 percent) of rated load. Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus [0] [_____] minus [5] [_____] percent) of rated load.

f. Certificate of the Brake Adjustment Record. Provide a brake adjustment record and installation/maintenance manuals for each brake on the crane. Each brake measurement must have a tolerance traceable to the associated brake manual or documentation provided by the brake manufacturer, location of measurements, and the actual brake setting. Changes made to settings of the brake, at any time, will void the record.

g. Contractor Hazardous Environment Certificate stating that the new crane and all associated components including the hoist are designed for operation in the hazardous environment specified in the Classification section.

h. Public Domain Software Certificate declaring that public domain software (e.g., freeware, shareware) is not used in the system.

i. Certificate stating that all Software and Services that are not required for operation and/or maintenance of the product have been removed. The software/services to be removed are identified in
SOFTWARE AND SERVICES.

1.6.6 Welding Qualifications and Procedure

Welding must be in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep and not exceed those specified in AWS D14.1/D14.1M and MHI MH27.1. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M.

1.7 CRANE SAFETY

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment. Material will be free from defects and imperfections that might affect the serviceability and appearance of the finished product. All material must be new and unused.

2.1.2 Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two bridge identification plates, one for each side of the bridge. Provide noncorrosive metal identification plates with letters which are easily read from the floor, showing a separate number such as BC-1, BC-2, for each bridge crane.

2.1.3 Capacity Marking

******************************************************************************
NOTE: NAVFAC requires markings to be indicated in pound units. The kilogram marking option is provided for cranes installed in a foreign country.
******************************************************************************

Mark the rated capacity in pound units [with kilogram units printed in a different color] on each side of the crane on the bridge girder. Capacity marks must be large enough to be clearly visible from the floor. Individual hoist units must have their rated capacity clearly marked on their lower block, and additionally labeled on the hoist body.

2.1.4 Safety Warnings

Affix labels in a readable position to each lift block or control station in accordance with ASME B30.16 and ASME B30.17. Submit safety warnings, diagrams and other instructions suitably framed and protected for display as indicated by the Contracting Officer as follows:
Design and locate the word "WARNING" or other legend to bring the label to the attention of the operator. Provide durable type warning labels and display the following information concerning safe-operating procedures: Cautionary language against lifting more than the rated load; operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; operating damaged or malfunctioning hoist; operating a rope hoist with a rope that is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

2.2 STRUCTURAL REQUIREMENTS

Structural requirements must be in accordance with MHI MH27.1. Structural steel materials must conform to the standards permitted in MHI MH27.1 and AISC 360. Skewing and other applicable lateral loads must be considered in the design.

2.2.1 Structural Connections

High-strength bolted structural connections must be designed and installed in accordance with RCSC A348. Bolts must be of ASTM F3125/F3125M Grade A325/A325M or Grade A490/A490M material. Galvanized bolts are not acceptable.

Welded connections for the crane must be performed in accordance with AWS D14.1/D14.1M. Welded connections to the building must be performed in accordance with AWS D1.1/D1.1M. Allowable stress values must comply with MHI MH27.1.

2.2.2 Crane Bridge Girder

a. Provide a crane bridge girder of patented track conforming to MHI MH27.1. Intermittent (“skip”) welds on bridge girder elements (e.g., web and flange interfaces) are prohibited. If the girder is notched to fit over the end trucks, reinforce the girder ends with vertical and horizontal stiffeners. Splices in the unsupported length of the girder are prohibited.

b. Submit manufacturer's standard published tables that verify the crane bridge girder is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the bridge. Patented track girder must be of welded steel construction and fabricated by a manufacturer regularly engaged in the production of this type of beam.

c. Keep splices in the bridge girders to a minimum and splices in high stress locations must be avoided. Make splices with complete joint penetration welds. Field (on-site) welded splices are prohibited.

2.2.3 Bridge End Trucks

**************************************************************************
NOTE: For cranes in hazardous areas which encompass the entire crane envelope, the drop lugs pose a sparking risk if it is metal-to-metal. Use the maximum anti-spark tailoring option to minimize this sparking risk.

SECTION 41 22 13.55  Page 27
Provide bridge end trucks conforming to ASME B30.17 and MHI MH27.1. Configure end trucks with a feature that limits end truck movement to 25.4 mm one inch in the event of wheel or shaft failure. Provide drop (safety) stops with contact surfaces of non-sparking materials.

2.2.4 End Stops

Fit the crane bridge girder(s) with structural steel end stops. Locate stops to permit maximum trolley travel. Design end stops in accordance with MHI MH27.1 and ASME B30.17. Provide a system in which the travel wheels do not contact the end stops. End stops must be designed to absorb the maximum kinetic energy and impact force developed by the bumper contact. Provide end stops compatible with trolley bumpers and designed to bolt to the crane bridge girder.

2.2.5 Bumpers

NOTE: The following paragraph contains tailoring for MAXHAZ for cranes located in hazardous areas which encompass the entire crane envelope; the bumper to end stop connection poses a sparking risk if it is metal-to-metal. Use the maximum anti-spark tailoring option to minimize this sparking risk.

Fit bridge end trucks and trolley frames with shock-absorbing bumpers capable of decelerating and stopping the bridge and trolley within the limits stated by ASME B30.17. Ensure bumpers conform to ASME B30.17. Bumpers must fully engage end stops. Mount bumpers so that there is no direct shear on mounting bolts (if any) upon impact. Bumpers must provide adequate clearance between the crane and surrounding structure when compressed to preclude damaging equipment (clearance requirements are defined in MHI MH27.1 or CMAA 74, as applicable, and ASME B30.17). When more than one crane is located and operated on the same runway, bumpers must be provided on their adjacent ends or on one end of one crane. Fit the other end of the end-truck with a structural steel stop to engage the bumpers of the adjacent crane. Ensure bridge bumpers are properly aligned with runway end stops. Metal to metal contact at the bumper to end stop connection is not permitted.

2.2.6 Crane Runway System

NOTE: For underrunning cranes, the runway and its support structure is usually supplied by the crane contractor. Use Crane Runway System only if crane contractor is to provide a new runway.

a. Provide the complete runway track suspension system that is required to hang the crane runway track at its indicated location from the structural supports indicated on the drawings. Provide runway and support structure for underrunning crane of patented track girders conforming to MHI MH27.1.

b. Splice assemblies must be from the same manufacturer as the patented
track and located under structural support members. Submit manufacturer's standard published tables that verify the crane runway track is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the beams.

c. Runway support structure must be designed, fabricated, and installed such that runway rails meet the alignment tolerances of MHI MH27.1. Provide means to allow for vertical adjustment of the runway track both before and after the system has been put in operation so that track can be erected and maintained level. Brace runway to restrain the track against damaging lateral and longitudinal movements. Where the runway track is suspended from hanger rods, provide means preventing the hanger rod nuts from backing off the rods. Allowable stress in hanger rods is 20 percent of the minimum specified ultimate strength of the material used.

d. The lower T-section ends of the runway must be aligned to minimize the horizontal gap on the running surface to not greater than 1.5 mm 1/16 inch and not greater than a vertical difference of 0.75 mm 1/32 inch for the wheel running surface alignment for a smooth crossing by the wheels. Provide splices located directly under structural support members. When runways are suspended, bracing preventing damaging lateral or longitudinal movement is required. Loads transmitted to the building through the suspension must have the review and approval of the building engineer of record (EOR) prior to installation.

e. Design, fabricate, and install new runway end stops in accordance with MHI MH27.1 and ASME B30.17. End stops must be designed to absorb the maximum kinetic energy and impact force developed by the bumper contact. Provide end stops compatible with end truck bumpers, designed to bolt to the runway support girders, and maximize bridge travel.

[2.2.7 Seismic Forces

******************************************************************************
NOTE: Seismic forces for underrunning cranes are typically considered negligible. If not considered negligible, include the analysis section below. Seismic forces must be considered in the design of the cranes with a component importance factor of greater than 1.0 and in facilities with a Seismic Design Category of D, E, or F per ASCE 7. Coordinate requirement with specification section DESIGN DATA: LOAD AND SIZING CALCULATIONS.
******************************************************************************

Perform a seismic analysis as a part of the design of the crane in accordance with ASCE 7-16. The seismic analysis must be included in the MHI MH27.1 extraordinary load case (Case 3).

For project locations beyond the scope of ASCE 7-16, a widely accepted design standard may be used for seismic analysis.

}2.3 MECHANICAL REQUIREMENTS

a. Provide steel shafts, gears, and keys, with the exception of worm gears which may be bronze. No three or more bearing shaft configurations are allowed.
b. Cast iron and aluminum used to support components of the hoist power transmission train must be ductile. For the purposes of this specification, "ductile" is defined as having a minimum elongation of 5 percent in 2.00 inches.

c. Provide steel or ductile/malleable cast iron brake housings of motor mounted disc brakes, brake lining backing plates, shoes and shoe holders. Provide spring-set brake shoe or pad linings of a non-asbestos material.

d. All mechanical components must be accurately aligned and positively secured to maintain the alignment. Parts must not be forced into position to obtain apparent alignment.

e. Provide minimum bearing life in accordance with ASME hoist performance standards and MHI MH27.1.

f. All "should" statements in CMAA 74, MHI MH27.1, and ASME B30 are considered to be "shall" statements.

2.3.1 Threaded Fasteners

Fasten mechanical connections that are not part of a commercial packaged assembly with SAE J429 Grade 5 fasteners, ASTM F436/F436M washers, and SAE J995 Grade 5 nuts. Lubricate all mechanical fasteners unless otherwise specified by the original component manufacturer.

2.3.2 Hoist

**************************************************************************
NOTE: Generally, hoist duty class roughly aligns with CMAA class. An H3 hoist service duty class would typically be specified for a CMAA 74 service class C crane; H4 for service class D. See the Crane Design Criteria – Classification section to identify the CMAA service duty class specified for this crane.
**************************************************************************

Provide hoist conforming to ASME B30.16 except as modified and supplemented in this section. Packaged hoist and trolley units (packaged hoists) must be double reeved electric wire rope hoist conforming to ASME HST-4 Duty Class [H3] [H4] or better and be rated for the operating environment.

Configure trolley such that the trolley frame contacts the trolley stops and prevents the trolley from dropping more than one inch in the event of an axle or wheel failure. Provide drop (safety) stops with contact surfaces of non-sparking materials. Metal to metal contact at the bumper to end stop connection is not permitted.

2.3.2.1 Hoist Brakes

**************************************************************************
NOTE: Each hoist must have, at a minimum, two brakes. For packaged hoists, the most common brake configuration is one electro-mechanical spring set brake and one mechanical load brake (or self-locking worm gear).
**************************************************************************
Consider the CONTROLS paragraph under ELECTRICAL REQUIREMENTS.

If a variable frequency drive (VFD) is selected for use, the brake configuration must reflect the type of VFD selected (open loop). If open loop controls are selected, brake configuration must be one electro-mechanical brake and one mechanical load brake (or self-locking worm gear).

NAVFAC tailoring option is for brakes utilized as holding brakes only.

**************************************************************************

a. Equip the hoist with two holding brakes, each with a minimum torque rating of 125 percent of the rated load hoisting torque. Provide a brake configuration with one electro-mechanical spring set brake and one mechanical load brake, or self-locking worm gear, that stops and holds 125 percent of the hoist's rated load and does not require the load to be raised before being lowered.

b. Electro-mechanical brakes must have an externally accessible means of manual release. Provide manual-adjusting brakes designed to permit inspection and adjustment without disassembly of the brake. The brakes must be equipped with a manual self-return to ON brake release; maintained brake releases must reset when power is applied. Double face-mounted brakes are not permitted.

2.3.2.2 Load Block and Hook

**************************************************************************

**NOTE:** NAVFAC tailoring options for uniquely marked hook and nut and commercial blocks.

Tailoring option for maximum anti-spark protection (upper hooks must be non-sparking).

**************************************************************************

a. Provide a load block constructed of non-sparking materials. Covering the exposed surfaces of the load block with bronze, stainless steel, or aluminum covers attached with similar fasteners is acceptable. The load block must be designed to prevent metal-to-metal contact of moving parts. The block must be fully enclosed, concealing the sheaves and wire ropes, except for wire rope slots and drain holes. The design must preclude the wire rope from being cut, pinched, crushed, or chafed in case of two-blocking. Standard commercial blocks may be used at their published ratings when their published design factors are 5.0 or greater.

b. Provide an unpainted and unplated single barbed hook of non-sparking material. Bronze clad hooks are prohibited. Hooks must conform to the requirements of \textit{ASME B30.10}. The hook must be a standard commercial product with a published design factor of 5.0 or greater. Fit hook with a safety latch designed to preclude inadvertent displacement of slings from the hook saddle. The hook and hook nut must be removable without unreeving of the hoist. Provide a hook nut secured to the hook with a commercial standard removable and reusable means. Do not weld hook nut. When provided, provide shank and nut threads with a Class 1
or 2 fit, per ASME B1.1. Uniquely mark the hook in a permanent fashion that is traceable to the NDT certification. The nut must be marked to match the hook. The hook nut must be of non-sparking materials. Hook must be free to rotate through 360 degrees when supporting the test load up to 125 percent of the rated capacity. Upper hooks of hook suspended hoists must be of non-sparking materials.

2.3.2.3 Hoisting Rope

**************************************************************************
NOTE: A solid non-sparking wire rope (e.g., stainless steel) is the preference for hazardous areas.

There are some packaged hoist and capacity combinations (e.g., 5 ton capacity) in which the published stainless steel wire rope breaking strength for the given rope diameter cannot meet the prescribed design factors per ASME B30.16. In those instances an alternative wire rope material is necessary. Drawn galvanized wire rope is acceptable in Division 2 hazardous areas provided the crane, hoist, or wire rope OEM provide a notification to the end user with the wire rope certification / submittal. This notification will identify that the wire rope is made of drawn galvanized steel, meaning it is manufactured from sparking materials but provided with a spark resistant outer layer. The outer layer or individual wire strands could become compromised if the wire rope is used in an improper manner or inadequately maintained, which would affect the integrity of the spark-resistant protection.
**************************************************************************

a. Wire rope must comply with ASME B30.30 and FS RR-W-410, ASTM A1023/A1023M, or BS ISO 4309 and have a rope classification appropriate for the usage. Wire ropes must be handled and seized in accordance with ASME B30.30. The wire rope must be in a double reeved configuration equalized with a sheave. Select wire rope minimum design factor in accordance with ASME B30.16. Provide proof of Wire Rope breaking force.

b. Wire rope must be spark resistant. Provide stainless steel hoist ropes with an independent wire rope, wire strand, or otherwise, steel core. [Drawn galvanized wire rope is acceptable in Division 2 hazardous areas when provided with a drawn galvanized wire rope end user notification.]

2.3.2.4 Drum

Provide grooved drum made of steel. Design drum in accordance with ASME B30.16. All hoisting rope is to be wound in a single layer and provided with no less than two dead wraps of hoisting rope remaining at each anchorage when the hook is in its extreme low position.

2.3.2.5 Sheaves

Provide sheaves constructed of non-sparking metals in the load block. Provide sheaves constructed of steel for the equalizer and in the upper...
sheave nest. Size sheaves in accordance with ASME B30.16 for the minimum pitch diameters of running and equalizer sheaves.

2.3.3 Travel Drives

Provide travel assemblies with a minimum of one driven wheel on each side of the web and at least one quarter of all wheels driven. The travel drive arrangement must consist of motor(s) driving through self-contained gear reduction units located at each driven wheel assembly. Gear reducers must be fully enclosed in an oil-tight housing and provided with a convenient means of lubricant level indication and draining. Open-type gearing is not acceptable, except for final drives.

2.3.3.1 Trolley Drives

**************************************************************************

NOTE: Trolley limit switches are an optional safety device.

Trolley travel limit switches are used to prevent the crane trolley from contacting the travel end stops at high speed should the crane operator mistakenly forget to slow down. If selected, ensure the appropriate options are chosen in the ELECTRICAL REQUIREMENTS, Limit Switches section.

**************************************************************************

Provide a motor-driven trolley arrangement. Acceleration and deceleration must meet the requirements specified in CMAA 70.[ Provide trolley travel limit switches.]

2.3.3.2 Bridge Drives

**************************************************************************

NOTE: Bridge limit switches are an optional safety device.

Bridge travel limit switches are used to prevent the crane bridge trucks from contacting the travel end stops at high speed should the crane operator mistakenly forget to slow down. If selected, ensure the appropriate options are chosen in the ELECTRICAL REQUIREMENTS, Limit Switches section.

**************************************************************************

Provide a motor-driven bridge arrangement. Acceleration and deceleration must meet the requirements specified in CMAA 74.[ Provide bridge travel limit switches.]

2.3.3.2.1 Bridge Travel Gearing

Gearing must conform to ANSI/AGMA 2001 and AGMA 908, with internal and external gear dimensional tolerances conforming to the applicable AGMA standard for tooth geometry and tolerances.

2.3.3.2.1.1 Bridge Travel Reducer

Gear reducers must be standard commercial products designed, manufactured, and rated in accordance with ANSI/AGMA 6013. Provide cranes with a CMAA

SECTION 41 22 13.55  Page 33
UFGS

service class "C" or higher with the corresponding "Industrial Duty" service factors. The speed reducer input (high speed) gear set must use helical (including double helical and herringbone), spiral bevel, or worm gear tooth forms. Provide torque arms that are not of the threaded rod type. Operation must be smooth and quiet.

2.3.3.2.1.2 Bridge Open Gearing

Provide all gears and pinions with adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2015-1 Accuracy Grade A8 or better. Wherever feasible, open gears must be enclosed with safety guards provided with openings with covers for inspection and access for grease lubrication.

2.3.4 Travel Brakes

**************************************************************************
NOTE: NAVFAC tailoring option for additional travel brake requirements.
**************************************************************************

Provide travel drives with an end-mounted electro-mechanical spring set brake conforming to the requirements of CMAA 74 or non-freecoasting mechanical drive capable of stopping the motion of the travel function within a distance in meters feet equal to 10 percent of the full load speed in meters feet per minute when traveling at full speed with a full load.

Spring set brakes must be provided with an externally accessible means to manually release the brake. Provide manual-adjusting brakes designed to permit inspection and adjustment without disassembly of the brake. The brakes must be equipped with a manual self-return to ON brake release; maintained brake releases must reset when power is applied. Double face-mounted brakes are not permitted.

2.3.4.1 Trolley Brake

**************************************************************************
NOTE: NAVFAC tailoring option to require electro-mechanical brakes be end-mounted.
**************************************************************************

Provide brakes for underrunning trolleys/carriers sized in accordance with ASME B30.17, but not sized larger than 150 percent of the drive motor rated torque.

2.3.4.2 Bridge Brake

**************************************************************************
NOTE: NAVFAC tailoring option to require electro-mechanical brakes be end-mounted.
**************************************************************************

Provide brakes with a minimum torque rating per CMAA 74 according to the applicable environment, but not sized larger than 150 percent of the drive motor rated torque.

2.3.5 Wheels

**************************************************************************

SECTION 41 22 13.55  Page 34
NOTE: The following paragraph contains tailoring regarding the use of non-sparking wheels with maximum anti-spark protection. Remove any conflicting items (i.e., wheels cannot be non-sparking and steel or ductile cast iron).

Provide under running wheel sizing and flange-to-rail head clearances in accordance with MHI MH27.1 recommendations. The wheels must be compatible with their respective runway profile. Wheel material is to be cast or forged steel, or ductile or malleable cast iron. Provide wheels of non-sparking material. Bronze wheels must have sufficient size and hardness to withstand the intended loading and use. Hollow stamped and gray cast iron wheels may not be used; the use of plate steel is prohibited. Minimum tread hardness for underhung wheels (non-bronze) that run on patented track is 375 BHN.

[2.3.6 Drip Pans]

NOTE: Drip pans may also be added for any type of crane service if there is an additional requirement to prevent lubrication from falling to the floor or lifted load. Any portion of this section may be used to support the request of the Activity. Not recommended for outdoor service.

List items a. and b. are generic drip pan requirements for inclusion beneath gearboxes. Paragraph c is less likely to be needed.

a. The crane must be designed to preclude leakage of lubricants onto the lifted loads or the floor. Equipment or components, which cannot be made leak-proof, must be fitted with unpainted corrosion resistant steel drip pans or must have the foundations seal welded to create a dam. Drip pans that utilize liquid sealant to prevent leakage of lubricants are not permitted.

b. The drip pans must be sized to hold the entire gear case fluid capacity, installed under all drive machinery, designed to permit easy removal of collected lubricant. A trolley floor designed to contain any lubricant drips may be used as fluid containment for any equipment that is mounted on it.

c. Provide drip pans fitted around the shank of the hook and extending outward to encompass all possible points of lubrication drips from the load block or wire rope. The drip pans must be easily removable without disassembly of the hook or load block and cannot interfere with the crane structure during testing of the upper limits.

]2.4 ELECTRICAL REQUIREMENTS

a. The design, selection, rating, and installation of the electrical portions of the crane and its accessories must conform to the requirements of NEMA ICS 3, NEMA ICS 8, the applicable ASME HST standard, and NFPA 70, and other requirements specified herein.

b. All electrical components must be industrial grade, commercially
available and comply with established national or internationally recognized approving organizations such as Underwriters Laboratories (UL) and Canadian Standards Association (CSA). All electrical components installed or operated in hazardous areas including but not limited to enclosures, junction boxes, disconnects, pendant controller, and electrification must be designed and rated for the NFPA 70 Hazardous Classifications specified in Classification section.

c. All electrical components must be located so they are easily accessible for inspection and maintenance without removing other parts, doors, or door center posts. Install electrical equipment and panel wiring in a neat and workmanlike manner in accordance with Electrical Construction Standard NECA NEIS 1. Each motion of the crane must be provided with a separate and independent variable frequency drive unit. The loss of any one function must not prevent the operation of other unaffected functions. Two independent relays, contactors, drive inputs, or other equivalent components/logic must be utilized for each function to provide directional control such that the failure of a single relay/contactor/component cannot result in motion in an unintended direction.

d. Disconnecting means for cranes must be in accordance with NFPA 70 Article 610.32. A permanent placard must be installed on the face of the main line disconnect that states "WARNING – THIS DOES NOT ISOLATE POWER TO LIGHTING, RECEPTACLES, AND ANCILLARY EQUIPMENT". Additionally, a lighting (ancillary equipment) disconnect must be provided, with lockout feature, as the isolation means for the lighting transformer and lighting circuit breaker panel, which must power the crane's ancillary equipment. It must feed 480 VAC to the primary side of the transformer directly from the runway conductors via tapping the line side of the main power disconnect. Provide individual disconnects, with lockout feature, capable of being locked in the open position for bridge lights and receptacles.

e. Unless otherwise specified, interconnecting wiring must be of copper stranded construction complying with Table 310.104(A) of NFPA 70. Interconnecting wiring containing asbestos in the insulation or outer covering are prohibited. Aluminum conductors must not be used. Aluminum connectors are allowed if they are rated for use with copper conductors (marked "AL/CU"). All conductors connected to or routed above resistors must have insulation shown in NFPA 70 Table 610.14(a) for 125 degrees C 257 degrees F. For packaged hoists and hoist/trolleys, provide wiring sizes in accordance with NFPA 70 Table 610.14(a). Motor branch circuit conductors not part of a packaged hoist and hoist/trolley must be sized as to have an ampacity not less than 150 percent of the motor full load current rating and to be no smaller than 12 AWG. Conductors must be selected and de-rated based on maximum ambient temperature. Continuous loads such as utility, heating, lighting, and air conditioning must be multiplied by 2.25 to determine ampacity in order to permit application of NFPA 70 610.14 (A) for crane supply conductors. Wire-nuts are not permitted on splices. However, connections for lighting ballasts may be made using wire-nuts (if applicable).

f. Excluding conduit directly connected to dynamic breaking resistors, raceways must maintain a 12-inch clearance between the raceway and dynamic braking resistors. A separate grounding wire, sized in accordance with Section 250.122 of NFPA 70, must be routed with all ungrounded conductors. Only one equipment grounding conductor must be
run in each conduit and be the largest size required for any circuit routed in that conduit. All wiring must be numbered or tagged at all connection points. Power conductors which are shielded such that their wire size cannot be easily determined must be labeled as to the conductor size. All unused conduit openings must be plugged.

g. When fiber optic cable is utilized, inspections and performance checks must be accomplished upon completion of on-site installation to ensure cable cleanliness and proper signal integrity. Testing and verification must be conducted by a knowledgeable fiber optics technician using specialized, calibrated equipment. Cables must be tested for signal loss/attenuation. The fiber optic system must also be tested using an Optical Time Domain Reflectometer (OTDR). Final attenuation and OTDR readings from each fiber optic cable run, including spares, must be documented as a baseline for future reference. All spare fiber optic cables must have protective covers over their ends to maintain cleanliness while not in use. When fiber optic cable is utilized the drive OEM's recommendations for encoders and optical to digital converters must be followed. All system components utilized for this purpose must have known compatibility prior to integration.

h. Power cables and low voltage signal cables may not be mixed in the same conduit.

i. The crane manufacturer must furnish and install all electrical equipment on the crane conforming to NEMA ICS 6, including motors, conforming to NEMA MG 1, electrically released brakes, switches, crane controllers, panels, operating station, wiring system, cables, and crane electrification.

2.4.1 Motors

**************************************************************************
NOTE: Inverter duty motors are required for open loop variable frequency drives (VFD).

U.S. Navy allows only 60-minute duty rating motors. 30-minute duty rating motors require Navy Crane Center approval. For non-Navy applications, the motor duty rating may be selected to match what is required by the class of HST-4 hoist (such as H1, H2, H3) specified.
**************************************************************************

Motors must meet all applicable requirements of NEMA MG 1 and UL 1004-1. CMAA 70 calculations for motor horsepower shall be used in selecting bridge, trolley, and hoist drive motors. All motors must have a minimum of a [60] [30] [_____] minute duty rating and be Totally Enclosed Non Ventilated (TENV), Totally Enclosed Fan Cooled (TEFC), or Totally Enclosed Blower Cooled (TEBC).[ Provide inverter duty motors for Open Loop Variable Frequency Drives (VFD).[ Provide AC squirrel cage induction type motors for the bridge, trolley, and hoist drives.] Provide motors with a minimum of Class F insulation. Provide motor overload protection utilizing a thermal sensitive device embedded in its windings.

2.4.2 Controls

**************************************************************************
NOTE: Use the first three paragraphs to select electronic variable frequency drive controls for either the hoist, bridge or trolley. With VFD controls, the hoist must be configured as open loop. Open loop is more cost effective and requires a mechanical load brake (or self-locking worm gear). Ensure the Hoist Brakes section of this specification reflect the type of controls chosen. Use the fourth, fifth, and sixth paragraphs to select one or two speed control for the hoist, bridge, or trolley. Selections can be made using a combination of electronic controls and one or two speed motor controls for the various functions.

When the two-speed bridge and trolley motor is specified, the slow speed will be 1/3 to 1/4 of rated travel speed. Reduced voltage starting, acceleration, and deceleration, serve to reduce the acceleration rate that is normal for squirrel-cage motors. Squirrel-cage motors with two-speed magnetic controls provide satisfactory results with slow bridge and trolley speeds, and should be specified when short travel distances are involved and where fine positioning is not required.

For faster bridge and trolley speeds or finer positioning requirements, specify electronic controls.

Various VFD manufacturers offer an option to overspeed the hoist to a value over 60Hz (usually 120Hz). This allows the operator to position the hoist at faster speeds when it is not loaded. When selecting this feature list the maximum no load speed in paragraph RATED CAPACITY AND SPEEDS.

**************************************************************************

a. Provide static reversing, variable frequency drives (VFD) for the [bridge,] [trolley] [and] [hoist] electric controls. VFD controllers must meet NEMA ICS 8, Part 8 and at a minimum, provide under-voltage protection, electronic instantaneous over current protection, DC bus over voltage protection, and be able to withstand output line to line shorts without component failure. Select bridge and trolley drives such that the continuous rating of the controller is not less than the calculated motor full load current based on CMAA 70 paragraph 5.2.9.1.1.1 and NFPA 70 Table 430.250. Select hoist drives such that the continuous rating of the controller is not less than 125 percent of the calculated motor full load current based on CMAA 70 paragraph 5.2.9.1.1.1 and NFPA 70 Table 430.250. All hoist drives must have a motor over-torque limit to lock out the hoist and prevent gross overload of the associated hoist. Provide dynamic braking for each electric drive that is sized per VFD manufacturer's requirements. Submit VFD Control Parameter Settings.

b. Provide speed control which is infinitely variable for each function, controlled via [radio control system] [and] [pendant pushbutton station]. Provide controls designed such that the maximum speed of each function will be limited to 25 percent of rated speed when a slow speed switch is actuated on the controller[s]. Energize a
yellow/amber light/indicator while in slow speed mode.]

c. The [hoist],[,] [trolley],[,] [and] [bridge] brakes must set after the
associated controller decelerates the drive motor to a controlled
stop. The hoist, trolley, and bridge, controllers must be sized to
provide sufficient starting torque to initiate motion of that crane
drive mechanism from standstill with 0 to 125 percent of rated load on
the hook. The hoist controller must prove torque before release of the
brakes and enable the drive motor to develop full torque continuously
at zero speed. Motors must operate smoothly at all speeds without
torque pulsations and must only be energized within the frequency range
of 50-60 Hz at rated speed. The hoist control system may utilize
overspeed up to 120Hz, unloaded only, if the drivetrain equipment has
all been balanced and is rated for the resulting speed.

d. The use of definite purpose contactors is prohibited. If IEC
contactors are used, the application cannot exceed the contactor
manufacturer's AC3 ratings for the contactor at a minimum.

e. On hoist function roll-up must be less than 3 mm 1/8 inch measured at
the hook block and roll-back must not occur over the entire load range.

f. Use of Uninterruptible Power Supplies (UPS) is prohibited. Feed
control circuits from a single phase, air cooled, double wound
transformer with a grounded metal screen between the primary and
secondary windings of the transformer.

g. Provide a main line contactor. Energization of the main line contactor
must be controlled by the POWER-OFF/POWER-ON switch/pushbutton on all
controllers. Upon actuation of the POWER-OFF pushbutton; power to all
drive motors, brakes, and controls must be removed. The mainline
contactor must not be able to be energize while the POWER-OFF
pushbutton is actuated. The POWER-OFF pushbutton circuitry must be
independent of all controls or any other electronic devices.

2.4.3 Protection

Protection must not be less than that required by NEMA ICS 3, NEMA ICS 8,
CMAA 74, NFPA 70, UL 1004-1, UL 943, 29 CFR 1910.147, 29 CFR 1910.179,
29 CFR 1910.306 and all applicable provisions of 29 CFR 1910. All
protection must be by circuit breakers or fuses. Provide a disconnect
switch or enclosed type circuit breaker readily accessible to the crane
operator for the crane disconnect. Motor branch circuits must be
individually protected by inverse time circuit breakers capable of being
locked in the open position. The means for locking must remain in place
with or without the lock installed. Motor full load current from NFPA 70
Article 430, Part XIV (Tables) must be used to calculate the circuit
breaker size.

Provide disconnecting means on the crane in accordance with NFPA 70 Article
610.32. Provide for lockout/tagout of all hazardous energy sources.
Provide product data for all circuit breakers and fuses.

2.4.3.1 Conductors

a. The crane contractor is responsible for ensuring that all conductors
from the load side of the existing floor level disconnect to the motor
branch circuits have adequate overcurrent protection complying with one
of the following:
(1) Not be greater than the largest rating or setting of any branch
circuit protective device plus the sum of the nameplate rating of
all other loads per NFPA 70 Article 610.41(A).

(2) Not be greater than the ampacity of all feeder conductors after
all ampacity correction factors have been applied.

b. Conductors for brake coils must be protected by fuses or other
protective devices. The device must be chosen to protect the brake
circuit conductors from ground faults or short circuits.

2.4.4 Resistors

Provide resistors with natural convection cooling sized as recommended by
the VFD OEM and fabricated of corrosion resistant metal; the use of "wire
wound" type resistors is prohibited for segments of 8 ohms or less. Mount
resistors in substantial, ventilated enclosures constructed entirely of
non-combustible materials. Provide resistors with terminals fitted in the
coolest position in the enclosure.

[2.4.5 Transients and Harmonics Protection

**************************************************************************
NOTE: The following items are required only for VFD Controls.
**************************************************************************

Provide contactors and relays with appropriate Metal Oxide Varistors (MOV)
or resistor-capacitor (R-C) surge absorbers installed across the respective
coil.

Provide transient protection for electronic drive controllers that is
either internal to the drive or via an MOV connected line-to-ground close
to the line terminals of the drive.

Provide line reactors rated for continuous duty operation based upon the
motor nameplate amperes. With motors of 50 horsepower or greater,
harmonics protection must be provided by an isolations transformer or as
recommended by the VFD OEM. For a drive motor branch circuit that exceeds
150 feet in length, a reactor must also be connected in series with the
controller load (output) terminals to provide standing wave protection or
as otherwise recommended by the VFD or motor OEM.

2.4.6 Limit Switches

a. Provide primary upper and lower geared limit switches. Geared limits
must allow reversing direction to back out of the limit without
resetting. The lower limit switch must be set such that there are a
minimum of two wraps of rope on the hoist drum.

b. Provide a backup mechanical hook block activated upper limit switch
wired independent of the directional controllers and the primary upper
limit switch that removes power from the hoist motor, hoist brake and
hoist controls conforming to NEMA ICS 5. The backup limit must require
hoist resetting prior to operation of the hoist in any direction.

c. Travel limit switches must be provided for the [bridge] [and] [trolley]
motion to slow the crane to [25 percent] [_____] of its rated speed
feet before the bridge end stops] [and] [[5] [_____] feet from the trolley end stops]. Limit switches must be mounted rigidly in a manner so as to protect the switch from misalignment or damage. The target/trip arm must be large enough to provide interception given a misalignment were to occur.

} d. Limit switches must be rated for the NFPA 70 Hazardous Classifications specified in the Classification section of this specification.

2.4.7 Operator Controls

**************************************************************************

NOTE: Available operator controls are pendant, and radio control. Cranes can also be set-up to be controlled by two separate systems. For cranes with one set of controls use paragraph 1. For cranes with two sets of controls use paragraph 2. In such a case some type of interlock must exist to prevent control from both systems simultaneously.

The pendant can be suspended from the trolley or an independent festooned messenger track system. The festooned system allows the operator to have maximum separation from the load. When this is a requirement include section Pendant Conductor System section of this specification.

When specifying a radio control system, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANECEININST 11450.2:

1. What type of batteries? Rechargeable?
2. Are spare batteries needed? How many?
3. Are spare remote control units required? How many?
4. Is a battery charger required?
5. Type of transmitter unit.
6. Is a belt/harness required for the remote control?

**************************************************************************

[ Provide crane equipped with a [pendant pushbutton station] [radio control system].

][Provide crane equipped with both a pendant pushbutton station and a radio control system. Provide a selector switch to allow the use of only one of the two available control stations on the pendant controller.

] If VFD controls are not provided, provide directional contactors with both mechanical and electrical interlocks.

Operator controls must be rated NEMA Type 7 for Class I, or NEMA Type 9 for Class II according to the NFPA 70 Hazardous Classifications specified in the CLASSIFICATION section of this specification.

[2.4.7.1 Pendant Pushbutton Station

The cranes must be controlled from a pendant pushbutton station suspended
from [the trolley] [an independent festooned messenger track system, operating the length of the bridge]. Provide multiconductor flexible cords for pendant pushbutton stations with #16 AWG minimum conductors. Provide a method of strain relief to protect the electrical conductors from damage. Locate the pendant pushbutton station [1200 mm 4 feet] [_____] above the finished floor. Pushbutton pendant station must have its elements legibly marked and arranged vertically, in order, in accordance with CMAA 74.[ Provide [one speed] [two speed] [3-step infinitely variable] [2-step infinitely variable] pendant pushbuttons for control of the [hoist][,] [trolley][,] [and] [bridge].] Provide pendant pushbuttons for control that spring return to the OFF position. Voltage in the pendant pushbutton station must not exceed 150 Volts AC or 300 Volts DC.[ Provide a maintained two-position selector switch for slow speed selection.] The pendant must be rated for the NFPA 70 Hazardous Classifications specified in the Crane Design Criteria "Classification" Section. Provide the pendant pushbutton station with a NEMA Type 7 for Class I, hazardous environments and NEMA Type 9 for Class II, hazardous environments, as classified by NFPA 70.

[2.4.7.1.1 Pendant Conductor System]

Provide a festoon type pendant conductor system. The festoon cables must be flat cables suspended from carriers riding on an I-beam or C-track. The pendant controller must be capable of traveling the entire length of the bridge and move independently of the trolley. Festoon loops must not extend below the high hook position.

[2.4.7.1.2 Radio Control System]

Provide each system with a [belly box] [handheld] [_____] type portable transmitter unit[ and an identical back-up transmitter unit].[ Provide each transmitter with an adjustable belt or harness to support it when worn by the operator.] Only one transmitter at a time can control the crane and there must be no interference from one crane's controller affecting operation of the other cranes in the building. Each transmitter must include: individual [infinitely variable spring return joystick motion control levers] [push button controls] for each hoist, trolley, and bridge; a maintained contact, keyed switch, marked ON-OFF, for portable transmitter unit power; indication of Battery Power, and indication of Transmitting Status; a red emergency STOP mushroom pushbutton;[ and ]a floodlight on/off pushbutton[ and a maintained slow speed selector switch]. The transmitters and all controls must each be clearly and permanently labeled with functionality and direction. Directions for controllers must be in accordance with CMAA 74 recommendations. The remote radio control system must be designed to meet the requirements of NEMA ICS 8, Part 9 and ECMA 15. Each radio remote control lever must be in the OFF position before the associated crane function can begin. The system frequency must be within the unlicensed FCC Part 15 range. Each control unit must maintain a continuous status signal to the associated receiver during operation. There must be no significant loss in systems efficiency and function at the end of eight hours of continuous battery use. The technical section of Form DD 1494 frequency allocation application (found on the NAVFAC/NCC website), addressing the Contractor's equipment, must be completed by the manufacturer of the radio control equipment being furnished under this contract.[ For unlicensed radio control systems, Form DD 1494 must be submitted to the activity's frequency coordinator for information.][ For licensed radio control systems, Form DD1494 must be submitted to the local frequency coordinator to initiate equipment approval for use in the geographical location.] The Contractor must receive approval from the
Government for the frequency to be used (licensed or unlicensed) for the radio remote system prior to design approval. Forms may be submitted via the Equipment Location Certification Information Database (EL CID) on-line system in lieu of submitting Form DD 1494.

2.4.8 Electrification Systems

**************************************************************************
NOTE: Various methods may be used to transfer power from the runway to the crane (Runway Conductor System) and then again to the trolley (Bridge Conductor system). Typically, the Runway Conductor System is a set of conductor bars on the runway and collector shoes on the crane. The Bridge Conductor system is typically a set of festoon cables.

Site conditions and environment might require the design to deviate from the norm. Hazardous locations will need to be designed with either a cable reel or festoon system.
**************************************************************************

2.4.8.1 Runway Conductor System

[ Provide a rigid runway Conductor Bar System for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. The crane must be grounded through the runway electrification system. Provide runway conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. If there is any way the hook block or wire rope can swing into the runway electrification, provide a guard installed to prevent contact.

Provide two Collector Shoes (tandem design) for each conductor; each collector shoe must be rated for not less than the runway conductor sizing, so as to provide redundancy.

][Provide a Festoon System for the runway conductor system utilizing cables suspended from carriers riding on an I-beam or C-track for the crane, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. Conductors must be fabricated from copper. The crane is required to be grounded through this conductor system. Provide conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. Festooned cable loops must not extend low enough to come into contact with any obstructions.

][Provide a Cable Reel System for the runway conductor system, including all necessary cables and hardware to connect the cable reel to the floor level fused disconnect switch. The cable reel must have three power conductors and an equipment grounding conductor. The crane is required to be grounded through this conductor system. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads.

][Provide a totally enclosed flexible cable tray electrification system (cable chain) for the runway conductor system, including all necessary

SECTION 41 22 13.55 Page 43
cables and hardware to the crane from a wall or column mounted disconnect switch. The cable chain must have three power conductors and an equipment grounding conductor. The conductors must be selected so as to be of the longest length without splices. Conductors must be fabricated from copper, and sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. The crane is required to be grounded through this conductor system.

2.4.8.2 Bridge Conductor System

Provide Festoon System for the bridge conductor system utilizing cables suspended from carriers riding on an I-beam or C-track. Conductors must be fabricated from copper. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. Festooned cable loops must not extend low enough to come into contact with any obstructions.

Provide a Cable Reel System for the bridge conductor system. The cable reel must have an equipment grounding conductor, and all necessary control cables. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley must be grounded through the cable reel connection and all conductors must be of copper construction.

Provide a totally enclosed flexible cable tray electrification system (cable chain) for the bridge conductor system. The cable chain must have three power conductors, an equipment grounding conductor, and all necessary control cables. The conductors must be selected so as to be of the longest length without splices and must be copper. A minimum of 20 percent of the control circuit conductors in the flexible cable tray system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system.

2.4.9 Overload Protection

**************************************************************************

NOTE: Overload protection on a crane is required and is provided by two types of systems: Capacity Overload Protection and Over-Torque Limit.

The Over-Torque Limit only applies to cranes with VFD controls. It is a parameter setting in the drive and is typically set at 150 percent of rated motor torque.

Capacity Overload Protection is usually adjustable. If adjustable, it needs to be set at less than the crane's minimum test load; recommend setting at 100 percent of rated capacity or less. This protection can take the form of one of the following devices:

1. Clutch – Not adjustable and is common on packaged hoists.
2. Load Limit Switch – Installed on the wire rope and measures deflection. Does not require a break in the wire rope and is simply clamped onto the wire. Typically used on smaller hoists that have magnetic controls. Can also be installed as part of
the equalizer sheave.
3. VFD Drive Overload Protection – Similar to the Over-Torque Limit, but is set at a lower setting. Adjusted via parameters within the drive.

**************************************************************************

a. Provide a capacity overload protective device for all hoist systems using VFD drive capacity overload protection (separate from torque limiting feature of the VFD). Set hoist capacity overload protection at [100] [_____] percent of rated capacity. Hoist capacity overload protection must be adjustable between 80 and 150 percent of hoist capacity. Provide a keyed override or other means to disable the hoist capacity overload protection when performing a load test.

[ b Initially, set the torque limiting capability of the VFD (that is separate from the capacity overload protective device) to 150 percent of the motor torque (amperage) necessary to hoist 100 percent load. It may be adjusted up only to avoid nuisance trips and adjusted down if possible while still avoiding nuisance trips.

]2.4.10 Enclosures

**************************************************************************

NOTE: Select classification of control panels, controls, and brakes based on the environmental conditions in which the crane will be installed:

1. Choose one of the following for an indoor installation: 1, 2, or 12.
2. Choose one of the following for an outdoor installation: 3, 4X, or 8.
3. Choose one of the following for a Class I Hazardous installation: 7 (indoor) or 8 (indoor/outdoor).
4. Choose one of the following for a Class II Hazardous installation: 9 (indoor).

Other enclosure types exist that might be a better alternative for a particular installation. If necessary, refer to NEMA 250.

**************************************************************************

a. Provide enclosures for control panels, controls, and brakes in accordance with NEMA 250 and NEMA ICS 6, Classification Type [1 indoor, general purpose] [12 indoor without knockouts, general purpose] [2 indoor, drip-proof] [3 outdoor, dust-tight, rain-tight, sleet-resistant] [4X outdoor] [_____] [7 indoor Class I hazardous] [9 indoor Class II hazardous] [8 indoor/outdoor Class I hazardous], or all controls must be intrinsically safe as defined by NFPA 70 Article 504.

[ b. Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.

] c. Gaskets of enclosures and fixtures, and joints and contact surfaces of hazardous/explosive enclosures must be kept free of any paint to prevent damage during removal and reinstallation of gaskets of enclosures.
2.4.11 Warning Devices

**************************************************************************
NOTE: A warning horn or light is required for all radio controlled cranes and recommended for all others.
**************************************************************************

[Provide a warning horn that is operable from a push button at the [pendant pushbutton] [radio control] station.] [Provide a warning [strobe light] [rotating beacon] that is illuminated at all times during movement of the hoist, trolley, or bridge function[, but may be deactivated on the operator control station].]

[2.4.12 Floodlights

Provide evenly spaced floodlights along the bridge. Select floodlights to provide an illumination level of 40 foot-candles at three feet above the finished floor. All lights must be vibration resistant and designed to prevent any material from falling from the fixture. Switch the floodlights from the [pendant pushbutton] [radio controlled] station.

[2.4.13 Pilot Devices

Provide Indicator Lights mounted in an enclosure on the bottom of the bridge with lights sized and positioned to be visible from the ground. The lights must be the dual-lamp type. Provide a white light to indicate that power is available to the crane and a blue light to indicate that the main contactor is energized. Light voltage must be 115 VAC. Provide nameplates that are legible from ground level. The nameplates must read, in their respective order, "POWER AVAILABLE" and "CRANE ENERGIZED". The POWER AVAILABLE light must be supplied by a separate, fused transformer for its energization.

[2.4.14 Electrical Outlets

**************************************************************************
NOTE: Electrical outlets are typically provided on trolleys for maintenance purposes on double girder cranes with top running custom built-up hoists (which typically have walkways). The addition of electrical outlets may not be a standard manufacturer option on packaged hoists and is not recommended for single girder cranes or underhung packaged hoists.
**************************************************************************

Provide a minimum of [one] [_____] 120 VAC duplex outlet[s] on the crane, mounted [on] [in] the [outside of the control panel(s)] [trolley] [cab] [_____. The circuit(s) supplying receptacles must incorporate ground-fault circuit-interrupter protection for personnel and be protected by a circuit breaker with a minimum rating of [15] [20] amps.

[2.4.15 Cyber Security of Control Systems

**************************************************************************
NOTE: Cyber Security of Control Systems requirements are tailored for NAVFAC. This subpart must be included for NAVFAC, it is not replaced by
**************************************************************************
NOTE: SECNAVINST 5400.15 designates NAVFAC as the functional technical authority for WHE. NAVFAC is designated as Functional Security Control Assessor (FSCA) and the Functional Authorizing Official (FAO) for Ashore Control Systems in their domain; therefore, this includes WHE control systems. WHE control system owners are responsible for the Information System Security Engineer (ISSE) functions and producing artifacts (documentation) for review by the FSCA and FAO.

All new and electrically overhauled cranes must implement the following cybersecurity requirements as applicable to the control system architecture (i.e., networked drives, non-networked drives, and any wireless applications) so that supporting artifacts and considerations are available for the implementation of the RMF process.

a. Provide the following for PLC, RTU, Supervisory Controller, or other network-capable (whether networked or not upon delivery) control devices as applicable:

(1) Hardware list (Hardware list must include the following for each device):

(a) Manufacturer
(b) Model
(c) Location
(d) Key technical ratings (e.g., memory)
(e) Serial number
(f) MAC addresses
(g) IP addresses

(2) Software List (Software list must include the following for each device):

(a) Manufacturer
(b) Version/subversion
(c) Location/device
(d) Used network ports/protocols/services

(3) List and discussion of all security features of Contractor hardware and software.
b. For every PLC, RTU, Supervisory Controller, or other network-capable control devices (whether networked or not upon delivery), deliver the following on CD/DVD:

(1) Original firmware
(2) Original firmware hash
(3) SOP for application of firmware updates/patches
(4) POC or website for firmware updates/patches
(5) Count of interfaces and types
(6) Protocols in use, per interface
(7) Configuration file
(8) SOP for configuration

2.4.15.1 Control System and Network

**************************************************************************
NOTE: Select options a. and b. if a standalone laptop is required. Recommend including one laptop if the activity regularly performs all crane maintenance.
**************************************************************************

[ a. Provide one rugged laptop type workstation (computer) complete with all compatible software (including software licenses), redundant physical back-up copies on CD/DVD of the installed software, and all necessary cables and special connectors to allow crane software to be troubleshooting, checked and upgraded, and for the data recorder to be accessed and information retrieved. Equip the workstation with a CD/DVD drive and the associated CD/DVD burning software. The workstation must also be equipped with USB ports (2.0 and 3.0), an Ethernet port, and a serial port. Delivering the software on a USB (flash drive) device is prohibited.

b. The laptop must be designed for an industrial environment and must be shock resistant and weatherproof as a minimum. Provide the laptop with a built-in CD/DVD reader with the capability to burn CDs and DVDs including associated software to burn CDs and DVDs.

] c. The Contractor must provide all equipment, including software and hardware, necessary for testing, installation, and communicating/troubleshooting all systems provided with the crane (e.g., engine/generator, control system, LID, etc.). The Contractor must provide all crane specific operational software files (e.g., ladder logic, functional block programming, etc.) for their associated systems (e.g., control systems, LID, engine generator, etc.).

d. A single common networked design must not be used for the control systems. A network for an individual function may be used as long as a failure of the network does not affect any other function/network except as defined for specific safety interlocks (e.g., LMI system). A common crane network may be used in a monitoring mode for recording faults and trending and is encouraged. Failure of the monitoring
system must not affect crane functions.

e. All provided hardware and software must be currently marketed products, not currently scheduled for end of life or obsolescence, to ensure system sustainability.

f. The control system engineering workstation hardware and operating system must be in conformance to the Common Criteria for IT Security Evaluation (IEC ISO 15408, visit https://www.niap-ccevs.org for more information).

g. Ensure there is no remote access capability enabled as remote access capabilities are prohibited. Physically disable or remove all modem/network devices not required for operational purposes.

2.4.15.2 Software and Services

a. Remove all Software and Services not required for operation and/or maintenance of the product. If removal is not technically feasible, then disable software not required for the operation and/or maintenance of the product. Configure the product to allow the ability to re-enable ports and/or services if they are disabled by software. The removal of software or services may not impede the primary function of the product. If software that is not required cannot be removed or disabled, document a specific explanation, and provide risk mitigating recommendations and/or specific technical justification. The software/service to be removed and/or disabled includes, but is not limited to:

   (1) Cameras

   (2) Games

   (3) Device drivers for product components not procured/delivered

   (4) Messaging services (e.g., email, instant messenger, peer-to-peer file sharing)

   (5) Source code

   (6) Software compilers in user workstations and servers

   (7) Software compilers for programming languages that are not used in the control system

   (8) Unused networking and communications protocols

   (9) Unused administrative utilities, diagnostics, network management, and system management functions

   (10) Backups of files, databases, and programs used only during system development

   (11) All unused data and configuration files

   (12) Remove and/or disable, through software, physical disconnection, or engineered barriers, all services and/or ports in the procured product not required for normal operation, emergency operations, or troubleshooting. This includes communication ports and physical
input/output ports (e.g., USB docking ports, video ports, and serial ports).

b. Provide documentation showing all disabled ports, connectors, and interfaces for all network-capable devices. In addition, provide summary documentation of the procured product's security features and security-focused instructions on product maintenance, support, and reconfiguration of default settings.

c. For the evaluation status of hardware and software, the Contractor must provide information on Common Criteria (IEC ISO 15408) or National Information Assurance Partnership (NIAP) or Federal Information Processing Standards (FIPS) evaluation status of hardware and software.

2.4.15.3 Access Control

a. The Contractor must configure each component of the procured product to operate using the principle of least privilege. This includes operating system permissions, file access, user accounts, application-to-application communications, and energy delivery system services.

b. Provide user accounts with configurable access and permissions associated with one or more organizationally defined user role(s), where roles are used.

c. Provide a system administration mechanism for changing user(s') role (e.g., group) associations.

d. The Contractor must document control system access control options by defining access and security permissions, user accounts, and applications with associated roles.

e. Provide recommended methods for the Acquirer to prevent unauthorized changes to the Basic Input/Output System (BIOS) and other firmware. If it is not technically feasible to protect the BIOS to reduce the risk of unauthorized changes, the Contractor must document this case and provide mitigation recommendations.

2.4.15.4 Control System Account Management

The Contractor must document all accounts (including, but not limited to, generic and/or default) that need to be active for proper operation of the procured product.

Remove or disable any accounts that are not needed for normal or maintenance operations, emergency, or troubleshooting of the energy delivery system.

2.4.15.5 Session Management

The Contractor may not allow multiple concurrent logins using the same authentication credentials, allow applications to retain login information between sessions, provide any auto-fill functionality during login, or allow anonymous logins.

Provide account-based and group-based configurable session-based logout and timeout settings (e.g., alarms and human-machine interfaces).
2.4.15.6  Authentication/Password Policy and Management

Provide a configurable account password management system that allows for, but is not limited to, the following:

a. Changes to passwords (including default passwords)
b. Selection of password length
c. Frequency of change
d. Setting of required password complexity
e. Number of login attempts prior to lockout
f. Inactive session logout
g. Screen lock by application
h. Comparison to a library of forbidden strings
i. Derivative use of the user name
j. Denial of repeated or recycled use of the same password

The Contractor must time stamp log files.

2.4.15.7  Logging and Auditing

Provide logging capabilities that cover the following events, at a minimum (as appropriate to their function):

a. Information requests and server responses
b. Successful and unsuccessful authentication and access attempts
c. Account changes
d. Privileged use
e. Application start-up and shutdown
f. Application failures
g. Major application configuration changes

2.4.15.8  Heartbeat Signals

The Contractor must identify heartbeat signals or protocols and recommend which should be included in network monitoring. At a minimum, include a last gasp report from a dying component or equivalent.

The Supplier must provide packet definitions of the heartbeat signals and examples of the heartbeat traffic if the signals are included in network monitoring.

2.4.15.9  Patch Management and Updates

The Contractor must verify that procured products (including third-party
hardware, software, firmware, and services) have appropriate updates and patches installed prior to delivery.

Provide documentation of the patch management program and update process (including third-party hardware, software, and firmware). This documentation must include resources and technical capabilities to sustain this program and process. Provide the Contractor's method or a recommendation for how the integrity of the patch is validated by the Acquirer as well as the Supplier's approach and capability to remediate newly reported zero-day vulnerabilities.

2.4.15.10 Malware Detection and Protection

a. The Contractor is required to implement at least one of the following:

(1) Provide a host-based malware detection capability that quarantines (instead of automatically deleting) suspected infected files. Provide an updating scheme for malware signatures. The Contractor must test and confirm compatibility of malware detection application patches and upgrades.

(2) If the Contractor is not providing the host-based malware detection capability, the Contractor must suggest malware detection products to be used and provide guidance on malware detection and configuration settings that will work with Contractor products.

b. The Contractor must validate that cybersecurity services running on the procured product (e.g., virus checking and malware detection) do not conflict with other such services running on the procured product.

c. For malware detection and protection, the Contractor must provide, or specify how to implement, the capability to automatically scan any removable media that is introduced to the product being acquired.

2.4.15.11 Physical Security

Provide lockable or locking enclosures or rooms for energy delivery systems and system components (e.g., servers, clients, and networking hardware) and for the systems used to manage and control physical access (e.g., servers, lock controllers, and alarm control panels). Provide a method for tamper detection on lockable or locking enclosures. If a physical security and monitoring system is used, tamper detection must be compatible. The Contractor must ensure that physical security features do not hamper the crane system operations. Provide the tools and instructions for making changes to locks, locking codes, keycards, and any other keyed entrances.

2.4.15.12 Wireless Technology

For wireless technology provisions, the Contractor must document:

a. Specific protocols and other detailed information required for wireless devices to communicate with the control network, including other wireless equipment that can communicate with the Contractor-supplied devices.

b. Use, capabilities, and limits for the wireless devices.

c. Power and frequency requirements of the wireless devices (e.g.,
microwave devices meet the frequency requirements of Generic Requirements [GR]-63 Network Equipment Building System [NEBS] and GR-1089).

d. Range of the wireless devices and verify that the range of communications is minimized to both meet the needs of the Acquirer's proposed deployment and reduce the possibility of signal interception from outside the designated security perimeter.

e. Wireless technology and associated devices compliance with standard operational and security requirements specified in applicable wireless standard(s) or specification(s) (e.g., applicable IEEE standards, such as 802.11).

f. Configuration control options that enable varying of the security level of the devices.

2.4.15.13 Control System Inventory

Provide the complete control system inventory. The Control System Inventory must include the following attributes, in tabular format, as applicable:

<table>
<thead>
<tr>
<th>General Information</th>
<th>Location Information</th>
<th>Hardware Details</th>
<th>Operating System and Platform</th>
<th>Network Information (Actual Function, not potential function)</th>
</tr>
</thead>
<tbody>
<tr>

2.5 PAINTING SYSTEM

**************************************************************************
NOTE: Three-coat zinc primer/epoxy/polyurethane system is provided for mild to severe atmospheric, indoor and outdoor cranes. For cranes in abnormal environments including exposure to chemicals or in immersion service, a system designed for that environment should be used. Other systems may suffice for milder environments.
**************************************************************************

a. Remove all grease, oil, and surface debris by solvent wiping or detergent/water scrubbing, prior to blast cleaning. Prepare surfaces to be coated by abrasive blasting to SSPC SP 6/NACE No.3, Commercial Blast Cleaning, or in accordance with the coating manufacturer's requirements, whichever is more stringent.

b. Use a painting system appropriate for the conditions provided in the Crane Design Criteria section of this specification. Paint exposed portions of the crane [and crane runway system] using a [three] [_____]-coat system as follows: [zinc-rich primer consisting of a minimum of 77 percent zinc by weight in the dry film, an anticorrosive epoxy intermediate coat, and an aliphatic polyurethane top coat] [_____]. All paint products must be supplied by a single manufacturer and free of chromates, lead, and mercury. Apply each coat in accordance with manufacturer's instructions and requirements. Ensure each coat is smooth, even, and free of runs, sags, orange peel, and other defects.[ Desired color of finish coat is [brilliant yellow] [_____].] Submit product data for painting system.

c. Coat faying surfaces of bolted connections per RCSC A348, but do not apply finish paint.

d. Paint, coatings, or galvanizing on the following items or areas is not acceptable: hoist wire ropes, hooks, hook nuts, sheave and drum grooves, wheel treads, lubrication fittings, nameplates, flange mounting faces, corrosion resistant steel, bronze, or other items not normally painted.

e. Factory paint electrical and mechanical equipment in accordance with the manufacturer's best standard practice for the specified environment.

2.6 IDENTIFICATION PLATES

**************************************************************************
NOTE: NAVFAC P-307 requires the capacity be displayed in pound units. The kilogram marking option is provided for cranes installed in a foreign country.
**************************************************************************

Furnish and install identification plates. Provide non-corrosive metal identification plates with clearly legible permanent lettering giving the manufacturer's name, model number, serial number, capacity in pound units, [with kilogram units printed in a different color,] and other essential information or identification.
2.6.1 Markings on Crane, Trolley, and Hook

**************************************************************************
NOTE: NAVFAC P-307 requires the capacity be displayed in pound units. The kilogram marking option is provided for cranes installed in a foreign country.
**************************************************************************

To avoid operation of the crane in the wrong direction, affix the appropriate directions (NORTH, SOUTH, EAST, and WEST) with arrows on both sides of the bridge and both sides of trolley, as applicable. Markings must be visible by the operator and from the loading point. Labels on the controls must have corresponding directional (NORTH, SOUTH, EAST, and WEST) markings. Markings must agree with the markings on controller. Do not indicate directional arrows on controller.

Mark the hook rated capacity in pound units[, with kilogram units printed in a different color,] on both sides of the hoist load block.

2.7 ELECTRICAL ASSEMBLY

Installation of all electrical wiring, conduit, and components must be performed in accordance with the requirements of NFPA 70. As a minimum, items a. through g. below must be followed:

a. All electrical connections must be installed in accordance with NFPA 70 Articles 110.14 or 430.9, as applicable, or as recommended by the device manufacturer.

b. Crimped terminal lugs, if used, must be properly sized for the wire and installed using the device(s) - e.g., crimping tool and indenter - recommended by the terminal lug manufacturer.

c. All spare conductors must be identified as spare conductors, and must have their ends insulated to preclude accidental contact with energized equipment.

d. Bonding straps and equipment grounding conductors must be connected to engineered ground points, have all paint removed from their termination points, or have tooth lockwashers (star lockwashers) installed, to insure proper grounding of the equipment.

e. Rigid Polyvinyl Chloride conduit may be used to protect festoon cable from physical damage when the cable is run along the footwalk of the crane, provided that only sections of conduit are used.

f. Festoon cable must be installed with suitable strain relief and protected from physical damage in accordance NFPA 70 Article 610.11(E)(1). This includes damage from chafing against the crane structure and any other type of damage that may be incurred.

g. Fiber optic cable must be installed in accordance with the manufacturer's installation guidelines. However, at a minimum the following guidelines must be adhered to: no sharp bends (bend radii must be greater than 1 inch or as prescribed by the manufacturer), avoid tight loops, no zip ties, and no stretching of cable.
PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

3.2 SHOP ASSEMBLY AND TESTS

NOTE: Shop inspection and testing at the manufacturing facility is typically recommended for specialized applications (e.g., ordnance handling, molten metal handling, special purpose service, hazardous/explosive area environments, precision handling operations requiring complex or synchronized lifting capacity, or custom designs). This section may not be necessary for standard commercial packaged hoists.

Shop assemble major components as completely as possible. Reieving of drums and sheaves is not advisable for shop testing, however it is acceptable for packaged hoists. Functionally test the crane system at the construction facility prior to shipment. The Government reserves the right to inspect the crane for compliance with this specification and to witness the functionality tests. Notify the Contracting Officer [14] [_____] days prior to starting testing operations.

3.3 ERECTION AND INSTALLATION

Perform the entire crane system erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's representative.

3.3.1 Mechanical Alignment

Align motors, couplings, brakes, gear boxes, and drive components in accordance with manufacturer's instructions.

3.3.2 Electrical Adjustments

Adjust control system in accordance with manufacturer's instructions. Store a copy of all Control Parameter Settings (PLC, VFD). Provide the final settings and configurations data on the Complete Schematic Wiring Diagram, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents. Provide the test conditions such as ambient temperature, motor load, date performed and person performing the adjustments as part of the Operational Tests report.

3.3.3 Field Welding

Perform welding indoors, where possible. Surface of parts to be welded
must be free from rust, scale, paint, grease, and other foreign matter. Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M.

3.3.4 Field Painting

Perform painting indoors, where possible. Field painting (including touch-up) must conform to the requirements of the coating manufacturer and as specified in paragraph PAINTING SYSTEM.

3.4 FIELD QUALITY CONTROL

3.4.1 Post-Erection Inspection

After erection, the Contractor[,] the Activity Crane Inspector/Test Director[,] and the Contracting Officer must jointly inspect the crane bridge and hoist systems and components to verify compliance with specifications and approved submittals. Notify the Contracting Officer [14] [_____] days before the inspection. Provide for approval a report of the inspection indicating the crane is considered ready for operational tests.

Document the results of this inspection and submit the post-erection inspection report to the Contracting Officer for approval.

3.4.2 Operational Tests

**************************************************************************

NOTE: Determine if Government furnished certified test weights are available at the site (recommended). If not, they must be provided by the Contractor. These weights are for acceptance testing and will not be permanently retained by the Government.

**************************************************************************

Check the clearance envelope of the entire crane prior to picking or traversing any load to ensure there are no obstructions. Test the systems in service to determine that each component of the system operates as specified, is properly installed and adjusted, and is free from defects in material, manufacture, installation, and workmanship. Rectify all deficiencies disclosed by testing and retest the system or component to prove the crane is operational.[ The Contractor must furnish test weights, operating personnel, instruments, and other apparatus necessary to conduct field tests on each crane. Solid weights must be measured using calibrated equipment traceable to National Institute of Standards and Technology (NIST) with a minimum accuracy of plus or minus two percent.]

3.4.2.1 No-Load Test

Raise and lower each hook through the full range of normal travel at rated speed for three complete cycles. Raise and lower each hook, testing other speeds of the crane. Verify proper operation of hoist limit switches. Operate the bridge and trolley in each direction the full distance between end stops and bring bumpers into contact with the end stops. Operate through the entire speed range and verify proper brake operation. Verify correct operation of all indication and ancillary devices.
3.4.3 Test Data

Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane. Record operating and startup current measurements for hoist, trolley, and bridge motors using appropriate instrumentation (i.e., clamp-on ammeters). Compare recorded values with design specifications or manufacturer's recommended values; abnormal differences (i.e., greater than 10 percent from manufacturer's or design values) must be justified or appropriate adjustments performed. In addition, note, investigate, and correct any high temperatures or abnormal operation of any equipment or machinery. Record hoist, trolley, and bridge speeds during each test cycle.

3.4.4 Hook Tram Measurement

Establish a throat dimension base measurement by installing two tram points and measuring the distance between these tram points (plus or minus 0.4 mm 1/64 inch). Record this base dimension. Measure the distance between tram points before and after load test. An increase in the throat opening from the base measurement is cause for rejection.

3.4.5 Load Tests

**************************************************************************
NOTE: For NAVFAC, require a rated load test of 100 percent (plus 0 / minus 10) and an overload test of 125 percent (plus 0 / minus 5) of the rated load.
**************************************************************************

a. Perform the following tests, as specified below.

b. Test loads used in this section are defined as the following:

   Wire rope run-in load: 25 – 50 percent of rated load.

c. Testing of cranes must be done with the use of test weights. The use of dynamometers in lieu of lifting test weights is not permitted. Each test weight for crane tests must be marked with a unique identification number and the weight in pounds. The weight marked must be the actual weight taken from the scale or other measuring device. Solid weights must be measured using calibrated equipment traceable to the National Institute of Standards and Technology (NIST), with a minimum accuracy of plus or minus 2 percent (i.e., indicated weight must be within plus or minus 2 percent of actual weight). A list of test weights, with identification numbers and weights, must be retained. The list must include the type and serial number (or other identifier) of the weighing device(s) used to weigh the test weights. Where a lifting attachment supports multiple test weights (e.g., stacked weights or multiple weights suspended from a padeye), the total capacity must be marked on the attachment. All rigging gear must meet OSHA and ASME requirements.
3.4.5.1 Wire Rope Run-In

The primary purpose of this procedure is to exercise the newly installed wire rope.

Place the load on the hook. Start at ground level and hoist up to one foot below upper limit at slow speed. Hoist down to lower limit at slow speed. Repeat hoisting and lowering of the load for approximately 10 hoisting cycles, increasing the speed for each cycle. During this test, the capacity overload lockout should not activate.

3.4.5.2 Rated Load Test

3.4.5.2.1 Hoist

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees clockwise and counterclockwise to check bearing operation with no binding. Observe for lowering of the load, which may indicate a malfunction of hoisting components or brakes. Verify that maximum beam and bridge girder deflections do not exceed MHI MH27.1 design limits.

b. Dynamic Load Test: Raise and lower test load through the full lift range and visually observe smooth control and acceleration between points. Completely stop the machinery at least once in each direction to ensure proper brake operation.

c. Hoist Mechanical Load Brake (or Self-locking Worm Gear): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position start the test load down at slow speed and return the controller to the “off” position as the test load lowers. The load brake must stop and hold the test load.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.2.2 Trolley

Operate the trolley (if space is available) the full distance of the bridge rails in each direction with a test load on the hook. Check proper functioning through the range of speeds. Verify proper brake action and stopping distance.

3.4.5.2.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway (if space is available) in one direction with the trolley at the far end of the bridge, and in the opposite direction with the trolley at the opposite end of the bridge. Use extreme caution. Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks. Verify proper brake action and stopping distance. Record deficiencies. Secure from testing if deficiencies are found.
3.4.5.2.4 Trolley Loss of Power Test

Raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of trolley travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the trolley stops and that the brake sets properly. Measure the distance required for the trolley to stop.

3.4.5.2.5 Bridge Loss of Power Test

Raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of bridge travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the bridge stops and that the brake sets properly. Measure the distance required for the bridge to stop.

3.4.5.3 Overload Test

3.4.5.3.1 Hoist

Disconnect or adjust the overload limit device to allow the hoist to lift the test load. Verify proper operation of the overload limit device after it is reconnected.

a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees clockwise and counterclockwise to check bearing operation with no binding. Observe for lowering of the load, which may indicate a malfunction of hoisting components or brakes.

b. Dynamic Load Test: Raise and lower test load and visually observe smooth control. Stop the load during raising and lowering to verify that the brakes holds the load.

c. Hoist Mechanical Load Brake (or Self-locking Worm Gear): Raise test load approximately 1500 mm 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.3.2 Trolley

Operate the trolley the full distance of the bridge rails in each direction with a test load on the hook (one cycle) through the range of speeds. Verify proper brake action.
3.4.5.3.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway in one direction with the trolley at the extreme end of the bridge, and in the opposite direction with the trolley at the opposite extreme end of the bridge (one cycle). Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on-site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [two] [_____] hard copies of operation and [two] [_____] hard copies of maintenance manuals for the equipment furnished along with an electronic copy (PDF) of each on a Compact Disc. Provide one complete set prior to performance testing and final copies upon acceptance. Provide operation manuals that detail the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, including weekly, monthly, semi-annual, and annual required maintenance items, possible breakdowns and repairs, and troubleshooting guides. Also include as-built drawings, piping and equipment layout, design calculations, Control Parameter Settings and printouts of any software, and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course (as applicable).

3.7 FIELD TRAINING

**************************************************************************
NOTE: Training is recommended, but not required.

Additional items that could be included in the blank: general review of the entire capabilities, limitations, and safety features of the crane.

An optional variable frequency drive (VFD) training is available, should the command feel the additional training is beneficial.
**************************************************************************

Conduct a training course for [eight] [_____] operating and maintenance staff[ and provide a copy of the training material to each participant]. Provide a training period consisting of a total of [four] [eight] [_____] hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and basic troubleshooting[, and [_____]].
Provide a minimum [four] [_____] hour training session on the Variable Frequency Drives (VFDs) discussing maintenance, troubleshooting of fault codes, theory of operation, and adjustment of crane parameters. This training session will be for an audience of approximately [eight] [_____] people.

3.8 FINAL ACCEPTANCE

**************************************************************************
NOTE: Use this paragraph as written for projects where the crane is the principal construction element, or represents a very significant portion of the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.
**************************************************************************

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on wire rope, hook, and electrical collector bars.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for monorail hoists with manual, electric, or air powered lifting chains or wire rope; with or without manual, electric or air powered trolleys and other accessories; suitable for indoor or outdoor use in general purpose service, ordnance handling service, or hazardous area environments.

This guide specification incorporates the design criteria and requirements identified in NAVCRANECECINSTRUCTION 11450.2A (December 2018).

This guide specification includes tailoring options for NAVFAC, pounds (per NAVFAC P-307), and tons. The NAVFAC tailoring option also includes requirements specific to the Navy and Marine Corps. Crane procurements for the Navy and Marine Corps must select the NAVFAC tailoring option.

Crane tailoring options are included for the Air Force, outdoor, ordnance/explosives handling, or hazardous (explosive) environments. Only one unique specialized application tailoring option should be selected at a time, however multiple can be used with additional specific project editing in the resulting sections. "General Purpose Service" is the default crane condition unless an alternate specialized tailoring option is selected. When "Maximum Anti-Spark" protection is required, the "Minimum Anti-Spark" tailoring option MUST ALSO be selected as the maximum requirements are in addition to the minimum requirements.

Selection or deselection of a tailoring option (select view-tailoring options) will include or exclude that option in the section. Specific project editing is still required for the resulting section.
Adhere to [UFC 1-300-02](https://www.fas.org/nuke/db/usgov/mil/ufgs/) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present. Of particular note, if procurement is to go on an existing monorail system, all references to installing and testing a new monorail and associated equipment such as end stops must be removed.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://www.fas.org/nuke/db/usgov/mil/ufgs/).

**************************************************************************

NOTE: Use this guide specification to specify cranes that are procured as part of a building construction contract for such applications as machine shops, warehouses, and other areas that do require specialized weight handling equipment.

Forward all procurement of OET systems at Naval Shore based activities with rated capacities of 9000 kg 20,000 pounds or greater or for use in specialized applications (e.g. ordnance handling, molten metal handling, special purpose service as defined in NAVSEA Publication 0989-030-7000, hazardous/explosive area environments, or precision handling operations requiring complex or synchronized lifting capacity) to: Naval Facilities Engineering Systems Command, Navy Crane Center, Building 491, Norfolk Naval Shipyard, Portsmouth, Va., 23709-5000. (See NAVFAC Instruction 11450.1B of 28 March 2014).

**************************************************************************

NOTE: Control types and systems may be specified as follows:

1. Remote or Pendant Crane Controls or a combination of the two can be provided.

2. Alternating current (AC) control systems must be specified. The vast majority of new cranes are AC powered and AC controlled.

Terminology: - refer to DEFINITIONS in this specification.
a. Ordnance/Explosives Handling – Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Hoists are required to must meet ASME HST-1 and ASME HST-4 duty class H4 (electric chain or wire rope hoists), ASME HST-5 and HST-6 duty class A4 (air chain and wire rope hoists), or the requirements of ASME HST-2 and ASME HST-3 (manual chain and manual lever hoists). Hoists are also required to have two brakes.

b. Hazardous (Explosive) Environments – Cranes operating in hazardous environments as defined by the cognizant activity safety office shall be equipped with electrical safety features that meet NEC Article 500. The activity safety office shall identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design. Materials for mechanical components shall be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

c(1) Minimum Anti-Spark Protection applies when only the load block enters the hazardous area.

c(2) Maximum Anti-Spark Protection applies when the hazardous area envelops the entire crane.

**************************************************************************
**************************************************************************

NOTE: The RFP must provide the relevant dimensions and load data for the crane. See "Crane Inquiry Data Sheet" in CMAA 74 section 6.1 or see "Crane Information Form for Underrunning Cranes(s)" pages 5 and 6 at the following Navy Crane Center link:

https://www.navfac.navy.mil/navfac_worldwide/specialty_centers/ncc/about_us/re

**************************************************************************
**************************************************************************

NOTE: Indicate on the plan drawings a schematic line for the location of the centerline of monorail track beam, including curves and switches. Only indicate the dimensions that are critical to locating points such as the end of the travel range of the hoist operating hook at each end of the track beam. Indicate any critical clearance requirements for the area adjacent the monorail track beam.

Indicate on the elevation drawings a generic elevation for the monorail beam. Only indicate the dimensions that are critical to locating points such as the ends of the vertical travel range of the hoist operating hook. Indicate any clearance requirements for the area above the monorail track.
When there is one hoist on one monorail system, the capacity rating of the monorail track beam and beam hangers must be equal to the hoist capacity. When there is more than one hoist on the monorail track beam, design and construct the monorail track beam and beam hangers for the most stressful positioning of the hoists on the track beam.

Indicate on the plan drawings the electrical junction box location (including mounting height).

1.2 DEFINITIONS

a. Monorail Track: The track system along which the crane operates horizontally, including track hangar rods, track connection devices, and runway structural supports.

b. Lifted Load: The load consisting of the rated load and the weight of lifting devices attached to the crane such as the load block, bucket, or other supplemental devices.

c. Pendant: A control for a hoist or a crane. The pendant hangs from the hoist by a cable at a height that is easy for the operator to reach.

d. Patented Track: A generic term referring to track built in accordance with MHI MH27.1 utilizing a composite track section incorporating a proprietary bottom flange shape.

e. Enclosed Track: A generic term referring track built in accordance with MHI MH27.2 whose related equipment operates on the internal lower operating or running flange of such track.

f. Rated Load: The maximum working load suspended under the load hook.

g. Standard Commercial Cataloged Product: A product, which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing on the manufacturer's published product data sheets. These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.

h. Operating Environments:

   h(1) General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as General Purpose Service if they are operating in
routine environments.

h(2) Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Hoists are required to must meet ASME HST-1 and ASME HST-4 duty class H4 (electric chain or wire rope hoists), ASME HST-5 and ASME HST-6 duty class A4 (air chain and wire rope hoists), or the requirements of ASME HST-2 and ASME HST-3 (manual chain and manual lever hoists). Hoists are also required to have two brakes.

h(3) Hazardous (Explosive) Environments: Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NFPA 70 Article 500. The activity safety office must identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

(a) Minimum Anti-Spark Protection is used when only the load block enters the explosive area.

(b) Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane.

1.3 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Remove the following sentence if the track rail is not to be installed as a part of the crane procurement. If rail is to be installed, ensure Section 05 12 00 STRUCTURAL STEEL is included in the Request for Proposal (RFP).
**************************************************************************

[ The requirements for the supporting structures of the monorail track and rail are specified in Section 05 12 00 STRUCTURAL STEEL, and must conform to AISC 360.

]1.3.1 Crane Design Criteria

**************************************************************************
NOTE: Clearly show the area of hook coverage, track dimensions, rail size, hook vertical travel, clear hook height, and lifting capacity on drawings.
**************************************************************************

Cranes will operate in the given spaces and match the track dimensions and rails indicated. Hook coverage, hook vertical travel, clear hook height, lifting capacity, and load test weight must not be less than that indicated.

1.3.1.1 General

**************************************************************************
NOTE: Add number of hoists, building name, and
hoist rated load capacity in kilograms pounds.

**************************************************************************

Include the following: Number of hoists [______], located in building identified as [______], with the capacity expressed in [______] metric tons tons kilograms pounds, for each hoist. Also clearly locate and identify each hoist and system components.

1.3.1.2 Classification

**************************************************************************

NOTE: For NAVFAC, specify ASME HST-1 and ASME HST-4 duty class H3 (electric) or ASME HST-5 and ASME HST-6 duty class A4 (air hoist) or higher.

**************************************************************************

NOTE: Refer to NFPA 70 for environmental requirements.

**************************************************************************

NOTE: Operating Environments

General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as General Purpose Service if they are operating in routine environments. Cranes operating in non-routine environments or unique, dedicated service should meet the requirements of one of the below Specialized Applications:

Ordnance/Explosives Handling: Cranes handling palletized or unpackaged ammunition, missiles, torpedoes, and other types of ordnance. Specify duty class as described in the paragraph DEFINITIONS for ordnance.

Hazardous (Explosive) Environments: Cranes operating in hazardous environments as defined by the cognizant activity safety office must be equipped with electrical safety features that meet NEC Article 500. The activity safety office must identify the specific Class, Division, and Group, as well as the envelope that the hazard exists, to allow proper design and must list these in this section. Materials for mechanical components must be chosen to minimize the potential for sparking, typically bronze, stainless steel, or aluminum. Hazardous environments are split into two groups: minimum anti-spark protection and maximum anti-spark protection.

a. Minimum Anti-Spark Protection is used when only the load block enters the explosive area.

b. Maximum Anti-Spark Protection is used when the hazardous area envelops the entire crane.
Provide a monorail system with [manual hoist][electric powered hoist][air-powered hoist] and [plain type (hand operated)][hand chain operated][electric powered]trolley for operation in an [indoor][outdoor] environment, [general purpose][ordnance handling][hazardous area] service, with an ambient temperature range of [_____] to [_____] degrees Celsius Fahrenheit. This hoist must operate in an NFPA 70 Class [____:], Division [____:], Group [____:] hazardous area. Hazardous protection is required for the [full height of the crane][18 inches above ground level][____:]. Monorail, hoist, trolley, equipment, materials, installation, examination, inspection, and workmanship shall conform to the applicable requirements of NFPA 70, ASME B30.17, ASME B30.16,[ ASME HST-1],[ ASME HST-2],[ ASME HST-3],[ ASME HST-4],[ ASME HST-5],[ ASME HST-6], MHI MH27.1[ and MHI MH27.2], as modified and supplemented by this specification.

The hoist must be [pendant controlled][radio controlled] and operate in the spaces and within the loading conditions indicated. The hoist must operate on [_____psi tool air][[_____] -volts AC, 60 Hz [____:], [single][three] phase] power source. Maximum trolley wheel loads (without impact) due to dead, trolley, and lifted loads, with the trolley in any position, must not cause a more severe loading condition in the track support structure than that produced by the design wheel loads and spacing indicated.

1.3.1.3 Rated Capacity and Speeds

**************************************************************************

NOTE: Plain type (hand operated) trolleys are recommended where trolley motion is infrequent or the distance is short, providing good load spotting ability and use for hoists of 3 metric ton 3 tons capacity and under. Plain type trolleys are not recommended for hoists of 3 metric ton 3 tons capacity and greater, or for tracks higher than 6 m 20 feet above the floor level. Motor operated trolleys are recommended where the operating frequency, travel distance, rated load, or beam elevation makes other types of trolleys impractical. Unless otherwise specified, the nominal rated maximum speed of the hoists and trolley will be the manufacturer's standard within the limits of Table 2 of ASME HST-1, HST-4, HST-5, HST-6, AS APPLICABLE. For higher tonnage ratings, consult with the manufacturer(s).

**************************************************************************

Provide hoist with a rated capacity of [_____] metric tons tons kg pounds. The hook lift capacity and speed shall be the manufacturer's standard within the limits specified. The hoist and trolley shall meet the minimum design requirements specified in [ASME HST-1, Duty Class [H3][H4]][ ASME HST-2][ASME HST-3][ASME HST-4, Duty Class [H3][H4][H5]][ASME HST-5, Duty Class [A4][A5]][ASME HST-6, Duty Class [A4][A5]].

1.4 VERIFICATION OF DIMENSIONS

The Contractor is responsible for the coordination and proper relation of their work to the building structure and to the work of all trades. Verify
all dimensions of the building that relate to fabrication of the monorail system and notify the Contracting Officer of any discrepancy before finalizing the crane order.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Manufacturer Qualification

Monorail System, including sub-system components manufactured by vendors, must be designed and manufactured by a company with a minimum of 10 years of specialized experience in designing and manufacturing the type of overhead crane required to meet requirements of the Contract Documents.

1.6.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing, and documentation. Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane.

[1.6.2.1 Inspection of Steel Castings]

******************************************************************************
NOTE: Navy Crane Center does not require magnetic-particle testing of steel castings. Magnetic testing for USACE projects should be coordinated with the Contracting Officer.
******************************************************************************

Visually inspect [and test ]load-carrying steel castings[ using the magnetic-particle inspection method][ using ultrasonic testing].[ Reference allowable degree of discontinuities to ASTM E125, and relationship to service loads and stresses, critical configuration, location and type.] All load bearing components, shafts, and gears, in the hoist drive train must be rolled or forged steel, except brake drums which may be ductile iron. Methods of repairing the discontinuities is subject to review by the Contracting Officer.

[1.6.2.2 Inspection of Hook Assembly]

Inspect hook[ by a magnetic-particle type inspection][ and X-rayed][ and tested ultrasonically] prior to delivery. Furnish documentation of hook inspection to Contracting Officer prior to field operational testing. As part of the acceptance standard, linear indications[ greater than 1.5 mm 1/16 inch] are not allowed. Welding repairs of hook are not permitted.
hook showing linear indications, damage or deformation is not acceptable.

1.6.2.2.1 Hook Non-Destructive Test (NDT)

******************************************************************************
NOTE: Delete this paragraph if selected agency does not require magnetic particle testing.
******************************************************************************

******************************************************************************
NOTE: For NAVFAC, substitute tailored paragraph.
******************************************************************************

Magnetic-particle inspect the hook over the entire area in accordance with ASTM A275/A275M or NAVSEA T9074-AS-GIB-010/271. Acceptance standard is no defects. A defect is defined as a linear indication that is greater than 3 mm (1/8 inch) or 1.5 mm (1/16 inch) long. For hooks of non-magnetic material, NDT shall be liquid penetrant (PT) method in accordance with ASTM E1417/E1417M. For PT testing of hooks containing stainless steels, titanium, or nickel based alloys, total halogens and Sulphur used in the NDT process shall be controlled as specified in NAVSEA T9074-AS-GIB-010/271.

Inspect each hook and shank over the entire surface area by magnetic particle inspection.

a. Procedure: Conduct magnetic particle inspection in accordance with ASTM A275/A275M with the following restrictions: Do not use DC yokes (including switchable AC/DC yokes used in the DC mode) or permanent magnet yokes. Do not use automatic powder blowers or any other form of forced air other than from a hand-held bulb for the application or removal of dry magnetic particles. Remove arc strikes. Equipment ammeters must have an accuracy of plus or minus 5 percent of full scale (equipment ammeter accuracy other than that stated is acceptable provided the MT procedure states that a magnetic field indicator is used to establish and verify adequate field strength for all aspects of the inspection.)

b. Acceptance Criteria: Defects found on the hook will result in rejection of defective items for use on furnished hoist. For this inspection, a defect is defined as a linear indication for which the largest dimension is greater than 1.5 mm (1/16 inch).

c. Test Report: Submit a test report of the magnetic particle inspection of each hook provided the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The NDT procedures including technique sheets specific to the types, shapes, and size of the parts being examined must adequately describe the orientation of the hooks within the magnetizing equipment. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheets, and certification to the Contracting Officer with the test report.

)[1.6.2.3 Hook Proof Test

******************************************************************************
NOTE: Hook proof tests are required for custom designed or non-ferrous (bronze or stainless steel) hooks. Bronze/stainless steel hooks are generally associated with minimum hazardous area requirements.

Proof test the load hook per ASME B30.10. Perform the proof test prior to Hook NDT.

1.6.3 Drawings

1.6.3.1 Monorail Crane System

a. Submit drawings showing the general arrangement of all components in plan, elevation, and end views. Show all major features of the crane including: [assemblies of hoist [and trolley] drive[s], ]hook envelope, and the general arrangement of the track beam system with switches and curves, details of all structural connections, clearances and principal dimensions. Include weights and centers of gravity of major components.

b. Submit shop drawings of all fabricated components. Shop drawing quality must be equivalent to the contract drawings accompanying this solicitation. Drawings must be reviewed, signed, and sealed by a licensed professional engineer.

c. Provide integral schedule of crane components on each drawing. The schedule must provide a cross reference between manufacturer data and shop drawings. Components listed on the schedule of crane components must include total quantity, description, original manufacturer, and part number. Distributing agents will not be acceptable in lieu of the original manufacturer.

1.6.3.2 Complete Schematic Wiring Diagram

Provide electrical schematic drawings with motor nameplate data[, VFD drive nameplate data] and overcurrent protective device ratings

1.6.4 Design Data: Load and Sizing Calculations

NOTE: Design data for Load and Sizing Calculations, and welding procedures, may not be available for commercially procured hoists and trolleys.

Submit complete list of equipment and materials, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Provide a list of all codes and standards, design assumptions, equations, specified efficiencies, limits, factors of safety, component ratings, and sources of values used. Include free body diagrams or sketches of each load case.[ Include seismic analysis of crane.]

1.6.5 Certificates

All certifications shall be dated and shall bear the original signature (above the printed name) of the authorized representative of the Contractor or the manufacturer of the items or equipment being certified. Each certification shall clearly identify the crane, the drives, components, and
location (as applicable) to which it applies:

[ a. Submit a Wire Rope Certification for each hoist with the wire rope manufacturer's certification that the rope meets the published breaking strength or the actual breaking strength of a sample taken from the reel and tested. Certification shall be traceable to the hoist, and reel.

][b. Submit a Load Chain Certification clearly indicating load chain breaking strength for each hoist, and clearly identified for traceability. Submit factory certification of load chain rated capacity.

][c. Submit a Monorail Track System Survey certifying monorails have been aligned in accordance with CMAA 74, MHI MH27.1, or MHI MH27.2 as applicable. If monorail(s) are existing and if the crane(s) cannot operate without restriction, the Contractor shall indicate crane limitations.

] d. Submit a Hazardous Material Certificate that the crane does not contain hazardous material including asbestos, lead, cadmium, chromium, PCBs, or elemental mercury. Products required for the designing and manufacturing of cranes must not contain the prohibited materials.

[ e. Submit a Loss of Power Test Certificate stating that a test may be performed in which power is removed from the crane while the hoist and trolley are in operation.

] f. Submit a Certificate of the Brake Adjustment Record. Provide a brake adjustment record and installation/maintenance manuals for each brake on the crane. Each brake measurement must have a tolerance traceable to the associated brake manual or documentation provided by the brake manufacturer, location of measurements, and the actual brake setting. Changes made to settings of the brake, at any time, will void the record.

g. Submit a certificate stating that the hoist, hook, and trolley system design and fabrication is in compliance with all listed standards.

1.6.6 Welding Qualifications and Procedure

Welding must be in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep and not exceed those specified in AWS D14.1/D14.1M, MHI MH27.1, MHI MH27.2 and CMAA 74 as applicable. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M.

1.7 CRANE SAFETY

1.7.1 Nuclear Safety Analysis

**************************************************************************

NOTE: Certification is required for cranes handling
nuclear materials. Results from the Safety Analysis will be utilized by the Using Agency as a basis for crane certification. Delete this paragraph if the crane is not required to handle nuclear materials.

This section is not applicable to NAVFAC projects. The Navy Crane Center must be involved with the procurement and overhaul of all NAVY cranes that handle Nuclear material as identified in the forward notes section of this specification.

**************************************************************************
Nuclear certification, testing, and rules of construction must be in accordance with 29 CFR 1910.147 and ASME NUM-1. Air Force Nuclear certified hoists must meet requirements of AFMAN 91-118. Submit analysis and test reports to Contracting Officer for approval.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment. Material will be free from defects and imperfections that might affect the serviceability and appearance of the finished product. All material must be new and unused.

2.1.2 Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two monorail identification plates, one for each side of the track beam. Provide noncorrosive metal identification plates with letters which are easily read from the floor, showing a separate number such as M-1, M-2, for each monorail hoist.

2.1.3 Capacity Marking

Mark the rated capacity in metric tons tons kg pounds units on each side of the monorail track beam. Capacity marks must be large enough to be clearly visible from the floor. Individual hoist units must have their rated capacity clearly marked on their bottom block, and additionally labeled on the hoist body. Rated capacity must include all accessories below the hook, such as load bars, magnets, grabs, and other weight handling equipment as part of the load to be handled.

2.1.4 Safety Warnings

Affix labels in a readable position to each lift block or control station in accordance with ASME B30.16 and ASME B30.17.

2.2 STRUCTURAL REQUIREMENTS

Structural steel materials must conform to the standards permitted in CMAA 74, MHI MH27.1, MHI MH27.2 and AISC 360 as applicable.
2.2.1 Structural Connections

High-strength bolted structural connections must be designed and installed in accordance with RCSC A348. Bolts must be of ASTM F3125/F3125M Grade A325/A325M or Grade A490/A490M material. Galvanized bolts are not acceptable.

Welded connections for the crane must be performed in accordance with AWS D14.1/D14.1M. Welded connections to the building must be performed in accordance with AWS D1.1/D1.1M.

2.2.2 Monorail Track System

**************************************************************************
NOTE: For Monorail Hoists, track and its support structure is usually supplied by crane contractor. Use Monorail Track System only if crane contractor is to provide a new track.

Monorail tracks may be of three types. "Patented track" as defined in the definitions section and built IAW MHI MH27.1, "enclosed track" built IAW MHI MH27.2 and "rolled steel shapes" which is defined in CMAA 74. The activity may decide the track type to be used or allow the provider to decide, except ordinance handling cranes require patented track.
**************************************************************************

Provide the complete track suspension system that is required to hang the monorail track at its indicated location from the structural supports indicated on the drawings. Provide monorail and support structure for underrunning monorail of rolled steel shapes conforming to CMAA 74, patented track beams conforming to MHI MH27.1, or enclosed track beams conforming to MHI MH27.2.

For rolled steel shapes, locate splices under structural support members.

For patented track beams, perform splices as necessary in accordance with the manufacturer's recommendations and requirements. Align ends of lower T-section to minimize the horizontal gap on the running surface to not greater than 1.59 mm 1/16 inch and not greater than a vertical difference of 0.79 mm 1/16 inch for the wheel running surface alignment for a smooth crossing by the wheels. Splice assemblies must be from the same manufacturer as the patented track and located under structural support members. Submit manufacturer's standard published tables that verify the monorail track is sized in compliance with all specification requirements. When standard published tables are not available, provide calculations for the strength design and deflection of the beams.

Monorail support structure must be designed, fabricated, and installed such that monorail meet the alignment tolerances of CMAA 74, MHI MH27.1 or MHI MH27.2, as applicable. Provide means to allow for vertical adjustment of the track both before and after the system has been put in operation so that track can be erected and maintained level. Brace track to restrain against damaging lateral and longitudinal movements. Where the track is suspended from hanger rods, provide means preventing the hanger rod nuts from backing off the rods. Allowable stress in hanger rods is 20 percent of the minimum specified ultimate strength of the material used.
2.2.3  End Stops

Fit monorail track system with end stops at all open end locations. Locate stops to contact the trolley bumper and permit maximum trolley travel. Metal to metal contact at the bumper to end stop connection is not permitted.

2.2.4  Additional Provisions for Outside Service

**************************************************************************
NOTE: This paragraph is applicable for outdoor cranes only.
**************************************************************************

Provide hoist trolley with parking brakes which will sufficiently hold the crane against a wind pressure of \( 240 \text{ Pa} = 5 \text{ psf} \) for in-service conditions. Provide hoist trolley with manually-operated pin locks at each rail, designed to securely anchor the crane against a wind pressure of \( 1.44 \text{ kPa} = 30 \text{ psf} \) for out-of-service conditions. Design members to prevent the collection of water on crane.

2.3  MECHANICAL REQUIREMENTS

**************************************************************************
NOTE: For ordnance handling, further material restrictions exist.
**************************************************************************

Cast iron and aluminum used to support components of the hoist power transmission train must be ductile. Gray cast iron load bearing parts are prohibited.

2.3.1  Hoist

**************************************************************************
NOTE: Electric chain hoists (ASME HST-1) only have the possibility of hoist duty classes H2, H3, or H4.
**************************************************************************

For ordnance handling, packaged hoists must be HST-4 Duty Class H4 or better.

For ordnance handling, custom hoist shafts must have a fatigue design factor of 1.5.

**************************************************************************
[Manual Hoist][Electric Chain Hoist][Air Chain Hoist]
**************************************************************************

Provide [manually][lever][Air] operated chain hoist conforming to ASME B30.16, and [ASME HST-2] [ASME HST-3] [ASME HST-5]. [ Electric chain hoist shall conform to ASME HST-1, NEMA ICS 8, NEMA MG 2, and NEMA ESPG] except as modified herein.

2.3.2.1  Hoisting Chain

a. Provide a welded link load chain.

b. Provide a chain stop or dead end connection to prevent the load chain from running out of the hoist at its fully extended position.
c. Provide chain hoists with 3 m (10 foot) lift or more with a load chain bucket.

2.3.3 Electric Wire Rope Hoist

Provide Electric Wire Rope Hoist conforming to ASME HST-4][Air Powered Wire Rope Hoist conforming to ASME HST-6] except as modified herein.

2.3.3.1 Hoisting Ropes

**************************************************************************

NOTE: Paragraph b is shown as optional only because there is a tailored paragraph b option for minimum hazardous area. One of the two options must be chosen and included in the specification.

**************************************************************************

**************************************************************************

NOTE: For minimum anti-spark protection, add tailored paragraph section.

**************************************************************************

Provide the following:

a. Rope lengths sufficient to maintain a minimum of two full wraps of rope at the dead end(s) of the drum, with the block in its lowest indicated position. The wire rope must be in a double reeved configuration with the equalizing method perpendicular to the running sheaves.

b. Provide hoisting ropes with improved plow steel, extra improved plow steel, or extra-extra improved plow steel, regular lay, bright, and uncoated with an independent wire rope, wire strand, or otherwise, steel core. Hot-dipped galvanized wire rope is not permitted. Provide stainless steel hoist ropes.

2.3.3.2 Sheaves

Provide steel sheaves. Provide sheaves constructed of non-sparking materials.

2.3.3.3 Drum

Provide drum made of steel. Design the drum such that all hoisting rope is wound in a single layer and so that not less than two dead wraps of hoisting rope remain on each anchorage when the hook is in its extreme low position.

2.3.4 Trolley

Provide a [manual][gearied manual][air motor powered][electric motor powered] trolley drive designed to operate from [[_____] track beam section][the track beam section furnished under this contract]. Configure trolley such that the trolley frame contacts the track end stops or bumper of an adjacent trolley and prevents the trolley from dropping more than one inch in the event of an axle or wheel failure (drop lugs). Drop lug contact surfaces shall be of non-sparking materials.
2.3.4.1  Trolley Wheels

**************************************************************************
NOTE: For maximum anti-spark protection, add the tailored words. Remove any conflicting items (i.e. wheels cannot be non-sparking and steel).
**************************************************************************

Wheel material is to be steel or ductile cast iron. Hollow stamped steel and gray cast iron wheels are prohibited. Wheels are to be made of forged steel. Provide wheels of non-sparking material. The minimum tread hardness for bronze wheels is 225 BHN.

2.3.4.2  Bumpers

For powered trolleys, fit the trolley frames with shock-absorbing bumpers. Ensure bumpers and end stops conform to ASME B30.17. Mount bumpers so that there is no direct shear on mounting bolts (if any) upon impact. Bumpers must provide adequate clearance between the hoist and surrounding structure when compressed to preclude damaging equipment. When more than one hoist is located and operated on the same track, bumpers shall be provided on their adjacent ends or on one end of one hoist such that the trolley frame of the adjacent hoist comes in contact with the bumper.

2.3.4.3  Trolley Brakes

**************************************************************************
NOTE: Only powered trolleys that don't have a non-coasting drive need a brake.
**************************************************************************

Provide trolley with either a non-coasting (i.e. worm) drive or with an end-mounted [air] [electro-mechanical] brake that is spring applied, [air] [electrically] released. The brakes must be equipped with a manual self-return to ON brake release and designed to permit inspection and adjustment without disassembly of the brake.

2.3.5  Hoist Brakes

**************************************************************************
NOTE: NAVFAC requires each hoist to have, at a minimum, two brakes, with the exception of manual hoists and non-ordnance handling pneumatic hoists which may have only one, which is typically a mechanical load brake.
**************************************************************************

2.3.5.1  Hoist Mechanical Load Brake

Provide a mechanical load brake that is capable of stopping and holding 125\% of the hoist's rated load and does not require the load to be raised before being lowered.

2.3.5.2  Hoist Secondary Brake

Provide a spring set electro-mechanical brake that stops and holds 125\% of the hoist's rated load. Equip spring set brake with a manual release mechanism that automatically resets when power is applied to the brake. If the hoist has more than one brake, each brake
shall independently stop and hold [125][100]125 percent of rated capacity.

][2.3.5.3  Air Hoist Brake

Equip [air] hoists with a braking means that prevents the lowering of the load in the event of a loss of air supply, can stop and hold [125][100]125 percent of the hoist's rated load, and does not require the load to be raised before being lowered.

2.3.5.4  Air Hoist Secondary Brake

Ordnance handling air hoists are to be equipped with a second holding brake with a minimum torque rating of [125][100]125 percent of the rated load hoisting torque.

2.3.6  Load Block and Hook

**************************************************************************

NOTE: Some text tailored to NAVFAC. For text tailored to Minimum Anti-Spark requirements, remove conflicting requirements (i.e. load block cannot simultaneously be steel.

For Ordnance Handling: The insulated link(s) are required unless the following conditions are met:

c. There is no threat of a lightning strike during operations;
d. There is no chance for contact with overhead power lines;
e. RF emissions control is in effect regardless of the HERO classification of the ordnance being held.

**************************************************************************

**************************************************************************

NOTE: Include sentences for custom design load block with trunnion if requested by using activity.

**************************************************************************

The load block must be constructed of steel non-sparking materials and designed to prevent metal-to-metal contact of moving parts. The design must preclude the wire rope from being cut, pinched, crushed, or chafed in case of two-blocking. The block must be clearly marked with the capacity in kilograms pounds on both sides. An insulated link must be provided on each hook block per the requirements of NAVSEA OP-5. Standard commercial blocks may be used at their published ratings when their published design factors are 5.0 or greater.

Provide an unpainted single barbed forged steel hook which complies with ASME B30.10. Provide an unpainted single barbed hook of non-sparking material with a minimum material longitudinal elongation of 16 percent in 2 inches. Bronze clad hooks are prohibited. Fit hook with a safety latch designed to preclude inadvertent displacement of slings from the hook saddle. The hook and hook nut must be removable [without unreeving of the hoist or ]disassembly of the block. Provide an easily removable and reusable means to positively secure the hook nut to the hook shank. Do not weld hook nut. Uniquely mark the hook in a permanent fashion that is traceable to the NDT certification. The nut must be marked to match the hook. The hook nut must be of non-sparking materials. Hook must be free
to rotate through 360 degrees when supporting the test load up to [125][100] 125 percent of the rated capacity. **Upper hooks of hook suspended hoists shall be of non-sparking materials.**

2.3.7 Wind Speed Indicating Device

Provide a wind speed indicating device in accordance with the requirements of **ASME B30.17.**

2.3.8 [Air][Manual] Hoist Capacity Overload Protection

Capacity overload protection which prevents further hoisting of a load set at or less than the crane's minimum test load. If a non-adjustable slip clutch is utilized, the OEM factory setting is acceptable and shall be identified. If the device is adjustable, it shall be adjusted to prevent hoisting in excess of the test load.

2.3.9 Air Hoist Limit Switches

Provide a Hoist limit switch to limit hook over-travel in both the raising and lowering direction. [The lower limit switch shall be set such that there are no less than a minimum of two wraps of hoist on the hoist drum upon limit switch actuation.] [For chain hoists, chain stops and an overload clutch that meets the requirements of **ASME B30.16** are acceptable as upper and lower limit switches.]

2.3.10 Air Hoist Air Supply

**************************************************************************
**NOTE: If the provided shop air is not lubricated chose the option to provide air lubricator.**************************************************************************

The air supply hose must not hang below the high hook position.[ Provide an air lubricator.]

2.4 ELECTRICAL REQUIREMENTS

The design, selection, rating, and installation of the electrical portions of the crane and its accessories must conform to the requirements of **NEMA ICS 8,** the applicable ASME HST standard, and **NFPA 70,** and other requirements specified herein.

The crane manufacturer must furnish and install all electrical equipment on the crane conforming to **NEMA ICS 6,** including motors, conforming to **NEMA MG 1,** electrically released brakes, switches, crane controllers, panels, operating station, wiring system, cables, and crane electrification.

2.4.1 Motors

**************************************************************************
**NOTE: Select two speed motors for trolley drives if magnetic controls are specified in paragraph CONTROLS; select single speed motors if electronic controls are specified in paragraph CONTROLS.**************************************************************************

U.S. Navy allows only 60-minute duty rating motors. 30-minute duty rating motors require Navy Crane Center approval. For non-Navy applications, the
motor duty rating may be selected to match what is required by the class of HST-4 hoist (such as H1, H2, H3) specified.

Motors must meet all applicable requirements of NEMA MG 1 and UL 1004-1. All motors must have a minimum of a 60 [30] [60] [_____] minute duty rating and be Totally Enclosed Non Ventilated (TENV), Totally Enclosed Fan Cooled (TEFC), or Totally Enclosed Blower Cooled (TEBC). Provide inverter duty motors if Variable Frequency Drives (VFD) are used. Provide motors with a minimum of Class F insulation. Provide motor overload protection utilizing a thermal sensitive device embedded in its windings. Provide motors painted to manufacturer's standard for "wash-down" service. Motors located outdoors must be furnished with anti-condensation heaters that remain energized when the mainline contactor is deenergized.

2.4.2 Controls

NOTE: Use the first three paragraphs to select electronic variable frequency drive controls for either the hoist or trolley.

Use the fourth paragraph to select one or two speed control for the hoist or trolley which the manufacturer may accomplish with magnetic controls or a simple VFD. Selections can be made using a combination of electronic controls and one or two speed motor controls split between the hoist and trolley.

When the two-speed trolley motor is specified, the slow speed will be 1/3 to 1/4 of rated travel speed. Reduced voltage starting, acceleration, and deceleration, serve to reduce the acceleration rate that is normal for squirrel-cage motors. Squirrel-cage motors with two-speed magnetic controls provide satisfactory results with slow trolley speeds and should be specified when short travel distances are involved and where fine positioning is not required.

For faster trolley speeds or finer positioning requirements, specify electronic controls.

Various VFD manufacturers offer an option to overspeed the hoist to a value over 60Hz (usually 120Hz). This allows the operator to position the hoist at faster speeds when it is not loaded. When selecting this feature list the maximum no load speed in section "Rated Capacity and Speeds".

NAVY requires hoist drives with a controller continuous rating of 125 percent of the motor full load current. Tailor to NAVFAC. All other groups may use 100 percent.
[trolley][ and ] [hoist] electric controls. VFD controllers must meet NEMA ICS 8, Part 8 and at a minimum, provide under-voltage protection, electronic instantaneous over current protection, DC bus over voltage protection, and be able to withstand output line to line shorts without component failure. Select trolley drive such that the continuous rating of the controller is not less than the motor full load current. Select hoist drives such that the continuous rating of the controller is not less than 125 100 percent of the motor full load current. All hoist drives must have a motor over-torque limit to lock out the hoist and prevent gross overload of the associated hoist. Provide dynamic braking for each electric drive that is sized per VFD manufacturer's requirements. Submit VFD Control Parameter Settings.

Provide speed control, which is infinitely variable for each function, controlled via [radio control system][ and ] [pendant pushbutton station]. [ Provide controls designed such that the maximum speed of each function will be limited to 25 percent of rated speed when a slow speed switch is actuated on the controller[s]. ][ Energize a yellow/amber light/indicator while in slow speed mode.]

The [hoist][ and ] [trolley] brakes must set after the associated controller decelerates the drive motor to a controlled stop. The hoist and trolley controllers must be sized to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 125 100 percent of rated load on the hook. The hoist controller must prove torque before release of the brakes and enable the drive motor to develop full torque continuously at zero speed. Motors must operate smoothly at all speeds without torque pulsations, and must only be energized within the frequency range of 50-60 Hz at rated speed.[ The hoist control system may utilize overspeed up to 120hz, unloaded only, if the drivetrain equipment has all been balanced and is rated for the resulting speed.]

[Provide [one][two]-speed controls for the [trolley drive][ and ] [hoist] drive. Controllers must meet the requirements of NEMA ICS 8. Ensure that an energized drive motor initially rotates only in the direction selected by the operator by activating the corresponding direction; i.e., is not overhauled. For AC squirrel cage motor controllers, the requirements of NEMA ICS 2, Part 2, for general-purpose controllers, must be met.]

[ Provide the trolley motor control systems with a drift point between OFF and the first speed control point in each direction.]

] The use of definite purpose contactors is prohibited. If IEC contactors are used, the application cannot exceed the contactor manufacturer's AC3 ratings for the contactor at a minimum.

] On wire rope hoist, roll-up must be less than 1/8-inch measured at the hook block and roll-back must not occur over the entire load range.

] Use of Uninterruptible Power Supplies (UPS) is prohibited. Feed control circuits from a single phase, air cooled, double wound transformer with a grounded metal screen between the primary and secondary windings of the transformer.

Provide a main line contactor. Energization of the main line contactor must be controlled by the POWER-OFF/POWER-ON switch/pushbutton on all controllers. Upon actuation of the POWER-OFF pushbutton; power to all drive motors, brakes, and controls must be removed. The mainline contactor must not be able to be energize while the POWER-OFF pushbutton is actuated.
The POWER-OFF pushbutton circuitry must be independent of all controls or any other electronic devices.

### 2.4.3 Protection

Protection must not be less than that required by NEMA ICS 8, CMAA 74, NFPA 70, UL 1004-1, 29 CFR 1910.147, 29 CFR 1910.306 and all applicable provisions of 29 CFR 1910. Provide enclosed type circuit breaker readily accessible to the crane operator for crane disconnect. Provide an On/Off button that removes power from the motors, brakes and control circuit on all [operator control stations] and [radio controllers]. Provide for lockout/tagout of all hazardous energy sources.

### 2.4.4 Resistors

Provide resistors with natural convection cooling sized as recommended by the VFD OEM and fabricated of corrosion resistant metal; the use of "wire wound" type resistors is prohibited for segments of 8 ohms or less. Mount resistors in substantial, ventilated enclosures constructed entirely of non-combustible materials. When mounted outdoors provide stainless steel resistor enclosures. Provide resistors with terminals fitted in the coolest position in the enclosure.

### 2.4.5 Transients and Harmonics Protection

**************************************************************************

NOTE: The following items are required only for cranes with VFD or radio controls.**************************************************************************

Provide contactors and relays with appropriate Metal Oxide Varistors (MOV) or resistor-capacitor (R-C) surge absorbers installed across the respective coil.

Provide transient protection for electronic drive controllers that is either internal to the drive or via an MOV connected line-to-ground close to the line terminals of the drive.

[ Provide line reactors rated for continuous duty operation based upon the motor nameplate amperes. With motors of 50 horsepower or greater, harmonics protection must be provided by an isolations transformer or as recommended by the VFD OEM. For a drive motor branch circuit that exceeds 150 feet in length, a reactor must also be connected in series with the controller load (output) terminals to provide standing wave protection or as otherwise recommended by the VFD or motor OEM.

### 2.4.6 Limit Switches

Limit switches must be rated for the NFPA 70 Hazardous Classifications specified in the Classification section of this specification.

Provide primary upper and lower geared limit switches. Geared limits must allow reversing direction to back out of the limit without resetting. [The lower limit switch must be set such that there are a minimum of two wraps of rope on the hoist drum. ]Provide a backup mechanical hook block activated upper limit switch wired independent of the directional controllers and the primary upper limit switch that removes power from the hoist motor, hoist brake and hoist controls conforming to NEMA ICS 5. The backup limit must require hoist resetting prior to operation of the hoist.
in any direction. For chain hoists, chain stops and an overload clutch that meets the requirements of ASME B30.16 are acceptable as upper and lower limit switches.

[ Travel limit switches must be provided for the trolley motion to slow the crane to [25 percent] [_____] of its rated speed [[5] [_____]] feet before the monorail end stops]. Limit switches must be mounted rigidly in a manner so as to protect the switch from misalignment or damage. The target/trip arm must be large enough to provide interception given a misalignment were to occur.

2.4.7 Operator Controls

**************************************************************************
NOTE: Available operator controls are pendant and radio control. Cranes can also be set-up to be controlled by two separate systems. For cranes with one set of controls use paragraph 1. For cranes with two sets of controls use paragraph 2. In such a case some type of interlock must exist to prevent control from both systems simultaneously.

When specifying a radio control system, the following requirements must be considered and if needed added to the specification. None are hard requirements of NAVCRANECECSTR 11450.2A:
1. What type of batteries? Rechargeable?
2. Are spare batteries needed? How many?
3. Are spare remote control units required? How many?
4. Is a battery charger required?
5. Type of transmitter unit.
6. Is a belt/harness required for the remote control?
**************************************************************************

[ Provide crane equipped with a [pendant pushbutton station] [radio control system].

][Provide crane equipped with both a pendant pushbutton station and a radio control system. Provide a selector switch to allow the use of only one of the two available control stations on the pendant controller.

] If VFD controls are not provided, provide directional contactors with both mechanical and electrical interlocks.

Operator controls must be rated for the NEC Hazardous Classifications specified in the Classification section of this specification.

2.4.7.1 Pendant Pushbutton Station

The cranes must be controlled from a pendant pushbutton station suspended from the trolley. Provide multiconductor flexible cords for pendant pushbutton stations with #16 AWG minimum conductors. Provide a method of strain relief to protect the electrical conductors from damage. Locate the pendant pushbutton station [1200 mm] [4 feet] [_____] above the finished floor. Pushbutton pendant station must have its elements legibly marked and arranged vertically, in order, in accordance with CMAA 74.[ Provide [one speed] [two speed] [3-step infinitely variable] [2-step infinitely
variable] pendant pushbuttons for control of the [hoist][ and ][trolley].] Provide pendant pushbuttons for control that spring return to the OFF position. Voltage in the pendant pushbutton station must not exceed 150 Volts AC or 300 Volts DC.[ Provide a maintained two-position selector switch for slow speed selection.] The pendant must be rated for the NEC Hazardous Classifications specified in the Crane Design Criteria "Classification" Section.

2.4.7.2 Radio Control System

Provide each system with a [belly box] [handheld] [_____] type portable transmitter unit[ and an identical back-up transmitter unit].[ Provide each transmitter with an adjustable belt or harness to support it when worn by the operator]. Only one transmitter at a time can control the crane and there must be no interference from one crane's controller affecting operation of the other cranes in the building. Each transmitter must include: individual [infinitely variable spring return joystick motion control levers] [push button controls] for each hoist and trolley; a maintained contact, keyed switch, marked ON-OFF, for portable transmitter unit power; indication of Battery Power, and indication of Transmitting Status; a red emergency STOP mushroom pushbutton;[ and] a floodlight on/off pushbutton[ and a maintained slow speed selector switch]. The transmitters and all controls must each be clearly and permanently labeled with functionality and direction. Directions for controllers must be in accordance with CMAA 74 recommendations. The remote radio control system must be designed to meet the requirements of NEMA ICS 8, Part 9 and ECMA 15. Each radio remote control lever must be in the OFF position before the associated crane function can begin. The system frequency must be within the unlicensed FCC Part 15 range. Each control unit must maintain a continuous status signal to the associated receiver during operation. There must be no significant loss in systems efficiency and function at the end of eight hours of continuous battery use. Provide a contact monitoring board with the crane radio system receiver.

2.4.8 Runway Conductor System

Provide a rigid runway Conductor Bar System for the runway conductor system, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. UV resistant. Steel (non-stainless) conductor bars are prohibited. The crane must be grounded through the runway electrification system. The grounded conductors must be a minimum of 70 square millimeters. Provide runway conductors sized for simultaneous motions of the hoist, trolley mechanisms, and any ancillary loads. If there is any way the hook block or [load chain] [wire rope] can swing into the runway electrification, provide a guard installed to prevent contact.

Provide two Collector Shoes (tandem design) for each conductor; each collector shoe must be rated for not less than the runway conductor sizing, so as to provide redundancy.

2.4.9 Overload Protection [and Load Indicating Device]

**************************************************************************
NOTE: Overload protection on a crane is required
and is provided by two types of systems: Capacity
Overload Protection and Over-Torque Limit.
The Over-Torque Limit only applies to cranes with VFD controls. It is a parameter setting in the drive and is typically set at 150 percent. Manual hoists, air hoists, and electric hoists with magnetic controls do not have this feature. Delete third paragraph if VFD controls are not specified.

Capacity Overload Protection is usually adjustable. If adjustable, it needs to be set at less than the crane's minimum test load. This protection can take the form of one of the following devices:
1. Clutch – Not adjustable and is common on package hoists.
2. Load Limit Switch – Installed on the wire rope and measures deflection. Does not require a break in the wire rope and is simply clamped onto the wire. Typically used on smaller hoists that have magnetic controls. Can also be installed as part of the equalizer sheave.
3. VFD Drive Overload Protection – Similar to the Over-Torque Limit but is set at a lower setting. Adjusted via parameters within the drive.
4. Separate Load Indicating Device – This involves the installation of a load cell and a digital readout that displays weight. The load cell is usually bolted onto the end of the wire rope or is installed as a pin in one of the sheaves.

Provide capacity overload protection for all hoist systems [separate from torque limiting feature of the VFD] [using the load indicating device (LID) described in the next paragraph]. Set hoist capacity overload protection at [______]. Hoist capacity overload protection must be adjustable between 80 and 150 percent of hoist capacity. Provide a keyed override or other means to disable the hoist capacity overload protection when performing a load test. If a non-adjustable slip clutch is utilized, the OEM factory setting is acceptable and must be identified.

Provide an LID for the hoist[s]. Provide [a display][displays] installed on the underside of [each] hoist to provide load information from the load indicating system, to be displayed in kilograms pounds. The display[s] must be large enough so that the operator can read the load value[s] from the ground level. The load indicating system capacity is to be compatible with the maximum test load for each hoist. The accuracy of the load indicating system is to be such that the indicated load is not less than 100 percent of the actual load, and not more than 110 percent of the actual load. The load indicating system must be configured with a set point for an overload limit. Provide Tare (zero) functionality at the operator's station for [the] [each] load indicating system. Any load bearing components used in the LID system must be steel, have a minimum design factor of 5 to 1 based on ultimate tensile strength and a hardness not to exceed HRC 40. Precipitation hardened stainless steel load bearing elements must be aged hardened at a minimum temperature of 1025 degrees F.

[Initially, set the torque limiting capability of the VFD (that is separate from the capacity overload protective device) to 150 percent of the motor torque (amperage) necessary to hoist 100 percent load. It may be adjusted up only to avoid nuisance trips and adjusted down if possible while still avoiding nuisance trips.
2.4.10 Enclosures

**************************************************************************
NOTE: Select classification of control panels, controls, and brakes based on the environmental conditions in which the crane will be installed:
1. Choose one of the following for an indoor installation: 1, 2, or 12.
2. Choose one of the following for an outdoor installation: 3, 4X, or 8.
3. Choose one of the following for a Class I Hazardous installation: 7 (indoor) or 8 (indoor/outdoor).
4. Choose one of the following for a Class II Hazardous installation: 9 (indoor).
Other enclosure types exist that might be a better alternative for a particular installation. If necessary, refer to NEMA 250.
**************************************************************************
Provide enclosures for control panels, controls, and brakes in accordance with NEMA 250 and NEMA ICS 6, Classification Type [1 indoor, general purpose] [12 indoor without knockouts, general purpose] [2 indoor, drip-proof] [3 outdoor, dust-tight, rain-tight, sleet-resistant] [4X outdoor] [7 indoor Class I hazardous] [9 indoor Class II hazardous] [8 indoor/outdoor Class I hazardous] [______]. Provide enclosures with listed drains to prevent accumulation of water within the enclosure. There must not be any condensation inside the control panels. If anti-condensation heaters are provided, these heaters must remain energized when the main line contactor is deenergized.

Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.

Gaskets of enclosures and fixtures, and joints and contact surfaces of hazardous/explosive enclosures must be kept free of any paint to prevent damage during removal and reinstallation of gaskets of enclosures.

2.4.11 Warning Devices

**************************************************************************
NOTE: A warning horn or light is required for all radio controlled cranes.
**************************************************************************

[Provide a warning horn that is operable from a push button at the [pendant pushbutton] [radio control] station.][Provide a warning [strobe] [rotating beacon] that is illuminated at all times during movement of the hoist or trolley function.]

2.4.12 Indicator Lights

Provide Indicator Lights mounted in an enclosure on the bottom of the trolley with lights sized and positioned to be visible from the ground. The lights must be the dual-lamp type. Provide a white light to indicate that power is available to the crane and a blue light to indicate that the main contactor is energized. Light voltage must be 115 VAC. Provide
nameplates that are legible from ground level. The nameplates must read, in their respective order, "POWER AVAILABLE" and "CRANE ENERGIZED". The POWER AVAILABLE light must be supplied by a separate, fused transformer for its energization.

2.4.13 Wind Speed Indicating System

Provide a wind speed indicating device. The transmitter must be mounted on the highest unobstructed location.

[2.5 PAINTING SYSTEM

**************************************************************************

NOTE: Three-coat zinc primer/epoxy/polyurethane system is provided for mild to severe atmospheric, indoor and outdoor cranes. For cranes in abnormal environments including exposure to chemicals or in immersion service, a system designed for that environment should be used. Other systems may suffice for milder environments.
**************************************************************************

Remove all grease, oil, and surface debris by solvent wiping or detergent/water scrubbing, prior to blast cleaning. Prepare surfaces to be coated by abrasive blasting to SSPC SP 6/NACE No. 3, Commercial Blast Cleaning, or in accordance with the coating manufacturer's requirements, whichever is more stringent.

Use a painting system appropriate for the conditions provided in the Crane Design Criteria section. Paint exposed portions of the crane [and crane track system] using a [three] [_____] -coat system as follows: [zinc-rich primer consisting of a minimum of 77 percent zinc by weight in the dry film, an anticorrosive epoxy intermediate coat, and an aliphatic polyurethane top coat] [______]. All paint products must be supplied by a single manufacturer and free of chromates, lead, and mercury. Apply each coat in accordance with manufacturer's instructions and requirements. Ensure each coat is smooth, even, and free of runs, sags, orange peel, and other defects. Desired color of finish coat is [brilliant yellow] [______]. Submit product data for painting system.

Coat faying surfaces of bolted connections per RCSC A348, but do not apply finish paint.

Paint the load block [brilliant yellow] [______] with black diagonal striping. Paint, coatings, or galvanizing on the following items or areas is not acceptable: hoist [load chain] [wire ropes], hooks, hook nuts, running bearing surfaces (including sheaves and wheel treads), grease fittings, or other items not normally painted.

Factory paint electrical and mechanical equipment including hoist, trolley, and track in accordance with the manufacturer's best standard practice (for the specified environment).

2.6 IDENTIFICATION PLATES

Furnish and install identification plates. Provide non-corrosive metal identification plates with clearly legible permanent lettering giving the manufacturer's name, model number, serial number, capacity in both kilogram and pound units printed in different colors, and other essential
information or identification.

2.6.1 Markings on Crane, Trolley, and Hook

**************************************************************************
NOTE: NAVFAC requires markings to be indicated in
pounds.
**************************************************************************

To avoid operation of the crane in the wrong direction, affix the
appropriate directions (NORTH, SOUTH, EAST, and WEST) with arrows on both
sides of the trolley, as applicable. Markings must be visible by the
operator and from the loading point. Labels on the controls must have
corresponding directional (NORTH, SOUTH, EAST, and WEST) markings.
Markings must agree with the markings on controller. Do not indicate
directional arrows on controller.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing
any work, verify all dimensions in the field. The Contractor is
responsible for the coordination and proper relation of the contracted work
to the building structure and to the work of all trades. Verify all
dimensions of the building that relate to fabrication of the crane and
notify the Contracting Officer of any discrepancy before finalizing the
crane order.

3.2 SHOP ASSEMBLY AND TESTS

Shop assemble major components as completely as possible. Functionally
test the crane system at the construction facility prior to shipment. The
Government reserves the right to inspect the crane for compliance with this
specification and to witness the functionality tests. Notify the
Contracting Officer [14] [_____] days prior to starting testing operations.

3.3 ERECTION AND INSTALLATION

Perform the entire monorail system erection in accordance with
manufacturer's instructions under the full-time supervision of the
manufacturer's representative.

3.3.1 Electrical Adjustments

Adjust control system in accordance with manufacturer's instructions.[
Store a copy of all Control Parameter Settings (PLC, VFD, and other
microprocessor-controlled equipment).] Provide the final settings and
configurations on the Complete Schematic Wiring Diagram, including but not
limited to, timer settings, resistor tap settings, potentiometer settings,
test-point voltages, supply voltages, motor voltages, motor currents.
Provide the test conditions such as ambient temperature, motor load, date
performed and person performing the configuration as part of the
Operational Tests report.

3.3.2 Field Welding

Perform welding indoors, where possible. Surface of parts to be welded
must be free from rust, scale, paint, grease, and other foreign matter.
Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M.

3.3.3 Field Painting

Perform painting indoors, where possible. Field painting (including touch-up) must conform to the requirements of the coating manufacturer and as specified in the paragraph PAINTING SYSTEM.

3.4 FIELD QUALITY CONTROL

3.4.1 Post-Erection Inspection

After erection, the Contractor[, the Activity Crane Inspector/Test Director,] and the Contracting Officer must jointly inspect the crane monorail track and hoist systems and components to verify compliance with specifications and approved submittals. Notify the Contracting Officer [_____] days before the inspection. Provide a report of the inspection indicating the crane is considered ready for operational tests.

Document the results of this inspection and submit the post-erection inspection report to the Contracting Officer for approval.

3.4.2 Operational Tests

**********************************************************************************************************************************************
NOTE: Determine if Government furnished certified test weights are available at the site. If not, they must be provided by the Contractor.
**********************************************************************************************************************************************

Check the clearance envelope of the entire crane prior to picking or traversing any load to ensure there are no obstructions. Test the systems in service to determine that each component of the system operates as specified, is properly installed and adjusted, and is free from defects in material, manufacture, installation, and workmanship. Rectify all deficiencies disclosed by testing and retest the system or component to prove the crane is operational.[ The Contractor must furnish test weights, operating personnel, instruments, and other apparatus necessary to conduct field tests on each crane. Solid weights must be measured using calibrated equipment traceable to National Institute of Standards and Technology (NIST) with a minimum accuracy of plus or minus two percent.]

3.4.2.1 No-Load Test

Raise and lower each hook through the full range of normal travel at rated speed for three complete cycles. Raise and lower each hook, testing other speeds of the crane. Verify proper operation of hoist limit switches. Operate the trolley in each direction the full distance between end stops. Operate through the entire speed range and verify proper brake operation. Verify correct operation of all indication and ancillary devices.

3.4.3 Test Data

Record test data on appropriate test record forms suitable for retention for the life of the crane. Record operating and startup current measurements for hoist and trolley motors using appropriate instrumentation (i.e., clamp-on ammeters). Compare recorded values with design specifications or manufacturer's recommended values; abnormal differences
(i.e., greater than 10 percent from manufacturer's or design values) must be justified or appropriate adjustments performed. In addition, note, investigate, and correct any high temperatures or abnormal operation of any equipment or machinery. Record hoist and trolley speeds during each test cycle.

3.4.4 Hook Tram Measurement

Establish a throat dimension base measurement by installing two tram points and measuring the distance between these tram points (plus or minus 0.4 mm 1/64 inch). Record this base dimension. Measure the distance between tram points before and after load test. An increase in the throat opening from the base measurement is cause for rejection.

3.4.5 Load Tests

**************************************************************************
NOTE: NAVFAC Tailoring – the NAVY requires a load test of 125 percent (plus 0 minus 5) of the rated load.
**************************************************************************

Perform the following tests as specified below.

Test loads used in this section are defined as the following:

Rated load test: [100 percent (plus 0 minus 10)] [100 percent (plus [_____] minus [_____]]) of rated load.

Overload test: [125 percent (plus 0 minus 5)] [125 percent (plus [0] [_____] minus [5] [_____]]) of rated load.

3.4.5.1 Rated Load Test

3.4.5.1.1 Hoist

a. Static Load Test: With the trolley centered between hangar supports, raise the test load approximately 300 mm one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees to check bearing operation with no binding. Observe lowering that may occur which indicates a weakness in the structure or malfunction of hoisting components or brakes. Measure and verify deflection for the longest monorail beam section do not exceed MHI MH27.1/MHI MH27.2 and L/600 for rolled steel shapes design limits, as applicable.

b. Hoist Mechanical Load Brake: Raise test load approximately 1500 mm (5 feet). With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again, with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

For hoists with primary and secondary holding brakes, raise the test load and release the secondary holding brake while testing the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage secondary holding brake and release the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may
indicate malfunction of hoisting components or brakes. Re-engage the
primary holding brake. Recheck proper operation of time delay and
ensure smooth positive stopping.

c. Raise and lower test load through the full lift range. Stop the
machinery at least once in each direction to ensure proper brake
operation.

d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm
8 feet. While slowly lowering the test load, disconnect the crane's
power source. Verify that the test load does not lower and that the
brake is set.

3.4.5.1.2 Trolley

Operate the trolley the full distance of the monorail system including all
curves and switches in each direction with rated load on the hook. Check
proper functioning through the range of speeds. Completely stop the
machinery at least once in each direction during each cycle to ensure
proper brake action.

3.4.5.1.3 Trolley Loss of Power Test

With rated load, raise the test load approximately midway between the
trolley and any permanent obstruction on the operating floor. Starting at
a safe distance from walls or other obstructions, attain a slow speed of
trolley travel. While maintaining a safe distance from obstructions,
disconnect the main power source at the wall mounted safety switch
(disconnect) to simulate a power failure. Verify that the trolley stops
and that the brake sets properly.

3.4.5.2 Overload Test

3.4.5.2.1 Hoist

Disconnect or adjust the overload limit device to allow the hoist to lift
the test load. Verify proper operation of the overload limit device after
it is reconnected.

a. Static Load Test: With the trolley centered between vertical supports,
raise the test load approximately 300 mm one foot. Hold the load for
10 minutes. Rotate the load and hook 360 degrees to check bearing
operation with no binding. Observe lowering that may occur which
indicates a weakness in the structure or malfunction of hoisting
components or brakes.

For hoists with primary and secondary holding brakes, raise the test
load and release the secondary holding brake while testing the primary
holding brake. Hold for 10 minutes. Observe for lowering of the load,
which may indicate malfunction of hoisting components or brakes.
Re-engage secondary holding brake and release the primary holding
brake. Hold for 10 minutes. Observe for lowering of the load, which
may indicate malfunction of hoisting components or brakes. Re-engage
the primary holding brake. Recheck proper operation of time delay and
ensure smooth positive stopping.

b. Raise and lower test load and visually observe smooth control. Stop
the load during raising and lowering to verify that the brakes holds
the load.
c. Hoist Mechanical Load Brake: Raise test load approximately 1500 mm 5 feet. [With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. ]The load brake must hold the test load. [Again, with the holding brake in the released position. ]Start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.

[d. Hoist Loss of Power Test: Raise the test load to approximately 2400 mm 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

3.4.5.2.2 Trolley

Operate the trolley the full distance of the monorail rail system including all curves and switches in each direction with a test load on the hook (one cycle) through the range of speeds. Verify proper brake action.

3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on-site testing, and instruct personnel in the operational and maintenance features of the equipment.

3.6 OPERATION AND MAINTENANCE MANUALS

Provide [two] [_____] hard copies of operation and [two] [_____] hard copies of maintenance manuals for the equipment furnished along with an electronic copy (PDF) of each on a Compact Disc. Provide one complete set prior to performance testing and final copies upon acceptance. Provide operation manuals that detail the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, including weekly, monthly, semi-annual, and annual required maintenance items, possible breakdowns and repairs, and troubleshooting guides. Also include as-built drawings, piping and equipment layout, design calculations, Control Parameter Settings and printouts of any software, and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course.

[3.7 FIELD TRAINING

**************************************************************************
NOTE: Training is recommended, but not required.
**************************************************************************

Conduct a training course for [_____] operating and maintenance staff[ and provide a copy of the training material to each participant]. Provide a training period consisting of a total of [_____] hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication,
general inspection, and [____].

3.8 FINAL ACCEPTANCE

**************************************************************************
NOTE: Use this paragraph as written for projects where the crane is the principal construction element or represents a very significant portion of the Contract cost. However, if the crane is part of a new facility or renovation, delete the acceptance paragraph from this section. Warranty period and operating and maintenance processes must coincide with the actual beneficial occupancy of the entire facility.
**************************************************************************

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on [wire rope] [load chain], hook, and electrical collector bars.

-- End of Section --

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for ultrasonic inspection of rolled steel plates.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification covers the ultrasonic inspection of rolled plates both in air and by immersion techniques for laminar types of flaws, for lack of bonding between plate and cladding, and for lack of fusion between the welded overlay and the base metal. Where ultrasonic inspection of weldments is to be required, use Section 05 05 23.16.13 10 ULTRASONIC INSPECTION OF WELDMENTS. If the work will involve both ultrasonic inspection of plates and of weldments, this section and Section 05 05 23.16.13 10 ULTRASONIC INSPECTION OF WELDMENTS may be used as separate sections of the contract specifications, or may be combined into a single section to be titled ULTRASONIC INSPECTION.
If combined, repetitions will be deleted, and the entire specification will be edited for appropriate paragraphs and definitions, reference specimens, acceptance/rejection standards, and other associated data.

**************************************************************************

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM E165/E165M (2023) Standard Practice for Liquid Penetrant Examination for General Industry

1.2 DEFINITIONS

1.2.1 A Scan

Method of data presentation on a cathode ray tube using rectangular coordinates in which a horizontal base line indicates elapsed time when reading from left to right. A vertical deflection in the base line indicates reflect signal amplitude.

1.2.2 Acoustically Similar Material

Material the same as that to be inspected; or another material proven to have acoustical velocity within plus or minus 3 percent and an attenuation within plus or minus 0.001 dB/mm 0.25 dB/inch of the inspected material for the inspection frequency and wave mode, using the same mode as that to be used for inspection.

1.2.3 Amplitude

When referring to an indication in A scan presentation, amplitude is the vertical height of the indication measured from peak-to-peak for radio frequency indications and trace-to-peak for video indications.

1.2.4 Attenuation

Dissipation or loss of energy as ultrasonic vibrations travel through the material. Attenuation is caused almost entirely by scattering of the ultrasonic vibrations generated by the search unit.

1.2.5 Attenuation-Correction Controls

Circuitry to provide a continuous increased amplification with respect to time. This circuitry compensates for the reduction in sensitivity with depth as a result of sound beam divergence and its attenuation in material.

1.2.6 Back Reflection or End Reflection

Reflection from the opposite side, end, or boundary of the material into which the ultrasonic energy was introduced.

1.2.7 Calibrated Gain Control (Attenuator)

Circuitry with which gain can be increased or reduced finite amounts by switching electrical signal attenuation into the circuit.

1.2.8 Calibration

Process of comparing an instrument or device with a standard to determine accuracy or produce a scale.

1.2.9 Cathode Ray Tube (CRT)

Electron tube in which a controlled beam of electrons from the cathode is used to produce an image on a fluorescent screen at the end of the tube.

1.2.10 Couplant

Any material, usually a liquid or semiliquid, used between the search unit and the inspection surface to exclude air and convey the ultrasonic
vibrations between the search unit and the material being inspected.

1.2.11 Damping Control

Control that varies the duration of transducer ringing.

1.2.12 Decibel (dB)

Units for the logarithmic expression of the ratio of power levels. Power levels can be functions of voltage, current, or impedance. Decibel units have no values of their own and are only significant when a reference is stated, as 10 dB above one reference level or 6 dB below another reference level.

1.2.13 Delay Control

Means of delaying the pattern obtained on the cathode ray tube.

1.2.14 Discontinuity

Anything within a material that will cause a detectable interruption in an ultrasonic beam.

1.2.15 Distance-Amplitude Correction Curve

Curve showing the relationship between signal amplitude and equal-sized reflecting surfaces at various distances from the transducer. Reference standards are used to obtain such curves.

1.2.16 Dynamic Range

Ratio of maximum to minimum size of reflective areas that can be adequately distinguished on the cathode ray tube at a constant gain setting.

1.2.17 Effective Depth of Penetration

Maximum depth at which the sensitivity is satisfactory for the quality of test desired.

1.2.18 Examination

Within the context of this specification, the word "examination" is equivalent to the word "inspection."

1.2.19 Gain Control

Circuitry designed into the ultrasonic system to vary reflection amplitude. This control is usually calibrated in decibels. It is also called the sensitivity control.

1.2.20 Gross

Background displacement of the trace on the cathode ray tube from the established baseline due to the gain setting, the characteristics of the test equipment, or the material under examination.

1.2.21 Hertz

One complete set of recurrent values of a periodic quality comprises a
cycle. In other words, any one set of periodic variations starting at one condition and returning once to the same condition is a cycle. A hertz is a unit of frequency equal to one cycle per second.

1.2.22 Immersion Techniques

Test methods in which the part to be tested and the search units are immersed in water or other suitable liquid couplant. A mechanical device is used to firmly hold and direct the wave angle of the search unit. The search unit does not contact the item being inspected.

1.2.23 Indication

Visual presentation on the cathode ray screen resulting from a sound beam reflection from a boundary surface or discontinuity.

1.2.24 Initial Pulse Indication

Usually called the "initial pulse". A signal on the CRT screen marking the instant at which a voltage impulse is applied to the transmitting crystal. Its rising edge is frequently invisible due to the time lag in the probe shoe and the consequent necessity to ensure coincidence between the time base zero and the instant at which the transmitter pulse actually enters the material under test.

1.2.25 Linearity

Property of an instrument revealed by a linear change in reflected signal or displacement. The vertical linearity is determined by plotting by change in ratios of signal amplitude from two adjacent reflections from an area of known size. The horizontal linearity is determined by plotting the distance the signal is displaced along the sweep against the change in material thickness or by noting the spacing of multiple back reflections.

1.2.26 Longitudinal or Compressional Waves

Simple compression refraction waves in which particle motion within a material is linear and in the direction of wave propagation. Also called straight beams, or compressional or normal waves.

1.2.27 Longitudinal Wave Inspection

Ultrasonic technique, normally using straight beam methods, in which longitudinal waves are the dominant form.

1.2.28 Mid-Screen Reflection

Reflection whose amplitude is equal to one-half the usable screen height on the CRT.

1.2.29 Megahertz (MHz)

One million hertz per second frequency.

1.2.30 NDT Level I

An NDT Level I individual should be qualified to properly perform specific calibrations, specific NDT, and specific evaluations for acceptance or rejection determinations according to written instructions, and to record
results.

1.2.31 NDT Level II

An NDT Level II individual should be qualified to set up and calibrate equipment and to interpret and evaluate results with respect to applicable codes, standards, and specifications.

1.2.32 NDT Level III

An NDT Level III individual should be capable of establishing techniques and procedures; interpreting codes, standards, specifications, and procedures; and designating the particular NDT methods, techniques, and procedures to be used.

1.2.33 Node

Distance a shear wave travels in a straight line from the inspection surface before being reflected by the opposite surface.

1.2.34 Pulse Repetition Rate

Number of spaced pulses of sound per second sent into the material being inspected.

1.2.35 Range Control

Means of expanding the pattern obtained on the CRT so any portion of the total distance being tested can be presented.

1.2.36 Reference Reflector

Standard reflector 1.52 mm 0.060 inch diameter reference hole in the IIW reference block. Other approved blocks may have a different diameter reflector.

1.2.37 Reflector

Boundary, consisting of an opposite side, crack, or separation, or a distinct change in material such as slag or porosity that reflects the ultrasonic energy the same as a mirror reflects light.

1.2.38 Refracted Waves

Waves that have undergone change of velocity and direction by passing from one material to another material with different acoustical properties. Refraction will occur wherever the angle of the incident wave to the interface is other than perpendicular.

1.2.39 Rejectable Discontinuity (Defect)

Reflector large enough to produce a signal (decibel rating) that exceeds the reject/repair line.

1.2.40 Resolution

Ability to clearly distinguish signals obtained from two reflective surfaces with a minimum separation distance. Near-surface resolution is the ability to clearly distinguish a signal from a reflector at a minimum
distance under the contact or near surface without interference from the initial pulse signal. Far-surface resolution is the ability to clearly distinguish signals from reflectors displaced at minimum distance from the far or back surface when the sound beam is normal to that back surface.

1.2.41 Ringing

Excitation of the transducer crystal due to a short pulse of high-voltage electricity.

1.2.42 Scanning

Process of moving the search unit or units along a test surface to obtain complete inspection of the entire volume of a material being inspected.

1.2.43 Search Unit

Device containing a piezoelectric material used for introducing vibrations into a material to be inspected or for receiving the vibrations reflected from the material. The active element of the search unit is defined as the effective transmitting area. Search units are also called transducers or probes. They may be single or dual and contain one or two piezoelectric elements, respectively, for transmission and reception. The single search unit is sometimes enclosed in a transducer wheel or search unit wheel. The search unit may be manually handled and placed in direct contact with the material to be inspected or may be held in a fixture for immersion technique.

1.2.44 Sensitivity

Measure of the ultrasonic equipment's ability to detect discontinuities. Quantitatively, it is the level of amplification of the receiver circuit in the ultrasonic instrument necessary to produce the required indication on the scope from the reference hole in the reference block. Also see "standard reference level".

1.2.45 Shear Waves

Waves in which the particles within the material vibrate perpendicularly to the direction in which the wave travels or propagates. Also called transverse waves.

1.2.46 Shear Wave Inspection

Inspection technique using shear waves in a material. The search unit is placed at an angle to the contact surface of the material so the resultant refracted sound is a shear wave at an angle to the normal.

1.2.47 Standard Reference Level

Mid-screen height reflection when beaming at the 1.52 mm 0.060 inch hole in the primary reference block or the reference hole in the secondary standard.

1.2.48 Surface Waves

Waves that propagate along the surface of the material and penetrate it to only about 1/2 wavelength. Also known as Rayleigh waves.
1.2.49 Test Frequency

Operating frequency in hertz per second of the search unit during period of activation. Frequency is usually expressed in megacycles per second or megahertz. The latter term has been adopted for international use and is preferred.

1.2.50 Video Form

Type of signal presentation on a CRT in which only the upper or position half of the signal appears.

1.3 SYSTEM DESCRIPTION

**************************************************************************

NOTE: The designer will indicate the extent of inspection required, where the inspection will be made, and the number of plates to be inspected. The number will depend on the service to which the plates will be subjected. For example, inspect all plates intended for pressure vessels and dynamically loaded structures such as rail and highway bridges, cranes, and missile service towers. In the case of plates for statically loaded structures such as buildings and storage tanks, inspection must be on the basis of heats in which the sample size must be in accordance with the governing specifications or standards for tensile tests. However, the plates intended for ultrasonic inspection will not be the same as those from which the tensile specimens were taken. For economy, plates should be inspected at the mill following final processing and before shipment. However, in some instances, this may not be expedient. Where critical, the designer will specify in detail the occasion for inspection in the construction process.

**************************************************************************

This section includes procedures, methods, standards, and descriptions of equipment which are used for [mill] [shop] [field] inspection of rolled plate, including clad materials which are 13 mm 1/2 inch or thicker, through which interpretable ultrasonic penetration is possible. Inspect plate [individually.] [by lots. Use a sample size of two plates per lot. A lot is defined as being all plates in a 50 mm 2 inch thickness interval rolled from the same heat. Include in the thickness determination any overlay, pressure cladding, or weld deposit.] Perform ultrasonic inspection to detect the following defects:

a. [Internal laminar discontinuities.]

b. [Lack of bond between roll or explosive bonded sheet.]

c. [Lack of fusion between welded overlays and base plate.]

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Procedures and Methods

Personnel Qualification and Certification

Equipment Qualification Requirements

SD-06 Test Reports

Reports and Results

1.5 QUALITY ASSURANCE

1.5.1 Personnel Qualification and Certification

Personnel must be qualified to perform ultrasonic inspection, as defined in ASNT SNT-TC-1A. Personnel must be certified under ASNT SNT-TC-1A and
ASNT SNT-TC-1A Q&A Bk C within a period of 1 year before the date of this contract. Other qualification or certification may be accepted at the Contracting Officer's discretion. Personnel with only an operator or inspector trainee certification will not be considered qualified to pass judgment on the acceptability of inspected items, but may work under the direct supervision of a qualified ultrasonic inspector. Qualified ultrasonic inspectors must be able to pass judgment on the acceptability of the item in accordance with paragraph ACCEPTANCE/REJECTION LIMITS.

1.5.2 Examinations

If the Contracting Officer doubts an individual's ability as an operator, inspector, or supervisor, recertify the individual in accordance with ASNT SNT-TC-1A. The Contracting Officer may participate in administering the examination and in evaluating the results.

1.6 REFERENCE STANDARDS

Use reference standards to calibrate the inspection equipment, test its operating condition, and record the sensitivity or response of the equipment during the inspection in accordance with paragraph EQUIPMENT QUALIFICATION REQUIREMENTS. Use standards that comprise a standard reference block and working standards as described next.

1.6.1 Standard Reference Block

Provide the standard reference block or primary standard consisting of the International Institute of Welding (IIW) reference block in AWS D1.1/D1.1M, Section: Inspection, subsection, Reference Standards. Also use the standard reference block in any reinspection on the same basis as the original inspection, even though the reinspection is to be performed by other ultrasonic instruments and accessories.

1.6.2 Working Standards

Recognized working standards detailed with the IIW block in AWS D1.1/D1.1M, such as the Sensitivity Calibration Block, may be used. Details of their use must be included in the procedure description submitted for approval. Use blocks of the same acoustical material as the plates to be inspected, that are suited for the applicable tests specified in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, and use as follows except where the IIW block is specifically required:

a. To assure adequate penetration of the base material.

b. To provide a secondary field standard.

c. To calibrate the equipment and to establish the standard reference level.

1.6.3 Resolution Test Block

Furnish a resolution test block in accordance with the details shown in AWS D1.1/D1.1M, Section: Inspection, subsection Reference Standards.

1.7 EQUIPMENT QUALIFICATION REQUIREMENTS

Evaluate the ultrasonic instrument and accessories on their arrival at the jobsite just before the start of the inspection, using the Contractor's
furnished primary standard; meet or exceed the requirements below. Do not use equipment that does not meet these requirements.

Submit the procedure specifications, the procedure qualification test records and the personnel qualification test records.

1.7.1 Requalification

Requalify equipment after normal use at intervals not to exceed 40 hours. In addition, requalify equipment immediately after maintenance or repair or when the Contracting Officer considers its operation questionable.

1.7.2 Longitudinal Wave System

1.7.2.1 Horizontal Linearity

Space the first three multiple reflections obtained through the thickness of the primary or secondary standard equally within plus or minus 5 percent when spread over 90 percent of the sweep length.

1.7.2.2 Vertical Amplitude Linearity

Two adjacent reflections of different amplitudes obtained through the thickness of the primary or secondary standard must vary in the same proportion as the amplitude of the first reflection is increased in discrete 2-dB increments between 20 and 80 percent of full screen height. For each gain setting, the amplitude of each reflection must vary by the same factor within plus or minus 5 percent.

1.7.2.3 Near-Surface Resolution

Excessive ringing that appears on the cathode ray tube (CRT) just to the right of the sound entry point must not exceed a 13 mm 1/2 inch equivalent distance in steel with the search unit placed on the 100 mm 4 inch edge of the IIW block and positioned for maximum amplitude reflection from the 1.52 mm 0.060 inch hole. Set the reference reflector to mid-screen and increase the gain 20 dB. In either case, excessive ringing must not appear on the CRT to the right of the sound entry point in excess of a 13 mm 1/2 inch equivalent distance in steel. Use the reference hole located at least 13 mm 1/2 inch from one edge of the AWS D1.1/D1.1M, Type SC secondary standards similarly. Acceptability must be on the same basis as in the primary standard.

1.7.2.4 Far-Surface Resolution

Delineate the three resolution holes in the resolution block appropriate for the angle of the transducer to be used in the inspection.

1.7.2.5 Signal-to-Noise Ratio

With the search unit located as in the near-surface resolution tests, set the gain to obtain an 80-percent full screen height first reflection from the respective reference reflector. A reference reflection-to-noise less than 10 to 1 is not acceptable.

1.7.2.6 Penetration

Obtain at least three multiple back reflections through plates up to 75 mm 3 inches thick and at least one for plates greater than 75 mm 3 inches.
In either case, the initial or back reflection only must fall within mid-screen range with a gain input no greater than 50 percent of the instrument capacity.

1.7.3 Immersion Testing

For immersion techniques, the back reflection from the interface between the couplant and the plate surface is called the "first interface signal". All measurements are to be referenced to this signal. Provide equipment that meets all requirements of paragraph EQUIPMENT SENSITIVITY CALIBRATION.

1.8 EQUIPMENT SENSITIVITY CALIBRATION

Perform sensitivity calibration immediately after a change of operators and at least every 30 minutes thereafter as testing proceeds. Recalibration is also required after any power interruption, including a change of source, when the equipment is suspected of being in error, or after relocation on the jobsite. The 30-minute and relocation calibrations may coincide. Before calibration is attempted, allow the instrument to warm up.

1.8.1 Calibration of Longitudinal Wave System

Adjust the instrument range and delay controls to display signals from the far surface of the plate to be inspected. Adjust the gain to produce a first back reflection 50 percent of full-scale. Establish the reject/repair line at 40 percent of full-scale or 2 dB below mid-screen height. Determine the relationship between the 50-percent reflection and the first back reflection from the 1.52 mm 0.060 inch reference hole in the primary standard in the following way: without further adjustment of the instrument gain after the initial sensitivity setting, couple the transducer to the primary standard and positioned for a maximum first back reflection from the 1.52 mm 0.060 inch reference hole. Adjust the instrument gain to bring the maximum reflection to mid-screen height and record this instrument gain setting. Also record a similar relationship, correlated with the respective plate identifications, for each subsequent plate inspected. Compensate for adjustment for loss of signal due to distance as specified below. However, for plates less than 25 mm 1 inch thick, no adjustment for loss of signal is required.

1.8.2 Calibration of Secondary Standard

After adjusting the first reflection from the reference hole in the secondary standard to a 50-percent full-scale response for a shear or longitudinal wave inspection, obtain a maximized reflection from the 1.52 mm 0.060 inch reference hole in the primary standard without changing the gain setting. Readjust this gain setting to obtain a 50-percent full-scale reflection. Record the readjusted setting to provide a basis for recalibration when the secondary standard is unavailable.

1.8.3 Equipment With a Calibrated Gain Control

When a calibrated gain control attenuator is used, position the transducer for maximum reflection from the reference hole in the secondary standard representing approximately 1/2 the longest inspection distance. Adjust this reflection to mid-scale by varying the gain control accordingly. Measure the difference in decibels between this amplitude and the signals obtained from the first, second, and longest distance reflections obtainable on the secondary standard. Record and plot the differences on a curve to determine the necessary correction to the amplitude at the various
inspection distances. A level 80 percent of the primary level, obtained from the corrected signal heights, is equal to the reject/repair line.

1.8.4 Equipment With Electronic Distance Compensation Circuitry

If the distance in amplitude between the first reflection and the reflection obtained from the maximum inspection distance is 1 dB or less, the instrument may be used as is. If not, use the procedure used for equipment with a calibrated decibel control to determine the necessary correction for the reflections obtained at the various inspection distances.

1.8.5 Longitudinal Wave Distance-Amplitude Corrective Curve

Construct and draw a longitudinal wave distance-amplitude correction curve on the face of the CRT when longitudinal waves are to be used in the inspection and when material thickness exceeds 50 mm 2 inches if the test equipment design permits. Use the reference hole in the secondary standard. Adjust the instrument sensitivity to 50 percent full-scale of the maximized response from the reference hole at 1/2 maximum inspection distance. Construct the reject/repair line at 80 percent of the established distance-amplitude curve. Take the reflection amplitudes to define this curve from the faces of the secondary sensitivity standard which are 25 mm 1 inch, 50 mm 2 inches, 1/2 maximum inspection distance, and the longest distance obtainable from the secondary standard, respectively, from the reference hole. When a correction curve cannot be drawn on the face of the CRT, apply an approved distance-amplitude correction method.

1.8.6 Longitudinal Wave Inspection Using Immersion Techniques

Use the reference hole in a secondary standard for each different inspection distance. Establish reject/repair limits by immersing both the search unit and secondary standard in the liquid bath in which the inspection is to be conducted. Use the following procedure:

a. Direct the longitudinal waves from the search unit toward the face of the secondary standard closest to the reference hole.

b. Position the search unit for maximum response. Adjust the amplitude of reflection to 50 percent full-scale. Mark the top of that indication on the CRT with a wax pencil or by other means. This establishes the standard reference level. Calculate and mark a point at 80 percent of the standard reference level. This locates the reject/repair point. Repeat the above procedure for each different surface-to-hole distance to establish reject/repair lines.

c. With the gain at the same setting and primary standard and search unit in the bath, obtain a maximized reflection from the 1.52 mm 0.060 inch reference hole in the primary standard. Readjust the gain setting to obtain a 50-percent full-scale reflection. Record the readjusted setting to provide a basis for recalibration when the secondary standard is unavailable.

1.8.7 Angle Wave System

The sensitivity level must be a minimum of a mid-screen height, 50-percent back reflection, with the transducer placed at the first node position from a plate edge. No other calibration tests are required unless repair of discontinuity excavation is accomplished by welding. In that case, when
inspection of the weld repair is required, accomplish qualification and calibration of the shear wave equipment in accordance with Section 05 05 23.16.13.10 ULTRASONIC INSPECTION OF WELDMENTS.

PART 2 PRODUCTS

2.1 ULTRASONIC EQUIPMENT

Provide ultrasonic test instrument conforming to the requirements listed in AWS D1.1/D1.1M, Section: Inspection, subsection, Ultrasonic Equipment, except any requirement relating to weld inspection and the following additional requirements:

2.1.1 Pulses

Provide an ultrasonic test instrument able to generate, receive, and present pulses in any frequency in the 1- to 10-megahertz (MHz) range.

2.1.2 Horizontal Linearity Test

Test the horizontal linearity of the ultrasonic instrument in accordance with the requirements for horizontal linearity of paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, in addition to the AWS D1.1/D1.1M requirement.

2.1.3 Resolution Tests

In addition to the resolution test specified in AWS D1.1/D1.1M for ultrasonic equipment, conduct both near- and far-surface resolution tests in accordance with the procedures specified for those characteristics in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS.

2.2 PROCEDURES AND METHODS

Use the pulse echo contact method with an A scan presentation for the ultrasonic inspection of plate except when immersion techniques may be approved for use in some applications. Submit for approval the procedures to be used for personnel and equipment qualification, equipment calibration, and inspection at least 30 days before their intended use. Approval will in no way affect the Contractor's obligation to employ qualified personnel, equipment, and procedures, and to perform the inspection as specified. Include the following in the procedure description:

a. Type of couplant.

b. Search unit characteristics including shape, nominal frequency, diameter, type, and transducer angle if other than straight.

c. Method and type of wave.

d. Equipment and accessories including manufacturer, model number, date of manufacture, last date of calibration, and the manufacturer's electrical, physical, and performance specifications.

e. Decibel (dB) compensation system for distance-amplitude correction.

2.3 TEST FREQUENCY

Provide test frequency for ferrous materials as specified in AWS D1.1/D1.1M,
Section: Inspection, subsection, Ultrasonic Equipment. For other materials that are difficult to penetrate, any frequency within the operating range of the equipment may be used. Demonstrate the effective depth of penetration and sound beam divergence to the Contracting Officer.

2.4 WAVE TYPES

Use types of waves and conditions as follows:

2.4.1 Longitudinal Waves

Use longitudinal waves to locate, identify, and evaluate defects in the various plate materials to be inspected.

2.4.2 Shear Waves

Shear waves may be used as a supplementary means of inspection to locate questionable areas.

2.5 CHANGES IN PROCEDURE

Should application of an approved procedure not provide for good resolution or adequate ultrasonic penetration as specified in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, make and approve changes in procedure or equipment such as frequency, pulse repetition rate, angle of search unit, couplant, or oscilloscope. Demonstrate adequacy of the new procedure to the Contracting Officer. During these tests, if any of the test system's characteristics fall below the levels listed in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, the Government reserves the right to require a change in procedure or equipment.

PART 3 EXECUTION

3.1 PREPARATION OF MATERIALS FOR INSPECTION

Provide inspection surface that is clean and free of loose scale, dirt, rust, grease, oil (other than couplant), and paint. Grind smooth any roughness on the inspection surface that could interfere with transmission of the ultrasound into the material enough to obtain a back or end reflection in excess of 40 percent full-scale. Inspect plates after final heat treatment or processing. Restore plate identification removed by grinding or other means after inspection.

3.2 INSPECTION PROCEDURE

**************************************************************************************************************************
NOTE: The designer will specify limits closer than those cited if the application is judged critical.
Delete inapplicable words, sentences, and paragraphs when the item mentioned is not to be furnished under this contract; for example, if clad plate is not furnished, delete all reference to clad plate.
**************************************************************************************************************************

Make inspection for [laminar types of flaws and] lack of fusion between welded overlay [or explosion bonded sheet] [and the base metal] as detailed below with the search unit coupled to the base plate. Use the correct frequency as defined in paragraph TEST FREQUENCY. Perform final evaluation
for acceptance or rejection with the equipment properly calibrated and the
gain control set at the reference level. Use the reject/repair line to
evaluate the quality of each item inspected. If a periodic calibration
check shows that the equipment is not operating properly or that the
sensitivity of the system has decreased more than 20 percent or 2 dB from
the established sensitivity level, reexamine all items that have been
inspected since the previous calibration. When adequate penetration, as
specified in paragraph EQUIPMENT QUALIFICATION REQUIREMENTS, cannot be
obtained by the proposed longitudinal wave method, modify the procedure in
accordance with paragraph CHANGES IN PROCEDURE.

3.2.1 Couplants

**************************************************************************
NOTE: The designer may limit the choice of
couplants if some couplants are considered injurious
to the item to be inspected.
**************************************************************************

The choice of couplant, such as oil or water, is optional, except as follows:

a. Use the same couplant as that used for equipment qualification and
calibration.

b. Do not use couplants that may cause corrosion of the reference
standards or the material being tested.

c. Do not use oil for plate to be installed in systems that will
handle liquid oxygen.

d. Provide couplants that have the proper viscosity to overcome
surface roughness or irregularities.

3.2.2 Detection of Laminar Types of Flaws

a. Mark off plates in grid lines with a maximum spacing of 12 inches
between lines, test along each grid line and also along a path within
one thickness (T) of the plate from each plate edge.

b. Maintain back or end reflection from the far surface of the plate
in excess of 40-percent of full-scale screen height during the entire
inspection to assure adequate ultrasonic penetration.

c. When a complete loss of back or end reflection occurs along any
grid line, inspect the entire area of the square adjacent to that
point. Continue complete testing of all additional adjacent squares
until the extent of the defective area is defined.

3.2.3 Detection of Lack of Bonding: Base Plate and Cladding

a. Inspect the clad area for any lack of bonding between the cladding
and the base metal. Mark off the clad area in grid lines with a
maximum spacing of 150 mm 6 inches between lines, test along each grid
line and also along a path within T of each edge.

b. Perform inspection from the base metal side, provided the interface
between the base plate and overlay can be resolved.
3.2.4 Detection of Lack of Fusion: Welded Overlay and Base Plate

a. Inspect the fusion-welded area for any lack of fusion between the overlay and the base plate. Mark off the fusion-welded area in grid lines with a maximum spacing of 150 mm (6 inches) between lines, test along each grid line and also along a path within T of each edge.

b. Perform inspection from the base metal side, provided the interface between the base plate and overlay can be resolved.

3.2.5 Immersion Techniques for Longitudinal Wave Inspection

This procedure may be used at the Contractor's option unless otherwise specified. Inspect plates for laminar type of flaws, lack of bonding between base plate and cladding, or lack of fusion between welded overlay and the base metal, as appropriate. In addition, make provision for immersing the plate and mounting the transducer in a fixture so that its motion along the required grid patterns can be controlled accurately.

3.3 ACCEPTANCE/REJECTION LIMITS

Evaluate discontinuities only when the ultrasonic equipment is properly calibrated. If discontinuities are detected, direct the sound beam to maximize the signal amplitude. To determine the length of a discontinuity, move the search unit parallel to the discontinuity axis in both directions from the position of maximum signal amplitude. One-half the amplitude (or a 6-dB increase in sensitivity) from a point at which the discontinuity signal drops rapidly to the baseline is defined as the extremity of the discontinuity. For discontinuities whose signal amplitudes exceed full screen height, consider 50-percent full-screen half peak amplitude of the signal. At this point, mark the scanning surface at the position indicated by the center of the transducer. Repeat this procedure to determine the other extremity. The length of the discontinuity is defined as the distance between these two marks. Determine and report the maximum signal amplitude, length, depth, and position within the inspection zone for discontinuities yielding a signal amplitude equal to or exceeding the reject/repair line. The minimum recordable length of discontinuity is 13 mm (1/2 inch).

3.3.1 Investigation of Questionable Indications

Bring any indications considered doubtful to the attention of the Contracting Officer, and repair the plate or investigate further as directed. Investigate indications detected within 10 mm (3/8 inch) or less of accessible surfaces further by liquid penetrant as provided in ASTM E165/E165M, or by magnetic particle methods in accordance with ASTM E709, as applicable, to determine if they penetrate the surface. Failure to locate the flaws by one of these methods requires further investigation by the other. For nonmagnetic materials, only dye penetrant inspection is required. Further investigate questionable defects by modifications of the inspection procedure in accordance with paragraph CHANGES IN PROCEDURE.

3.3.2 Inspection of Repairs

Reexamine repairs by the same procedure that originally detected the faults, and meet the standards of acceptance for the original plate. More than two repairs to the same area are to be accepted at the discretion of the Contracting Officer.
3.3.3 Acceptance Standards

**************************************************************************
NOTE: The extent and diameters of defective areas depend on the class of service intended for the plates undergoing inspection. The designer will indicate the applicable class or classes and the intended service in the blank space provided for this purpose. For example: "All plate materials intended for dynamically loaded structures must conform to Class I requirements; those designed for foundations must conform to Class III requirements". Where only one class of service is required, inapplicable matter in parentheses will be deleted.

The tolerable extent of lack of bond depends on the service requirement of the plates and the severity of forming operations which might increase the size of the discontinuities judged acceptable. Reinspection of areas for lack of bond or fusion must be specified if the designer believes the original "safe" areas will extend after cold forming.

**************************************************************************

Plates will be unacceptable if they contain any of the defective areas detailed below:

a. Evaluate laminar types of flaws on the basis of their proximity to the plate surfaces. For evaluation, apply the zonal locations defined below in terms of base plate thickness, T. The T/4 criteria apply when the flaw is situated within T/4 distance of their nonoverlaid or base plate surfaces. The T/2 criteria apply to flaws located in the cross sectional area between T/4 layers of either overlaid or base plate surface. The T/4 criteria applies if the flaw extends from one zone to the other. Any single or two or more defects resulting in a reflection that exceeds the reject/repair line simultaneously with a continuous loss of back reflection from the far surface is cause for rejection, provided the extent of the single or multiple defects cannot be contained within a circle whose diameter is subject to the limits listed in TABLE II. Plate materials intended for [_____] must conform to class [_____] requirements whereas those intended for [_____] must conform to class [_____] requirements. [Other plate materials must conform to class [_____] requirements.]

b. Lack of bond criteria applies to areas at which the cladding is overlaid on the base plate by a pressure or forging process. Lack of bond type flaws include:

(1) Any area that results in an interface back reflection exceeding the reject/repair line and that cannot be contained within a circle of 150 mm 6 inch diameter.

(2) Two or more smaller areas, each of which results in interface back reflection exceeding the reject/repair line, and which cannot be contained within a circle of 150 mm 6 inch diameter unless separated by a distance equal to the maximum dimension of the larger detective area.
c. Lack of fusion criteria applies to areas at which cladding is overlaid on the base plate by a fusion welding process. Lack of fusion type flaws include:

(1) Any area that results in an interface back reflection exceeding the reject/repair line and that cannot be contained within a circle of 150 mm 6 inch diameter.

(2) Two or more smaller areas, each of which results in an interface back reflection exceeding the reject/repair line, and which cannot be contained within a circle of 150 mm 6 inch diameter unless separated by a dimension equal to, or greater than the larger defect.

(3) Any in-line inclusions in the overlay, 25 mm 1 inch long or equal to 1/2 the plate thickness, whichever is greater.

(4) Any area that results in an interface back reflection exceeding the reject/repair line that is closer than 50 mm 2 inches or less to any point at which penetrations are to be made through the cladded thickness.

### 3.4 REPAIRS AND REPLACEMENT

**NOTE:** The designer will indicate or specify, directly or by reference to a suitable publication, the limiting dimensions for repairable defects. Where no applicable specifications exist, repairs will be limited to those areas at which their depth extends within 3/8 the plate thickness of the surface.

Replace plates containing defects in excess of the limit specified on a one-for-one basis or, at the Contractor’s option, may be repaired if such defects are within the limits shown in TABLE I. [When plates are inspected on a lot basis, individually inspect each plate in the lot if more than one plate in the representative sample is found defective.] Reexamine repairs by the same procedure originally used to detect the faults, and the repairs must conform to the standards listed in paragraph ACCEPTANCE/REJECTION LIMITS.

#### 3.5 REPORTS AND RESULTS

Submit reports containing the following information to the Contracting Officer:

a. Identification of each production plate by heat number and plate number, plate thickness, and the initial and final decibel settings needed for correlation of the plate back reflection with the standard reference block reflection as specified in paragraph EQUIPMENT SENSITIVITY CALIBRATION. Permanently record heat number and plate number on each production plate.

b. Place of plate inspection.

c. Identification and description of the standard reference block.

d. Details of methods, types of waves used, search unit, frequencies, inspection equipment identification, and calibration data with enough detail to permit duplication of the inspection later.

e. Locations, dimensions, area (if any) of unacceptable defects and their repairs. These may be noted on a sketch or marked-up drawing.

f. A record of repaired areas as well as the results of the repaired area reinspection.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirement for diesel or natural gas fueled engines used as prime movers for vertical pumps at civil works flood control pumping stations. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide is intended to be used in the preparation of project specifications along with Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE, and Section 35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS. The Designer should edit the title of this section to reflect appropriate project requirements.

The designer is responsible for making a prime mover selection from either an electric motor, a diesel engine, or a natural gas engine. The guidance for
making proper selection is contained in EM 1110-2-3105, "Mechanical and Electrical Design of Pumping Stations".

The specification is written for a construction contract. Under a construction contract, these components can be purchased and installed by a Construction Contractor. A single contract allows the Contractor to obtain the most optimum combination and be responsible for the total performance of the unit, including shaft alignment. This also makes it feasible for the Contractor to perform a dynamic analysis of the pump, speed reducer, and prime mover system, as described in Section 35 45 01, and makes the Contractor solely responsible for acquiring the necessary data to perform such analysis.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving
authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 WELDER QUALIFICATIONS

Perform welding in accordance with qualifying procedures using performance qualified welders and welding operators. Qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. Welding and nondestructive testing procedures for pressure piping are specified in Section 40 05 13.96 WELDING PROCESS PIPING.

Notify the Contracting Officer 24 hr in advance of tests, and perform the tests at the work site, if practical. The welder or welding operator must apply the assigned symbol near each weld made as a permanent personal record. Submit a letter listing the welder-qualifying procedures for each welder, complete with all supporting data such as test procedures used, what was tested to, and a list of the names of all welders and their identification symbols.

1.4 REGULATORY REQUIREMENTS

1.4.1 General

Conform design, fabrication, and installation of the equipment to the [specified] [applicable national, state, and local] codes. Submit documentation for conformance according to paragraph SUBMITTALS.

1.4.2 Layout and Shop Drawings

Submit layout and shop drawings including the following:

a. Base-mounted equipment, complete with base and all attachments including anchor bolt template and recommended clearances for maintenance and operation.
b. Complete starting system.

c. Complete fuel system.

d. Complete cooling system.

e. Complete intake and exhaust systems.

f. Layout of relays, breakers, switches, and instrumentation provided and applicable single line and wiring diagrams with a written description of the sequence of operation.

g. Lubrication system complete including piping, pump(s), strainers, filters, [heat exchangers for lube oil and turbocharger cooling], [electric heater], controls, and wiring.

h. Location, type, and description of vibration isolation devices for all applications.

i. The safety system, together with a detailed description of its operation. Include wiring schematics, safety devices with a listing of their normal ranges, alarm and shutdown valves (to include operation parameters such as pressures, temperatures, voltages, currents, and speeds).

j. Layout of the engine control panel and alarm panel.

k. Mounting and support for each panel and major piece of electrical equipment.

l. Engine lifting points and rigging instructions.

m. Alignment information for the engine, [gear box] and [pump] specifying sequences, tolerances, and temperature change effects.

1.5 DELIVERY, STORAGE, AND HANDLING

Protect material and equipment from weather, humidity, temperature variation, dirt, dust, and other contaminants during delivery and storage. Lift, move, and store the engine in accordance with manufacturer's requirements.

1.6 PROJECT/SITE CONDITIONS

**************************************************************************
NOTE: The designer should specify the ambient conditions where the engine drive will be installed. Maximum and minimum air temperature is determined by location. For indoor installation, use indoor design maximum and minimum temperatures. For outdoor installations use the 99-percentile selection from ASHRAE Guide application tables for the installation location.
**************************************************************************

<table>

1.7.2 Special Tools

Provide one complete set of special tools required for maintenance. Special tools are those that only the manufacturer provides for special purposes or to reach otherwise inaccessible parts. Supply tools complete with a suitable tool box.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 General Requirements

Provide and install complete and totally functional, [the] [each] engine with all necessary ancillary equipment including, but not limited to, air filtration, starting system, instrumentation, lubrication, fuel system, cooling system, and engine exhaust system. [The] [Each] engine rating must be in accordance with SAE J1995. Provide DieselNatural Gas Fueled Engine Pump Drive composed of complete units with all components, accessories, and system interconnections coordinated, so that the complete assembly has the capabilities required, for proper operation with the pump specified under Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE and the speed reducer specified in Section 35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS.

Submit written documentation that the products being supplied are appropriate for this engine pump drive, including past performance of the drive on certain types of service, i.e., marine generators, pump drives, locomotives, metal shredders, etc., with a minimum operation of 2,000 hr per year of service with a minimum of 2 years of qualifying service. The certification of the unit's speed, horsepower, and duty rating that forms the basis of the qualifying experience is required for acceptance and must be within 30 percent of [this drive's rating] [these drives' ratings].

2.1.2 Performance Requirements

**************************************************************************
NOTE: The designer should specify the service requirements for the pump drive: Continuous,
Standby, or Emergency. The designer should furnish pump manufacturer's data including pump curves and plans unless this specification is used in conjunction with pump specification Section 35 45 01 as a package. The selection of the engine speed should follow the guidance given in EM 1110-2-3105. Rated capacity should be based on the pump manufacturer's recommendation.

</tbody>
</table>

2.1.3 Arrangement

NOTES: The engine shaft can be connected to the gear box by either a flexible coupling or universal joint assembly. In cases where the engine is large or the operating floor space is limited, a flexible coupling would be more appropriate. Manufacturer's recommendations should be solicited for arrangement alternatives. The designer should determine the configuration of the day tank, main fuel storage tank, and engine injection ports. If the main storage fuel tank is the lowest point in the engine fuel system, then a pump will be required to deliver fuel oil to the day tank.

Each engine, as shown and specified, is to be used as the prime mover for the vertical pump.[ Connect the engine shaft to the reducer input shaft with two universal joints and an intermediate shaft.][ Connect the engine shaft to the reducer input shaft with a flexible coupling.] Coordinate among the manufacturers of the diesel natural gas fueled engine, gear reducer, and the pump manufacturer to ensure the compatibility of these components including, but not limited to, the proper fit of engine and reducer shafts, the interaction of major components, and control of safety and alarm signals. Supply fuel for each engine by an individual day tank located near the engine and in accordance with NFPA 37. Fuel oil will be supplied by gravity[pumped] to day tank from outside storage tanks. Supply natural gas to the fuel solenoid shutoff valve to be supplied on the engine. Use a cooling system to maintain engine and lubricating oil...
temperatures at the temperatures recommended by the manufacturer. Furnish a starting system along with necessary accessories for engine start-up. Provide each engine with a completely independent lubrication [and pre-lubrication] system with an engine-driven primary pump.

2.2  MATERIALS AND EQUIPMENT

2.2.1  Standard Products

Provide materials and equipment, comprising the engine drive system, which are the standard products of manufacturers regularly engaged in the production of diesel/natural gas fueled engine pump drives and that essentially duplicate products which have been used satisfactorily for at least two years prior to bid opening. An offer proposing an experimental engine, one having a lesser or greater number of cylinders than the offerers' standard production engines, or one without a demonstrated satisfactory service record as a full diesel/natural gas fueled engine operating not less than 1,200 hr a year at not less than 75 percent rated load, will be rejected. All products must be new.

2.2.2  Equipment and Performance

Submit equipment and performance data certifying that the engine and cooling system function properly in the ambient temperature specified and provides the following design and performance data:

a. The maximum allowable inlet temperature of the [coolant fluid] [coolant air].

b. The minimum allowable inlet temperature of the [coolant fluid] [coolant air].

c. The maximum allowable temperature rise in the [coolant fluid through the engine] [cooling air across the engine].

d. The magnitude of monitored values defining alarm or action set points, and the tolerance (plus and/or minus) at which the protective device activates the alarm or action.

e. The minimum allowable inlet fuel temperature/fuel supply pressure.

f. The maximum impact/dynamic load that will be transferred from the engine to the structure.

Manufacturer's standard catalog data including a description and depiction of each engine and all ancillary equipment in sufficient detail to demonstrate complete specification compliance. If standard catalog data does not contain sufficient detail to verify compliance, then submit supplementary support documentation to verify compliance. Submit all data on the engine manufacturer's letterhead and signed by a representative or official of the manufacturer authorized to make technical representations of his company's products.

2.2.3  Nameplates

Provide each major component with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the equipment. As a minimum, provide nameplates for the following items:
a. Engines
b. Pumps and pump motors
c. Radiators
d. Heaters
e. Exhaust mufflers
f. Heat exchangers
g. Day tanks

2.2.4 Personnel Safety Devices

Insulate, fully enclose, guard, or fit with other types of safety devices all exposed moving parts, parts that produce high operating temperatures, parts which may be electrically energized, and parts that may be a hazard to operating personnel. Install the safety devices so that proper operation of the equipment is not impaired.

2.3 MATERIALS

2.3.1 Filter Elements

Provide fuel-oil, lubricating-oil, and combustion-air filter elements which are the manufacturer's standard type and able to filter out particles down to a 25 to 40 micron size, unless otherwise noted.

2.3.2 Pipe (150 psi System and Under)

Provide pipe for sleeves, fuel/lube-oil, compressed air, coolant, exhaust, and miscellaneous uses in compliance with ASTM A53/A53M, or ASTM A106/A106M steel pipe. Pipe smaller than 50 mm 2 inch must be Schedule 80. Pipe 50 mm 2 inch and larger must be Schedule 40.

a. Flanges and flanged fittings: ASTM A181/A181M, Class 150, or ASME B16.5.

b. Pipe welding fittings: ASTM A234/A234M, Grade WPB or WPC, Class 150 or ASME B16.11, 1360.7 kg 3,000 lbs.

d. Valves: MSS SP-80, Class 150.

e. Gaskets: manufacturer's standard.

2.3.3 Temperature Gauges for Oil or Water Service

Manufacturer's standard flush-mounted, 100 mm 4 inch minimum diameter dial size with standard operating point at 50 percent of the full gauge range. Provide gauge construction and materials that are appropriate for the intended service.

2.3.4 Pipe Hangers

MSS SP-58

2.3.5 Pressure Gauges

Manufacturer's standard flush mounted, 100 mm 4 inch minimum dial diameter with standard operating point at 50 percent of the full gauge range. Ensure gauge construction and materials are appropriate for the intended service.
2.4 DIESEL/NATURAL GAS FUELED ENGINE

**************************************************************************
NOTES: Specify the fuel type if different than No. 2 diesel. The rating of the equipment should be in accordance with SAE standards. If the facility is located below 457 m 1,500 ft in elevation above sea level and the intake air temperature is under 38 degrees C 100 degrees F, then de-rating is not required.

Naturally aspirated engines are available to about 1,500 kW continuous. Turbocharged engines are generally available from 50 to 350 kW continuous. Turbocharged-aftercooled engines are generally available from 200 kW to over 4,000 kW continuous. Engine suppliers should be contacted for recommendations regarding the appropriate engine based on the application.

**************************************************************************

a. The engine must be a full diesel, 2 or 4 cycle, compression-ignition type, for stationary applications and operate on No. 2-D diesel fuel conforming to ASTM D975. The engine must be naturally aspirated, turbocharged, or turbocharged-aftercooled.

a. The engine must be a natural gas fueled, 2 or 4 cycle, spark ignition type, for stationary applications and operate on standard pipeline natural gas. The engine must be naturally aspirated or turbocharged-aftercooled.

b. Provide engine rating as specified in paragraph PERFORMANCE REQUIREMENTS. The engine must be of the vertical in-line, vee, or opposed-piston type, with a solid cast block or individually cast cylinders. Provide opposed-piston engines with no less than four cylinders. Provide current models of a type in regular production complete with all devices specified or normally furnished with the engine.

2.4.1 Fuel Consumption

Do not exceed the following maximum limits based on the conditions listed below:

<table>
<thead>
<tr>
<th>SIZE RANGE</th>
<th>PERCENT OF RATED FULL LOAD</th>
<th>FUEL USAGE kg/kWhLbs/bhp-hr</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 - 299</td>
<td>75 - 100</td>
<td>0.2720.447</td>
</tr>
<tr>
<td>300 - 999</td>
<td>75 - 100</td>
<td>0.2610.429</td>
</tr>
<tr>
<td>1,000 - 2,500</td>
<td>75 - 100</td>
<td>0.2430.400</td>
</tr>
</tbody>
</table>

Conditions:

a. 45 MJ/kg 19,350 BTU/pound heat value for fuel.
b. Sea level operation.
c. Intake air temperature not over 32 degrees C 90 degrees F.
d. Intake air barometer pressure not less than 95.7 kPa 28.25 inch of mercury.

<table>
<thead>
<tr>
<th>SIZE RANGE NET kW</th>
<th>PERCENT OF RATED FULL LOAD</th>
<th>FUEL USAGE kJ/kWh btu/bhp-hr</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>1,000 - 2,500</td>
<td>75 - 100</td>
<td>11,3258,000</td>
</tr>
</tbody>
</table>

Conditions:

a. Based on 118 octane natural gas with a heat value of 33,500 kJ/m3 900 btu/ft3.
b. Sea level operation.
c. 25 degrees C 77 degrees F ambient air temperature at 30 percent relative humidity.
d. 100 kPa 29.53 inch of mercury barometer pressure.

2.4.2 Crankcase Pressure Relief Valve

**************************************************************************
NOTES: Engines larger than 20 kW 27 hp must utilize a pressure relief valve on the crankcase to relieve primary crankcase explosions. The crankcase pressure relief valve vents quickly and then reseats to prevent return of air and to protect against secondary explosions. The plans should show the crankcase pressure relief valve vent piping on indoor engine installations.
**************************************************************************

Provide a pressure relief valve in the crankcase. Vent the crankcase in accordance with the manufacturer's recommendations, except do not use the engine exhaust as the venting system. Pipe crankcase breathers, if provided on engines installed in either a building or enclosure, to vent to the outside. If the engine is located outside, fit the crankcase breather with a goose-neck to prevent rain entry.

Provide a pressure relief valve in the crankcase. Vent the crankcase in accordance with the manufacturer's recommendations. Crankcase breathers using the venturi effect of the exhaust system will be allowed only when designed, installed, and provided directly from the engine manufacturer. Otherwise, vent the crankcase to the outside and fit with a goose neck to prevent rain entry.
2.5 FUEL SYSTEM

The fuel system for each engine must conform to requirements of NFPA 30 and NFPA 37. Include the following items.

2.5.1 Fuel Pump

Provide each engine with an engine-driven, positive displacement engine fuel pump. Provide pump with the capacity to transfer fuel from the day tank at a rate in excess of maximum fuel consumption stated in paragraph FUEL CONSUMPTION, as well as supplying adequate pressure for the fuel injectors.

Provide each engine with a fuel solenoid shutoff wired to a shutdown system and a fuel pressure regulator supplied by the engine manufacturer to control the fuel over air mixture to the engine. The fuel supply pressure available at the site is [_____] kPa [_____] inch H20. The engine fuel system design must be adequate to power to 110 percent load at the site fuel supply pressure as stated above.

2.5.2 Filter

Supply a minimum of one duplex filter with a trans-flow change-over valve for each engine. Provide filter with inlet and outlet connections plainly marked. Provide an indicating differential pressure gauge across the filter. Locate the filter on the inlet side of the fuel pump. Ensure the filter is capable of filtering out particles down to 25 micron size.

Provide each engine with a fuel filter located upstream of the fuel solenoid shutoff to filter 100 percent of the incoming gas. Provide filter with inlet and outlet connections plainly marked. Provide an indicating differential pressure gauge across the filter. Ensure the filter is capable of filtering out particles down to 5 micron size.

2.5.3 Strainer

Provide a full flow strainer of the replaceable cartridge type between the engine and the fuel tank, upstream of the duplex filter. Provide an indicating differential pressure gauge for upstream and downstream of the strainer. Ensure the strainer cartridge is capable of filtering out particles down to 125 micron size.

2.5.4 Fuel Gas Compressor

Where the basic engine fuel system design requires fuel pressures above that available at the site, a fuel gas compressor is required. Select and certify this fuel gas compressor by the engine manufacturer to comply with both these specifications and the requirements of the engine throughout its load range and up to 110 percent load. Package the fuel gas compressor on the same skid as the engine with a fully plumbed fuel system providing one point for fuel connection and junction boxes as required for electrical connections.

2.5.5 Safety Bypass Valve

Provide a safety bypass valve next to the pump isolation valve to prevent the buildup of excessive pressures if the discharge line or fuel pump filters become clogged. This bypass must protect the fuel piping from over-pressurizing and will relieve it at [_____] kPa psi. The bypass valve
relief line must return the fuel to the engine day tank.

2.5.6 Day Tank

**************************************************************************

NOTE: See NFPA 37 and NFPA 30 for day tank restrictions on allowable day tank sizes. The day tank should be located in close proximity to the engine to avoid exceeding the total suction head capabilities of the engine-driven fuel pump (paragraph FUEL PUMP). Nominal suction head capabilities of typical engine-driven fuel pumps are in the range of 2.75 to 3.65 m 9 to 12 ft.

Delete this paragraph in its entirety if natural gas fueled engines are specified.
**************************************************************************

Provide each engine with a day tank located next to the engine. Fit each day tank with a fuel supply line, fuel return line, local fuel fill port, direct reading liquid level indicator, vent, fill limit float switch assembly for automatic control of the fuel oil transfer pump (if provided), alarm level sensing device, and a drain line. Provide a fuel return line cooler, if recommended by the engine manufacturer. Provide each day tank with [a [_____] L gal capacity] [capacity sufficient to supply the engine without interruption for 2 hr] [capacity sufficient to supply the engine for [_____] hr continuously at 100 percent rated load without being refilled].

2.5.6.1 Drain Line

Equip each day tank drain line with a shutoff valve and arrange to allow drainage into 220 L 55 gal drums.

2.5.6.2 Local Fuel Fill

Provide each local fill port with a [screw-on cap][hinged, fill cap]. Provide an air vent with brass screen so that the day tank does not develop a vacuum leading to the collapse of the day tank as the system empties.

2.5.6.3 Fuel Level Limit Devices

a. Provide each day tank with a fill level float switch assembly device to:

   (1) Initiate refueling of the day tank at the low level mark, (e.g., 30 percent volume remaining).

   (2) Stop refueling of the day tank at the high level mark, (e.g., 90 percent volume).

b. Provide each day tank with a separate level-sensing device to activate alarms at day tank overfill and day tank empty. Day tank empty must indicate at 20 percent volume remaining. Day tank overfill must indicate at 95 percent volume. See paragraph ALARM PANEL for further function requirements.

2.5.6.4 Redundant Fuel Shutoff

To stop fuel flow to the day tank, provide an automatic shutoff valve on
the fill line of the day tank and provide an automatic safety device to stop the pump supplying fuel to the day tank. Activate the valve and the safety device at the overfill level as defined in paragraph SAFETY SYSTEM, and respond before any fuel is forced out of the fuel overflow line.

2.5.6.5 Arrangement

Position and arrange the day tank so that fuel level in the day tank at the day tank empty level is above the suction port of the engine-driven fuel pump. Position and arrange the day tank overflow connection so that the highest possible fuel level in the day tank is below the fuel injectors. The fuel supply line from the day tank to the engine connections must be welded steel pipe. Provide a water drain at the low point of the day tank.

2.5.7 Fuel Supply System

Provide diesel fuel supply from the main diesel fuel storage to the day tank as specified in Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS. Provide natural gas fuel supply system as specified in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES and Section 23 11 20 FACILITY GAS PIPING.

2.5.8 Main Fuel Storage Tank

**************************************************************************
NOTE: The location of this tank is important for day tank draining and day tank fuel supply. The appropriate type and location should be determined by costs and operational requirements and should follow local, state, and Federal Environmental Protection Agency regulations, Section 33 56 10 and NFPA-30.
**************************************************************************

The main fuel storage tank is specified in [Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS][____].

2.6 LUBRICATION

**************************************************************************
NOTE: Delete the adjustable requirement for pressure regulation on the pressurized lube oil system for engines smaller than 1,000 kw 1,350 hp.
**************************************************************************

Provide each engine with a separate lube-oil system conforming to NFPA 30 and NFPA 37. Pressurize each system by engine-driven pumps.[ Adjust and regulate the system pressure as recommended by the engine manufacturer.] Furnish a sump tank as required. The lube-oil pump must draw oil from the oil pan or sump tank through a mesh intake strainer and force it through a lubricating oil cooler and a single or duplex full-flow strainer into the engine. Protect the pump by a relief valve to bypass the oil into sump. Bypass a portion of the oil from the sump through a lubricating oil filter and back into the engine oil pan or sump. Regulate the lubricating oil temperature by means of an automatic temperature regulator which will control the amount of bypass oil around the cooler. Make the system readily accessible for service such as draining or refilling. Permit the addition of oil and have oil-level indication with the set operating.
2.6.1 Pump Filters

Provide one full-flow, duplex, 80 micron filter for each pump. Ensure the filter is readily accessible and capable of being changed without disconnecting the piping or disturbing other components. Provide filter with inlet and outlet connections plainly marked. Provide an indicating differential pressure gauge across the filter.

2.6.2 Lube-Oil Sensors

Equip each engine with lube-oil temperature and pressure sensors. Use temperature sensors to provide signals for pre-high and high lube-oil indication and alarms. Locate pressure sensors downstream of the filters and provide signals for pre-low and low lube-oil indication and alarms.

2.6.3 Lubricating Oil Strainer

Furnish a full-flow, oil strainer in-line, ahead of the engine. The strainer must be as recommended by the engine manufacturer. Provide a bottom drain plug to allow easy removal of the sludge.

2.6.4 Pre-Lubrication Oil Pump

**************************************************************************
NOTE: Normally, engine size greater than 350 kW 470 hp and engines with a period in excess of two weeks between operations require pre-lubrication. If pre-lubrication is required, utilize this paragraph.
**************************************************************************

Provide pre-lubricating oil pump with a capacity and head rating as recommended by the engine manufacturer. Incorporate a built-in relief valve and directly connect to an electric motor with the motor-pump assembly mounted on a common case iron or steel base. Furnish the pump complete and ready for operation with all controls inclusive. Allow the pre-lubrication pump to completely fill the engine oil lines and establish lubricating oil pressure prior to starting. Provide pump motor in accordance with the requirements of paragraph MOTORS.

2.7 COOLING SYSTEM

**************************************************************************
NOTE: There are three basic types of engine cooling systems available. These are systems using liquid-to-air heat exchangers (radiators) or cooling towers, systems using liquid-to-liquid heat exchangers (systems using shell and tube, plate and frame heat exchangers) and systems using submerged pipe systems. No matter which system is specified, engine outlet water temperature should be kept constant, and the differential between inlet water to outlet water of the cooling system should be kept at about 8 degrees C 15 degrees F. The radiator requires forced air through the heat exchanger causing higher noise levels. For an indoor application, the radiator can be located outside with a higher pressure pumping system to deliver the required flow to the radiator. The radiator should be mounted less than 15 m 50 ft above the engine to
avoid leakage at the engine water pump seal.

When the approach between coolant and air temperatures is under 15 degrees C 27 degrees F, towers become more economical. A surrounding clean environment is required with towers due to the openness of the design. The shell and tube heat exchanger requires an expansion tank to remove air from the system. The raw water supply system should be closely coordinated when applying a shell and tube heat exchanger.

Cooling towers have limiting working ranges and can be applied successfully only in certain climates.

The submerged pipe cooling system requires a large quantity of raw water and an expansion tank. Factors for consideration when evaluating cooling systems include engine size, space limitations, acceptable noise levels, raw water supply, maintenance, operational requirements, and system operating costs. Engine suppliers should be contacted for assistance in selecting the appropriate cooling system for the application.

a. Each engine must have its own cooling system. Provide closed type system that operates automatically while the engine is running.

b. Provide cooling system with an engine-driven water pump, [fin-tube radiator,] [cooling tower,] [remotely mounted fin-tube radiator,] [shell-tube heat exchanger, expansion tank,] [plate and frame heat exchanger, expansion tank,] [submerged pipe, expansion tank,] and an automatic temperature regulating valve. The maximum temperature rise of the coolant across each engine is not allowed to exceed the engine manufacturer's recommendation as submitted in paragraph SUBMITTALS.

c. Provide closed type engine cooling system arranged to prevent rust and minimize formation of scale deposits within the engine. Circulate jacket-coolant through the engine at the temperature and flow rate recommended by the engine manufacturer. The coolant must be an ethylene-glycol water mixture with a concentration sufficient for freeze protection at the minimum outdoor temperature specified. The maximum temperature rise of the coolant is no more than that recommended and submitted in paragraph SUBMITTALS.

2.7.1 Coolant Pumps

**************************************************************************
NOTE: Delete raw-water pump option for closed-loop systems.
**************************************************************************

Provide centrifugal type engine-driven jacket water pumps. [ Raw-water centrifugal circulating pumps must be [electric motor driven equipped with manual-off-automatic controllers] [engine driven].] Provide each engine with an engine-driven primary pump. Provide electric motor driven secondary pumps with automatic controllers. Provide a bronze fitted, single stage type pump with removable seal rings and stuffing box and
properly sized for the intended purpose.

2.7.2 Radiator

**************************************************************************
NOTE: Radiator location and mounting details should be shown on the plans. An electric motor-driven fan is provided on remotely located radiators to circulate air across the radiator. The fan should operate when the engine operates.
**************************************************************************

Size each radiator to limit the maximum allowable temperature rise on the coolant across the engine to that recommended and submitted in paragraph SUBMITTALS, for the maximum outdoor design temperature and site elevation. Use radiator fabrication materials that are corrosion resistant and suitable for service in the ambient application conditions. The radiator may be factory coated with corrosive resistant film provided that corrective measures are taken to restore the heat rejection capability of the radiator to the initial design requirement via over-sizing or other compensating methods. Internal surfaces must be compatible with liquid fluid coolant used. Materials and coolant are subject to approval by the Contracting Officer. Ensure radiators are the pressure type incorporating a pressure valve, vacuum valve, and a radiator cap. Provide radiator caps for pressure relief prior to removal. Ensure each radiator and the entire cooling system is capable of withstanding a minimum pressure of 48.4 kPa 7 psig. Protect each radiator with a strong grille or screen guard. Radiators must have at least two tapped holes. Equip one tapped hole in the radiator with a drain cock; plug the rest. [Provide the remote located radiator with an electric motor-driven fan. Wire the fan to operate when the engine operates.]

[2.7.2.1 Shell and Tube Heat Exchanger]

Provide a multiple pass shell type heat exchanger with removable U-tube bundles to facilitate cleaning and retubing. The heat exchanger must be of sufficient capacity to cool the engine with [_____] degrees C F input cooling water. Operate the heat exchanger with low temperature water in the shell and high temperature coolant in the tubes. Construct exchangers in accordance with requirements of ASME BPVC SEC VIII D1 and certify with an ASME stamp secured to the heat exchanger. Construct shells with seamless steel, welded steel, or cast iron. Provide tubes that are either cupronickel or inhibited admiralty, meeting requirements of ASTM B395/B395M, suitable for the temperature and pressure specified. Design the shell side and tube side of the heat exchanger for 1.03 MPa 150 psig working pressure and factory test at 2.06 MPa 300 psig. Locate high temperature, low temperature, and pressure relief connections in accordance with the manufacturer's standard practice. Coolant pressure loss through clean tubes must be as recommended by the engine manufacturer. Minimum coolant velocity through the tubes must be at least 300 mm/sec 12 inch/sec and sufficient to assure turbulent flow. Provide one or more pressure relief valves for each heat exchanger in accordance with ASME BPVC SEC VIII D1. Install a drain connection with a 19 mm 3/4 inch hose bib connection at the lowest point in the system near the heat exchanger.

][2.7.2.2 Plate and Frame Heat Exchanger]

The heat exchanger must be a multiple pass type with removable plates to facilitate cleaning. The heat exchanger must be of sufficient capacity to
cool the engine with [_____] degrees C F input cooling water. Construct heat exchanges in accordance with ASME BPVC SEC VIII D1 and certify with an ASME stamp secured to the heat exchanger. Select materials for the plate and frames that are appropriate for the service required. Locate high and low temperature and pressure relief connections in accordance with the manufacturer's standard practice. Water pressure loss through clean plates must be as recommended by the engine manufacturer. Provide one or more pressure relief valves for each heat exchanger in accordance with ASME BPVC SEC VIII D1. Install a drain connection with a 19 mm 3/4 inch hose bib connection at the lowest point in the system near the heat exchanger.

[2.7.2.3 Cooling Tower

**************************************************************************
NOTE: The maximum outdoor design temperature, coolant temperature, and availability of water are critical to the proper selection of the appropriate cooling tower. Applicable ASHRAE guides should be consulted for application guidance.
**************************************************************************

Size the cooling tower to limit the maximum allowable temperature rise in the coolant across the engine to that recommended by the engine manufacturer. The Contractor is responsible for the proper selection of system components based on the site conditions and the diesel/natural gas fueled engine pump drive[s] used. Internal and external materials must be appropriate for the heat used. Use cooling towers in conjunction with a liquid-to-liquid heat exchanger to keep the engine cooling in a closed loop with conditioned coolant. Furnish the cooling tower as a complete operating system with a liquid-to-liquid heat exchanger, a surge tank, an auxiliary water pump, necessary filters in the water return lines, and interconnecting piping and isolation valves as required for maintenance and operation.

[2.7.2.4 Submerged Pipe

**************************************************************************
NOTE: Protection for the submerged pipe or coil should be considered. The pipe or coil should be kept out of mud or silt and away from the bottom of the cooling pond to ensure maximum efficiency.
**************************************************************************

Provide pipe or coil of sufficient length to cool the engine at the specified raw water temperature. Use piping materials as specified in paragraph PIPE. Install pipe as specified in paragraph PIPING INSTALLATION. Always slope the pipe from the return bend up to prevent air locks in the system. Furnish a drain plug at the lowest point of the system. Connect the system so that the jacket water flows from the engine to the cooling coils and then to the expansion tank before returning to the jacket water pump inlet.

[2.7.3 Thermostatic Control Valve

Provide a modulating type, thermostatic control valve in the coolant system to maintain the engine coolant temperature in the range submitted in paragraph SUBMITTALS.
2.7.4 Ductwork

Provide ductwork as specified in [Section 23 30 00 HVAC AIR DISTRIBUTION] [_____] except use a flexible connection to connect the engine radiator. Material for the connection must be wire-reinforced fiber glass. The connection must be airtight.

2.7.5 Temperature Sensors

Equip each engine with coolant temperature sensors. Use temperature sensors to provide signals for pre-high and high coolant temperature indication and alarms.

Equip each engine with coolant temperature systems for both the jacket water system and the intercooler system when the engine is turbocharged.

2.7.6 Expansion Tank

**************************************************************************
NOTE: Size of the expansion tank at least 15 percent of the coolant volume in the total system to take care of expansion.
**************************************************************************

Furnish an expansion tank of no less than [_____] L gal for each engine. Properly fit the tank for vent, overflow, expansion, and make-up lines. The tank must be suitable for an operating temperature of 121 degrees C 250 degrees F and a working pressure of 860 kPa 125 psig. Construct tank of welded steel, hot-dipped galvanized inside and outside after fabrication, test, and stamp in accordance with ASME BPVC SEC VIII D1 and register with the National Board of Boiler and Pressure Vessel Inspectors. Mount tank so that the bottom of the tank is above the top of the engine. Support tank by steel legs or bases for vertical installations or steel saddles for horizontal installation.

2.8 SPECIAL LIMITATIONS

2.8.1 Sound Limitations

**************************************************************************
NOTE: The noise limits must conform to applicable local and OSHA codes. The designer is responsible for determining code noise limit requirements for specific site applications. Specific information regarding applicable noise limits should be inserted in this section. Site specific requirements and limitations are key components in the criteria selection. Generally, the most cost effective approach is to use hearing protection in conjunction with building and room insulation to control noise.
**************************************************************************

[_____]

2.8.2 Vibration Isolation and Seismic Restraints

**************************************************************************
NOTE: Provide seismic requirements and show details on the drawings if the Government designer (either
Corps office or A/E) is the Engineer of Record. Delete the bracketed phrase in the last sentence of this paragraph if seismic details are not provided. Pertinent portions of UFC 3-301-01 and properly edited Sections 13 48 73 and 22 05 48.00 20 must be included in the contract documents.

Limit the maximum engine vibration in the horizontal, vertical, and axial directions to 0.15 mm 6 mils peak-peak RMS, with an overall velocity limit of 24 mm/sec 0.95 inch/sec RMS. Install a vibration-isolation system between the floor and the base. The vibration-isolation system must limit the maximum vibration transmitted to the floor at all frequencies to a maximum of [_____] [_____] peak force. Provide engine with a vibration-isolation system in accordance with the manufacturer's standard practice. Design and qualify vibration-isolation systems (as an integral part of the base and mounting system) to the seismic forces specified. Where the vibration-isolation system does not secure the base to the structure floor or unit foundation, provide seismic restraints in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC and as indicated.

2.9 AIR INTAKE EQUIPMENT

Provide filters and silencers in locations that are convenient for servicing as shown on the project plans. The silencer must be of the high-frequency filter type, located in the air intake system as recommended by the engine manufacturer. A combined filter silencer unit meeting requirements for the separate filter and silencer items may be provided. Expansion elements in air-intake lines must be [copper][rubber].

2.10 EXHAUST SYSTEM

Provide a separate and complete system for each engine. Support exhaust piping to minimize vibration. Make provisions for pipe thermal expansion. Where a V-type engine having more than one exhaust outlet is provided, use a V-type connector, with necessary flexible sections and hardware, to connect the engine exhaust outlets. Incorporate engine-mating and silencer-mating flanges, eliminating the need for adapters. Ensure the muffler and exhaust piping together is capable of reducing the noise level at the exhaust discharge location to a point below the maximum sound levels specified in paragraph SOUND LIMITATIONS, at a distance of [_____] m ft from the end of the exhaust piping directly along the path of discharge for horizontal discharged exhaust; or at a radius of [_____] m ft from the muffler/discharge piping, at 45 deg apart in all directions, for vertically discharged exhausts, with the engine operating at 100 percent of service load.

2.10.1 Flexible Sections and Expansion Joints

Provide a flexible section at each engine and an expansion joint at each muffler. Provide flexible sections and expansion joints with flanged connections. Ensure flexible sections are multiple-ply stainless steel expansion bellows type with standard 38 and 76 mm 1.5 and 3 inch allowable axial expansion. Use elements in the flexible sections that are capable of absorbing vibration from the engine and compensating for thermal expansion and contraction.
2.10.2 Exhaust Muffler

NOTE: Muffler locations and mountings should be shown on the plans. The designer should consider the use of first cost versus life-cycle cost analysis to determine the appropriate metal to use. Stainless steel Series 321 and aluminized steel should be considered in lieu of painted steel materials.

Provide a chamber type exhaust muffler. Fabricate the muffler of welded steel and design for [outside] [inside] [vertical] [horizontal] mounting. Provide eyebolts, lugs, flanges, or other items as necessary for support of the muffler in the location and position indicated on the plans. Do not allow the pressure drop through the muffler to exceed the recommendations of the engine manufacturer. Fabricate outside mufflers from [aluminized steel] [stainless steel]. Provide muffler with a drain valve, nipple, and cap at the low-point of the muffler. Supply a complete muffler with any necessary soot boxes or inspection ports required for adequate operation and maintenance. Size the entire exhaust system appropriately so that the operation of the engine is not affected by the exhaust system.

2.10.3 Exhaust Piping

NOTE: Exhaust piping should be sized at a gas velocity of less than 25.4 m/sec 5,000 fpm. The exhaust piping location and routing should be shown on the plans.

Slope horizontal sections of the exhaust piping downward away from the engine to a condensate trap and drain valve. Make changes in direction utilizing long radius fittings. Run exhaust piping not covered in this paragraph in accordance with paragraph PIPING INSTALLATION. Insulate exhaust piping, mufflers, and silencers with ASTM C533 calcium silicate insulation, minimum of 75 mm 3 inch thickness or an appropriate thickness to limit the surface temperature to values below 80 degrees C 175 degrees F. Secure insulation with no less than 9.525 mm 0.375 inch wide Type 304 stainless steel bands spaced no farther apart than 200 mm 8 inches on center. Provide an aluminum jacket encasing the insulation. Provide aluminum jacket with a minimum thickness of 0.406 mm 0.016 inch with a factory-applied polyethylene and kraft paper moisture barrier. Secure the jacket with no less than 13 mm1/2 inch wide stainless steel bands, spaced no farther apart than 200 mm 8 inch on centers. Lap longitudinal and circumferential seams of the jacket no less than 75 mm 3 inch. Install jackets on horizontal lines so that the longitudinal seams are on the bottom side of the pipe. Place the seams of the jacket for the vertical lines on the off-weather side of the pipe. On vertical lines, overlap the circumferential seams of the jacket so that the lower edge of each jacket overlaps the upper edge of the jacket below. Provide vertical exhaust piping with a hinged, gravity-operated, self-closing rain cover. When the exhaust pipe exits the building, isolate the pipe from the [wall][roof] by means of thimbles in accordance with NFPA 37.
2.11 PYROMETER

**************************************************************************
NOTE: For engines smaller than 1,000 kW 1,340 hp delete this paragraph. Pyrometers with individual thermocouples are not normally available and should not be specified for engines smaller than 1,000 kW 1,340 hp.
**************************************************************************

Provide a pyrometer [multi-point selector with individual thermocouples][ and thermocouple] with calibrated leads to indicate the temperature [in each engine cylinder and the combined exhaust] [in the combined exhaust]. For a supercharged engine, provide additional points, thermocouples and leads to show the temperature in the turbocharger exhaust gas outlet and combustion air discharge passages. Provide a double pole selector switch, with an off position, one set of points for each thermocouple, and a suitable indicating dial. Calibrate the pyrometer, thermocouple, leads, and compensating devices to show true exhaust temperature within ±1 percent above the highest temperature encountered at 110 percent load conditions.

2.12 EMISSIONS

The finished installation must comply with Federal and local regulations and restrictions regarding the limits of emissions such as carbon monoxide (CO), hydrocarbon (HC), and nitros (NOx).

2.13 STARTING SYSTEM

**************************************************************************
NOTE: The engine can be started by either pneumatic (compressed air) or an electric starting system. The selection of the starting system should be based on costs and availability of compressed air or electric power. The starting system should be of adequate capacity to start the engine under the coldest conditions encountered. Generally, in pumping plants with an existing station air system or where a station air system will be installed, a pneumatic system will have the lowest initial cost. The designer should ensure that the requirements for the station air system include an air receiver of adequate size to accommodate the cranking cycle of each engine in the station without recharge by the station air compressor. Paragraph 2.11.1 ALTERNATE 1 should be deleted when a pneumatic starting system is specified. ALTERNATE 2 of this paragraph should be deleted when an electric start system is specified.

Torque available from air motors of pneumatic systems is capable of accelerating the engine to twice the engine cranking speed in about half the time required by electric starters. The starting system should be the manufacturer's standard equipment.

The starting system, regardless of type, should have a start-stop switch providing functions including
testing, reset, manual run/start manual stop, an adjustable cranking cycle and cool down mode of operation.

If an electric system is provided, an adjustable cranking limit device should be specified to limit the engine cranking to a specified time limit.

Provide each diesel engine with a starting system. Provide a pneumatic or electric system of sufficient capacity to start the engine at the minimum temperature specified. Provide system with a start-stop switch which provides functions including testing, reset, manual run/start, manual stop, and adjustable cranking and cooling down operation. Ensure the starting system is the manufacturer's standard equipment.

2.13.1 Electrical Starting System

NOTE: Delete this paragraph and subparagraphs in their entirety if a pneumatic starting system is specified.

Provide an electrical starting system to operate on a -V DC utilizing a negative circuit ground. Include an adjustable cranking device to limit the engine cranking to a specified time limit. Provide starting motors in accordance with SAE ARP892.

2.13.1.1 Battery

NOTE: Select a nickel-cadmium type battery only when the battery temperature cannot be maintained above -6 degrees C 22 degrees F.

Provide a starting battery system and include the battery, battery rack, intercell connectors, spacers, automatic battery charger with overcurrent protection, metering, and relaying. Provide battery in accordance with SAE J537. Design critical system components (rack, protection, etc.) to withstand the seismic acceleration forces specified in subparagraph VIBRATION ISOLATION AND SEISMIC RESTRAINTS under paragraph SPECIAL LIMITATIONS. The battery must be a lead-acid [nickel-cadmium] type, with sufficient capacity, at the minimum [outdoor] [indoor] temperature specified, to provide a minimum cranking cycle consisting of three cranking periods of up to 8 sec per period with 8-sec intervals between crank periods.

2.13.1.2 Battery Charger

Provide a current-limiting battery charger, conforming to UL 1236, to automatically recharge the batteries. Ensure charger is capable of providing both automatic float charging and equalizing charging of the battery installation. The charger must be capable of recharging fully depleted batteries within [8] hr and providing a floating charge rate for maintaining the batteries in a fully charged condition. Provide an ammeter and voltmeter on the charger to indicate charging rate and voltage. Ensure charger has alarm functions providing indications of low
battery voltage, high battery voltage, and battery charger malfunction.

2.13.2 Compressed Air Starting System

**************************************************************************
NOTES: Delete this paragraph and subparagraphs in their entirety if an electric starting system is specified.

The complete compressed air system should be shown on the plans. Two receivers, redundant piping, and two compressors may be required so that starting capability is not lost when tank maintenance is required. Valve arrangement should permit any receiver to be removed from service, drained, repaired, or replaced without loss of starting air from the system. The check valves between the plant air system and the air starting receivers should be considered to ensure that failure of the plant air system does not deplete the backup supply. The designer should analyze various starting scenarios and determine the necessity of providing a gasoline or diesel engine-driven compressor for a black-plant (no electrical sources available) start-up.

Each compressor should have sufficient capacity to refill the air starting system air receiver in a maximum of 3 min. Size the receiver to crank the largest engine for 15 sec at an ambient temperature of 21 degrees C 60 degrees F without recharging.

Either the air-motor starting option or the cylinder injection starting option should be used and the other paragraph deleted.
**************************************************************************

Provide a compressed air starting system. Use station service air. Furnish a complete system with oilers, regulators, and solenoid control valves. Provide air motor type system with a working pressure of 1.03 MPa 150 psig or cylinder injection type with a working pressure of 2.07 MPa 300 psig. Provide compressed air system piping as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.13.2.1 Air Filter

Install an air filter upstream of the air connection to each engine. The filter must be capable of removing particles 10 mm 3/8 inch and larger.

2.13.2.2 Air Driven Motors or Cylinder Injection

Either type of air starting system, air motors or direct injection, is acceptable. If an air motor starting system is used, the cranking motors must be complete with a solenoid valve, strainer, and lubricator. If cylinder injection starting is used it must be accomplished by admitting compressed air into two or more engine cylinders through a timing valve, or through a distributor into a sufficient number of cylinders to ensure successful starting regardless of piston positions.
2.13.3 Starting Aids

**********************************************************************
NOTE: Jacket coolant and/or lube-oil heaters are normally provided for most applications to aid starting. Either injection or glow plugs may also be required for combustion air temperatures significantly below 0 degrees C 32 degrees F. Consult manufacturers for availability and need in the application size range.
**********************************************************************

2.13.3.1 Jacket-Coolant Heaters

Mount a thermostatically controlled electric heater in the engine coolant jacketing to automatically maintain the coolant within ±10 deg of the control temperature. Operate the heater independently of engine operation so that starting times are minimized, condensation is controlled, and the system ensures dependable, cold weather starts. Power supply for the heaters will be [_____] volts AC.

2.13.3.2 Glow Plugs

Design glow plugs to provide sufficient heat for fuel combustion within the cylinders to guarantee starting at an ambient temperature of -23 degrees C -20 degrees F.

2.13.3.3 Lube Oil Heaters

Mount a thermostatically controlled electric heater in the engine lube oil storage tank to automatically maintain the lube oil within ±10 deg of the control temperature. Operate the heater independently of engine operation so that starting times are minimized and the system ensures dependable cold weather starts. Select heaters so that heater skin temperatures do not exceed 150 degrees C 300 degrees F and have maximum heat densities of 0.02 W/mm square 13 W/inch square. Power supply for the heaters will be [_____] volts AC.

2.14 SAFETY SYSTEM

Provide and install all system items, such as devices, wiring, remote annunciator panels, and alarm panels, as a complete system to automatically activate the appropriate signals and initiate appropriate safety actions. Provide safety system with a self-test method to verify its operability. Provide alarm signals with manual acknowledgment and reset devices. The alarm signal systems must reactivate for new signals after acknowledgment is given to any signal. The systems must be dealt with as an alarm on that system element. Provide remote annunciator panels and alarm panel as specified in paragraph PANELS.

2.14.1 Audible Signal

**********************************************************************
NOTE: High dB levels are required for audible alarms located near an engine. Audible signaling devices with sound levels in excess of 100 dB should be specified for engine room application, and the alarm location should be shown on the plans.
**********************************************************************
The audible alarm signal must sound at a frequency of [70] [_____] Hz at a volume of [75] [_____] dB at 3.1 m 10 ft. The sound must be continuously activated upon alarm and silenced upon acknowledgment. Provide signal locations as shown on the plans.

2.14.2 Visual Signal

The visual signal must be a panel light. Ensure the light is normally be off but activates to blinking upon alarm. The light must change to continuously lit upon acknowledgment. If automatic shutdown occurs, the display must remain in an activated status to indicate the cause of failure and must not reset until the cause of alarm has been cleared and/or restored to the normal condition. Shutdown alarms must be amber.

2.14.3 Alarms and Action Logic

2.14.3.1 Shutdown

Use shutdown signals to simultaneously activate the audible signal, activate the visual signal, and stop the engine.

2.14.3.2 Problem

Use problem signals to activate the visual signal.

2.14.4 Alarm Panel

Fabricate and locate the panel as specified in paragraph PANELS, and contain the following functions:

FUNCTION OR INDICATION/CONTROL ACTION (AUXILIARY ACTION)

a. Red emergency stop (push button or switch)/shutdown engine.

b. Day tank overfill indication (95 percent volume)/problem (shutdown pump supplying fuel to day tank).

b. Panel-mounted detonation sensing system with alarm and shutdown lights. The detonation system will sense individual cylinder detonation and individually adjust cylinder timing to avoid detonation. The system must be programmable by standard PC with software and operating manual supplied at no additional charge. The system installed must have the capability of up to 30 crankshaft degrees of total timing variation for each cylinder. Beyond a programmed limit, the system will act to shut down the engine.

c. Engine overspeed indication (overspeed indication point as recommended by the engine supplier)/shutdown engine.

d. High lube-oil temperature indication (temperature as submitted)/shutdown engine.

e. Low lube-oil pressure indication (pressure as submitted)/shutdown engine.

f. High coolant fluid outlet temperature indication (temperature as submitted)/shutdown engine.
g. Pre-low lube-oil pressure indication (110 percent of low lube-oil pressure)/problem (none).

h. Pre-high coolant fluid temperature indication (5 degrees C 10 degrees F lower than high coolant-fluid outlet temp. alarm)/problem (none).

i. Pre-high lube oil temperature indication (5 degrees C 10 degrees F) lower before problem (none).

j. Day tank empty indication (20 percent volume remaining)/shutdown engine.

j. Crankcase pressure switch (adjustable) to detect crankcase pressure increase associated with scoring of liner and possible short term catastrophic failure. Shutdown with setpoint as submitted. Setpoint of the crankcase pressure switch is to be adjusted during start-up to provide close tolerance protection without nuisance tripping.

k. Failure to start within the specified time indication/problem (none).

l. Compressed air low-pressure indication (80 percent of working pressure)/problem (none).

m. Engine battery voltage-low/problem (none).

n. Engine battery voltage-high/problem (none).

o. Engine battery charger malfunction/problem (none).

2.14.5 Time-Delay on Alarms

For startup of the engine, install time-delay devices bypassing the low lubricating oil pressure alarm during cranking and the low coolant-fluid outlet temperature alarm. The lube-oil time-delay device must return its alarm to normal status after the engine starts. The coolant time-delay device must return its alarm to normal status 5 minutes after the engine starts.

2.14.6 Remote Alarm Panel

**************************************************************************
NOTE: The remote alarm panel location should be shown on the plans. Delete requirements for the remote alarm panel where it is not used. The remote panel may be furnished loosely and unmounted, to be installed on the pump station control console by others.
**************************************************************************

Provide a remote alarm panel with 100 percent functional redundancy to the alarm panel. Locate and mount the remote panel as shown on the plans. Pack and ship the remote panel as directed by the Contracting Officer for installation by others on the station control console.

2.15 GOVERNOR

Provide each engine with a governor to control the rotational speed of the
engine in response to changing load requirements. Configure the governor for safe manual adjustment of the speed during operation of the engine, without special tools.

2.15.1 Speed Regulating Governor

Maintain close speed regulation under all load conditions. Do not allow the speed variation to exceed 6 percent of normal speed when full load is suddenly applied or removed. Design the governor such that the engine speed may be changed by governor adjustment during engine operation to any speed between 80 and 100 percent of the normal speed (corresponding to normal operating pump speeds) within 2 percent. The speed fluctuation at any load is not allowed to exceed 2 percent. Mount a raise/lower speed control on the engine instrument board. Provide speed adjust control with provisions for allowing control of the speed control circuits from a remote location. Provide engine fuel rack servomotor suitable for operation from a 120-V AC source.

2.15.2 Emergency Overspeed Governor and Load Limit

*****************************
NOTE: If the pump drive is out of service for extended periods with little or no maintenance, then the shutdown mechanisms for overspeed should prevent both fuel and air supplies from entering the cylinders. If the units are well maintained and used frequently, either type termination should work satisfactorily.
*****************************

Provide an emergency governor with overspeed trip on each engine to shutdown the unit should the speed exceed a predetermined RPM. Also provide an alarm signal for remote indication. The emergency governor must be independent of the regulating governor. When the overspeed stop has been tripped, the shutdown mechanisms must be such that the engine fuel[ and] air supply is prevented in the shortest time practicable from entering the engine cylinders. The trip mechanism may be part of the governor. Set the overload fuel limit at 110 percent of the full load as specified in paragraph DIESEL ENGINE.

2.15.3 Governor Controls Location

Locate governor control at a point convenient to the location of the engine instrument board as shown on the plans.

2.16 ENGINE INSTRUMENT BOARD

*****************************
NOTES: All panels (including the engine instrument board), except the remote panel, can be combined. Delete the pyrometer devices for engines smaller than 1,000 kW 1,340 hp. See paragraph PYROMETER.

Use the first subparagraph "f" and first subparagraph "g" if diesel engines are specified; use the second subparagraph "f" and second subparagraph "g" if natural gas fueled engines are specified.
*****************************
Provide engine instrument board as specified in paragraph PANELS, and contain the following items:

a. Coolant-fluid inlet temperature display
b. Lubricating-oil pressure indicator
c. Lubricating-oil inlet temperature display
d. Red emergency stop (push-button or switch)
e. Run-time meter
f. Fuel meter display
g. Fuel-header-pressure display
f. Manifold vacuum display
g. Intake air temperature display
h. Tachometer display
i. Engine start-stop switch
j. Start-attempt indicator light
k. Lubricating-oil prelubricating pump start-stop switch
l. Alarm panel

[ m. Pyrometer display with selector switch]

**************************************************************************
NOTE: The following instrumentation may be included on the engine instrument board.
**************************************************************************

[ n. Ammeter for starting battery charger]
[ o. Voltmeter for starting battery]
[p. Timer for setting the starting battery charger's equalize charging rate duration]
[q. Air starting system pressure]

2.17 PANELS

**************************************************************************
NOTE: All panels (including the engine instrument board), except the remote panel, can be combined into a single panel paragraph. Provide a panel-mounting location and detail for panels not mounted on the engine base. The designer may elect other locations such as adjacent to the engine, etc. Provide panel nameplate and instrument nameplate, unique identifiers, or user-preferred
identifiers. Provide sizes, materials, and attachment preferences.

Delete either the analog or electronic instruments paragraph option.

Each panel must be of the type and kind necessary to provide specified functions. Mount panels [on the engine base by vibration/shock absorbing type mountings][as shown on the plans]. Mount instruments flush or semiflush. Provide convenient access to the back of panels to facilitate maintenance. Calibrate instruments using recognized industry calibration standards. Provide a panel identification plate which clearly identifies the panel function as indicated on each panel. For each instrument and device on the panel, provide a plate which clearly identifies the device and its function as indicated. Ensure all instruments and devices are vibration resistant.

2.17.1 Enclosures

Design enclosures for the application and environment, conforming to NEMA ICS 6. Locking mechanisms [are optional] [must be keyed alike].

2.17.2 [Analog] [Electronic]

NOTE: Select appropriate alternative paragraph.

Provide analog electrical indicating instruments in accordance with ANSI C39.1 with semiflush mounting. Panel-mounted instruments must [be the manufacturer's standard][have 100-deg scales] with an accuracy of no less than 2 percent. The instrument's operating temperature range must be $-20$ to $+65$ degrees C $-4$ to $+150$ degrees F.

Provide electronic indicating instruments that are 100 percent solid state, state-of-the-art, microprocessor controlled to provide all specified functions. Ensure control, logic, and function devices are compatible as a system, sealed, dust and water tight, and utilize modular components with metal housings and digital instrumentation. Provide an interface module to decode serial link data from the electronic panel and translate alarm, fault, and status conditions to a set of relay contacts. Ensure instrument accuracy is no less than 2 percent for unit mounted devices, and 1 percent for control room, panel mounted devices, throughout a temperature range of $-20$ to $+65$ degrees C $-4$ to $+150$ degrees F. Data display must utilize LED or back-lit LCD. Additionally, the display must provide indication of cycle programming and diagnostic codes for troubleshooting. Use a numeral height of $13 \text{ mm}$ $1/2 \text{ inch}$ $[_____] \text{ mm}$ $[_____] \text{ inch}$.

2.17.3 Parameter Display

Provide continuous indication of the tachometer, lubricating-oil pressure, and safety system parameters. Specify a momentary switch for other panels.

2.18 BASE

NOTES: The diesel-engine pump drive can be equipped so that it has its own base, or it can be on an
integral base with the pump and speed reducer. With an integral base, coordination with the other equipment specifications and the use of the statement, "suitable holes for anchor bolts", should be included in the plans and specifications.

Coordinate with the subparagraph VIBRATION ISOLATION AND SEISMIC RESTRAINTS under paragraph SPECIAL LIMITATIONS.

Construct the base of structural steel. Design the base to rigidly support the engine, ensure permanent alignment of all rotating parts, arrange to provide easy access to allow changing of lube-oil, and ensure that alignment is maintained during shipping and normal operation. Do not permit skidding in any direction during installation. Mitigate and withstand the effects of synchronous vibration of the engine and pump. Provide base with [suitable holes for anchor bolts] [_____] mm inch diameter holes for anchor bolts]. Ensure the entire engine assembly is capable of withstanding the load imposed by earthquake forces.

2.19 MOTORS

Provide electric motors conforming to the requirements of NEMA MG 1. Provide motors with sealed ball bearings and a maximum speed of 1,800 rpm. Provide motors with drip-proof frames; ensure alternating current motors larger than 373 W 1/2 hp are of the squirrel-cage induction type for operation on [_____] V, [50] [60] Hz, three-phase AC power. Provide alternating current motors 373 W (1/2 hp) or smaller, that are suitable for operation on 120 V, [50] [60] Hz, single-phase, AC power. Use direct current motors that are suitable for operation on [125] [_____] V DC. Provide motor controllers and starters conforming to the requirements of NFPA 70 and NEMA ICS 2.

2.20 PAINTING

Clean, prime, and paint the engine and the accessory equipment including, but not limited to, panels, valves, piping, intake, and exhaust system components [in accordance with the manufacturer's standard color and practice] [as specified in Section [09 90 00 PAINTS AND COATINGS] [09 97 02 PAINTING: HYDRAULIC STRUCTURES].

2.21 FACTORY INSPECTION AND TESTS

Prior to shipment, inspect and test each engine at the factory in the presence of the Contracting Officer or the authorized government representatives. Inspect and test all components including, but not limited to, governors, instrumentation panels, engine starting system, intake and exhaust, lubrication system, cooling system, and fuel system. Complete inspection and make all necessary repairs prior to testing. Unless otherwise directed by the Contracting Officer or the authorized government representative, perform the following factory tests:

a. Simulated emergency or overspeed trip test.

b. Sustained operation test of 4 hr at rated full load.

c. Sustained operation test of 2 hr at 70 percent of rated full load.
d. Fuel consumption tests of not less than 1 hr each at 70 and 100 percent rated full load, respectively, using [the type of diesel fuel specified][natural gas].

e. Operate engine at no load to demonstrate that the governor and its associated engine manifold shutoff valve function properly.

f. Take test data at 30-min intervals and record on the manufacturer's diesel natural gas fueled engine test data sheets. The test data sheets must provide entries for all data required for the evaluation of diesel natural gas fueled engine performance including noise and vibration. Submit test data for approval as required in paragraph SUBMITTALS. Do not ship engine until the test data has been approved by the Contracting Officer.

PART 3 EXECUTION

3.1 EXAMINATION

Before performing any work, visit the installation site and verify all details of the work. For new construction, review plans and elevations for adequacy and notify the Contracting Officer in writing of any discrepancies.

3.2 INSTALLATION

**************************************************************************
NOTE: Provide an equipment layout on the plans which allow clear space for operation and maintenance in accordance with NFPA 70 and IEEE C2. Include requirements for staging and a laydown area for disassembly or removal and replacement of major parts of the engine. Additionally, it is advisable to provide access to remove the unit and/or major parts of equipment from the engine room and the building through either doors/passageways or equipment hatches. For large units, specify a bridge crane of an adequate capacity as recommended by the engine manufacturer.
**************************************************************************

Coordinate the installation of the equipment furnished under this section and related pumps and gear reducers under other sections and install in accordance with the approved installation procedures. Submit a copy of the manufacturer's installation and alignment procedures, including a detailed description of the manufacturer's recommended break-in procedure.

3.3 PIPING INSTALLATION

Do not allow any section of pipe within a building to exceed 6 m 20 ft in length between flanged fittings. Except where otherwise specified, utilize flanged fittings to allow for complete dismantling and removal of each piping system from the facility without disconnecting or removing any portion of any other system's equipment or piping. Make connections to all equipment with flexible connectors and isolation valves. Bend pipe with pipe benders, and ensure no malformation is visible on bent pipe. Properly flash pipes extending through the roof. Support piping and permit to expand and contract without damage to joints or hangers. Install drain valves of 15 mm 0.6 inch at each low point in the piping.
3.3.1 Supports

Provide hangers, inserts, and supports of sufficient size to accommodate any insulation and conform to MSS SP-58. Space supports in accordance with ASME B31.1. Do not attach piping supports to metal decking. Do not attach supports to the underside of concrete filled floors or concrete roof decks unless approved by the Contracting Officer.

3.3.1.1 Ceiling and Roof

Support exhaust piping with appropriate sized Type-41 single pipe roll and threaded rods; support all other piping with appropriately sized Type 1 clevis and threaded rods.

3.3.1.2 Wall

Make wall supports for pipe by suspending the pipe from appropriately sized Type 33 brackets with the appropriate ceiling and roof pipe supports.

3.3.2 Flanged Joints

Provide Class 125 type flanges, drilled, and of the proper size and configuration to match the exhaust outlet of the engine. Ensure flanged joints are gasketed and made to be square and tight.

3.3.3 Cleaning

After fabrication and before assembly, manually wipe clean all piping interiors of all debris.

3.3.4 Pipe Sleeves

Fit pipes passing through construction such as ceilings, floors, or walls with sleeves. Extend each sleeve through and securely fasten in its respective structure and cut flush with each surface. Build the structure tightly to the sleeve. The inside diameter of each sleeve must be a minimum of 15 mm 0.6 inch larger than the outside diameter of the passing pipe or pipe covering, and where pipes pass through combustible materials, 25 mm 1 inch larger than the outside diameter of the passing pipe or pipe covering.

3.4 ELECTRICAL INSTALLATION

Electrical installation must comply with NFPA 70, IEEE C2, and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide vibration isolation for all conduit, cable trays, and raceways attached to the engine.

3.5 ONSITE INSPECTION AND TESTS

Perform the tests outlined in the subsequent subparagraphs after complete installation of each engine and its associated equipment and in accordance with the approved Dynamic Analysis of Engine, Pump, and Governor. Include supporting calculations with the Dynamic Analysis submittal.

Record data taken during runs at 30-min intervals and include all available pressure and temperature data which is monitored by the instrumentation furnished with the engine.
3.5.1 Instruments

Verify readings of items such as panel gauges, meters, displays, and instruments provided under the specification during all test runs by test instruments of greater precision and accuracy than the operational equipment. Calibrate instruments used in the tests by a recognized standards laboratory within 30 days prior to testing.

3.5.2 Sequence

Follow the sequence outlined in subsequent paragraphs. Make measurements and record all parameters necessary to verify that each engine meets specified parameters. If the results of any of the test sequences are not satisfactory, make adjustments or replacements and repeat the test sequence until satisfactory results are obtained.

3.5.2.1 Piping Test

a. Flush lube-oil and fuel-oil piping with the same type of fluid intended to flow through the piping, until the out-flowing fluid is free of obvious sediment and emulsions.

b. Hydrostatically pressure test the lube oil, fuel-oil and coolant piping [and piping and pressure vessels of the air starting system] at 150 percent of the maximum anticipated working pressure, but in no case less than 1.03 MPa 150 psig for a period of 2 hr to demonstrate the piping has no leaks. If piping is to be insulated, perform the test before the insulation is applied.

Submit certificates of compliance for pressure vessels including official, signed statements from the fabricators of heat exchangers and expansion tanks associated with the engine cooling system certifying compliance with ASME BPVC SEC VIII D1.

3.5.2.2 Initial Inspection

a. Visually inspect and check engine mounting bolts for proper application and torque.

b. Demonstrate correct functioning of the high and pre-high lubricating oil temperature circuit by removing the temperature-sensing elements from the engine and immersing the elements in a vessel containing controlled-temperature hot oil and recording the temperature at which the elements activate.

c. Demonstrate correct functioning of the high and pre-high coolant-fluid outlet temperature circuit by removing the temperature-sensing elements of the circuit from the engine and immersing the elements in a vessel containing controlled-temperature hot coolant-fluid and recording the temperature at which the elements activate.

3.5.2.3 Electric Protective Device Tests

Visually and mechanically inspect, adjust, test, and calibrate protective devices in accordance with the manufacturer's published instructions. Document device ratings, settings, and other operational data.
3.5.2.4 Safety Run Test

Should there be insufficient water available to operate the plant and to perform the engine tests, the Contracting Officer may delay the test for up to 9 months. The safety run test consists of the following sequence of tests:

a. Start the engine, record the starting time, and perform all of the engine manufacturer's recommended after-starting checks and inspections following a reasonable warm-up period.

b. Operate engine for at least 2 hr at 75 percent rated speed.

c. Verify proper operation of all controls.

d. Verify proper operation and set points of all gauges and instruments. Record setpoints.

e. Verify proper operation of all ancillary equipment.

f. Activate manual emergency stop switch and record the time to stop the engine.

g. Start the engine, record the starting time, perform and record the engine manufacturer's after-starting checks and inspections, and operate the engine for at least 15 min at 75 percent of rated speed.

h. Manually adjust the governor to increase engine speed past the overspeed limit. Record the engine RPM at shutdown.

i. Manually fill the day tank to a level above the overfill limit. Record the level at which the overfill alarm activates. Verify shutdown of the fuel transfer pump. Drain the day tank below the overfill limit following the test.

j. Remove the time-delay low-lube oil pressure alarm bypass temporarily from the engine safety circuits and make an attempt to start the engine. Record the results.

k. Attach a manifold to the engine oil system containing a shutoff valve in series with a connection for the engine's oil pressure sensor, followed by an oil pressure gauge, ending in a bleed valve. Move oil pressure sensor from the engine to the manifold and temporarily seal its normal location on the engine. Place the manifold shutoff valve in the open position and close the bleed valve.

l. Start the engine, record the starting time, perform and record the engine manufacturer's after-starting checks and inspections, and operate the engine for at least 15 min at 75 percent of rated speed.

m. Close the manifold shutoff valve. Slowly bleed off the pressure in the manifold through the bleed valve while observing the pressure gauge. Record the pressure at which the engine shuts down. Capture oil spillage from the bleed valve in a container. Refill oil system, remove the manifold, and reinstall the engine's oil pressure sensor on the engine following the test.

n. Start the engine, record the starting time, perform and record the engine manufacturer's after-starting checks and inspections, and
operate the engine for at least 15 min at 100 percent of rated speed. Record the maximum sound level in each frequency band at a distance of 22.9 m 75 ft from the end of the exhaust piping directly along the path of discharge for horizontally discharged exhausts. Record the maximum sound level in each frequency band at a distance of [22.9 m 75 ft] [10.7 m 35 ft] from the silencer at 45 deg apart in all directions around the unit.

a. Slowly drain the fuel from the day tank to lower the fuel level below the no fuel level limit and record the level at which the audible alarm sounds. Add the fuel back to the day tank, filling it above the low level alarm limit following the test.

3.5.2.5 Final Inspection

a. Remove the lube-oil filter and examine the oil and filter by the engine manufacturer for excessive metal, abrasive foreign particles, and other indications of engine distress. Verify any corrective actions for effectiveness by running the engine for 8 hr at full rated speed, then re-examine the oil and filter.

b. Inspect the engine and check all engine mounting bolts for tightness and visible damage.

3.6 MANUFACTURER'S FIELD SERVICE

3.6.1 Onsite Training

**************************************************************************
NOTE: Delete video taping if not required.
**************************************************************************

Conduct training courses for the plant operating staff as designated by the Contracting Officer. The training period consists of a total of [_____] hr of normal working time and commence after the system is functionally completed, but prior to final acceptance. Cover pertinent points involved in operating, starting, stopping, and servicing the equipment, as well as all major elements addressed in the operations and maintenance manuals. Additionally, include demonstrations and instruction in all routine maintenance operations including oil change, oil filter change, air filter change, etc. [Submit two [CD] [DVD] copies of the entire training session.]

Submit a letter giving the proposed date for conducting the onsite training course[ and][,] the agenda of instruction [, a description of the video taping service to be provided, and the kind and quality of the tape].

3.6.2 Field Engineer

Furnish a qualified engineer to supervise the complete installation of the engine, assist in performance of the onsite tests, and instruct personnel regarding operational and maintenance features of the equipment. Submit certification that the field engineer is qualified to perform the functions.

3.7 FIELD PAINTING

Perform field painting as specified in Section [09 90 00 PAINTS AND COATINGS] [09 97 02 PAINTING: HYDRAULIC STRUCTURES].
3.8 MANUFACTURER'S PUBLISHED INSTRUCTIONS

Post instructions, including wiring and control diagrams showing the key mechanical and electrical control elements and a complete layout of the entire system. The instruction set must be weatherproof, laminated in plastic, framed, and posted at a location as directed.

3.9 ACCEPTANCE

Final acceptance of the engine will not be made until the Contractor has successfully completed all tests, corrected all defects in installation material, and/or installation procedures, and all deficiencies identified in on-site testing or routine operation have been corrected.

3.10 CLOSEOUT ACTIVITIES

3.10.1 As-Built Drawings

Submit As-Built Drawings accurately depicting the as-built configuration of the supplied, installed, and accepted diesel/natural gas fueled engine pump drive.

3.10.2 Operation and Maintenance Manual

Also submit an Operation and Maintenance Manual for the diesel/natural gas fueled engine detailing start-up and operating procedures, lubrication instructions, installation and alignment procedures, routine maintenance requirements and procedures, complete detailed procedures for disassembly and reassembly of the engine, parts list for all parts detailed, assembly plans of the engine showing all parts, suppliers for all parts, settings and adjustment for protective devices, and a list of all tools, handling devices, and spare parts furnished.

NOTE: This guide specification covers the requirements for fans, blowers or vacuum pumps and drive units.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 UNIT PRICES

NOTE: On many hazardous, toxic, radioactive waste (HTRW) projects, the Contractor is required to treat air or off-gas, as well as furnish the equipment. Measurement and payment and unit pricing may be necessary to cover treatment costs.

When it is determined that lump sum contract is advisable this paragraph will be deleted.

Measurement and payment will be based on completed work performed in accordance with the drawings, specifications, and the contract payment
schedules. No additional payment will be made for installation, calibration or commissioning of the equipment.

1.1.1 Measurement
Volume of [air supplied] [off-gas treated] will be determined by initial and final meter readings.

1.1.2 Payment
Payment will be made for volume of [air supplied] [off-gas treated] at the contract unit price per actual cubic meter foot. Payment will include the furnishing of testing, plant, labor, and material and incidentals necessary to complete the work, as specified and as shown.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detailed Drawings; G[, [______]]

Detailed Process Flow Diagrams; G[, [______]]

Piping and Instrumentation Diagram; G[, [______]]

Control System; G[, [______]]

SD-03 Product Data
1.4 QUALITY ASSURANCE

1.4.1 Contractor

Contractor must have a minimum of [2] [3] [5] [_____] years of experience in the construction of systems for handling sour gas, condensable gas, off-gas or vapor.

1.4.2 Single Source Supplier

Assign to a single supplier full responsibility for the furnishing of the off-gas moving system. The designated single supplier, however, need not manufacture the system but must coordinate the selection, assembly, installation, and testing of the entire system as specified herein.

1.4.3 Manufacturer's Representative

Provide the services of a manufacturer's field service representative who is experienced in the installation of the equipment furnished and who has complete knowledge of the proper operation and maintenance of the system. Submit the names and qualifications of the manufacturer's representative and training engineers, and certification from the manufacturer that the representative and trainers are qualified in the appropriate technical areas.

1.4.4 Detailed Drawings

Submit detailed drawings including location of components, layout and anchorage of equipment and appurtenances, equipment relationship to other parts of the work, clearances for maintenance and operation of the off-gas system and subsystems. Drawings must be to the approved scale.
1.4.5 **Detailed Process Flow Diagrams**

Submit detailed process flow diagrams and data including, but not limited to: air and off-gas stream flows, direction of flow, range of flow rate and range of composition, identified by lines and arrows denoting the direction and destination of the flow; material, mass and energy balances for the entire air and off-gas system; subsystem equipment, operating capacity and operating conditions; blowers and pumps, valves and other in-line devices; sizes of conveying devices (pipe, ducts, etc.); number of parallel components or lines.

1.4.6 **Piping and Instrumentation Diagram**

Submit a piping and instrumentation diagram indicating: process equipment; instrumentation; piping and valves; stacks, vents and dampers; control equipment (including sensors, process controllers, control operators, valves, interlocks, and alarms); labels and other necessary information to correlate to the process flow diagram. Include blowers and pumps, valves and other in-line devices.

1.5 **PARTNERING/PRE-INSTALLATION MEETING**

**************************************************************************
NOTE: Remove this paragraph when meeting is not required.
**************************************************************************

[Partnering] [Pre-installation] meeting will be required. Ensure that involved subcontractors, suppliers, and manufacturers are [notified] [represented]. Furnish the date and time of the meeting to the Contracting Officer for approval.

1.6 **DELIVERY, STORAGE, AND HANDLING**

Store in a clean, dry location equipment delivered to the site and designated for storage; cover the equipment for protection against dust and moisture. For equipment stored longer than 60 days, suspend silica bags in the outlet and inlet of unit, fill bearings full of grease, fill unit with oil, coat machine surfaces with grease, and enclose entire unit with plastic or tarp. Turn shaft of rotating equipment, including motors, every two weeks to prevent flat spots on bearings.

1.7 **SEQUENCING AND SCHEDULING**

**************************************************************************
NOTE: Coordinate with the appropriate air pollution control equipment. The temperature increase induced by the air moving equipment may affect the materials selected in other Sections of the contract. Review the table of contents to assure that appropriate specifications have been included.
**************************************************************************

Details of and requirements for [stack] [vapor injection] [vapor extraction well construction] [_____] and treatment equipment are included in other sections of this specification. Notify the Contracting Officer of any deviations from head conditions specified for the source and discharge to ensure coordination with this Section. Provide pipe and valves not specified in this Section in accordance with Section 31 21 00 OFF-GASSING.
MITIGATION.

1.8 EXTRA MATERIALS

**************************************************************************
NOTE: This paragraph covers items to be furnished to the Government by the Contractor for future maintenance and repair. Items that might be difficult to obtain because of color or pattern match, or spare parts needed to ensure continued operation of critical equipment should be included. Specifications should identify the items, state the quantities required, and indicate to whom, when, and where items are to be delivered. Insert text as required or remove this paragraph.
**************************************************************************

Deliver auxiliary equipment, tools and spare parts at the same time as the equipment to which they pertain. Protect and safeguard the equipment, tools and parts until completion of the work, at which time deliver them to the Contracting Officer. Furnish auxiliary equipment and spare as follows:

a. Spare parts for each different item of material and equipment specified including the parts recommended by the manufacturer to be replaced after [1] [and] [3] [year] [years] service.

b. For each air mover: one extra of each part used that is made from glass, hard rubber, or clear plastic; one complete set of gaskets; [4] [_____] air intake filter replacement cartridges.

c. Provide one complete set of special tools, calibration devices, and instruments [as recommended by the manufacturer for field maintenance of the system] [as required for operation, calibration, and maintenance of the equipment]. Special tools are considered to be those tools which, because of their limited use, are not normally available but which are necessary for the particular equipment. Special tools must be high-grade, smooth, forged, alloy, tool steel.

d. One or more [tool boxes] [tool boards] [steel tool cases] complete with flat key locks, two keys, and clips or hooks to hold each special tool mounted [in the equipment room] [on the wall in a convenient location] [as directed by the Contracting Officer].

e. One [pressure] [lever type] grease gun or other lubricating device for each type of grease required.

f. [_____] sheaves of differing diameter covering the range of operation of belt driven equipment.

g. [_____].

1.9 MAINTENANCE SERVICE

**************************************************************************
NOTE: This paragraph covers provisions for maintenance service as applicable to critical systems, equipment, and landscaping. Insert text as required or remove this paragraph.
**************************************************************************
Maintenance service includes [____].

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Design Requirements

******************************************************************************

NOTE: Determine design wind speed from ASCE 7-16 or UFC 3-301-01. Use 161 km/h 100 mph minimum. Use 1.2 kPa 25 psf snow load for most heavy snow climates; delete snow load where maximum snow is not a factor. In some cases, local climates and topography will dictate that a value greater than 197 Pa 25 psf be used for snow loading; this may be determined from ANSI A58.1, local codes, or by research and analysis of the effect of local climate and topography. Coordinate with paragraph Seismic Requirements in PART 3.

******************************************************************************

Ensure capacity and design of the air moving equipment and accessories is suitable for 24-hour full load service in an [outdoor] [indoor] [_____] location, and meets the following criteria.

2.1.2 Selection Criteria

**************************************************************************
NOTE: Requirements included here may limit the selection of specified equipment.
**************************************************************************

Design air moving equipment using criteria based upon actual model developmental test data, and select it at a point within the maximum efficiency for a given impeller/casing combination. Deviations within [10] [5] [3] percent of maximum efficiency are permissible. Air moving equipment having impeller diameters larger than [90] [95] percent of the published maximum impeller diameter for the casing, or less than [15] [10] [5] percent larger than the published minimum impeller diameter for the casing, will be rejected. Do not base acceptable maximum impeller diameter calculations on percentage of impeller diameter range for a given casing.

2.1.3 Performance Requirements

**************************************************************************
NOTE: Provide required information for each air mover identified on the drawings. Co-ordinate with PART 2 and delete inapplicable requirements. Verify that more than one manufacturer's product can meet the efficiency requirement, ideally more than three.
**************************************************************************

Equipment identification number [_____] must be [appropriate for the capacity requirements of this paragraph] [a fan] [a blower] [a vacuum pump] [______]. [Standard] [Actual] output volume must be a minimum of [_____] cubic meters/second cfs at a [minimum inlet] [minimum positive discharge] pressure of [_____] kPa feet of water [gage] [actual] [positive] [vacuum]. The minimum efficiency must be [_____] percent under the stated conditions.

2.1.4 Service Conditions

**************************************************************************
NOTE: Delete chemical data if the equipment is designed to deliver a fresh air supply. Standard materials will be adequate.
**************************************************************************

Service [air supply to] [vapor collected from] [municipal landfill] [hazardous waste landfill] [petroleum spill] [subsurface remediation unit] [air stripper]. Anticipated contaminant concentration in the [air] [vapor] [off-gas] is:
### 2.2 MATERIALS AND EQUIPMENT

#### 2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate equipment that has been in satisfactory operation at least [2] [_____] years prior to bid opening. Provide equipment supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Ensure pieces of equipment of the same types are products of the same manufacturer. Provide new and unused equipment, except for test equipment. Materials may be reprocessed/recycled with equivalent durability and product warranty/guarantee.

#### 2.2.2 Nameplates

Provide each piece of equipment with a standard nameplate securely affixed in a conspicuous place showing the manufacturer's name, address, type or style, model, serial number, and catalog number. In addition, the nameplate for each air moving unit must show the capacity in standard cubic meters/second feet per minute (SCFM) at rated speed in rpm and head in kPa inches of water. Nameplate for each electrical motor must show, at least, the minimum information required by paragraph 10.38 of NEMA MG 1. Show any other information that the manufacturer may consider necessary to complete identification on the nameplate.

### 2.3 AIR MOVING EQUIPMENT

*********************************************************************************************************************************************

**NOTE:** Coordinate these paragraphs with a schedule on the drawings showing the air moving equipment identification number and type and with paragraph Performance Requirements. Delete inappropriate types of equipment or service.

*********************************************************************************************************************************************

Furnish and install air moving equipment complete with drive units, filters, controls and appurtenances indicated or specified. Provide
equipment capable of operating at partial-load conditions without increased vibration over the normal vibration at full load operation and capable of continuous operation down to the lowest step of unloading. Provide each unit with unloading, vibration isolators, thermal overloads, high-and-low pressure safety cutoffs, low oil pressure cutout, internal motor-winding temperature sensing protection device, internal pressure relief valve, a complete oil charge, and protection against short cycling. Submit the following:

2.3.1 Capacities and pressure differentials

Make and model with associated performance charts and curves (including the complete selection of impeller sizes for a given casing for centrifugal blowers).

2.3.2 System Layout

Diagrams showing the complete layout of the entire system, including equipment, piping, valves, wiring and control sequence. Condensed operating instructions in typed form explaining preventative maintenance procedures, safe methods of checking the equipment for normal operation, and safe procedures for starting and stopping the equipment. Post diagrams and instructions, framed under glass or in approved laminated plastic, where directed before acceptance testing of the systems.

2.3.3 Component Items List

Complete list of equipment and materials. A listing covering component items forming a system or items that are interrelated and scheduled to be coordinated and submitted concurrently. Schedule certifications to be submitted with the pertinent drawings. Include in the data tabular lists showing location, features, or other pertinent information regarding products, materials, equipment, or components to be used in the work.

2.3.4 Manufacturer Testing Certification

Date statements after contract award. State the Contractor's name and address, project and location, and the specific requirements which are being certified. Indicate in the certificate the methods of testing used. In lieu of a certificate, a seal or label from a nationally recognized testing agency will be acceptable as evidence that the equipment conforms to agency requirements.

2.4 FANS

******************************************************************************
NOTE: See Section 1 (Fans and Systems) of AMCA 201 (Fan Application Manual) for additional guidance on selection of fans.
******************************************************************************

Provide centrifugal or propeller type fans as best suited for the application.

2.4.1 Single-Stage

******************************************************************************
NOTE: Fan pressure will vary with fan revolutions per minute (RPM) ratio squared. Single stage
******************************************************************************
equipment allows flow variation at low end pressure.

Fans are generally divided into two classifications based on the airflow through the impeller. The classes are centrifugal and axial. In axial fans, airflow is parallel to the shaft. Axial fans are most commonly used in low static pressure applications, while centrifugal fans are used at higher static pressures.

**************************************************************************

A single-stage fan is allowable for the capacity range 0.025 to 50 cubic meters/second 53 to 106,000 cfm at pressure ranges from 0.25 to 15 kPa 0.08 to 5 feet of water column.

2.4.2 Industrial Centrifugal

An industrial centrifugal fan is allowable for the capacity range over 45 cubic meters/second 95,000 cfm at pressure ranges from 7.5 to 12 kPa 2.5 to 4 feet of water column.

2.4.3 Pressure Blower

A pressure blower fan is allowable for the capacity range of less than 2.4 cubic meters/second 5,100 cfm at pressure ranges from 10 to 30 kPa 3.3 to 10 feet of water column.

2.4.4 Multiple Stage

**************************************************************************

NOTE: Multiple stages limit volume and develop pressures toward the upper end.

**************************************************************************

A multi-stage pressure blower fan is allowable for the capacity of less than 3.3 cubic meters/second 7,000 cfm at pressure ranges up to 70 kPa 23 feet of water column or vacuum to -40 kPa -13 feet of water column.

2.4.5 Backwards Inclined Impeller

**************************************************************************

NOTE: If the flow is relatively clean, backwards inclined impeller fans should be specified for higher efficiency and quieter operation.

**************************************************************************

A backwards inclined impeller fan is allowable for the capacity range over 190 cubic meters/second 403,000 cfm and pressure ranges from 2.5 to 4.5 kPa 0.84 to 1.5 feet of water column.

2.5 DYNAMIC BLOWERS

**************************************************************************

NOTE: Dynamic blowers should be designed for highest inlet pressure loss and highest inlet air temperature conditions within the design operating range.
Provide oil-free dynamic blowers of modular design with the required number of compression stages to comply with the specified operating requirements.

2.5.1 Single Stage Centrifugal

A single stage centrifugal blower is allowable for pressure ranges from 0.25 to 7.5 kPa 0.084 to 2.5 feet of water column.

2.5.2 Regenerative

******************************************************************************
NOTE: Regenerative blowers are compact single or multi-stage centrifugal blowers.
******************************************************************************

A regenerative blower is allowable for capacity up to 5 cubic meters/second 10,000 cfm and pressure ranges of 20 to 60 kPa 6.7 to 20 feet of water column or vacuum up to -35 kPa -12 feet of water column.

2.5.3 Axial Flow

An axial flow blower is allowable for pressure ranges higher than 70 kPa 23 feet of water column or vacuum requirements greater than -40 kPa -13 feet of water column.

2.6 POSITIVE DISPLACEMENT BLOWERS

2.6.1 Rotary Lobe

A rotary lobe blower is allowable for capacity up to 14 cubic meters/second 30,000 cfm at pressures higher than 125 kPa 42 feet of water column or up to 10 cubic meters/second 21,200 cfm at vacuum up to -125 kPa -41.8 feet of water column.

2.6.2 Helical Screw

A helical screw blower is allowable for capacity up to 1 cubic meter/second 2,100 cfm and pressure ranges of 30 to 60 kPa 10 to 20 feet of water column or vacuum up to -35 kPa -11.7 feet of water column.

2.7 VACUUM PUMPS

2.7.1 Dry Rotary Blower

A dry rotary blower vacuum pump is allowed for vacuum flows of 1 cubic meter/second 2,100 cfm at -90 kPa -30.1 feet of water column to 6 cubic meters/second 12,700 cfm at -60 kPa -20.1 feet of water column.

2.7.2 Water-Sealed Rotary Blower

A water-sealed rotary blower vacuum pump is allowed for vacuum flows of 1 cubic meter/second 2,100 cfm at -80 kPa -26.8 feet of water column to 6 cubic meters/second 12,700 cfm at -70 kPa -23.4 feet of water column.

2.7.3 Rotary Vane

A rotary vane vacuum pump is allowed for vacuum flows of 2.5 cubic m/second 5,300 cfm at -100 kPa -33.5 feet of water column to 4.25 cubic m/second 9,000 cfm at -60 kPa -20.1 feet of water column. Include oil injection and
outlet demisting systems for each rotary vane vacuum pump.

2.7.4 Liquid Ring

A liquid ring vacuum pump is allowed for vacuum flows of 2.5 cubic m/second 5,300 cfm at -80 kPa -26.8 feet of water column to 8 cubic m/second 16,950 cfm at -60 kPa -20.1 feet of water column. Include water injection systems and outlet water separation systems for each liquid ring vacuum pump.

2.8 CASING OR HOUSING

Provide casing or housing of modular design to permit inspection or removal and replacement of wearing parts. Provide ample clearance between the impeller or blades and casing. Incorporate ribbed construction to resist heat accumulation, deflection and distortion under the specified operating conditions.

2.8.1 Construction Materials

**************************************************************************
NOTE: Three types of spark resistant construction are available for fans as detailed by AMCA 99 (Classification for Spark Resistant Construction). Temperature is limited to 177 degrees C 350 degrees F when using aluminum parts.

Type A - all aluminum fan housing, inlet cone and wheel with a ground and polished steel shaft cover with an aluminum sleeve.

Type B - aluminum wheel and wear plate where shaft passes through the housing.

Type C - aluminum inlet cone and wear plate where shaft passes through the housing.
**************************************************************************

Fabrication must be from [alloy steel] [monel] [316 stainless steel] [304 stainless steel] [heavy gauge hot rolled low carbon steel with continuous welds] [fiberglass in accordance with ASTM D4167]. Construction must be close grain cast [iron] [aluminum Type [A] [B] [C] in accordance with AMCA 99] of uniform quality and free from blowholes, porosity, hard spots, shrinkage defects, cracks, and other injurious defects.

2.8.2 Single Piece Casing

Provide single piece casings with separate head plates.

2.8.3 Horizontally Split Casing

Machine horizontally split casings at the split to maintain the pressure without a gasket.

2.8.4 Vertically Split Casing

Provide vertically split casings consisting of rigid sections secured between inlet and outlet heads by steel tie rods.
2.8.5 Connections

2.8.5.1 Inlet and Discharge Connections

**************************************************************************
NOTE: Threaded and sweat connections should be considered if flange-connected types are not available in small capacity units.
**************************************************************************

Inlet and discharge connections must be ASME B16.1 or ASME B16.5 [Class 125] [125 pound] [_____] drilled and tapped flanges and are an integral part of the head. Connections 75 mm 3 inches in diameter and smaller must be [threaded] [sweat] [_____].

2.8.5.2 Casing Drains

Provide tapped and plugged drains at the low points in the casing.

2.8.5.3 Lifting Eyes

Provide casing with lifting eyes capable of supporting the equipment for installation and maintenance purposes.

2.9 BLADES OR IMPELLERS

**************************************************************************
NOTE: Require non-sparkling impeller material if it is likely that the mixture of air and other gases will be within the explosive limits during the project life.
**************************************************************************

Cast or fabricate blades, vanes or impellers [iron] [aluminum] [aluminum alloy] [fiberglass] [monel] [steel] [carbon steel] [phenolic coated steel] [PTFE coated steel] [304 stainless steel] [316 stainless steel] [non-sparkling material].

2.9.1 Dynamic Impellers

Provide guide or diffuser vanes configured to receive and direct flow to the downstream impeller at the inlet to each centrifugal blower stage. Ensure centrifugal impellers are [open radial bladed] [closed backward bladed]. Butt multiple stage impeller hubs against each other either directly or through one piece metal spacers.

2.9.2 Rotary Lobe Impellers

Provide straight, two-lobe involute type rotary lobe impellers which operate without rubbing, liquid seals, or lubrication.

2.10 SHAFT

Make shaft of accurately machined, ground and polished high grade [ductile iron casting] [alloy steel] [stainless steel] [carbon steel]. Impellers or blade [and shaft must be a common casting.] [assembly must be mounted and keyed to the shaft and secured by a lock nut.] Design must permit inspection or replacement of the [seals] [and] [bearings] without [disconnecting suction or discharge piping] [disassembling the casing].

SECTION 43 11 00.10  Page 20
Design the shaft to operate at below [80] [90] percent of the first critical speed. Provide shaft of sufficient diameter, mass and strength to perform the work required with minimum vibration.

2.11 SEALS, GASKETS AND PACKING

Select gasket and packing material in accordance with WEF MOP 11. Ensure gaskets and seal ratings encompass the maximum pressure or vacuum capacity of the equipment and the ranges of temperature and quality of the off-gas or air.

2.11.1 Shaft Seals

Provide solid carbon mechanical ring shaft seals where the shaft passes through the inlet and discharge heads. Ensure seals are [purged] [or] [non purged], [balanced] [or] [unbalanced] to conform to specified service requirements. Ventilate to the atmosphere on the impeller side of shaft seals to eliminate carry-over of lubricant into the air stream.

2.11.2 Internal Seals

Provide labyrinth seals between blower stages.

2.11.3 Bearing Seals

Provide a [lip type oil] [grease] seal at each bearing to prevent lubricant from leaking into the output. Ventilate to the atmosphere on the impeller side of oil seals to eliminate any carry-over of lubricant into the air stream.

2.12 BEARINGS

**************************************************************************
NOTE: Verify bearing L-10 life requirements.
**************************************************************************

2.12.1 Shaft Bearings

Support shaft by anti-friction [spherical ball] [roller] bearings designed for both radial and thrust loads and sized for a minimum L-10 life of [30,000 hours] [50,000 hours] [5 years] continuous operation as defined by ABMA 9 or ABMA 11.

2.12.2 Blower Bearings

**************************************************************************
NOTE: Delete inapplicable lubrication methods.
**************************************************************************

Provide each blower with two [pressure, oil lubricated, sleeve type journal] [splash, oil lubricated, anti-friction type] [oil bath lubricated] [grease lubricated] bearings. Bearings must be self-aligning, designed for both radial and thrust loads and sized for an L-10 life of [30,000 hours] [50,000 hours] [5 years] continuous operation as defined by ABMA 9 or ABMA 11. Replace the bearings without disassembling the casing or disconnecting piping.
2.13 DRIVE CONNECTION

**************************************************************************
NOTE: Direct-driven equipment is limited to common synchronous motor speeds (3600, 1800, and 1200 rpm). This equipment is usually noisier than belt-driven equipment because it tends to run at higher speeds. Motors that run slower than 1800 rpm are expensive and not as readily available.

On belt-driven equipment, the speed is increased or decreased by changing pulleys or changing the diameter of adjustable pitch pulleys. On a fixed air moving system, flow rate is directly proportional to speed. The power requirement varies with the cube of the speed. A 25 percent increase in speed raises the flow rate 25 percent, but it almost doubles the power requirement. V-belts are generally used on positive displacement blowers.
**************************************************************************

Each unit must be [close coupled] [directly connected through a flexible coupling] [driven by a V-belt].

2.13.1 Coupling

Provide heavy-duty, flexible forged steel spacer coupling, keyed or locked to the shaft. Disconnect without removing the driver half of the driven unit half of the coupling from the shaft. Machine outside surface of coupling parallel to the axis of the shaft. Machine coupling faces perpendicular to the axis of the shaft.

2.13.2 V-Belt Drive

Design v-belt drive for no less than 150 percent of the driving motor capacity. When belt drive is provided, provide an adjustable sheave to furnish no less than 20 percent speed adjustment. Select sheaves to provide the required capacity at the approximate midpoint of the adjustment. The drive belt must be [covered with an acoustically treated sheet metal guard] [or] [completely enclosed within the unit casing].

2.14 GEARS

Make gears of hardened, helical, alloy steel, manufactured in accordance with AGMA 6011 with a minimum 1.5 service factor applied to full power rating of the motor. [Furnish single speed centrifugal blower with high speed increasing gears.] [Time positive displacement impellers by a pair of machined, heat-treated, spur tooth timing gears.] Mount timing gears on the impeller shafts on a tapered fit and secure by a lock nut.

2.15 LUBRICATION SYSTEM

**************************************************************************
NOTE: Delete inapplicable lubrication systems.
**************************************************************************

Provide [pressure oil lubricated] [splash oil lubricated] [grease lubricated] drive. Provide [pressure oil lubricated] [splash oil lubricated] timing gears and gear end bearings. Lubricate bearings and
seals as previously indicated. Design system to prevent leakage and contamination. Design oil-lubrication systems and vents so that oil vapors do not enter the air stream or motor and the shaft bearings will be isolated. Provide each oil reservoir with an opening for filling, an overflow opening with overflow container at the proper location to prevent overfilling, and a drain at the lowest point.

2.15.1 Pressure Oil

Provide console mounted pressure oil lubrication system and include a main oil pump driven by the shaft, an auxiliary electric motor driven oil pump, an oil cooler, an oil [strainer] [or] [filter], oil reservoir with 3-minute minimum retention time, and the switches, temperature and pressure gauges and controls necessary to protect unit. The electric motor driving the auxiliary oil pump must be totally enclosed fan cooled (TEFC), Design Type B in accordance with NEMA MG 1, with Class F insulation and equipped with 120 volts space heaters. Provide control in accordance with NEMA ICS 1. Provide factory piped and wired lubrication system with minimal interconnecting piping between the console and the oil pump required in the field.

2.15.2 Splash Oil

Provide splash lubrication by a slinger on the shaft splashing oil into the bearing whenever the compressor is running. A constant level oiler located on the bearing housing or a metering orifice will be provided to maintain the oil level in the oil reservoir integral with the bearing housing. Provide a sight level gauge in the bearing housing. Provide a labyrinth seal combined with an atmospheric vent to prevent oil contamination of the air stream.

2.15.3 Grease

Equip grease type bearings with grease fittings. Extend grease tubing to a convenient location if fittings are inaccessible. Provide grease fittings which prevent over-lubrication and over-pressurization.

2.16 INTAKE FILTER

Install intake [screen and filter] [filter] on inlet to each unit.

2.16.1 Efficiency

Intake filter must be at least [90] [96] percent efficient when tested in compliance with ASHRAE 52.2 dust spot method. [Provide high volume bag intake filter for filtration down to 5 microns 2 mils on vacuum pump intake.]

2.16.2 Surface Area

Provide a minimum filter surface area of 1 square meter per 0.127 cubic m/second 1 square foot per 25 cubic feet/minute to produce a filter flow through velocity of less than 0.127 m/second 25 feet per minute.

2.16.3 Media

Filter media must be [washable] [or] [disposable] dry type felt material made from [glass fiber,] [polyester,] fiber resistant to moisture and chemicals to which it will be exposed with 25 mm 1 inch pleat separation.
2.16.4 Weather Hood

Coat steel intake hood and filter housings with a chemically resistant coating and ensure entire unit element is resistant to moisture and chemicals to which it will be exposed.

2.17 NOISE MINIMIZATION

**************************************************************************
NOTE: Equipment selection should consider the pressure drop through silencer or muffler.
**************************************************************************

Install flexible connections and silencers, muffler or sound barriers on the equipment [discharge] [inlet and discharge] to attenuate sound level.

2.17.1 Silencer

**************************************************************************
NOTE: Canister type silencers should be considered for attenuation of low frequency sound levels, pressures higher than 5 kPa 20 inches of water and velocities greater than 20 meters per second 4,000 feet per minute. Use high temperature acoustical packing for temperature greater than 122 degrees C 250 degrees F.
**************************************************************************

Provide each blower with [inlet] [and] [discharge] silencers. Use silencers for [standard] [critical] grade silencing. Provide [absorption] [canister] [chamber] type intake silencers. Provide [absorption] [canister] [chamber] [combination chamber-absorption] type discharge silencers. Construct canister type silencer of two concentric perforated cylinders lined with high temperature acoustical packing forming an annular flow path, with an internal plug creating a blocked line of sight. Use silencer size as recommended by the silencer manufacturer and compatible with the blower requirements. Ensure silencer connections match the adjacent piping. Provide mounting brackets as required for silencer support. Construct silencer of heavy-duty rolled and welded steel plate with the inner liner welded to the outer shell to acoustically deaden the outer shell.

2.17.2 Muffler

**************************************************************************
NOTE: Hot-gas mufflers should be considered to effectively minimize the transmission of hot-gas pulsations whenever the noise level is an important consideration.
**************************************************************************

Install hot-gas muffler [on the intake] [on the exhaust] [in-line] to minimize the transmission of hot-gas pulsations.

2.17.3 Acoustical Insulation

Wrap silencers, [interior air piping,] [expansion joints,] [valves,] [and] [drive guards] with 25 mm 1 inch thick high density woven glass fiber mat
having a minimum density of 4.6 kg/square meter 15 ounces/square foot and lag with a 0.41 mm 0.016 inch thick aluminum jacket. Provide insulation conforming to EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.

2.17.4 Sound Barriers

**************************************************************************
NOTE: Barriers generally have limited high frequency attenuation.
**************************************************************************

Make sound barriers of insulated ductwork fastened to sheet steel walls. Limit flow velocity parallel to barriers to 1200 m 4000 feet per minute at pressures less than 5 kPa 20 inches of water.

2.18 MONITORING

**************************************************************************
NOTE: On projects with extensive process monitoring and control, replace text with a reference to Section 40 60 00 PROCESS CONTROL.
**************************************************************************

Equip each unit for monitoring the flow downstream of any bypass connections. Calibrate sensors with standards traceable to NIST and in conformance with NIST SP 250.

2.18.1 Flow

[Provide a turbine type flow meter equipped with transmitter and recorder for continuous metering of the process flow. Ensure accuracy is within 0.5 percent of full scale.] [Provide gas meters conforming to AGA ANSI B109.2.]

2.18.2 Temperature

2.18.2.1 Thermometers

Provide thermometers conforming to ASME PTC 19.3 TW with wells and temperature range suitable for the use encountered. Provide thermometers to indicate [inlet air temperature,] [discharge air temperature,] [and] [lubrication oil temperature.] Ensure thermometers are either red-reading mercury-in-glass type or dial type. Scale range must include full range of expected operation and up to 125 percent, but no more than 150 percent of maximum. Ensure accuracy is within 0.5 percent of full scale.

2.18.2.2 Thermocouples

Provide sensors conforming to ISA MC96.1, Type K, and provide downstream of each blower or as otherwise directed. Ensure thermocouple is suitable for continuous operation and control at temperatures up to [_____] degrees C F, accurate to [0.75] [_____] percent of full scale, and long enough to be inserted 150 mm 6 inches into the air flow. Provide thermocouple with an adjustable flange and with a protecting tube suitable for insertion into the air flow without support of the projecting end. Supply compensating lead wire 1.52 mm 16 gauge in diameter and 30 m 100 feet long with a weatherproof braid for connecting the thermocouple to the instrument. The installed unit must indicate gas passage temperatures and activate the high temperature alarm when the set point temperature is exceeded.
2.18.3 Pressure

**************************************************************************
NOTE: Verify the pressure ranges for the system.
**************************************************************************

Provide 6 mm 1/4 inch NPT female high and low pressure connections with a 
[stainless steel bar stock valve] [suitable shutoff cock] at each 
connection.  [Provide high pressure connection to the gauge with a 10 

micrometer 10 micron pleated paper filter and the low pressure connection 
with a fine mesh stainless steel strainer.] [Provide each pressure 
connection to the gauge with a snubber.]

2.18.3.1 Draft Gauge

Provide gauge conforming to ASME B40.100 with a diaphragm or bellows 
actuating system, a circular scale and a zero adjustment screw.  Provide 
inlet gauges with a range of 0 to 7.5 kPa 0 to 30 inches water gauge vacuum. 
Include the accessories for [control panel] [wall] [pipe] mounting.

2.18.3.2 Pressure Gauge

Provide gauges conforming to ASME B40.100 with a single Bourdon tube style 
actuating system, a circular scale and a zero adjustment screw.  Provide 
discharge gauges with a range of 0 to 75 kPa 0 to 11 psi.  Include the 
accessories for [control panel] [wall] [pipe] mounting.

2.18.3.3 Differential Pressure Gauge

Equip housing of each unit with a direct-reading gauge that measures the 
differential pressure range [of 0 to 100 kPa 0 to 14.5 psi with an accuracy 
of plus or minus 2 percent of full scale, calibrated linearly with 2 kPa 
0.34 psi scale graduations] [necessary to operate in conjunction with the 
corresponding venturi tube].  During operating conditions the pointer must 
be within the mid-range of the gauge.  Ensure accuracy is within 0.5 
percent of full scale.

2.18.3.4 Piston Element

Provide piston type element consisting of a spring-supported, corrosion 
resistant piston moving inside a glass cylinder with an operating pressure 
of 1.03 MPa 150 psi.  Provide cylinder with stainless steel end flanges 
with Viton O-ring seals and a cylinder burst pressure of no less than 4.15 
MPa 600 psi.  Construct the gauge such that a 3-valve manifold is not 
necessary.  If only one bar stock valve is closed, do not damage the gauge 
by up to 2.1 MPa 300 psi differential pressure in either direction.

2.18.3.5 Bellows Element

Install bellows pressure sensing element to measure pressure differential 
across the air moving equipment and dual opposed, liquid filled, 
rupture-proof type with bellows movement converted to rotation and 
transmitted by a torque tube.  Provide stainless steel bellows housing with 
a rated working pressure of no less than 3.5 MPa 500 psi.  Use liquid to 
fill the bellows that is suitable for the expected maximum temperature of 
the off-gas and the minimum ambient temperature.
2.18.4 Contaminant Monitoring and Sampling

2.18.4.1 Explosimeter
Perform continuous monitoring and recording of percentages of upper and lower explosive limits.

2.18.4.2 Hygrometer
Locate humidity sensor downstream of the heat exchanger or blower.

2.18.4.3 Sampler
Provide sampling port and equipment for collecting discrete and composite samples with adequate access for personnel and equipment.

2.18.4.4 Transmitter
Use transmitter to provide an analog two-wire electrical 4-20 milliamp signal directly proportional to the differential pressure and accurate to within 0.25 percent of sensor indication. Provide transmitter with built-in pulsation damper and suitable over-range protection. Do not require recalibration due to power outages. Transmitter must be UL listed for [Class 1, Division 1, Group D hazardous locations] [the electrical classification for the area as indicated on the drawings]. Supply each transmitter with a factory assembled five-valve stainless steel manifold. Furnish vent valves on upper ports of each transmitter. Mount and install transmitter according to manufacturer's recommendations.

2.18.4.5 Remote Indicator and Recorder
Display monitored parameters and excursion alarms locally on the control panel. Record digital data at intervals not exceeding one minute. Maintain process data in the control room and record on magnetic media in the approved micro computer compatible digital format. Flow information must include rate monitoring, integration and totalizing. Maintain hard copies of recorded data and summaries of recorded data in the control room. Ensure copies are available upon request.

2.19 CONTROL SYSTEM

**************************************************************************
NOTE: The designer will decide which automatic controls are needed and delete any inapplicable items.
**************************************************************************

Provide [a manual][an automatic] control system. Automatic controls are responsible for the balancing of the capacity with system requirements. Use these controls to automatically balance the equipment capacity with the load. Provide the system with the necessary control devices required for normal operation. Also include each of the following: a safe system operating mode when controls fail, indications for system failure, protective mechanisms and controls that are required for the safe operation of system equipment in an enclosure conforming to NEMA ICS 6. Submit wiring and ladder diagrams, and control sequences showing the control of the entire system.
2.19.1 Sequence of Control

**************************************************************************
NOTE: Develop and insert the sequence of control for each system.
**************************************************************************

The sequence of control are as follows: [____].

2.19.2 Sequence of Equipment Operation

**************************************************************************
NOTE: Develop the sequence of equipment operation and insert requirements in this paragraph.
**************************************************************************

Include instrumentation to modulate the output to meet pressure and/or volume demands as well as start or stop units if the system requires pressure and/or volume control.

**************************************************************************
Include logic to allow for automatic or manual alternation of lead/lag/standby assignments of units installed in parallel. Include Instrumentation to modulate the pressure and volume output as well as start or stop units to meet pressure and/or volume demands. Off-gas systems with safety, emission, or process controls are subject to automatic control logic permissives. Include start and stop push button switches, [hand-off-automatic (H-O-A) switches where the system controls operation] [safety features such as blade and belt guards, vibration or temperature switches] [surge warning and shutdown] [low oil pressure,] [high oil temperature switches] [process oriented switches such as upstream or downstream process equipment failure shutdown or emission detection shutdown]. Provide additional controls or protective devices as indicated.

Submit detailed manufacturer's data on the overall controls, sensors, process controllers, control operators, valves, interlocks and alarms.

2.19.3 Intake Volume Control

**************************************************************************
NOTE: Under colder air operating conditions, in centrifugal blowers with a relatively flat characteristic flow curve, volume may be controlled over a narrow working range by adjusting variable inlet guide vanes to vary the pressure-volume characteristics. Variable inlet vanes are acceptable, but inefficient. A butterfly valve may be used to create inlet head losses to throttle the blower inlet and reduce volumetric flow rate.
**************************************************************************

Install [automatically] [manually] controlled [adjustable guide vanes] [line sized butterfly valve] on blower inlet to create inlet head losses and reduce the volumetric flow rate.

2.19.4 Outlet Volume Control

**************************************************************************
NOTE: The most efficient method to vary both volume
and pressure is to vary the speed of the driver.

Other methods of controlling output are outlet damper and eddy current coupling (generally an outdated way to achieve speed control). Outlet dampers may serve if high pressure at low volume is desired and high energy costs are not of concern.

[Install variable speed control to control output volume] [Provide automatically controlled bypass to recirculate directly around the blower] [Install manual line sized [unloading] [check] [butterfly] valve on blower outlet to create system head losses and reduce the volumetric flow rate].

2.19.5 Panel

**************************************************************************

NOTE: Delete inapplicable items. Consider site location and operational factors for alarm requirements. Indicate equipment on drawings and/or reference other specifications as appropriate.

**************************************************************************

A NEMA [4] [7] [12] [explosion proof] [weather proof] [instrument panel] [control panel] enclosing relays, Contractor, timers, and selector switches must be [floor mounted] [wall mounted] [mounted with vibration isolators on the unit] and provided with hinged cover and latch. Provide direct reading type instruments that are factory mounted and connected. Connect shutdown feature to the annunciator on the instrument panel and identify each shutdown feature. Include the following features and instruments:

a. Running time meter.

b. Alarm annunciator [with single audible alarm] [and] [with contacts to operate a remote alarm] and individual lights for each alarm condition.

2.19.6 Protective Devices

Provide blower protective devices, upon alarm condition, to cause immediate de-energization of the motor, initiate the automatic shutdown sequence, and provide audible and visual alarm indication.

2.19.6.1 Bearing Temperature

Install temperature sensors with switches on each bearing. The control relay, selector switch, test push buttons, and running indicator, or light, on the panel must indicate bearing status. High temperature of any bearing must initiate protective shutdown and the indicator, or light, must indicate the affected bearing.

2.19.6.2 Surge and Overload Protection

**************************************************************************

NOTE: Centrifugal blowers are subject to a characteristic called "surge" or minimum flow point below which the blower performance is unstable. The instability manifests itself in pressure pulsations and flow reversals which can become severe enough to damage the blower or system. Surge occurs when the...
system resistance is greater than the pressure that the blower is capable of producing at a given inlet volume; this results in a backward rush through the blower and out the inlet, lowering the pressure in the discharge line at which time normal compression resumes and cycle is repeated, until discharge pressure is decreased or blower pressure increased. Surge may be prevented by using manual or automatic controls.

Provide a set-point controller to monitor current input to the motor. Allow the controller to open and close the inlet [guide vanes] [butterfly valve] in response to current. Initiate automatic shutdown sequence and give visual indication of reason for shutdown if surge conditions are indicated by the motor current. Provide manual control and override to enable equipment startup and shutdown.

2.19.6.3 Oil Temperature and Pressure

Install temperature and pressure sensors with switches on each oil pump. The control relay, selector switch, test push buttons, and running indicator, or light, on the panel must indicate status. High oil temperature, high oil pressure or low oil pressure must initiate protective shutdown and the indicator, or light, must indicate the affected setting.

2.20 ELECTRICAL EQUIPMENT

NOTE: Show hazardous area classification on the drawings.

Provide electrical equipment conforming to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical motor driven equipment herein specified complete with motors, motor starters, and controls. Provide electrical equipment and wiring in accordance with NFPA 70, with proper consideration given to environmental conditions such as moisture, dirt, corrosive agents, and hazardous area classification.

2.20.1 Electric Motors

Drive each electric motor-driven unit by a weather-protected, Type [I][II][totally-enclosed fan cooled] continuous-duty electric motor. Provide motor with a [_____] service factor. Provide [squirrel-cage induction][synchronous] motors with normal-starting-torque and low-starting-current characteristics, and sized to avoid exceeding the nameplate power rating throughout the entire published characteristic curve. Provide premium efficiency type integral size motors in accordance with NEMA MG 1. Use motor bearings to provide smooth operations under the conditions encountered for the life of the motor. Provide adquate thrust bearing in the motor to carry the weight of the rotating parts plus the hydraulic thrust that are capable of withstanding upthrust imposed during starting [and under variable head] conditions specified. Ensure motors are rated [_____] volts, [_____] phase, 60 Hz and such rating is stamped on the nameplate. Motors must conform to NEMA MG 1.
2.20.2 Control Equipment

[Manually controlled units must have START-STOP pushbutton in cover.] [Automatically controlled units must have three-position MANUAL-OFF-AUTOMATIC selector switch in cover.] Provide additional controls or protective devices as indicated.

2.20.3 Variable Speed Controls

**************************************************************************
NOTE: Include this paragraph if any of the motors has a variable speed control.
**************************************************************************

The variable speed motor controller must convert 460 volt plus 15 percent, minus 5 percent, three phase, 60 Hz (plus or minus 2 Hz) utility power to adjustable voltage/frequency, three phase, ac power for stepless motor control from 5 percent to 105 percent of base speed. With the product data submittal for the controls, provide capacities and capacity ranges; performance charts and curves.

2.20.3.1 Description

Use variable speed drive to produce an adjustable ac voltage/frequency output for complete motor speed control. The variable speed drive must be automatically controlled by [a pneumatic 20.7 to 103.4 kPa 3 to 15 psig control signal] [a grounded electronic control signal]. The variable speed drive must be self contained, totally enclosed in a NEMA MG 1 ventilated cabinet and capable of operation between 0 and 40 degrees C 32 and 104 degrees F. The variable speed drive maximum output current rating must be equal to or exceed the motor nameplate full load. The manufacturer must advise the maximum recommended motor sine wave current for each controller rating. Variable speed drive multiple motor operation at same frequency/speed must be possible as long as the sum of connected motor full load sine wave currents are less than or equal to the variable speed drive maximum continuous current rating. Variable speed drive must be [85] [90] [95] percent efficient at 100 percent of rated output power.

2.20.3.2 Governing Requirements

Provide variable speed drive in compliance with 47 CFR 15 regulation of RF1/EMI emission limits for Class A computing devices. Display the FCC label of compliance on the variable speed drive. Variable speed drive and option design and construction thereof must comply with the applicable provisions of NFPA 70, Article 43D, Sections A-L.

2.20.3.3 Basic Features

Provide variable speed drive with the following basic features:

a. Hand/off/auto operation.

c. Minimum/maximum adjustable speeds.

d. Speed potentiometer.

e. Auto restart.
f. Linear timed acceleration and deceleration for soft starting and stopping.

g. Controlled speed range 3-63 Hz. (Factory set at 15 Hz minimum).

h. Terminal connections for time clock control, fire, smoke, freeze detectors, and EP relay pre-set speed override.

i. Output frequency terminals for remote metering.

2.20.3.4 Protective Circuits and Features

Provide variable speed drive controller including the following protective circuits/features:

a. Current limits to 100 percent design by slowing the down motor.

b. Instantaneous electronic trip to automatically shut down the motor if current exceeds 120 percent of design or phase-to-phase output short circuit occurs.

c. The variable speed drive will restart automatically when input line returns to normal in the event of intermittent power outage or phase loss or overvoltage shutdown.

d. Input power protection shuts down the unit on low input line voltage or loss of an input phase.

e. Insensitive to incoming power phase.

f. Fast acting current limiting input fuses, (Class J) rated with 200,000 interrupting amperes capability.

g. Isolated 115 volt control circuit and dedicated control transformer.

h. Line-to-line fault protection.

i. Line-to-ground short circuiting and accidental motor grounding protection.

j. Output thermal overload relay trip.

2.20.3.5 Adjustments

The variable speed drive must have 0 to 75 percent of minimum speed, and 100 percent of maximum speed, adjustments available via potentiometers located on the faceplate of a single, regulator printed circuit board.

2.21 APPURTENANCES

2.21.1 Dielectric Fittings

Install dielectric fittings between threaded ferrous and nonferrous metallic pipe, fittings and valves. Use dielectric fittings, suitable for the required working pressure, to prevent metal-to-metal contact of dissimilar metallic piping elements.
2.21.2 Isolation Joints

Install isolation joints between nonthreaded ferrous and nonferrous metallic pipe, fittings and valves. Isolation joints must consist of a sandwich-type flange isolation gasket of the dielectric type, isolation washers, and isolation sleeves for flange bolts. Isolation gaskets must be full faced with outside diameter equal to the flange outside diameter. Bolt isolation sleeves must be full length. Units must be of a shape to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.21.2.1 Sleeve-type Couplings

Use sleeve-type couplings for joining plain end pipe sections. The two couplings must consist of one steel middle ring, two steel followers, two gaskets, and the necessary steel bolts and nuts to compress the gaskets.

2.21.2.2 Split-sleeve Type Couplings

Use split-sleeve type couplings, in aboveground installations when approved in special situations, that consist of gaskets and a housing in two or more sections with the necessary bolts and nuts.

2.21.3 Valves

******************************************************************************
NOTE: Evaluate the need for silencers and/or carbon adsorption units if handling toxic gases downstream of relief and/or unloading valves.

Threaded connections are common on valves 25 mm 1 inch and smaller, and are sometimes used on valves up to 50 mm 2 inch. If a welded end connection is desired for valves 50 mm 2 inch and smaller, a socketweld is usually chosen. Socketweld end dimensions are standardized by ASME B16.11. Buttweld ends are preferred when zero leakage is required. The valve body material must be compatible with the adjoining pipe material for welding.

******************************************************************************

Valve diameter must be equal to the diameter of the pipe in which the valve is located unless otherwise indicated. Ensure valves are [screw] [socket weld] [buttweld] [sweat] [flange] connected. Rated operating conditions are [_____] degrees C F and [_____] kPa psig, minimum. Materials of construction are [aluminum] [bronze] [stainless steel] [_____] body, [bronze] [316 stainless steel] trim, and [Buna-N] [EPR] [Viton] [PTFE] elastomers. Mark valves in accordance with MSS SP-25 to identify the manufacturer, valve sizes, pressure rating, body and seat material.

2.21.3.1 Relief Valve

******************************************************************************
NOTE: Relief valves are provided in the following configurations: weighted type (install in horizontal position only), spring type and pilot operated diaphragm type which (with an optional solenoid valve) can be used for an unloading valve as well. Relief valves are also used to relieve possible...
thermal expansion in a pipe line if no other provisions exist. Indicate on the drawings a site flow indicator downstream of each relief valve. Indicate the operating pressure required for each valve.

ASTM F1508 covers only spring-loaded, angle style valves.

Provide relief valve capable of maintaining a constant upstream pressure regardless of the downstream demand for each air mover. Valve must be [ASTM F1508 angle spring loaded] [weighted] [pilot-operated diaphragm] differential pressure relief valve with a [_____] percent accumulation. Rate valve to relieve [the full capacity of the air moving equipment] [_____] cubic meters/second [feet/minute]. Ensure valve is factory-set to open at the [actual] [gauge] [pressure] [vacuum] of [_____] kPa psi and field adjustable within a minimum range of plus or minus 20 percent. Locate valve within [_____] m feet upstream of vacuum equipment or downstream of pressure equipment.

2.21.3.2 Unloading Valve

NOTE: Unloading valves allow the blower to start under reduced pressure.

Unloading valve must be [pilot-operated diaphragm valve with auxiliary solenoid operator] [butterfly valve] actuated by the system controls and field adjustable within a minimum range of plus or minus 20 percent. Set unloading valve to relieve [_____] cubic m/second feet/minute at a set gage pressure of [_____] kPa psi or a vacuum of [_____] kPa inches Hg.

2.21.3.3 Combination Relief and Unloading Valve

NOTE: Combination valves should be carefully located with respect to heavily contaminated off-gas streams or deleted in favor of separate valves.

Set combination relief and unloading valve to relieve at a set [actual] [gauge] [pressure] [vacuum] of [_____] kPa psi.

2.21.3.4 Purge Valve

NOTE: For vacuum pump applications, an automatic purge valve is useful in clearing the system of vapors which may condense in shutdown or startup.

Equip each vacuum unit with a manually adjustable, normally closed automatic purge valve. Ensure valve is factory-set to open at at the gauge pressure of 0.5 kPa 0.15 inches Hg and field adjustable within a minimum range of plus or minus 20 percent. Locate valve within 1 m 3.3 feet downstream of vacuum equipment.
2.21.3.5  Vacuum Breaker

**********************************************************************
NOTE: Edit the settings appropriately for the equipment required.
**********************************************************************

Provide [pilot-operated diaphragm type with auxiliary solenoid operator]
[butterfly valve actuated by blower system controls] vacuum breaker to
protect blower or vacuum pump from surges. Rate valve to relieve 0.05
cubic m/second 1.76 cfm at a set gage pressure of 100 kPa 14.7 psi or a
vacuum of -50 kPa -15 inches Hg. Materials must be [aluminum] [bronze]
[stainless steel] body, [bronze] [316 stainless steel] trim, and [Buna-N]
[EPR] [Viton] [Teflon] elastomers. Provide rating of 100 degrees C 212
degrees F and 1000 kPa 147 psi, minimum.

2.21.3.6  Check Valve

Provide a [pilot-operated diaphragm valve with auxiliary solenoid operator]
[butterfly valve actuated by system controls] with a closing time of 1 to 5
seconds, located on the discharge side of each air mover. Prevent reverse
flow and open at a controlled rate to keep air mover starting surges from
shocking downstream equipment. Opening rate must be adjustable from 5 to
60 seconds.

2.21.3.7  Control Valve

**********************************************************************
NOTE: Starting and stopping the air moving equipment is preferable to operation against a closed system.
**********************************************************************

Valve must be a [pilot-operated diaphragm valve with auxiliary solenoid operator] [butterfly valve actuated by system controls].

2.21.3.8  Back Pressure Valve

Valve must be capable of maintaining a constant upstream pressure regardless of the downstream demand.

2.21.3.9  Manual Valve

[Provide ball valves in accordance with MSS SP-72. Provide gate, plug and ball valves in accordance with API Spec 6D. Provide thermoplastic gas shutoffs and valves in accordance with ASME B16.40. Manual valve must be wrench operated, rising stem, with cap.] [Provide non-automatic valve as required by Section 31 21 00 OFF-GASSING MITIGATION.]

2.21.4  Inlet and Discharge Elbows

Inlet and discharge elbows must be of the long sweep type with ASME B16.1,
Class 125 flanges.

2.21.5  Expansion Coupling

Provide inlet and the outlet of each unit with flexible expansion couplings
of extra heavy gauge rubber, wire reinforced type suitable for temperature
range of minus 29 to plus 121 degrees C minus 20 to plus 250 degrees F and
pressure range from 51 to 103 kPa 15 inches of mercury vacuum to 15 psig.

2.21.6 Heat Exchanger

Provide [an air-to-air] [a water cooled] heat exchanger on the blower [inlet] [outlet] with sufficient capacity to reduce the air temperature [_____] degrees C F.

2.21.7 Flame Arrestor

Locate flame arrestor immediately upstream of any source of flame. Submit rating, capacity and pressure differentials. Also include installation instructions with the submittal.

2.21.8 Drip Trap

Provide drip trap in accordance with ASTM F1139.

2.21.9 Liquid Receiver

Design, fit, and rate liquid receivers for 0.345 MPa 50 psi working pressure. Provide each receiver with a storage capacity no less than [_____] L gal. Equip each receiver with inlet and outlet drop pipe, drain with valve, relief valve and two bull's-eye liquid-level sight glasses. Ensure sight glasses are in the same vertical plane, 90 degrees apart, perpendicular to the axis of the receiver, and not over 75 mm 3 inches horizontally from the drop pipe measured along the axis of the receiver. In lieu of bull's-eye sight glass, provide external gauge glass with metal glass guard and automatic closing stop valves. The outside of liquid receivers must be galvanized or supplied with commercial enamel finish.

2.21.10 Air Receiver

Design receiver for 0.345 MPa 50 psi working pressure. Equip receivers with safety relief valves and accessories, including pressure gauges and automatic and manual drains. Design and construct receivers in accordance with ASME BPVC SEC VIII D1 and with the design working pressures specified herein. Provide a display of the ASME seal on the receiver or a certified test report from an approved independent testing laboratory indicating conformance to the ASME Code. The outside of air receivers must be galvanized or supplied with commercial enamel finish.

2.22 BASE PLATE

Mount each unit on all-welded structural steel or cast iron base complete with vibration isolators with published load rating. Provide base plate with vertical jacking screws to facilitate leveling. Isolate the entire unit from the building structure.

2.23 WEATHERPROOF ENCLOSURE

**************************************************************************
NOTE: Include this paragraph for equipment mounted partially or completely outdoors.
**************************************************************************

Provide a weatherproof enclosure for the air moving equipment and motor assembly. Provide enclosure with lockable access doors and louvered for ventilation. [Insulate and equip the enclosure with a thermostatically
controlled electric heating and ventilation.]

2.24 ATTACHMENTS

Provide shafts, chains or gear driven equipment with all-metal guards enclosing the drive mechanism. Construct guard of galvanized sheet steel, or galvanized woven wire, or expanded metal set in galvanized steel frame. Secure guards in position by steel braces or straps which will permit easy removal for servicing the equipment.

2.25 COATINGS OR FINISHES

**************************************************************************
NOTE: Consult with coatings supplier on specific coating once liquid and gas composition are known. Be aware of the VOC content of the coating and the regulations that restrict application of high VOC coatings; use low VOC coatings unless quality of coating will not meet requirements.
**************************************************************************

Clean and prime motors, casings and similar parts of equipment finished in the shop and give two finish coats with [alkyd primer followed by two alkyd modified silicone final coats] [severe chemical service phenolic type coatings] [paint suitable for the environment in which the unit is to be placed] at the factory. Give ferrous surfaces not painted at the factory a shop coat of grease or other suitable rust resistant coating.

2.26 FACTORY TESTS

**************************************************************************
NOTE: Delete inapplicable tests.
**************************************************************************

Equipment is subject to in-plant shop and quality control inspections before approval for shipment from manufacturer’s facilities. Operate rotating parts of the equipment throughout the required range without excessive end thrust, vibration or noise.

2.26.1 Integrity

Test each [impeller] [rotor] assembly by operating at a speed to [20] [_____] percent above operating speed and check for cracks using the dye penetrant method or similar method of equal accuracy.

2.26.2 Balance

Statically and dynamically balance rotating parts in accordance with ISO 1940-1. First critical speed is at least 150 percent of maximum operating speed. Statically and dynamically balance the shaft and impeller or blade assembly as a unit. Removing of metal from the impeller or blades by boring is not an acceptable means of balancing the shaft and impeller unit. Impeller or blade assemblies must be statically and dynamically balanced to within 0.5 percent of W times R squared, where W equals weight and R equals impeller radius.

2.26.3 Deflection

Total shaft peak-to-peak dynamic deflection measured by vibrometer at seal
face is not allowed to exceed 5.1 microns 2 mils under the complete range of operating conditions.

2.26.4 Vibration

**************************************************************************
NOTE: Deflection is normally specified for centrifugal blowers. Velocity is normally specified for positive displacement blowers.
**************************************************************************

[Vibration is not allowed to exceed 2.5 microns 1.0 mil at the bearing housing with the equipment operating.] [Ensure peak vibration velocity is less than 7.62 mm/second 0.30 inch per second.]

2.26.5 Capacity

Determine volume and pressure characteristics of air moving equipment by the [manufacturer] [a nationally recognized testing agency] in accordance with AMCA 210. Submit certified test results and sample calculation from test readings to the Contracting Officer. Where two or more identical units are specified, the capacity of only one representative unit needs to be tested.

2.26.6 Noise

Test air moving equipment with sound attenuation devices installed by the [manufacturer] [a nationally recognized testing agency]. Submit certified test results and sample calculation from test readings to the Contracting Officer. Where two or more identical units are specified, only one representative unit needs to be tested. Test fans in accordance with AMCA 300 with results interpreted in accordance with AMCA 301.

2.26.7 Variable Speed Drive

Subject each variable speed drive to an in-plant quality control inspection. Integrated circuits must undergo a 160-hour "burn-in" to test reliability. Cycle the temperature between 0 and 70 degrees C 32 and 158 degrees F during the "burn-in". Each completed unit must undergo a fully loaded 24-hour "burn-in".

2.26.8 Continuity

Check wiring and instrumentation assembled at the factory for continuity prior to shipping.

2.26.9 Receivers

Ensure receivers are factory air tested to 1.5 times the specified working pressure.

2.26.10 Valve Testing

Test relief valves in accordance with ASME PTC 25.
PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

**************************************************************************

NOTE: Rotary lobe blowers must be absolutely horizontal to operate properly.
**************************************************************************

Install vibration dampener in sufficient quantity to isolate each unit from the structural base on which the unit is installed. Install, align and level each air moving unit and motor in accordance with the written instruction of the manufacturer [and under the direct supervision of the manufacturer's representative]. [Deviation from horizontal must be below limits of measurement.] [Set impellers by the manufacturer's representative]. Do not use flexible couplings to compensate for misalignment between driver and driven unit. Blower venting is not allowed to violate the provisions of either ACGIH 2098 or AMCA 99.

3.2.1 Concrete Foundations

Provide concrete for equipment foundations [as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE] [with a minimum compressive strength of at least 17 MPa 2,500 psi]. Provide concrete foundations that are [integral with and of the same class as that of the building floor] [entirely separated from the surrounding floor with a premolded filler strip installed between the foundation and floor slab as shown]. Furnish foundation bolts, as required, for proper positioning during the placement of the concrete.

3.2.2 Seismic Requirements

**************************************************************************

NOTE: Provide seismetic requirements, if a Government designer (either Corps office of A/E) is the Engineer of Record and show on the drawings. Delete the bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-310 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC, properly edited, must be included in the contract documents.
**************************************************************************

Support and brace equipment and attached valves to resist seismic loads as specified under UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC[as shown on the drawings].

3.3 FIELD PAINTING

Do not paint stainless steel, galvanized steel, and nonferrous surfaces.
3.3.1 Touch-Up Painting

Clean factory painted items, requiring touching up in the field, of foreign material and prime top-coat with the manufacturer's standard factory finish, provided it does not discolor in the presence of hydrogen sulfide fumes, high water vapor atmosphere, alkaline water vapor, and concentrated chlorine (oxidizing) conditions.

3.3.2 Exposed Ferrous Surfaces

Paint equipment which did not receive a factory finish and other exposed ferrous surfaces as specified in Section 09 90 00 PAINTS AND COATINGS. Ensure coating is not less than 0.05 mm 1.75 mils thick.

3.4 MANUFACTURER'S FIELD SERVICES

Provide the services of a manufacturer's representative experienced in the installation, adjustment, and operation of the equipment specified. Supervise the installing, adjusting, and testing of the equipment.

3.5 POSTING FRAMED INSTRUCTIONS

Post framed instructions containing wiring and control diagrams where directed. Post condensed operating instructions as specified. Post the framed instructions before acceptance testing of the systems.

3.6 FIELD TESTING

3.6.1 Deficiencies

If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests.

3.6.2 Correct Installation

Assure that the units and appurtenances have been installed correctly, there is no objectionable heating or vibration, noise from any part is not excessive, and manual and automatic controls function properly.

3.6.3 Field Equipment Test

After installation of the air moving units and appurtenances is complete, carry out operating tests to ensure that the installation operates properly. [Make arrangements to have the manufacturer's representative present when field equipment tests are made.] Give each unit a running field test in the presence of the Contracting Officer for a minimum of [4] [_____] hours [at its rated capacity] [at the point of maximum power requirement indicated on the head-capacity curve or point on the curve selected by the Contracting Officer]. Provide an accurate and acceptable method of measuring the discharge flow and pressure.

3.6.4 Noise Suppression

Sound level must be less than [60] [70] [80] dB measured at 1.5 m 5 feet from the source.

3.6.5 Reporting

Submit test reports in booklet form showing field tests performed to adjust
each component and field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed equipment. Identify test methods used and record test results. Indicate the final position of controls in each test report.

3.7 CLOSEOUT ACTIVITIES

3.7.1 Field Training

**************************************************************************

NOTE: The number of hours required to instruct a Government representative in operation and maintenance of the system will depend on the complexity of the system specified. Designer is to establish the number of hours of training based on equipment manufacturer recommendations, system complexity and consultation with the installation.

**************************************************************************

Conduct a field training course for designated operating, maintenance and supervisory staff members. Submit training course curriculum and training instructions 14 days prior to the start of training. Provide training after the system is functionally complete but prior to final acceptance tests, for a total period of [16] [24] [_____] hours of normal working time. Cover the items contained in the operating and maintenance instructions.

3.7.2 Operating and Maintenance Instructions

3.7.2.1 Operating Instructions

Submit [six] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include in the operating instructions the following for system components: manufacturer's name, model number, service manual, parts list, and brief description of each piece of equipment and its basic operating features; flow diagrams; system layout showing piping, valves, and controls; [as-built] [approved] wiring and control diagrams; control sequence describing startup, operation, and shutdown; manufacturer's bulletins, cuts, and descriptive data.

3.7.2.2 Maintenance Instructions

Submit [six] [_____] complete copies of maintenance instructions for each piece of equipment including the following: manufacturer's complete list of parts, recommended spare parts and supplies, with current unit prices and source of supply; routine maintenance procedures, including the requirements of WEF MOP 11, as a minimum; possible breakdowns and repairs; a troubleshooting guide to help the operator determine what steps must be taken to correct any equipment problems.

3.4 INSTRUCTION TO GOVERNMENT PERSONNEL

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for non-breathing air compressed air systems inside of buildings with pressures up to 862 kPa (gage) 125 psig.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Project requirements may require supplemental information added to the paragraphs contained herein.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard’s Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section, with the additions and modifications specified herein.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
- Air compressor
- Air Dryer
- Air receiver
- Desiccant air dryers
- Desiccant
- Pipe
- Fittings
- Valves
- Pressure gages
- Hangers and supports
- Quick disconnect couplings
- Filters
- Strainers
- Traps
- Lubricators
- Flexible connections
- Dielectric unions
- Hose reel assembly
- Valve box
- Identification labels for piping
- Tubing

For receivers, include Manufacturer's Data Report Form U-1 or U-1A

SD-06 Test Reports
- Non-Destructive Examination (NDE) report for welding of piping
- Leak tightness tests
SD-07 Certificates

Employer's record documents
Welding procedures and qualifications
Cleaning and flushing procedures

SD-08 Manufacturer's Instructions

Air receiver

Include manufacturer's recommended certification test procedure and recommended procedure for cleaning, external painting, and delivery preparation.

SD-10 Operation and Maintenance Data

Air compressor, Data Package 4
Air dryer, Data Package 4

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals

Posted operating instructions for air compressor
Posted operating instructions air dryer

1.4 QUALITY ASSURANCE

**************************************************************************
NOTE: The SMACNA Seismic Restraint Manual referenced in the paragraph below shall be applied to locations subject to significant risk of seismic induced loads. The degree to which this manual is to be used for contract drawings and specifications shall be determined by the designer of record in coordination with the NAVFAC Engineering Field Division's Mechanical Design Branch.
**************************************************************************

Provide work specified in this section, including design, materials, fabrication, assembly, erection, installation, and examination, inspection and testing of compressed air systems in conformance with ASME B31.9[ and SMACNA 1981], as modified and supplemented by this specification section and accompanying drawings. In ASME B31.1, ASME BPVC SEC VIII D1, and ASME BPVC SEC IX, the advisory provisions shall be considered mandatory, as though the word "shall" had been substituted for "should" wherever it appears; reference to the "authority having jurisdiction" and "owner" shall be interpreted to mean the Contracting Officer.

1.4.1 Welding procedures and qualifications

Provide welding work specified in this section for compressed air piping systems in conformance with ASME B31.9, as modified and supplemented by
this specification section and the accompanying drawings. The welding work includes: qualification of welding procedures, welders, welding operators, and nondestructive examination personnel; maintenance of welding records, and examination methods for welds.

1.4.1.1 Butt Welded Joints

Butt welded joints shall be full penetration joints.

1.4.2 Employer's Record Documents

Submit to the ROICC for his review and approval the following documentation. This documentation and the subject qualifications shall be in compliance with ASME B31.9.

a. List of qualified welding procedures that is proposed to be used to provide the work specified in this specification section.

b. List of qualified welders, and welding operators that are proposed to be used to provide the work specified in this specification section.

c. List of qualified weld examination personnel that are proposed to be used to provide the work specified in this specification section.

1.4.3 Welding Procedures and Qualifications

Specifications and Test Results: Submit copies of the welding procedure specifications and procedure qualification test results for each type of welding required. Approval of any procedure does not relieve the Contractor of the responsibility for producing acceptable welds. Submit this information on the forms printed in ASME BPVC SEC IX or their equivalent.

1.4.3.1 Certification

Certification: Before assigning welders or welding operators to the work, submit a list of qualified welders, together with data and certification that each individual is performance qualified as specified. Do not start welding work prior to submitting welder, and welding operator qualifications. The certification shall state the type of welding and positions for which each is qualified, the code and procedure under which each is qualified, date qualified, and the firm and individual certifying the qualification tests.

1.4.3.2 Renewal of Qualification

Requalification of a brazer or brazing operator shall be required under any of the following conditions:

a. When a brazer or brazing operator has not used the specific brazing process for a period of 6 months.

b. There is specific reason to question his ability to make brazes that will meet the requirements of the specifications.

1.4.4 Equipment Data

Submit the following data for equipment listed for "Operation and Maintenance Instructions, Parts and Testing."
a. Name and address of authorized branch or service department.

b. Characteristic curves.

c. Following applicable data completely filled in:

   Manufacturer and model number [_____]

   Operating speed [_____]

   Capacity [_____] (CMS) (CFM)

   Type of bearings in unit [_____]

   Type of lubrication [_____]

   Type and adjustment of drive [_____]

   Capacity of tank [_____]

   Electric motor: Manufacturer, frame and type [_____]

   Motor speed [_____] rad/sec RPM

   Current characteristics and kW hp of motor [_____]

   [_____] Thermal cut-out switch: Manufacturer, type and model [_____]

   Starter: Manufacturer: Type and model [_____]

1.5 SAFETY PRECAUTIONS

1.5.1 Temperature Restriction

**************************************************************************
NOTE: The designer shall assure that the piping design temperature is not exceeded, especially for high pressure systems. Provide aftercoolers and high temperature shutdown devices as required for safe operation of the systems.
**************************************************************************

Compressors or other equipment shall not discharge compressed air to the piping systems above [38] [_____] degrees C [100] [_____] degrees F unless approved by the Contracting Officer. Aftercoolers or other devices shall be provided to comply with the temperature restriction.

1.5.2 Rotating Equipment

Fully guard couplings, motor shafts, gears and other exposed rotating or rapidly moving parts in accordance with OSHA 29 CFR 1910.219. Provide rigid and suitably secured guard parts readily removable without disassembling guarded unit.

1.5.3 Welding and Brazing

Safety in welding, cutting, and brazing of pipe shall conform to AWS Z49.1.
PART 2  PRODUCTS

2.1  LOW PRESSURE AIR COMPRESSOR, 7 1/2 TO 224 KW 10 TO 300 HP

7 1/2 kW to 224 kW, up to 862 kPa (gage) 10 to 300 hp, up to 125 psig.
Configuration and dimensions of the air compressor shall be compatible with
the indicated space allocated. Sound level shall not exceed 84 dBA one
meter from compressor unit. Conform to FS XX-C-2816 and following ordering
data (paragraph 6.2) thereof:

a. Specification title, number and date: As listed hereinbefore under
"REFERENCES."

b. Type: [I - Single acting (reciprocating)] [II - Double acting
(reciprocating)] [III - Rotary (vane, screw)].

c. Issue date of applicable specifications and standards: As specified.

d. Packaged assembly requirement: [Packaged Unit required] [Field
assembled].

e. First article inspection: [Not required; furnish certified test
report.] [Required.]

f. Capacity (cms) (cfm): [At least as indicated.] [ cms cfm:____].

Discharge working pressure: [At least as indicated.] [ kPa (gage) psig:
[____].]

g. Number of stages for Type I compressor: [Single stage.] Type I [Two
stages].

Water-jacketed cooling: [Not applicable.] [Required] [Not required].

h. Number of stages for Type II compressor: [Single Stage] [Two stages]
[Not applicable].

i. Oil-free air delivery Type II compressors: [Required.] Type II [Not
required.]

j. Type bearings: Manufacturer's standard.

k. Air filter to function as muffler: Required.

l. Air Filter conformance with MS: Not required; provide manufacturer's
standard.

m. Safety valve in discharge line when no receiver provided: [Not
applicable.] [Required, ASME BPVC SEC VIII D1 and ASME BPVC SEC IX
Code stamped safety relief valve.]
n. Shut-off valve on compressor discharge: [Not required] [Required].

o. Oil Filter compliance with FS F-F-351: Not required; provide manufacturer's standard.

p. Drain plug conformance with MS: Not required; provide manufacturer's standard.

q. Electric, thermostatically controlled immersion oil heater: [Not] required.

r. Compressor regulation method: [Constant-speed control]. [Dual control: Alternative constant speed or automatic start-stop.]

s. Timed stop control (for constant speed control: [Not applicable] [Required].

**************************************************************************

NOTE: Edit Table A to select only the optional safety controls required for the project.

**************************************************************************

t. Optional safety controls required: As specified on Table A.

tt. Preservation-packaging: Not applicable.

2.2 LOW PRESSURE AIR COMPRESSOR UNIT, LESS THAN 7 1/2 kW 10 HP

Low pressure air compressor unit, less than 7 1/2 kW 10 hp, up to 862 kPa (gage) 125 psig, shall conform to the following.

2.2.1 Compressor and Receiver Capacity

Sized as indicated. [Oil-free air] [Air] delivered at indicated pressure.

2.2.2 Mounting

Common sub-base for receiver and compressor.

2.2.3 Compressor Type

Reciprocating [or rotary].

2.2.4 Nameplate

Metal, securely fastened to equipment or base, listing:

Manufacturer's name and address
Model and serial numbers
Compressor operating data and rating.

2.2.5 Receiver

2.2.6 Receiver Condensate Drain

Automatic float-type trap per CID A-A-60001.

2.2.7 Compressor Accessories

Air inlet filter and silencer. Air-cooled intercooler and aftercooler which reduce air discharge temperature to 38 degrees C 100 degrees F.
2.2.8 Control

Unloaded start with enclosed diaphragm-type pressure switch automatically controlling start-and-stop.

2.2.9 Motor

Squirrel-cage induction motor with drip-proof enclosure and conforming with NEMA MG 1, suitable for operation on the indicated power supply. Rated horsepower of motor shall equal or exceed power required for continuous operation of compressor at full load.

2.2.10 Starter

Capacity and electrical characteristics shall be compatible with motor. Starter shall conform with NEMA ICS 2 with NEMA ICS 6 enclosure. Include thermal overload protection of all phases.

2.2.11 Noise

84 dBA maximum sound level one meter from compressor unit.

2.3 LOW PRESSURE AIR RECEIVER

ASME BPVC SEC VIII D1, labeled and rated for \[862\] \[1379\] kPa (gage) \[125\] [200] psig, equipped with required valves and trimmings, including gage and automatic drain valve and ASME BPVC SEC VIII D1 and ASME BPVC SEC IX pressure safety relief valve. Pressure as indicated. [Sandblast exterior and interior to SSPC SP 10/NACE No. 2, near-white. Lining shall be a factory applied 0.20 mm 8 mil minimum white epoxy coating.] Exterior finish shall be [standard factory finish] [two coats of rust inhibitor primer and one coat epoxy enamel].

2.4 LOW PRESSURE COMPRESSED AIR DRYERS

******************************************************************************
NOTE: Normally used for under 944 scms 2000 SCFM capacity systems.
******************************************************************************

Provide low pressure compressed air dryers of the mechanical refrigeration type, equipped with an automatic temperature shutdown switch to prevent freezing, a regenerative air to air exchanger (in capacity sizes above 4.72 or 28.31 scms 10 or 60 scfm as standard with the manufacturer), and a main compressed air cooling exchanger. Refrigeration system shall cool compressed air to dry the air. Dryer shall have no internal traps or filters and shall have pressure drop not greater than \[20.68\] \[____\] kPa \[3\] \[____\] psi [indicated]. Air shall leave the dryer at a temperature of \[____\] degrees C F and dew point of \[____\] degrees C F, based on an inlet temperature of \[38\] \[____\] [100] \[____\] degrees C F. Provide internal tubing, wiring, and piping complete, such that only connections to air inlet and outlet, to refrigerant compressor contactor, and to condensate drain are necessary.

2.4.1 Air Circuit

a. Regenerative Heat Exchanger: Inlet compressed air to outlet compressed air heat exchanger (in capacity sizes above 4.70 or 28.30 scms 10 or 60
scfm as standard with the manufacturer) designed to reduce cooling load at design conditions minus 7 degrees C 20 degrees F by inlet air precooling.

b. Main Heat Exchanger: Single-pass, with air in the tubes, heat sink, direct expansion, or flooded cooler type.

c. Separator: Fabricated in accordance with ASME B31.1; code stamp not required; moisture separator low velocity type incorporating change of air flow direction to prevent moisture carryover.

d. Dryer Operating Pressure: 862 kPa (gage) 125 psig working pressure.

e. Drain Line: Provide with exterior mounted condensate trap to facilitate servicing.

2.4.2 Refrigeration System

a. Refrigeration Compressor: ANSI/AHRI 520. Hermetic, semi-hermetic, or open reciprocating type equipped with automatic start-stop or unloading capacity control; standard components include inherent motor protection, crankcase oil strainer, and suction screen. Refrigerant shall be R-22.

b. Dryer Controls: Capable of automatic 0 to 100 percent capacity control. Refrigeration controls shall maintain pressure dew point within the specified range without freezing of condensate. Controls shall include such devices as capillary tube, expansion valve, suction pressure regulator, thermostat, or other approved devices as standard with the manufacturer. Dryer shall have automatic shutdown switch sensor located at point of lowest temperature to prevent freezing.

c. Refrigerant dryer and suction line strainer.

d. Air-cooled condenser, with condenser fan and motor.

2.4.3 Instrumentation and Control

Include control panel in dryer cabinet containing:

a. Indicators for the Following Services: Inlet air pressure gage, discharge air pressure gage, inlet air temperature gage, main exchanger temperature gage, refrigeration compressor suction pressure gage, refrigeration compressor discharge pressure gage, green "Power On" light, power interruption light, and high temperature light.

b. Electrical Relays: Locate in an enclosed portion of the panel, accessible for ease of servicing.

c. Controls and Interlocks: To maintain required compressed air dew point and to cycle air-cooled condenser with refrigeration compressor [while maintaining head pressure control with low ambient temperature].

2.5 LOW PRESSURE COMPRESSED AIR DRYER (CHILLED WATER TYPE)

**************************************************************************
NOTE: Chilled water air dryers are usually provided for 944 scms 2000 scfm and larger capacities.
CAUTION: Specify correct system pressure. If the
specification is edited to use a dryer with direct heat exchange between air and refrigerant, assure that the air is not used for breathing since refrigerant leakage into the compressed air may be hazardous to personnel; warning signs may be required.

Provide low pressure compressed air dryer of the mechanical refrigerator type, with closed chilled water system, regenerative air to air exchanger, and main compressed air to water heat exchanger. Refrigeration system shall produce chilled water which, in turn, circulates through air-water exchanger to dry the air. Provide internal tubing, wiring and piping complete, such that only connections to air inlet and outlet, to pump contactor, to refrigerant compressor contactor, to condensate drain, and to air cooled condenser need be provided. Dryer shall be suitable for a compressed air operating pressure of \(862\text{ kPa (gage)}\) \(125\text{ psig}\), with air leaving temperature of \([_____]\) degrees \(\text{C}\) and dew point of \([_____]\) degrees \(\text{C}\) at rated pressure.

2.5.1 Air Circuit

a. Regenerative Heat Exchanger: Air to air exchanger, with inlet air passing through tubes and outlet air in shell, designed to reduce cooling load at design conditions by precooling inlet air minus 7 degrees \(\text{C}\) 20 degrees \(\text{F}\).

b. Main Heat Exchanger: Shell and tube construction, single-pass, with air in tubes and water in shell, designed for minimum air pressure drop, flanged connections, tubes rolled into tube sheets, and ASME BPVC SEC VIII D1 and ASME BPVC SEC IX Code stamped.

d. Drain: With condensate trap.

2.5.2 Chilled Water Circuit

a. Circulating Pump: Single stage, mechanical seals, electric motor driven with line shut-off valves.

b. Liquid Cooler: Direct expansion, refrigerant in tubes, water in shell, designed for \(2068\text{ kPa (gage)}\) \(300\text{ psig}\) working pressure, removable tube bundle, ASME BPVC SEC VIII D1 and ASME BPVC SEC IX Code stamped and insulated with foam type insulation.

d. Flow Switch: To shut down refrigeration compressor on loss of chilled water flow.

2.5.3 Refrigeration System

a. Refrigeration Compressor: ANSI/AHRI 520. Hermetic or semihermetic reciprocating type, with 183 rad/sec 1750 rpm motor, integral capacity control, oil pressure pump, oil scavenger pump, full-flow oil filter, oil sight glass, inherent motor protection, crankcase heater, suction and discharge service valve, crankcase oil strainer, Monel suction
screen, and hot gas bypass capacity control below last step of unloading. Refrigerant shall be R-22.

b. Accessories: Include a discharge line muffler, sight glass, refrigerant dryer, solenoid valve, thermostatic expansion valve, and suction line strainer.

c. Air-cooled Condenser: As indicated. Complete air-cooled condenser factory-fabricated and assembled unit consisting of coils, fans, and electric-motor drive. Base capacity at design conditions on minus 7 degrees C 20 degrees F temperature differential between entering air and condensing refrigerant. Saturated refrigerant condensing temperature not over 40.5 degrees C 105 degrees F. Base entering dry bulb outside air temperature on [32] [_____] degrees C [90] [_____] degrees F. Do not take subcooling into account in determining compressor and condenser capacities. Air-cooled condenser may be used for refrigerant storage in lieu of a separate receiver, provided that condenser storage capacity is 20 percent in excess of fully charged system. [Provide head pressure control during low ambient temperature.]

2.5.4 Instrumentation and Control

Provide a control panel on the dryer containing:

a. Pressure gages 114 mm 4 1/2 inches diameter) for the following services:

(1) Inlet air
(2) Condenser water inlet
(3) Refrigeration compressor suction
(4) Refrigeration compressor oil pressure
(5) Outlet air
(6) Condenser water outlet
(7) Refrigeration compressor discharge

b. Electrical Relays: Locate in an enclosed portion of the panel, accessible from front of panel.

c. Start-Stop buttons and green running indicating light.

d. Controls and Interlocks

(1) 115-volt control transformer
(2) Circulating pump across the line contactor
(3) Compressor across the line contactor
(4) Condenser water pressure safety switch
(5) Freeze protection safety switch
(6) Pump-out relay with normally open and normally closed contacts
(7) Oil safety switch
(8) Four stage thermostatic control
(9) Refrigerant dual pressure switch

2.5.5 Temperature Indicators

a. Air inlet
b. Air outlet
c. Chilled water in
d. Chilled water out
e. Dew point

2.6 DESICCANT AIR DRYERS

Chamber of welded steel, 862 kPa (gage) 125 psig working pressure, ASME labeled conforming to ASME BPVC SEC VIII D1, with flanged or threaded fittings, and [manual] [automatic] drain valve. Manufacturer's recommended desiccant in tablet form which will not nest or cake. Contractor shall provide a supply of desiccant for initial operations in unbroken shipping containers equal to not less than four charges of desiccant for the dryer.

2.7 LOW PRESSURE COMPRESSED AIR PIPING AND ACCESSORIES

Low pressure compressed air piping and accessories 862 kPa (gage) at 65 1/2 degrees C 125 psig at 150 degrees F, shall conform to the following:

2.7.1 Steel Piping

b. Fittings, size 50 mm 2 inches and larger: ASME B16.9, carbon steel, butt welding, schedule 40, or ASME B46.1, carbon steel welding neck flanges, Class 150, ASME B46.1, flanged fittings, carbon steel, Class 150, gaskets 1.50 mm 1/16 inch oil resistant synthetic rubber ASTM D1330, bolts ASTM A193/A193M, Grade B7, and nuts, ASTM A194/A194M, Grade 7. Butt welded joints shall be full penetration consumable insert or backing ring type.

c. Fittings, size 40 mm 1 1/2 inches and smaller: ASME B16.3, threaded malleable iron, Class 150, or ASME B16.11, forged carbon steel Class 3000 socket welding or Class 2000 threaded. Joints may also be butt welded or flanged, as specified for sizes 50 mm 2 inches and larger.

d. Flat-faced steel flanges: Where connections are made to Class 125 cast iron flanges with steel flanges, use only flat-faced Class 150 steel flanges.

e. Unions: ASME B16.39, Class 1 (2068 kPa (gage) 300 psig WOG).

2.7.2 Copper Tubing

a. Tubing: ASTM B88M ASTM B88, Type K or L, hard drawn, Class 1.
b. Fittings: ASME B16.22 wrought copper or bronze, with silver brazed joints.

c. Brazing filler metal: FS QQ-B-654, Class III.

f. Flared fittings: ASTM B88M ASTM B88, Type K or L, annealed, with ASME B16.26 or SAE J513 flared fittings.

2.7.3 Valves

2.7.3.1 Gate Valves

a. Bronze Gate Valves: MSS SP-80, Class 150, 50 mm 2 inches and smaller, wedge disc, rising stem, inside screw type, with brazed joints ends when used with copper tubing.

b. Steel Gate Valves: ASME B16.34, 50 mm 2 inches and smaller, ASME B16.34, over 50 mm 2 inches, flanged ends, outside screw and yoke type with solid wedge or flexible wedge disc, [Class 150] [as recommended by the manufacturer for the conditions indicated.] [Provide motor operator where indicated.]

2.7.3.2 Globe and Angle Valves

a. Bronze globe and angle valves: MSS SP-80, Class 150, 50 mm 2 inches and smaller, Class 200, except that Class 150 valves with brazed ends may be used for copper tubing. Valves shall have renewable seats and discs except brazed-end valves which shall have integral seats.

b. Steel globe and angle valves: ASME B16.34, 50 mm 2 inches and smaller, ASME B16.34, over 50 mm 2 inches, flanged ends, [Class 150.] [As recommended by the manufacturer for the conditions indicated.] [Provide motor operator where indicated.]

2.7.3.3 Pressure Reducing Valves

ANSI/NFPLA T3.12.3, with nominal pressure rating of not less than inlet system pressure indicated. Provide pressure reducing valves capable of being adjusted to specified flow and pressure, and suitable for intended service. Provide pilot valve for dome loaded type if required for proper operation.

2.7.3.4 Safety Valves

ASME BPVC SEC VIII D1 and ASME BPVC SEC IX Code stamped safety valve), 862 kPa (gage) 125 psig, for unfired pressure vessels, bronze, with threaded or flanged connections; factory set and sealed.

2.7.3.5 Check Valves

MSS SP-80, Bronze body with brazed joint or threaded ends or steel body with flanged end, ASME B16.34, or threaded ends, ASME B16.34. The check
valve shall have a perforated piston with closed downstream end, in line with the pipe and held closed by a steel poppet return spring.

2.7.3.6 Pressure Regulators

Diaphragm type, air loaded, tight closing single seat, brass body [with integral filter and bowl]. [Pressure regulators used to deliver compressed air for cleaning shall be factory set at not more than 207 kPa (gage) 30 psig and shall be nonadjustable.]

2.7.3.7 Needle Valves

One-piece bodies with integral or screwed bonnet, stems of hardened stainless steel with fine thread for metering and ease of adjusting, teflon packing; and shall be of the pressure balanced type. Needle valves shall be of the slow opening type.

2.7.3.8 Ball Valves

Full port design, copper alloy body, except sizes 65 mm 2.5 inches and larger shall be ANSI Class 150 steel-bodied. Valves shall have two-position lever handles.

2.7.4 Pressure Gages

ASME B40.100, Accuracy Grade A, for air, with steel or brass case, and nonshatterable safety glass, and a pressure blowout back to prevent glass from flying out in case of an explosion. Gages shall have a 90 mm 3 1/2 inch minimum diameter dial and a dial range of approximately twice working pressure.

2.7.5 Hangers and Supports

Provide pipe hangers and supports conforming to MSS SP-58, MSS SP-69, and ASME B31.1, except as specified or indicated otherwise. Furnish zinc plated pipe hangers and supports except for copper plated inserts for copper piping. Provide tubing supports of U-shaped steel bolts and nuts firmly secured to adequately support structures such as walls, columns, floors, or brackets. Clips shall fit closely around piping but shall have sufficient clearance to permit longitudinal movement of piping during normal expansion and contraction. Provide supports at valves, fittings, branch lines, outlets, changes in direction, equipment, and accessories.

2.7.6 Quick Disconnect Couplings

All brass and suitable for a working pressure of not less than 862 kPa (gage) 125 psig. Female side of coupling (fixed end) shall have male thread connection with automatic shutoff. Provide male side of coupling with hose stem and ball check to bleed pressure from hose and prevent hose whipping.

2.7.7 Single Cartridge Type Filters

862 kPa (gage) 125 psig operating pressure and filter housing of brass or bronze. Provide cellulose cartridge filters of graded density construction capable of removing liquids and solids of 5 microns and larger. Filter capacity shall be compatible with rated flow of equipment or pressure reducing valves provided.
2.7.8  Strainers

**FS WW-S-2739.** Bronze or malleable iron body, Class 125, Style Y, Type II, simplex type, with 20-mesh Monel or stainless steel screen.

2.7.9  Traps

**CID A-A-60001** to drain water and other liquids from system. Type of traps, as indicated, and rated working pressure not less than system operating pressure.

2.7.10  Lubricators

Brass body, 862 kPa (gage) 125 psig minimum rating, with [clear plastic bowl and metal guard.] [metal bowl.]

2.7.11  Flexible Connections

Vibration isolation, wire braid reinforced corrugated metal hose type, line-sized, with bronze end connections, suitable for pressure indicated. Length as recommended by manufacturer but not less than [457] [_____] mm [18] [_____] inches.

2.7.12  Dielectric Unions

Steel female pipe thread end and copper solder-joint ends, conforming to dimensional, strength and pressure requirements of **ASME B16.39**, Class 1. Steel parts shall be galvanized or plated. Union shall have a water-impervious insulation barrier capable of limiting galvanic current to one percent of the short-circuit current in a corresponding bimetallic joint. When dry, it shall also be able to withstand a 600-volt breakdown test.

2.7.13  Tetrafluoroethylene Tape

2.7.14  Hose Reel Assembly

Complete with 15 meters 50 foot hose rated for a minimum of 862 kPa (gage) 125 psig, ball stop, hose extension with air coupler, hose rollers, [reel enclosure,] [nonsparking ratchet pawl,] and required accessories.

2.8  SLEEVES

2.8.1  Floor Slabs, Roof Slabs, and Outside Walls Above and Below Grade

Galvanized-steel pipe having an inside diameter at least 12.70 mm 1/2 inch larger than the outside diameter of the pipe passing through it. Provide sufficient sleeve length to extend completely through floors, roofs, and walls, so that sleeve ends are flush with finished surfaces except that ends of sleeves for floor slabs shall extend 15 mm 1/2 inch above finished floor surface. Sleeves located in waterproofed construction shall include flange and clamping ring.

2.8.2  Partitions

Galvanized sheet steel, 26 gage or heavier, of sufficient length to completely extend through partition thickness with sleeve ends flush with
2.9 VALVE BOX

Provide rectangular concrete design with words "Compressed Air" cast or otherwise marked on the cover. Size shall be large enough for removal of valve without removing box. Provide valve box for areas as follows:

a. Roads and traffic areas: Heavy Duty, cast iron cover
b. Other areas: Standard duty, heavy steel plate or concrete cover

2.10 IDENTIFICATION LABELS FOR PIPING

Labels for pipes 20 mm 3/4 inch o.d. and larger shall bear printed legends to identify contents of pipes and arrows to show direction of flow. Except that of pipes smaller than 20 mm 3/4 inch o.d., labels shall have color coded backgrounds to signify levels of hazard in accordance with PFI ES 22. Legends and type and size of characters shall also conform to PFI ES 22. Labels shall be made of plastic sheet in conformance with CID A-A-1689 with pressure-sensitive adhesive suitable for the intended applications or they may be premolded of plastic to fit over specific pipe outside diameters 20 mm 3/4 inch and larger. For pipes smaller than 20 mm 3/4 inch o.d., furnish brass identification tags 38 mm 1 1/2 inches in diameter with legends in depressed black-filled characters.

2.11 BURIED UTILITY WARNING AND IDENTIFICATION TAPE

Polyethylene plastic tape manufactured specifically for warning and identification of buried utility lines. Tape shall be of the type provided in rolls, 150 mm 6 inches minimum width, color codes for compressed air (gray) with warning and identification imprinted in bold black letters continuously and repeatedly over entire tape length. Warning and identification shall be "CAUTION BURIED COMPRESSED AIR LINE BELOW" or similar wording. Code and letter coloring shall be permanent, unaffected by moisture and other substances contained in trench backfill material.

2.12 FRESH WATER

Fresh water for cleaning, flushing, and testing shall be clean and potable.

2.13 SOURCE QUALITY CONTROL

Test air compressors and compressed air dryers at the factory to assure proper operation. Certify satisfactory accomplishment of tests.

PART 3 EXECUTION

3.1 INSTALLATION

Install materials and equipment as indicated and in accordance with the manufacturer's recommendations.

3.1.1 Excavation and Backfilling

Section 31 00 00 EARTHWORK.
3.1.2 Corrosion Protection

Provide corrosion protection for buried steel piping in accordance with Section 09 97 13.28 PROTECTION OF BURIED STEEL PIPING AND STEEL BULKHEAD TIE RODS.

3.1.3 Piping

Provide Non-Destructive Examination (NDE) report for welding of piping. Unless specifically stated to the contrary, fabrication, assembly, welding, and brazing shall conform to ASME B31.1 for all piping of the air system. Piping shall follow the general arrangement shown. Cut piping accurately to measurements established for the work. Work piping into place without springing or forcing, except where cold-springing is specified. Piping and equipment within buildings shall be entirely out of the way of lighting fixtures and doors, windows, and other openings. Locate overhead piping in buildings in the most inconspicuous positions. Do not bury or conceal piping until it has been inspected, tested, and approved. Where pipe passes through building structure, pipe joints shall not be concealed, but shall be located where they may be readily inspected and building structure shall not be weakened. Avoid interference with other piping, conduit, or equipment. Except where specifically shown otherwise, vertical piping shall run plumb and straight and parallel to walls. Piping connected to equipment shall be installed to provide flexibility for vibration. Adequately support and anchor piping so that strain from weight of piping is not imposed on the equipment.

3.1.3.1 Fittings

******************************************************************************
NOTE: Delete bending of medium and high pressure pipe when not included in project.
******************************************************************************

Use long radius ells where appropriate to reduce pressure drops. Pipe bends in lieu of fittings may be used for low pressure piping where space permits. Pipe bends shall have a uniform radius of at least five times the pipe diameter and must be free from any appreciable flattening, wrinkling, or thinning of the pipe. Mitering of pipe to form elbows, notching straight runs to form full sized tees, or any similar construction shall not be used. Make branch connections with welding tees, except factory made forged welding branch outlets or nozzles having integral reinforcements conforming to ASME B31.1 may be used.

3.1.3.2 Clearances for Welding

Provide clearances from walls, ceilings, and floors to permit the installation of joints. The clearances shall be at least 150 mm 6 inches for pipe sizes 100 mm 4 inches and less, 250 mm 10 inches for pipe sizes over 100 mm 4 inches, and sufficient in corners. However, the specified clearances shall not waive requirements for welders to be qualified for the positions to be welded.

3.1.3.3 Cleaning and Flushing Procedures

Before jointing and erection of piping or tubing, thoroughly clean interiors of pipe sections, tube, and components. In steel pipe, loosen scale and other foreign matter by rapping sharply and expel by wire brush and swab. Blow out both steel pipe and copper tube and components with
compressed air at 689 kPa (gage) 100 psig or more. Maintain cleanliness by closure of pipe/tube openings with caps or plugs. Before making final terminal connections, blow out complete system with compressed air at 689 kPa (gage) 100 psig or more.

3.1.3.4 Changes in Pipe Size

Use reducing fittings for changes in pipe size. The use of bushings will not be permitted. In horizontal lines, 65 mm 2 1/2 inches and larger, reducing fittings shall be of the eccentric type to maintain the bottom of the lines in the same plane.

3.1.3.5 Drainage and Flexibility

Compressed air piping shall be free of unnecessary pockets and pitched approximately 25 mm per 10 meters 3 inches per 100 feet in the direction of flow to low points. Where pipes must be sloped so that condensate flows in opposite direction to air flow, slope 50 mm per 10 meters 6 inches per 100 feet or greater. Provide flexibility by use of fittings, loops, and offsets in piping. Install branches at top of a main to prevent carryover of condensate and foreign matter.

3.1.4 Threaded Joints

Where possible use pipe with factory cut threads, otherwise cut pipe ends square, remove fins and burrs, and cut taper pipe threads in accordance with ASME B1.20.1. Threads shall be smooth, clean, and full cut. Apply thread tape to male threads only. Work piping into place without springing or forcing. Backing off to permit alignment of threaded joints will not be permitted. Engage threads so that not more than three threads remain exposed.

3.1.5 Welding and Brazing Procedures

Perform welding and brazing in accordance with qualified procedures using qualified welders and welding operators and brazers. Do not perform welding and brazing when the quality of the completed weld or braze could be impaired by the prevailing working or weather conditions. The Contracting Officer will determine when weather or working conditions are unsuitable for welding. Welding of hangers, supports, and plates to structural members shall be in accordance with AWS D1.1/D1.1M.

3.1.5.1 Cleaning for Welding and Brazing

Surfaces to be welded or brazed shall be free from loose scale, slag, rust, paint, oil, and other foreign material. Joint surfaces shall be smooth and free from defects which might affect proper welding. Clean each layer of weld metal thoroughly by wire brushing, grinding, or chipping prior to inspection or deposition of additional weld metal.

3.1.5.2 Stress Cracking During Brazing

For material susceptible to stress corrosion cracking from molten brazing filler metal, avoid applying stress during brazing.

3.1.5.3 Welding or Brazing of Valves

Welding or Brazing of Valves: Disassemble valves subject to damage from heat during welding or brazing and reassemble after installation. Open valves two or three turns off the seat when not subject to heat damage.
during welding or brazing; do not backseat valve.

3.1.6 Flare Fittings

Provide flare fittings only where necessary to connect copper tubing to equipment. Use short sections of annealed tubing soldered or brazed to hard drawn tubing using couplings on expanded ends on the annealed tubing made with special tools designed for that purpose. Make flares with the appropriate flaring tools. Cut annealed tubing only with cutting wheel tool. Do not ream out inside burr or lip left by the cutting wheel but fold back lip with flare tool to form seal/gasket inside flare. When new, the flare should cover not more than 75 percent of the flare seating surface of either the male or female flare fittings. Put the flare nut on the tube before making the flare.

3.1.7 Valves

ASME B31.1. Install valves at the locations indicated and elsewhere as required for the proper functioning of the system.

3.1.7.1 Gate Valves

Provide gate valves unless otherwise directed. Install valves in positions accessible for operation and repair. Install valve with stem horizontal or above.

3.1.7.2 Globe Valves

Install globe valves so that the pressure will be below the disk. Install globe valves with the stems vertical.

3.1.7.3 Pressure-Reducing Valves

Provide compressed air entering each pressure-reducing valve with a strainer. Provide each pressure-reducing valve unit with two block valves and with a globe or angle bypass valve and bypass pipe. Provide a bypass around a reducing valve of reduced size to restrict its capacity to approximately that of the reducing valve. Provide each pressure reducing valve unit with an indicating gage to show the reduced pressure, and a safety valve on the low pressure side. These requirements do not apply to small pressure regulating valves used to adjust pressure for pneumatic equipment.

3.1.8 Hangers and Supports

**************************************************************************
NOTE: See NAVFAC P-355, "Seismic Design for Buildings," Chapter 10, "Mechanical and Electrical Elements," for calculating pipe support spacing for schedules not shown. Delete Table I and reference to seismic requirements if not required.
**************************************************************************

Selection, fabrication and installation of piping hangers and supports shall conform to MSS SP-58, MSS SP-69 [except that spacing of the hangers and supports shall be as per Table I.] [Provide seismic restraints for piping in accordance with PPIC Seismic Restraint.]

3.1.9 Pressure Gages

Provide pressure gages with a shut-off valve or petcock installed between the gage and the line.

3.1.10 Strainers

Provide strainers with meshes suitable for the services where indicated, or where dirt might interfere with the proper operation of valve parts, orifices, or moving parts of equipment.

3.1.11 Equipment Foundations

Provide equipment foundations of sufficient size and weight and of proper design to preclude shifting of equipment under operating conditions or under any abnormal conditions which could be imposed upon the equipment. Provide foundations which meet the requirements of the equipment manufacturer, and when required by the Contracting Officer, obtain from the equipment manufacturer approval of the foundation design and construction for the equipment involved. Equipment vibration shall be maintained within acceptable limits, and shall be suitably dampened and isolated.

3.1.12 Equipment Installation

Install equipment strictly in accordance with these specifications, and the manufacturers' installation instructions. Grout equipment mounted on concrete foundations before piping is installed. Install piping in a manner that does not place a strain on any of the equipment. Do not bolt flanged joints tight unless they match properly. Extend expansion bends adequately before installation. Grade, anchor, guide and support piping without low pockets.

3.1.13 Cleaning of System

Clean the various system components before final closing as the installations are completed. Remove foreign matter from equipment and surrounding areas. Preliminary or final tests will not be permitted until
the cleaning is approved by the Contracting Officer.

3.1.14 Pipe Sleeves

Provide pipe sleeves where pipes and tubing pass through masonry or concrete walls, floors, roofs, and partitions. Hold sleeves securely in proper position and location before and during construction. Sleeves shall be of sufficient length to pass through entire thickness of walls, partitions, or slabs. Extend sleeves in floor slabs \(50 \text{ mm} \) \(2\text{ inches}\) above the finished floor. Pack space between the pipe or tubing and the sleeve firmly with oakum and caulk both ends of the sleeve with elastic cement.

3.1.15 Floor, Wall, and Ceiling Plates

Provide chromium-plated steel or nickel-plated cast iron plates on pipes passing through floors and partitions of finished rooms. Provide painted cast-iron, malleable iron, or steel for other areas.

3.1.16 Flashing for Buildings

Provide flashing [as required] [in accordance with Section 07 60 00 FLASHING AND SHEET METAL] where pipes pass through building roofs and outside walls.

3.1.17 Unions and Flanges

Provide unions and flanges where necessary to permit easy disconnection of piping and apparatus, and as indicated. Provide a union for each connection having a screwed-end valve. [Provide unions or flanges not farther apart than \(30 \text{ meters} \) \(100 \text{ feet}\).] [Provide unions or flanges as indicated.] Provide unions on piping under \(50 \text{ mm} \) \(2\text{ inches}\) in diameter, and provide flanges on piping \(50 \text{ mm} \) \(2\text{ inches}\) and over in diameter. Install dielectric unions or flanges between ferrous and non-ferrous piping, equipment, and fittings; except that bronze valves and fittings may be used without dielectric couplings for ferrous-to-ferrous or non-ferrous to non-ferrous connections.

3.1.18 Painting of Piping and Equipment

Paint piping and equipment in accordance with Section 09 90 00 PAINTS AND COATINGS.

3.1.19 Identification of Piping

Identify piping in accordance with PFI ES 22. Use commercially manufactured piping identification labels. Space identification marking on runs not farther apart than \(15 \text{ meters} \) \(50 \text{ feet}\). Provide two copies of the piping identification code framed under glass and install where directed.

3.1.20 Warning and Identification Tape

Coordinate installation of utility warning and identification tape with backfill operation. Provide tape above buried lines at a depth of \(200 \text{ to} \) \(300 \text{ mm} \) \(8 \text{ to} \) \(12 \text{ inches}\) below finish grade.

3.2 CLEANING SILVERBRAZED PIPING

************************************************************************************************************

NOTE: All silverbrazed piping, including low
pressure systems, should be cleaned to preclude corrosion from residual brazing flux.

Clean silver brazed piping to remove residual flux remaining in the system after fabrication. Use one of the procedures below. The hot flush and hot recirculating flush are preferred. Minimum flow rate through any part of the system in \text{liters per second} \quad \text{gallons per minute} \quad \text{shall be} \quad 0.0037 \quad 1.5 \quad \times \text{the inside diameter of the pipe in} \quad \text{mm} \quad \text{inches}. \quad \text{For any flushing method used, the system shall be full of water so that joints are completely submerged at all times.}

3.2.1 Hot Flushing Method

Hot flush the system for one hour using heated fresh water. No part of the system shall go below 43 degrees C 110 degrees F.

3.2.2 Hot Recirculating Flush Method

Perform hot recirculating flush for one hour. Heat water during flushing so that no part of the system falls below 43 degrees C 110 degrees F. After completing the hot recirculating flush, flush the system with cold fresh water for 15 minutes.

3.2.3 Cold Soak Method

Cold soak the system using fresh water at not less than 15.50 degrees C 60 degrees F for 12 hours. Following the 12 hour soak, flush the system with fresh water at not less than 15.50 degrees C 60 degrees F for 4 hours.

3.3 FIELD QUALITY CONTROL

3.3.1 Examinations

3.3.1.1 Welding Examinations

[The Contractor shall] [The Government will] perform visual examinations to detect surface and internal discontinuities in completed welds. NDE on piping welds covered by ASME B31.9 is visual inspection only. Verify piping welds meet the acceptance criteria. Submit a NDE report meeting the requirements specified in ASME B31.9. Visually examine all welds. When examination indicates defects in a weld joint, the weld shall be repaired by a qualified welder. Remove and replace defects as specified in ASME B31.1, unless otherwise specified. Repair defects discovered between weld passes before additional weld material is deposited. Whenever a defect is removed, and repair by welding is not required, blend the affected area into the surrounding surface, eliminating sharp notches, crevices, or corners. After defect removal is complete and before rewelding, examine the area by the same methods which first revealed the defect to ensure that the defect has been eliminated. After rewelding, reexamine the repaired area by the same test methods originally used for that area. Any indication of a defect shall be regarded as a defect unless reevaluation by surface conditioning and reexamination shows that no unacceptable defects are present. The use of any foreign material to mask, fill in, seal, or disguise welding defects will not be permitted.

3.3.1.2 Brazing Examinations

The Contractor shall perform brazing examinations. Visually examine all
compressed air systems as follows:

a. Check brazed joint fit-up. Diametrical clearances shall conform to brazing procedure requirements.

b. Check base material of pipe and fitting for conformance to the applicable drawing or specification.

c. Check grade of brazing alloy for conformance to the brazing procedure before fit-up or brazing.

d. Check completed brazed joint for a complete ring of brazing alloy between the outside surface of the pipe and the face of the fitting, and for a visible fillet.

e. Check stainless steel and other susceptible material for evidence of stress cracks. Check inside of joint if possible with borescope or other aids.

Defective joints may be repaired. However, no more than two attempts to repair by reheating and additional face feeding of brazing filler metal will be permitted, after which the defective joint shall be unsweated, reprepared as a new joint, examined for defects on pipe and fittings, and re brazed.

3.3.2 Testing

******************************************************************************
NOTE: If air (pressure) drop tests are used for system acceptance, assure leakages at acceptable rates through valves (or other components) are not causing pressure drop. Most hard-seated valves have some allowable leakage rate (about 10 cubic centimeters 0.0026 gal per hour of water per 25 mm one inch of valve size or 3 liters per hour 0.1 cubic feet per hour of gas per mm inch of valve size). Delete check for cross-connection if only one type of system is involved in project.
******************************************************************************

3.3.2.1 General Requirements, Testing

Perform testing after cleaning. Contractor shall provide everything required for tests. Tests shall be subject to the approval of the Contracting Officer. Calibrate the test pressure gages with a dead weight tester within [15] [_____] days before use and certify by initial and date on a sticker applied to dial face. [Pressurize each piping system individually and check to assure that there are no cross-connections between different systems prior to hydrostatic and operational tests.]

3.3.2.2 Hydrostatic Tests and Leak Tightness Tests

a. Preliminary Preparation

Remove or isolate from the system the compressor, air dryer, filters, instruments, and equipment which would be damaged by water during hydrostatic tests and reinstall after successful completion of tests.

b. Performance of Hydrostatic Tests
Hydrostatically test piping systems in accordance with ASME B31.1. Vent or flush air from the piping system. Pressurize system for 10 minutes with water at one and one-half times design working pressure, then reduce to design working pressure and check for leaks and weeps.

c. Compressed Air Leak Test

After satisfactory completion of hydrostatic pressure test, blow systems dry with clean, oil-free compressed air, and test with clean, dry air at design working pressure. Brush joints with soapy water solution to check for leaks. Install a calibrated test pressure gage in piping system to observe any loss in pressure. Maintain required test pressure for a sufficient length of time to enable an inspection of joints and connections.

3.3.2.3 Operational Tests

Test equipment as in service to determine compliance with contract requirements and warranty. During the tests, test equipment under every condition of operation. Test safety controls to demonstrate performance of their required function. Completely test system for compliance with specifications.

3.4 INSTRUCTION TO GOVERNMENT PERSONNEL

Provide [2] [_____] man-days of instruction to [2] [_____] Government personnel in accordance with Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS for each type of compressor and compressed air dryer in the project.

NOTE: This guide specification covers the requirements for flow measuring equipment for use in potable water or sewage treatment plant.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Special consideration not included in this guide must be given to sewage with high salt water concentration or carrying industrial wastes containing components detrimental to materials used in typical treatment plant and biodegrading micro-organisms.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in
the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME PTC 19.5 (2022) Flow Measurement

AMERICAN WATER WORKS ASSOCIATION (AWWA)

AWWA C700 (2020) Cold-Water Meters - Displacement Type, Metal Alloy Main Case

1.2 SYSTEM REQUIREMENTS

The flow measuring equipment shall be the [variable head meter type for closed channel] [variable head meter type for open channel] [variable area meter type] [propeller meter type] [electromagnetic meter type] [volumetric meter for [open] [closed] channel] [ultrasonic meter type]. The design shall permit ease of installation and shall not have any features hazardous to personnel or detrimental to the equipment. Provision shall be made to align and adequately lubricate moving parts. Interior parts shall be

SECTION 43 21 29 Page 4
1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Flow measuring equipment components

Read-out device

SD-06 Test Reports

Flow measuring equipment calibration

Open channel test
Dimensional inspection report
Closed channel test
SD-08 Manufacturer's Instructions
Flow measuring equipment components

Submit manufacturer's written recommendation for installation and handling.

1.4 QUALITY ASSURANCE

1.4.1 Requirements

Perform calibration and submit test report for flume in variable head meter for open channel. Submit dimensional inspection report and flow versus differential head curve for variable head meters for closed channel; accuracy shall be plus or minus 1.0 percent over a 10 to 1 flow range. Submit as required in paragraph entitled "Field Tests and Inspections."

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

******************************************************************************
NOTE: Choose the paragraphs which follow based on type of meter needed for the system selected in the paragraph entitled "System Requirements."
******************************************************************************

Unless otherwise specified, all materials and equipment shall be standard commercial products in regular production by the manufacturer and suitable for the required service.

2.1.1 Variable Head Meter for Closed Channel

******************************************************************************
NOTE: Delete this paragraph and the subparagraphs which follow when variable head meter for closed channel is not required.
******************************************************************************

Shall include [an orifice plate] [a flow nozzle] [a Venturi tube] as differential head producer, a diaphragm meter as differential measurement, and [an indicator] [and an integrator] as read-out device[s]. [Remote transmission also shall be included.] Meter shall be provided for [potable water] [plant water] [water for chlorination] [air for aeration] [recirculated plant effluent] [plant effluent] [plant influent] [bypass line] [primary sludge] [return sludge] [sludge to waste] [digested sludge] flow where indicated.

2.1.1.1 [Orifice Plate]

******************************************************************************
NOTE: Select this paragraph entitled "Orifice Plate," or the paragraphs below entitled "Flow Nozzle," "Venturi Tube," or "Modified Venturi."
******************************************************************************
Shall be of the differential producing type with circular hole, and designed for insertion in a [_____] mm inch pipe where indicated. The orifice plate shall measure the flow of [_____] to [_____] [cubic meter per second] [gpm]. Provide the orifice plate with a flange union to hold the plate perpendicular to the axis of the pipe. The flange shall have a pressure rating of 862 kPa 125 psi and shall have threaded ends. The orifice plate shall be of stainless steel and shall be furnished with a tab designating line size, orifice size, and flow direction. The orifice plate shall be in accordance with recommendations of the ASME PTC 19.5, except as modified herein. The pressure taps shall be of the [flange] [one diameter upstream and one-half diameter downstream] [corner] type and sized in accordance with recommendations of the ASME PTC 19.5.

2.1.1.2 [Flow Nozzle]

Shall be of the differential producing type having a modified Venturi flow nozzle contour, and designed for at least 90 percent head recovery for insertion in [_____] mm inch pipe where indicated. The nozzle shall measure the flow of [_____] to [_____] [cubic meter per second] [gpm]. The flow nozzle shall have 862 kPa 125 psi flanged ends conforming to ASME B16.1. Construct the nozzle of cast iron conforming to ASTM A126, Grade B. The throat liner shall be of bronze conforming to ASTM B61. The length of the throat liner shall be equal to 75 percent of the throat diameter. The inlet pressure tap shall be one diameter upstream and the outer pressure tap shall be [one-half diameter downstream] [the throat type]. [The taps for use with sewer and sludge must have built-in capabilities for manual rodding of the holes.]

2.1.1.3 [Venturi Tube]

Shall be of the differential producing type, and designed for [potable water] [sewage] [sludge] service with at least 90 percent head recovery [in accordance with recommendations of the ASME PTC 19.5] for use in a [_____] mm inch pipe where indicated. The Venturi shall measure the flow of [_____] to [_____] [cubic meter per second] [gpm]. The Venturi shall have 862 kPa 125 psi flanged ends conforming to ASME B16.1. The laying length shall be approximately that indicated. Construct the body of cast iron conforming to ASTM A126, Grade B. The throat section and vent bushing shall be bronze conforming to ASTM B61. [For sludge service, equip the tube with manual vent cleaners requiring not more than 1.57 rad 90 degrees rotation for full operation.] [For sludge service, provide a water purge system and two matched assemblies of piping, valves, rotometers, and fittings. The purge system shall operate on a clean water supply of 0.000063 cubic meter per second one gpm at a regulated pressure of 69 kPag 10 psig greater than line pressure. The Venturi interior waterways shall be finished with an anti-stick coating.]

2.1.1.4 [Modified Venturi]

Shall be of the differential producing type, and designed for [potable water] [sewage] [sludge] service with at least a 90 percent head recovery for use in a [_____] mm inch pipe where indicated. The Venturi shall measure the flow of [_____] to [_____] [cubic meter per second] [gpm]. The laying length shall be approximately that indicated. The modified Venturi shall be of the insert type constructed of fiberglass reinforced polyester. The holding flange shall be carbon steel, bronze, or fiberglass reinforced plastic with integral pressure taps for mounting between 862 kPa
2.1.1.5 Diaphragm Meter

Shall have a range of [_____] to [_____] [cubic meter per second] [gpm], and a minimum differential of not less than 25 mm one inch. The maximum differential shall be equal to the range squared but shall not exceed 2500 mm 100 inches of water column. It shall have stainless steel bellows with built-in overrange protection to prohibit deformation of the bellows. Contain the bellows in a forged brass or cadmium-plated forged carbon steel housing to withstand a working pressure of at least 3.45 MPa 500 psi. Transmit the output motion of the bellows to the local read-out device. There shall be zero adjustment in the diaphragm meter. Accuracy shall be plus or minus 0.5 percent of full scale over a 3 to 1 flow range.

2.1.2 Variable Head Meter for Open Channel

******************************************************************************
NOTE: Delete these paragraphs when variable head meter for open channel is not required.
******************************************************************************

Shall include [a weir] [a flume] as head producer, a stilling well with float and cable as head measurement, and [an indicator] [a recorder] [and an integrator] as read-out device(s). [Remote transmission also shall be included.] Provide meter for [potable water] [plant influent] [bypass line] [plant effluent recirculation] [return sludge] [plant effluent] flow where indicated.

2.1.2.1 Weir

******************************************************************************
NOTE: Select this paragraph entitled "Weir," or the paragraphs below entitled "Parshall Flume," or "Flume."
******************************************************************************

Shall be of the [rectangular] [1.05 rad] [60 degree] [triangular (V-notch)] [1.57 rad] [90 degree] [triangular (V-notch)] [Cipolletti] type as indicated. The weir shall measure the flow of [_____] to [_____] [cubic meter per second] [mgd]. The upstream face of the weir plate shall be flat and smooth. Any bolts or rivets used to fasten the plate shall be countersunk flush with the plate. Bolt holes shall include provision for adjustment of height and level. The edges of the weir plate exposed to flow shall not exceed 3 mm 1/8 inch in thickness; where thicker plates must be used, the edge shall be beveled 0.78 rad 45 degrees or more to the required 3 mm 1/8 inch. Make the weir plate of stainless steel or fiberglass reinforced polyester laminate containing at least 30 percent fiberglass by weight.

2.1.2.2 Parshall Flume

Shall be of the Parshall type, and shall measure the flow of [_____] to [_____] [cubic meter per second] [mgd]. The flume shall have a converging upstream section, a throat, and a diverging downstream section. The complete unit shall have vertical walls. Stilling wells and throat floor shall be inclined downward. Construct the flume of polyester resin reinforced with not less than 30 percent fiberglass by weight and provided with locking devices for engagement with the grout around the liner.
Reinforcing ribs shall be an integral part of the flume while removable bracing shall be provided to ensure proper maintenance of liner dimensions during shipment and installation.

2.1.2.3 Flume

Shall be of the characterized type, and shall measure the flow of ____ to ____ [cubic meter per second] [mgd]. The flume shall have a cast iron measuring section having a circular inlet and a characterized outlet. The inlet line size shall be ____ mm inches. The inlet shall be ASME B16.1, 862 kPa 125 psi, flanged. The flume shall have a flat invert free from pockets and obstructions. [Equip the flume with a manual vent cleaner and sediment trap.]

2.1.2.4 Float and Cable

Shall have a range of ____ to ____ [cubic meter per second] [mgd] with a head measurement of ____ mm inches. Measure the crest level in a stilling well as indicated. The measuring system shall include a float, cable, drum, transfer gear assembly, and cam mechanism to provide uniformly graduated units of flow. The float shall be of polyester, stainless steel, or copper, and of a weight and shape that conform to the application requirements. The cable shall be plastic-coated multi-strand stainless steel, stainless steel beads, or multi-strand monel. Groove the drum to prevent overlapping of the cable. Provide the float and cable with stops to prevent overranging and to provide a zero adjustment. All materials of construction shall be corrosion-resistant. Provide protection tubes for the cables. Accuracy shall be plus or minus 2 percent of the actual rate over a 5 to 1 range.

2.1.3 Variable Area Meter for [Open] [Closed] Channel

**************************************************************************
NOTE: Delete this paragraph when a variable area meter for an open or closed channel is not required.
**************************************************************************

Provide a variable area meter as indicated. Make the variable area meter of a tapered tube with a float that will indicate a flow range of ____ to ____ [cubic meter per second] [gpm]. The tube shall be glass with flow units etched on it and shall be placed vertically for reading. It shall consist of fiberglass, stainless steel, or aluminum with stainless steel fitted ends and fluorinated hydrocarbon rubber or chloroprene 0-rings. The float shall be stainless steel and easily read. The metering tube shall be easily removed for range change or cleaning without tools or removing the meter from the line. Provide a needle valve for adjusting flow where indicated. Accuracy shall be plus or minus 5 percent over a 3 to 1 range.

2.1.4 Propeller Meter

**************************************************************************
NOTE: Delete this paragraph when a propeller meter is not required.
**************************************************************************

Provide a propeller meter where indicated. The meter shall measure the velocity and convert it to flow units. The meter shall have a range of ____ to ____ [cubic meter per second] [gpm] for use in a ____ mm
inch pipe. Materials shall conform to the applicable requirements of AWWA C704. [The propeller meter shall be of the saddle type for a working pressure of 862 kPa 125 psi and be supplied with a steel welding saddle and separate straightening vanes.][The propeller meter shall be of the tube type for a working pressure of 862 kPa 125 psi and be furnished complete with a tube, built-in straightening vanes, and 862 kPa 125 psi ASME B16.1 flanged ends, or threaded connections, as appropriate for the pipe.] Provide the meter head with a conical shaped three-blade propeller mounted transversely in the line. The meter shall be completely sealed from water pressure and able to withstand thrust on the front of the propeller. Accuracy shall be plus or minus 2 percent of actual rate over a 10 to 1 range.

2.1.5 Electromagnetic Meter

******************************************************************************

NOTE: Delete this paragraph when an electromagnetic meter is not required.
******************************************************************************

******************************************************************************

NOTE: For plant influent service, allow the optional use of chloroprene-lined stainless steel or steel, polyurethane-lined stainless steel or steel, or fiberglass tubes. For primary sludge service, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, vitreous enamel-lined stainless steel or steel, glass-lined stainless steel or steel, or tetrafluoroethylene-lined aluminum tubes. For recirculated plant effluent, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, chloroprene-lined stainless steel or steel, or fiberglass tubes. For return sludge service, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, chloroprene-lined stainless steel or steel, or fiberglass tubes. For sludge to waste service, allow the optional use of tetrafluoroethylene-lined stainless steel, vitreous enamel-lined stainless steel or steel, or glass-lined stainless steel or steel tubes. For digested sludge service, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, chloroprene-lined stainless steel or steel, or fiberglass tubes. For plant effluent service, allow the optional use of tetrafluoroethylene-lined stainless steel or steel, chloroprene-lined stainless steel or steel, or fiberglass tubes. For sludge to waste service, allow the optional use of tetrafluoroethylene-lined stainless steel, vitreous enamel-lined stainless steel or steel, or glass-lined stainless steel or steel tubes.

******************************************************************************

******************************************************************************

NOTE: Delete the bracketed sentence beginning "Provide a transformer..." when power supply is 120 volts.
******************************************************************************

******************************************************************************

NOTE: Delete requirements for cleaning except when meter is for any sludge service.
Provide a magnetic flow meter where indicated. The magnetic flow meter shall measure the flow of [_____] to [_____] [cubic meter per second] [mgd] and be suitable for a [_____] mm inch pipe. The magnetic flow meter system shall include a flow tube, local read-out receiver, [remote transmission,] and interconnecting cable where indicated. The flow meter shall be a [tetrafluoroethylene-lined stainless steel or steel] [chloroprene-lined stainless steel or steel] [polyurethane-lined stainless steel or steel] [vitreous enamel-lined stainless steel or steel] [glass-lined stainless steel or steel] [tetrafluoroethylene-lined aluminum] [fiberglass] tube with the necessary cores and coils to provide a magnetic field without any interference and with [1034 kPa] [150 psi] [modified ASME B16.1 carbon steel flanges] [Dresser type coupling] [Victaulic type couplings] [integral fiberglass flanges]. Electrodes shall be of stainless steel. The tube shall operate from [120] [240] volts, [_____] hertz, single-phase ac power. A weatherproof housing shall cover the magnets, coils, and connections. [Provide a transformer within the transmitter housing to provide 120 volts power to the receiver.] [Provide a system for cleaning the electrodes or tube automatically without taking the tube out of service. Automatic mechanical cleaning of electrodes or tube will not be acceptable.] The metering tube shall have an approximate laying length as indicated. Provide all necessary cable between the transmitter and receiver. Accuracy shall be plus or minus one percent over a 10 to 1 range. The receiver shall convert the ac voltage signal generated in the flow tube to a uniform flow signal. There shall be an adjustment for zero and span.

2.1.6 Volumetric Meter

******************************************************

NOTE: Delete this paragraph when a volumetric meter is not required
******************************************************

Provide a volumetric meter where indicated. The meter shall conform to AWWA C700. The meter shall be of the rotating-disc type for use in a [_____] mm inch pipe and shall be of the frostproof type, if applicable.

2.1.7 Ultrasonic Meter

******************************************************

NOTE: Delete this paragraph when an ultrasonic meter is not required.
******************************************************

Provide an ultrasonic meter where indicated. The meter shall have a velocity range of 0 to 1.52 meters per second through 0 to 6.10 meter per second 0 to 5 feet per second through 0 to 20 feet per second for use with a [_____] mm inch pipe. The flow meter shall consist of [separate transmitting and receiving transducers clamped to the outside of the pipe to measure the liquid flow without, in anyway, intruding into or altering the pipe.] [the primary element employing a single pair of electro-acoustic transducers mounted diagonally in a flow tube, and in direct contact with the liquid flow to be measured] [a single transducer with twin crystals encapsulated in an epoxy housing mounted on the outside of the pipe. The transmitting crystal shall emit a continuous ultrasonic pulse or frequency into the liquid stream to be reflected back to the receiving crystal. It shall measure the difference in frequencies which is
proportional to the liquid flow. The transmitter shall contain all
necessary circuitry enclosed in NEMA 4 [indoor] [outdoor] housing suitable
for [wall] [panel] mounting and connected to the transducers by [_____] m
feet of cable. It shall produce an accurate 4 to 20 mA dc signal linear
with flow rate. It shall provide linearity of plus of minus 0.5 percent
and repeatability of 0.1 percent under simulated flow. Long term drift of
the pulse rate output shall be less than 0.1 percent. It shall operate
with 115 or 230 volt plus or minus 10 percent, 50 or 60 Hz electrical
power. The unit shall function over an ambient temperature range of
[_____] degrees C to [_____] degrees C F indoor or [_____] degrees C F to
[_____] C F outdoor. The flow rate indicator shall be integrally mounted
in the transmitter housing. Graduate 150 mm 6 inch scale length in [meter
per second] [cubic meter per second] [fps] [gpm].

2.2 READ-OUT DEVICE

**************************************************************************
NOTE: Retain appropriate paragraphs and delete
others.
**************************************************************************

Provide the meter with the following read-out device which shall read from
[_____] to [_____] [cubic meter per second] [gpm].

2.2.1 [Local Read-Out]

**************************************************************************
NOTE: Choose this paragraph entitled "Local
Read-Out," or the paragraph below entitled "Local
Read-Out and Remote Transmission," including its
subparagraphs "Indicator," "Recorder," and
"Integrator."
**************************************************************************

Provide [an indicator] [a recorder] [and an integrator] for local read-out
of flow. The scale graduation shall be [uniform] [square root]. The
read-out shall be visible through a shatterproof clear window. The
read-out mechanism shall not be affected by the intended end use
environment. The unit shall be non-corrosive and weatherproof or provided
with a separate weatherproof housing with a sealed door for access to the
mechanism, and designed to prevent the accumulation of moisture or fog
inside the case. Provide a suitable mounting.

2.2.2 [Local Read-Out and Remote Transmission]

Provide [an indicating transmitter] [a recording transmitter] [and an
integrator] for local read-out and transmission of flow data to remote
read-out. The scale graduation shall be [uniform] [square root]. The
read-out shall be visible through a shatterproof clear window. The
read-out and transmission mechanism shall not be affected by the intended
end use of environment. The transmission shall be impulse duration type or
milliampere dc analog signal type to the remote read-out. Actuate all
transmission by the output motion or the ac voltage signal of the meter.
Power required [shall come from the meter] [shall be [_____] volts, [_____]
hertz, ac]. When impulse duration type transmission is used, the system
shall have a 15 second maximum cycle actuating a cam-operated contact. The
contact shall be of the totally-enclosed type. The unit shall be
non-corrosive and weatherproof or provided with a separate weatherproof
housing with a sealed door for access to the mechanism, and designed to
prevent the accumulation of moisture or fog inside the case. Provide a suitable mounting.

2.2.2.1 Indicator

Shall be a minimum of 150 mm 6 inches long.

2.2.2.2 Recorder

Shall be a minimum of 250 mm 10 inches in diameter and shall rotate once [daily] [weekly] [monthly]. The chart drive shall be driven by a synchronous motor from [_____] volts, [_____] hertz, ac.

2.2.2.3 Integrator

Shall read the total flow in the units specified using only a whole power of 10 multiplier.

2.2.3 Remote Read-Out

Provide [an indicator] [a recorder] [and an integrator] for remote read-out of flow. The scale graduation shall be [uniform] [square root]. The read-out shall accept the signal output and be of the same range and flow units as the local read-out and remote transmission device. The signal shall actuate an electro-mechanical receiver in which the input duplicates the output of the remote transmission device. Ac or dc power supply shall be provided, if required. The read-out shall be visible through a shatterproof clear window. The read-out shall not be affected by the intended end use environment. The unit shall be weatherproof or provided with a separate weatherproof housing with a sealed door for access to the mechanism, and designed to prevent the accumulation of moisture or fog inside the case. Provide a suitable mounting.

2.2.3.1 Remote Read-Out Indicator

Shall be a minimum of 150 mm 6 inches long.

2.2.3.2 Remote Read-Out Recorder

Shall be a minimum of 250 mm 10 inches in diameter and shall rotate once [daily] [weekly] [monthly]. The chart drive shall be driven by a synchronous motor from [_____] volts, [_____] hertz, ac.

2.2.3.3 Remote Integrator

Shall read the total flow in the units specified using only a whole power of 10 multiplier.

2.3 ELECTRICAL REQUIREMENTS

**************************************************************************
NOTE: Delete paragraph except when electromagnetic meter, electric drive chart for recorders, or remote read-out is required.
**************************************************************************
**************************************************************************
NOTE: Delete requirements for signal circuit when remote read-out is not required.
**************************************************************************
Unless indicated or specified otherwise, the electrical components of the meters, such as chart drives and electrical disconnecting (isolating) means, are included under this section. [Provide wiring for signal circuit as specified by the equipment manufacturer.] The interconnecting conduit and wire (except when otherwise specified herein, or when included in factory-assembled equipment) and the electrical connection of the meters to the electrical power circuit are specified in Division 16.

2.4 SPARE PARTS

NOTE: Delete the bracketed sentence when recorder is not required.

Provide all standard recommended spare parts as specified in the manufacturer's instruction manuals for each component in the system. [Furnish one year's supply of charts and ink for each recording device.]

PART 3 EXECUTION

3.1 MATERIALS PROTECTION

The entire tube, except the throat section of the [flow nozzle] [Venturi] [characterized flume], shall receive a series of coats of paint conforming to MIL-DTL-24441. Apply the paint in the following order: one coat of Formula 150, one coat of Formula 151, one coat of Formula 156, and one coat of Formula 152. The final total dry-film thickness shall be not less than 0.25 mm 10 mils. Furnish all other items in accordance with the manufacturer's standard practice suitable for end use environment.

3.2 INSTALLATION

Furnish the services of an engineer representative of the manufacturer of the flow measuring equipment for checking the installation, making the necessary adjustments and calibrations, placing the equipment in operation, and performing the acceptance tests. The representative also shall be available for not less than 2 days to instruct operating personnel in the use, operation, and maintenance of the equipment during the initial operating period. Install all flow measuring equipment in accordance with the recommendations of the manufacturer. Install variable head meter[s] for closed channel[s] in accordance with the ASME PTC 19.5. Install weir[s] with the top exactly level at the elevation indicated.

3.3 FIELD TESTS AND INSPECTIONS

Test and calibrate in place the flow measuring equipment to demonstrate that it meets the accuracy requirements for the full range of flows specified herein. Provide all labor, equipment, and incidentals required for the tests, including electric power and water required for tests. The Contracting Officer will witness all field tests and conduct all field inspections. The Contractor shall give the Contracting Officer ample notice of the dates and times scheduled for tests. Rectify any deficiencies found and retest work affected by such deficiencies at the Contractor's expense. Record data from each field test shall be recorded and documented in a formal field test report.

NOTE: This guide specification covers the requirements for systems to transfer organic contaminants from water to activated carbon adsorption media.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1   UNIT PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.
[reactivation][disposal] and replacement of the activated carbon includes placement of the spare unit in service, disconnection of the exhausted unit, drainage and treatment of the free water, transport of the activated carbon [to and from reactivation][to the disposal] facility, [reactivation][disposal and replacement] of the activated carbon and placement of the fresh carbon filled unit in the spare position.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 Pre-Installation Meeting

**************************************************************************
NOTE: Remove this paragraph when meeting is not required.
**************************************************************************

[Partnering][Pre-installation] meeting is required. Ensure that involved subcontractors, suppliers, and manufacturers are [notified][represented]. Furnish the date and time of the meeting to the Contracting Officer for approval.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
SD-02 Shop Drawings
   Adsorption Battery Components
   Backwash System
   Carbon Storage and Transfer System

SD-03 Product Data
   Activated Carbon Adsorption Units

SD-10 Operation and Maintenance Data

Activated Carbon Adsorption System; G[, [_____]]

Operation and Maintenance Data in accordance with Section 01 78 23 OPERATION MAINTENANCE DATA, Data Package [2][3].

Preventive Maintenance Plan And Schedule

1.5 MAINTENANCE MATERIAL SUBMITTALS

Provide special tools necessary for adjustment, operation, maintenance, and disassembly for each type of equipment furnished; a lever type grease gun or other lubricating device for each type of grease required; and one or more steel cases mounted on the wall complete with flat key locks, two keys, and clips or hooks to hold each tool in a convenient location. Provide tools that are high-grade, smooth, forged, alloy, tool steel. Deliver tools at the same time as the equipment and hand over on completion of the work.

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

Provide pressure rated adsorption shells bearing the ASME BPVC SEC VIII D1 code stamp.

1.6.2 Qualifications

1.6.2.1 Constructor

Requires a cumulative minimum of [2][3][5][_____] years of experience in the construction of water treatment plants, wastewater treatment plants, industrial wastewater treatment plants, or industrial wastewater pretreatment plants.

1.6.2.2 Single Source Supplier

Assign full responsibility for the furnishing of the adsorption system to a single supplier. The designated single supplier coordinates the selection, assembly, installation, and testing of the entire system as specified herein. The designated single supplier need not manufacture the entire system.

1.6.2.3 Manufacturer's Representative

Provide the services of a manufacturer's field service representative experienced in the installation, adjustment, and operation of the equipment furnished and who possesses complete knowledge of the proper operation and maintenance of the system.
1.6.2.4 Welding

Provide documentation including welding procedures, lists of welders, and qualifications of welding operators in accordance with Sections 8.2 and 8.8 of AWWA D100.

1.6.2.5 Reactivation Facility

Provide qualifications of reactivation facility procedures and operation in accordance with AWWA B605.

1.7 DELIVERY, STORAGE, AND HANDLING

Submit instructions for any required sampling, preparation and shipping of activated carbon to reactivation or disposal facility. Submit a copy of the safety data sheet along with [materials] [materials and each chemical] delivered to the site. Submit the safety data sheet in conformance with 29 CFR 1910 Section 1200(g) for [activated carbon][activated carbon and each chemical].

1.7.1 Granular Activated Carbon

Package, mark, and ship granular activated carbon for potable water treatment in accordance with [AWWA B604, ][AWWA B604 and AWWA B605].

1.7.2 Powdered Activated Carbon

Package, mark, and ship powdered activated carbon for potable water treatment in accordance with AWWA B600.

1.7.3 Equipment and Accessories

Protect equipment delivered and placed in storage from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide an activated carbon adsorption units system as a complete process for removal of organic and inorganic contaminants from water as specified herein. Provided equipment to include, but not be limited to, vessels containing activated carbon, supporting equipment and accessories. Terminology is in conformance with ASTM D2652.

2.1.1 System Submittals

Submit the following data:

a. Process flow diagrams and instrumentation diagrams(s) showing all major pieces of process equipment with controls. Show on the drawings complete piping, wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and properly functions as a unit. Also show proposed layout and anchorage of equipment and appurtenances; equipment relationship to other parts of the work; clearances for maintenance and operation; and shop and erection details, including cuts, copes, connections, holes, bolts, and welds.
b. List of Federal, State, and local laws, regulations, and permits concerning activated carbon adsorption units that are applicable to operations and the requirements imposed by those laws, regulations, and permits.

c. Instrumentation and controls; capacities and pressure drop; make and model; complete list of equipment and materials, including manufacturer's descriptive and technical literature; performance charts and curves; catalog cuts; and installation instructions.

d. A complete list of parts, supplies and recommended spare parts for each different item of material and equipment specified, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [1] and [3] year(s) of service.

e. Structural calculations for the adsorber shells, tanks and mounting and support details. Verification from a Registered Professional Engineer, licensed to practice mechanical or structural engineering, as appropriate, in the State in which the system was fabricated, stating that the fabrication drawings and pressure calculations for the shells and tanks were designed for the listed conditions in accordance with the appropriate codes and standards.

f. Designs for foundations, footings and supports. Verification from a Registered Professional Engineer, licensed to practice mechanical or structural engineering, as appropriate, in the State in which the system was fabricated, stating that the erection drawings for the shell and tank foundations and supports were designed for the listed conditions in accordance with the appropriate codes and standards.

g. Submit removal and replacement instructions including handling and reactivation of spent activated carbon in accordance with AWWA B605.

2.1.2 Design Requirements

******************************************************************************
NOTE: Determine wind speed from ASCE 7-16, Chapter 1. Provide seismic requirements, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the bracketed phrase in the first paragraph if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT, properly edited, must be included in the contract documents.
******************************************************************************

Provide seismic details in accordance with UFC 3-301-01 and [Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT][ as indicated].

2.1.3 Influent Chemical Conditions

NOTE: Obtain an analysis of the water to be treated giving appropriate information to be inserted in the blank spaces. Provide all the available information. Average values for inorganic constituents may be adequate if additional information is not available.

Use of activated carbon for filtration is rarely cost effective. Plain or enhanced sedimentation is the preferred method for removal of suspended solids. Length of runs between backwash cycles and the media capacity may be reduced by biological activity or physical plugging which may result from continuous application of iron bearing or bioactive turbid waters to the adsorption unit. Activated carbon is fouled by growth on the media and formation of deposits on the carbon surface. Iron in the ferrous state may pass through the system. Ferric compounds are insoluble over a pH range of about 3 to 8, the pH range of most water supplies. Manganese is insoluble at a pH of 9 or greater. Pretreatment should be evaluated if iron exceeds 0.2 mg/L, manganese exceeds 0.1 mg/L, calcium exceeds 80 mg/L or magnesium exceeds 40 mg/L.

Lowering the pH by addition of mineral acids has been used to decrease the hydrogen bonding of dissolved organics and to increase metal solubility.

Raw water should be coagulated and filtered if the suspended solids exceed 5 mg/L (ppm) or if the turbidity exceeds 2.5 NTU. Prefiltration may aid in reducing deposition of iron or manganese.
Oxidizing agents, commonly chlorine or oxygen, may result in a loss of volume capacity and more frequent replacement of the media. Sources of oxidizing agents should be removed where feasible.

Influent inorganic chemical concentrations of [waste water][water from surface impoundment][ground water] are as determined by the AWWA 10084 method for each.

### 2.1.4 Performance Requirements

#### 2.1.4.1 Flow Rate

- **Minimum**: [_____] L/second gpm
- **Average**: [_____] L/second gpm
- **Maximum**: [_____] L/second gpm

#### 2.1.4.2 Water Temperature

- **Minimum**: [_____] degrees C degrees F
- **Average**: [_____] degrees C degrees F
- **Maximum**: [_____] degrees C degrees F

### 2.1.5 Bench Scale Data

**************************************************************************

**NOTE: Include results, require performance of tests or both.**

**************************************************************************

#### 2.1.5.1 Isotherm Data

[Results of isotherm tests, as determined by ASTM D3860, are as follows: [____].] [Carry out the isotherm test data with activated carbon similar to that to be supplied for use. If applicable, use reprocessed/reactivated carbon typical of the type to be supplied in the isotherm tests, including the same type of manufacture if from processed coal, coconut shell, wood, etc.]

#### 2.1.5.2 Operating Performance Data

Results of operating performance tests are as follows: [____].
### Carbon Equivalency Test Data

Results of carbon equivalency tests are as follows: [___].

### Organic Contaminant Concentrations

**NOTE:** Water treated for potable use should meet the maximum contaminant level goals (MCLGs) of 40 CFR 141 for each identified organic contaminant. Additional requirements for potable water may be imposed by regulators or the Army Center for Health Promotion and Preventive Medicine. Because concentrated organic solutions are more readily treated than dilute solutions, overstatement of the influent concentrations of organic chemicals usually leads to problems. It is more prudent to increase the contact requirement in Paragraph: ADSORPTION BATTERY COMPONENTS and not apply safety factors here.

\]

2.2 EQUIPMENT

=================================================================================================================

NOTE: Completeness of steam regeneration is pressure/temperature dependent.
=================================================================================================================

Provide new and unused materials and equipment with the exceptions noted for reprocessed activated carbon, reprocessed materials and modular treatment units. Provide an estimate or analysis of the pre-existing "heel" and the nature of any residual with the supply documentation if reprocessed carbon is to be supplied. The Contracting Officer reserves the option to refuse delivery of reprocessed carbon if, in the opinion of the Contracting Officer, the quality might interfere with accomplishment or verification of the treatment.

2.2.1 Activated Carbon

=================================================================================================================

NOTE: To determine the working capacity of a specific brand of activated carbon: Determine the contact time (inverse of reaction rate) for the particular brand of carbon at the known total volatile organic content in the influent water and determine the amount of carbon required (isotherms) to obtain the reduction of the known volatile organic carbon content in the influent water.

Utilize rapid small-scale column test procedures to verify properties of activated carbon being used.

Designer should also evaluate with government whether full-scale column testing is warranted based on project size, flow rate, economics, etc. in an effort to ensure the Government is getting the optimum GAC and not wasting.

Activated carbon used in treatment of water for
Activated carbon should be in accordance with AWWA if the treated water goes into a potable water system. Verify with the appropriate authorities that wastewater carbon is acceptable for water that is to be discharged or re-injected.

Provide material free from impurities that affect the serviceability and appearance of the finished product. Provided activated carbon that does not require dosing or addition of a chemical mixture or solution to the water to be treated or to the water used for backwashing. Furnish the following quantity: [[_____] cubic meters cubic feet][[_____] kg pounds] of processed and graded activated carbon for [potable] [waste] water treatment. Submit design calculations indicating removals of each of the listed compounds in the carbon bed. Material must conform to the following:

a. Adsorptive capacity, iodine number as determined by ASTM D4607, not less than [500][650][900][950][1,000][_____] milligrams per gram. Submit the iodine number; isotherm and column test data.

b. Apparent density, as determined by [ASTM D2854][ASTM D5158], [0.4 to 0.6][_____] grams per cc[25 to 37][_____] lb. per cu. ft, corrected for moisture.

c. Effective size [0.35 to 1.30][_____] mm [0.14 to 0.5][_____] inches and uniformity coefficient not greater than [2.1][_____), as determined by ASTM D2862, with the following gradation:

<table>

</tbody>
</table>

d. Submit manufacturer's certificates, including the name and address of the production facility, attesting that the activated carbon furnished meets the specified requirements. Submit certification of the
activated carbon [supplier][transporter][reactivation facility in accordance with AWWA B605]. Submit copies of the Department of Transportation licenses of carbon reactivation service.

2.2.1.1 Powdered Activated Carbon

Provide powdered activated carbon for potable water service in conformance with AWWA B600.

2.2.1.2 Granular Activated Carbon

Provide clean and hard granules.

2.2.1.2.1 Potable Water Service

Provide granular activated carbon for potable water service conforming to [AWWA B604][AWWA B604 and AWWA B605], as appropriate. Submit reports of testing granular activated carbon in accordance with AWWA B604.

2.2.1.2.2 Waste Water Service

Provide granular activated carbon for waste water service [reprocessed from previous as long as it meets the specified requirements][of a type suitable for reactivation] and supported by services for transportation of [shell][and spent carbon] and reactivation[ of spent carbon]. Submit documentation and copies of licenses to the Contracting Officer.

2.2.2 Adsorption Battery Components

**************************************************************************
NOTE: See EM 1110-1-4008 Liquid Process Piping for compatibility of materials with the solution being treated. General rules for configuration of a liquid phase activated carbon system are as follows:

a. Two stage serial operation to provide longer contact and more complete exhaustion of the carbon is preferred, particularly when anticipated carbon consumption is high, required bed depths exceed 4.5 meters 15 feet and/or contact times in excess of 30 minutes are required for contaminant reduction. In serial operation, the unit with the freshest carbon at any given time should be in the lag position. For critical operations, lead, lag and standby units should be provided.

b. Multiple units in parallel operation are frequently used for high flows with low contamination levels when short contact times are adequate. Single units should be used only in installations in which the system can be shut down for change out of the activated carbon adsorption media. Multiple smaller units are always preferable to single large units containing the same amount of carbon and providing equal contact.

c. Upflow pulsed bed operation should be considered in lieu of multiple units in series.
d. An appropriate piping configuration arrangement can adapt the units for serial or parallel operation. Arrangements that allow conversion from parallel to series and the reverse, provide the flexibility to respond to differing conditions.

e. Design surface loadings range between 0.7 and 4 liters per second per square meter (1 and 6 gpm/sq ft). Lower surface loadings result in longer runs between backwashes and higher backwash flow rate requirements.

f. Minimum bed depth is based on the contact time required to achieve the required removal. Additional bed volume allows time between carbon changes. The minimum bed depth specified should not be less than 0.75 m (30 inches) to avoid short circuiting. Minimum freeboard above the bed must be not less than 25 percent of bed depth. At loading rates between 3.4 and 4 liters per second per square meter (5 and 6 gpm/sq ft) the minimum bed depth should be increased from 0.75 m (30 inches) to 1 m (36 inches) in proportion to the surface loading to maintain the volumetric loading below 4.5 liters per second per cubic meter (2 gpm per cubic foot).

g. Coordinate number and location of units with the appropriate drawings.

Provide adsorption batteries consisting of [_____] units. Performance specified refers to each unit and not to the battery as a whole. Provide a downflow liquid adsorption unit, having a capacity to treat [_____] liters (gallons) of water at a flow rate not exceeding [_____] L/second (gpm) with a maximum influent total organic carbon concentration of [_____] [milligrams][micrograms] per liter during the interval between carbon replacements to a maximum effluent total organic carbon concentration of [_____] [milligrams][micrograms] per liter. Ensure carbon replacement intervals are not less than [_____] days.

2.2.2.1 Head Loss

NOTE: Compare several manufacturers data and select a reasonable number.

Head loss in each unit at rated flow must not exceed [2][3][7][30][60] [_____] kPa (0.3)[0.44][1][4][8][_____] psig when filled with fresh media. Submit demonstration of, or design calculations for, the total head loss through the carbon, adsorbers and appurtenant piping.

2.2.2.2 Adsorption Shell

NOTE: Avoid pressurizing shells that do not conform to ASME BPVC SEC VIII.
Ensure adsorber shells have a minimum effective cross sectional area of [_____] square meters square feet with a minimum straight shell (tangent line to tangent line) height of [_____] meters feet.

2.2.2.2.1 Modular units

**************************************************************************
NOTE: Transportable units should be considered for units containing less than 900 kg 2000 pounds of activated carbon and the required hydraulic capacity is less than 600 liters per second 10,000 gpm or the appropriate configuration is a standard product of a nearby supplier. Spare units are used for replacement of exhausted units, which are returned to the carbon manufacturer for reactivation of the activated carbon. Drum style containers may be used for very small amounts of carbon.
**************************************************************************

Modular units need not be new if pressure rating and all other requirements of this section are met. Provide factory assembled units secured to a structural frame suitable for shipment or transport with a forklift and set on a level area for operation. Prepare unit for connection to on-site pipelines. Mount shell on skid supports of cast-iron or steel to support the weight of the units, carbon and water while in service without point bearing on the floor slab. Fabricate skid mountings and shells for the live and dead loads of the shell full of water. Provide assembly structure that is adequate to provide support to the units during transport. Provide connectors for connection of modular tank inlets and outlets to the permanent piping system. Provide modular units in compliance with [AWWA B605][Section 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS] for transport of spent carbon.

2.2.2.2.2 Permanent Units

Design, fabricate, and erect adsorption shells not equipped with an open vent of steel in accordance with ASME BPVC SEC VIII D1 for a gage working pressure of [8.8][_____] MPa [125][_____] psi. Stamp working pressure on shell. Fiberglass or polyethylene adsorption shells are acceptable if equipped with an open vent or overflow. Ensure fiberglass shells comply with AWWA D120 or with ASTM D3299 with nozzle flanges in accordance with ASTM D5421. Ensure polyethylene shells conform to ASTM D1998. Line steel shell and both sides of false bottom with nontoxic epoxy, vinyl ester or rubber. Supply shells with cast-iron or steel supports. Fabricate supporting structures and shells for the seismic and wind loads listed in the design requirements, plus live and dead loads of the shell full of water.

2.2.2.2.3 Connections

Provide a vent and a rupture disc on the influent of each adsorber. Provide each adsorber with a means for carbon fill and removal and with permanent connections for water inlet, outlet, and backwash.

2.2.2.2.4 Openings

**************************************************************************
NOTE: Access openings 100 by 150 mm 4 x 6 inches or larger will be provided in upper head of shells less
than 0.9 meter 36 inches in diameter; access openings 275 by 400 mm 11 x 15 inches or larger will be provided for shells 0.9 meters 36 inches in diameter and larger.

Provide each shell with an access opening [100 x 150][275 x 375][_____] mm [4 x 6][11 x 15][_____] inches or larger. Provide openings with closure and positive seal adequate for the tank pressure rating.

2.2.2.5 Hardware

Provide stainless steel bolts and attaching hardware conforming with ASTM F593.

2.2.2.3 Collection/Underdrain System

NOTE: Select appropriate system and remove subparagraphs describing systems not needed in the project.

Provide an underdrain system within the shell for collecting treated water as specified below and to distribute the backwash water uniformly over the entire bed cross-section at velocities that prevent channeling of the carbon bed. Under actual operating conditions do not wash the activated carbon out of the apparatus regardless of the change of demand rate up to the maximum on the apparatus.

2.2.2.3.1 Nozzle Type

Provide a collector/backwash nozzle for each [93,000][_____] square mm [1][_____] square foot of carbon surface area.

2.2.2.3.2 Deflector-Plate Type

NOTE: Shells smaller than 1500 mm 60 inches in diameter will be equipped with nozzles or deflector-plate collector system.

Provide a deflector-plate made of [cast-iron][or][steel], and [rubber][or][nontoxic epoxy] lined, fastened to the bottom of the shell, and arranged for discharge through radial slots. Provide pipe connections for treated water outlet or backwash inlet on the underside between the deflector and the shell bottom.

2.2.2.3.3 False Bottom Type

NOTE: Shells larger than 1500 mm 60 inches in diameter may be equipped with false-bottom or header-lateral-distributor type collector system.

Provide a false bottom with attached strainers constructed of stainless steel strainers and fasteners.
2.2.2.3.4 Header-Lateral-Distributor Head Type

**************************************************************************

NOTE: The false bottom or header-lateral-distributor head type will be allowed for all shells 900 mm 36 inches in diameter or larger.
**************************************************************************

Provide a header-lateral-distributor head consisting of a circular, square or branched manifold or header, connected to laterals provided with strainer heads or strainers with openings placed radically so as to discharge horizontally or downward. Provide [stainless steel, conforming to ASTM A312/A312M and ASTM A530/A530M] [polyvinyl chloride, conforming to ASTM D1785 or ASTM D2241] headers and laterals. Manufacture strainer heads and strainers of materials compatible with the header-lateral system, (polyethylene, polypropylene, polyvinyl chloride or stainless steel). Ensure laterals and strainer heads, after being placed, do not protrude into the header or laterals. Support system by [a steel plate or steel angles conforming to ASTM A666 with [vinyl ester] [nontoxic epoxy] [or rubber] linings] [or by] [concrete fill] [or] [directly on the bottom of the shell].

2.2.3 Mode of Operation

2.2.3.1 Serial Operation

Provide valves on the influent, effluent and backwash connections of each unit to allow any unit to operate and function as the lead or lag unit or stand-by as required.

2.2.3.2 Parallel Operation

Provide valves on the influent, effluent and backwash connections on each of the parallel units adequate to allow the unit to be taken out of service to backwash or change out the activated carbon in the unit without affecting the operation of the other units.

2.2.3.3 Parallel or Serial Operation

Provide units designated for use in either series or parallel operation with valves on the connections that allow switching between modes of operation without disconnecting any of the piping.

2.2.4 Total Organic Carbon Analyzer

**************************************************************************

NOTE: Optimum operation for serial operation would be for the lead column to be operated until the influent and effluent are of equal concentration and the carbon bed is completely spent. The combination of a predictable influent and a well developed sampling program would eliminate the need for the on-line analyzer.
**************************************************************************

Provide a wall mounted analyzer for automatically testing the total organic carbon content of the water in the effluent line leading from each
adsorption unit. Provide analyzer capable of carrying out intermittent tests on the effluent and giving visual warning that the residual organic carbon present exceeds a predetermined limit. Equip the analyzer with necessary wiring and [controls for automatic alternation of units][an alarm device to give notice] when the total organic carbon in the water delivered by the lead adsorption unit exceeds [_____] [milligrams][micrograms] per liter [ppm][ppb].

2.2.5 Water Meter

Provide each adsorption unit with a displacement or turbine-type water meter reading in [_____] liters gallons, conforming to AWWA C700 or AWWA C701 as appropriate. Provide meter in the adsorption unit [influent line][effluent line] and locate to be readily accessible for reading and setting. Provide infinitely adjustable meter contacts over the range of the meter to permit setting to suit actual total organic carbon content of the water being treated. Equip meter with necessary wiring and electric controls for automatic backwashing or an alarm device to give notice when the adsorber has delivered [_____] liters gallons of water.

2.2.6 Differential Pressure Sensor

Provide differential pressure sensor capable of measuring plus or minus 5 percent variation in the pressure drop across the media. Equip sensor with necessary wiring and controls for automatic backwashing or an alarm device to give notice when the pressure differential exceeds the set point.

2.2.7 Interlocks and Alarms

Provide interlock system to prevent backwashing of more than one unit at a time and to prevent backwashing when the waste backwash tank capacity is inadequate to contain any additional backwash. Provide a manual-reset alarm timer on the backwash control panel for timing backwash cycles. Locate alarm lights on the local control panel and duplicate on a panel in the main control room. Locate audible annunciator above the appropriate vessel with an automatically resetting waterproof manual shut-off located with no obstructions to access [_____][1.2] m [_____][4] feet above grade.

2.2.8 Pressure Gauges and Sampling Cocks

2.2.8.1 Pressure Gauges

Provide pressure gauges connected to the influent and effluent to indicate the pressure loss through the adsorber and its pipe, valve, and fitting assembly for each adsorption unit. Provide precision type gauges with bronze Bourdon tube and phenolic case and an accuracy of plus or minus 1/2 percent conforming to ASME B40.100.

2.2.8.2 Sampling Cocks and Valves

Provide [steel, ][PVC][ or ][brass], ground key, lever handle, faucet type sampling cocks or ball valves upstream of the adsorbers and on the downstream side of each unit for sampling the influent and the effluent of each of the individual adsorbers.

2.2.9 Valves

**************************************************************************
NOTE: Delete the inapplicable types of operation.
**************************************************************************
Ensure the design of the valve operators and mechanisms avoids initial surges and sudden inrushes of influent or backwash by gradually allowing flows to increase as ports are opened. Provide a dial pointer to indicate each step of the operation.

2.2.9.1 Butterfly Valves

Provide butterfly valves 75 through 1,800 mm 3 through 72 inches conforming to AWWA C504.

2.2.9.2 Gate Valves

Provide gate valves less than 75 mm 3 inches in diameter made of bronze with screwed ends, conforming to MSS SP-70 and valves 75 mm 3 inches or larger must conform to AWWA C509. Provide valves that open in counter clockwise direction, with an operating wheel having an arrow, cast in the metal, indicating the direction of opening.

2.2.9.3 Package-Type Valve Nest

Provide package-type valve nest consisting of a pilot valve connected with fittings as may be required to each one of a nest of valves hydraulically or pneumatically operated. Connect the nest of valves to raw water inlet, treated water outlet, backwash inlet and outlet, and activated carbon refill inlet and outlet.

2.2.9.4 Ball Valves

Provide full port stainless steel ball valves on carbon fill and discharge lines.

2.2.10 Isolation Joints

2.2.10.1 Dielectric Fittings

Provide dielectric fittings between threaded ferrous and nonferrous metallic pipe, fittings and valves, to prevent metal-to-metal contact of dissimilar metallic piping elements. Ensure fittings are suitable for the required working pressure.

2.2.10.2 Isolation Joints

Provide isolation joints between nontthreaded ferrous and nonferrous metallic pipe, fittings and valves. Provide isolation joints consisting of a sandwich-type flange isolation gasket of the dielectric type, isolation washers, and isolation sleeves for flange bolts. Provide full faced isolation gaskets with outside diameter equal to the flange outside diameter. Bolt isolation sleeves must be full length. Provide units shaped to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.2.10.2.1 Sleeve-type Couplings

Use sleeve-type couplings for joining plain end pipe sections. Provide couplings consisting of one steel middle ring, two steel followers, two gaskets, and the necessary steel bolts and nuts to compress the gaskets.
2.2.10.2.2 Split-sleeve Type Couplings

Use split-sleeve type couplings in aboveground installations when approved in special situations; consisting of gaskets and a housing in two or more sections with the necessary bolts and nuts.

2.2.11 Pipe and Fittings

Provide pipe hangers and supports with Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING. Provide pipe, valves and fittings for liquids in accordance with Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING. Provide pipe, valves and fittings for compressed air in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.2.12 Bolts, Nuts, and Fasteners

Unless otherwise indicated, furnish galvanized bolts, anchor bolts, nuts, washers, plates, bolt sleeves, and all other types of supports necessary for the installation of the equipment with the equipment.

a. Where indicated, specified, or required, provide anchor bolts with square plates at least 100 by 100 by 9 mm 4 by 4 by 3/8 inch thick or with square heads and washers set in the concrete forms with suitable sleeves.

b. Provide expansion bolts with malleable-iron and lead composition elements.

c. Unless otherwise specified, provide stud, tap, and machine bolts of refined bar iron, with threads conforming to ASME B1.1.

d. Zinc coat bolts, anchor bolts, nuts, and washers specified to be galvanized after being threaded, by the hot-dip process in conformity with ASTM A123/A123M or ASTM A153/A153M. Provide Type 316 stainless steel bolts, anchor bolts, nuts, and washers indicated to be stainless steel.

2.2.13 Electrical Work

******************************************************************************
NOTE: Carbon dust is conductive and ignitable and can form explosive mixtures with air. Coordinate hazard areas with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and the drawings. AWWA calls for water tight enclosures.
******************************************************************************

Implement indicated hazard classifications in accordance with NFPA 70. Perform electrical work in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2.13.1 Motors

Provide electrical motor-driven equipment complete with starters and alternating current motors conforming to NEMA MG 1. Provide single-phase 115-volt 60 cycle fractional horsepower electric motors. Provide three-phase 60 cycle integral horsepower electric motors. Provide motor starters complete with properly sized thermal overload protection and other appurtenances necessary for the motor specified. Design each motor for
operation in a 40 degree C 104 degree F ambient temperature.

2.2.13.2 Controls and Panels

Provide manual or automatic controls and protective or signal devices required for the operation specified, and any control wiring required for controls and devices. Ensure motor controls conform to NEMA ICS 1 and enclosures for power and control panels conform to NEMA ICS 6.

2.2.14 Storage Tanks

Fabricate each tank from steel conforming to ASTM A666 not less than 5 mm 3/16 inch thick, lined with enamel, or of fiber glass filament-wound reinforced plastic construction, conforming to ASTM D3299.

2.2.15 Backwash System

******************************************************************************
NOTE: The backwash system is a major system that should be shown on the drawings. Four or more adsorbers in parallel may have sufficient effluent flow for backwashing because the backwash flow requirement for a single adsorber is approximately equal to three times the effluent flow. Backwash supply tankage and backwash pumps might not be required if the discharge pressure is adequate. Elimination of waste backwash tankage is rarely feasible.
******************************************************************************

Initiate backwash operation via [fully automatic differential pressure sensors or timers][semiautomatic push button switch in response to an alarm connected to a water meter][manual in response to an alarm connected to a water meter].

2.2.15.1 Backwash Flow Controller

Install an adjustable flow control valve on the backwash supply header to regulate the flow at any set point between [_____] and [_____] L/second gpm to the backwashing adsorber regardless of variations in upstream head conditions.

2.2.15.2 Backwash Initiation and Return to Service

[Ensure automatic and semiautomatic controls permit backwashing to proceed automatically with no manual assistance. ][Control manual backwash and return to service manually by the operator by turning the multiport valve or pilot valve. ] Controls are subject to convenient and accurate manual adjustment designed for manual operation in the event of failure of the electrical equipment.

2.2.15.3 Backwash Supply Tankage

******************************************************************************
NOTE: Each filter is backwashed at approximately 10.2 liters per second per square meter 15 gallons per minute per square foot to provide 25 to 50 percent bed expansion. Backwash supply 10.2 liters per second x 900 seconds x 2 backwashes for each
******************************************************************************
Provide backwash supply system with a minimum effective capacity to provide storage of [_____] liters gallons.

2.2.15.4 Backwash Waste Holding Tankage

Provide waste backwash system holding tank having a minimum capacity to provide storage of [_____] liters gallons.

2.2.15.5 Valves, Switches, and Sensors

Equip each tank with a [float][ or ][solenoid] operated inlet valve. Activate solenoid-operated valve by a [probe, ][a float-operated switch][ or ][a timer together with a float switch] to automatically shut off the incoming flow in the event of failure of the timing mechanism. Mount water inlet valves and switches externally. Mount floats and probes internally or externally, as long as the rapid evacuation of the tank does not interfere with their operation.

2.2.16 Pumps

Provide backwash pump in accordance with Section 23 21 23 HYDRONIC PUMPS. Provide waste backwash return pump in accordance with Section 23 21 23 HYDRONIC PUMPS.

2.2.16 Carbon Storage and Transfer System

Provide a fresh carbon storage system with a minimum capacity of the system provides storage of [_____] kg pounds of dry carbon at a bulk density of [_____] kg per cubic meter pounds per cubic foot.
2.2.16.2  Spent Carbon Storage Tanks

Provide a spent carbon storage supply system with a minimum capacity to store [_____] kg pounds of wet carbon saturated with organics.

2.2.16.3  Carbon Slurry Transfer Pump

Provide carbon slurry transfer pump in accordance with Section 23 21 23 HYDRONIC PUMPS.

2.3  TESTS, INSPECTIONS, AND VERIFICATIONS

Assemble the adsorption system equipment in the shop to the maximum practical extent. Conduct a factory pressure test at [125][250][_____] percent of the rated pressure of the equipment. Examine fiberglass tanks in accordance with ASTM E1067/E1067M. [Furnish test reports with the equipment][Submit factory pressure test reports to the Contracting Officer prior to shipment of the equipment].

PART 3  EXECUTION

3.1  EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2  INSTALLATION

3.2.1  Equipment Installation

******************************************************************************
NOTE: Pump bases and footings for adsorbers should be located and detailed on the drawings.
******************************************************************************

Mount each adsorber shell or tank [by anchoring to a footing isolated from the floor slab][on a skid base]. Provide anchor brackets, anchor rods or straps to hold the shell to anchors in the footing. Fabricate skids from [cast iron][ or ][steel] channels and design to support the equipment and to distribute the weight in transit and in service filled with water without point loading on the tank or concrete slab.

3.2.2  Pipe, Valves, Fittings and Appurtenances

Install piping, including cleaning, cutting, threading and jointing, in accordance with Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING or Section 22 00 00 PLUMBING, GENERAL PURPOSE, as appropriate to the application. Provide differing metals with isolation devices.

3.2.2.1  Strainers

******************************************************************************
NOTE: This paragraph is needed only for header-lateral-distributor collectors.
******************************************************************************

Protect strainer heads and strainers during placement of concrete fill provided for support of the header-lateral-distributor head.
3.2.2.2 Heat Trace and Insulation

Provide exterior pipe and appurtenances with an electrical heat trace and insulate in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.2.3 Electrical Work

Perform electrical work as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

Transfer

3.2.4 Onsite

**************************************************************************
NOTE: The flow rate is usually based on a 50 mm 2 inch pipe diameter. Average velocity in the pipe during transfer should be between 0.9 and 2.1 meters 3 and 7 feet per second to maintain the carbon in suspension. Design velocities above 3 meters 10 feet per second result in excessive head losses and unstable operation. The slurry carries between 0.1 and 0.4 kg carbon per liter 0.7 and 3 lbs. carbon per gallon of water.
**************************************************************************

Unload spent media from and load new media in permanently mounted adsorbers. Transfer carbon slurry between vessels at a rate between [_____] and [_____] L/second gpm.

3.2.5 Offsite Reactivation of Modular Units

Remove modular units from service, disconnect from the permanent piping, drain of free water and return to the supplier for reactivation.

3.3 FIELD QC

3.3.1 Sequencing and Scheduling

**************************************************************************
NOTE: Head conditions for the influent pumps, backwash pumps and carbon slurry transfer pumps specified in Section 23 21 23 HYDRONIC PUMPS depend on the head losses encountered in the equipment specified in this Section.
**************************************************************************

Perform sampling and analyses to demonstrate system performance and effluent compliance.

3.3.2 Tests

Carefully inspect all products for defects in workmanship and material; clean debris and foreign matter out of valve openings and seats; operate all operating mechanisms to check their proper functioning; and check all nuts and bolts for tightness. Repair or replace valves and other equipment which do not operate easily or are otherwise defective.
3.3.2.1 Hydrostatic Tests

********************************************************************************
NOTE: Disinfection of vessels that are supplied prefilled with carbon is not feasible. The test pressure for vessels supplied with carbon should not exceed the rated pressure. Testing of pipe and fittings should be specified in the same section that the pipe is specified in.
********************************************************************************

After installation, test all tanks for water tightness. Include testing plugs or caps, all necessary pressure pumps, pipe connections, gauges, other equipment, and all labor. Test at a pressure of [[_____] kPa psi ]][as indicated in the schedule]. Isolate the piping systems from the tanks for pressure testing at the specified test pressures.

3.3.2.2 Performance Tests

********************************************************************************
NOTE: The approximate constant flow rate for the operating capacity test will be inserted in the blank spaces provided. For some adsorption units, the tests may be modified as necessary where high capacity activated carbons are used and the total organic carbon is such that complete tests would require abnormally extended periods of time. In such cases this paragraph will be suitably rewritten. 
********************************************************************************

After installation of the activated carbon adsorption system, carry out operating tests to assure that the system operates properly. If any deficiencies are revealed during any tests, correct such deficiencies and repeat the tests. Put [each][a typical] adsorption unit through a complete cycle of operation [at a constant flow rate][to exhaustion at a constant flow rate] of approximately [_____] L/second gpm for the capacity test. Document a complete log of each test run, with the following data: date, time of readings and sampling, total backwash, and total water treated. Determine total organic carbon removed by analyses of the influent at such intervals as gives a representative organic carbon content. When the required quantity of water, [_____] liters gallons, has been run through the adsorber, take samples of the effluent for analysis. Use results of the tests in determining the capacity and performance of the adsorption unit.

3.3.2.3 Liquid Sampling and Analyses

Collect, mark, preserve and analyze influent and effluent samples.

3.3.2.4 Activated Carbon Sampling and Analyses

Perform sampling and analyses of the activated carbon media in accordance with [requirements for spent carbon transport and requirements of AWWA B605 and of the reactivation facility][requirements of the RCRA permitted treatment, storage and disposal facility].
3.3.2.5 Discharge

During the capacity test, store treated water as necessary to maintain the required flow rate. Submit reports for discharge permit compliance.

3.3.2.6 Utilities

The contractor is responsible for obtaining water, electric power and other utility items as well as the disposal of water drainage during testing.

3.3.3 Manufacturer Field Service

Provide the services of a representative of the manufacturer experienced in the installation, adjustment, and operation of the equipment specified to supervise the installation, adjustment, and testing of equipment.

3.3.4 Posting Framed Instructions

Post framed instructions containing wiring and control diagrams showing the complete layout of the system where directed. Prepare, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system, frame and post beside the diagrams. Submit wiring and control diagrams, systems layouts and isometrics, instructions, and other sheets, prior to posting. Post the framed instructions before acceptance testing of the systems.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Painting/Corrosion Prevention

Coat or paint all ferrous surfaces.

3.4.1.1 Exterior Surfaces

Solvent-clean factory primed surfaces before painting. Prepare and prime surfaces that have not been factory primed in accordance with the paint manufacturer's recommendations. Apply the paint system to the outside of the tank in accordance with Section 09 90 00 PAINTS AND COATINGS. Provide color as indicated on the paint schedule or as otherwise approved.

3.4.1.2 Interior Surfaces

**************************************************************************
NOTE: Some state and local health agencies have listings of acceptable paint materials for the interior of potable water tanks. Contact the appropriate state and local authorities to determine if the paint systems are acceptable. If these systems are not acceptable, determine the best acceptable system and revise this specification accordingly. Some states require NSF approval for coatings in contact with potable water. The zinc coating system specified in Section 3.8 of AWWA D102 is not acceptable.
**************************************************************************

Coat tank interior surfaces with the coating conforming to Section 3.2, 3.3, 3.4, 3.5, 3.6, or 3.7 of AWWA D102. System of three coats, 0.10 -
0.15 mm 3.9 - 5.9 mils dry film thickness (DFT) per coat, for total of 0.30 - 0.45 mm 11.7 - 17.7 mils minimum DFT.

3.4.1.3 Touch-Up Painting

Touch up factory painted items as needed. Factory painted items requiring touching up in the field must be thoroughly cleaned of all foreign material, primed and top-coated with the manufacturer's standard factory finish.

3.4.1.4 Field Painting

Paint equipment which did not receive a factory finish as specified in Section 09 90 00 PAINTS AND COATINGS.

3.4.1.5 Corrosion Resistant Metals

Painting of corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel is not required unless otherwise specified.

3.4.2 Field Training

Conduct a training course for designated operating, maintenance and support staff members. The training period, for a total of [8][12][16][_____] hours of normal working time, must start after the system is functionally completed but prior to final acceptance tests. Field training must cover each item contained in the operating and maintenance data.

3.5 MAINTENANCE

Submit a preventive maintenance plan and schedule including routine recommended chemical preventive measures for handling contaminant/biofouling of the carbon adsorption unit under conditions of the application including strong acid/alkali/alternative chemical soaks and instructions for storage and handling of treatment chemicals and waste products.

NOTE: This guide specification covers the requirements for air pollution control equipment and accessories for use with various pollutant emitters.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Approved Detail Drawings; G[, [_____]]

SD-03 Product Data
Emission Monitoring System
Air Pollution Control Equipment
Instrumentation and Controls
Training
System Performance Test; G[, [_____]]

SD-06 Test Reports
Factory Tests
System Performance Test;

SD-07 Certificates
Manufacturer's Field Representative

SD-10 Operation and Maintenance Data
Air Pollution Control Equipment; G[, [_____]]
Accessories; G[, [_____]]

1.3 QUALIFICATIONS

1.3.1 Welding

**************************************************************************
NOTE: If the need exists for more stringent requirements for weldments, delete the first bracketed statement and the last bracketed statement applies. Dust collection equipment covered by the guide specification is not normally manufactured to the requirements of the ASME Boiler and Pressure Vessel code. Welding of these vessels will be governed by Section 05 50 14 STRUCTURAL METAL FABRICATIONS.
**************************************************************************

[Weld piping welded in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and
welders are to be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests and the tests furnished at the work site if practicable. The Contracting Officer will furnish a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators. The welder or welding operator must apply his assigned symbol near his welds using a rubber stamp or felt-tipped marker with permanent weatherproof ink or other methods approved by the Contracting Officer that do not deform the metal. Structural members are to be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING. [Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING.] Non-Pressurized dust collection vessels must be welded in accordance with provisions of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.3.2 Contractor

Contractor must have a minimum of [2][3][5][_____] years of experience in the construction and maintenance of industrial air pollution control systems.

1.3.3 Manufacturer's Field Representative

Provide a manufacturer's field representative and training engineer, who is experienced in the installation, adjustment, and operation of the equipment furnished, and who has complete knowledge of the proper operation and maintenance of the system. Field representative will be onsite to supervise the installation, adjustment and compliance testing of the equipment. Field representative must provide supervision of the system for [_____] days after startup of the system.

1.4 CONSTRUCTION REQUIREMENTS

Ensure system is suitable for [indoor] [outdoor] installation and provided [with] [without] a weather enclosure. [Provide unit with [_____] mm inch of insulation with a k value of [_____] W/m K Btu/h ft] [Unit will not be insulated]. System must be designed for [a wind load of [_____] kph mph] [and] [an internal [negative] [positive] static pressure of [_____] Pa inch of water gauge]. [Design system for a snow load of [_____] kPa psf]. Seismic protection of equipment must be in accordance with UFC 3-301-01, Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT, Section 23 05 48.19 [SEISMIC] BRACING FOR HVAC, and Section 26 05 48 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT, and Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL.

1.5 DELIVERY, STORAGE, AND HANDLING

Store all equipment delivered and placed in storage as recommended by the manufacturer, with protection from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

1.6 EXTRA MATERIALS

**************************************************************************

NOTE: Include items needed for future maintenance and repair, items that might be difficult to obtain and spare parts needed to ensure continued operation of critical equipment.

**************************************************************************
Provide auxiliaries for maintenance with the equipment and include all special tools, rigs, jigs, fixtures, equipment, or other devices required for normal operation and service. Provide any equipment required for routine maintenance such as filter wash facilities, oil or refrigerant removal, and replacement devices. Include tests or measurement instruments or gauges. Also furnish the following:

a. Spare parts for each different item of material and equipment specified including all the of parts recommended by the manufacturer to be replaced after [1 year] [1 year and 3 years] service.

b. One set of special tools for each type of equipment, including calibration devices, and instruments required for adjustment, calibration, disassembly, operation, and maintenance of the equipment.

[One set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment].

c. One or more steel tool cases mounted on the wall, installed in a location agreed to by the government, complete with flat key locks, two keys, and clips or hooks to hold each special tool.

d. [_____].

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Standard Products

Provide material and equipment that are the standard products of a manufacturer regularly engaged in the manufacture of the products. Use items of equipment that essentially duplicate equipment that has been in satisfactory use at least 2 years prior to bid opening. Provide equipment supported by maintenance organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Maintenance organization must respond to a service call within [_____] hours [_____] days.

2.1.2 General Requirements

Provide equipment and appurtenances as specified and as shown on the approved detail drawings, and suitable for the service intended. Provide new and unused materials and equipment including testing equipment furnished under the contract. Ensure components that serve the same function and are the same size are identical products of the same manufacturer.

Detail drawings contain complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

2.1.3 Nameplates

Provide each major component of equipment with the manufacturer's name, address, type or style, model or serial number, and catalog number on a
plate secured to the equipment. Ensure each piece of equipment bears the approval designation and the markings required for that designation. Mark valves in accordance with MSS SP-25 and securely attach tag with the manufacturer's name, catalog number and valve identification permanently displayed.

2.1.4 Equipment Guards[ and Access]

**************************************************************************

NOTE: Catwalk, ladder, stair, and guardrail may be required. If so, select the applicable item, delete the others, and indicate on drawings the selected item.

**************************************************************************

Enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts so located that any person may come in close proximity thereto, to prevent accidental personal injury, in accordance with 29 CFR 1910, Subpart O, Machinery and Machine Guarding. Provide removable guards and arrange to allow access to the equipment for maintenance. Guard or cover high-temperature equipment and piping so located as to endanger personnel or to create a fire hazard with insulation of type specified for service. Provide [items such as[ catwalk,][ stair,][ ladder,][ and][ guardrail] where shown and in accordance with Section [08 31 00 ACCESS DOORS AND PANELS][05 51 33 METAL LADDERS][05 51 00 METAL STAIRS][05 52 00 METAL RAILINGS]]

Platforms, Walkways, Stairways, Handrails, Kick plates and Fixed Ladders that are required for operation, examination, testing and maintenance of pollution and waste control equipment must be provided as required for access. Platforms, walkways, stairways, handrails, kick plates and fixed ladders must be factory or shop fabricated, must provide suitable access, and must meet 29 CFR 1910-SUBPART D for safety of maintenance and operating personnel. Walkways must be provided for maintenance and inspection of maintenance points. Walkways and platforms must be connected by stairways or fixed ladders. Platforms, walkways, stairways, fixed ladders, handrails, and kick plates must be hot dipped galvanized after fabrication in accordance with ASTM A123/A123M. Minimum galvanized coating weight per surface must be not less than 0.70 kilogram per square meter 2.3 ounces per square foot.

2.2 GAUGE

**************************************************************************

NOTE: Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process must dictate material selection.

**************************************************************************

Conform gauge to the following:
2.2.1 Draft Gauge

**ASME B40.100.** Provide tubing for gauges for service above 66 degrees C 150 degrees F conforming to ASTM B68/B68M; for service below 66 degrees C 150 degrees F, plastic tubing conforming to ASTM D3350 may be used.

2.2.2 Gauges, Pressure and Vacuum

**ASME B40.100,** select a pressure range that is approximately twice the normal operating pressure of the media. The maximum operating pressure should not exceed 75% of the full-scale range.

2.3 LOW-WATER CUTOFF

**************************************************************************

NOTE: Low-water cutoff applies to all wet scrubber tanks, reservoirs, and sumps if low level or loss of water can affect scrubber or boiler operation and safety. Coordinate requirement for deenergizing boiler panel to stop firing the boiler if scrubber components are subject to damage from excess heat in a loss of water supply.

**************************************************************************

Provide low-water cutoff for all scrubber liquid sumps, holding tanks, reservoirs, and mixing tanks. Cut-off must cause a safety shutdown of the scrubber and must be provided with auxiliary contacts to be used to sound an alarm. [Low-water shutdown must require a manual reset before any equipment can recycle or operate.]

2.4 PIPE, FITTINGS, AND TUBING

Provide pipe, fittings, and tubing conforming to the following:

2.4.1 Pipe

**ASTM A53/A53M,** Type S, Grade A, standard weight; or copper pipe, **ASTM B42.**

2.4.2 Nipples

**ASTM A733,** standard weight to match adjacent piping.

2.4.3 Pipe Fittings

2.4.3.1 Steel Pipe Fittings

**ASME B16.9** for butt-welding fittings; **ASME B16.11** for socket-welding fittings; and **ASME B16.5** for flanged fittings.

2.4.3.2 Brass or Bronze Pipe Fittings

**ASME B16.15,** Class A, 862 kPa 125 pound.

2.4.3.3 Malleable-Iron Pipe Fittings

**ASME B16.3,** type to match adjacent piping.
2.4.3.4 Unions

ASME B16.39, type to match adjacent piping.

2.4.3.5 Flanges, Cast-Iron and Bronze

2.4.3.6 Pipe Threads

ASME B1.20.2M, ASME B1.20.1.

2.4.4 Tube, Copper

2.4.4.1 Tube for Air, Water, Gas, and Drains

ASTM B68/B68M or ASTM B88M, ASTM B88.

2.4.4.2 Tube for Refrigeration Systems

ASTM B280.

2.5 STEEL SHEET

Provide steel sheets conforming to the following:

2.5.1 Zinc Coated (Galvanized)

ASTM A653/A653M; ASTM A924/A924M for dust collector casings, housing, and components. Gauges specified are manufacturers' standard gauge.

2.5.2 Low-Carbon

ASTM A568/A568M. Gauges specified, for dust collector casings, housings, and components, refer to manufacturers' standard gauge.

2.5.3 Corrosion Resistant

2.6 AIR TRAPS

Provide air traps for removal of moisture from plant compressed air supplied to air pollution control equipment conforming to ASTM F1139.

2.7 THERMOMETERS

Provide thermometers conforming to ASME PTC 19.3 TW with wells and temperature range suitable for the use encountered.

2.8 VALVES

Provide valves conforming to ASME B16.34, and the following:

2.8.1 Angle Valves

MSS SP-80, Types 1, 2, or 3, Class 125, except that valves over 80 mm 3 inch must have iron bodies and brass or bronze standard trim with glands or
followers in the stuffing boxes. Provide valves with nonmetallic renewable composition discs and raised flat seats designed for 862 kPa 125 psi steam. Secure wheels with hexagonal nuts.

2.8.2 Check Valves

MSS SP-80, Types 1, 2, 3, or 4, Class 125, as required. Ensure valves over 80 mm 3 inch have iron bodies and are the swing type designed for 862 kPa 125 psi steam. Provide check valves with renewable composition discs or with metallic discs of the regrinding type to permit regrinding without removing valve from the line.

2.8.3 Ball Valves

Provide ball valves having flanged or buttwelded end connections conforming to MSS SP-72; provide ball valves having threaded end connections conforming to MSS SP-110. Ball valves must be one piece construction, full port, and adjustable packing glands. Seats and seals must be made of tetrafluoroethylene, and be designed for 862 kPa 125 psi.

2.8.4 Globe Valves

MSS SP-80, Type 1. Ensure valves over 80 mm 3 inch iron bodies and brass or bronze standard trim and glands or followers in the stuffing boxes. Provide valves with nonmetallic renewable composition discs and raised flat seats designed for 1035 kPa 150 psi steam. Secure wheels to the stems with hexagonal nuts.

2.9 WATER METERS

Provide disc type water meters with reinforced disc for hot water above 66 degrees C 150 degrees F, and rubber or carbon disc for cold water, that are constructed of bronze composition or cast iron protected by noncorrosive coating. Ensure moving parts subject to wear are easily replaceable. Provide meters conforming to the requirements of AWWA C700.

2.10 ELECTRICAL WORK

**************************************************************************

NOTE: Indicate on drawing the type and class of motor enclosure depending on environment in which the motor is to be used.

**************************************************************************

Provide electrical motor-driven equipment specified complete with motors, motor starters, and controls. Provide electrical equipment and wiring in accordance with [Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM]. [Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION]. [Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION]. Ensure electrical characteristics are as indicated or specified. Provide motor starters complete with thermal overload protection and other appurtenances necessary for the motor control specified. Ensure each motor is of sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Provide manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices specified but not shown. Motors must conform to NEMA MG 1, with enclosures as indicated [except as specified for Petrol Vapor Recovery Unit]. Assemble controls, interlocks, instruments, status indication lights, and other devices required for operation and
observation of equipment status on an [open face panel] [enclosed panel with [latched door] [key locked door]]. Provide [factory-assembled panel, connected to equipment, and mounted on unit] [or] [factory assembled panel and boxed for field installation]. [Instrumentation and control system must include local control panels and a central control panel located in the facility control room. The control system must integrate local controls provided with equipment, as specified, so that complete system operation can be monitored and controlled from the control room]. Integrate the air pollution control system with the emission generating equipment. The control system must provide integrated control of all system processes and equipment, and contain all necessary instrumentation required for monitoring and operation of the air pollution control system. Ensure control system panels graphically display the system. Provide local control panels with selector switches so that equipment can be operated manually for test and maintenance purposes. Incorporate suitable safety interlocks to assure that proper permissive conditions have been met prior to changing the operating status of major system components. Automatically initiate shutdown of the air pollution control equipment system, or portion thereof, with alarms should unsafe conditions arise during operation of the system. Provide visible and audible alarms on critical functions locally and at central control room. Provide controls conforming to NEMA ICS 1. Provide enclosures for power and control panels conforming to NEMA ICS 6.

2.11 DRAFT FANS

**************************************************************************
NOTE: In new installations, coordinate design with boiler or incinerator specification. For retrofit, fans will be sized for air pollution control equipment. For fans operating in corrosive or erosive environment, provide liners for scroll sheets and rotor blades. References to draft fans will be deleted if inapplicable for the equipment specified.**************************************************************************

Furnish centrifugal fans conforming to AMCA 801 [Type I] [Type II] [forced draft] [and] [induced draft] as an integral part of air pollution control equipment design. Provide [centrifugal] [_____] fans with [backward curved blades] [radial tip blades] [or] [axial flow type]. Size each fan for an output volume and static pressure rating sufficient for pressure losses, leakages, temperature, and elevation corrections for ASHRAE 169, 1 percent Cooling Dry Bulb, Mean-Coincident Wet Bulb ambient conditions. In addition, ensure fan sizing includes margins of 10 percent volume and 21 percent static pressure, plus margins of [5] [_____] degrees C [10] [_____] degrees F for forced draft fans and [22] [_____] degrees C [40] [_____] degrees F for induced draft fans. [Provide induced draft fans with outlet dampers]. Ensure noise levels for fans do not exceed 85 decibels in any octave band at a 914 mm 3 foot station. Provide fan bearings which are [air cooled] [or] [water cooled], and backward curved fan blade type with bearings not requiring water cooling may be of the self-aligning antifriction type. [Provide scroll sheets and rotor blades with liners.]

2.11.1 Draft Fan Control

**************************************************************************
NOTE: Variable speed control, inlet vane control, and inlet damper control are, in descending order of efficiency, capable of control draft fan**************************************************************************
conditions. The choice is based on economics. However, in erosive services, inlet vane control is not desirable.

Provide forced draft centrifugal fans with [inlet vane control] [variable speed control] where indicated. Provide induced draft centrifugal fans with [inlet vane control] [inlet damper control] [variable speed control]. [Provide axial propeller fans with variable propeller pitch control and variable speed drive.] Provide inlet vanes or dampers suitable for use with air pollution control equipment.

2.11.2 Draft Fan Drives

NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.

Steam driven boiler auxiliaries will not be used unless the exhaust steam can be utilized completely. Reference to steam drives will be deleted if inapplicable for the equipment specified.

Drive fan by [an electric motor] [or] [a steam turbine]. [Provide [drip-proof] [totally enclosed nonventilated] [totally enclosed fan-cooled] [totally enclosed fan-cooled], electric motor suitable for installation in a Class II, Division 1, Group F, hazardous location conforming to NFPA 70]. [Provide magnetic [across-the-line] [reduced voltage start] type motor starter with [general-purpose] [weather-resistant] [water tight] [dust-tight] [explosion-proof] enclosure and furnish with four auxiliary interlock contacts]. [Operate steam turbines properly with a steam inlet pressure of [_____] Pa psig and with steam back pressure of [_____] Pa psig. Provide turbines with horizontally-split, centerline support casings, water-cooled bearing housings with ring-oiled, babbitt-lined, bronze packed sleeve bearings. Also equip turbines with a mechanical shaft speed governor and valve, and independent emergency overspeed governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, removable stainless steel steam strainer [without disconnecting piping], any special wrenches and tools required for servicing turbine, and a sentinel warning on the exhaust casings. Turbines must conform to ASME PTC 6].

2.12 DUCTWORK

NOTE: References to ductwork will be deleted if inapplicable for the equipment specified. Ductwork thickness or gauge will depend on both size and pressure.

Ductwork must be [galvanized sheet metal conforming to ASTM A653/A653M] [_____] with a minimum thickness of [_____] mm [_____] gauge [_____] inch [_____] gauge. Ductwork must be sized to limit friction losses in accordance with ASHRAE 90.1 - IP Fan Power Limitation Guidelines. Ductwork must be constructed in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION. Seismic protection of equipment must be in accordance with UFC 3-301-01,
Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT, and Section 23 05 48.19 [SEISMIC] BRACING FOR HVAC. Brace ducts externally and install and anchor so as to be free of vibration. Provide sound and vibration control in accordance with Section 22 05 48.00 20 MECHANICAL SOUND, VIBRATION, AND SEISMIC CONTROL. Provide access and inspection doors as indicated, with a minimum of one in each section between dampers or items of equipment. Construct duct with long radius elbows having a centerline radius of 1.5 times the duct width, or where the space does not permit the use of long radius elbows, short radius or square elbows with factory-fabricated turning vanes may be used. Ensure duct joints are substantially air-tight and have adequate strength for the service.

2.13 AIR POLLUTION CONTROL EQUIPMENT

**************************************************************************
NOTE: Delete all equipment requirements not required on the project. Title 40, Part 60 of the Code of Federal Regulations for Protection of Environment (40 CFR 60), state and local codes contain regulations pertaining to air pollution control. 40 CFR 60 contains Standards of Performance for New Stationary Sources. In addition, EPA Test Report No. AP-42 with latest supplements contains emission factors for the specific pollutant emitter (uncontrolled). Determine the degree of required pollutant removal from the gas stream to meet the more stringent of local, state and EPA regulations and indicate whether EPA, state or local regulations apply. With the information thus obtained, determine the most effective and economical air pollution control equipment required. This process will be repeated for each pollutant emitter identifying the pertinent regulation. Indicate on drawings for each pollution control equipment electric power requirements including motor sizes, etc., where applicable. Coordinate performance, operation, and control of pollution control equipment with all other related system components to assure total system operation and that safety requirements are met. Indicate on drawings any such items as walkways, guardrails, stairs, and ladders furnished as part of the pollution control equipment, if required.
**************************************************************************

Performance of equipment must be as indicated in Paragraph SCHEDULES. [Provide paint spray and wet process gas ductwork in compliance with AIHA Z9.3 and NFPA 91.][ Provide air and water piping in compliance with ASME B31.1.][ Use particulate emission control equipment conforming to ASME PTC 38.][ Provide equipment with steel walkways, safety rails and stairs, or ladders as indicated. Ensure access is by means of [ 29 CFR 1910.28compliant ladder][step stairs with handrails]].

a. Submit a complete list of equipment and material, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Spare parts data for each different item of material and equipment specified, after approval of detail drawings and not later than [_____] months prior to the date of beneficial occupancy. Include a complete list of

SECTION 44 10 00 Page 21
parts and supplies, with current unit prices and source of supply.

b. Submit proposed diagrams, instructions, and other sheets, prior to posting. Post framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, including equipment, piping, valves, and control sequence, where directed. Prepare condensed operating instructions explaining preventative maintenance procedures, methods of checking the system for normal, safe operation, and procedures for safely starting and stopping the system in typed form, frame as specified above for the wiring and control diagrams, and post beside the diagrams. Post the framed instructions before acceptance testing of the system.

c. Submit detailed manufacturer's data on the instrumentation and controls. Include overall controls, sensors, process controllers, control operators, ladder diagrams, timers, sequence of controls, valves, alarms, signals, interlocks and cut off systems. Data describing in detail the equipment used to monitor emissions, including the sampling probe, filters, sampling pump, moisture separator/drier, tubing, analyzer, analyzer calibration system, data recorder, and alarms. Process and instrumentation diagrams (P&IDs).

2.13.1 Dry Dynamic Precipitator

**************************************************************************
NOTE: Select construction features required including drive component and delete all others.

Dry dynamic precipitators may be used for collecting coarse dry particulates from coal crusher, conveyor, and bunker ventilation where the objective is to control material losses and to remove coarse fly-ash particulates from boiler flue gases of chain-grate or stoker-fired boilers. It is not effective in removing gaseous pollutants or particles of 7 micrometers and under.
**************************************************************************

Unit must be a mechanical collector consisting of a motor-driven fan, a fan casing, a hopper or dust bin, fan motor, fan motor starter with overload protection, [fan drive coupling] [belt drive with fan and motor pulleys and adjustable motor base], fan and motor mounting base on hopper, and a [ceiling mounting] [floor mounting] stand for the entire assembly. The fan must comply with AMCA 99, Section 99-0401, Classification for Spark Resistant Construction, AMCA 210, and AMCA 300.

5.13.1.1 Fan Impeller

Fan Impellers must be steel and designed to provide the static head required for pumping the dirty and cleaned gas streams through the duct systems and related components. Ensure impeller is keyed and locked on a cold drawn, turned and polished steel shaft mounted on heavy duty grease or oil lubrication ball or roller bearings. Provide shaft with a diameter and stiffness that will limit deflection at the maximum shaft loading, within the operating range of the fan, to no more than 0.167 mm/meter 0.002 inch/foot of shaft. Provide shaft with a locked key slot for mounting a pulley, a direct drive, or coupling. Balance the entire rotating assembly dynamically at operating speeds. Balance fans dynamically and factory-test in accordance with AMCA 204 at the design operating RPM to Fan Application Category BV-3, Balance Quality Grade G6.3 or approved equivalent.
Installed vibration levels must not exceed the levels specified in AMCA 801.

2.13.1.2 Fan Casing

Fan casing must be abrasion resistant cast iron conforming to ASTM A48/A48M or abrasion resistant steel consisting of a fan support base with back-housing, involute fan discharge scroll with inlet and discharge duct connections, and a dirt discharge port. Provide scroll with readily replaceable wear plates and constructed to permit field positioning the direction of discharge in at least eight different directions. Scroll must provide means for accumulating and diverting the bulk of the particulate enriched gas stream into the hopper before the gas stream is returned to the inlet to the scroll.

2.13.1.3 Hopper Storage

**************************************************************************
NOTE: Determine the rate and quantity of pollutant material collected, the final disposition of the material, and the manner and frequency of transport to disposal location. From this, determine the hopper size to be indicated and select the bracketed hopper outlet. Delete those not selected.
**************************************************************************

Hopper storage capacity must be as indicated. Construct unit of no less than 3.4 mm 10 gauge [welded low carbon] [corrosion resistant] steel plate for the vertical sides and bottom which must be sloped steeper than the slump angle of the material being collected to minimize bridging over at the outlet. Construct top to support the fan, motor, and drive without buckling or being resonated by the fan and no less than 6.4 mm 1/4 inch thick. Provide hopper with an access door and [a manually-operated rotary lock] [a motor-driven rotary lock] [a guillotine-type slide gate].

2.13.1.4 Test Connections

Provide pressure test connections at the suction and discharge ducts connecting to the precipitator.

2.13.2 Wet Dynamic Precipitator

**************************************************************************
NOTE: Select construction features required including drive component and delete all others. Wet dynamic precipitators are frequently used for ventilation air cleaning of coal crushing, conveying, and storage facilities where the dust loading is 1 to 4.6 grams per cubic meter 1/2 to 2 grains (weight) per cubic foot of air and the particles are 50 percent or more of 2 to 7 micrometers size. It will remove some gaseous pollutants.
**************************************************************************

Provide a mechanical collector unit consisting of a motor-driven fan, a fan casing with water sprayhead, [a hopper or slurry bin,] fan motor, fan motor starter with overload protection, [fan drive coupling,] [belt drive with fan and motor pulleys and adjustable motor base,] [fan and motor support on the hopper] [a rigid structural steel base] arranged for [floor
2.13.2.1 Collector

Note: Delete inapplicable materials and equipment. Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process must dictate material selection.

Provide collector consisting of a heavy steel plate fan housing constructed of low carbon steel. Provide fan with ASTM A240/A240M stainless steel blades and rivets. Fasten blades to a heavy forged steel hub mounted on a forged, ground, and polished ASTM A302/A302M stainless steel shaft supported on ball or roller bearings. Provide shaft with a diameter and stiffness that will limit deflection at the maximum shaft loading to no more than 0.167 mm/meter 0.002 inch/foot of shaft. Ensure impeller and driven units are lock-keyed to the shaft with the entire assembly dynamically balanced at all operating speeds. Dynamically balance fans and factory-test in accordance with AMCA 204 at the design operating RPM to Fan Application Category BV-3, Balance Quality Grade G6.3 or approved equivalent. Provide housing and impeller with components that will provide for uniformly covering rotating and stationary parts with a film of moving water to provide for wetting and capturing of centrifugally impinged particulates. Provide means for separation from the air stream and drainage of the water and particulate slurry from the collector. Installed vibration levels must not exceed the levels specified in AMCA 801.

2.13.2.2 Hopper Storage

Note: Determine hopper storage capacity and indicate an open drain or valved outlet. Omit entire paragraph if hopper is not required for an installation piped to drain filtrate to a coal recovery or ash pit.

Hopper storage capacity must be as indicated. Construct unit of no less than 3.4 mm 10 gauge [welded black] [welded corrosion resistant] steel plate for the vertical sides and sloped bottom. Construct top to support the fan, motor, and drive without buckling or being resonated by the fan and no less than 6.4 mm 1/4 inch thick. Slope hopper bottom for complete drainage of slurry of collected material; free of ledges and pockets; and provide for full free flushing of particulate when operating wet. Provide hopper with an inspection window, cleanout, and access door. Provide hopper with electric heating coils, modules, or blankets to keep collected material dry and free flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F.
2.13.2.3 Nonstainless Components

Coat water wetted, nonstainless components with a permanently bonded, abrasion and corrosion resistant rubber facing suitable for the operating temperature of the gas stream.

2.13.2.4 Water Supply Components

Provide precipitator with water supply components sized to meet equipment capacity requirements and include:

a. A stainless steel water supply strainer with removable screen, flow control valve [with rate adjustment] [pressure gauge] [low pressure alarm switch] [water meter].

b. Analog solenoid water flow control valve.

c. Adjustable water pressure control switch with contacts to open on low pressure to stop or prevent operation of the fan motor if water pressure is below the minimum required for efficient operation of the collector. [An additional set of contacts to close on low pressure to permit operation of an annunciator alarm.] The adjustable range of the switch trip must be from [_____] to [_____] kPa [_____] to [_____] psig.

d. Water pressure gauges with 0 to 690 kPa 0-100 psig range.

e. Adjustable automatic water pressure or water flow rate regulator to provide a steady controlled rate of water flow as required for optimum collector performance.

f. Water flow meter sized for rate required by the collector.

2.13.2.5 Test Connections

Provide pressure test connections at the suction and discharge ducts connecting to the precipitator.

2.13.2.6 Drain Connections

Provide slurry drain connections which are screwed or flanged pipe connections sized as recommended by the manufacturer.

2.13.3 Conical Dry Dust Collector

**************************************************************************
NOTE: The conical dry dust collector removes up to 80 percent by weight of particles, 10 micrometers and over, from a gas stream and is used primarily on general industrial dusts and occasionally to clean boiler flue gases since it has a temperature tolerance up to 371 degrees C 700 degrees F. It is not effective in removing gaseous pollutants or particles of 7 micrometers size and under. Its high air friction drop may require a booster fan. It normally is selected for pressure drops in the 890 Pa to 1652 Pa 3-1/2 to 6-1/2 inch water gauge range at operating conditions.
**************************************************************************
Provide a mechanical collector unit consisting of a top horizontal involute scroll gas inlet and outlet mounted over a vertical cylindrical shell or cone which has a narrow angle cone below. Design unit specifically to impart a high velocity vortex spin to the incoming downflowing gas stream to throw particulates to the wall of the cylinder and cone before turning upward in an internal vortex to the outlet. Replaceable wear plates [are] [are not] required.

2.13.3.1 Scrolls, Cylinder, and Cone

**************************************************************************
NOTE: Delete inapplicable materials and equipment.
Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process must dictate material selection.
**************************************************************************

Provide scrolls, cylinder, and cone consisting of no less than [3.4 mm 10 gauge] [4.8 mm 3/16 inch] [9.5 mm 3/8 inch] [welded black] [corrosion resistant] steel. Connect inlet and outlet scrolls for [clockwise] [counterclockwise] connection and rotation of the vortex when looking down on the collector. Provide four equally spaced, welded steel support brackets on the bottom of the inlet scroll or on the vertical walls of the cylindrical section of the collector. Do not use collector cone for storage. Remove and collect particulate, and provide cone bottom with an air-tight seal. Provide [a guillotine-type slide gauge] [a manually-operated rotary lock] [a motor-driven rotary lock] on the [bottom of cone] [bottom of surge tank] [bottom of storage receptacle].

2.13.3.2 Test Connections

Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.3.3 Self-Cleaning Ductwork to Collector

The design velocities of self-cleaning duct must be determined for specific dust handled and duct sized accordingly to maintain required velocity range.

Design all ductwork between dust source and collector to be self-cleaning. Ductwork meeting the following requirements will be considered to be self-cleaning.

a. A duct at an angle greater than 45 degrees to the horizontal plane with gas flowing downward.

b. A duct at an angle greater than 60 degrees to the horizontal plane with gas flowing upward.
2.13.4 Multitube, Centrifugal Dry Dust Collector

NOTE: The multitube centrifugal dust collector has similar performance to the conical dry dust collector except it removes more of both coarse and fine particulates. This collector is often used on stoker-fired boiler applications. The pressure drop range is normally 635 Pa to 1144 Pa 2.5 to 4.5 inches water gauge at operating conditions. Sixty degree hopper valley angle is considered adequate for worse case coal/ash scenario. If designer can confirm that application is less demanding, he should consider a lower valley angle 55 degrees or 45 degrees. In certain applications the size of the unit may require some subassembly in the field, negating the restrictions on field assembly.

Provide a mechanical collector unit utilizing a number of parallel vertical or horizontal tubes of small diameter in an enclosure having a single gas inlet and single gas outlet.

2.13.4.1 Inlet Tube Assemblies, Casing and Hopper

Provide inlet tube assemblies that are replaceable [cast iron] [wear resistant steel with replaceable cast iron spinner vanes and cones] [wear resistant steel with replaceable spinner vanes and cones]. Provide [3.4 mm 10 gauge] [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [low carbon] [corrosion resistant] steel casing with the dust released into a [3.4 mm 10 gauge] [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [black] [corrosion resistant] steel sloped bottom dust hopper. Ensure hopper valley angle is 60 degrees from the horizontal. Provide hopper with a poke hole and access door. Provide hopper bottom outlet with [a guillotine-type slide gate] [a gravity-type trip gate opened by the weight of the collected material] [a manually-operated rotary lock] [a motor-driven rotary lock]. Provide unit with a welded steel support assembly for field erection with no additional work other than setting and bolting the unit in place.

2.13.4.2 Test Connections

Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.5 Dry Electrostatic Precipitator (Dry ESP)

NOTE: Electrostatic precipitators are highly effective with efficiencies up to 99.9 percent by weight in removing fine particulates down to 0.3 micrometers in size from gas streams having light loading of material by weight. They are frequently applied in gas streams of 371 degrees C 700 degrees F or higher but may require a precleaner such as a dynamic precipitator, conical, or multitube centrifugal to bring the gas stream down to an optimum loading. They require a relatively large space. They have a very low gas flow friction but are quite sensitive to having a uniform distribution.
of gas flow through the unit. The efficiency may sharply fall under a gas flow above design rate. Efficiency is also affected by dust particle electrical resistivity which can be too high or too low for maximum performance. Frequently in these situations the addition of relatively small quantities of flue gas conditioning agents have been very effective in improving precipitator performance. Depending on the particle electrical resistivity level, flue gas conditioning will be considered a viable option. Commercial systems are available for ammonia, sodium compounds (carbonate and sulfate), and sulfur trioxide flue gas addition. Pulse energization, the modification to a conventional precipitator power supply to include the capability to superimpose a high voltage pulse on the base voltage, is a second enhancement technique for high resistivity particle applications. Intermittent pulsation, the programmed interruption of normal high voltage waveform, is another enhancement technique. Optimization of precipitator energization and rapping systems through the use of microprocessor-based controls results in lower power levels, reduced electrode failure, and overall improved collection efficiency. Examples of control schemes that can be accomplished with properly programmed microprocessors include:

a. Spark Prediction and Advance

b. Back Corona Detection

c. Opacity Feed Back

d. Rapping Optimization

e. Electrical Power Conservation

Reentrainment of collected material can be limited by a proper balance of factors that affect performance, such as gas velocity through the plates; uniformity of gas velocity profile; ratio of plate height to depth; size of lumps of agglomerated material rapped from the collecting plates and discharge electrodes; and others. Control may also be achieved by a system of automatic programmed gas flow dampers coordinated to operate with related rappers for sequential cleaning of each of the chambers.

Power consumption is generally equivalent to the additional power required by other collecting methods. The pressure drop across units is typically less than 127 Pa 0.5 inch water gauge. Caution should be exercised in their use where combustible or explosive coal dusts or oil fumes may be present and could be ignited by a "spark-over" of the high voltage across the electrodes.
Provide unit in compliance with requirements of ICAC EP-1, ICAC EP-7, and ICAC EP-8, to remove [aerosols] [and] [particulates] from processed gas stream by impressing a polarized electrostatic charge to the contaminants causing them to be drawn to and deposited upon opposite polarity charged plates. Unit must contain multiple chambers and be of gas-tight construction. Unit must be suitable for [indoor] [outdoor] installation. Provide unit with [insulator compartments] [penthouse]. Provide unit with anti-sneak baffles to force all gas flow through ionizing gas passages and to prevent gas bypassing the precipitator sections. Provide assembly consisting of discharging electrodes and opposite charged plates, high voltage power pack and controls, a rapping system for knocking dust from the discharge electrodes and collector plates, perforated gas distribution plates, sheet steel enclosure with dust collecting hopper bottom, dirty gas inlet, clean gas outlet, and structural steel frame. Ensure precipitator systems include microprocessor based controls [flue gas conditioning systems] [pulse energization] [intermittent energization].

2.13.5.1 Electrostatic Precipitator Layout and Component Drawings

Drawings must indicate the kind, size, arrangement, weight of each component, and breakdown for shipment; the external connections, location of local controls, remote control panels, anchorages, and supports required; the dimensions needed for installation and correlation with other materials and equipment; [seismic structural calculations;] and foundation and loading information. Supply drawings for each component showing design and assembly. Provide schematics of all electrical and pneumatic circuits used. Submission must include, but not limited to the following details:

a. Transformer-rectifier equipment.

b. High voltage switches and disconnects.

c. High voltage fuses and circuit breakers.

d. Control systems.

e. Ground lugs.

f. Protection against electrolysis.

g. Graphic display panel indicating power components.

h. Lubrication locations.

i. Electrodes and collecting surfaces.

j. Platforms, walkways, stairways, and ladders which will be required for operation, inspection, testing, and maintenance, and furnished with the precipitator.

k. Location of field welds, in conformance to AWS D1.1/D1.1M

2.13.5.2 Discharge Electrodes

Discharge electrodes must be [wires and weights] [rigid electrodes] [rigid frame]. Provide top supported discharge electrodes with the bottom free to
provide laterally restrained electrodes to maintain optimum spacing from the plates. Provide electrodes with a stiffness, length, or restraints required to prevent vibration or flutter when the unit is in service.

2.13.5.3 Collecting Plates

Provide collecting plates consisting of vertical panels of multiple steel strips hanging edgewise in the horizontal air stream so as to form the equivalent of many vertical splits of the gas stream into many gas passages. Use strips that are convoluted, stiffened or constructed with raised ribs, to provide sufficient stiffness to prevent distortion of the plates and also present vertical ridges to support boundary layer edges to increase plate dust retention. Provide top supported plates with the bottom free to expand and contract with changes of gas stream temperature. Coordinate plate configuration and support system design with the plate rapping system design and operation to shed collected material from the plates and to retain a consistent and optimum spacing from the discharge electrodes. Assemble the collecting surfaces at the factory. Factory assembled modules which can be shipped to the field for erection may be provided. Provide high voltage frames with sway braces or other devices as required to prevent swaying. Incorporate gas baffles into the collecting plates to provide a gas flow quiescent zone and to provide stiffening.

2.13.5.4 Power Supply and Control System

Provide solid state microprocessor type power supply and control system. Control system must provide for continuous monitoring and regulating of applied voltage for effective maximum performance of precipitation over the range of plate loadings with minimum sparking and arcing to the plates. Provide entire system with a system of safety interlocks and grounding devices to prevent personnel physical contact with high voltage components. Provide voltage insulators with heaters.

2.13.5.5 Rapping Systems

Provide rapping systems consisting of multiple hammers or other impact devices to cause particulate shedding from the collecting plate. Ensure rapping is automatically programmed so that a minimum number of collecting plates and discharge electrodes are rapped simultaneously. Ensure rapper controls have adjustments for independent field repeat intervals and for independent field rest time. Design unit to limit reentrainment of collected material falling from the collecting plates and discharge electrodes during the rapping operation without exceeding the design cleaning efficiency. Provide the rapper system with surge suppressors and other devices as required to eliminate high voltage spikes.

2.13.5.6 Inlet and Discharge Ducts

Provide inlet and discharge ducts with turning vanes, deflectors, and baffle plates to provide for uniform distribution of gas flow through all gas passages and in each gas passage in accordance with ICAC EP-7. Provide pressure test connections at the inlet and discharge ducts connecting to the precipitator.

2.13.5.7 Dust Storage Hopper

Provide unit with a [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [low carbon] [corrosion resistant] sloped steel bottom dust storage hopper having the
dust holding capacity indicated. Arrange hopper to prevent reentrainment of collected material into the gas stream. Provide hopper bottom with rappers or fluidizing pads and a hopper valley angle of 60 degrees which is free of pockets, ribs, fins, or any other obstruction to hold or interfere with free release of collected material to the outlet. Provide outlet with [a guillotine-type slide gate] [a manually-operated rotary lock] [a motor-driven rotary lock]. Provide hopper with a poke hole and gasketed access door and with a collected material level indicator for [local indication] [local indication with terminals for wiring to a remote indicator]. Provide a special plate reinforced "pounding area" on each hopper face for external manual vibrating. Each pounding plate will be 300 by 300 by 25 mm12 by 12 by 1 inch thick ASTM A36/A36M plate steel. Provide a work platform with stairs to each pounding area for units with pounding areas more than 1.50 meters5 feet above ground. [The level indicator must include a high material level audible alarm.] [Provide hopper with electric heating coils, modules, or blankets to keep collected material dry and free flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F]. [The capacity of the heating coil module or blanket must be as shown.] [Base the heating coil module or blanket's size on the ambient temperature of [_____] degrees C degrees F]. [Provide an individually, thermostatically controlled hopper heater system with adjustable setpoint and include power, control, and alarm components.] [Size the system to provide a hopper skin temperature of not less than [_____] degrees C degree F when the insulation is in place during minimum ambient temperatures specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Insulation must be installed in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Design the system with a minimum heating safety factor of 1.1 and a minimum wind heat loss factor of 1.12.]
programmed interruption of normal high voltage waveform, is another enhancement technique. Optimization of precipitator energization and rapping systems through the use of microprocessor-based controls results in lower power levels, reduced electrode failure, and overall improved collection efficiency. Examples of control schemes that can be accomplished with properly programmed microprocessors include:

a. Spark Prediction and Advance
b. Back Corona Detection
c. Opacity Feed Back
d. Rapping Optimization
e. Electrical Power Conservation

When recycled water is used, the solids content of the water increases with each recycling. If the solids content becomes excessive, the effectiveness of the cleaning mechanism is reduced. Increased solids content can also lead to plugging of spray nozzles.

Power consumption is generally equivalent to the additional power required by other collecting methods. The pressure drop across units is typically less than 127 Pa or 0.5 inch water gauge. Caution should be exercised in their use where combustible or explosive coal dusts or oil fumes may be present and could be ignited by a "spark-over" of the high voltage across the electrodes.

2.13.6.1 Wet Electrostatic Precipitator Layout and Component Drawings

Drawings must indicate the kind, size, arrangement, weight of each component, and breakdown for shipment; the external connections, location of local controls, remote control panels, anchorages, and supports required; the dimensions needed for installation and correlation with other materials and equipment; [seismic structural calculations;] and foundation and loading information. Supply drawings for each component showing design and assembly. Provide schematics of all electrical and pneumatic circuits used. Submission must include, but must not be limited to the following details:

a. Transformer-rectifier equipment.
b. High voltage switches and disconnects.
c. High voltage fuses and circuit breakers.
d. Control systems.
e. Ground lugs.
f. Protection against electrolysis.

g. Graphic display panel indicating power components.

h. Lubrication locations.

i. Electrodes and collecting surfaces.

j. Platforms, walkways, stairways, and ladders which will be required for operation, inspection, testing, and maintenance, and furnished with the precipitator.

k. Location of field welds, in conformance to AWS D1.1/D1.1M

2.13.6.2 Discharge Electrodes

Discharge electrodes must be [wires and weights] [rigid electrodes] [rigid frame]. Discharge electrodes must be top supported with the bottom free to expand and contract with gas stream temperature changes. Electrodes must be laterally restrained to maintain optimum spacing from the plates. Electrodes must have a stiffness, length, or restraints required to prevent vibration or flutter when the unit is in service.

2.13.6.3 Collecting Plates

Collecting plates must be configured in a [circular], [concentric], [tubular], or [flat] plate manner. The plates must be of sufficient stiffness to prevent distortion of the plates. Plates must be top supported with the bottom free to expand and contract with changes of gas stream temperature. Plate configuration and support system design must be coordinated with the plate spray system design and operation to shed collected material from the plates and to retain a consistent and optimum spacing from the discharge electrodes. Assemble the collecting surfaces at the factory. Factory assembled modules which can be shipped to the field for erection may be provided. Provide high voltage frames with sway braces or other devices as required to prevent swaying. Incorporate gas baffles into the collecting plates to provide a gas flow quiescent zone and to provide stiffening.

2.13.6.4 Power Supply and Control Systems

Power supply and control system must be solid state microprocessor type. Control system must provide for continuous monitoring and regulating of applied voltage for effective maximum performance of precipitation over the range of plate loadings with minimum sparking and arcing to the plates. Entire system must be provided with a system of safety interlocks and grounding devices to prevent personnel physical contact with high voltage components. Voltage insulators must be provided with heaters.

2.13.6.5 Spray System

The WESP must be provided with a [prequench cycle], [continuous wash cycle], [intermittent wash cycle, operating every __ hours]. Recycled water must be provided with a conditioning system to keep a consistent [____], [5-7] pH. Blowdown systems must keep suspended solids under [____] ppm, and chloride concentration below [____] ppm. All water used in the WESP spray system must be routed to a water treatment facility before discharge.
2.13.6.6 Inlet and Discharge Ducts

Inlet and discharge ducts must be provided with turning vanes, deflectors, and baffle plates to provide for uniform distribution of gas flow through all gas passages and in each gas passage in accordance with EP-7. Pressure test connections must be provided at the inlet and discharge ducts connecting to the precipitator.

2.13.6.7 Corrosion Resistance

Due to the saturated conditions of the process gas WESPs are susceptible to corrosion. Proper analysis of the Material selection must be based on the process gas, expected pH and chloride levels of the water. Material of construction must be [carbon], [corrosion resistant] steel, or [_____].

2.13.7 Wet Scrubber

**************************************************************************

NOTE: Select scrubber type based on efficiency required. Wet scrubbers are used for the removal of gaseous pollutants such as sulfur oxides, nitrogen oxides, and other gaseous materials from boiler flue gases. Removal of sulfur oxides (flue gas desulfurization) is covered by Paragraphs "Wet Flue Gas Desulfurization System" and "Spray Dryer Flue Gas Desulfurization System". Wet scrubbers will also remove fumes, mists, dusts, and smoke particles from laboratory fume hood and welding booth exhausts. With appropriate adsorbents they can collect vapors of paint thinners and solvents. They can handle boiler flue gases as high as 371 degrees C or 700 degrees F, but impose a heavy water demand for evaporative cooling causing a heavy water vapor plume from the chimney. This water use also increases flue and chimney condensation and possible corrosion damage. Those problems can be minimized with a heat exchanger with a pump and water coils to precool the hot flue gas to the scrubber and deliver the recovered heat to the relatively cool cleaned gas out of the scrubber, as required. Any surplus heat can be used for other heating applications. The scrubber requires a water and chemicals supply system with problems of slurry or sludge removal; chemicals storage, mixing, feeding, and monitoring; and corrosion prevention of wetted parts. Since the scrubber system is relatively costly to install and operate, care should be exercised to limit its use to the function that only it can perform. In addition to its primary function of removing gaseous pollutants, it will also remove particulates. In addition to water sources shown within brackets, there may be other sources such as recycled water from waste treatment plant among others. Insert source within brackets and delete the others.

**************************************************************************

Provide unit in compliance with ICAC EP-1 and all federal and state regulations as a wet scrubber for removing gases, fumes, and particulates.
from the air exhausted from [welding] [and] [paint spray] booths [and from [_____]]. Ensure scrubber is one of the types identified as a [venturi,] [spray,] [tray,] [fixed packed bed,] [mobile bed,] [impingement,] [or] [entrainment] type [or a combination of these types]. Unit must have moisture eliminator with chevron, mist pad, or loose fill type design. Unit must employ a small quantity of water or chemical neutralizing water solution to provide for maximum scouring and pollutant removal of the gas stream. Water demand rates of less than 0.13 L/second per cubic meter per second one gpm per 1000 cfm of processed gases must use [potable] [cooling tower blowdown] [_____] water with waste to drain. Water demand in excess of the above flow rate must provide for recirculation of the washing liquor. Provide unit with [an automatic water supply control valve,] [a float-operated water level control valve,] [a totalizing water meter,] strainer, and water pressure gauge.

2.13.7.1 Chemical System

**************************************************************************
NOTE: Investigate user agency, facility operation, and maintenance standards and procedures; analyze the pollution control equipment's consumption of materials; confer with equipment suppliers; and determine the optimum time period for reserve capacity. Select the "reserve" time period, and delete all other periods. The above investigation will also determine if the last sentence within the brackets should be retained or deleted.
**************************************************************************

Provide each unit requiring neutralizing chemical additives with a complete automatic chemical monitoring, control, mixing, feeding, and reserve storage system. Provide chemical system with a reserve capacity for [[24] [36] [48] hours] [[3] [7] [10] days] of continuous scrubber operation at design conditions without requiring servicing. [Provide components that must be taken out of service for routine maintenance or chemical loading in duplicate arranged for transfer by manual operation of switches and valves.]

2.13.7.2 Scrubber

Scrubber must be fluid-tight construction of [glass fibre reinforced polyester] [rolled low-carbon steel coated with a protective coating that is suitable for the process gas and temperature] [ASTM A302/A302M stainless steel] [ASTM A240/A240M stainless steel] [PVC] [CPVC] [polypropylene] [FRP lined mild steel]. Provide unit with leak-tight viewing windows and access doors to permit appraisal of entire operation as well as full access for all service operations or parts replacement. Use vanes, baffles, deflectors, or diffuser plates to provide for uniform gas flow through the processing area. Scrubber must be factory assembled, piped, and wired on floor mounted welded steel bases as indicated.

2.13.7.3 Recirculation Pumps

**************************************************************************
NOTE: Determine if facility will require continuous operation or if it can be shut down or if the pollution control equipment can be out of service for extended periods. If continuous operation is required, select wording for duplicate pumps and remove brackets.
**************************************************************************
Unit requiring recirculation of the scrubbing liquor must be provided with [direct] electric motor centrifugal pumps [in duplicate] to conform to HI ANSI/HI 3.1-3.5. Pumps must develop the system pressure head required by the scrubber. Ensure materials, construction, ratings, application, and testing conform to the standards and recommendations of HI ANSI/HI 3.1-3.5 for corrosion resistant operation of pumping the scrubber liquor. [Provide a manual selector switch for selection of "Lead" and "Lag" operation of the duplicate pumps.] Provide each pump with a discharge pressure gauge appropriate for the pump head and a low pressure limit switch to [start the backup pump] [and] [close a circuit for an alarm]. Provide pumps with corrosion-resistant strainers, valves, and piping suitable for the system and the gas to be processed. [Provide pumps for metering the feed rate of scrubber chemical additives with [manual] [automatic] means for varying the feed rate.]

2.13.7.4 Piping Materials

NOTE: Delete inapplicable materials and equipment.
Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process must dictate material selection.

Provide piping materials that are compatible with the scrubber fluids. Nozzles must be non-plugging type for wetting packing.

2.13.7.5 Scrubber Collector System

Provide each scrubber requiring the use of chemical additives with a system for removing and dewatering the collected material and chemical residues of the scrubber process. Provide related equipment and controls. Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.8 Dry Fabric Collector for Boiler Flue Gases

NOTE: Dry fabric collectors are highly effective in removing up to 99.9 percent by weight of particulates of submicron size and larger from gas streams of more than 229 mg per cubic meter 0.1 grain (weight) per cubic foot. Emissions will consistently be less than 11 mg per cubic meter 0.005 grain/actual cubic foot. Fabrics are available for gas streams up to 288 degrees C 550 degrees F and are often used for particulate removal from coal handling operations and boiler flue gases. Fibre selection and fabric construction and finish are extremely critical to the performance and service life of a dry fabric collector. Chemical, temperature and abrasion resistance, strength, and
dimensional stability are important fibre selection considerations. Fabric weave, weight, finish, and dimensional stability are major fabric requirements. Fabric filters can be harmed by corrosive chemicals. It may be necessary to scrub the gas prior to the dry fabric collector. The space requirement is rather large and pressure drop is typically in the 1.02 kPa to 1.53 kPa, 4 to 6 inch water gauge range. An important consideration is whether the processed stream can be interrupted, such as a nonproduction type welding facility exhaust, or if it must remain in continuous operation, such as for a base boiler plant. If the process is relatively small and the dust loading is relatively light, or if the process is intermittent, it may be desirable and economic to use replaceable deep pocket type or automatic moving media type filters. If the loading is high and process must not be interrupted, a cleanable baghouse type unit may be desired.

**************************************************************************
Unit must be type identified as [an unsupported tubular [unibag] [multibag] [side entry] [top entry] type] [a supported filter element [tubular] [or] [envelope] type]. Provide fabric collectors in compliance with ICAC F-3. Coordinate the collector provided with the boiler combustion control and safety system so as to assure that the boilers operate within design conditions throughout entire operating range at design capacity of the collector. Ensure collector is an ICAC [standard collector, medium-to-heavy duty, usually continuous service cleaning gases at [_____] degrees C degrees F] [special or custom-designed collector, heavy duty continuous service cleaning gases at [_____] degrees C degrees F].

2.13.8.1 Filter Cleaning

**************************************************************************

NOTE: In the last sentence, three filter cleaning methods are available, any or all of which may be allowed depending upon site conditions and available utilities. Under the present state of the art, the use of compressed air pulse jet cleaning should be limited to systems below 142 cubic meter per second 300,000 acfm (actual cfm). Efforts to reduce flue gas pressure drop in fabric collectors have led to the development of more vigorous cleaning methods, in particular, the use of sonic horns in combination with conventional air exchange cleaning methods, such as reverse air, pulsed jet, or shake/deflate. Up to 60 percent reduction in pressure drop has been realized using sonic horns with no deterioration in particulate emission levels. Pressure level, frequency, power levels, and spatial distribution of horns within the collector compartment are all important specification criteria.

**************************************************************************

Filter element cleaning must be automatically initiated and executed [on an adjustable programmer time cycle] [by operation of an adjustable high filter pressure drop switch]. Accomplish cleaning by powered vibrator or
shaker devices, reverse cleaned air flow with [positive] [negative] air pressure in the unit, a combination of shaker and reverse air flow [or compressed air pulse jet cleaning]. [Filter element cleaning must include sonic horns.]

2.13.8.2 Filter Enclosure

Fabricate filter enclosure of [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [low carbon] [corrosion resistant] steel of welded or bolted construction or combinations thereof. Give enclosure sheets supporting strength and rigidity by folding or bending or support on supplemental structural steel shapes. Provide unit with gas inlet and outlet connections and baffles, vanes, deflectors, or low friction diffuser plates that will ensure uniform gas flow to all elements of the fabric system without causing flutter, vibration, or erosion of the fabric. Provide hinged, latched, and gasketed access doors for all parts and areas that require inspection or service. Secure and support fabric elements by internal rings or equivalent method so that the entire fabric surface is so deployed that gas flow and particulate collection will be uniform over entire working surface. Ensure dust shedding properties are uniform so that entire fabric surface will be equally cleared by a cleaning operation without damage to media other than normal service wear. Arrange media in elements, sections, pockets, or tubes that can be handled, removed, replaced, and secured without special facilities.

2.13.8.3 Collector Cleaning

Provide units with means for isolating a compartment or section for cleaning while other compartments are performing their normal dust removal function. Compartment isolation must effectively prevent reentrainment of the particulate during the cleaning operation. Base unit rating upon operation with one section out for cleaning. Cleaning operation must be [operator initiated and executed by manually operating the cleaning cycle on each compartment in sequence until all filters have been cleaned] [operator initiated to have the filters cleaned automatically one compartment at a time until all filters have been cleaned] [automatically initiated by an adjustable filter air pressure drop switch operating at a high pressure set point to initiate the filter cleaning operation] [automatically initiated by a timer to initiate the filter cleaning operation]. Once started, the cleaning operation must progressively clean one compartment at a time until all filters are cleaned. Remove collected particulate by discharging from a hopper below. Collector manufacturer must provide all of the components required for the entire cleaning operation including [manual rappers] [motorized rappers] [rotary air valve] [manual dampers] [motorized dampers] [compressed air surge receiver] [air compressor with receiver, motor drive, and controls] [blast or pulse jet controls, nozzles, and valves] [shaker or flutter blower, motor, drive, and controls]. [Provide automatic operations with a manual override for starting, stopping, interrupting, and restarting operation.]

2.13.8.4 Test Connections

Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.8.5 Flue Gas Dust Collectors Designed for In-Place Cleaning

Provide dust collectors designed and constructed for in-place cleaning of the fabric with a [3.4] [4.8] [6.4] mm [10 gauge] [3/16 inch] [1/4 inch]
[low carbon] [corrosion resistant] steel sloped bottom dust storage hopper having the dust holding capacity as indicated. Construct collector and hopper system to minimize reentrainment of collected material into the gas stream. Provide hopper bottom with rappers or fluidizing pads and with a hopper valley angle of 60 degrees from the horizontal and free of pockets, ribs, fins, or any other obstruction to hold or interfere with free and complete release of all collected material to the outlet. Provide outlet with [a guillotine-type slide gate] [a motor-driven rotary lock] [automatic lock hoppers]. Provide hopper with a poke hole and gasketed access door and with a collected material level indicator for [local indication] [local indication with terminals for wiring to a remote indicator]. Level indicator must include a high material level audible alarm. [Provide hopper with electric heating coils, modules, or blankets to keep collected material dry and free flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C [degrees F]].

2.13.9 Dry Fabric Collector for Dust Control

**************************************************************************
NOTE: Dry fabric collectors are highly effective in removing up to 99.9 percent by weight of particulates of submicron size and larger from gas streams of more than 229 mg per cubic meter 0.1 grain (weight) per cubic foot. Emissions will consistently be less than 11 mg per cubic meter 0.005 grain/actual cubic foot. Fabrics are available for gas streams up to 288 degrees C 550 degrees F and are often used for particulate removal from coal handling operations and boiler flue gases. Fibre selection and fabric construction and finish are extremely critical to the performance and service life of a dry fabric collector. Chemical, temperature and abrasion resistance, strength, and dimensional stability are important fibre selection considerations. Fabric weave, weight, finish, and dimensional stability are major fabric requirements. Fabric filters can be harmed by corrosive chemicals. It may be necessary to scrub the gas prior to the dry fabric collector. The space requirement is rather large and pressure drop is typically in the 1.02 kPa to 1.53 kPa 4 to 6 inch water gauge range. An important consideration is whether the processed stream can be interrupted, such as a nonproduction type welding facility exhaust, or if it must remain in continuous operation, such as for a base boiler plant. If the process is relatively small and the dust loading is relatively light, or if the process is intermittent, it may be desirable and economic to use replaceable deep pocket type or automatic moving media type filters. If the loading is high and process must not be interrupted, a cleanable baghouse type unit may be desired.
**************************************************************************

Provide unit of the type identified as [an unsupported tubular [unibag] [multibag] [side entry] [top entry] type.] [a supported filter element [tubular] [or] [envelope] type.] Provide fabric collector in compliance
with ICAC F-5 and ICAC F-3. The collector must be an ICAC F-5 [unit, Type I, for light duty, intermittent service cleaning gases at or near room temperature.] [standard collector, for light-to-medium duty [intermittent] [continuous] service cleaning gases at continuous temperatures from room temperature to 135 degrees C 275 degrees F] [standard collector, for medium to heavy duty 260 degrees C 500 degrees F] [special or custom designed collector, heavy duty continuous service cleaning gases at [_____] degrees C degrees F].

2.13.9.1 Filter Cleaning

**************************************************************************
NOTE: The choice of filter cleaning methods should be based on site conditions, available utilities, and operational requirements. For example, dust control of coal bunkering is usually intermittent as related to arrival of coal transporters and does not warrant a fully automatic continuous operation facility. Under the present state-of-the-art, the use of pulse jet cleaning should be limited to systems up to 142 cubic meters per second 300,000 acfm (actual cfm).
**************************************************************************

Filter cleaning of collector units processing air or gas streams at or near ambient temperatures, must be [manually initiated and executed by [operating the required dampers and cleaning devices]] [automatically initiated and executed [on an adjustable or timed cycle] [by operation of an adjustable high filter pressure drop switch]]. [Powered cleaning must be for [intermittent] [continuous] service employing [powered vibrator or shaker devices] [reverse air flow with atmospheric air and] [reverse cleaned air pressurized air flow with] [positive] [negative] air pressure in the unit [compressed air pulse jet cleaning] [of individual or a few elements] [of an entire compartment].] [Filter element cleaning must include sonic horns.]

2.13.9.2 Filter Enclosure Construction

Fabricate filter enclosure of [3.4] [4.8] [6.4] mm [10 gauge] [3/16 inch] [1/4 inch] [low carbon] [corrosion resistant] steel of welded or bolted construction or combinations thereof. Give enclosure sheets supporting strength and rigidity by folding or bending or support on supplemental structural steel shapes. Provide unit with gas inlet and outlet connections and baffles, vanes, deflectors, or low friction diffuser plates that will insure uniform gas flow to all elements of the fabric system without causing flutter, vibration, or erosion of the fabric. Provide hinged, latched, and gasketed access doors for all parts and areas that require inspection or service. Secure and support fabric elements in a manner to have the entire fabric surface so deployed that gas flow and particulate collection will be uniform over the entire working surface. Ensure dust shedding properties are uniform so that the entire fabric surface will be equally cleared by a cleaning operation without damage to the media other than normal service wear. Arrange media in elements, sections, pockets, or tubes that can be handled, removed, replaced, and secured without special facilities.

2.13.9.3 Intermittent and Continuous Service Units

[Equip intermittent service units with [washable] [cleaning-in-place]
fabric filters.] [Provide continuous service units with means for isolation of a compartment or section for cleaning while other compartments are performing their normal dust removal function. Ensure compartment isolation effectively prevents reentrainment of particulate during the cleaning operation.] Base unit rating upon operation with one section out for cleaning. Cleaning operation must be [operator initiated and executed by manually operating the cleaning cycle on each compartment in sequence until all filters have been cleaned] [operator initiated to have the filters cleaned automatically one compartment at a time until all filters have been cleaned] [automatically initiated by an adjustable filter air pressure drop switch operating at a high pressure set point to initiate the filter cleaning operation] [automatically initiated by a timer to initiate filter cleaning operation]. Once started, the cleaning operation must progressively clean one compartment at a time until all filters are cleaned. Removal of collected particulate must be by [raking out] [removal and dumping of a particulate pan or tray] [draining from a hopper below]. Collector manufacturer must provide all of the components required for the entire cleaning operation including [manual rappers] [motorized rappers] [manual dampers] [motorized dampers] [compressed air surge receiver] [air compressor with receiver, motor, drive, and controls] [blast or pulse jet controls, nozzles, and valves] [shaker or flutter blower, motor, drive, and controls] [traveling ring components]. [Provide automatic operations with a manual override for starting, stopping, interrupting, and restarting operation.]

2.13.9.4 Test Connections

Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.9.5 Dust Collectors Designed for In-Place Cleaning

Provide dust collectors designed and constructed for in-place cleaning of the fabric with a [3.4] [4.8] [6.4] mm [10 gauge] [3/16 inch] [1/4 inch] [low carbon] [corrosion resistant] steel sloped bottom dust storage hopper having the dust holding capacity as indicated. Construct collector and hopper system to minimize reentrainment of collected material into the gas stream. Provide hopper bottom with rappers or fluidizing pads and ensure the hopper valley angle is 60 degrees from the horizontal and free of pockets, ribs, fins, or any other obstruction to hold or interfere with free and complete release of all collected material to the outlet. Provide outlet with [a guillotine-type slide gate] [a manually-operated rotary lock] [a motor-driven rotary lock] [automatic lock hoppers]. Provide hopper with a poke hole and gasketed access door, and a collected material level indicator for [local indication] [local indication with terminals for wiring to a remote indicator]. Include a high material level audible alarm. [Provide hopper with electric heating coils, modules, and blankets to keep collected material dry and flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F].

2.13.10 Gaseous Emissions Control Unit

**************************************************************************
NOTE: The gaseous emissions control units are to be used for cleaning particulate and gaseous solvent materials from the exhaust air at laboratory fume hoods, welding booths, water curtain paint spray booths, and other similar type problems. The fabric
prefilter will collect a reasonable amount of particulates and the carbon will adsorb the gaseous vapors. The unit may be used without the prefilter to collect gasoline vapor from small storage tank vents, but the tank should be installed underground or be shaded to minimize boil-off. Project conditions may make regeneration of the carbon desirable. A typical gaseous emission control with carbon regeneration unit consists of two or more adsorber vessels with deep bed (typically 450 to 600 mm 18 to 24 inches) of high grade gas phase activated carbon. The manufacturer should provide the bed depth as part of his design, and should consider the life cycle cost when sizing the adsorbent unit. The dampers and control valves will be based on timer operation or solvent sensor operation. Once the adsorption bed is saturated with solvent vapors, the flow into the adsorber is automatically diverted to the second adsorber. Low pressure steam is used to desorb the saturated adsorber, regenerating the carbon and producing a steam and solvent mixture which is condensed in a shell and tube condenser. Water insoluble solvents should be separated in a decanter for reuse. The system must be complete with adsorber vessels, blower, filter, condenser, and controls. Deposition of the waste effluents is dependent on the specific project and cannot be determined in the guide specification.

**************************************************************************

Ensure unit complies with ICAC G-1 and consists of a dry type particulate removal precleaner followed by an adsorption unit of activated carbon or other approval adsorbent material.

2.13.10.1  Prefilter

Provide [cleanable] [replaceable] prefilter. Provide prefilter with a cleaning performance equal to or exceeding ASHRAE 52.2 of 95 percent arrestance by weight, 80 to 90 percent atmospheric dust spot efficiency, and a dust-holding capacity of not less than 530 grams per 1 cubic meter per second 250 grams per 1,000 cfm cell. Provide media complying with UL 900 and with a support frame or construct to be self-supporting without sagging either with or without gas flow. Hold each cell securely in place with applied pressure leak-tight joint between the media, media flange, and media collar, and secure the filter to the media bulkhead with latches or clips to permit removal, replacement, and securing without special tools.

2.13.10.2  Adsorbent Unit

Provide adsorbent section consisting of [a system of trays, hollow panels, canisters, or other means of holding a deep bed of activated carbon conforming to ASTM D2854 and ASTM D2862, or other adsorbent material, to cause the processed gas to pass through a uniform depth of material in the gas flow direction][a system of filter frames constructed of activated carbon loaded in a pleated, non-woven synthetic media, with a V-bank configuration]. Design trays, panels, and canisters to assure that the adsorbent bed will be uniform, full and free of voids or thin spots and supported and contained to prevent movement, pulverizing, abrasion, or
dusting of the adsorbent and easy and full recharging without special facilities or tools.] Secure adsorbent units leak-tight in a [bulkhead] [filter frame] forcing all gas to pass through the adsorbent bed.

2.13.10.3 Prefilter and Adsorbent Assemblies

Enclose prefilter and adsorbent assemblies in a welded, bolted, or riveted sheet metal enclosure that limits both in-leakage or out-leakage of gas. Ensure enclosure access doors or panels are bolted, or gasket-sealed and latched to provide independent access to the prefilter and the adsorbent plenums. Design the enclosure for the maximum differential pressure (positive or negative) under any mode of operation.

2.13.10.4 Inlet and Outlet Ducts

Provide unit with inlet and discharge vanes, baffles, diffusers, or other devices to assure uniform gas flow through the processors. Provide pressure test connections at the inlet and outlet ducts connecting to the collector.

2.13.11 Petrol Vapor Recovery Unit

**************************************************************************
NOTE: The petrol vapor recovery unit is intended for use at fuel depots or fuel distribution terminal facilities. It is used to recover fuel vapors by refrigerated condensation of the material from tank and transporter vents. Underground storage tanks at petrol dispensing stations do not commonly require refrigerated petrol recovery units but are equipped to have the unloading fuel displace a like volume of vapor from the underground tank into the transporter through a vent hose and manifold which are integral with the transporter vehicle. The transporter then hauls this vent gas to the local depot for recovery as the transporter is reloaded. Some jurisdictions may require vehicle tank venting back to the storage tank as the vehicle is loaded. Gaseous emission activated carbon emission control units, with and without carbon regeneration, can be used in this application.
**************************************************************************

Provide a complete air-cooled mechanical refrigerated electric-operated unit designed for condensing the fuel vapors vented from gasoline system storage tanks. Ensure recovery process is in two steps. Precool the vent gas to slightly above water freeze point to remove most of the water vapor without a defrost cycle in the first step. During second step, cool the gas to the required vapor pressure with minimum frost collection. Include storage capacity and circulation system for defrosting fluid. Provide refrigerants which are classified as nontoxic, nonflammable, conforming to ASHRAE 15 & 34, Group 1.

2.13.11.1 Defrosting

[Fuel handling operation will allow defrosting for about [4] [5] [6] hours after midnight.] [Fuel handling operation will not allow time for defrosting and provide a duplicate cooler with automatic controls to alternate the units between cool and defrost modes with status indication...
of each.]

2.13.11.2 Unit Operation and Control

Provide unit for [complete monitoring and control at the unit] [operation and control at the unit with remote indication of ON-OFF position of unit power supply switch] [operation and control at the unit with remote indication of operating and control of the unit with complete process indication with maintenance and service operation at the unit]. [Provide [visible] [and] [audible] alarms on critical functions [locally] [and at remote station].]

2.13.11.3 Design and Fabrication Requirements

Provide unit from single supplier and of coordinated design, fully assembled and subjected to factory tests before shipment. Skid mount unit on a permanent steel base with pick-up lugs and anchor bolt holes for installation on a concrete foundation. Provide electric power connection, vent gas inlet, return line for condensed hydrocarbons, and drain for aqueous liquids. Install components in a ventilated weather proof enclosure with full accessibility for operation and service through hinged access doors with latches or removable panels. Use doors for access to all operating functions. Insulate cold components and piping of the entire system subject to sweating or frosting. Provide electrical equipment and installation work conforming to requirements of hazardous locations for Class I, [Division I,] [Division II,] Group D, of NFPA 70 and NFPA 496, and Type X conforming to UL 5, UL 674, UL 1203, and UL 823 requirements. Inlet vent gas flow to the unit must be through a 0.075 mm 200 mesh removable ASTM A240/A240M stainless steel or equal strainer. Perform refrigeration work complying with ASHRAE 15 & 34 and ASME B31.5. Ensure petrol vapor, condensed hydrocarbon returns, and aqueous waste piping is in compliance with ASME B31.3.

2.13.12 Gravel Bed Filter

**************************************************************************
NOTE: Electrostatically enhanced gravel beds, combining granular filtration and electrostatic collection, are highly effective with collection efficiencies in excess of 99 percent on submicron particles. Gravel beds without electrostatic enhancement have collection efficiency greater than 95 percent on coarser particulate. They are frequently applied to gas streams in excess of 371 degrees C 700 degrees F and are particularly suitable for the collection of high resistivity particulates with potential fire and explosion hazards. Gravel beds are more compact then electrostatic precipitators or fabric filters for comparable applications. The unit is relatively insensitive to variations in gas flow and temperature excursions, and, in most cases, chemical makeup of the exhaust gas and particulate. Pressure drop across the gravel bed ranges from 763 Pa to 1271 Pa 3 to 5 inches water gauge. Carbon steel is the normal material of construction although high temperature and/or corrosive environments require the use of alloys or stainless steel.
**************************************************************************
The system must remove particulates from process gas streams through granular filtration in a moving bed of filter media supplemented by electrostatic collection resulting from the application of high voltage power to [an electrical grid located in the bed] [an ionization grid located upstream of the bed in addition to an electrical grid located in the bed].

2.13.13 Wet Flue Gas Desulfurization System

**************************************************************************
NOTE: A flue gas desulfurization (FGD) system is used to reduce emission of sulfur dioxide from solid waste incinerator and boiler flue gases. It can also reduce other acid gas emissions such as hydrochloric acid and hydrofluoric acid. FGD systems are classified as either wet or dry processes. In the wet process, the flue gas reacts with a sorbent solution, producing a liquid product. The reagent selected will result in either a waste product, which must be disposed of, or a by-product, in which the sulfur recovered is in useable form. In general, the capital cost of regenerative systems may be up to twice the cost of non-regenerable systems.
**************************************************************************

System must remove sulfur dioxide, [hydrochloric acid] [hydrofluoric acid] [particulates] [and] [_____] from processed gas stream. Provide [non-regenerative] [regenerative] system and use wet scrubbing process. Include all equipment required for a complete, operable FGD system, including wet scrubbing system, complete reagent feed system, [waste] [by-product] handling system, and instrumentation and controls for safe, reliable operation of the system.

2.13.13.1 Wet Scrubber System

Provide wet scrubber complying with ICAC EP-1. Scrubber must be a [venturi,] [spray,] [tray,] [fixed packed bed,] [mobile bed,] [impingement,] [or] [entrainment,] type [or a combination of these types]. Provide scrubber consisting of fluid-tight construction of [glass fiber reinforced plastic] [rolled low-carbon steel coated with a protective coating that is suitable for process gas and temperatures] [ASTM A302/A302M stainless steel] [ASTM A240/A240M stainless steel] [______]. Construct unit with leak-tight viewing windows and access doors to permit appraisal of scrubbing process as well as full access for all service operations or parts replacement. Use vanes, baffles, deflectors, or diffuser plates that provide for uniform gas flow through the scrubbing chamber. Design scrubber internal components to minimize scaling and plugging inside the tower. Provide mist eliminator consisting of fluid-tight construction. Ensure vanes, baffles, or deflectors provide for uniform gas flow to the mist eliminator elements. Design mist eliminator to minimize re-entrainment of liquid into the gas stream. Provide mist eliminator with a water washing system to prevent solids buildup on the blades. Size and orient washing nozzles to spray entire mist eliminator area. Provide system with clean gas reheater upstream of stack to prevent acidic condensation and corrosion in the stack.
2.13.13.2 Reagent Feed System

Provide reagent feed system including all components required for storage of dry reagent, preparation of reagent slurry, delivery and re-circulation of the selected reagent. Use one reagent feed system to serve all scrubbers. Reagent feed system must have a reserve capacity for [24] [36] [48] hours of continuous FGD operation at design capacity without servicing. Provide components that must be taken out of service for routine maintenance or reagent loading in duplicate, arrange for transfer by manual operation of switches and valves. Include all tanks, agitators, pumps, piping, valves and other equipment required by a specific system design. Provide system equipment of design, material and construction appropriate for scrubbing solution delivery and for re-circulation of scrubbing effluent. Design piping to prevent settling of scrubbing solution inside the pipes. Include provisions for drainage and clean-out of feed system components, including pumps and piping in the design.

2.13.13.3 Waste Handling System

Provide waste handling system including all equipment required for pre-disposal treatment of the scrubbing effluent, including tanks, agitators, liquid-solid separator, vacuum filter, solid waste holding bin, pumps, piping, and valves as required.

2.13.13.4 Test connections

Provide pressure test connections at the inlet and outlet ducts connecting to the scrubber.

2.13.14 Spray Dryer Flue Gas Desulfurization System

**************************************************************************
NOTE: A flue gas desulfurization (FGD) system is used to reduce emission of sulfur dioxide from solid waste incinerator and boiler flue gases. It can also reduce other acid gas emissions such as hydrochloric acid and hydrofluoric acid. FGD systems are classified as either wet, wet/dry, or dry processes. The spray dryer FGD process is a wet/dry process, in which the flue gas reacts with an alkaline reagent, usually a lime slurry, and the reaction product is in dry form. The reagent selected will result in either a waste product, which must be disposed of, or a by-product, in which the sulfur recovered is in useable form. In general, the capital cost of regenerative systems may be up to twice the cost of non-regenerable systems.
**************************************************************************

System must remove sulfur dioxide, [hydrochloric acid] [hydrofluoric acid] [particulates] [and] [_____] from processed gas stream. Provide non-regenerative system and use a spray dryer scrubbing process. Include all equipment required for a complete, operating FGD system, including spray dryer scrubbing system, complete slurry feed system, waste handling system, particulate collecting unit consisting of [fabric filter collector,] [electrostatic precipitator,] and instrumentation and controls for safe, reliable operation of the system.
2.13.14.1 Spray Dryer System

Provide spray dryer in compliance with ICAC EP-1. Spray dryer must be of gas-tight construction. Construct unit with leak-tight viewing windows and access doors to permit appraisal of scrubbing process as well as full access for all service operations or parts replacement. Spray dryer system must include flue gas preheater prior to spray dryer inlet. Design vanes, baffles, deflectors, or diffuser plates to provide complete mixing of flue gas and chemical reagent, and to provide adequate time for chemical reaction and evaporation of liquid in spray dryer chamber. Provide [rotary] [or] [dual fluid] atomizing system to provide uniform dispersion of the chemical reagent in the spray dryer chamber and prevent gas droplet deposition on spray dryer walls. [Dual fluid nozzle atomizers must use compressed air as the atomizing fluid. Provide a dedicated air compressor system for dual fluid atomizing system.] Design scrubber internal components to minimize scaling inside the tower.

2.13.14.2 Reagent Feed System

Provide chemical reagent feed system including all components required for storage, preparation, delivery and re-circulation of the chemical reagent. Use one reagent feed system to serve all scrubbers. Reagent feed system must have a reserve capacity for [[24] [36] [48] hours] [[3] [7] [10] days] of continuous FGD operation at design capacity without servicing. [Provide components that must be taken out of service for routine maintenance or reagent loading in duplicate, arrange for transfer by manual operation of switches and valves.] Include all tanks, agitators, filters, pumps, piping, valves and other equipment required by a specific system design. Provide system equipment of design, material and construction appropriate for reagent delivery and for re-circulation of spray dryer effluent. Design piping to prevent settling of solids inside the pipes. Include provisions for drainage and clean-out of feed system components, including pumps and piping in the design.

2.13.14.3 Particulate Collecting Unit

Design particulate collecting unit to collect spray dryer products and fly ash remaining in the gas stream exiting the spray dryer. Provide particulate collection unit consisting of [fabric filter collector] [electrostatic precipitator]. [Provide fabric filter collector in accordance with paragraph DRY FABRIC COLLECTOR FOR BOILER FLUE GASES]. [Provide electrostatic precipitator in accordance with paragraph DRY ELECTROSTATIC PRECIPITATOR (DRY ESP)].

2.13.14.4 Test connections

Provide pressure test connections at the inlet and outlet ducts of each spray dryer and fabric filter collector.

2.13.15 Selective Catalytic Reduction (SCR) System

**************************************************************************
NOTE: All fossil fuel burning processes produce nitrogen oxides (NOx). Selective catalytic reduction (SCR) reduces NOx to N2 in the presence of a catalyst. The reducing gas is usually ammonia (NH3), and the catalyst may be composed of various materials, such as oxides of vanadium or tungsten.

SECTION 44 10 00 Page 47
The catalytic reduction reaction requires temperatures in the range of about **300 to 425 degrees C** (600 to 800 degrees F). Selection of the catalyst material and configuration, as well as the operating temperature, depends on the type of fuel being burned. The catalytic reactor will receive a high dust, low dust, or tail end gas stream, depending on its location in the system. In the high dust location, the catalyst is located upstream of an electrostatic precipitator. Location of the SCR system downstream of an electrostatic precipitator results in a low dust environment for the catalyst. In the tail end location, the SCR system is located downstream of an electrostatic precipitator and/or a flue gas desulfurization system, which provides the cleanest gas to the catalyst. Location of the SCR in the system will have an impact on catalyst life.

Efficiency of conventional SCR equipment in removal of NOx is about 80-90 percent. SCR may be used in conjunction with combustion modifications, such as low NOx burners. A potential complication of SCR using ammonia when high sulfur coal is burned is the formation of ammonium bisulfate. When unreacted ammonia passes through the catalytic reactor, called ammonia slip, it will combine with SO3 present in the flue gas, forming ammonium bisulfate. Ammonium bisulfate, a sticky, corrosive material, will condense on downstream equipment. Ammonia slip is a major design concern when burning high sulfur coal.

Design system to reduce nitrogen oxides from processed gas stream. Use ammonia as the reducing agent. Include all equipment required for a complete, operable SCR system, including, but not limited to, ammonia delivery system, catalytic reactor [with sootblowers], ash removal system, instrumentation and controls for safe, reliable operation of the system, and other pollution control devices as required.

### 2.13.15.1 Ammonia Delivery System

Provide ammonia delivery system including all components required for storage, preparation, and delivery of ammonia to the flue gas stream downstream of the economizer, prior to the catalytic reactor. Design ammonia delivery system to automatically deliver ammonia based on the quantity of NOx detected in the gas stream. Design ammonia vaporizers to ensure uniform ammonia distribution in the gas stream. Locate ammonia vaporizers in ductwork at a sufficient distance upstream of the catalytic reactor to provide complete mixing of ammonia and flue gas prior to the catalytic reactor inlet.

### 2.13.15.2 Catalytic Reactor

Catalytic reactor must provide environment for chemical reaction between ammonia and nitrogen oxides, to produce elemental nitrogen and water as the products. Ensure catalytic reactor configuration provides for uniform gas flow through all elements of the reactor. Catalytic reactor must be of gas tight construction Locate catalytic reactor between boiler economizer and
boiler air preheater. [Locate catalytic reactor [upstream of an electrostatic precipitator] [downstream of an electrostatic precipitator] [downstream of a flue gas desulfurization system] [downstream of an electrostatic precipitator and a flue gas desulfurization system].] [Provide catalytic reactor with sootblowers.] Limit ammonia slip to [_____] ppm.

2.14 EMISSION MONITORING SYSTEM

**************************************************************************
NOTE: Provide in-situ opacity monitoring equipment where applicable to insure emission compliance of the particulate control equipment.

State and local regulatory authorities should be contacted at an early stage of the project design to determine if they consider the test methods cited to be adequate, and if they have any additional requirements.
**************************************************************************

Provide emission monitoring system complete with all components, accessories, analyzers [analyzer calibration system] [and recorders,] [alarms], and free-standing factory assembled panel to [monitor opacity, sulfur dioxide, nitric oxide, nitrogen dioxide, and carbon monoxide emissions in boiler flue gases.] [In-situ opacity monitoring.] [_____] System must [continuously monitor] [time program monitor as indicated] [be manually operated to monitor] the emissions. Submit reports for emissions permit compliance. Indicate [and record] emissions in ppm and percent of sample.

Emission monitoring system must be designed for monitoring the specific flue gas characteristics (moisture) discharged.

2.14.1 Gas Sampling System

Sampling locations for air pollution control equipment performance must be in accordance with 40 CFR 60, Appendix A. Use a vacuum pump to draw a gas sample through a filter probe mounted inside the stack, a prefilter, and a moisture separator/drier. It must discharge the sample through a flow meter on each analyzer to atmosphere as indicated. Provide equipment and necessary tubing for automatically purging pollutants from sampling tubing, stack probe, and drier tubing, and for automatic regeneration of the drier. Cleaning and drying operation must be time programmed.

2.14.2 Analyzing System

System must provide simultaneous measuring and analyzing of sample gas by each analyzer with independent flow meters, valves, piping, and accessories. Each analyzer must indicate ppm of the measured pollutant. Provide each analyzer with a visual color coded, panel mounted, high limit alarm with a single audible alarm with silencing button for all alarms. Provide a relay on each analyzer for connection to a remote alarm.

Analyzers must incorporate only approved methods of detection as per 40 CFR 60, Appendix B, Performance Specification 1 (PS-1), ASTM D6216, and Clearance Permit System 001 (CPS-001) when applicable. Analyzers must be capable of satisfying applicable EPA and/or local regulations as listed in the operating permit for relative accuracy. Analyzer Sensitivity must meet all performance criteria of PS-1 and all other applicable state and federal
regulations. Analyzer output signals must have the capability of communicating a signal directly to the [plant control system] [existing Data Acquisition System]. The output signal must be linearly proportional to the opacity value sensed for entire scale in use. Discrete Output Signals of System Controller must be available for Analyzer malfunction, Analyzer is in calibration, and Measured concentration exceeds predefined limits. Analyzers must be equipped with a direct readout display or an independent output for a local panel display device. Analyzer displays must provide readings in accepted engineering units.

2.14.3 System Mounting

Gas sampling, analyzing [, and recording] systems must be piped, wired, and mounted within a factory fabricated 2.657 mm 12 gauge cold rolled black steel enclosure with angle frame support and key-locked doors for [wall] [floor] mounting. Entire system must be suitable for 120 Vac, 60 Hz, single-phase electric service.

2.14.4 Calibration

Provide calibration gas tanks of capacities indicated complete with regulators, valving, and tubing for the specified emissions.

2.15 FACTORY APPLIED INSULATION

**************************************************************************
NOTE: Insert equipment and related piping, casings, and enclosures requiring insulation as applicable.
**************************************************************************

Insulate the following equipment and appurtenances with materials, jacketing, and finishes, as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS:

a. [_____]
b. [_____]

2.16 PAINTING AND FINISHING

Provide equipment and component items that are factory primed and finish coated with the manufacturer's standard finish. Painting must be in accordance with SSPC SSPM. Clean exterior surfaces to base metal in accordance with SSPC SP 6/NACE No.3 and paint at the factory with two coats of paint conforming to FS TT-P-28FS TT-P-28. Items located outside the building must have weather resistant finish. Refinish damaged finish surfaces with an identical type of finish used at the factory. Power clean to bare material and touch up exterior surfaces damaged during field installation or during shipment.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.
3.2 INSTALLATION

Install work as indicated and in accordance with manufacturer's diagrams and written instructions. [A factory installation specialist must be at the site for erection of [dry electrostatic precipitator], [wet electrostatic precipitator], [baghouse], [scrubber], [wet flue gas desulfurization system], [spray dryer flue gas desulfurization system], [selective catalytic reduction system] [and] [petrol vapor recovery unit] [and] [emission monitoring system]}. Field applied insulation must be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Provide an aluminum, brass, or type 304 or 316 stainless steel nameplate and fasten to equipment in a visible location by means of rivets or sheet metal screws of the same material as the nameplate material. Nameplate must contain data that consists of the manufacturer's name, model or series number, and serial number. Indent or emboss the information in the metal. Offset the nameplate a sufficient amount to avoid being covered by insulation.

3.3 OPERATION AND PERFORMANCE REQUIREMENTS

**************************************************************************

NOTE: Select the appropriate performance data forms required for the equipment selected. Fill in the data on the forms. Delete or retain the topic items as appropriate. EPA Technical Report AP-42 including Supplements 1 through 9 (and later supplements if issued) will be used to determine the properties or qualities and quantities of uncontrolled emissions from the various polluting equipments, systems, and operations to be corrected under this guide specification. Show in tables on drawings operating performance requirements for fans, pumps, motors, and other auxiliaries, indicating cfm, gpm, hp, etc. Fill out separate table for each air pollution control equipment selected for a given project in accordance with the following guide:

<table>
<thead>
<tr>
<th>Table</th>
<th>Type Effluent</th>
<th>Applicable Equipment</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>General Dust</td>
<td>Dry Dynamic Centrifugal Fabric, Fabric, or Wet Dynamic</td>

<td>Refrigeration Unit or Sources Fabric Prefilter with Activated Carbon with Regeneration</td>
</tr>
</tbody>
</table>

**************************************************************************
Air pollution control equipment must process and remove pollutants from exhaust gas streams to produce an effluent that will conform to 40 CFR 50 and other federal, state, and local regulations, without degrading the performance of related system components. The air pollution control equipment installed must perform the cleaning operation as indicated on the Air Pollution Equipment Performance Data forms attached to this section.

3.4 FRAME INSTRUCTIONS

Post framed instructions containing wiring and control diagrams under glass or in laminated plastic where directed. The instructions must show wiring and control diagrams and complete layout of the entire system. The instructions must include, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. Post the framed instructions before acceptance testing of the system.

3.5 FIELD QUALITY CONTROL

3.5.1 System Performance Test

The right is reserved by the Government to inspect the equipment at the manufacturer's plant, during or after manufacture. Acceptance at the factory will not constitute final acceptance.

Upon completion, and prior to acceptance of the project, test the air pollution control equipment and monitoring system in accordance with 40 CFR 60, Appendix A and state and local codes by an independent testing organization accredited by The American Association for Laboratory Accreditation (A2LA) to meet three environmental standards; the Stack Testing Accreditation Council (STAC) for ASTM D7036. [A factory startup specialist must be at the site to direct and monitor startup for testing of [electrostatic precipitator,] [baghouse,] [scrubber,] [wet flue gas desulfurization system] [spray dryer flue gas desulfurization system] [selective catalytic reduction system] [petrol vapor recovery unit] [emission monitoring system].] Notify the Contracting Officer [_____] days in advance of the test date. [An independent testing organization must furnish all instruments and personnel required for the tests.] Submit a proposed performance test procedure, 30 days prior to the proposed test date, containing a complete description of the proposed tests and sample locations, with calibration curves or test results by an independent testing laboratory of each instrument, meter, and gauge to be used in the tests. The test must not commence until the procedure has been approved. Electricity and water will be furnished by the Government. Conduct and fully document emission monitoring certification testing as required by local, state, and federal regulatory requirements to demonstrate compliant system operation.

3.5.1.1 Retesting

If any deficiencies are revealed during test, correct such deficiencies and reconduct the tests.

3.5.1.2 Reporting

Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed, including results, to
provide compliance with the specified performance criteria, upon completion and testing of the installed system. Each test report must indicate the final position of controls and performance criteria.

3.5.2 Manufacturer's Field Service

Provide services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the specified equipment. The representative must supervise the installing, adjusting, and [testing] [testing start-up] of the equipment.

3.6 CLOSEOUT ACTIVITIES

3.6.1 Training

**************************************************************************
NOTE: Insert number of hours required to train personnel for the equipment operations.
**************************************************************************

Conduct training course for operating and maintenance staff as designated by the Contracting Officer. [Contractor to provide maintenance for first year after acceptance, and provide proposal for annual maintenance thereafter.] The training period, of a total of [_____] hours of normal working time, must start after the system is functionally completed, but prior to final acceptance tests. The field instructions must cover all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations. Submit training course curriculum and training instructions [14] [_____] days prior to the start of training.

3.6.2 Operations and Maintenance

Submit complete copies of operation manual outlining the step-by-step procedures required for system startup, operation, and shutdown. Include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and its basic operating features. Also, submit complete copies of maintenance manual listing routine maintenance procedures, possible breakdowns and repair, and troubleshooting guides. Include piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed. Ensure operation and maintenance manuals are approved prior to training course.

3.7 SCHEDULES

a. TABLES I and II: List any or all properties of particulate materials such as corrosive, toxic, abrasive, sticky, flammable, explosive, abrasive, friable, spherical fibrous, and hygroscopic.

b. TABLES I and III: Delete reference to particulates if the scrubber is to be installed with a particulate precleaner.

c. TABLE III: Delete reference to water supply data if not applicable for equipment selected.

d. TABLES III and IV: The volume to be listed here is the total volume of exhaust or ventilation air flow with which the pollutant is mixed. Add or delete items under Analysis of Gaseous Pollutants.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for systems to transfer organic contaminants from a contaminated air/gas stream (e.g. landfill off gas, soil vapor extraction, air stripping, process tank vapors, thermal desorption) to activated carbon adsorption media.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: This specification only covers offsite disposal or regeneration of activated carbon; it does not cover onsite regeneration.

1.1  UNIT PRICES

NOTE: On many hazardous, toxic and radioactive waste (HTRW) projects, the Contractor is required to treat contaminated air/gas, as well as furnish the
equipment. Measurement and payment and unit pricing may be necessary to cover treatment costs. Write the contract to provide an incentive for the Contractor to do the job efficiently. It may be preferable to base payment on the kg lbs of contaminants removed from the air/gas stream entering the carbon vessel. However, if carbon is being used to treat the air from an air stripper, the basis would be the volume of water treated in the air stripper or kg lbs of volatile organic chemicals in the water stream entering the air stripper. Or, if the mass of contaminant decreases during the long term operation of the unit, while at the same time the O&M expenses stay approximately constant, it may be preferable to base the payment on the volume of air/gas treated.

**************************************************************************

Payment for contaminated air/gas treated will be as described in the Payment Schedule of the Bid Form.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF HEATING, REFRIGERATING AND AIR-CONDITIONING ENGINEERS (ASHRAE)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B40.100 (2022) Pressure Gauges and Gauge Attachments
ASTM INTERNATIONAL (ASTM)

ASTM D2652 (2011; R 2020) Activated Carbon

ASTM D2866 (2011) Total Ash Content of Activated Carbon

ASTM D2867 (2009; R 2014) Moisture in Activated Carbon

ASTM D4607 (2014) Determination of Iodine Number of Activated Carbon

SHEET METAL AND AIR CONDITIONING CONTRACTORS' NATIONAL ASSOCIATION (SMACNA)

U.S. DEPARTMENT OF DEFENSE (DOD)

UFC 3-301-01 (2023) Structural Engineering

1.3 SUBMITTALS

**********************************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office

SECTION 44 13 10.13 Page 5
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Activated Carbon Adsorption Units; G[, [____]]

SD-03 Product Data

Emissions

Activated Carbon Adsorption Units; G[, [____]]

Vapor Phase Activated Carbon; G[, [____]]

Posted Framed Instructions; G[, [____]]

SD-05 Design Data

Activated Carbon Adsorption Units; G[, [____]]

SD-06 Test Reports

SD-07 Certificates

Vapor Phase Activated Carbon

Certification of the activated carbon [supplier] [transporter] [regeneration facility]. [Copies of the Department of Transportation licenses of carbon transporter service.]

Activated Carbon Adsorption Units Carbon Vessel Fabrication

SD-08 Manufacturer's Instructions

Activated Carbon Adsorption Units
1.4 QUALIFICATIONS

1.4.1 Contractor

1.4.2 Single Source Supplier

Assign to a single supplier full responsibility for furnishing of the activated carbon system. The designated single supplier, however, need not manufacture the system but coordinates the selection, assembly, installation, and testing of the entire adsorption system, including preheater, the blower and ductwork specified in other Sections. The supplier has [been in the business of manufacturing, fabricating or installing these systems for a minimum of [2] [_____] years] [manufactured and supplied a minimum of [5] [_____] vapor phase carbon adsorption units].

1.4.3 Carbon Vessel Fabricator

**************************************************************************
NOTE: Verification from a registered professional engineer should only be required for large systems which have to be bolted to the foundation. Delete this paragraph for small units which are on forktubes or a flat base and not fastened to the foundation.
**************************************************************************

Provide verification from a Registered Professional Engineer, licensed to practice mechanical or structural engineering, as appropriate, in the State in which the system is to be installed to verify that: 1) The fabrication drawings and pressure calculations for the vessels and appurtenances were done for the site conditions in accordance with the appropriate codes and standards. 2) The erection drawings for the shells and tank foundations and supports were done for the site conditions in accordance with the appropriate codes and standards. Submit certification from this Engineer documenting the verification.

1.5 PARTNERING AND/OR PRE-SUBMITTAL MEETING

**************************************************************************
NOTE: Remove this paragraph when a meeting is not required.
**************************************************************************

A [partnering] [and] [Pre-submittal] meeting will be required. Ensure that involved subcontractors, suppliers, and manufacturers are notified. Furnish the date and time of the meeting to the Contracting Officer for approval.
1.6 DELIVERY, STORAGE, AND HANDLING

Preassemble parts to the largest extent possible, compatible with transportation limitations and equipment protection considerations. Field assembly, if any, requires merely bolting together of match-marked components. Crate and deliver equipment to protect against damage during shipping. Protect flange faces from damage. Cover all openings to prevent entrance of dirt, water and debris. Properly protect all parts so that no damage or deterioration will occur during a prolonged delay from the time of shipment until installation is completed and until the units and equipment are ready for operation. Properly protect finished iron or steel surfaces to prevent rust and corrosion. Protect all equipment, delivered and designated for storage, from the weather (humidity and temperature), dirt and dust, and other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Provide additional information about equipment preceding and following the carbon vessel. This is to provide the vendor with a complete picture of the unit's purpose and operation. Some paragraphs may be eliminated or modified if this Section is to be issued as a performance specification. Others will be eliminated or modified if it is to be issued as a design specification.

Laboratory adsorption studies are seldom done for air/gas adsorption. Estimates are obtained from isothermal data or from vendor computer programs. The ASTM Standards do not provide information on the minimum and maximum values that are acceptable for specifying carbon. Manufacturers may need to be contacted to determine the acceptable values. The characteristics for virgin and regenerated carbon will be different. Verify that the requirements are correct for the type of carbon specified.
**************************************************************************

Provide a vapor phase activated carbon adsorption system as a complete once-through forced flow system. Furnish system capable of reducing the levels of the listed organic contaminants to the values shown in paragraph Performance Requirements. Fill the unit with granular activated carbon for removal of organic contaminants from [landfill gas] [soil vapor extraction air/gas] [air stripping air/gas] [process tank vapor emissions] [low temperature thermal desorption air/gas] [______]. Equipment includes, but is limited to, vessels containing activated carbon, supporting equipment and accessories. Terminology is in conformance with ASTM D2652. Provide complete system with [[2] [______] parallel trains of [2] [______] carbon vessels in [series] [parallel]] [[2] [______] carbon vessels in series [parallel]], activated carbon, [blowers], instruments, controls, valves, piping, pre-heater/coolers and other specified appurtenances. Arrange the piping [as shown on the drawings] [______] to allow any of the [2] [______] units to serve as the primary unit and to also allow any unit to operate alone while the other units are being emptied and refilled with fresh carbon. Design the system to operate continuously, 24 hours per day, 7
days per week.

2.1.1 Design Requirements

**************************************************************************

NOTE: The most difficult part of designing an activated carbon adsorption system may be determining the contaminant concentration in the air/gas stream to be treated. Many times design estimates are based on limited data. The actual rate, particularly after the unit has operated for a while, may be much different. An approach may be to design the process for easy addition or removal of carbon units as determined after startup.

Determine seismic parameters from paragraph Seismic Requirements, and wind speed from ASCE 7-16, Chapter 1, or UFC-3-301-01. Specify whether the unit will be installed inside or outside and any other conditions that will affect the operation of the unit. Coordinate this Section with other pertinent Sections to ensure that information is presented only once. Verify that the floor and footings are designed to support the equipment.

**************************************************************************

Meet the following requirements:

a. Minimum equipment design life: [_____] years.

b. Vessel type: [permanent with carbon] [replacement] [interchangeable canisters].

c. Adsorption system design requirements:
   (1) Maximum vertical projection: [_____] m ft.
   (2) Maximum ground surface coverage: [_____] by [_____] m ft.

d. Seismic parameters: [_____].

e. Wind speed (maximum): [_____] km/h mph.

f. Ground snow load: [_____] kPa psf.

g. Ambient air temperature:
   (1) Maximum: [_____] degrees C degrees F.
   (2) Minimum: [_____] degrees C degrees F.

2.1.2 Influent Air/Gas Conditions

**************************************************************************

NOTE: Remove this paragraph if the specification is to be issued as a design specification. Obtain an analysis of the air/gas to be treated giving appropriate information to be inserted in the blank spaces. The inlet air/gas composition may be
difficult to obtain. If the specification is to be issued as a performance specification the inlet composition will need to be estimated.

Oxygen and methane data are useful if the methane concentration is high enough to have a potential to be in the explosive range. If the concentration is well below this range, remove the methane and oxygen concentration lines. Provide all available information. All available pertinent site characterization data should be placed in an appendix of the technical specifications or on the drawings, and referenced here. Indicate the detail to which site characterization has been performed and indicate where data gaps exist. The information should also include soil gas data, chemical data, geotechnical data, sampling locations, and boring logs. Table must be edited to add contaminants not listed and delete those that are not applicable. Verify that carbon will adsorb the organic chemicals since many organic chemicals do not adsorb well on carbon.

2.1.3 Performance Requirements

**************************************************************************

NOTE: Remove these paragraphs if the specification is to be issued as a design specification. Removal expressed as a percent is dependent on inlet concentrations which can vary. Ensure that the desired emission rates can be met before using
percent removal.

2.1.3.3 Carbon Replacement

Replace carbon at intervals no less than [_____] days.

2.1.4 Design Calculations

**NOTE: Delete this paragraph when design is done by the Government.**

Supply a copy of all the design calculations to the Contracting Officer before initiation of construction.

2.1.5 Conformance to Design

Provide calculations, layouts and drawings of the carbon adsorption system to clearly show the basis for the design; including isotherms, estimated breakthrough volumes, and calculations to show that the entire system will conform to paragraph Performance Requirements.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that
essentially duplicate items that have been in satisfactory use for at least [2] [_____] years prior to bid opening. Provide materials and equipment supported by a service organization that is located within [_____] km miles of the site.

2.2.2 Nameplates

Provide major equipment items such as adsorption vessels, blowers and motors with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.3 Vapor Phase Activated Carbon

**************************************************************************
NOTE: Performance specifications are recommended to allow the Contractor to install proven "off-the-shelf" units supplied by two or three reputable manufacturers. Determine if the first charge of carbon needs to be virgin carbon for liability requirements. Remove items not required below.
**************************************************************************

Provide material conforming to the following list; submit certificates attesting that the activated carbon furnished meets the specified requirements. Also, submit the type of activated carbon, with isotherms for the selected carbon, with each of the volatile organic compounds listed in the effluent requirements for the anticipated temperature range at 50 percent relative humidity. Use design calculations or vendor computer models to estimate the mass of carbon required and the breakthrough curves for the listed organic compounds in the carbon bed.

a. Provide an initial charge of carbon that is [virgin] [regenerated] [virgin or regenerated] carbon. Provide subsequent charges that are [virgin] [regenerated] [virgin or regenerated] carbon.

b. Furnish carbon adsorption system capable of reducing emissions for individual compounds to below the limits specified in SYSTEM DESCRIPTION.

c. Base approximate average volatile organic composition of the vapor stream on estimated influent component levels as specified in SYSTEM DESCRIPTION.

d. Provide minimum butane working capacity of new activated carbon of [23.8] [_____] percent by weight as determined by ASTM D5228.

e. Provide minimum iodine number of virgin or reactivated carbon of [1000] [_____] as determined by ASTM D4607.

g. Provide maximum total ash content of [10] [_____] percent by weight as determined by ASTM D2866.

h. Provide minimum hardness number of [90] [_____] necessary for the required life in vapor phase applications as determined by ASTM D3802.
i. Provide uniform activated carbon particle size for consistent pressure drop characteristics. Provide maximum particle size of 4.6 mm 0.2 inch diameter as determined by ASTM D2862.

j. The granular activated carbon must be of the type that can be accepted for offsite regeneration of the spent activated carbon by an approved carbon regeneration facility.

k. Provide minimum apparent density of [0.45] [_____] g/cc as determined by ASTM D2854.

l. Maximum pressure drop is [_____] kPa/m inches of water per foot of bed depth, measured in air at 21 degrees C 70 degrees F.

m. US Sieve size is [4 x 8] [______].

n. Furnish material that is free from impurities that affect the serviceability and appearance of the finished product.

2.4 ACTIVATED CARBON ADSORPTION UNITS

**************************************************************************

NOTE: General rules to the system designer for configuration of a vapor phase activated carbon system as follows:

a. Two stage series operation to provide longer contact and more complete exhaustion of the carbon is preferred. In series operation, the unit with the freshest carbon at any given time should be in the lag position. For critical operations, lead, lag and standby units should be provided as specified in paragraph SYSTEM DESCRIPTION.

b. Multiple units in parallel operation are frequently used for high flows with low contamination levels when short contact times are adequate. Single units should be used only in installations in which the system can be shut down for change out of the activated carbon adsorption media. Multiple smaller units containing the same amount of carbon and providing equal contact are usually preferable to single large unit.

c. An appropriate piping configuration which can adapt the units for series or parallel operation should be considered. Arrangements that allow conversion from parallel to series and the reverse allow the flexibility to respond to differing conditions.

d. Surface loading ranges between 12 and 24 cu m/min/sq m 40 and 80 cfm/min/sq ft are often used.

e. Minimum bed depth at a given velocity is based on the minimum contact time required to achieve the required removal. Additional bed volume allows more time between carbon changes.
f. The relative humidity of the air/gas entering the carbon unit should be 50 percent or less. If the air/gas entering the unit has entrained water an air/gas-water separator should be used. Without this, the temperature of the air/gas will have to be elevated enough to vaporize the mist and lower the relative humidity to about 50 per cent. At this higher temperature the organic chemical may not adsorb well.

2.4.1 Velocity

NOTE: In an up-flow system the velocity should generally be in the range of 12 to 24 m/sec 40 to 80 feet per minute; this depends on the particle size. In a down-flow system, the flow velocity is only limited by the allowable pressure drop.

The minimum and maximum acceptable flow velocities are as follows: 0.25 m/sec at [_____] cu m/sec minimum; and 0.375 m/sec at [_____] cu m/sec maximum 40 ft/min at [_____] scfm minimum; and 80 ft/min at [_____] scfm maximum.

2.4.2 Vapor Distribution/Collection Systems

Provide effective distribution across the bed throughout the stated capacity range. Provide a system to minimize short circuiting or channeling of contaminated air/gas through the carbon vessel. Design the system to evenly distribute the controlled contaminated air/gas flow across the cross section, with the nominal velocity under design conditions not exceeding 0.41 m/sec 80 fpm for up-flow systems. Adequately design the inlet and outlet to prevent local pressurization in excess of the vessel rating or design.

2.4.3 Shell Design

NOTE: Most carbon vessels are not designed for vacuum. Verify that a vacuum cannot be drawn on the vessel exceeding the manufacturer's recommendation. If the vessel will have internal pressure greater than 103 kPa 15 psig, it may need to be ASME rated. Vessels with less than this pressure may or may not need to be pressure rated depending on special ASME or State/local codes.

2.4.3.1 Corrosion Prevention

Use corrosion resistant steel, fiberglass, or other plastic for shell construction or a steel shell with a corrosion resistant [enamel] [_____] coating. Provide lining system with a corrosion resistant [epoxy or phenolic resin] [_____] coating. Furnish paint kits for use after assembly and finishing.
2.4.3.2 Manways

Minimum manway requirements, for access, addition and removal of carbon are [1] [_____] per adsorber and 610 mm 24 in minimum nominal diameter.

2.4.3.3 Insulation

**************************************************************************
NOTE: Insulation is optional. It may be needed if the carbon units are installed outside in cold climates. A high differential pressure across a fan or blower that precedes the carbon unit may result in a high air/gas discharge temperature. Pipes and fittings down stream may not need insulation. Plastic or fiberglass pipes and fittings should not be used if the discharge temperature can exceed that recommended for the material.
**************************************************************************

Install insulation [and heat tape] to prevent cooling of the air/gas in the system as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Insulate all outside surfaces of the following equipment: [adsorbers] [pipes] [fittings] [stacks] [____].

2.4.3.4 Vessel

**************************************************************************
NOTE: If the specification is to be issued as a performance specification, remove adsorber diameter and carbon quality in this paragraph. Delete the minimum bed depth for a performance specification. Small units do not need inlet air/gas distributors. Add a paragraph requiring an outside access ladder if the top of the vessel must be accessed frequently. The number of carbon vessels should conform to those specified in SYSTEM DESCRIPTION.
**************************************************************************

Comply with the following requirements:

a. Minimum Number of Vessels: [2] [____].
b. Minimum Adsorber Diameter: [____] m ft.
c. Material of Construction: [carbon steel] [____].
e. Minimum Carbon Quantity per Vessel: [____] kg lbs.
f. Minimum Carbon Bed Depth: 922 mm 36 inches.
g. Flow Direction: [upflow] [downflow].
h. Outlet Collector: [____].
i. Inlet Distributor: Integral
j. Min. Allowable Temperature: [____] degrees C degrees F.
Each unit must be skid-mounted. Fabricate skids of cast iron or steel channels and design to support the equipment and to distribute the weight in transit and in service without loading on the tank or concrete slab; equip with lifting lugs and pre-pipe internally. Secure each vessel to a structural steel frame suitable for shipment or transport with a forklift or crane and set on a level area for operation. Coat exterior structural steel surfaces with a suitable primer and top coat to resist corrosion due to water spray. Provide a minimum of one ground connection for each unit. If required, provide each unit with an inlet air/gas distributor. Provide sampling ports on the inlet and outlet pipes of each vessel to allow independent sampling and measurement of breakthrough for each unit.

2.4.3.5 Fire Sprinklers

**************************************************************************
NOTE: A fire suppression system is needed if the carbon manufacturer believes the adsorbed contaminant can react and cause a fire.
**************************************************************************

Equip carbon vessels with an internal water sprinkler to suppress carbon fires.

2.4.3.6 Seismic Requirements

**************************************************************************
NOTE: Provide seismic requirements, if a government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Remove the bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC properly edited, must be included in the contract documents.
**************************************************************************

Support and brace adsorption units to resist seismic loads as specified under UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC [as shown on the drawings].

2.4.4 Unit Submittals

2.4.4.1 Layout and Detail Drawings

Drawings showing complete equipment layout, piping, wiring and schematic diagrams, and installation instructions and any other details required to show equipment relationships, clearances for maintenance and operation and to demonstrate that the system has been coordinated and will properly function as a unit. Process flow diagrams and instrumentation diagrams showing all major pieces of process equipment with controls. Details on the carbon adsorber shell including information on vapor diffusion, carbon contact shell dimensions, construction materials and structural and supporting design calculations.
2.4.4.2 Calculations and Modeling

Design calculations or computer modeling results for vapor phase carbon adsorption system indicating removals of each of the organic compounds listed. Demonstration of, or design calculations for, the total head loss through the carbon unit. Provide isotherm and design calculations or manufacturer's computer models to estimate the mass of carbon required and the breakthrough curves. Calculations showing how the vapor phase carbon adsorption system functions with the entire air/gas system including carbon vessel, [regeneration equipment], preheater, instrumentation and controls, dimensions, capacities, make and model, materials of construction, coating systems, pressure drop through each component of the system, including line sizing, valving, pressure and temperature gauges. Structural calculations for fabrication and erection drawings if requested (not needed for drum/canister applications).

2.4.4.3 System Supplier Testing

Submit certificate from system supplier showing that the equipment has been tested and has passed all quality control criteria.

2.5 ACCESSORIES

2.5.1 Blowers

Conform to Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS.

2.5.2 Preconditioning Equipment for Inlet Air/Gas Stream

******************************************************************************

NOTE: An air/gas preheater may not be needed if the carbon unit is preceded with a blower. Blowers heat the air/gas which reduces the relative humidity. A blower may raise the temperature of the air/gas more than needed. If this occurs, cooling will be required before entering the carbon unit. If a specific type of preheater is needed, specific information on the type of heater, materials of construction and type of energy source (electricity, steam, natural gas) should be indicated on the drawings or added to the specifications. Either the paragraph on the air/gas preheater or the air/gas cooler or both should be deleted.

******************************************************************************

[A preheater is required if the relative humidity is greater than [50] [_____] per cent. Provide preheater [of the type and size as shown on the schedule on the drawings] [______]. The preheater must lower the relative humidity of the influent to [50] [_____] percent. Provide materials of construction and controls and cutoffs. Provide heating element that is [directly] [indirectly] heated.] [The vapor stream leaving a forced draft blower that precedes the carbon vessel must pass through a heat exchanger that cools the air/gas stream. Provide heat exchanger of the type and size as shown on the schedule on the drawings. The heat exchanger must lower the temperature enough to raise the relative humidity to no more than 50 percent.]
2.5.3 Carbon Storage and Transfer System

**************************************************************************
NOTE: Fresh carbon storage vessels and exhausted carbon storage vessels are not usually used in vapor phase systems. In large systems, the carbon is vacuumed or removed by eductor (water) and put into a truck. In smaller systems the carbon is usually removed by vacuum.

If there is no onsite storage, two trucks are needed, one empty to receive the used carbon and one with fresh carbon. Economics should dictate whether to install extra vessels at the site or to have an empty truck accompany the truck with the fresh carbon. It is often desirable to size the vessels to hold a full truck load of activated carbon to reduce shipping costs. On many small systems, the entire vessel containing the used carbon is replaced with a vessel containing fresh carbon. Vessels are sometimes filled from 400 to 450 kg 900 to 1000 pound sacks or 90 kg 200 pound drums. In this situation, no storage tanks are needed. Remove the paragraph on fresh Carbon Storage Tank and Exhausted Carbon Storage Tanks if these will not be required.
**************************************************************************

2.5.3.1 Fresh Carbon Storage Tanks

Provide a fresh carbon storage system. Minimum capacity of the system must provide storage of [_____] kg pounds of dry carbon at a bulk density of [_____] kg/cubic meter pcf.

2.5.3.2 Exhausted Carbon Storage Tanks

Provide an exhausted carbon storage supply system. Minimum capacity of the system must provide storage of [_____] kg pounds of wet carbon saturated with organic chemicals.

2.5.3.3 Sampling Valves

Provide sampling valves at the inlet and outlet of each carbon unit.

2.5.3.4 Piping

Furnish piping in accordance with Section 31 21 00 OFF-GASSING MITIGATION.

2.6 ACTIVATED CARBON INSTRUMENTATION AND CONTROLS

**************************************************************************
NOTE: These paragraphs can be used in conjunction with Sections 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION and 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC modified as required for this application. An instrumentation and control Guide Specification for hazardous waste systems is being written.
**************************************************************************
2.6.1 Sensors and Transmitters

******************************************************************************
NOTE: The humidity interlock will prevent condensation of water vapor in the carbon during startup if conditions exist that could allow high humidity air to the carbon unit.
******************************************************************************

Provide sensors and transmitters that have a range selected for the application, using the smallest range available from the controls manufacturer that will meet all expected sensed conditions in the sequence of control. Provide sensors and transmitters consisting of the following:

2.6.1.1 Relative Humidity Sensors

Provide relative humidity sensing element with a relative humidity sending range from 0 to 100 percent (condensing). Provide sensor capable of sensing a condensing air stream (100 percent RH) without affecting the sensors calibration or harming the sensor. Provide sensing elements with an accuracy of plus or minus 5 percent of full scale within the range of 20 to 80 percent relative humidity. Mount all sensors in locations that are accessible for calibration and fit for ease of calibration and re-calibration.

2.6.1.2 Airflow Measuring

******************************************************************************
NOTE: Pitot-tube type flow measuring devices can malfunction if the air/gas contains water droplets.
******************************************************************************

Provide velocity sensing elements that are the [RTD or thermistor type, with linearizing means. Distribute the sensing elements across the pipe in the quantity and pattern set forth for measurements and instructions in ASHRAE FUN SIA and SMACNA 1780 for traversing of ducted airflows. The resistance to airflow through the airflow measurement station must not exceed 2 mm 0.08 inch water gauge at an airflow of 600 m/min 2,000 fpm. Station construction must be suitable for operation at airflows of up to 1500 m/min 5,000 fpm over a temperature range of 4 to 60 degrees C 40 to 140 degrees F, and an accuracy of plus or minus 3 percent over a range of 40 to 760 m/min 125 to 2,500 fpm scaled to air volume.] [multiple pitot tube type with averaging manifolds. Distribute the sensing elements across the pipe in the quantity and pattern set forth for measurements and instruments in ASHRAE FUN SIA and SMACNA 1780 for the traversing of ducted airflows. The resistance to airflow through the airflow measurement station must not exceed 2 mm 0.08 inch water gauge at an airflow of 600 m/min 2,000 fpm. Station construction must be suitable for operation at airflows of up to 1500 m/min 5,000 fpm over a temperature range of 4 to 60 degrees C 40 to 140 degrees F, and an accuracy of plus or minus 3 percent over a range of 150 to 760 m/min 500 to 2,500 fpm scaled to air volume. Do not use this device if the required velocity measurement is below 210 m/min 700 fpm.]

2.6.1.3 Pressure Gauges

Provide pressure gauges conforming to ASME B40.100.
2.6.1.4 Thermometers

Provide dial type thermometers, 88 mm 3-1/2 inch diameter, chromium plated case; remote or direct-type bulb as required; plus or minus 0.5 degree C 1 degree F accuracy; white face with black digits graduated in 1 degree C 2 degree F increments. Provide thermometer wells of the separable socket type for each thermometer with direct-type bulb. Range of thermometers is [_____] to [_____] degrees C degrees F.

2.6.2 Controllers

Provide controllers that have set point, action, proportional band, authority throttling range, ratio, and remote set point adjustment as required to meet requirements of the sequence of control. Mount controllers on a unit control panel located [in the same room as the system being controlled] [near the carbon vessels].

2.6.2.1 Relative Humidity Controllers

Provide space-type humidity controllers that take full control action for a relative humidity change of plus or minus 5 percent of the setting of the controller. Set point adjustment range is approximately [20] [_____] percent to [80] [_____] percent relative humidity. Provide controllers with adjustable throttling ranges. Mount insertion type controllers in the interior of piping and fit with air shields where so recommended by the manufacturer.

2.6.2.2 Alarms

Alarm annunciation must be by [visual] [and] [audible] indication. Alarm signals must be locked in and require manual reset. [Furnish an auto dialer] [Telemeter alarms to the master control panel in the control room].

2.6.2.3 Relative Humidity Alarms

Install relative humidity alarms immediately upstream from the carbon vessels to alert the operator of relative humidity exceeding [50] [_____] percent.

2.6.2.4 Pressure Alarms

Install pressure [alarms] [indicators] on each side of the carbon vessels to alert the operator of excessive pressure drop.

2.6.2.5 Temperature Alarms

**************************************************************************
NOTE: Temperature or carbon monoxide alarms can be used to monitor for fire in the carbon bed.
**************************************************************************

Provide temperature on excursions (drop or rise) of [10] [_____] degrees C [18] [_____] degrees F outside the control range in the duct leaving the carbon vessel.

2.6.2.6 Carbon Monoxide Alarms

Provide carbon monoxide alarms to alert the operator of concentrations in excess of [100] [_____] ppm in the exit gas.
2.6.2.7 Timing Interlock

Provide a timing interlock to delay starting the blower until the preheater has been turned on for [15] [_____] seconds. Provide interlock to prevent saturation of the carbon during startup procedures and to delay blower stops after every shut performed.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with the details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancies before performing the work.

3.2 EQUIPMENT INSTALLATION

Install equipment as shown and in accordance with written instructions of the manufacturer. Each vessel must be [anchored to a footing isolated from the floor slab] [mounted on a skid base]. Provide anchor brackets, anchor rods or straps to hold the shell to anchors in the footing. Design reinforced concrete foundations for each carbon unit to support the unit and in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.3 PAINTING FOR CORROSION PREVENTION

Paint equipment which did not receive a factory finish, unless specified otherwise. Apply paint system to the outside of the tank in accordance with Section 09 90 00 PAINTS AND COATINGS. Prime surfaces that have not been factory primed and top coat with the manufacturer's standard factory finish. Provide factory painting conforming to manufacturer's standard factory finish. Repair all defects in the finish prior to or during installation of the equipment as specified in Section 09 90 00 PAINTS AND COATINGS. Paint all exposed ferrous surfaces not painted in the factory in accordance with Section 09 90 00 PAINTS AND COATINGS. Painting of corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel is not required, unless otherwise specified. Coat or paint all ferrous surfaces. Provide color as indicated on the paint schedule or as otherwise approved.

3.4 POSTED FRAMED INSTRUCTIONS

Post installation instructions, sequences, and precautions, including tolerances for level, horizontal, and vertical alignment as specified. Submit for approval prior to posting: Grouting requirements, including grout spaces and materials; wiring and control diagrams; system layouts and isometrics; instructions and other sheets; operating instructions explaining preventive maintenance procedures and checks to assure the system is operating normally and safely. Methods of checking the system for normal safe operation; procedures for operating the system; and prepare procedures for safely starting and stopping the system in typed form, framed and posted beside the diagrams. Write instructions for any required sampling, carbon transfer and shipping of activated carbon to regeneration or disposal facility. Catalog cuts are not acceptable.

3.5 FIELD QUALITY CONTROL

Submit reports on tests performed to show compliance with instructions.
Include in the test reports all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Indicate in each test report the final position of all controls. Reflect performance test data in the operating instructions.

3.5.1 Equipment Tests

After installation of the carbon adsorption system is complete, carry out operating tests to ensure that the unit installed operates properly. Inspect all products carefully for defects in workmanship and material; clean debris and foreign matter out of all equipment; test all operating mechanisms to check their proper functioning; and check all nuts and bolts for tightness. Repair or replace valves and other equipment which do not operate easily or are otherwise defective. Assure that there is no vibration, or noise from any parts. If deficiencies are revealed during tests, correct such deficiencies and reconduct the tests at the Contractor's expense.

3.5.2 Performance Tests

**************************************************************************

NOTE: Running the unit to exhaustion should only be required if this is expected to occur within the test period. Some vessels may not get to exhaustion for a long period of time. Verify that the sample ports are addressed in Section 34 21 00 OFF-GASSING MITIGATION. Coordinate sampling requirements of this paragraph with the sampling requirements of other units/processes in the entire treatment train.

**************************************************************************

After installation of the activated carbon adsorption system, carry out operating tests to ensure that the system operates properly. Include the adsorption units, all accessories and instruments and controls. If any deficiencies are revealed during any tests, correct such deficiencies and repeat the tests. Run [each] [a typical] adsorber at a constant flow rate of approximately [_____] cubic meters/second scfm [until the maximum emissions as listed in paragraph Chemical Requirements occur] [for [24] [_____] hours]. Make a complete log of each test run, giving the following data: date, time of readings and sampling. Determine total chemicals removed by analyses of the inlet and outlet for the chemical requirements listed in paragraph Performance Requirements. Take samples of the emissions for analysis after [each [_____] cubic meters feet have been run through the adsorber] [[_____] hours of operation]. Use results of the tests in determining the capacity and performance of the adsorption unit. Submit the reports to document emissions permit compliance. Perform sampling and analyses in accordance with [______].

3.5.3 Spent Activated Carbon Sampling and Analyses

Perform sampling and analyses of the spent activated carbon media in accordance with requirements [for spent carbon transport and requirements of the regeneration facility] [of the RCRA permitted treatment, storage and disposal facility].

3.5.4 Carbon Testing

Test the carbon to be used during the performance testing to ensure it
meets the requirements of [____].

3.5.5 Breakthrough Monitoring

**************************************************************************
NOTE: Continuous emission monitors are not addressed in this Section. If continuous emission monitors are required, verify that the detector used is specific for the chemicals to be monitored.
**************************************************************************

Monitoring the emissions for the chemicals listed in paragraph CHEMICAL REQUIREMENTS once every [7] [____] days to determine when to replace the granular activated carbon. Record the volume of air/gas that was treated, from the time that the vessel was placed in the upstream position until breakthrough was consistently determined, as the breakthrough volume. Breakthrough volume is the volume of air/gas that was treated before the concentration of any one of the chemicals in paragraph Chemical Requirements was exceeded. The criteria for determining when to replace granular activated carbon may be modified as more data are generated.

3.5.6 Noncompliance with Performance Requirements

Removals must meet or exceed those specified in the performance requirements of this specification. If at any time during the first [12] [____] months of operation the results of the organic analyses of the air/gas emissions are not in compliance with maximum emissions levels listed in paragraph CHEMICAL REQUIREMENTS, except for periods when the carbon is saturated, flow through the unit and the system is inoperable. If at any time the operation of the system does not meet the flow rate requirements, instrumentation or control requirements set forth in this contract, stop flow through the system. Proceed immediately to repair or modify the system for compliance with the contract documents. Make repairs or modifications entirely at the Contractor's expense. Notify the Contracting Officer one day before the system is to be restarted and retested.

3.6 OPERATION AND MAINTENANCE SUPPLIES

3.6.1 PARTS, TOOLS AND HANDLING EQUIPMENT

Submit a complete list of parts, supplies, special tools, instruments and accessories and special lifting and handling devices required for periodic maintenance, repair, adjustment and calibration and recommended spare parts for each different item of material and equipment specified, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [one] [____] and [three] [____] years of service.

3.6.2 EXTRA MATERIALS

Within 30 days of system approval, furnish a spare parts list for each different item of material and equipment specified with the shop drawings submitted. Include in the list parts, supplies, prices and sources schedule. Furnish those spare parts and special tools which are recommended by the manufacturer. Also provide 12 months supply of any expendable items and frequently replaced parts, except for carbon, as identified by the manufacturer. Following completion of the startup and operating period [replenish the spare parts inventory and provide a twelve
month supply] [supply the [carbon regeneration] [carbon disposal] facility name, address and price schedule].

3.7 MANUFACTURER'S FIELD SERVICE

Provide the services of the manufacturer's representative, who is experienced in the installation, adjustment and operation of the equipment specified, for a minimum of [16] [_____] hours at the site. Supervise the installation, adjustment, and testing of the equipment. Prior to startup, inspect the equipment for alignment and connections by a factory representative. Inspect the final installation and supervise the adjustment and testing of the equipment. Schedule and coordinate the testing to coincide with the later phases of the carbon column testing, to prove out the complete installation in the presence of a Government representative. After completion of all testing, assist the plant operators in plant startup.

3.8 CLOSEOUT ACTIVITIES

3.8.1 Operating and Maintenance Manuals

Submit [six] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include in the instructions layout, wiring, and control diagrams of the system as installed. Also the manufacturer's name, model number, service manual, parts list, brief description of all equipment and their basic operation features, and operating instructions for each piece of equipment and bulletins, cut sheets and descriptive data. [Six] [_____] complete copies of maintenance instructions listing routine preventative maintenance procedures, possible breakdowns and repairs, and trouble shooting guides list showing lubricants for each item of mechanical equipment, approximate quantities needed per year and recommended lubrication intervals.

3.9 FIELD TRAINING

Conduct a training course of operating staff as designated by the Contracting Officer. Start the training period, for a total of [24] [36] hours of normal working time, after the system is functionally complete but prior to final acceptance tests. Cover the topics included in the Operating and Maintenance Manuals. Also provide [16] [_____] hours of training, as directed by the Contracting Officer, following completion of the [one year] [_____] operating period for the follow-in Contractor.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for systems to destroy, by thermal oxidation, organic contaminants contained in an off-gas stream; with options to use concentration system, heat recovery and/or a catalyst to conserve fuel.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 UNIT PRICES

NOTE: Measurement and payment requirements will be specified for work subject to extreme variation in estimated quantity when unit price bidding is required. This paragraph is not used when quantities can be reasonably calculated from information included in the contract.

Measurement and payment and unit prices for quantities of off-gas treated
will be determined in accordance with the Bid Schedule.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or
complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-10 Operation and Maintenance Data
1.4 QUALIFICATIONS

1.4.1 Contractor

Have had a minimum of [2] [3] [5] [_____] years of experience in the construction of industrial air pollution control systems, sanitary wastewater sludge digestion gas systems, landfill off-gas or vapor extraction off-gas handling systems.

1.4.2 Single Source Supplier

Assign to a single supplier full responsibility for the furnishing of the adsorption system. The designated single supplier, however, need not manufacture the system but coordinate the selection, assembly, installation, and testing of the entire specified system.

1.4.3 Manufacturer's Field Representative

Provide the services of a manufacturer's field representative and training engineer, who is experienced in the installation, adjustment, and operation of the equipment furnished, and who has complete knowledge of the proper operation and maintenance of the system. Submit names and qualifications of each manufacturer's field representative and training engineer with written certification from the manufacturer that each representative and trainer is technically qualified.

1.4.4 Welders

[Welders must have passed qualification tests using procedures covered in AWS B2.1/B2.1M or ASME BPVC SEC IX and have the appropriate certification.] [Qualifications of welders, and welding and nondestructive testing procedures for piping will be as specified in Section 40 05 13.96 WELDING PROCESS PIPING.] [Structural members must be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] Require any welder to retake the test when, in the opinion of the Contracting Officer, the work of the welder creates reasonable doubt as to proficiency.

1.5 REGULATORY REQUIREMENTS

**************************************************************************
NOTE: Add applicable regional, state, or local requirements. Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS includes basic requirements.
**************************************************************************

Abide by the following requirements: [____].

1.6 PARTNERING OR PRE-INSTALLATION CONFERENCE

[Partnering] [Pre-installation] conference [may] [will] be [requested] [required]. Ensure that involved subcontractors, suppliers, and manufacturers are [notified] [represented]. Submit the date and time of the conference to the Contracting Officer for approval.
1.7 DELIVERY, STORAGE, AND HANDLING

Protect from the weather, excessive humidity, excessive temperature variation, and dirt, dust, or other contaminants all equipment delivered and placed in storage. Catalyst material are to be protected in accordance with the manufacturer's recommendations.

1.8 SEQUENCING AND SCHEDULING

**************************************************************************
NOTE: Testing of the thermal oxidation system should be concurrent with the start of gas flow from the landfill, vapor extraction system, or other source.
**************************************************************************

Installation of the thermal oxidizer must be complete and the system operational prior to completion of the [gas collection system] [vapor extraction system] [landfill cap]. Avoid point source release of untreated off-gas to the maximum extent consistent with completion of the contract. Perform sampling and analyses to demonstrate system performance and emission compliance.

1.9 EXTRA MATERIALS

**************************************************************************
NOTE: Include items needed for future maintenance and repair, items that might be difficult to obtain and spare parts needed to ensure continued operation of critical equipment. Consider whether an initial operating period is included in the contract.
**************************************************************************

[Provide an inventory of all equipment, tools, and items to the Contracting Officer at the start of the operating period. Update the inventory monthly. A current inventory must be delivered to the Contracting Officer when the operating period is complete.] [Concurrent with delivery and installation of the specified equipment, furnish auxiliary equipment and spare parts.] Furnish the following:

a. [Spare parts for each different item of material and equipment specified including all of the parts recommended by the manufacturer to be replaced after [1 year] [1 year and 3 years] service.] [Spare parts, replacement parts and other items duplicated or replaced during the operating period.]

b. For each type of grease, one lever type grease gun or other lubricating device.

c. [One set of special tools for each type of equipment including calibration devices, and instruments required for adjustment, calibration, disassembly, operation, and maintenance of the equipment.] [One set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment.]

d. One or more steel tool cases mounted on the wall in a convenient location complete with flat key locks, two keys, and clips or hooks to hold each special tool.
e. A [three] [six] month supply of lubricants, [fuel,] [and] [consumable items] at the end of the contract.

f. [_____].

PART 2   PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a thermal (catalytic) oxidation system as a complete unit process for destruction of organic contaminants carried in the [off-gas] [vapor phase]. Equipment must include, but not limited to, a complete and operational thermal oxidation system, including supporting equipment and accessories.

2.1.1 Design Requirements

**************************************************************************
NOTE: Find the wind speed and seismic zone for the stack design in ASCE 7-16.
**************************************************************************

Provide the thermal oxidation system in conformance with section 60.18 of 40 CFR 60. Provide vertical and lateral supports for the stack in accordance with NFPA 82 and NFPA 211, as applicable, for the wind forces indicated. Design the system for the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
</tr>

2.1.3 Performance Requirements

Minimum retention time in the combustion chamber will be [0.5] [1.0] [1.5] [2.0] [2.5] [_____] seconds at [1095] [982] [820] [760] [400] [260] degrees C [2,000] [1,800] [1,500] [1,400] [750] [500] degrees F minimum at maximum flow. The flow rate must be [constant at [_____] cu m/second scfm] [off and on at [_____] cu m/second scfm maximum, with a turndown range of four to one (4:1)] [variable between [_____] cu m/second scfm minimum and [_____] cu m/second scfm maximum]. Flow rates are to be based on measurement at standard temperature and pressure (STP), 101.3 kPa at 15.5 degrees C 14.7 psia at 60 degrees F. Influent gauge pressure must vary between [_____] Pa inch H2O minimum, [_____] Pa inch H2O average, and [_____] Pa inch H2O maximum. Inlet temperature must vary between [_____] degrees C degrees F minimum, [_____] degrees C degrees F average and [_____] degrees C degrees F maximum. Materials of construction are to be compatible with the ambient and operating temperatures and long term exposure to untreated and treated gas constituents.

2.1.4 Off-Gas Composition

If the unit will be classified as a hazardous waste incinerator, required emission limits for specific compounds are given in the National Emission Standard for Hazardous Air Pollutants (NESHAP) Maximum Achievable Control Technology (MACT) Standard. The MACT standard is scheduled to be finalized the end of 1998 and will not appear in hard copies of the 40 CFR 63 until the July 1999 edition is issued by EPA. Until the 1999 CFR is available, it will be necessary for designers to obtain the Federal Register in which the new standard is given.

Establishing and enforcing air regulations is primarily done at the State level; therefore, it is critical that designers research State specific requirements applicable to the unit.
The BDT control device is a combustion device capable of reducing NMOC emissions by 98 weight-percent or an outlet NMOC concentration of 20 ppmv or less. The EPA 98 percent DRE requirement applies to total emissions as determined by stack gas analysis (to include aerosols, particulates, VOCs, etc.), not individual contaminants, and may not be attainable on individual contaminants in long term performance.

Include appropriate off-gas discharge requirements (or DRE) and products of incomplete combustion (if appropriate). Use energy conservation/recovery on long term or high volume devices.

**************************************************************************

The system must be capable of oxidation of the organic components of gaseous, solid and aerosol type emissions, as follows. Submit reports for permit compliance.

* Destruction percentage will be determined as follows: 100% x ((Influent mass - Effluent mass)/(Influent mass)).

** Dry basis, as hexane at 3 percent oxygen.

2.2 MATERIALS AND EQUIPMENT

**************************************************************************
NOTE: A life cycle cost analysis should be performed before selection of the equipment option: flare, enclosed combustor, thermal oxidizer, catalytic thermal oxidizer, regenerative thermal oxidizer, recuperative thermal oxidizer or catalytic recuperative thermal oxidizer.
**************************************************************************

2.2.1 Standard Products

Materials and equipment are to be the standard products of a manufacturer regularly engaged in the manufacture of such products and essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment must be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.2.2 General Requirements

Equipment and appurtenances are to be as specified and as shown on the detail drawings, and be suitable for the service intended. Materials and equipment will be new and unused, except for testing equipment. Components that serve the same function and are the same size are to be identical products of the same manufacturer. The system will be rejected upon failure to achieve both the minimum temperature and the minimum retention time specified in paragraph PERFORMANCE REQUIREMENTS.

Provide detail drawings containing complete flow diagrams, piping, wiring, schematic, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings must show capacities and pressure drop; heat and material balances; make and model; complete list of equipment and materials. Show on drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation.

2.2.3 Nameplates

Each major item of equipment must have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment. Each piece of equipment must bear the approval designation and the markings required for that designation.

SECTION 44 13 51 Page 18
Valves are to be marked in accordance with MSS SP-25 and bear a securely attached tag with the manufacturer's name, catalog number and valve identification permanently displayed.

2.2.4 Equipment Guards [and Access]

Belts, chains, couplings, and other moving parts are to be completely enclosed by guards, to prevent accidental personal injury, in accordance with 29 CFR 1910, Subpart O, Machinery and Machine Guarding. Guards are to be removable and arranged to allow access to the equipment for maintenance. Enclose high temperature components with thermal insulation to prevent ignition of combustible materials and to preclude personnel contact.

2.3 FLARE

**************************************************************************
NOTE: See 40 CFR 60.18 for shroud requirements; edit this paragraph if shroud is not needed.
**************************************************************************

The [candlestick] [open] [ground] flare are to be composed of an open combustion chamber without enclosure or shroud.

2.4 ENCLOSED COMBUSTOR

**************************************************************************
NOTE: Enclosed combustors must demonstrate either 98 percent NMOC reduction or outlet NMOC concentration of 20 ppmv or less.
**************************************************************************

The enclosed combustor must be composed of a vertical enclosed combustion chamber that maintains a constant temperature by controlling fuel and combustion air.

2.5 THERMAL OXIDIZER

**************************************************************************
NOTE: Catalytic oxidation operates at a reduced temperature and should be considered when the organic carbon is between 150 ppmv and 2,000 ppmv. Review the anticipated off-gas analysis for substances that mask or poison catalysts. Edit this paragraph as required.
**************************************************************************

The thermal oxidizer must be composed of a horizontal enclosed combustion chamber, with catalyst, that maintains a constant temperature by controlling fuel and combustion air. Ensure catalyst is suitable for use under the conditions listed in paragraph SYSTEM DESCRIPTION and fabricated in modules for ease of installation in the combustion chamber. Thermal oxidizer must be compatible reduced temperature operation with the catalyst in place and high temperature operation without using the modular catalyst unit.

2.6 REGENERATIVE THERMAL OXIDIZER

**************************************************************************
NOTE: This system is a high temperature operation that recovers energy by cycling exhaust and inlet gases through regenerative heat exchange media.

Compose the thermal oxidizer of a horizontal enclosed combustion chamber that maintains a constant temperature by controlling fuel and combustion air.

2.7 RECUPERATIVE THERMAL OXIDIZER

NOTE: This system consists of a high temperature operation, without catalyst, or low temperature operation, with catalyst, that recovers energy by counter current passing of the exhaust and inlet gases through the heat exchanger. Edit this paragraph as required for job conditions.

Compose the thermal oxidizer of a horizontal enclosed combustion chamber, with catalyst modules, that maintains a constant temperature by controlling fuel and combustion air. The thermal oxidizer must be compatible with the temperatures of operation with or without using the modular catalyst unit.

2.8 CONTAMINANT CONCENTRATION SYSTEM

NOTE: Fuel costs for dilute or wet off-gas streams are substantially reduced by using a concentration system. Consider a concentration system if the organic carbon is less than 2,000 ppmv.

Increase inlet gas concentration of [total hydrocarbon] [methane] [non methane organic compounds (NMOC)] [_____] by a minimum of [ten] [five] [two] times the initial concentration.

2.9 HEAT RECOVERY SYSTEM

NOTE: Use media for regenerative systems or heat exchanger for recuperative systems.

2.9.1 Media Chambers

Ensure exhaust flow through media chambers recycle a minimum of [50] [_____] percent of the heat input at maximum operating conditions (maximum flow and temperature).

2.9.2 Heat Exchanger

Ensure the multiple pass, or single pass plate heat exchanger, or tube and shell heat exchanger recycle a minimum of [80] [_____] percent of the heat input at maximum operating conditions (maximum flow and temperature).
2.10 Flame Trap/Arrester

NOTE: This is a safety requirement that must be implemented.

Provide flame arrester, in accordance with FM APP GUIDE, at the inlet to the oxidation system. The pressure drop across the flame arrester must be a maximum of [_____] [1.5] kPa [_____] [6] in W.C. at maximum flow. Ensure the flame arrester has a clean-out cover to facilitate maintenance.

2.11 Inlet Protection

NOTE: The system should be protected by moisture reduction.

2.11.1 Knock-Out Pot

Provide knock out pot, with a minimum collection efficiency of [98] [98.5] [99] percent.

2.11.2 Mist Eliminator

Provide a mist eliminator, with a minimum collection efficiency of [85] [98] [98.5] [99] [_____] percent of the impinging mist.

2.12 Ignition System/Burner Assembly

2.12.1 Pilot

NOTE: ASCE 25-16 applies to earthquake actuated systems.

Provide automatic gas shutoff system conforming to ASCE 25-16 on the pilot supply. The pilot assembly must be removable and provided with pressure indicator, pressure regulator, solenoid valve, manual shutoff valve and pilot gas pressure manometer port. Pilot inlet nozzle will be 150# ANSI, stainless steel, flanged.

2.12.2 Igniter

Provide electronic spark ignition. The igniter assembly must be removable from outside the combustion chamber without disconnecting conduit or wiring.

2.12.3 Burner Assembly

Ensure the primary air mixed burner is compatible with the specified fuel, has multiple small gas ports or jets, and constructed of 304L/316L stainless steel, heat and corrosion resistant alloy steel, ceramic and/or castable refractory. The burner must be of adequate capacity to maintain the required combustion temperature at the maximum flow with no fuel value in the off-gas.
2.12.4  Refractory Insulation

Provide removable, cast venturi burner lining assemblies with a [1500] [_____] degrees C [2,700] [_____] degrees F rating. Refractory insulation will be continuous, a minimum of 50 mm 2 inches of ceramic fiber insulation blanket surrounding the combustion cylinder, attached to the wall and floor with Inconel studs and washers, with plate retainers installed around all open edges of the blanket. Coat the refractory insulation with a high temperature, surface sealer protectant.

2.13  EXHAUST TREATMENT

2.13.1  Adsorber

**************************************************************************
NOTE: Adsorbers are not commonly required.
**************************************************************************

Treat exhaust gas with an activated carbon adsorption system in accordance with Section 44 13 10.13 VAPOR PHASE ACTIVATED CARBON ADSORPTION UNITS.

2.13.2  Scrubber

**************************************************************************
NOTE: Scrubber is used only for high acid concentrations resulting from chlorine or sulfur in the feed or combustion of nitrogen.
**************************************************************************

Ensure scrubber removes [85] [90] [95] [_____] percent of the acid gas formed.

2.14  STACK

2.14.1  Minimum Exit Velocity

The stack exit velocity will be no less than [_____] m/sec ft/sec.

2.14.2  Minimum Elevation

The stack elevation will be no less than stated in paragraph Design Requirements.

2.14.3  Lining

Stack will be lined with ceramic and/or castable refractory.

2.14.4  Lightning Protection

Provide an engineered lightning protection system with grounding.

2.14.5  Lugs

Provide lifting lugs at the top of the stack for ease of installation; each lug must be capable of supporting the entire weight of the stack.

2.14.6  Access

Provide access to the interior of the stack by an insulated, [hinged or
supported 0.6 x 0.6 m 24 x 24 inch square or 0.6 m 24 inch diameter, manway] [150 x 150 mm 6 x 6 inch square or 150 mm 6 inch diameter, hand hole] located above the burners.

2.14.7 Ladder

Mount an aluminum or galvanized steel fixed ladder to allow access for removal or replacement of each of the thermocouples. The ladder furnished with the system will have side rails. Individual rung ladders are not acceptable. Conform ladder 29 CFR 1910, Part 27 Fixed Ladders, except as specified herein. Provide the safety cage with locking device to prevent unauthorized access.

2.15 PROVISIONS FOR OBSERVATION AND SAMPLING

2.15.1 Observation Ports

Provide observation ports or sight glasses with removable tempered glass covers and cooling holes. View port diameter will be a minimum of [75 mm [3] [2] inch. Ports must be located to allow viewing the pilot flame, the base of the main flame, and a view of each of the thermocouples.

2.15.2 Inlet Sample Port

Inlet sample port [50] [_____] mm [2] [_____] inch minimum diameter, with cap and cooling holes, located upstream of all contributing flows, with the exception of the off-gas.

2.15.3 Outlet Sample Port

Outlet sample port [50] [_____] mm [2] [_____] inch minimum diameter, with cap and cooling holes, located [upstream of the cooling or dilution air inlet] [and] [two stack diameters from the top of stack].

2.15.4 Sampling Equipment

**************************************************************************
NOTE: Add sampler requirements.
**************************************************************************

Provide the following equipment: [_____].

2.16 CONTROLS

**************************************************************************
NOTE: Blower controls are in Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS. Omit last sentence if not applicable to the project.
**************************************************************************

Link set points, signals and control functions and dampers by a central programmable logic controller (PLC) located in the control panel. Control signals are to be 4-20 ma or 0-10 Vdc, compatible with the controller and sensor or control device. Include burner control diagnostics. For parameters specified to be continuously recorded, record digital data at intervals not exceeding one minute. Sensors are to be calibrated with standards traceable to NIST and in conformance with NIST SP 250. Connect each alarm to an [auto-dialer] [or] [telemetry] system.
2.16.1 Ultraviolet (UV) Flame Scanner

Provide ultraviolet scanner, installed and calibrated to provide for safety shutdown on the absence of flame. The signal from each scanner must incorporate a time delay appropriate to the control sequence. The burner flame scanner will monitor the burner flame. The pilot flame scanner will monitor the pilot flame.

2.16.2 Timers

Automatic timers must provide independent adjustment of the start and duration of each step in the control sequence.

2.16.2.1 Purge Timer

Set the minimum purge cycle at four changes of [air] [or] [inert gas]. Purge cycle must have both automatic and manual start.

2.16.2.2 Igniter Timer

**************************************************************************
NOTE: The spark duration adjustment extends the life of the plug, transformer and other pilot components.
**************************************************************************

Provide an igniter timer, with [manual] [automatic] adjustment of the spark duration, to set the time and duration of the igniter spark during the ignition cycle, and to compensate for the distance of the pilot gas supply from the oxidizer.

2.16.2.3 Pilot Timer

At the end of the purge, the pilot timer must begin automatic ignition. If the UV sensor fails to sense the pilot flame, close the pilot solenoid valve, extinguish the pilot flame, the system must shut down and the pilot fail alarm activated.

2.16.2.4 Main Flame Timer

Extend the main flame timer beyond the pilot timer cycle. When the burner flame lights and the temperature exceeds the low temperature set point on the temperature controller, shut off the pilot flame. Shut down the system, and activate the main flame fail alarm, if the UV sensor fails to sense the pilot flame or the flame temperature does not reach the low temperature set point by the end of the main flame step.

2.16.3 Temperature Sensors, Transmitters and Controllers

Submit detailed manufacturer's data on the overall controls, sensors, process controllers, control operators, ladder diagrams, timers, sequence of controls, valves, alarms, signals, interlocks and cut off systems. Data describing in detail the equipment used to monitor emissions, including the sampling probe, filters, off-gas transport tubing, sampling pump, moisture removal system, analyzer calibration systems, and data recorder. Process and instrumentation diagrams (P&IDs).
2.16.3.1 Thermocouples

NOTE: Narrow temperature ranges are more responsive than broad ranges because the sensitivity is a percentage of the range.

Conform thermocouples to ASTM E230/E230M, Type K, suitable for continuous operation and control at temperatures up to [50] [100] [150] [_____] degrees C [80] [180] [260] [_____] degrees F above the temperature specified in the performance requirements and accurate to 0.75 percent of the maximum temperature. Provide each thermocouple used for control with high and low set points and an adjustable time delay before initiation of each control action. A thermocouple located in or immediately downstream of the combustion chamber must control burner operation and [indicate] [and] [record] combustion chamber temperatures. Space [three] [_____] additional thermocouple ports at vertical intervals equal to the stack diameter, starting two stack diameters from the top of the stack. Compensating lead wire connecting the thermocouple to the read out must be 16 gauge with a weatherproof braid.

2.16.3.2 Thermometers

Conform thermometers to ASME PTC 19.3 TW, with wells and temperature range suitable for the use encountered.

2.16.3.3 Combustion Chamber Temperature Controller

The combustion temperature control must [record the combustion chamber temperature] [and] [maintain the temperature between the adjustable high temperature and low temperature set points]. The controller will control the [damper actuator motors] [blowers]. Control logic will include auto position signal and automatic switch over capabilities.

a. Shut down the system and do not attempt to restart if the temperature exceeds the allowable combustion chamber temperature range. A high temperature shutdown must activate the high temperature alarm.

b. During operation, shut down the system and not attempt to restart if the temperature falls below the allowable combustion chamber temperature range. During the ignition cycle, if the temperature does not reach or exceed the low temperature shutdown setting, the system must shut down and not attempt to restart. A low temperature shutdown during operation or during the ignition cycle must activate the low temperature alarm.

2.16.3.4 Primary Combustion Air Control

NOTE: For this and the following paragraph, refer to Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS for combustion air control.

Furnish fully adjustable air dampers on each burner with remote operation by external lever control, sized to provide a minimum of [100] [115] percent of theoretical stoichiometric air as primary air. Ensure dampers allow the operator to adjust the primary air/fuel ratio while burner is in
operation.

2.16.3.5 Total Combustion Air Control

Provide motor operated louver dampers. Actuators must cause louvers to fail open on loss of signal or power. Provide two multistage centrifugal blower trains, each with a suction valve, discharge valve, and discharge check valve.

2.16.3.6 Quenching/Dilution Air Control

Provide motor operated louver dampers. Ensure actuators cause louvers to fail open on loss of signal or power.

2.17 FLOW METERS, TRANSMITTERS AND FLOW CONTROLLER

The flow control system must include an automatically actuated main fuel valve with fail-closed feature and limit switches for position indication. Ensure the flow rate metering system includes recording, totaling and alarm capabilities.

2.17.1 Off-Gas Flow Meter

Conform flow metering for the off-gas AGA Report No 3.

2.17.2 Supplemental Fuel Flow Meter

**************************************************************************
NOTE: Supplemental fuel meters should be sized on peak requirement. Off-gas meters should be based on blower size.
**************************************************************************

Conform gas meters to [AGA ANSI B109.1] [AGA ANSI B109.2] [AGA ANSI B109.3].

2.18 PRESSURE MEASUREMENT AND CONTROL

Furnish one differential pressure sensor with large diameter sensing holes. Provide a differential pressure transmitter and mount within 1 m 3 feet of the sensor. Install a compound vacuum/pressure gauge on each blower. Furnish the compound gauges with a differential pressure range of [0.1 to 100] [_____] kPa [0.015 to 15] [_____] psig. The piping from the sensor to the transmitter must be 3 mm 1/8 inch stainless steel tubing with stainless steel drain valves on each pipe, at low points. Piping must be plumbed so that condensate will drain back into the pipe. The transmitter must be equipped with zero and span adjustment, and provide a standard volumetric output rate reading to the chart recorder (included with the control system) without the need for separate compensating pressure or temperature transducers. A pressure gauge must be installed on the discharge side of each blower. The pressure gauges must be furnished with a range of 0 to 34 kPa 0 to 5 psi. The gauges are to be weatherproof, with 113 mm 4-1/2 inch dials and Type 316 stainless steel Bourdon tubes. Furnish the gauges with pressure snubbers and diaphragm seals and valves. Isolation valves are to be installed between the process pipe and the seal. Diaphragm seals are to be furnished with top and bottom housings and diaphragms of Type 316 SS. The diaphragm cavities are to be liquid filled with silicone.
2.18.1 Draft Gauges

Draft gauges are to be Type I, Class 1 or 2, as applicable, conforming to ASME B40.100 with a diaphragm or bellows actuating system and a circular scale. The gauges will have a zero adjustment screw. Provide suitable shutoff cocks.

2.18.2 Pressure Gauges

Conform pressure gauges to ASME B40.100 and be of pressure detecting Class, single Bourdon tube style, and suitable for detecting air pressure.

2.18.3 Pressure Switches

Pressure switches are to be provided to activate the blowers.

2.18.4 Pressure Release

A pressure release valve are to be located on the off-gas line upstream of the oxidizer.

2.19 EXPLOSIMETER

**************************************************************************
NOTE: The fuel concentration should be greater than 30 percent of LEL. Combustion air should be less than 30 percent of LEL.
**************************************************************************

A combustible gas analyzer, with a minimum of four in-line sensors, calibrated to methane are to be located in the control panel.

2.19.1 Lower Explosive Limit (LEL)

The lower explosive limit of the fuel and of the off-gas must be continuously indicated. The lower explosive limit of the off-gas must be continuously recorded.

2.19.2 Upper Explosive Limit (UEL)

The upper explosive limit of the combustion air and of the off-gas are to be continuously indicated.

2.20 OXYGEN METERING AND MAKE-UP AIR CONTROL

2.20.1 Oxygen Meter

The upper oxygen level of the combustion air and of the off-gas are to be continuously indicated.

2.20.2 Methane Monitor

The methane level of the combustion air and of the off-gas are to be continuously indicated.

2.21 OPERATING INDICATORS AND ALARMS

Simulated running lights to indicate normal operating conditions and alarms are to be displayed at the control panel.
2.21.1 Visible Alarms

Each visible alarm are to be indicated at the control panel and by a red light at the device.

2.21.2 Audible Alarms

Locate each audible alarm at the device.

2.21.3 Remote Alarms

**************************************************************************
NOTE: The Contractor should respond to alarms for the duration of the contract.
**************************************************************************

Remote alarms must activate the programmable auto dialer. A prerecorded message must provide specific information to the operator about the alarm condition. At contract close out, the dialer must be reprogrammed to the number indicated by the Contracting Officer.

2.22 ELECTRICAL WORK

**************************************************************************
NOTE: Hazard classifications in accordance with NFPA 70 should be indicated on the drawings.
**************************************************************************

Ensure all electrical equipment, wiring and controls comply with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and with NFPA 70, with proper consideration given to environmental considerations such as moisture, dirt, corrosive agents and proper NFPA 70 hazardous area classification. Provide lightning and surge protection.

2.22.1 Motors

Provide electric motor driven equipment complete with starters and alternating current motors conforming to NEMA MG 1. Fractional horsepower motors are to be 115-volt, single-phase, 60 cycle. Integral horsepower motors are to be three-phase, 60 cycle. Provide motor starters complete with properly sized thermal overload protection and other appurtenances necessary for the motor specified. Each motor will be designed for operation in ambient temperatures up to 40 degrees C 104 degrees F. Submit manufacturer's certificates attesting that the motors meet the NFPA 70 requirements for the hazardous area classification.

2.22.2 Control Panels

A complete control panel with options for various control schemes and control wiring must be included. Manual or automatic controls, protective or signal devices and control wiring for the controls and devices required for the operation specified must be provided. Conform motor controls to NEMA ICS 1. Conform enclosures for power and control panels to NEMA ICS 6. Panels located outdoors will be [NEMA 4X] [NEMA 4] and be weatherproof.

2.22.3 Resistance Heaters

**************************************************************************
NOTE: The designer should select the most cost effective heat source for the application.

Electric resistance pre-heaters and dryers are to be used where indicated on the drawings.

2.23 AUXILIARY FUEL SYSTEM

NOTE: The designer should select the most cost effective heat source for the location.

2.23.1 Feed Capability

The auxiliary fuel system will have direct feed capability to the thermal destruction system with meters, pressure gages and controls to maintain the specified operating conditions. Design must be in conformance with the applicable requirements of NFPA 30 and NFPA 31, NFPA 54 or NFPA 58, as appropriate to the fuel type.

2.23.2 Auxiliary Fuel Regulator

Auxiliary fuel rate must be controlled by the temperature of the combustion chamber.

2.23.3 Secondary Containment

Fuel storage tanks are to be provided with secondary containment as required by NFPA 30, paragraph 2-3.4 Control of Spillage from Aboveground Tanks.

2.24 VALVES

Design of valve operators and mechanisms must avoid initial surges and sudden inrushes by gradually allowing flows to increase.

2.24.1 Butterfly Valves

Butterfly valve will be cast iron body with resilient seat, 316 stainless steel disc and shaft and actuator. Valve will have fail-safe closing in ease of a power failure. Valve will have location limit switch for use in the control system.

2.24.2 Other Valves

Conform other valves to API Spec 6D, ANSI Z21.15/CSA 9.1 or ASME B16.33 as appropriate for the type.

2.25 JOINTS

2.25.1 Dielectric Fittings

Install dielectric fittings between threaded ferrous and nonferrous metallic pipe, fittings and valves. Dielectric fittings must prevent metal-to-metal contact of dissimilar metallic piping elements and be suitable for the required working pressure.
2.25.2 Isolation Joints

Isolation joints must be installed between non-threaded ferrous and nonferrous metallic pipe, fittings and valves. Isolation joints will consist of a dielectric sandwich type flange isolation gasket with isolation washers and isolation sleeves for flange bolts. Isolation gaskets are to be full faced with outside diameter equal to the flange outside diameter. Bolt isolation sleeves are to be full length. Units are to be of a shape to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.25.2.1 Sleeve Type Couplings

Sleeve type couplings must be used for joining plain end pipe sections. Each coupling will consist of a steel middle ring, two steel followers, two gaskets, and the necessary steel bolts and nuts to compress the gaskets.

2.25.2.2 Split Sleeve Couplings

Split sleeve type couplings may be used in aboveground installations, when approved in special situations, and consist of gaskets and housing in two or more sections with the necessary bolts and nuts.

2.25.3 Bolts, Nuts, and Fasteners

Bolts, anchor bolts, nuts, washers, plates, bolt sleeves, and all other types of supports necessary for the installation of the equipment are to be furnished with the equipment and are to be galvanized unless otherwise indicated. Anchor bolts must be provided with square plates at least 100 by 100 by 9 mm or have square heads and washers and be set in the concrete forms with suitable sleeves. Expansion bolts must have malleable-iron and lead composition elements. Unless otherwise specified, stud, tap, and machine bolts are to be of refined bar iron. Conform all threads to ASME B1.1. Bolts, anchor bolts, nuts, and washers specified to be galvanized, be zinc coated, after being threaded, by the hot-dip process in conformance with ASTM A123/A123M or ASTM A153/A153M. Bolts, anchor bolts, nuts, and washers indicated to be stainless steel will be Type 316 stainless steel.

2.26 FACTORY TESTS

Skid mount and assemble the thermal oxidation system equipment in the shop, to the maximum practical extent, in the configuration outlined in the detail drawings and specifications. Perform a factory pressure test at \([125] [250] [_____]\) percent of the rated pressure of the equipment. Perform continuity check and process simulation at the factory before shipping the control panel. Test fire the system with the specified fuel and air and maintained at the temperature specified in paragraph PERFORMANCE REQUIREMENTS for [two] [_____] hours. Submit test reports [with the equipment] [to the Contracting Officer prior to shipment of the equipment].

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.
3.2  PREPARATION

Inspect all equipment and products for defects in workmanship and material. Clean debris and foreign matter out of valve openings and seats. Check each operating mechanism during operation to check proper functioning. Each nut must be checked for tightness. Valves and other equipment that do not operate easily or are otherwise defective are to be repaired or replaced.

3.3  FOUNDATIONS AND SKID BASES

Foundations for the thermal oxidizer and appurtenances, and pads for skid bases, are to be constructed of concrete, reinforced where necessary, in conformance with the applicable requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE, except as otherwise shown or specified. Concrete surface are to be [75] [_____] mm [3] [_____] inch above grade in outdoor locations. Mounting feet must be provided so that appropriate anchorage can be provided. Anchor embedment depth and spacing must be sufficient for seismic attachment to the foundation and for prevention of overturning. Concrete pad must extend [150] [_____] mm [6] [_____] inch beyond the equipment.

3.4  ERECTION

3.4.1  Welding

**************************************************************************
NOTE: Use second set of brackets when critical pipe welding is required.
**************************************************************************

[Welding procedures will be as specified in AWS D1.1/D1.1M] [Welding and nondestructive testing procedures for piping will be as specified in Section 40 05 13.96 WELDING PROCESS PIPING] [Structural members will be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING].

3.4.2  Painting/Corrosion Prevention

All ferrous surfaces must be coated or painted. Exposed ferrous surfaces are to be painted in accordance with Section 09 90 00 PAINTS AND COATINGS. Color will be as indicated on the paint schedule or as otherwise approved.

3.4.2.1  Factory Primed Surfaces

Factory primed surfaces are to be solvent-cleaned before painting.

3.4.2.2  Touch-Up Painting

Factory painted items must be touched up as needed. Factory painted items requiring touching up in the field must be thoroughly cleaned of foreign material, primed and top coated with the factory finish.

3.4.2.3  Field Painting

Equipment which did not receive a factory finish are to be prepared, primed and painted, as specified in Section 09 90 00 PAINTS AND COATINGS.
3.4.2.4 Corrosion Resistant Metals

Painting of corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel is not required unless otherwise specified.

3.5 INSTALLATION

3.5.1 Insulation

Equipment and piping will be insulated in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.5.2 Utilities

**************************************************************************
NOTE: Points of connection are normally shown on the drawings. Occasionally, the name, address and telephone number of each utility company is shown on the drawings. Delete the following paragraphs if the information is shown elsewhere.
**************************************************************************

Fuel and utilities are to be provided at locations shown on the drawings. Verify availability and locations of utilities and compensate the utility company for connection and usage. Fuel, water, sewer, power and any other utility bills must be paid on receipt.

3.5.2.1 Electricity

The power [utility] [company] is [____], telephone number [____].

3.5.2.2 Water

The water [utility] [company] is [____], telephone number [____].

3.5.2.3 Natural Gas

The natural gas [utility] [company] is [____], telephone number [____].

3.5.3 Fuel System

**************************************************************************
NOTE: Coordinate requirements for the fuel source specified in paragraph Feed Capability.
**************************************************************************

Fuel system installation and testing will comply with the applicable requirements of NFPA 30 and NFPA 31, NFPA 54 or NFPA 58, as appropriate to the type of fuel.

3.6 POSTING FRAMED INSTRUCTIONS

**************************************************************************
NOTE: If the user preference is known, show the location on the drawings and edit this paragraph.
**************************************************************************

Wiring and control diagrams and typed condensed operating instructions

SECTION 44 13 51 Page 32
framed under glass or in laminated plastic must be posted where directed. Diagrams will show the complete layout, wiring and control of the entire system. Condensed operating instructions will explain preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. The diagrams and instructions must be posted before acceptance testing of the system.

3.7 FIELD QUALITY CONTROL/TESTS

3.7.1 Pressure and Leakage Test

**************************************************************************
NOTE: Testing of pipe and fittings should be specified in the pipe specification. The test pressure for vessels should not exceed the rated pressure.
**************************************************************************

After installation, test all piping, equipment, joints and connections for gas tightness. Test connections and piping by subjecting the complete system to pneumatic pressure of not less than \([105] \text{ kPa} [15] \text{ psi}\) [the pressure indicated in the schedule] for 6 hours. During the test, the system must be disconnected from the source of pressure and, with corrections made for barometric and temperature changes, the pressure must remain constant for the test period, as indicated by a test gauge. Test joints using a soapy water solution to detect leaks.

3.7.2 Operational/Performance Tests

**************************************************************************
NOTE: Coordinate with the blower specification and the design sequence of operation. Testing requirements should be edited to fit the intended mode of operation for the system. Flow rates for operating capacity tests will be inserted in the blank spaces provided.
**************************************************************************

After installation and pressure testing, the entire off-gas system must be subjected to [an operational test] [a performance test] to demonstrate satisfactory functional efficiency. Use results of the tests in determining the capacity and performance of the oxidation unit. Correct any deficiencies revealed during the tests and repeat the tests.

3.7.2.1 Constant Flow Tests

**************************************************************************
NOTE: This procedure is appropriate for a system without blowers or with a single constant speed blower.
**************************************************************************

Operate each unit at a constant flow rate of approximately \([_____] \text{ cubic m/second cubic feet/second} \) (actual) for the capacity test. Take samples of the influent and effluent at \([1] [8] \text{ hour} [1 \text{ day} [1 \text{ week}] \text{ intervals for analysis.}
3.7.2.2 Variable Flow Tests

**************************************************************************
NOTE: This procedure is appropriate for a system with variable speed blowers regulated by a pressure controller.
**************************************************************************

Operate each unit at flow rates varying between [_____] and [_____] cubic m/second [_____] and [_____] cubic feet/second (actual). Take samples of the influent and effluent at the high flow rate and [1 intermediate rate] [2] [3] [_____] intermediate rates] for analysis.

3.7.2.3 Cyclic Flow Tests

**************************************************************************
NOTE: This procedure is appropriate for a system with constant speed blowers operated by on/off control.
**************************************************************************

Put each unit through a complete cycle of operation [at a constant flow rate of approximately [_____] cubic m/second cubic feet/second (actual)] [through the complete range of flows]. Take samples of the influent and effluent at the beginning and end of each cycle and at [1 intermediate time] [2] [3] [_____] intermediate times] for analysis.

3.7.3 Sampling and Analyses

Collect samples of influent and effluent off-gas and analyze for the parameters listed in Paragraph OFF-GAS COMPOSITION in accordance with the Sampling and Analysis Plan.

3.7.4 Test Logs and Reports

Provide a complete log of each test, giving the following data: date, time of each reading and each sampling event, fuel use, and total off-gas treated. Upon completion and testing of the installed system, submit test reports, with corresponding logs and in booklet form, showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Indicate the final position of controls on each test report.

3.7.5 Manufacturer's Field Service

Employ services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative must supervise the installation, adjustment, calibration, commissioning, start-up and operational/performance testing of the equipment.

3.8 CLOSEOUT ACTIVITIES

3.8.1 Operating Instructions

Provide complete copies of detailed operating instructions with step-by-step procedures and sequences for system startup, operation and shutdown. The instructions include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and the
operating features of each element. The instructions will include as-built drawings of the piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed. Describe automatic controls, functional logic, control loops, set points and alarm signals. Include flow diagrams in the instructions.

3.8.2 Maintenance Instructions

Provide complete copies of maintenance instructions listing maintenance procedures, possible breakdowns and repairs, and trouble shooting guides.

3.8.3 Field Training

NOTE: Complexity of the system and experience of the user operators should be taken into consideration.

Provide a field-training course for designated operating and maintenance personnel. Submit the training course curriculum and training instructions, [14] [_____] days prior to the start of training. Provide training for a total period of [_____] hours of normal working time and start after the system is functionally complete but prior to the [performance] [operational] test. Field training must cover each item contained in the operating and maintenance manuals, as well as demonstrations of routine maintenance operations.

3.9 MAINTENANCE

NOTE: Select the option that is compatible with the Bid Schedule.

Manage, operate, maintain, and monitor the off-gas control system [until contract close out] [for at least [one year] [_____] after construction, startup and performance testing are complete]. Provide at a minimum, an operator on site [eight] [_____] hours per week to operate, maintain, and calibrate the equipment and instruments, and to collect samples for analyses. A qualified person must be on call to respond to emergencies and alarm conditions at the off-gas system within two hours of alarm conditions. Prepare compliance and monitoring records and reports and maintain for the Contracting Officer and regulatory agencies. The operator must maintain a log of the actions taken.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for factory fabricated storage tanks used to contain fire suppressant discharge. Except when used to contain fire suppressant discharge during an emergency, the containment tank must remain empty. The containment tank must be expeditiously emptied after each emergency that discharges fire suppressant, water or fuel. The tank operator will need to use the strapping chart and stick gauge to determine quantity for disposal. The tank is not meant for storing hazardous substances other than emergency discharges that are expeditiously emptied and would not include connections that would allow any discharges to storm or sanitary sewer.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
capacities less than or equal to 227,000 L 60,000 gal. Additional system components/devices necessary to meet state and local regulations must be added by the designer.

Coordinate the design and installation of underground factory-fabricated storage tanks with Base Environmental.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy
and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY CONTROL

1.3.1 Regulatory Requirements

1.3.1.1 Permitting

Obtain necessary permits in conjunction with the installation of storage tanks as required by federal, state, or local authority.

1.3.1.2 Registration

**************************************************************************

NOTE: Confirm with the DoD Installation the number of days required to obtain the permit documentation.
**************************************************************************

Obtain and complete all tank registration forms required by federal, state, and local authorities. Submit all completed tank registration forms within [30][_____] days after contract award to the Contracting Officer. The Contracting Officer will ensure the Base Environmental staff for the DoD Installation submits the forms to the proper regulatory agencies.

1.3.1.3 Licensed Personnel

Tank installers must be licensed by the state when required by state law or regulations.

1.3.2 Contractor Qualifications

**************************************************************************

NOTE: Include specific local regulatory requirements into the specification as applicable.
**************************************************************************

Each installation Contractor must have successfully completed at least 3 projects of the same or similar scope, and the same size or larger within
the last 3 years and demonstrated specific installation experience in regard to underground tank installation. Submit a letter listing prior projects, the date of construction, a point of contact for each prior project, the scope of work of each prior project, and a detailed list of work performed. The letter must also include evidence of prior manufacturer's training, and other related information.

[State certified installers must be provided by the Contractor. ] Each installation Contractor must have taken, if applicable, manufacturer's training courses on the installation of storage tanks and meet all applicable licensing requirements in the state. Installers must also be trained and certified by the manufacturer to install the equipment and materials[ and be STI certified].[ Contractor must have Pollution Liability Insurance.]

1.4 DELIVERY, STORAGE, AND HANDLING

Handle, store, and protect system components and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer, upon recommendation by Base Environmental for the DoD Installation. Replace damaged or defective items.

1.5 PROJECT/SITE CONDITIONS

Exposed moving parts, parts that produce high operating temperatures and pressures, parts that may be electrically energized, and parts that may be a hazard to operating personnel must be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Install safety devices so that proper operation of equipment is not impaired.

1.6 WARRANTY

All factory fabricated storage tanks must come with a manufacturer's warranty of a minimum period of 30 years. All warranty paperwork will be completed and submitted by Contractor to both the tank and system component manufacturers, the Contracting Officer, and the Base Environmental for the DoD Installation. This includes all applicable completed manufacturers' equipment installation checklists.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

This section defines the requirements for factory fabricated storage tanks used to contain fire suppressant discharge.

2.1.1 Design Requirements

2.1.1.1 Electrical Work

**************************************************************************
NOTE: Coordinate the ignition temperature of the fuel(s) to be handled with the electrical design. Ignition temperatures will be as defined in NFPA 497. Fuel ignition temperatures will dictate the maximum allowable location classification of the electrical system components.
**************************************************************************
2.1.1.1  Grounding and Bonding

Grounding and bonding must be in accordance with NFPA 70, NFPA 77, NFPA 780, API RP 540, API RP 2003, IEEE 142, and IEEE 1100. Provide jumpers to overcome the insulating effects of gaskets, paints, or nonmetallic components.

2.1.1.2  Earthwork

**************************************************************************

NOTE: The designer developing the earthwork specifications will evaluate the need for a filter fabric to be installed between the native soil and the new backfill material. The intent of a filter fabric would be to prevent the displacement of new backfill material with native soil due to a high water table. If the new backfill material is displaced, it could affect the structural integrity of the tank. If a filter fabric is determined to be necessary, include the requirements for the new fabric in the excavation and backfilling specifications.

**************************************************************************

Excavation and backfilling for tanks must be as specified in Section 31 00 00 EARTHWORK.

2.2  MANUFACTURED UNITS

Provide materials and system components that are standard products of a manufacturer regularly engaged in the manufacturing of such products and that are of a similar material, design and workmanship. Provide materials and system components that have been in satisfactory commercial or industrial use for a minimum 3 years prior to bid opening. The 3 year period must include applications of the system components and materials under similar circumstances and of similar size. Provide materials and system components that have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 3 year period.

Internal parts and components of system components, piping, piping components, and valves that could be exposed to fuel during system operation must not be constructed of zinc coated (galvanized) metal, brass, bronze, or other copper alloys. Do not install cast iron bodied valves in piping systems that could be exposed to fuel during system operation.

2.2.1  Underground Storage Tank

Provide a factory fabricated double wall storage tank. Tank may be either steel with a non-metallic outer jacket or a double wall fiberglass tank. Tank must be designed and manufactured for an underground, horizontal installation. The exterior tank walls must be separated from the interior tank walls by standoffs; creating an open or interstitial space. The entire interstitial space must be monitorable for leaks.

**************************************************************************

NOTE: Provide a concrete anchor pad(s) or deadmen for any tank that will be installed in areas subject
to high water tables or flooding. Size the pad(s) or deadmen in accordance with API RP 1615. Require the tank to be connected to the pad(s) or deadmen in accordance with the tank manufacturer's recommendations.

Delete the bracketed sentences if concrete anchor pads or deadmen are not required.

[ For tanks requiring concrete anchor pads or concrete deadmen, provide holddown straps and accessories as recommended by the tank manufacturer. Use filler strips between the tank shell and any metal holddown straps that conform to the tank manufacturer's requirements.

2.2.1.1 Double Wall Tank (Steel with Non-Metallic Jacket)

The primary tank must be constructed of steel and jacketed with a non-metallic secondary containment tank. The entire tank assembly must conform to UL 58 Type II and UL 1746 Part III. The UL 58 label must be affixed to the exterior surface of the tank.

2.2.1.2 Double Wall Fiberglass Tank

Provide a UL 1316 compliant fiberglass tank. The tank manufacturer must be recognized by Underwriters Laboratories as a manufacturer of tanks listed to the UL 1316 standard. The UL 1316 label must be affixed to the exterior surface of the tank.

2.2.1.3 Tank Protective Coatings

2.2.1.3.1 Interior Surfaces

Use an SSPC QP-3 certified coating company to apply interior coating. Coat 100 percent of a metal tank's interior surfaces including all metal piping and metal appurtenances with the manufacturer's standard coating system.

2.2.1.4 Tank Piping Penetrations

NOTE: Use tank manholes as the primary point of entry for piping penetrations unless unfeasible. Pipe penetrations into an underground storage tank are the most likely place for a leak to occur. Designing pipe penetrations to enter through a tank manhole allows each of the penetrations to be contained in a manhole containment sump. The piping that penetrates the manhole must be flanged on both sides of the manhole hatch. This will allow the piping to be removed from the manhole and allow removal of the manhole without having to cut the piping.

Where stand alone tank piping penetrations are required, indicate on the drawings the required number, size, and location of each penetration.

Flanged nozzles must be installed in locations with ISO Corrosivity Categories C3, C4, and C5.
Provide a flanged pipe nozzle for each tank piping connection. Seal all unused or spare tank piping penetrations with a steel blind flange.

**2.2.1.5 Tank Striker/Impact Plates**

*NOTE: Striker plates under all openings used for manual gauging in steel tanks and all openings in fiberglass tanks.*

Provide an interior striker/impact plate under the manual gauging/sampling hatch and each tank manhole and pipe connection. Each plate must be a minimum of 6 mm 1/4 inch in thickness, be larger in diameter than the tank penetration, fit the curvature of the tank bottom, and be completely coated in the same fashion as the interior tank bottom coating. Each plate must be welded or bonded to the tank bottom at the factory (full circumference connection). The welds must be non-destructive tested using the appropriate means.

**2.2.1.6 Manual Gauging/Sampling Hatch**

Provide a combination gauging and sampling hatch assembly that includes a bronze top-seal type adapter with a corresponding locking type cap (adapter and cap both externally-mounted to the top of the tank) and a [steel][ or ] [aluminum] stilling well pipe. The stilling well pipe must be a minimum 100 mm 4 inches in size and extend downward through the top of the tank to within 75 mm 3 inches of the tank bottom. Provide the entire length of pipe inside the tank with 13 mm 1/2 inch wide by 300 mm 12 inches long slots at alternate locations. Coat the pipe in the same fashion as the interior tank bottom coating.

**2.2.1.7 Tank Manhole**

*NOTE: Indicate the number, size, and location of each tank manhole required.*

Provide tanks 18,900 L 5,000 gallons and smaller with a minimum of one 760 mm 30 inch tank manhole to allow for internal tank access. Provide tanks larger than 18,900 L 5,000 gallons with a minimum of two 915 mm 36 inch tank manholes (one manhole for access).

Provide a minimum of [2][1][_____] tank manholes with an internal diameter of [760 mm][813 mm][915 mm][30 inches][32 inches][36 inches]. Provide each manhole with a matching flanged watertight manhole cover. Manhole covers must be UL listed, be constructed of pressed or mild steel, and include a UL listed gasket. Frame and cover assembly must be rated to withstand H-20 highway loading as defined by AASHTO HB-17.

**2.2.1.8 Atmospheric Vent**

Provide atmospheric, updraft type cap no closer than 5 feet from any building openings. Cap must be constructed of aluminum or carbon steel and
have an internal brass or bronze insect screen, minimum 40-mesh. Cap must prevent rain, snow, or ice from entering the vent piping.

2.2.1.9 Nameplates

**************************************************************************
NOTE: In a salt water environment, substitute acceptable non-corroding metal such as, but not limited to, nickel-copper, 304 stainless steel, or monel. Aluminum is unacceptable. Nomenclature (or system identification) should be established by the designer.

Require melamine plastic nameplates for all NAVFAC projects. Also, for NAVFAC projects, require nameplates to be associated or keyed to system charts and schedules.
**************************************************************************

Attach nameplates to all specified system components defined herein. List on each nameplate the manufacturer's name, address,[ contract number,][ acceptance date,] component type or style, model or serial number, catalog number, capacity or size, and the system that is controlled. Construct plates of[ anodized aluminum][ stainless steel][ melamine plastic, 3 mm 0.125 inch thick, UV resistance, black with white center core, matte finish surface and square corners][______]. Install nameplates in prominent locations with nonferrous screws, nonferrous bolts, or permanent adhesive. Minimum size for nameplates is 25 by 65 mm 1 inch by 2.5 inches. Provide manufacturer's storage tank nameplates as required. Provide normal block style lettering with a minimum height of 6 mm 0.25 inches. Accurately align all lettering on nameplates.[ For plastic nameplates, engrave lettering into the white core.][ Key the nameplates to a chart and schedule for each system. Frame charts and schedule under glass, and locate where directed near each system. Furnish two copies of each chart and schedule. Each nameplate description must identify its function.]

2.2.2 Manhole Containment Sump

**************************************************************************
NOTE: Require on the drawings a containment sump to be installed directly above each tank manhole. Do not require the sump to be connected in any way to the surfaces above (e.g., street manhole cover, concrete and similar accessories).

Typical installations include a street manhole cover to be installed directly above each sump in order to allow access to the sump and the tank manhole below. Size the manhole cover large enough to allow the removal of the sump access cover below.
**************************************************************************

Provide a factory fabricated, direct-buried sump that provides a watertight connection either directly to the exterior of the tank or to a flanged manhole opening. Sump must be constructed of [fiberglass reinforced plastic][______]. Sump construction must be chemically compatible with the type of products being handled within the connecting tank. Sump must allow access to a tank manhole cover without disturbing surrounding backfill. Sump must be larger in diameter than the connecting tank manhole, designed
to withstand the underground burial loads, and prevent the influx of rainfall drainage or ground water.

2.2.2.1 Piping Penetrations

Sump sides allow the penetration of carrier pipes, exterior containment pipes, conduits, and vapor pipes as required. Boot or seal sump penetrations to ensure that liquid will not escape from the sump in the event that the liquid level within the sump rises above the pipe penetration. Boots and seals used must be chemically compatible with the type of products being handled, be water resistant to prevent the influx of water from outside the sump, and be designed and installed to accommodate the anticipated amount of thermal expansion and contraction in the piping system.

2.2.2.2 Access Cover

**************************************************************************
NOTE: Require watertight covers if high ground water is a problem and frequent access to the manhole below is not necessary. Watertight covers are generally bolted or strapped down. Strapped down covers provide easy access to the sumps without the use of tools. Friction fit covers will prevent the influx of rainwater and are easily removable by hand.
**************************************************************************

Where indicated, cap the entire top of a containment sump with a friction fit bolted down, watertight strapped down, watertight] access cover that allows water to flow away from the manhole. Construct cover of the same material as the sump. Cover must have a larger diameter than the tank manhole cover below. Provide lightweight cover not exceeding 16 kilograms 35 pounds.

2.2.3 Interstitial Space Access Sump

Provide an access sump around the interstitial monitoring pipe to allow for manual monitoring of the interstitial space of the tank in accordance with RP900-17 Section 7.5.7. Cap the monitoring pipe with a watertight threaded cap, quick release cap, or other cap as may be recommended by the manufacturer. Both the monitoring pipe and the sump will be labeled respectively as the "interstitial monitoring pipe" and "interstitial monitoring pipe access". Label must be affixed to the exterior surface of the tank.

2.3 COMPONENTS

Provide materials and system components that are standard products of a manufacturer regularly engaged in the manufacturing of such products, that are of a similar material, design and workmanship. Provide materials and system components that have been in satisfactory commercial or industrial use for a minimum 3 years prior to bid opening. The 3 year period must include applications of the system components and materials under similar circumstances and of similar size. Provide materials and system components that have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 3 year period.

Internal parts, system components, piping, piping components, and valves
that could be exposed to fuel during system operation must not be constructed of zinc coated (galvanized) metal, brass, bronze, or other copper alloys. Do not install cast iron bodied valves in piping systems that could be exposed to fuel during system operation.

2.3.1 Independent Level Alarm System

**************************************************************************

NOTE: Level alarms are used to ensure that the tank does not fill by infiltration in the drain line or other means. The containment tanks needs to remain empty so that it can contain fire suppressant discharge during the anticipated fire event.

Use this paragraph for tanks equal to or greater than 112,500 L 30,000 gallons. These tanks are required to have an independent level alarm system in addition to an independent manual tank gauging system.

This paragraph should be used for tanks less than 112,500 L 30,000 gallons to provide a level alarm system.

Include the bracketed options if multiple tanks are to be monitored as part of the design.

**************************************************************************

[ Provide an independent level alarm system that will monitor [2][_____] programmable liquid level setpoints. The system must delineate between each individual setpoint[ as well as each individual tank]. The system must produce an audible and visible alarm in the event of monitoring an alarm condition. Mechanically-actuated float assemblies must be field adjustable. The system must be totally independent of the tank gauging system.

]2.3.1.1 Setpoints

**************************************************************************

NOTE: The suggested low-low level alarm setpoint for underground tanks is 5 percent tank capacity.

**************************************************************************

Configure the alarm system's setpoints in accordance with the following.

a. Low Level Setpoint. Produce an audible and visual alarm condition when a tank's liquid level rises above [10][_____] percent capacity.

b. Low-Low Level Setpoint. Produce a visual alarm condition when a tank's liquid level rises above [5][_____] percent capacity.

2.3.1.2 Independent Level Alarm Control Panel

**************************************************************************

NOTE: Indicate on the drawings the location of the system control panel. Panels located outdoors will require NEMA 4 enclosures. Panels located indoors will only require a standard industrial enclosure. Explosion-proof enclosures are typically unavailable.
Install the control panel for the alarm system in a NEMA 4 rated enclosure in accordance with NEMA 250 standard industrial enclosure. Provide panel with left and right swinging doors.

2.3.1.2.1 Audible Alarm

**NOTE: If speakers external to the panel are necessary, indicate their location on the drawings.**

Provide panel with [internal][external] speakers that produce a buzzer sound of [70][_____] decibels or greater in the event of a detected alarm condition.

2.3.1.2.2 Visual Alarm

Provide panel with a visual alarm that illuminates in the event of a detected alarm condition. The visual alarm may include either individual lights for each alarm condition or a single light and a liquid crystal display (LCD) panel that displaces information regarding each alarm condition.

2.3.1.2.3 Acknowledge Switch

Provide panel with a [pushbutton][keyed] acknowledge switch that will deactivate the audible alarm. The acknowledge switch must not deactivate subsequent audible alarms unless depressed manually again for each occurrence. Under no circumstance will this acknowledgement switch extinguish the visual alarms until the alarm condition has been corrected. The acknowledge switch must be an integral component located on the front of the control panel.

2.3.1.2.4 Test Pushbutton

Provide panel with a manual test pushbutton that will enable operators to verify that the panel is powered, and the visual and audible alarms are working properly.

2.4 MATERIALS

2.4.1 Piping

Pipe shall be of the sizes indicated and conform to the specified requirements.

2.4.1.1 Poly Vinyl Chloride (PVC) Pipe

Submit the pipe manufacturer's resin certification, indicating the cell classification of PVC used to manufacture the pipe, prior to installation of the pipe.

2.4.1.1.1 Type PSM PVC Pipe

ASTM D3034, Type PSM, maximum SDR 35, produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.
2.4.1.1.2 Profile PVC Pipe

ASTM F794, Series 46, produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.1.3 Smooth Wall PVC Pipe

ASTM F679 produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.1.4 Corrugated PVC Pipe

ASTM F949 produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.2 Polyethylene (PE) Pipe

Submit the pipe manufacturer's resin certification, indicating the cell classification of PE used to manufacture the pipe, prior to installation of the pipe. The minimum cell classification for polyethylene plastic will apply to each of the seven primary properties of the cell classification limits in accordance with ASTM D3350.

2.4.1.2.1 Smooth Wall PE Pipe

ASTM F714, maximum DR of 21 for pipes 80 to 600 mm 3 to 24 inches in diameter and maximum DR of 26 for pipes 650 to 1200 mm 26 to 48 inches in diameter. Produce pipe from PE certified by the resin producer as meeting the requirements of ASTM D3350, minimum cell class 335434C.

2.4.1.2.2 Corrugated PE Pipe

**************************************************************************
NOTE: Do not install corrugated PE pipe culverts and storm drains beneath airfield pavements unless approved in writing by the major command. Type S pipe has a full circular cross-section, with an outer corrugated pipe wall and a smooth inner liner. Type C pipe has a full circular cross-section, with a corrugated surface both inside and outside. Corrugations may be either annular or helical.
**************************************************************************

AASHTO M 294 Type [S][C]. For slow crack growth resistance, determine acceptance of resins by using the notched constant ligament-stress (NCLS) test meeting the requirements of AASHTO M 294. Provide pipe with pipe walls having the following properties:

<table>
<thead>
<tr>
<th>Nominal Size (mm) (inch)</th>
<th>Minimum Wall Area (square mm/m) (square in/ft)</th>
<th>Minimum Moment of Inertia of Wall Section (mm to the 4th/mm) (in. to the 4th/in.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>300 12</td>
<td>3200 1.5</td>

<td>375 15</td>
<td>4000 1.91</td>
<td>870 0.053</td>
</tr>
</tbody>
</table>
### 2.4.1.2.3 Profile Wall PE Pipe

**ASTM F894**, RSC 160, produced from PE certified by the resin producer as meeting the requirements of **ASTM D3350**, minimum cell class 334433C. Provide pipe with pipe walls having the following properties:

<table>
<thead>
<tr>
<th>Nominal Size (mm) (inch)</th>
<th>Minimum Wall Area (square mm/m) (square in/ft)</th>
<th>Minimum Moment of Inertia of Wall Section (mm to the 4th/mm) (in. to the 4th/in.)</th>
</tr>
</thead>

<td>13,650 6.45</td>
<td>13,110 0.800</td>
</tr>
</tbody>
</table>

### 2.4.1.3 Steel Reinforced Polyethylene (SRPE) Pipe

SRPE pipe will meet the requirements of **ASTM F2562/F2562M** 200 – 3000 mm 8 – 120 inch diameter pipe and **AASHTO MP 20** (300 – 152512 – 60 inch diameter pipe).

### 2.4.1.4 Polypropylene (PP) Pipe

Double wall and triple wall pipe with a diameter of 300 to 1525 mm 12 to 60
inches must meet the requirements of ASTM F2736, ASTM F2764/F2764M, or ASTM F2881/F2881M.

2.5 ACCESSORIES

2.5.1 Stick Gauge

NOTE: Provide each tank with a stick gauge and tank calibration chart. Provide a minimum of one additional gauge for each tank.

For each tank, provide [2][_____] wooden stick gauges with length sufficient to allow the measurement of the entire level in the corresponding tank. Provide gauges compatible with the fuel to be measured (no swelling or damage from fuel contact). Provide gauge with non-sparking caps on each end. Mark gauges in m/mm in 1 mm increments feet/inches in 1/16 inch increments. Marking must be embossed into the stick and painted in a contrasting color impervious to water and hydrocarbon products.

2.5.2 Manual Interstitial Space Monitoring Equipment

Provide all equipment and materials required to monitor the interstitial space.

2.5.2.1 Dip Stick

Provide [2][_____] dipsticks for manual interstitial space monitoring.

2.5.3 Tank Strapping Table

NOTE: Provide each tank with a tank calibration chart.

Reference API MPMS 2.2E is for horizontal tank applications. For tanks smaller than 19,000 L 5,000 gallons, choose tank manufacturer certified strapping tables.

Furnish [2][_____] API MPMS 2.2E [tank manufacturer ]certified strapping tables (calibration charts) for each tank. One of the tables must indicate the liquid volume in liters for each 1 mm of tank depth and the other in gallons for each 1/16 inch of tank depth. Strapping table volumes for all tanks 19,000 liters 5,000 gallons and larger must be determined using physical measurements and not calculated values. For each tank, provide an electronic media file of each strapping table.[ For tanks larger than 19,000 L 5,000 gallons, perform tank strapping after installation at the site.]

2.5.4 Concrete Anchor Bolts

Provide concrete anchor bolts that conform to ASTM A307, Grade C, hot-dipped galvanized.
2.5.5 Bolts and Studs

Provide carbon steel bolts and studs that conform to ASTM A307, Grade B, hot-dipped galvanized. Provide stainless steel bolts and studs conforming to ASTM A193/A193M, Grade 8.

2.5.6 Nuts

Provide carbon steel nuts conforming to ASTM A563, Grade A, hex style, hot-dipped galvanized. Provide stainless nuts conforming to ASTM A194/A194M, Grade 8.

2.5.7 Washers

Provide flat circular washers under each bolt head and each nut. Washer materials must be the same as the connecting bolt and nut. Provide carbon steel washers conforming to ASTM F844, hot-dipped galvanized. Provide stainless washers conforming to ASTM A194/A194M, Grade 8.

2.5.8 Street Manhole Assembly

**************************************************************************
NOTE: Delete this paragraph if street manhole assemblies are addressed in the Civil specifications.
**************************************************************************

Style A frames are for manholes up to 760 mm 30 inches in diameter. Style B frames are for manholes between 915 and 1070 mm 36 and 42 inches in diameter.

**************************************************************************
NOTE: During design, layout system components to allow adequate access for routine maintenance. Do not rely solely on the Contractor to make these judgments. Show access doors where applicable for maintenance.
**************************************************************************

Install work so that parts requiring periodic inspection, operation, maintenance, and repair are readily accessible. Handle storage tanks with extreme care to prevent damage during placement and install in accordance with the manufacturer's installation instructions and NFPA 30. Inspect the exterior surface of each tank for obvious visual damage prior to and during the placement of each storage tank. Repair surface damage to a storage tank according to manufacturer's requirements before proceeding with the system installation. Provide the termination of fill lines within a tank.
with an anti-splash deflector. Provide nylon dielectric bushings on pipe connections to a steel tank.

3.1.1 Underground Storage Tank

Install underground storage tanks in accordance with API RP 1615 except as modified herein. Place tank on a 3 mm per 30 mm 1/8 inch per foot slope with the fill point at the low end and the vent connection at the high end. Locate tank so that discharge pipes slope up uniformly toward the outlet. Install containment sumps prior to any backfill being added above the storage tanks.

3.1.1.1 Steel Underground Storage Tank Handling

Store, handle, and place externally coated steel tanks with care and in a manner that will minimize damage to the coating and will not reduce its protective value. Place coated tanks in position carefully and with a minimum of handling. Prior to backfilling a tank, visually inspect the tank exterior protective coating for damage. Repair any damaged tank coating in accordance with the appropriate UL standard, UL 1746 or UL 58.

3.1.1.2 Steel Underground Storage Tank Installation Procedures

******************************************************************************

NOTE: Provide straps and anchors designed to prevent flotation of underground tanks located in areas with high groundwater level or subject to flooding. Provide electrical isolation strips between hold-down straps and metal tanks. Anchors may be concrete anchor slab under the tank or concrete deadmen. Tailor paragraph to suit design. Underground storage tanks occasionally rely on backfill and top slab to hold the tank in place in addition to the hold down straps and concrete deadmen. When new or existing USTs are exposed, the contractor must take steps to ensure the tank remains safely in place without damage. Manufacturer’s suggestions for installation of new tanks must be followed and used on existing tanks until the tank is safe from damage due to a sudden or slow influx of water. Existing hold down straps must be inspected to assure they are adequate for holding the tank in place and compromised hold downs reported to the Resident Engineer with a suggested solution. The recommendations of API 1615 must also be followed.

******************************************************************************

[Set tank on a minimum of 150 mm 6 inches of backfill material. ][Anchor tank to a reinforced concrete anchor pad as indicated using manufacturer's supplied holddown straps. Separate tank from an anchor pad by a minimum of 300 mm 12 inches of backfill material. Coat metal straps, turnbuckles, anchors, and accessories to resist corrosion. ]Uniformly place backfill material around the entire tank and extend to grade level. Inspect tank cathodic protection anodes, if applicable, to ensure integrity during backfill operations.
3.1.1.3 Fiberglass Underground Storage Tank Handling

Handle tank with extreme care to prevent damage during installation and transportation to the site. Any damaged tank must be replaced or repaired and tested under direct supervision and advice of the tank manufacturer, using the manufacturer's written procedures.

3.1.1.4 Fiberglass Underground Storage Tank Installation Procedures

******************************************************************************

NOTE: Provide straps and anchors designed to prevent flotation of underground tanks located in areas with high groundwater levels or subject to flooding. Anchors may be a concrete anchor slab under the tank or concrete deadmen. Tailor paragraph to suit design. Underground storage tanks occasionally rely on backfill and top slab to hold the tank in place in addition to the hold down straps and concrete deadmen. When new or existing USTs are exposed, the contractor must take steps to ensure the tank remains safely in place without damage. Manufacturer's suggestions for installation of new tanks must be followed and used on existing tanks until the tank is safe from damage due to a sudden or slow influx of water. Existing hold down straps must be inspected to assure they are adequate for holding the tank in place and compromised hold downs reported to the Resident Engineer with a suggested solution. The recommendations of API 1615 must also be followed.

Use 300 mm 12 inches of backfill in Maryland.
Maryland requires 300 mm 12 inches of backfill under a UST.
******************************************************************************

[Set tank on a minimum of [300 mm][150 mm] [12 inches][6 inches] of backfill material. ][Anchor tank to a reinforced concrete anchor pad as indicated through the use of manufacturer's supplied holddown straps. Separate tank from an anchor pad by a minimum of 300 mm 12 inches of backfill material.]

3.1.2 System Components

Properly level, align, and secure system components in place in accordance with manufacturer's instructions. Provide supports for system components, appurtenances, and pipe as required. Install anchors, bolts, nuts, washers, and screws where required for securing the work in place. Sizes, types, and spacing of anchors and bolts not indicated or specified must be in accordance with manufacturer's instructions for proper installation.

3.2 FIELD QUALITY CONTROL

3.2.1 Underground Storage Tank Tightness Tests

******************************************************************************

NOTE: Pneumatic tests are the preferred type of tightness tests. Brine level tests will only be specified for Fiberglass tanks. Delete the
inapplicable tests.

Perform a tightness test on each underground storage tank on-site just prior to their placement into the ground. Pneumatically pressurize each storage tank's primary chamber to 35 kPa 5 psig and monitor for a drop in pressure over a 2-hour period during which there must be no drop in pressure in the tank greater than that allowed for thermal expansion and contraction. Following the successful completion of the primary chamber test, bleed the pressure from the primary chamber into the interstitial space. Maintain this pressure while applying soapsuds or equivalent material over the exterior of the tank. While applying the soapsuds, visually inspect the entire tank, including the bottom surfaces, for leaks (bubble formations). Inspection of the bottom surfaces of a tank may be performed by rotating the tank; however, a tank may only be rotated in strict accordance with the manufacturer's recommendations. Do not rotate a tank more than 90 degrees from the upright position. During testing, install a pressure relief device that relieves at the tank manufacturer's suggested pneumatic pressure limit. Gauges used in pneumatic tests must have a scale with a maximum limit of 103 kPa 15 psig.

3.2.1.1 Brine Level Test

In lieu of the pneumatic testing procedures described above, a brine level test may be performed on the interstitial space of double-walled Fiberglass tanks (not applicable to steel tanks). For a brine level test, completely fill a Fiberglass tank's interstitial space with a brine solution. Connect a riser pipe to the interstitial space that will allow the solution to rise within the riser at least 300 mm 12 inches. After filling the interstitial space, the tank must set approximately 3 hours. Following the 3-hour period, measure and record the level of solution within the riser. After a subsequent 4-hour period, again measure and record the level of solution within the riser. If the level of solution within the interstitial decreases anytime during the test, the tank is considered leaking and therefore fails the test.

3.2.1.2 Repairs

Repair leaks discovered in either the primary chamber or the interstitial space in accordance with the tank manufacturer's instructions. Following any tank repairs, re-test the tank until the tank successfully passes the testing requirements defined herein.

3.2.2 Tank Manufacturer's Tests

In addition to the tests required herein, perform any additional tests (i.e., leak tests) on each storage tank that are required by the tank manufacturer's written test procedures. Manufacturer's tests that are redundant to tests already required by this specification will only be performed once per tank. Repair all leaks discovered during the tests in accordance with manufacturer's instructions. Following tank repairs, re-test the tank until the tank successfully passes the manufacturer's testing requirements.

3.2.3 Tank Inspection Reports

Prior to system commissioning, a certified inspector must inspect the completed underground tank in accordance with STI SP131 and deliver a full report to the Contracting Officer. The report must include the tank data...
plate information and photograph of the tank data plate. Provide the paper and electronic copies of the report and UTMs to the Contracting Officer for filing with the tank's "as-built drawings." Refer to Section 01 45 00 QUALITY CONTROL for STI SP001 Inspector's Certification requirements.

3.3 DEMONSTRATIONS

Conduct a training session for designated Government personnel in the operation and maintenance procedures related to the system components and systems specified herein. Include pertinent safety operational procedures in the session as well as physical demonstrations of the routine maintenance operations. Furnish instructors who are familiar with the installation/system components and systems, both operational and practical theories, and associated routine maintenance procedures. The training session consists of a total of [_____] hours of normal working time and starts after the system is functionally completed, but prior to final system acceptance. Coordinate with the Contracting Officer prior to scheduling onsite training and agree on a proposed date for conducting the training session. Notify the Contracting Officer at least 14 working days prior to the proposed training date.

3.4 TANK FILL TESTS

Fill each storage tank to verify the tank level alarm system operates properly. Stop filling each tank when the operation of all alarms is verified. Correct and retest any problems with the level alarm system until alarms operate as specified herein.

Appendix [______]

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for precipitation/coagulation/flocculation (P/C/F) systems with flow rates ranging from 4 to 940 liters 1 to 250 gallons per minute.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: This Section is intended for specification of PCF unit processes and is specifically applicable for remediation of ground water and landfill leachate containing dissolved heavy metals. This guide specification should not be used until thorough, site specific treatability studies (jar testing) have been performed, clearly demonstrating that P/C/F is an appropriate treatment technique that can meet the performance criteria set forth in this Section.
1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN PETROLEUM INSTITUTE (API)

AMERICAN WELDING SOCIETY (AWS)
1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a “G.” Generally, other submittal items can be reviewed by the Contractor’s Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets
following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY CONTROL

**************************************************************************
NOTE: The designer should review all federal, state, and local regulations to determine the applicable regulations which may impact the design of the P/C/F system. Specifically, water regulations should be reviewed to determine the required effluent quality for a specific site. Air regulations should be reviewed to determine if tank covers, vents, and emission control devices are required. Hazardous waste regulations, which cover tank standards and secondary containment, may apply where the groundwater or leachate being treated is classified as a hazardous waste.
**************************************************************************

1.3.1 Regulatory Requirements
Obtain all permits, certifications, and/or meet the regulatory requirements necessary for the configuration, installation, startup, and operation of the treatment plant. Ensure all work meets or exceeds applicable minimum requirements established by federal, state, and local laws and regulations. Notify the Contracting Officer within 30 days of a change in regulatory requirements which may affect the contract. Submit permits, certifications, and/or substantive regulatory requirements before work starts plus copies of applications for permits and certifications not required until later, along with a schedule for obtaining them. Transport, store and handle equipment, raw materials (including reagents/additives), contaminated materials, and treated materials in accordance with Sections 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS and 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES.

1.3.2 Qualifications
Contractor and Subcontractors demonstrate that their capabilities and experience with similar P/C/F systems and applications are adequate to supply, install, and operate a P/C/F system to remediate [ground water] [and] [landfill leachate] [_____] by providing descriptions of at least [2]
[_____] P/C/F full-scale remediation projects. Provide a field team (consisting of [ground water] [and] [landfill leachate] [_____] unit operators, quality control personnel, health and safety personnel, supervisory engineering, and technical staff) qualified to install and operate the treatment system. Field team personnel are required to have a minimum of [_____] years' experience in the installation and operation of similar treatment systems and show evidence of satisfactory operation for each installation. Welding procedures and welders are required to be qualified in accordance with the code under which the welding is specified to be accomplished. Submit [one] [_____] [copy] [copies] of qualified procedures and list of identification symbols and names of certified welders and welding operators prior to the commencement of welding operations.

1.4 DELIVERY, STORAGE, AND HANDLING

Store and protect from inclement weather, excessive humidity and temperature variation, and dirt, dust or other contaminants, per the recommendations of the equipment manufacturer. The government is not responsible for damage caused by improperly storing materials.

1.5 SITE CONDITIONS

1.5.1 Ambient Conditions

**************************************************************************
**NOTE:** When temperatures are below freezing, the treatment plant equipment may not function properly and efficiently. The general practice is to avoid the operation of an outdoor treatment plant during extreme winter weather. In places where there is a long winter season or in projects where plant operation is required throughout the year to meet the project schedule, the remediation activities should be performed inside a building with proper heating and ventilation. For outdoor operations, piping and equipment should be designed with freeze protection by insulation and heat-tracing.
**************************************************************************

Ensure the P/C/F system is [operated continuously] [not operated] [_____] during the winter when temperatures reach freezing or below. Install the system [outdoors] [indoors] [____:]. Provide outdoor equipment with [insulation] [_____] and [heat tracing] [____:]. Ensure the system is equipped with sufficient lighting as shown on the drawings for security purposes and for treatment plant operation during inadequate daylight or at night. Refer to Sections 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and 26 56 00 EXTERIOR LIGHTING for proper heating, ventilation, air conditioning, and illumination.

1.5.2 Existing Conditions

**************************************************************************
**NOTE:** Provide seismic requirements, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the second bracketed phrase at the end of this paragraph if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Sections

SECTION 46 07 13.13 Page 9
Operate the P/C/F system in a [remote] [urban] [industrial] [commercial] [residential] setting. The Contractor is required to become familiar with the existing site conditions, including site location, site configuration, topography, climate, site accessibility, and adjacent land use. Ensure the P/C/F system is designed for a soil bearing capacity of [_____] MPa psf. Provide seismic protection [in accordance with UFC 3-301-01] [as shown on the drawings].

1.6 MAINTENANCE MATERIAL SUBMITTALS

1.6.1 Spare Parts

Submit a list of spare parts with the manufacturer's part number, a current unit price, [date of manufacturer] and source of supply for each different material or equipment specified, after approval of the related submittals and not later than [_____] months prior to the system startup. Include the following information on: 1) parts recommended by the manufacturer to be replaced during the first [_____] years of service, 2) a list of special tools recommended by the manufacturer for each type of equipment furnished including special tools necessary for adjustment, operation, maintenance, and disassembly and 3) spare parts data for each different item of equipment and materials specified. At least two (2) sources of supply are suggested to be submitted.

PART 2 PRODUCTS

NOTE: The designer should review the methodologies and results of the previously conducted treatability testing and other predesign information, along with the required effluent quality, to determine the types and sizes of equipment, the chemicals, and chemical dosages to be specified.

As a minimum, the designer should provide a process flow diagram (PFD), a piping and instrumentation diagram (P&ID), an instrument index, a site layout drawing, and an equipment layout drawing. The PFD should depict the P/C/F and ancillary equipment required for the specific water to be treated and display the process design conditions for each unit. Such process design conditions should include consideration of minimum, average, and maximum values of each significant parameter (e.g. pressure, temperature, flow rate, etc.). The P&ID should define all piping and instrumentation of the system and should include descriptive tag names for all piping and fittings including materials of construction, tag number, and line size. The P&ID drawings should also include tag numbers for all instruments in accordance with ANSI/ISA 5.1. The instrument index should include drawings detailing the types of instruments to be used, their range and scale, related appurtenances, and their associated
UFGS

tag numbers; all such information must be coordinated with the P&ID.

The designer should verify that the appropriate (on/off, proportional, set point, etc.) controller to be used in the P/C/F system for chemical feed control is specified in Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS. The designer should provide a site layout drawing to indicate to an equipment supplier what the general location of the equipment will be and how much space is available for the proposed equipment. The designer should also provide a detailed equipment layout drawing that identifies all the major equipment and their related orientations inside the site plan. This equipment layout drawing should indicate where off-site piping and utility lines enter and/or leave the site. If the equipment layout drawing is only a suggestion or recommendation to the Contractor, the designer should so state on the drawing.

**************************************************************************

2.1 SYSTEM DESCRIPTION

2.1.1 P/C/F System Description

**************************************************************************

NOTE: The system described in this paragraph includes the P/C/F equipment required for a water treatment plant to remove dissolved metals. The system can be a stand-alone system, or it can be a pretreatment system for other systems such as air stripping, advanced oxidation, activated carbon, etc. Ancillary P/C/F equipment which may be required for pre-treatment or post-treatment of the water is also described and includes an equalization unit, an oxidation/reduction unit, a clarification unit, a post-pH adjustment unit, and an effluent holding unit. The precipitation, coagulation, and flocculation units may be supplied by the Contractor as individual pieces of equipment or as a single, integral unit. Typically, if a single unit is supplied, it will incorporate the coagulation, flocculation, and precipitation equipment within a clarification unit. Alternately, a unit may be supplied which performs two of the processes, e.g., precipitation and coagulation within one unit.

This paragraph should be edited to identify only the necessary equipment to suit conditions at the project site. The design team should review treatment objectives, water characterization data, and results of previously conducted treatability testing and other predesign information to determine the equipment required.

**************************************************************************

The Precipitation/Coagulation/Flocculation (P/C/F) system is required to be a fully integrated water treatment plant which is designed to remove
dissolved heavy metals and solids from [groundwater] [and] [landfill leachate] [_____]. The system is required to include equipment for [flow equalization,] wastewater conveyance, precipitation, coagulation, flocculation, clarification, [post-pH adjustment,] and treated effluent storage required to meet the specified performance requirements. Provide the P/C/F system complete with required instruments, controls, and local control panels. Provide a main control center to facilitate the overall control of the treatment plant. Factory or shop preassembled all parts to the maximum extent possible, compatible with transportation limitations and equipment protection considerations. Minimize field assembly to the assembly of match-marked components. Submit installation instructions and framed, typed operating instructions for posting and explaining methods of checking the system for startup and normal safe operations, normal and emergency shutdown operations, and procedures for safely starting and stopping each piece of equipment within the system.

2.1.1.1 Equalization Unit

Provide the equalization unit with [one tank] [_____ tanks] complete with accessories, mixers, piping, valves, [pumps,] motors, and instrumentation and controls to provide a constant flow and contaminant concentration to the subsequent treatment equipment. Furnish components of the unit as shown on the drawings.

2.1.1.2 Oxidation/Reduction Unit

**************************************************************************
NOTE: Delete this paragraph if the contaminants in the water to be treated do not include metals which require reduction prior to precipitation (e.g., chromium 6+), or metals which require oxidation prior to precipitation (e.g., iron or manganese).
**************************************************************************

[Provide the reduction unit with a mix tank, a mixer, a chemical feed system for acid addition, a chemical feed system for the reducing agent addition, piping, valves, pumps, motors, pH controls, oxidation-reduction potential (ORP) controls, and other instrumentation and controls as indicated on the drawings.]  [Provide the oxidation unit with a mix tank, a mixer, a chemical feed system for oxidant addition, piping, valves, pumps, motors, oxidation-reduction potential (ORP) controls, and other instrumentation and controls as indicated on the drawings.]

2.1.1.3 Precipitation Unit

Provide the precipitation unit with a mix tank, a mixer, a chemical feed system for the precipitant addition, piping, valves, pumps, motors, pH controls, and other instrumentation and controls as indicated on the drawings.

2.1.1.4 Coagulation Unit

Provide the coagulation unit with a mix tank, a mixer, a chemical feed system for the coagulant addition, piping, valves, pumps, motors, and instrumentation and controls as indicated on the drawings.

2.1.1.5 Flocculation Unit

Provide the flocculation unit with a tank with accessories (e.g., nozzles,
supports, lifting lugs, etc.), a mixer, a flocculation chemical stream feed system for the coagulant aid addition, piping, valves, pumps, motors, and instrumentation and controls as indicated on the drawings.

2.1.1.6 Clarification Unit

Provide the clarification unit with an inclined plate or tube type settler with all necessary accessories (e.g., inlet distribution system, separator module, skimmer, etc.), [a thickener,] a sludge removal system, piping, valve, pumps, motors, and instrumentation and controls as indicated on the drawings.

2.1.1.7 Post-pH Adjustment Unit

Provide the post-pH adjustment unit complete with piping, chemical feed systems for both acid and base addition, and in-line pH instrumentation and controls as indicated on the drawings.

2.1.1.8 Effluent Holding Unit

Provide [one effluent holding tank] [[_____ effluent holding tanks] to store treated water for testing prior to discharging. Ensure all tanks include piping, valves, sample taps, pumps, and instrumentation and controls as indicated on the drawings.

2.1.2 Performance Requirements

**************************************************************************

NOTE: The designer, in consultation with the appropriate technical team personnel, should use the treatability testing results and other predesign information to set influent parameters, such as maximum and minimum ground water and landfill leachate flow rates, maximum and minimum temperatures, pH, viscosity, density, and maximum and minimum influent metals and solids concentrations. The required effluent quality is typically established by federal, state, or local agency permit or regulation.

The designer should consider that fugitive emissions from landfill leachates or contaminated groundwater may have volatile components. Federal, state, or local air regulations should be consulted to establish allowable air emissions for the P/C/F system.

Performance requirements for the Contractor will indicate that the supplied equipment must be operated to meet the required effluent quality. Performance requirements for the Contractor stated in this paragraph should only apply to the performance of the complete system and not individual pieces of equipment. Performance criteria and minimum equipment standards for specific equipment should be listed under PART 2 PRODUCTS, where applicable.

Flow rates specified for the P/C/F system should be
consistent with the pumping rates required by
Section 23 21 23 HYDRONIC PUMPS or 22 13 29 SANITARY
SEWERAGE PUMPS.

Provide a P/C/F system capable of processing [ground water] [landfill
leachate] [_____] at the conditions provided below:

<table>
<thead>
<tr>
<th>Flow Rate</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum</td>

</tbody>
</table>

Provide a P/C/F system capable of meeting the maximum effluent metals and
solids concentrations achieved in the previously conducted treatability
testing (report appended to this specification), as listed below at the
indicated maximum concentrations. Influent and effluent solids are as
determined in accordance with Part 2000 Physical and Aggregate Properties,
and metals as determined in accordance with Part 3000 METALS of AWWA 10084:

SECTION 46 07 13.13 Page 14

</tbody>
</table>

Ensure the P/C/F system instrumentation and controls have the necessary accuracy and sensitivity to measure and control the operating ranges of the specified equipment. Perform sampling and analysis in accordance with [____].

2.1.3 Results of Previously Conducted Treatability Studies

**************************************************************************

NOTE: Treatability testing reports should be appended to this specification to enable the Contractor to make a full evaluation of the testing methodologies used, the results of the testing, and to evaluate the completeness of necessary data gathering. The Contractor will use these treatability testing reports along with the required effluent quality to select the specific P/C/F equipment (including ancillary equipment) required to meet the specified performance requirements.

**************************************************************************

Even though methodologies and results of the previously conducted treatability studies in Appendix [____] have demonstrated that P/C/F is capable of meeting the post treatment criteria identified in this section, perform an independent evaluation of these studies and results in accordance with ASTM D2035. Based on the Contractor's own interpretation of all treatability study results, provide a full scale treatment plant which meets the performance requirements identified in this section.

2.1.4 Utilities

**************************************************************************
NOTE: The locations and details (such as utility point of contact, sizes, capacities, and flows) of the utility hookups should be provided on the drawings for the Contractor to use.

Provide the utilities associated with the installation and operation of the treatment plant including, but not limited to: telephone, electricity, water, [gas], sanitary and solid waste facilities. The [telephone] [electricity] [______], [steam] [water] [gas] [sanitary] [______], and [solid waste facilities] [______] are available at the site. Refer to the drawings for hookup locations.

2.1.5 Design Submittal

Submit the following items:

a. Detailed drawings of clarifiers showing the dimensions, nozzle orientation and elevations, interconnecting piping, equipment layout, hydraulic profile, and other details required to demonstrate that the unit has been coordinated and properly functions as part of the overall P/C/F system. Show proposed layout, foundation requirements (to include seismic considerations in seismically active areas and soils assumptions based on site specific geotechnical information), anchorage of equipment and accessories, installation/connection details, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation. Submit manufacturer's descriptive data, specifications, technical literature, utility requirements, performance charts and curves, and catalog cuts for the clarifier.

b. Electrical one-line diagrams for instrumentation and controls, illustrating all electrical components (motor controls, disconnects, starters, selector switches, pushbuttons, pilot lights, conduit, wire, etc.), electrical load analyses, cable and conduit schedules (including conduit designation, materials of construction, descriptions for each conduit of the end points of each conduit segment in a run, wire count by number, type and size, wire length, etc.), and complete control ladder logic diagrams. Coordinate all control ladder logic diagrams between components and ladder rungs to illustrate component tag names for all relays, timers, selector switches, pushbuttons, pilot lights, etc. Number tag wires and terminals. Distinguish terminal designations between terminals contained within differing enclosures such as control panels, equipment enclosures, motor control centers, etc. Ensure all auxiliary relay contacts are illustrated and designated. Number all ladder rungs with cross referencing between all associated rungs. Provide a narrative description that has been fully coordinated with the ladder logic diagrams so as to fully describe all control operations, sequences, interlocks, alarms, and shutdowns for the P/C/F system including, but not limited to, flow control systems, level control systems, pH/ORP control systems, chemical addition control systems, pump/valve controls, alarm and shutdown schemes, PLC input/output points, and all component interlocking. Designate the locations of all control panels, equipment enclosures, motor control centers, etc. on an equipment layout drawing. Submit manufacturer's descriptive data, specifications, technical literature, utility requirements, performance charts and curves, and catalog cuts for each instrument and control component supplied.
c. A pre-startup test plan identifying the procedures and methods used to verify the integrity, calibration, and operability of the equipment, piping, electrical wiring, and instruments and control systems. Specify acceptance criteria and tolerances to be achieved during the pre-startup testing within the plan.

d. A list of the P/C/F system components and specify its required performance criteria when operated using contaminated water. Ensure the test plan describes the operating procedures to be followed during the test period including detailed descriptions of the measurements, record keeping, sampling and analyses to be performed to document that performance criteria has been achieved. Address full-scale operation of all equipment, piping, electrical wiring, and instruments and control systems included in the P/C/F system within the plan.

e. Manufacturer's certificates attesting that the equipment meets the specified requirements. Date the statement after the award of the contract, state the Contractor's name and address, name the project and location, and list the specific requirements which are being certified. Ensure the certificate indicates the methods of testing used.

f. [Six] [_____] copies of operation and maintenance manuals for the P/C/F system containing the manufacturer's operating and maintenance instructions for each piece of equipment. Provide one complete set prior to the performance of the field test (see Paragraph Tests); submit the remaining sets prior to startup. Furnish each set in loose leaf three-hole ring binders. Inscribe the following identification on the covers: the words "OPERATING AND MAINTENANCE INSTRUCTIONS," name of equipment, name and location of the building, name of the Contractor, and contract number. Place cover sheets before instructions identifying each subject. Use standard letter size paper for instruction sheets, with larger sheets of drawings folding in to approximately the same size. Include, but do not limit the instructions to the following:

1. System layout detailing piping, piping supports, valves, and controls.

2. Approved wiring and control ladder logic diagrams prepared in accordance with ANSI/ISA 5.1 including a drawing index, legend and symbols list, and abbreviation and identifiers.

3. A narrative control sequence describing startup, operation, and normal and emergency shutdown to include the detailed operational narrative described in Paragraph Control System.

4. Operating instructions for each equipment, instruments and control system including process monitoring requirements and recommendations for operations reporting to document the results of all process monitoring.

5. Maintenance instructions for each piece of equipment, including lubrication instructions and a troubleshooting guide to help the operator determine what steps to take to correct anticipated problems that may occur in the system.

6. Manufacturer's bulletins, cut sheets and descriptive data of equipment; submitted after approval of detail drawings, and not...
later than [2] [_____] months prior to delivery of the system.

2.2 MANUFACTURED UNITS

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Provide new and unused equipment, except for test equipment. Where two or more pieces of equipment performing the same function are required, they are required to be products of the same manufacturer. Equipment is required to be supported by a service organization that is, in the opinion of the Contracting Officer, capable of providing service, materials, and equipment in an expedient manner.

2.2.2 Tanks

Submit detailed drawings of each tank showing the dimensions, nozzle orientations and elevations, interconnecting piping, equipment layout, hydraulic profile, and any other detail required to demonstrate that the tank has been coordinated and properly function as a part of the overall P/C/F system. On the drawings, show the proposed layout, foundation requirements, anchorage of equipment and accessories, installation/connection details, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation. Submit manufacturer's descriptive data, specifications, technical literature, and catalog cuts for each tank supplied.

2.2.2.1 General Requirements

**************************************************************************

NOTE: When required by the corrosive nature of stored water, lack of proper maintenance facilities, or by climatic conditions, this paragraph will be modified to provide for corrosion allowance.

Determine basic wind speed from ASCE-7. The designer will choose between the AWWA and API procedures. Use 1200 Pa 25 psf snow load for most heavy snow climates; delete snow load where maximum snow is insignificant. In some cases, local climate and topography will dictate that a value greater than 1200 Pa 25 psf be used for snow loading.

In some application, wastewaters may require closed tanks to contain and/or control air emissions. VOCs from landfill leachate or groundwater from contaminated plumes can require closed tanks for the entire system. Show all process nozzles, spare nozzles, vents, drains, and manholes on the P&ID. If tanks are located inside a room or building, the designer can delete the wind loading requirements.

**************************************************************************

Use manufacturer's standard size tanks whenever possible. Tank construction material and paints, coatings, or liners are required to be compatible with the wastewater to be stored. Select tank dimensions to fit the available space as shown on the drawings. Unless noted otherwise on
the drawings, include flanged fittings for inlet, outlet, overflow, and drain on each tank. Provide manholes when shown on the drawings. Provide hold down lugs to anchor the tank to the base. Provide influent and effluent baffles and weirs to avoid short circuiting. Ensure the tank geometry combined with mixer design to avoid dead spots and excessive turbulence relative to internal tank baffles and mixer orientation. Ensure the system provides for complete mixing. Tanks supplied as part of the P/C/F system are required to meet the following nominal size requirements:

<table>
<thead>
<tr>
<th>Type of tank</th>
<th>Design Hydraulic Retention Time (HRT)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Minimum</td>
</tr>
<tr>
<td>Equalization Tank</td>
<td>[2]</td>

<td>Coagulation Tank</td>
<td>[1]</td>
</tr>
<tr>
<td>Flocculation Tank</td>
<td>[20]</td>
</tr>
<tr>
<td>Effluent Holding Tank</td>
<td>[5]</td>
</tr>
</tbody>
</table>

Design, fabrication, and erection of the tank in accordance with [AWWA D100] [API Std 650] [AWWA D103] except as modified herein. Minimum equipment design life: [_____] years. Design tanks for a [basic wind speed of [_____] km/hour mph in accordance with ASCE 7 or designed in accordance with [AWWA D100] [AWWA D103] [API Std 650] wind load design, whichever provides the greater pressure.] [snow load of [1200 Pa 25 psf] [[_____] kPa psf] ][freeboard of [03m 1 ft][____].] Utilize a safety on overturning of elevated tanks under design wind load of 1.33 minimum. When a footing is required, use an inverted truncated pyramid of earth with 2 on 1 side slopes above top of footing in determining overturning stability.

### 2.2.2.2 Tank Construction Materials

**************************************************************************
**NOTE: Tank shell thickness should be calculated using AWWA D100, AWWA D103, or API 650 procedures. The strength of the materials of construction for each tank should include allowances specified herein.**
**************************************************************************

2.2.2.2.1 Carbon Steel

Carbon steel sheet is required to be hot rolled in accordance with ASTM A283/A283M Grade C with a minimum yield of 476 MPa 40,000 psi; use a minimum thickness of 3.4 mm 10 gauge. Ensure structural steel conforms to ASTM A36/A36M and [AWWA D100] [AWWA D103] [API Std 650] for steel tanks.

2.2.2.2.2 Polyethylene

Provide polyethylene tanks manufactured in accordance with ASTM C582.
2.2.2.3 Stainless Steel

Ensure stainless steel conforms to the material specification for 304SS, 316SS, 316LSS, 317SS.

2.2.2.4 Structural Steel

Ensure structural steel conform to ASTM A36/A36M.

2.2.2.5 Fiberglass

Provide fiberglass tanks in conformance with ASTM D3299.

2.2.2.6 Corrosion Allowance

******************************************************************************
NOTE: The designer should specify a minimum corrosion allowance for wetted surfaces giving consideration to the types of liquids to be stored, the vapors above the liquids, and the atmospheric environment. It is expected that some tanks in the P/C/F system may have a low pH and some may have a high pH, and others will have contaminants and chemicals at varying concentrations. A corrosion allowance can be calculated using available corrosion rate information from material suppliers or National Association of Corrosion Engineers (NACE) standards. The designer should take into account the changes in temperature over the range of operating conditions and the effects of liquids and vapors on the materials of construction.
******************************************************************************

Corrosion allowance is dependent upon the materials of construction and finish coatings. Corrosion allowances are to be calculated as follows:
For a lined interior finish, corrosion allowances are allowed to be [0.0 mm 0.0 inches] [______]. For a coated or painted interior finish, the corrosion allowance is allowed to be [0.0 mm 0.0 inches] [______]. For tanks with no protective finish, the corrosion finish is required to be [0.0 mm 0.0 inches] [______].

2.2.2.4 Shop Fabrication

Perform all welding in conformance with [AWWA D100] [AWWA D103] [API Std 650] using ASME certified welders. Ensure all shell seams are full penetration using Sub Arc Welding (SAW). Ensure other seams are made with [Gas Metal Arc Welding (GMAC)] [Shielded Metal Arc Welding (SMAC)] [Flux Cored Arc Welding (FCAW)] [Submerged Arc Welding] processes.

2.2.2.5 Bolts

Bolts used in the shell joints are required to meet the requirements of Section 2.2 of AWWA D103. Bolts used in tanks designed under [AWWA D100] [API Std 650] are required to meet the requirements as specified in [AWWA D100] [API Std 650].

2.2.2.6 Gaskets

Ensure all bolted connections use gaskets of suitable chemical resistance
for the service. Gaskets used to seal bolted joints in tanks are required to meet the requirements of AWWA D103 Section 2.10.

2.2.2.7 Accessories

2.2.2.7.1 Manholes and Pipe Connections

Manholes and pipe connections are required to meet the minimum requirements of [AWWA D100] [AWWA D103] [API Std 650]. Provide the number, type, elevation, orientation, and size of manholes and pipe connections [as shown on the drawings] [provided by Contractor].

2.2.2.7.2 Baffles, Weirs, and Overflow Pipes

******************************************************************************
NOTE: Design each tank with an overflow that will pipe, channel, or otherwise direct an overflowing tank to a containment area or to the next tank in the system. If a weir or exit pipe is plugged and cannot pass the maximum process flow rate, wastewater must be contained to prevent spills.
******************************************************************************

Design inlet baffles to dissipate influent flow energy at maximum flow rates and to avoid short circuiting to effluent weirs. Weirs for the tanks are required to consist of an overflow weir and outside drop pipe, adequately supported and capable of discharging the design flow rate with [_____] mm inches of head. [Install the top of the weir [_____] mm inches below [the top edge of the tank] [overflow height].] [as indicated.] Provide all tanks with emergency overflow outlets to direct overflow of wastewater to a containment area. Terminate the overflow pipe 300 to 600 mm 1 to 2 feet above grade and fit it with a flapper valve or screen to prevent ingress of birds, insects, or small animals of any kind. Design internals to meet the requirements of [AWWA D100] [AWWA D103] [API Std 650].

2.2.2.7.3 Vents

******************************************************************************
NOTE: Vents on covered tanks should be designed to allow vapor control systems to be attached. Design tank vents in accordance with guidelines published in the American Institute of Chemical Engineers (AICHE) G3 "Guidelines for Safe Storage and Handling of High Toxic Hazard Materials" (1988), and API Publication 2557 "Vapor Collection and Control Options for Storage and Transfer Operations in the Petroleum Industry" (1993).
******************************************************************************

On covered tanks, weld the vent to a cover plate on the roof. Provide tank manufacturer's standard type mushroom vent with bird and insect screen. Design vent as specified by [AWWA D100] [AWWA D103] [API Std 650]. Size the open area of a vent screen at 50 percent in excess of the [_____] L/second gpm pump-in rate and [_____] L/second gpm pump-out rate. Screening for vent is required to conform to [AWWA D100] [AWWA D103] [API Std 650] ensuring fail-safe operation in the event that screen frosts over. Ensure the bottom of the screen is sufficiently elevated for snow consideration in the area.
2.2.2.7.4 Ladders and Safety Devices

Provide an outside access ladder on tanks greater than 1.5 m (5 feet) in height. Provide ladders and safety devices in accordance with [AWWA D100] [AWWA D103] [API Std 650]. Locate ladders as shown on the drawings. In addition, provide safety cage, rest platforms, roof ladder handrails, and other safety devices as required by federal or local laws or regulations.

2.2.2.7.5 Scaffold and Cable Support

Include attachment rings or hooks on the inside and outside of closed top tanks, at four points at the top of walls, to secure scaffolding and cable support during maintenance activities.

2.2.2.7.6 Miscellaneous Tank Accessories

Ensure miscellaneous tank accessories, such as support legs, saddles, skirts, lifting lugs, etc., conform to [AWWA D100] [AWWA D103] [API Std 650].

2.2.3 Chemical Feed Systems

**************************************************************************
NOTE: The designer must verify that appropriate (on/off, proportional, set point) controller is specified in Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.
**************************************************************************

Provide chemical feed systems in accordance with Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS. Furnish control signals and wiring to the chemical feed controllers in accordance with the requirements of this section.

2.2.4 Mixers

**************************************************************************
NOTE: Different types of mixers can be used for a P/C/F treatment system including: impeller, jet and in-line static mixers. Delete items that are not required. Impeller mixers are divided into three groups: propellers, turbines, and paddles. Turbine and propeller mixers are used for rapid mixing applications while paddle mixers are typically used in flocculation.

Propeller mixers are high speed mixers, operated on low horsepower, which are used primarily for flash mixing applications. Propeller speeds range from 400 rpm to 1750 rpm. When top entry is required, the propeller mixer is mounted angled and off center. Where side entry is recommended, the propeller mixer is mounted horizontally, offset from the centerline of the tank.

Turbine mixers are primarily used in low speed applications where heavy solids may be generated and a large mixing energy input is required to keep the solids in suspension. These type mixers can be used
for equalization of the wastewater, flash mixing or flocculation. Turbine speed ranges from 55 to 125 rpm. The turbine mixer is typically mounted vertical, one half to one diameter off the floor of the mixing chamber. In an unbaffled tank the unit is mounted off center. In a baffled tank the unit is mounted on center.

Paddle mixers are low speed mixers whose peripheral paddle speed typically varies from 0.15 to 0.61 m/sec (0.5 to 2.0 feet/second). Paddle mixers are used primarily in flocculation applications.

Jet mixers use hydraulic action for mixing resulting in lower capital and operating costs as compared to impeller mixers. Jet mixers are used only for rapid mixing, and are not suitable for flocculation due to the high pressure liquid ejected at the discharge nozzle, which can break up the floc previously formed.

Static mixers are typically installed downstream of chemical addition points for blending or dispersion applications. They are used in combination with metering pumps and must be sized based on the flow rate. In-line static mixers use hydraulics for mixing instead of impellers, requiring no external power and no maintenance. In-line static mixers have high head losses up to 1 m (3 ft); and the mean temporal velocity gradient G cannot be changed to meet varying requirements.

Mixers are usually sized based on liquid viscosity, liquid temperature and liquid density among other parameters. However for each of the mixing locations, at most sites, it is expected that the viscosity and density will not be significantly different from water; if that is not the case, the designer should specify the requirements that the mixing device must meet.

Furnish mixers on each tank or unit as designated on the drawings. On tanks, supply tank baffles, where required by the mixer design, to achieve complete mixing and mixer support as required. Submit detailed drawings of each mixer including dimensions, mounting details, wiring, schematics, and any other details required to demonstrate that the system has been coordinated and properly functions as a unit. Submit manufacturer's descriptive data, specifications, technical literature, utility requirements, performance charts and curves, and catalog cuts for each mixer supplied.

2.2.4.1 Equalization Unit Mixer

NOTE: Because the water level in the equalization tank varies, the designer must specify the minimum water level at which the mixer will be turned off to avoid burning out the mixer motor.
Mixers are required to be a [propeller] [turbine] [paddle] [jet] type mixer. Number of mixers: [_____].

a. Ensure propeller, turbine, or paddle mixers meet the following requirements. Mounting: [[top] [side] [bottom] entering] [_____]. Mixer speed: [constant] [variable] at a maximum rpm of [_____]. Variable speed turndown ratios are required to be [4:1] [_____]. Design mixer to develop a velocity gradient (G value) not less than [300] [_____] sec-1. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [_____] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [_____]. Impeller construction: [carbon steel] [316 stainless steel] [_____]. Design mixer bearings to operate continuously at full load for [100,000 hours] [_____] before replacement.

b. Jet mixers are to consist of, but not be limited to, a jet motive pump to circulate liquid in the mixing basin; jet mixing nozzle assembly, retrieval system and in-basin secondary fluid lines. Design jet mixer to obtain a maximum mean velocity of [100] [_____] sec-1 or G(t) values of [104] [_____]. The jet motive pump is to be driven by submersible non-clog units. Provide motors that operate on 230/460 volt, three phase, 60 hertz power supply. Provide nozzle assembly and piping made of [plastic] [or] [stainless steel] [_____] material to prevent corrosion by process liquid.

2.2.4.2 Precipitation Unit Mixer

Achieve mixing by use of a [propeller] [turbine] [jet] [in-line static] type mixer. Number of mixers: [_____].

a. Provide propeller or turbine type mixers that meet the following requirements. Mounting: [[top] [side] [bottom] entering] [_____]. Mixer speed: [constant] [variable] at a maximum rpm of [_____]. Variable speed turndown ratio is required to be [4:1] [_____]. Design mixer to develop a maximum velocity gradient (G value) not less than [300] [_____] sec-1. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [_____] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [_____]. Impeller construction: [carbon steel] [316 stainless steel] [_____]. Design mixer bearings to operate continuously at full load for [100,000 hours] [_____] before replacement.

b. Provide jet mixer consisting of, but not be limited to, a jet motive pump to circulate liquid in the mixing basin; jet mixing nozzle assembly, retrieval system and in-basin secondary fluid lines. Design the jet mixer to obtain a mean velocity of [25-100] [_____] sec-1 or G(t) values of [103-104] [_____]. The jet motive pump is to be driven by submersible non-clog units. Provide motors that operate on 230/460 volt, three phase, 60 hertz power supply. Provide nozzle assembly and piping made of [plastic] [or] [stainless steel] [_____] material to prevent corrosion by process liquid.

c. Provide in-line static mixers that meet the following requirements. Maximum precipitant feed rate: [_____] L/s gpm. Provide in-line static mixers with a helical shaped element which is made of the same material.
as the housing wall. The sealing edge between the element and housing wall is required to create an integral unit without pieces to fatigue or vibrate. Ensure the in-line static mixers incorporate the required number of elements to provide complete mixing at all design conditions. Size the mixer to fit [_____] mm inches diameter conveying pipe. Materials of construction: [carbon steel] [stainless steel] [polyethylene] [polypropylene] [FRP] [Teflon] [_____].

2.2.4.3 Coagulation Unit Mixer

Achieve mixing by use of a [propeller] [turbine] [jet] [in-line static] type mixer. Number of mixers: [____].

a. Propeller or turbine mixers are required to meet the following requirements. Mounting: [[top] [side] [bottom] entering] [____]. Mixer speed: [constant] [variable] at a maximum rpm of [____]. Variable speed turndown ratio is required to be [4:1] [____]. Design mixer to develop a velocity gradient (G value) not less than [300] [_____] sec-1. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [____] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [____]. Impeller construction: [carbon steel] [316 stainless steel] [____]. [Provide] [Do not provide] the mixer support with the mixer. Design mixer bearings to operate continuously at full load for [100,000 hours] [____] before replacement.

b. Jet mixers consist of, but are not be limited to, a jet motive pump to circulate liquid in the mixing basin; jet mixing nozzle assembly, retrieval system and in-basin secondary fluid lines. Design jet mixer to obtain a mean velocity of [25-100] [____] sec-1 or G(t) values of [103-104] [____]. The jet motive pump is to be driven by submersible non-clog units. Provide motors that operate on 230/460 volt, three phase, 60 hertz power supply. Provide nozzle assembly and piping made of [plastic] [or] [stainless steel] [____] material to prevent corrosion by process liquid.

c. Provide in-line static mixers that meet the following requirements. Maximum coagulant feed rate: [_____] L/s gpm. Provide in-line static mixers that have a helical shaped element which is made of the same material as the housing wall. The sealing edge between the element and housing wall is required to create an integral unit without pieces to fatigue or vibrate. Provide in-line static mixers that incorporate the required number of elements to provide complete mixing at all design conditions. Size the mixer to fit [_____] mm inches diameter conveying pipe. Materials of construction: [carbon steel] [stainless steel] [polyethylene] [polypropylene] [FRP] [Teflon] [_____].

2.2.4.4 Flocculation Unit Mixer

Provide mixers that are [turbine] [paddle] type mixers. Number of mixers: [____]. Mounting: [[top] [side] [bottom] entering] [____]. Mixer speed: [constant] [variable] at a maximum rpm of [____]. Variable speed turndown ratio is required to be [4:1] [____]. Design mixer to develop a maximum velocity gradient (G value) no more than [100] [_____] sec-1. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [____] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [____]. Impeller construction: [carbon steel] [316 stainless steel] [____]. [Provide] [Do not provide] mixer support. Design mixer bearings to operate continuously.
2.2.4.5 Effluent Holding Unit Mixer

Achieve mixing by use of a [propeller] [turbine] [jet] [in-line static] type mixer. Number of mixers: [____].

a. Provide propeller or turbine mixers meeting the following requirements. Mounting: [[top] [side] [bottom] entering] [____]. Mixer speed: [constant] [variable] at a maximum rpm of [____]. Variable speed turndown ratio is required to be [4:1] [____]. Design mixer to develop a velocity gradient (G value) not less than [300] [____] sec-1. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [____] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [____]. Impeller construction: [carbon steel] [316 stainless steel] [____]. [Include][Do not include] mixer support. Design mixer bearings to operate continuously at full load for [100,000 hours] [____] before replacement.

b. Provide jet mixers consisting of, but not limited to, a jet motive pump to circulate liquid in the mixing basin; jet mixing nozzle assembly, retrieval system and in-basin secondary fluid lines. Design jet mixer to obtain a mean velocity of [25-100] [____] sec-1 or G(t) values of [103-104] [____]. The jet motive pump is to be driven by submersible non-clog units. Provide motors that operate on 230/460 volt, three phase, 60 hertz power supply. Provide nozzle assembly and piping made of [plastic] [or] [stainless steel] [____] material to prevent corrosion by process liquid.

2.2.5 Clarifiers

**************************************************************************
NOTE: This paragraph specifies only inclined plate or tube settlers. The inclined plate or tube settlers requires minimum space, no moving parts (therefore minimizing maintenance), less potential for short circuiting, and generally lower capital and operating costs than conventional clarifiers. For metallic sludges, the overflow rate typically ranges from 2.1 to 4.2 L/s/sq. m 360 to 720 gpm/sq. ft. and generally will not exceed 5.9 L/s/sq. m 1000 gpm/sq. ft.
**************************************************************************

Clarifier is required to be an inclined [plate] [or] [tube] settler designed to meet the following conditions:

a. Influent pH: Maximum [____], Minimum [____].

b. Solids Loading: [____] kg/day lbs/day.

c. Effluent TSS: [____] mg/L.

Provide for an effective surface overflow rate of [____] L/m3/m2.s gpd/ft2 and a detention time of [2] [____] hours at the design flow rate. Clarifiers are required to include, at a minimum, the following accessories: influent distribution system, a separator module consisting of [corrugated plate packs,] [inclined tube packs,] skimmer mechanism with
scum collection trough, sludge removal system, effluent collection flumes, access ladder, operating platform, associated piping, fittings, sampling valves, and a sludge hopper.

2.2.5.1 Clarifier Vessel

Construct the bottom and sides of the clarifier vessel 6 mm 1/4 inch minimum thickness carbon steel plate meeting or exceeding ASTM A36/A36M. Provide the vessel complete with inlet, outlet, overflow, and drain connections. The structural steel framework is an integral part of the vessel to ensure it is self-supporting. Design the clarifier for seismic forces in accordance with paragraph Existing Conditions.

2.2.5.2 Influent Distribution and Effluent Collection Systems

The influent distribution system dissipates the entrance energy and equalizes flow to the separator module. Include weirs and baffles to control the local velocities and eliminate short circuiting. Use adjustable weirs along each effluent collection flume to maintain uniform flow distribution.

2.2.5.3 Separator Module

Construct the separator module using [parallel corrugated plates placed [38 mm 1-1/2 inches] [[_____] mm inches] apart] [inclined tubes at [45] [60] [_____] degrees from the horizontal]. The separator module is required to be constructed to be removable for maintenance and inspection. Construct the separator module with corrosion resistant materials. Provide [corrugated plate packs] [tube packs] constructed of [fiberglass reinforced plastic] [polypropylene] [coated steel] [stainless steel] [_____].

2.2.5.4 Skimmer and Sludge Collection/Thickening Devices

The mechanical skimmer and drive is required to continuously collect floating scum and remove it to a collection trough. Equip the sludge holding compartment with a hopper bottom having sides tapering downward at an angle not less than [55] [_____] degrees above horizontal for sludge collection. The sludge hopper is to be mounted in a [fixed] [removable] [_____] position and be equipped with a vibrator pack for sludge thickening. Size the sludge hopper to provide a minimum of [_____] L gallons of sludge storage. Provide a flanged outlet for each hopper which connects to a pump for sludge removal.

2.2.5.5 Miscellaneous

Supply the clarifier with a steel platform around the perimeter complete with ladder, handrail, and toe plates. Paint in conformance with Sections 09 90 00 PAINTS AND COATINGS and 09 97 02 PAINTING: HYDRAULIC STRUCTURES, unless otherwise indicated.

2.2.6 Piping/Valves

Provide piping and valves for chemical feed in accordance with Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS. Install low point drains in interconnecting piping.

2.2.7 Pumps

Provide pumps that meet the following requirements. Provide pumps for
specific services and accessories per the following specifications.

2.2.7.1 Water Pumps

**************************************************************************
NOTE: Water pumps include, but are not limited to, the following: equalization transfer pumps, water pumps for chemical dilution, and effluent water recycle and discharge pumps. Water pumps may be horizontal or vertical centrifugal pumps. Delete and/or add paragraphs to meet job requirements.
**************************************************************************

Design water pumps in accordance with Section 23 21 23 HYDRONIC PUMPS.

2.2.7.2 Chemical Metering Pumps

**************************************************************************
NOTE: Chemical metering pumps may be piston, positive displacement diaphragm, or balanced diaphragm pumps. The unit application depends on the pressure involved, corrosiveness of the chemical, feed rate, accuracy required, viscosity and specific gravity of the fluid, other liquid properties, and the type of control.
**************************************************************************

Manufacture and install chemical metering pumps in accordance with Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.

2.2.7.3 Sludge Pumps

**************************************************************************
NOTE: Sludge pumps may be centrifugal, diaphragm (air operated) or progressive cavity. The unit application depends on the pressure involved, the pumping rate (constant or variable), the specific gravity of the sludge and the type of control.
**************************************************************************

Manufacture and install sludge pumps in accordance with Section 22 13 29 SANITARY SEWERAGE PUMPS.

2.2.8 Electrical Equipment

2.2.8.1 General

Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and in conformance with NFPA 70. Install circuits in accordance with Sections 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION and 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

2.2.8.2 Electric Motors

**************************************************************************
NOTE: Electrical motor driven equipment should be provided complete with motors, motor starters, and controls.
**************************************************************************
Provide for each motor a circuit breaker type combination motor circuit protector, complete with properly sized thermal overload protection on each phase, along with a hand-off-automatic (HOA) selector switch; red and green pilot lights; manual reset pushbutton; and all other appurtenances necessary for the motor control specified. Ensure each motor has sufficient capacity to drive the equipment at the specified capacity at or below a 1.0 service factor and without exceeding the nameplate rating of the motor when operating at the specified electrical system voltage and frequency. Each electric motor-driven piece of equipment is required to be driven by a chemical/mill duty, [explosion-proof] [totally-enclosed fan cooled (TEFC)] [totally-enclosed non-ventilating (TENV)] [_____] motor rated for continuous duty at a 40 degrees C ambient temperature. Provide motor with a [1.15] [1.0] [_____] service factor. Ensure all motors conform to the respective sections of NEMA MG 1. Three phase motors are required to be squirrel-cage induction type having normal-starting-torque and low-starting-current characteristics. Size motors with sufficient power and torque so that the nameplate power rating, without consideration of the service factor, is not exceeded under any operating condition. Provide adequate thrust bearings in the motor to handle any thrust forces that are transmitted to motor under any operating condition. Three phase motors are required to be rated at 230/460 volts, 60 hertz. Fractional horsepower motors are required to be 115 volts, 60 hertz. Stamp all motor nameplate information on the attached nameplate in accordance with the requirements of NEMA MG 1. Supply motors that have a premium efficiency design, class F insulation, automatic thermal protection of the stator windings, and standard NEMA frame ratings.

2.2.9 Instrumentation And Control

**************************************************************************
NOTE: Instrumentation and control systems are used in water treatment to ensure consistent quality, to optimize process reliability, to assist operating personnel in monitoring process operations, and to minimize operating costs. The measurement and control instruments may range from a simple control panel indicator to a complex, multi-component, programmable logic controller based system.

In developing the scope of the instrumentation and control system design, the designer should consider the following parameters: size of the plant, type and complexity of the treatment process, type of vendor-supplied controls, amount of funds available, current design standards, discharge compliance criteria, special interfaces with other control systems, and the ability of the owner to properly maintain a control system. Generally, the designs of P/C/F systems incorporating manual operation would be limited to batch processes in which the control of pumps and chemical addition is accomplished by operator action. The continuous operation of P/C/F systems usually involves more complex control schemes. Chemical addition can be manually or automatically proportioned to flow and/or to other process feedback signals generated by process instrumentation. The degree of automation incorporated into the system design...
generally depends upon the complexity of the treatment system, the remoteness of the site, the planned level of operator attention, and the duration of the project. Systems designed for unattended operation would require the greatest degree of automated system controls. Control schemes may include the use of remotely located programmable logic controllers, remote data telemetry, and telecommunication systems.

The designer should consider how the P/C/F system will be operated for each site-specific application. The equipment used in a P/C/F system can be supplied to operate either in a batch or a continuous mode of operation. A batch operation may be more economical than continuous operation when wastewater flows are small (less than 0.6 L/s 10 gpm), or are intermittent from sources such as a small landfill leachate recovery system or small ground water pumping wells. When the wastewater flows are larger than 0.6 L/s 10 gpm, continuous operation should be used. In the continuous mode of operation, all equipment would run uninterrupted and the wastewater would be fed to the system at a controlled rate.

If a batch operation is used, the designer must decide whether treatment can be performed in one single tank or if multiple tanks are required. In a single tank, the required chemicals for precipitation, coagulation, and flocculation are added sequentially to the same tank at a mixing intensity appropriate for the chemical being added. Following chemical addition, all mixers would shut down to allow a quiescent time for settling to occur. The settled sludge on the bottom of the tank could be drawn off and the supernatant adjusted for final pH. The water can be stored in this one tank until it is analyzed and discharged, or a separate tank can be used to store the water. This type of system is appropriate for sites that generate small amounts of water where the time to treat one batch does not exceed the time to generate a volume of water to be treated. A flow equalization tank must be provided to receive the water while treatment is occurring in the batch tanks.

Alternatively, if more frequent treatment is required, batch treatment can employ multiple tanks where one volume of water is pumped sequentially through the precipitation, coagulation, flocculation, and clarification tanks. The equipment used in this system would be the same as for a continuous operation, except that the instrumentation and controls would be designed to allow intermittent pumping, mixing, and chemical addition rather than continuous. In either mode of operation, the controls can be designed to operate the system with 1) manual control, 2) semiautomatic
control, or 3) automatic control. The designer must select the control scheme appropriate for the site considering the complexity of the system and personnel availability.

In manual control, the operator will start only one process at a time (e.g., precipitation, coagulation, flocculation, clarification, etc.) and check the results of each before starting next operation. In semiautomatic control, the operator must be present to start the P/C/F system and transition from one process to another will be controlled automatically using either an electronic or pneumatic distributed control system. In automatic control, the entire system will operated without an operator. The normal running of the system is linked to one or more governing factors (tank level, flow rate, etc.) which will start up each system when set points are reached. Maximum reliability of a fully automated system can be obtained by using a logic control system which checks that the orders given have been received and carried out and, if not, stops the operations and alarms the operator. All controls should have manual override.

**************************************************************************

Provide the instrumentation and control system to be [batch] [on-off in response to influent flow] [manual] [semi-automatic] [automatic] [_____] with complete electrical power, control and instrumentation as specified or recommended by the equipment manufacturer for the safe operation and supervision of the P/C/F system. Supply the instrumentation and control package for the P/C/F system as indicated on the drawings. Ensure the probes for pH and oxidation reduction potential (ORP), measuring devices, and level sensors specified in the following four subparagraphs are made of materials resistant to chemical attack over a pH range of 2 to 12, and suitable for a temperature range from [0 to 100] [_____] degrees C [32 to 212] [_____] degrees F and for the liquid to be monitored. All enclosures for pH, flow, and level sensors and transmitters are to be rated NEMA 4X.

2.2.9.1 pH Monitoring/Control

Provide pH probes [where indicated on drawings] [on the effluent line of each reactor] for the purposes of pH monitoring and/or pH control through an associated control device (PLC, single loop controller, etc.). Ensure installed probes are easily removable without interrupting service. Provide probe materials that are resistant to operating pressures of up to [_____] kPa psi. Interconnect the probes to associated transmitters/indicators that are located preferably in the main control panel. Connect probes to a micro-processor based pH analyzer having a 4 digit readout with 38 mm 1-1/2 inch high letters and an isolated 4 - 20 mA DC output signal proportional to the pH. Ensure the accuracy of the pH unit is plus or minus 0.5 percent of full scale.

2.2.9.2 ORP Monitoring/Control

Provide an oxidation reduction potential (ORP) probe [where indicated on drawings] [_____] for the purpose of ORP monitoring and/or control. Install probe so it is easily removable without interrupting service. Supply probe materials that are resistant to operating pressures of up to
Interconnect the probes to associated transmitters/indicators that are located [preferably] in the main control panel. Connect the probe to a microprocessor based pH analyzer having a 4 digit readout with 38 mm 1-1/2 inch high letters and an isolated 4 – 20 mA DC output signal proportional to the ORP. Ensure the accuracy of the ORP unit is plus or minus 0.5 percent of full scale.

2.2.9.3 Flow Monitoring/Control

Provide flow measuring devices [where indicated on drawings] [on the influent line] [on the effluent line] for the purpose of flow monitoring and/or control. Install measuring devices in a manner that ensures they are easy to maintain without interrupting service. Supply measuring devices that are resistant to operating pressures of up to [_____] kPa psi. Connect measuring devices to a microprocessor based flow analyzer having a digital readout with 38 mm 1-1/2 inch high letters and an isolated 4 – 20 mA DC output signal proportional to the flow. Ensure the accuracy of the flow monitoring unit provided is plus or minus 0.5 percent of full scale. Coordinate the type of flow meter selected with the application involved as shown on the drawings to assure that the flow meter meets all installation and operational criteria (upstream and downstream distances from appurtenances, minimum and maximum flow velocities, degree of required accuracy, full pipe flow, etc.).

2.2.9.4 Level Monitoring/Control

Provide level indicator gauges of the direct-reading type, equipped with a shutoff valve, on the discharge side of the tank. Provide gauges with 150 mm 6 inch dials that are stem mounted and conform to ASME B40.100. Provide gauges with accuracy of Grade A in accordance with ASME B40.100. Calibrate gauges in kPa psi in not more than 10 kPa 2 psi increments from 0 to 350 kPa 0 to 50 psi in excess of the normal operating pressure at the tank. Provide level (float) switches that are mechanically actuated with Form C contacts. Include a sending unit in all electronic level sensing devices that transmits an analog or discrete signal, as required for the application, to an associated control panel or control device. Provide level monitoring/control sensors [where indicated on drawings] [______]. Locate sensors in a location to be easily removable without interrupting service. Connect analog level sensors to a microprocessor based level indicator and/or controller as required by the application having a 4 digit readout with 38 mm 1-1/2 inch high letters and an isolated 4 – 20 mA DC output signal proportional to the level to be measured.

2.2.9.5 Control System

******************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************** ********************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************************
control or processing equipment. This procedure should delineate all normal operational values for each component of the P/C/F system.

**************************************************************************

Design the control system to operate as shown on the drawings and described in the operating and control procedures provided [below] [as an attachment]. Ensure all alarms and/or shutdowns consist of both visible alarm lights and audible alarm signals on either the main control panel, or on a remote microprocessor controller screen. Ensure the alarms and shutdowns function through a first-out-sequence annunciation. Provide alarms for high and low water and chemical levels, high and low pH values, and high and low ORP values. Provide automatic shutdowns for each system when a control value or an operational system ranges out of normal operational limits where personnel safety is a concern, where mechanical damage can occur to process equipment, or where the process excursion has the potential to violate discharge water quality criteria; such shutdowns can occur for both high and low conditions. Ensure power failures and equipment failures initiate an alarm as well as an orderly and automatic shutdown of the treatment system. [Provide for auto-dialing to an indicated remote location to report each alarm or shutdown that stops the movement of process water through the treatment system or stops chemical feed systems. The Contractor is responsible for providing the associated telephone line for the auto-dialer system.] Provide all control power transformers, relays, adjustable timers, auxiliary contacts, switches, or additional equipment required to interconnect the treatment equipment to a monitoring/control system. Furnish conduit and wiring between control panels, treatment components, and all control devices.

2.2.9.6 Control Panel Enclosures

Ensure all required control panels for the control system are rated NEMA 4X [fiberglass] [stainless steel] and are sized to assure that adequate internal space is available for all components specified and/or required with an allowance of no less than 30 percent spare space. To the greatest extent possible, install all instrument transmitters in or adjacent to the control panel enclosure.

2.2.10 Structural Skids

Where a P/C/F system has structural skids, supply skids fabricated in accordance with Section 05 12 00 STRUCTURAL STEEL. Submit shop details for each structural skid including members (with their connections) not shown on the drawings. Show standard welding symbols on the drawings in accordance with AWS A2.4.

2.2.11 Paint/Coatings

**************************************************************************

NOTE: UFGS 09 97 02 is a guide specification developed for Civil Works projects.

**************************************************************************

Perform paint and coatings work in accordance with Sections 09 90 00 PAINTS AND COATINGS[ and 09 97 02 PAINTING: HYDRAULIC STRUCTURES].

2.2.12 Insulation/Heating/Ventilation
NOTE: In cold climates, exposed pipe, valves, pumps and equipment should be insulated and/or heat traced to prevent freezing. Tanks should be insulated and heated to keep the tank contents above freezing temperatures.

Provide insulation for pipes, valves, pumps, tanks, instrumentation and controls, and other equipment in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.2.13 Nameplates

Provide a nameplate on each major item of equipment that includes the manufacturer's name, address, type or style, model or serial number, and catalog number. Secure nameplate to the item of equipment.

2.2.14 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration and maintenance of the equipment, as recommended by the manufacturer. Provide a list of special tools including description, manufacturer, model number, and a source for purchasing replacements if lost.

PART 3 EXECUTION

3.1 EXAMINATION

NOTE: The designer will determine if the examination by the Contracting Officer is to apply to all equipment or only to special items to be inspected.

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before work begins. After equipment is delivered to the site and prior to installation, examine the treatment plant equipment for any damage, defect, or deterioration and verify that all construction equipment used at the site is of sufficient capacity and in good mechanical condition. Document the results of this pre-installation examination and submit to the Contracting Officer for review.[ Contracting Officer reserves the right to also conduct this examination independently.] Based on the examination, the Contracting Officer has the right to reject damaged, defective, or deteriorated equipment. The contractor is required to correct surface damage to equipment following the manufacturer's requirements. Any costs associated with the delay caused by the rejection of equipment is understood to be borne by the Contractor. Provide all specified preconstruction submittals to the Contracting Officer.

3.2 INSTALLATION

Handle equipment with extreme care to prevent damage during placement. Install equipment, except as otherwise specified, as indicated on the drawings, and in accordance with the manufacturer's written instructions [and under direct supervision of the manufacturer's representative] [______]. Installation includes furnishing all materials required for
initial operation. Properly level, align, and anchor all equipment in
place in accordance with the manufacturer's instructions. Provide supports
for equipment, appurtenances, and pipes as required. Install piping runs
to be straight and evenly supported. Install valves with stems horizontal
or above the pipe centerline. Install flanges and unions where valve and
equipment maintenance may require disassembly. Provide the P/C/F system
complete and ready for operation. Ensure all plumbing work conforms to the
requirements of [Section 22 00 00 PLUMBING, GENERAL PURPOSE][____].

3.2.1 Foundations

Construct foundations for tanks, clarifier, and other equipment of
reinforced concrete, except as shown or specified herein.

3.2.2 Excavating, Filling, and Grading

Perform excavation, filling, and grading work to conform to the applicable
requirements of Section 31 00 00 EARTHWORK.

3.2.3 Cathodic Protection

Provide cathodic protection on steel tanks and clarifiers, conforming to
Section 26 42 15 CATHODIC PROTECTION SYSTEM FOR THE INTERIOR OF STEEL WATER
TANKS.

3.2.4 Welding

Perform tank welding in accordance with [Section 8 of AWWA D100] [AWWA D103
] [API Std 650].

3.2.5 Erection

Perform tank erection in accordance with [Section 10 of AWWA D100] [AWWA D103] [API Std 650].

3.2.6 Field Painting

**************************************************************************
NOTE: UFGS Section 09 97 02 is a guide
specification developed for Civil Works projects.
**************************************************************************

Perform field painting in accordance with Sections 09 90 00 PAINTS AND
COATINGS[ and 09 97 02 PAINTING: HYDRAULIC STRUCTURES]. Do not paint
stainless steel, galvanized steel, and nonferrous surfaces.

3.2.7 Inspections and Testing

Inspect and test tank in accordance with Section 11 of AWWA D100. Mill and
shop inspections [are not required] [are required to be performed by an
approved commercial inspection agency]. Contractor is required to perform
the hydrostatic test. Perform final hydrostatic test before painting.

3.2.8 Radiographic Inspection and Testing

Perform tank radiographic inspection and testing of tanks in accordance
with Section 11 of AWWA D100. Radiographic inspections [are not required]
[are required to be performed by an approved commercial inspection
agency]. Perform all testing before painting.
3.3 FIELD QUALITY CONTROL

3.3.1 Inspection

**************************************************************************

NOTE: The system's P&ID and the as-built drawings are used to verify that all equipment, piping, and valves are installed according to plans and specifications. The electrical one-line diagrams and wiring diagrams are useful to verify the electrical and instrumentation systems. Grounding of equipment should also be inspected. Vendor's certified shop drawings and equipment operating manuals should be used to check the equipment installation and operation.

**************************************************************************

After the installation is complete, each component the Contracting Officer inspects to verify that the components of the system are properly installed according to drawings and specifications. Correction of all discrepancies found and work affected by such deficiencies is wholly at the Contractor's expense.

3.3.2 Tests

Ensure each piece of equipment is subject to an operational test, under the supervision of a factory representative. The Contracting Officer maintains the right to observe test. Tests are required to demonstrate that the equipment is not defective and is in safe and satisfactory operating condition. Notify the Contracting Officer [7] [_____] days prior to the dates and times for acceptance tests. Perform a running field test on all equipment in the presence of the Contracting Officer for a minimum of [2] [_____] hours. If any deficiencies are revealed during the tests, correct such deficiencies and repeat the tests. Submit Test Reports in booklet form showing field tests performed to adjust each component and to prove compliance with the specified performance criteria upon completion and testing of the installed system. Identify all test methods used and record all test results. Indicate within each test report the final set point of each control device. Provide test reports for pre-startup testing and startup performance testing; also include test reports showing the results of factory tests performed.

3.3.3 Manufacturer's Service

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative is required to supervise the installation, adjustment, and testing of the equipment. Include up to [5] [7] [10] [_____] days of service.

3.4 SYSTEM STARTUP

**************************************************************************

NOTE: Pre-start-up procedures should be provided for each component of the P/C/F system and procedures should be provided for start-up of the whole system. The startup plan must include pre-startup checkouts, pre-startup testing, and the
actual startup. The following sections describe startup operations of a P/C/F treatment system. The startup procedure follows a planned sequence of events for each component of the system.

3.4.1 Hydrostatic Tests

NOTE: The test pressure should not exceed 130 percent of the rated pressure. Testing of pipe and fittings should be specified in the same section where the pipe is specified in.

After installation, test all tanks for leaks or damage in shipment. Test the tanks hydrostatically [to [_____] kPa psig] [as indicated in the schedule] or 1.5 times the system operating pressure, whichever is greater. Test the tanks for a period of [24] [_____] hours. Furnish testing plugs or caps, all necessary pressure pumps, pipe connections, gauges, other equipment, and all labor required. Repair all damage or leaks in tanks or replace tanks at the Contractors expense. Test the joints of air lines using a soapy water solution to detect leaks.

3.4.2 Pre-startup Checkout

NOTE: The pre-startup checkouts are designed to verify the integrity of the system components prior to pre-startup testing.

Ensure the following items subjected to the pre-startup checkout:

a. Check foundations to verify that they are placed and sealed properly;

b. Check system to verify that all equipment has been properly installed and connected;

c. Check rotating equipment which requires lubrication to ensure that manufacturer's procedures have been followed;

d. Level and check all equipment for proper alignment, anchored, and static ground wires installed;

e. Check piping, flange bolts, gaskets, and hoses to ensure that connections are tight, and flushed clean;

f. Check valves for position and operability and flushed clean;

g. Check electrical wiring and lighting to verify that wiring has been completed correctly;

h. Perform continuity checks on wiring loops;

i. Check High/Low liquid level alarms on tanks, as well as pump on/off level controls, for proper installation and response;

j. Check chemical feed systems for proper installation;
k. Check chemicals for proper type, required quantity and mixing; fill tanks;

l. Check lockout devices and site security devices checked for proper installation.

3.4.3 Pre-startup Testing

**************************************************************************
NOTE: The pre-startup testing of the system should be performed to verify the integrity of each component and of the whole system prior to actual startup.
**************************************************************************

Subject each component of the system to the pre-startup testing as described below:

a. Pressure test piping and hoses transporting liquid on clean water for at least one hour, with no loss of pressure at 1.5 times the working pressure; pressure test tanks at the maximum hydraulic head using clean water;

b. Test electrical wiring to verify that there is no wiring damage or deterioration that could cause injury to personnel or damage to equipment;

c. Turn power on to test equipment and control systems only after the electrical systems are tested and certified ready for operation;

d. Test lighting and put in service to support work in all areas of the plant;

e. Test rotating equipment such as pumps, mixers, and blowers, if used, for correct direction of rotation by bumping the starter manually;

f. Operate each pump for a minimum of [4] [_____] continual hours at operating or test conditions. Ensure that the units, controls and instrumentation have been installed correctly, and that there is no over-heating, vibration or excessive noise;

g. Depending on the complexity of the control system, testing can proceed from this point to verify that manual and automatic controls function properly and control valves open/close. Fill all tanks and empty to determine if high and low level alarms sound at the prescribed liquid level;

h. Test safety shutdown sequences, controls/alarms and interlocks in the control system to ensure that they are installed properly and functioning as intended;

i. Label and test each emergency shutoff switch to determine that it works properly;

j. Test electrical "lockout" devices with padlocks to ensure that power has been disconnected;

k. Calibrate instrumentation before systems are put into service. Test
all pressure and temperature gauges against standardized gauges. Utilize NIST SP 250 calibration standards where they exist.

3.4.4 Startup Performance Testing

**************************************************************************
NOTE: The startup check and functional performance tests should be performed in accordance with the manufacturer's recommended procedures. The startup should proceed following a startup plan prepared well in advance. Performance testing begins with equipment or components, proceeds through systems, and ends with the complete treatment system passing its performance specifications and contractual requirements testing.
**************************************************************************

Do not initiate startup until after each component of the system has been demonstrated to meet the requirements of the pre-startup testing and until written approval has been received from the Contracting Officer. Once steady state operation is achieved, perform a functional performance test as described in the following startup checklist:

a. Check flow rates, pH, and contaminant levels of the wastewater feeding the reactor tank;

b. Check pump operating points to verify that the actual operating point matches the pump curve specification for flow and pressure;

c. Start/stop pumps from all control mechanisms;

d. Check that current draw and voltage balance match specifications for all phases;

e. Check the reagent feeding systems to verify that the actual chemical feed rate is within the specified accuracy range;

f. Check the pH in the reactor to verify that operating values are within the design range;

g. Adjust the reagent feed rates, and the pH control system as required to achieve maximum metal removals;

h. Monitor the composition of the effluent to verify that it meets the specified performance requirements.

i. Check the clarifier overflow rate to verify that it is within the design range;

j. Check the sludge collecting device to verify that it is operating properly, and no sludge is overflowing the weir;

k. Check the control system to verify that the system operates within set parameters; and

l. Check the monitoring systems and instruments to verify that they hold calibration.

m. Include [48] hours of operation processing water from the
design influent source at design capacity and meeting effluent requirements with less than 20 percent down time. Before system acceptance, the Contractor is required to correct any deficiencies and complete all performance checks. Replace or upgrade equipment not capable of performing as specified at no additional cost. Submit Proof of Performance and Equipment Certificate of Conformance as specified. Submit a list of the proposed operating conditions for process parameters to be continuously monitored and recorded. Include detailed descriptions of the proof of performance schedule, operating conditions and parameters, influent sources, and required sampling and analyses.

3.4.5 Field Training

NOTE: The field training provided by the Contractor must be modified if the process will be operated by the Contractor for the first year.

Upon completion of the installation and at a time designated by the Contracting Officer, conduct a field training course for a representative of the Government in the operation and maintenance of equipment furnished under the contract. Ensure these field instructions cover all the items contained in the operation and maintenance instructions. Provide training for a total period of [8] [16] [_____] hours per day for a period of [5] [_____] days of normal working time and start after the system is functionally complete but prior to final acceptance tests. Ensure field instructions cover the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations. Prepare a video tape of the field training course as a permanent record for future training use.

3.4.6 Operation and Maintenance Manual Updates

NOTE: The O&M Manual is intended for use by operating personnel and should be adapted to the particular features of the equipment installed; therefore, the document must be written for the operator.

Include the following items in the O&M manual:

a. General description of the treatment process;
b. A detailed description of equipment;
c. Process flow diagram;
d. Piping and instrumentation diagrams;
e. Certified drawings for equipment components and equipment layout;
f. Practical operating procedures including performance testing, influent, and effluent concentrations, and trend analysis of influent;
g. A complete set of fully updated and annotated piping and instrument diagrams, process flow diagrams, instrument indexes, control ladder...
logic diagrams, description of controls, alarms, interlocks, instrument interface, and maintenance procedures;

h. Specialty items such as type of oil and grease, desiccants, tools, analytical instruments, etc.;

i. Initial startup procedures;

j. Emergency and scheduled shutdown procedures;

k. Monitoring and quality control, spill controls;

l. Equipment specifications;

m. A list of modes of failure for each piece of equipment;

n. Fault/failure analysis, and trouble shooting guide;

o. List of spare parts;

p. Process safety and protective equipment requirements; and

q. Record keeping (electronic or other) requirements.

In order to plan all the inspection and maintenance operations required for plant operation, the contract is required to provide a maintenance schedule. Include the following items in the maintenance schedule:

a. Scheduled maintenance procedure for each piece of equipment;

b. Sensor and measurement device calibration frequency;

c. Periodic reports regarding consumption of chemicals such as acid, caustic, polymer, and coagulants;

d. Electronic or other recording data;

e. Personnel training requirements;

f. The time required for each maintenance task;

g. Equipment shutdown and lock and tag requirements during maintenance/repair; and

h. Mothballing and preservation procedures for equipment layaway.

Record the entire schedule and the results of each task for future analysis. Include other items as follows:

a. Spare parts list with suppliers and costs;

b. Plant utility requirements such as electrical, air, drinking water, service water, telephone, and sewer;

c. Detailed safety procedures for chemical handling; and

d. Name, address, and telephone number of technical personnel to contact in case of an emergency related to the treatment system.
Final acceptance of the P/C/F system is contingent upon these documents being supplied, reviewed, and approved by the Contracting Officer.

3.4.7 System Operation by Contractor

Do not initiate the first period of operation until after the Contractor has successfully completed all work and received written approval from the Contracting Officer. Continue to operate the system for a period of [30 days] [6 months] [1 year] [_____] being responsible for operations, process monitoring, maintenance, chemical testing, and record keeping during operation in conformance with this specification.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for prefabricated package wastewater treatment biochemical and aeration systems, including extended aeration, contact stabilization, step aeration, and complete mixing. These facilities are intended for treatment of domestic wastewater only. Special consideration must be given to wastewater containing industrial wastes.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: On the project drawings, show:

1. Type of plant: (Extended Aeration, Contact Stabilization, Step Aeration, or Complete Mixing).
2. Design flow.
3. 5-day BOD loading.
4. Suspended solids loading.
5. Whether a comminutor is needed for facilities 1.09 L/s 25,000 GPD or less in size.

6. Whether mechanical aerator is allowed.

7. Whether plant should be concrete, steel, composite, or a combination.

8. Whether piling is required for foundations.

9. Whether hypochlorinator or whether chlorinator will used for facilities in 4.38 to 6.57 L/s 100,000 to 150,000 GPD range.

10. Whether raw wastewater recirculation box (recirculation to pumping station) is needed.

11. Whether plant is to be of aboveground or belowground construction.

12. Seismic loading (if necessary).

13. Electric power characteristics for motors.

14. Whether automatic operation of air lift pumps are required.

15. Wind load and ice load for rotating sludge collector.

16. Organic loading (5-day BOD).

17. Total suspended solids.

18. Size of hypochlorite mixing chamber if larger capacity than 113.4 L 30 gallons is needed.

19. Size of hypochlorite solution chamber if larger capacity than 208 L 55 gallons is needed.

20. Whether, for extended aeration type plant, eventual conversion to step aeration type is anticipated.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding
Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Spare Parts

Provide manufacturer recommended spare parts that are identical and interchangeable with original parts. Protect spare parts from corrosion and furnish in clearly marked containers. Spare parts must meet standards recommended by the manufacturer in the manufacturer's operation, maintenance, or instruction manual.

1.4 QUALITY CONTROL

Unless otherwise specified, all materials and equipment must be new and be standard commercial products in regular production by the manufacturer, and suitable for the required service.

1.4.1 Manufacturer's Representative

Procure the services of an engineer representative of the manufacturer of the major portion of the treatment plant who is also familiar with the other equipment furnished. The representative inspects the equipment after erection, make adjustments in placing the equipment in operation, and is present during final inspection, start-up, and acceptance test.

1.4.2 Regulatory Requirements

**************************************************************************
NOTE: Ensure compliance with NPDES permits.
**************************************************************************

Conduct a regulatory review to determine impact of new and existing permit conditions and regulations. Notify the Contracting Officer of any discrepancies.
1.4.3 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and which essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment manufacturer must be able to provide on-site support and should be convenient to the site.

1.4.4 List of Prior Installations

Submit a list of installations where plants of similar type as specified have been constructed, including the date of construction and capacity of the plant. Certify that the plant furnished and installed is the latest model and that spare parts are available.

1.4.5 Welding

Weld in accordance with AWS D1.1/D1.1M.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery and Storage

Inspect materials delivered to site for damage. Unload and store with a minimum of handling. Store materials in enclosures or under protective covering. Rubber gaskets which are not to be installed immediately must be stored under cover, out of direct sunlight. Do not store materials directly on the ground. Keep interior of pipes, valves and fittings free of dirt and debris.

1.5.2 Handling

Handle pipe, fittings, valves, and other accessories in such manner as to ensure delivery in sound, undamaged condition. Avoid damage to coatings and linings on pipe and fittings; make repairs if coatings or linings are damaged.

1.6 PROJECT AND SITE CONDITIONS

1.6.1 Environmental Requirements

Comply with applicable local, state, and Federal environmental requirements as directed by the Contracting Officer.

1.7 WARRANTY

Provide a system with a minimum [5] [_____] year warranty. Submit the manufacturer's warranty for each piece of equipment.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Design Requirements

*************************************************************************
NOTE: Insert values for 5 day BOD loading, total suspended solids (TSS), and design and peak flow rates; values should be based on tests of the

SECTION 46 07 53 Page 14
wastewater to be treated. A typical influent value for BOD is 200 mg/L.

If effluent standards require a 5-day B.O.D. of less than 10 mg/L, effluent filters are recommended. Tertiary treatment may be required.

Provide a Package Wastewater Treatment Plant capable of treating wastewater with the following flow and removal requirements:

a. Average daily design flow of [_____] L/s gallons per day of domestic wastewater

b. Total Suspended Solids removal; [80] [90] [_____] percent

c. 5-day BOD removal; [80] [90] [_____] percent

The influent domestic wastewater has a 5-Day BOD and Total Suspended Solids (TSS) concentration between [200] [400] [_____] mg/L

2.1.2 Package Wastewater Treatment Plant

Plant material selection includes steel, concrete, composite. Among the factors to be considered are initial cost, maintenance costs, life expectancy, and possible need for relocation during period of useful life.

The Package Wastewater Treatment Plant includes a [comminutor,] aeration chamber, [flow equalization chamber,] clarifier chamber, sludge holding chamber, disinfection chamber, aeration equipment, and other related equipment. Duplicate facilities of equal size having a combined capacity equal to the average design flow specified when one unit is out of service are acceptable.

2.1.3 Components and Systems

NOTE: Delete reference to mechanical sludge collection equipment for extended aeration type below 0.66 L/s 15,000 GPD capacity. For facilities below 0.66 L/s 15,000 GPD capacity, hopper bottom only should be specified for settling chambers. For facilities above 4.38 L/s 100,000 GPD capacity, mechanical sludge collectors only should be used in clarifier chambers. For plants between 0.66 L/s and 4.38 L/s 15,000 and 100,000 GPD capacity, either hopper bottom or mechanical sludge collector should be allowed as a Contractor's option.

Delete reference disinfection equipment not used. Hypochlorinator may be specified for facilities 4.38 L/s 100,000 GPD capacity and below. Chlorinator may be specified for facilities 6.57 L/s 150,000 GPD capacity and above. Between 4.38 L/s and 6.57 L/s 100,000 GPD and 150,000 GPD capacity either is
suitable. Selection should be made on basis of existing station or base practices, local availability, and comparative costs.

Delete reference to mechanical sludge collector for extended aeration of 4.38 L/s 100,000 GPD capacity and less and for step aeration of 3.0 L/s 67,500 GPD capacity and less.

The Package Wastewater Treatment Plant includes the following equipment: A diffused air aeration system [or mechanical aerator(s)] for the aeration chamber and the sludge holding chamber; [mechanical sludge collection equipment for the clarifier chamber;][ froth control system for the aeration chamber;] sludge pumps in the clarifier chamber and the sludge holding chamber for sludge transfer; scum removal system for the clarifier chamber; [a comminutor at the plant inlet;] a disinfection system, and all necessary piping.

[2.1.4 Concrete Work

**************************************************************************

NOTE: The applicable requirements for cast-in-place concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE and Section 03 45 33 PRECAST [PRESTRESSED] STRUCTURAL CONCRETE should be incorporated into the appropriate section of the project specification.

**************************************************************************

Concrete work includes [concrete plant walls, partitions, and bottom;] [support slab for all-steel plant or concrete bottom for steel wall plant;] and concrete pad for equipment support.

]2.2 MANUFACTURED UNITS

2.2.1 Process Chambers

**************************************************************************

NOTE: Use appropriate wording depending on whether plant is to be installed above ground (hydrostatic pressures...liquid level) or below ground (soil pressures...operating level).

Delete reference to comminutor and screening basket when not required for the plant. For facilities of 1.09 L/s 25,000 GPD capacity and below, the comminutor and bar screen unit may be omitted, and in lieu thereof, a screening basket provided in the aeration chamber. For installations in which all wastewater has passed through a comminutor and bar screen upstream of the plant, a comminutor and bar screen unit need not be provided as a part of the plant equipment.

Delete reference to influent distribution channel for extended aeration type.

For a detention time in the aeration chamber,
values of 18 to 24 hours for extended aeration, 5.0 to 7.5 hours for step aeration, and 30 minutes to 2 hours for contact stabilization systems.

For organic loading in aeration chamber, insert 5.67 kg 12.5 pounds, 5 day BOD for extended aeration, 13.6 to 22.1 kg 30 to 50 pounds, 5-day BOD for step aeration, and 52.16 kg 115 pounds, 5-day BOD for complete mixing systems. Organic loadings used in this specification are those for wastewater strength of 200 mg/L. Organic loadings for higher strength wastewater would be proportional.

Delete the requirement for clarifier chamber detention time when the complete mixing process is specified.

For detention time in the clarifier chamber for extended aeration, insert 4.0 hours for plants of less than 2.19 L/s 50,000 GPD, 3.6 hours for plants from 2.19 L/s 50,000 GPD to 6.57 L/s 150,000 GPD capacity, and 3.0 hours for facilities of 6.57 L/s 150,000 GPD capacity and above. For step aeration, insert 3.0 hours.

Delete reference to mechanical aeration when step aeration or complete mixing is specified, or when not allowed for extended aeration. Mechanical aerator may not be suitable for use in areas having prolonged periods of sub-freezing temperatures when spray may form accumulation of ice. Consideration should be given to temperature and detention time of the liquid and freeboard in the chamber in determining temperatures that may be tolerated. Mechanical aerator is not suitable for extended aeration where eventual conversion to step aeration is contemplated.

For extended aeration, insert 0.013 L/s 300 GPD for 6.57 L/s 150,000 GPD capacity and less; and 0.026 L/s 600 GPD for facilities of more than 6.60 L/s 150,000 GPD capacity. For step aeration, insert 0.026 L/s 600 GPD. For complete mixing, insert 0.02 L/s 50 GPD.

Delete reference to mixing with aeration chamber contents for extended aeration and step aeration.

Delete references to and requirements for seismic loading when unnecessary to consider seismic loading. For specific environmental loads (wind, seismic) see UFC 3-301-01.

**************************************************************************

Pass the raw wastewater through a [comminutor] [screening basket] [and an influent distribution channel], aeration chamber of adequate capacity to provide [not less than [_____] hours detention time and] a maximum organic loading not to exceed [_____] kg per 1000 cubic meter [_____] pounds 5-day BOD per 1,000 cubic feet of aeration chamber volume at average design flow.
rate. A clarifier chamber of adequate capacity to provide [not less than [_____] hours detention time and] a surface settling rate not to exceed [_____] L/s per square meter GPD per square foot at average design flow rate. The settled sludge is [collected by a mechanical sludge collector and] recirculated back to the aeration chamber [where it is rapidly and thoroughly mixed in with the aeration chamber contents,] or wasted to the sludge holding chamber. Size a disinfection chamber to provide a detention time of at least 15 minutes at peak flow and then to an outfall. The sludge holding chamber has a capacity of not less than 0.057 cubic meter 2 cubic feet per capita. Aeration is by [diffused air] [mechanical aeration]. Plant includes an aeration chamber, [equalization chamber,] clarifier chamber, sludge holding chamber, and disinfection chamber. Chambers may be separate or contiguous with a common partition between. Ensure the plant structure and separate chamber structures withstand [hydrostatic pressures [and seismic loading] when installed above grade and filled to normal operating liquid level] [soil pressures (as indicated by Government-furnished soil borings) when installed below grade, backfilled, and dewatered] [and seismic loading when installed below grade, backfilled, and filled to normal liquid operating level]. The plant and foundation must have sufficient mass to overcome flotation forces when the entire plant is dewatered. Provide for dewatering of individual chambers or compartments and the entire plant.

The Package Wastewater treatment Plant is constructed of [steel] [composite] [concrete] [_____.] It must be complete and self-sufficient except for electric power, water supply, and disinfection agent. All structural steel must conform to ASTM A36/A36M. All submerged steel members must have minimum thickness of 6 mm 1/4 inch. Perform cast-in-place concrete in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Precast concrete must be in accordance with [_____.] Results of Government-made soil bearing tests will be furnished to the Contractor.

2.2.1.1 Aeration Chamber

**************************************************************************
NOTE: A mechanical aerator may not be suitable for use in areas having prolonged periods of sub-freezing temperatures when spray may form accumulation of ice. Consider temperature and detention time of the liquid and freeboard in the tank in determining temperatures that may be tolerated. A mechanical aerator is not suitable for extended aeration type where eventual conversion to step aeration is contemplated.
**************************************************************************

The aeration chamber will have capacity to provide [a minimum of [24][_____] hours retention of the average daily flow] [a volume of [_____] L gallons]. Ensure that the interior configuration of the aeration chamber provides thorough mixing and efficient air dispersion, precludes short-circuiting of the liquid flow, and inhibits solids deposition. Provide a [_____] mm inch diameter influent opening, reinforced with a pipe flange or steel plate and with a suitable connection for the [inlet sewer] [raw wastewater pump discharge pipe]. Provide air diffusers in accordance with paragraph DIFFUSED AIR AERATION EQUIPMENT.
2.2.1.2 Clarifier Chamber

NOTE: Delete the first and fourth sentences for extended aeration type facilities above 4.38 L/s 100,000 GPD capacity, step aeration type facilities above 3.0 L/s 67,500 GPD capacity, and for all complete mixing type facilities.

Delete reference to mechanical sludge collection equipment for extended aeration type below 0.66 L/s 15,000 GPD capacity. For facilities below 0.66 L/s 15,000 GPD capacity, hopper bottom only should be specified for clarifiers. For facilities above 4.38 L/s 100,000 GPD capacity, consider mechanical sludge collectors clarifier chambers. For facilities between 0.66 L/s and 4.38 L/s 15,000 and 100,000 GPD capacity, either hopper bottom or mechanical sludge collector may be allowed as a Contractor's option.

In all facilities (except circular facilities with a concentric inner clarifier) where the design flow exceeds 4.38 L/s 100,000 GPD, the clarifier chamber should be in multiple units each capable of independent operation and whose combined capacity equals the design flow rate when one unit is out of operation. In fourth sentence, delete first and third optional wordings when design flow is 4.38 L/s 100,000 GPD and below; delete second optional wording when design flow exceeds 4.38 L/s 100,000 GPD.

[Provide clarifier chamber with a minimum of 4 hours retention time and a hopper bottom[ when mechanical sludge collection equipment is not provided]. ]The clarifier chamber[, except in circular facilities with a concentric inner tank,] is [in a single unit][ or ][in multiple units] [each of which is capable of independent operation and] whose combined capacity equals the design flow when one unit is out of operation.[ The hopper bottom of the clarifier cannot have slide slopes of less than 1.05 rad 60 degrees from the horizontal; horizontal area of hopper bottom is commensurate with the capability of the sludge pump for efficient sludge withdrawal. In lieu of the above, a flat bottom may be provided with a mechanical sludge scraper in accordance with paragraph SLUDGE AND SCUM COLLECTION AND TRANSFER EQUIPMENT.] Provide means of velocity control at the clarifier chamber inlet. Provide a scum baffle, weir, or other means to prevent scum from passing out with effluent. Provide air lift sludge and scum pumps in accordance with paragraph SLUDGE AND SCUM COLLECTION AND TRANSFER EQUIPMENT.

2.2.1.3 Sludge Holding Chamber

NOTE: Insert capacity, generally all waste sludge produced in one week of operation.

Provide a sludge holding chamber with a minimum capacity of [_____] cubic meters cubic feet. Provide a supernatant draw-off connection between the sludge-holding chamber and the aeration chamber. Provide an inlet pipe
2.2.1.4 Disinfection Chamber

Provide a disinfection chamber as an integral part of the plant or an adjacent detached tank. Ensure at least 15 minutes contact time at peak flow rate. Provide baffles to eliminate short-circuiting and ensure complete mixing. Provide disinfection equipment in accordance with paragraph DISINFECTION EQUIPMENT. Provide a flange on the outlet of the tank.

2.2.1.5 Structural Requirements for Steel Tanks

Provide tanks suitable for support by and anchorage to a concrete base. Steel tank walls and bottom are structural steel plate. Use minimum 6 mm 1/4 inch structural steel shapes for reinforcing and bracing are in the thinnest section. Placement of reinforcing and bracing cannot adversely affect the performance characteristics with the aeration tank. All sides, compartment partitions, tank bottoms, braces, and corners are continuously welded inside and out and ground smooth before priming. Ensure that water tightness is provided by means of welding. Ensure that the common partitions are reinforced to withstand pressures resulting from liquid level differentials that would occur when any individual compartment(s) is dewatered while contiguous compartments remain at normal operating liquid level.

2.3 EQUIPMENT

2.3.1 Aeration Equipment

**************************************************************************

NOTE: Delete reference to mechanical aerator when step aeration type or complete mixing type is specified, or when not allowed.

**************************************************************************

Aeration will take place by [diffused air] [fixed mechanical aeration]. Ensure that the aeration system supplies a minimum of [3] [_____] cubic meters of air per minute per 100 cubic meters of tank volume [30] [_____] cubic feet of air per minute per 1000 cubic feet of tank volume (cfm/1000 cu. ft.). The aeration equipment will completely mix the contents of the aeration tank and maintain a minimum velocity of 0.18 m/s 0.6 fps.

2.3.1.1 Diffused Air Aeration Equipment

**************************************************************************

NOTE: Delete reference to coarse bubble type when not allowed. For facilities of 2.19 L/s 50,000 GPD capacity and below, fine bubble diffusers or coarse bubble diffusers are allowed as Contractor’s option. For facilities of more than 2.19 L/s 50,000 GPD, use fine bubble diffusers.

**************************************************************************

Aeration equipment includes diffusers, diffuser holder assembly, air blower assembly, and piping. Provide [fine bubble] [coarse bubble] diffusers.
Ensure that the oxygen transfer capacity of the diffuser system is capable of furnishing an adequate supply of oxygen in the aeration tank to meet treatment requirements at the design wastewater load.

2.3.1.1 Air Diffusers

Ensure that the diffuser layout provides sufficient mixing capacity to thoroughly mix the waste water throughout the tank depth. Use fixed-nozzle diffusers, individually attached to the headers by screwed connections, U-bolts, or stainless steel straps and springs. Welded or other nonremovable connections are not acceptable. Ensure an oxygen transfer efficiency of at least 6 percent and a pressure drop not greater than 3.5 kPa 0.5 psi at the design flow rate. Provide diffusers of plastic, stainless steel, rubber, or other corrosion resistant material and seal under no-flow conditions to prevent wastewater from entering the piping system.

2.3.1.1.2 Diffuser Holder Assembly

**************************************************************************
NOTE: Delete reference to swing-out type when steel plant only is required.
**************************************************************************

The assembly includes an air control and shut-off valve and all the air piping downstream from this valve. Select a butterfly valve, plug valve, or globe valve suitable for air control with indicator markings for throttling and complete shut-off. The diffuser holder assembly is the [fixed type] [or swing-out type]. Ensure that the spacing of diffuser assemblies in the tank and diffusers on the header is as recommended by the diffuser manufacturer. Provide independently valved and supported headers capable of being independently removed from service without the use of a crane or hoist and without dewatering of the tank.

2.3.1.1.3 Air Diffusers

Provide a drop-pipe with air diffusers in the chamber with placement of diffusers near the bottom. Ensure that the amount of air supplied to the tank is sufficient to allow aerobic stabilization of solids and in no case less than 0.25 cubic meter per second of air per 1,000 cubic meters 15 CFM of air per 1,000 cubic feet of tank volume.

2.3.1.2 Mechanical Aeration Equipment

**************************************************************************
NOTE: Delete paragraph and subparagraph when step aeration type or complete mixing type is specified, or when mechanical aerator is not allowed.
**************************************************************************

Provide a fixed type mechanical aerator. Include a drive assembly, impeller shaft, impeller, and shroud. Provide all accessories necessary for proper operation and to generate the necessary required oxygenation capacity, including flow straightening surge rings or tank baffles.

2.3.1.2.1 Drive Assembly

Provide a fully enclosed for outdoor installation drive assembly including an electric motor, gear reduction unit, and bearings.
a. Motor: Motor is constant speed, totally enclosed, fan-cooled, horizontal type, with solid shaft, suitable for outdoor service, and conforming to NEMA MG 1. Ensure that the motor is of adequate wattage horsepower to drive the equipment continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Motor must be suitable for operation with the voltage characteristics indicated. Motor must be protected against overload, low voltage, and unbalanced voltage. Connect vertical motor directly to the gear reduction unit or else connect by a flexible coupling. Connect horizontal to the gear reduction unit by a flexible coupling only. In lieu of a constant speed motor with a gear reduction unit, a two-speed motor may be provided as a means of speed reduction.

b. Gear Reduction Unit: Ensure a minimum AGMA service factor when the unit is operating at full load motor wattage horsepower, 24 hours a day continuous running under moderate shock loads, of 1.5 for speed reducers and 2.0 for gear motors. Ensure a life expectancy of 100,000 hours with the probability of no more than 10 percent failures prior to its expected life. Gearing may be spur, helical, spiral bevel, or a combination. If helical, the helical angle must not exceed 0.314 rad 18 degrees. Worm gearing will not be acceptable. All gears must be AGMA Quality 10 or higher as outlined in AGMA ISO 10064-6, AGMA ISO 17485 or AGMA 2011. Provide a lubrication system for the gears.

c. Bearings must have a minimum rated life expectancy (L-10) of 100,000 hours based on ABMA 11 Standards when operating continuously at the rated full-load motor wattage horsepower and speed under the specified loading conditions. Internal bearings may be either oil or grease lubricated. All grease lubrication pressure lines must be fed from fittings accessibly located above the platform supporting the mechanism. Underwater bearings are not acceptable.

2.3.1.2.2 Impeller Shaft

Ensure that the shaft is of sufficient diameter to withstand the loading imposed by the impeller, using a safety factor of 1.5. The shaft must be removable from the speed reducer.

2.3.1.2.3 Impeller

The aeration blades must be designed to achieve the maximum aeration and pumping effect. The impeller must be readily removable from the shaft.

2.3.1.2.4 Shroud

Equip the aerator with a shroud to prevent the mixed liquor from splashing and spraying the underside of the supporting platform, walkway, railings, and walls of the aeration tank.

2.3.1.2.5 Mechanical Aerator Supports, Walkways and Rails

Place supports for mechanical aerator mounting plate on the bottom of the chamber or extended from structural steel beams on tank walls. Provide a service walkway to the mechanical aerator and handrails on each side.
2.3.1.3 Screening

**************************************************************************
NOTE: Delete comminutor and subparagraphs when comminutor is not required. For facilities of 1.09 L/s 25,000 GPD capacity and below, the comminutor may be omitted, and a screening basket provided. For installations in which all wastewater has passed through a comminutor and bar screen upstream, a comminutor is not required.
**************************************************************************

Provide a [comminutor] [screening basket] [bar screen] in the influent line immediately upstream of the aeration chamber.

[2.3.1.3.1 Comminutor]

Provide a rotating type comminutor capable of cutting all wastewater solids including sticks, rags, and stringy material without clogging the screen or binding, jamming or stalling the moving parts under normal load conditions. Ensure that the comminutor is capable of continuous operation and have a hydraulic capacity at least equal to the treatment facility peak flow rate and at zero flow conditions. Ensure that the screen configuration is such that all wastewater must pass through it before entering the treatment facility. Space screen bars not greater than 6 mm 1/4 inch apart. Provide cutters constructed of tool steel with a surface hardness of at least 35 on Rockwell C scale. Ensure cutters are removable for replacement. Ensure free discharge where the discharge is located above the liquid level in the aeration chamber or controlled discharge when partially submerged.

2.3.1.3.1.1 Comminutor Drive

Provide a comminutor driven by an electric motor, constant speed, totally enclosed, horizontal or vertical type, suitable for outdoor service, and conforming to NEMA MG 1. The motor must be of adequate wattage horsepower to drive the comminutor continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Motor must be suitable for operation with the voltage characteristics as indicated. Motor must be protected against overload, low voltage, and unbalanced voltage.

[2.3.1.3.2 Screening Basket]

Provide at the plant influent, a readily removable, fabricated steel screening basket, sized for maximum flow, located so that the total volume of incoming raw wastewater is screened before it enters the plant. Fabricate the basket from 5 mm 3/16 inch diameter 302 stainless steel wire or 10 mm 3/8 inch hot-rolled steel bars with 25 mm one inch space between bars.

[2.3.1.3.3 Bar Screen]

Provide an inlet bar screen to remove large solids from the incoming raw wastewater. Fabricate the bars from 13 mm 1/2 inch diameter bars spaced 25 mm one inch apart and arranged as shown in the drawings. The bars will be sloped to permit easy cleaning of debris. Furnish a drying deck for the debris.
2.3.2 Sludge and Scum Collection and Transfer Equipment

**************************************************************************
NOTE: For facilities below 0.66 L/s 15,000 GPD capacity, hopper bottom only should be specified for clarifier chambers. For facilities above 4.38 L/s 100,000 GPD capacity, mechanical sludge collectors should be used in clarifier chambers. For facilities between 0.66 L/s and 4.38 L/s 15,000 and 100,000 GPD capacity, either hopper bottom or mechanical sludge collector should be allowed.

Delete reference to mechanical sludge collection equipment for extended aeration facilities below 0.66 L/s 15,000 GPD capacity.
**************************************************************************

Provide equipment to collect sludge from the bottom of the clarifier chamber. Collect sludge through the use of a hopper bottom clarifier chamber or a flat bottom clarifier chamber with a mechanical collector. The equipment will also collect scum from the top of the clarifier. Sludge and scum collection and transfer equipment includes sludge transfer pump(s), [mechanical sludge collection equipment [(if used)],] scum collection and transfer system, and supernatant transfer.

2.3.2.1 Sludge Transfer Pumps

Provide a positive sludge recirculation system. If the sludge clarifier is the hopper bottom type, provide at least one air lift pump in each hopper. If the clarifier contains a mechanical sludge collector, provide an air lift pump at the collector discharge. Each air lift includes a foot piece, eductor, air and vent piping, and control valves. Sludge recirculation air lifts will have recirculation capacity of 0 percent to 150 percent of the design flow. Support pump and equip with a clean-out plug for cleaning and maintenance.

2.3.2.2 Mechanical Sludge Collection Equipment

If the clarifier does not have a hopper bottom, provide a mechanical sludge collector to scrape the entire tank bottom. Mechanical sludge collectors may be either the rotating arm or conveyor type. Drive the collector by an electric motor through an appropriate gear or chain drive. Position motors and drives above the plant high water level or use equipment suitable for submerged service. Ensure motors are totally enclosed and conform to NEMA MG 1. Furnish each motor with a magnetic starter with thermal overload protection and control devices conforming to NEMA ICS 1. Avoid sludge-residence time exceeding 3 hours. Scraper blades will be replaceable. Provide collector drive with overload protection.

2.3.2.3 Scum Collection and Transfer Equipment

2.3.2.3.1 Scum Collection in Hopper Bottom Settling Tanks

Scum collection is accomplished by means of a suction skimmer. Suction skimmer is a 50 mm 2 inch diameter drop pipe supported by a structural steel member and so mounted that it can be raised or lowered with respect to the liquid surface by means of stainless steel adjusting screws with hand knobs or by corrosion-resisting turnbuckles located above the liquid surface. Attach the lower end of drop pipe to a 50 mm 2 inch air lift by
means of a flexible hose of chloroprene or other material suitable for use in sewage.

2.3.2.3.2 Scum Collection in Circular Settling Tanks

Scum Collection in Circular Setting Tanks With Mechanical Sludge Collectors: Scum collector assembly includes a blade skimmer and a scum trough. Assembly is continuously move surface scum to the scum trough. The assembly discharges scum with a minimum discharge of water. Blade skimmer includes an arm fabricated of structural steel shapes and attached to a steel blade skimmer or floating redwood skimmer, with an adjustable chloroprene wiper. Scum skimmer is supported by the center shaft and one scraper arm. Scum trough is welded structural steel, minimum thickness 6 mm 1/4 inch, has a connection to the scum airlift pump, and supported from the tank wall or scum baffles. Shape the inclined approach ramp leading to the scum trough to contain the scum as it is moved up the incline to the trough by the scum skimmer.

2.3.2.3.3 Scum Collection in Rectangular Settling Tanks

Scum Collection in Rectangular Setting Tanks With Mechanical Sludge Collectors: Accomplish the scum collection by means of traveling blade or paddle skimmer or by suction skimmer. Attach the traveling blade or paddle skimmer to the traveling sludge collector at surface level and designed to sweep the surface of the settling tank in one direction only with each pass of the sludge collector. Collected scum is discharged into a trough, collector pipe or suction skimmer. Scum trough is steel, 6 mm 1/4 inch minimum thickness, with approach ramp and have a connection to the scum air lift pipe and supported from the tank wall. The collector pipe is steel pipe with a 1.05 rad 60 degree wide slot cut symmetrically above the vertical axis. At maximum intervals of 750 mm 30 inches, a 50 mm 2 inch wide band of full circumference is left for stiffness. End supports includes a rolled steel collar welded to an adjustable steel end plate. Provide a readily renewable grease-resistant, watertight seal and so constructed that it will allow smooth action of the revolving pipe. Ensure that the seal is readily renewable without removing pipe. Secure the end supports to the concrete walls by stainless steel anchor bolts having a minimum diameter of 16 mm 5/8 inch. Collector pipe operator is a manual, lever type, mounted on the collector pipe. Operator is steel pipe having a minimum diameter of 31 mm 1 1/4 inches and secured to the collector pipe with a bolted connection. The operator extends at least 900 mm 3 feet above the top of tank and permits rotation of the collector pipe to at least 0.52 rad 30 degrees of each side of the vertical axis. Ensure that the collector pipe has a suitable means of discharge to the scum airlift pump.

2.3.2.3.4 Scum Recirculation System

Scum transfer is accomplished by means of an airlift pump. Airlift pump consists of a 50 mm 2 inch airlift skimming device. The skimming device will skim and return floating material to the aeration chamber. Equip the supply airline with a valve to regulate the rate of return. Ensure the scum intake is adjustable providing exact positioning of the skimmer at water level.

2.3.2.4 Supernatant Transfer

When a pump is used for supernatant transfer, provide a positive means of flow regulation. Provide all necessary piping.
2.3.3 Froth Control System

**************************************************************************
NOTE: Froth removal may be required where nicardia foaming is a potential problem.
**************************************************************************

Provide a froth control system including: pump, piping, manifold, spray nozzles, and valves.

2.3.3.1 Froth Control System Pump

Provide an electric motor operated, self-contained, submersible pump suitable for the required service. Mount the pump with the suction no less than 50 mm 2 inches below the water surface but not so deep that the pump will pick up settled solids. Provide an intake screen around the pump suction. Ensure that the screen openings are no larger than the pump nozzle opening. Provide a watertight motor in accordance with NEMA MG 1. Provide controls, including a magnetic starter with start and stop buttons and a circuit breaker with reset button in conformance with NEMA ICS 1.

2.3.3.2 Spray Nozzles

Provide self-cleaning spray nozzles, that will produce a sharp flat or conical spray at normal pumping rates. Use spray nozzles of corrosion-resisting materials to provide sufficient force at a flow rate of 0.1 L/second 1-1/2 gpm per nozzle to effectively break down accumulated froth. Mount spray nozzles to provide uniform coverage of the chamber.

2.3.3.3 Piping and Valves

Provide a froth spray header of at least 25 mm one inch diameter galvanized steel or PVC pipe and mount above the water surface opposite the air diffusers. Provide for a garden hose connection for wash-down purposes.

2.3.4 Air Blower Assembly

Provide an air blower assembly including: air blowers, blower driver, V-belt drive (for positive displacement blower), housing and accessories. Provide each blower with [a filter-silencer on the suction side,] a check valve, pressure relief valve, and pressure gauge.

2.3.4.1 Air Blower

Provide at least two air blowers with the capacity to produce the plant air requirement at the necessary operating pressure including allowance for pressure drop in air piping, fittings, and accessories. The unit will deliver [_____] cubic meters/second cfm when operating at [_____] kPag psig. Ensure blowers are suitable for continuous operation. Each blower must have the capacity to provide the total plant air requirement.

2.3.4.2 Blower Driver

The blower drive consists of an electric motor, V-belts, and sheaves. Motor must be suitable for operation with the voltage characteristics as indicated. Blower motor will be weatherproof conforming to NEMA MG 1. Provide a constant speed, totally enclosed, fan-cooled motor, suitable for outdoor service, and conforming to NEMA MG 1. Ensure that the motor is of adequate wattage horsepower to drive the equipment continuously at the

SECTION 46 07 53 Page 26
maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Ensure that the motor is suitable for operation with the voltage characteristics as indicated. Protect the motor against overload, low voltage, and unbalanced voltage. Provide any silencing or dampening required.

2.3.4.3 Air Blower and Blower Driver Housing

Mount the blower-driver on a base plate with vibration dampening in a weatherproof, corrosion resistant enclosure. Ensure that the base plate has provisions for adjustment of V-belt tension, and provides the necessary anchoring. Provide louvers or ventilation adequate to provide air for cooling and, if the intake is in the enclosure, for blower supply. Allow access to the blowers and motors for maintenance.

2.3.4.4 Air Blower Accessories

[2.3.4.4.1 Air Filter Silencer

**************************************************************************
NOTE: Optional, consider use of filter-silencers on blowers of 0.094 cubic meters/second 200 cfm or less or separate silencer and air filter as well as a discharge silencer on blowers over 0.094 cubic meters/second 200 cfm.
**************************************************************************

Provide filter-silencer type, cleanable, air filters. If filters are mounted outside, provide weatherproof enclosures. Provide filters having a maximum pressure loss of 25 mm 1.0 inch water gage mm In.W.G. at the maximum capacity of blower when clean. Ensure that the silencing chamber has a peak attenuation in the frequency range 300–1, 1,200 cycles per second.

]2.3.4.4.2 Pressure Relief Valve

Provide a pressure relief valve for each blower on the discharge side. Furnish a valve for a pressure setting of not more than 90 percent of the maximum operating pressure.

2.3.4.4.3 Check Valve

Provide a check valve on the discharge side of each blower.

2.3.4.4.4 Pressure Gage

Provide an air pressure gage on the discharge line from each blower. Gauge scale range to include the full range of expected operation and up to 125 percent, but not more than 150 percent of maximum. Mount the gages in an easy to read location within the enclosure.

2.3.5 Disinfection Equipment

**************************************************************************
NOTE: Delete the reference to a heater for plants in areas where freezing temperatures are not encountered.
**************************************************************************

For small facilities of that do not require flow
proportional chlorination, a tablet chlorinator offers a safe and effective means of disinfection.

Delete unused disinfection system paragraphs below. Hypochlorinator may be specified for plants 4.38 L/s 100,000 GPD capacity and below. Chlorinator may be specified for all plants 6.57 L/s 150,000 GPD capacity and above. Make a selection on basis of existing station or base practices, local availability, and comparative costs.

**************************************************************************

Provide the manufacturer's standard disinfection system [Chlorine Tablet Feed] [Chlorinator Assembly] [Hypochlorinator Assembly] [UV Disinfection].

[2.3.5.1 UV Disinfection]

Ultra-violet system includes lamps, ballasts, and controls.[ Provide heater.]

][2.3.5.2 Chlorine Tablet Feed]

Provide a tablet chlorinator feeder[, provide heater if required].

][2.3.5.3 Hypochlorinator Assembly]

Provide hypochlorite assembly in accordance with Section 46 31 11 CHLORINE GAS FEED EQUIPMENT. Provide an adjustable capacity system of between 2 to 8 mg/L of chlorine equivalent, with fully automatic and manually adjustable operation[, provide heater if required].

][2.3.5.4 Chlorinator Assembly]

Chlorinator assembly includes chlorinator, scale, chlorine gas manifold, flexible connector, water piping, chlorine solution piping, vent tubing, vacuum signal tubing, diffuser, and housing. Provide chlorinator assembly in accordance with Section 46 31 11 CHLORINE GAS FEED EQUIPMENT. Ensure that the chlorinator has proportional-automatic control. Ensure that the chlorinator receives chlorine gas from chlorine cylinders and water from the water supply system[, provide heater if required]. Discharge the chlorine solution through piping to the diffuser located in the chlorine contact chamber.

][2.3.6 Flow Measuring Equipment]

2.3.6.1 V-notch weir

Use a V-notch weir that can measure flow to plus or minus 2 percent of the actual rate over a five-to-one range.

2.3.6.2 Float Operation

Provide flow measurement of wastewater by an effluent weir and a recorder. The recorder will be of the electrically operated circular or strip chart type and continuously record the flow through the plant in L/second gpm. The recorder will also produce an electrical signal in proportion to the flow for control of the chlorinator. Provide a weatherproof enclosure for the recorder.
2.3.6.3 Ultrasonic Measuring

Measure wastewater flow by an effluent weir and an ultrasonic flow meter with digital recorder. Measurement is noncontact, echo-time measuring-type for use with V-notch weir. Provide reference receivers for instant compensation in gas medium for temperature, atmospheric pressure and humidity changes. Provide a NEMA 4X enclosure for the transmitter and include an indicator and recorder. Ensure the transmitter provides a flow proportional signal if required.

2.3.6.4 Flow Control

Provide adjustable weirs at the inlet and outlet of the disinfection chamber for control of wastewater depth in the plant.

2.4 COMPONENTS

2.4.1 Piping System

2.4.1.1 Air Piping

Air piping includes all piping from the blowers to the diffusers and air lift pumps. Provide gate valves in air piping branches from air main when serving two or more air diffuser drop pipes; provide gate valves as blow-off valves for air mains.

2.4.1.2 Sludge Return, Waste Sludge and Scum Return Piping

Provide valves on air lift discharge piping between the air lift discharge riser and the air separator. Provide gate valves, globe valves, or plug valves in branch piping for return sludge and waste sludge lines when separate return sludge and waste sludge pumps are not used.

2.4.1.3 Froth Control System Piping

Provide valves in suction and discharge piping to froth control pump and in the froth control main line piping.

2.4.1.4 Miscellaneous Piping

Provide a flanged connection to incoming wastewater line. [Provide inlet piping for concrete aeration tanks in sleeve in wall and connected to incoming sewer by means of a grout ring. ]Provide gate valves or shear gates for a tank drain or dewatering piping.

2.4.2 Electrical Control System Components

**************************************************************************
NOTE: Specify outdoor type enclosure except when enclosure will be located in a building.
**************************************************************************

The system includes enclosure; main and branch circuit breakers; starters, contactors, and reset buttons; selector switches, push buttons, and pilot lights; circuit control items for electrical control of the various plant components; and all necessary wiring and tubing. Provide an electrical control system in accordance with NEMA ICS 1. Ensure that all electrical components are in accordance with the requirements of NFPA 70.
Mount electrical controls in [outdoor weatherproof enclosure, NEMA [3R][4X]] [indoor enclosure, NEMA 1 OR NEMA 12]. Wire electrical controls so that the various items of plant equipment can be operated either manually or automatically. Completely wire all electrical control system components and mount in the enclosure at the manufacturer's facility and test prior to shipment from the factory. The electric service available is [_____] volt, [_____] phase, [_____] Hertz, [_____] wire. [Install all push buttons, selector switches, and indicating lights on the outside of the door(s), properly identified with name plates. ]Identify all components on the [outside of enclosure and on the] internal panel.

2.4.2.1 Sequence of Operation

Ensure the electrical control system and its components perform the following automatic functions:

******************************************************************************
NOTE: Delete reference to comminutor when not required.
******************************************************************************

a. The 7-day program timer automatically starts and stops the blowers [comminutor,] [and froth control system pump]. A percentage timer automatically starts and stops blower motors.

b. If operating lead blower should stop, standby blower, acting in response to setting of failure transfer timer, automatically starts and stays in operation until such time as lead blower returns to service. Range of failure transfer timer is such as to prevent the transfer to the standby system from such causes as momentary interruptions of power, loss of power and similar malfunctions. Provide a selector switch to allow manual change in the lead-standby system. Arrange pressure switches in the motor control circuit to cause the system failure transfer circuit to operate when there is a lack of or loss of pressure due to belt slippage or breakage, or air loss, until such time as the fault is corrected. Horn and warning light alarm circuits are energized to indicate that the standby system has replaced the selected lead blower in operation.

c. [Chlorinator is controlled by the flow meter and starts, stops, and proportionally regulates the dosage in response to the received signals. ][Hypochlorinator][Tablet feeder] starts and stops in response to signals from liquid level sensing probes.]

d. Thermostat automatically places into operation equipment automatically taken out of service by the 7-day timer when the outside air temperature drops below 0 degrees C 32 degrees F or any other predetermined temperature setting.

e. A percentage timer automatically controls the sludge transfer pump, scum transfer pump, and supernatant return pump.

[f. Ensure that the froth control system pump is suitably interlocked with blowers so as to automatically start and stop in parallel with the blowers.]

2.4.2.2 Circuit Breakers

All circuit breakers must be thermal magnetic type and meet the
requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.4.2.2.1 Main Circuit Breaker

Ensure that the main circuit breaker has a maximum capacity of 150 percent of the electrical load. The main circuit breaker has an external handle mechanism mounted outside the enclosure to permit operation of this breaker from outside the enclosure. Provide the main circuit breaker with positive locking device to permit locking the operating handle.

2.4.2.2.2 Branch Circuit Breakers

**************************************************************************
NOTE: Delete references to unused components.
**************************************************************************

Provide an E-frame bolt-on type branch circuit breakers mounted on an interior bus bar. Provide branch circuit breakers for each blower, [comminutor,] [mechanical aerator(s),] froth control system pump, [sludge collector drive motor,] [hypochlorinator,] control circuit, [control circuit transformer,] flow meter, [chlorinator housing heater,] [hypochlorinator housing heating device,] drive motor, lighting circuit(s), and receptacle. Ensure that the panel includes spaces for four additional circuit breakers.

2.4.2.3 Starters, Contactors, and Reset Buttons

Provide magnetic starters for each blower motor, [(each) mechanical aerator motor,] [comminutor motor,] and froth control system pump motor, [sludge collector drive motor]. Mount reset buttons for magnetic starters on enclosure doors.

2.4.2.4 Selector Switches, Pushbuttons, and Pilot Lights

Mount selector switches, pushbuttons, and pilot lights on the outside of the enclosure. Provide One Hand-Off-Automatic (H-O-A) selector switch for each motor starter. Provide one selector switch for changing lead blower in the lead-standby system. Provide push buttons for manual (Hand) operation of motors. Provide pilot lights for each H-O-A selector switch: red to indicated motor is running and amber to indicate automatic operation. Connections to the selector switch are such that only the normal automatic regulating control devices will be by-passed when the switch is in the "Hand" position. Connect all safety control devices such as motor overload protection devices in the motor control circuit in both the "Hand" and "Automatic" positions.

2.4.2.5 Circuit Controls

**************************************************************************
NOTE: Delete last sentence when not necessary.
**************************************************************************

Circuit controls include the following: Program timer, 30-minute percentage timer, thermostat, control circuit transformer, and all necessary relays and pressure switches to carry out the sequence of operation as specified above. Program timer is the 7-day type, electric motor driven, with each hour of the day shown. Ensure that the time intervals are adjustable with a minimum switching interval of 4 hours. Percentage timer is 30-minute type.[ Provide a transformer to step down
incoming service voltage to 120 volts.]

[2.4.2.6 Alarm

**************************************************************************
NOTE: Delete requirements for alarm circuit auxiliary contacts where transmission of alarm to remote 24-hour manned station is impractical or not desired. Transmission is preferred where necessary to expedite investigation of alarm condition. Insert identity of remote location. Provision should be made in the appropriate section of the project specification to extend alarm circuit wiring from auxiliary contacts to the remote location.
**************************************************************************

Provide a horn or 150 mm 6 inch bell alarm, battery and necessary circuits to sound alarm:

a. when standby blower(s) has replaced lead blower

b. when power to plant has been interrupted

[ Include an alarm circuit with auxiliary contacts for transmission of signal indicative of either alarm condition to [____].

]2.4.2.7 Electrical Wiring

Wire all control circuits in accordance with the Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.5 MATERIALS

2.5.1 Treatment and Painting

Except as otherwise specified, treat and paint equipment in accordance with the manufacturer's standard practice.

2.5.2 Lubrication

For equipment requiring lubrication, provide means for lubrication of all moving parts and lubricate prior to delivery.

2.5.3 Steel Plates, Shapes, and Bars

For steel plates, shapes, and bars, conform to ASTM A36/A36M or ASTM A276/A276M.

2.5.4 Ductile Iron Pipe and Fittings

For ductile iron pipe, conform to AWWA C151/A21.51, ASME B16.4 and ASME B16.5.

2.5.4.1 Flanged Ductile Iron Pipe

For flanged pipe, conform to AWWA C115/A21.15 with ASME B16.1, Class 125 flanges.
2.5.4.2 Joints
For joints for ductile iron pipe, conform to AWWA C111/A21.11.

2.5.4.3 Fittings for Ductile Iron Pipe
For fittings for ductile iron pipe, conform to AWWA C110/A21.10.

2.5.5 Steel Pipe
For steel pipe, conform to AWWA C200.

2.5.5.1 Flanged Joints
For flanged joints, conform to AWWA C207, Class B Ring Type.

2.5.5.2 Slip Joints
For slip joints, conform to AWWA C200.

2.5.5.3 Mechanical Joints
For mechanical joints, conform to AWWA C200.

2.5.5.4 Welded Joints
For welded joints, conform to AWWA C206.

2.5.5.5 Fittings for Steel Pipe
For steel pipe fittings, conform to AWWA C200.

2.5.6 Galvanized Steel Pipe and Fittings
Galvanized steel pipe will conform to ASTM A53/A53M, standard weight, galvanized. Pipe smaller than 100 mm 4-inch diameter will have screwed joints in accordance with ASME B1.20.2M ASME B1.20.1. Fittings will be galvanized malleable iron in accordance with ASME B16.3. Pipe 100 mm 4-inch diameter and larger has flanged joints and fittings in accordance with AWWA C207.

2.5.7 Polyvinyl Chloride (PVC) Pipe and Fittings
PVC pipe and fittings less than 100 mm 4-inch diameter will be in accordance with ASTM D1785 or ASTM D2241. PVC pipe and fittings 100 mm 4 inch in diameter and larger is in accordance with ASTM D2241 or AWWA C900 and have push-on joints.

2.5.7.1 Push-On Joints
Push-on joints will conform to ASTM D3139 or ASTM F477.

2.5.7.2 Solvent Cement
Solvent cement will conform to ASTM D2564.

2.5.8 Pipe Hangers and Supports
Pipe hangers and supports will conform to MSS SP-58.
2.5.9 Valves

2.5.9.1 Angle, Check, and Globe Valves

Angle, check and globe valves will conform to MSS SP-80, Type 3 Globe and Angle, Types 3 and 4 Check.

2.5.9.2 Gate Valves

Gate valves will conform to MSS SP-80 or MSS SP-70.

2.5.9.3 Plug Valves

Bronze plug valves will conform to MSS SP-78. Iron plug valves will conform to API Spec 6D.

2.5.10 Butterfly Valves

Provide butterfly valves conforming to AWWA C504.

2.5.11 Joint Compound

Joint compound for screwed joints will be a stiff mixture of graphite and oil, inert filler and oil, or a graphite compound.

2.5.12 Joint Tape

Joint tape for screw joints will conform to ASTM D3308.

2.5.13 Bolts and Nuts

Bolts and nuts will conform to ASTM A307, Grade B.

2.5.14 Gears

2.6 ACCESSORIES

[2.6.1 Chlorine Gas Manifold

Ensure that the chlorine gas manifold is a material resistant to chlorine and suitable for the working pressure involved.

2.6.2 Flexible Connector

Ensure that the flexible connector between the chlorine gas manifold and the chlorinator is extra-heavy Type K seamless copper tube conforming to ASTM B88M ASTM B88.

2.6.3 Water Piping

Water piping is schedule 80 PVC piping with solvent welded joints. Provide a gate valve and check valve conforming to MSS SP-80 and a Y-pattern brass or stainless steel strainer.
2.6.4 Solution Piping

Ensure that the solution piping from chlorinator to diffuser is flexible polyethylene pipe, chlorine solution hose, rigid polyvinylchloride (PVC) pipe, or rigid acrylonitrile-butadiene-styrene (ABS) pipe.

2.6.5 Vent Tubing

Vent tubing is any elastomer or plastic tubing resistant to chlorine or chlorine solutions. Any other material having qualities acceptable for such use may be substituted in place of the elastomer or plastic tubing. Slope the vent line continuously downward to outside of housing without dips or sags. Provide an insect screen at end of line.

2.6.6 Signal Tubing

Signal tubing is Type K soft copper tubing.

2.6.7 Diffuser

Provide a diffuser of rigid PVC or ABS pipe, resistant to chlorine solution. Provide an open channel type diffuser that is perforated and fastened at each end to the tank wall near the bottom in the flow stream of the influent to the chlorine contact tank.

2.6.8 Housing

Enclose the chlorinator scale, piping, and controls in a weatherproof housing constructed of 0.9 mm 20 gage metal with minimum 25 mm one inch insulation. Provide a full access door for easy access to equipment. Mount the housing on top of treatment plant or on a concrete pad adjacent to the chlorine contact tank that projects not less than 150 mm 6 inches beyond outside face of housing. Provide a thermostatically controlled space heater within the housing to maintain a temperature of 21 degrees C 70 degrees F.

2.6.9 Appurtenances and Accessories

2.6.9.1 Walkways, Platforms, and Bridges

**************************************************************************
NOTE: Include handrails around plant perimeter if plant is installed with tank walls at or near grade.**************************************************************************

Provide access walkways and platforms for access to all equipment for operation and maintenance. Make walkways and platforms nonslip open grating fabricated from galvanized steel, factory painted mild steel, aluminum, or fiberglass. Provide rigid handrails along the sides of walkways and platforms [and around the perimeter of the entire plant]. Fabricate handrails from aluminum, galvanized steel or painted steel, be 1075 mm 42 inch high, and have two horizontal rails. Provide gates as required for access to equipment. Provide access walkways, platforms, and handrails conforming to Section 05 12 00 STRUCTURAL STEEL.

2.6.9.2 [Access Stairway] [Access Ladder]
NOTE: Delete references and requirements for access ladder as Contractor's option unless it can be justified on an economic and technical basis. Although more expensive, a stairway is preferable in that it provides safer and easier access to platforms and walkways.

Delete "raised platform floor plate" or "grating" as necessary. Delete references and requirements for raised platform floor plate or for grating as necessary. Grating is recommended where snow or ice accumulation may be anticipated; otherwise, use floor plate.

When top of plant is more than 600 mm 24 inches above surrounding ground level, provide an access [stairway] [ladder]. Fabricate stairway of structural steel members. Steps are [raised-pattern floor plate] [grating]. Provide access ladder(s) of steel or aluminum and be 450 mm 18 inches wide minimum, with step bars spaced 300 mm 12 inches on center. Provide ladders anchored at the bottom, top, and intermediate points with brackets 1.8 m 6 feet apart. Ensure that the brackets are the same size as side bars and of such length as to hold ladder 150 mm 6 inch away from walls. Provide curved returns at top of ladder. Aluminum side bars and step bars conform to ASTM B221M ASTM B221.

2.6.9.3 Handrails

Provide handrails on stairways, platforms, bridges, and other points of personnel access for operation and inspection. Provide a handrail around the perimeter of the tank if the top of the exposed side wall is less than 1.07 m 3 feet 6 inches above grade. Construct handrails of structural steel section or of standard 38 mm 1 1/2 inch pipe conforming to ASTM A53/A53M.

[2.6.9.4 Raw Wastewater Recirculation Box

NOTE: Delete this paragraph when raw wastewater recirculation box is considered unnecessary. When wastewater is pumped to the treatment plant, the use of a raw wastewater recirculation box (which recirculates a portion of incoming wastewater back to the pumping station) should be considered to provide uniform flow and avoid surges through the plant. Base decision on undesirability of surge effects on the plant vs. economics of the recirculation system.

Fabricate a raw wastewater recirculation box from 6 mm 1/4 inch steel plate and have suitable sized connections for incoming raw wastewater line, plant influent line, and recirculation line. Provide box with a fixed weir and an adjustable weir or other suitable means of flow regulation so that a portion of the incoming raw wastewater may be recirculated. Provide a removable or hinged cover. Continuously weld the joints inside walls, bottom, and partitions inside and out. After welding, remove weld spatter and extreme roughness. Inlet cannot be less than 200 mm 8 inch size.
2.6.9.5 Influent Flow Division Box

**************************************************************************
NOTE: Delete this paragraph when not used. Delete for extended aeration type 0.66 L/s 15,000 GPD and below and for all step aeration type and complete mixing type facilities and extended aeration type when complete mixing type facilities and extended aeration type when eventual conversion to step aeration type is contemplated.
**************************************************************************

With two or more aeration tanks, provide a plant influent flow division box. Fabricate the box of 6 mm 1/4 inch steel plate and have suitably sized connections for incoming raw wastewater line and influent lines to each aeration tank. Ensure that the box for dividing flow between two tanks has a hinged divider plate that will permit adjustment of from zero to 100 percent to either outlet. Divider plate has locking nut and handle. Ensure that the box has a hinged cover with provisions for padlocking. Provide a continuous weld for all inside walls, bottom, and partitions, inside and out. After welding, remove all weld spatter and extreme roughness. Flow division boxes for more than two tanks are as specified herein, except that method of flow division is as recommended by the manufacturer of the plant.

2.6.9.6 Influent Distribution Channel

**************************************************************************
NOTE: Delete this paragraph for extended aeration type except when eventual conversion to step aeration type is contemplated.
**************************************************************************

Use first optional wording in fifth sentence for step aeration type and second optional wording for complete missing type.

**************************************************************************

Continuously weld the aeration tank influent distribution channel to the side of the tank wall. Ensure that the bottom of the channel is at the same elevation as the liquid surface of the aeration tank. The inlet to the channel is at one point and not less than 200 mm 8 inches in diameter. Fabricate the channel from steel plate of not less than 6 mm 1/4 inch thickness. Provide the channel with [adjustable weirs or stop gates, not less than three in number, spaced the full length of the channel] [multiple discharge openings] for uniform distribution to the aeration tank. Provide weir or stop gates of stainless steel or aluminum. Ensure that the gates have gaskets on the bottom, with wedges or other means to insure a close fit. Guides for the gates are of the same material as the gates. Ensure that the channel is of such size as to accommodate the peak flow to the plant.

2.6.9.7 Sludge Division Box

**************************************************************************
NOTE: Delete this paragraph when sludge return is not used.
**************************************************************************

Provide a sludge division box to divide return sludge and waste sludge.
Fabricate the box of 6 mm 1/4 inch steel plate and have a suitably sized connection for incoming sludge and outlets for return sludge and waste sludge. Provide the box with a hinged plate or adjustable gate that will permit adjustment of flow from zero to 100 percent to either outlet. Plate or gate to have a locking nut and handle. Provide a weir on each outlet. Ensure that the box is adequately [covered] [and baffled] to prevent splashing of the sludge. Continuously weld all joints between walls, bottom, and partitions inside and out. After welding, remove all weld spatter and extreme roughness.

2.6.9.8 Clarifier Effluent Weir and Scum Baffle

Provide weir and scum baffles of stainless steel, ASTM A240/A240M, ASTM A36/A36M, or aluminum ASTM B209M ASTM B209 or ASTM B221M ASTM B221, alloy 6061, temper T6. Provide weirs, of a size and section for structural stability to handle peak flows through the plant. The upstream face of the weir plate is flat and smooth. Ensure that the weir plates and baffle supports permit horizontal and vertical adjustment of the weir and baffle. Mount weir plates to fill any voids between the tank and the weir plate.

2.6.9.9 Mixer for Return Sludge Mixing

**************************************************************************
NOTE: Delete this paragraph and subparagraphs thereto except for complete mixing type.
**************************************************************************

2.6.9.9.1 General

Provide a vertical mixer and include a drive assembly, impeller shaft and impeller, and support. The mixer will continuously mix raw wastewater with return sludge so that the mixture is homogeneous.

2.6.9.9.2 Drive Assembly

Mixer driver assembly includes an electric motor connected to a gear reduction unit whose output shaft is directly connected to the mixer impeller shaft. Motor is constant speed, totally enclosed, fan-cooled horizontal type, suitable for outdoor service, and conforming to NEMA MG 1.

Ensure that the motor is of adequate wattage horsepower to drive the equipment continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Ensure that the motor is suitable for operation with the voltage characteristics indicated. Protect the motor against overload, low voltage, and unbalanced voltage. Power transmission from motor to impeller shaft is by means of a vertical or a right angle gear reduction unit. Ensure that the reduction ratio is such as to produce the proper operating speed for the mixer.

Ensure that the gear reduction unit will withstand any loadings produced by thrust, out-of-balance, and vibration resulting from operating conditions and operate from zero rpm to a speed compatible with the impeller speed. All components must continuously withstand the full load wattage horsepower. Use bronze for worm gears. Use wrought or alloy steel for all other gears. The gear teeth may be through-hardened, contour-induction-hardened, nitrided, or carburized. Flame-hardened gears will not be acceptable. Provide a lubrication system for the gears.
Ensure that the housing is of high quality, close-grained cast iron or fabricated steel. Bearings may be lubricated with oil or grease. Base plate or mounting lugs are of steel or integrally cast with the gear reduction unit and furnished with leveling anchor bolts with lock nuts.

2.6.9.10 Anchorage

Materials necessary for anchorage of the plant to the concrete support slab are as recommended by the manufacturer of the facility.

2.7 TESTS, INSPECTIONS, AND VERIFICATIONS

2.7.1 Factory Inspection

**************************************************************************
NOTE: Delete the paragraph when concrete plant only is required.
**************************************************************************

Factory inspection includes soundness of welds and water tightness for tanks fabricated at the factory. Inspect the primary and finish shop painting for pin holes or voids.

2.7.2 Quality Assurance

2.7.2.1 Package Wastewater Treatment Plant Layout Drawings

Show the complete assembly of the plant with all components, equipment, and parts, each with an assigned number corresponding to the plant manufacturer's parts list.

2.7.2.2 Package Wastewater Treatment Plant Component Drawings

Show construction details for each component and piece of equipment, including aeration chamber, clarifier chamber, sludge holding chamber, disinfection chamber, blower assembly, diffuser layout, pump assemblies, [comminutor assembly,] [mechanical aerator assembly,] support slab, [disinfection assembly,] appurtenances, and all piping and wiring.

2.7.2.3 Diffuser Layout Drawings

Show construction details for the diffuser layout including diffusers, diffuser holders and diffuser holder assemblies, blower assembly, and air piping layouts.

[2.7.2.4 Mechanical Aerator Drawings

**************************************************************************
NOTE: Delete the bracketed phrase when step aeration type of complete mixing type is specified or when mechanical aerator is not allowed for extended aeration type.
**************************************************************************

Show manufacturer's suggested geometry in sufficient detail for construction.[ Show construction details for the mechanical aerator assembly, including shroud and draft tube (if used).]
2.7.2.5 Excavation and Backfilling

Include specific instructions for excavation and backfilling as interrelated to plant installation and any special concrete work necessary.

2.7.2.6 Package Wastewater Treatment Plant Performance Test Reports

Submit reports of plant performance evaluation tests by the National Sanitation Foundation (NSF). These tests are performed in conformance with the criteria based on the use of the Standard Performance Evaluation Method of the NSF report. [Base the test on the subdivision flow pattern. ]For all units not tested by NSF, reports of independent performance tests are required on the type of plant submitted for the project. These tests are in accordance with the Standard Performance Evaluation Method based on the subdivision flow pattern as established by the NSF.

2.7.2.7 Chamber Tests

**************************************************************************
NOTE: Delete paragraph sentence when concrete plant only is required.
**************************************************************************
Submit a test report stating that all chambers of the prefabricated steel plant have been tested (1) as watertight, (2) welds are sound, (3) the finish is smooth, and (4) are shop painted before shipment to the site.

2.7.2.8 Electrical Control System

Ensure that the electrical control system and its components are wired and tested, including motors and controls in accordance with specification requirements for manual and automatic operation of wastewater treatment plant equipment.

2.7.2.9 Mechanical Aerators

**************************************************************************
NOTE: Delete paragraph when step aeration type or complete mixing type is specified or when mechanical aerator is not allowed.
**************************************************************************
Submit certification that the aerator has an oxygenation capacity of 1.36 kg 3.0 lb of oxygen per electrical input watt per hour horsepower per hour, when tested under standard conditions in clear tap water at 20 degrees C 68 degrees F and zero D.O. Certification includes description of test procedure, test data, and calculations of oxygenated capacity. Also furnish data to substantiate that the manufacturer's aerator can achieve mixing and adequate velocities for the geometry of the basin as indicated.

2.7.2.10 Materials Not Labeled or Certified

For materials whose compliance with organizational standards or specifications is not regulated by an organization using their own listings or labels as proof of compliance, submit a certificate stating that the material complies with the applicable referenced standard or specification. This statement is in addition to any proof required.
2.7.3 Source Quality Control

**************************************************************************
NOTE: When two or more 22.0 L/s 0.5 MGD or four or more 11 L/s 0.25 MGD Package Wastewater Treatment Plants are contracted for at one time, select the alternative to witness the factory tests.
**************************************************************************

Conduct all factory tests by the manufacturer of the package Package Wastewater Treatment Plant in the presence of the Contracting Officer.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Protection from Moving Parts

Ensure that all belts, chains, couplings, and other moving parts are completely enclosed by guards to prevent accidental personal injury. Guards are removable or so arranged as to allow access to the equipment for maintenance. If equipment is housed in a lockable enclosure, this is sufficient protection and no additional guards are necessary.

3.2 PREPARATION

All work not absolutely required to be performed in the field is performed in a factory under controlled conditions. Fabricate the treatment facility from not less than 6 mm 1/4-inch steel plate with welded joints and reinforced as necessary with steel angles, tees, or other structural members. Construct the units for transportation, installation, and operation without detrimental buckling, distortion, or other defects. Tanks cannot leak when filled with water or wastewater. Excavation, filling, and backfilling is in accordance with Section 31 00 00 EARTHWORK. Install a reinforced concrete foundation pad, of the size and design recommended by the treatment facility manufacturer, in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.2.1 Corrosion Protection

**************************************************************************
NOTE: Specify corrosion protection for metal plants in contact with soil. If other than steel is specified, specify an appropriate protective coating system for the plant material.

Cathodic protection is only recommended in severely corrosive soils or environments.

Identify site specific atmospheric conditions that would produce a corrosive environment for plant materials so that the proper protective coatings or corrosion resistant materials can be provided.
**************************************************************************

For [below ground] [partially above and partially below ground] [above ground] metal plants, provide corrosion protection. Provide an exterior [75 mil polyurethane coating] [_____] [_____] mil coating and cathodic protection] that protects the plant from the in situ soil conditions.
3.2.2 Electrical Work

Electrical work is in accordance with the applicable requirements of Section [33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION][33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION].

3.3 INSTALLATION

Install the treatment facility and equipment in compliance with the manufacturer's written instructions. Submit drawings containing complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show on the Drawings the proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

3.3.1 Sequence of Operations

Sequence of operations follows the recommendations of the facility manufacturer. Installation of facility cannot begin until the concrete support slab has achieved not less than fifty percent of its maximum strength. Modify backfilling operations as recommended by the instructions of the plant manufacturer. Complete, inspect and receive approval for all welding, corrosion protection, alignment, water tightness testing, painting, and anchoring before any backfilling is done.

3.3.2 Matchmarking

Ensure that all parts and components of the plant are clearly match marked, corresponding to assembly drawings furnished by the manufacturer of the facility.

3.3.3 Piping and Valve Installation

Install piping in a neat manner with all joints tight and with no undue marring of finishes. Ensure that installed piping, valves, and fittings are free from strain and excessive stresses caused by weight or misalignment.

3.3.4 Clarifier Floor

**************************************************************************
NOTE: Delete requirements for signal transmission to the chlorinator when not used.
**************************************************************************

When a rotating sludge collector is used, work is as hereinbefore specified through placing of tank floor except for sludge cone. Provide a sludge cone in accordance with the manufacturer's recommendations. The tank floor is then given a screed finish, after which the floor is roughened by scoring with a rake or similar tool. Following installation of the rotating sludge collector mechanism, bring the tank floor to finish grade by means of a cement-mortar grout surfacing swept into place by use of the sludge collector arms, as hereinafter specified. When the collector mechanism has been erected and inspected by the engineer representative of the manufacturer and the arms and blades have been adjusted to give the required clearance above final floor grade, fasten a 50 by 150 mm 2 by 6
inch wooden straight-edge with metal-clad edge to each sweeping arm approximately 6 mm 1/4 inch below the sweeping blades to provide a suitable squeegee.

Cement-mortar grout is composed of one part cement, three parts sand, with sufficient water as required for conditions of placement, and with one teaspoon of powdered aluminum added per bag of cement. Before the cement-mortar grout is placed, thoroughly clean the floor of dirt, soil, or other substances that would prevent the proper bonding of the surfacing to the concrete subfloor. Bring the grout surfacing to finish grade as nearly as possible by hand. Rotate the collector arms with straightedges attached manually to complete the operation. Use of the drive unit for sweeping in the grout surfacing will not be permitted. Make provision to prevent grout from entering the sludge cone; remove immediately any grout which falls in the sludge cone or on the tank walls.

3.3.5 Utilities Service Connections

3.3.5.1 Water Service

**************************************************************************
NOTE: Specify in the appropriate section of project specification the nearest point of connection to the facility, and also type of connection available.

Delete reference to "frost-proof" for facilities in areas where freezing temperatures are not encountered.

Delete reference either to chlorinator or to hypochlorinator.

Delete reference either to chlorinator or to hypochlorinator.
**************************************************************************

The water line is a[ 25 mm one inch] [_____] copper water line extending from a point not less than[ 1.52 m 5 feet] [_____] from the treatment facility to the [hypochlorinator housing] [chlorinator]. Provide a 25 mm one inch valve in a[ frost-proof] valve box below grade.[ Provide a 19 mm 3/4 inch hose bibb in the [hypochlorinator] [chlorinator] housing.]

3.3.5.2 Electrical Service

Provide electric service from a point not less than 1.52 m 5 feet from the treatment plant to the electrical control system enclosure.

3.4 FIELD QUALITY CONTROL

Conduct field inspections and witness field tests specified in this specification. Perform field tests and provide all labor, equipment and materials required for testing, except that the Government will provide water, fuel, and electric power required for field test, when available. Correct all defective equipment, materials, or workmanship disclosed as a result of the tests given herein at no cost to the Government.

3.4.1 Tests

Before allowing any liquid to discharge into the tanks, ensure that all
tanks, chambers, channels, launders, piping and pieces of equipment are clean and free of any debris such as pieces of wood, concrete or leaves. Test all mechanical and electrical units as specified herein. Remedy any defects that occur before or during the tests, make changes or replacement equipment as necessary and retest.

3.4.1.1 Coating Testing

Examine coatings for flaws and test for thickness and holidays. Measure thickness of coatings by a commercial film thickness gauge. Test coatings for pinholes, holidays, and other defects with an electric flaw detector equipped with an audible signal that operates when a pinhole is detected. The detector is a 90-volt wet sponge pinhole detector.

3.4.1.2 Comminutor Tests

**************************************************************************
NOTE: Delete the paragraph when comminutor is not required for facility.
**************************************************************************
Operate the comminutor with liquid flowing through the comminutor. After two hours of operation, check for overheating, noise, vibration, and speed of the motor and comminutor. Check the automatic reversing of the comminutor when an object is lodged in the cutting stream.

3.4.1.3 Mechanical Aerator Tests

**************************************************************************
NOTE: Delete paragraph when step aeration type or complete mixing type is specified or when mechanical aerator is not allowed for extended aeration type.
**************************************************************************
Test the mechanical aerator(s) as soon as practicable after installation, and the aeration tank is ready for use. Operate the aerator under the varying submergence conditions specified in the factory test. During these tests, operate the unit(s) without overheating or excessive vibration and ensure satisfactory operation. Conduct the field tests under the supervision of the facility manufacturer. Supply labor and materials necessary to properly perform the tests. During the tests, take operating data at regular intervals and incorporate in a report. Base data readings on facility meters, gages, and instruments, and include the following: motor amperes, motor kilowatts, bearing temperatures, and lubricating oil pressures and temperatures.

3.4.1.4 Blower-Driven Assembly Operation Tests

Test the blower-driven assembly as soon as practicable after installation. Operate the blower under varying capacities and discharge pressures covering the range of conditions specified. During these tests, ensure that the units operate without overheating or excessive vibration. Conduct the initial operation of the blower driver and the the field tests under the supervision of the facility manufacturer. Supply such labor and materials as may be necessary to properly perform the tests. During the tests, take operating data at regular intervals and incorporate in a report. Base the data readings on facility meters, gages and instruments, and include the following:
a. Air volume
b. Air inlet and discharge pressure and temperature
c. Motor amperes
d. Motor kilowatts
e. Bearing temperatures
f. Stator temperatures
g. Lubricating oil pressures and temperatures
h. Lubricating oil cooling water temperatures

3.4.1.5 Diffusers

Conduct performance capacity and mixing tests on the diffusers in the field according to the manufacturer's instructions.

3.4.1.6 Hypochlorinator Tests

**************************************************************************
NOTE: Delete this paragraph when hypochlorinator is not required.
**************************************************************************

Inspect and adjust the pulley and belt drive for the average flow of feed solution desired. Test the capacity of the feeder for a period of not less than 2 hours nor more than 6 hours. Make the following tests:

a. Check the unit for leaks.

b. Determine the amount of chemical solution used during the test run to ascertain if the unit is functioning within the prescribed limits of the feed rate indication plus 15 percent.

c. Ensure the unit shuts off automatically when the liquid elevation in the chlorine contact tank drops below the contact sensing probes and start when the water rises. The unit starts and stops 10 times out of 10 consecutive starts.

3.4.1.7 Chlorinator Tests

**************************************************************************
NOTE: Delete this paragraph when chlorinator is not required.
**************************************************************************

Operate the unit for a period of not less than 2 hours nor more than 6 hours. Perform the following tests:

a. Check the unit for leaks by using an aqueous ammonia solution on a cotton or cloth swab on a wooden stick held close to all connections of the chlorinator.

b. Determine the amount of chlorine used during the test run to ascertain if the unit is functioning within the prescribed limits of 4 percent of
the set feed rate.

c. Stop the chlorinator when the water supply is interrupted or shut off.
d. When the gas supply is exhausted or shut off, there is no back-flow of water into the unit.

3.4.1.8 Air Lift Pump

Test the air lift pump for discharge capacity in liters per second gallons per minute of clean water. Base this on percentage of submergence of the eductor pipe to the total height of the eductor pipe. Test and adjust the air throttling valve to provide the desired discharge rate. Test all joints in the airline for leaks at 689.4 kPa 100 psi pressure.

3.4.1.9 Electrical Control System Tests

The plant manufacturer's representative inspects the installation of the electrical control system with the Contracting Officer and checks circuits and connections to all motors and electrical controls. The manufacturer's representative, upon satisfactory operation of all circuits and controls to the Contracting Officer, submits [three] copies of a letter certifying that the wiring is complete and in accordance with the intent of the specifications for both manual and automatic operation and proper functioning of the Package Wastewater Treatment Plant.

3.4.2 Inspection

3.4.2.1 Alignment and Leveling

Make inspections to assure that the facility is level within tolerances recommended by the facility manufacturer. Check all facility components and equipment to ensure that they are properly aligned and level.

3.5 SYSTEM STARTUP

A manufacturer's representative will be present at facility start-up. Follow the manufacturer's manual on operation and maintenance step by step, so that as each piece of equipment is put into operation, the manufacturer's representative will explain in detail its function. Once the facility is filled with water or wastewater the follow the furnished flow diagram and check out the on-site inspection.

Adjust equipment as required. Examine the plant to determine if it is structurally sound. Report and correct all defects, submit findings.

3.6 ADJUSTING AND CLEANING

3.6.1 Coating Repair

If welding is required after application of the coating or if the coating is damaged in any way, repair consists of preparing the affected area in compliance with manufacturer's recommendations and reapplying the coating to that area. If holidays are detected or film thickness is insufficient, prepare the surface and apply additional coats in the affected area in compliance with the manufacturer's instructions.
3.6.2 Adjustments

For items of equipment involving V-belt drives, adjustment of sheave alignment and belt tension is carried out in accordance with product manufacturer's instructions.

3.7 CLOSEOUT ACTIVITIES

3.7.1 Operation and Maintenance Manuals

Post framed instructions containing wiring and control diagrams under glass or in laminated plastic where directed. The instructions show wiring and control diagrams and complete layout of the entire system. The instructions include, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. Post the framed instructions before acceptance testing of the system.

Submit [_____] copies of operation and maintenance manuals for the treatment facility equipment furnished. [One][_____] complete set prior to performance testing and the remainder upon acceptance. Operation manuals detail the step-by-step procedures required for system startup, operation, and shutdown. Operation manuals include the manufacturer's name, model number, parts list, and brief description of all equipment and their basic operating features. Maintenance manuals list routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Maintenance manuals include piping and equipment layout and simplified wiring and control diagrams of the system as installed.

Submit Package Wastewater Treatment Plant Operation and Maintenance Data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

3.7.2 Demonstration

As soon as practicable after completion, perform an operating test of the treatment facility and all equipment to demonstrate that the facility functions properly. After completion of all tests, adjust the facility for proper operation while on-line with the wastewater source in accordance with the manufacturer's written instructions. For the final acceptance, the facility must perform as specified, submit Package Wastewater Treatment Plant acceptance test results.

NOTE: This guide specification covers the requirements for sewage bar screen and mechanical shredder for use in sewage treatment plants normally handling domestic sewage.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com).

PART 1 GENERAL

NOTE: Refer to UFC 3-240-02 for design requirements. This guide specification is written for one bar screen and mechanical shredder.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date,
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Materials And Equipment; G[, [_____]]

SD-03 Product Data
   Spare Parts
   Framed Instructions

SD-06 Test Reports
   Tests

SD-10 Operation and Maintenance Data
   Operating and Maintenance Instructions; G[, [______]]

1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Extra Materials

Furnish a complete set of manufacturer's recommended spare parts, including cutting teeth and combs or other cutting elements, fasteners, screens, seals or bearings, etc. Furnish special tools for the proper operation and maintenance of equipment, installed in a wall-mounted hardwood or metal container.

Submit spare parts data for each different item of material and equipment specified, after approval of the detail drawings, and not later than [_____] months prior to the date of beneficial occupancy. Include in the data package a complete list of parts and supplies, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [1][ and ][3] year(s) of service.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

a. Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products, that conform to the respective publications and other requirements specified and that essentially duplicate equipment that has been in satisfactory use at least 2 years prior to bid opening. Ensure all equipment is supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.
b. To each major item of equipment, securely attach a plate to the item that includes the manufacturer's name, address, and catalog or model number. In lieu of adding a nameplate on the shredder and bar screen, integrally cast the adding a manufacturer's name or trademark onto the shredder, or stamp, or otherwise permanently mark the shredder.

c. Fully enclose moving parts of the equipment, such as drive chains and sprockets, in removable guards. Fully enclose equipment above the level of the sewage-carrying channel in a cast iron or 1.897 mm (14 gauge) sheet steel or wrought-iron housing. Ensure housing is provided with a sufficient number of doors or removable panels to ensure ready access to any part of equipment for repairs, replacements, or cleaning. The joint between the housing and the concrete foundation is required to be leakproof.

d. Submit detail drawings consisting of a complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions. Ensure detail drawings contain complete wiring and schematic diagrams, equipment layout and anchorage, and any other details required to demonstrate that the system has been coordinated and is fully functional as a unit.

2.1.1 Bearings

ABMA 9 and ABMA 11.

2.1.2 Iron, Steel, and Miscellaneous Metal

2.1.2.1 Miscellaneous Metal

Provide bolts, nuts, anchors, washers, and other types of supports necessary for the installation of equipment made of steel or wrought iron, galvanized according to the requirements of ASTM A153/A153M.

2.1.2.2 Malleable Iron

ASTM A47/A47M, grade No. 32510, minimum.

2.1.2.3 Structural Steel

ASTM A36/A36M.

2.1.3 Motors, Electric

NEMA 250, NEMA ICS 1, NEMA ICS 3, NEMA ICS 4, NEMA ICS 6 and NEMA MG 1.

2.1.4 Motor Controls

NEMA ICS 2.

2.1.5 Switches, Enclosed

UL 98.

2.2 COMPONENTS

2.2.1 Electrical Work

Provide electrical equipment and wiring in accordance with Section 26 20 00.
INTERIOR DISTRIBUTION SYSTEM. Electrical work must comply with NFPA 70, latest edition. Supply with electrical characteristics as indicated. Provide automatic control and protective or signal devices required for the operation specified, and any control wiring required for controls and devices but not shown on electrical plans, under this section of the specification.

2.2.1 Electric Motors

Provide equipment complete with motors of the [open] [totally enclosed] ball-bearing squirrel-cage induction type, with a maximum speed not to exceed 1800 rpm. Provide motors of sufficient capacity to drive equipment at the specified capacity without exceeding rating shown on nameplate attached to the motor.

2.2.1.2 Motor Controls

**************************************************************************

NOTE: For complex automatic controls, the Designer is to review UFGC Section 40 60 00 PROCESS CONTROL and reference it in this paragraph if required.

**************************************************************************

Provide motor controls required to control the motor in the manner indicated or specified with the associated motor and ensure they contain properly sized thermal-overload protective elements. Except where otherwise indicated, provide starters in [general-purpose] [weatherproof] enclosures. Where manual control is specified, provide starter with a start-stop pushbutton in the cover. Where automatic control is specified, provide starter with a hand-off-automatic selector switch in the cover. Provide each starter with an appropriate nameplate or stencil identifying the equipment controlled. [Provide controls in accordance with Section 40 60 00 PROCESS CONTROL.]

2.2.2 Hydraulic Work

Provide hydraulic equipment and application in accordance with Section 35 05 40.14 10 HYDRAULIC POWER SYSTEMS FOR CIVIL WORKS STRUCTURES. Provide manual or automatic control and protective or signal devices required for the operation specified, and any control wiring or hydraulic connections required for controls and devices but not shown on electrical or hydraulic plans, under this section of the specification.

2.2.2.1 Fluid Motors

Provide equipment complete with fluid motors of the [vane] [piston] type. Ensure motors are of sufficient capacity to drive equipment at the specified rating without exceeding rating shown on the nameplate attached to the motor.

2.2.2.2 Hydraulic Controls

Provide controls in the manner indicated or specified, coordinated with the associated equipment, and having properly sized overload protective elements.

2.2.2.3 Fluid Power Valves

SAE J1677.
2.2.2.4 Fluid Tubing

SAE J1677.

2.2.2.5 Hydraulic Fluid

Provide hydraulic fluid in accordance with Section 35 05 40.14 10 HYDRAULIC POWER SYSTEMS FOR CIVIL WORKS STRUCTURES.

2.3 MANUFACTURED UNITS

2.3.1 Mechanically-Cleaned Bar Screen

A bar screen consists of a stationary bar screen, a screen rake, a rake mechanism operated by [an electric] [a hydraulic] drive unit, and a dead plate and rake-cleaning device, where required. Install equipment so as not to obstruct the flow of sewage to bar screen. Unless otherwise specified, ensure all metal that is submerged in the sewage-carrying channel or that comes in contact with sewage consists of wrought iron, steel, cast iron, or other equally corrosion-resistant metal.

2.3.1.1 Bar Screen

Ensure each bar screen is suitable for installation in a rectangular channel [_____] m [_____]-feet [_____]-inches wide by [_____] m [_____]-feet [_____]-inches deep, and is designed for handling sewage flows as follows:

a. Minimum, [_____] cubic meters/day MGD.

b. Average, [_____] cubic meters/day MGD.

c. Maximum, [_____] cubic meters/day MGD.

2.3.1.2 Screen Rake

Ensure rake is designed to rake up screenings collected on the bar screen and in the openings between bars, and to convey screenings to a [drain platform] [collection trough] [grinder]. Provide rake made of cast iron, steel, or other suitable material not less than [_____] mm inch thick. Space rake teeth to pass between bars of the screen. Ensure rake teeth plate is easily removable and replaceable.

2.3.1.2.1 Rake Mechanism

Provide a revolving-frame, automatic-hoist, endless-chain type mechanism, or screw-drive type mechanism that includes parts and accessories necessary for a complete operating unit. Ensure parts for the mechanism are amply proportioned for stresses that may occur during fabrication, erection, and operation. Provide interchangeable individual parts that are alike in each. Provide shearing pins or an overload-release mechanism for overload protection. Ensure rake speed ranges from [_____] to [_____] m/second feet per minute. Provide rake mechanism with a complete and adequate system of lubrication to moving parts subject to wear. Provide grease- or oil-lubricated bearings except submerged bearings which are required to be fabricated from alloy-bearing metal designed to operate without any lubrication and to prevent accumulation of deposits.
2.3.1.2.2 Revolving-Frame-Type

A revolving-frame-type rake mechanism consists of two pairs of structural-steel-angle rake arms mounted on a horizontal shaft. Screen rakes are attached to steel crossbars mounted on the outer end of each pair of rake arms. The entire rake mechanism is required to revolve about the horizontal shaft.

2.3.1.2.3 Automatic-Hoist-Type

An automatic-hoist-type rake mechanism consists of a reciprocating rake mounted on a horizontal shaft or frame and guided by steel channels or angles at each end of the frame. The rake and frame are pulled up the slope of the guide rails by two or more cables operating over motor-propelled grooved drums. After screenings are discharged, the rake frame is required to automatically tilt and lower to the bottom of screen.

2.3.1.2.4 Endless-Chain-Type

An automatic-chain-type rake mechanism consists of a drive chain, drive sprockets, and sprocket wheels mounted on a drive shaft, and an idler shaft where required, operating two endless chains with rakes securely attached.

a. Fabricate the drive chain connecting motor sprocket with the drive shaft and the endless chain of malleable iron with heat-treated-steel pins or rivets. Provide a chain tightener or takeup bracket for drive chain. Ensure chains are of suitable size and design to withstand strains imposed.

b. Fabricate the sprockets for the drive and endless chains of semi-steel or cast iron with chilled teeth and rims. Grind the rims and teeth of the sprockets to fit chains. Provide sprockets of the size recommended by the equipment manufacturer. Fabricate shafts of cold-rolled steel, straight and true, and of ample diameter to transmit the power required without undue deflection. Accurately cut the keyways where required. Provide malleable iron or bronze safety collars where required to keep shafting and sprockets in alignment.

2.3.1.2.5 Screw-Drive Type

A screw-drive type rake mechanism consists of a reversing threaded screw-drive and bearing nut attached to rake. Provide all rakes with reciprocating action.

2.3.1.2.6 Rake Mechanism Control Equipment

Start motors by means of [automatic time switch for intermittent operation, adjustable to give 3 to 60 minutes between cycles] [float switch for automatic operation at predetermined levels] [float switch for automatic operation at predetermined rise in head of sewage on the upstream side of the screen bar]. [Provide floats constructed of corrosion-resistant metal.]

a. Endless-Chain-Type-Rake Mechanism: Provide a motor-reversing switch so that direction of travel of the rake mechanism is reversible in the event of jamming. Provide a motor-reversing switch consisting of a double-throw externally operable switch enclosed in a [raintight] [watertight] enclosure. Mark the switch as follows: "Forward," "Off," "Reverse."
b. Automatic Hoist-Type Rake Mechanism: Provide starters for this type of rake mechanism that are the reversing type. Arrange control devices so that on completion of upward travel of the rake mechanism, motor stops and then reverses, and rake travels to the lower position, at which point motor again stops and automatically adjusts for the next automatic operation.

c. Revolving Frame-Type Rake Mechanism: Provide an emergency stop push-button and a rake limit switch in a weatherproof enclosure, to always stop the rake out of water after discharge of screenings.

d. Bearing Type Rake Mechanism: Control the travel of the rake in a downward or upward direction by proximity switches. Provide for adjustable frequency. Provide rake delay on the [top] [bottom]. Provide [electric][hydraulic] rake drive. Provide overload protection for down and up stroke. Provide drive with a control panel (minimum NEMA ICS 2) mounted.

e. Rake Wiper: Where required to remove screenings from rake, provide a rake wiping or scraping device at the discharge point of rake. Fabricate device to include either a plate attached to swinging hinged arms or a continuous hinged plate actuated by motion of the rake. Design wiper so that after cleaning of the rake is completed, wiper falls into the proper place ready for the next scraping operation. Control the fall of wiper either mechanically or hydraulically to absorb any shock.

f. Dead Plate or Apron: Provide a wrought iron or steel dead plate where required to prevent any deposited screenings from falling into the downstream side of rake. Ensure provided dead plate is not less than 2.657 mm 12 gauge metal if required by the design and type of rake mechanism installed, and is rigidly braced if required.

2.3.2 Mechanical Shredder, Cutter, or Grinder

2.3.2.1 Operation Requirements

Provide shredder, cutter, or grinder unit suitable to receive screenings from screening unit specified and to discharge resulting pulp into the sewage flow. Operate machine by means of an electric drive unit designed to cut sewage solids, including sticks, rags, and stringy material without clogging, jamming, or stalling moving parts. Direct connect grinder and drive unit by a flexible or friction-type coupling integrally mounted on a structural steel or cast iron base. Provide grinder with a water-flushing system where required to flush ground solids through the machine. Ensure machine provided has a capacity of grinding [_____] kg pounds of sewage screening per hour.

2.3.2.2 Control Equipment

Arrange control so that shredder motor automatically start when the rake-mechanism motor starts. Provide a relay to allow the shredder to continue to run for a predetermined time after rake mechanism has stopped, and to automatically stop the shredder motor.

2.3.2.3 Cutter Mechanism

The cutter consists of cutting blades or impellers mounted on a revolving shaft or drum in contact with a stationary cutter screen or blade. Provide
cutting devices made of tool steel or other material equally suitable for cutting tools. Ensure devices are accurately cut and ground to size to provide sharp cutting edges having extreme resistance to wear.

2.3.2.4 Bearings

Provide bearings of the self-aligning ball or roller type. Design bearings and bearing supports to safely carry and withstand the stresses imposed by the disintegrating action of the grinder.

2.3.2.5 Stuffing Boxes

Wherever the drum shaft passes through the machine housing, provide stuffing boxes of proper depth and construction.

2.3.2.6 Lubrication

Ensure bearings and moving parts, subject to wear, are provided with adequate devices for grease or oil lubrication.

2.4 PAINTING

Thoroughly clean, prime, and give all equipment two finish coats of paint at the factory in accordance with the recommendations of the manufacturer.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

3.2.1 Installation of Concrete Foundations

Use concrete for foundations as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Concrete foundations are required to be integral with, and of same strength as the building floor, unless otherwise specified. For concrete used in foundations that are entirely separated from the surrounding floor, use 17 MPa 2500 psi. When new foundations are constructed on existing concrete, bond new concrete to old as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Furnish foundation bolts, as required, for proper positioning during placement of concrete.

3.2.2 Installation of Equipment

Install all materials and equipment as shown and in accordance with the approved written recommendations of the equipment manufacturer.

3.2.3 Field Painting

Field painting is specified in Section 09 90 00 PAINTS AND COATINGS.
3.3 FIELD QUALITY CONTROL

3.3.1 Tests

After installation of the sewage bar screen and mechanical shredder is complete, conduct operational tests required to demonstrate that the sewage bar screen and mechanical shredder and controls operate in accordance with the requirements of this section of the specifications. At a minimum, operate the rake through \([5][10][__]\) cycles to ensure the system is operating correctly. Conduct a minimum of \([2][5][__]\) tests with the rake loaded with debris to simulate actual field conditions. Indicate the final position of controls in each test report.

3.3.2 Manufacturer's Field Services

Obtain the services of the manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. Ensure the representative supervises the installation, adjustment, and testing of the equipment.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Framed Instructions

Provide framed instructions, including wiring and control diagrams, showing the complete layout of the entire system, posted where directed. Pot the framed instructions before acceptance testing of the systems. Prepare condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system in typed form, framed as specified above for the wiring and control diagrams and posted beside the diagrams. Submit proposed diagrams, instructions, and other sheets, prior to posting.

3.4.2 Operating and Maintenance Instructions

Submit operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include within the instructions the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Submit maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include simplified diagrams for the system as installed.

3.4.3 Training

Provide a field training course for designated operating and maintenance staff members. Provide training for a total period of \([____]\) hours of normal working time and starting after the system is functionally complete but prior to final acceptance tests. Cover all of the items contained in the Operating and Maintenance Instructions in the field training.

-- End of Section Table of Contents --
This guide covers the requirements for grit removal and handling equipment to remove, collect, pump, and wash grit from wastewater. This guide is for treatment of domestic wastewater only.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification is for treatment of domestic wastewater only. Special consideration must be given to wastewater containing industrial wastes.

Show the following information on the project drawings.

1. Size, depth and general configuration of grit separation, chamber, final discharge point, collection, removal, and washing facilities. Give space limitations which may affect optional choices;

2. Percentage of removal of grit required;
3. Electrical characteristics of motor(s) for grit separation, collection, removal, pumping and washing equipment;

4. Flow range in cubic meter per second mgd facility is designed to serve;

5. Type of diffuser holder assembly;

6. Supply of external air quantity in cubic meter per second cfm and pressure in kPa psi;

7. Type of diffuser, whether non-porous nozzle or valve orifice type is used;

8. Source of power for hoist.;

9. Type of velocity control, whether regulator or weir;

10. Applicable wind and ice loadings;

11. Type of grit pump configuration, whether vertical or horizontal;

12. Removal capacity of screw conveyer in cubic meter per second cubic feet per hour;

13. Pitch diameter of flights and liner plate diameter for screw conveyors;

14. Type of wastewater from which grit is to be removed, whether raw wastewater or settled primary sludge;

15. Capacity in cubic meter per second gpm and pressure in kPa psi for the cyclone;

16. Cyclone pressure switch range in kPag psig;

17. Type of walkway, whether raised pattern floor plate or grating, on shallow tank separator; and

18. Whether corrosive conditions exist in wastewater or in atmosphere at installation.

************************************************************************************

1.2  DEFINITIONS

1.2.1  Grit

The settleable solids load present in wastewater such as sand, gravel, cinders, metal fragments not ameliorated by secondary treatment or sludge removal techniques and capable of producing excessive wear on mechanical equipment.

1.2.2  Grit Separation

The process of separating grit from wastewater by controlling the velocity of the wastewater with aeration to suspend organics or by tank configuration to separate the grit from the organic solids by differential sedimentation and scour.

1.2.3  Grit Collection

**************************************************************************
NOTE: Delete the first option when an aerated grit chamber with an inclined bottom is required, delete the second option when an aerated grit chamber with an inclined bottom is not required.
**************************************************************************

The process of gathering the separated grit in a hopper or other point of collection [by mechanical equipment designed for the purpose] [by means of hydraulic flow over an inclined chamber floor].

1.2.4  Grit Removal
NOTE: Delete the first option when washing equipment is not required, delete the second option when washing equipment is required.

The process of conveying grit out of the chamber from the point of collection in the chamber to [washing equipment for further processing] [the indicated point of discharge]. Grit removal equipment may accomplish some dewatering.

1.2.5 Grit Washing

The process of further separation of grit by washing putrescible matter from the removed grit by means of sprays or washing the tanks and dewatering with screw conveyors or cyclones. These screw conveyors or cyclones also convey the grit to the indicated point of discharge.

1.3 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a
code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 SPARE PARTS

Furnish spare parts for the equipment specified above in the quantities listed below. The spare parts must be identical and interchangeable with the original parts. Furnish the parts in wooden containers clearly marked with contents on two sides and top. Where the number of spare part units required by the schedule results in a fractional number of units, round off the number furnished to the next highest.

### QUALITY CONTROL

#### 1.5.1 Regulatory Requirements

**NOTE**: Design Grit Removal System in accordance with UFC 3-240-01, "Wastewater Treatment and Collection."

Ensure compliance with permits.

Conduct regulatory review to determine impact of new and existing permit conditions and regulations, communicate with federal, state, local and DOD agencies.

#### 1.5.2 Qualifications

Ensure welds are in accordance with AWS D1.1/D1.1M using procedures, materials, and equipment of the type required for the work.

#### 1.5.3 Shop Drawings

Submit grit handling equipment drawings showing layout of all equipment. Include construction and erection details for all components of the complete grit separation, collection removal [and washing] system and also show associated connections with plant piping.

### DELIVERY, STORAGE, AND HANDLING

Package equipment and parts for shipment to prevent breakage, damage or problems with calibration, readings or controls. Inspect materials delivered to the site for damage and unload and store with a minimum of handling. Store equipment and materials indoors, off the floor. Area must be dry with adequate ventilation, free from dust or water, and permit easy access for inspection and handling.

### WARRANTY

PART 2   PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a grit removal system to separate, collect, remove, wash and deposit grit at the indicated point of its discharge, within the area and at the elevations indicated.

2.1.1 Design Requirements

**************************************************************************
NOTE: Delete all references to washing when washing is not included in the grit removal system. The use of any combination of grit removal system for any wastewater treatment facility will be the responsibility of the project engineer. The combinations of equipment for the following systems are several:

1. Aerated grit system.
2. Aerated grit system (inclined bottom chamber).
3. Longitudinal grit system.
4. Vortex type grit system.
5. Detritor grit removal.

Select the grit removal system based on the following factors:

1. Site area availability;
2. Amount of grit anticipated;
3. Type of sewer system, separate or combined;
4. Other selected process i.e., air available if diffused air activated sludge processes; incineration disposal for grit; primary sedimentation process; and

**************************************************************************

2.1.2 Grit Removal System Type

**************************************************************************
NOTE: Choose one of the paragraphs below, AERATED GRIT REMOVAL SYSTEM, INCLINED BOTTOM GRIT REMOVAL SYSTEM, LONGITUDINAL GRIT REMOVAL SYSTEM, VORTEX TYPE GRIT REMOVAL SYSTEM, and DETRITOR GRIT REMOVAL SYSTEM.

Determine which grit removal system is suitable for the project. Delete paragraphs which describe systems and options which are not included in the project. When it is anticipated that the bottom of a chamber will be utilized for grit storage, a screw conveyor should be used for collecting grit when the
depth of the stored grit is expected to exceed the height of a rake or bucket collector. Use a grit pump for removal when a cyclone is included with the washing equipment. Space limitations may preclude the use of inclined removal equipment. Delete reference to screw-type washers when a cyclone is the only washer required. Delete screw conveyor when space limitations prohibit an inclined screw, delete screw conveyor and bucket elevator when a cyclone is included in washing equipment.

**************************************************************************
[2.1.2.1 Aerated Grit Removal System]

Separate grit in an aerated grit chamber. Collect and remove grit by [horizontal screw conveyor and bucket elevator,] [horizontal screw conveyor and inclined screw conveyor,] [horizontal screw conveyor and grit pump,] [chain and bucket equipment,] [airlift pump]. Use a [cyclone] [and] [screw-type washer].

[2.1.2.2 Inclined Bottom Grit Removal System]

Separate grit in an inclined bottom aerated grit chamber. Chamber bottom must be inclined to move grit to the point of removal. Remove grit by [screw conveyor] [airlift pump] [bucket elevator] [grit pump]. Use a [cyclone] [and] [screw-type washer].

[2.1.2.3 Longitudinal Grit Removal System]

Separate grit in a longitudinal grit chamber. Collect and remove grit by [horizontal screw conveyor and bucket elevator,] [horizontal screw conveyor and inclined screw,] [horizontal screw conveyor and grit pump,] [chain and bucket equipment]. Use a [cyclone] [and] [screw-type washer].

[2.1.2.4 Vortex Type Grit Removal System]

Separate grit in a vortex type grit removal system. Remove grit by a [grit pump] [airlift pump]. Use [cyclone] [and] [screw-type washers].

[2.1.2.5 Detritor Grit Removal System]

Separate grit in a detritor grit removal system, including a rotating grit-collecting mechanism and a reciprocating grit-washing mechanism. Collect and remove grit by [grit auger and grit pump,] [horizontal screw conveyor and bucket elevator,] [horizontal screw conveyor and inclined screw,] [horizontal screw conveyor and grit pump,] or [chain and bucket equipment]. Use a [cyclone] [and] [screw-type washer].

[2.1.3 Performance Requirements]

Provide a system capable of separating and removing [_____] percent of [_____] mesh grit having a specific gravity of [2.65] [_____] from a flow ranging from [_____] to [_____] cubic meter per second million gallons per day.

[2.1.4 Electrical Requirements]

Unless indicated or specified otherwise, electrical components of mechanical equipment, such as motors, motor starters, control (pushbutton)
stations, electrical disconnecting (isolating) means, and other devices functioning to control associated mechanical equipment, are included under this section. The work must be complete and operable, and in accordance with NFPA 70 and the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2 ASSEMBLY [OR] FABRICATION

2.3 EQUIPMENT

Unless otherwise specified, provide standard commercial products in regular production by the manufacturers and suitable for the required service. Unless otherwise specified, structural steel must conform to ASTM A36/A36M, hot-dip galvanized in accordance with ASTM A123/A123M or ASTM A153/A153M. Submerged steel must have a minimum thickness of 6 mm 1/4 inch. Unless otherwise specified, cast iron must conform to ASTM A48/A48M. Bronze castings not otherwise specified must conform to ASTM B30. Drives, lubrication, and bearings must be accessible from walkways at or above ground level.

2.3.1 Materials and Equipment

**************************************************************************
NOTE: Choose this paragraph and its subparagraphs or one of the paragraphs below, LONGITUDINAL GRIT SEPARATION EQUIPMENT, VORTEX TYPE GRIT SEPARATION, and DETRITOR GRIT REMOVAL EQUIPMENT, and its subparagraphs.
**************************************************************************

[2.3.1.1 Aerated Grit Separation Equipment

Include air piping and valves, swing diffuser holder assembly, header pipes, hoist, and diffusers. Provide baffles of structural steel plate 50 mm 2 in, or manufacturer's standard. Provide system with air from an external supply at a maximum rate of [_____] cubic meter per second cfm at [_____] kPa psi.

2.3.1.1.1 Air Piping

Provide manufacturer's recommended piping from air main to diffusers.

2.3.1.1.2 Diffuser Holder Assembly

Provide an upper pivot joint with air control and shut-off valve, a drop pipe with intermediate pivot joint, and a diffuser header. Provide unit with mounting to wall anchorage and a rotating joint, either permanently lubricated or with grease fittings for lubrication. Include gaskets at each pivot bearing to ensure air and water tightness. Provide valve for air control with indicator markings for throttling and complete shut-off, conforming to AWWA C504. Provide connections for the upper and lower hanger pipes. Provide locking device to allow positive locking in any position. Ensure spacing of diffuser assemblies in the basin and diffusers on the header is as recommended by the diffuser manufacturer. Ensure the diffuser is level. Provide a portable hoist to raise and lower the diffuser assembly. Use hoist by the same manufacturer, and compatible with, the diffuser holder assembly. Hoist must be hydraulically operated and adequately powered to raise the assembly from the tank. Provide means of locking the diffuser header in a raised position over the tank or the
walkway.

2.3.1.1.3 Diffusers

Provide saddle mounted or thread mounted diffusers as recommended by the manufacturer. Ensure diffusers are sized for the particular application for the range of exit velocity and back pressure.

2.3.1.2 Longitudinal Grit Separation Equipment

**************************************************************************
NOTE: Choose one of the following paragraphs

VELOCITY CONTROL REGULATOR or PROPORTIONAL WEIR.

Where corrosive environment is not present, specify structural steel. Where corrosion can occur and cost is not a factor, specify stainless steel, otherwise specify aluminum, or manufacturer standard.
**************************************************************************

Control velocity with a [velocity control regulator] [proportional weir].

2.3.1.2.1 Velocity Control Regulator

Maintain the velocity of flow through a channel of cross sections indicated. Provide regulator conforming to [AIST PB-229, Type 304 stainless steel] [structural steel] [aluminum conforming to ASTM B209M ASTM B209 or ASTM B221M ASTM B221, Alloy 6061, Temper T6]. Regulator opening must be adjustable and provide a range of flows from zero to [_____] cubic meter per second mgd.

2.3.1.2.2 Proportional Weir

Control velocity with a [AIST PB-229, Type 304 stainless steel] [aluminum conforming to ASTM B209M ASTM B209 or ASTM B221M ASTM B221, Alloy 6061, Temper T6] [structural steel] proportional weir. Weir will provide a constant velocity through the grit chamber for a range of flows from [_____] to [_____] cubic meter per second mgd.

2.3.1.2.3 Framework and Control Sections

**************************************************************************
NOTE: Specify material compatible with material specified in paragraph VELOCITY CONTROL REGULATOR or PROPORTIONAL WEIR.
**************************************************************************

Provide compatible fasteners for anchoring or bolting the control device.

2.3.1.3 Vortex Type Grit Separation

2.3.1.3.1 Forced Vortex

Include motor drive assembly, paddle drive tube; [air [lift pump,] piping and valves,] [vacuum pump] [suction pump]; and control box.[ Provide system air from an external supply at a maximum rate of [_____] cubic meter per second CFM at [_____] kPa psi.]
2.3.1.3.1 Mechanical Drive

Ensure sustained operation at the continuous output torque rating without excessive wear and to develop twice the continuous output torque rating without damage to or failure of the drive assembly components.

2.3.1.3.2 Induced Vortex

Include [air [lift pump,] piping and valves,] [vacuum pump] [suction pump]. [Provide system air from an external supply at a maximum rate of [_____] cubic meter per second CFM at [_____] kPa psi.].

2.3.1.3.3 Multi-Tray Vortex

Provide manufacturer standard trays and distribution system.

2.3.1.4 Detritor Grit Removal Equipment

Provide manufacturer's standard system.

2.3.1.5 Collector Systems

**************************************************************************

NOTE: Choose one paragraph, and its subparagraphs, of the following: SCREW COLLECTOR AND BUCKET ELEVATOR, SCREW [COLLECTOR] [AND] [CONVEYOR] or CHAIN AND BUCKET ELEVATOR COLLECTOR.

Some manufacturers combine a screw collector and a bucket elevator utilizing the bucket chain to drive the screw and using only one drive assembly. This unit may be used in either an aerated grit removal system or a longitudinal grit removal system when the screw conveyor is not more than 15 m 50 feet long or when the amount of grit to be removed does not exceed 0.06 cubic meter per second 120 cubic feet per hour. Delete this paragraph and all subparagraphs when this unit is not allowed as an alternate to the separate units or when the above physical limits will be exceeded.

**************************************************************************

2.3.1.5.1 Screw Collector and Bucket Elevator

Provide a unit utilizing the bucket chain of the elevator as a drive chain for the screw collector. Include screw shafts and bearings, liner plate, chain, sprockets, grit buckets, drive assembly, housing and overload protection. Ensure unit is capable of continuous and intermittent operation with a removal capacity of not less than [_____] cubic meter per second cubic feet per hour of dry grit weighing [1922] [_____] kg per cubic meter [120] [_____] pounds per cubic feet.

2.3.1.5.1.1 Screw Collector Assembly for Combination Unit

**************************************************************************

NOTE: The following table lists the requirements for selecting a screw.

Alternate screw type can be helicoid with short shafts.

a. Provide [_____] mm inch diameter screw, half pitch with 10 mm 3/8 inch flights and mounted on [_____] mm inch steel pipe conforming to ASTM A53/A53M and bushed for [_____] mm inch shaft. As an alternate, provide a helicoid type screw conveyor section with 10 mm 3/8 inch steel flights. Screw must be made in the manufacturer's standard lengths.

b. Ensure shafts are cold rolled steel conforming to ASTM A108 and coupling bolts are AIST PB-229, Type 316 stainless steel. Couple driven end to the foot shaft of the bucket elevator. Grease lubricate tail shaft bearings; provide with cast iron, high carbon or heat treated alloy steel bushings. Ensure bearings are rated for a minimum of five years on a continuous service basis.

c. Provide a curved 10 mm by [_____] mm 3/8 by [_____] inch I.D. steel liner plate with edges drilled for plug welding to 13 by 150 mm 1/2 by 6 inch steel straps embedded in the concrete, with a Brinell hardness of 300 to 350.

2.3.1.5.1.2 Bucket Elevator Assembly for Combination Unit

a. Provide bucket chain of ASME B29.400 combination "H" Type Mill C102 having an average ultimate strength of 160 kN 36,000 pounds and weighing no less than 15 kg per meter 9.7 pounds per foot, with chain links of corrosion resisting malleable iron having an average tensile strength of at least 483 MPa 70,000 psi and an average Brinell hardness between 170 and 190.

b. Ensure sprockets are high-test cast iron, having a minimum tensile strength of 138 MPa 20,000 psi cast in a chill, with a Brinell hardness of not less than 360 with a chill depth of at least 5 mm 3/16 inch,
stress relieved before machining. Sprocket teeth must be accurately
ground to fit chain. Sprockets must be split construction assembled
with cadmium plated nuts and bolts. Driven sprocket and the sprockets
on the head shaft and screw shaft must be keyseated with keys and
keyseats conforming to ASME B17.1 or ASME B17.2.

c. Ensure shafting is solid, cold-finished steel conforming to ASTM A108,
straight and continuous for full width of tank, of sufficient size to
transmit the maximum force developed by the drive assembly. Provide
keyways where necessary to attach or locate sprockets on shafting.
Keys and keyseats must conform to ASME B17.1 and ASME B17.2. Use
polished shafting in areas of contact with bearings.

d. Ensure bearings are babbitt-lined, ductile-iron type, self-aligning
ball-and-socket type or heat treated ductile-iron self-aligning type,
designed to allow minimum field variations without shimming. Provide
bearings above water with flush ball-check grease-lubrication
fittings. Water lubricate underwater bearings with tops designed to
prevent solids accumulation. Equip underwater bearings with flush
ball-check grease-lubrication fittings. Ensure all bearings are rated
for a minimum of 5 years on a continuous service basis.

e. Fabricate grit buckets of structural steel or malleable iron with
hardened lip designed to drain off free water; attached to chains at
not more than 1.5 m 5 foot intervals with heat treated carbon steel
pins and rivets having a minimum diameter of 17 mm 11/16 inch.

2.3.1.5.1.3 Drive Assembly for Combination Unit

Include motor; speed reducer; drive sprocket on output shaft of speed
reducer; drive chain from drive sprocket to driven sprocket; shear pin; and
chain guard. Fully enclose unit and ensure suitability for mounting
outside and exposed to the weather.

a. Motor must be suitable for operation with the voltage characteristics
as indicated.

b. Ensure chain and belt drives incorporated in the drive assembly have a
minimum factor of safety of 4 as applied to ultimate breaking or
transmission strength of the chain or belt with respect to the loads
transmitted at normal continuous operating load.

2.3.1.5.1.4 Housing

**************************************************************************
NOTE: Specify galvanized steel unless corrosion is
considered a problem.
**************************************************************************

Mount 1.8 mm 14 gage [galvanized steel] [AIST PB-229, Type 302 or
AIST PB-229, Type 304 stainless steel] on the structural supports and
securely fasten to the structural frame with bolts or sheet metal screws of
the same material as the housing. Provide suitable openings for chain
installation and inspection at convenient locations in the housing.

2.3.1.5.2 Screw [Collector] [and] [Conveyor]

**************************************************************************
NOTE: Choose this paragraph and its subparagraphs,
the paragraph above, SCREW COLLECTOR AND BUCKET ELEVATOR, and its subparagraphs, or the paragraph below, CHAIN AND BUCKET ELEVATOR COLLECTOR and its subparagraphs.

NOTE: Screw mechanisms may be used as collectors, conveyors, or both together. Delete "collector and" when screw type collector is not allowed; delete "and conveyor" when screw type conveyor is not allowed; use all optional wording and appropriate pluralizations when both screw collector and conveyor are not allowed.

Include screw assembly, motor drive assembly, [liner plates,] [and] [trough,] and appurtenances. Liner plates and troughs may be fiber reinforced plastic instead of steel.

Provide screw [collector] [and] [conveyor] suitable for continuous or intermittent operation and with a removal capacity of not less than [_____] cubic meter per second cubic feet per hour of dry grit weighing [1922] [_____] kg per cubic meter [120] [_____] pounds per cubic foot.

2.3.1.5.2.1 Screw Assembly

NOTE: The following table lists the requirements for selecting a screw.

<table>

Alternate screw type can be helicoid with short shafts.

a. Provide [horizontal] [inclined] screw of [_____] mm inch diameter, half pitch with 10 mm 3/8 inch flights butt welded or fillet welded both sides and mounted on [_____] mm inch Schedule 80 steel pipe conforming
to ASTM A53/A53M and bushed for [_____] mm inch shaft. As an alternate, a helicoid type screw conveyor section with 10 mm 3/8 inch steel flights may be provided with short shafts of solid cold rolled steel conforming to ASTM A108. Screw must be made in manufacturer's standard lengths with a coupling flight connection for ease of installation and removal. Protect outer leading edges of the flighting with a coating of weldment, a minimum of 25 mm one inch wide and 3 mm 1/8 inch thick. If carbon steel flighting is provided with a minimum 10 mm 3/8 inch thickness, it will be acceptable without coating provided that it has a minimum Brinell hardness of 500.

b. Ensure shafting is cold rolled steel conforming to ASTM A108 and coupling bolts are AIST PB-229, Type 316 stainless steel. Provide keyway to attach driven sprockets. Keys and keyseats must conform to ASME B17.1 or ASME B17.2.

c. Ensure driven sprocket is high-test cast iron having a minimum tensile strength of 138 MPa 20,000 psi cast in a chill, and with a Brinell hardness of not less than 360 with a chill depth at least 5 mm 3/16 inch, and stress relieved before machining. Sprocket teeth must be accurately ground to fit chain. Sprocket must be split construction assembled with cadmium-plated nuts and bolts. Key seat sprocket on the screw drive shaft.

d. Grease lubricate tail shaft bearings; provide with cast iron, high carbon or heat treated alloy steel bushings. Ensure bearings are rated for a minimum of 5 years of continuous service.

**************************************************************************
NOTE: Delete first optional paragraph below when horizontal screw collector is not allowed: Delete second optional paragraph when inclined screw conveyor is not allowed.
**************************************************************************

e. Grease lubricate drive end bearings for horizontal screw; provide bearings with high carbon or heat-treated alloy steel bushings. Ensure bearings are suitable for taking thrust. Provide bearings with lubrication fittings brought to an accessible location. Ensure bearings are rated for a minimum of 5 years of continuous service.

f. Ensure drive end bearings for inclined screw are extra heavy roller bearing pillow blocks, suitable for taking thrust. Grease lubricated ball bearings will be allowed. Ensure bearings have a minimum rated life expectancy (L-10) of 40,000 hours based on American Bearing Manufacturers Association Standards on a continuous service basis.

2.3.1.5.2.2 Motor Drive Assembly

Include an electric-motor-driven speed reducer; drive sprocket on output shaft of speed reducer; drive chain from drive sprocket to driven sprocket; shear pin; and chain guard.

a. Motor must be suitable for operation with the voltage characteristics as indicated.

b. Ensure chain and belt drives incorporated in the drive assembly have a minimum factor of safety of 4 as applied to ultimate breaking or transmission strength of the chain or belt with respect to the loads.
transmitted at normal continuous operating load.

2.3.1.5.2.3 Liner Plate

*******************************************************
NOTE: Specify liner plate for horizontal grit collector and trough for inclined grit conveyor.
*******************************************************

Provide curved 10 by [_____] mm 3/8 by [_____] inch I.D. abrasion-resistant steel liner plate with edges drilled for plug welding to 50 by 150 mm 1/2 by 6 inch steel straps embedded in the concrete for the horizontal screw, and a Brinell hardness of 300 to 350.

2.3.1.5.2.4 Steel Trough

*******************************************************
NOTE: Specify liner plate for horizontal grit collector and trough for inclined grit conveyor.
*******************************************************

Fit abrasion-resistant stainless steel 10 mm 3/8 inch thick trough with a gasket at the inspection opening, a clean-out plate on the lower end and a discharge spout on the upper end. Ensure the upper (drive end) bearings are suitable to take thrust for inclined screw. Ensure trough has a Brinell hardness of 300 to 350.

2.3.1.5.2.5 Structural Supports

*******************************************************
NOTE: Delete this paragraph when inclined screw conveyor is not allowed. Specify galvanized steel unless corrosion is considered a problem.
*******************************************************

Construct structural supports using minimum 6 mm 1/4 inch thick material[ and based on a safety factor of 4.0 against vertical load and torque]. Use [AIST PB-229, Type 302 or AIST PB-229, Type 304 stainless steel] [galvanized steel] assembly and anchor bolts.

2.3.1.5.3 Chain and Bucket Elevator Collector

*******************************************************
NOTE: Choose this paragraph and its subparagraphs or one of the paragraphs above, SCREW COLLECTOR AND BUCKET ELEVATOR and SCREW [COLLECTOR] [AND] [CONVEYOR], and its subparagraphs.
*******************************************************

Provide chain and bucket collection and removal assembly suitable for continuous or intermittent operation with a removal capacity of not less than [_____] cubic meter per second cubic feet per hour of dry grit weighing [1922] [_____] kg per cubic meter [120] [_____] pounds per cubic foot which operates at a speed of from 0.04 to 0.05 meter per second 8 to 10 feet per minute. Include housing, motor drive assembly, chain, shafting, sprockets, grit buckets, and overload protection.
2.3.1.5.3.1 Chain and Bucket Assembly

a. Ensure bucket chains are ASME B29.400 combination "H" Type Mill C110 having an average ultimate strength of 134 kN 30,000 pounds and must weigh no less than 7.8 kg per m 5.2 pounds per foot with links of corrosion resisting malleable iron having an average tensile strength of 483 MPa 70,000 psi and an average Brinell hardness between 170 and 190.

b. Ensure sprockets are high-test cast iron, having a minimum tensile strength of 138 MPa 20,000 psi cast in a chill, and a Brinell hardness of not less than 360 with a chill depth of at least 5 mm 3/16 inch and stress relieved before machining. Sprocket teeth must be accurately ground to fit chain. Sprockets must be split construction assembled with cadmium-plated nuts and bolts. Driven sprocket on the head shaft must be of the offset type. Keyseat sprockets on the head shaft. Keys and keyseats must conform to ASME B17.1 or ASME B17.2. Do not keyseat idler wheel and chain take-up shaft sprocket but, except for number of teeth, must be identical in other respects to the head shaft sprockets. Set-screw idler wheel and take-up shaft sprocket but, except for number of teeth, must be identical in other respects to the head shaft sprockets. Set-screw idler wheel and take-up shaft sprocket to the shaft.

c. Ensure bearings babbitt-lined, self-aligning ball-and-socket type or heat treated ductile-iron, self-aligning type. Bolt bearings, except those for bracket-supported driven sprockets, to the tank walls. Ensure bearings are designed to allow minimum field variations without shimming. Bracket supports, except on head shaft driven sprocket, are not be allowed. Provide bearings above water with flush ball-check grease-lubrication fittings. Provide water lubrication to underwater bearings, with tops designed to prevent solids accumulation, and flush ball-check grease-lubrication fittings. Provide self-aligning take-up bearings on take-up shaft arranged to slide between or to be steadied by two cast iron, mild steel or silicon bronze guides, with a minimum range of travel of 250 mm 10 inches and positioned by a stainless steel or silicon bronze threaded power bolt, which must be arranged for locking at any position of the bearing. Ensure bearings are rated for a minimum of 5 years of continuous service.

d. Fabricate grit buckets of structural steel or malleable iron with hardened lip[ and stirring flights fabricated from structural steel angles and plates]. Ensure buckets are designed to drain off free water. Buckets[ and stirring flights] must have replaceable alloy cast iron or malleable iron wearing shoes that can be rotated to distribute the wear. Attach buckets[ and stirring flights] to the chains at not more than 1.5 m 5 foot intervals with heat treated carbon steel pins and rivets having a minimum diameter of 17 mm 11/16 inch.
For each collector mechanism, provide one or two industrial type steel rail(s), minimum weight 8 kg per m, 16 pounds per yard. Include necessary splice bars, rail clips, and appurtenances. Ensure structural steel return tracks have a minimum thickness of 10 mm, 3/8 inch. Support return tracks by steel cross members supported from chamber walls.

2.3.1.5.3.2 Motor Drive Assembly

Include a motor; speed reducer; drive sprocket on output shaft of speed reducer; drive chain from drive sprocket to driven sprocket; shear pin; and chain guard. Ensure unit is fully enclosed and suitable for mounting outside and exposed to the weather.

a. Motor must be suitable for operation with the voltage characteristics as indicated.

b. Ensure chain and belt drives incorporated in the drive assembly have a minimum factor of safety of 4 as applied to the ultimate breaking or transmission strength of the chain or belt with respect to the loads transmitted at normal continuous operating load.

2.3.1.5.3.3 Housing

Mount 1.8 mm, 14 gage, galvanized steel, AIST PB-229, Type 302 or AIST PB-229, Type 304 stainless steel, above the operating floor and 5 mm, 3/16 inch, below the floor, on structural supports and securely fastened to the structural steel frame with bolts or sheet metal screws of the same material as the housing. Ensure the drive unit and head shaft assembly are as indicated on the shop drawings. Provide suitable openings for chain installation and inspection at convenient locations in the housing.

2.3.1.6 Grit Pump

Provide heavy-duty vertical, horizontal, torque flow vortex pump with mechanical variable speed drive. Position pump suction and discharge as indicated. Ensure pump is suitable for pumping grit under the following conditions of services:

- Capacity: [_____] cubic meter per second gpm
- Maximum Solid Size: [_____] mm inches
- Range of Head Conditions: [_____] m feet
- Amount of Grit in Water: [_____] percent

Final selection of pump operating conditions will depend upon actual cyclone selected. Include casing, impeller shaft, bearings, motor, drive
unit, $6.28 \text{ rad} 360 \degree$ pressure sensors, and anchor bolts.

2.3.1.6.1 Pump Casing

Provide manufacturer standard pump casing. Equip suction and discharge with flanges.

2.3.1.6.2 Radial and Thrust Bearings

Provide a minimum rated life expectancy (L-10) of 40,000 hours based on ABMA 11 when operating continuously at the rated full-load motor wattage and speed under the specified loading conditions. Internal bearings may be either oil or grease lubricated.

2.3.1.6.3 Pump and Motor Base

Provide manufacturer's standard base.

2.3.1.6.4 Motor

Motor must be suitable for operation with the voltage characteristics as indicated.

2.3.1.6.5 Drive Unit

Provide drive unit with a mechanical variable speed drive with a [___] to 1 ratio, manually adjustable in infinite steps over the entire range.

2.3.1.6.6 Pressure Switch

Provide a pressure switch in the piping to the cyclone to monitor the pressure buildup. [Wire switch to an alarm which will actuate when pressure exceeds a preset value. Provide industrial type alarm including rotating beacon, 90-decibel horn, and spare contact for remote signal.] Furnish switch for a pressure range of from [___] to [___] kPag psig with an adjustable alarm contact.

2.3.1.7 Airlift Pump

Include an air pipe, educator, foot piece, tail pipe, air separator and a vent pipe. Provide zinc-coated Schedule 40 steel pipe to the educator of adequate size to discharge the required amount of liquid without excessive pressure drop. Provide a MSS SP-80 globe valve, MSS SP-72 ball valve, or MSS SP-78 plug air control valve on the air pipe for accurate adjustment of the airlift discharge rate. Ensure tail pipe below the foot piece, the educator pipe, air separator and vent from it are of zinc-coated steel. Fittings must be of zinc-coated malleable iron or cast iron. Provide educator with a clean-out above the water level. Install airlift pump so as to permit easy removal for maintenance.

2.3.1.8 Cyclone

Provide cylindrical-conical cyclone unit with a replaceable, high-density, lining, with a capacity of [___] cubic meter per second gpm at a maximum feed pressure of [___] kPa psi and capable of making a separation at approximately [___] mesh predicated on a feed solids concentration of not more than one percent solids for grit pumped from the point of removal of the grit chamber. Provide flanged components for feed connections, and transition fittings to adapt to both the feed and overflow connections.
2.3.1.9 Screw Type Washing Equipment

Include washing tank, steel screw conveyor mounted in a housing, drive unit, and supporting substructures.

Provide heavy-duty stainless steel vessel grit washer suitable to capture grit slurry and separate the grit from the organics. The Grit Washer must be suitable for the following conditions of services:

Design Flow of Grit Slurry per unit: [_____] cubic meter per second gpm

Grit Processing Capacity per unit: [_____] kg per hr ton per hr

Maximum water content in washed grit: [_____] percent at design flow

Maximum volatile solids in washed grit: [_____] percent at design flow

Minimum capture rate of [_____] size grit: [_____] percent at design flow

Surface overflow rate: [_____] cubic meter per second per squared meter gpm per square foot

Horsepower of Driver: [_____] watts HP

2.3.1.9.1 Mechanism

**************************************************************************
NOTE: The following table lists the requirements for selecting a screw.

Alternate screw type can be helicoid with short shafts.
**************************************************************************
Convey grit from washer settling compartment and discharge by means of a screw conveyor. Mount [_____] mm inch diameter, [half pitch] with 10 mm 3/8 inch flights, incline screw on [_____] mm inch pipe. Provide manufacture's standard screw, ensuring ease of installation and removal.

a. Grease lubricate tail shaft bearings; provide with high carbon or heat treated alloy steel bushings. Ensure bearings are rated for a minimum of 5 years of continuous service.

b. Ensure drive end bearings are extra heavy roller bearing pillow blocks suitable for taking thrust. Grease lubricated ball bearings are acceptable. Ensure bearings have a minimum rated-life expectancy (L-10) of 40,000 hours based on ABMA 11 on a continuous service basis.

2.3.1.9.2 Housing

Construct the washing tank of 6 mm 1/4 inch steel plate, suitably reinforced and mounted on steel supports. Ensure tank provides a settling compartment for grit separation. Provide suitable anchor bolts. Arrange the substructure to support the washing tank and cyclone, include necessary mounting brackets as a component part of the washer.

2.3.1.9.3 Drive Unit

Provide mechanical variable speed drive unit with a [_____] to 1 ratio, manually adjustable in infinite steps over the entire range.

2.3.1.9.4 Motor

Motor must be suitable for operation with the voltage characteristics indicated.

2.3.1.9.5 Overflow Weir

Regulate depth of liquid in the settling compartment by an adjustable weir fitted at the end of the settling tank. Regulate pool depth to a minimum of 150 percent of the spiral diameter.

2.4 COMPONENTS

2.4.1 Motor

Provide motor that is constant speed, totally enclosed, thermally protected horizontal type, suitable for outdoor service, and conforming to NEMA MG 1. Motor must be of adequate wattage horsepower to drive the equipment continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Motor must be suitable for operation with the voltage characteristics as indicated. Protect motor against overload, low voltage, and unbalanced voltage. Connect motor directly to speed reducer or drive unit through a flexible coupling.

2.4.2 Speed Reduction Unit

Provide speed reducer with a fully enclosed gear reduction unit. Ensure gears used in speed reducer conform to applicable requirements of the following standards. Ensure speed reducer is designed with a minimum AGMA service factor of 2.0 and has an AGMA Service Classification II.

2.4.3 Bearings

Provide anti-friction drive bearings conforming to the following minimum schedule of rated-life expectancy (L-10) based on the ABMA Standards when operating at the normal continuous torque rating of the mechanism.

a. Worm and wheel gear box bearings: L10-100,000 hours

b. Geared motor (direct drive): L10-100,000 hours

c. Intermediate helical and spur gear box bearings: L10- 17,000 hours

d. Geared motor (indirect drive): L10- 17,000 hours

2.4.4 Chain and Belt Drives

Enclose chain and sprockets or V-belt and pulleys connecting motor and speed reducer in a weatherproofed guard. Chain connecting motor and speed reducer must be steel roller type. Sprockets must be hardened ground alloy steel or high-test cast iron, having a minimum tensile strength of 276 MPa 40,000 psi cast in a chill, and must have Brinell hardness of not less than 360 with a chill depth of not less than 5 mm 3/16 inch. Sprocket teeth must be accurately ground to fit the chain. V-belt drives must be adjustable to increase or decrease belt tension. Drive sprocket must be keyed on the output shaft of the speed reducer and provided with shear pin overload protection. Provide a drive chain tightener to adjust and tighten the chain.

2.4.5 Drive Unit

Provide drive unit that is mechanical variable speed drive with ratio indicated, and is manually adjustable over the entire range. The drive unit must be suitable for mounting with motor provided. Include a motor sheave, speed reduction sheave and V-belt. Transmit the required power with multiple belts. Ensure a minimum service factor of 1.5.

2.4.6 Overload Protection and Alarm

Provide waterproof torque actuated overload alarm system, or indicating ammeter overload unit designed to indicate the load on the mechanism at all times, to sound an alarm in case of impending excessive load, and to stop the mechanism when such load is reached. Include an industrial Type 90-decibel horn, rotating beacon, relay and reset button in a weatherproof metal housing with a removable gasketed cover. Construct horn of corrosion-resisting material and ensure that it is suitable for remote mounting. Provide shut-off switch, for horn and beacon.

2.5 MATERIALS

2.5.1 Finishes

Except as otherwise specified, treat and paint equipment in accordance with the manufacturer's standard practice.
PART 3 EXECUTION

3.1 INSTALLATION

Install grit handling equipment and accessories specified herein in accordance with approved shop drawings and manufacturer's recommendations. Provide all lubricants for initial operation.

3.1.1 Air Piping

Install piping in alignment and support with pipe hangers and supports. Make mechanical joints in accordance with the requirements of AWWA C600. Make flanged joints tight, avoid undue strain on flanges, valves, fittings, and other equipment and accessories. Make screwed joints tight with pipe thread tape, pipe cement and oil, or PTFE powder and oil, applied to the male threads only. Leave no more than 3 threads exposed, ensure threads are full cut. Make up joints for PVC pipe with solvent cement conforming to ASTM D2564 and join in accordance with the Appendix thereto.

3.1.2 Grit Pump

Mount the pump complete with driver and motor on a heavy duty base. Ensure the base is complete with machined undersurface mounting pads and lifting brackets. Install the complete unit in accordance with the recommendations of the manufacturer. Provide oil and grease for initial operation in accordance with the manufacturer's recommendations.

3.1.3 Cyclone

Install in accordance with the manufacturer's instructions to ensure self-regulation and produce a low moisture grit.

3.2 FIELD QUALITY CONTROL

3.2.1 Tests

3.2.1.1 Grit Separation, Collection, Removal and Washing Equipment

Test equipment in operation to demonstrate correct alignment, smooth operation, freedom from vibration and freedom from noise and overheating of moving machinery. Correct all defects.

3.2.1.2 Aerated Grit Equipment

3.2.1.2.1 Air Diffusers

Test for uniformity. Each diffuser must have uniform distribution along the entire header as determined by the method of testing specified.

a. Test using a large easily read scale for measuring the flow of air to the header system and pressure gauges for measuring pressure at the third point of the header. Test the header and diffusers in the aerated grit tank. Use orifice type meter, of proper size, and installed in accordance with the recommendation of AGA GMC. Before tests are started, check the calibration of the orifice meter with a standard displacement type gas meter of not less than [_____] cubic meter per second cubic feet per hour capacity which has been accurately calibrated volumetrically in a manner satisfactory to the Contracting Officer.
b. For uniformity testing, submerge diffusers in tap water to a depth of 0.30 m one foot. Diffuse air at a rate of [_____] cubic meter per second cubic feet per minute per diffuser for one minute. Then reduce the airflow to [_____] cubic meter per second cubic feet per minute per diffuser, observe uniformity. Replace nozzle having unsatisfactory distribution.

3.2.1.3 Grit Pump

After pump has been installed, conduct such tests as are necessary to indicate that the pump conforms to the specifications. A 24-hour operating period of the pump is required before acceptance. Submit sufficient data, including manufacturer's rating curves showing pump characteristics of head, wattage brake horsepower, and speed to show that the pump meets all requirements of the specifications.

3.2.1.4 Performance Tests

**************************************************************************
NOTE: Performance tests consist of determining the amount of grit entering the chamber and the amount of grit in the effluent from the chamber and comparing the two values as a percentage.
**************************************************************************

Provide field test data demonstrating the performance of grit removal efficiencies as specified. Specified performance must be met before equipment will be accepted. The contractor is responsible for testing costs. Submit an acceptable grit removal efficiency test procedure prior to actual testing.

3.2.1.5 Cyclone

Upon installation, operate equipment for 24 continuous hours at the design flow specified. During this period, sample cyclone overflow periodically as directed by the Contracting Officer, but not less than once every four hours. Dry and test samples as specified by AASHTO T 27 and AASHTO T 11. If particles average more than 5 percent larger in size than [_____] mesh, adjust the equipment to meet these specifications.

3.2.2 Manufacturer Field Service

3.2.2.1 Manufacturer's Representative

Provide the services of an engineer representative to supervise the field installation and start-up of the equipment and accessories, in accordance with the manufacturer's specifications.

3.3 CLOSEOUT ACTIVITIES

3.3.1 Grit Handling System
Submit grit handling equipment information, including operation and maintenance manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA, for each item of the grit separation, collection, removal and washing system.

1.2 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Comminutor; G[, [_____]}

SD-03 Product Data

Spare Parts

Submit after approval of the drawings and not later than [_____] months prior to the date of beneficial occupancy.

Materials and Equipment

Framed Instructions

SD-06 Test Reports

Field Tests

Booklet form.

SD-10 Operation and Maintenance Data

Operating Instructions; G[, [_____]}

[Six] [_____] copies each of the operation and maintenance manuals.
1.3 QUALITY CONTROL

1.3.1 Manufacturer's Services

Obtain the services of the manufacturer's representative experienced in the installation, adjustment, and operation of the equipment specified to supervise the installing, adjusting, and testing of the equipment.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect from weather, humidity and temperature variations, dirt and dust, or other contaminants all equipment delivered and placed in storage.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide materials and equipment conforming to the respective publications and other requirements specified and which are the standard products of a manufacturer regularly engaged in the manufacture of the products. Provide items of equipment that essentially duplicate equipment that has been in satisfactory use at least 2 years prior to bid opening. Ensure equipment is supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.1.1 Nameplates

Provide nameplates for major equipment items to include manufacturer's name, address, type or style, catalog number and model or serial number on a plate securely attached to item of equipment. In lieu of nameplate on the comminutor, integrally casting the manufacturer's name or trademark with comminutor, stamping, or otherwise permanently marking is acceptable.

2.1.2 Protection From Moving Parts

Fully enclose moving parts of the equipment, such as drive chains and sprockets, in removable guards. Fully enclose all equipment above the level of the sewage-carrying channel in a cast-iron or 1.720 mm (14 gauge) 14 gauge sheet steel or wrought-iron housing. Provide housing with a sufficient number of doors or removable panels to insure ready access to any part of equipment for repairing, replacing, or cleaning. Ensure all joints between the housing and the concrete foundation are made leakproof.

2.1.3 Design

**************************************************************************
NOTE: Refer to UFC 3-240-02 for design requirements. The following information should be shown on the project drawings covered by the specification as appropriate:

a. Size and type of channel pipe or joint in which comminutor is to be mounted. Specify whether comminutor access openings are located within pits or manholes.

b. Minimum, average, and maximum sewage flows. The maximum rating of a comminutor should be made with the combs fully submerged.
c. Normal and maximum liquid levels, including flooding level for submersible drive.

d. Allowable head loss at maximum flow. Head loss should not be set too low for it could exclude rotating type comminutors.

e. Whether comminutor has free discharge or controlled discharge.

f. Whether location requires explosion-proof equipment.

g. Electrical power characteristics.

h. Type of drive mounting and elevations pertinent thereto.

i. Channel design, size and type, should be conducted in manner that optimizes channel width and allows for maximum competition among comminutor suppliers. If the channel width is designed too narrow it could exclude rotating type comminutors.

j. Each comminutor device should have a by-pass for maintenance and repair purposes.

Provide a comminutor capable of passing a minimum flow of [_____] cubic meters/second million gallons per day (mgd), an average flow of [_____] cubic meters/second mgd, and a maximum flow of [_____] cubic meters/second mgd. Ensure the head loss at maximum flow does not exceed [_____] mm inches of water. Design comminutor for [free] [controlled] discharge. [Design so the downstream submergence is [_____] mm inches at maximum flow for controlled discharge units.] Ensure comminutor is capable of operating satisfactorily at zero flow.

2.2 COMPONENTS

2.2.1 Electric Motor and Controller

Provide electric motors that conform to NEMA MG 1. Provide motor controller that conforms to NEMA ICS 2.

2.2.2 Comminutor

Provide a comminutor of the [rotating] [or] [oscillating] type for use in a sewage treatment plant. Comminutor consists of an electric motor-driven mechanical shredder or cutter with [gear motor] [hydraulic drive] capable of continuous and automatic operation and must reduce sewage solids to particle sizes between 6.4 and 9.5 mm 1/4 and 3/8 inch. The cutting and screening mechanism are required cut or shred all sewage solids including sticks, rags, and stringy material, without removing them from the sewage flow, without clogging the screen, and without binding, jamming, or stalling the moving parts.

Submit drawings indicating clearances required for maintenance and operation, containing complete wiring and schematic diagrams, equipment
layout and anchorage, and any other details required to demonstrate that the system has been coordinated and properly function as a unit.

2.2.2.1 Rotating Drum Type

Rotating drum type comminutors are required to include a slotted drum that functions as a screen and support for the rotating cutters, a casing supporting the stationary cutters, and a drive assembly. Evenly spaced cutting teeth pass through a stationary comb section cutting against it as the cutters rotate. Ensure the unit has a smooth, continuously available torque, 360-degree rotation with equal performance in either direction of rotation. Provide casing made of close-grain cast iron or aluminum alloy of adequate strength and rigidity to withstand all loads imposed on it from the operation of the comminutor and drive assembly. Provide casing with manufacturer's recommended concave semi-circular screen of stainless steel attached to it.

2.2.2.2 Rotating Disc or Conical Type

Rotating disc or conical type comminutors include a stationary grid frame cutter-comb support with cutter-combs, rotating cutter plate/screen with adjustable teeth, and a drive assembly. Cutter plates are fixed and keyed to the center drive shaft permitting only one cutter tooth and a cutter comb to be engaged at one time for load power saving. Provide frame, grid, and discs made of close-grained cast iron or aluminum alloy. Construct the conical screen of the manufacturer's recommended stainless steel.

2.2.2.3 Oscillating Type

Oscillating type comminutors include a stationary semi-circular screen, a stationary cutter bar mounted on a support casing, an oscillating cutter bar, and a drive assembly. Ensure cutter bars are adjustable and readily removable for inspection, sharpening, or replacement. Actuate oscillation by mechanical conversion of the driver rotation. Provide a casing made of close-grain cast iron or aluminum alloy of adequate strength and rigidity to withstand all loads imposed on it from the operation of the comminutor and drive assembly. Construct the casing of the manufacturer's recommended semi-circular screen of stainless steel attached to it.

2.2.3 Motor Controller

Mount the control panel where indicated. Ensure the motor controller is rated as indicated and conform to NEMA ICS 2. Ensure the control system includes an automatic motor starter reset for power failure protection [and an automatic drive motor reversal with time delay for jamming protection in the event of hard particle entrapment in the comminutor cutters]. Design the reversing controller to sense jams and reverse motor rotation as often as necessary, while continuing to operate providing partial sweeps on the comminutor arm, with no danger of motor damage. Provide an audible and visual alarm system to signal both field operator and area office in case of malfunction.

2.2.4 Gear Motor

******************************************************************************
NOTE: Totally enclosed motors should be used except in locations where explosive-proof equipment is required.
******************************************************************************
Provide an electric motor of constant speed, [totally enclosed] [totally enclosed fan cooled] [explosion-proof], capable of operating in air, partially or completely submerged. Ensure motors are UL listed for Class I, Div I, Group D service, horizontal or vertical type, suitable for outdoor use and conforming to NEMA MG 1. The unit is required to be capable of withstanding any loadings produced by the thrust, out-of-balance, and vibrating forces resulting from operating conditions. Supply gears made of be wrought or alloy steel except that worm gears be bronze. Flame hardened gears are not acceptable. Construct housing of close-grained cast iron, fabricated steel, or aluminum alloy.

2.2.5 Gear Motor Mounting

Mount the comminutor gear motor [close-coupled with the comminutor] [on [an open] [a gas tight] stand with universal shaft to the comminutor. Enclose universal shaft in protective piping to elevation indicated. Provide protective piping with a tapped and plugged hole for drainage] [on an extension pipe at the elevation indicated with universal shafting to the comminutor. Equip extension pipe with handholds to allow inspection and repair of shafting].

2.2.6 Hydraulic Drive

Mount hydraulic actuator on the unit and connected to the shaft. Supply pressurized hydraulic fluid using a power unit that includes an oil reservoir, motor-driven positive displacement pump, and all necessary control valves. Ensure the pump motor is constant speed [totally enclosed] [totally enclosed fan cooled] [explosion-proof], vertical type suitable for outdoor service and conform to NEMA MG 1. Protect motor against overload, low voltage, and unbalanced voltage. Provide rubber-covered abrasion-resistant pressure hose with suitable connectors for connecting the power unit to the hydraulic actuator.

2.2.7 Cutting Elements

Fabricate all secured elements, combs, teeth, and bars of a corrosion- and wear-resistant chrome-tungsten type alloy or equal possessing Brinell Hardness of 450 or better. Ensure all elements are readjustable to compensate for wear, and removable for sharpening or replacement.

2.2.8 Bearings

Provide bearings of the antifriction type having a rating-life expectancy (L-10) of 100,000 hours when equipment is operating continuously. [Provide intermediate guide bearings, where required for extended shafting, for adequate support and alignment made of the ball bearing type enclosed in a self-aligning pillow block housing.]

2.2.9 Lubrication

Lubricate and protect all moving parts of the comminutor from flooding according to the manufacturer's recommendations. Ensure bearings are either oil or grease lubricated. Ensure gear reduction unit is oil lubricated. Provide oil lubricated bearings and reduction units with a sight glass or other positive means of determining oil level. Ensure grease-lubrication pressure-line fittings and oil fill and drain lines are easily accessible when comminutor is in place.
2.3 MATERIALS

Provide materials that conform to the following:

2.3.1 Cast Iron

ASTM A48/A48M Class 30, minimum.

2.3.2 Bearings

ABMA 9 and ABMA 11.

2.3.3 Aluminum Alloy

ASTM B108/B108M.

2.3.4 Miscellaneous Metal

Provide bolts, nuts, anchors, washers, and other types of supports necessary for the installation of equipment made of steel or wrought iron, galvanized according to the requirements of ASTM A153/A153M. Ensure all anchor bolts and nuts for the comminutor, motor, or power unit are Type 316 stainless steel, ASTM F593.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Install materials and equipment as shown and in accordance with the approved written recommendations of the equipment manufacturer.

3.2.1 Installation within a Channel

**************************************************************************

NOTE: Delete this paragraph when comminutor is to be installed in a pipeline.

**************************************************************************

Ensure the comminutor, motor, power unit, guide bearings, and all equipment requiring attachment to structural supporting members are furnished complete with bolts, nuts, anchors, washers, sole plates, or any other type of supports necessary for the installation of the equipment.

3.2.2 Installation within a Pipeline

**************************************************************************

NOTE: Delete this paragraph when comminutor is to be installed in a channel.

**************************************************************************

Provide comminutor with standard flanged or bell and spigot connections for installation in pipeline.
3.2.3 Electrical Work

Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical characteristics as indicated. Provide manual or automatic control and protective or signal devices required for the operation specified, and any control wiring required for controls and devices but not shown on electrical plans.

3.2.4 Painting

Thoroughly clean, prime, and give two finish coats of paint to all equipment at the factory in accordance with the recommendations of the manufacturer. Ensure all field painting complies with Section 09 90 00 PAINTING, GENERAL.

3.2.5 Special Tools

Furnish special tools for the proper operation and maintenance of equipment. Install in a wall-mounted hardwood or metal container. Furnish a complete set of manufacturer's recommended spare parts including cutting teeth and combs or other cutting elements, fasteners, screens, seals or bearings, etc. Include a complete list of parts and supplies with current unit prices and source of supply in the spare parts data submission.

3.2.6 Framed Instructions

Post, where directed, framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system. Prepare condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system in typed form, framed as specified above for the wiring and control diagrams, and posted beside the diagrams. Submit proposed diagrams, instructions, and other sheets, prior to posting. Post the framed instructions before acceptance testing of the systems.

3.3 FIELD TESTS

After installation of comminutor is complete, conduct operational tests required to demonstrate that the comminutor operates in accordance with the specified requirements. Submit test reports showing all field tests performed on the installed system to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Ensure each test report indicates the final position of controls.

3.3.1 Scheduling

Provide the Contracting Officer [14] [_____] calendar days notice of the dates and times scheduled for the tests.

3.3.2 Tests

Test the comminutor mechanism in the operation mode to demonstrate correct alignment, smooth operation, proper adjustment, freedom from vibration, and freedom from noise and overheating of moving machinery. Ensure the test period includes one hour of operation in each specified range and not less than one cycle of automatic stop, reversal, and restart. Measure head losses at the specified flow ranges during the tests to assure that the requirements are met. Test operate installed controls to assure that
operational requirements of paragraph MOTOR CONTROLLER are satisfied. Make two complete cycles to verify that the system continues to function satisfactorily under all requirements.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Training

**************************************************************************
NOTE: Consult equipment manufacturers for recommended time required to train personnel for the proper operation of the unit and insert number of hours.
**************************************************************************

Provide a field training course for operating and supervising staff members. Provide training for a total period of [_____] hours of normal working time and must start after the system is functionally complete but prior to final acceptance tests. Ensure the field instructions cover all of the items contained in the operating and maintenance instructions.

3.4.2 Operating Instructions

Provide manual of operation explaining in detail step-by-step procedures required for system startup, operation, and shutdown. Include parts list, and a brief description of all equipment and operating features in the instructions.

Provide maintenance manuals explaining in detail routine maintenance procedure including inspection, adjustments, lubrication, and cleaning. List possible breakdown, methods of repair, and a troubleshooting guide in the instructions. Include piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed in the instructions for the equipment furnished. One complete set prior to performance testing and the remainder upon acceptance. Identify the manuals by title, equipment and manufacturer. Submit and obtain approval of all manuals prior to the field training course.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for parallel plate, and vertical tube gravity oil-water separators to remove free oil and particulate matter from oily waste water.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Vertical tube coalescers shall not be used on Army projects.

NOTE: When influent conditions require treatment beyond the capability of a parallel plate, vertical tube, or API type gravity separator (e.g. presence of a mechanical or chemical oil-water emulsion), the designer shall prepare specifications to add one or more of the following unit operations to the separation system to comply with discharge criteria:

Hydrocyclone
Chemical pretreatment unit
Flocculator
Dissolved air floatation unit
Electrocoagulation unit
Filter membranes
Cartridge filters
Activated carbon absorber
Multimedia filtration
Sludge dewatering equipment

In addition, these separators are not intended as containment devices. Where applicable regulations dictate containment of accidental spills, suitable containment systems shall be designed.

******************************************************************************

NOTE: The following information shall be shown on the project drawings:

1. Inlet and outlet pipe invert elevations.

2. Sampling ports integral with the influent pipe and effluent pipe, when required.

3. Accessory equipment.

******************************************************************************

PART 1 GENERAL

1.1 REFERENCES

******************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

******************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B16.5 (2020) Pipe Flanges and Flanged Fittings
1.2 SYSTEM DESCRIPTION

1.2.1 Applications

**************************************************************************
NOTE: Delete parts of paragraph which are not applicable for project with respect to liquid carrier. Identify oily wastewater source(s) such as machine and paint shops, aircraft maintenance operations, aircraft washrack and rinse (corrosion control) areas, tank farm and fuel transfer areas, runway and fire training areas, bilge and ballast water, accidental spills, and contaminated stormwater runoff.
**************************************************************************

**************************************************************************
NOTE: Pumping of influent will mechanically emulsify oil in water unless a positive displacement pump or other low emulsifying, de-rated pump is used.
**************************************************************************
NOTE: Identify site specific atmospheric conditions that would produce a corrosive environment for oil-water separator materials so that the proper protective coatings or corrosion resistant materials can be provided.

The separator shall remove free oil [and] emulsified oil [and suspended solids] from oil-in-water mixtures of [freshwater] [freshwater and seawater] [seawater] originating from [_____] operations. The influent oil-in-water mixture will [flow by gravity] [be pumped] to the unit which [will] [will not] be located in an area with a corrosive atmosphere. [The corrosive atmosphere is composed of [_____]].

1.2.2 Influent Characteristics

NOTE: Insert maximum design flow and wastewater characteristics which have been established by direct measurement and chemical analysis.

Provide oil-water separator designed for a maximum flow of [_____] liters per second [gallons per minute]. Operating temperatures of the influent oil-in-water mixture will range from [_____] to [_____] degrees C degrees F and ambient air temperatures will range from [_____] to [_____] degrees C degrees F. The specific gravity [gravities] of the [oil] [oils] at operating oil-water temperatures will range from [_____] to [_____] degrees F. The specific gravity of the [freshwater] [freshwater and seawater] [seawater] at operating temperatures will range from [_____] to [_____] degrees C degrees F. The average specific gravity of the suspended solids is [______]. The influent is further characterized as follows:

NOTE: List additional types and concentrations of detergents, anti-oxidants, solvents, acids or bases, and heavy metals that may be present in the oil-in-water mixture. If these additional items are present: chemical addition, flocculation and dissolved air flotation, or other appropriate unit operations may be needed for effective treatment of these constituents.

<table>
<thead>
<tr>
<th>Oil-in-Water Mixture</th>
<th>Minimum</th>
<th>TO</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total solids</td>
<td>[_____]</td>
<td>to</td>
<td>[_____] mg/L</td>
</tr>
<tr>
<td>Total suspended solids</td>
<td>[_____]</td>
<td>to</td>
<td>[_____] mg/L</td>
</tr>
<tr>
<td>[Total grease and oil]</td>
<td>([____])</td>
<td>[to]</td>
<td>([____] mg/L)</td>
</tr>
</tbody>
</table>
### Performance Requirements

*NOTE: Make choice based on standards or guidelines established by environmental regulatory agency(ies); or other design considerations, such as unit wastewater treatment process(es) that follow downstream from this separator. Quantity of free oil removed is dependent on characteristics of oil-in-water mixture. The practical minimum concentration achievable is 10 mg/L for a parallel plate separator under ideal conditions.*

*NOTE: In general, free oil is defined as dispersed oil globules that rise to the surface of the water in which it is contained. The rate of rise of the oil particle is a function of its size and specific gravity as defined by Stoke's Law. Oil droplets with diameters of greater than 20 microns and specific gravities of 0.95 or less are considered to constitute the free oil form. Smaller oil droplet diameters are attributed to mechanically or chemically emulsified oil.*

The [grease and oil] [petroleum hydrocarbon] concentration in the effluent from the oil-water separator shall not exceed the following limitations:

<table>
<thead>
<tr>
<th>Contaminants</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Total grease and oil, 30-day average]</td>
<td>[[_____] mg/L]</td>
</tr>
<tr>
<td>[Total grease and oil, daily maximum]</td>
<td>[[_____] mg/L]</td>
</tr>
<tr>
<td>[Petroleum hydrocarbon, 30-day average]</td>
<td>[[_____] mg/L]</td>
</tr>
<tr>
<td>[Petroleum hydrocarbon, daily maximum]</td>
<td>[[_____] mg/L]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

To achieve [this goal] [these goals], it will be necessary to remove all free oil droplets equal to or greater than [20][_____] microns.
1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Separator; G[, [_____]]

[ Accessory equipment; G[, [_____]]

Submit shop drawings for separator [and accessory equipment] including principal dimensions, location of fittings and unit foundation. Include data to verify center of gravity with the unit empty and filled with water.

SD-05 Design Data
Submit analysis, signed by a registered professional engineer, which indicates that at the calculated overflow rate, the separator will be provided with the required square meter square feet of projected plate separation area to achieve the specified performance under laminar flow (i.e. Reynolds number of less than 500) conditions. Calculations shall take into account the rate of flow, potential surge flow, influent concentrations, particle characteristics, fluid temperature, fluid specific gravities, and pH.

**SD-06 Test Reports**

**Shop hydrostatic test; G[, [____]]**

Submit results of hydrostatic and dynamic testing.

**Inspection**

**Field hydrostatic test**

**Preoperational test**

**In-service test**

**SD-07 Certificates**

**Separator corrosion protection; G[, [____]]**

Submit written verification on the fabricator's letterhead that surface preparation and coating application were performed in accordance with the manufacturer's printed recommendations for the coating system.

**SD-08 Manufacturer's Instructions**

**Separator system; G[, [____]]**

**SD-10 Operation and Maintenance Data**

**Separator system, Data Package 3; G[, [____]]**

**Accessory equipment, Data Package 3; G[, [____]]**

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

#### 1.4 DELIVERY, STORAGE, AND HANDLING

##### 1.4.1 Delivery and Storage

Inspect materials delivered to site for damage; unload and store with minimum handling. Store materials on-site in enclosures or under protective coverings. Protect materials not suitable for outdoor storage to prevent damage during periods of inclement weather, such as subfreezing...
temperatures, precipitation, and high winds. Store materials susceptible to deterioration by direct sunlight under cover and avoid damage due to high temperatures. Do not store materials directly on ground. If special precautions are required, prominently and legibly stencil instructions for such precautions on outside of equipment or its crating.

1.4.2 Handling

Handle separator in such a manner as to ensure delivery to final location in sound, undamaged condition. Take special care not to damage interior and exterior surfaces of separator, coalescing plates, [or tubes] and associated supports and pipe coatings or linings. Make satisfactory repairs to damaged materials at no cost to Government. Carry and do not drag materials.

PART 2 PRODUCTS

2.1 MATERIALS

**************************************************************************
NOTE: Insert reinforced concrete or other suitable material if carbon steel is not acceptable. On larger separators (e.g. flow rate greater than 3.16 L/s 50 gpm, 6 mm 1/4 inch minimum thickness for carbon steel is recommended. Consult manufacturers' data.
**************************************************************************

Use [3/16] mm inch minimum thick carbon steel conforming to ASTM A36/A36M or material having equivalent structural properties and corrosion resistance for separator, hoppers, stationary and adjustable weirs, nozzles, flow distributor and energy dissipator device, bolts, seals, stiffeners, washers, [separator cover] and nuts. Weld in accordance with AWS D1.1/D1.1M to provide watertight separator that will not warp or deform under load. Use welders qualified in accordance with AWS Standard Qualification Procedure. Grind welds smooth and remove weld spatter. Fabricate free of kinks and sharp bends in a manner not to reduce the strength of steel to a value less than that intended by the design. Size and shape of bends shall be uniform. Clean and finish [carbon steel] surfaces as described in paragraph entitled "Separator Corrosion Protection."

2.1.1 Separator Corrosion Protection

2.1.1.1 Steel Separator

After shop conducted hydrostatic tests have been successfully completed, provide a MIL-DTL-24441 coating system to the interior and exterior surfaces of the separator. Prior to shop painting, abrasive blast clean the surfaces in accordance with SSPC SP 10/NACE No. 2 to a surface profile of 0.025 to 0.0625 mm 1 to 2 1/2 mils. Apply primer conforming to MIL-DTL-24441/1, Formula 150 applied to a minimum dry film thickness of 0.075 to 0.10 mm 3 to 4 mils. Apply intermediate coat conforming to MIL-DTL-24441/2, Formula 151 applied to a minimum dry film thickness of 0.075 to 0.10 mm 3 to 4 mils. Apply topcoat conforming to MIL-DTL-24441/3, Formula 152 applied to a minimum dry film thickness of 0.075 to 0.10 mm 3 to 4 mils. Total dry film thickness shall not be less than 0.23 mm 9 mils. Repair and replace areas of the coating system which are found to be damaged or defective upon delivery of equipment to the site or found to be...
defective due to work of the applicator. An interior polytetrafluoroethylene liner with a minimum thickness of 3 mm 1/8 inch may be provided in lieu of paint coating the interior separator surfaces.

2.1.1.2 Other Than Steel Separator

**************************************************************************

NOTE: If other than steel is specified for the separator material, the designer shall specify an appropriate protective coating system for the separator material specified.

**************************************************************************

After shop conducted hydrostatic tests and have been successfully completed, provide a coating system which will protect the separator from the oil-in-water mixture, [atmosphere,] and in situ soil conditions specified herein.

2.1.1.3 Cathodic Protection

**************************************************************************

NOTE: Specify cathodic protection for metal separators in contact with soil. Design cathodic protection in accordance with the current edition of UFC 3-570-02N, "Electrical Engineering Cathodic Protection" and edit the appropriate guide specification for inclusion in the project specification.

**************************************************************************

For [below ground] [partially above and partially below ground] [above ground] metal separators, provide cathodic protection with test stations as specified in Section [26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM] in addition to the protective coating.

2.1.2 Substitutions

**************************************************************************

NOTE: Designer shall check manufacturer's literature to assure construction material option selected is capable of withstanding anticipated forces and moments for the size of separator designed. Navy has experienced some problems with the fiberglass covered plywood and timber units when the fiberglass cracks; due to water seepage, wood has deteriorated causing structural failure.

**************************************************************************

NOTE: Insert suitable material if carbon steel is not acceptable. Consult manufacturers' data.

**************************************************************************

Separators constructed of [reinforced fiberglass][or] [reinforced glass fiber resin laminates over a rigid urethane foam core] may be provided in lieu of carbon steel [______]. Provide fiber glass separator with lifting straps. Glass fiber reinforced plastic weirs may be accepted as a suitable weir and baffle material provided that necessary requirements for anchorage
of these items include provisions for contraction and expansion. Surfaces shall be seamless, chemically resistant to oil-in-water mixture, and resistant to ultraviolet deterioration.

2.1.3 External Surfaces

**************************************************************************

NOTE: Include bracketed text as appropriate for below ground or partially below ground installations.
**************************************************************************

External surfaces and appurtenances shall be resistant to corrosion from the in situ soil, [backfill material,] [groundwater,] [and surface runoff] [surface runoff and the surrounding atmosphere] [soil pH] [soil resistivity].

2.1.4 Internal Surfaces

**************************************************************************

NOTE: The solvents in oil allow some plastic composite surfaces to absorb the oil. Once the plastic surfaces become saturated with oil they can become sticky. This is especially critical with plates since solids will tend not to slide down and eventually will clog the area between the parallel plates, resulting in increased maintenance.
**************************************************************************

Parallel plate [or vertical tube] material and orientation shall enhance oil coalescence and solids removal, and be corrosion and chemically resistant to the oil-in-water mixture [and atmosphere] as specified in paragraph entitled "SYSTEM DESCRIPTION."

2.1.5 Hardware

Bolts, stiffeners, washers, nuts, screws, pins, and fittings as required shall be corrosion resistant [and resistant to seawater]. Provide materials that are inherently corrosion resistant and not merely treated with a corrosion-resistant coating, such as provided by the galvanizing process.

2.1.6 Accessibility

**************************************************************************

NOTE: Separators below grade with access manholes and extension tubes to the surface are not recommended because of the obvious problems associated with visual inspection, cleaning, maintenance and safety. The designer is encouraged to provide an open type unit with removable grates, covers, or guard rail in order to minimize safety problems and improve accessibility. The preferred design is a separator with top at or above grade and open to the atmosphere, or if absolutely necessary, a cover which is completely removable. Access for routine sampling of wastewater should be provided. The cover should be designed so that it is easily removable by one person without the use of special hoists or other equipment. A separator that is
completely open will require a guardrail around the top. However, if the designer is faced with an air emission standard (i.e. State of California) the separator may need to be vapor tight and would preclude the use of open separators.

Do not bury tops of separators. Make the entire top area of the separator visible from ground surface. Separators below grade with access manholes and extension tubes to the surface will not be permitted. Use separators with an open top or a completely removable cover. Use open top separators with removable grating unless otherwise shown. Use top cover and grating that is easily removable by two persons. As a minimum provide access hatches over the following areas: parallel plates, oil storage compartments, Influent sampling area, effluent sampling area, oil skimmer, and weirs. Parts subject to wear or requiring adjustment, inspection, cleaning or repair shall be accessible and capable of convenient removal when required.

2.2 SEPARATION CHAMBER

Provide [above ground] [below ground] [partially above and partially below ground] separator to withstand hydraulic and soil loadings under static and dynamic conditions while empty and during operating conditions. Provide adequate support for additional loadings from separator appurtenances including weirs, hoppers, internal supports, parallel plate [or vertical tube] oil coalescers, equipment transportation, and rapid lowering and braking of load during handling operations. Bolt separator [and accessories] to weld-fabricated, structural steel skid base, or mount on manufacturer's standard base.

2.2.1 Lifting Mechanism

**NOTE:** For units fabricated from fiberglass, specify straps. In a salt water environment substitute acceptable non-corroding metal such as but not limited to copper-nickel, 316 stainless steel, or monel. Aluminum is unacceptable. Consult manufacturers' data.

Fit separator with lifting [lug] [strap] [padeye] [support] for handling and installation. Each [lug] [strap] [padeye] [support] shall carry the total dry weight of the separator and attendant appurtenances. Prominently display lifting instructions on [anodized aluminum] [_____] plate located on outside of separator.

2.2.2 Flanges

Use only flat face flanges and drill 1,034 kPa 150 pound ANSI Standard bolt circle and remove burrs. Use flanged piping connections that conform to ASME B16.5, welding neck type.

2.2.3 Weirs

**NOTE:** Insert suitable material if carbon steel is not acceptable. Consult manufacturers' data.
NOTE: Angle of slope of hopper bottom shall be greater than the angle of repose of the stored material. Volume and angle of repose for solids collected to be determined by designer based on oil-in-water mixture characteristics and frequency of cleaning.

Attach stationary weirs and adjustable weir supports to separator side walls to provide a watertight seal between adjoining compartments and trough to prevent hydraulic short-circuiting. Use carbon steel [_____] for weir plates and baffles. Provide sharp crested weirs of size and section specified by manufacture. Provide slotted holes in weir plates and baffles or supports to permit horizontal and vertical adjustment of weir or baffle. Use nondeteriorating sealant or gaskets for mounting weir plates. Fill voids between separator wall and weir plate with sealant to make watertight.

2.2.4 Low Point Drains

Provide means at low points for dewatering separator.

2.2.5 Identification Plates

NOTE: In a salt water environment substitute acceptable non-corroding metal such as but not limited to copper-nickel, 316 stainless steel, or monel. Aluminum is unacceptable. Nomenclature (or system identification) to be established by designer.

Provide [anodized aluminum] [_____] identification and instruction plates and stamp necessary data. Securely affix plates, in prominent location, to separator with nonferrous screws or bolts of not less than 3 mm 1/8 inch in diameter. Nomenclature shall be [______].

2.2.6 Instruction Plates

Instruction plates shall describe special or required procedures to operate and service equipment, and shall include warnings of hazardous procedures and notice of safety and health requirements. Plates shall be durable and legible throughout equipment life.

2.2.7 Warning Sign

On entrances to the separator (and entrances to the vault) place a permanent sign which states the following: "DO NOT ENTER separator ( OR VAULT ) OR PERFORM HOT WORK ON OR IN separator UNTIL THE ATMOSPHERE HAS BEEN TESTED AND CERTIFIED GAS FREE AND SAFE."

2.3 INLET COMPARTMENT

NOTE: Where a separate sedimentation basin has been provided the volume of the inlet compartment may be reduced. If total solids are less than 100 mg/L,
These elements may be eliminated after adequate benchscale testing has been completed to support this conclusion. Designer shall indicate run of solids removal line from outlet nozzle to a point above grade.

Provide inlet compartment of sufficient volume to effectively reduce influent [suspended] [settleable] solids and dissipate energy. Use inlet compartment that provides a minimum of 45 minutes detention ahead of the oil coalescing compartment. Provide nonclogging flow distributor and energy dissipator device [and the primary solids collection hopper] as specified in paragraph entitled "Reduction of Solids". Locate [adjustable, primary surface oil overflow weir and] sample ports as recommended by the manufacturer.

2.4 OIL SEPARATION COMPARTMENT

2.4.1 General

The maximum surface loading rate for the oil separation compartment shall be [_____] liters per square meter per day) [_____] gallons per day per square foot. The separator will also provide a minimum detention time within the oil separation compartment of [_____][45] minutes at design flow. Detention time will recomputed by calculating the volume of the separation zone within the separator and dividing this volume by the design flow rate. For computing detention time, total volume shall be reduced by 20 percent for the space occupied by settled solids (sediment) and accumulated oil at the surface.

2.4.2 Parallel Plates

Provide parallel plates at an angle from 0.70 to 1.05 rad 40 to 60 degrees with respect to longitudinal axis of the plate corrugations and space not less than 19 mm 3/4 inch apart for removal of free oil and settleable solids. Configuration used shall not promote solids buildup on plates which would increase velocities to point of discharging an effluent of unacceptable quality. Maintain laminar flow at maximum design flow rate throughout plate packs including entrance and exit so as to prevent re-entrainment of oil(s) with water. Flow through plate packs shall be in a downflow mode parallel to plate corrugations or cross-flow perpendicular to plate corrugations, so that the oil collects and coalesces at high point of corrugations and rises to top of pack without clogging from oil or settleable solids. Make minimum effective projected surface area ( [_____]square meters [_____]square feet).

NOTE: Vertical tube coalescers shall not be used on Army projects.

2.4.3 Vertical Tubes

If vertical tubes are provided, install tubes perpendicular to bottom of tank and align in a pattern to maintain laminar flow at maximum design flow rate through tube packs including entrance and exit to prevent emulsifying the oil(s) with water. Inlet to tube packs shall prevent hydraulic short-circuiting of oil-in-water mixture across the top of the tubes.
2.4.4 Supports

Brace and support individual plates [and tubes] or plate packs [and tube packs] to withstand loads associated with transportation and operation of units, including inplace cleaning. Equip each plate [or tube] pack with lifting lugs or other attachments for handling and installation. Each lug shall carry total weight of plate pack [or tube pack]. Provide adequate structural supports to facilitate inplace cleaning of plate pack [or tube] bundles.

2.4.5 Baffles

Provide oil retention baffle, adjustable surface oil overflow weir with trough, and stationary underflow baffle. Position underflow baffle to prevent resuspension of solids that have accumulated in secondary solids hopper.

2.5 OUTLET COMPARTMENT

Provide outlet compartment of [_____] cubic meter cubic feet, an adjustable overflow effluent weir, a sampling port, and nozzles.

2.6 ACCESSORIES [AND ACCESSORY EQUIPMENT]

******************************************************************************
NOTE: Specific project requirements may include one or more of the following accessories:

Access platforms
Access ladders (with minimum 1050 mm 42 inch extensions above hatch opening with locking device)
Handrailing
Waste oil transfer pump
Oily waste transfer pump
Sludge transfer pump
Sludge or waste oil storage tanks
Immersion heaters
Tank windows
System monitoring and control instrumentation (e.g. oil content monitor, oil-water interface sensors, control panel, pressure gages, high level alarms, oil flooded alarms, tank level indicators)
Sight glasses
Inlet strainer (duplex)
Air vent valve
Pitot tube sampling valve assemblies
Check valves
Manually actuated valves
Motor actuated valves
Explosion proof doors
Separator backwash system

Select and specify as required. For those accessories required in the project, specify detailed requirements (including sizes, ratings, capacities, performance characteristics) in subparagraphs under paragraph entitled "ACCESSORIES [AND ACCESSORY EQUIPMENT]."
******************************************************************************
NOTE: Review applicable Federal, State, and local air pollution and ventilation requirements to determine need for vapor containment.

Provide bolts, stiffeners, washers, nuts, screws, pins, gaskets, and fittings as required for adjustable weirs, [separator covers] and parallel plate packs [or vertical tube packs]. [Provide separator covers with a vapor proof seal for vapor control with [_____] mm inch inside diameter gas vents and suitable access manways to each separator compartment.]

2.7 FABRICATION

NOTE: Specific project requirements may include one or more of the following accessories:

Access platforms
Access ladders (with minimum 1050 mm 42 inch extensions above hatch opening with locking device)
Handrailing
Waste oil transfer pump
Oily waste transfer pump
Sludge transfer pump
Sludge or waste oil storage tanks
Immersion heaters
Tank windows
System monitoring and control instrumentation (e.g. oil content monitor, oil-water interface sensors, control panel, pressure gages, high level alarms, oil flooded alarms, tank level indicators)
Sight glasses
Inlet strainer (duplex)
Air vent valve
Pitot tube sampling valve assemblies
Check valves
Manually actuated valves
Motor actuated valves
Explosion proof doors
Separator backwash system

Select and specify as required. For those accessories required in the project, specify detailed requirements (including sizes, ratings, capacities, performance characteristics) in subparagraphs under paragraph entitled "ACCESSORIES [AND ACCESSORY EQUIPMENT]."

Where the separator is to be mounted in a concrete vault with a hatch cover, the designer shall address, as a minimum, the following:

1. Hatch covers shall provide access to the entire separator.

2. Hatch covers shall lock in the open position.
3. Light weight covers for non-traffic areas.

4. Interior ladder rungs shall not be set away from cover opening so as to require a person to swing in and grab.

**************************************************************************

NOTE: Review applicable Federal, State, and local air pollution and ventilation requirements to determine need for vapor containment.

**************************************************************************

Provide shop fabricated, skid mounted oil-water separator, or other shop fabricated unit approved by the Contracting Officer, which is comprised of a separator containing an inlet compartment, parallel plate [or vertical tube] oil coalescing compartment, outlet compartment [and the following accessories]:

[ Separator Cover [with vapor proof seal] ]

2.7.1 Shop Hydrostatic Test

Prior to applying coatings, perform hydrostatic test at atmospheric pressure by filling separator with water in the shop for a minimum of 4 hours. Testing shall be conducted after all seams have been cleaned and all welds have been inspected in accordance with ASTM E165/E165M. Acceptance criteria, for the hydrostatic test, is no leakage after 4 hours using a thorough visual inspection for the leaks.

2.7.2 Reduction of Solids

**************************************************************************

NOTE: Designer shall address special influent characteristics as part of the design when using this specification. Special characteristics include, but are not limited to, inflow rate, grit content, viscosity of petroleum product, AFFF foam, heavy metals, and reverse emulsion. Determine need for a solid waste basin preceding the separator and specify solid waste basin requirements when required by site conditions.

**************************************************************************

NOTE: If total solids are less than 100 mg/L, these elements may be eliminated after adequate benchscale testing has been completed to support this conclusion. Designer shall indicate run of solids removal line from outlet nozzle to a point above grade.

**************************************************************************

Inlet compartment shall reduce [suspended] [settleable] solids to nonclogging level for parallel plates [or vertical tubes,] and provide a uniform oily wastewater hydraulic loading across inlet face of oil coalescing compartment, under laminar flow conditions. Equip compartment with an inlet nozzle with wastewater sampling port, nonclogging flow...
distributor and energy dissipator device, [primary solids collection hopper,] [primary solids outlet nozzle,] [oil retention weir,] [adjustable surface oil overflow weir with trough,] [primary oil outlet nozzles]. The oil-water separator shall be preceded by a solid water basin which includes a removable solids or trash basket. Equip the solid water basin with a hoist for servicing the trash basket. Size the basket to retain all solids larger than 75 mm 3 inches in any dimensions. The solid waste basin shall have a minimum storage volume of [945] [_____] liters [250] [_____] gallons.]

2.7.3 Oil Coalescing Compartment

**************************************************************************

NOTE: The interpretation of "easily removable" has two meanings in the industry. One is the complete removal of the entire bundle from the separator; the second is removal of individual 300 mm square one foot square bundles. The designer shall adapt the specification to the specific demands of the project.

**************************************************************************

Equip oil coalescing compartment with easily removable and reinstallable, parallel, corrugated plates [or vertical tubes] arranged to optimize separation of free oil from liquid carrier. Use parallel plates [or vertical tubes] that are easily removable without dismantling packs and without confined space entry. Provide adjustable surface oil overflow weir with trough, oil outlet nozzle and stationary underflow baffle, oil retention baffle positioned to prevent discharge of free oil that has been separated from the carrier liquid in inlet and oil coalescing compartments. Provide access to each plate pack [or tube bundle] from top. Each bundle shall be equipped with handles or lifting rings. Plate designs that permit cleaning of plate packs in place are not acceptable.

2.7.4 Wastewater Sampling Port

Equip inlet and outlet compartments, adjustable overflow effluent weir, effluent trough, and wastewater outlet nozzle with wastewater sampling ports permitting easy access for obtaining isokinetic influent and effluent samples.

2.7.5 Connections

Connect the separator at the inlet and outlet pipe invert elevations indicated. Follow equipment manufacturer's recommendation for setting and adjusting top of weir elevations throughout unit.

2.7.6 Storage

**************************************************************************

NOTE: Normally oil storage compartments will be contained inside the separator and the requirement for an adjacent waste oil storage tank will be deleted. However, when conditions warrant, an adjacent waste oil storage tank may be provided. In order to size the waste oil tank, the designer shall contact the activity to determine frequency of waste oil collection performed at the activity. Designer shall check current Federal and State requirements governing the need and installation criteria for secondary containment (e.g. double wall waste oil
tank).

Provide oil and suspended solids collection, storage, and transfer systems as an integral part of proposed oil-water separator system. As a minimum, the separator oil storage compartment shall have a capacity of not less than 10 percent of the total separator volume. (The adjacent waste oil tank shall have a capacity of [_____] liters gallons.)

PART 3   EXECUTION

3.1   INSPECTION

Inspect each component of separator for compliance with requirements specified in PART 2   PRODUCTS. Redesign or modification of equipment to comply with specified requirements, or necessary redesign or modification following failure to meet specified requirements, shall receive particular attention for adequacy and suitability. This element of inspection shall encompass visual examinations and dimensional measurements. Noncompliance with specified requirements, or presence of one or more defects preventing or lessening maximum efficiency of separator operation, shall constitute cause for rejection.

3.2   INSTALLATION

Lift separator as required without parallel plate packs [or vertical tube packs] in place onto level foundation using lifting mechanism provided. Level separator and bolt to supports to prevent hydrostatic uplift and ensure unit stability. Use a lifting bar through lugs to insert plate packs into separator and place on supports. Caulk around packs and pack supports with sealing compound conforming to ASTM C990 to prevent hydraulic short-circuiting. Avoid abrupt contact between the packs and the separator walls and pack supports to avoid damage. Separator system installation shall be conducted in accordance with manufacturer's recommendations.

3.3   FIELD QUALITY CONTROL

3.3.1   Field Hydrostatic Test

After separator has been leveled and secured to foundation and parallel plate packs [or vertical tube packs] are in place, level effluent overflow weir at elevation specified by manufacturer and hydrostatically test unit at atmospheric or operational pressure (for no leakage) for an additional 8 hours by filling with water. Perform the hydrostatic test prior to backfilling below ground or partially below ground installations.

3.3.2   Preoperational Test

The manufacturer's service representative shall inspect, operate, and test unit before in-service testing by the Contractor.

3.3.2.1   Tests

Tests shall include but not be limited to the following:

a. Soundness (without cracked or otherwise damaged parts).

b. Completeness in all details, as specified.
c. Correctness of setting, alignment, and relative arrangement of each component.

d. Verification of proper operation for all system components.

3.3.2.2 Preoperational Investigation and Test Report

Submit manufacturer's service representative's preoperational test report. Document inspections, operations, adjustments, and tests performed and indicate whether they were acceptable or not. For unacceptable items, describe corrective action taken or recommended. Include detailed descriptions of points inspected, tests and adjustments made, quantitative results obtained if such are specified, and suggestions for precautions to be taken to ensure proper maintenance. Include the manufacturer's certificate that equipment conforms to specified requirements and is ready for permanent operation and that nothing in installation will render manufacturer's warranty null and void.

3.3.3 In-Service Test

After hydrostatic test and preoperational test have been successfully completed and unit has been properly connected to influent and effluent piping, allow influent oil-in-water mixture previously described in paragraph entitled "SYSTEM DESCRIPTION" to flow into separator filled with water. Adjust and level [primary] [and secondary] surface oil overflow weirs to optimize oil skimming and minimize water overflow to oil recovery. Optimize operation of unit within 5 working days. Operate unit for a minimum of ten separator volume changes prior to testing for removal of contaminants and document testing results.

3.3.3.1 Analytical Methods

Test and sample preservation methods for test contaminants shall be in accordance with the latest revisions of AWWA 10084, APHA Standard Methods for the Examination of Water and Wastewater, EPA 600/4-79/020, EPA Methods for Chemical Analysis of Water and Wastes, or those substitute methods approved by the governing regulatory agencies having jurisdiction.

3.3.3.2 Test for Contaminants

Verify the separator efficiency by testing influent and effluent for contaminants described in paragraph entitled "Performance Requirements." If effluent quality is found to be unacceptable, then verify influent to effluent performance in particle size removal at the site. Tests shall be performed by an independent certified testing laboratory.

3.3.3.3 Sampling Procedures

************************************************************************************************************
NOTE: The separator top hatch covers are used by many manufacturers to satisfy the sampling port requirement. The designer has the option to provide dedicated sampling points integral to the influent pipe and effluent pipe.
************************************************************************************************************

Within an 8 hour period and at regular intervals collect a minimum of 10 influent and effluent samples from sampling ports provided as part of the separator. Purge each sampling port to remove built-up solids or other...
material prior to collecting sample. Collect wastewater samples isokinetically in clean glass containers with polytetrafluoroethylene lined caps. Collect duplicate wastewater samples in separate glass containers. Do not attempt to split sample. Use containers for other contaminants as recommended in references listed in paragraph entitled "Analytical Methods."

3.3.3.4 Acceptance Criteria

**************************************************************************
NOTE: Based on standards or guidelines established by environmental regulatory agency(ies) in which the project is located or based upon wastewater treatment process(es) that follow downstream from this separator, specify the maximum unacceptable limit permitted in order for the separator to be accepted as meeting the performance requirements of this specification.
**************************************************************************

90 percent of the effluent samples taken shall not exceed the specified daily maximum limit for [grease and oil] [petroleum hydrocarbon] contaminants. The remaining samples shall not exceed [[_____] mg/L for grease and oil] [[_____] mg/L for petroleum hydrocarbon] contaminants. If the separator does not meet requirements of this specification, due to poor workmanship and wrong fabrication dimensions, the unit may be rejected. If the unit is not operating at design efficiency 5 days after installation, Government may reject system. In the event Government rejects unit, Contractor shall remove separator or defective components and replace with acceptable unit or components and test as specified above.

1.2 SUBMITTALS

**********************************************************************************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that
require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 MAINTENANCE MATERIAL SUBMITTALS

**************************************************************************
NOTE: Designer must specify any additional devices that are required to be provided by the contractor to ensure the system operator is able to accurately measure the desired analytes being distributed by this system. Delete items below which may not be required for specific project.
**************************************************************************

Concurrent with delivery and installation of the specified equipment, furnish auxiliary equipment and spare parts as follows:

a. Spare parts for each different item of material and equipment specified including all of the parts recommended by the manufacturer to be replaced after [1][ and][ 3] [year][years] service.

b. For each machine: one extra of each part used that is made from glass, hard rubber, or clear plastic; one extra set of solution-hose connections; one extra set of diaphragms, two filler plug seal washers; two ball checks; two seats; two complete sets of all gaskets; one spare diaphragm for each back pressure regulator; one hydraulic plunger assembly for each different size metering pump; one of each type of material back pressure regulator, with three spare springs and fluorocarbon resin diaphragms for each; one spare diaphragm and air valve for pulsation dampener.

c. For each different size of direct current motor one SCR circuit board with 12 drive motor fuses and 12 SCR controller fuses; overload replacement elements for each size and type of motor.
d. One set of special tools for each type of equipment including calibration devices, and instruments required for adjustment, calibration, disassembly, operation, and maintenance of the equipment.

e. Two pairs of safety goggles and/or face shields, two chemical resistant aprons, and two pairs of chemical resistant gloves in one or more wall mounted steel cases.

f. One assembly tool for tubular diaphragm.

g. One lever type grease gun or other lubricating device for each type of grease required.

h. One or more steel tool cases mounted on the wall in a convenient location complete with flat key locks, two keys, and clips or hooks to hold each special tool.

i. [_____].

1.4 DELIVERY, STORAGE, AND HANDLING

Protect material and equipment delivered and placed in storage from the weather, excessive humidity and excessive temperature variation, dirt, dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a chemical feed system consisting of a chemical supply storage tank from which the chemical solution is pumped through piping or tubing, as appropriate, to the point of application. Include with each chemical feed system controlled volume pumps, tanks, mixers, gauges, back pressure regulators, strainers, pressure relief valves, sight glasses and flow metering devices, check valves, and hand valves.

2.1.1 System Requirements

Select and fabricate the pumps in accordance with HI ANSI/HI 7.1-7.5 and HI 9.1-9.5 except as modified herein. Provide pump stands and platforms adequate to support the pumping system.

2.1.2 Performance Requirements

Capacity and features of the chemical feed systems and accessories must be suitable for 24-hour full load service in ambient, non-freezing conditions.

2.1.3 Submittal Data for Chemical Feed System

Submit manufacturer's performance charts, and pump curves. List of materials, list of equipment, including a complete list of parts and supplies with current unit prices and source of supply. List of special tools for each type of equipment furnished including special tools necessary for adjustment, operation, maintenance, and disassembly.

2.1.4 Extended Warranty

Provide Manufacturer's Extended Warranty to cover system components for
2.2 EQUIPMENT

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least [2][5][__] years prior to [bid opening][request for proposal]. Equipment must be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Submit Service Organization Certificates outlining their location and qualifications to the Contracting Office.

2.2.2 Nameplates

Secure a plate to each major item of equipment containing the manufacturer's name, address, type or style, model or serial number, and catalog number.

2.2.3 Controlled Volume Pumps

**************************************************************************
NOTE: See HI 7.1-7.5 to determine the optimum type of metering pumps with capacities between 0.04 liters per hour 0.011 gph and 10,000 liters per hour 2500 gph. Materials for each pump must be as recommended in Table 9.3 of HI 9.1-9.5 for the material to be pumped. If the system backpressure is not at least 5 psi 0.35 bar greater than the suction pressure, a backpressure valve must be installed in the discharge piping to prevent flow through (downhill pumping) which contributes to pump failure and undesired flow at pump shutdown. System backpressure must not exceed the rated discharge pressure of the pump.
**************************************************************************

Provide controlled volume pumps as defined by HI ANSI/HI 7.1-7.5. Each pump must be capable of delivering chemical solution at any rate from the minimum flow rate to the maximum flow rate and be capable of continuous operation at rated capacity. Accuracy must be plus or minus 2 percent over a 100 to 1 range from the required maximum capacity to the minimum pumping rate. Net positive suction head required cannot exceed 90 percent of the net positive suction head available, as installed. Provide in a configuration as simple as practicable to provide equipment isolation, bypass and reliable service and to be readily accessible for inspection, cleaning, adjustment, repairs, and replacements.

2.2.3.1 Acid Feed System

Provide the following for [hydrochloric][sulfuric][__] acid solution delivery.

<p>| Concentration of material on suction side of pump: | Minimum [<em><strong><strong>] percent; maximum [</strong></strong></em>] percent. |</p>
<table>
<thead>
<tr>
<th>Number of pumps:</th>
<th>[____].</th>
</tr>
</thead>

</tbody>
</table>
Back pressure at point of injection: [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride] [or] [_____] construction with [fluorocarbon resin] [or] [chlorosulphonated polyethylene] diaphragms.

Suction valve cartridge: [Single][Double][Slurry type] ball check.

Discharge valve cartridge: [Single][Double][Slurry type] ball check.

Materials of construction allowed for wetted parts: [Type [304L][316][316L] stainless steel,] [PVC,] [hypalon,] [nylon,] [fluorocarbon resin,] [chlorosulfonated polyethylene,] [hard rubber,] [_____.]

2.2.3.3 Base Feed System

Provide the following for [sodium carbonate (soda ash)][sodium hydroxide (caustic soda)][_____] solution delivery.

Concentration of material on suction side of pump: Minimum [_____] percent; maximum [_____] percent.

Number of pumps: [______].

Type of pump: [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm].

Configuration: [Simplex][Duplex][Multiplex].

Feed or flow rate: Minimum [_____] L/hour gph; maximum [_____] L/hour gph.

Back pressure at point of injection: kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at kPapsig. Regulators must be of construction with diaphragms.

Suction valve cartridge: [Single][Double][Slurry type] ball check.

Discharge valve cartridge: [Single][Double][Slurry type] ball check.
Materials of construction allowed for wetted parts: [Type [304L][316][316L] stainless steel,] [PVC,] [hypalon,] [nylon,] [fluorocarbon resin,] [chlorosulfonated polyethylene,] [hard rubber, ____].

2.2.3.4 Biocide Feed System

Provide the following for [copper sulfate][_____] solution delivery.

<table>
<thead>
<tr>
<th>Description</th>
<th>Details</th>

Back pressure at point of injection: [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride][ or ][_____] construction with [fluorocarbon resin][ or ][chlorosulphonated polyethylene] diaphragms.

Suction valve cartridge: [Single][Double][Slurry type] ball check.

Discharge valve cartridge: [Single][Double][Slurry type] ball check.

Materials of construction allowed for wetted parts: [Type [304L][316][316L] stainless steel,][ PVC,][ hypalon][ nylon,][ fluorocarbon resin,][ chlorosulfonated polyethylene,][ hard rubber][, _____].

2.2.3.7 Miscellaneous Feed System

Provide the following for [poly(diallyldimethylammonium chloride)][calcium chloride][sodium aluminate][sodium metabisulfite (sodium pyrosulfite)][sodium chloride][sodium silicate][monosodium phosphate][disodium phosphate][_____]solution[slurry] delivery.

Concentration of material on suction side of pump: Minimum [_____] percent; maximum [_____] percent.

Number of pumps: [_____].

Type of pump: [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm].

Configuration: [Simplex][Duplex][Multiplex].

Feed or flow rate: Minimum [_____] L/hourgh; maximum [_____] L/hourgh.

Back pressure at point of injection: [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride][ or ][_____] construction with [fluorocarbon resin][ or ][chlorosulphonated polyethylene] diaphragms.

Suction valve cartridge: [Single][Double][Slurry type] ball check.
### 2.2.3.8 Oxidant Feed System

Provide the following for [potassium permanganate][hydrogen peroxide][_____] solution delivery.

<table>
<thead>
<tr>
<th>Concentration of material on suction side of pump:</th>
<th>Minimum [<em><strong><strong>] percent; maximum [</strong></strong></em>] percent.</th>
</tr>

</tr>
</tbody>
</table>

### 2.2.3.9 Precipitant Feed System

Provide the following for [_____] solution delivery.

<table>
<thead>
<tr>
<th>Concentration of material on suction side of pump:</th>
<th>Minimum [<em><strong><strong>] percent; maximum [</strong></strong></em>] percent.</th>
</tr>
</thead>
</table>
Number of pumps: [______].

Type of pump: [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm].

Configuration: [Simplex][Duplex][Multiplex].

Feed or flow rate: Minimum [_____] L/hour; maximum [_____] L/hour.

Back pressure at point of injection: [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride][ or ][_____] construction with [fluorocarbon resin][ or ][ chlorosulphonated polyethylene] diaphragms.

Suction valve cartridge: [Single][Double][Slurry type] ball check.

Discharge valve cartridge: [Single][Double][Slurry type] ball check.

Materials of construction allowed for wetted parts: [Type [304L][316][316L] stainless steel,][ PVC,][ hypalon][ nylon,][ fluorocarbon resin,][ chlorosulfonated polyethylene,][hard rubber][, _____].

## 2.2.3.10 Primary Coagulant Feed System

Provide the following for [aluminum sulfate][ferric chloride][ferric sulfate][ferrous sulfate][_____] solution delivery.

| Concentration of material on suction side of pump: | Minimum [_____] percent; maximum [_____] percent. |
| Number of pumps: | [_____]. |
| Type of pump: | [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm]. |
| Configuration: | [Simplex][Duplex][Multiplex]. |
| Feed or flow rate: | Minimum [_____] L/hour; maximum [_____] L/hour. |
### Back pressure at point of injection:

[_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride] or [_____] construction with [fluorocarbon resin] or [chlorosulphonated polyethylene] diaphragms.

### Suction valve cartridge:

[Single][Double][Slurry type] ball check.

### Discharge valve cartridge:

[Single][Double][Slurry type] ball check.

### Materials of construction allowed for wetted parts:

[Type [304L][316][316L] stainless steel,][ PVC,][ hypalon][ nylon,][ fluorocarbon resin,][ chlorosulfonated polyethylene,] [hard rubber][, ____].

---

### 2.2.3.11 Prophylaxis Feed System

Provide the following for [hydrofluosilicic acid][sodium fluoride][sodium silicofluoride][_____] solution delivery.

<table>
<thead>
<tr>
<th>Concentration of material on suction side of pump:</th>
<th>Minimum [<em><strong><strong>] percent; maximum [</strong></strong></em>] percent.</th>
</tr>

</tr>
</tbody>
</table>

### Suction valve cartridge:

[Single][Double][Slurry type] ball check.

### Discharge valve cartridge:

[Single][Double][Slurry type] ball check.
2.2.3.12 Sequestrant Feed Systems

Provide the following for [sodium polyphosphate, glassy (sodium hexametaphosphate)][sodium tripolyphosphate][_____] solution delivery.

| Concentration on suction side of pump: | Minimum [_____] percent; maximum [_____] percent. |
| Number of pumps: | [_____] |
| Type of pump: | [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm] |
| Configuration: | [Simplex][Duplex][Multiplex] |
| Feed or flow rate: | Minimum [_____] L/hourgph; maximum [_____] L/hourgph. |
| Back pressure at point of injection: | [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride][ or ][_____] construction with [fluorocarbon resin][ or ][chlorosulphonated polyethylene] diaphragms. |
| Suction valve cartridge: | [Single][Double][Slurry type] ball check. |
| Discharge valve cartridge: | [Single][Double][Slurry type] ball check. |
| Materials of construction allowed for wetted parts: | [Type [304L][316][316L] stainless steel,][PVC,][hypalon][nylon,][fluorocarbon resin,][chlorosulfonated polyethylene,][hard rubber][,_____] |

2.2.4 Controls

**************************************************************************

NOTE: Proportional control is appropriate for variable flow systems. Batch systems should have manual, pH, ORP, or timer control. Constant pumping rate systems should respond to pump operation or a flow switch, if the pumps are remote from the feed system. Designer should delete any paragraphs below that are not necessary for this specific project.

SECTION 46 30 00 Page 20
Provide the chemical metering equipment with the appurtenances and accessories, as required, for flow capacity adjustment. Provide manual range adjustment on all systems.

2.2.4.1 Automatic Control

Provide automatic control with the capability to vary feed rate based on signals from a [flow], [oxidation-reduction potential (ORP)], [or] [pH] meter or controller.

2.2.4.1.1 Flow meter and Controller

Provide flow meter and controller capable of varying the chemical dosage in proportion to the measured flow with the dosage per flow unit manually adjustable.

2.2.4.1.2 Oxidation-Reduction Potential Probe

Provide oxidation-reduction potential probe located where indicated. Supply probe capable of varying the chemical feed rate in response to the deviation from set point.

2.2.4.1.3 pH Probe

Provide pH probe and locate the pH probe where indicated. Supply probe capable of varying the chemical feed rate in response to the deviation from set point.

2.2.4.2 Semiautomatic Control

Provide semiautomatic control with the capability to automatically start and stop the chemical metering equipments. The pump start and stop must respond to [flow switch] [ or ] [pump operation] [ or ] [timer] status. Install flow switch for semiautomatic operation in the pipe line upstream of chemical injectors.

2.2.4.3 Manual Control

Provide nonautomatic control with the capability for starting or stopping the chemical metering equipment and adjustment of the solution feed rate by the operator.

2.2.5 Drives for Controlled Volume Pumps

************

NOTE: Alternating current motors are preferred where a reliable power supply is accessible. Water power drives are feasible only when the take off can be located at a point with significantly higher pressure than the injection pressure. Designer should delete any paragraphs below that are not necessary for this specific project.

************

Provide with and drive the metering pumps by [water pressure] [alternating current electric motor] [direct current electric motor] [plant air] [gasoline engine] drives.
2.2.5.1 Water Pressure Drive

Provide appropriate pressure regulation devices for water pressure drives operated off system water pressures.

2.2.5.2 Electric Motor Drive

Electric motor must be of sufficient capacity to operate the chemical metering equipment under all operating conditions without exceeding their rated nameplate current or power, or their specified temperature limits. Provide motors having starting characteristics and ruggedness necessary under the actual conditions of operations or clean-up procedures used in the areas where they are located. Alternating current motors with power rating of 248.6 W/3 hp or less must be 115 volts, single-phase, 60-Hz service; motors with power rating in excess of 248.6 W/3 hp must be 460 volts, three-phase, 60-Hz service. Electrical features of direct current motors, including the ratings of the motors, must be compatible with the capabilities and ratings of the rectifier controllers with which they are used.

2.2.5.3 Gasoline Engine Drive

Provide gasoline engines that develop sufficient horsepower to operate the chemical metering equipment continuously under the maximum operation conditions without overheating or overloading when operating at a speed not to exceed [_____] rpm. Provide 4-cycle, vertical, single cylinder, high tension magneto, air cooled type engines. Connect the engine to the pump or mechanical device by V-belts that are fully guarded.

2.2.6 Calibration Standpipes

Provide chemical metering equipment with a calibration standpipe for measuring pump output. The standpipe must allow convenient observation of the change of fluid level for at least 1/2 minute at full stroke and maximum speed settings, and of Schedule 80, clear PVC pipe conforming to ASTM D1785 with Schedule 80 fittings equipped with a flanged connection to the pump manifold and an end cap fitted with a PVC vacuum breaker and ball valve for air venting. The standpipe must have a clear, observable length of at least [300 mm/12 inches][_____] and be permanently calibrated in liters gallons and fractions thereof, to allow reading of the fluid contents with an accuracy of [1][_____] percent.

2.2.7 Valves

2.2.7.1 Metering Pump Valves

Equip the metering pump with adjustable internal vacuum and pressure relief valve, hydraulic oil refill valve, and automatic air bleed valve. The relief valve must be adjustable over the full pressure range of the pump and preset at the factory.

2.2.7.2 Suction and Discharge Valves

Fit suction and discharge valve cartridges with ball checks that open to full pipe diameter.
2.2.7.3 Back Pressure Valve

Install back pressure regulating valve on the pump discharge and factory adjust to crack open at the indicated pressure. Provide spring opposed diaphragms with loading pressures adjustable by means of a screw in the top works.

2.2.7.4 Pulsation Dampeners

*****************************************************************************
NOTE: The pulsation dampener should always be installed as close to the pumps as possible in order to reduce the length of pipe in which pulsating flow occurs. A pulsation dampener is a pneumatically charged diaphragm within a chamber that stores energy carried in the acceleration of the pumped fluid. On the discharge side it will protect sensitive equipment from pulsating flow spikes, and will translate pulsating flow to near linear flow by reducing the peak flow and pressure generated by the metering pump. When a pulsating dampener is used on the suction side of a metering pump, it will improve suction pressure conditions by reducing pressure losses associated with the acceleration of the fluid.
*****************************************************************************

Size pulsation dampeners for the displacement of each pump. Pulsation dampeners must have a diaphragm separating the upper chamber from the lower chamber. Charge the upper chamber with compressed air to 50 percent of the expected line pressure. Provide the diaphragm of molded construction and prevent the air charge from being dissolved in the process fluid. The lower chamber must be [plastic][ or ][lined with inert plastic material] to prevent corrosion by the process fluid. Equip the upper chamber with a tire valve type charging valve and air pressure gauge. Provide an air line and air hose with pressure regulator and hand-operated, lever-type valve suitable for charging the pulsation dampers.

2.2.8 Solution Tanks

*****************************************************************************
NOTE: This paragraph lists tank specifications. If single wall tanks are preferred, designer must ensure secondary containment is provided within the plans and that containment is separated from other tank containment areas to prevent mixing of chemicals during a spill event. Size dissolving baskets and tank mixers to provide initial mixing and maintain suspensions.
*****************************************************************************

Provide tanks that are fully resistant to the effects of the full-strength and fully diluted solution concentrations, and be pressure rated for 1.5 times the weight of solution at full capacity. Each tank must have the capacity listed in the following table and be equipped with a fill nozzle, vent, discharge, level instrument, drain, and two spare connections. Reinforce tanks to withstand all forces when full of solution. Tanks must be completely shop fabricated with no field assembly permitted. Provide drain connections permitting complete drainage of the tank. All gaskets must be fluorocarbon elastomer; nuts and bolts Type 316 stainless steel;
and steel supports either stainless or epoxy coated. Furnish each tank with a calibrated side wall strip to indicate volume. Attach a permanent plastic sign indicating the tank contents to the front of each tank. Fit tanks smaller than 900 mm36 inches in diameter with removable lids. Fit tanks larger than 900 mm36 inches in diameter with 600 mm24 inch manways. Manufacture polyethylene tanks in accordance with ASTM D1998. Manufacture fiberglass tanks in accordance with ASTM D3299 with flanged openings in accordance with ASTM D5421. Line steel tanks with [ceramic], [rubber] or [plastic], as indicated herein. Provide tanks designated to be double walled or provided with secondary containment, as indicated in the tables. Provide dissolving baskets and tank mixers as indicated. Provide floating seals as indicated.

2.2.8.1 Acid Tank

Provide [hydrochloric][sulfuric] acid solution resistant tank and comply with the following:

| Number of tanks: | [______]. |
| Minimum tank capacity: | [_____] litersgal. |
| Sign reading: | "DANGER - [HYDROCHLORIC][SULFURIC] ACID SOLUTION." |
| Mixer: | [Constant][Variable] speed [_____] rpm, maximum. |
| Dissolving basket: | [______]. |
| Floating seal: | [______]. |
| Containment: | Double wall and secondary containment. |

2.2.8.2 Adsorption Agent Tank

Provide [powdered activated carbon][_____] slurry resistant tank and comply with the following:

| Number of tanks: | [______]. |
| Minimum tank capacity: | [_____] litersgal. |
| Sign: | [______] |
| Mixer: | [Constant][Variable] speed [_____] rpm, maximum. |
| Dissolving basket: | [______]. |
| Floating seal: | [______]. |
| Containment: | Double wall and secondary containment. |

2.2.8.3 Base Tank

Provide [sodium hydroxide (caustic soda)][_____] solution resistant tank and comply with the following:
2.2.8.4 Biocide Tank

Provide [copper sulfate][Tolcide(R)][Glutaraldehyde][_____] solution resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Number of tanks:</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum tank capacity:</td>

</tbody>
</table>

2.2.8.5 Coagulant Aid Tank

**************************************************************************
NOTE: Polyelectrolytes degrade with storage.
**************************************************************************

Provide [polyelectrolyte][_____] solution resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Number of tanks:</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum tank capacity:</td>
<td>[_____] litersgal.</td>

</tr>
</tbody>
</table>
Mixer: [Constant][Variable] speed [_____] rpm, maximum.

Dissolving basket: [____].

Floating seal: [____].

Containment: Double wall and secondary containment.

2.2.8.9 Precipitant Tank

Provide [_____] solution resistant tank and comply with the following:

Number of tanks: [____].

Minimum tank capacity: [_____] liters/gal.

Sign reading: [____].

Mixer: [Constant][Variable] speed [_____] rpm, maximum.

Dissolving basket: [____].

Floating seal: [____].

Containment: Double wall and secondary containment.

2.2.8.10 Primary Coagulant Tank

Provide [aluminum sulfate][ferric chloride][ferric sulfate][ferrous sulfate] solution resistant tank and comply with the following:

Number of tanks: [____].

Minimum tank capacity: [_____] liters/gal.

Sign reading: [____].

Mixer: [Constant][Variable] speed [_____] rpm, maximum.

Dissolving basket: [____].

Floating seal: [____].

Containment: Double wall and secondary containment.

2.2.8.11 Prophylaxis Tank

Provide [hydrofluosilicic acid][sodium fluoride][sodium silicofluoride] solution resistant tank and comply with the following:

Number of tanks: [____].
Minimum tank capacity: [_____] litersgal.

Sign reading: [____].

Mixer: [Constant][Variable] speed [_____] rpm, maximum.

Dissolving basket: [____].

Floating seal: [____].

Containment: Double wall and secondary containment.

2.2.8.12 Sequestrant Tank

**************************************************************************
NOTE: Polyelectrolytes degrade with storage.
**************************************************************************

Provide [sodium polyphosphate, glassy (sodium hexametaphosphate)][sodium triplyphosphate] solution resistant tank and comply with the following:

Number of tanks: [____].

Minimum tank capacity: [_____] litersgal.

Sign reading: "CAUTION - [SODIUM HEXAMETAPHOSPHATE] [SODIUM TRIPOLYPHOSPHATE] SOLUTION - SLIP HAZARD."

Mixer: [Constant][Variable] speed [_____] rpm, maximum.

Dissolving basket: [____].

Floating seal: [____].

Containment: Double wall and secondary containment.

2.2.9 Pressure Gauges

Provide diaphragm type gauges with Bourdon tube and diaphragm compartments filled completely with oil, and made of materials suitable for the application. Install diaphragm seals at each gauge connection to isolate gauges from corrosion, sludge or other hazards of the process fluid. Provide seal material that is compatible with the oil in the gauge and the process fluid.

2.2.10 Injectors

Introduce injectors for chemical solution into the pipeline mains by means of a [hard rubber] [or] [plastic] injection nozzle, or by means of a suitable diffuser tube inserted through a corporation cock. Construct the device for introducing the solution into a pressure main in such a way that accidental breakage of discharge hose or tubing does not cause water to escape from the pipeline, and allows disassembling of the unit without leakage.
2.2.11 Piping

2.2.11.1 Backflow Preventor

Provide backflow prevention devices or air gaps on tank fill lines in accordance with NAPHCC NSPC.

2.2.11.2 Chemical Solution Piping

**************************************************************************
NOTE: Select materials in accordance with EM 1110-1-4008 Liquid Process Piping.
**************************************************************************

Incorporate provisions to allow solution piping to be conveniently and safely bled of trapped air and minimize infiltration of air bubbles. Provide chemical solution piping in accordance with Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING.

2.2.11.2.1 Smaller than 40 mm1-1/2 inch Diameter

Chemical solution piping smaller than 40 mm1-1/2 inch diameter must be [PVC pipe conforming to ASTM D1785 or CPVC pipe conforming to ASTM F441/F441M] tubing[ or] [rubber hose]. Provide plastic fittings for plastic pipe with [flanged] [or] [threaded] joints. Make joints for rubber hose using a clamp-type mechanical coupling.

2.2.11.2.2 Piping 40 mm1-1/2 inch Diameter or Greater

Chemical solution piping of 40 mm1-1/2 inch diameter or larger must be [rubber-lined] [or] [plastic-lined] steel pipe. Steel pipe must have [threads] [or] [flanges integral with the pipe] [or] [forged-steel flanges screwed to the pipe barrel].

2.2.11.3 Pipe Lining

Linings for steel pipe smaller than 150 mm6 inches must be not less than 4.8 mm3/16 inch thick. Provide continuous linings free of holidays.

2.2.11.4 Pipe Fittings

For steel pipe provide [flanged conforming to ASME B16.1 or ASME B16.5] [or] [forged-steel threaded conforming to ASME B16.11] pipe fittings.

2.2.11.5 Plumbing

Provide water piping, drain, waste and vent piping in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.2.12 Electrical Work

**************************************************************************
NOTE: Coordinate hazard areas with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and the drawings.
**************************************************************************

Provide electric motor-driven equipment complete with motor, motor starter, and controls. Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Implement hazard
classifications in accordance with NFPA 70.

2.2.12.1 Motor Starters

Provide motor starters complete with thermal overload protection and other appurtenances necessary for the motor control specified.

2.2.12.2 Control and Protective Devices

Provide manual or automatic control and protective or signal devices required for the operation and any control wiring required for controls and devices. Provide motor controls conforming to NEMA ICS 1 or NEMA ICS 2. Prewire equipment to the maximum practicable extent. Control cabinets must conform to the requirements of UL 50, NEMA 250, [Type 4,[Type 7,[ or ]][Type 12].

2.2.13 Equipment Appurtenances

Provide galvanized steel, cadmium plated or Type 316 stainless steel bolts, nuts, anchors, washers and all other types of supports necessary for the installation of the equipment.

2.2.14 Factory Painting

Factory painting must conform to manufacturer's standard factory finish, provided it does not discolor in the presence of hydrogen sulfide fumes, high water vapor atmosphere, alkaline water vapor, and concentrated chlorine (oxidizing) conditions. Coating must be at least \(0.05 \text{ mm} = 1.75 \text{ mils}\) thick.

2.2.15 Factory Test Report

Factory examine fiberglass tanks in accordance with ASTM E1067/E1067M prior to shipping. Furnish a copy of the corresponding test report with each tank.

2.3 MATERIALS

Submit Safety Data Sheets in conformance with ANSI Z400.1/Z129.1 for each chemical. Provide a [30][90][_____] day supply at the maximum pumping rate for each feeder or pair of duplexed feeders. Submit [two][_____] copies of certification stating that each supplied chemical meets the following requirements.

2.3.1 Acids

AWWA B300 Hydrochloric (muratic acid), AWWA B703 sulphuric (sulfuric acid).

2.3.2 Adsorption Agents

AWWA B600 powdered activated carbon.

2.3.3 Bases

AWWA B501 caustic soda, AWWA B511 potassium hydroxide, AWWA B201 soda ash (sodium carbonate).
2.3.4 Biocides

Glutaraldehyde (10 to 50 percent solution); Tolcide(R) (50 percent solution); AWWA B602 copper sulfate.

2.3.5 Coagulant Aids

NSF/ANSI 60 Anionic polyelectrolytes, NSF/ANSI 60 cationic polyelectrolytes.

2.3.6 Disinfecting Agents

AWWA B302 ammonium sulfate, AWWA B300 hypochlorites.

2.3.7 Miscellaneous

AWWA B451 poly(diallyldimethylammonium chloride), AWWA B452 EPI-DMA polyamines, AWWA B453 polyacrylamide, AWWA B550 calcium chloride, AWWA B405 sodium aluminate, AWWA B601 sodium metabisulfite (Sodium Pyrosulfite), AWWA B303 sodium chloride, AWWA B404 liquid sodium silicate, AWWA B504 monosodium phosphate, anhydrous, AWWA B408 polyaluminum chloride, AWWA B505 disodium phosphate, anhydrous.

2.3.8 Oxidants

[50][35][_____] percent NSF/ANSI 60 hydrogen peroxide solution, AWWA B603 potassium permanganate [potassium permanganate may be supplied in powder form for onsite preparation] at the discretion of the Contracting Officer.

2.3.9 Precipitants

AWWA B501.

2.3.10 Primary Coagulants

AWWA B403 aluminum sulfate, AWWA B407 liquid ferric chloride, AWWA B406 ferric sulfate, AWWA B402 ferrous sulfate.

2.3.11 Prophylaxis

AWWA B703 hydrofluosilicic acid, AWWA B701 sodium fluoride, AWWA B702 sodium silicofluoride.

2.3.12 Sequestrants

AWWA B502 sodium polyphosphate, glassy (sodium hexametaphosphate), AWWA B503 sodium tripolyphosphate.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Submit detail drawings containing complete piping, wiring, schematic, flow diagrams, and any other details required to demonstrate that the system has
been coordinated and properly functions as a unit. On the drawings show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation.

3.2.1 Chemical Feeding Equipment

Install controlled volume pumps, equipment, and appurtenances to provide a complete and integrated system in accordance with the instruction of the manufacturer and under the direct supervision of the manufacturer's representative.

3.2.2 Gasoline Engines

Install gasoline engines in accordance with NFPA 37.

3.2.3 Pipe, Tubing, Hangers and Supports

Install pipes and tubes in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

3.2.4 Field Painting

Thoroughly clean, prime and top-coat factory painted items requiring touching up in the field with the manufacturer's standard factory finish provided it does not discolor in the presence of hydrogen sulfide fumes, high water vapor atmosphere, alkaline water vapor, and concentrated chlorine (oxidizing) conditions. Paint the equipment which did not receive a factory finish as specified in Section 09 90 00 PAINTS AND COATINGS. Coating must be at least 0.05 mm1.75 mils thick. Provide piping identification as specified in [ASME A13.1][Section 09 90 00 PAINTS AND COATINGS. Mark pipe carrying materials not listed in Section 09 90 00 PAINTS AND COATINGS in accordance with ASME A13.1.]

3.2.5 Framed Instructions

Submit framed instructions for approval prior to postings. Final size must be easy to read by operators 5 feet from instructions. Limit frame size to 11" x 17" size provide multiple frames if needed. Post framed instructions, containing wiring and control diagrams, where directed. Post condensed operating instructions as outlined in paragraph 3.4.2 Operating Instructions. Post the framed instructions before acceptance testing of the systems.

3.3 FIELD QUALITY CONTROL

3.3.1 Testing

After installation of each controlled volume pump, carry out operating tests as specified below to assure that the chemical metering installation operates properly. If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests. Submit reports of all tests in booklet form prior to final acceptance of the installation. Show all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate in each test report the final position of controls.
3.3.1.1 Tank Testing

Clean tanks of loose debris and dry prior to testing. Field test tanks for leaks or damage in shipment. Hydrostatically test tanks to [_____] kPapsig or 1.5 times the system operating pressure, whichever is greater, to detect large leaks and then with the specified chemical to detect small leaks. Test each tank with its solution for a period of 24 hours at which time no visible leakage is evident. Supply all pipes, hoses, pumps, water, power and other equipment required to convey the test liquids and to carry out the tests. Repair damage or leaks in tanks or replace tanks. Replace damaged ceramic tanks.

3.3.1.2 Controlled Volume Pumps - Operational Tests

Test pumps to demonstrate that the pumps are capable of operating without vibration or leakage. Perform testing at the pump's maximum flow rate and at half the flow rate. Demonstrate testing while controlled and operated in all feasible modes with the pumps operated singly and in unison. Plot the response of each pump on curves for the various operating pressures encountered and the results compare to the curves shown on the manufacturer's published pump data. If control characteristic curves are not available at the time of testing, the pump manufacturer's service engineer must generate such curves for each pump; graphically depicting the pump displacement at 25, 50, 75, and 100 percent of motor speed for SCR equipped pumps, and at 25, 50, 75, and 100 percent of maximum stroke position for all pumps. Generate curves only for the specified back pressure.

3.3.1.3 Controlled Volume Pumps - Time, Volume and Pumping Pressure Tests

Test pumps by filling [the standpipe][a portable calibrated standpipe furnished by the Contractor] with chemical and measuring the outage, with all other equipment valved off. Record the time, volume and pumping pressures.

3.3.1.4 System Pressure Tests

******************************************************************************
NOTE: To establish that full service can be provided, fill in the blank with the numerical value of the pressures that can be expected during normal operation of the system.
******************************************************************************

Carry out tests at [_____] and [_____] kPapsig. Manually control back pressure valves for this testing, and reset as necessary after testing. The time to deliver a given quantity of chemical at a given stroke and speed setting must be the same at all pressures.

3.3.1.5 Flow Tests

Test pumps to demonstrate zero L/secondgpm flow at a zero stroke or speed setting. Failure to meet this test is cause for rejection. Test pumps through full range of performance: min. flow [_____] Submit test results to prove pump functions within specified system parameters.

3.3.1.6 Synchronization Tests

Operate the pumps for a period of 4 hours to demonstrate that the double
diaphragm systems do not lose their synchronization. Loss of synchronization is also cause for rejection; repair or replace the pump as necessary to achieve synchronization. Fully retest repaired or replaced equipment.

3.3.2 Chemical Waste

**************************************************************************

NOTE: In selection of chemicals, consider the environmental consequences, including disposal of precipitated solids and other wastes. Select the most appropriate options and edit to fit the situation for drinking water or waste water treatment systems.

**************************************************************************

Neutralize chemicals wasted during testing procedures to achieve a pH value between 6.5 and 9.5 and a chlorine concentration of not more than 1 percent (10,000 mg/L). Route all chemicals wasted during testing procedures [as directed by the Contracting Officer][to the sanitary sewer] [through the treatment process] at a rate that the process can assimilate without upset.

3.3.3 Manufacturer Field Service

Provide the services of a manufacturer's representative who is certified by manufacturer in the installation, adjustment, and operation of the equipment specified. The representative must supervise the installation, adjustment, and testing of the equipment. Submit certificates to Contracting Officer for approval.

3.4 CLOSEOUT ACTIVITIES

3.4.1 FIELD TRAINING

Conduct a field training course for designated operating, maintenance and supervisory staff members. Provide training for a total period of [_____] hours of normal working time and start after the system is functionally complete but prior to final acceptance tests. Cover all of the items contained in the Operating and Maintenance Instructions during field training.

3.4.2 Operating Instructions

Submit complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include in the instructions the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Also include in the instructions as-built drawings of the piping layout, equipment layout, simplified wiring and control diagrams of the system as installed, and flow diagrams.

3.4.3 Maintenance Instructions

Submit complete copies of maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and trouble-shooting guides.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for liquid phase advanced oxidation processes using titanium dioxide or hydrogen peroxide and/or ozone with or without ultraviolet light.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SECTION 46 30 13 Page 8
1.3 QUALIFICATIONS

******************************************************************************
NOTE: Designer should edit the subsequent paragraphs and remove requirements not applicable to the project.
******************************************************************************

1.3.1 Contractor

Provide documentation of a minimum of [3] [_____] years of experience in the construction of water, wastewater, industrial wastewater, or hazardous and toxic waste water treatment facilities. The Contractor is responsible for installation and start-up of the AOP equipment supplied, as well as operator training.
1.3.2 Equipment Manufacturer

Submit a statement by the equipment manufacturer listing any exception to or deviations from the contract drawings and specifications. Written evidence that equipment and accessories are a product of a qualified and experienced manufacturer. Statement indicating the system is capable of treating the wastes to the levels identified.

1.3.3 Ultraviolet (UV) Oxidation System Supplier

Equipment provided must duplicate equipment that has been in satisfactory service for a minimum of [2] [_____] years prior to bid opening. The UV oxidation system supplier is responsible for furnishing a complete prepackaged system. The supplier need not manufacture the entire system, but coordinate the selection, assembly, installation, and testing of the entire system as specified.

1.3.4 Manufacturer's Representative

Provide services, as specified, of a qualified manufacturer's field representative experienced in the installation, adjustment, and operation of the equipment furnished and who has complete knowledge of the proper operation and maintenance of the system. Include a statement indicating the operators designated to train the on site operators have been trained to operate the installed equipment.

1.3.5 Welding

Perform welding following qualified procedures, using performance qualified welders and welding operators. Furnish a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators to the Contracting Officer prior to beginning any work on the AOP equipment.

1.4 REGULATORY REQUIREMENTS

Conform the AOP system to all federal, state, regional, and local regulations concerning chemical storage, air, noise and water pollution control requirements.

1.5 PRE-SUBMITTAL CONFERENCE

Assemble the primary process designer, AOP equipment and major component suppliers, electrical and mechanical subcontractors, and major component manufacturer's representatives at [the construction site] [_____] prior to preparation of the Contractor's AOP submittal for government approval. This meeting is intended to ensure that facility construction is properly scheduled; power, control, plumbing, space interfaces are verified; and responsibilities coordinated among subcontractor's and suppliers and reflected on the Contractor's AOP submittals.

1.6 DELIVERY, STORAGE, AND HANDLING

*****************************************************************************************************************
NOTE: Designer should coordinate with the Contracting Officer and user to determine appropriate locations for equipment storage. Identify unusual requirements either here or on the

SECTION 46 30 13 Page 10
Deliver equipment free of structural or other damage and place in storage, in accordance with the manufacturer's requirements, protected from structural damage, the weather, excessive humidity and excessive temperature variation; and dirt, dust, or other contaminants that could otherwise damage its components.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

************************************************************
NOTE: This paragraph should be edited to identify the appropriate contaminants of concern as well as those parameters which potentially inhibit the process as indicated in ETL 1110-1-161 ULTRAVIOLET/CHEMICAL OXIDATION dated 29 March 96.

Effluent limitations are generally dictated by regulatory requirements. List the performance requirements in this specification.

If this specification is used as part of a Request for Proposals, the designer should identify maximum values for power and oxidant usage based on bench or pilot studies and include this information in Paragraph Performance Requirements.

************************************************************

Provide the AOP including all items necessary as a complete system for removal of those chemicals identified below to the levels indicated. Equipment includes, but is not limited to, AOP contact vessels, lamps when required, piping to units upstream and downstream of the contact vessels, oxidant feed system, gas emission treatment, controls, accessories and equipment to provide complete and functional system within the limits identified. Analytical and sampling protocols areas specified in [______].

2.1.2 Performance Requirements

Submit performance tests results indicating temperature rise through the reactor, oxidant dosage, detention time, catalyst dosage, ultraviolet light dosage, ambient gas monitoring results, and treatment system off gas monitoring and destruction results, equipment and analytical testing methods used, and removal of constituents identified below stated in mass/unit volume treated relative to the influent concentration.

Report in booklet form, upon completion of the installed system. Test report will include field tests performed to adjust each component and field tests conducted to prove compliance with the specified performance criteria. Test report must indicate the recommended position of the controls.

2.1.3 Treatability Testing

The previously conducted treatability study information contained in Appendix [_____] is provided for the Contractor's information. The study results indicate [ultraviolet oxidation] [peroxone] [_____] is capable of meeting the criteria in paragraph PERFORMANCE REQUIREMENTS. Evaluate the applicability and adequacy of the treatability studies and results provided. If deemed necessary by the Contractor, additional studies may be performed at the Contractor's expense to confirm the previously conducted treatability study and results. Based on the Contractor's own interpretation of the previous studies and results, and additional studies and results the Contractor elects to perform, provide a full scale treatment plant which meets the requirements identified.

2.2 STANDARD PRODUCTS

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and which essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment is to be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.3 NAMEPLATES

Provide each major item of equipment with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment. Nameplates are to be provided for, but not limited to, each contact vessel, pumps, motors, oxidant equipment and accessories, and electrical components such as transformers.

2.4 MATERIALS

2.4.1 Plates, Shapes and Bars

Conform steel to ASTM A36/A36M; stainless steel must conform with ASTM A276/A276M, type 316.

2.4.2 Pipe and Fittings

******************************************************************************
NOTE:  Designer should coordinate with the oxidizer
******************************************************************************
equipment suppliers to coordinate piping and gasket material requirements.

Gasket materials for pipe and fittings are to be silicon, or teflon unless otherwise shown or specified.

2.4.2.1 Stainless Steel Pipe

a. Conform pipe 100 mm 4 inch and larger to ASTM A312/A312M, Schedule 40, Type 316L with maximum carbon content of 0.04 percent. Conform flanged fittings to ASME B16.5, F316L Class 150 with 2 mm 1/16 inch minimum thickness silicon, teflon, expanded PTFE, PVDF, or viton gaskets. Butt weld fittings must conform to ASTM A403/A403M and MSS SP-43, Grade 316L, Schedule 10S with full penetration welds.

b. Pipe less than 100 mm 4 inch will be type TP316, and conform to ASTM A312/A312M Schedule 80S for threaded joints, and Schedule 40S for welded joints. Conform flanged joints to ASTM A182/A182M, F316 or F316L, Class 150; dimensions and drilling are to be in accordance with ASME B16.5 with 2 mm 1/16 inch minimum thickness silicone, teflon, expanded PTFE, PVDF, or viton gaskets. Butt weld fittings must conform to ASTM A774/A774M, ASTM A778/A778M, and ASME B16.9.

c. Liquid tubing 10 mm 3/8 inch and smaller will be seamless austenitic stainless steel and conform to ASTM A269/A269M, Type TP316. Wall thickness are to be adequate for the pressure required. Fittings must be compression type made from bar stock material conforming to ASTM A276/A276M, Type 316, with forgings conforming with ASTM A182/A182M, Type 316. Assemblies will consist of tube, fittings and components of one manufacturer.

2.4.2.2 Polyvinyl Chloride (PVC) Pipe

PVC pipe and fittings less than 100 mm 4 inch diameter will be in accordance with ASTM D1785 or ASTM D2241. PVC pipe and fittings 100 mm 4 inch in diameter and larger will be in accordance with ASTM D2241. Pipe and joints are to be rated for a working pressure of [_____] kPa psi. Solvent cement joints must conform to the requirements of ASTM D2564. Flanged joint diameter and drilling must conform to ASME B16.5, Class 150.

2.4.2.3 Polytetrafluoroethylene (PTFE) Pipe and Tubing

Conform pipe and fittings to ASTM D1710, Type I, Grade 1, Class A, with PTFE compression type fittings. Pipe, tubing and associated fittings are to be rated for a minimum working pressure of [_____] kPa psi.

2.4.2.4 Polyvinylidene Fluoride (PVDF) Pipe and Tubing

PVDF pipe, tubing and fittings are to be manufactured from materials conforming to ASTM D3222 for type II homopolymers. Pipe tolerances for outside diameter and wall thickness will be in accordance with ASTM D1785 for schedule 80 pipe. Tubing and associated fittings are to be rated for a minimum working pressure of [_____] kPa psi.

2.4.2.5 Copper Pipe

Pipe 100 mm 4 inch and smaller will be standard weight, seamless, cold drawn type conforming to ASTM B88M ASTM B88 Type K, temper H. Fittings are
to be cast or wrought copper alloy, solder joint type, conforming with ASME B16.18 or ASME B16.22, as appropriate. Solder used will be lead free and comply with ASTM B32, grade Sb5, 95-5 tin-antimony or Sn96, 96-4 tin-silver solder.

2.4.3 Pipe Hangers and Supports

Pipe hangers and supports will conform to MSS SP-58.

2.4.4 Stainless Steel Gas Tubing and Fittings

Stainless steel tubing will conform to ASTM A778/A778M. Wall thicknesses will be a minimum of 1.5 mm 0.062 inch for tubing 250 mm 10 inches and smaller, tubing 300 mm 12 inch in diameter will have a minimum wall thickness of 1.9 mm 0.078 inch, tubing 350 through 450 mm 14 through 18 inch in diameter will have a minimum wall thickness of 2.7 mm 0.109 inch. Fittings will conform to ASTM A774/A774M, and be of the same material, grade, schedule or wall thickness as specified for tubing. Joints are to be full penetration butt welded joints or Van Stone type joints using angle face rings with bracing flanges drilled in accordance with ASME B16.5.

2.4.5 Valves

2.4.5.1 Liquid Oxygen (LOX)

LOX valves are to be bronze or Type 316 stainless steel intended for cryogenic extended service. Materials must be compatible with the piping installed.

2.4.5.2 Gate

Gate valves are to comply with the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.4.5.3 Ball

Ball valves are to comply with the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE. Valves used for hydrogen peroxide service are to be passivated and vented in accordance with the hydrogen peroxide supplier recommendations.

2.4.5.4 Check

Check valves are to comply with the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.4.6 Injectors

**************************************************************************
NOTE: Designer should coordinate pressure requirements with equipment manufacturers to determine if supplemental pumping is required to ensure adequate gas transfer. In certain situations, multiple injectors may be required if large flow variations are expected. Injectors are most commonly used on smaller applications such as multiple columns in series where ozone can be injected to the individual columns.
**************************************************************************
High efficiency venturi type injectors will be constructed of 316L stainless steel or PVDF at a rated pressure of [_____] kPa psi. Each unit will have a liquid flow capacity of [_____] L/s gpm, and be capable of applying 150 percent of the design gas flow of standard [_____] L/minute cubic feet/hour of a [_____] percent ozone in [air] [oxygen] mixture. Injectors are to be designed to operate with an available pressure head to the injector of [_____] kPa psi, and a back pressure of [_____] kPa psi.

2.4.7 Diffusers

NOTE: Designer should coordinate with diffuser manufacturers to determine the proper flow rate and coverage per diffuser. Rod type diffusers are generally used on larger rectangular tanks versus the dome or disc type which can be used in either circular reactors, or on rectangular units.

Coordinate access requirements with paragraph AOP Reactor Vessel.

Fine bubble diffusers are to be ceramic construction, of the tube, disc or dome type. Ceramic are to be of bonded silica or alumina, and be resistant to degradation by ozone in oxygen concentrations of [16] [_____] percent. Pore size will be a maximum of [50] [_____] um [0.002] [_____] inch or the manufacturer's standard pore size which will produce bubbles [2] [_____] mm [0.005] [_____] inch in diameter or smaller. Gas flow per diffuser will be a maximum of standard [_____] L/s cubic feet/minute at a submergence of [_____] m feet. Maximum allowable headloss per diffuser is limited to [_____] mm inch. Brackets, holders, bolts, rods, washers and other accessories are to be 316 stainless steel unless otherwise indicated. Gaskets are to be of silicone construction.

2.4.8 Couplings

Fittings, flanges, bolts, nuts and washers are to be the same material as the piping unless otherwise indicated. Sleeve type couplings for ozone service are to be of stainless steel conforming with ASTM A312/A312M, Grade TP316L with ozone resistant gaskets. Couplings for non-ozone ferrous metal piping will be ASTM A53/A53M, Grade B.

2.4.9 Insulating Joints

Insulating joints are to be provided when ferrous metal piping is joined with non-ferrous metal piping, fitting or valve materials. Insulating flanges are to be installed and have insulating flange gaskets, insulating sleeves for studs, and insulating washers for both sides of flanges. Steel washers are to be installed between the insulating washers and nuts. Couplings are to be of the same pressure rating as the pipe installed.

2.4.10 In Pipeline Static Mixers

NOTE: Static mixers are generally recommended to ensure complete mixing when peroxide is used. Static mixers may also be needed in other processes in the treatment train; if so, coordinate and list
those requirements separately or coordinate them
with other specification sections to ensure there is
no duplication.

In pipeline static mixers are to be installed [at the locations indicated] [upstream of the reaction chamber]. Mixers are to be [installed in a flanged section of piping] [with removable mixing sections] [inserted into the pipeline], have a pressure rating equal to that of the piping installed, have a maximum headloss of [_____] mm inch of water, [at [_____] L/s gpm] while inducing completely turbulent mixing conditions in the pipeline installed. Mixers [and housing] are to be constructed of [Grade 316 stainless steel] [_____] and be compatible with [hydrogen peroxide] [______]. [The static mixer must be ported for direct application of the applied chemical.]

2.4.11 Bolts, Nuts, Anchors and Fasteners

Bolts, nuts, anchors and fasteners will be stainless steel in conformance with ASTM F593.

2.5 MANUFACTURED UNITS

NOTE: Edit the following paragraphs to reflect the type of ozone generator feed gas (air or oxygen) that is included in the design package. A cost comparison should be performed prior to selecting the feed gas. Typically, oxygen in a liquid form or generated onsite from ambient air will be used. Air feed ozone generators typically produce ozone concentrations of approximately 2 percent in air, while oxygen feed systems typically produce ozone concentrations of 6 percent or greater in oxygen. VSA systems are generally used for systems that generate greater than 900 kg 2000 pounds per day.

For liquid oxygen (LOX) tanks, smaller than the minimum capacity stated in NFPA 55, state that the requirements indicated in the standard are to be applied to the tank size specified. LOX tanks should not be located inside a treatment facility. This paragraph contains statements describing a complete manufactured unit, usually a standard catalog item; statements may include descriptive requirements for the materials, specific fabrication, finishes, and function. Separate paragraphs for each different item should be used when appropriate. The name used for the manufactured unit must be consistent throughout the specification.

Generally, skid mounted equipment is preferred; however, this may not be possible with larger oxygen generation units (greater than 225 kg 500 pounds per day). Verify dimensions with manufacturers to ensure the skid mounted units are transportable and do not have an excessively large space requirement over equipment that is field assembled. The
following paragraphs may need to be modified to allow assembly, wiring, and plumbing in the field.

Additional information is contained in ETL 1110-1-161.

**************************************************************************
Submit wiring and control diagrams, systems layouts and isometrics, component identification tables, instructions, and other sheets, prior to posting. Condensed operating instructions explaining preventative maintenance procedures, methods of checking the system for safe operation, making adjustments, and procedures for safely starting and stopping the system are to be prepared in typed form, framed and posted beside the diagrams.

2.5.1 Swing Adsorption Oxygen Generation System

The Oxygen Generation System are to be Swing Adsorption type. [Pressure swing adsorption (PSA) [Vacuum swing adsorption (VSA)] system equipment must be a complete unit process, including the compressor, [particulate filters,] [aftercooler separator,] heat exchangers, switching valves, instrument air dryer, adsorbent beds, adsorbent material, [oxygen receiver,] controller and other equipment as required by the manufacturer to provide a complete and operational oxygen generation system. [The unit] [Each component] will be completely wired requiring only [interconnecting wiring between components] [an external connection for a single external power supply and remote monitoring] [and control] be done in the field. [PSA] [VSA] system equipment must include all work from the outside air inlet to the ozone generator inlet connection. The [PSA] [VSA] system must be a continuous output system with the following characteristics:

| Min. oxygen generation capacity | [_____] kg/day lbs/day |
| Oxygen purity (minimum) | [90] [_____] percent |
| Temperature to generator (max.) | [30] [_____] degrees C[86] [_____] degrees F |
| Dewpoint maximum (below 0 degrees) | [60] [_____] degrees C[76] [_____] degrees F |
| Oxygen utilization efficiency (min.) (Ratio of oxygen delivered to the ozone generator/oxygen present in the air feed to the oxygen) | [40] [_____] percent |
| Cycle time (adjustable range) | [_____] minutes |
| Hydrocarbon concentration to ozone generator (maximum) | [0] [3] [_____] ppm |
| Discharge pressure to ozone generator | [_____] kPa psi |
| Power supply | [480] [_____] volt, 3 phase, 60 hertz. |
| Cooling water supply (max. temperature) | [_____] degrees C F |
| Cooling water flow rate (maximum) | [_____] L/s gpm |

Adsorption vessels will be designed and constructed in accordance with ASME BPVC SEC VIII D1.
2.5.2 Liquid Oxygen (LOX) Storage and Supply System

**************************************************************************
NOTE: Provide seismic requirements for piping, tanks and related equipment supports, if a Government designer is the Engineer of Record, and show on the drawings. Delete the inappropriate bracketed phrase. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC, properly edited, must be enclosed in the contract documents.
**************************************************************************

LOX storage system and associated equipment must comply with NFPA 55 and CGA G-4.4. Tanks, vaporizers and regulators are to be suitable for exterior installations. Cleaning for components, equipment, valves, piping and tanks for oxygen service are to be accomplished in accordance with CGA G-4.1, CGA HB. The system must be rated to withstand a minimum wind speed of [_____] km miles per hour, maximum ambient temperature [_____] degrees C F, minimum ambient temperature [_____] degrees C F, [_____] relative humidity, and [_____] meters feet mean sea level altitude. System must be supported and braced to resist seismic loads as specified in UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC] [as indicated].

2.5.2.1 LOX Storage Tanks

**************************************************************************
NOTE: Typically, 304 stainless steel is used for LOX inner tanks less than 6000 L 1500 gallons or 6750 kg 15,000 pounds, while 9 percent nickel units are generally specified for larger tanks principally due to economic considerations. Typical maximum operating pressure for the LOX system will generally be less than 515 kPa 75 psi; significant cost savings can be achieved by reducing the tank pressure requirements, but lower pressure tanks may require a longer lead time to procure since the 1.2/1.7 MPa 175/250 psi tanks are most commonly provided.
**************************************************************************

Bulk LOX storage tanks are to be [_____] kg pound double walled vertical tanks constructed in conformance with [ASME BPVC SEC VIII D1] [____], rated for a maximum operating pressure of [1.2] [_____] MPa [175] [_____] psi and design temperature between minus 212 and plus 65 degrees C minus 350 and plus 150 degrees F, and seismic parameters defined in previous paragraph. Construct the inner wall of [Grade 304 stainless steel] [9 percent nickel steel] [____], the outer shell constructed of carbon steel with a minimum outer shell thickness of [10] [_____] mm [0.375] [_____] inch. Annular area between the inner and outer walls are to be insulated to limit oxygen boil off rate to less than [0.25] [_____] percent of the tank capacity per day at the maximum ambient conditions. Piping must be copper or 316 stainless steel. Fittings must be bronze or 316 stainless steel.
2.5.2.2 Vaporizers

NOTE: Vaporizers should be designed for the anticipated flow rate to the ozone generator. If vaporizers are oversized, gas temperatures will reach outside ambient temperatures, resulting in higher oxygen gas temperatures during the summer months being fed to the ozone generator, reducing its efficiency. Normal operating pressure for an ozone generator is approximately \(103 \text{ kPa} 15 \text{ psi}\). Resulting pressure at the diffusers is approximately \(103 \text{ kPa} 15 \text{ psi}\) less system losses.

In cold climates, heaters may be required to warm the oxygen gas feed to the ozone generator. The actual heating requirements should be coordinated with the ozone generator manufacturer. In cases where ambient temperatures fall below freezing for extended periods, supplementary heating may be necessary.

LOX systems may require a small quantity of nitrogen gas be added to the feed stream to facilitate ozone gas flow through the generator. This may be accomplished by adding a small volume of dried ambient air (about 2 percent).

Vaporization equipment will consist of a minimum of [2] [3] ambient air vaporizers and [single] [double] regulator system complete with automatic switching and a manual bypass. Each vaporizer must be rated for 100 percent capacity, under continuous operation at a [_____] cubic meters/second SCFM withdrawal rate and also capable of supplying a peak withdrawal rate of [_____] cubic meters/second scfm. Design the vaporization equipment for an inlet pressure of [_____] kPa psi, and a maximum headloss between the tank and ozone generator of [_____] kPa psi. The vaporizer extrusions must have extra wide spacings between the individual extrusions with a minimum area per extrusion of [1.65] [_____] square meters/meter [5] [_____] sf/ft. [Heaters are to be provided to automatically warm the oxygen feed gas to the ozone generator when the oxygen feed temperature falls to less than [_____] degrees C F. Ensure heaters are capable of warming the oxygen feed gas to a temperature range between [10 and 22] [_____] degrees C [50 and 72] [_____] degrees F]. Each vaporizer must operate for a minimum of [8] [_____] hours at the minimum ambient conditions and continuous withdrawal rate specified. The defrost cycle for each vaporizer be a maximum of [8] [_____] hours at the minimum ambient conditions and continuous withdrawal rate specified. Piping between the LOX tank and ozone generator are to be insulated as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.5.2.3 Regulators

Regulators are to be factory tested with outlet pressure field adjustable over a downstream pressure range from [69 to 172] [_____] kPa [10 to 25] [_____] psi, from 0 to 100 percent of the specified oxygen flow rate. Regulators are to be rated at \(1030 \text{ kPa} 150 \text{ psi}\), and constructed of 316 stainless steel.
2.5.3 Ozone Generator Air Feed System

System equipment which processes ambient air directly as the ozone generator feed gas must be provided by a single supplier, [be of the pressure swing type and] include an air compressor and receiver, aftercooler, [refrigerative dryer], vapor/liquid separator, [coalescing and] [particulate] filters, desiccant air dryer, particulate after filter, switching valves, pressure, temperature and moisture monitors, local controller and other equipment as required by the manufacturer to provide a complete and operational air preparation system. [The equipment must be skid mounted.] Adsorption vessels are to be designed and constructed in accordance with ASME BPVC SEC VIII D1. Adsorption material must be [activated alumina] [____]. The unit is to be completely wired requiring only an external connection for a single external power supply and remote monitoring [and control]. The air preparation system supplier is responsible for all work from the outside air inlet to the ozone generator inlet connection. The air preparation system is to be a continuous output system with the following characteristics based on 100 percent relative humidity and maximum ambient temperature of [_____] degrees C F:

<table>

2.5.4 Ozone Generator System

NOTE: Delete this paragraph if an ozone generator is not used. Horizontal tube, medium frequency generators are the most common; however, since the state of the art is constantly changing, verify that other types of generators are not available or appropriate for the particular application.

Coordinate pressure requirements with paragraph Ozone Generator Air Feed System. Typical pressure ranges required for ozone systems are dependant upon the final ozone outlet pressure, generally between 69 and 103 kPa 10 and 15 psi plus losses through the equipment.
Ozone generation equipment are to be continuous duty water cooled, multi-tube glass or non-glass multitube dielectric [horizontal tube] [vertical tube] assemblies contained in a pressure vessel [with hinged gas-tight doors] with a rated design pressure of [_____] kPa psi. Each unit is to be provided with [medium] [high] frequency electrical power supply units including input and output transformers, power controller, frequency inverter, harmonic mitigation equipment (if required). The generator must be provided with complete controls, [compatible with the central control unit,] instrumentation, panels, appurtenances and miscellaneous equipment required for a complete ozone generating system using [oxygen] [air]. All equipment, valves, piping, associated appurtenances must be suitable for ozone in [oxygen] [air] service.

Generator design requirements are as follows:

<table>

2.5.4.1 Ozone Generator Vessels

All ozone generator metal parts which come into contact with ozone or cooling water are to be constructed of Type 316L stainless steel. The vessel must be designed to resist an internal pressure of 1.5 times the design pressure, including the tubes and shell. Provide over pressure protection based on worst case operating conditions. The vessels are to be constructed in accordance with ASME BPVC SEC VIII D1 code. Provide viewing ports to allow visual inspection of all internal dielectrics during operation.

2.5.4.2 Dielectric Tubes

Dielectric tubes are to be constructed to resist thermal shock and to evenly distribute the applied electrical charge over the entire dielectric surface without arcing. Dielectric tubes are to be formed from either glass or a non-glass material with a certified voltage breakage strength of 1.5 times the maximum possible operating voltage under maximum temperature and applied power conditions. Dielectric tubes are to be protected by fuses or functionally equivalent devices to prevent shorting dielectric tubes from damaging the shell and tube structure in the ozone generator.
2.5.5 Ozone Destruct System

****************************************
NOTE: High concentrations of chlorinated organics may be liberated by systems which use ozone in air or oxygen. These chlorinated organics may "poison" a catalyst bed designed only for ozone destruction. If considerable concentrations of chlorinated organics are anticipated (greater than 1000 ppm) in the reactor off gas, a chlorine resistant catalyst should be specified or a separate specification section should be used.
****************************************

Ozone off gas destruction equipment must be thermal assisted catalyst destruct type units suitable for moist ozone in [oxygen] [air] service. The catalyst containment unit, piping, ductwork, and other metallic components are to be constructed of 316 stainless steel. The units are to be capable of destroying contactor off gas generated by the ozone generators which feed the AOP reactors. The ozone destruction unit must have the capability to function at a minimum turn down ratio of 20 to 1. Each off gas destruction unit are to be a skid mounted unit consisting of [a demister,] an electric resistance heater, catalyst trays and containment vessel [, and a centrifugal blower]. The destruction unit discharge duct must be sloped away from the destruct unit to reduce the probability of catalyst fouling from condensation. Ducts carrying ozone laden off gas from the AOP reactors are to be sloped to a low point valved drain located upstream of the ozone destruct system. The ozone destruct system must reduce the ozone concentration from the off gas flow to less than [0.10] [_____] ppm by volume of ozone from zero flow to the maximum off gas flow rate. Normal operation is defined as [50] [_____] percent of the maximum off gas flow rate with an ozone concentration of [1.0] [_____] percent by weight. Ozone destruction equipment are to meet the following requirements:

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Requirement Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum pressure drop through catalyst at max flow rate</td>
<td>[<em><strong><strong>] mm of mercury [</strong></strong></em>] inches of water</td>
</tr>
<tr>
<td>Maximum pressure drop through heater at max flow rate</td>
<td>[<em><strong><strong>] mm of mercury [</strong></strong></em>] inches of water</td>
</tr>
<tr>
<td>Maximum off gas relative humidity</td>
<td>[_____] percent</td>
</tr>
<tr>
<td>Catalyst chamber empty bed contact time</td>
<td>[1.0] [_____] seconds</td>
</tr>
<tr>

<td>[120] [<em><strong><strong>] degrees C [250] [</strong></strong></em>] degrees F</td>
</tr>
<tr>
<td>Off gas temperature to catalyst bed</td>
<td>[15] [<em><strong><strong>] degrees C [60] [</strong></strong></em>] degrees F</td>
</tr>
<tr>
<td>Power supply</td>
<td>[480] [<em><strong><strong>] volts, [3] [</strong></strong></em>] phase, 60 hertz</td>
</tr>
</tbody>
</table>

The catalyst are to be non-hazardous [manganese dioxide/copper oxide] [nickel] [_____] based material suitable for catalytic ozone destruction at
the specified conditions. Provide the catalyst containment unit with a flanged and bolted top or hatch a minimum of 300 mm 12 inch in diameter to facilitate change out of the catalyst material when the catalyst is exhausted.

2.5.6 Hydrogen Peroxide System

**************************************************************************
NOTE: Edit Section 46 30 00 WATER AND WASTEWATER
CHEMICAL FEED SYSTEMS to provide on-off, set point,
or proportional control as appropriate.

Hydrogen peroxide storage system requirements should be coordinated with suppliers to ensure material compatibility. Floating roof manway area should equal 1 in 2 per 400 L 100 gallons for solutions less than 52 percent, and 2 in 2 per 400 L 100 gallons for solutions greater than 52 percent. Process safety management requirements must be followed any time more than 3375 kg 7500 pounds of H2O2 is stored, or the solution strength is greater than 52 percent; refer to 29 CFR 1910.119 for information.

Hydrogen peroxide storage tanks should be located outside when possible. Polyethylene should not be used for peroxide concentrations greater than 52 percent.

**************************************************************************

The hydrogen peroxide storage tank must be constructed of cross linked polyethylene, 316 stainless steel, or 99.5 percent pure aluminum alloys designated in [ASTM B209M] [ASTM B209] as 1060, 5254, 5652. Hydrogen peroxide storage tanks are to be provided with secondary containment [as detailed on the drawings] [110] percent of the maximum storage tank volume. Hydrogen peroxide storage tanks are to be equipped with [50] mm [2] inch female quick fill connection; [600] mm [24] inch hinged, weighted and gasketed manway cover; [50] mm [2] inch filtered breather vent; liquid level site tube; and [600] inch free floating roof manway cover. All piping connections must be flanged. Conform feed pumps to the requirements of Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.

2.5.7 Redox Potential Meter

Provide the oxidation reduction meter [where indicated on the drawings] [on the effluent line of each reactor]. Probe is to be easily removable without interrupting service. Probe materials are to be resistant to ozone as well hydrogen peroxide attack over a pH range of 2 to 12 and operating pressures of up to [_____] kPa psi and suitable for a temperature range from [0 to 100] [_____] degrees C [32 to 212] [_____] degrees F and suitable for the medium monitored. Probe must transmit output to an ORP analyzer with digital output. The ORP analyzer must transmit a [(4 to 20) [ma] signal proportional to the ORP] [direct digital reading] to the central control unit.
2.5.8 pH Probe

The pH probe is to be provided [where indicated on the drawings] [on the effluent line of each reactor]. Ensure probe is easily removable without interrupting service. Probe materials are to be resistant to ozone as well hydrogen peroxide attack over a pH range of 0 to 14 and operating pressures of up to [_____] kPa [_____] psi and suitable for a temperature range from [0 to 100] [_____] degrees C [32 to 212] [_____] degrees F and suitable for the medium monitored. Probe must transmit output to a pH analyzer with digital output. The pH analyzer must transmit a [[4 to 20] [_____] mA signal proportional to the pH] [direct digital reading] to the central control unit.

2.5.9 Ozone Monitors

2.5.9.1 Vapor Phase

Separate ozone monitors are to be provided to monitor ozone in ambient air, [at the locations shown on the drawings,] determining the ozone levels downstream of the off gas ozone destruct system, [and the ozone concentration in the ozone generator discharge]. The ambient air monitoring unit intake is to be located [within 455 mm 18 inches above the treatment plant floor] [at the location shown on the drawings] [adjacent to the AOP process equipment]. The ambient air monitors are to be interlocked with the ozone generation system to initiate an alarm condition, and ozone generator shut down when readings exceed preset levels. Analyzers are to be [4 to 20 mA] [direct digital] output ultraviolet adsorption photometer type with built in pressure and temperature compensation. Ozone off gas monitor must have a minimum of five separate ranges to monitor concentrations between [[0 to 15] [_____] percent,] [[0 to 99,000] [_____] ppm by volume]. Ambient air and off gas destruct monitors must have a minimum of five separate ranges to monitor concentrations between [0 to 10] [_____] ppm. Each monitor is to be provided with a built in digital ozone concentration readout at the unit.

2.5.9.2 Liquid Phase

Liquid phase monitors are to be provided [where indicated on the drawings] [on the effluent line of the last reactor]. Sensor must transmit output to an ozone analyzer with digital display and remote signal transmission to the central control unit. Probe must transmit output to a liquid phase ozone analyzer with digital output. The liquid phase ozone analyzer must transmit a [[4 to 20] [_____] mA signal proportional to the ozone concentration] [direct digital reading] to the central control unit.

2.5.10 Temperature Sensors

Temperature sensors are to be dual switch trip point independently adjustable type with a minimum accuracy of 0.5 percent of full scale. Thermal system is to be constructed of 316L stainless steel. Temperature range will be from [0 to 100] [_____] degrees C [32 to 212] [_____] degrees F and suitable for the medium monitored. Sensor must transmit output to an analyzer with digital output. The analyzer must transmit a [[4 to 20] [_____] mA signal proportional to the temperature] [direct digital reading] to the central control unit.

2.5.11 Compressors

Air compressors are to conform to CAGI B19.1. Air compressors are to be
factory packaged [rotary screw] [centrifugal] [rotary] [reciprocating] type units. The air compressors are to be packaged in an enclosure with sound attenuating properties which allow a maximum noise level measurement of 75 dBA at the equipment enclosure. Air compressors are to be [water] [air] cooled and rated for continuous operation. Guards must shield exposed moving parts. Compressor motors and starters are to conform with the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Air compressors are to have the manufacturer's name and address, together with trade name, and catalog number on a nameplate securely attached to the equipment. Any special maintenance instructions (required before startup or shutdown) are to be included in the Operations and Maintenance Manuals. Compressor equipment used for processing ambient air for the ozone generator feed gas are to include the air compressor, receiver with automatic condensate drain, intake air filter and silencer, after cooler, a high efficiency moisture separator, [refrigerative dryer], pressure, temperature and moisture monitors, local controller and other equipment as required by the manufacturer to provide a complete and operational oil free, dry compressed air system. Compressor receivers, air piping, valves and appurtenances unless otherwise specified, are to be in conformance with Section 22 00 00 PLUMBING, GENERAL PURPOSE. Dry contacts and 4 to 20 mA signals are to be provided in the control panel for remote monitoring.

<table>

2.5.12 Blowers

Blowers are to conform to [Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS] [______]. Dry contacts and 4 to 20 mA signals are to be provided in the control panel for remote monitoring.

2.5.13 Dew Point Monitor

The dew point transmitter are to be of a solid state design housed in a NEMA 4 enclosure as defined in NEMA 250, with an accuracy of plus or minus 3 degrees C over an operating ambient temperature range of minus 10 to plus 60 degrees C, over a dew point range of minus 110 to plus 10 degrees C. The transmitter must receive the signal from the thin film aluminum metal oxide sensor, convert and send it as a [single 4 to 20 mA DC signal proportional to the dewpoint level] [direct digital reading] to the central control unit. Sensor must transmit output to an analyzer with digital display.

2.5.14 Pressure Gauges

Water pressure gauges are to be glycerine filled units conforming to the requirements of ASME B40.100.
2.5.15 Sampling Ports

Aqueous and gas phase sampling ports are to be provided [where indicated on the drawings] [upstream and downstream of each reactor vessel]. Sampling ports are to be provided at locations accessible to plant operators. Ports and associated piping are to be constructed of [6] [12] [_____] mm [1/4] [1/2] [_____] inch minimum diameter [PVDF] [316 stainless steel] [teflon] [_____] with [PVDF] [316 stainless steel] [_____] [NPT x hose] ball valves.

2.5.16 Gas Flow Meters

**************************************************************************
NOTE: Numerous meters may be required which may necessitate a table be included identifying the flow capacity for each unit.
**************************************************************************

Flow meters for ozone or oxygen applications must have stainless steel body, tube, valves, floats, and knobs with glass windows. Flow meter must be rated for a flow rate of [_____] cms scfm at a minimum pressure of [345] [_____] kPa [50] [_____] psi. Provide each flow meter with a separate stainless steel valved connection for ease of maintenance. Equip each pipe penetration through the reactor wall serving a single ozone diffuser or bank of diffusers with a flow meter. The [air] [oxygen] feed stream to the ozone generator must also be equipped with a flow meter. Each flow meter must have an easily readable scale in cms scfm with a minimum of ten divisions from zero to 150 percent of the expected flow through the meter. Provide each meter with an analyzer which receives the signal from the flow meter transmitter, converts and sends it as a [single 4 to 20 mA DC signal proportional to the flow rate] [direct digital reading] to the central control unit. Sensor must transmit output to an analyzer with digital display.

2.5.17 Level Monitoring

Pressure type level sensors, associated analyzers and transmitters are to be provided for each liquid process tank associated with the AOP system. Ensure sensor element is removable for servicing or replacement without taking the tank out of service. As a minimum, the following tanks are to be equipped with level monitoring equipment: [reactor vessels,] [hydrogen peroxide storage and feed tanks,] [equalization tank,] [effluent storage and equalization tanks,] [______]. Each level control element are to be of solid state design constructed of materials compatible with the liquid stored. Provide each controller with an analyzer which receives the signal from the level sensor, converts and sends it as a [single 4 to 20 mA DC signal proportional to the liquid level] [direct digital reading] to the central control unit.

2.5.18 Reactor Vessel

**************************************************************************
NOTE: Coordinate paragraph Gas Flow Meters requirements for the application; indicate penetration requirements, if a packing support is required; view ports; site glasses; or material options to stainless steel reactors. Also include access requirements for removal and maintenance of diffusers. Coordinate unique concrete material ozone resistance requirements with Section 03 30 00

SECTION 46 30 13 Page 27
CAST-IN-PLACE CONCRETE if concrete reactor vessels are used.

Reactors for peroxone systems, where either the ozone or hydrogen peroxide dose is not expected to exceed 25 ppm, may be constructed of fiberglass if appropriate resins are used. Coordinate with tank suppliers regarding specification requirements.

The reactor vessel will be [circular] [rectangular], fabricated of [316L stainless steel] [concrete conforming to Section [03 30 00 CAST-IN-PLACE CONCRETE] [_____] provided with [_____] mm inch, [_____] kPa psi flanged connections. Reactor vessels will have a minimum water depth above the diffusers of [6] [_____] m [18] [_____] feet, with a minimum free board water depth above the liquid level of 600 mm 2 feet. Reactor will be designed to accommodate a vacuum of [25] [_____] mm [1] [_____] inch applied to the reactor headspace. Welding will be performed in accordance with AWS D1.1/D1.1M by welders certified to have passed qualification tests using procedures covered in AWS B2.1/B2.1M or ASME BPVC SEC IX. Reactors are to be equipped with openings required to ensure maintenance and installation/removal of the following equipment: liquid inlets and outlets, gas inlet supply and off gas collection points, sampling connections, [quartz sheath wipers], [UV lamps], [pH probe], [redox meter], [level switch], site glass liquid level indicator, and other connections as indicated or required. Reactor vessels are to be equipped with a minimum of [one] [_____] viewing port no smaller than [0.5] [_____] m [1.5] [_____] feet located [0.7] [_____] m [2] [_____] feet minimum above the bottom of the reactor. The viewing port must be covered with clear plastic material not susceptible to ozone degradation, with a minimum thickness of [10] [_____] mm [3/8] [_____] inch.

2.6 ELECTRICAL

Electrical products are to be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Reactor vessels containing ultraviolet lamps are to be independently grounded.

2.6.1 Motors

Motors, all motor starters, and any control or signal wiring required for the operation of the specified equipment are to be provided and installed under this section in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM unless otherwise specified herein, in other sections, or indicated on the drawings.

2.6.2 Local Controls and Panels

Manual or automatic controls, protective or signal devices required for the operation specified, and any control wiring required for controls and devices, provided. Enclosures for local power and control panels are to conform to NEMA ICS 6.

2.6.3 Ultraviolet Equipment Electrical Requirements

a. Provide a separate prewired power panel for each module.

b. Ground fault detection or independent ground will be standard with the UV lamp equipment.
c. Control and monitoring components are to be housed in NEMA enclosures. Internal components are to be sealed from the environment. System electronics to be used in an interior environment are to be housed in enclosures conforming to NEMA 250 TYPE 12. System electronics to be used in an exterior and corrosive environment, as defined in NEMA 250, are to be housed in enclosures conforming to NEMA 250 TYPE 4X.

d. Provide sufficient cooling to the medium and high temperature UV bulbs as well as associated ballasts to prevent overheating.

e. Wiring and electrical connections are to be protected against moisture and corrosive gases to prevent electrical shorts or failure. Electrical installation and materials are to conform to NFPA 70. The unit must be completely wired requiring only an external connection for a single external power supply and remote monitoring and control.

f. Interconnecting, multiconductor, unshielded cables must be suitable for outdoor installation. Insulation will be thermoplastic rubber with an operating range of minus 60 to 125 degrees C minus 75 to 260 degrees F with low temperature flexibility and flame retardants. UV stabilized jacketing must be resistant to oils, chemicals, fuels, solvents, and to mechanical abuse and abrasion. Cable must be supplied by the equipment manufacturer and be of sufficient length and number for a complete system.

g. Cableways provided are to be stainless steel, 1.98 or 1.59 mm 14 or 16 gauge thick.

2.7 AOP CONTROL SYSTEM

**************************************************************************
NOTE: Delete items within this paragraph that do not apply. Not all UV systems (especially those with low intensity lamps) have light intensity monitors; verify design requirements for type or need of lamps. Hydrogen peroxide monitoring on all but very large plants (larger than 5.7 ML/day 1.5 MGD) will consist of tank level readings and an indication that the chemical feed pump is working. Coordinate with paragraph Alarms and Interlocks if separate audible or visual alarms beyond the control system specified are required, and their location.

If an autodialer is required, reference the controls and instrumentation section of the specification; or if none is included and an autodialer is required, include those requirements in this paragraph.
**************************************************************************

Equipment will be locally controlled and capable of receiving standard digital or analog control signals from the plant central control system. Provide status and adjustments to the equipment [locally] [and] [from the plant central control system]. Instruments are to be provided with mounting hardware as appropriate. Transmitters with digital outputs must be accurate to within [_____] percent. All equipment will be designed for operation on a 120 volts 60 hertz electrical input. Provide controls to remotely monitor [and adjust] [hydrogen peroxide delivery rate,] [oxygen] [air] [and ozone output,] [_____] [individual lamp failure,] [power on and
off status for each lamp [ballast] [ultraviolet lamp intensity]. [Provide each lamp with a nonresettable elapsed time meter with ability to record operable hours from 0 to 99,999].

2.7.1 Ozonation Control System

The ozonation control system must be interfaced with the plant central control system. Changes to the ozone generator equipment operating conditions are to be accomplished locally or from the master control panel. The power, control and instrumentation system provided as specified or as recommended by the ozone generator manufacturer for safe operation and supervision of the ozone generator and related gas feed equipment. Provide schematics and interconnecting wiring diagrams for power, control, and instrumentation circuits. Provide control power transformers, relays, adjustable timers, auxiliary contacts, switches, or additional equipment to interconnect the generator to other auxiliary equipment and master control panel, and control circuits as shown on schematic or instrument control drawings. An emergency stop button must be provided at the local generator control panel. The ozone generator must be protected from power surges, and variations in power supplied to the equipment.

2.7.2 Hydrogen Peroxide Feed

**************************************************************************
NOTE: Hydrogen peroxide metering rate is generally done manually with an interlock to shut the system down when a flow switch or other interlock at the AOP master control indicates a flow interruption. If a variable flow rate is anticipated, although rarely used, the hydrogen peroxide feed rate can be tied to the influent meter or AOP master control. Coordinate operation with Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.
**************************************************************************

Conform hydrogen peroxide feed pump and control to the requirements of Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.

2.7.3 Alarms and Interlocks

**************************************************************************
NOTE: Delete items in this paragraph that are not required.

Coordinate this paragraph with process and instrumentation diagrams (PIDs) and other specification sections. Metering accuracy for hydrogen peroxide is generally done manually. Indicate if separate audible or visual alarms beyond the AOP master control system are required, and their location.
**************************************************************************

Provide alarms and interlocks to ensure proper operation of the advanced oxidation equipment, and its sequenced shutdown based on potentially unsafe or improper conditions that may exist. The following paragraphs list alarms that (as a minimum) are to be monitored at the central control point, or that will initiate shutdown of the appropriate advanced oxidation equipment components.
2.7.3.1 AOP System

Failure of major equipment components such as lamps, ballasts, or safety interlocks must initiate system, followed by plant shutdown, if not acknowledged.

a. AOP system alarms and control interlocks are to be provided for the following items:

(1) Lamp failure
(2) Ballast failure
(3) Safety interlocks for open door on reactor vessel or panel
(4) High water temperature in AOP reactor vessel
(5) Low water flow to the reactor vessel
(6) Sleeve wiper failure
(7) High pressure in reactor vessel headspace
(8) [______].

b. Submit the following data for the AOP System

(1) Manufacturer’s descriptive and technical literature; performance charts and curves, catalog cuts for specified equipment including: instrumentation and controls; capacities and pressure drop; model number; and installation instructions.

(2) Materials of construction; inlet and outlet pipe sizes; power demand requirements; and ozone generator cooling water flow rate.

(3) Spare parts data for each piece of equipment, current unit prices and source of supply.

(4) Manufacturer’s descriptive and technical literature; performance charts and curves, catalog cuts for specified equipment including: instrumentation and controls; capacities and pressure drop; model number; and installation instructions.

(5) Materials of construction; inlet and outlet pipe sizes; power demand requirements; and ozone generator cooling water flow rate.

(6) Spare parts data for each piece of equipment, current unit prices and source of supply.

(7) Manufacturer’s certificates stating that the equipment meets the specified requirements, and has been installed in accordance with the equipment manufacturer’s requirements.

2.7.3.2 Metering Pump

Pump failure must initiate system, followed by plant shutdown, if not acknowledged. Metering Pump alarms and control interlocks are to be provided for the following items:

a. Hydrogen peroxide feed
b. Catalyst feed
c. Pump failure
d. [______].
2.7.3.3 Hydrogen Peroxide Tank

Hydrogen peroxide tank [alarms] [and control interlocks] are to be provided for the following items:

a. High liquid level
b. Low liquid level
c. Low low liquid level
d. High temperature
e. High pressure
f. [____].

2.7.3.4 Ozone System

Ozone system alarms and control interlocks are to be provided for the following items:

a. High dew point in gas feed to ozone generator
b. Over current to the power supply unit (PSU)
c. Over voltage to the PSU, rectifier, and inverter
d. Over frequency protection
e. High temperature shut down
f. High inlet gas temperature
g. High inlet cooling water temperature
h. High gas pressure to the generator
i. Insufficient gas flow to the generator
j. High outlet ozone gas temperature
k. High moisture level in control cabinet
l. [____].

Major equipment component failure such as over current, over voltage, over frequency, high cooling water temperature or other condition that could damage the equipment or result in effluent non-compliance must initiate system, followed by plant shutdown, if not acknowledged.

2.7.3.5 Gas Feed System

Gas feed system alarms and control interlocks are to be provided for the following items:

a. High pressure across gas filters
b. High temperature in gas desiccant dryer
c. High pressure downstream of reducing valves
d. Air preparation system failure
e. Ozone monitor failure
f. [____].

Major equipment component failure, such as high cooling water temperature, air preparation failure, or other condition that could damage the air feed or ozone equipment, or result in effluent non-compliance must initiate system, followed by plant shutdown, if not acknowledged.

2.7.3.6 Ozone Destruct System

Ozone destruct system alarms and control interlocks are to be provided for the following items:

a. High ozone in ambient air space
b. High gas flow rate to destruct unit
c. Low temperature in ozone destruct unit
d. High ozone in destruct unit exhaust gas
e. Ozone destruct system failure
f. High ozone concentration in off gas
g. Destruct system failure
h. [_____].

Health and safety ambient ozone level non-compliance must initiate ozone system alarm and shutdown, followed by overall plant shutdown, if alarm is not acknowledged (high ambient ozone levels will not shutdown the ozone destruct system concurrently with other processes).

2.7.3.7 Cooling Water System

Cooling water system alarms and control interlocks are to be provided for the following items:

a. Cooling systems failure
b. High water temperature
c. No/low cooling water flow
d. Pump failure
e. [_____].

Major equipment component failure such as no/low cooling water flow, pump failure or other condition that could damage the gas feed, ozone equipment or result in effluent non-compliance must initiate ozone generator, followed by plant system shutdown, if not acknowledged.

2.7.3.8 Metering Accuracy

Metering accuracy alarms and control interlocks are to be provided for the following items: Ozone and Hydrogen Peroxide

2.7.3.9 Ground Fault

Provide a ground fault protection alarm.

2.8 SPECIAL EQUIPMENT AND TOOLS

Provide one set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment. Provide a tube cleaning rack or racks with adequate capacity to hold [50] [100] percent of the dielectric tubes from the ozone generator being serviced. Equip each rack with locking casters to allow the rack to be easily moved between the ozone generator and the location where the dielectric tube cleaning will occur. Each dielectric is to be provided with an individual padded holder.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work. Compare the limits of work for the equipment supplied to field conditions to ensure the limits previously identified for piping, electrical and control interfaces meet the actual physical requirements at the facility. Bring any discrepancies to the attention of the Contracting Officer for correction.
3.2 PREPARATION

**************************************************************************
NOTE: This paragraph covers actions required to physically prepare the surface, area, or site to incorporate the specified primary products.
**************************************************************************

Provide the reactor vessel, [ozone and feed gas equipment,] [hydrogen peroxide storage and feed system,] [electrical support equipment,] and [_____] with an equipment pad isolated from the floor slab [as detailed on the drawings] [adequate to properly support the equipment]. Reinforced concrete are to be designed and installed in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Prior to placing ozone piping, or other equipment, into service it is to be cleaned by one of the methods specified in CGA G-4.1. Piping and equipment used to store or feed hydrogen peroxide must be passivated in accordance with the hydrogen peroxide supplier's requirements.

3.3 EQUIPMENT INSTALLATION

Perform the equipment installation as indicated on the drawings, shop drawings, manufacturer's instructions and recommendations. Piping, valves, fittings, and appurtenances are to be installed in accordance with the manufacturers recommendations, as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE, or as otherwise indicated. All valves, fittings, meters and other appurtenances are to be given unique identification numbers corresponding to those used in operation and maintenance manuals, and in AOP submittals prepared. Identification numbers are to be placed on brass identification tags and securely fastened to all valves, fittings, meters and other appurtenances. Tags are to be no less than 38 mm 1-1/2 inches in diameter with depressed black figures 13 mm 1/2 inch high. Piping for wet ozone service must be PVDF, stainless steel, or PTFE. Piping for dry ozone service must be PVDF, stainless steel, or PTFE. Oxygen Piping will be copper or stainless steel. Hydrogen peroxide piping is to be stainless steel, PTFE or PVDF. Oxygen piping will [be insulated in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS] [not be insulated].

3.4 ELECTRICAL WORK

Perform electrical work in accordance with the drawings and applicable requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Equipment is to be appropriate for continuous duty, and installation in a dusty, humid and corrosive environment. Electrical equipment and wiring must comply with NFPA 70.

3.5 TOOLS

Provide tools to the Contracting Officer prior to the onsite training identified in paragraph FIELD TRAINING.

3.6 PAINTING/CORROSION PROTECTION

All ferrous surfaces are to be coated or painted. Color will be as indicated on the paint schedule or as otherwise approved. Factory painted items are to be touched up as needed. Factory painted items requiring touch up in the field are to be thoroughly cleaned of all foreign material,
primed and top coated with the manufacturer's standard factory finish in accordance with the manufacturer's recommendations, including dry finish thickness. Equipment which did not receive a factory finish must be painted in accordance with the requirements indicated in Section 09 90 00 PAINTS AND COATINGS. Painting corrosion resistant metals such as brass, bronze, aluminum, copper, galvanized steel and stainless steel is not required unless otherwise specified.

3.7 CHEMICALS

**************************************************************************
NOTE: Coordinate these requirements with other specifications which may address extended operation and maintenance occurring in some HTRW Projects. If other supplies such as catalysts are required, include that information as well.
**************************************************************************

Provide the chemicals needed to do all the operational and start up testing, and completely refill the [oxygen], [hydrogen peroxide], [catalyst], [_____] tanks at the time of contract completion.

3.8 WELDING

**************************************************************************
NOTE: Use second set of brackets when critical pipe welding is required.
**************************************************************************

[Piping will be welded in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and welders are to be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests. Structural members are to be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] [Welding and nondestructive testing procedures for piping will be as specified in Section 40 05 13.96 WELDING PROCESS PIPING.]

3.9 SAMPLING AND ANALYSIS

Perform sampling, analysis, and sample turn around time to demonstrate system performance and effluent compliance. Submit a commissioning/demonstration plan for approval to ensure the equipment meets the standards indicated. Coordinate this plan with other plans and unit operations to ensure they do not conflict and the AOP system is ready for testing. Coordinate and obtain regulatory approvals prior to notifying the contracting officer that the equipment is ready for testing.

3.9.1 Plan Details

The plan will include a detailed description of proposed sampling and analysis required to document system performance. A plan detailing the sampling locations, frequency, analytical protocols, and duration which will ensure the equipment complies with the standards indicated. Submit the plan to the Contracting Officer [_____] [30] days prior to equipment start up. Coordinate work within this section with other sections to ensure upstream and downstream unit processes are complete and operational prior to startup/commissioning the AOP unit.
3.9.2 Plan Calculations

Include the following calculations in the commissioning/demonstration plan.

a. Headloss calculations through the process units at the design flow rate, including headloss calculations for associated compressed air and pumping systems.

b. Oxidant demand and subsequent AOP unit sizing.

c. Electrical usage rate.

d. Removal performance and material mass balance.

e. Chemical feed requirements and equipment sizing.

f. Diffuser system layout, mass transfer calculations.

3.9.3 Chemical Sampling

The chemical parameters identified in paragraph PERFORMANCE REQUIREMENTS [and ambient and ozone off-gas destruction concentrations] are to be sampled [daily] [______], monitored [at the locations identified on the drawings] [at the locations indicated in the startup/commissioning plan] for [7] [______] days of continuous 24 hour operation, using analyses with detection limits one order of magnitude lower than the levels indicated in paragraph PERFORMANCE REQUIREMENTS.

3.10 POSTING FRAMED INSTRUCTIONS

Post framed instructions containing wiring and control diagrams, under glass or in laminated plastic, adjacent to the equipment or where otherwise directed before acceptance testing of the system. Condensed operating instructions, prepared in typed form, are to be framed as specified above and posted beside the diagrams. Post the framed instructions before acceptance testing of the systems.

3.11 FIELD TESTS AND INSPECTIONS

**************************************************************************
NOTE: These tests are required for installed or completed work; they are different and separate from those required for materials and products prior to installation or application. Delete tests not applicable or required.

Provide in this section a reference to the plant commissioning or start-up specification which includes the processes in the treatment facility.
**************************************************************************

Accessories such as the [UV equipment,] [ozone generator,] [compressor,] [ozone generator gas feed equipment,] and [_____] are to be factory tested prior to shipment to the job site.

3.11.1 AOP Reactor Vessel

The AOP reactor vessel and attached appurtenances are to be assembled at
the factory and an operational test of all components accomplished prior to shipment. Certification that the equipment and components assembled at the factory are operational and meet the specification requirements are to be provided to the Contracting Officer a minimum of [10] calendar days prior to shipment. Components not assembled at the factory are subject to the same tests and inspections prior to onsite leak testing using potable water. Following installation at the project site, and prior to leak testing, retest the AOP system to ensure the equipment and auxiliary components act as a complete and operational system. This will include operation of all valves, pumps, blowers, analyzers, alarms, meters, interlocks, monitors, level and pump controls, sensors, switches, off gas destruct equipment and all other equipment associated with the AOP system. Complete testing prior to leak testing and written notification provided to the Contracting Officer stating the equipment is working in accordance with the contract documents and manufacturer's recommendations prior to the commencement of leak testing.

3.11.2 Diffuser or Injector System

Pressure test the entire gas piping system with dry air or oxygen at a minimum of [two] times the normal design pressure for a minimum of 60 minutes and such additional time as required for the Contractor to inspect the piping system for leaks. All leaks are to be repaired and the system retested until no leakage is detected. Do not introduce ozone into the system until all leaks have been identified, repaired, and the system retested. [Diffusers] [Injectors] are to be installed in accordance with the suppliers recommendations. After installation, the [diffusers] [injectors] are to be covered with clear water to a depth of approximately [1] m [3] feet. Dry air or oxygen must be released through the [diffusers] [injectors] and the system are to be inspected for uniform air or oxygen distribution throughout the reactors. Following the initial testing at [1] m [3] feet, the distribution testing must be repeated at a water depth of [3] m [9] feet to ensure bubble distribution is adequate throughout the reactor. [Diffuser] [Injector] replacement or repositioning must be accomplished as required to maintain uniform air distribution throughout the reactor. If after repositioning, air distribution throughout the reactor lacks uniformity, additional redistributors or deflectors are to be installed in the reactor as recommended by the [diffuser] [injector] supplier to accomplish uniform flow distribution throughout the reactor.

3.11.3 Leak Testing

Leak testing must be accomplished at the factory to verify the integrity of the reactor vessels and associated gas and liquid piping. The factory leak test are to be accomplished on the reactor vessel and appurtenances following assembly at the factory. Onsite hydrostatic leak testing will include all piping between the upstream and downstream processes, and be accomplished using potable water at a pressure 1.5 times the working pressure, or 350 kPa 50 psi unless otherwise approved by the Contracting Officer. The reactor vessel and appurtenances are to be isolated from the connecting piping and retested for leaks using potable water following assembly at the site. The ozone generator gas connections are to be tested with dry air or oxygen at the maximum pressure allowed by the manufacturer, or as identified in the previous paragraph. Any gas or liquid leaks identified during the aforementioned testing must be repaired and the system retested until the systems are free of leaks.
3.11.4 Control Panel

A local control panel functionality test are to be performed and approved by the Contracting Officer prior to commencement of leak testing or testing using oxidizers. The central control testing must be accomplished prior to overall plant startup.

3.11.5 Ozone Generation System

**************************************************************************
NOTE: The installer or manufacturer should demonstrate the operation and efficiency of the equipment. Power consumption for ozone generation should be less than 10 kWh per 0.5 kg pound of ozone generated assuming a PSA oxygen feed system is used to generate a 10 percent ozone feed; verify this with multiple equipment suppliers based on the specific ozone application pressures to be used, gas feed, and applied ozone concentration.
**************************************************************************

The ozone generation system must be tested to ensure that the actual ozone production, power usage, or water consumption rates meet recommended requirements. Power usage must be measured after achieving steady state conditions as determined by the ozone generator supplier. Power usage must be measured at the central motor control center or at each individual component including the [air dryer,] [refrigerant driers,] [desiccant driers,] [oxygen generator,] ozone generator, cooling water pumps, and master control panel. Power usage must be within [5] [_____] percent of [_____] kWh per kg pound of ozone generated at 100 percent of rated capacity. Also measure cooling water supply. Cooling water consumption rate are not to exceed [_____] L/s gpm at the parameters listed in paragraph Ozone Generator System by more than [5] [_____] percent. If the equipment does not meet the specified consumption rates, make the necessary system revisions to meet the rates specified at no additional cost to the Government. Power usage must also be evaluated at 25, 50, and 75 percent of the design production rate.

3.12 MANUFACTURER'S SERVICES

**************************************************************************
NOTE: Use this paragraph when manufacturers are to provide field quality control with onsite personnel for instruction/supervision of the installation or application of their products, or for startup or demonstration.

This paragraph covers requirements of the installer or manufacturer to demonstrate the operation and maintenance of equipment to the owner's personnel.
**************************************************************************

Provide a manufacturer qualified service representative, experienced in the installation, adjustment, operation and maintenance of the equipment specified, for a minimum of [3] [_____] days to supervise the installation, adjustment, testing, and to provide instruction in the operation, and maintenance of the equipment. If major components from multiple suppliers are provided, such as an [ozone generator] [air preparation system] [oxygen preparation system] [ozone destruct system] [_____], each supplier
is required to visit the site a minimum of [1] [_____] times during equipment installation or startup. During the startup and [one] [_____] years operating period, the major equipment suppliers are required to be onsite [2] [_____] times to verify that the equipment is installed and operates properly, and to provide trouble shooting and technical assistance.

3.13 FIELD TRAINING

Provide a field training course for designated operating and maintenance staff members. The training will include operation of individual components as well as the integrated system, maintenance needs and procedures, instrument calibration, safety issues and emergency procedures, control and alarm features, troubleshooting equipment and control problems, and laboratory analytical procedures. Training will be provided during normal working time and will start after the system is functionally complete but prior to performance testing. Field training must cover all of the items contained in the operating and maintenance manuals. Each major equipment vendor including, but not limited to, the ozone generator, ozone destruct system, ozone monitoring system, and gas feed system is required to provide two [8] [_____] hour periods of classroom and hands-on operating instruction to the individuals selected by the Contracting Officer. The first period will be at system startup and the second [as defined by the Contracting Officer] [at the end of the Contractor's operating contract, prior to turning over to the long term facility operator]. Upon completion, submit certificates indicating the designated personnel have received training specified and have successfully operated the installed AOP equipment.

3.14 MAINTENANCE

3.14.1 Extra Materials

**************************************************************************
NOTE: Delete inapplicable portions of these paragraphs. Coordinate this section with other sections of the specifications to ensure there are not conflicts regarding supplying consumables. Verify the duration of the initial operating period, which is generally 1 year.
**************************************************************************

Furnish the initial supplies to fill the vessels, as well as all consumables during the startup, prove out, and initial operation period. At the time the Contractor turns the plant over to the long term Operation and Maintenance Contractor, the vessels storing consumables such as LOX, hydrogen peroxide [and] [_____] are to be refilled within [two] [five] days prior to the plant turn over.

3.14.1.1 Lamps

Provide a complete set of lamps reserved for change out by the equipment supplier following the one year warranty period. This extra set of lamps are to be delivered to the treatment facility 60 days prior to the end of the one year warranty period and installed by the Contractor. Lamp replacement during the one year warranty period is to be provided by the supplier, as needed by the Contractor.
3.14.1.2 Spare Parts

The supplier must provide, in addition to the lamps specified above, a minimum of ten percent of each of the following items, or a minimum of two, whichever is greater:

a. Lamp ballasts
b. Quartz sleeves
c. End seals
d. Socket connectors
e. O-rings
f. Quartz sleeve cleaners
g. Diffusers
h. Rotometers
i. Generator dielectrics
j. Generator dielectric fuses
k. pH probe element
l. ORP probe element

3.14.2 Maintenance Service

**************************************************************************
NOTE: Delete this paragraph if UV lamps are not used. The designer may want to provide additional information regarding lamp change out if the system is limited to a certain lamp type. Medium pressure lamps have an approximate life of 3 to 4000 hours, while low pressure lamps have an approximate life of 7 to 10000 hours; certain proprietary, high intensity lamps may have a life less than 2000 hours.
**************************************************************************

Changing out lamps, ballasts, and quartz tube wipers, at the frequency recommended by the manufacturer during the one year warranty period or as otherwise required, is Contractor's responsibility. Lamps and ballasts supplied as specified below, are to be provided in addition to the complete set supplied for installation (following the warranty period) and those installed as needed during the warranty period. The ozone generator dielectrics are to be cleaned in accordance with the manufacturer's recommendations immediately prior to the conclusion of the Contractor's operating period; or after one year, if greater than one year after startup, and at the conclusion of the Contractor's operating period.

3.14.3 Operating Instructions

Submit [six] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system start-up, operation and shutdown, routine maintenance, potential breakdowns and repairs, and
troubleshooting. The instructions are to include drawings and schematics of the system as installed. The instructions are to include the manufacturer's name, model number, service manual parts list and brief description of all equipment and their basic operating features. The instructions are to include, but not be limited to, the following:

a. System layout showing piping, valves and controls, process flow diagrams, piping and instrumentation diagrams with all valves, meters, and similar units identified.

b. Approved wiring and control diagrams prepared in accordance with ANSI/ISA 5.1 including a drawing index, legend and symbols list, and abbreviations and identifiers.

c. A control sequence describing startup, how to make adjustments to the equipment during operation, standard and emergency shutdown procedures.

d. Operating and maintenance instructions for each piece of equipment, including lubrication instructions and other periodic maintenance and inspection information as well as trouble shooting guides.

e. Manufacturer's bulletins, cut sheets and descriptive data, parts lists, and recommended spare parts, and sources of supply for all major pieces of equipment.

NOTE: This guide specification covers the requirements for chlorine feeding equipment for the treatment of water or sewage.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature.
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B16.3 (2021) Malleable Iron Threaded Fittings, Classes 150 and 300

ASME B16.11 (2022) Forged Fittings, Socket-Welding and Threaded

ASME BPVC SEC VIII D1 (2019) BPVC Section VIII-Rules for Construction of Pressure Vessels Division 1

ASTM INTERNATIONAL (ASTM)

ASTM F441/F441M (2023) Standard Specification for Chlorinated Poly(Vinyl Chloride) (CPVC)
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Auxiliary Equipment and Spare Parts

**************************************************************************
Note: Delete any items listed below that are not required. Designer must specify, in addition to the list provided below, what additional device or devices are required to be provided by the contractor in the performance of this contract to ensure that the user of the equipment is able to measure the desired analytes that are being distributed by this system.
**************************************************************************

Furnish auxiliary equipment and spare parts as follows:

a. One spare flow rate indicator for each machine.

b. One flexible tank connection for each machine, except where the machine is direct cylinder-mounted.

c. Three each of all special gaskets to fit all joints and unions.
d. One set of all necessary hose clamps to suit all hose connections.

e. Fifty cylinder valve gaskets.

f. One 118 mL 4 ounce bottle of ammonia.

g. Stationary metal platform scale without wheels, with a capacity of
   [2][4][_____] chloride containers of [1][2][_____] kg pounds size and of
   the [dial][beam] type.

h. [[1][2][_____] air-purifying respirators, with cartridges conforming to
   30 CFR 72; Subpart 710.] [[_____] self-contained air breathing units.]

i. [1][2][_____] residual-chlorine comparator of a type employing
   permanent color standards and 13- or 26-millimeter viewing-depth sample
   tubes, with corrosion-resistant case, a color disk reading from 0.0
   mg/L to [_____] mg/L, and sufficient DPD tablets for 100 tests.
   Provideresidual chlorine comparators that meet EPA requirements.

j. [1][2][_____] emergency repair kit for chlorine cylinders.

k. [1][2][_____] emergency repair kit for chlorine [1][_____] metric ton
   containers.

1.3.2 Special Tools

For each type of equipment furnished provide:

a. Special tools necessary for adjustment, operation, maintenance, and
   disassembly.

b. A grease gun or other lubricating device for each type of grease
   required.

c. One or more steel cases mounted on the wall complete with flat key
   locks, two keys, and clips or hooks to hold each tool in a convenient
   location. Provide high-grade, smooth, forged, tools fabricated from
   alloy tool steel. Provide lever type grease guns. Deliver tools at
   the same time as the equipment and hand over on completion of the work.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather,
humidity and temperature variation, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a chlorine feed system for the treatment of sewage effluent or
potable water systems. Provide system consisting of chlorine feed pump,
controls, cylinder connections, gauges, meters, etc. as described in the
following paragraphs.

2.1.1 Standard Products

Provide equipment and material which are the standard products of a
manufacturer regularly engaged in the manufacture of the products and that
essentially duplicate items that have been in satisfactory use for at least [2 years prior to bid opening][2 years prior to issuance of Request for Proposal]. A service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site must be proposed to support all equipment.

### 2.1.2 Nameplates

Secure a plate to major equipment items containing the manufacturer's name, address, type or style, model or serial number, and catalog number.

### 2.1.3 Miscellaneous Supports

Provide bolts, nuts, anchors, washers, and all other types of supports necessary for the installation of the equipment which are fabricated of galvanized steel, cadmium plated steel, or Type 316 stainless steel.

### 2.1.4 Submittal Data

Submit a complete list of equipment and material, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Submit a list of Spare parts data for each different item of material and equipment specified, after approval of the detail drawings and not later than [1][3][_____] months prior to the date of beneficial occupancy. Include in the data a complete list of parts and supplies, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [1][ and][ 3] year(s) of service.

### 2.1.5 Material Compatibility

Supply materials that are compatible with the concentration of solutions to which they are exposed. It is the contractor's responsibility to ensure all supplied materials are compatible within all submitted products.

### 2.1.6 Factory Painting

Use factory paint which conforms to manufacturer's standard factory finish.

### 2.2 CHLORINE-FEEDING MACHINE

Select components for the machine for the treatment of [water][sewage] by the application of chlorine [solution][gas] against a [positive][negative] head of [_____] mmfeet using the facility's system for operation of the machines under a variation in pressure from [_____] minimum to [_____] maximum kPapsi. The chlorine-feeding system consists of controls and devices necessary for a complete operating system including a chlorine pressure gauge or other device that indicates loss of chlorine pressure, a chlorine pressure-reducing valve, a meter with rate-of-flow, injector, pressure-relief valves, water-pressure gauges, water strainers, backflow preventer and water-pressure regulator if required.

#### 2.2.1 Mounting

Provide each chlorine-feeding machine with means for [direct cylinder mounting][wall mounting][floor mounting on a panel or in a cabinet] so that the chlorine gas feed rate control is under [a vacuum][pressure] when the machine is in operation. [Mix chlorine gas with liquid after being measured through the meter. ]It is essential that the chlorine feeding
machine function accurately regardless of normal variations in pressure in the chlorine cylinders[ and in the liquid pressure operating the machines].

2.2.2 Protection of Components

Automatically protect the machine against flooding or damage in the event of a failure of the chlorine supply so that under operating conditions it is not possible for water to get back into the chlorine inlet line or dry-gas control parts. Provide parts subject to contact with chlorine made of materials resistant to the action of chlorine at the pressures and concentrations that could be encountered. Construct a system as simple as practicable that provides reliable service and is readily accessible for inspection, cleaning, adjustment, repairs, and replacements.

2.2.3 Capacity

**************************************************************************
NOTE: Choose chlorine feed capacity based on minimum and maximum chlorine requirements required by chemical analysis to treat water fed through the system.
**************************************************************************

Provide Chlorine-feeding machines capable of delivering chlorine from a minimum of [_____] kg/pounds to a maximum of [_____] kg/pounds in 24 hours while operating continuously at rated capacity.

2.2.4 Chlorinator Controls

Provide [fully automatic][semiautomatic][program control][manually-adjusted] type chlorine-feeding machine. [All fully automatic machines are to be equipped to receive standard 4-20 mA control signals.] [Fully automatic controls consist of devices with accessories to adjust continuously the rate of chlorine feed automatically in direct proportion to [flow][ and][ chlorine residual] to compensate for changes in the chlorine demand of the [water ] [or ] [sewage] being chlorinated. Acceptable controls are not to require manual attention other than adjustment of the required chlorine residual.] [Semiautomatic controls consist of devices with accessories to start and stop the chlorine-feeding machine automatically with the starting and stopping of the [water] [or] [sewage] being chlorinated or with a timer mechanism.] [Program control consists of a device with accessories to change the chlorine feed rate of the machine automatically according to a predetermined cycle.] [Manual controls consist of adjustment and indicating devices for regulating the chlorine dosage manually. Provide manually adjusted types that are capable of receiving standard 4-20 mA control signals by the addition of an automatic control device.]

2.2.5 Cylinder Connections

Provide cylinder connections for attaching standard chlorine cylinders to the chlorine-feeding machines. Connections include flexible metal tubing, an auxiliary valve for each chlorine cylinder, a manifold for connecting [2][4][_____] cylinders to each chlorine-feeding machine, and other necessary fittings, unless the machine is direct cylinder-mounted.
2.2.6 Switchover Valves

Supply two or more mechanically operated or loss of chlorine supply-operated automatic gas switchover valves to automatically regulate chlorine gas [pressure] [vacuum] and install [in the gas header] [directly on the chlorine cylinders]. Size the switchover valves appropriately and equipped with filters [and traps]. Factory set the switchover [pressure] [vacuum].

2.2.7 Chlorine Pressure Gauges

Supply chlorine pressure gauges, when applicable, of the diaphragm type with the Bourdon tube and diaphragm compartments filled completely with suitable oil. Construct the gauge on the line from the chlorine tank to indicate accurately the pressure of chlorine gas as supplied from the gas tank to the chlorine feeder.

2.2.8 Chlorine Pressure-Reducing Valves

Provide chlorine pressure-reducing valves that reduce the pressure of the gas and maintain the pressure constant for any given setting of rate of feed regardless of changes in the cylinder pressure.

2.2.9 Vacuum and Chlorine Relief

Provide vacuum and chlorine relief to limit the vacuum within the chlorine-feeding machines and provide for the release to a suitable vent to the outside atmosphere of any chlorine gas pressure build-up in the parts of the machine, normally under vacuum, through improper functioning of the equipment. A vacuum sealing valve which seals off the system when excessive vacuum is present may be substituted for the vacuum relief valve.

2.2.10 Chlorine-Metering Devices

Furnish chlorine-metering devices in sufficient numbers to cover properly the range specified. The chlorine feed rate control system must maintain the feed rate within 4 percent of the indicated rate.

2.2.11 Injectors

Provide injectors with the chlorine-feeding machines to receive all chlorine and solution water and to discharge the resulting solution to the points of application. Introduce the chlorine solution into the [water] [or] [sewage] main by means [of a [ceramic] [hard rubber] [or] [plastic] injection nozzle] [of a suitable diffuser tube inserted into the main through a corporation cock].

2.2.12 Alarm Actuators

Equip each chlorine-feeding machine with alarm actuators to indicate loss of vacuum and excess vacuum. Provide alarm actuators for low chlorine gas pressure and high chlorine gas pressure, unless the chlorine-feeding machine is direct-cylinder mounted. [Also, provide a solution water low pressure alarm actuator.]

2.2.13 Pumps

Provide a pump for each chlorine-feeding machine when the minimum water pressure specified is below that required for satisfactory operation of the
machine. Provide hydraulically operated or electric motor-drive pumps. The electric motor will be rated for [____]-volt, [____]-phase, [____]-Hz ac, and a maximum speed of [____] rpm. Equip the pump with a suitable starter in accordance with the type of control specified.

2.3 EVAPORATORS

**************************************************************************
NOTE: Delete this paragraph in its entirety for installations where chlorine withdrawal rates will not exceed chlorine gasification rate.
**************************************************************************

Evaporators are required whenever gas withdrawal rates exceed the rate at which liquid chlorine gasifies at the operating temperature. Provide water immersed tank heat-exchanger evaporators suitable for evaporating liquid chlorine complete with controls and devices for a complete operating system including: Vaporizing chamber, electric water heaters, water temperature thermostat and indicator, high and low water temperature alarm actuators, water-level gauge, automatic make-up water control system, low water alarm actuator, chlorine gas temperature, and pressure gauges, [make-up water visual flow-indicator], ammonia-type flanged connections for chlorine inlet and outlet, drain and vent line connections, and cathodic protection system with ammeter. Provide parts which are subject to contact with chlorine made of materials resistant to the action of chlorine at pressure and concentrations that could be encountered. Construction is to be as simply as practicable to provide reliable service and to be readily accessible for inspection, cleaning, adjustment, repair and replacement.

2.3.1 Capacity

Provide evaporators with a capacity to convert [_____] kg/pounds per day of liquid chlorine into gaseous state.

2.3.2 Vaporizing Chamber

Provide a vaporizing chamber constructed of steel and designed to conform to ASME BPVC SEC VIII D1. Test the chamber hydrostatically at 5.5 MPa/800 psig minimum. Protect the gas chamber and water bath tank from cathodic corrosion. Provide insulated, galvanized tank to conform to ASTM A153/A153M.

2.3.3 Water Heaters

Design the water heaters for operation on a 3-phase, 60-Hz current of the voltage indicated. Include a vapor-sealed magnetic contactor for handling the current to the heaters. The holding coil is to be rated for single-phase, 60-Hz current.

2.3.4 Switchover System

Supply a liquid chlorine automatic switchover system to automatically change to reserve supply when the on-line liquid chlorine supply runs out.

2.3.5 Pressure-Relief System

Equip each evaporator with a chlorine pressure relief system located downstream of the gas outlet with the following features:

a. Rupture disk with 1.7 MPa250 psig minimum rating.
b. Pressure switch protected by a diaphragm seal and actuated at 137.9 kPa (20 psig).

c. Self-reseating pressure relief valve with manufacturer's standard pressure rating, set for a pressure compatible with the respective rupture disk rating figure.

2.4 PIPING

2.4.1 Water Piping

Provide galvanized steel water piping conforming to ASTM A53/A53M or provide copper tubing conforming to ASTM B88M ASTM B88. Malleable-iron unions and fittings for installation of steel pipe are to conform to ASME B16.3.

2.4.2 Chlorine Piping

Provide chlorine solution piping smaller than 40 mm (1-1/2 inches) in diameter made of [PVC pipe conforming to ASTM D1785 or CPVC pipe conforming to ASTM F441/F441M] [rubber hose]. Provide piping of 40 mm (1-1/2 inches) in diameter or larger made of [plastic pipe] [rubber hose] [rubber-lined] [plastic-lined steel pipe]. Line steel pipe smaller than 150 mm (6 inches) with plastic lining not less than 3.2 mm (1/8 inch) thick; and for steel pipe larger than 150 mm (6 inches), it cannot be less than 4.8 mm (3/16 inch) thick. Provide plastic fittings for plastic pipe with [flanged] [threaded] joints. Provide joints for rubber hose that use a clamp-type mechanical coupling. Provide lined steel pipe that is [threaded] [flanged integral with the pipe] [forged-steel flanges screwed to the pipe barrel]. Provide fittings for steel pipe which are [flanged conforming to ASME B16.1 or ASME B16.5] [forged-steel threaded conforming to ASME B16.11] and are compatible with lined steel pipe.

2.4.2.1 Piping for Dry Chlorine

**************************************************************************
NOTE: Selection of chlorine-gas piping is dependent on the service for which the system is designed. The designer will consult the Chlorine Manual and CI Pamphlet 6, Piping Systems for Dry Chlorine for applicable piping system.
**************************************************************************

Ensure piping for dry chlorine conforms to CI Pamphlet 1 and CI Pamphlet 6. Ensure steel pipe 19 through 40 mm/4 through 1-1/2 inches in diameter conforms to [ASTM A106/A106M, Schedule 80, Grade A or B] [ASTM A587]. Ensure steel pipe over 40 mm/1-1/2 inches in diameter conforms to ASTM A53/A53M, Schedule [40] [80], Grade [E] [E] [S]. Fittings for steel pipe are to conform to CI Pamphlet 6. [Provide seamless copper tubing conforming to ASTM B88M ASTM B88 in the annealed state with Type K wall thickness or heavier. Provide fittings for copper tubing in accordance with CI Pamphlet 6.] If moisture may be present, provide piping smaller than 40 mm/1-1/2 inches in diameter made of [polyvinylidene fluoride] [polyvinylidene fluoride lined steel pipe]; if piping is larger than 40 mm/1-1/2 inches in diameter, provide polyvinylidene fluoride lined steel pipe. For piping for dry or moist chlorine gas under vacuum provide chlorinated polyvinyl chloride pipe.
2.4.2.2 Piping for Liquid Chlorine

Specify piping for liquid chlorine free of moisture the same as for dry chlorine gas under pressure. Whenever a portion of the liquid chlorine piping can be isolated between two closed valves, protect that portion with a liquid chlorine expansion chamber.

2.4.3 Cylinder Connections

Use cylinder connections made of flexible metal tubing of required size cadmium-plated copper. Install flexible cylinder connector assembly with lead-gasketed, naval-bronze fittings.

2.5 ELECTRICAL WORK

Provide electric motor-driven equipment, and wiring per Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Ratings will be as indicated. Provide motor starters complete with thermal-overload protection and other appurtenances necessary for motor controls specified. Provide manual or automatic control and protective or signal devices required for controls and devices. Prewire all electrical connections at junction terminal boxes and at contactor-starter unit enclosures.

PART 3 EXECUTION

3.1 INSTALLATION

Submit detail drawings containing complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show on the drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

3.1.1 Chlorine-Feeding Equipment

Install the chlorine feeding machines, [the evaporators] and all equipment appurtenances in accordance with CI Pamphlet 1 and CI Pamphlet 6 so as to provide a complete and integrated system in accordance with the instructions of the manufacturer [and under the direct supervision of the manufacturer's representative].

3.1.2 Pipe, Tubing, Hangers, and Supports

Install pipes and tubes in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

3.2 FIELD QUALITY CONTROL

3.2.1 Tests

After installation of the chlorine-feeding machine [and evaporators] is complete, perform an operating test at design system flow rates and pressures to assure that the chlorine-feeding installation operates properly. Test all piping hydrostatically and for leaks. No leaks are allowed in piping. If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests.

Submit test report in booklet form showing all field tests performed to
Adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate in each test report the final position of controls.

3.2.2 Manufacturer Field Service

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified, to supervise the installation, adjustment, and testing of the equipment.

3.3 Field Painting

Paint equipment which did not receive a factory finish as specified in Section 09 90 00 PAINTS AND COATINGS. Follow manufacturers' recommendations for number of coats, primer and paint type and thickness. Thoroughly clean factory painted items requiring touching up in the field of all foreign material and prime and topcoat with the manufacturer's standard factory finish (provided it does not discolor in the presence of hydrogen sulfide fumes, high water vapor atmosphere, alkaline water vapor, and concentrated chlorine (oxidizing) condition)s. Provide coating that is not less than 0.05 mm 1.78 mils thick.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Training

Conduct a field training course for designated operating staff members conducted by the manufacturer's representative and provided for a total period of [8][16][_____] hours of normal working time. Start after the system is functionally complete but prior to final acceptance tests. Cover all of the items contained in the operating and maintenance instructions during field training.

3.4.2 Operating Manuals

Submit complete copies of operating manuals outlining the step-by-step procedures required for system startup, operation and shutdown. Include in the manuals the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features.

3.4.3 Maintenance Manuals

Submit complete copies of maintenance manuals listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include in the instructions gas pipe layout, liquid chlorine pipe layout, dilution liquid pipe layout, equipment layout, and simplified wiring and control diagrams of the system as installed.

3.4.4 Framed Instructions

Post framed instructions, containing wiring and control diagrams, where directed. Post operating instructions as discussed in the Operating and Maintenance Manual. Post the framed instructions before acceptance testing of the systems.

-- End of Section Table of Contents --
This guide specification covers the requirements for circular clarifiers for use in Water Resource Recovery Facilities (WRRFs). This guide specification may be used to prepare specifications for either primary or secondary clarifiers for the treatment of domestic wastewater only. Special consideration must be given to wastewater containing industrial wastes.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Show the following on the project drawings or provide:

1. Type of clarifier: primary or secondary
2. Dimensions of clarifier tank
3. Whether clarifier is a center feed with peripheral overflow type or a peripheral feed with center overflow type
4. Whether influent enters through side of tank or through center column when clarifier is center feed with peripheral overflow type

5. Whether rapid sludge removal system is to be used and the number and size of the sludge uptake pipes

6. Size of influent well when clarifier is a center feed with peripheral overflow type

7. Size and section of effluent trough when clarifier is a peripheral feed with center overflow type

8. Size and section of weirs and baffles; and anchorage details

9. Sizes of piping, points of connection to plant piping, and types of joints for wall castings and sleeves

This guide specification may be used to prepare specifications for either primary or secondary clarifiers.

1.2 SUBMITTALS

**************************************************************************
**NOTE:** Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Circular Clarifier System; G[, [_____]]
1.3  ADMINISTRATIVE REQUIREMENTS

1.3.1  Pre-Installation Meetings

**************************************************************************
NOTE: Conduct a regulatory review to determine impact of new and existing permit conditions and regulations; coordinate with Environmental Services Group to determine permitting responsibility.
Design separator in accordance with UFC 3-240-01.
Ensure compliance with NPDES permits.
**************************************************************************
Coordinate with the Government for environmental concerns and permits.
Ensure compliance with permits and requirements.

1.4  DELIVERY, STORAGE, AND HANDLING

Ensure that the equipment and parts are packaged for shipment to prevent breakage and damage to components. Deliver materials to the site, inspect for damage, unload and store with minimum handling. Store materials off the ground and under a weathertight covering.

1.5  WARRANTY

PART 2   PRODUCTS

2.1   SYSTEM DESCRIPTION

2.1.1   Circular Clarifier

**************************************************************************
NOTE: Construct the concrete section of the project specification in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

When a center feed with peripheral overflow clarifier is not specified for the project, delete references to this type and the requirements for associated components, including scum removal assembly (for this type), center column used as influent pipe, influent well, and (peripheral) weirs and scum baffles.

When a peripheral feed with center overflow clarifier is not specified for the project, delete references to this type and the requirements for associated components, including scum removal assembly (for this type), influent skirt, and effluent trough and weir assembly.

**************************************************************************

Clarifier equipment includes a clarifier mechanism [with effluent trough and weir assembly], [weirs and baffles,] [influent skirt,] and piping. Use structural steel conforming to ASTM A36/A36M. For completely or intermittently submerged steel members use a minimum thickness of 6 mm 1/4 inch. Use cast iron conforming to ASTM A48/A48M, Class 30 minimum.

2.1.1.1   Shop Drawings

Show the complete assembly of the circular clarifier system with all components, mechanisms, and parts; each with an assigned number corresponding to the equipment manufacturer's parts list. Show details for each component of the clarifier mechanism including installation of piping, anchorage, wiring, tank, and tank floor surfacing.

2.1.2   Clarifier Mechanism   Design Requirements

**************************************************************************
NOTE: Design clarifier in accordance with UFC 3-240-01.

Delete requirements for and references to rapid sludge removal system when this system is not included in the project.

When a center feed with peripheral overflow clarifier is larger than 11 m 35 feet in diameter or peripheral feed with center overflow clarifier is larger than 18 m 60 feet in diameter, delete requirements for and references to bridge-supported clarifier mechanisms and associated components, including support bridge, center shaft, and scraper arms of structural shapes.

SECTION 46 43 21   Page 9
Other items associated with the circular clarifier, but not covered in this section, include (when used) valves, sluice gates, and perimeter handrail. These items should be covered in the appropriate sections of the project specification.

The clarifier mechanism includes a sludge collector assembly [with rapid sludge removal system]; drive assembly; [supporting bridge or] center column and access bridge; operating platform and access walkway; influent [well] [skirt and effluent trough and weir assembly]; scum removal assembly; overload protection and alarm; and electrical control equipment.

The drive assembly rotates the sludge collector assembly, that [moves settled sludge to a centrally located sludge hopper] [concentrates settled sludge ahead of pipes for rapid sludge removal system]. At maximum hydraulic capacity, or no chains, sprockets, bearings (except sleeve bearing when used) or operating mechanism is below the liquid surface or in contact with the liquid. Assemble the mechanism in the shop to ensure proper fitting of parts, match-mark for erection, and disassemble for shipment.

2.1.2.1 Design

NOTE: Insert torque value(s) as follows:

<table>
<thead>
<tr>
<th>Support Mechanism</th>
<th>Diameter (meters feet)</th>
<th>Torque (Joulesfoot-pounds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bridge-supported</td>
<td>6-8.5 m20-28 feet</td>
<td>2,710 joules2,000 foot-pounds</td>
</tr>
<tr>
<td>Bridge-supported</td>
<td>9-12 m30-40 feet</td>
<td>5,420 joules4,000 foot-pounds</td>
</tr>
<tr>
<td>Bridge-supported (for peripheral feed with center overflow type only)</td>
<td>13-18 m42-60 feet</td>
<td>8,130 joules6,000 foot-pounds</td>
</tr>
<tr>
<td>Center-column-supported</td>
<td>Less than 16.8 mm 55 feet</td>
<td>27,100 joules20,000 foot-pounds</td>
</tr>
<tr>
<td>Center-column-supported</td>
<td>16.8 to 23 m55 to 75 feet</td>
<td>40,650 joules30,000 foot-pounds</td>
</tr>
</tbody>
</table>

This guide specification is written for one
clarifier. If the project includes more than one circular clarifier, all necessary pluralizations should be made or use the word "each."

Insert peripheral speed value(s) as follows:

<table>
<thead>
<tr>
<th>Peripheral Speed</th>
<th>Primary Clarifier</th>
<th>Secondary Clarifier</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.04 to 0.06 meter per second</td>
<td>0.035 to 0.05 meter per second</td>
</tr>
<tr>
<td></td>
<td>8 to 12 fpm</td>
<td>7 to 10 fpm</td>
</tr>
</tbody>
</table>

Use recommended values from UFC 3-301-01, Structural Engineering, for wind load and ice load.

Provide a clarifier mechanism manufactured for continuous 24-hour service under design load without excessive wear, damage, or failure. Ensure that the operating stresses do not exceed those allowed in AISC 360. Ensure a minimum continuous output torque rating of [_____] joules foot-pounds [for center-column-supported units and [_____] joules foot-pounds for bridge-supported units] with the scraper arms rotating at a constant speed producing a peripheral speed of [_____] meter per second fpm.

Ensure a safety factor of 2.5, to withstand all structural and mechanical stresses brought about by the following loadings: continuous output rated torque load; dead load; wind load of [_____]; ice load of [_____] (except on scum skimmer); and a live load of 2.5 kPa 50 psf on the access bridge [or on access section of supporting bridge]. Under maximum load, deflection of access bridge must not exceed 1/240 of span; deflection of supporting bridge must not exceed 1/360 span.

2.2 EQUIPMENT

2.2.1 Sludge Collector Assembly

NOTE: Delete requirements for center shaft and rapid sludge removal system when not included in this project.

Provide a sludge collector assembly including scraper arms, scraper blades, [and] center drive cage or drum [or center shaft] [and rapid sludge removal system].

2.2.1.1 Scraper Arms, Blades & Squeegees

NOTE: Use first bracketed wording in the second sentence when rapid sludge removal system is not included in the project; use second bracketed wording in this sentence when rapid sludge removal system is included.

Use structural steel, using welded truss construction of triangular or box section [; or structural steel shapes or closed end pile supported either
by steel guy-rods or steel tie-rods or both]. Weld or bolt steel scraper blades, with attached squeegees, to scraper arms and [move settled sludge to a centrally located sludge hopper] [concentrate settled sludge ahead of pipes for rapid sludge removal system]. Connect scraper arms to [center shaft or] center drive cage or drum by bolted or welded connections. Use scraper blades of steel plate with a minimum thickness of 6 mm 1/4 inch. Make squeegees bronze [, fiberglass,] or stainless steel with a minimum thickness of 3 mm 1/8 inch [for metal, 6 mm 1/4 inch for fiberglass], and connect to scraper blades with bronze or stainless steel bolts and nuts with a minimum of 50 mm 2 inches. of vertical adjustment.

2.2.1.2 Center Drive Cage or Drum

Fabricate of structural steel, using a box truss or cylindrical drum construction. Connect center drive cage or drum to drive assembly with machine screws or a bolted connection.

2.2.1.3 Center Shaft

Construct from a solid steel shaft or steel pipe conforming to ASTM A53/A53M, Schedule 40.

2.2.1.4 Rapid Sludge Removal System & Piping

Rapid sludge removal system includes [_____] mm inch diameter sludge uptake pipes of PVC 1120 or PVC 1220 conforming to ASTM D1784, ASTM D3034, SDR 35 or ASTM D2241, SDR 26, attached to the scraper arms and arranged so that the flow from each can be observed, adjusted, and sampled in the sludge well. Uptake pipe system includes all necessary intermediate clamps and supports and terminates in a suitable fitting or flexible coupling in sludge well. Provide the discharge end of each uptake pipe with an adjustable slip tube or orifice control gate to permit flow adjustment. Sludge well must be of structural steel plate having a minimum thickness of 6 mm 1/4 inch.

2.2.2 Drive Assembly

***************************************************************
NOTE: Delete reference to chain drives when clarifier tank is more than 12 m 40 feet in diameter. Check with manufacturer.
***************************************************************

Include motor, speed reduction and turntable gearing, turntable bearing assembly, drive assembly bearings, and belt drives[ or chain drives, or both]. Drive assembly must permit sustained operation at the continuous output torque rating without excessive wear and develop twice the continuous output torque rating without damage to or failure of drive assembly components.

2.2.2.1 Motor

Provide a motor adequate to drive the sludge collector assembly continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Provide the starting torque needed to move sludge collector assembly from a dead stop in a dewatered clarifier tank as well as torque needed to move it from a dead stop under the maximum loading specified without overloading.
Motor must be suitable for operation with the voltage characteristics as indicated. Protect motor against overload, low voltage, and unbalanced voltage. Use a constant speed motor, totally-enclosed, fan-cooled, suitable for outdoor service, and conforming to NEMA MG 1. Flexible coupling for connecting shafts of close-coupled motor and speed reducer must conform to the applicable requirements of AGMA 9002, and ANSI/AGMA 9000. Motor position must be adjustable to increase or decrease belt [or chain] tension.

2.2.2.2 Speed Reduction and Turntable Gearing

NOTE: Delete references relating to pinion-and spur-gear reduction unit and intermediate speed reducer when clarifier tank is less than 11 m 35 feet in diameter.

Delete reference to worm-gear reduction unit when clarifier tank is more than 11 m 35 feet in diameter.

Speed reduction and turntable gearing for the primary [and intermediate ]speed reducer[s] must be a worm or helical or a combination thereof. Gearing for the turntable must be [a worm gear reduction unit] [a pinion-and-spur-gear reduction unit]. Ensure an AGMA service factor as recommended in the applicable AGMA Standards ANSI/AGMA 6113 ANSI/AGMA 6013, ANSI/AGMA 6034 or when drive is operating at full load motor wattage horsepower, 24 hours a day continuous running. Gearing will withstand any loadings produced by thrust, out-of-balance, and vibration resulting from operating conditions and operate from zero rpm to a speed consistent with the maximum peripheral speed. Component parts of the speed reduction and turntable gearing will operate at sustained operation at the continuous output torque rating for the life expectancy specified without excessive wear and develop twice the continuous output torque without damage to or failure of any component part.

2.2.2.2.1 Gear Lubrication

Provide an oil or grease lubrication system for speed reduction gearing, including means to stop drive motor in event of insufficient lubrication.

2.2.2.3 Gearmotor

Gearmotor, where practicable, may be used in lieu of separate motor and primary speed reducer. Motor component of gearmotor must be as specified in paragraph MOTOR. Speed reducing component of gearmotor must conform to the applicable requirements specified in paragraph SPEED REDUCTION AND TURNTABLE GEARING, and in ANSI/AGMA 6113 ANSI/AGMA 6013 and ANSI/AGMA 6034.
2.2.2.4 Turntable Bearing Assembly

Turntable bearing assembly includes the turntable bearings upon which the turntable and attached sludge collector assembly are supported; the turntable; and the drive assembly/turntable support base. Assembly must withstand all radial and axial loads imposed by drive assembly and sludge collector assembly. Arrange component parts for replacement of balls or rollers, or the bearing raceways, or the complete bearing unit. Bearing raceway material must have adequate strength to withstand all radial and axial loads and must have a Rockwell "C" hardness of not less than 58.

Turntable bearing assembly [for a center-column-supported clarifier mechanism] must support, where applicable, a drive assembly, turntable, spur gear, and one end of the access bridge. [A bridge-supported clarifier mechanism may incorporate a submerged split-case, water-lubricated bottom guide bearing or an intermediate steady bearing where manufacturer's design requires use of such bearing in addition to turntable bearings.] A bottom support bearing is not acceptable. Bearing must run in an oil bath or be grease-lubricated. Turntable and drive assembly/turntable base must be of cast iron, nodular cast iron, or steel; if of steel, these parts must have sufficient thickness to provide the rigidity necessary to maintain alignment of sludge collector assembly. Turntable must be cast integrally with spur gear or be fastened to the spur gear with machine screws or bolts.

2.2.2.5 Drive Assembly Bearings

Load rating and fatigue life for bearings must be based on ABMA 9 and ABMA 11, as applicable. Bearings must be either oil lubricated or grease lubricated.

2.2.2.6 Chain Drives and Belt Drives

Belt drives[ and chain drives] incorporated in drive assembly include V-belt-and-pulley[ and chain-and-sprocket] arrangements, except that belt drives must not be used directly on the[ center shaft or on the] center drive cage or drum. Belt drives[ and chain drives] must have a minimum safety factor of 4 as applied to ultimate breaking or transmission strength of the belt[ or chain] with respect to loads transmitted at twice the continuous output torque rating of the clarifier mechanism.

Key mount the pulleys[, sprockets,] and other motive power transmitting connections. Connect the [drive pulley] [drive sprocket] on the output shaft of the primary speed reducer by a shear-pin hub arrangement to protect the motor against overload[; sprocket must have a bronze bushing with grease lubrication]. Shear-pin hub arrangement must be such that it will not bind or freeze into position. Fabricate guards of steel and make weatherproof.

2.2.3 Scum Removal

**************************************************************************
NOTE: Select the applicable paragraphs(s) from the following:
**************************************************************************

[ Provide a skimmer assembly and [heated] scum trough. Skimmer assembly will continuously move surface scum to tank periphery and automatically flush the scum into the scum trough with a minimum discharge of water. ]
2.2.3.1 Skimmer Assembly

**************************************************************************
NOTE: Delete references to and requirements for aluminum wherever a corrosion problem with aluminum may be anticipated.
**************************************************************************

**************************************************************************
When center feed with peripheral overflow type clarifier is larger than 11 m 35 feet in diameter or peripheral feed/center overflow type clarifier is larger than 18 m 60 feet in diameter, delete requirements for and references to bridge-supported clarifier mechanisms and those components peculiar thereto, including support bridge, center shaft, and scraper arms of structural shapes.
**************************************************************************

Skimmer assembly includes a [fixed] [hinged or pivoting] skimming blade, a hinged or pivoting plow blade with wiper blades, and support legs. Skimming blade must be of structural steel and extend from influent well to scum trough. Plow blade is [structural steel] [aluminum], and is the width of the scum trough. Securely clamp in position grease- and oil-resistant wiper blades. Ensure the plow blade and its hinged or pivoted connections have proper alignment and is in continuous contact between wiper blades, scum trough approach ramp, and scum baffle. Plow blade must have provision for field adjustment in the vertical plane. Provide means to carry plow blade smoothly over the scum trough. Use corrosion-resistant materials for moving parts within the skimming assembly. Support blades, provide bracing where necessary to maintain the rigidity of the assembly. Use structural steel for support legs.

2.2.3.2 Scum Trough

Provide a welded structural steel scum trough, minimum thickness 6 mm 1/4 inch with a flanged connection for the scum discharge pipe, supported from the tank wall. The inclined approach ramp leading to discharge section of scum trough must be shaped to contain the scum as it is moved up the incline to the trough by the plow blade.

]2.2.3.3 Scum Removal Assembly

**************************************************************************
NOTE: Select the applicable paragraphs(s) from the following:
**************************************************************************

When a peripheral feed with center overflow type clarifier is not specified for the project, delete references to the scum removal assembly (for this type).

In cold climates where ice build-up is a problem, require heated scum trough and hinged or pivoting skimming blades in lieu of fixed blades.

**************************************************************************
Scum Trough: Use an adjustable dipping weir type scum trough and include collector pipe and operator.

(1) Provide a steel collector pipe conforming to ASTM A53/A53M Schedule 20 minimum. Pipe must have a 1.05 rad 60 degree wide slot cut symmetrically about the vertical axis, with the horizontal edges of the slot parallel to the longitudinal axis of the pipe. At maximum intervals of 750 mm 30 inches, a 50 mm 2 inch wide band of full circumference must be left for stiffness. The pipe must be plugged on the inboard end and open on the effluent end. End supports include a rolled steel collar welded to an adjustable steel end plate. Provide a grease and oil-resistant, watertight seal, so constructed that it allows smooth motion of the rotating pipe; seal must be readily renewable without removing pipe. Secure end supports to concrete tanks walls by stainless steel anchor bolts of 16 mm 5/8 inch minimum diameter.

(2) Operator: Mount a manual operating lever on the collector pipe. Lever must be steel pipe having a minimum diameter of 31 mm 1 1/4 inches and secured to collector pipe with a chain or bolted connection. Lever must extend at least 0.91 m 3 feet above the top of the tank wall and permit rotation of collector pipe at least 0.52 rad 30 degrees each side of the vertical axis.

2.2.4 Center Column

*******************************************************************************
NOTE: When a center feed with peripheral overflow type clarifier is not specified for the project, delete references to this type and the requirements for those components peculiar thereto, including center column used as influent pipe.
*******************************************************************************

Use a cylindrical, structural steel, column to support the entire clarifier mechanism, including the inboard end of access bridge. The center column also serves as the influent pipe with large openings at its upper end to direct influent flow into the influent well at a low velocity. Provide an accurate fit between the top of the center column and the drive assembly. Attach the center column to the drive assembly with bolts or machine screws. Provide anchorage for the center column to the tank according to the manufacturer's instructions.

2.2.5 Effluent Trough and Weir Assembly

Assembly must include effluent trough, effluent weirs, and supporting members. For effluent trough use welded structural steel. Attach weir plates to each side of the effluent trough. Weir plates must be structural steel[ or fiberglass]. Bolt weir plates to effluent trough and permit horizontal and vertical adjustment of weir. Ensure proper alignment. Supporting members must be of sufficient cross section to prevent vertical movement due to the flotation forces developed with trough empty and liquid level in tank at base of weir. Supporting assembly must be capable of vertical adjustment to permit leveling of trough.

2.3 MANUFACTURED UNITS

2.3.1 Access Bridge, Walkway, and Operating Platform

Provide an access bridge extends from tank sidewall to the center and
beyond that is sufficient to support walkway and operating platform. Where the bridge supported unit is used, the supporting bridge must be used as the access bridge. Ensure walkway and operating platform are skidproof. Walkway and operating platform must comply with 29 CFR 1910. Ensure maximum deflection of L/360 when both dead and live loads are applied.

[2.3.2 Supporting Bridge]
Include two structural steel beams and braces of sufficient depth and thickness to support entire clarifier mechanism within the specified maximum allowable deflection.

[2.3.3 Influent Well]
Provide an influent well to diffuse the liquid into the tank. The well must project below and 100 mm 4 inches above the water level at maximum hydraulic capacity and radially diffuse and dampen the influent without inhibiting the clarifier process. Provide a flanged connection for the influent pipe.

[2.3.4 Influent Skirt]

**************************************************************************
NOTE: Delete references to and requirements for aluminum wherever a corrosion problem with aluminum may be anticipated.
**************************************************************************

The tangential inlet must be shaped to direct influent liquid through the influent raceway. Influent skirt is [steel sheet] [aluminum sheet, minimum thickness] 1.8 mm 14 gage, with bars or structural shapes at top and bottom for rigidity. [Aluminum must conform to ASTM B209M ASTM B209 or ASTM B221M ASTM B221, Alloy 6061, Temper T6. ]Supporting assembly must be capable of horizontal and vertical adjustment for final location and leveling of influent skirt.

2.4 COMPONENTS

2.4.1 Electrical Control System
Provide an enclosure; main and branch circuit breakers; starter, contactors, and reset buttons; pushbuttons; lockout/tagout disconnects and appurtenances and all necessary wiring. Electrical control system must be in accordance with NEMA ICS 1 and NEMA ICS 2. Design, fabrication, and installation of electrical components must be in accordance with requirements of NFPA 70. Mount electrical controls in a weatherproof enclosure.

2.4.1.1 Circuit Breakers
Circuit breakers must be thermal magnetic type and meet the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Main circuit breaker must have a maximum capacity of 150 percent of the electrical load. The main circuit breakers must be an external handle mechanism, with positive locking device, mounted outside the enclosure to permit operation of breaker from outside the enclosure. Provide branch circuit for each drive motor, control circuit, [trough heating device,] and receptacle. Ensure that the panels include spaces for two additional circuit breakers.
2.4.1.2 Motor Starter [, Contactors,] and Pushbutton Station

Provide a pushbutton actuated magnetic motor starter with overload and undervoltage protection for the motor. Starter must have thermal overload protection in each phase and short circuit protection. Ensure overload protective devices give adequate protection to motor windings, are of thermal inverse-time-limit type, and include a manual-reset type pushbutton. Use 2-button Start-Stop pushbutton station.[ Provide contactors for trough heating devices.]

2.4.1.3 Overload Protection and Alarm Device

Provide clarifier mechanism with an overload protection and alarm device to indicate load on the mechanism at all times, to sound an alarm in case of impending excessive load, and to stop the mechanism when such load is reached. Device must be of the torque-actuated or indicating-ammeter type, mounted except for alarm, in an enclosure. Include an industrial-type horn or 150 mm 6 inch bell, relay, reset button, test circuit, and an independent On-Off switch. The horn or bell must be constructed of noncorrodible material and be suitable for remote mounting.[ Provide auxiliary contacts in alarm circuit for transmission of signal to existing alarm system.]

2.4.1.4 Wiring

Wire control circuits with 1.8 mm No. 14 gage stranded, 1 mm 2/64 inch insulation machine-tool wire with ring tongue compression type lugs and number tags on both ends of wires. All power circuit wiring must be minimum 2.5 mm No. 12 gage, include all terminations as necessary and be labeled with number tags. Secure wires with either plastic ties or wiring duct, or both. Wires going to components mounted on the enclosure door must be secured in a cable-like bundle and strapped to the door and the enclosure with sufficient slack to allow easy operation of the door. Terminate circuits requiring field connection on panel terminals.

2.4.2 Lubrication

Provide bearings and other moving parts subject to wear with lubrication.

2.4.3 Key Mounted Connections

Where connections between shafts and sprockets, gears, pulleys, and other component parts are specified to be key mounted, keys and keyways must conform to ASME B17.1 or ASME B17.2.

2.4.4 Weir Plates and Scum Baffles

Use [steel] [aluminum conforming to ASTM B209M ASTM B209 or ASTM B221M ASTM B221, Alloy 6061, Temper T6] [ fiberglass]. Ensure weir plates and baffles or their supports permit horizontal and vertical adjustment of the weir and baffle. Seal according to manufacturer's recommendations.

2.5 MATERIALS

2.5.1 Clarifier Piping Connections

The influent connection to the clarifier will be as shown on the drawings and consist of one [___] mm inch diameter flanged pipe connection. The
effluent connection will be as shown on the drawings and consist of one [_____] mm inch diameter flanged pipe connection.

2.5.1.1 Pipe and Fittings

Use manufacturer's standard pipe and fittings.

2.5.2 Anchor and Connecting Bolts, Nuts, and Washers

Use manufacturer's standard anchor and connecting bolts, nuts, and washers. Show bolt sizes and locations on the approved shop drawings for the equipment[, except as otherwise indicated].

2.5.3 Grout Materials

Use grout conforming to ASTM C1107/C1107M.

2.5.4 Materials Protection

Except as otherwise specified, treat and paint equipment in accordance with the manufacturer's standard practice.

2.6 ACCESSORIES

2.6.1 Spare Parts

Provide manufacturer recommended spare parts that are identical and interchangeable with original parts. Protect spare parts from corrosion and furnish in clearly marked containers. Spare parts must meet standards recommended by the manufacturer in the manufacturer operation, maintenance, or instruction manual.

2.6.2 Tools

Provide special tools necessary for the proper maintenance and operation of the equipment together with a properly identified hardwood or metal box for their storage.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 General

Install clarifier equipment in accordance with the manufacturer's instructions. Correctly align equipment components.[ After final positioning of center column, provide full bearing under base plate using non-shrink grout.]

3.2 PREPARATION

3.2.1 Surfacing of Clarifier Tank Floor

Perform surfacing operation in accordance with the approved recommendations of the manufacturer of the clarifier equipment, except as otherwise specified.

Immediately before the surfacing operation is begun, clean the floor of all dirt, soil, and other substances which would prevent the proper bonding of
the surfacing to the concrete subfloor. Bring the grout surfacing to finish grade, as near as possible, by hand. If the manufacturer's recommended procedure calls for use of straightedges attached to scraper arms, fasten a 50 by 150 mm 2 by 6 inches metal clad wooden straightedge to each scraper arm approximately 6 mm 1/4 inch below the scraper blade to form a suitable screed; rotate scraper arms manually to complete the surfacing operation; do not use drive unit to move the arms. Prevent grout from entering sludge cone; immediately remove any grout that falls in the sludge cone or on clarifier tank walls. Immediately after surfacing operation is complete, clean clarifier tank floor and circular clarifier equipment of deposits of excess grout.

3.3 INSTALLATION

Install clarifier in accordance with the manufacturer's installation instructions.

3.3.1 Piping

******************************************************************************

NOTE: Delete piping applications not covered in this section. In general, piping external to the clarifier tank that is part of the water resource recovery facility interconnecting piping system should be covered in a separate piping section in the project specification.

******************************************************************************

Install piping in accordance with manufacturer's instructions. Make flanged joints up tight, avoid undue strain on flanges. Align bolt holes for each flanged joint. Use full size bolts for the bolt holes; use of undersized bolts to make up for misalignment of bolt holes or for any other purpose is not be permitted. Install flanged pipe so that adjoining flange faces are not out of parallel to such degree that the flanged joint cannot be made watertight without overstraining the flange. Provide hangers and supports where necessary to support piping.[ For buried piping, use push-on joints or mechanical joints, and make in accordance with AWWA C600; for mechanical joints, also follow recommendations of Appendix A to AWWA C111/A21.11].

3.3.2 Weirs

Mount weir plates in accordance with manufacturer's instructions. Use sufficient sealant to fill all voids between tank and weir plates.

3.4 FIELD QUALITY CONTROL

3.4.1 General

Perform all field tests and provide all labor, equipment, and incidentals required for tests. The Contracting Officer will witness field tests and conduct all field inspections. Provide the Contracting Officer ample notice of dates and times scheduled for tests.

3.4.2 Tests

Test circular clarifier mechanism as in operation to demonstrate correct alignment, smooth operation, proper adjustment of flow distribution, freedom from vibration, and freedom from noise and overheating of moving machinery. Include in test at least two full cycles of successful
operational sequences to demonstrate that the system continues to function satisfactorily after meeting all operational requirements.

3.4.3 Repair Painting

Inspect painted surfaces for holidays, scratches, chipping, and other damage. Refinish imperfections by cleaning burrs and rough surfaces and sanding to a smooth finish, prime and repaint.

3.4.4 Manufacturer Field Service

Provide the services of the clarifier equipment manufacturer's representative or technician, experienced in installation and operation of the type of systems being provided, to supervise the erection, start-up, acceptance tests, and final inspection.

3.5 CLOSEOUT ACTIVITIES

3.5.1 System Operation

Provide Circular Clarifier, Data Package 3, including operation and maintenance manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA, providing basic data relating to the design, operation and maintenance of the circular clarifier.

### 1.2 SUBMITTALS

*Note: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.*

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for

Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Equipment Installation

Drawings as specified.

SD-03 Product Data

Materials and Equipment

SD-06 Test Reports

Field Testing

SD-10 Operation and Maintenance Data

Operating and Maintenance Manuals; G[, [_____]]

1.3 QUALITY CONTROL

1.3.1 Qualifications

Welding procedures and welders are required to be qualified in accordance with the code under which the welding is specified to be accomplished.

1.4 MATERIALS SUBMITTALS

Submit a complete list of equipment and materials, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, proposed diagrams, installation instructions and other sheets. Spare parts data for each different item of material and equipment specified, after approval of the related submittals, and not later than [_____] months prior to the date of beneficial occupancy. Include a complete list of parts and supplies, with current unit prices and source of supply.
1.4.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and which essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment in required to be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

1.4.2 Nameplates

Include on each major item of equipment the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

1.4.3 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment.

1.4.4 Factory Painting

Unless otherwise specified, clean, prime, and give two coats of machinery enamel to all equipment at the factory. Fiberglass, stainless steel, and galvanized components need not be painted.

1.5 DELIVERY, STORAGE, AND HANDLING

Ensure all equipment delivered and placed in storage is stored with protection from the weather, excessive humidity and excessive temperature variation; and dirt, dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

An air and gas diffusion system consists of Air Supply Equipment, the Air Distribution System, the Air Diffusers, and other Miscellaneous Equipment, as specified herein.

2.2 EQUIPMENT

2.2.1 Air-Supply Equipment

The air-supply consists of [multi-stage] [_____] [centrifugal] [and] [or] [positive displacement] air blowers and drive units with filters, controls, and appurtenances as indicated or specified.

2.2.1.1 Centrifugal Blowers

**************************************************************************
NOTE: Blowers should be identified on the drawings by type and operating characteristics.
**************************************************************************

2.2.1.1.1 Performance and Design Requirements

Provide blowers that are [multistage] [single stage] centrifugal, oil-free types designed for continuous duty with [closed backward-bladed] [open
radial-bladed] impellers. Provide with performance and design requirements as shown.

2.2.1.1.2 Casing

Provide centrifugal blowers of modular design with the casing either vertically or horizontally split and with the required number of compression stages to comply with the specified operating requirements. Machine all horizontally split casings at the split to be tight without a gasket. Vertically split casings are to include rigid cast iron sections held securely between cast iron inlet and outlet heads by steel tie rods. Provide tapped and plugged drains at the lowest points of the casing. Ensure inlet and discharge connections comply with ASME B16.1 [Class 125] [125 pound] [_____] drilled and tapped flanges and are an integral part of the head. Provide casing with lifting eyes capable of supporting blower.

2.2.1.1.3 Impellers

**************************************************************************
NOTE: Other impeller materials, such as steel, are available. Consult with various manufacturers for recommendations.
**************************************************************************

Provide impellers cast of high grade [aluminum alloy] [steel], mounted and keyed to the shaft and secured by a locknut. Install impeller hubs to be butted against each other either directly or through one piece metal spacers. Provide ample clearance between the impeller and casing. Test each impeller by operating at a speed to [20] [_____] percent above operating speed and check for cracks using the dye penetrant method or similar method of equal accuracy. Ensure the impeller and shaft assembly are statically and dynamically balanced as a unit. Removing of metal from the impeller by boring is not an acceptable means of balancing the impeller and shaft unit. Vibration is not allowed to exceed 0.025 mm 1.0 mil at the bearing housing with the blower operating. First critical speed is required to be at least 150 percent of maximum operating speed.

2.2.1.1.4 Diffusers

Provide diffuser vanes, cast into each section of the blower casing, to receive air from the impeller and direct the air to the next impeller for multi-stage type blowers.

2.2.1.1.5 Shaft

Provide a shaft of ground and polished high grade [high alloy steel] [carbon steel][stainless steel] of sufficient diameter to operate below first critical speed.

2.2.1.1.6 Shaft Seals

Provide solid carbon ring shaft seals where the shaft passes through the inlet and discharge heads. Design seals to permit seal inspection or replacement without disconnecting suction or discharge piping.

2.2.1.1.7 Internal Seals

Provide labyrinth type seals between stages.
2.2.1.1.8 Bearings

**************************************************************************
NOTE: Delete inapplicable lubrication method.
Verify bearing L-10 life requirements.
**************************************************************************

Provide each blower with two [pressure oil lubricated sleeve type journal] [splash oil lubricated anti-friction type] bearings. Design bearings for both radial and thrust loads and size for an L-10 life of 5 years continuous operation as defined by ABMA 9 or ABMA 11. Design bearings to allow replacement without disassembling the blower casing or disconnecting piping.

2.2.1.1.9 Pressure Oil Lubrication System

Provide a console mounted pressure lubrication system to oil the sleeve bearings. The lubrication system consists of a main oil pump mounted on and driven by the blower shaft, an auxiliary electric motor driven oil pump, an oil cooler, an oil filter, a 3-minute retention time oil reservoir, and all required switches, temperature sensors, and gauges. Ensure the electric motor driving the auxiliary oil pump has Class F insulation, Type NEMA Design B, in accordance with NEMA MG 1, and is totally enclosed fan cooled; equipped with 120 volts space heaters; and controlled in accordance with NEMA ICS 1. Completely pipe the lubrication system and wire with only interconnecting piping between the console and the pump required in the field.

2.2.1.1.10 Splash Oil Lubrication System

Provide a simple splash lubrication system with each bearing having its own oil reservoir integral with the bearing housing. Maintain proper oil level by a constant level oiler located on each bearing housing. Provide a slinger on the shaft to splash oil into the bearing when the compressor is running. Provide a sight level gauge in the bearing housing. Provide a labyrinth seal combined with an atmospheric vent to prevent oil contamination of the air stream.

2.2.1.1.11 Inlet Guide Vanes

Provide inlet guide vanes for each single stage centrifugal blower.

2.2.1.1.12 Centrifugal Blower Speed Increasing Gears

Provide high speed, single stage centrifugal gears made of hardened, helical, alloy steel, manufactured in accordance with AGMA 6011 with a minimum 1.5 service factor applied to full horsepower rating of blower.

2.2.1.2 Positive Displacement Blowers

**************************************************************************
NOTE: Blowers should be identified on the drawings by type and operating characteristics.
**************************************************************************

2.2.1.2.1 Performance and Design Requirements

Provide positive displacement rotary blowers, oil-free types, designed for continuous duty. Performance and design requirements are to be as shown.
2.2.1.2.2 Casing

Provide a one piece blower casing with separate head plates constructed of close-grained cast iron, suitably ribbed to prevent distortion under the specified operating conditions. Fabricate casing with lifting eyes for installation and maintenance purposes.

2.2.1.2.3 Impeller and Shaft

Provide impeller and shaft constructed of a common ductile iron casting. Provide impellers of the straight, two-lobe involute type that operate without rubbing, liquid seals, or lubrication. Ensure the peak vibration velocity of blower is less than 7.62 mm/second 0.30 inch/second.

2.2.1.2.4 Timing Gears

Positively time impellers by a pair of machined, heat-treated, spur tooth timing gears. Mount timing gears on the impeller shafts on a tapered fit and secured by a locknut.

2.2.1.2.5 Bearings

******************************************************************************
NOTE: Verify bearing L-10 life requirements.
******************************************************************************

Support impeller shaft by antifriction [spherical ball] [roller] bearings sized for a minimum L-10 life of [30,000] [50,000] hours as defined by ABMA 9 or ABMA 11.

2.2.1.2.6 Seals

Provide a lip type oil seal at each bearing to prevent lubricant from leaking into the air stream. Provide labyrinth seals at the point where the shaft passes through the head. Provide ventilation of the impeller side of the oil seals to atmosphere to eliminate any carry-over of lubricant into the air stream.

2.2.1.2.7 Lubrication

******************************************************************************
NOTE: Delete inapplicable lubrication system. Use bracketed sentences if "pressure oil lubricated" is to be used in the lubrication system.
******************************************************************************

Provide drive and bearings of the [grease lubricated type and also provide with a grease fitting] [splash oil lubricated type]. Provide timing gears and gear end bearings of the [pressure oil lubricated type] [splash oil lubricated type]. Regulate oil level by a metering orifice.

[If using a full pressure lubrication system built into positive displacement blower, direct connect to oil pump and include oil strainer, oil reservoir, piping to bearings, and oil spray for gears with piping to air-to-oil cooler. Design oil vents so that oil vapors do not enter motor. Design system to prevent leakage and dirt contaminants.]
2.2.1.3 Drive Connection

[Connect the blower to the motor by a heavy-duty flexible forged steel spacer coupling, keyed or locked to the shaft.] [Connect the blower to the motor by a V-belt drive capable of transmitting the motor power to the blower. Provide additional sheaves so that the blower's output can be varied in [0.189] \([_____]\) cubic meter/second \([40] \[_____]\) cfm increments between minimum and maximum flow conditions.] Cover the drive with an acoustically treated sheet metal guard.

2.2.1.4 Motors

Size motors to be within their rated load under the specified operating conditions. Ensure all motors conform to NEMA MG 1 and are the squirrel cage induction Type NEMA Design B, Class B or F insulated, with a service factor of not less than 1.15. Motors are required to be horizontal foot-mounted, totally enclosed fan-cooled, cast iron or aluminum construction and a quiet series type with a noise level not exceeding 80 dB (A Scale). The motor frame is required to be the standard NEMA assigned frame size supplied for constant speed use on full voltage, fixed frequency line power. Provide resistance temperature detectors (RTD's) embedded in two phases of the stator windings. Provide motor bearings with a minimum L-10 life of 50,000 hours.

2.2.1.5 Power Factor Capacitors

Equip all motors over 3.7 kW 5 hp with power factor correcting capacitors. Furnish capacitors complete with internal fusing and bleed-off resistors. Provide for a corrected power factor of not less than 95 percent at full load. Install capacitors in enclosures coordinated with the individual motor construction with leads terminated in the motor terminal box and identified as capacitor leads. Provide overcurrent device settings within the motor controls that are properly reduced for the motor and capacitor combination.

2.2.1.6 Blower - Motor Base

Provide a full length common base of steel box construction for the blower and drive. Ensure the base is suitable for direct attachment to the foundation. Provide anchor bolts, [anti-vibration strips,] and grout as required for proper installation.

2.2.1.7 Concrete Foundation

Provide a concrete foundation as indicated. Ensure the foundation is entirely separated from the surrounding floor. Provide concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.2.1.8 Filters

[Consult diffuser manufacturers to verify the percent efficiency required for the diffusers specified. Use of prefilter blanket increases...]
filter life.

Delete the last sentence for warm climate projects.

**************************************************************************

Provide filters of the [washable dry type,] [disposable dry type,] rated to be at least 90 percent efficient when tested in compliance with ASHRAE 52.2 dust spot method. Ensure filter has at least 0.093 square meter 1 sq. ft. of filter area per 0.0118 cubic meter/second 25 cfm of air flow. Use polyester felt filter material with 25 mm 1 inch pleat separation. For filters located outside of the building, provide a weather hood designed to keep rain, snow, and other foreign articles away from the filter element. Design the weather hood for inlet velocities between the hood and the filter element of 2.54 m/second 500 ft/min or less. Provide a manometer or differential pressure gauge on the filter unit to indicate when the filter element requires cleaning or replacing. [Provide a filter element by-pass with counter-weighted doors to prevent destruction of the element in the event freezing moisture clogs the filter].

2.2.1.9 Accessories

**************************************************************************

NOTE: Consult the blower manufacturer to determine silencer requirements.

**************************************************************************

2.2.1.9.1 Silencers

Provide each blower with [inlet] [and] [discharge] silencers. Provide silencers for [standard] [critical] grade silencing. Provide intake silencers of the [chamber] [absorption] type. Provide discharge silencers of the [chamber] [absorption] [combination chamber-absorption] type. Size silencer as recommended by the silencer manufacturer and ensure compatibility with the blower requirements. Ensure silencer connections match the adjacent piping. Provide mounting brackets as required for silencer support. Construct silencer of heavy-duty rolled and welded steel plate with inner liner properly welded to outer shell for purpose of deadening outer shell.

2.2.1.9.2 Acoustical Insulation

Wrap silencers, [interior air piping,] [expansion joints,] [valves,] [and] [drive guards] with 25 mm 1 inch thick high density woven glass fiber mat having a minimum density of 4.6 kg/square meter 15 ounces/square foot and lag with a 0.41 mm 0.016 inch thick aluminum jacket. Comply with EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.

2.2.1.9.3 Gauges

Provide gauges that comply with ASME B40.100. Ensure inlet gauges have a range of [0 to 762 mm] [_____] [0 to 30 inch] [_____] water gauge vacuum. Ensure outlet gauges have a range of [0 to 103 kPa] [_____] [0 to 15 psi] [_____]. Provide all accessories for [control panel] [wall] [pipe] mounting of the gauges.

2.2.1.9.4 Thermometers

Provide thermometers to indicate [inlet air temperature,] [discharge air
temperature,] [lubrication oil temperature,] [and] [diffuser point of discharge temperature for three locations within the system]. Thermometers of either red-reading mercury-in-glass type or dial type are acceptable. Provide a scale range covering the full range of expected operation and up to 125 percent, but not more than 150 percent of maximum.

2.2.1.9.5 Temporary Screens

Provide a temporary screen, consisting of 16-mesh wire backed up by 6.4 mm 1/4 inch hardware cloth, at the blower inlet connection. Remove the screens after initial blower start-up and testing.

2.2.1.9.6 Inlet and Discharge Elbows

Provide inlet and discharge elbows of the long sweep type constructed of cast iron with ASME B16.1, Class 125 flanges.

2.2.1.9.7 Expansion Couplings

Provide couplings of the extra heavy gauge rubber, wire reinforced type suitable for temperature range of -29 to plus 121 degrees C -20 to plus 250 degrees F and pressure range from 381 mm 15 inch of mercury vacuum to 103 kPa 15 psig.

2.2.1.10 Manual Control System

**************************************************************************
NOTE: Delete inapplicable control system. NEMA 3R and NEMA 4 Types are exterior panel types.
**************************************************************************

Provide each blower with a control panel containing all starters, circuit breakers, disconnects, and other equipment required for manual starting and stopping of the blower. Ensure controls and motor control centers conform to NEMA ICS 1, NEMA ICS 2, NEMA ICS 3, NEMA ICS 4, NEMA ICS 6, UL 508, and UL 845. Ensure circuit breakers conform to IEEE C37.13. Provide the control panel in a NEMA 250, [Type 12] [Type 3R] [Type 4] enclosure. Ensure all materials and construction complies with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2.1.11 Automatic Control and Monitoring System

**************************************************************************
NOTE: Delete inapplicable control system.
**************************************************************************

Provide each blower with an automatic control and monitoring system to control start-up and shut-down sequences, to indicate various operation parameters, and to actuate blower protective devices. All accessory devices are required to be operated through this system.

2.2.1.11.1 Panel Construction

**************************************************************************
NOTE: NEMA 3R and NEMA 4 Types are exterior panel types.
**************************************************************************

Enclose the automatic control and monitoring system in a NEMA 250, [Type
12] Type 3R or Type 4 panel and that is completely wired and tested with internal connections being made on terminal blocks. Provide a power supply to the control panel rated at [_____] volts ac, [_____] phase, 60 Hz to a [_____] amp flange mounted disconnect. Derive internal voltages, including [120] [_____] volts ac, from the [_____] volts ac supply. Provide control power transformer rated at [_____] volts primary and [_____] volts secondary with kVA rating as recommended by the manufacturer. Ensure instrument and control transformers comply with IEEE C57.13 and NEMA ST 20.

2.2.1.11.2 Automatic Control

a. Provide automatic controls for all machine parts to ensure proper startup and shutdown sequences. Provide a manual-off-automatic switch for each blower. In addition, provide manual control switches for the [auxiliary oil pump,] [unloading valve,] [and] [inlet butterfly valve]. Ensure the manual control switches are active only when the selector switch is in the manual position. When the selector switch is in the automatic position, initiate the control system sequence startup of the blower as follows:

(1) Start auxiliary oil pump and allow to run for 3 minutes.

(2) Open unloading valve and close inlet butterfly valve.

(3) Start main drive motor.

b. When the motor reaches full speed, open the inlet butterfly valve and close the unloading valve. Open the inlet butterfly valve to a minimum set point slightly above the surge point. Control the inlet butterfly valve from then on by a 4 to 20 mA dc signal from the control system to maintain the desired flow. When the shaft-driven main oil pump reaches specified pressure setting, stop the auxiliary oil pump.

c. Upon turning the selector switch to the off position, initiate the control panel sequence shutdown of the blowers as follows:

(1) Open the unloading valve and close the inlet butterfly valve.

(2) De-energize the drive motor.

d. When the shaft-driven oil pump pressure drops, start the auxiliary oil pump and allow to run for [30] [_____] minutes to provide for post lubrication and cooling.

2.2.1.11.3 Indicators

Provide the following indicators, mounted on the control panel:

a. Inlet and outlet pressure gauges.

b. Valve position indicators for the unloading valve (open or closed) and the inlet butterfly valve (in percentage open).

c. Inlet air volume in cfm indicator. Provide an ammeter measuring the current draw of the blower motor and calibrated so that a given amount of current draw correspond to the volume of air being handled by the blower.

d. Lights to indicate the auxiliary oil pump is running and is as required.
2.2.1.11.4 Blower Protective Devices

a. All blower protective devices, upon alarm condition, are required to cause immediate de-energization of the motor, initiation of the automatic shutdown sequence, and provide audible and visual alarm indication. Equip positive displacement blowers with automatic pressure relief valve.

b. Provide bearing temperature protection consisting of encapsulated temperature switches in milled slots directly over each blower bearing, a control relay, a selector switch and test pushbuttons, and a running light. Upon excessively high temperature of any bearing, initiate protective shutdown and indicate which bearing is affected.

c. Provide a protective device to prevent the blower from operating in a surge condition. Initiate automatic blower shutdown sequence when the blower is reduced to surge volume as indicated by motor current draw and give visual indication of reason for shutdown. Provide an override as necessary for blower startup and shutdown.

d. Provide a system to control blower overload by opening and closing the inlet [butterfly valve] [inlet guide vanes on single stage centrifugal blower] based upon the current draw of the motor. The system is required to monitor motor current input to a suitably conditioned and set-point controller.

2.2.1.11.5 Vibration Monitoring

Provide vibration pick-ups for motor and blower bearings. Provide vibration monitoring system on control panel. Equip centrifugal blowers with radial and axial vibration monitoring. Monitor consists of front panel and circuit board and includes switches for display of signal and alarm levels, LED indicators for annunciation of OK and alarm status, calibration and alarm adjustments, and connectors for output signals.

2.2.1.11.6 Control Logic

Provide control logic to monitor dissolved oxygen level signals and select the number and [inlet guide vane setting for single stage centrifugal blowers] [rotation speed of positive displacement blowers] to provide for sufficient air to maintain desired dissolved oxygen level in aeration tank(s).

2.2.2 Air Distribution System

Provide a system, including piping, valves, and supports to distribute air from the blowers to the air diffusers. Ensure the system is of adequate capacity for the intended purpose and is adjustable for balancing of air distribution.

2.2.2.1 Air Main

Supply the air main from the blowers to the air supply assemblies as indicated. Provide eccentric reducers at each change in air main diameter. Ensure the crown of the air main is maintained at the same elevation for the full length of the tank. Provide fittings as indicated. For air main piping 150 mm 6 inches in diameter and larger, provide be
ductile iron or Schedule 40 steel pipe. For air main piping less than 150 mm 6 inch in diameter, provide ductile iron or Schedule 40 galvanized steel pipe. Provide hangers and supports as required for a complete installation.

2.2.2.2 Removable Header Air Distribution System

******************************************************************************
NOTE: Delete inapplicable header types and materials of construction.
******************************************************************************

Provide removable header air distribution systems as indicated that consist of an air supply assembly, removable header assembly, and supports. Ensure the system is compatible with the air main and the specified diffusers.

2.2.2.2.1 Air Supply Riser Assembly

******************************************************************************
NOTE: Include this paragraph if distribution system is mounted on a T-wall.
******************************************************************************

Provide an air supply riser assembly for each removable header to connect the drop leg to the air main. The riser assembly consists of a vertical pipe projecting from the air main through a floor sleeve cast in the concrete T-wall, an elbow, a butterfly valve between the elbow and the drop leg, and required supports and anchors.

2.2.2.2.2 Air Supply Lateral Assembly

******************************************************************************
NOTE: Include this paragraph if distribution system is mounted on a Y-wall.
******************************************************************************

Provide an air supply lateral assembly for each removable header to connect the drop leg to the air main. The lateral assembly consists of piping, a butterfly valve, and required supports and anchors.

2.2.2.2.3 Removable Header Assembly

The removable header assembly consists of a drop leg and a header. The upper end of the header assembly contains a 90 degree elbow with face ring and neoprene gasket for connection to the air supply assembly. The connection to the air supply assembly is required to be a [quick coupling flange][grooved coupling system]. Provide a flanged connection for the lower end of the drop leg for connection to the header. Provide welded end caps and a beveled flange on the headers for connection to the drop leg. Provide diffuser connectors for field installation of diffusers. Design the removable header assembly to withstand a vertical load that results in a moment of 56.5 Nm 500 inch-pounds at the diffuser connection without permanent deformation. Provide lifting lugs on the assembly as required for removal of the header. Fabricate the removable header assembly of stainless steel or galvanized steel as follows:

a. Stainless Steel Systems: Fabricate the removable header assembly from 304L stainless steel complying with ASTM A240/A240M. Ensure drop legs and headers have a nominal wall thickness of 2.78 mm 0.1094 inch (12 gauge). Use the header dimensions as indicated with dimensional
tolerances complying with ASTM A530/A530M and ASTM A554. Fabricate welded wrought stainless steel fittings and welded stainless steel tubular products in accordance with ASTM A774/A774M and ASTM A778/A778M. Perform all welding in the shop. Add filler wire to all welds to provide a cross section equal to the parent material. Ensure butt welds have full penetration to the interior surface. Ensure all interior weld beads are smooth, evenly distributed, with an interior projection not exceeding 2 mm 1/16 inch. Wire brush outside weld areas with stainless steel brushes. After fabrication, passivate the assembly by pickling and ensure it is completely neutralized. Use nickel plated ductile iron for the quick-coupling flange and equip with a stainless steel hinge pin. Provide anchor bolts made of 303 stainless steel.

b. Galvanized Steel Systems: Fabricate the removable header assembly from Schedule 40 steel pipe conforming to ASTM A53/A53M. Perform all welding in the shop. Ensure all butt welds are full penetration welds with an interior projection not exceeding 2 mm 1/16 inch. Ensure welding conforms to AWS D1.1/D1.1M. Hot-dip galvanized the assembly after fabrication. Provide anchor bolts made of 303 stainless steel. Use nickel plated ductile iron for quick-coupling flange and equip with a stainless steel hinge pin.

2.2.2.4 Supports and Guides

Support removable header by two adjustable supports with vee-shaped guides. Fabricate supports from 6 mm 1/4 inch steel plate and provide at least 25 mm 1 inch vertical adjustment. The supports are required to support the weight of the assembly so that the quick-coupling can be easily disconnected.

2.2.2.3 Rotary or Swing Header Air Distribution System

******************************************************************************
NOTE: Delete inapplicable header types and materials of construction.
******************************************************************************

Provide rotary or swing header air distribution systems as indicated consisting of an air supply assembly, rotary or swing-type air header assembly, and supports. Ensure system compatibility with the air main and the specified diffusers.

2.2.2.3.1 Air Supply Assembly

Provide an air supply assembly for each rotary or swing header to connect the upper swing joint to the air main. The assembly consists of the required pipe and fittings, a butterfly valve, and a combination connector and support for the upper swing joint.

2.2.2.3.2 Rotary or Swing Header Assembly

The rotary or swing header assembly consists of an upper swing joint, a knee joint, hanger pipes, and a header. The upper swing joint connects to the air supply assembly and includes connectors for field installation of diffusers. Design the rotary or swing header assembly to withstand a vertical load that results in a moment of 56.5 Nm 500 in-lb at the diffuser connection without permanent deformation. Provide lifting lugs on the assembly as required to lift the header assembly out of the tank.
Fabricate the rotary or swing header assembly of stainless steel systems, carbon steel systems, galvanized steel systems, or fiberglass systems as follows:

a. Stainless Steel Systems: Provide upper swing joint and knee joint of cast stainless steel. Connect between the two sections by means of a stainless steel pin working in a graphite bronze bushing. Provide graphite impregnated cast bronze bearings complying with ASTM B584. Provide seal rings with labyrinth grooves between the two joint sections. Provide a grease fitting to lubricate the seal rings. Provide an adjustable stop to prevent the knee joint from opening beyond 180 degrees. Fabricate the hanger pipes and air headers from 304L stainless steel in accordance with ASTM A240/A240M. Fabricate the upper hanger pipes from Schedule 10S. Fabricate the hanger pipes from Schedule 5S. Fabricate air header pipes from 12 gauge. Provide header dimensions as indicated with dimensional tolerances in accordance with ASTM A530/A530M and ASTM A554. Fabricate welded wrought stainless steel fittings and welded stainless steel tubular products in accordance with ASTM A774/A774M and ASTM A778/A778M. Perform all welding in the shop. Add filler wire to all welds to provide a cross section equal to the parent material. Ensure butt welds have full penetration to the interior surface. Ensure interior weld beads are smooth, evenly distributed, and with an interior projection not exceeding 2 mm \( \frac{1}{16} \text{ inch} \). Wire brush outside weld areas with stainless steel brushes. After fabrication, passivate the assembly by pickling and ensure it is completely neutralized. Weld the hanger pipes to the upper swing joint and knee joint. Flange connect the header pipe to the hanger pipe. Weld diffuser connectors to the header. Provide the header with welded end caps.

b. Carbon Steel Systems: Provide the upper swing joint and knee joint of cast steel. Connect between the two sections by means of a stainless steel pin working in a graphite bronze bushing. Use graphite impregnated cast bronze bearings in accordance with ASTM B584. Provide brass seal rings with labyrinth grooves between the two joint sections. Provide a grease fitting to lubricate the seal rings. Provide an adjustable stop to prevent the knee joint from opening beyond 180 degrees. Fabricate the hanger and header pipes from schedule [40] [80] carbon steel pipe in accordance with ASTM A524/A524M. Provide header dimensions as indicated. Perform welding in the shop. After fabrication, paint the assembly with the manufacturer's standard finish. Weld the hanger pipes to the upper swing joint and knee joint. Connect the header pipe to the hanger pipe. Weld diffuser connectors to the header. Provide the header with welded end caps.

c. Galvanized Steel Systems: Provide the upper swing joint and knee joint made from cast iron. Connect between the two sections by means of a stud equipped with a spring to maintain seal between the faces. Use graphite impregnated bronze seal rings and bearings in accordance with ASTM B584. Provide grease fittings for lubrication. Fabricate the hanger and header pipes from schedule [40] [80] galvanized steel pipe in accordance with ASTM A53/A53M. Provide header dimensions as indicated. The header consists of two lengths of pipe, flange connected to a cast iron tee. Screw connect the hanger pipes to the upper swing joint and knee joint, and flange connected to the header tee. Weld the diffuser connectors to the header. Provide the header with gasketed, screwed end caps.

d. Fiberglass Systems: Provide the upper swing joint and knee joint of
the trunnion sleeve type manufactured of glass reinforced synthetic resin capable of continuously operating in pH levels of 5.0 to 9.0 and at gas temperatures up to 108 degrees C 225 degrees F. Rib all areas of high stress to provide increased strength. Provide each rotating bearing surface with ring type air seals. Hold the assemblies together by a 13 mm 1/2 inch diameter stainless steel rod with locking nuts. Fabricate the hanger and header pipes from reinforced thermosetting resin pipe in accordance with ASTM D2310, Type I, Grade l, Class F, ASTM D2992, and ASTM D2996. Provide pipe in accordance with the following: 275.8 MPa 40,000 psi minimum hoop stress; 65.5 MPa 9,500 psi minimum tensile strength; 131.0 MPa 19,000 psi minimum axial compression strength; minimum 55 Barcol hardness; 54.75 degree wind angle; 2.8 mm 0.110 inch minimum wall thickness. Provide ultraviolet protection for the pipe material. Provide liner resin that is 85 to 89 percent resin with glass filler and at least 0.51 mm 0.020 inch thick. Use filled epoxy adhesive joints. Provide header dimensions as indicated. Flange connect the hanger to the header.

2.2.2.3.3 Supports and Guides

Provide supports and guides as required for support and leveling of the header.

2.2.2.4 Fixed Header Air Distribution System

**************************************************************************
NOTE: Delete inapplicable header types and materials of construction.
**************************************************************************

Provide a fixed header air distribution as indicated consisting of a drop leg assembly, fixed headers, and supports. Ensure the system is compatible with the air main and the specified diffusers.

2.2.2.4.1 Drop Leg Assembly

Provide a drop leg assembly to connect the fixed headers to the air main. Provide the assembly of the dimensions indicated.

2.2.2.4.2 Fixed Headers

Provide fixed headers of the dimensions and configuration indicated. Provide header connections of a type allowing rotational adjustment of individual header sections of sufficient strength to transmit the longitudinal forces caused by expansion and contraction of the header. Design the headers to allow expansion and contraction up to a maximum temperature of 52 degrees C 125 degrees F without damage to the system. Prevent rotation of the header due to thermal expansion and contraction. Provide fixed headers of stainless steel systems or fiberglass systems as follows:

a. Stainless Steel Systems: Fabricate all welded parts of the system from 304L stainless steel in accordance with ASTM A240/A240M. [Provide stainless steel pipe with a 2D finish in accordance with ASTM A480/A480M.] Provide pipe wall thickness as follows: for 250 mm 10 inch diameter and less, supply 1.59 mm 0.0625 inch (16 gauge) thick pipe; for 300 mm 12 inch diameter, supply 1.98 mm 0.0781 inch (14 gauge) thick pipe; for 350 mm 14 inch through 450 mm 18 inch diameter, supply 2.78 mm 0.1094 inch (12 gauge) thick pipe; for 500 mm 20 inch diameter, supply 3.18 mm
0.1250 inch (11 gauge) thick pipe; for 600 mm 24 inch diameter, supply 3.57 mm 0.1406 inch (10 gauge) thick pipe. Provide header dimensions as indicated with dimensional tolerances in accordance with ASTM A530/A530M and ASTM A554. Fabricate welded stainless steel fittings and welded stainless steel tubular products in accordance with ASTM A774/A774M and ASTM A778/A778M. Perform all welding in the shop. Add filler wire to all welds to provide a cross section equal to the parent material. Ensure butt welds have full penetration to the interior surface. Ensure interior weld beads are smooth, evenly distributed, and with an interior projection not exceeding 2 mm 1/16 inch. Wire brush outside weld area with stainless steel brushes. Prior to fabrication, passivate each part of the assembly by pickling and ensure it is completely neutralized. Provide bolts, washers, follower flanges, and other non-welded parts made of 304 stainless steel. Provide low silicon bronze nuts in accordance with ASTM B98/B98M.

b. Fiberglass Systems: Provide reinforced thermosetting resin pipe in accordance with ASTM D2310, Type I, Grade 1, Class F, ASTM D2992, and ASTM D2996. All pipe is required to be in accordance with the following: 65.5 MPa 9,500 psi minimum tensile strength; 110.3 MPa 16,000 psi minimum axial compression strength; minimum 55 Barcol hardness; 54.75 degree wind angle; 2.8 mm 0.110 inch minimum wall thickness. Provide ultraviolet protection for the pipe material. Use liner resin with 85 to 89 percent resin with glass filler and is at least 0.51 mm 0.020 inch thick. Use filled epoxy adhesive joints. Provide header dimensions as indicated. Provide a 25 mm 1 inch drain leg at each end of each section of pipe.

2.2.2.4.3 Support System

Provide a system for support and anchoring of the header. Ensure the system is compatible with the expansion and contraction control design. Ensure the support system provides for a minimum of 100 mm 4 inch vertical adjustment and 25 mm 1 inch lateral adjustment of the header. Contour the system to fit the bottom 90 degrees of the pipe while maintaining a bearing surface at least 50 mm 2 inch wide.

2.2.2.5 Lagoon Air Distribution System

**************************************************************************
NOTE: Delete inapplicable header types and materials of construction.
**************************************************************************

2.2.2.5.1 Fixed Air Distribution Headers

Provide fixed air distribution headers to connect the air main to the lagoon aeration diffuser tubing. Construct header and feeder piping using PVC with flanged or threaded connections. Provide one of the following types of air distribution systems:

a. Dual Header System: The system consists of a dual header supported above the side slopes, one on each side of the lagoon with feeder tubes connecting to each end of the diffuser tubing.

b. Single Header System: The system consists of a single header, supported above the lagoon bottom in the center of the lagoon with feeder tubes connecting to one end of the diffuser tubing.
2.2.2.5.2 Supports

Provide adjustable supports that allow free longitudinal movement with little or no lateral or vertical movement for the air header piping. Ensure all ferrous metal in the support system is galvanized.

2.2.2.5.3 Airlift Purge System

Provide a plastic airlift, complete with integral plastic air jet. Include air supply tubing and piping connected to the main air header. Provide a control valve on the air supply pipe.

2.2.2.5.4 Gas Cleaning System

Provide a complete system as required for gas cleaning of the air diffusion system. Provide a single valve to control flow to all points.

2.2.3 Diffusers

**************************************************************************
NOTE: Aeration tanks should be identified on the drawings. Diffuser performance requirements should be inserted. Maximum allowable headloss should not exceed 14 inches of water.
**************************************************************************

2.2.3.1 Diffuser Performance

a. Provide an air flow rate of [_____] standard L/second/28.3 cubic meters scfm/1000 cubic feet of tank volume.

b. Provide an oxygen transfer rate of [_____] kg pounds of oxygen per day per 28.3 cubic meters 1000 cubic feet of tank volume at the specified air flow rate in clear water at 20 degrees C 68 degrees F and zero dissolved oxygen.

c. Set maximum allowable headloss in the system to [_____] mm inch of water, excluding submergence.

2.2.3.2 Porous Diffusers

**************************************************************************
NOTE: Delete inapplicable types of diffusers and materials of construction.
**************************************************************************

The mean permeability rating of the porous diffusers will be inserted. The permeability rating is defined as the number of cubic meters per second cfm of air, at 21 degrees C 70 degrees F and 10 to 25 percent relative humidity, that will pass through 0.093 square meter 1 square foot of diffuser area to the atmosphere, under a differential pressure equivalent to 508 pascals 2 inches of water below the plate or within the tube when it is tested dry in a room maintained at a temperature of 21 degrees C 70 degrees F and a relative humidity between 30 and 50 percent. To date, this is the accepted method of measuring the ability of porous diffuser media to diffuse air and provide a desirable rate of oxygen.
absorption. Lower permeability should produce smaller bubbles, which should result in higher rates of oxygen absorption. Lower permeability rating, however, requires higher air pressure and results in more rapid clogging and higher pressure losses. Consequently, any benefits obtained initially by specifying a permeability rating may be offset by the higher maintenance and operating costs. The best balance between desired oxygen absorption and operating and maintenance cost is afforded by a permeability rating of from 0.203 to 0.406. Non-porous diffusers do not have a permeability rating.

Provide one of the following types of diffusers with a mean permeability rating of [_____]:

2.2.3.2.1 Porous Ceramic Discs

Provide porous ceramic plate diffusers composed of silica sand bonded together with a synthetic silicate, fused alumina, or an organic bond; grains of crystalline aluminum oxide bonded with high alumina glass; aluminum silicate grains ceramically bonded at high temperature; crushed porcelain grains bonded together with alumina glass or electrically fused aluminum grains bonded together with alumina glass. Ensure all diffuser plates provide [_____] square mm square inch of horizontal diffuser area.

2.2.3.2.2 Porous Membrane Tubes with Supports

Provide porous membrane media composed of a tubular flexible synthetic membrane sheath that is open at one end and closed at the other. Ensure the tubular sheath fits over a tubular air duct/air plenum frame or is supported by a one-piece semicircular corrosion resistant support rod. Clamp the sheath to a nozzle with a corrosion resistant removable clamp. Ensure the sheath is capable of flexing from its unexpanded shape to its expanded inflated convex hollow cylindrical shape when air is diffused through it to slough foulants. Ensure apertures of the sheath close whenever the air flow is shut off and purge themselves when air is restarted. Supply each diffuser with a check valve for wastewater backflow prevention. Ensure the nozzle is compatible with the diffuser connector on the air header.

2.2.3.2.3 Porous Cloth Media with Plastic Tube Liner

Provide porous cloth media composed of a tubular flexible synthetic fiber cloth sheath that is open at one end and closed at the other. The media fits over a plastic tube liner and is clamped to a cast iron nozzle with a stainless steel clamp. Vinyl coat the cast iron nozzle, except for the threads attaching it to the header. Provide diffuser media [_____] mm inch in length and a diameter of [_____] mm inch.

2.2.3.3 Non-Porous Diffusers

**************************************************************************
Provide one of the following types of diffusers with a mean permeability rating of [____]:

2.2.3.3.1 Non-Porous Diffusers

NOTE: Delete inapplicable types of diffusers and materials of construction.

**************************************************************************
2.2.3.3.1 Nozzle-Type Diffusers

Provide one of the following nozzle type diffusers:

a. Diffuser consisting of a molded plastic body with four high velocity, short tube orifices, each discharging at right angles to the adjacent orifice. [Equip the diffuser with a deflector ring above the discharge orifices and include a control orifice to ensure proper headloss.]

b. Diffuser consisting of molded plastic and including a top piece containing inverted V-shaped air shear slots and an upward sloping air deflector and a bottom piece containing a control orifice and an air header connector.

2.2.3.3.2 Orifice-Type Diffusers

Provide one of the following non-valved orifice type diffusers:

a. Diffuser constructed of stainless steel and consisting of a balancing nozzle, an inverted air reservoir, air exit ports located on horizontal planes on two levels, and a deflector. Ensure the deflector directs the liquid along the diffuser's outer walls.

b. Diffuser consisting of an open bottom, molded plastic, rectangular box containing tapered air release holes. Ensure air entering the diffuser is controlled by a control orifice.

c. Diffuser consisting of an elongated, peaked dome air chamber with steep inverted V-shaped serrations on both sides. Ensure air exiting the header is controlled by an orifice.

2.2.3.3.3 Valved Orifice Diffusers

Provide one of the following valved orifice diffusers:

a. Diffuser consisting of a molded plastic body with an air flow control orifice and a PVC disc cap retained by a stainless steel ring.

b. Diffuser consisting of a stainless steel body containing a control orifice, a polytetrafluroethylene ball, and a stainless steel deflector disc.

c. Diffuser consisting of a molded plastic body with air release orifices, a ball check valve, and a screw-in cap that allows varying the quantity of orifices through which air can exit.

d. Diffuser consisting of a cone-shaped plastic base with a flexible elastomer cover held in place by a center bolt.

e. Diffuser consisting of a rubber body with a molded control orifice (pinch valve) that is normally closed and is actuated by specific pressures applied to the backside of the diffuser.

2.2.3.4 Lagoon Aeration Diffuser Tubing

******************************************************************************
NOTE: Delete inapplicable types of diffusers and materials of construction.
******************************************************************************
Use [13] [_____] mm [1/2] [_____] inch inside diameter flexible polyethylene diffuser tubing containing small, precise, orifices or slots in the lower side of the tubing at [38] [_____] mm [1-1/2] [_____] inch maximum spacing. Ensure the orifice is small enough to prevent particulate matter from flowing through the orifice during negative diffuser pressure. Pre-weight the diffuser by a continuous lead strip in the bottom of the tube encapsulated in polyethylene.

2.2.3.5 Spare Diffusers

**************************************************************************

NOTE: The percentage of replacements required will be inserted. A sound policy would require sufficient media to enable the operator to replace all media in any one aeration tank.

**************************************************************************

Furnish not less than [_____] percent of the installed quantity of diffusers as replacements. Furnish diffusers complete with all parts required for installation.

2.2.4 Materials and Equipment

Ensure materials and equipment conform to the following respective publications and other specified requirements.

2.2.4.1 Ductile Iron Pipe and Fittings

Provide ductile iron pipe conforming to AWWA C115/A21.15 or AWWA C151/A21.51. Provide thickness class as follows: Class 51 for pipe up to 100 mm 4 inch diameter and over 750 mm 30 inch diameter; Class 51 for pipe 150 mm 6 inch through 600 mm 24 inch diameter. Provide mechanical joints that conform to AWWA C111/A21.11 as modified by AWWA C151/A21.51. Provide flanged joints that conform to AWWA C110/A21.10. Provide fittings that conform to AWWA C110/A21.10. Ensure all buried piping has standard bituminous coating and lining.

2.2.4.2 Steel Pipe and Fittings

Provide steel pipe 150 mm 6 inch in diameter and larger in accordance with AWWA C200. Provide steel pipe less than 150 mm 6 inch in diameter with threaded end, galvanized, in accordance with ASTM A53/A53M, standard weight. Ensure mechanical joints conform to AWWA C200. Ensure flanged joints conform to AWWA C207. Provide fittings for steel pipe 150 mm 6 inch in diameter and larger in accordance with AWWA C200 and fabricated in accordance with AWWA C208. For steel pipe less than 150 mm 6 inch in diameter, provide galvanized fittings in accordance with ASME B16.3.

2.2.4.3 Polyvinyl Chloride (PVC) Pipe and Fittings

**************************************************************************

NOTE: The Designer must use caution when specifying PVC air piping. PVC pipe and fitting use is normally reserved for low pressure, low temperature environments where ultraviolet exposure is limited. PVC tends to become brittle with age and even air pressures much lower than the rated pressure class.

**************************************************************************
of the pipe can cause catastrophic failure.

Ensure PVC pipe and fittings conforming to ASTM D1785, Schedule [40] [80] [120], or ASTM D2241, SDR [21] [26] [32.5]. Use solvent weld joints conforming to ASTM D2564.

2.2.4.4 Stainless Steel Tubing and Fittings

Unless shown or specified otherwise, provide stainless steel tubing in accordance with the following.

2.2.4.4.1 Stainless Steel Tubing

Ensure stainless steel tubing conforms to ASTM A778/A778M. Provide wall thicknesses as follows: tubing 250 mm 10 inch diameter and less, provide 1.59 mm 0.0625 inch (16 gauge) thick tubing; tubing 300 mm 12 inch diameter, provide 1.98 mm 0.078 inch (14 gauge) thick tubing; tubing 350 mm 14 inch through 450 mm 18 inch diameter, provide 2.78 mm 0.109 inch (12 gauge) thick tubing; tubing 500 mm 20 inch diameter, provide 3.17 mm 0.125 inch (11 gauge) thick tubing; tubing 600 mm 24 inch diameter, provide 3.57 mm 0.140 inch (10 gauge) thick tubing.

2.2.4.4.2 Stainless Steel Tubing Fittings

Provide stainless steel tubing fittings conforming to ASTM A774/A774M, grade and schedule or wall thickness as specified for tubing.

2.2.4.4.3 Stainless Steel Tubing Joints

Fabricate stainless steel tubing joints by shop welding full penetration butt joints or Van Stone joints using angle face rings with backing flanges drilled in accordance with ASME B16.5, Class 125.

2.2.4.5 Pipe Hangers and Supports

Provide pipe hangers and supports conforming to MSS SP-58.

2.2.4.6 Valves

2.2.4.6.1 Butterfly Valves

Ensure butterfly valves and operators conform to AWWA C504, air service class [25A] [____], flanged or mechanical joint ends as required.

2.2.4.6.2 Gate Valves

Ensure gate valves conform to AWWA C500, flanged or mechanical joint ends as required.

2.2.4.6.3 Globe Valves

Ensure globe valves conform to MSS SP-80, Type 3, Class 150.

2.2.4.6.4 Relief and Unloading Valves

Provide combination relief and unloading valves with [carbon steel] [____] body, that allow blower unloading for startup, and are set for pressure relief at [____] kPa psig.
2.2.4.6.5 Check Valves

Provide check valves of double door type, flange or wafer style, capable of handling 862 kPa 125 psig cold working pressure (CWP) with cast iron body and aluminum bronze internal parts, low torque spring for low pressure air service. Ensure seal material is capable of handling temperatures from -29 to plus 121 degrees C -20 to plus 250 degrees F with tight shutoff capability.

2.2.4.7 Expansion Couplings

Construct expansion couplings for nonsubmerged locations in the aeration system of materials suitable for temperatures up to 121 degrees C 250 degrees F and pressures up to 103 kPa 15 psig. Use couplings of the filled arch type. Provide back-up or retaining rings as required. Yoke couplings to transmit tension loadings. Ensure the compressive and lateral movement of the joint is not impaired by the yoke system.

2.2.5 Hoist

**************************************************************************
NOTE: Coordinate with type of air distribution system specified. Delete steering attachment where not required.
**************************************************************************

Provide portable hoist designed to raise and lower the [removable] [rotary or swing] air distribution system. Hoist is to be furnished by the aeration system manufacturer. Mount the hoist on wheels or casters [and provide a suitable steering attachment]. Power the unit by [hand] [hand pump] [battery operated motor] [air operated motor] [electric motor] [gasoline engine]. Provide a means to hook the hoist in place during the hoisting operation. Equip the lifting arm with a quick latching arrangement to securely grip the air diffusion unit without the use of tools. Provide a hoist of sufficient capacity for the required service.

2.2.6 Metering and Instrumentation

**************************************************************************
NOTE: Insert section number and title or delete sentence and insert metering and instrumentation requirements.
**************************************************************************

Metering and instrumentation is specified in Section [____].

2.2.7 Purge System

**************************************************************************
NOTE: Coordinate specific purge system requirements with equipment manufacturer.
**************************************************************************

Provide a purge system incorporated into the aeration system. Locate purge valves at the low points in the system to allow bleeding off of condensed water that builds up in the air piping. Purge valves may be incorporated into an automatic pump system when low points occur below water level.
PART 3   EXECUTION

3.1   EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2   EQUIPMENT INSTALLATION

Submit drawings containing complete wiring and schematic diagrams, control diagrams, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show in the drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

3.2.1   Blower Installation

Install blowers as indicated and in accordance with the manufacturer's written instructions.

3.2.2   Air Distribution System Installation

**************************************************************************
NOTE: The range of adjustment of the system on the header is dependent on various design parameters such as header size and basin shape and size. Consult various manufacturers for proper dimension.
**************************************************************************

Install the air distribution system as indicated and in accordance with the manufacturer's written instructions. Perform all excavation, trenching, and backfilling in accordance with the applicable requirements of Section 31 00 00 EARTHWORK. Maintain the crown of the air main at the same elevation. Adjust the system such that all diffusers on a header are within [_____] mm inch of a common horizontal plane.

3.2.3   Diffuser Installation

Install diffusers as indicated and in accordance with the manufacturer's written recommendations.

3.2.4   Framed Instructions

Post framed instructions containing wiring and control diagrams under glass or in laminated plastic where directed. Show wiring and control diagrams and complete layout of the entire system in the instructions. Also include, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. Post the framed instructions acceptance testing of the system.

3.2.5   Welding

**************************************************************************
NOTE: Retain the applicable welding requirements.
**************************************************************************
[Weld piping in accordance with qualified procedures using performance qualified welders and welding operators. Ensure the procedures and welders are qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer are acceptable to the extent permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests perform all tests at the work site if practical. Instruct the welder or welding operator to apply his assigned symbol near each weld he makes as a permanent record. Weld structural members in accordance with AWS D1.1/D1.1M.] [Welding and non-destructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING.]

3.2.6 Electrical Work

Ensure all electrical work is performed in accordance with the National Electric Code (NFPA 70, Latest Edition).

3.3 FIELD QUALITY CONTROL

3.3.1 Field Testing

Submit performance test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate the final position of controls in each test report.

3.3.1.1 Blower Test

After the air distribution and diffusion systems have been installed, test each blower at the specified operating conditions to determine compliance with the specifications and proper operation.

3.3.1.2 Piping System Test

Test all piping with air at a minimum of two times the normal design pressure for at least 60 minutes and such additional time as is required for the Contracting Officer to inspect the piping for leaks. Repair all leaks and retest and the system until no leakage is discovered.

3.3.1.3 Diffuser Test

After diffuser installation, cover the diffusers with clear water to a depth of approximately 600 mm 2 feet. Release air through the diffusers and inspect the system for uniform air distribution. Replace diffusers as required to obtain uniformity.

3.3.2 Manufacturer's Services

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. Ensure that the representative supervises the installation, adjustment, and testing of the equipment.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Field Training

Provide a field training course for designated operating and maintenance
staff members. Provide training for a total period of [___] hours of normal working time and start training after the system is functionally complete but prior to final acceptance tests. Cover all of the items contained in the operating and maintenance manuals in the field training.

3.4.2 Operating and Maintenance Manuals

Provide [six] [___] copies of operation and [six] [___] copies of maintenance manuals for the equipment furnished. Submit one complete set prior to performance testing and the remainder upon acceptance. Ensure the operating manuals detail the step-by-step procedures required for system startup, operation, and shutdown. Ensure operating manuals include the manufacturer's name, model number, parts list, and brief description of all equipment and their basic operating features. Ensure the maintenance manuals list routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include piping and equipment layout and simplified wiring and control diagrams of the system as installed. Have all manuals approved prior to the field training course.

3.5 PAINTING

Conduct all field painting as specified in Section 09 90 00 PAINTS AND COATINGS.

NOTE: This guide specification covers the requirements for a trickling filter for use in sewage treatment plants normally handling domestic sewage.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Special consideration must be given to sewage carrying industrial wastes containing components detrimental to biodegrading microorganisms. Show the following information on the project drawings or provided by the project designer:

a. Dimensions of filter tank and elevation of base slab.

b. Design flows and loading rate.

c. Available head.
d. Depth of filter bed.

e. Size of inlet piping.

f. Location of vent stack pipes.

g. Design loads for wind and ice where applicable.

h. Clearance of arms above filter surface.

i. Number of distribution arms.

j. Type(s) of filter media to be allowed.

k. Type of filter blocks.

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Rotary Distributor; G[, [_____]]

SD-03 Product Data

Rotary Distributor; G[, [_____]]

Spare Parts
Submit spare parts data after approval of the detail drawings and not later than [_____] months prior to the date of beneficial occupancy.

Plastic Media; G[, [____]]]Filter Media

SD-07 Certificates

Size And Grading

Layout Of Filter Block Units

SD-10 Operation and Maintenance Data

Operating and Maintenance Manuals

1.3 EXTRA MATERIALS

Provide spare nozzles, seals, and all other standard spare parts as recommended in the manufacturer's instruction manuals for each component of the equipment. Include a complete list of parts and supplies, with current unit prices and source of supply.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

A trickling filter includes a rotary distributor, reinforced concrete walls and base, filter media, filter block underdrainage system, and all other components indicated or necessary for proper operation.

2.2 MATERIALS

**************************************************************************
NOTE: Delete materials that are not used.
**************************************************************************

2.2.1 Standard Products

Unless otherwise specified, provide standard commercial products in regular production by the manufacturer and suitable for the required service. [Provide ASTM A36/A36M structural steel.] [Provide ASTM A53/A53M steel pipe for structural members and distributor arms.] [Provide steel members with a minimum thickness of 6 mm 1/4 inch when members will be in contact with sewage, completely or intermittently, during normal operation of the equipment.] [Provide ASTM A48/A48M, Class 30 cast iron.] [Provide ASTM B209 (3003-H14)aluminum alloy for structural members, and provide ASTM B429/B429M (6063-T6) aluminum alloy for pipe.]

2.2.2 Materials Protection

Provide ferrous metal surfaces that can be pickled in accordance with SSPC SP 8. Provide ferrous metal surfaces, including rotating assembly, distributor arms, supports, and attachments that are zinc coated in accordance with ASTM A123/A123M or ASTM A153/A153M, as applicable. Pickle and galvanize the interior and exterior of all fabricated ferrous metal components after fabrication. Insulate components such as gaskets, couplings, or bushings, of a dielectric-type To prevent corrosive action of
bimetallic-type contacts, at connections between dissimilar metals.

2.2.3 FILTER MEDIA

2.2.3.1 Quality

******************************************************************************
NOTE: When plastic media is to be used exclusively, delete all requirements for and reference to other materials. Consider economic and geographic influences when deciding the filter media type. When trickling filters will be used in cold weather conditions, covers, hydraulic controls, and ventilation should be considered to ensure the optimum trickling filter biological performance.
******************************************************************************

[Provide [crushed stone or crushed slag] or ] [random-dumped or stacked modular plastic] media. Ensure the top 460 mm 18 inches of media has a loss by the 20-cycle sodium sulfate soundness test of ASTM C88 of not more than 10 percent by weight; the balance of the media must pass a 10-cycle test using the same criteria.] [Provide plastic media that is random-dumped ring type or stacked modular type. Provide random-dumped ring type media of long term heat aging, rigid polypropylene plastic specially manufactured as trickling filter media, with a minimum void volume of 90 percent, and a minimum surface area of 82 square meters per cubic meter 25 square feet per cubic foot.] [Provide plastic stacked modular type [vertical or crossflow] media of saran, polyvinyl chloride (PVC), fiberglass reinforced resins, or plastic equally resistant to oxidation, ozone aging or effects of ultraviolet exposure, and a minimum void volume and surface area per cubic meters feet volume as required for random-dumped ring type media.] Provide media with a minimum projected life of 25 years in the intended service. Base projected life on case history or simulated aging tests as performed by an independent testing laboratory acceptable to the Contracting Officer. Substantiate such tests by certified test reports. Provide installed media that can provide support for the weight of two workmen working together on any part of the surface of the filter without damage or displacement of the media.

2.2.3.2 Size and Grading

[Conform stone or slag media to the following size distribution and grading and mechanical graded over a vibrating screen with square opening: 100 percent passing 5.0 inch sieve; 95-100 percent by weight retained on 3.0 inch sieve; 2 percent by weight passing the 2.0 inch sieve; and 1 percent by weight passing the 1.0 inch sieve.] [Provide plastic media in accordance with the manufacturer's standard as approved by the Contracting Officer. Provide random-dumped media with a specific gravity between 0.90-0.97 grams per cubic centimeter, a minimum tensile strength of 4500 pounds per square inch, and a minimum modulus of elasticity of 200000 pounds per square inch. Provide stacked modular media with a specific gravity between 1.39-1.50 grams per cubic centimeter, a minimum tensile strength of 6000 pounds per square inch, and a minimum modulus of elasticity of 325000 pounds per square inch. Evaluate the module's bearing capacity in the top layer, intermediate layers, and bottom layers.]
2.3  EQUIPMENT

2.3.1  Standard Products

Unless otherwise specified, provide standard commercial products in regular production by the manufacturer and suitable for the required service.

2.3.2  Rotary Distributor

Provide a rotary distributor suitable for the uniform distribution of sewage over the filter bed at the rates of flow and operating conditions specified herein. Provide a rotary distributor including distributor arms, center column, and other appurtenances necessary for proper operation. Provide a rotary distributor that rotates solely from the reaction of sewage flowing through jets or nozzles in the distributor arms and operates freely and effectively over the entire range of operation. Submit detail rotary distributor drawings and installation instructions. Include detail drawings containing equipment layout and anchorage, and sufficient details to demonstrate that the rotary distributor will properly function as a unit.

2.3.2.1  Operating Requirements

**************************************************************************
NOTE: Delete ice coating requirements in warm climates.
**************************************************************************

Provide a rotary distributor designed for a filter bed of [_____] mm feet inside diameter. Provide design flows that range from a minimum of [_____] L/second gpm to a maximum of [_____] L/second gpm and with average design loading of [_____] L/second gpm. Provide an available total head at the inlet (above the media surface) of [_____] at the maximum rate of flow. Ensure the maximum velocity in the arms does not exceed 1.22 m/second 4.0 fps. Provide a rotary distributor and each of its component parts that are designed to withstand all structural and mechanical stresses brought about by the following loadings: weight of equipment plus liquid; wind loading; and a live load of [_____] N pounds at any point on the arm; and an ice coating of [_____] mm inch thick. Provide a minimum safety factor of 1.6 based on the yield point of the steel. Provide anchorage of the concrete center pier that is designed to resist, with a 2.0 minimum safety factor, a maximum overturning moment brought about when arms on one side of the distributor are filled with water and those on the other side are empty. Ensure vertical deflections at the end of the distributor arms do not exceed 100 mm 4 inches. Provide arms that have a clearance above the surface of filter bed as indicated. Provide a rotary distributor designed for continuous 24-hour service under the design load without excessive wear, damage, or failure. Ensure stresses developed under the aforementioned operating conditions and loads do not exceed the stresses allowed under AISC 360.

2.3.2.2  Center Column

**************************************************************************
NOTE: Delete bracketed wording pertaining to weirs or dependent on the provisions of weirs when distributors have less than four arms, except when two-compartment arms are used.
**************************************************************************

The trickling filter tank should be constructed in
accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Walls should have standard finish. Horizontal surfaces should have screed finish. Insert the following requirements in the appropriate place: "Construct the hollow concrete center pier, including installation of anchor bolts, in accordance with the recommendations of the manufacturer of the rotary distributor, as approved by the Contracting Officer."

Type IIA cement normally will be specified, but Type V cement will be specified when the soils contain in excess of 0.2 percent water soluble sulfate as SO(4), or waste water contains in excess of 1,000 parts per million sulfates. Alkali reactive aggregates require use of a cement containing less than 0.60 percent alkalis. Type I cement may be permitted when it can be assured that the water soluble sulfates in the soil will be less than 0.1 percent and the waste water will contain less than 150 parts per million sulfates over the design life of the project. Air entrainment admixtures will be used in all types of concrete.

**************************************************************************

Provide a mast-type or turntable-type center column including a stationary assembly, rotating assembly, seal, bearing assembly, lubricating fittings, and anchor bolts. Provide port areas or openings to permit unrestricted flow of sewage from inlet in stationary assembly through rotating assembly into distributor arms.

a. Stationary Assembly: Fabricate elements of the stationary assembly from cast iron, structural steel, steel pipe, or aluminum alloy. Provide a stationary assembly with a [_____] mm inch diameter inlet, and designed for anchorage to the hollow concrete center pier by anchor bolts.

b. Rotating Assembly: Fabricate elements of the rotating assembly from cast iron, structural steel, or aluminum alloy, except as otherwise specified herein. Select cast iron turntables only, when provided. Provide steel for nonstructural applications with a minimum yield point of 207 MPa 30,000 psi. [Provide an adjustable weir to divide the flow between the primary and secondary arms so that only primary arms will operate at minimum flow and that all arms will discharge uniformly at maximum flow. Provide a weir that is accessible for adjustment without dismantling the equipment. Provide a weir in the rotating assembly, unless provided in each secondary arm as specified hereinafter.] Provide a rotating assembly with machined surfaces suitable for installation of distributor arms and a height that provides suitable anchorage for the distributor arm supports.

c. Seal: Provide a mechanical seal or an air gap to prevent the leakage of water between the stationary and rotating assemblies at the maximum hydraulic head. Any type of seal employing mercury as the sealing element is not allowed.

(1) Mechanical Seal: Design the mechanical seal, to withstand the full hydraulic head in the rotating assembly. Provide seals having an annular ring of replaceable grease-resistant neoprene or
tetrafluoroethylene with a low coefficient of friction. Provide seals between horizontal surfaces that are maintained against the seal plate by annular steel weight strips and steel seal clamps. Provide seals between vertical surfaces that are spring loaded in steel retainer rings attached to the rotating assembly.

(2) Air Gap: Provide an air gap, to prevent the liquid from entering the rotor bearing and that requires no auxiliary equipment to maintain the air gap between the fixed feeder pipe or column and the rotating sleeve and/or drum. Provide means to prevent the liquid level in the rotating equipment from rising positively to the elevation of the air gap. Provide a relief device to prevent this that is constructed to force any overflow to discharge on the surface of the filter, visible to the operator and at a point above or apart from normal distribution outlets.

d. Bearings: Ensure radial and axial loads of the rotating assembly and distributor arms are transmitted to the stationary assembly by an anti-friction thrust bearing of the ball or roller type. Provide guide or steady bearings where necessary to maintain alignment. Design bearing so that the rotating assembly maintains its alignment, starts freely, and operates satisfactorily at the minimum head at all conditions of wind and temperature. Ensure bearings are designed for the vertical thrust of the machine full of water and the horizontal thrust due to eccentric loads on the arms. Provide bearings that have a minimum rated life expectancy of 100,000 hours (L-10). When the equipment is operating continuously under specified loading conditions, the load rating and the fatigue life is based on ABMA 9 and ABMA 11, as applicable.

e. Lubrication Fittings: Provide all moving parts subject to wear and all bearings with adequate means for lubrication. Lubrication is by grease or oil, as suitable. Provide greased bearings with fittings for grease gun service. If not easily accessible, provide a bearing lubrication with grease tubing extended to convenient locations. Provide grease fittings that prevent over-lubrication and pressure build-up injurious to bearings. Provide oil reservoirs that are liberal in size and have an opening for filling, an overflow opening at the proper location to prevent overfilling, an oil-level sight glass, and a drain at the lowest point. Provide the manufacturer's recommended lubricant sufficient for 6 months of normal operation.

f. Anchor Bolts: Provide anchor bolts, with necessary hex nuts and washers, fabricated of Type 304 stainless steel. Provide anchor bolts and accessories to secure the stationary assembly to the hollow concrete center pier.

2.3.2.3 Distributor Arms

Provide distributor arms that are attached to the rotating assembly by flanged or screwed connections. Provide arms fabricated of steel pipe, structural steel with a minimum wall thickness of 6 mm 1/4 inch, or aluminum alloy that conforms to ASTM B241/B241M. [When the adjustable flow division weir specified in paragraph Rotating Assembly is not provided in the rotating assembly, provide one adjustable, accessible overflow weir in each secondary arm to cut off flow to that arm at minimum flow and to allow uniform flow of all arms at maximum flow.] Provide the end of each arm with a quick-opening shear gate for flushing. Support the arms from the rotating assembly by cables, steel tie rods with turnbuckles, or a steel
truss. Conform wire strand for cables to ASTM A475. Provide arm supports to support the design loads. Brace arms laterally by means of horizontal steel tie rods with turnbuckles. Provide each arm with openings spaced to distribute the flow uniformly over the filter bed. Provide nozzles and spreaders at each opening and constructed of corrosion-resistant nonferrous material. Design nozzles to provide maximum reactive force with minimum head loss. Ensure spreaders disperse the flow evenly from each opening. Provide spreaders that are easily removable for cleaning and equipped with replaceable orifices permitting variation of flow capacity with different orifices. Provide rectangular-arm distributors that have orifices in the spreaders. Provide orifices of nonclogging design.

2.3.2.4 Center Pier Supply Fittings

Provide the [_____] mm inch supply inlet line junction fitting with a [base tee and riser pipe] [base-plate with short riser pipe and flange] suitable for the rotary distributor center column attachment. Construct center pier supply fittings of ductile iron, or steel conforming to AWWA C151/A21.51 or ASTM A53/A53M, respectively.

2.4 FILTER BLOCKS

Provide an underdrain system that includes rectangular and cut tile blocks, cover blocks for drainage channels, and vent blocks. Conform all blocks to ASTM C159, Type I-H, except provide cover blocks without apertures and provide vent blocks with openings to accommodate vent stacks. Provide cut or angle blocks that are cut on an angle to conform approximately to the wall curvature. Provide filter underdrain blocks that have semicircular inverts or equivalent sections and cover the entire floor of the filter. Provide vent stack pipes of extra strength vitrified clay pipe conforming to ASTM C700 and that are provided as indicated.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Placing Rotary Distributor

**************************************************************************
NOTE: Delete bracketed wording pertaining to weirs or dependent on the provisions of weirs when distributors have less than four arms, except when two-compartment arms are used. Coordinate with paragraph CENTER COLUMN.
**************************************************************************

Provide rotary distributor that is installed in accordance with the recommendations of the manufacturer and by workmen experienced in the installation of this type of equipment. Carefully check all components with galvanized or other corrosion-protective coating and restore any damaged or abraded areas to the original or an equivalent coating. Provide proper alignment of all equipment. Set the anchor bolts in place and the nuts tightened against the shims. Securely bolt the stationary assembly in place. Further check the alignment of equipment after securing to the foundations and, after confirming all alignments, grout the stationary assembly in place using grout that conforms to ASTM C1107/C1107M. Align equipment with associated piping and under no circumstances will "pipe springing" be allowed. [ Set the weirs in accordance with the directions of
the manufacturer, based on anticipated flows.]

3.1.2 Placing Filter Block

Lay filter underdrain blocks in a dry mortar bed. Provide mortar that contain one part cement conforming to ASTM C150/C150M, Type II, and 4 parts sand conforming to ASTM C144, except a 1:3 cement–sand mortar bed for the first course of blocks where cover blocks are used. After the blocks are laid and before the stone is placed, dampen the dry mortar bed by sprinkling. Install filter blocks providing an uninterrupted flow through the drainage channels in the blocks to the effluent channel. Lay blocks in true alignment, with cross joints staggered in longitudinal rows at right angles to the center drains. Start the rows of blocks at the edge of the drainage channel and end at a sufficient distance from the filter wall to provide an air passage around the inside periphery of the filter. Provide air ducts comprised of either blocks or stacks for venting air to the atmosphere as shown on the drawings. Provide the manufacturer's plan layout of filter block units.

3.1.3 Placing Filter Media

Store stone or slag media delivered to the filter site on wood planks or other clean hard surface areas. Do not dump stone and slag directly into the filter. Rescreen and fork the media at the filter site to remove all fines before placement in the filter. Place material by hand to a depth of 300 mm 12 inches above the filter blocks and place all material without damaging or displacing the underdrains. Place the remainder of the material by means of belt conveyors, wheelbarrows, or other equipment recommended by the manufacturer. Place the media in layers not exceeding 450 mm 18 inches in depth. Place filter media as near as practicable in final position to avoid excessive rehandling; take special care to avoid breakage or segregation of different size particles. Dumping the filter media directly from trucks into the filter, dropping the filter media from heights exceeding 1 m 3 feet or throwing the media into the filter is not permitted. If it is determined that an excessive amount of fractured stone or dust is passing into the underdrains, remove and rescreen the filter media at a location outside the filter walls. Walkways or runways over the filter, except for the purpose of installing materials or equipment for the filter, are not permitted. Storing materials, such as cement or sand, or placing heavy construction equipment within the filter walls will not be permitted. Do not pass concrete, sand, dirt, or other materials deleterious to the filter over the filter by any means. Driving trucks, tractors, or other heavy equipment over the filter during or after construction is not permitted.[ Install plastic filter media in accordance with the recommendations of the media manufacturer.]

3.2 FIELD TESTS AND INSPECTIONS

Provide all labor, equipment, and incidentals required for the tests, except that water required for the field tests will be supplied as set forth in the CONTRACT. Notify the Contracting Officer [____] days prior to dates and times of field tests. Perform all field tests in the presence of the Contracting Officer. Rectify any deficiencies found and completely retest work affected by such deficiencies. Test the distributor mechanism to demonstrate correct alignment, smooth operation, and uniformity of flow distribution over the filter media.
3.3 CLOSEOUT ACTIVITIES

Submit **operating and maintenance manuals**. Provide manuals that include the manufacturer's name, model number, service manual, parts list, brief description of all equipment and their basic operating features, and simplified wiring diagrams for the system as installed.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Resident Office; and “PO” for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Treatment System Installation; G[, [_____]]

SD-03 Product Data

Manufactured Units; G[, [_____]]

Spare Parts; G[, [_____]]

Framed Instructions; G[, [_____]]

Manufacturer's Written Instructions; G[, [_____]]

Welding

SD-06 Test Reports

Field Tests and Inspections; G[, [_____]]

Furnish test results in booklet form not less than 30 days prior to the date of work completion.

SD-10 Operation and Maintenance Data

Operating and Maintenance Instructions; G[, [_____]]

[Six] [_____] [hard] [optical disc] copies.

1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Extra Materials

Submit spare parts data for all materials and for each different item of equipment specified, after approval of the detail drawings, and not later than [3] [_____] months prior to the date of work completion. Include in the data a complete list of parts and supplies, with current unit prices.

SECTION 46 53 62 Page 8
1.4 DELIVERY, STORAGE, AND HANDLING

Protect from damage, deterioration, weather, humidity and temperature variations, dirt and dust, or other contaminants, equipment in storage as required by the manufacturer.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
**NOTE:** A continuous loop reactor or oxidation ditch utilizes biological action to degrade organics in the wastewater. Consideration should be given to wastewaters from industrial facilities to ensure there are no components detrimental to microorganisms. In addition, Army facilities utilizing continuous loop reactors should include pretreatment equipment such as bar screens, comminuters and a grit chamber as required by the process conditions. Final clarification, sludge handling and disinfection equipment is also generally required. These and other possible components of the complete treatment system guide are not covered under this section.

Continuous loop reactors can take on many shapes (racetrack, folded U, concentric multi-channel, etc.) and configurations (serus, parallel, etc.). The designer is required to consider these options for space limitations, construction cost considerations, maintenance cost considerations, etc.

As required for military construction, only sprayed concrete (shotcrete) or placed reinforced concrete will be acceptable for the basin construction. Clay lined or synthetic membrane lined basins (even those protected from erosion) are not acceptable.

**************************************************************************

The work required by this section consists of furnishing and installing a continuous loop reactor (CLR). The system specified is a modified form of the activated sludge process and classified as an extended aeration system. The basin is to be constructed of an [earthen channel with an impervious sprayed concrete surface] [reinforced concrete structure], constructed at the depth and configuration indicated. The basin includes all aeration/mixing equipment, [piping,] [pumps,] [baffles,] [weirs] and [turning walls] necessary for proper performance and operation.

2.1.1 Design Requirements

**************************************************************************
**NOTE:** Some states and regulatory agencies require a minimum detention time of 24 hours. Check the governing regulations for activated sludge/extended aeration processes for the project location.
Insert average daily and peak daily flow rates and the required BOD5 removal efficiency. Typically, 90-95 percent removal can be achieved in a continuous loop reactor. Comply with UFC 3-240-02 to determine design criteria.

Treatment of the wastewater is accomplished by contact with the waste activated sludge in the CLR for a minimum of [18] hours. Size the CLR for an average daily flow of [_____] L/second mgd and a peak daily flow of [_____] L/second mgd. The CLR is required to remove a minimum of [_____] percent of the influent five day BOD at the average daily flow rate and influent five day BOD.

2.1.2 Mixing Parameters

The aeration/mixing system selected provides the propelling force for circulation and mixing of the basin contents. Size the aeration/mixing unit(s) to maintain an average horizontal velocity of not less than [0.305] m/second [1.0] fps throughout the basin and maintain a uniform mixed liquor suspended solids (MLSS) concentration throughout the basin at MLSS concentrations up to [5000] mg/L, with one aeration/mixing device not operating.

2.1.3 Aeration Parameters

NOTE: The Actual Oxygen Requirement (AOR) is calculated by the designer. The oxygen required for oxidation of BOD and the oxygen required for nitrification must be included in the AOR. Typical values are 0.82 kg 1.8 pounds of oxygen per 0.45 kg 1.0 pound of BOD applied and 2.1 kg 4.6 pounds of oxygen per 0.45 kg 1.0 pound of TKN applied. The alpha coefficient is defined as the ratio of the oxygen transfer in the wastewater to the oxygen transfer in clean water and may vary from 0.2 to 1.5. The alpha coefficient is a direct multiplier in determining oxygen transfer capabilities and is affected by mixed liquor temperature, liquid depth and basin geometry, the level of turbulence, mixing patterns and the nature of dissolved organics and mineral constituents in the wastewater and even the type of aeration equipment. Fine bubble aeration systems typically have lower alpha values than mechanical aeration systems. Because of this variation in alpha value a default value is not shown below. The Beta coefficient is defined as the ratio of oxygen saturation level for the wastewater (mixed liquor) to the oxygen saturation level for tap water. Theta is a temperature correction coefficient for oxygen transfer efficiency (OTE). Values of 1.020 to 1.028 are normally used for diffused air systems, while a value of 1.024 is normally used for mechanical aeration systems.

An OTE of 0.507 mg oxygen per joule 3.0 lb. oxygen/hp-hr under standard conditions is an average value for aeration equipment commonly used in closed
loop reactor applications. Designer should contact the aerator manufacturer for the OTE of a particular aerator. An aeration system in this range will provide oxygen transfer for an average power cost. Insert the efficiency value desired for the particular design.

The requirement to maintain a minimum dissolved oxygen concentration of 0.5 mg/L should be omitted if the designer has provided for an anoxic zone within the reactor.

Base the aeration/mixing system selected upon the following process requirements:

a. Actual Oxygen Requirement (AOR) [_____] kg oxygen/day lbs. oxygen/day.

b. Alpha Coefficient [_____].

c. Beta Coefficient [0.95] [_____].

d. Theta Coefficient [1.024] [_____].

Select the aeration/mixing system to provide no less than [_____] mg oxygen/joule lb. oxygen/hp-hr under standard (clean water) conditions [and to maintaining a dissolved oxygen concentration of not less than [0.5] [_____] mg/L anywhere in the CLR]. Provide factory test results for a similar treatment application and configuration to substantiate the OTE.

2.2 MANUFACTURED UNITS

Provide a complete list of equipment and materials, including manufacturer's descriptive and technical literature; performance charts and curves; catalog cuts; installation instructions; and a recommendation on quantities of spare parts to have on hand at all times for each piece of equipment.

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and which essentially duplicate items that have been in satisfactory use in similar facilities for at least 2 years prior to bid opening. Ensure all aeration/mixing equipment, associated accessories, and appurtenances is supplied by the same manufacturer. Ensure equipment is supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.2.2 Nameplates

Provide pumps, blowers and motors with the manufacturer's name, address, type or style, model or serial number, and catalog number on a stainless steel plate permanently secured to the item of equipment.
2.2.3 Protection of Moving Parts

Completely enclose, chains, couplings, and other moving parts by use of guards to prevent accidental personal injury. Configure guards to be removable or so arranged as to allow access to the equipment for maintenance. If equipment is housed in a lockable housing, ensure housing provides sufficient protection and no additional guards are necessary.

2.3 EQUIPMENT

2.3.1 Disc and Rotor Aerators

**************************************************************************
NOTE: The paragraphs that follow contain optional types of aeration systems which may be used by the designer. Only the paragraphs applying to the selected system should be left and the others removed. However, if the disc and rotor option is selected note that these aerators can normally be substituted, one for the other, in the same basin configuration so that both disc and rotors may be specified.
**************************************************************************

2.3.1.1 Aeration Mechanism

Provide the [disc] [or] [rotor] aeration system as indicated. Provide complete units and include [disc] [or] [rotor] assemblies, shaft, or torque tube, drive unit, bearings, supports and all appurtenances necessary for the proper operation of the equipment. Design the [disc] [or] [rotor] aeration system for continuous operation.

2.3.1.1.1 Disc Assembly

**************************************************************************
NOTE: Twelve individual discs or rotors in an assembly are typical. The diameter of the unit is variable and should be designed based upon basin configuration, oxygen transfer rates, velocity and efficiency requirements.
**************************************************************************

Provide each assembly with individually molded [plastic] [fiberglass] discs, [_____] mm inch in diameter and mounted not less than 150 mm 6 inch on center. Provide the number and spacing of disc assemblies indicated. Secure the disc assemblies to the shaft with a clamp ring, by using a keyed shaft or by another method to hold the assembly tightly, ensure no slippage, and provide continuous proper alignment. Split the discs into two sections for attachment or removal without disassembling the shafting. Supply stainless steel positioning bolts to hold the two halves together on the shaft.

2.3.1.1.2 Rotor Assembly

**************************************************************************
NOTE: Twelve individual discs or rotors in an assembly are typical. The diameter of the unit is variable and should be designed based upon basin configuration, oxygen transfer rates, velocity and
efficiency requirements.

Each blade assembly consists of [12] [_____] individual or six dual [stainless steel] [plastic] [epoxy coated steel] [hot-dipped galvanized steel] blades, [_____] mm inch in diameter mounted not less than 150 mm 6 inch on center. Provide the number and spacing of rotor assemblies indicated. Secure the blade assemblies to the shaft with a clamp ring, by using a keyed shaft, by compression between the assembly blades and the shaft or by another method to hold the assembly tightly, ensure no slippage, and provide continuous proper alignment. Provide the blades so they are removable by unbolting. Welding blades to the shaft is not allowed.

2.3.1.1.3 Velocity Baffles

Provide velocity baffles at the indicated locations and alignment and in accordance with all structural and installation requirements as recommended by the manufacturer of the aeration mechanism.

2.3.1.1.4 Splash Plates

NOTE: If outboard bearings are not required or if they are designed to be wetted, or if protective covering hoods include splash protection delete this paragraph.

Mount fabricated [steel] [aluminum] [stainless steel] plates in the vertical concrete walls at the drive assembly and outboard bearings and bolt to the frames as indicated. Ensure the opening in the wall formed by the splash plate is of sufficient width for removal of shafts. Where the shaft passes through the splash plates, provide a rubber gasket seal on both sides to seal water from the service area.

2.3.1.1.5 Disc and Rotor Immersion Requirements

NOTE: To maintain the water level within the recommended range it is very important that the effluent weir be sized properly and be manually adjustable.

The immersion depth will vary with the diameter of rotor selected. The depths indicated assume a standard 1220 mm 48 inch diameter unit.

To ensure the most efficient operation of the aeration system and to avoid damage to the drive system the [operate disc with a minimum immersion of [300] [_____] mm [12] [_____] inch and a maximum immersion of [535] [_____] mm [21] [_____] inch] [operate rotor blades with a minimum immersion of [100] [_____] mm [4] [_____] inch and a maximum immersion of [355] [_____] mm [14] [_____] inch].

2.3.1.1.6 Shafts and Bearings
NOTE: There are no apparent mechanical or operational advantages in stub shafts and continuous through shafts. Different manufacturers market different shafts. Check with potential manufacturers before specifying shaft type. Contractor should usually be allowed to use either shaft.

Support the [disc] [or] [rotor] assembly at both ends by a shaft fabricated of steel conforming to ASTM A36/A36M. Provide a [solid steel shaft] [steel torque tube shaft with a minimum 9.5 mm 0.375 inch wall thickness]. Furnish each [disc] [or] [rotor] assembly support bearing assemblies. Ensure bearings are waterproof, self-aligning and consist of a cast-iron pillow block set on adjustable anchor plates. Provide grease lubricated bearings with a minimum L-10 life of 100,000 hours in accordance with ABMA 9 or ABMA 11.

2.3.1.1.7 Protective Covering

Provide an [ultraviolet light protected fiberglass] [_____] cover, extending over the length of each aeration unit. Design the cover to protect all adjacent structures from splashing caused by the units. Mount the cover independent of the aeration equipment and install in accordance with the manufacturer's requirements.

2.3.1.2 Drive System

2.3.1.2.1 Reducer

Construct the drive system reducer to maintain alignment of bearings and gearing while absorbing the external loads of the [disc] [or] [rotor] assembly. Design the unit to continuously withstand all internal loadings developed at the full load motor wattage horsepower, including motor starting torques up to 250 percent of motor running torques. Design the unit to also withstand all external loadings produced by torque, out-of-balance and vibration resulting from operating conditions. Provide a speed reducer with lifting lugs. Vent the interior of the gear case by use of an approved breather, constructed to retard the entrance of water vapor.

2.3.1.2.2 Housing

Construct drive to be weatherproof and made of steel in accordance with ASTM A36/A36M or high grade cast-iron in accordance with ASTM A48/A48M. Apply a protective coating that will not peel, crack or discolor at continuous operating temperatures up to 121 degrees C 250 degrees F.

2.3.1.2.3 Rating

Provide drive gearing with a minimum service factor of at least [1.4] [_____] times the rated brake horsepower of the drive motor. Ensure gear reduction system is suitable for continuous operation and moderate shock loading in accordance with ANSI/AGMA 6113AGMA 6013 for gear motor reducers or gear motors using helical and spiral bevel gears.

2.3.1.2.4 Bearings

Provide power transmission bearings that are of the antifriction type and
have a minimum L-10 life of 100,000 hours at maximum operating speed in accordance with ABMA 9 or ABMA 11. Ensure bearings are fully sealed and protected from water spray.

2.3.1.2.5 Lubrication

**************************************************************************
NOTE: If lubricating pumps are not used delete subparagraph b. and edit accordingly.
**************************************************************************

a. Provide lubrication by [gears running in an oil bath] [an oil slinger] [pumps]. Provide the drive with an oil "dam", spring loaded lip seals or other means of positive protection against lubricant leakage around the output shaft. Also provide an oil level gauge or sight glass and drain fittings. Ensure the thermal rating of the gear reducer exceeds the design load or provide proper cooling.

b. Ensure lubricating pumps are removable for maintenance without disassembly of the drive and/or removal of the motor. Provide either a low pressure or low oil level switch to shut off the unit in the event of insufficient lubrication.

2.3.1.2.6 Couplings

Transmit power from the motor to the gear reduction system by means of [a flexible coupling, direct drive of the non-lubricated type, manufacturer's standard, selected to provide a minimum service factor of 2.0] [sheaves and [V-belts] [chains]. To reduce the output speed, provide removable sheaves.] Cover the assembly with a suitable guard and protect from splashing.

2.3.1.3 Mounting

Provide a base mounted drive system which is separately mounted on a concrete pier or a shaft mounted drive system which is supported by the drive side rotor bearing.

2.3.2 Low Speed Surface Aerators

Furnish and install low speed mechanical surface aerators as indicated. Ensure each supplied unit is complete and include an electric motor, a gear reducer, shaft and impeller driven at a constant speed, and all necessary fasteners, stabilizers, anchoring devices, and other mechanical and structural appurtenances necessary for the mounting and operation of the units. Design the aerators for continuous operation.

2.3.2.1 Impeller Shaft

Construct the shaft of [carbon steel] and size to withstand all torque loads and bending moments produced by operation of the system. Design the shaft and bearing assembly to allow operation below 80 percent of its natural frequency without the use of stabilizing devices. Ensure the shaft is constructed so its deflection will not affect the alignment of the antifriction bearings or cause misalignment of the gearing during the mixing/aeration operation. Ensure the shaft supporting the impeller is removable from the drive assembly, without disassembly of the gear box. Use rolling, antifriction type bearings on the impeller shaft which have a minimum L-10 life of 100,000 hours in accordance with ABMA 9 or ABMA 11.
Support the entire weight of the shaft and impeller by a thrust bearing integral with the gear reducer. Use a rigid coupling to connect the shaft and turbine assembly to the output shaft of the reducer. Provide bearings on the shaft that are either grease or oil lubricated, and are positively sealed against penetration of moisture, or leakage of lubricant down the shaft. Include provisions for checking the adequacy of lubrication.

2.3.2.2 Impeller

Construct the impeller of [carbon steel] ______ and positively fasten it to the shaft with all [carbon steel] ______ hardware. Provide means for adjustment of the impeller. If the adjustment is on the shaft, provide means to prevent the impeller from dropping off the shaft during adjustment. Impeller submergence to ensure the most efficient operation of the aeration system.

2.3.2.3 Drive System

2.3.2.3.1 Reducer

Construct the drive system reducer to maintain alignment of bearings and gearing while absorbing the external loads of the impeller. Design the unit to withstand continuously all internal loadings developed at the full load motor **wattage horsepower**, including motor starting torques up to 250 percent of motor running torques. Design the unit to also withstand all external loadings produced by torque, thrust, out-of-balance and vibration resulting from operating conditions. Provide the speed reducer with lifting lugs. Vent the interior of the gear case by means of an approved breather, constructed to retard the entrance of water vapor.

2.3.2.3.2 Housing

Construct the drive housing to be waterproof and made of steel in accordance with ASTM A36/A36M or high grade cast-iron conforming to ASTM A48/A48M. Apply a protective coating that will not peel, crack or discolor at continuous operating temperatures up to 121 degrees C 250 degrees F.

2.3.2.3.3 Rating

Provide gearing with a minimum service factor of at least [2.5] _____ times the rated brake horsepower of the drive motor. Ensure the gear reduction system is suitable for continuous operation and moderate shock loading in accordance with ANSI/AGMA 6113AGMA 6013 for motor reducers or gear motors using helical and spiral bevel gears.

2.3.2.3.4 Bearings

Use power transmission bearings of the antifriction type which have a minimum L-10 life of 100,000 hours at maximum operating speed in accordance with ABMA 9 or ABMA 11. Ensure bearings are fully sealed and protected from water spray.

2.3.2.3.5 Lubrication

******************************************************************************
NOTE: If lubricating pumps are not used delete subparagraph b. and edit accordingly.
******************************************************************************
a. Provide for lubrication by [gears running in an oil bath] [an oil slinger] [pumps]. Provide drive with an oil "dam" or other means of positive protection against lubricant leakage around the output shaft. Also provide an oil level gauge or sight glass and drain fittings. Ensure the thermal rating of the gear reducer exceeds the design load. If this is not the case, then provide a proper means of cooling.

b. Ensure lubricating pumps are removable for maintenance without disassembly of the drive and/or removal of the motor. Provide either a low pressure or low oil level switch to shut off the unit in the event of insufficient lubrication.

2.3.2.3.6 Couplings

Transmit power from the motor to the gear reduction system by a non-lubricated coupling which is direct driven. Use manufacturer's standard couplings selected to provide a minimum service factor of 2.0.

2.3.2.4 Mounting

************************************************************

**NOTE:** To maintain the water level within the recommended range it is very important that the effluent weir be sized properly and be manually adjustable. Verify immersion depth with potential manufacturers.

************************************************************

Construct a [structural bridge of steel conforming to ASTM A36/A36M] [concrete bridge] and support assembly designed to mount each aeration unit as indicated. Structurally anchor the bridge assembly to the basin walls. To ensure the most efficient operation of the aeration system, mount the aerator with the top of the impeller blades [50] [_____] mm [2] [_____] inch above the minimum water surface elevation. Ensure the blades are not submerged more than [200] [_____] mm [8] [_____] inch at the maximum water surface elevation.

2.3.2.5 Protective Covering

The manufacturer is required to supply an [ultraviolet light protected fiberglass] [_____] cover for each aeration unit. Design the cover to protect all adjacent structures from splashing caused by the unit. Mount the cover independent of the aeration equipment and be install it in accordance with the manufacturer's requirements.

2.3.3 Submerged Turbine Draft Tube Aerators

Furnish and install the submerged turbine draft tube aeration system as indicated. Provide the unit complete to include blowers, drive unit, turbine aerator unit and supports, draft tube assembly, and all appurtenances necessary for the proper operation of the equipment. Design the aerators for continuous operation.

2.3.3.1 Impeller Shaft

Construct the shaft of [carbon steel] [_____] and size it to withstand all torque loads and bending moments produced by operation of the system. Design the shaft and bearing assembly to allow operation below 80 percent
of its natural frequency without the use of stabilizing devices. Construct the shaft so that its deflection will not affect the alignment of the antifriction bearings or cause misalignment of the gearing during the mixing/aeration operation. Ensure the shaft supporting the impeller is removable from the drive assembly, without disassembly of the gear box. Use rolling, antifriction type bearings on the impeller shaft with a minimum L-10 life of 100,000 hours in accordance with ABMA 9 or ABMA 11. Support the entire weight of the shaft and turbine by means of a thrust bearing installed integrally with the gear reducer. Use a rigid coupling to connect the shaft and turbine assembly to the output shaft of the reducer. Provide bearings on the shaft that are either grease or oil lubricated and are positively sealed against penetration of moisture or leakage of lubricant down the shaft. Provide means for checking the adequacy of lubrication.

2.3.3.2 Impeller

Construct the impeller of [carbon steel] [_____] and positively fasten it to the shaft with all [carbon steel] [_____] hardware. The impeller is required to be removable from the shaft. Means for adjustment of the impeller. If the adjustment is on the shaft, provide a means to prevent the impeller from dropping off the shaft during adjustment.

2.3.3.3 Drive System

2.3.3.3.1 Reducer

Construct the drive system reducer to maintain alignment of bearings and gearing while absorbing the external loads of the impeller. Design the unit to continuously withstand all internal loadings developed at the full load motor wattage horsepower, including motor starting torques up to 250 percent of motor running torques. Design the unit to withstand all external loadings produced by torque, thrust, out-of-balance and vibration resulting from operating conditions. Provide lifting lugs with the speed reducer. Vent the interior of the gear case using an approved breather, constructed to retard the entrance of water vapor.

2.3.3.3.2 Housing

Provide a weatherproof drive housing constructed of steel in accordance with ASTM A36/A36M or high grade cast-iron conforming to ASTM A48/A48M. Apply a protective coating that will not peel, crack or discolor at continuous operating temperatures up to 121 degrees C 250 degrees F.

2.3.3.3.3 Rating

Ensure the gearing has a minimum service factor of at least [2.0] [_____] times the rated brake horsepower of the drive motor. Ensure the gear reduction system is suitable for continuous operation and moderate shock loading in accordance with ANSI/AGMA 6113AGMA 6013 for motor reducers or gear motors using helical and spiral bevel gears.

2.3.3.3.4 Bearings

Provide power transmission bearings that are antifriction type and have a minimum L-10 life of 100,000 hours at maximum operating speed in accordance with ABMA 9 or ABMA 11. Ensure bearings used are fully sealed and protected from water spray.
2.3.3.3.5 Lubrication

**************************************************************************
NOTE: If lubricating pumps are not used delete subparagraph b. and edit accordingly.
**************************************************************************

a. Provide lubrication by [gears running in an oil bath] [an oil slinger] [pumps]. Provide drive with an oil "dam" or other means of positive protection against lubricant leakage around the output shaft. Also provide an oil level gauge or sight glass and drain fittings. Ensure the thermal rating of the gear reducer exceed the design load or provide proper cooling.

b. Ensure all lubricating pumps are removable for maintenance without disassembly of the drive and/or removal of the motor. Provide either a low pressure or low oil level switch to shut off the unit in the event of insufficient lubrication.

2.3.3.6 Couplings

Transmit power from the motor to the gear reduction system by using a non-lubricated coupling, direct driven. Ensure all couplings are the manufacturer's standard and select to provide a minimum service factor of 2.0.

2.3.3.4 Draft Tube

Each draft tube consists of upper and lower sections of epoxy coated steel. The upper section consists of the suction cone, supports for connection to the turbine support assembly, air distribution assembly, deflection-limiting system, flow direction baffles, and supports for connection to the bottom section. The bottom section is required to be [_____] mm feet long, sufficient to carry the design flow with minimal pressure drop. Shape bottom section to carry the wastewater to a sufficient depth to dissolve the required oxygen and direct the flow forward in the channel. The draft tube is required to be [_____] mm inch in diameter with a 6 mm 1/4 inch minimum wall thickness, and equipped with grout rings as shown.

2.3.3.5 Mounting

Construct a [structural bridge of steel conforming to ASTM A36/A36M] [concrete bridge] and support assembly designed to mount each aerator as indicated. The bridge assembly is required to be sufficient to support the turbine aerator, suction cone, air sparge assembly and the flow directional baffle assembly.

2.3.3.6 Air Supply Equipment

Provide blower(s) that conform to Section 46 51 00.00 10 AIR AND GAS DIFFUSION SYSTEM.

2.3.4 Jet Aeration

**************************************************************************
NOTE: Jet aeration systems require that preliminary treatment system be included upstream of the CLR to remove grit and other larger particles to reduce the
The aeration equipment covered in this specification is listed below along with some general requirements for their use. For further assistance in determining the applicability of the CLR, refer to UFC 3-230-14A and for design criteria refer to UFC 3-240-02.

a. Disc or Rotor (Brush) Aerators: This type of aeration system creates surface agitation to provide oxygen transfer and imparts a horizontal velocity by the rotation of the unit. The channel may be constructed with either sloped or vertical side walls. Typically the channels are constructed 2.4 m 8 feet to 3.7 m 12 feet deep. Channels greater than 2 m 7 feet deep may require a velocity baffle downstream of the aeration unit to help impart a downward velocity to the wastewater and improve mixing along the channel bottom. The CLR should not be constructed with a sidewater depth greater than 4.3 m 14 feet if disc or brush aerators are specified. In addition, turning walls are recommended at each bend to maintain channel velocities around the corners.

b. Low Speed Surface Aerators: This type of aeration system creates surface agitation to provide oxygen transfer and imparts a velocity to the wastewater by the swirling action created by the impeller. The aerators must be placed at the turns in the channel to achieve effective horizontal velocity. At bends where aerators are not located, turning walls are recommended to maintain channel velocities around the corners. Floating aerators should not be considered for use in a CLR application due to the area required for the pontoons. The channel may be constructed with either sloped or vertical side walls. With this equipment, vertical side walls are recommended at the turns. Channel depths will vary from 2 to 5 m 6 to 16 feet). Draft tubes should be provided when recommended by the manufacturer.

c. Submerged Turbine Aerators: Submerged turbine aerators used in CLR's utilize a downward pumping impeller to force an air and water mixture through a draft tube that extends below the bottom of the basin and through a barrier wall extending across the basin. The barrier wall may be constructed of concrete, compacted clay or reinforced earth. The turbine's impeller should be located at a depth of approximately 20 percent of the basin sidewater depth. The air is discharged through a sparge ring below the impeller and becomes entrained in the downward flow of water through the draft tube. The system requires an air blower, as well as the turbine unit. However, the system offers turn down flexibility because the turbine and blower are
operated independent of each other. Sloped or vertical walls are acceptable with this system and the basin should have a single side water depth within the range of 2.4 to 5 m 8 to 16 foot sidewater depth. In addition, turning walls are recommended at each bend to maintain channel velocities around the corners.

d. Jet Aeration: Jet aeration combines air flow and pumped liquid in a vortex jet nozzle which is discharged just above the channel floor. The jet system consists of a recirculation pumping system and an air blower, each feeding headers that discharge through the jet nozzles. The typical configuration utilizes a concrete basin with a 3.7 to 6 m 12 to 20 foot sidewater depth, preferably with vertical side walls. In addition, turning walls are recommended at each bend to maintain channel velocities around the corners. The jet nozzles can be fixed or they can be mounted on removable or swing headers to facilitate maintenance. Removable and swing header systems will require the construction of thrust blocks located behind the nozzles to prevent any deflection caused by the jet action.

e. Diffused Aeration/Low Speed Mixer System: In this system, a coarse, medium or fine bubble diffused aeration system is used in conjunction with a submerged low speed mixing unit that supplies the horizontal velocity. The propeller type mixer, mounted on guide rails, is positioned immediately upstream of the diffusers. Vertical or sloping side walls are acceptable with basin sidewater depth ranging between 3.7 to 6 m 12 to 20 foot. In addition, turning walls are recommended at each bend to maintain channel velocities around the corners. Vertical side walls are recommended in the area of the diffusers to maximize oxygen transfer. Consideration should also be given to providing a removable or swing header system to facilitate maintenance of the diffusers.

f. System Choice: Since the configuration of the channel will vary with the type of equipment selected, the choice of aeration system must be decided upon first. Each aeration system listed above is specified herein. Only the paragraphs applying to the aeration system selected should be included in the specification. All paragraphs and subparagraphs for the other aeration systems should be deleted.

**************************************************************************

Provide the jet aeration system as indicated. The system includes air-liquid jet manifolds, [vertical propeller] [submerged centrifugal] pumps, pneumatic backflush system, air blowers, and all in-basin air and liquid piping and supports. Design the jet aeration system for continuous operation.
2.3.4.1 Submerged Jets

**************************************************************************
NOTE: The nozzle size will affect the performance of the system by changing the water and air mixture. The standard nozzle size is 40 mm 1-1/2 inches, however, the process requirements should be checked to determine proper nozzle size. The number and size of nozzles is site specific and is effected by the tank size, solids concentration, oxygen demand requirements and other factors. Designer should contact the equipment manufacturer for information on nozzle sizing.
**************************************************************************

The jet aeration system consists of [fiberglass reinforced plastic] [_____] jet nozzles, oriented in a common direction and attached to a common manifold. The manifold consists of separate liquid and air piping so that the air and liquid do not mix prior to reaching the mixing chamber of the jet. The liquid portion of the manifold is required to provide uniform distribution of mixed liquor from the inlet of the manifold to each of the jets. The jets consist of 2 nozzles and a mixing chamber constructed integrally with the manifold. The primary jet directs the mixed liquor into the mixing chamber where air is introduced and combined with the liquid. The air-liquid mixture then discharges into the secondary nozzle and, hence horizontally into the basin. Carefully mold the two nozzles to maintain proper alignment and tolerances. To reduce the likelihood of plugging, each jet nozzle has a minimum intake and discharge diameter of 40 mm 1-1/2 inches. Construct the manifold assembly of [fiberglass reinforced plastic] [epoxy coated carbon steel] [______]. Design the manifold to withstand all normal stresses encountered in shipping, handling and operation.

2.3.4.2 Recirculation Pumps

**************************************************************************
NOTE: Select the applicable pump from the following paragraphs:
**************************************************************************

2.3.4.2.1 Vertical Propeller Pump

**************************************************************************
NOTE: Vertical propeller pump manufacturer design manuals should be consulted to determine spacing of pumps to avoid influence of the pump suctions.

Pumps should be identified on the drawings by a number. Insert the identification number in part b. of this paragraph; part b. should be repeated as necessary for pumps of the same type with different operating characteristics.
**************************************************************************

a. General: Install the pumping system as indicated and ensure it is suitable for outdoor installation. Design the unit, consisting of vertical shaft, [single] [multistage] propeller type pump and motor to operate safely in the reverse direction of rotation, due to water
returning through the pump. Carry the weight of the revolving parts of the pump, including the unbalanced hydraulic thrust of the propeller, by means of a thrust bearing in the motor. Support the pump from a base plate by means of a vertical column having horizontal discharge located below the base plate.

b. Pump Characteristics: Provide pump number(s) [_____] having the following operating characteristics:

(1) Pump Service.

(2) Design Operating Point: [_____] L/second gpm flow, [_____] mm feet head, [_____] percent efficiency.

(3) Maximum Operating Point: [_____] L/second gpm flow, [_____] mm feet head, [_____] percent efficiency.

(4) Minimum Operating Point: [_____] L/second gpm flow, [_____] mm feet head, [_____] percent efficiency.

(5) Propeller Type: [_____].

(6) Discharge Diameter: [_____] mm inch.

(7) Bell Diameter: [_____] mm inch.

(8) Column Length: [_____] mm feet.

(9) Operating Speed: [_____] rpm.

(10) Minimum Bell Submergence: [_____] mm inch.

(11) Pump Control: [_____].

c. Pump Column and Discharge Elbow: Construct the pump supporting column of steel pipe with a minimum [6] [_____] mm [1/4] [_____] inch thickness. Use a flanged discharge opening for connection to the discharge pipe. Use long radius discharge elbows made of [welded steel] [cast-iron].

d. Base Plate: Suspend the pumping unit from a base plate of adequate structural design to support the weight of the complete unit filled with water. Fabricate the base plate of cast iron or steel and size to allow the entire pump to be removed, with the discharge flange attached. Use stainless steel base plate mounting hardware. Locate the packing box on or above the base plate to provide for easy maintenance. Mount the motor above the pump.

e. Suction Bell and Impeller Housing: Construct the suction bell and impeller housing of [ductile] [cast] iron [_____] and design for easy removal of the propeller and lower bearing. Provide the suction bell with a flared inlet designed to reduce entrance loss and provide with flanges to adequately support the lower bearing and support the weight of the propeller and propeller shaft.

f. Propeller: Construct the pump propeller using [bronze] [_____] and balance propeller statically and dynamically to reduce vibration and wear.
g. **Propeller Shaft**: Size the propeller shaft to operate without objectionable distortion or vibration in both forward and reverse rotation. Fabricate the propeller shaft using [stainless steel] and direct couple propeller shaft to the line shaft. Ensure the propeller shaft is adjustable with reference to the bowl. Construct the line shaft of [carbon steel] and extend as one unit to the motor shaft. Enclose the line shaft in a water-tight steel column.

h. **Bearings**: Ensure the pump is equipped with a [bronze] sleeve bearing immediately above the propeller, and a [bronze] lower support bearing below the propeller. For line shafts greater than 3 m 10 feet in length, also provide [bronze] intermediate shaft bearings. Install the intermediate shaft bearings inside the water-tight steel column. At the top of the line shaft, include a [bronze] tension bearing with a tension nut and tension ring. Ensure all bearings are easily replaceable and spaced to provide adequate support for the shaft and to prevent vibration. Use bearings with an L-10 life of 100,000 hours in accordance with ABMA 9 or ABMA 11.

i. **Lubrication**: Equip the pump with an automatic lubricating system which supplies grease lubricant to all but the lower support bearings. Grease pack the lower support bearings.

2.3.4.2.2 **Submersible Centrifugal Pumps**

Provide submersible centrifugal pumps used for the jet aeration system in accordance with Section 22 13 29 SANITARY SEWERAGE PUMPS.

2.3.4.2.3 **Self-Priming Centrifugal Pumps**

Provide self-priming centrifugal pumps used for the jet aeration system in accordance with Section 22 13 29 SANITARY SEWERAGE PUMPS.

2.3.4.2.4 **Vertical Turbine Pumps**

**************************************************************************
**NOTE: Vertical turbine pump manufacturer design manuals should be consulted to determine spacing of pumps to avoid influence of the pump suctions.**
**************************************************************************

Provide vertical turbine pumps used for the jet aeration system in accordance with Section 23 21 23 HYDRONIC PUMPS.

2.3.4.2.5 **Pump Suction Screens**

Mount a [stainless steel] screen to the suction of the pump. Provide a screen sized to ensure nothing larger than 25 mm 1 inch in diameter to pass.

2.3.4.3 **Blowers**

Provide blowers in accordance with Section 46 51 00.00 10 AIR AND GAS DIFFUSION SYSTEM.

2.3.5 **Diffused Aeration/Slow Speed Mixer System**

Furnish and install the diffused aeration/slow speed mixer system as
indicated. Provide a complete system including air supply, distribution and diffuser equipment designed to satisfy the oxygen requirement, and the adequate number of submersible mixing units to create and maintain a horizontal velocity in the basin and maintain solids suspension. The air supply and distribution system includes blowers, piping, valves, diffusers, supports and all necessary appurtenances to ensure proper operation of the equipment. The mixing units consist of a propeller driven by a [submersible electric motor] [hydraulic system], a support structure that allows the unit to be easily removed from the basin, and all cables and appurtenances necessary to ensure proper operation of the equipment. Design the combined system for continuous operation.

2.3.5.1 Diffused Aeration System

Provide the diffused aeration and blower system as specified in Section 46 51 00.00 10 AIR AND GAS DIFFUSION SYSTEM.

2.3.5.2 Slow Speed Mixer (With Submersible Electric Motor)

**************************************************************************
NOTE: Designer will allow bids on either hydraulic motors or electric motors unless job requirements warrant eliminating one of the options.
**************************************************************************

Ensure all components of the mixer, including the motor, are capable of continuous underwater operation while the mixer blade is either completely submerged or partly submerged. In addition, ensure all components of the mixer, including motor, are capable of continuous operation in air, completely unsubmerged, for a minimum of [2] [_____] hours.

2.3.5.2.1 Mixer Propeller

Construct the propeller of [ASTM A167, Type 304 stainless steel] [cast-iron] [molded fiberglass] [_____] and shape so that no solids, fibrous material and other material found in normal wastewater applications collects on the blades. Dynamically balance the propeller to [5.3] [_____] N/meter [0.03] [_____] pounds/inch and [internally key it for engagement with the shaft] [ensure it slides onto the shaft and is securely fastened with a screw washer and sleeve] [______].

2.3.5.2.2 Drive System

Provide each mixer be direct-driven, close-coupled, completely submersible units. Use mixer motors that are squirrel-cage induction, shell type design, housed in an air-filled, watertight chamber. Insulate the stator winding with moisture-resistant Class F insulation in accordance with NEMA MG 1 and design for continuous duty. Ensure the cable entry is an integral part of the stator casing and is leakproof. In addition, machine all mating surfaces where water tight sealing is required and fit with [nitrile] [_____] rubber O-rings.

2.3.5.2.3 Shafts and Seals

Ensure the mixer motor shaft is integral with the propeller shaft and rotates on two permanently lubricated bearings. Provide ball bearings with a minimum L-10 life of 100,000 hours as defined by ABMA 9 or ABMA 11. Provide each mixer with a tandem mechanical rotating shaft seal system on the propeller shaft. Provide lapped end face type seals and run them in an
oil reservoir. The inner seal is required to contain one stationary and one positively driven rotating ceramic ring. The outer seal is required to contain one stationary and one positively driven rotating tungsten carbide ring.

2.3.5.2.4 Mounting

Configure mixer capable of being raised and lowered from the basin for ease of repair and maintenance. Mount the mixer on and guide by a sliding bracket constructed to withstand all thrust created by the mixer. Provide a lifting cable and winch mechanism to permit raising and lowering of the mixer on the sliding bracket.

2.3.5.3 Slow Speed Mixer (With Hydraulic Motors)

Each hydraulic horizontal mixer consists of a hydraulic power unit and motor, a direct drive shaft and propeller, hydraulic lines, and all mounting and support brackets to provide for proper operation. In addition, all components of the mixer are required to capable of continuous operation in air, completely unsubmerged, for a minimum of [2] [_____] hours.

2.3.5.3.1 Mixer Propeller

Construct the propeller of [cast-iron] [molded fiberglass] [_____] and shaped so that no solids, fibrous material and other material found in normal wastewater applications collects on the blades. Dynamically balance the propeller to [5.3] [_____] N/meter [0.03] [_____] pounds/inch and [internally key it for engagement with the shaft] [ensure it slides onto the shaft and is securely fastened with a screw washer and sleeve] [______].

2.3.5.3.2 Drive System

a. Hydraulic Motor: Provide hydraulic motor of the low speed, high torque, fixed displacement type to drive the propeller. Ensure the hydraulic motor is capable of withstanding end thrust loads of not less than 4.45 kN 1000 pounds either into or out from the motor. Ensure hydraulic motor is rated for a B-10 life of not less than 100,000 hours in accordance with ABMA 9 or ABMA 11. Connect the hydraulic motor to the hydraulic pump with a hose having a continuous pressure rating of not less than 20.7 MPa 3000 psi.

b. Hydraulic Pump: Enclose the hydraulic pump in the hydraulic reservoir and mount directly to the electric motor adapter. Ensure the hydraulic pump has a continuous pressure rating of not less than 13.8 MPa 2000 psi. Ensure the hydraulic fluid flow control mechanism lock and is fully adjustable to allow for infinitely variable speed control.

c. Reservoir and Accessories: Construct the hydraulic reservoir of steel. Include a filler/breather assembly, and a fluid level/temperature gauge and clean-out cover. Connect the hydraulic reservoir to the hydraulic motor with a hose having a continuous pressure rating greater than the rating of the hydraulic pump but not less than 20.7 MPa 3000 psi.

2.3.5.3.3 Mounting

Provide mixer capable of being raised and lowered from the basin for ease of repair and maintenance. Mount the mixer on and guide by a sliding
bracket constructed to withstand all thrust created by the mixer. Provide a lifting cable and winch mechanism to permit raising and lowering of the mixer on the sliding bracket.

2.3.6 Lubrication Requirements

Provide an adequate means of lubrication for all moving parts subject to wear. Except as otherwise specified, lubricate using grease or oil. Provide grease fittings for all grease-type bearings. If bearings are not easily accessible, provide grease tubing in a convenient location. Provide bearings with relief ports to prevent build-up of pressures which might damage the bearings or seals. Size oil reservoirs liberally and provide with an opening for filling, an overflow opening at the proper location to prevent overfilling, and a drain opening at the lowest point. Vent reservoirs to prevent pressure build-up.

2.3.7 Electric Motors

Utilize a squirrel-cage induction motor suitable for continuous duty. Provide motor with a non-overloading power rating for any conditions under which the driven equipment function.

2.3.7.1 Frame

Select the motor frame size in accordance with NEMA MG 1. Ensure that motors of the same rating, mounting, and characteristics are interchangeable.

2.3.7.2 Design

Induction motors are required to be Design B as defined in NEMA MG 1, with normal torque and low starting current.

2.3.7.3 Enclosure

Provide a totally enclosed fan cooled enclosure.

2.3.7.4 Terminal Boxes

Size cast-iron terminal boxes for the space required, for the allowable bending radius and stiffness of the motor supply cables, and for terminating a grounding conductor. Provide gaskets for the terminal boxes and threaded conduit entrances or hubs. Ensure terminal boxes are rotatable for connection from any one of four directions at 90 degree intervals with a motor lead seal and separator gasket provided between the motor frame and terminal box.

2.3.7.5 Bearings

Provide grease lubricated, shielded, antifriction steel ball bearings and grease with a moisture resistant grease. Ensure all grease fittings and excess grease purge plugs are readily accessible and locate externally so that bearing lubricant can be changed without removing fan housing or dismantling the motor.

2.3.7.6 Windings

Provide nonhygroscopic, epoxy coated motor windings.
2.3.7.7 Motor Characteristics

Ensure motor rotors receive a standard dynamic balance. Ensure the maximum amplitude (peak to peak) of motor vibration, as measured at the bearing housing, and the method of measurement are in accordance with NEMA MG 1. Ensure motor characteristics such as wattage horsepower, speed, rpm, voltage and phase requirements and insulation class are provided as indicated.

2.3.7.8 Motor Controls

NEMA ICS 1.

2.3.8 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration and maintenance of the equipment.

2.4 MATERIALS

Ensure materials and equipment conform to the following requirements.

2.4.1 Steel Plates, Shapes and Bars

ASTM A36/A36M.

2.4.2 Pipe

Furnish and install piping as indicated and ensure it is in accordance with the applicable standard specification.

2.4.2.1 Steel Pipe

ASTM A53/A53M, all pipe sizes.

a. Flanged Joints: ASTM A707/A707M.

d. Welded Joints: AWS D1.1/D1.1M.

e. Bolts: ASTM A307, Grade B.

f. Fittings: ASTM A420/A420M.

2.4.2.2 Ductile-Iron Pipe

AWWA C115/A21.15, all pipe sizes.

e. Bolts and Nuts: ASTM A307, Grade B.

f. Coatings and Linings: Provide bituminous coating on all buried piping.

2.4.2.3 Polyvinyl Chloride (PVC) Pipe and Fittings

Provide PVC pipe and fittings less than 102 mm 4-inch diameter in accordance with ASTM D1785 or ASTM D2241. Provide PVC pipe and fittings 102 mm 4 inch in diameter and larger in accordance with ASTM D2241 and ensure they have push-on joints.

2.4.3 Pipe Hangers and Supports

MSS SP-58.

2.4.4 Valves

2.4.4.1 Gate Valves

Gate valves are required to withstand a working pressure of not less than 1.03 MPa 150 psi. Ensure valves have a clear waterway equal to the full diameter of the valve, and are opened by turning counterclockwise. On operating nut or wheel handle, provide an arrow, cast in metal, indicating the direction of opening. For valves used for buried service, provide with non-rising stem (NRS), 50 mm 2 inch square nut operated with joints applicable to the pipe or installation. Furnish buried valves with extension stems comprised of socket, extension stem and operating nut, that are long enough to bring operating nut to within 150 mm 6 inch of grade. Furnish one 1.2 m 4 foot "T" handle valve wrench for each quantity of six buried valves. For gate valves which are exposed or installed inside, provide outside screw and yoke (OS&Y), handwheel operated with flanged ends unless otherwise indicated. Flanges are not to be buried. Provide a approved pit for all flanged connections.

a. Valves smaller than 75 mm 3 inch are required to be all bronze conforming to MSS SP-80, Type 1, Class 150.

b. Valves 75 to 305 mm 3 to 12 inch in size are required to be resilient-seated gate valves conforming to AWWA C509.

c. Valves 355 mm 14 inch and larger are required to be iron body, bronze mounted conforming to AWWA C500. Provide solid wedge type valves. Equip valves with gearing to reduce operating effort. Equip all valves installed in horizontal lines in the horizontal position with stems horizontal with bronze track, roller and scrapers to support the weight of the gate for its full length of travel. Fit valves installed in vertical pipe lines with stems horizontal with slides to assist the travel of the gate assembly.

2.4.4.2 Plug Valves

Plug valves are required to be eccentric type capable of withstanding a minimum working pressure of 1.03 MPa 150 psi. Provide flange valve conforming to ASME B16.1, Class 125. Provide mechanical or push-on type rubber gasket joint ends conforming to AWWA C110/A21.10 and AWWA C111/A21.11.
Ensure port area for valves is at least 80 percent of full pipe area. Valve bodies, plugs or discs, seats, shafts, shaft seals and actuators are required to conform to AWWA C504. Valves are required to open counterclockwise and the operating nut or wheel have an arrow, cast in metal, indicating the direction of opening. Ensure valves meet all performance, leakage, and hydrostatic tests required by AWWA C504. On request, furnish a certified statement from the manufacturer that proof-of-design tests were carried out as described in AWWA C504 and all requirements were successfully met.

2.4.4.3 Check Valves

Check valves are required to permit free flow of sewage forward and provide a positive check against backflow. Check valves are required to withstand a minimum working pressure of 1.03 MPa 150 psi or as indicated. Provide iron body check valves. Directly cast on the body the manufacturer's name, initials, or trademark and also the size of the valve, working pressure, and direction of flow. Flanges are required to be the 56 kg 125 pound type complying with ASME B16.1.

a. Provide ball check valves with flanged or threaded ends and the non-slam type. Construct ball of stainless steel unless otherwise specified.

b. Ensure swing check valves comply with AWWA C508, are bronze mounted, and have flanged ends. Equip check valves with [outside lever and spring] [______].

2.4.5 Joint Compound

For joint compound for threaded joints, use a stiff mixture of graphite and oil, inert filler and oil, or a graphite compound.

2.4.6 Joint Tape

Ensure joint tape for threaded joints complies with ASTM D3308.

PART 3 EXECUTION

3.1 EXAMINATION

Verify all dimensions in the field, and advise the Contracting Officer of any discrepancy in the contract documents before performing the work.

3.2 TREATMENT SYSTEM INSTALLATION

Submit drawings containing complete wiring and schematic diagrams; equipment layout and anchorage; and any other details required to demonstrate that the system has been coordinated and functions as a unit. Drawings are to show the proposed layout and anchorage of equipment in appurtenances and equipment relationship to other parts of the work including clearances required for maintenance and operation. Submit all submittals for this system at the same time. It is not acceptable to piecemeal submittals.

Perform all excavation, filling, and backfilling in accordance with Section 31 00 00 EARTHWORK. Install reinforced concrete, of the size and design indicated, in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.
3.2.1 Welding

Weld piping in accordance with AWS D1.1/D1.1M using welders certified to have passed tests using procedures in accordance with AWS B2.1/B2.1M or ASME BPVC SEC IX. Ensure the welder or welding operator applies the assigned personal symbol near each weld made, as a permanent record. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING.

Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests and perform the tests at the work site if practicable.

3.2.2 Pipe and Valve Installation

Install piping with all joints tight and with no undue marring of finishes. Ensure installed piping, valves, and fittings is free from strain and excessive stresses caused by weight or misalignment.

3.2.2.1 Flanged Joints

Tighten bolts uniformly to prevent overstressing flanges and misalignment.

3.2.2.2 Screwed Joints

Make screwed joints tight with joint compound, applied to the male threads only, or with joint tape.

3.2.2.3 Push-On Joints for PVC Pipe

Bevel pipe ends to facilitate assembly. Mark pipe to indicate when the pipe is fully seated. Lubricate gaskets to prevent displacement. Exercise care to ensure that the gasket remains in proper position in the bell or coupling while joints are made.

3.2.2.4 Solvent-Weld Joints for PVC Pipe

Weld joints in accordance with the manufacturer's written instructions.

3.2.2.5 Valves

Installed and locate valves for easy access for operation.

3.2.3 Equipment Installation

Install equipment in accordance with the manufacturer's written instructions.

3.2.4 Electrical Work

Perform electrical work in accordance with the applicable requirements of Section [______].

SECTION 46 53 62 Page 31
3.2.5 Painting

Paint all metal surfaces, except aluminum, bronze, brass, galvanized steel, and stainless steel. Perform surface preparation and painting in the field. Finish manufactured items, such as motors and switchboards, per with the manufacturer's standard finish.

3.2.5.1 Preparation and Application

Prepare ferrous metal surfaces in accordance with SSPC SP 6/NACE No.3 and painted with a three coat MIL-DTL-24441 epoxy painted to achieve a total dry film thickness of 150 microns (6 mils). The contractor may substitute Master Painter's Institute (MPI) #120 Epoxy, High build, Self-Priming, Low Gloss, for MIL-DTL-24441.

3.2.5.2 Coating Examination

Examine all coatings for flaws and test for thickness and holidays. Measure the thickness of coatings wet and dry using a commercial film thickness gauge. Notify the Contracting Officer in advance of any painting. Do not apply additional coats until the previous coat has been approved. Perform all repair or additional coatings at no additional cost to the government.

3.2.5.3 Coating Repair

If welding is required after application of the coating or if the coating is damaged in any way, repair by preparing the affected area in compliance with SSPC SP 6/NACE No.3 and reapply the coating to that area. If holidays are detected or film thickness is insufficient, prepare the surface and apply additional coats in the affected area in compliance with the manufacturer's instructions.

3.3 FIELD QUALITY CONTROL

3.3.1 Field Tests And Inspections

Supply water required for the field tests. Give the Contracting Officer [14] [_____] days prior notice of the dates and times for acceptance tests to allow the Contracting Officer the ability to witness all field tests. Rectify any deficiencies found. All work affected by such deficiencies required to be completely retested at the Contractor's expense.

3.3.1.1 Basin Leakage Test

After completion of the installation and as soon as practical, conduct a leakage test on the CLR basin. Fill the basin with clean water and leave standing for 24 hours. Basin leakage is not allowed to exceed 25 mm 1 inch drop in water surface elevation in 24 hours. Repair leaks encountered and retest the basin. Ensure the basin is watertight prior to proceeding with the tests specified below.

3.3.1.2 Operating Tests

After completion of the installation and as soon as practical, perform an operating test of the CLR and all equipment to demonstrate that the system functions properly. Include all manufacturer's recommended tests for equipment vibration, horizontal and vertical alignment and structural integrity. Check and verify wattage horsepower [and air flow rates] against the manufacturer's design data for the specified equipment. Ensure
the aerator wattage horsepower meets nameplate plus or minus five percent. After completion of all tests, adjust the system for proper operation in accordance with the manufacturer's written instructions and the operating and maintenance instructions.

3.3.1.3 Velocity Test

After completion of the basin leakage and operating tests, conduct a velocity test on the basin. Record velocity cross-sections at a distance of 3 m 10 feet upstream of the shaft centerline of each aerator. Cross-sections consist of a minimum of 16 velocity measurements equidistantly spaced so that the distance between measurement points does not exceed 1.2 m 4 feet vertically or horizontally. Begin measurement points at approximately 0.6 m 2 feet from walls. The average velocity at each cross-section is not to be less than 0.3 m/s 1.0 fps. Where average velocities are found to be less than that specified, make modifications to the system as needed to produce the required velocities at no extra cost to the Government.

3.3.1.4 Standard Oxygen Transfer Efficiency Test (S.O.T.E.)

After completion of the velocity test, perform an S.O.T.E. test in accordance with ASCE 2-06. The aeration system oxygenation capacity is not allowed to be less than [1.4] [_____] kg [3] [_____] pounds of oxygen per watt horsepower per hour with [_____] aeration units operating at a combined power draw of [_____] watts horsepower. Repeat tests in the same water until ten tests have been run or until the total dissolved solids (TDS) exceed 2000 mg/L. Plot a minimum to maximum power curve from the results. Base power input on wire power. Use a nationally recognized independent testing laboratory for all tests.

3.3.1.5 Reporting Test Results

Upon completion and testing of the installed system, submit test reports that show all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Indicate the final position of controls in each test report. Report results in accordance with paragraph 9.0 "REPORTING" of ASCE 2-06.

3.3.2 Manufacturer's Services

3.3.2.1 Supervise Installation, Adjustment, and Testing

Obtain the services of the manufacturer's representative experienced in the installation, adjustment, and operation of the equipment specified to supervise the installation, adjustment and testing of the equipment in accordance with manufacturer's written instructions.

3.3.2.2 Field Training

Conduct a training course for the operating staff as designated by the Contracting Officer. Provide a training period consisting of a total of [_____] hours of normal working time and start after the system is functionally complete but prior to final acceptance tests. Ensure all field instruction covers all of the items contained in the Operating and Maintenance Instructions, as well as demonstrations of routine maintenance operations. Notify the Contracting Officer at least 14 days prior to date of proposed conduction of the training course.
3.4 CLOSEOUT ACTIVITIES

3.4.1 Framed Instructions

Submit approved wiring and control diagrams showing the complete layout of the entire system, including equipment, piping valves, and control sequence, framed under glass or in approved laminated plastic, for posting where directed. In addition, prepare in typed form condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system. Frame as specified above for the wiring and control diagrams and post beside the diagrams. Post the framed instructions before acceptance testing of the systems.

3.4.2 Operating And Maintenance Instructions

Furnish instructions including the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Permanently bind each set and include a hard cover. Inscribe the following identification on the covers: the words "OPERATING AND MAINTENANCE INSTRUCTIONS," name and location of the facility, name of the Contractor, and contract number. Ensure information includes, but is not necessarily limited to, the following:

a. System layout showing piping, valves, and controls.

b. Approved wiring and control diagrams.

c. A control sequence describing startup, operation, and shutdown.

d. Operating and maintenance instructions for each piece of equipment, including lubrication instructions and troubleshooting guide.

e. Manufacturer's bulletins, cut sheets and descriptive data, parts lists, and recommended spare parts.

f. Simplified diagrams for the system as installed.

NOTE: This guide specification covers the requirements for filtration systems with capacity less than 750 liters 200 gallons per minute.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature...
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's
Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

*************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Filtration System; G[, [_____]]

Include complete wiring and schematic diagrams; equipment layout and anchorage; and any other details required to demonstrate that the system has been coordinated and will properly function as a unit.

SD-03 Product Data

Posting Framed Instructions
Qualifications
Media
Materials and Equipment
Control System
Spare Parts

Submit after approval of the shop drawings, and not later than [_____] days prior to the start of operation.
1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Extra Materials

Provide standard spare parts as recommended in the manufacturer's instruction manuals for each component of the equipment. Submit spare parts data for each different item of material and equipment specified. Include in the data a complete list of parts and supplies, with current unit prices and source of supply.

1.4 QUALIFICATIONS

Submit qualifications of the installer, and the manufacturer's and media supplier's representatives.

1.4.1 Installer

Installers are required to have a minimum of [_____] years' experience in the installation of a minimum of [_____] similar filtration systems and are required to show evidence of satisfactory operation for each installation.

1.4.2 Manufacturer's Representative

Ensure a representative of the filtration system manufacturer, who is familiar with the design and experienced in the installation, adjustment, and operation of the equipment specified is present at the jobsite during installation of the filtration system.

1.4.3 Media Supplier Representative

Ensure a representative of the media supplier who is experienced in the installation of the specified filtration media is present at the jobsite during media installation.

1.5 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from weather, excessive humidity, excessive temperature variation, and dirt, dust, or other contaminants.
2.1 SYSTEM DESCRIPTION

Provide a [pressure] [continuous backwash] [traveling bridge] [cartridge] [bag] filtration system. Design, construct and install the filtration system to comply with the following design conditions. Supply auxiliary systems and equipment required to maintain complete and workable filter systems including, but not limited to, required piping between units, auxiliary equipment for plumbing and power, and controls and interfaces between auxiliary equipment and the filter. Chemical additives [are] [are not] allowed to enhance the filtration system. Construct the installation [indoors] [outdoors]. [_____] volts of electricity, [_____] Pa psi air pressure, and [_____] Pa psi water pressure is available for installation.

2.1.1 Influent Flow Characteristics

**************************************************************************
NOTE: This paragraph describes influent flow characteristics for continuous backwash, traveling bridge, and pressure filtration systems.
**************************************************************************

2.1.3 Cartridge and Bag Influent

- **NOTE**: This paragraph describes influent flow characteristics for cartridge and bag filtration systems. In addition to the information listed below, concentrations of Target Compound List (TCL) and Target Analyte List (TAL) compounds in the waste stream should be included in the influent stream characteristics paragraph. This information will

SECTION 46 61 00 Page 13
help ensure that the bag or cartridge filtration materials are compatible with the waste stream.

2.2 EQUIPMENT

2.2.1 Materials and Equipment

**************************************************************************
NOTE: Pipes, valves, pumps, and appurtenances are generally supplied as part of the package filtration system, but the designer must specify those sites requiring special materials of construction, sizing, etc., based on the influent stream characteristics.
**************************************************************************

Ensure all recyclable materials conform to EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.

2.2.1.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Provide equipment that is supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.2.1.2 Nameplates

Provide each major item of equipment with the manufacturer's name, address, type of style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.2.1.3 Protection of Moving Parts

Completely enclose by guards belts, chains, couplings, and other moving parts to prevent accidental personal injury. Fabricate guards to be removable or arranged in a way to allow access to the equipment for maintenance. If equipment is housed in a lockable housing, ensure the housing provides sufficient protection and no additional guards are necessary.
2.2.1.4 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment.

2.2.1.5 Steel Plates, Shapes and Bars

ASTM A36/A36M.

2.2.1.6 Pipe and Fittings

Provide pipe and fittings that conform to the standards specified below.

2.2.1.6.1 Steel Pipe

ASTM A53/A53M.

a. Flanged Joints: ASTM A707/A707M.

b. Welded Joints: AWS D1.1/D1.1M.

c. Bolts: ASTM A307, Grade B.

d. Fittings: ASTM A420/A420M.

2.2.1.6.2 Ductile Iron Pipe

AWWA C115/A21.15.

e. Bolts and Nuts: ASTM A307, Grade B.

2.2.1.6.3 Stainless Steel Pipe

ASTM A312/A312M, Schedule 40, Type 316 or Type 304.

c. Fittings: ASME B16.3.

d. Bolts: ASTM A193/A193M, Class 1, Grade B8.

2.2.1.6.4 Polyvinyl Chloride (PVC) Pipe

Provide PVC pipe and fittings less the 100 mm 4 inch diameter in accordance with ASTM D1785 or ASTM D2241. Provide PVC pipe and fittings 100 mm 4 inch in diameter or larger in accordance with ASTM D2241 with push-on joints.

2.2.1.7 Pipe Hangers and Supports
MSS SP-58.

2.2.1.8 Valves

2.2.1.8.1 Steel Valves
ASTM A216/A216M, Grade WCB.

2.2.1.8.2 Cast Iron Valves
ASTM A126, Class B.

b. Gate Valves: MSS SP-70.
c. Plug Valves: MSS SP-78.
e. Ball Valves: MSS SP-72.

2.2.1.8.3 PVC Valves
ASTM D1784, Class 12454-B (formerly designated Type I, Grade 1).

2.2.1.9 Other Materials

2.2.1.9.1 Polypropylene Support Material

**************************************************************************
NOTE: The polypropylene requirements are applicable to use for support materials for bag and cartridge filters.
**************************************************************************
ASTM C1147.

2.2.1.9.2 Joint Compound

Use joint compound for threaded joints made from a stiff mixture of graphite and oil, inert filler and oil, or a graphite compound.

2.2.1.9.3 Joint Tape

Provide joint tape for threaded joints that complies with ASTM D3308.
2.2.2 Electrical Equipment

2.2.2.1 Electrical Work

[Provide electrical motor-driven equipment specified complete with [motors] [motors and motor starters] and controls.] [Motor starters complete with properly sized thermal overload protection and other appurtenances necessary for the motor specified.] Perform electrical work as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices.

2.2.2.2 Electric Motors

Provide motors that conform to NEMA MG 1. Provide motors with nameplate horsepower equal or greater than 380 watts 1/2 hp that are suitable for 480 volt, 3 phase operating service, unless otherwise specified. Provide motors of greater than 760 watts 1 hp that are high efficiency type as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2.2.3 Motor Controls

Provide controls that conform to NEMA ICS 1.

2.2.2.4 Electrical Power Control

**************************************************************************
NOTE: Generally, the filter manufacturer will supply a standard control system with the package unit. To allow maximum flexibility, the control system should be specified only to the extent necessary to achieve project needs. The following sub paragraphs provide specification for several control system components the designer may require the manufacturer to incorporate into the package system. Delete paragraphs not required.
**************************************************************************

2.2.2.4.1 General Requirements

Provide a [manual] [semi-automatic] [automatic] [_____] complete electrical power, control, and instrumentation system as specified or recommended by the equipment manufacturer for the safe operation and supervision of the filter units and related equipment, except those items specified to be furnished under other sections. Provide schematics and interconnection wiring diagrams for power, control, and instrumentation circuits to equipment specified. Provide terminal blocks (plus 25 percent spare terminals) in panels to terminate field and interconnection wiring.

2.2.2.4.2 Control System

Provide control power transformers, relays, adjustable timers, auxiliary contacts, switches, or additional equipment as required to interconnect the filter equipment to a remote plant monitoring system, and control circuits as shown on schematic or instrument control system drawings. Furnish conduit wiring between control panels and control devices as part of this specification. Submit a description of the control system including, but not be limited to, the following items:
a. Product information for sensors/transducers and field instruments.

b. Programmable Controller System Information

(1) System Description
(2) Hardware Description
(3) Software Description

c. Panels, Consoles, and Cabinets Information

(1) Layout Drawings
(2) Panel schematic and internal point-to-point wiring interconnect and/or piping diagrams
(3) Electrical control schematics in accordance with NFPA standards for all circuits indicated in the specifications or on the Contract Drawings. "Typical" wiring diagrams are acceptable but the use of tables or charts to describe wire numbers is not acceptable. Label wires and shown on the submittal drawings.
(4) Plan showing equipment layout.
(5) Stock lists or Bill of Materials for each panel including tag number, functional name, manufacturer's name, manufacturer's model number, and quantity for components mounted in and on the panel, console, or cabinet.

d. Field wiring and piping diagrams and point-to-point wiring diagrams including interconnections between field devices, panels, control stations, lighting panels, and motor starters.

e. Instrument loop diagrams for analog display, control and I/O loops prepared using ISA standard symbols.

f. System Software Documentation to include the following as a minimum:

(1) Complete hard copies of ladder diagram programming.
(2) Complete listing of external and internal I/O address assignments, register assignments, and preset constant values along with functional point descriptions. Also list unused/undefined I/O and data table registers available.
(3) Complete hard copies of program documentation for all types of programs.
(4) Detailed system memory map defining memory segments used and spare memory segments available for system memory, I/O tables, Data Tables, and control program.
(5) Complete database listing.
(6) User's manual describing procedures and providing examples for use of programming terminal, accessories, and system utility routines to perform control, program modification, program verification,
diagnostics, program documentation, loading and backup, and other required system support functions.

2.2.2.5 Remote Alarm and Process Variable Monitoring

**************************************************************************
NOTE: Coordination with remote systems, such as Supervisory Control and Data Acquisition (SCADA) System and annunciators, must be specified in this paragraph and must include the method of transmission to remote locations for the process variables to be monitored for each unique application. If remote alarm and process variable monitoring is not used, this paragraph must be deleted.
**************************************************************************

2.2.2.6 Bolts, Nuts, Anchors, and Washers

Provide steel bolts, nuts, anchors, and washers, galvanized in accordance with ASTM A153/A153M.

2.2.2.7 Valves

Transfer water to and from the filtration unit by a means of [ball valve] [butterfly valve] [globe valve] [air solenoid] [_____] for [automatic] [semiautomatic] [manual] operation. Design the valve mechanisms such that gradually increasing flows are attained as ports are opened and initial surges and sudden inrushes of water are avoided. Include a dial pointer to indicate each step of the operation.

2.2.2.8 Pumps

Supply air compressors where insufficient head is available to move the [influent] [effluent] [backwash] [wash] water. Ensure the pump complies with the requirements of Section 23 21 23 HYDRONIC PUMPS.

2.2.2.9 Air Compressors

Supply pump in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.2.2.10 Pressure Gauges

Show or schedule gauge sizes and scale ranges on the Contract Drawings. Provide gauges that comply with ASME B40.100 Type 2A, as a minimum. Provide compound gauges on the suction side of pumps and standard pressure gauge on the discharge side of pumps. Use gauges with clear acrylic or shatterproof glass windows and shock-resistant cases. Set the design operations to fall at the midpoint of the graduated scale. Equally space major divisions and show in whole integers. Engrave scale units on the scale face. Limit pointer travel to not less than 200 degrees nor more than 270 degrees arc. Provide gauge accuracy of plus or minus 0.5 percent of span. Provide each gauge, except those for hydraulic systems, with a process shutoff valve.

2.2.2.11 Gauge Panel

Provide a gauge panel on which [1] [2] [_____] nominal pressure gauges to sense unit inlet and outlet pressures and [1] [2] [_____] pressure switch
are mounted. Wire the pressure sensor switch to a control panel which
sounds an alarm when the differential pressure exceeds the [maximum
differential pressure specified in Paragraphs Design Criteria or Cartridge
and Bag Design Criteria (as applicable)] [maximum differential pressure
specified by the manufacturer].

2.2.2.12 Tank Requirements

**************************************************************************
NOTE: Further requirements for tanks specific to
each filtration process are presented in the
applicable paragraph.
**************************************************************************

2.2.2.12.1 Parameters

Provide specified tanks in accordance with the following general
requirements, unless otherwise indicated. Provide each tank with flanged
fittings for inlet, outlet, overflow and drain. Provide the size,
elevation and orientation in accordance with construction drawings.
Provide hold down lugs to anchor the tank to the base.

2.2.2.12.2 Tank Construction Materials

**************************************************************************
NOTE: Tank construction materials must be
compatible with the materials to be handled. This
requirement is applicable for all tanks (e.g.,
filter tanks, backwash tanks, chemical feed, polymer
supply, etc.).
**************************************************************************

Provide tank construction material compatible with the material to be
handled. Provide tanks constructed of polyethylene, polypropylene, and
fiberglass reinforced plastic (FRP) that conform to applicable material and
construction provisions of ASTM C582, ASTM D3299, and ASTM D4097. Provide
tanks constructed of steel that conform with applicable material and
construction provisions of AWWA D100. Fabricate carbon steel tanks with
ASTM A283/A283M carbon steel Grade C or D and protected with [an
appropriate interior coating system for the intended service] [vinyl ester
epoxy] [_____] in accordance with applicable requirements in Section
09 90 00 PAINTS AND COATINGS. Fabricate stainless steel tanks of Type 304
stainless steel conforming to ASTM A167 with structural support conforming
to ASTM A276/A276M. Provide exterior painting or coating in accordance
with Paragraph PAINTING.

2.2.2.12.3 Site Glasses

Provide a [_____] mm inch diameter observation port in the tank wall.
Locate the observation port [at the surface of the filter media] [at the
media interface] [_____] .

2.2.3 Media

Provide filter materials that conform to the requirements of AWWA B100.
Perform a sieve analysis in accordance with ASTM C136/C136M and AWWA B100.
Determine specific gravity in accordance with ASTM C127 for support media
and ASTM C128 for [silica sand] [anthracite coal] [high-density media].
Submit characteristics of each filter media material.
2.2.3.1 High-Density Sand

Provide high-density sand composed from [garnet] [ilmenite] [_____] with a specific gravity of [3.6] [4.0] [4.2] [_____] , uniformity coefficient less than or equal to [_____] , and an effective size between [_____] and [_____] . Ensure ninety-five percent of the material is larger than or equal to [_____] .

2.2.3.2 Silica Sand

Provide silica sand with an effective size between [_____] and [_____] , uniformity coefficient less than or equal to [_____] , and a specific gravity of [2.55] [2.60] [2.65] [_____] . Ensure ninety-five percent of the material is larger than or equal to [_____] .

2.2.3.3 Anthracite Coal

Provide anthracite coal with a specific gravity of [1.45] [1.50] [1.55] [1.73] [_____] , uniformity coefficient of [_____] , and an effective size between [_____] and [_____] . Ensure ninety-five percent of the material is larger than or equal to [_____] . The anthracite media is required to be clean and free from thin or scaly pieces, with a calcium carbonate and magnesium carbonate hardness of [_____] .

2.2.3.4 Support Media

Provide support gravel consisting of hard, rounded stones with an average specific gravity of not less than [_____] . Ensure not more than [_____] percent by weight has a specific gravity of [_____] or less. Ensure gravel contains not more than [_____] percent by weight of thin, flat, or elongated pieces (pieces in which the largest dimension exceeds three times the smallest dimension), and is free from shale, mica, clay, sand, loam, and organic impurities of any kind.

2.2.4 Continuous Backwash Filtration System

2.2.4.1 Equipment Capacity

Provide each unit with a moving bed, continuous backwash [upflow] [downflow] granular media filter, having a capacity to filter [_____] L/minute gpm of water at the operating conditions identified in Paragraph Design Criteria.

2.2.4.2 Filter Tank

**************************************************************************
NOTE: Provide seismic details if a Government designer (either Government Agency Office or A/E) is the engineer of record, and show on the drawings. Delete the bracketed phrase, in the last sentence, if seismic details are not provided. Pertinent portions of UFC 3–301–01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.
**************************************************************************

Provide a cylindrical, sloped-bottom filter tank with the dimensions shown and constructed of [epoxy coated carbon steel] [type 304 stainless steel]
[fiberglass reinforced plastic] [_____] construction, free from physical imperfections. Construct the tank with a minimum number of pieces and a minimum thickness of metal parts exposed to the water of [______]. Fit the tank with lifting lugs to facilitate handling and placement. Provide the filter tank with sufficient support to withstand wind speed in excess of [_____] km/hour mph and design for seismic forces in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC [as shown on the drawings].

2.2.4.3 Filter Media

Provide silica sand filter media at a total depth of [_____] m feet. Ensure all media conforms to the requirements of AWWA B100.

2.2.4.4 Influent Dosing System

******************************************************************************
NOTE: Each continuous backwash filter manufacturer has a particular influent dosing system. The influent dosing system should be specified only to the extent necessary to achieve the project objectives.
******************************************************************************

Provide an influent dosing system capable of delivering the influent stream uniformly over the entire media bed. Introduce the influent water to the [bottom] [top] of the filter tank. Construct all components of the dosing system of [stainless steel] [fiberglass reinforced plastic] [______].

2.2.4.5 Effluent Collection System

Collect effluent by [discharge of filtrate overflow over an effluent weir constructed of [stainless steel] [fiberglass reinforced plastic] [______] and placed and sized dimensionally as shown on the Construction Drawings.] [a filtrate line connected to a filtrate chamber consisting of a cylinder with a wedgewire screen periphery and hood. Construct the screen of stainless steel trapezoidal bars having an opening smaller than the finest media grain. Configure and size dimensionally the effluent collection system as shown on the Construction Drawings.] [______] discharge effluent through a [______] mm inch diameter [stainless steel] [fiberglass reinforced] [______] pipe.

2.2.4.6 Media Cleaning System

The media cleaning system consists of a sand lift, sand washer, sand distribution equipment and reject collection system.

2.2.4.6.1 Sand Lift

The sand lift consists of [Type 304] [Type 304L] stainless steel eductor pipe. The pipe mounts [externally] [internally] and fixed [by welding] [by means of a [______] ANSI gasketed flange] [______] to the filter vessel. Supply compressed air at [______] to [______] cubic meters cubic feet per minute at [______] Pa psig to the eductor pipe. Provide a suction rate that is sufficient to result in internal recycling of the media once every [______] hours.
2.2.4.6.2 Sand Washer

**************************************************************************
NOTE: Delete cross-sectional area sizing requirements if the sand washer unit is external to the filter tank.
**************************************************************************

The sand washer consists of a chamber constructed of [Type 304 stainless steel] [acrylic] [fiberglass reinforced plastic] [____]. Provide a sloped floor to clear the sand from the bottom of the chamber. Equip the chamber with [____] baffles attached to its walls with a slope sufficient to cause the descending sand to strike the opposing chamber wall before dropping to the next level. Size the cross-sectional area to assure sufficient velocity of upflowing water to transport separated solids into the wash chamber and out the reject pipe.

2.2.4.6.3 Sand Distribution Equipment

Return the cleaned sand to the bed via a [sand distribution cylinder] [sand distribution cone] [return pipe] [washbox skirt] [____], constructed of [fiberglass reinforced plastic] [Type 304 stainless steel] [____] placed and sized as shown. Return the sand so that the media distributes evenly in a cone on top of the media bed.

2.2.4.6.4 Reject Collection System

The reject collection system consists of a stainless steel reject weir and a [____] diameter reject nozzle. Position the reject weir to achieve the desired differential head between the effluent water and the reject water. Design the reject collection system to allow no more than [2] [10] [20] [____] percent reject water.

2.2.4.7 Effluent Rate Control

Control filter operation by the liquid level in the filter tank using a proportional, displacer-type liquid level sensor. Provide an automatic effluent control [globe] [ball] [____] valve with a pneumatic positioner to regulate the degree of opening in response to a [____] to [____] pneumatic signal. Ensure that an increase in signal air pressure increases the degree of valve opening. Ensure the flow control system is self-contained and does not require manual adjustments.

2.2.4.7.1 Pneumatic Controls

The pneumatic controls consist of a pressure gauge and a flowmeter. Mount the pressure gauge on the panel with a [____] to [____] Pa psi range and a [____] mm inch face. Provide a flowmeter of the variable area type with a stainless steel indicator. Provide the meter with a metering valve, [____] mm inch scale, and a range of [____] to [____] cubic meters cubic feet per minute. Mount both devices on a hinged panel visible through a window in the control enclosure.

2.2.4.7.2 Headloss Switch

Supply a headloss switch to signal when the media bed is beginning to foul. Rate the switch contacts at [____] amps and connect to [an alarm] [process controls] [purge valve] [____].

SECTION 46 61 00 Page 24
2.2.4.8 Equipment Control Panel

The equipment manufacturer is required to furnish a control panel containing all necessary timers, contact switches, internal wiring, completely assembled and mounted in a NEMA [4] [4X] [12] [_____] enclosure. The control panel provides for [automatically starting and stopping pumps] [manual operation of the control valves] [______]. Mount the control panel on the filter unit and provide electrical wiring and connections external to the unit.

2.2.4.9 Flowmeters

Equip influent and effluent lines with [kennison nozzle] [parshall flume] [shuntflo stream] [sonic] [_____] flowmeters.

2.2.5 Traveling Bridge Filter

2.2.5.1 Tank

Provide a tank [_____] wide by [_____] long by [_____] deep constructed of [_____] thick [mild steel] [carbon steel] [______]. Construct the assembled tank to allow loading and unloading as a unit and equip with lifting lugs. Furnish integral supports so that the body of the tank, when installed, are [_____] mm inches above the concrete slab. Place the supports to allow for full inspection of the underside of the tank. Construct tank in accordance with Paragraph Tank Requirements and prepared in accordance with the requirements of Paragraph PAINTING and Paragraph MATERIALS PROTECTION.

2.2.5.2 Filter Bed

2.2.5.2.1 Cell Dividers

Provide a filter bed [_____] wide by [_____] long and consisting of a series of self-supporting lateral partitions (cell dividers) which divide the filter into a multitude of [_____] wide compartments. Arrange each compartment for connection to a separate backwash port. Fabricate the divider sheets of [glass fiber reinforced plastic binder] [Type 304 stainless steel] [______] with a finished thickness of [______]. Ensure all divider sheets are without voids and/or air pockets. Cell sheets are not allowed to twist, curve or bend.

2.2.5.2.2 Porous Plate

Provide a porous plate supporting underdrain constructed of [fused aluminum oxide] [polyethylene] [______] to a thickness of [_____] that is factory installed. Provide for a maximum pore diameter of [_____] microns. Provide sheets with a porosity between [_____] and [_____] and a minimum flexural strength of [_____] Pa psi. The plate allows a flow of [_____] L gallons per minute per [_____] mm inch water column pressure. Seal the porous plate completely with a [polyurethane] [silicone] [______] sealant during installation. Provide a sealant with, at a minimum, [_____] hardness and [_____] tensile strength that does not contain asbestos fibers.

2.2.5.3 Voids Distribution

Provide media with uniform voids distribution from coarse to fine in the direction of flow. Ensure all filter materials conform to the requirements of AWWA B100.
2.2.5.4 Rails

Provide [_____] kg lb ASCE rails with stainless steel splice plates and hardware mounted on the two main filter walls. Provide Type 304 stainless steel caps factory installed on each rail. Install and have a factory service engineer field adjust carriage rail stops fabricated from 300 Series stainless steel.

2.2.5.5 Carriage Mechanism

2.2.5.5.1 Carriage Frame

Traveling carriage or bridge systems contain and support the [positive drive mechanism] [pumps] [automatic backwash system] [washwater removal system] [motors] [limit switches] [______]. Fabricate the carriage frame of welded steel construction. Provide a separate maintenance platform.

2.2.5.5.2 Carriage Drive

The carriage drive unit consists of a gear reducer, sprockets, stainless steel drive shaft, a NEMA B design single speed [_____] watt TCFC motor for three phase, [_____] hertz, [_____] volt power supply, provided with a sealed conduit box. Design the drive unit so that a torque limiting device is not required and has a strength of [______]. Ensure all gear reducers are AGRA approved. Provide the drive shaft of sufficient size to adequately and safely withstand bending and torsional loads of starting and operating. Fully enclose all gearing in an oil-tight cast iron housing with the gears running in oil and anti-friction type bearings.

2.2.5.5.3 Carriage Wheels

Provide double flanged wheels of hardened Type 304 stainless steel. Provide self-aligning bearings with lubrication fittings. Provide wheels capable of compensating for minor misalignment of rails by sliding on the shaft. Do not use horizontally mounted wheels within the tank to align the carriage. Do not use caster-type wheels.

2.2.5.6 Automatic Backwash System

******************************************************************************
NOTE: If adjustable compression springs are not required, delete the second sentence.
******************************************************************************

Attach a fabricated backwash support frame to the traveling carriage on the effluent chamber side. Furnish adjustable stainless steel compression springs mounted between the carriage weldment and the backwash frame to allow adjustment of the backwash valve from outside the tank while the filter is in use. Mount a backwash shoe on the frame that can independently follow any irregularities of the matching backwash surface along the effluent ports. Construct the shoe of a material softer than the mating backwash surface (strip). Control the shoe flexible movement by using 300 series stainless steel springs. Attach the shoe to the piping by means of a flexible hose. Connect the piping to the backwash pump and include a throttle valve to achieve the correct pumping rate. Factory bolt the backwash surface (strip) to the effluent header by means of countersunk Type 304 stainless steel fasteners.
2.2.5.7 Washwater Removal System

Fabricate the washwater hood from [[304] [316L] stainless steel] [fiberglass reinforced plastic] [______]. Ensure the hood permits the uniform expansion of the filter media. Fabricate the hood width to be [_____] times the cell width. Install a [stainless steel] [PVC] [_____] manifold in the upper portion of the washwater hood and connect to the washwater pump. Provide the washwater hood with a [high density polyethylene] [304 stainless steel] [_____] raking device and a minimum of two vent pipes extending to [_____] above the overflow weir.

2.2.5.8 Washwater Launders

Construct the washwater launders from [_____] mm inch [A36 steel] [fiberglass reinforced plastic] [_____] with a [_____] mm inch depth and [_____] mm inch width as an integral part of the filter tank wall. Ensure both backwash and washwater pumping systems are capable of discharging into the launder. Provide a "V" notch weir plate to calibrate and balance the flow of the washwater pumping system.

2.2.5.9 Equipment Control

2.2.5.9.1 Automatic Controls

Furnish automatic controls for the filter operation as an integral part of the carriage mechanism. Mount the automatic controls on the end of the filter tank. Factory assemble the carriage mechanism and attaching components and test for mechanical and electrical operation prior to shipment.

2.2.5.9.2 Control Panel

Provide the control panel with a hinged door for access to the control equipment. Mount "Hand-off-auto" selector switches with indicating lights for each pump motor and the carriage motor on the front of the panel door. Provide a main disconnect switch to de-energize the control panel with a pendulum handle operator extending through the control panel door. Provide a ground fault protected convenience outlet. Fabricate the enclosure from NEMA [3R] [4X] [______], [painted steel] [Type 300 series stainless steel] construction, factory wired and tested. The pump and carriage motor controls consisting of magnetic contactors with thermal overcurrent protective devices.

2.2.5.9.3 Motors

Include controls, a timing device, relays and magnetic motor starters for each pump motor and carriage motor in the panel. Actuate these motors automatically by a predetermined increase in hydraulic head, or by the timing device to control the interval between each cleaning cycle. [Terminate the cleaning cycle by a signal from the low water sensing electrode. Control the "off time" of the cleaning cycle by a reset timer with a range of 1 minute to 60 hours. When the timer times out, actuate the motors. During the "on time", de-energize the timer and reset for starting "off time" at the end of the cycle. Should high water occur "off time", start the motors by a relay actuated from the high water electrode signal, with a corresponding resetting of the timer.] [Continue the washing cycle, when activated, for one complete pass of the filter bed. Under normal operation, ensure the carriage does not come to rest other than at either end of the filter.]
2.2.5.9.4 Backwash Mechanism

Wire the control sequence for the backwash mechanism so the backwash mechanism stops at either end of the filter upon termination of the backwash cycle, which is also at the low operating probe signal. Install a low water shut-off probe to prevent pumping the filter tank below the minimum water level point. Furnish additional electrodes to protect the submersible pumps by giving a signal prior to reaching the overflow point.

2.2.5.9.5 Electrification System

Provide a stretch cable electrification system. Construct the cable of [_____] diameter stainless steel. Provide a stainless steel turnbuckle at one end for cable tension adjustment. Equip the electrification system with a number of non-friction nylon trolley carriers which support the electrical flat cable used to power the carriage. Connect the electrification system to a NEMA [4X] [3R] [_____] [Type 300 series stainless steel] [fiberglass reinforced plastic] equivalent junction box.

2.2.5.9.6 Factory Tests

Submit test reports of all factory tests specified in the above paragraphs and throughout this specification.

2.2.5.10 Auxiliary Equipment

2.2.5.10.1 Pumps

Power the backwash and washwater systems by a submersible pump suspended from the filter carriage. Any pumps other than dual submersible pumps are not acceptable. Furnish each pump capable of providing a minimum pumping rate of [_____] at a head of [_____]. Equip the pumps with stainless steel shafts, and abrasive-resistant impellers. Supply pumps in accordance with the requirements of Section 23 21 23 HYDRONIC PUMPS.

2.2.5.10.2 Weirs

Construct the influent and effluent weirs of sufficient length so that the flow does not exceed [_____] L cubic feet per minute per weir length at the average daily flow. Install the influent weir [_____] mm inch above the effluent weir. Install the effluent weir [_____] mm inch above the top of the cell dividers. Fabricate the weirs of Type 304 stainless steel to be [_____] deep with [_____] mm inch adjustment. Mount the weirs on [_____] mm inch mild steel plate with Type 304 stainless steel hardware on [_____] mm inch centers sealed with a neoprene rubber gasket. Install the overflow weir a minimum of [_____] mm inch above the effluent weir. Fabricate the weir to be the full width of the filter. Do not allow the overflow to discharge into the backwash channel.

2.2.5.10.3 Backwash Channel and Washwater Trough

Fabricate the bottom surface of the washwater trough to be at least [_____] m feet above the overflow weir. Construct the backwash channel of [stainless steel] [fiberglass reinforced plastic] [______]. Provide a tank drain in the backwash channel.
2.2.6 Pressure Filters

2.2.6.1 Pressure Filter Tank

******************************************************************************
NOTE: Delete the partition wall requirement if the vessel will not be divided into multiple filter cells.
******************************************************************************

Construct the pressure filter tank to have a diameter of [_____] m feet, a height of [_____] m feet, straight shell length of [_____] m feet and oriented [horizontally] [vertically]. Provide each vessel with [_____] partition wall to divide the vessel into [_____] filter cells. Construct the filter vessels of welded steel and test to withstand a hydrostatic pressure of [_____] Pa psi in excess of the working pressure of [_____] Pa psi. Design and fabricate the vessel in accordance with the ASME BPVC SEC VIII D1 and stamp and certify as such. Provide lifting lugs, supports, connections and appurtenances as detailed on the drawings. Construct the filter tank in accordance with Paragraph Tank Requirements and prepared in accordance with the requirements of Paragraph PAINTING and Paragraph MATERIALS PROTECTION.

2.2.6.2 Underdrain System

Furnish each filter with [pipe laterals with nozzles] [pipe laterals with orifices] [a porous plate] [_____] underdrain system. Provide underdrain of standard manufacturer's design particular to the supplied filter unit and furnished with the constructed package unit. Design the underdrain system to withstand all loads due to design pressures, design loading rates, and loads from the media to be installed in the filter tank.

2.2.6.3 Pressure Filters Media

Ensure the media provides uniform voids distribution from coarse to fine in the direction of flow. Ensure filter materials conform to the requirements of AWWA B100.

2.2.6.4 Distributor/Collector

Provide each filter with an influent distributor/backwash collector of the [central manifold] [lateral arm] [_____] type. Fabricate the influent distributor and waste water collector as an integral part of the filter tank. Construct the system from [steel] [aluminum] [fiberglass] [_____] of the manufacturer's standard design.

2.2.6.5 Surface Wash Agitators

******************************************************************************
NOTE: Since surface wash systems vary greatly, additional information regarding the strength, construction, method of connection and nozzle size and type may be required to adequately specify surface wash agitators. The designer is required to add this information and any other additional information necessary for adequate specification.
******************************************************************************

Provide each filter with a [straight line] [S-shaped] [______], [single]
[double] arm [rotary] [fixed] agitator constructed of [stainless steel] [brass-bronze] [_____] components. Design the agitator to create the most efficient degree of agitation to all portions of the filter. Ensure each agitator is capable of discharging [_____] L cubic feet per minute of water at an operating pressure of [_____] Pa psi. Maximum increase in bed expansion from surface wash is [_____] percent.

2.2.6.6 Air Scour System

2.2.6.6.1 Air Wash Distribution

Provide each tank with a separate air wash distributor. The distributor consists of a [brass] [red brass] [_____] mm inch air header with [_____] mm inch slotted [brass] [red brass] laterals on approximately [_____] mm inch center. [Introduce air to the media bed through the underdrain system.] [Introduce air at the top of the [gravel support layer] [underdrain].] A headloss up the wall of the filter of [_____] L per minute per square meter cubic feet per minute per square foot at [_____] mm inch of water column is acceptable.

2.2.6.6.2 Air Blower

Supply a positive displacement air blower for supplemental air wash. Provide the blower with a minimum capacity of [_____] L cubic feet per minute at [_____] Pa psi discharge pressure and supply in accordance with the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.2.6.7 Equipment Control

2.2.6.7.1 Control Valves

Ensure the filter influent, backwash, waste, rinse, and surface wash valves allow for automatic operation of each filter unit.

2.2.6.7.2 Effluent Rate Controllers

Provide each filter with an effluent rate of flow controller consisting of a [flanged venturi tube] [butterfly valve] [electronic differential pressure transmitter] [______].

2.2.6.7.3 Backwash Controller

Provide one backwash rate of flow controller consisting of a [flanged venturi tube] [butterfly valve] [electronic differential pressure transmitter] [______].

2.2.6.8 Equipment Control Panel

Supply a control panel with a NEMA [4X] [12] [_____] enclosure to contain all necessary timers, lights, contact switches, internal wiring, etc. and associated equipment to allow for the completely automatic operation of the system. Provide the control panel for [automatically starting and stopping pumps] [manual operation of the control valves] [[manual] [automatic] [_____] backwash initiation] [_____]. Initiate backwash by [elapsed time] [high head loss] [high turbidity] [manual initiation] [______]. Furnish the panel completely assembled, wired, and tested at the factory prior to shipment. Provide the panel with required switches for manual operation as required.
2.2.6.9 Backwash Tank

**************************************************************************
NOTE: The designer should consider the size of the facility in determining whether a separate specification section for the backwash tank is warranted or if the following paragraph is adequate.
**************************************************************************

Furnish the backwash tank with a capacity of [_____] to backwash the system at the manufacturer's recommended rate, pressure and frequency. Construct the tank in accordance with the requirements of Paragraph Tank Requirements.

2.2.7 Cartridge Filter

2.2.7.1 Equipment Capacity

Supply [_____] filtration units. [_____] units are required to be on-line, [_____] units are required to be on standby. On-line and standby units are required to have the capacity to treat the entire waste stream as specified in Paragraph Cartridge and Bag Design Criteria.

2.2.7.2 Filter Material

Filter material consists of [acetate] [acrylic] [glass] [nylon] [polyester] [polypropylene] [rayon] [saran] [cotton] [fluorocarbon] [teflon] [polyethylene] [_____] construction.

2.2.7.3 Cartridge Style

Cartridge style are to be [double open end industrial] [single open ended (SOE) flat closed end to fit housings with 020 O-ring posts] [SOE flat closed end with external 222 O-rings] [double open end with internal O-rings] [SOE flat closed end with external 226 O-rings] [SOE fin end with external 226 O-rings] [SOE fin end with external 222 O-rings] [double open end with internal O-rings] [SOE fin end with external 120 O-rings].

2.2.7.4 Gasket or O-Ring Material

Provide the gaskets or O-rings fabricated from [silicone] [buna-n] [white silicone] [white buna-n] [viton-a] [EPDM] [teflon].

2.2.7.5 Pore Size/Rating

Provide filter pore sizes of [0.1] [0.2] [0.45] [1] [3] [10] [30] [50] [75] [100] [200] [_____] microns.

2.2.7.6 Filter Cartridge Dimensions

The filter cartridge is required to be the standard length of 250 mm 10 inch. Provide the cartridge inside diameter of [______]. Provide the cartridge outside diameter of [______].

2.2.7.7 Core Material

Provide cartridge core material made of [tinned steel] [polypropylene] [304 stainless steel] [316 stainless steel] [______].
2.2.7.8  Filter Housing

2.2.7.8.1  Material of Construction

**************************************************************************
NOTE: Where flange options are specified, the designer must account for clearance of flanged fittings during installation.
**************************************************************************

Construct the filter housing head, shell, and associated internal and external connections and internal and external hardware of [304 stainless steel] [316 stainless steel] [carbon steel] [teflon] [polypropylene] [fiberglass reinforced plastic] [acrylic]. Prefabricate the housing and deliver to the site in such a condition that the unit can be fastened in the location designated on the design drawings. Provide the filter housing with the following dimensions and inlet, outlet, and system control connections:

<p>| | |</p>

2.2.7.8.2  Shell O-Ring Material

Provide filter housing shell O-ring material composed of [buna-n] [silicon] [neoprene] [viton-a] [ethylene] [propylene] [_____] material.

2.2.8  Bag Filter

2.2.8.1  Equipment Capacity

Supply [_____] filtration units. [_____] units are set to be on-line, [_____] are set to be standby. Each on-line and standby unit is required to have the capacity to treat the entire waste stream as specified in Paragraph Cartridge and Bag Design Criteria.

2.2.8.2  Filter Material

Provide filter material consisting of [acetate] [acrylic] [glass] [nylon] [polyester] [polypropylene] [rayon] [saran] [cotton] [fluorocarbon] [teflon] [polyethylene] [_____] construction.

2.2.8.3  Gasket Material

Provide a single gasket cover seal for each bag element. Provide [silicone] [buna-n] [white silicone] [white buna-n] [viton-a] [EPDM] [teflon]as material of construction.
2.2.8.4 Pore Size/Rating

Provide bag pore size of [0.1] [0.2] [0.45] [1] [3] [10] [30] [50] [75] [100] [200] [_____] microns.

2.2.8.5 Bag Surface Area

Provide bag surface area of [_____].

2.2.8.6 Bag Support

Support material fabricated from [tinned steel] [polypropylene] [304 stainless steel] [316 stainless steel] [_____] material.

2.2.8.7 Filter Housing

2.2.8.7.1 Material of Construction

******************************************************************************
NOTE: Where flange options are specified, the designer must account for clearance of flanged fittings during installation.
******************************************************************************

Construct the filter housing head, shell, and associated internal and external connections and internal and external hardware of [304 stainless steel] [316 stainless steel] [carbon steel] [teflon] [polypropylene] [fiberglass reinforced plastic] [acrylic]. Prefabricate the housing and deliver to the site in such a condition that the unit can be fastened in the location designated on the design drawings. Provide filter housing having the following dimensions and inlet, outlet, and system control connections:

<table>
<thead>
<tr>
<th>Diameter</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overall Height</td>
<td>[_____]</td>
</tr>
<tr>
<td>Inlet/Outlet</td>
<td>[<em><strong><strong>] [NPT] [Flange] [ANSI 150 lb] raised face, [threaded flanges] [</strong></strong></em>]</td>
</tr>
<tr>
<td>Body/Sump Drain</td>
<td>[<em><strong><strong>] [NPT] [Flange] [</strong></strong></em>]</td>
</tr>
<tr>
<td>Vent</td>
<td>[<em><strong><strong>] [NPT] [Flange] [</strong></strong></em>]</td>
</tr>
<tr>
<td>Gauge</td>
<td>[<em><strong><strong>] [NPT] [Flange] [</strong></strong></em>]</td>
</tr>
</tbody>
</table>

2.2.8.7.2 Shell O-Ring Material

Provide filter housing shell O-ring material made of [buna-n] [silicon] [neoprene] [viton-a] [ethylene] [propylene] [_____] material.

2.2.9 Sample Ports

Locate two sample ports, at a minimum, on each unit; one to sample the influent and one to sample the effluent. Fabricate so the sample ports are readily accessible and of the manufacturer's standard design and placement.
2.2.10 Turbidimeter

************************************************************************************
NOTE: Delete the interface screening requirement if turbidity monitoring will not be performed at the media interface and for bag and cartridge filters.
************************************************************************************

Install a turbidimeter for automatically testing the turbidity of the water in the [influent line] [effluent line] [media interface] for each filter unit. Obtain [influent] [effluent] samples directly from the piping. Collect interface samples from a screen located within the media bed [_____] mm [inch] above the media interface. House the turbidimeter in a NEMA [4x] [12] [_____] enclosure located within [_____] from the sensor. Turbidimeter is required to be programmable to read in NTU, FTU, and engineering units and provide a measurement range from [_____] NTU to [_____] NTU.

2.2.11 Drain Line

Locate a drain line to facilitate the removal of water from the filter tank. Ensure the drain line is readily accessible and of the manufacturer's standard design and placement.

2.2.12 Chemical Feed

Provide chemical feed systems in accordance with the requirements of Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.

2.2.13 Materials Protection

Treat the interior and exterior of fabricated ferrous metal components after fabrication to prevent corrosion. Sandblast the surfaces of the filter tanks and completely factory finish paint prior to shipment. Use insulating components such as gaskets, couplings, or bushing or dielectric-type which prevent corrosion of bimetallic-type contacts, at connections between dissimilar metals.

2.2.14 Access Walkways, Platforms, Ladders And Handrails

************************************************************************************
NOTE: Drawings should provide for the location of access walkways, platforms, ladders and handrails.
************************************************************************************

Provide walkways, platforms and ladders for access to equipment for operation and maintenance in accordance with Section 05 50 13 MISCELLANEOUS METAL FABRICATIONS. Walkways and platforms are required to be nonslip open grating fabricated from [galvanized steel] [aluminum] [fiberglass] [______]. Provide rigid handrails and kick-plates along the sides of walkways and platforms. Fabricate handrails from [galvanized steel] [aluminum] [______], to be [______] high, and to have two horizontal rails. Provide gates as required for access to equipment. Set the last rung of the ladder on top at the same level as the top of the tank. Ensure construction conforms to ASSP A1264.1 and ALI A14.3.
PART 3 EXECUTION

3.1 EXAMINATION

Verify all dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

3.2.1 Fabrication

Any work not required to be performed in the field is to be performed in a factory under controlled conditions.

3.2.2 System Installation

Install the system such that proper wastewater flow through the unit and required effluent conditions as specified in Paragraphs Design Criteria or Cartridge and Bag Design Criteria (as applicable) is achieved and maintained. Perform all electrical work in accordance with the applicable requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.2.3 Painting

Perform painting in accordance with applicable requirements provided in Section 09 90 00 PAINTS AND COATINGS, and additional requirements provided herein.

3.2.3.1 Metal surfaces

Paint all metal surfaces except aluminum, bronze, brass, galvanized steel, and stainless steel. Surface prepare and paint in the shop or in the field as indicated. Finish manufactured items, such as motors and switchboards, with the manufacturer's standard finish.

3.2.3.2 Preparation and Application

Prepare ferrous metal surfaces in accordance with SSPC SP 6/NACE No.3 and paint with two or three coats of MIL-DTL-24441 epoxy paint to achieve a total dry film thickness of 150 microns (6 mils). Master Painter's Institute (MPI) #120 Epoxy, High Build, Self-Priming, Low Gloss, is an acceptable replacement to MIL-DTL-24441.

3.2.3.3 Coating Testing

Examine coating for flaws and tested for thickness. Measure the thickness of coatings wet and dry using a commercial film thickness gauge. Notify the Contracting Officer in advance of any painting. Do not apply additional coats until the previous coat has been approved. Repair or add additional coats at no additional cost to the government.

3.2.3.4 Coating Repair

If welding is required after application of the coating or if the coating is damaged in any way, prepare the affected area in compliance with SSPC SP 6/NACE No.3 and reapply the coating to that area. If holidays are detected or film thickness is insufficient, prepare the surface and apply additional coats in the affected area in compliance with the manufacturer's instructions.
3.2.4 Valve And Pipe Installation

3.2.4.1 Valves

Install valves as nearly as possible in the position shown in the Contractor provided Shop Drawing. Install and support valves in their respective position free from distortion and strain on appurtenances during handling and installation. Inspect material for defects in workmanship and material. Debris and foreign material Clean out debris and foreign material from valve openings and seats; operate operating mechanisms to check their proper functioning, and check nuts and bolts for tightness. Valves and other equipment which do not operate easily or are otherwise defective are to be repaired or replaced at no additional cost.

3.2.4.2 Piping

Install piping to accurate lines and grades. Use temporary supports that are sufficiently rigid to prevent shifting or distortion of the pipe. Make provision for expansion where necessary. Pitch piping toward low points, and provide for draining at these low points. Use a sufficient number of unions or flanges allow for the dismantling of all water pipe, valves, and equipment. Install piping including cleaning, cutting, threading and jointing, in accordance with [Section 22 00 00 PLUMBING, GENERAL PURPOSE] [______].

3.2.5 Filter Tank

3.2.5.1 Installation

Install the filter tank in accordance with the recommendations of the manufacturer and by workers experienced in the installation of this type of equipment. Check Components with corrosion protective coating and restore any damaged or abraded areas to the original or an equivalent coating.

3.2.5.2 Erection of Equipment

Properly align equipment. Turn unit to a vertical position and set in place. Set the anchor bolts in place and tighten the nuts against the shims. After the foundation alignments have been approved, bolt the stationary assembly securely in place. Check the alignment of equipment after securing to the foundations. Remove bracing and shipping from the bottom and/or interior of the tank. Connect piping as indicated. Close valves.

3.2.6 Underdrain

**************************************************************************
NOTE: Prefabricated package systems may have the underdrain installed. This paragraph should only be included where the underdrain is to be installed in the field.
**************************************************************************

Install the underdrain in accordance with approved shop drawings and requirements of the manufacturer, including instructions of the manufacturer's representative. Clean and wash the filter tank prior to installation of the underdrain. Replace broken or defective components. Do not modify the manufacturer-supplied underdrain. Following
installation, completely clean the underdrain system and wash free of loose materials and debris. Restore any damaged surfaces to the original or equivalent coating. Do not subject to internal water pressure or testing of the system for a minimum of [_____] days after completion of installation. Maintain the underdrain system in clean condition until installation of filter media.

3.2.7 Support Media

******************************************************************************
NOTE: The need for a supporting layer of gravel will depend on the selected underdrain. If the underdrain does not require a gravel layer, delete this paragraph. Also, delete this paragraph for traveling bridge, continuous backwash, cartridge and bag filters.
******************************************************************************

Provide gravel size and layer thickness as follows:

<table>
<thead>
<tr>
<th>Gravel Layer</th>
<th>Layer Thickness</th>
<th>Size Limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bottom</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Second</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Third</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Top layer</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Place the gravel by hand to avoid movement to the underdrain system and to ensure free passage of water from the underdrain. Complete each gravel layer before the next layer above is started. Remove gravel that becomes mixed and replace in layers as specified. Obtain the correct thickness of each layer as follows: Before the gravel is placed, mark the top of each layer on the side of the filter. Then level the top of each layer against a water surface held at the appropriate mark. No particles are allowed to be less than half submerged, and nowhere are places to be left where additional gravel can be placed without the particles extending more than 1/2 their volume above the water surface. Blackwash the support gravel after it has been placed, in accordance with AWWA B100.

3.2.8 Filter Media Installation

******************************************************************************
NOTE: Media installation may be performed by the manufacturer supplying the filter system for package treatment systems. This paragraph should be used only when the media will be installed in the field. Delete the freeboard requirement for filtration systems which do not require bed expansion during backwashing.
******************************************************************************

Install media under the supervision of the filter equipment supplier. Before installing the filter media, check all piping connections and ensure
filter components are in good condition and proper position. Place media to the depths [required by the manufacturer] [as follows:

<table>
<thead>
<tr>
<th>Media Type</th>
<th>Layer Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sand</td>
<td>[_____]</td>
</tr>
<tr>
<td>Anthracite</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Leave a minimum freeboard of [_____] between the top of the media and the top of the tank.

3.2.8.1 Media Layers

Complete each layer of media before the next layer above is started. Deposit each layer of media so as not to disturb the level surface of the layer below. Remove and replace media which is made dirty before or after placement.

3.2.8.2 Cleaning of Media

Backwash, scrape, and skim the filter media in accordance with AWWA B100 to remove excess fine material upon completion of placement of each layer. Perform the number of washes, the wash rate and duration of wash to achieve the specified gradation for each layer in accordance with the recommendations of the filter media supplier.

3.2.9 Identification Systems

3.2.9.1 Identification Tags

**************************************************************************

NOTE: Delete when identification tags are not considered necessary on small projects.
**************************************************************************

Install identification tags made of brass, engraved laminated plastic, or engraved anodized aluminum, indicating service and valve number on valves, except those valves installed on supplies at plumbing fixtures. Size tags to be 35 mm 1-3/8 inch minimum diameter, and stamp and engrave all markings. Provide black indentations, for reading clarity. Attach tags to valves with No. 12 AWG, copper wire, chrome-plated beaded chain, or plastic straps designed for that purpose.

3.2.9.2 Color Coding

**************************************************************************

NOTE: Color coding for piping identification as required by using agency will be developed and inserted in the Color Code Schedule in Section 09 90 00 PAINTS AND COATINGS.
**************************************************************************

Color code piping identification as specified in Section 09 90 00 PAINTS AND COATINGS.
3.2.10 Vent Line Installation

NOTE: This paragraph only applies to cartridge and bag filters.

Install the vent line according to the manufacturer's standard design and placement. Locate the vent line in position to reduce system operating pressure prior to replacement of filter elements.

3.3 FIELD QUALITY CONTROL

NOTE: If the Contractor will be responsible for obtaining water for filter acceptance testing, such requirement should be indicated in the following paragraph.

Perform field tests in the presence of the Contracting Officer and provide labor, equipment, and incidentals required for the tests. Provide for disposal of all waste residuals resulting from the tests. Notify the Contracting Officer [_____] days prior to the date and time for the acceptance tests. Rectify any deficiencies found and retest any work affected by such deficiencies.

3.3.1 Initial Operation

Following completion of installation of the treatment systems and after the Contractor and manufacturer's representative agree the system is ready for operation, operate the system over an initial operating period not to exceed [_____] days. Demonstrate proper operation of the equipment, including, but not limited to, the ability of the system to produce the minimum specified effluent requirements detailed in Paragraphs Design Criteria or Cartridge and Bag Design Criteria (as applicable), proper operation of the media cleaning equipment, and the control system ability to provide the correct operational logic to optimize the filtration process.

3.3.2 Acceptance Testing

Commence acceptance testing not sooner than [_____] days and not later than [_____] days following approval of the initial operation. Demonstrate within the acceptance the ability of the filtration system to meet the specified effluent requirements when operating at the design flow rate and demonstrate the ability of the control system to provide the correct operational logic to optimize the filtration process. Conduct the tests over [_____] days of continuous operation. Collect [_____] effluent samples during each [_____] hour period. Do not take samples less than [_____] hours nor more than [_____] hours apart. Analyze the samples for [turbidity] [total suspended solids] [effluent particle size] [_____] by standard methods as described in [______]. For the filtration system to qualify for process acceptance, the average value of each of the filtered water effluent parameters monitored during the continuous testing is required to not exceed the values of the specified parameters. In the event that the specified filtered water quality requirements are not met during the period that acceptance testing is conducted, the defective equipment or operation must be modified or replaced and the testing repeated. The schedule for retesting is subject to approval by the
Contracting Officer.

Submit test reports in booklet form showing field tests performed to adjust each component and to prove compliance with the specified performance criteria. Indicate the final position of controls in each test report.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Posting Framed Instructions

Post frame instructions containing wiring and control diagrams under glass or in laminated plastic where directed. Frame condensed operating instructions, prepared in typed form, as specified above and post beside the diagrams. Submit proposed diagrams and instruction prior to posting. Post the framed instructions before acceptance testing of the system.

3.4.2 Field Training

Provide a field training course for designated operating and maintenance staff members. Provide training for a total period of [_____] hours of normal working time and start after the system is functionally complete but prior to final acceptance test. Cover all of the items contained in the Operating and Maintenance Instructions in the field training. Ensure the instructions include, but are not necessarily limited to the following:

a. System layout showing piping, valves and controls and installation requirements.

b. Approved wiring, logic, and control diagrams prepared in accordance with ANSI/ISA 5.1 including a drawing index, legend and symbols list, and abbreviations and identifiers.

c. A control sequence describing startup, operation, and shutdown; including the functional and operational description of the control system covering the procedures for programming, operation, startup, shut-down, and calibration.

d. Operating and maintenance instructions for each piece of equipment, including checkout, troubleshooting, and servicing.

e. Manufacturer's bulletins, cut sheets and descriptive data, parts list, and recommended spare parts.

3.4.3 Operating And Maintenance Instructions

Provide operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include the manufacturer's name, model number, service manual, parts list, and brief description of equipment and their basic operating features in the instructions. Also, provide maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and trouble shooting guides. Include simplified diagrams for the system as installed. Show valves numbered and tagged in the manual and provide a schematic indicating the number of each valve. Permanently bind each set and provide with a hard cover. Inscribe the following identification on the covers: the words "OPERATING AND MAINTENANCE INSTRUCTIONS," name and location of the facility, name of the Contractor, and contract number.

NOTE: This guide specification covers the requirements for ultraviolet (UV) disinfection equipment for treatment of wastewater.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This specification should be used to allow the Contractor to install proven "off-the-shelf" units supplied by reputable vendors. This guide specification includes technical requirements for ultraviolet disinfection equipment and controls. This specification will not be used for disinfection of water or industrial wastes.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide
specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

ANSI C82.4 (2017; R 2022) Lamp Ballasts - Ballasts for High-Intensity-Discharge and Low-Pressure Sodium Lamps

NEMA 250 (2020) Enclosures for Electrical Equipment (1000 Volts Maximum)

NEMA ICS 1 (2022) Standard for Industrial Control and Systems: General Requirements

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2023; ERTA 4 2023; ERTA 5 2023; ERTA 6 2023) National Electrical Code

U.S. DEPARTMENT OF DEFENSE (DOD)

UFC 3-240-01 (2020; with Change 2, 2021) Wastewater Collection and Treatment

1.2 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Layout; G[, [______]]

SD-03 Product Data
   Framed Instructions
   Field Training; G[, [______]]
   Spare Parts
   UV System Equipment

SD-06 Test Reports
   Design Conditions
   Operating Test
   Site Visits

SD-07 Certificates
   Manufacturer's Qualifications
   Standard Products

SD-10 Operation and Maintenance Data

Instruction Plan; [__, [____]]

Operating and Maintenance Manuals; [__, [____]]

[Six] [____] complete [hard] [optical disc] copies of operating instructions and maintenance instructions. Each manual must have an index listing the contents and tab separators between sections. [Manuals must be bound in sturdy three-ring, loose-leaf binders.]

1.3 ADMINISTRATIVE REQUIREMENT

1.3.1 Preconstruction Conference

A preconstruction conference is required and all subcontractors, suppliers, and UV equipment manufacturer are required to attend.

1.4 MAINTENANCE MATERIAL SUBMITTAL

1.4.1 Extra Materials

Supply all new spare parts that are exact replacements and separately packaged. Submit the parts list including recommended spare parts and maintenance supplies with current unit prices and source of supply for each item of operable equipment. Include parts recommended by the manufacturer to be replaced after 1 and 3 years of service. List special tools, instruments, accessories, and special lifting and handling devices required for periodic maintenance, repair, adjustment, and calibration.

Include with the package bill of materials with quantity, item description, and part number. Furnish the following spare parts and safety equipment:

a. One completely assembled lamp module.

b. Ten percent of the total number of the system lamps.

c. Five percent of the total number of the system ballasts.

d. Ten percent of the total number of the system lamp sleeves.

e. Ten sets of lamp end seals.

f. Ten sets of lamp socket connectors.

g. [Four] [____] personnel safety shields which block out UV wavelengths between 200 and 400 nm.

1.5 QUALITY ASSURANCE

1.5.1 Qualifications

1.5.1.1 Contractor Qualifications

Possess a minimum of [2] [____] years of experience in the construction of water, wastewater, and/or industrial wastewater facilities.

1.5.1.2 Manufacturer's Qualifications

Manufacturer is required to demonstrate experience in the production of substantially similar equipment, and is required to show evidence of satisfactory operation of identical equipment to that proposed in at least
3 installations for a period not less than one year disinfecting secondary effluent with similar effluent flow and characteristics to the treatment plant in this contract.

1.5.1.3 Equipment Parts

Manufactured parts to standard sizes and gauges so that repair parts furnished at any time can be installed in the field. Ensure that like parts of duplicate units are fully interchangeable.

1.6 DELIVERY, STORAGE, AND HANDLING

Protect from damage, deterioration, weather, excessive humidity, excessive temperature variation, dirt, dust, and contaminants equipment and materials delivered, handled, and placed in storage, from the time of shipment until installation is completed and the equipment and materials are ready for operation. Mark and store equipment to permit easy identification and inspection. Tag each item of the equipment or mark it as identified in the delivery schedule or on the shop drawings. Include with each shipment complete packing lists and bills of materials.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide an ultraviolet (UV) disinfection system complete and operational with controls and accessories as shown and as specified. Provide equipment suitable for outdoor open channel, gravity flow installation including, but not limited to, the following components, and appurtenances necessary for the interconnection of components, in the quantities required:

a. UV lamp module with support rack and bracket.
b. UV system instrumentation, controls, and power distribution.
c. Wireway and interconnecting cables.
d. Water level control device.
e. UV intensity monitoring system.
f. Elapsed time meter.
g. Cleaning system.
h. Spare parts.

2.1.1 Operation of Existing Facility

**************************************************************************
NOTE: Include the following paragraph only where UV disinfection system is replacing another disinfection system at the existing wastewater treatment plant.
**************************************************************************

Maintain the continuous flow of wastewater and disinfection until the new system is tested, approved and fully operational. No discharge of untreated wastewater, reduction in existing hydraulic capacity or organic treatment capacity is allowed.

2.1.2 Design Conditions

**************************************************************************
NOTE: Determine or estimate plant flows, total suspended solids (TSS), UV transmittance, and
influent microorganism count. A value for UV transmittance must be determined from an independent laboratory. Occasionally, a wastewater quality may be encountered which exceeds the experience of design engineers (e.g. due to an unfamiliar process design, a familiar but poorly operated process, an under-designed plant, an unusual influent to the treatment plant, etc.). In these cases, a pilot study should be conducted to provide information required for design. Channels must be designed for peak design flow.

The reports listed below in subparagraphs a. thru f. need to be tailored by the designer to meet state standards where the process is being permitted.

**************************************************************************

Ultraviolet equipment are required to disinfect wastewater effluent with the following characteristics:

<table>
<thead>
<tr>
<th>Description</th>
<th>Initial</th>
<th>Design</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peak flow, cubic meter per sec Mgd</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Average flow, cu. meter/sec Mgd</td>
<td></td>
<td></td>

Submit the following reports confirming compliance with the design conditions characteristics:

a. Results of tests done by an independent testing laboratory showing effective hydraulic design of the reactor, including headloss calculations.

b. Documentation showing that the type of ballast required for the particular lamp supplied for the system have performed successfully for a period of not less than one year.

c. Hydraulic calculations demonstrating compliance with the specified hydraulic characteristics.

d. Residence time distribution (RTD) data plotted as concentration versus time, and as cumulative tracer passed versus time in accordance with UFC 3-240-01. The Contracting Officer reserves the right to require separate tests to be conducted on a system identical in design to the proposed system if the hydraulic test data submitted by the
manufacturer is determined to be unacceptable.

e. In the test unit used in the development of the RTD curves, use a number of lamps based on achieving the stated treatment adjectives for a worst case realistic influent scenario for the system. Utilize the same lamps, electronic lamp controller, ballast and automatic level controller as that proposed in the full scale system.

2.1.3 Performance Requirements

**************************************************************************
NOTE: Typical values for nominal average intensity, UV density and theoretical retention time are 5100 microwatts per square cm, 3.35 watts per liter, and 7 seconds, respectively. Nominal average intensity will vary between manufacturers. Density depends upon the design of the particular UV system and the number of lamp banks. Retention time depends upon the channel geometry and number of lamp banks. Insert values per specified equipment manufacturer's calculations.
**************************************************************************

2.1.3.1 Inactivation

**************************************************************************
NOTE: Predominate effluent criteria used in performance requirements for UV systems is for whole body contact: 200 most probable number (MPN)/100 ml of fecal coliforms, with a maximum 7-day average of 400 MPN/100 ml. Some states have different microbe and disinfection standards; therefore, determine the site specific disinfection requirements from the state permitting authority.
**************************************************************************

Provide a system capable of reducing the influent [fecal coliform] [_____] count to [200 MPN/100 mL] [_____] on a 30 day geometric mean of daily samples.

2.1.3.2 UV Dose

**************************************************************************
NOTE: Conventional units for UV dosage are microwatt-seconds per square cm. The standard dosage of UV radiation is determined by the effluent; unfiltered effluent may require a 30,000 dosage while a dosage of 16,000 to 20,000 is more typical of filtered effluent to achieve a disinfection safety factor of 2.0. Insert value per equipment manufacturer's recommendation.
**************************************************************************

Use a UV dosage not less than [_____] microwatt-seconds per square cm based on peak design flow conditions, lamp output at 65 percent of its initial level after 1 year (8750 hours) of lamp operation without fouling on the lamp sleeves, and minimum UV transmittance as stated in paragraph Design Conditions.
2.1.3.3 Nominal Average Intensity

Ensure the nominal average intensity within the channel is not less than [_____] microwatts per square cm at a transmittance of 70 percent after 100 hour burn-in of lamps and with no fouling on the lamp sleeves.

2.1.3.4 UV Density

Ensure the UV density of the channel is not less than that required in the test runs, lab analysis, channel configuration, and residence times.

2.1.3.5 Retention Time

Ensure that the actual retention time \( t \) of the effluent within the system determined by hydraulic analysis is not less than 0.9 times the theoretical retention time \( T \). Ensure the theoretical retention time \( T \) is not less than [_____] seconds at the peak design flowrate.

2.1.3.6 Plug Flow

The flow characteristics through the system are expected to closely simulate ideal plug flow conditions under the full operating flow range. The Morrill Dispersion Index, defined as the time required for 90 percent of the salt and dye traces to pass, divided by the time required for 10 percent to pass, is to be less than 2.0. The ratio of the time required for 50 percent of tracer to pass to the mean residence time is required to have a value between 0.9 and 1.1. The ratio of the time of initial tracer appearance to the theoretical residence time is required to have a value greater than 0.5.

2.1.3.7 Dispersion

Ensure the dispersion coefficient, which accounts for the deviation of the channel's hydraulic behavior from that of perfect plug flow, is less than 100 square cm per second. Ensure the dispersion number (ratio of the dispersion coefficient to the product of flow velocity and channel length) is less than 0.1.

2.1.3.8 Turbulence

Flow through the system is required to be turbulent with a Reynolds Number greater than 4,000 at average flow.

2.1.3.9 Channel Volume

Make full use of the channel volume throughout the flow range. Ensure the ratio of the mean residence time \( \theta \) to theoretical residence time \( T \) is greater than 0.9.

2.1.3.10 Headloss

Ensure the headloss caused by each bank of horizontal lamp modules is such that at the peak flow rate no lamp is exposed to the atmosphere and the maximum depth over the uppermost lamp sleeves is 40 mm 1.5 inch. The headloss through vertical lamp banks is not allowed to exceed 150 mm 6 inch.

2.1.3.11 Cross Sectional Area

Ensure the cross-sectional area occupied by the lamp module frame at the

SECTION 46 66 56 Page 10
entrance and exit of each bank is no greater than 35 percent of the cross-sectional area occupied by the effluent in the channel.

2.1.3.12 Aspect Ratio

Provide a minimum aspect ratio (ratio of channel length to hydraulic radius) of 15 per lamp bank.

2.2 EQUIPMENT

2.2.1 UV System Equipment

Submit product data to include: design calculations relevant to the type of system proposed indicating removal performance including dose; nominal average intensity within each reactor; UV density; theoretical retention time of effluent within the system; dispersion coefficient; maximum headloss caused by each bank of lamp modules; lamp module cross-sectional area; aspect ratio of lamp bank; installation list; manufacturer's illustrations; and a statement by the equipment manufacturer listing any exception to or deviations from the contract drawings and specifications.

2.2.1.1 Layout

The physical layout of the system shown is based on equipment manufactured by [______]. Submit drawings showing fabrication methods, assembly, accessories, installation details and point-to-point wiring diagrams; instrumentation and controls; equipment; dimensions; make and model; materials of construction and installation instructions. In the drawing, indicate clearances required for maintenance and operation and include complete wiring and schematic diagrams, equipment layout, dimensions, templates and directions for the installation of anchor bolts and other anchorages and any other details required to demonstrate that the system has been coordinated and will properly function as a unit.

If UV equipment proposed is sufficiently different than that shown, submit detailed, modified layout drawings and descriptions for approval by the Contracting Officer within 5 working days following Notice to Proceed. Also obtain approval, if applicable, from the State permitting authority for the sufficiently different equipment and layout proposed within [15] [_____] working days following Notice to Proceed.

2.2.1.2 Equipment Construction

2.2.1.2.1 UV Lamp Module

a. Module consists of lamps with each lamp placed in an individual sleeve. Module is required to be capable of being withdrawn as a unit and replaced without interrupting operation of any other module, to be self-supporting in the channel, and to be capable of supporting a weight of 90 kg 200 pounds.

b. Horizontal lamp module a have lamps in sleeves sealed and supported in a NEMA 6P stainless steel frame. Electrical wires which carry power to the lamps and ballasts are required to be completely enclosed in the frame and isolated from the wastewater. The frame is required to be capable of protecting lamps and sleeves from foreign material or debris within the channel.

c. Vertically oriented modules have lamps installed in a weatherproof,
watertight enclosure. Fit sleeve to the enclosure using compression fitting and neoprene gasket. Wiring is required to include numbered terminal strips which correspond to the numbering in the main power panel. Fit lamp enclosure with a waterproof wiring connector to allow the enclosure to be disconnected and removed from the channel. Install lamp connection above the waterline or ensure it is waterproof. Provide a safety interlock switch to turn off power to the lamps when module enclosure covers are opened. Provide a Class B, ground fault circuit interrupter for each enclosure to turn off power if water enters the enclosure. Arrange lamps so that they can be replaced without disassembling or removing lamp module.

d. Ensure system allows for complete system shutdown or by-pass.

e. Ensure system allows for continuous disinfection while replacing lamps, sleeves, and ballasts; and while cleaning the lamp sleeves.

f. Individual lamp modules weighing 25 kg 55 pounds or less are required to be removable without requiring mechanical lifting devices. Systems with individual lamp modules weighing over 25 kg 55 pounds are to be provided with a mechanical lifting device as [specified] [indicated].

2.2.1.2.2 UV Lamps

a. Supply low-pressure mercury vapor type lamps of the hot-cathode, instant-start design in which the coiled filamentary cathodes are heated by the arc current. Provide a clamped design filament that withstands shock and vibration.

b. Ensure lamps have the following characteristics:

(1) 90 percent of UV radiation within the wavelengths of 233.7 to 273.7 nm.

(2) Produce a minimum UV intensity of 190 microwatts per square cm at a distance of 1 meter.

(3) Maximum power input of 65 watts (not including ballast losses).

(4) Have a minimum arc length of 1475 mm 58 inches.

(5) Rated to produce zero levels of ozone.

(6) Have a minimum UV output of 26.7 watts at 100 hours.

c. Provide a lamp base made of metal and ceramic, resistant to UV light and ozone. Ensure lamp tube is capable of transmitting 90 percent of the radiation produced therein.

d. Ensure that changing lamps does not require removal of the sleeve from the lamp module frame. Ensure lamp ballasts are capable of being replaced by plant operating personnel.

e. Ensure system uses lamps available from at least 2 currently active lamp manufacturers without modifications to the system.

2.2.1.2.3 UV Lamp Sleeve

a. Provide a sleeve consisting of clear fused quartz circular tubing rated
for transmittance of 89 percent or more and not be subject to solarization over its life. Provide a nominal wall thickness between 0.8 and 2.09 mm 20 and 53 inch.

b. Configure sleeve such that one end of each sleeve is closed and the other end is sealed by a lamp end seal and compressed O-ring. The closed end of the sleeve is required to be held in place by means of a retaining O-ring. No part of the sleeve is allowed to come in contact with any steel in the frame.

2.2.1.2.4 Lamp End Seal and Lamp Holder

a. Configure sleeve so the open end of the lamp sleeve is sealed by means of a stainless steel nut which compresses an external sleeve O-ring seal. Ensure the sleeve unit has a surface which allows a positive hand grip for tightening without the use of any tools for removal.

b. Hold the lamp holder in place in such a way as to isolate and seal the lamp from the module frame and other lamps in the module. Configure the lamp sleeve such that in the event of a fracture, the seal prevents moisture from entering the module frame and the electrical connections to other lamps in the module. Incorporate UV resistant materials into the lamp holder to prevent lamp sleeve from touching steel.

2.2.1.2.5 UV Lamp Module Support Rack

Fabricate rack from stainless steel construction that does not allow UV light to radiate above the channel when the lamp modules are energized and fully immersed in the effluent.

2.2.1.3 Lamp Array Configuration

2.2.1.3.1 Horizontal

Arrange horizontal lamp configurations in a uniform array with lamps parallel to each other and to the flow. Space lamps evenly in horizontal and vertical rows with centerline spacings equal in both directions. Pattern the single array to be continuous and symmetrical throughout each reactor.

2.2.1.3.2 Vertical

Configure vertical lamps in a staggered uniform array with lamps parallel to each other, but perpendicular to the flow. Space lamps evenly with alternating rows offset by one-half the uniform centerline spacing.

2.2.1.4 Water Level Control

**************************************************************************

NOTE: If more than 1 channel is required, there needs to be a positive method of flow distribution to each channel. The downstream level control device is designed to build-up negligible head at peak flow rates and may not distribute flow equally to all channels. The equipment manufacturer should be consulted for recommended methods of flow distribution in multiple channels.

Automatic Slide/Sluice Gates: These gates are
required, two per channel, if the UV system is to operate in an automatic mode for multiple channel configurations. These gates are not necessarily supplied by the UV equipment manufacturer. Additionally, it is the gate manufacturer’s responsibility to properly install and set up each gate, such that a gate closed limit switch, one per gate, is transmitted to the UV Control Center. Each gate must be able to receive one opening and one closing signal from dry 10 amp contacts located in the Control Center. To insure disinfection under all conditions, gate interlocking, both mechanical and electrical, is required to prevent all gates from being closed at any given time. These interlocks are the responsibility of the gate manufacturer.

During automatic operation, if channels are to be placed in and out of service, accommodations should be made to drain the channel when the channel is not in service. Channels, when out of service, must be completely isolated and not allow any leakage through slide gates or valves to enter final effluent.

******************************************************************************

a. Place a level control device [at the discharge end] [both ends] of each channel. Level control device is required to maintain constant channel water level within tolerances required to keep lamps submerged and prevent excessive water layer over the top lamps.

b. [Pivot the automatic level controller above the effluent water surface so that each unit opens across the width of the channel. Adjust counterweights using counterbalance weight at startup for the full flow range. Counterweights are not to require adjustment after initial setting. Use stainless steel, Lexan, Delrin bearings, counterweights of carbon steel with galvanized finish and corrosion resistant seal of neoprene or other suitable elastomer.] [Use stainless steel for fixed weirs.] [____].

c. Install a water level sensor within the channel to provide an alarm indication and/or automatic system shutdown in the event the water level drop below the uppermost part of the top row of horizontal lamps. Provide alarm contacts for remote annunciation.

2.2.2 Electrical

2.2.2.1 Parameters

a. Divide the system into the proper number of parallel electrical subsystems for the peak design flow.

b. Power each electrical subsystem from a distribution center and include ground fault circuit detection, circuit protection, modules, and interconnecting cables.

c. Supply one power panel for each module and prewire by the manufacturer, except for the final connection of the individual modules to the power panel.
d. Provide standard ground fault detection with the UV equipment manufacturer.

e. House control and monitoring components and power supply in NEMA enclosures. Seal internal components from the environment. House system electronics to be used in an interior environment in enclosures conforming to NEMA 250 Type 12. House system electronics to be used in an exterior and corrosive environment, as defined in NEMA 250, in enclosures conforming to NEMA 250, Type 4X.

f. Provide sufficient cooling to ballasts. Ensure magnetic ballasts have a minimum allowable air flow per ballast of 0.014 cu. m/s 30 cfm.

g. Protect wiring and electrical connections against moisture to prevent electrical shorts or failure. Ensure electrical installation and materials conform to NFPA 70. Completely wired the unit requiring only an external connection for a single external power supply and remote control.

h. Ensure controls and designations conform to NEMA ICS 1.

2.2.2.2 Interconnect Cables

a. Multiconductor unshielded cable suitable for outdoor installation.

b. Thermoplastic rubber insulation with operating range of minus 60 to 125 degrees C minus 76 to 52 degrees F with low temperature flexibility and flame retardants.

c. UV stabilized jacketing resistant to oils, chemicals, fuels, solvents, and to mechanical abuse and abrasion.

d. Cable supplied by the equipment manufacturer in sufficient length and number for a complete system.

e. Cable of a modular repairable type to allow for field replacement and repair of its components by plant operators.

2.2.2.3 Connectors and Receptors

Waterproof Type S.O. cable connectors for in-line connection. Design to allow fast and easy positive coupling and uncoupling. Mount connector out of possible flood-prone environments. Use "snap-on" style connectors having no threads that allow for visual confirmation that the connection is locked in place.

2.2.2.4 Ballasts

Supply ballasts that conform to ANSI C82.4; are coordinated to the ballast supplies; are rated for [120] [208] [240] [277] [480] [volts] [the voltage indicated]; and have a power factor of not less than 90 percent at a crest factor of 2.0 or less, and a voltage range of not less than plus or minus 10 percent. Ensure ballasts are suitable for operating at [minus 15] [minus 30] [minus 40] degrees C [5] [minus 22] [minus 40] degrees F and above. Locate and/or enclose magnetic ballasts in an environment not susceptible to the effects of heat, cold and moisture. Use modular design ballasts allowing for quick disconnect and replacement by operators.
2.2.2.5 Cableway

If required by the equipment manufacturer, install cable in weatherproof and submersible cableway. Fabricate the cableway of stainless steel, 1.98 or 1.59 mm thick 14 or 16 gauge. Ensure cableway is gasketed and completely watertight under a submerged condition.

2.2.2.6 Instrumentation and System Controls

2.2.2.6.1 Controls

Provide equipment of the fully automatic program control type capable of receiving standard 4-20 mA control signals from the plant effluent flowmeter. Control of 2 or more banks of modules by turning lamp banks on and off in proportion to flow variations. Provide controls capable of continuously adjusting the UV intensity automatically in proportion to wastewater flow. Provide controls that require no manual attention other than adjustment of the required UV intensity.

2.2.2.6.2 Lamp Status Indicators

a. Provide indicators that indicate the status whether ON/OFF of each lamp in the module being powered.

b. Provide indicators to indicate the status "POWER ON", only, in each module.

c. Ensure the lamp monitoring system indicates the geometric location of each individual lamp and operating status of each lamp by means of a neon lamp or alpha-numeric data display (LED or LCD). Upon lamp failure, illuminate the corresponding lamp and activate contact closure for remote alarm annunciation. Provide contact closure for remote annunciation to indicate lamp module failure due to ground fault interruption.

2.2.2.6.3 UV Intensity Detection System

a. Provide a submersible UV sensor to continuously sense the UV intensity produced in each bank of lamp modules. Ensure the sensor measure only the germicidal portion of the light emitted by the lamps within the channel between 254.5 and 255.0 nm. Display the UV intensity on the intensity meter. Locate each UV intensity probe at a point of minimum expected intensity within the lamp array. Mount the probe to any lamp in the array using a clip-on and self-aligning mount to assure the proper spacing from the tube without necessity of hand tools. Factory calibrate the probe with verification in the field prior to startup. The UV equipment manufacturer is required to provide justification for the sensor location.

b. Provide one UV intensity meter per bank of lamp modules. The meter is required to indicate safe intensity, low intensity, and unsafe intensity by means of color codes on the meter face, or have a 0 to 100 percent scale. Clearly label the UV intensity meter and locate on the remote control panel.

c. Provide a nonresettable elapsed time meter per bank of lamp modules. Ensure the meter records hours of UV bank operation from 0 to 99,999 hours.
d. Provide one hand/off/auto switch for each UV bank and for each automatic slide gate shown and specified.

e. Time delay alarms to prevent nuisance alarms.

2.2.2.6.4 Minor Alarms

Provide minor alarms and dry contacts to indicate that maintenance attention is required. Include the following minor alarms:

a. Low warning UV intensity.
b. Individual lamp failure.

2.2.2.6.5 Major Alarms

Provide major alarms and dry contacts to indicate an extreme condition in which the disinfection performance may be jeopardized. Include the following major alarms:

a. Low UV intensity.
b. Lamp failure of 2 or more adjacent lamps.
c. Multiple lamp failure.
d. Module failure.

2.2.2.6.6 Flow Pacing

**************************************************************************

NOTE: If the system consists of 2 or more banks of lamps, the system can be flow-paced using a signal from an effluent flow monitoring device in the plant.
**************************************************************************

a. Provide a flow pacing system to turn the UV banks on and off in relationship to the signal received from the plant effluent flowmeter. Ensure the flow pacing sequence is as recommended by the UV equipment manufacturer. Where lamp dimming is used, provide a controller to allow plant operator to ratio the flow to UV dosage and UV intensity. Where on/off control is used, ensure the system allows the operator to vary the flowrate setting and allow the operator the option to operate individual banks in either the manual or automatic mode. Provide logic and time delays to regulate the UV bank ON/OFF cycle to prevent excessive cycling on both startup and shutdown of the UV bank. Multicycle lamps may be specified in applications which demand up to 100,000 annual cycles.

b. The normal mode of operation places each effluent channel continuously in service.

2.2.3 Cleaning System

2.2.3.1 General Requirements

Provide cleaning equipment and cleaning solutions. Provide a cleaning system that is [a permanent in-channel installation] [an out-of-channel installation] [a portable cleaning installation with basin] for cleaning individual lamp sleeves or entire lamp modules.
2.2.3.2 Cleaning Tank

Fabricate portable cleaning tank of stainless steel and equip with air blower (compressor), lamp module rack, hose connections and drains. Ensure tank holds at least [3 horizontal modules] [1 vertical module] and is equipped with hard rubber casters. Provide sealed cover for tank to prevent spilling. Equip unit with disconnect switch, a grounded plug and 3 m 10 feet of outdoor cable.

2.2.3.3 Cleaning Rack

Provide a cleaning rack mounted above the portable cleaning tank to hold one horizontal module above the cleaning liquid for hand wiping of the sleeves.

2.2.3.4 Cleaning Fluid

Provide sleeve conditioner and cleaning solution 12 months of normal operation. Supply conditioner and cleaning solution in containers not greater than 20 L 5 gallon capacity.

2.3 MATERIALS

All metal in contact with plant effluent is required to be either Type 316 or Type 304 stainless steel, passivated. Wiring which may be exposed to UV light is required to be a material that resists degradation by UV light. Material exposed to UV light is required to be stainless steel, passivated; quartz; polytetrafluoroethylene or other UV resistant material.

2.3.1 Standard Products

Provide material and equipment which are the standard product of a manufacturer regularly engaged in the manufacture of the product and which essentially duplicate equipment that has been in satisfactory operation for at least 2 years prior to bid opening. Submit written evidence that equipment and accessories are products of a qualified and experienced manufacturer. Ensure equipment is supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.3.2 Nameplates

Provide major equipment items with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.4 ANCHOR BOLTS

Provide stainless steel anchor bolts of the size required and with ample strength for the purpose intended by the Contractor. Embed anchor bolts directly during placement of concrete at depths sufficient to account for potential concrete spalling or deterioration.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify dimensions in the field, and advise the Contracting Officer of any discrepancy before
performing the work.

3.2 INSTALLATION

Perform installation in accordance with the drawings, shop drawings, and manufacturer's instructions and recommendations.

3.3 FIELD QUALITY CONTROL

3.3.1 Operating Test

After Contractor and Contracting Officer have mutually agreed that the equipment installation is complete and ready for continuous operation, conduct an operating test of the equipment and controls in the presence of the Contracting Officer to demonstrate satisfactory operation.

Include in the book form test report all field tests performed to adjust each component and field tests conducted to prove compliance with the specified performance criteria. Ensure the test report indicates the final position of controls.

3.3.2 Performance Testing

a. Begin performance testing after the UV equipment has been installed and field tested. Collect samples at times when the flow through the plant is at or near the peak flow rating from one section of the channel. Where multiple systems are supplied, the plant flow is required to be at or near the peak flow rating of at least one system or one section of the UV system.

b. Analyze the samples collected for the following, using standard testing methods or procedures:

   (1) [Fecal coliform] [_____] in MPN/100 mL just prior to UV disinfection.
   (2) [Fecal coliform] [_____] in MPN/100 mL just after UV disinfection.
   (3) Total suspended solids prior to disinfection.
   (4) Percent UV transmittance at 254 nm with 1 cm cell length prior to disinfection.

c. Continue performance testing for 14 days and collect samples 3 times per 24 hour period. Record the data obtained in booklet form. Ensure test reports indicate the final position of controls.

d. The effluent quality exiting the UV unit is required to be equal to or better than the specification requirement. Continue retesting for at least 2 consecutive days or until satisfactory bacteriological results have been obtained.

e. Submit statements signed by responsible official or representatives of the manufacturer attesting to conformance to the specified requirements. Date the statements after performance testing has been completed, include the name the project, and list the specific requirements which are being certified.
3.3.3 Manufacturer's Representative

Provide the services of a qualified manufacturer's field service representative to supervise the installation, adjustment, testing of equipment and instruct plant operators in the care, operation, and maintenance of the equipment.

3.3.4 Site Visits

Manufacturer's representative is required to assist in the proper installation and checking of the equipment for a period of time necessary to insure a completed installation. Submit a written report of the results of each visit by the manufacturer's representative, including purpose and time of visit, tasks performed and results obtained.

The representative is required to, for a period not less than three full days, start up the equipment, supervise initial operations, perform the required field tests and instruct plant operators in the proper care, operation and maintenance of the equipment. Upon request of the Government, at any time during the 1-year warranty period, the representative will recheck the system, recalibrate and adjust equipment, answer plant operator's questions and review operation and maintenance procedures.

3.4 ADJUSTING AND CLEANING

Test, calibrate, adjust and operate to verify its satisfactory operation. Clean equipment of dirt, dust and foreign matter.

3.5 CLOSEOUT ACTIVITIES

3.5.1 Operating and Maintenance Manuals

a. Submit operating instructions outlining the step-by-step procedures required for system startup, normal operation, short- and long-term deactivation, and shutdown. Include an introduction and overall equipment description, purpose, functions, and simplified theory of operation in the beginning of the instructions. Include the manufacturer's name, model number, service manual, parts list, and brief description of each piece of equipment and its basic operating features in the instructions. Include component layouts, simplified wiring, and control diagrams for the system as installed. Ensure performance test data is reflected in the operating instructions.

b. Submit maintenance instructions listing routine maintenance procedures, calibration procedures, possible breakdowns and repairs and troubleshooting guides, prior to the start of the training course.

3.5.2 Field Training

Include a combination of classroom and hands-on training at the site. Instruct designated maintenance and operations personnel in the recommended corrective and preventive maintenance procedures for the equipment. Submit the proposed lesson plan of field instruction, 30 days prior to commencement of scheduled training. Cover each item contained in the operating and maintenance manuals in the field training.
3.5.2.1 Instruction Plan

Prepare a lesson plan which includes the elements presented in the outline specified below. Identify specific components and procedures in the proposed lesson plan. Detail specific instruction topics. Reference and attach to the proposed lesson plan training aids to be utilized in the instruction where applicable. Describe any hands-on demonstrations planned for the instruction and estimated duration of each segment of the training in the lesson plan.

3.5.2.2 Training Outline

Include in the instruction, as a minimum, the following elements presented in the following outline:

a. Equipment operation.
b. Detailed component description.
c. Equipment preventative maintenance.
d. Equipment troubleshooting.
e. Equipment corrective maintenance.
f. Hands-on demonstrations.

3.5.2.3 Framed Instructions

Post framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, where directed. Prepare condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system in typed form and post beside the diagrams. Post the framed instructions before acceptance testing of the systems.

NOTE: This guide specification covers the requirements for sludge collecting equipment. Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

********************************************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

********************************************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

   Installation

SD-03 Product Data

   Sludge Collectors for Rectangular Tanks
   Collectors for Circular and Square Tanks
   Spare Parts
   Framed Instructions
   Qualifications

SD-06 Test Reports

   Testing

SD-10 Operation and Maintenance Data

   Operating and Maintenance Manuals; G[, [_____]]

   [Six] [_____] [hard] [optical disc] copies of operation and
   [six] [_____] copies of maintenance manuals for the equipment
   furnished. One complete set prior to performance testing and the
   remainder upon acceptance.

1.3 QUALIFICATIONS

   Qualify procedures and welders in accordance with the code under which the welding is specified to be accomplished. Submit qualified procedures and list of names and identification symbols of qualified welders and welding operators, prior to welding operations.

1.4 DELIVERY, STORAGE, AND HANDLING

   Protect all equipment, delivered and placed in storage, from the weather, excessive humidity and excessive temperature variation; and dirt, dust, or other contaminants.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

   Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least
2 years prior to bid opening. Provide equipment supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.1.2 Nameplates

Provide each major item of equipment with the manufacturer's name, address, type or style, model or serial number, and catalog number if applicable on a plate secured to the item of equipment.

2.1.3 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment.

2.1.4 Spare Parts

Submit spare parts data for each different item of material and equipment specified, after approval of the related submittals and not later than [_____] months prior to the date of beneficial occupancy. Include in the data a complete list of parts and supplies, with current unit prices and source of supply.

2.2 MATERIALS

**************************************************************************
NOTE: Steel components are often specified galvanized where not submerged or intermittently wetted to minimize painting and paint maintenance.
**************************************************************************

2.2.1 Steel Plates, Shapes, and Bars

Provide steel plates, shapes, and bars that are ASTM A36/A36M, minimum 6 mm 1/4 inch thickness unless otherwise specified.

2.2.2 Malleable Iron

Provide malleable iron conforming to ASTM A47/A47M.

2.2.3 Iron Castings

Provide iron castings conforming to ASTM A48/A48M.

2.2.4 Aluminum for Structural and Rolled Shapes

Provide aluminum for structural and rolled shapes conforming to AA H35.1/35.1M, alloy 6061-T6, and AA ANSI H35.2M.

2.2.5 Aluminum for Extruded Shapes

Provide aluminum for extruded shapes conforming to AA H35.1/35.1M, alloy 6063-T6.

2.2.6 High Strength Bolts

Provide high strength bolts conforming to ASTM A325M ASTM A325 with suitable nuts and washers conforming to ASTM A354; galvanized, ASTM A153/A153M.
2.2.7 Anchor Bolts

Provide anchor bolts conforming to ASTM A307; galvanized, ASTM A153/A153M.

2.2.8 Fiberglass Reinforced Polyester Plastic (FRP)

2.2.8.1 Molded FRP

Fiberglass reinforced polyester plastic must be 6 mm 1/4 inch thick and molded by the matched die method to produce uniform, smooth surfaces. Through the use of "low profile" resin systems, ensure all surfaces are smooth, resin rich, free of voids and porosity, without dry spots, crazes, or unreinforced areas, and provide for increased corrosion resistance and weathering.

2.2.8.2 FRP Laminate

Provide laminate with a glass content of 30 plus or minus 2 percent using Type "E" glass with chrome or silane finish. Provide powdered reinforcements consisting of 47.5 plus or minus 1 percent of resin mixture. Use resin mixture of the "low profile" type. Ensure final laminate thickness is within plus or minus 10 percent of the specified thickness.

2.2.8.3 Physical Properties

Physical properties of fiberglass reinforced polyester plastic are as follows:

a. Minimum Tensile Strength: 96.5 MPa 14,000 psi conforming to ASTM D638.

b. Minimum Flexural Strength: 172.4 MPa 25,000 psi conforming to ASTM D790.

c. Minimum Flexural Modulus: 0.9 by 10 to the sixth power conforming to ASTM D790.

d. Minimum Impact, Notches, Izod: 720 Joules/meter 13.5 ft-lb per inch conforming to ASTM D256, Method A.

e. Maximum Average Coefficient of Thermal Expansion: 29 by 10 to the negative sixth power mm per mm, per degree K 16 by 10 to the negative sixth power inch per inch, per degree F.

f. Maximum Water Absorption: 0.02 percent in 24 hours conforming to ASTM D570.

2.2.8.4 Resin Sealing

Where plates of nonstandard length or mounting hole configuration are required, resin seal machined or cut edges.

2.3 HANDRAILS

**************************************************************************

NOTE: Handrails specified are the utilitarian type. Drawings will show design requirements, locations, and general configuration of railing. Where railing is to be fabricated of material other
than pipe, this paragraph must be rewritten for type chosen and the drawings must show configuration and design requirement for type of railing selected.

Provide handrails that are **1065 mm** **42 inches** high with two horizontal rails. Fabricate handrails of Schedule 40 [galvanized] steel pipe conforming to ASTM A53/A53M or Schedule 40 [mill finished] [anodized] aluminum pipe conforming to ASTM B429/B429M. Provide pipe size of [40] [50] mm (1-1/2) [2] inch NPS. To maximize extent practicable, shop fabricate railing. Provide rigid joints consisting of flush-finished welded assembly. Reinforce joints with tight fitting interior sleeves and assembly by welding rails and posts to flush-type fittings, or by mitering and welding joining rails to posts. Locate expansion joints at lengths of rails as recommended by the manufacturer. Provide inner-sleeved slip joint type expansion joints with one end of the sleeve secured to the railing. Locate expansion joints and splices near the intersection of rails and posts. Make bends in railing smooth and in a manner that will not crush or deform the railing. Grind all welds smooth and ensure railings are free of burrs and sharp corners and edges. Removable sections must be as indicated.

2.4 FLOOR GRATING AND FRAMES

Design [carbon steel] [aluminum] [stainless steel] grating in accordance with [NAAMM MBG 531] [NAAMM MBG 532] to meet the indicated load requirements. Band edges with bars 6 mm 1/4 inch less in height than bearing bars for grating sizes above 19 mm 3/4 inch. Make banding bars flush with the top of bearing grating. Provide frames of welded steel construction finished to match the grating. [Galvanize floor gratings and frames after fabrication.]

2.5 FLOOR PLATES

**NOTE:** Specific pattern should not be indicated unless required for matching purposes or to meet design requirements.

Provide aluminum floor plates in conformance with ASTM B632/B632M. Provide other aluminum floor plates consisting of 6 mm 1/4 inch thick, [raised thread steel] [pattern indicated] [galvanized] [slip-resistant, carbon steel conforming with ASTM A283/A283M having a minimum static coefficient of friction of 0.50 when tested in accordance with ASTM D2047. Ensure wearing surface is aluminum oxide or silicon carbide].

2.6 LUMBER

Provide Red Cypress conforming to NHLA Rules, clear, S4S finish. Provide Redwood conforming to RIS Grade Use, clear all heart, S4S finish.

2.7 MOTORS

Provide motors conforming to NEMA MG 1.
2.8 COLLECTORS FOR CIRCULAR AND SQUARE TANKS

2.8.1 Drive Unit

Provide drive unit consisting of a gear reducer and motor, direct or flexible coupled. Provide drive unit with a [cast iron housing] [or] [fabricated steel housing with integral hardened steel raceway] and designed in compliance with ABMA 9 and ABMA 11, ANSI/AGMA 2001 and ANSI/AGMA 6034. Base the continuous torque rating of the spur gear assembly upon the smaller of the values developed by ANSI/AGMA 2001 and consider as the rated torque capacity the entire gear will develop continuously over a 20-year period. Rate drive unit as follows:

<table>
<thead>
<tr>
<th>Approximate Rotational Speed</th>
<th>[_____] rpm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continuous Operating Torque</td>
<td>[_____] N-m ft-lb</td>
</tr>
<tr>
<td>Alarm Torque</td>
<td>[_____] N-m ft-lb</td>
</tr>
<tr>
<td>Shut-off Torque</td>
<td>[_____] N-m ft-lb</td>
</tr>
<tr>
<td>Momentary Peak Torque</td>
<td>[_____] N-m ft-lb</td>
</tr>
</tbody>
</table>

2.8.2 Bridge Supported Drive

The reduction unit must be one of the following types:

2.8.2.1 Primary Worm Gear Type

A unit consisting of a primary worm gear speed reducer coupled with a final reduction gear. Mount the final gear on a ball bearing assembly with the balls running in replaceable hardened alloy steel races. Ensure all bearings for this type of unit are antifriction type and run in an oil bath. Ensure reduction unit has housings effectively sealed against contaminants. Provide an oil filling and level check pipe.

2.8.2.2 Chain and Sprocket Drive Type

A unit consisting of a chain and sprocket drive, connected to a worm and worm gear final reduction unit. All bearings for this type unit must be tapered roller type.

2.8.3 Bridge Supported Drive Torque Tube

Bolt a steel torque tube to the final reduction gear to support and rotate the sludge collection arms.

2.8.4 Center Pier-Supported Drive Reduction Unit

Provide the helical or worm gear type primary speed reducer, coupled to the intermediate speed reducer directly or by a standard steel roller chain and steel sprockets. Protect chain and sprockets by chain guards. The intermediate speed reducer consists of a worm and worm gear or planetary gear, keyed to a shaft which drives the internal spur gear. Ensure the final speed reducer is a spur gear designed to withstand the maximum torque loads imposed on the clarifier mechanism. Provide antifriction type bearings. Run bearings in cast iron units in replaceable hardened alloy
steel races. Run all gears in an oil bath. Provide oil seals and oil fill, drain, and level check systems. Lubricate chains as recommended by the manufacturer. Provide a drive cage, with provision to connect to the final reduction unit. Fabricate drive cage from structural steel members and design to withstand the momentary peak torque of the collector without permanent deformation of the members. The drive cage must have provision for attachment of sludge removal arms.

2.8.5 Electric Motor

Provide motor that operates on [_____] volts ac, [_____] phase, 60 Hz and is totally enclosed fan cooled with a minimum [1.15] [_____] service factor. Equipment vendor must size motor to be of sufficient size for duty to be performed and do not exceed full load rating under the most severe conditions expected. Make necessary adjustments to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed. Furnish each motor with a magnetic full-voltage starter conforming to NEMA ICS 1. The starter must be in weatherproof cast metal enclosure. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor. Mount controls in starter cover or in separate weatherproof cast metal enclosure.

2.8.6 Overload Protection

Provide drive unit with an overload protection system, enclosed in a weatherproof housing. The system must consist of two micro-switches actuated by the movement of the worm shaft in the worm gear housing. Adjust switches to sound an alarm when the torque reaches [120] [_____] percent of the continuous operating torque and to stop the drive motor when the torque load reaches [140] [_____] percent of the continuous operating torque. Visually indicate overload points. Provide a shear pin assembly to serve as back-up overload protection and set to fail at [160 to 180] [_____] percent of continuous operating torque.

2.8.7 Influent

2.8.7.1 Siphon Feed Influent/Support Column

**************************************************************************
NOTE: Siphon feed influent is most commonly associated with center pier supported mechanisms.
**************************************************************************

Provide a combination influent and support column to support the drive, collector mechanism, and access bridge and to serve as the center influent pipe. Fabricate column from steel plate and anchor to the concrete. The column must be a minimum of [_____] mm feet-inches in diameter and have a series of openings near the upper end to direct flow into the influent feedwell at low velocity.

2.8.7.2 Siphon Feed Influent Feedwell

**************************************************************************
NOTE: Use 76 mm per second 0.25 fps for primary collectors and 46 mm per second 0.15 fps for secondary collectors.
**************************************************************************

Fabricate the influent feedwell from steel plate sections with bolted...
connections and support from the center cage. Ensure the feedwell is of adequate size and design to diffuse the flow into the tank. Design feedwell such that the flow-through velocity does not exceed \[46 \text{ mm/second} \] \[76 \text{ mm/second} \] \[0.15 \text{ fps} \] at maximum flow. Provide baffled ports at the water surface in the feedwell to permit the escape of scum.

2.8.7.3 Side Feed Influent Feedwell

**************************************************************************

NOTE: Side feed influent is most commonly associated with bridge supported mechanisms.
**************************************************************************

Fabricate the influent feedwell from steel plate with necessary stiffening members. Support the feedwell by structural steel members which span the tank and are attached to brackets mounted on the tank wall above design water level. Design feedwell to diffuse the flow into the tank and with baffled ports at the water surface to permit the escape of scum. Provide a flanged pipe connection and an influent pipe from the tank side.

2.8.7.4 Influent Feedwell for Thickeners

**************************************************************************

NOTE: Energy dissipating feedwells may not be required for all thickeners.
**************************************************************************

Fabricate the influent feedwell from steel plate with necessary stiffening members. Ensure feedwell is of energy dissipating design having 3 internal peripheral horizontal shelves with tangential inlet ducts to provide counterflows of influent which shear on each other as they are displaced inward beyond the shelves. Support the feedwell by structural steel members which span the tank and are attached to brackets mounted on the tank wall. Provide a flanged pipe nozzle and influent pipe from the tank side. Provide a cleanout at the point where the flow splits prior to entering the influent feedwell.

2.8.7.5 Peripheral Feed Influent

Provide peripheral feed system consisting of an influent channel and either an orifice and baffle system or a downcomer pipe system. Construct influent channel of [concrete] [steel plate] at the periphery of the tank and in conjunction with the effluent channel. Design influent and effluent channels for proper flow distribution and collection. The orifice and baffle system must consist of orifice openings in the floor of the influent channel, a steel plate orifice baffle for each orifice, and a steel plate influent skirt to prevent short circuiting. Use orifice dimensions and spacing as determined by the manufacturer for even flow distribution. The orifice baffles must contain no restriction less than the diameter of the orifice or greater than the orifice diameter plus 25 mm 1 inch. Extend the influent skirt 1.5 m 5 feet below the water surface or 300 mm 1 foot below the influent channel bottom, whichever is greater. Provide sufficient clearance between the bottom of the influent skirt and the tank floor to permit operation of the collector mechanism. Provide downcomer pipe system consisting of steel drop pipes spaced evenly around the influent channel. The bottom of the drop pipe must have a fiberglass 90 degree bend and flared discharge nozzle oriented toward the center of the tank.
2.8.8 Scraper Sludge Removal

Provide unit consisting of [one] [two] [_____] structural steel scraper arms, equipped with blades or scrapers designed to move settled sludge to a hopper at the center of the tank. Provide adjustable [spring brass] [PVC] [galvanized steel] squeegees for each scraper blade. Ensure squeegees project 40 mm 1-1/2 inches below the scraper blade and are adjustably secured by [brass] [or] [stainless steel] bolts and nuts.

2.8.9 Hydraulic Sludge Removal

**************************************************************************
NOTE: Hydraulic sludge removal is most commonly associated with activated sludge systems.
**************************************************************************

Accomplish hydraulic sludge removal by the use of the header and manifold system or the uptake pipe system.

2.8.9.1 Header

Design header to continuously remove the required proportional settled solids volume to effect uniform withdrawal over the entire tank diameter, collecting larger volumes of sludge at greater distances from the tank center. Collect the sludge from the tank bottom and transmit it through the header to the manifold, removal being accomplished by hydrostatic pressure. Maximum peripheral speed of the header is not allowed to exceed [0.061] [_____] meters/second [12] [_____] fpm and maximum allowable head loss from the clarifier water level to the sludge pipe connection at the pier bottom is [_____] mm feet. Provide header that is fabricated from steel plate, rectangular, and varies in size from a minimum at the outer end to a maximum at the center of the tank. Stepped and constant cross sectional area type headers are not acceptable. The header must be parallel to the tank bottom, and mount the longitudinal cross sectional axis at an angle of 45 degrees to provide a peaked top. Extend the leading edge of the header downward 50 mm 2 inches to provide an equalizing vane as an integral part of the header and to direct the sludge into the area of influence of the orifice. Provide a 3.175 mm 10 gauge steel scraper with a neoprene blade to clean the tank bottom around the manifold and direct the sludge to the first orifice. Space inlet orifices along the length of the header such that in a single revolution the header will clean the entire tank bottom. Maximum orifice spacing is [775] [_____] mm [30] [_____] inches. Drill orifices accurately in the header. Support the header from the center cage by steel tie-bars with turnbuckles, clevises, and locknuts. The support system must hold the header in alignment both horizontally and vertically. Provide a suitable counterweight to counterbalance the header.

2.8.9.2 Manifold

Fabricate the sludge collection manifold from steel plate. Provide two seals to ensure that the sludge enters the manifold only through the headers. Anchor the bottom plate to the tank bottom, align, and grout in place.

2.8.10 Uptake Pipe System

**************************************************************************
NOTE: Provide sufficient quantity of nozzles for a
Provide system consisting of a sludge discharge column within the influent column; [two] [_____] truss-type sludge collection arms, supported from and driven by the drive cage; V-plow blades and squeegees attached to the sludge collection arms; a minimum of [_____] suction nozzles per arm, supported by the sludge collection arms, and piping to a sitewell; and either sludge control boxes or variable orifice slip tubes inside the sitewell.

a. Fabricate sludge discharge column from steel plate and extend from the sludge sitewell to the bottom of the stationary influent column where it connects to the sludge discharge pipe under the tank bottom.

c. Provide suction nozzles that are a minimum of [_____] mm inches in diameter. Provide Schedule 80 PVC suction piping sized for a flow velocity no less than 0.16 meters/second 0.5 fps at minimum flow to prohibit solids settling in the piping. Provide Type 304 stainless steel or Schedule 80 PVC fittings with bell-type ends with O-ring seals.

d. Provide sitewell approximately [_____] mm feet square by [_____] mm feet deep, fabricated from steel plate, and containing either sludge control boxes or variable orifice slip tubes. Provide a neoprene seal between the sitewell and influent column. Ensure sludge control boxes are integral with the sitewell. Control sludge being withdrawn from each section of the arm by a submerged orifice sludge control box to allow pacing of the recycled rate. Each box must have a manually controlled PVC gate valve with positioning stem and position indicator. Provide variable orifice slip tubes of steel or PVC pipe construction that permit throttling of individual sludge lines by rotating the slip tubes.

e. Induce sludge flow by means of hydraulic head differential between the tank water level and the sludge control boxes or variable orifice slip tubes at a head of [_____] mm feet. The total sludge drawoff must be dependent on and controlled solely by the pumping rate from outside the mechanism.

2.8.11 Corner Scrapers for Square Tanks

Provide a corner blade on [one] [each] sludge scraper arm. Corner scraper blades consist of a straight blade attached to two horizontal members mounted on the main scraper arm. Pivot the scraper mechanism on special underwater bearings and actuate by a counterweight or spring to keep the end of the arm in contact with the side of the tank. Provide steel guide plates for the tank corners to direct the path of the corner blades. Provide a carrier wheel on the outer end of each corner blade. Provide springs, cable, and chain composed of stainless steel, galvanized steel, or other corrosion-resistant material.

2.8.12 Scum Removal for Tank Water Surface
NOTE: Use of dual skimmer arms and wide scum beach/box improves scum removal performance.

Scum removal consists of a [single] [dual] skimming device, a scum baffle, and [one] [two] skimmer blade ramp(s) and scum box(es).

a. Sweep the water surface of the tank and automatically move the scum up the skimmer blade ramp and into the scum box. Support skimming devices by structural steel members attached to the [sludge collection arms and counterweight] [torque tube]. Do not rely on the scum baffle for support. Provide neoprene scum scraper blade.

b. Fabricate scum baffle from [steel plate] [or] [fiberglass reinforced polyester plastic]. [Provide fiberglass scum baffle plates in standard lengths not to exceed 3600 mm 12 feet]. Construct connections between baffle sections in a manner that will not interfere with smooth contact of the skimmer. Provide all supports and connectors required for a complete installation.

c. Provide scum boxes of the dimensions indicated and fabricated from steel plate. Provide assembly with a scum sump, vertical steel sides, and a sloping skimmer blade ramp. Provide a flexible connector between the scum outlet piping and the tank wall. [Provide an automatic flushing device, which will open as the scraper passes.]

2.8.13 Influent Channel Scum Removal

NOTE: Influent channel scum removal is required only on peripheral feed collectors. Delete the inapplicable system.

In addition to the tank water surface scum removal, provide a system for removal of scum from the influent channel. The system consists of [an additional scraper blade attached to the main tank skimmer,] [or] [an influent channel spray nozzle system designed to move the scum to the scum box,] a scum box, and a motorized telescopic scum control valve. Provide all controls required for the system.

2.8.14 Bridge

2.8.14.1 Bridge Design and Construction

Provide bridge fabricated from structural steel and all-welded construction. Use either truss or beam type bridge design. Maximum allowable deflection of the bridge is 1/360 of the span length under a live load of 2.9 kPa 60 psf. Provide bridge walkway composed of [floor plate] [grating]. Provide handrail with a 100 mm 4 inch high toe plate on both sides of the walkway. If truss-type bridge construction is used, the truss members may be used as handrail.

2.8.14.2 Bridge for Bridge-Supported Drives

The bridge must span the entire tank diameter and be supported by and anchored to the tank wall. The bridge must support the drive and collector mechanism and provide access for maintenance. Ensure access walkway is at least 900 mm 3 feet wide. Provide at least 775 mm 2 feet 6 inches
clearance between the drive unit and the handrails on all sides where maintenance is required.

2.8.14.3 Bridge for Center Pier-Supported Drives

Support bridge on one end by the tank wall and on the other end by the drive unit. Ensure access walkway is at least 900 mm 3 feet wide and extends to a point 775 mm 2 feet 6 inches beyond the drive assembly. Provide at least 775 mm 2 feet 6 inches clearance between the drive unit and the handrails on all sides where maintenance is required.

2.8.15 Effluent

2.8.15.1 Weir Plates

**************************************************************************
NOTE: Sludge collectors which require additional linear footage of weir, beyond weir trough circumference length can utilize finger weir or weir pans to increase length up to two and one-half times length of single circumferential weir. Manufacturer of this type should be required to have at least five years experience in furnishing weir pan systems.
**************************************************************************

Weir plates must be [fabricated from steel plate] [or] [fiberglass reinforced polyester plastic]. Provide weir plates of the dimensions indicated. Mold vee notches in fiberglass weir plates in the plate; cut edges are not acceptable. Mount weir plates in a manner to be watertight and to provide a minimum of 50 mm 2 inches vertical adjustment.

2.8.15.2 Effluent Trough and Drop Box

**************************************************************************
NOTE: The effluent trough and drop box may be cast of concrete with the tank wall and deleted from this specification.
**************************************************************************

Fabricate the effluent trough and drop box from [steel plate] [or] [fiberglass reinforced polyester plastic]. Trough and drop box dimensions are as indicated. Ensure joints between sections are watertight. Provide support assemblies of adequate strength to prevent trough or box distortion through filling and draining of the tank.

2.9 SLUDGE COLLECTORS FOR RECTANGULAR TANKS

2.9.1 Chain and Flight Scraper Type Collectors

Provide sludge collector including chain, flight and wear shoes, sprockets, shafts, wall bearings, return tracks with support brackets, tee rails, drive unit complete with reducer, motor and overload device, and all associated attachment and anchor bolts. Allow chain for primary tank collectors to run over four sets of sprocket wheels at a design speed of [_____] fpm, so that the flights will clean the sludge from the tank bottom and skim the surface on the return run, concentrating scum in front of the scum pipe. Allow chains for intermediate tank collectors to run over three sets of sprocket wheels at a design speed of [_____] fpm, so that the flights will clean the sludge from the tank bottom and route it to the
sludge collection trough. Ensure cross collectors run at twice the speed of the longitudinal collectors. Select collector components based upon the following criteria: operation under dry tank conditions; friction factor for dry steel on dry steel of 0.33; friction factor for polyurethane on dry steel of 0.25; bearing friction of 5 percent of shaft assembly.

2.9.1.1 Metallic Chains

Manfacture metallic chains of corrosion-resistant processed metal having an average tensile strength of 551.6 MPa (80,000 psi) and a hardness range of 179-229 Brinell. Provide 7205 heavy pintle type chains with 150 mm 6 inch pitch, weighing 7.6 kg/m (5.1 lb/ft), and with plain and attachment links assembled with 19 mm 3/4 inch diameter hardened steel pins and rivets. The chain must have an allowable working load of 15.7 kN (3,540 pounds) and proof test each assembled strand at a minimum of 83.6 kN (18,800 pounds) to detect and remove defective castings. Provide rigid attachments for full depth of the flight and attach with four 10 mm 3/8 inch diameter bolts. Match chain sections within 5 mm in 3 meters 3/16 inch in 10 feet, tag, and wire together in pairs.

2.9.1.2 Nonmetallic Chains

Provide nonmetallic chains with 152 mm 6 inch pitch links manufactured of acetal resin and connected with pins manufactured of reinforced nylon resin. Provide pins of T-head or T-end construction to prevent rotation and hold in place without the use of pinlocks or cotters. Provide chain with a working load of 8.0 kN (1,800 pounds). Provide rigid attachments full depth of the flights and attach with four 10 mm 3/8 inch diameter bolts.

2.9.1.3 Drive Chains

Provide H-78 mill type drive chains manufactured of a corrosion resistant processed metal, consisting of 66.27 mm 2.609 inch pitch links, and with an allowable working load of 10.4 kN (2,350 pounds). Proof test each assembled strand at a minimum of 44.5 kN (10,000 pounds) to detect and remove defective castings. Provide a hot-dip galvanized chain tightener to take up unnecessary slack in the drive chain.

2.9.1.4 Wood Flights

Provide wood flights of 50 by 150 mm 2 by 6 inch nominal size and space approximately 3000 mm (10 feet) on centers. Use redwood or red cypress flights. Drill all flights accurately and notch at the factory to ensure proper alignment.

2.9.1.5 Fiberglass Flights

Provide fiberglass flights of 50 by 150 mm 2 by 6 inch nominal size, especially designed for sludge collector service. Provide scraper with continuous fiberglass filaments running the full length of the member and include a scraper lip on the leading edge to ensure cleaning of the tank floor. Include filler blocks for bolting the member to the chain attachment links. Ensure flight spacing is approximately 3 m (10 feet). Buoyant flight design will not be acceptable.
2.9.1.6 Wearing Shoes

Provide each flight with 13 mm 1/2 inch thick polyurethane wearing shoes to run on the floor rails and return tracks. Ensure wearing shoes are reversible, providing two usable wearing surfaces.

2.9.1.7 Rails

Furnish two 11 kg 25 pound ASCE tee rails and install in the tank floor in accordance with manufacturer's written recommendations.

2.9.1.8 Return Tracks

Provide return tracks composed of 76.2 by 50.8 by 9.5 mm 3 by 2 by 3/8 inch thick steel angles with 6 mm 1/4 inch thick steel support brackets. Design each bracket to cantilever the return track off the tank wall. Space support brackets approximately 3000 mm 10 feet apart and fasten to the tank wall by a minimum of two anchors.

2.9.1.9 Sprockets

Provide sprockets consisting of chilled tooth bearing surfaces with a hardness of no less than 360 Brinell and chill depth of at least 4.8 mm 3/16 inch. Key driving sprockets firmly to the headshaft. Provide corner shafts with one sprocket setscrewed and one running loose on the shaft. Provide double-life type collector chain sprockets composed of split construction. Ensure headshaft sprockets are no less than [_____] mm inch pitch diameter and have no less than [_____] teeth. Ensure all other collector chain sprockets are no less than [_____] mm inch pitch diameter and have no less than [_____] teeth. Traction wheels, idler wheels, or other substitutions for sprockets will not be acceptable. Fit the drive sprocket with a bronze bushing and provide with a shear pin device to provide for full protection of equipment in case of excessive loading. Ensure the driving sprocket on the reducer shaft is not less than [_____] mm inch pitch diameter and has no less than [_____] teeth. Provide driven sprocket on the collector headshaft composed of split construction, no less than [_____] mm inch pitch diameter, and no less than [_____] teeth.

2.9.1.10 Shafts

Ensure shaft sizing is compatible with the tank dimensions and sprocket location. Maximum shaft deflection is 4 mm/meter 3/64 in/ft of shaft length. Shafting must be straight and true, solid, cold-finished steel and held in alignment with set collars. Shafting must contain keyways with fitted keys where necessary and must be of sufficient size to transmit the power required. Extend shafting the full width of the tank and turn in bearings mounted on the tank walls. Ship shafting to the project site as complete subassemblies with sprockets, bearings, and set collars in place.

2.9.1.11 Bearings

Provide underwater bearings consisting of cast iron construction, babbitted, and of the water-lubricated, ball and socket, self-aligning type designed to prevent the accumulation of settled solids on their surfaces. Bolt bearings directly to the tank wall in a manner to permit easy adjustment. Ensure take-up bearings provide no less than 250 mm 10 inches of horizontal travel. Take-up bearings must be of cantilevered design, with a fabricated steel support base, and have cadmium plated take-up screws. Design take-up bearings so that no recesses in the concrete are
required to maintain clearances.

### 2.9.1.12 Drive Unit

Provide drive unit consisting of a motor, speed reducer, and electrical control equipment to power the sludge collector. Where a drive unit operates two separate collectors, provide suitable clutches to permit independent operation of each collector. Ensure drive unit for primary collectors is rated for [_____] N-m ft-lb torque, based on dry tank conditions. Ensure drive unit for intermediate collectors is rated for [_____] N-m ft-lb torque, based on dry tank conditions. Base torque rating of the gear assembly on the smaller of the values developed by ANSI/AGMA 2001 and consider as the rated torque capacity the entire gear will develop continuously over a 20-year period. Design drive unit in accordance with ABMA 9 and ABMA 11 and ANSI/AGMA 2001 and ANSI/AGMA 6034.

a. The motor must be totally-enclosed, fan-cooled; ball bearing, constant speed; and of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. Provide motor conforming to NEMA standards and suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. Connect the motor directly to the speed reducer by a flexible coupling. V-belt drives are not acceptable. Make necessary adjustments to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. The drive unit speed reducer must be of the [helical] [worm] gear type, fully housed, running in oil, with antifriction bearings throughout.

c. Furnish each motor with a magnetic full-voltage starter conforming to NEMA ICS 1. Provide starter in weatherproof cast metal enclosure. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor. Mount controls in starter cover or in separate weatherproof cast metal enclosure. [If motors have reversing starters, provide a jog type switch such that mechanism is activated in the reverse direction only as long as button is pushed down. Ensure multiple collectors operated by same drive unit have jaw type disengaging clutches.] [Provide sludge-collector motors with nonreversing starters and 2-button start-stop pushbutton stations.]

### 2.9.1.13 Overload Protection System

Provide a shear pin assembly to serve as overload protection and set to fully protect the equipment.

### 2.9.1.14 Cross Collector

Provide cross collector of either the helical coil or the conveyor type and designed to scrape and convey the collected sludge from the sludge channel to a sludge sump. Use materials in the construction of the cross collector of the same type and quality as those used in the main sludge collector. Helical coil consists of a helical steel blade mounted on a steel shaft, driven by a sprocket-connected drive. Conveyor must be similar in operation to the conveyor used in the main sludge collector.

### 2.9.2 Traveling Bridge Type Collectors

Provide traveling bridge collector composed of a complete bridge assembly supported on ASCE type rails. Provide bridge assembly consisting of a
traveling bridge with walkway, bridge drive, sludge removal system, support rail and anchorage parts, and electrical control panel with necessary controls for the operation of the mechanism. Design drive train to withstand maximum horizontal loads placed on the bridge and sludge removal system. Ensure all parts of each mechanism are proportioned for stresses that may occur during fabrication, erection, and operation. Provide bridge with a travel speed of [_____] meters/second, and a reverse speed of [_____] meters/second.

2.9.2.1 Bridge Construction

**************************************************************************
NOTE: Beam bridges are normally provided for tank widths between 4.5 and 13.75 m 15 and 45 feet. Truss bridges are normally provided for widths greater than 13.75 m 45 feet.
**************************************************************************

Design bridge to span the entire width of the tank and to withstand all dead loads required for the proper operation of the mechanism, a [_____] N pound sludge load per foot of blade length, and a 2394 Pa 50 psf live load on the walkway. Maximum deflection under all loads not allowed to exceed 1/360 of the span length. Provide walkway that is a minimum of 750 mm 30 inches wide and cover it with [floor plate] [grating]. [Construct bridge of parallel beams with lateral bracing as required.] [Construct bridge of two parallel trusses fabricated from structural steel and diagonal supports welded to the upper and lower chords.]

2.9.2.2 Bridge Drive

**************************************************************************
NOTE: Gear and rack drivers are desirable in climates that have freezing rain and snow.
**************************************************************************

Provide bridge drive consisting of a drive assembly, wheels, rails, drive shaft, [rack and pinion,] and controls.

a. Provide drive assembly consisting of a [single speed] [dual speed] [variable speed] drive, gear reducer, drive chain, and drive and driven sprockets. Fully enclose all gearing in an oil-tight housing with the gears running in oil. Use anti-friction type bearings. Provide roller chain type drive chain. Ensure motor is totally-enclosed, fan-cooled; ball bearing; and of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. Provide motor conforming to NEMA standards and suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] service factor. V-belt drives are not acceptable. Make necessary adjustments to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. Furnish each motor with a magnetic full-voltage starter conforming to NEMA ICS 1. Provide starter in weatherproof cast metal enclosure. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor. Mount controls in starter cover or in separate weatherproof cast metal enclosure.

c. Provide drive shaft of sufficient size to adequately and safely withstand all bending and torsional loads of starting and operating.
Support drive shaft by multiple, grease lubricated bearings. Provide two load-bearing wheels, one flanged and one flangeless, running on roller bearings mounted on idler shafts at each end of the bridge. Provide running rails that are 18 kg 40 pound [_____] ASCE with standard rail splices and anchor to the tank wall. Provide four rail stops; locate at travel extremes. Drive bridge by gears with a 75 mm 3 inch pitch, keyed to the ends of the drive shaft. Mesh gears with a steel rack anchored to the top of the tank wall.

2.9.2.3 Scraper Sludge Removal, Blades, and Supports

**************************************************************************
NOTE: Scraper type traveling bridge collectors are normally used for primary basins where the volume of sludge is low and the main requirement is to increase the sludge concentration.
**************************************************************************

Provide scraper blades consisting of a minimum 300 12 inch deep structural steel channel, polyurethane wear shoes, and neoprene strips acting as squeegees on the tank bottom. Position and guide scraper blade assembly by two or more rigid structural steel support assemblies attached to the bridge. Attach scraper blade assemblies through pivot joints and bearings to the support assemblies. Ensure scraper assembly retracts above the water surface for maintenance and inspection.

2.9.2.4 Scraper Sludge Removal Cross Collector

**************************************************************************
NOTE: Cross collectors are normally desirable on long basins. Spacing of cross collectors is dependent upon the type of sludge encountered.
**************************************************************************

Provide a screw cross collector consisting of a drive unit with an overload alarm, vertical drive torque shaft, underwater gear box, helical screw, bearings, and anchors. Provide drive unit consisting of a motor and gear reducer connected to a vertical drive shaft through a flexible coupling. Provide totally-enclosed, fan-cooled, ball bearing, constant speed motor of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. Provide motor conforming to NEMA standards and suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. Vendor must size motor of sufficient size for duty to be performed without exceeding full load under most severe conditions expected. Make necessary adjustments to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

a. The gear reducer must be of the worm gear type with anti-friction bearings and completely immersed in oil in a sealed housing.

b. Provide a replaceable switch, with normally open and normally closed contacts to be actuated upon shear pin failure. Design drive unit to rotate the screw at a speed of [_____] rpm. Provide pressure lubricated underwater gear box with bearings and seals designed for submerged operation. Provide grease lubrication lines from each submerged bearing to an accessible location. Provide helical screw with [_____] mm inch diameter blades of 4.8 mm 3/16 inch thick steel plate welded to a hollow steel core. Support screw by end bearings.
c. Furnish each motor with a magnetic full-voltage starter conforming to NEMA ICS 1. Provide starter in weatherproof cast metal enclosure. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor. Mount controls in starter cover or in separate weatherproof cast metal enclosure.

d. Provide an automatic control system for operation of the collector, enclosed in a NEMA 250, Type 3R control panel and mounted on the bridge. Prewire and factory test all electrical components. Provide an electric overload system, consisting of suitable relays and an indicating meter plainly showing the overload points. The overload system must sound an alarm when the load reaches full load torque capacity of the drive motor and de-energize the motor. Provide a torque sensing and indicating device to indicate percentage of maximum torque being developed.

2.9.2.5 Vacuum Sludge Removal

**************************************************************************
NOTE: Vacuum and siphon sludge removal systems are normally used for secondary basins in activated sludge systems where large volumes of sludge are to be removed.
**************************************************************************

Provide traveling bridge with [_____] sludge pick-up heads, each [_____] mm feet, inches long, suspended from the bridge. Provide pick-up heads with continuous slot orifices or include neoprene sludge guides covering all settling areas to divert the sludge to large diameter inlet ports. Power vacuum system by [_____] self-priming centrifugal solids handling pumps mounted on the bridge. Provide pumps capable of pumping [_____] L/second gpm per pump at a static head of [_____] mm feet.

a. Provide totally-enclosed, fan-cooled, ball bearing, constant speed pump motor of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. Provide motor conforming to NEMA standards and suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. Connect motor directly to the speed reducer by a flexible coupling. V-belt drives are not acceptable. Make necessary adjustments to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. Furnish each motor with a magnetic full-voltage starter conforming to NEMA ICS 1. Provide starter in weatherproof cast metal enclosure. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor. Mount controls in starter cover or in separate weatherproof cast metal enclosure.

c. Provide a manual control system for operation of the collector, enclosed in a NEMA 250, Type 3R control panel and mounted on the bridge. Prewire and factory test all electrical components. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor.
2.9.2.6 Siphon Sludge Removal

2.9.2.6.1 Sludge Removal Siphons

Provide traveling bridges with [_____] sludge removal siphons, [each consisting of a horizontal pipe header with uniformly spaced inlet ports] [each having one large diameter pick-up port and neoprene sludge guides covering all settling areas to divert sludge to the inlet ports]. Submerge siphon discharge in the sludge trough.

2.9.2.6.2 Vacuum Priming System

[Provide a portable vacuum pump for siphon priming. Connect pump manually to a male hose cock on the siphon pipe. Manually turn connection between the pump and siphon pipe to "OFF" as the pipe is primed.] [Provide a bridge mounted vacuum pump for siphon priming. Pipe pump to a vacuum header through a vacuum canister. Terminate vacuum header by hand-operated valve to allow vacuum header purging after the priming operation. Manually turn each connection between the vacuum header and siphon pipes to "OFF" as the pipe is primed.]

2.9.2.6.3 Siphon Flow Control

[Control sludge removal rate of each siphon pipe by an eccentric plug valve, manually operated from the bridge by a handwheel.] [Control sludge removal rate of each siphon pipe by a pneumatically controlled variable orifice pinch valve. Size valve to provide no restriction or change of shape in the siphon pipe when in the full open position. Adjust throttling status of each valve manually and independently maintain by a pneumatic control circuit. Automatically allow the siphon pipes to purge daily at maximum velocity and then return flows to the preset quantities.] [Control sludge removal rate of the siphons by a control box at the discharge end of the traveling bridge. Provide control box of sufficient depth to allow filling the box to the water level in the tank. Regulate discharge from the control box by a [manually] [pneumatically] [hydraulically] [electromechanically] operated sluice gate.]

2.9.2.7 Airlift Pump Sludge Removal

Provide traveling bridge with [_____] sludge pick-up heads, each [_____] mm feet, inches long, suspended from the bridge. Provide pick-up heads including neoprene sludge guides covering all settling areas to divert the sludge to large diameter inlet ports. Size drop pipes for a maximum sludge removal rate of 100 percent of the average daily flow. Use airlift to provide a pumping rate of [_____] L/second gpm per pump at a static head of [_____] mm feet. Power airlift system by a positive displacement blower or centrifugal compressor, depending on air volume required. Mount compressor on the bridge.

a. Provide totally-enclosed, fan-cooled, ball bearing, constant speed compressor motor of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. Provide motor conforming to NEMA standards and suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. Connect motor directly to the speed reducer by a flexible coupling or V-belt drive. Make necessary adjustments to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.
b. Furnish each motor with a magnetic full-voltage starter conforming to NEMA ICS 1. Provide starter in weatherproof cast metal enclosure. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor. Mount controls in starter cover or in separate weatherproof cast metal enclosure.

c. Provide a manual control system for operation of the collector, enclosed in a NEMA 250 Type 3R control panel and mounted on the bridge. Prewire and factory test all electrical components. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor.

2.9.2.8 Power Supply Stretch Cable System

Provide a stretch cable system, consisting of a stainless steel cable stretched between two anchor posts. Provide cable with a number of pulleys which support the electrical cable used to power the collector. Loop electrical cable in coils with each coil being attached to a separate pulley. Upon traveling to the end of the basin, extend the coils to form a draped electrical cable supported by the pulleys, and as the cable returns, retract the loops by the action of the bridge.

2.9.2.9 Power Supply Trolley Track System

Provide a trolley track system, which allows the electrical cable to uncoil and retract as the bridge moves.

2.9.2.10 Power Supply Cable Reel System

Provide a cable reel system capable of unwinding and rewinding the power cable while maintaining a constant tension on the cable. Provide a strain relief device to protect the fixed end of the cable.

2.9.2.11 Control System for Bridge Drive

**************************************************************************

NOTE: NEMA Class 250, Type 4X is recommended where corrosive gases, dust, or water hosedown are environmental factors. NEMA 4X type is not ventilated.
**************************************************************************

Provide an automatic control system for operation of the collector, enclosed in a NEMA 250, Type 3R control panel and mounted on the bridge. Prewire and factory test all electrical components. Provide an electric overload system, consisting of suitable relays and an indicating meter plainly showing the overload points. The overload system must sound an alarm when the load reaches full load torque capacity of the drive motor and de-energize the motor. Provide a torque sensing and indicating device, mounted on the bridge, to indicate percentage of maximum torque being developed.

2.9.3 Center Track Airlift Pump Type Collectors

**************************************************************************

NOTE: Center track airlift pump type collectors are normally limited to basins no larger than 12 m 40 feet long and 6 m 20 feet wide.
**************************************************************************
Provide collector consisting of a support beam and track assembly, carriage assembly, motor and gear reducer, drive chain and sprockets, sludge pick-up assembly, and compressor. Ensure all moving parts are above the water level. Ensure lubrication and adjustment points are readily accessible. Design system to handle a horizontal load (drag) of $[438 \text{ N} \ [30 \text{ pounds per lineal meter foot} ]$ on the scraper blade and all stresses which may occur in fabrication, shipping, erection, and operation. Provide unit with a traverse speed of $[\text{mm/second fpm}]$ in both directions.

2.9.3.1 Support Beam and Track Assembly

The support beam and integral track must constitute a single box structure spanning the length of the basin. Locate track inside the support beam for weather protection. Provide assembly of sufficient rigidity to withstand both horizontal and vertical loads without supplemental stiffening members. Provide a mounting assembly for attaching the beam and track to the basin wall at the correct height.

2.9.3.2 Carriage Assembly

Provide a carriage assembly to traverse the track assembly. Provide assembly with four flanged support wheels to travel along the track. Ensure assembly has four additional wheels to oppose moment resulting from drag on the scraper blade.

2.9.3.3 Drive Assembly

Provide drive assembly consisting of a motor and gear reducer driving a continuous chain through a shear pin protected drive sprocket. Provide single speed, $[\text{volts ac}, \ [\text{phase}] ]$, $60 \text{ Hz motor}$. Mount motor and gear reducer directly on the support beam. Totally enclose drive sprocket, chain, and driven sprocket in the support beam assembly. Provide a means for adjusting chain tension at the driven sprocket. Direct linkage between the drive chain and the carriage is prohibited. Allow chain to run continuously in one direction with reciprocating motion of the carriage imparted by a fitting on the chain which will engage the carriage at two different points. Allow a brief dwell time at each end of the travel. Engagement of the carriage must not produce eccentric loads on the chain.

a. Provide totally-enclosed, fan-cooled, ball bearing, constant speed motor of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. Provide motor conforming to NEMA standards and suitable for operation on $[\text{volts ac}, \ [\text{phase} ]$, $60 \text{ Hz with [1.15] service factor}$. Make necessary adjustments to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. Furnish each motor with a magnetic full-voltage starter conforming to NEMA ICS 1. Provide starter in weatherproof cast metal enclosure. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor. Mount controls in starter cover or in separate weatherproof cast metal enclosure.

2.9.3.4 Airlift Pump

**************************************************************************

NOTE: Airlift pumps are made of noncorrosive
materials. Air lines are removable with multiorifice diffuser discharge end. Airlift pump must be properly reinforced to handle structural and dynamic loads. Capacity, submergence, and air requirements should be calculated for each airlift pump. Priming pump vacuum is heavy-duty industrial vacuum with minimum liquid volume of 23 liters 6 gallons, double filtration system, and automatic water level shutoff float.

Provide each collector with a sludge pick-up head [_____] mm feet, inches long, suspended from the carriage. Provide pick-up head including neoprene sludge guides covering all settling areas to divert the sludge to large diameter inlet ports. Size drop pipe for a maximum sludge removal rate of 100 percent of the average daily flow. Use airlift to provide a pumping rate of [_____] L/second gpm per pump at a static head of [_____] mm feet. Power airlift system by positive displacement blowers or centrifugal compressors, depending on air volume required. Provide a pair of compressors to feed a common air manifold to provide air supply for [_____] collectors as shown. Provide required check valves, shut-off valves, and regulating valves for isolation, regulation, and balancing.

a. Provide totally-enclosed, fan-cooled, ball bearing, constant speed compressor motor of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. Provide motor conforming to NEMA standards and suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. Connect motor directly to the blower by a flexible coupling or V-belt drive. Make necessary adjustments to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. Furnish each motor with a magnetic full-voltage starter conforming to NEMA ICS 1. Provide starter in weatherproof cast metal enclosure. Provide a separate pole with manually reset thermal-overload protection in each ungrounded conductor. Mount controls in starter cover or in separate weatherproof cast metal enclosure.

2.9.3.5 Controls

NOTE: NEMA Class 250, Type 4X is recommended where corrosive gases, dust, or water hosedown are environmental factors. NEMA 4X type is not ventilated.

Provide an automatic control system for operation of the collector. Enclose controls in a NEMA 250, Type 3R control panel and mount on the support beam. Ensure all electrical components are prewired and factory tested.

2.9.4 Floating Bridge Siphon-Type Collectors

Provide collector consisting of a floating bridge, bridge drive and idler stand, siphons and sludge removal system, float system, control system, and necessary support structures and anchorage. Ensure collector is capable of removing settled solids from the tank floor and discharging them into a
sludge trough. Control flow rate of the mechanism over a range of [_____] \( \text{L/second gpm} \) to [_____] \( \text{L/second gpm} \) per collector bridge assembly by individually adjustable siphon pipes.

2.9.4.1 Floating Bridge

Design and contract floating assembly to comply with the hydraulic conditions of the system. Provide bridge consisting of rigidly interlaced aluminum beams, stainless siphon pipes, and fiberglass floats, all designed to support the entire mechanism and maintain a minimum floating clearance of 50 mm (2 inches) from the floor of the collector basin. Furnish beams of sufficient size to support the floats and the siphon pipes. Furnish stainless steel brackets and pipe clamps to securely mount all of the siphon pipes in the proper position to the support beams. Mount floats securely to the siphon pipes to provide uniform travel of the bridge in both directions, the full length of the collector basin. Design floats for the general hydraulic conditions and consisting of closed cell polyurethane foam encased in a fiberglass enclosure and support by structural aluminum angle. Ensure recyclable materials conform to EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING. Secure aluminum tow brackets to the siphon pipes and furnish with stainless steel mounting hardware of adequate quantity and size to withstand the loading and tension applied to the towing cable when the collector reverses direction. Secure inboard and outboard end trucks and guide wheel assemblies to the floats or support beams and design to allow for thermal expansion and contraction of the floating bridge. Provide wheels composed of noncorrosive material.

2.9.4.2 Bridge Drive Assembly and Idler Stand

Tow each floating bridge along the longitudinal length of the basin by a stainless steel, stranded wire cable. Use cable of adequate size to tow the entire structure and span the length of the tank with a minimum of catenary. Affix drive cable to floating bridge assembly through tow bridle assembly. Provide bridge drive consisting of a reducer driven by a constant torque, variable speed dc electric motor, [single] [_____] phase, 60 Hz, [120] [_____] volts, totally enclosed, suitable for continuous duty. House reducer in an oil- and dust-tight casing, equip with anti-friction bearings, and design for splash-type lubrication. Provide switches permitting directional change of the unit on the drive base assembly. Provide an idler stand complete with adjustable base and sheave at the opposite end of the tank. Provide a complete corrosion-resistant enclosure for each drive and idler assembly.

2.9.4.3 Sludge Removal System

******************************************************************************
NOTE: Assemblies, parts, and connectors in submerged service should be made of 304/316 stainless steel or fiberglass, rather than aluminum.
******************************************************************************

Provide total sludge removal capacity range of the vacuum sludge removal system which is adjustable from [_____] \( \text{L/second gpm} \) to [_____] \( \text{L/second gpm} \). Construct all siphon piping and headers of stainless steel with vacuum tight welded joints. Design piping assembly structure to adequately support itself on the tank floor with the basin dewatered. Provide orifices of adequate size and spacing in each header pipe. Design entrance velocity at each orifice to create an angular zone in influence, to permit
all sludge on the basin floor to be cleaned at the end of each cycle. Each siphon pipe must be independent from the others and independently controlled. Terminate and discharge each siphon pipe into a sludge control device. The submerged siphon piping must be stainless steel on the exterior surface in accordance with collector manufacturer's recommendations to protect the pipe from oxygen cell corrosion. Furnish individual sludge control for each siphon as an integral part of the siphon collector. Ensure control is corrosion resistant and adequately supported. Suspend control device from the floating structure and secured to the siphon piping. Manually adjust flow rate by setting the adjustable discharge opening using a rising stem operator. Construct sludge control device to prevent air from breaking the siphon during priming. Design siphon collector to permit priming of each suction header. Furnish a priming device consisting of a portable, wet-dry vacuum pump with handle and wheels. Provide valves for each siphon pipe that are capable of holding 635 mm 25 inches of mercury with zero leakage. Provide flexible single ply rubber priming hose and quick disconnect couplings with each unit. The vacuum pump must be industrial wet/dry type, [single] [_____] phase, 60 Hz, [120] [_____] volts ac. Provide one priming pump per pair of siphon collector mechanisms.

2.9.4.4 Control Panel

Furnish a control panel by the collector manufacturer containing all controls necessary for the operation of the collector. Ensure all of the components are factory installed in a NEMA 250, Type 4 [4X] [3R] enclosure, factory prewired to numbered terminal strips within the enclosure and factory tested. Include manual override controls for collector travel in addition to the automatic operations. Furnish a reversing mechanism with time delay relays to change the collector direction of travel automatically. Provide a SCR controller to vary the speed of the collector at between [1.2] [_____] m/minute [4] [_____] fpm and [3.7] [_____] m/minute [12] [_____] fpm for both directions of the bridge travel. Furnish limit switches with internal heaters and stainless steel limit switch actuators to reverse the movement of the collector. Mount one limit switch securely to the bridge drive, and mount the other limit switch securely to the idler stand. Affix microswitch to overclutch clutch to activate alarm and shut down.

2.9.4.5 Automatic Programmer

Provide a programmer in the control panel to automatically adjust rate of collector travel. Upon reversing direction of the collector, allow collector rate of travel to increase automatically for manually preset distance and then return to preset normal rate of travel. Ensure programmer has a manual override. Provide a single phase, 60 Hz, [120] [_____] volts ac solid state, encapsulated, proximity switch as an integral part of the programming control.

2.9.5 Scum Removal

Provide a retracting surface skimmer to remove scum from the tank. Attach mechanism with a blade extending the width of the tank, or as required, to the bridge. Allow skimmer to operate while the bridge is traveling in one direction only and retract for the return trip of the bridge. Provide a beaching type scum trough across one end of the basin. Construct trough of [steel plate] [or] [fiberglass] to the dimensions indicated. Provide all hardware required for trough installation.
2.9.6 Effluent Removal

**************************************************************************
NOTE: Coordinate with paragraph WEIR PLATES.
**************************************************************************

Provide weir plates composed of [fabricated steel plate] [or] [fiberglass reinforced polyester plastic] of the dimensions indicated. Mold vee notches in fiberglass weir plates in the plate; cut edges are not acceptable. Mount weir plates in a manner to be watertight and to provide a minimum of 50 mm 2 inches vertical adjustment. Fabricate effluent trough from [steel plate] [or] [fiberglass reinforced polyester plastic] to the dimensions indicated. Ensure joints between sections are watertight. Provide support assemblies of adequate strength to prevent trough distortion through filling and draining of the tank.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 FACTORY PAINTING

Ensure all ferrous metal equipment, except stainless steel and galvanized steel, is cleaned, primed, and given two coats of machinery enamel at the factory. Field paint in accordance with Section 09 90 00 PAINTS AND COATINGS.

3.3 FRAMED INSTRUCTIONS

Post framed instructions, containing wiring and control diagrams under glass or in laminated plastic, where directed. Show wiring and control diagrams and complete layout of the entire system. Include, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. Submit a copy of the posted instructions proposed to be used. Post framed instructions before acceptance testing of the system.

3.4 EQUIPMENT INSTALLATION

3.4.1 Installation

Install equipment as indicated and in accordance with the manufacturer's written instructions. Submit drawings containing complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

Furnish grease and oil, of grades recommended by the manufacturer, as part of the installation and as required for initial operation.
3.4.2 Adjusting

Make field adjustments as required for proper operation of the equipment.

3.4.3 Testing

3.4.3.1 Operational Test

Subject each mechanism to an operational test, under the observation of the Contracting Officer. Demonstrate that the equipment is not defective and is in safe and satisfactory operating condition. Submit performance test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate in each test report the final position of controls.

3.4.3.2 Torque Test

Conduct a torque test on one mechanism selected by the Contracting Officer. Conduct test under the supervision of a factory serviceman and observation of the Contracting Officer. The purpose of the test is to verify the structural integrity and adequacy of the mechanism and drive. Perform torque test consisting of securing all rake arms at multiple points by cables to anchor bolts installed in the tank floor at locations recommended by the manufacturer. Apply a torque load to the drive by hand if possible. Measure the magnitude of the applied load by a calibrated pressure reading, the plunger and rod area, and the distance of the line of action of each cylinder from the centerline of the mechanism. Take readings at 100, 120, and 140 percent of continuous operating torque. Apply test loads such that the torque overload device can be used to indicate the alarm and motor shut-off torque values of the drive.

3.4.3.3 Retesting

If any deficiencies are revealed during any test, correct such deficiencies and reconduct the tests.

3.4.4 Tank Bottom

Finish the tank bottom in such a manner that full contact will be obtained between the [sludge scrapers] [flights] [manifold] and the surface.

3.5 WELDING

**************************************************************************
NOTE: If the need exists for more stringent pipe welding requirements, delete the sentences in the first set of brackets.
**************************************************************************

[Weld piping in accordance with qualified procedures using performance qualified welders and welding operators. Use qualified procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests and perform the tests at the work site if practical. The welder or welding operator must apply his assigned symbol near each weld he makes as a permanent record. Weld structural members in]
accordance with Section 05 05 23.16 STRUCTURAL WELDING.] [Use welding and nondestructive testing procedures for piping as specified in Section 40 05 13.96 WELDING PROCESS PIPING.]

3.6 MANUFACTURER'S SERVICES

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. Supervise the installation, adjustment, and testing of the equipment.

3.7 CLOSEOUT ACTIVITIES

3.7.1 Field Training

Provide a field training course for designated operating and maintenance staff members. Provide training for a total period of [____] hours of normal working time and start after the system is functionally complete but prior to final acceptance tests. Cover all of the items contained in the Operating and Maintenance Manuals.

3.7.2 Operating and Maintenance Manuals

Detail in the Operation manuals the step-by-step procedures required for system startup, operation, and shutdown. Include in the Operation manuals the manufacturer's name, model number, parts list, and brief description of all equipment and their basic operating features. List in the Maintenance manuals routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include in the Maintenance manuals piping and equipment layout and simplified wiring and control diagrams of the system as installed. Obtain approval of manuals prior to the field training course.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for turbine oil for hydroelectric power plants. Requirements in this section assume a complete or significant change out of power plant oil. For contracts procuring smaller amounts of supplemental oil, testing requirements may be lessened depending on risk-tolerance, and it might be cost-effective for all testing to be performed by the Government rather than the Contractor.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: It is advised to consult with the technical proponent of the specification prior to its use. Corps Districts/Project offices can contact the Hydroelectric Design Center for assistance and/or request additional information/clarification related to the information contained in the entire document (POC: Catherine Campbell 503-808-4255 or Catherine.L.Campbell@usace.army.mil).
NOTE: Initial compatibility testing is more involved than per-delivery compatibility testing. Initial compatibility testing is to demonstrate that the chemistry of the new name-brand oil is itself compatible specifically with the in-service oil at the plant in question. Per-delivery compatibility testing is to confirm the delivered oil is in fact the correct oil, and to confirm that no contamination occurred during delivery which affected compatibility. Often the initial compatibility testing is performed by the Government, for instance using oil samples which are sent in together with bids for a job. For a very large job such as a major powerhouse rehabilitation, where the turbine oil replacement is only a fraction of the cost, it might be advantageous to require the Contractor to perform the initial compatibility testing. Initial compatibility testing should include all Tier 1 and Tier 2 tests in ASTM D7155 "Standard Practice for Evaluating Compatibility of Mixtures of Turbine Oil" plus Viscosity and Acid Number from Tier 3, and RPVOT, Rust Prevention, and Copper Corrosion from Tier 4. This testing should be performed even if the oil being purchased for the complete plant oil replacement is the same name-brand of oil which was purchased for the previous complete plant oil replacement, to ensure that even the same name-brand oil is still compatible with in-service oil. (A name brand can have a change in the proprietary recipe without notification to the Government.) Depending on the situation, an additional Tier 4 test may be recommended also to reduce risk, the Sludging and Corrosion test. This test is onerous, especially if performed on 5 or 6 samples with varying ratios of new and old oil, because it takes 1,000 hours just to run the test. An example scenario when the Sludging and Corrosion test may be warranted is when turbine oils from different manufacturers are being mixed (because neither manufacturer can fully vouch for expected compatibility between their oils), and in particular when the new oil will NOT be completely replacing the old oil, meaning the oils must work together long-term, in any ratio, because the Plant's turbine oil all gets mixed together over the years. Initial test results can take up to 4-6 weeks even expedited (and will take even longer if 1,000-hr tests are ordered). If multiple bids/brands might be accepted, testing on bidder-submitted samples by the Government may exceed GPC (Government purchase card) limits depending on number of samples/bids. If testing is to be done at this stage, it is recommended to solicit quotes ahead of time to allow for timely testing and adequate competition. The testing
duration should also be taken into account when soliciting the contract.

Note that for significant quantities of oil, such as a railcar at at time (20,000-24,000 gallons), and especially if the Contractor is filtering the oil pre-delivery, the lead time between placing a task order and getting a delivery can be 12-16 weeks or longer.

This specification assumes use of traditional Group 1 and 2 mineral oils, not any Environmentally Acceptable Lubricants (EALs), because a drop-in EAL turbine oil replacement is not considered technically feasible at this time. If experimenting with a synthetic EAL is desired, for instance during a major rehabilitation in an environmentally sensitive area, replacing turbines, and with opportunity to replace any incompatible oil-wetted materials (seals, paint), please contact the PROPOUNENT. There are efforts both pending and underway to develop, research, test, and vet potentially feasible EALs, for example by the Centre for Energy Advancement through Technological Innovation (CEATI) Hydropower Plant Equipment Interest Group (HPEIG). At this time, however, the most viable candidates for performance in hydropower units are also entirely incompatible with in-service oils, as well as incompatible with several materials. Additionally, there is concern that EALs might not have as much hydrodynamic thrust bearing load capacity as traditional mineral oils.

**************************************************************************
**************************************************************************

NOTE: The 17/15/12 cleanliness level and 100 ppm water content PPM level in this spec assume that all the oil is being changed in a Powerhouse at once, in which case it is typically more convenient for the Government to have the Contractor perform filtration and dehydration such that new oil does not require any purification by the Project prior to use. (For digital governors, the offline "kidney-loop" filter dedicated to the governor sump can further polish the governor oil up to 15/13/10, if the governor sump has breathers to exclude contamination from the air.) If only supplemental oil is needed or the Project wishes to handle purifying, the cleanliness and water requirements should be changed to FIO or removed.

Two recommended ways of oil procurement are through a SATOC (Single Award Task Order Contract) or a DLA (Defense Logistics Agency) purchase. A SATOC allows for issuing task orders each time the powerhouse is ready to accept another "batch" of oil. DLA purchases allow for specification of a name brand product for consistency and risk reduction. Extra storage may be key to having enough flexibility to
deliver only the new oil from the clean lubrication oil tank in the oil storage room to the powerhouse for makeup oil and to fill empty units, while holding all oil that is drained back to the dirty lubrication oil tank in the oil storage room to be trucked away. During this transition, the Project's own lube oil purifier would be entirely idle, with no oil being moved from the dirty tank to the clean tank. This offers tremendous savings and simplicity over constructing a parallel oil delivery system to keep the new and old oils separate. To get extra storage room for incoming and outgoing oil, it may be beneficial to empty out the transformer oil tanks, wasting any residual oil, testing for PCBs (hopefully none) and wiping those tanks down to accept lube oil, at least temporarily. At the end of the contract, it may be desirable to empty and wipe down at least the dirty transformer oil storage tank again, to be ready in case a sudden urgent need to drain a transformer comes up. To change all the oil in the powerhouse this way, it is strongly recommended for the new oil being delivered to be clean enough to go straight to the units.

Ordering "batches" of oil in railcar quantities (20-24k gallons) to the extent possible will get the Government a better price.

Oil can be delivered to temporary Contractor-provided storage containers onsite at the Project, or the delivery truck's tanks can remain on-site within a containment berm. This allows the Government to use a sample taken from the actual delivered oil, send it to the lab for testing, and only move it into Government tanks or equipment after it passes all tests. If the oil is immediately moved into Government tanks or equipment, and failed oil test results arrive later, this can be very difficult to resolve satisfactorily with the Contractor. (The risk may be acceptable in a case where a Contractor is making multiple oil deliveries, and has successfully delivered acceptable oil a few times, and is using the exact same procedures through the contract.)

For change out of all the oil in a Powerhouse, it is highly recommended to flush the system first; see EM 1110-2-1424 LUBRICANTS AND HYDRAULIC FLUIDS. Contact the Hydroelectric Design Center for questions, concerns, and support for flushing specifications.

**************************************************************************
1.1 SUMMARY
**************************************************************************

NOTE: When changing the oil in a Powerhouse, there will typically be some waste. It is highly desirable to have flexibility in the contract to allow the
last delivery order to be an unknown amount smaller than a full truckload, though typically that will mean a higher per-gallon price for the final delivery.

It is desirable to have zinc-free turbine oil. Zinc-free oil is more environmentally friendly. Also zinc additives like "ZDDP", while effective, can break down under certain conditions into undesirable compounds. Over time, ZDDP + Water + Heat \(\Rightarrow\) Sulfuric Acid + Hydrogen Sulfide. This can pose a risk, for example in a poorly ventilated area such as the bottom of a damp regulating outlet tower in a reservoir with hydraulic-operated gates and a submerged oil heater in the sump. Typically for hydropower applications, zinc or ZDDP as an anti-wear additive is not needed due to relatively mild conditions, though there are some exceptions such as when speed-increasing gears are part of the equipment being lubricated by the same turbine oil. (Even in these cases, "extreme pressure" additives should be avoided due to being more chemically aggressive and unnecessary.) Note that some oils may have "EP" in the name brand without actually having the aggressive additives.

For turbine bearings and governors in powerhouses, however, compatibility requirements have sometimes led to the choice of non-zinc-free oils.

Typically if an oil is zinc-free, its Product Data Sheet (PDS) will explicitly claim "zinc-free".

There are times when a particular name brand of oil is justified and this is known prior to advertisement because comprehensive compatibility checks were done beforehand for a complete oil replacement, or the quantity of top-off oil does not justify experimenting with anything other than the existing name brand. This specification has bracketed choices which allow for a name brand to be indicated if approved.

**************************************************************************
**************************************************************************

NOTE: Depending on initial oil compatibility testing strategy and/or whether a name brand is justified, consult with contracting regarding whether the language about "...bidders must submit one gallon of proposed turbine oil with proposals" in the second paragraph belongs here and/or in Instructions to Offerors.

The seven ratios below include 2 special ratios (highlighted orange) using 5% and 95%. These are not normally part of the ASTM D7155 testing, but can be included for an extra fee if communicated with the oil testing lab ahead of time. The number of ratios can be reduced depending on the situation and
risk tolerance. The test with just 5% in-service oil is meant to represent a situation where all of the in-service oil is intended to be removed, but some residue remains. The test with just 5% new oil is meant to represent a situation where a small portion of new oil is used as "make-up" oil in governor sump full of in-service oil.

This specification includes zinc and chlorine-free rust and oxidation inhibited (R&O) mineral oils for use in hydraulic turbine and generator bearings, Kaplan turbine hubs, hydraulic-turbine governors, and other applications, where high grade turbine oil having anti-corrosion and anti-oxidation properties is required. In addition, this specification covers delivery and installation of up to [_____] gallons of approved [(ISO viscosity grade 68)][(ISO viscosity grade 100)] turbine oil for [_____] Powerhouse. Laboratory test results for [each railcar of oil ordered and for ]each truck of oil delivered are required.[ Oil is to be delivered at the unusual cleanliness level of 17/15/12(c) and with less than 100 ppm of water.]

Because compatibility is a critical feature of replacement turbine oil, bidders must submit one gallon of proposed turbine oil with proposals. The Government will have compatibility tests performed at its own cost. Any oils which fail to demonstrate compatibility with the in-service oil at [_____] Powerhouse per ASTM D7155 will be ineligible. The following tests from ASTM D7155 will be performed:

From Tier 1 Visual Appearance, all tests.
From Tier 2 Interfacial Properties, all tests.
From Tier 3 Physical/Chemical Properties, ASTM D445 or ASTM D7042, and ASTM D664 or ASTM D974.
From Tier 4 Performance Properties, ASTM D2272, ASTM D665 [, and ASTM D130][ASTM D130, and ASTM D4310].

The above tests will be performed with the following seven ratios:

100 percent new oil to 0 percent in-service oil
95 percent new oil to 5 percent in-service oil
90 percent new oil to 10 percent in-service oil
50 percent new oil to 50 percent in-service oil
10 percent new oil to 90 percent in-service oil
5 percent new oil to 95 percent in-service oil
0 percent new oil to 100 percent in-service oil

Potential bidders may wish to have their own tests conducted prior to bidding, and may request a one-gallon sample of in-service oil for that purpose.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only. The year refers to the basic date of issuance of the standard or code. All Codes and Standards are to include published Interpretations and Interim Amendments or Revisions by the Standard or Code Authorities referenced must be current as of date of contract.

U.S. ARMY CORPS OF ENGINEERS (USACE)

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project.

The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "HDC" for the Hydroelectric Design Center MCX in Portland District, "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

In this SUBMITTALS paragraph below, choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Oil Test Independent Laboratory Qualifications; G,HDC
Oil Delivery Truck [And Temporary Contractor-Provided Clean Oil Storage Tank ]Cleaning Methods; G,HDC

Filtration Procedure(s); G,OPS,HDC

OIL SAMPLING PLAN; G,OPS,HDC

Certification Of Clean Oil Delivery Truck, Per Delivery; G,HDC,OPS

Chain Of Custody, Per Delivery; G,OPS

1.4 OIL TEST INDEPENDENT LABORATORY QUALIFICATIONS

Submit for approval the qualifications of the proposed oil testing laboratory, within 60 days of Award. The laboratory must be independent of [oil manufacturer][ExxonMobil][Shell][Chevron] and independent of the Contractor. The laboratory must be ISO ISO/IEC 17025 certified, and must have a minimum of 3 years of experience performing the ASTM D7155 Tier 1 Visual Appearance compatibility testing (note that this Tier 1 testing is not certified by ISO). Examples of qualifying laboratories are:

TestOil, 20338 Progress Drive, Cleveland, OH 44149, (216) 251-2510

SGS Herguth Laboratories, 101 Corporate Place, Vallejo, CA 94590, (800) 645-5227

Lubrication Engineers, 1919 E. Tulsa Street, Wichita, KS 67216, (800) 537-7683

MRT Laboratories, 305 Nebraska Street, South Houston, TX 77587, (713) 944-8381

1.5 OIL DELIVERY

*****************************************************************
NOTE: Quarantining the oil in Contractor storage
reduces the risk taken on by the Government. In a
case where the oil fails compatibility, any tanks that held the incompatible oil will need to be thoroughly cleaned prior to accepting more oil. By utilizing Contractor-provided storage tanks, it can be ensured that the Government tanks will not be contaminated by incompatible oil. This also puts the entire chain of custody of any rejected oil in the hands of the Contractor.

However, using Contractor-provided temporary oil storage also adds cost and increases the need for oil spill prevention measures. It may be an added burden for the Project to inspect daily for leaks, for instance. There are various ways to reduce everyone’s risk, depending on the partnering relationship, costs, and quantity of oil. For example, if several railcars (20-24k gallons of oil) are being ordered, and the distributor has a tank farm with rail spurs, they may be able to hold a railcar from the manufacturer pending a set of test results to be approved by the Government. Then the distributor takes custody of the oil from the manufacturer, pumps it into clean tanks for filtration, submits cleanliness measurements to the Government, then pumps it into clean trucks for delivery, takes a sample from the truck at delivery, pumps it into the Government’s clean tank, where it is quarantined pending acceptable test results from that sample. This way, Government acceptance of the oil depends only on factors which were in the Contractor’s control. However, the Contractor must have confidence in their process, because rejection will mean the oil must be removed from the Government’s tank and replaced at no additional cost to the Government. Also in this case the Government’s tank should be cleaned, pumping or vacuuming out all oil and using squeegees and/or lint-free rags to wipe surfaces clean. Cleaning Government tanks prior to accepting the first delivery of new oil into them is good practice in any case. If other on-site work is already required in the contract, it might be worth requiring the Contractor to perform this work, which likely includes tanks which are confined spaces.

In any case, the samples used for final Government acceptance of the oil should be taken after the oil is onsite at the Powerhouse, to avoid accepting oil which is then contaminated during delivery. (One exception might be a tote which was filled and shipped directly from the oil manufacturer, which is sealed with no opportunity for contamination between the manufacturer and the Project.)

**************************************************************************

[All oil deliveries will be held in Contractor-provided temporary onsite storage for up to one week after submittal of lab test results in order to allow for review and approval. ]

SECTION 48 06 15 Page 13
remove the oil from the Government tank and replace it within 12 weeks at no additional cost to the Government.] Particular lab test results required include both property testing and compatibility testing as specified below.

1.5.1 OIL DELIVERY TRUCK [AND TEMPORARY CONTRACTOR-PROVIDED CLEAN OIL STORAGE TANK] CLEANING METHODS

Submit for approval the specific cleaning fluid and methods which will be used to clean oil delivery trucks and the qualifications of the truck cleaning company, within 60 days of Notice of Award. Include a description of how the cleaning procedure results in zero residue and therefore minimizes risk of contamination of new oil. Include a description of what documentation will be offered to serve as certification that a delivery truck was cleaned. Cleaning methods must include but not be limited to the steps outlined in paragraph Oil Delivery Truck [and Temporary Contractor-Provided Clean Oil Storage Tank] Cleaning or approved equivalent procedure.

Once the delivery truck, hoses, and pump(s) have been cleaned the first time per these specifications, if no products other than [the approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68] have been transported by this equipment as evidenced by the manifests, then additional cleaning is not needed between loads.

1.5.1.1 Oil Delivery Truck [and Temporary Contractor-Provided Clean Oil Storage Tank] Cleaning

(a) Drain each compartment and discharge line.

(b) Use one of the following as a cleaning fluid:
   (i) clean unused diesel fuel with less than 0.1% biodiesel and less than 0.2% total additives
   (ii) kerosene
   (iii) gasoline
   (iv) jet fuel

(c) For tanks or single-compartment trucks, utilize a minimum of 50 gallons of cleaning fluid in the compartment. For triple-compartment trucks, utilize a minimum of 10 gallons of cleaning fluid in each compartment.

(d) Introduce cleaning fluid from the top of each compartment, such as by attaching a spinner ball or spray head to man-way on top of compartment. Attach the discharge hose to the discharge port of the compartment. Circulate the cleaning fluid through the discharge hose to the spinner ball or spray head. Repeat this for a minimum of 30 minutes. If there are multiple discharge ports, clean each discharge port (i.e., circulate the cleaning fluid through each discharge port during the cleaning process).

(e) After cleaning process is complete, discharge the cleaning fluid through the discharge hose to a proper container.

(f) After cleaning, check the compartment for residual product, emulsion, dirt, strong odor, or foreign debris. If compartment does not look clean, repeat flushing procedure.

(g) After cleaning, drain all discharge ports on the transport, including all manifold points of discharge and all internal valves opened, and
check for residual product or diesel fuel. Slight elevation of the transport front will facilitate drainage. Total residual cleaning fluid remaining in the entire transport or tank must not be more than 5 gallons.

(h) Use a nitrogen or dry compressed-air blowdown.

1.5.1.2 Onboard Hose Cleaning

(a) Drain and flush all hoses used to deliver product with cleaning fluid. Inspect, and repeat as needed until clean.

(b) Drain cleaning fluid from hoses and blow dry with nitrogen or air.

1.5.1.3 Onboard Pump Cleaning

(a) Clean pump to be visibly free of dirt, water, or other contamination.

(b) Pump a minimum of 4 gallons of [approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68]. Oil used for pump flushing may be of any viscosity.

1.5.2 DELIVERY HOSE REQUIREMENTS

Hoses must have a rated pressure of no less than 125 psi or 150 percent of the relief valve setting on the delivery pump system, whichever is greater. Delivery hose must be not less than 2 inches in nominal diameter. Hoses must be cleaned by a rag or pig to remove any loose visible contamination including dirt, sludge, varnish, lint, metal or any other visually observable debris. Before connecting the hoses allow the Government to visually check to confirm that the cleaning has occurred.

[1.5.3 FILTRATION PROCEDURE(S)

**************************************************************************

NOTE: There is good evidence that filtration does eventually remove anti-foam additives from the oil regardless of the method used. Certainly it is preferable to filter oil that is above 50 degrees F and relatively dry. All other things being equal, higher flow rates seem to be beneficial in slowing removal of anti-foam additives. See also notes at paragraph PROPERTIES and paragraph DEGRADATION.

**************************************************************************

Submit filtration procedure(s) no later than 30 days prior to filtering any oil. Procedures must follow oil manufacturer's recommendations and must include, but not be limited to, flow rates, temperatures, and filter information such as manufacturer, media, micron & Beta ratings. As applicable, differentiate between procedures for pre-delivery filtration at Contractor facility, pre-delivery filtration in delivery truck, onsite filtration in Contractor-provided temporary storage tank, and filtration during delivery through a filter cart.

]1.5.4 OIL SAMPLING PLAN

Obtain all samples per ASTM D4057 or ASTM D4177. See also paragraph OIL TESTING AND SAMPLES. Submit for approval an oil sampling plan including but not limited to the following:
(a) Description of method of delivery (e.g. truck capacity, number of compartments) and onsite storage (e.g. Contractor-provided temporary double-walled storage tank) for each delivery of [_____] gallons of new [approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68].

(b) Procedure to take oil samples for acceptance testing and for the Government (e.g. truck driver will pull sample with equal parts of oil coming from each oil compartment, with Government witness, and will label the container with the date and product name).

Procedure to provide clean sample bottles to the Government for in-service oil from [_____] Power Plant for compatibility testing (e.g. shipped directly from testing lab).

1.5.5 OIL SPILL PREVENTION PROCEDURE

**************************************************************************
NOTE: A spill prevention RESPONSE plan (who to call, cleanup) should also be submitted per the environmental specification complying with site specific environmental concerns and requirements. Any other requirements or plans per the environmental specification or PDT's ECC should also be submitted. Compliance with the Clean Water Act is a HIGH priority.
**************************************************************************

Submit an Oil Spill Prevention Procedure no later than 30 days prior to delivery, including but not limited to containment around the delivery truck, product data for oil spill prevention materials to be brought onsite, planned placement of oil socks/diapers, taping plastic around any hose connections, and plugging any drains being crossed by the hoses. The work must also include spill prevention for the truck, hoses, and any temporary storage tanks through which the oil is delivered, stored, and removed. Spill prevention must be in compliance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. Spill prevention must be set up and observed by the Government prior to delivering or removing any oil.

1.6 OIL VENDOR QUALIFICATIONS

Submit qualifications certifying that the oil vendor:

(a) Is an Authorized Distributor of [approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68], as indicated either on the distributor locator website or by a letter from [oil manufacturer][ExxonMobil][Shell][Chevron]

(b) Can prove through other documentation such as manifests, chain-of-custody documentation, and/or a letter from [oil manufacturer][ExxonMobil][Shell][Chevron], that the oil being provided is the exact name brand specified, AND;

(c) In addition to a or b, also has the ability to provide consistent timely turnaround on oil sample test results, as evidenced by a contracted relationship with, or a letter of commitment from, a qualified testing lab or labs.
PART 2  PRODUCTS

[2.1 INITIAL COMPATIBILITY TESTING

**************************************************************************

NOTE: As was noted above, compatibility between new oil and in-service oil must be evaluated and determined by lab testing. Only oils found to be compatible may be mixed with in-service oil or used as replacement oil. The compatibility testing is necessary, even when both base oils are mineral oils such as Group 1 and Group 2 oils, because the new oils currently readily available on the market may have been formulated with different additives, which may not be fully compatible with additives of the in-service oils. Compatibility testing for oil purchases of any significant volume is necessary even when replacing in-kind, as formulas change over the years. This paragraph is included in brackets in case the decision has been made to have initial compatibility testing performed by the Contractor. "Equivalency" of another product cannot be established without repeating all of this testing, because oil manufacturer's additive package "recipes" are proprietary. If there is a need to switch from one new oil to another new oil mid-way through the contract (for instance due to manufacturer stopping production of original product), this testing must be conducted between new oil #1 and new oil #2 as well as between new oil #2 and the in-service oil.

**************************************************************************

Do not purchase any oil, other than in quantities required to perform testing, prior to Government approval of initial compatibility testing results from an approved independent oil testing laboratory. Coordinate with the Contracting Officer to provide sample container(s) to the proper address and to have sample(s) of in-service oil shipped to the laboratory for evaluation of compatibility between the two oils. Perform compatibility evaluation in accordance with ASTM D7155, including the following tests for each of the seven mixtures listed below:

From Tier 1 Visual Appearance, all tests.
From Tier 2 Interfacial Properties, all tests.
From Tier 3 Physical/Chemical Properties, ASTM D445 or ASTM D7042, and ASTM D664 or ASTM D974.
From Tier 4 Performance Properties, ASTM D2272, ASTM D665, [and ASTM D130][ASTM D130, and ASTM D4310].

Oils which fail to demonstrate compatibility with the in-service oil at [_____] Powerhouse per ASTM D7155 will not be approved for purchase. Perform all the tests listed above with each of the following seven ratios:

100 percent new oil to 0 percent in-service oil
95 percent new oil to 5 percent in-service oil
90 percent new oil to 10 percent in-service oil
50 percent new oil to 50 percent in-service oil
10 percent new oil to 90 percent in-service oil
5 percent new oil to 95 percent in-service oil
0 percent new oil to 100 percent in-service oil

Do not purchase any oil other than the exact name brand of oil which has been approved by the Government as being compatible with in-service oil. No "equivalent" products are acceptable for this requirement.

[2.2] CERTIFICATION OF BRAND NAME PRODUCT

Submit certification such as a letter with the manufacturer's certificate of analysis, Product Data Sheet (PDS), and Material Safety Data Sheet (MSDS) attachments that the product to be delivered per these specifications is the exact brand name specified. No "equivalent" products are acceptable for this requirement.

[2.3] GENERAL REQUIREMENTS

2.3.1 Properties

**************************************************************************

NOTE: In recent years, it has become apparent from test results that filtering oil to the desired cleanliness levels DOES remove anti-foam additive. Cleanliness levels are more important than foam for equipment life. It may be necessary to check whether oil level sensors are susceptible to false readings in case of foam (e.g. ultrasonic, laser). Removal of anti-foam additive affects the foam "tendency", meaning how much foam is formed, but should not significantly affect foam "stability", or how long the foam lasts. Therefore, if the Contractor is to filter new oil, the foam tendency test results must be FIO (though the foam stability test results are still "G"). If the Contractor is not required to filter new oil prior to delivery, then the foam tendency results are "G" (as well as the stability results) but the cleanliness and water content results are FIO.

**************************************************************************

Provide turbine oil which is a blend of virgin petroleum-based stocks plus additives, free of [zinc and ]chlorine, resulting in high-grade turbine oil having anti-rust and anti-oxidation properties suitable for use in hydraulic turbines, generator bearings, Kaplan turbine hubs and related applications. Chemical and physical characteristics of oil must meet or exceed the requirements listed in TABLE 1, [with the exception that foam tendency results are FIO][with the exception that cleanliness and water content results are FIO]. Determine oil characteristics by tests conducted in accordance with the tests methods as noted in the table.

2.3.2 Chemical And Physical Characteristics

The turbine oil must conform to the requirements established in TABLE 1 when tested according to the standards indicated. Submit certified test data showing that the oil meets or exceeds characteristics values specified in TABLE 1.

**************************************************************************
NOTE: This table must be tailored depending on the actual oil chosen, in particular with respect to the RPVOT value and Acid Number. If there is a wide range of allowable turbine oils, add a requirement that the values for these characteristics must be within either 10 percent of the manufacturer's published value or within the manufacturer's quality control limits (in case values are not published) for new, unused oil.

2.4 DEGRADATION

**************************************************************************
NOTE: In recent years, contracts for turbine oil replacement have required that the Contractor deliver oil to 17/15/12 cleanliness, and also test delivered oil for properties & characteristics. Results from this have shown that filtration will affect "foam tendency" significantly due to removal of anti-foam additives (especially if oil is filtered with high water content). But even though the removal of anti-foam additives will tend to allow more foam to be generated (tendency), that foam should still subside when the oil is at rest – in other words, "foam stability" should NOT be significantly affected by the removal of the anti-foam additive.
**************************************************************************

The physical and chemical properties of the oil, with the exception of foam tendency, must not be degraded (changed from the specified values) by filtration through two-micron mechanical type filters, by centrifugal purification, two-micron coalescing filters, balanced charge agglomeration or by vacuum type purifier, all of which have been designed for turbine oil.

2.5 HOMOGENEITY

Additive agents must remain uniformly distributed throughout the oil at all temperatures above the pour point and up to 120 degrees C 250 degrees F. When the oil is cooled below the pour point, it must regain homogeneity while standing at temperatures of 5 degrees C 10 degrees F above the pour point, and retain clear and bright appearance.

PART 3 EXECUTION

3.1 OIL TESTING AND SAMPLES

**************************************************************************
NOTE: Actual testing plans, pre-advertisement, pre-award, and/or during contract, can vary depending on the details of the situation. Please
consult with the proponent.

Due to the cost to perform testing on oil, it is recommended to provide an estimate to the number of tests required throughout the life of the contract.

3.1.1 Data of Chemical and Physical Characteristics, Per Delivery

As a rough estimate for information only, [_____] of these submittals are expected to be required overall.

Furnish certified test data, for the [approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68], showing results for all the values specified in TABLE 1. The certified test data must be submitted for approval within five business days after the delivery unless otherwise approved. This testing is required for each delivery of oil; differentiate the submittals using an identifier such as a delivery date and powerhouse name. A new submittal is required for each delivery.

3.1.2 Compatibility Testing Results, Per Delivery

As a rough estimate for information only, [_____] of these submittals are expected to be required overall.

Furnish certified test data, showing compatibility results for each delivery of oil per ASTM D7155 Tier 1, visual rating, using blends of in-service oil and new oil the ratios 100/0, 90/10, 50/50, 10/90, 5/95 and 0/100; include results for all six samples (the two "neat" oil samples and the four mixtures). Each compatibility test requires a sample of the powerhouse's in-service oil, which will be furnished by the Government, in a Contractor-furnished one-gallon sample container. Use one gallon of new oil from each delivery, which is a blend of oil from each container used in the delivery, e.g. if oil is delivered by a tanker truck with one extra tank, the gallon used for this testing should be half from the truck and half from the extra tank. The certified test data must be submitted for approval within ten business days after each delivery of oil unless otherwise approved. This testing is required for each delivery of oil; differentiate the submittals using an identifier such as a delivery date and powerhouse name.

3.1.3 One Gallon of Oil From Each Onsite Tank or Truck

As a rough estimate for information only, [_____] of these one-gallon samples are expected to be required overall.

Submit a one-gallon sample of the oil from each container in the truck at each delivery. Sample is to be obtained in a manner specified in ASTM D4057 or ASTM D4177. Contractor may submit a single gallon of evenly mixed oil from all containers if desired - e.g. if oil is delivered by a tanker truck with one extra tank, a single gallon, comprised of a half-gallon from the truck, and a half-gallon from the extra tank, may be submitted rather than two separate gallons. This sampling is required for each delivery of oil; differentiate the samples using an identifier such as a delivery date on the sample container.

[3.2 FILTRATION

In all cases, including at Contractor's facility if applicable, warm oil to
a minimum of 50 degrees Fahrenheit prior to filtration.

3.3 DELIVERY OF NEW OIL

Deliver new oil in accordance with specifications and in coordination with the Contracting Officer for the delivery schedule. Spill prevention must be set up and observed by the Government prior to delivering any oil.

3.3.1 Oil Delivery and Removal Procedure

[Coordinate with the Contracting Officer regarding best location for oil delivery and removal trucks onsite.] [Park delivery and removal trucks as close as possible to the oil fill/discharge cabinet in the erection bay.] [Use a filtration cart with calibrated particle counter during each oil delivery. Deliver new oil at a minimum of 50 degrees Fahrenheit through the filtration cart.] Submit a detailed Oil Delivery and Removal Procedure for new oil deliveries and for the used oil removal[, including but not limited to product data on the filtration cart, product data on the filters themselves, product data on the particle counter, and calibration certificate for the particle counter per ISO 11171]. Include details regarding how used oil will be removed and disposed of. Set up oil delivery truck inside erected truck spill containment. Set up spill containment for the hoses prior to connecting and routing the hoses. All spill prevention equipment and provisions must be approved by the Contracting Officer prior to delivering oil. Take samples at each delivery of new oil as specified herein.

3.3.2 Chain of Custody, Per Delivery

Upon delivery of oil, provide a chain of custody report that includes documentation such as the bill of lading. Reports must track the oil, referenced by its batch number, from its origin to final delivery signed and dated by a designated representative. In the event of a failed compatibility test, this will be used to investigate when the oil was contaminated. Submit chain of custody at each delivery; use dates to differentiate among submittals.

3.3.3 Certification of Clean Oil Delivery Truck, Per Delivery

As a rough estimate for information only, [_____] of these submittals are expected to be required overall.

Prior to pumping oil into a powerhouse, submit certification that the truck used for that particular delivery was cleaned per the approved procedure, and that only [approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68] has since been introduced into the truck. [This may be submitted electronically at the time the truck is being filled with oil for this contract, or may be submitted physically at the time of delivery.] Note that rejection of truck cleanliness constitutes rejection of oil delivery, unless otherwise approved in writing by the Contracting Officer.

3.3.4 Temporary Onsite Oil Storage

Provide means of temporary new oil storage to hold approximately [_____] gallons of new oil or leave oil truck tankers on site as new oil storage while compatibility testing is performed. Provide means of temporary used oil storage to hold approximately [_____] gallons of used oil, and remove used oil once the Project is ready to dispose of it. Oil containment measures must be provided with any form of temporary storage except in the
instance of a double-walled tank. Coordinate with Project personnel for staging locations.

Upon Government approval of oil delivered to temporary onsite storage, pump approved oil into the Government's storage tank.

3.4 INSPECTION AND ACCEPTANCE

NOTE: The Corps' Districts/Projects may perform Quality Assurance (QA) tests on samples taken at the delivery point. The QA tests should include, as a minimum, the viscosity, acid number, elemental spectroscopy, and oxidation stability. Any of the other tests in TABLE 1 are beneficial and should be considered in addition to the minimum QA tests. Samples should be taken from each bulk shipment and from not less than 10 percent of the drums taken at random from drum shipments. Such samples should be not less than 4 L (1 gal), which may be stored in more than one sample container, and a portion of each sample should be saved for later confirmation tests in the event that the results from the first tests indicate that the oil does not meet the specification requirements.

At the point of oil delivery, the Government will obtain samples in a manner specified in ASTM D4057, and may perform such tests as are deemed necessary to determine whether the oil meets compatibility requirements as well as the specifications values listed in TABLE 1. The delivered oil must remain in a storage tank (if applicable) and cannot be used until the test results are received from the laboratory. Should the oil fail to meet requirements, or show results incompatible with being the specified name brand required, or be so contaminated at the delivery point that it fails compatibility testing with in-service oil, the Contractor is responsible for removing oil[,] cleaning Government tanks used to store that oil[,] and disposing of the rejected oil and replacing the oil at no additional cost to the Government, within 3 months of initial delivery.

3.5 TANK CLEANING

NOTE: Do NOT permit the use of any detergents in cleaning tanks, or any turbine oil-containing equipment. Do NOT permit the use of engine oil either, because engine oil is HIGHLY additized, including detergents and dispersants that will contaminate the turbine oil. Even pipe dope, cosmoline, and other common substances or residues on piping equipment should be prevented from contaminating turbine oil-containing equipment. Any of the cleaning fluids allowable per paragraph OIL DELIVERY TRUCK [AND TEMPORARY CONTRACTOR-PROVIDED CLEAN OIL STORAGE TANK ]CLEANING METHODS is acceptable as an interim measure, but the final cleaning should be with lint-free absorbent rags.
[In the event that new oil was allowed to be stored in the Government's storage tank at the power plant, and that oil subsequently fails to meet criteria and is rejected by the Government, clean the Government tanks after removal of rejected oil.

][Clean the two xx,xxx-gallon transformer oil storage tanks. ][Clean the xx,xxx-gallon Clean Lube Oil Storage Tank prior to any oil deliveries. ][Clean the xx,xxx-gallon Dirty Lube Oil Storage Tank after all used oil has been removed from the powerhouse. ]Tanks must be thoroughly manually cleaned by the Contractor. The Contractor is to physically clean and wipe out all residues from the tanks using oil-absorbent and lint-free cloths to remove all visible dirt, varnish, and debris, to the point that no residual contamination can be detected on clean lint-free white cloths. If desired, the Contractor may propose for the Contracting Officer's approval, use of their own equipment other than cloths as a first cleaning, such as a vacuum, squeegee system or pump. This may be necessary to remove oil from the very bottom of tanks. Detergents may NOT be used. Engine oil (which is highly additized including detergents) may NOT be used at all, not even on rags used to clean the tank. In any case, the final cleaning must be performed manually with oil absorbent and lint-free cloths. In this process, coordinate work with the Contracting Officer, perform all work in accordance with [SECTION 01 11 01.00 XX SUPPLEMENTARY REQUIREMENTS], and comply with all confined space requirements and procedures. The plan must be a complete plan in accordance with 29 CFR 1910 and EM 385-1-1. Cleaning of tanks is to be considered completed when inspected and approved by the Contracting Officer.

]3.6 REMOVAL OF USED OIL

**************************************************************************
NOTE: Removal of used oil typically requires about a week's notice. The truck used to remove oil is typically completely separate from the delivery truck, and is subcontracted out. It is desirable for the contract to have flexibility regarding the total number of truckloads to be removed, and to allow for a final oil removal with less than a truckload, which will affect pricing for that load.
**************************************************************************

Remove and properly dispose of up to [_____] 8,000-gallon truckloads of used oil from the Powerhouse. With the truck parked inside the powerhouse as close as possible to the oil [supply/discharge cabinet connections][storage tanks] as directed by the Government. Approximately [_____] gallons at a time of existing used oil will be pumped to the truck. Dispose of oil offsite in accordance with applicable laws and regulations. Coordinate with the Government prior to arriving on-site for final staging locations.

**************************************************************************

[ Section 26 08 00, APPARATUS INSPECTION AND TESTING apply to this section ]
with additions and modifications specified herein.

NOTE: To expedite interconnection and activity, solicit local utility point of contact, if known.

Coordinate with local utility interconnection and activity. [Point of contact [______].]

1.3 DEFINITIONS

a. Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in the IEEE Stds Dictionary.

b. Unless otherwise specified or indicated, solar energy conversion terms used in these specifications, and on the drawings, are as defined in ASTM E772.

1.4 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**************************************************************************
NOTE: Permits are assumed to be obtained by firm holding design responsibility. Ensure this is clarified in contract bid package.

1.5 MAINTENANCE MATERIAL SUBMITTALS

Comply with requirements specified in Section 01 78 00 CLOSEOUT SUBMITTALS.

1.6 QUALITY ASSURANCE

1.6.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.6.2 Drawings

Submit minimum of three (3) hard copies of drawings for government approval prior to manufacturing and equipment construction or integration. Submit shop drawings at a minimum of 11 by 17 inches in size using a minimum scale of 1/4 inch per foot, for the exception of drawings not requiring scale. Submit site plan drawings and riser diagram and general notes at a minimum of 24 by 36 inches. Submit Installation and Assembly Details at a minimum
1.6.2.1 Product Drawings

Submit complete detailed product drawings for the solar PV system consisting of shop drawings and product data sheets. Include in the shop drawings [one][three] [four] wire diagrams, utility interconnection diagrams, switchboard and switchgear drawings layout and arrangement of PV modules, support and mounting mechanism, inverters, combiner boxes, AC and DC disconnects, equipment enclosures, conduits, monitors, meters, and all other accessories associated with the installation of the PV system. Provide equipment dimensions, weights and structural mounting details.

Provide design Calculations. Include nameplate data, size, and capacity of each PV module. Include all assumptions such as applicable wind speed, snow and seismic loads. Include applicable federal, military, industry, and technical society publication references.

1.6.2.2 Installation and Assembly Drawings and Details

Submit site plan drawings, components and interconnection wiring and general notes, and installation and assembly Details drawings prior to start of construction. Include sufficient detail on drawings for all parts of the work to enable the Government to check conformity with the requirements of the contract documents. Include in the site plan drawings: topographic and utility survey; bore logs; soils report; site plan(s); site construction details; structural drawings; structural construction details; site electrical plan; and site electrical construction details. Include in the installation and assembly drawings and details: parts lists; assembly drawings; interconnection wiring diagrams; wire and cable schedules; wire and cable termination schedules; instrument plan; instrument and control wire, conduit and cable schedules; instrument wire and cable termination schedule; control diagrams; control sequence of operation; seismic restraint details; and wind restraint details.

1.6.2.3 "As-Built" and Record Drawings

After completion of construction, submit As-Built Drawings prepared and certified by the construction contractor, showing in red ink, on-site changes to the original construction details and all underground utilities measured from field benchmarks, accurate to within 1" of centerline of the utility. Immediately record for inclusion into the as-built drawings all modifications to original drawings made during installation. Indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Prepare "as-built" on a minimum of 24 by 36 inches vellum using red ink.

After submittal and approval of "As-built" Drawings, submit Record Drawings, prepared and by the project engineer(s) and architect(s), of the original design drawings reflecting all design changes and contractor noted changes in the "As-Built" drawings.

1.6.3 Standard Materials and Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products with satisfactory commercial or industrial use for [2][_____] years prior to bid opening, and
past performance documentation with consistent design and bill of materials. Include applications of equipment and materials under similar circumstances and of similar size. Where two or more items of the same class of equipment are required, products will be from a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in the technical section.

Proof of compliance with requirements of UL, where material or equipment is specified to comply. The label of or listing in UL Electrical Construction Directory will be acceptable evidence. In lieu of the label or listing, a written certificate from an approved nationally recognized testing laboratory (NRTL) equipped to perform such services, stating that the items have been tested and conform to the requirements and testing methods of Underwriters Laboratories may be submitted.

1.6.3.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation of not less than 6,000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished. These alternative qualifications do not apply to materials in Section 2.2 of Section 26 31 00 FACILITY-SCALE SOLAR PHOTOVOLTAIC (PV) SYSTEMS.

1.6.3.2 Material and Equipment Manufacturing Date

Do not use products manufactured more than 3 years prior to date of delivery to site, unless specified otherwise.

1.6.4 Operations and Maintenance Data

Submit operation and maintenance Data Package 5 in accordance with Section 01 78 23, OPERATION AND MAINTENANCE DATA and as specified herein.

1.6.5 Commissioning Agents

Commissioning Agents Qualifications: Engage commissioning service personnel, that specialize in the types of inspections and tests to be performed.

1.6.6 Installers

Demonstrate that installers have successfully installed at least four projects that, in aggregate, equal or exceed the size of the proposed project. Provide references for each of these referenced projects.

1.6.7 Qualified Testing Organization

Engage the services of a qualified testing organization to provide inspection, testing, calibration, and adjustment of the solar PV system and equipment listed herein. The organization must be independent of the supplier, manufacturer, and installer of the equipment. The organization must be a First Tier Contractor.

The organization must have been regularly engaged in the testing of electrical materials, devices, installations, and systems for a minimum of 5 years. The organization must have a calibration program, and test instruments used to be calibrated in accordance with NETA ATS.
1.6.8 Permitting
The [Owner][Contractor] is responsible for obtaining all necessary development permits and regulatory and utility service provider approvals prior to construction.

The [Owner][Contractor] is responsible for obtaining all necessary electrical and building permits and inspections.

1.6.9 Training
Provide training by a factory trained instructor to provide full instructions to designated Government personnel in the operation, maintenance and programming of the specified systems and equipment. Include safety training for first responders including fire department[, ][][][] and [][][] representatives.

Submit Training documentation along with the proposed training date[s], at least [14][] days prior to date[s] of proposed training course. Provide training session for [six][] personnel specifically oriented to installed equipment, system layout, and user operations.

1.7 DELIVERY, STORAGE, AND HANDLING
Store solar PV panel modules in the original packaging according to the manufacturer's guidance, and remain in packaging until day of installation. If a solar PV module is removed from its packaging, store according to the manufacturer's guidance. Do not store solar PV panel modules on-site for more than [12][] months.

1.8 WARRANTY
Warrant the overall system for both parts and labor for a minimum period of [5][] years. Provide the following component specific warranties:

a. Photovoltaic Modules: Minimum warranty period of 25-year for linear minimum output and 10-years for workmanship, material, visual, and manufacturing defects from the date of manufacture followed by an additional fifteen (15) years at not more than 20 percent power loss.

b. Ground Mounting Structure: Mounting structure system hardware to be free from defects in the material and workmanship for a minimum period of [10][] years.

c. Combiner Boxes: Combiner boxes to be free from defects in material and workmanship for a period of [5][] years.

d. Inverters: Inverters to be from defects in material and workmanship for a minimum period of [20][] years.

Provide a list of all applicable warranties for all equipment and components. Include warranty information, names, addresses, telephone numbers, and procedures for filing a claim and obtaining warranty services.

1.8.1 Inverter Software Upgrades
Provide and install, at no cost or charge, any inverter software upgrades that become available during the warranty period.
1.8.2 Warranty Exclusions

The warranty must cover all system malfunctions and failures except those resulting from misuse, abuse, neglect, fire, vandalism, acts of nature, or other causes beyond the control of the Contractor or manufacturer.

1.9 CERTIFICATIONS

Provide Seismic Certification and Wind Certification, prepared by a licensed professional engineer or National Recognized Testing Laboratory, (NRTL) for all components and assembled systems in accordance with ICC IBC, ASCE 7-10 state and local building codes. Seismic and wind certifications must demonstrate system will withstand wind and seismic requirements as installed and remain online and functional after a seismic or wind event.

1.10 HEALTH AND SAFETY REQUIREMENTS

Section 01 35 26, GOVERNMENTAL SAFETY REQUIREMENTS applies to this section with additions and modifications specified herein.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide utility scale solar PV system feeding AC power to utility grid in accordance with IEEE 1547 and local utility regulations. The PV system must comply with these specifications, all applicable codes and standards, all construction documents, and all local authorities having jurisdiction.

Installation must consist of either a fixed-axis, single- or dual-axis utility scale-ground mount system. Tracking requirements must comply with local siting requirements regarding reflectivity restrictions and airspace safety requirements. Support structures must either be individual modules or where applicable, groups of panels configured for shade structures. Provide all necessary accessories for a complete, secure, and operational solar PV system. Commercial-grade and residential-grade rooftop systems are excluded from this UFGS.

2.1.1 System Requirements

2.1.1.1 System Characteristics

The system characteristics include [_____] minimum rated [kW][MW] DC output, [_____] minimum [kWh][MWh] AC per year, [_____] system voltage, and [fixed axis][tracking [one-][two-]axis] ground-mounted at full load rated power [1][_____] percent mean ambient summer operating temperature. Rate all electrical equipment for the current and voltage ratings appropriate for the application.

The system must be rated for outdoor installation. Provide system equipment capable of operating under the location's maximum and minimum documented temperatures during summer and winter times. The entire system must be rated and warranted to withstand and operate under these conditions.

2.1.1.2 Capacity Ratings

Specify rated PV system capacity in direct current (DC) [kilo][mega]watts peak under both Standard Test Conditions (STC) and Photovoltaics for
Utility Scale Applications (PVUSA) Test Conditions (PTC) ratings.

a. The STC rating assumes direct current referred as "[k][M]Wdc-STC". It is also referred as [kilo][mega]watts peak, or "[k][M]Wp". Specific PV module manufacturer maximum and minimum power data must be specified for this rating. The STC rating is based on 1,000 watts/m² solar irradiance, 25 degrees C cell temperature, air mass equal to 1.5, and ASTM G173 standard spectrum.

b. The PTC rating is based on 1,000 watts/m² solar irradiance, 20 degrees C ambient temperature and 1 meter/second wind speed at 10 meters above ground level.

2.1.1.3 System Wiring

NOTE: The possible exposure to a corrosive environment should be carefully examined. Even when the correct conductor size and the selected joining (connecting) method have satisfied all the IEEE 837 test requirements, it may be prudent to choose a larger conductor size to compensate for some gradual reduction in the conductor cross section during the design life of the installation where the soil environment tends to promote corrosion. Coordinate soil environment with Geotechnical Engineer.

System wiring [must conform to Section [_____] and ]must be in accordance with Section 690 of NFPA 70. The conductors used must have a temperature rating of [90][_____] degrees C or higher and be sized according to the appropriate DC or AC voltage application. Cabling exposed to sunlight must be UV resistant. [All wiring must be copper conductor if Navy eventually takes ownership of system.]

[Provide conduits in accordance with Section [____]. ]Use galvanized rigid steel conduit above grade and mount on UV resistant high-density polyethylene (HDPE) supports. Conduit below grade must be Schedule 40 PVC, minimum.

2.1.1.4 Site Design

Provide adequate space for personnel, vehicles and equipment throughout the PV array to facilitate installation, inspection and maintenance access to all modules.

2.2 PHOTOVOLTAIC MODULES

NOTE: Include in this section specifying CEC information and requirements for projects abiding by California Energy Commission.

Utilize PV modules with [crystalline silicon][ribbon sheet][thin film] technology and conform to Section 26 31 00 FACILITY-SCALE SOLAR PHOTOVOLTAIC (PV) SYSTEMS. Include bypass diodes with each PV module installed in the module junction box.
2.2.1 Compliance

The PV modules must comply with the Buy American Act and must be listed on the California Energy Commission's PTC list and must qualify for eligibility under the California Solar Initiative (CSI) Program. The system must comply with IEC 61215 or IEC 61646.

2.2.2 Electrical Characteristics

Provide high-power type PV module(s), with typical peak power of not less than [315] watts, +/- [3] percent power tolerance, under Standard Test Conditions (STC). The AC output must not be less than [80] percent of the DC kWp rating. The individual current harmonics and TRD are not to exceed the limits specified in IEEE 1547.

The operating voltage corresponding to the power output mentioned above should be at least [54] volts. The open circuit voltage of the PV modules under STC should be at least [64] volts. Operate PV module at an ambient temperature range of [minus 40] degrees C to [plus 85] degrees F with [100] percent relative humidity.

2.2.3 Terminal Box

Include a terminal box on the module having a provision for opening for replacing the cable, if required.

2.2.4 Nameplate

Include the following on the module nameplate so as to be clearly visible:

a. Name of the Manufacturer or distinctive logo;

b. Model or Type Number;

c. Serial Number;

d. Year of make;

e. Peak wattage rating;

f. Peak voltage; and

g. Peak current.

2.3 INVERTERS

Provide solid state type inverter unit capable of accepting the output of the photovoltaic panels and providing rated output as indicated. Provide the inverter with monopole, negative grounded, and positive grounded array configuration capabilities.

2.3.1 Listings

Provide inverter listed on the California Energy Commission’s PTC list and must qualify for eligibility under the CSI Program. The inverter must be UL 1741 listed and conform to IEEE 1547A and NFPA 70 standards.
2.3.2 Ratings

Rate the inverter's output as [250][500][___] kW, [600][1,000][___] Vdc, 3 phase, [320-600][420-850][___] maximum power point tracking (MPPT) voltage range. The peak inverter power conversion efficiency must be [95][97][___] percent or greater.

Operate inverter at an ambient temperature range of [minus 20][___] degrees C [minus 4][___] degrees F to [plus 50][___] degrees C [plus 122][___] degrees F with [95][___] percent humidity (non-condensing).

2.3.3 Safeties and Protection

Equip each inverter with the following safeties and Protection:

a. DC input disconnect;
b. Surge protection;
c. Ground fault interrupter;
d. Isolation transformer;
e. AC output disconnect; and
f. Data Monitoring Equipment/System.

The inverter must be able to sustain an overload across its output terminals up the [150][___] percent load, while supplying any load within its rating and without reducing its output voltage. Fuse power semiconductors in the inverter with fast acting fuses to prevent cascading failures. Provide each fuse with a blown fuse and alarm indicating diodes on the control panel.

2.3.4 Features

Include each inverter with the following:

a. Automatic operation including start-up, shutdown, self-diagnosis, and fault detection;
b. Digital Signal Processor (DSP) based controls with self-diagnostics and [remote][local] display of operating status;
c. Over- and under-voltage and frequency protection, shutting down the inverter in compliance with UL 1741; and
d. Anti-islanding protection to prevent back-feeding inverter generated power to the grid in the event of a utility outage.

Provide inverter in [floor-mount][wall-mount][support structure mount], NEMA [1][3R][4][4X][6][6P], [steel][aluminum][stainless steel][polymeric] enclosure in accordance with NEMA 250.

2.4 COMBINER BOXES

Provide combiner box[es] in [wall-mount][pole-mount], NEMA [3R][4X][___], [steel][aluminum][stainless steel] enclosure in accordance with NEMA 250. Include in the combiner box[es] fuses and a bus to combine the outputs of
the strings. Each combiner box must be UL 1741 listed and operate at an ambient temperature range of [minus 25][_____] degrees C[minus 13][_____] degrees F to [plus 57][_____] degrees C[plus 135][_____] degrees F.

Provide combiner box capable of at least [12][_____] inputs and an input fuse rating of [15][_____] amps. Include output circuit disconnecting means listed for intended use and purpose.

Provide combiner box output terminals for paralleling two conductors for the PV positive and negative, as well as the equipment ground conductors. Run set of wires from the combiner box to the inverter. Combiner output must be compatible with inverter input.

2.5 GROUND MOUNTING STRUCTURES

Provide array ground mounting structure for PV modules that provides the designed panel tilt. The mounting system must be [ground][tracking] mounting type [, [two][four] rails][, [one][two] axis], and be [UL 2703] and [UL Subject 3703] listed.

Design all structural components in a manner commensurate with attaining a minimum [30][_____] year design life. Array mounting hardware must be compatible with the site considerations and environment. Aluminum and stainless steel components and hardware are preferred.

2.5.1 Wind and Seismic Ratings

The mounting system and overall installation must be capable to withstand winds of Category [1][2][3][4] or [5] as defined by the Saffir-Simpson Hurrican Wind Scale for all attachment points and consistent with the manufacturer's installation instructions. Provide wind certifications for all components and assemblies.

All structures and structural elements must be suitable for Seismic Design Category [_____] in accordance with UFC 3-301-01, ICC IBC, ASCE 7-10, and all other applicable building codes and standards pertaining to the erection of such structures.

2.6 CAST-IN-PLACE CONCRETE

Provide concrete foundations for ground mounting structural members as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE and in accordance with manufacturer's recommendations.

Provide mounting assembly and connections where system is to be installed on a concrete structure.

2.7 METERING AND POWER MONITORING

Provide and install a revenue grade alternating current (AC) Interval Data Recording (IDR) meter, located on the output side of the inverter, complete with industry standard telemetry for communications with Ethernet, cellular or other common output capabilities. Meter must conform to the Owner's[, Navy's,] and Electrical Company metering requirements. [If the power is tied into the Navy's internal electrical grid, then advanced metering infrastructure (AMI) meters are to be installed. Provide new AMI meters that are compatible with installation's current AMI system.]
2.7.1 Meter Characteristics

The meter must be UL listed and have an operating temperature range of [minus 20][_____] degrees C [minus 4][_____] degrees F to [plus 70][_____] degrees C [plus 158][_____] degrees F with a humidity range of [95][_____] percent relative humidity (RH) non-condensing. Provide the meter conforming to ANSI C12.1.

Provide meter capable of measuring kWh, Demand, Instantaneous power, volts, amps, watts, VAR and VA per phase.

2.7.2 Power Monitoring System

[Provide and connect][Connect] meter to a power monitoring/data collection system recording solar production through Time of Use (TOU) increments applicable to the installation and utility standards, with a minimum [15][_____] minute intervals and [30][_____] day memory.

2.8 POSTED OPERATING INSTRUCTIONS

Provide posted operating instructions for solar PV system equipment laminated between thermoplastic sheets. After operating instructions are approved, install where directed.

2.9 MANUFACTURER'S NAMEPLATE

Provide on each equipment item, including PV panels, a nameplate bearing all manufacturer's information securely affixed in a conspicuous place. Nameplates exposed to weather are to be ASTM A240/A240M Type 316 stainless steel with stamped engraving.

2.10 FIELD FABRICATED NAMEPLATES

**************************************************************************
NOTE: Use of the following paragraph where nameplates are fabricated to identify specific equipment designated on drawings.
**************************************************************************

Provide field fabricated nameplates in accordance with ASTM D709 as specified or as indicated on the drawings. Minimum size of nameplates is 25 by 65 mm 1 by 2.5 inches. Lettering is a minimum of 6.35 mm 0.25 inch high normal block style.

2.11 WARNING SIGNS

Provide clearly visible warning signs for arc flash protection in accordance with UFC 3-501-01 and NFPA 70E for all electrical equipment and components that are required to examine, adjust, service, or maintain while energized.

2.12 CABLE TAGS IN MANHOLES, HANDHOLES, AND VAULTS

Provide machine printed polyethylene cable tags for each cable entering or leaving manholes, handholes, and vaults. Do not provide handwritten tags.

2.13 GROUNDING AND BONDING

NFPA 70, IEEE 80, IEEE 142, IEEE 242, and IEEE C2, except that grounds and...
grounding systems must have a resistance to solid earth ground not exceeding 5 ohms.

2.13.1 Ground Rods

Provide ground rods made of [copper-clad steel] [solid copper] conforming to conform to UL 467 with minimum diameter of [19][_____] mm/[3/4][_____] in and length of [3][_____] m/[10][_____] ft.

2.13.2 Ground Plates

Provide grounding plates made of [copper-clad steel][iron][stainless steel] [solid copper] conforming to UL 96.

2.13.3 Ground and Bonding Conductors

Equipment grounding conductors must be insulated stranded copper, except that sizes No. 10 AWG and smaller must be solid copper. Insulation color must be continuous green for all equipment grounding conductors, except that wire sizes No. 4 AWG and larger must be identified per NFPA 70 NEC.

Bonding conductors must be bare stranded copper, except that sizes No. 10 AWG and smaller must be bare solid copper. Bonding conductors must be stranded for final connection to motors, transformers, and vibrating equipment.

2.13.4 Ground Connections

Below Grade and Inaccessible Locations: Exothermic-welded type connectors.

Above Grade:

a. Bonding Jumpers: Listed for use with aluminum and copper conductors. For wire sizes No. 8 AWG and larger, use compression-type connectors. For wire sizes smaller than No. 8 AWG, use mechanical type lugs. Connectors or lugs must use [zinc-plated][cadmium-plated] steel bolts, nuts, and washers. Bolts must be torqued to the values recommended by the manufacturer.

b. Connection to Building Steel: Exothermic-welded type connectors.

c. Connection to Grounding Bus Bars: Listed for use with aluminum and copper conductors. Use mechanical type lugs, with [zinc-plated][cadmium-plated]/ steel bolts, nuts, and washers. Bolts must be torqued to the values recommended by the manufacturer.

2.14 Lightning Protection System

Provide Lightning Protection System and components in accordance with Section 26 41 00 LIGHTNING PROTECTION SYSTEM.

PART 3 EXECUTION

**************************************************************************

SECTION 48 14 00 Page 20
NOTE: Use and coordinate paint and coating requirements with Section 09 90 00, PAINTS AND COATINGS when provided in the job. Use the second bracketed option when Section 09 90 00 is not provided or when requirements are beyond what is specified in Section 09 90 00.

3.1 INSTALLATION

3.1.1 Site Preparation

Prepare the site for system installation by removing vegetation, grading for adequate drainage and avoid standing water on site, and excavating and compacting foundations for individual module installation. Provide access roads, pathways, fencing and other improvements as necessary for site access and security. Provide vegetation barrier to keep surrounding area free from array-shading vegetation as required.

Provide walking and vehicle space throughout the PV array to facilitate installation, inspection, and maintenance access to all modules in accordance with NFPA 70 and IEEE C2. Maintain a minimum ground clearance of [3][__] m[10][__] ft 3 m around arrays. Maintain a minimum ground clearance of [1][__] m/[3][__] ft below arrays for all site-specific conditions including possible array-shading vegetation, ground/vegetation maintenance, and/or array-shading snowfall.

3.1.2 Equipment Installation

Install all equipment and all required wiring for a complete and operational system. Follow manufacturer's guidelines for the installation of the array components, including mounting hardware and PV modules. Provide required conductor terminations to devices for a complete system to function as specified and indicated. Complete installation must comply with all local building codes, manufacturer's instructions, and applicable industry standards.

3.1.3 Conductor Installation

Furnish and install conductors required to connect incoming and outgoing circuits. Install conductors with conduits, boxes, and terminal cabinets in a totally enclosed installation. Install buried cable per Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Comply with IEEE 1547 for interconnection with utility providers. Color-code all conductors per Section 26 05 19.00 10, INSULATED WIRE AND CABLE and as recommended by the equipment manufacturer.

Rate all enclosures for electrical connections and interconnections for [NEMA 6 in accordance with NEMA 250] or [IP67 in accordance with ANSI IEC 60529].

3.2 GROUNDING

Ensure PV system grounding installation is in accordance with NFPA 70 and IEEE C2.

3.2.1 Grounding Electrodes

Provide ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL
DISTRIBUTION. Connect grounding conductors to ground rods by exothermic weld or compression connector.

3.3 FOUNDATIONS OF EQUIPMENT AND ASSEMBLIES

[Conduct soil borings and provide recommended foundation design by a licensed geotechnical engineer.] [Design foundation in accordance with foundation design recommendations.] Construct equipment foundations.

3.3.1 Ground Mounted Structures

Provide reinforced concrete foundations for ground mounted structures. Provide 4" reinforced concrete housekeeping pads for electrical equipment other than PV structures.

Provide excavating and backfilling in accordance with Section 31 00 00 EARTHWORK. Perform concrete work in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Coordinate provision of utility warning and identification tape with backfill operation. Provide tapes above buried lines at a depth of 8 to 12 inches below finish grade.

3.4 FIELD APPLIED PAINTING

Apply field painting as specified in Section 09 90 00 PAINTS AND COATINGS.

3.5 FIELD FABRICATED NAMEPLATE MOUNTING

Provide equipment nameplates as indicated.

3.6 WARNING SIGN MOUNTING

Provide the number of warning signs required to be readable from each accessible side. Locate and space signs in accordance with NFPA 70E.

3.7 CABLE TAG INSTALLATION

Install cable tags in manholes, handholes, and vaults as specified, including each splice. Locate tags over any fireproofing, if any, and clearly visible on cabling without disturbance in manholes, handholes, and vaults.

Identify and label all cables per NFPA 70.

3.8 [FACTORY SYSTEM TESTING]

[Provide testing of the complete system in accordance with IEEE 1547.1A. IEEE 1547 allows for type testing to be performed on complete systems, multifunction relays, discrete devices, or any combination. If type testing is performed on anything other than a fully integrated system, some of the component times may not be available. In these cases, production and/or commissioning tests must be conducted to fully demonstrate the ability of the complete system to comply with the timing required by IEEE 1547.]

3.9 FIELD QUALITY CONTROL

3.9.1 Manufacturer's Field Service

Provide the services of factory trained and approved field service engineer during system installation, testing and commissioning.
3.10 COMMISSIONING

**************************************************************************
NOTE: Sections 01 91 00.15 BUILDING COMMISSIONING, are intended for building systems, however, the basic requirements are applicable to PV commissioning processes. Section 01 91 00.15 will need to be tailored for PV systems when compiling project specifications.
**************************************************************************

Conduct Commissioning, after the system is installed and is ready for operation, in accordance with Section 01 91 00.15 BUILDING COMMISSIONING, item (6) renewable energy generation, to verify that the completed and installed system meets the requirements of IEEE 1547. Tailor for non-building systems.

3.10.1 Commissioning Agent Qualification

Individual qualified in testing protective equipment (e.g., professional engineer, factory-certified technician, licensed electrician with experience in testing protective equipment) must perform or directly supervise commissioning tests.

3.10.2 Commissioning Plan and Schedule

Develop and implement a commissioning plan and commissioning schedule in accordance with Section 01 91 00.15 BUILDING COMMISSIONING.

3.10.3 Start-up Pre-functional Checklists

Carry out a checklist of startup requirements and conduct a series of safety tests to ensure proper installation, safe operation, and performance conforming to specification.

3.10.4 Functional Performance Testing

Prepare test procedures and conduct functional performance testing of the installed system. Include the following test requirements:

a. All inverter startup tests as specified by the inverter manufacturer in the inverter operation manual;

b. Actual power;

c. Loss of grid;

d. Grid resume;

e. Data monitoring check out;

f. \( V_{oc} \) measurement of every source circuit and log it;

g. Verify tightness of all wiring terminations;

h. Verify proper markings and labeling of all wire terminations and enclosures;
i. Verify startup/shut down procedures;

j. Verify system [5][_____] minutes delay upon restart;

k. Verify PV array quick connectors are fully mated and wires are neatly secured;

l. Verify no debris on the modules, no damaged or broken modules;

m. Verification and inspections (see IEEE 1547.1 7.2)

n. Field-conducted type and production tests (see IEEE 1547 7.3))

o. Unintentional islanding functionality test (see IEEE 1547.1)

p. Cease-to-energize functionality test (see IEEE 1547.1)

q. Unintentional islanding functionality test (see IEEE 1547.1)

q. Cease-to-energize functionality test (see IEEE 1547.1 7.5)

r. Revised settings (see IEEE 1547.1 7.6)

3.10.5 Functional Performance Testing Results

Coordinate, observe and record the results of the functional performance testing. Coordinate retesting as necessary until satisfactory performance is verified. Verify the intended operation of individual components and system interactions under various conditions and modes of operation.

Document items of non-compliance in materials, installation or operation. Immediately address observed non-conformance and deficiencies in terms of notification to responsible parties, and provide recommended actions to correct deficiencies.

3.10.6 Final Commissioning Report

Prepare and submit final commissioning report. Summarize all of the tasks, findings, conclusions, and recommendations of the commissioning process in accordance with IEC 62446. Include the results of all tests and a listing of the final settings.

3.11 FINAL ACCEPTANCE

The acceptance of the solar PV system occurs only after all deficiencies identified by the functional acceptance tests and commissioning report are corrected[, and the system operates successfully during a [30][_____] day initial testing period].

The Contracting Officer must sign appropriate certificates, if equipment and systems are operating satisfactorily in accordance with the specifications, stating the system's operation has been tested and accepted at the end of the final start-up and testing.

3.12 CLOSEOUT ACTIVITIES

3.12.1 Demonstration

Demonstrate, upon completion of functional acceptance tests, that all
circuits and devices are in proper operating condition and performing as intended.

3.12.2 Training

Furnish training service by a factory-trained representative for a period of \[5\][___] calendar days. Document that each qualified employee has received the required training in accordance with 29 CFR 1910. Maintain all training documentation in a central location for the entire employee's employment duration. Minimum documentation data includes employee's name, training name, and date(s) of training.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for medium-temperature (38-82 degrees C 100-180 degrees F), liquid-flat-plate or evacuated tube collector loop systems, heat storage tanks, pumps, controls and related equipment and materials.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Applications of the solar systems may be domestic hot water, space heating, swimming pool heating, process fluid heating, spa water heating, air conditioning for solar cooling and heating, agricultural process heating, or other commercial and industrial uses.

NOTE: The following information shall be shown on the project drawings:

1. Control equipment operation matrix.
2. Control operations sequence.

3. Details of soft-drawn copper-tubing connectors to top and bottom headers of solar-collector panel.

4. System diagram.

5. Panel array layout and locations.

6. System equipment locations.

7. Equipment piping details.

8. Mounting details.

9. Schedules in accordance with UFC 3-400-01, "Renewable Energy Systems - Facility".

PART 1  GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section with additions and modifications specified herein.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

SECTION 48 14 13.00 20 Page 9
Solar Energy Systems; G[, [_____]]

Include collector structural supports, solar collector control sequences, and instrument mounting and interconnections.

SD-03 Product Data

Piping; G[, [_____]]

Instrumentation; G[, [_____]]

Valves; G[, [_____]]

Piping Specialties; G[, [_____]]

Pumps; G[, [_____]]

Solar Storage Tanks; G[, [_____]]

Solar Collectors; G[, [_____]]

For the selected collectors, include test results per ASHRAE 93.

Heat Exchangers; G[, [_____]]

Compression Tanks; G[, [_____]]

Solar-Boosted Domestic Water Heaters; G[, [_____]]

Collector Heat Transfer Fluid; G[, [_____]]

Insulation Around Piping and Storage Tanks; G[, [_____]]

For each pump, include manufacturer's data including pump speed and characteristic impeller performance curves. Indicate capacity versus head, efficiency, and brake power for the full range from shut-off to free delivery.

SD-06 Test Reports

**************************************************************************
NOTE: Underground tanks are not a recommended method for thermal storage. A design with thermal storage within a building is more ideal for efficiency.
**************************************************************************

[ Underground Solar Storage Tanks Holiday Test; G[, [_____]]

Submit a factory holiday test certificate for each tank.]

SD-07 Certificates

Solar Energy System Installation; G[, [_____]]

Submit technical representative's certification that the solar energy system installation has been done as recommended by the manufacturer.
1.4 QUALITY ASSURANCE

For brazing and soldering procedure qualification, conform to ASME B31.1; for preparation and procedures for joints, conform to ASME B31.1 and CDA A4015.

1.4.1 Operation and Maintenance Data

Submit Solar Energy Systems data package for the following items in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

a. Troubleshooting guide for solar energy systems
b. Solar collector warranty
c. Operation instructions
d. Preventive maintenance and inspection data, including a schedule for system operators.
e. Project drawings.

1.5 SOLAR COLLECTOR WARRANTY

NOTE: Warranties on Navy construction: Warranties for equipment, materials, or design furnished, or workmanship performed by the Contractor or any subcontractor or supplier, has a duration of one year from the date of final acceptance of the work. An exception is in normal commercial practice longer warranty period for particular construction are given.

A warranty duration of longer than a year, and not covered normally by the industry, requires a Level III Contracting Officer's written determination documenting that the extra warranty protection is needed.

The warranty clause for solar collectors in this guide specification has been approved by NAVFACENGCOM HQ in accordance with the requirements of the Naval Facilities Acquisition Supplement (NFAS). NFAS can be found at the following link:
This clause may be used without any HQ approval or request for waiver.

Furnish ten year manufacturer's warranty against defects in materials and workmanship.

### 1.6 POSTED OPERATING INSTRUCTIONS

Provide for piping identification codes and diagrams of solar energy systems, operating instructions, control matrix, and troubleshooting instructions.

### 1.7 HEALTH AND SAFETY RECOMMENDATIONS

Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS, applies to this section with additions and modifications specified herein.

### PART 2 PRODUCTS

#### 2.1 SOLAR ENERGY SYSTEMS

NOTE: SRCC OG-300 applies to residential and light commercial systems of 119 gallons or less. SRCC OG-100 applies to the collectors only.

[SRC OG-300 listed] [SRCC OG-100 Collector certification], and provide necessary materials to fabricate solar energy systems in accordance with this section. At the Contractor's option, provide factory-prefabricated solar equipment packages which include heat exchanger, compression and storage tanks, pumps and controls and which meet the requirements of this section or are certified by an ANSI-accredited certification body to SRCC STD 300 or other applicable ANSI standard.

#### 2.2 PIPING

##### 2.2.1 Copper Pipe

ASTM B88M ASTM B88, minimum Type L, hard drawn copper tubing, except that the connection tubes of collectors may be soft-drawn.

##### 2.2.2 Bronze Flanges and Flanged Fittings

##### 2.2.3 Solder-Joint Fittings

ASME B16.22, wrought copper.

##### 2.2.4 Unions

##### 2.2.5 Dielectric Union

Provide insulated union with a galvanized steel female pipe-threaded end
and a copper solder joint end conforming to ASME B16.39, Class 1. Provide a dry insulation barrier, impervious to water and capable of withstanding a 600 volt breakdown test and limiting galvanic current to one percent of the short circuit current in a corresponding bimetallic joint.

2.2.6 Expansion Joints

2.2.6.1 Bellow Expansion Joints

**************************************************************************
NOTE: In corrosive atmospheric conditions such as oceanic air, use only nickel-chromium-iron alloy bellows.
**************************************************************************

Corrugated, [unreinforced] [or] [with [reinforcing] [or] [equalizing] rings], and [single-bellow] [double-bellow] expansion joints. Construct bellows of [copper alloy] [nickel-chromium-iron alloy, conforming to ASTM B168] [or] [stainless steel].

2.2.6.2 Guided Slip-Tube Expansion Joints

[Ring packing with seal to allow repacking under pressure][Permanent packless seal], [internally][internally and externally] guided, and [single][double] slip-tube. Provide drain port in the housing. [For packless seal, provide a Type 304 or 321 stainless steel bellows with laminated or multi-ply construction.]

2.3 VALVES

[Provide end connections as indicated.] Valves shall open when turned counterclockwise.

2.3.1 Gate Valves

MSS SP-80, bronze, Class 150; [Type 1, solid wedge non-rising stem] [or] [Type 2, solid wedge, inside screw rising stem]; with solder, threaded, or flanged ends.

2.3.2 Globe and Angle Valves

MSS SP-80, bronze, Class 150; [Type 1, metal disc integral seat] [or] [Type 2, non-metallic disc, integral seat]; with solder, threaded, or flanged ends.

2.3.3 Ball Valves

MSS SP-72 for flanged or butt-welding ends or MSS SP-110 for threaded, socket-welding, solder joint, grooved and flanged ends.

2.3.4 Balancing Cocks, Flow Rate Control and Meter

Bronze, solder, threaded, or flanged ends. Provide square head, flow indicator arc or check pressure ports for differential flow metering device. Provide valve construction with rating of 116 degrees C at 862 kPa 240 degrees F at 125 psi.
2.3.5 Check Valves

**************************************************************************
NOTE: When thermal siphon is a problem, such as an active flow indicator during nighttime or poor system performance, use only spring-loaded check valves with elastomer seals.
**************************************************************************

MSS SP-80, bronze, Class 150; [Type 3, swing check, metal disc to metal seat] [or] [Type 4, swing check, non-metallic disc to metal seat]. [Provide spring-loaded construction with elastomer seals.]

2.3.6 Water Pressure-Reducing Valves

ASSE 1003 with ASSE seal, self contained, direct acting, and single seat diaphragm.

2.3.7 Control Valves

UL listed. Provide valves actuated by electric motors. Construct valves to permit replacing valve seals without draining the system. Provide bronze body construction and stainless steel valve stems, with rating of 4 to 166 degrees C at 862 kPa 40 to 240 degrees F at 125 psi. Include external position indicators and steel enclosures to protect operating components.

2.3.7.1 Shutoff and Diverting Control Valves

Bronze valves with 100 percent shutoff, stainless steel butterfly or ball, and elastomer seats and seals.

2.3.7.2 Non-Shutoff Mixing Valves

ASSE 1017, MSS SP-25 marking modulating, [bronze] [or] [brass] body construction, stainless steel valve stems, and thermostatically controlled.

2.3.7.3 Valve Operators

Provide electric [two-position] [or] [proportioning] operators, with oil-immersed gear trains. Two-position operators may be single-direction with [spring-return] [or] [reversing] construction. [For [reversing] [and] [proportioning] operators, provide limit switches to limit the lever in either direction unless the operator is the stalling type.] Operators shall function properly with a 10 percent plus or minus change in the line voltage feeding the equipment. Totally enclose operators and gear trains in dustproof housings of pressed steel or metal castings with rigid conduit connections. Equip valve operators with a spring yield device so that when in the closed position it will maintain on the valve disc a pressure equivalent to the pressure rating of the valve.

2.3.8 Air Vents and Relief Valves

2.3.8.1 Air Vents

CID A-A-60001, float construction for pressures up to 862 kPa 125 psi.
2.3.8.2 Relief Valves

ASME labeled valves with a relief setting 200 percent higher than the normal operating pressure. Provide nonferrous or stainless steel valve seats and moving parts exposed to fluid, compatible with the operating conditions.

2.4 PIPING SPECIALTIES

2.4.1 Bolts and Nuts

Stainless steel; ASTM A193/A193M for bolts and ASTM A194/A194M for nuts.

2.4.2 Gaskets

******************************************************************************
NOTE: For cold weather region of below minus 10 degrees C 14 degrees F, consider gaskets made of rubber in accordance with ASTM D3667 (for flat plate solar collectors) or ASTM D3832 (for evacuated tube solar collectors), Type C.
******************************************************************************

[Fluorinated elastomers, ethylene-propylene-diene-terpolymer (EPDM) or silicone][ASTM D3667, Type C rubber][ASTM D3832, Type C rubber], compatible with flange faces.

2.4.3 Brazing Metal

AWS A5.8/A5.8M, 15 percent silver-base alloy, minimum melting point 816 degrees C 1,500 degrees F, for copper pipes rated at maximum 862 kPa and 177 degrees C 350 degrees F. Provide cadmium free filler metals.

2.4.4 Solder Metal

ASTM B32, Alloy Grade Sb5, Sn95, or Sn96, with minimum melting 221 degrees C 430 degrees F.

2.4.5 Strainers

Class 125; Style Y pattern; threaded or soldered ends, for 50 mm 2 inches and smaller; and flanged ends in accordance with ASME B16.1, for 65 mm 2 1/2 inches and larger.

2.4.6 Piping Identification Labels

Plastic slip-on or adhesive backed labels conforming to ASME A13.1.

2.4.7 Hangers and Supports

MSS SP-58, as required by MSS SP-69.

2.5 [BOOSTER] [AND] [CIRCULATING] PUMPS

******************************************************************************
NOTE: If silicone based fluids are used, rotary pumps should be used to avoid seepage problems.
******************************************************************************
[Section 23 21 23 HYDRONIC PUMPS, centrifugal] [CID A-A-50561, rotary]; pump styles as indicated. Provide flanged inlets and outlets, mechanical seals, flexible couplings, and electronically commutated motors (ECM). Select pumps to operate not more than 5 percent below and on the shut-off side of the maximum efficiency point of the impeller curve. Provide bronze or cast iron body construction, bronze or stainless steel fitted.

2.6 COMPRESSION TANKS

ASME BPVC SEC VIII, steel construction with ASME label for 862 kPa (gage) 125 psig working pressure. Hot-dip galvanize interior and exterior surfaces of tanks after fabrication. Provide cast iron or steel saddles or supports. Provide tanks with drain, fill, air charging and system connections, and liquid level gage.

2.7 SOLAR STORAGE TANKS

**************************************************************************

NOTE: Small mixing pumps and shrouds to enhance tube bundle heat exchanger performance in the tanks are an exception and should be used only where required. The corrosive nature of some water supplies may require copper lining. For better stratification (hot water on the top, cold water on the bottom), vertical solar tanks should be used. Up to 18,950 liters 5,000 gallon capacity, solar storage tanks may be unpressurized, internally stainless-steel-lined, factory insulated, and covered with enamel steel outer jackets for indoor applications or fiberglass jackets for outer and underground applications. Solar storage tanks, if intended for an usable life in excess of 5 years, should not be pressurized. Unpressurized stainless steel tanks should last in excess of 20 years; other unpressurized tanks should last up to 15 years; pressurized steel tanks with copper heat exchangers may last only 3 to 8 years, due to galvanic corrosion. Recommend 122 liters 3 gallons of storage capacity for each square meter foot of collector surface facing the sun.

**************************************************************************

Except as modified herein, FS F-T-2907; [stone lined (cement lined)] [glass lined] [stainless steel] [Type 18-8 stainless steel lined] [or] [baked-on phenolic] steel tank with ASME label for [862 kPa (gage)] [125 psig] [____]. Do not use baffles or perforated pipes in tank construction. For the steel tank, include [collector loop heat-exchanger bundle] [and] [domestic hot water] [and] [space heating] heat-exchanger bundle.

2.7.1 Underground Tanks

UL listed, [double-walled,] fiberglass coated steel tanks. Provide exterior surfaces of steel tanks with a glass reinforced isophthalic polyester resin of sufficient thickness to resist 35,000-volt Holiday test. Provide automatic monitoring system with audible alarms to continuously monitor leaks.
2.7.2 Tank Insulations and Jackets

Comply with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Separate aboveground tanks from supports with insulation.

2.8 HEAT EXCHANGERS

**************************************************************************

NOTE: Where potable fluids are not used, double wall and vented construction provides fail-safe leak detection without attendance by any operator. If the operator is not present, sound alarms may not be heard, and visual indicators may not be observed in some cases. For many years, industrial applications commonly use shell-and-tube or tube-in-tube heat exchangers. In recent years, some industrial applications use plate-and-frame heat exchangers as options. Plate-and-frame construction requires much less space, i.e., from one tenth to one half of the space required by shell-and-tube construction. Plate-and-frame heat exchangers generally have high heat transfer rates. Electropolished stainless steel plates may be specified to minimize fouling. Titanium or nickel-brazed stainless steel heat exchangers should be used in spas due to high temperature water and high chlorination.

**************************************************************************

ASME BPVC SEC VIII, construction with ASME label for 1034 kPa (gage) 150 psig working pressure and 2068 kPa (gage) 300 psig factory-rating pressure. [Provide automatic monitoring system with audible alarms to continuously monitor leaks.] [Provide relief vent with a visual indicator to detect leaks by the change of coloring in the heat transfer fluid.]

2.8.1 Plate-and-Frame Construction

[Stainless steel] [or] [monel] plates and carbon steel frames, with baked epoxy-enamel, and shroud. Provide stainless steel side bolts and nozzles. Provide one piece molded [nitrile rubber] [ethylene-propylene rubber viton] [neoprene] [or] [butyl] gaskets. Fabricate heat exchangers with design results of heat transfer coefficients greater than 5680 watt per square meter degree C 1,000 Btu per square foot per hour per degree F.

2.8.2 [Shell and Tube] [or] [Tube in Tube] Construction

[Double wall vented], [straight tube] [or] ["U" tube] [as indicated]. Low temperature water [mixture] shall pass through tubes. High temperature water [mixture] shall pass through shells. Fabricate tubes from [16 mm 5/8 inch] [or] [20 mm 3/4 inch] od [stainless steel] [or] [seamless No. 20 BWG cupro-nickel (90-10)]. Provide tube bundles removable through flanged openings.

2.9 SOLAR COLLECTORS

**************************************************************************

NOTE: In accordance with ASHRAE 93 and ASHRAE 96, a solar collector is "a device designed to absorb incident solar radiation and to transfer the energy to a liquid passing through it." Use the liquid
flat-plate collector for system design, including cooling applications up to 141 kW 40 tons. Use ASHRAE 93 for glazed collectors and ASHRAE 96 for unglazed collectors. The State of Florida requires all solar collectors to be certified by FSEC (Florida Solar Energy Center). If the project site is not in Florida and the state and local regulations do not prohibit FSEC certified collector, the use of FSEC collector may be considered as an option. Provide lightning protection as required by the local environment. A collector in which the internal risers and headers are in a reverse return arrangement will have uniform flow and uniform heating, but it will be too restrictive to limit only this arrangement. When inlet and outlet tubes are not located conveniently on the collector, the collector will take up additional space, resulting in more exposed roof area between the collector.

**************************************************************************

[ASHRAE 93] [ASHRAE 96] [SRCC OG-100 and SRCC CRIS listed] [or] [Florida Solar Energy Center (FSEC) certified]; liquid flat-plate collectors and evacuated tube collectors. Provide factory fabricated and assembled, [single glazed] [double glazed] [triple glazed] [or] [unglazed] panels. [Internal manifold collectors may be used if manufacturer standard.]

Include the following design features:

2.9.1 Collector Sizes

Maximum filled weight not to exceed 24.40 kg per square meter five pounds per square foot of gross collector area.

2.9.2 Minimum Performance Parameters

**************************************************************************

NOTE: In accordance with ASHRAE 93 and ASHRAE 96, instantaneous collector efficiency is "the amount of energy removed by the transfer liquid per unit of gross collector area during the specified time period divided by the total solar radiation incident on the collector per unit area (solar flux) during the same time period, under steady-state or quasi-steady-state (the state of the solar collector test when the flow rate and temperature of the liquid entering the collector are constant but the exit liquid temperature changes gradually due to the normal change in irradiation that occurs with time for clear sky conditions) conditions." Read ASHRAE 93 and ASHRAE 96 for further details and unit measurements.

**************************************************************************

Provide total collector flow rate in accordance with manufacturer's recommendations. Provide instantaneous collector efficiency as follows:
Minimum Instantaneous Collector Efficiency, Percent | Inlet Fluid Parameter
---|---
74 | 0
54 | 0.03
40 | 0.05

Determine inlet fluid parameter (IFP) in accordance with the following formula:

\[
\text{IFP} = \frac{A - B}{C}
\]

Where:

- \( A \) = Liquid inlet temperature in collector
- \( B \) = Ambient air temperature
- \( C \) = Solar flux

2.9.3 Absorber

Fabricate of [aluminum] [stainless-steel] [copper tubes on copper sheet or aluminum] [or] [copper tubes with copper or aluminum fins]. Provide the absorber rated for [1034 kPa (gage)] [150 psig] [_____] with working pressure of [862 kPa (gage)] [125 psig][______].

2.9.4 Absorber Plate Coating

Provide selective or semi-selective absorber coating with minimum absorptivity 0.90, maximum emissivity 0.12, and minimum breakdown temperature at [204 degrees C] [400 degrees F][______].

2.9.5 Collector Case

Fabricate from at least 20 gage [galvanized steel] [or] [ASTM B209MASTM B209 alloy or equivalent aluminum]. Paint collector box with durable baked enamel or powder coat. In the back of case, provide insulation with a heat transfer factor of maximum 0.57 watts per degree C per square meter 0.1 Btu per hour per degree F per square foot. Use only insulation without out-gassing or other breakdown at or under stagnation temperature, such as rigid mineral fiber panels. Fabricate cover frame and glazing channel of [galvanized sheet steel] [stainless steel] [or] [extruded aluminum]. Provide preformed gaskets of EPDM or silicone as specified.

2.9.6 Collector Cover (Glazing Material)

ASTM C1048, Kind FT, fully tempered glass; Condition A, uncoated surfaces; Type I, transparent glass; Class 1, clear; Quality q3, glazing select; [3] [5] [or] [4] mm [1/8] [3/16] [or] [5/32] inch float glass.

2.9.7 Collector Identification

On each collector, provide the following information:

- a. Manufacturer's name or trademark
- b. Model name or number
c. Certifying agency label and rating.

2.9.8 Other Components

Provide collectors for the complete removal of internal moisture which may develop in the collectors. [Collector weep holes or desiccants with air vents may be used. If desiccants are used, provide 8 mesh silica gel with approximately 10,000 cycles of regeneration.]

2.9.9 Hail Protection

Manufacturer's hail protection performance measured according to ASTM E822, or equivalent.

2.10 COLLECTOR SUPPORTS

[As indicated.] [Provide a commercial integrated structural system, supplied by a single manufacturer, consisting of formed aluminum or galvanized or plated steel channels, perforated with round or square holes, and corrosion resistant brackets, clamps, bolts and nuts.]

2.11 COLLECTOR HEAT TRANSFER FLUID

**************************************************************************
NOTE: In lieu of the collector heat transfer fluid, the use of water in a drainback concept may be acceptable. Recommend to use only non-toxic heat transfer fluid.
**************************************************************************

Conform to the following:

a. Liquid useful temperature range of [-40] to [204][_____] degrees C [400][_____] degrees F.

b. Non-ionic, high dielectric, non-aqueous, non-reactive, stable fluid which does not corrode copper, aluminum, iron, or steel, or attack plastics.

c. Flash point exceeding 193 degrees C 380 degrees F.

d. Fluid stability of five years.

e. Maximum acute oral toxicity of 5 grams per kilogram 5000 ppm.

2.12 SOLAR-BOOSTED DOMESTIC WATER HEATERS

ASHRAE 90.1 - SIASHRAE 90.1 - IP and UL listed. Provide built-in [, double wall] heat exchanger and factory insulation jacket. Non-pressurized, vented, drainback systems may use single-wall heat exchanger.

2.13 INSULATION

Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.14 INSTRUMENTATION

Use corrosion resistant materials for wetted parts of instruments.
2.14.1 Solar Controller

UL listed. Solid-state or electrical only, with overvoltage protection.

2.14.1.1 Differential Temperature Control

Factory assembled and packaged device.

2.14.1.2 High Limit Control

Provide high temperature cut-off to limit upper half of the storage tank temperature to be [71] [82] [_____] degrees C [160] [180] [_____] degrees F.

2.14.1.3 Swimming Pool Control

**************************************************************************
NOTE: Delete this paragraph if the project is not for a swimming pool.
**************************************************************************

Provide adjustable thermostatic setting to prevent pool overheating, with range from [13] [_____] to [29] [_____] degrees C [56] [_____] to [85] [_____] degrees F. Turn solar heater on when solar collectors are 2.77 degrees C 5 degrees F hotter than pool temperature. When pool temperature is above the thermostatic setting, drain water from the panels.

2.14.1.4 Controller Enclosure

NEMA 250; Weathertight rated to NEMA 4X.

2.14.2 Differential Thermostat

**************************************************************************
NOTE: Use this only in large systems, generally not residential. It is recommended that the differential thermostat be 4.40 degrees C 8 degrees F turn on and 1.70 to 2.80 degrees C 3 to 5 degrees F turn off.
**************************************************************************

Provide UL-listed differential thermostat for controlling the magnetic starter, not in the same circuit as pump motor. [For integral collector freeze protection, provide two independent contact relays [, rated ten amperes at 120 Vac].] [Provide a switch with ON, OFF, and AUTO positions.] Provide weathertight enclosures.

2.14.3 Sensors

**************************************************************************
NOTE: Delete this paragraph if solar collectors are unglazed.
**************************************************************************

Construct sensors to withstand stagnation temperatures of glazed solar collectors. Provide primary and alternate collector sensors attached to an absorber plate. Provide [copper] [brass] wells which can be inserted into the collector tube, storage tank, or [____]. Sensors may be strapped onto pipes and covered with insulation.
2.14.4 Pressure Gages

ASME B40.100, brass body, and minimum 90 mm 3 1/2 inch diameter dial face.

2.14.5 Tank Gages

CID A-A-50568; Type [I, buoyant force;] [II, diaphragm;] [or] [III, purge, bubble-pipe].

2.14.6 Thermometers

ASTM El, [liquid-in-glass type] [dial type, liquid-filled tube and bulb]. For pipe and tank applications, provide separate sockets fabricated of brass, copper, or stainless steel and rated for 862 kPa 125 psi working pressure.

2.14.7 Test Ports

Solid brass, 6 mm 1/4 inch fitting to receive either a temperature or pressure probe 3 mm 1/8 inch outside diameter, two valve cores of neoprene, fitted with color coded and marked cap with gasket, and rated for 6894 kPa (gage) 1,000 psig.

2.14.8 Monitoring System

**************************************************************************
NOTE: For small systems such as family housing, do not use monitoring system, due to high initial cost and the labor to maintain it.
**************************************************************************

a. [Solar Differential Controller with] Kilojoule Btu Meter: [Controller conforming to UL 873 with] Sensing and Monitoring device to measure and display the heat energy produced by the solar system, with minimum sensitivity of 0.5 percent over the entire scale. Provide electromechanical kJ Btu counter plus digital-panel meter indicating sensor temperatures, differential temperature, flow rate, and watt Btu per minute or hour.

b. [Water] [and] [Heat Transfer Fluid] Leak Detection: UL-listed system consisting of a sensor probe, control panel, and LED indicators for [water; yellow,] [and] [heat transfer fluid; red,] with audible alarm at minimum 75 dB sound level; reference 10 exponential minus 12 watts.

2.15 SOLAR COLLECTOR CONTROL SEQUENCES

As indicated.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Solar Collector System

**************************************************************************
NOTE: Disinfect domestic water systems, if connected with solar collector panels. Provide disinfection provisions in either Section 22 00 00
**************************************************************************
Install the solar collector system in accordance with this section and the printed instructions of the manufacturer. [Disinfect domestic water systems, if connected with collector panels, in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.] Prior to system start-up, protect collector from direct sunlight.

3.1.2 Piping Installation

Accurately cut pipe to measurements established on site and work into place without springing or forcing. Locate piping out of the way of windows, doors, openings, light fixtures, electrical conduit, equipment, and other piping. Provide for expansion and contraction. Do not bury, conceal, or insulate until piping has been inspected, and tested. Locate joints where they may be readily inspected. Provide flexibility in piping connected to equipment for thermal stresses and vibration. Support and anchor piping connected to equipment to prevent strain from thermal movement and weight from being imposed on equipment. [Provide seismic restraints in accordance with SMACNA 1981.] Install hangers and supports in accordance with MSS SP-69 and MSS SP-58, unless otherwise indicated.

3.1.2.1 Fittings

Provide long-radius ells wherever possible to reduce pressure drops. Do not bend pipes, miter pipe to form elbows, use bushings, or notch straight runs to form full-sized tees. Provide union for disconnection of valves and equipment for which a means of disconnection is not otherwise provided. Provide reducing fittings for changes of pipe size.

3.1.2.2 Measurements

Determine and establish measurements for piping at the job site and accurately cut pipe and tubing lengths accordingly. Where possible, install full pipe lengths. Do not use couplings to join random lengths.

3.1.2.3 Cleaning

Thoroughly clean interior of water piping before joining by blowing clear with either steam or compressed air. Maintain cleanliness of piping throughout installation. Provide caps or plugs on ends of cleaned piping as necessary to maintain cleanliness.

3.1.2.4 Panel Connections to Headers

Connect panels to top and bottom headers with soft-drawn long bend "S" or "U" copper tubes brazed with 15-percent silver solder. Provide tube bender only. Hand-formed tubing will not be acceptable. Install bottom headers behind the panels to protect the header insulation from abuse. For panels with internal headers, provide copper couplings and soldering.

3.1.2.5 Header Thermal Expansion and Contraction

3.1.2.6 Flanged Joints

Provide flanged joints for making flanged connections to flanged pumps and other flanged piping components. Install joints so that flanged faces bear uniformly. Engage bolts so that there is complete threading through the nuts and tighten until bolts are equally torqued.

3.1.2.7 Sleeves

Provide schedule 10 galvanized steel sleeves for pipe and tubing passing through floors, roofs, walls and partitions of either concrete or masonry construction, except that sleeves are not required for floor slabs on grade. After piping has been installed, pack oakum into the space between the pipe or tubing and the sleeve and seal both ends with insulating cement.

3.1.2.8 Flashing

[Section 07 60 00 FLASHING AND SHEET METAL.] Provide watertight flashing for pipe and tubing extending through the roof.

3.1.2.9 Escutcheons

Provide chrome plated steel escutcheons for uninsulated pipe and tubing passing through floors, walls and ceilings.

3.1.2.10 Drain Lines

Provide drain lines from air vents and relief valves to the nearest [roof drains] [floor drains] [disposal points as directed].

3.1.2.11 Insulation and Identification

Insulate piping in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. [Frostproof air vents by insulating or shielding from night sky reverse radiation.] After piping has been insulated, apply identification labels and arrows in accordance with ASME A13.1. Apply identification over the insulation jacket of piping. Provide two copies of the piping identification code framed under glass and install where directed. Where insulation shall be exposed to the exterior of a building, sunlight, or the elements, insulation shall be shielded from the elements with appropriate aluminum, stainless steel, or UV-inhibited PVC jacketing.

3.1.2.12 Excavating and Backfilling

Provide in accordance with Section 31 00 00 EARTHWORK. Coordinate provision of utility warning and identification tape with backfill operation. Provide tapes above buried lines at a depth of 200 to 300 mm 8 to 12 inches below finish grade.

3.1.3 Instrumentation

Install instruments as recommended by the control manufacturers. [For the monitoring system to detect [water] [and] [heat transfer fluid], locate the sensor probe in the lowest corner of double-wall [tank] [and] [heat exchanger].] Locate control panels [inside mechanical room] [______].

SECTION 48 14 13.00 20 Page 24
3.2 FIELD QUALITY CONTROL

3.2.1 Field Inspection

Prior to initial operation, inspect the piping system for conformance to drawings, specifications and ASME B31.1. Inspect the following information on each collector:

a. Manufacturer's name or trademark
b. Model name or number
c. Certifying agency label and rating.

3.2.2 Tests

Provide equipment and apparatus required for performing tests. Correct defects disclosed by the tests and repeat tests. Conduct testing in the presence of the [Contracting Officer] [QC Representative].

3.2.2.1 Piping Test

**************************************************************************
NOTE: Use pneumatic test if non-aqueous heat transfer fluid are used, to avoid contamination of fluids with water and to eliminate seepage problems.
**************************************************************************

[Pneumatically test new piping for leakage using air at a pressure of 138 kPa (gage) 20 psig or] [Test new water piping for leakage using water at a pressure of at least 690 kPa (gage) 100 psig or] 1.5 times the system pressure. Install a calibrated test pressure gage in the system to indicate loss in pressure occurring during the test. Apply and maintain the test pressure for one hour, during which time there shall be no evidence of leakage, as detected by a reduction in test pressure. Should a reduction occur, locate leaks, repair, and repeat the test.

3.2.2.2 Operation Tests

**************************************************************************
NOTE: Insert appropriate Section number and title in blank below using format per UFC 1-300-02.
**************************************************************************

Perform tests on mechanical systems, including pumps, controls, controlled valves, and other components in accordance with manufacturer's written recommendations. Test entire system in accordance with [Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC][_____] and ASTM E1160.

3.2.3 Manufacturer's Field Services

Furnish the services of a technical representative of the collector
manufacturer, at the job site during each phase of inspection, installation, and testing. For solar collectors, furnish the services of a manufacturer's representative to instruct Government personnel for one manday, in the operating and maintenance of equipment. Notify the Contracting Officer in writing, prior to scheduling instructions.

NOTE: This guide specification covers the requirements for wind generator systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN INSTITUTE OF STEEL CONSTRUCTION (AISC)

AMERICAN SOCIETY OF CIVIL ENGINEERS (ASCE)

AMERICAN SOCIETY OF SAFETY PROFESSIONALS (ASSP)

ASSP Z359 (2013) Fall Protection Code

AMERICAN WIND ENERGY ASSOCIATION (AWEA)

AWEA O&M RP (2013) AWEA Operations and Maintenance Recommended Practices

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

IEEE 242 (2001; Errata 2003) Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems - Buff Book

IEEE 519 (2022) Standard for Harmonic Control in Electrical Power Systems

IEEE 1547 (2018) Interconnection and Interoperability of Distributed Energy Resources with Associated Electric Power Systems Interfaces
1.2 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE 100.

Unless otherwise specified or indicated, wind turbine terms used in these specifications, and on the drawings, are as defined in IEC 61400-SER.

1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 Pre-Installation Meetings

Comply with Section 01 30 00 ADMINISTRATIVE REQUIREMENTS and hold a pre-installation meeting [no earlier than][1][2][_____] weeks prior to start of installation work.

1.3.2 Scheduling

Provide a delivery and installation schedule to the CO [no later than] [30][60][_____] days prior to start of installation work to allow internal coordination.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**NOTE**: Permits are assumed to be obtained by firm holding design responsibility. Ensure this is clarified in contract bid package.

**SD-01 Preconstruction Submittals**

Commissioning Plan; G[, [_____]]

Commissioning Schedule; G[, [_____]]

**SD-02 Shop Drawings**

**NOTE**: Submittal is for diagrams and instructions from a manufacturer or fabricator for use in producing the product and as aids to the Contractor for integrating the product or system into the project and prepared by or for the Contractor to show how multiple systems and interdisciplinary work will be coordinated.

Shop Drawings, Drawings, Schedules; G[, [_____]]

**NOTE**: Control diagram and software documentation to include software/Contractor's manual, program
listing, and applicable hierarchy diagrams. The software manual must describe the functions for all wind turbine system control and monitoring software and must include all instructions necessary for proper loading, testing, debugging, and operations. Software description must include the following as a minimum: general system descriptions, including control system operating philosophies, sequence of operations, and interface definitions; explanation of program error messages; Data format, entry retrieval, archiving, and trending capabilities.

**************************************************************************
SECTION 48 15 00  Page 9
Submit Operation and Maintenance (O&M) Data specifically applicable to this contract and a complete and concise depiction of the provided equipment, product, or system, stressing and enhancing the importance of system interactions, troubleshooting, and long-term preventative maintenance and operation in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA, Data Package 5. Comply with AWEA O&M RP.

Include manufacturer's standard wind turbine system operations manuals that integrate operational instructions for the installed equipment. The wind turbine system manual must fully describe all wind turbine system operational aspects including, but not limited to:

a. Control and monitoring configuration and instruction.

b. System performance capabilities and equipment specifications.

c. System startup, shutdown, and emergency procedures.

d. Definition and use of all system, command, and applicable software.

e. Alarms and alarm presentation.

f. Recovery and restart procedures.

g. Contractor commands.

h. Detailed step-by-step instructions must be provided for user interfaces, such as control consoles, indicating/control panels, and peripheral devices.

1.5.1 Preventative Maintenance Manuals

Preventative Maintenance Manuals must include as a minimum, the applicable visual examinations, software and hardware tests, and diagnostic routines and resultant adjustment procedures necessary for periodic maintenance of control equipment. Instructions on how to load and use the test and diagnostic program and special or standard test equipment must be an integral part of the manuals.

1.5.1.1 Corrective Maintenance Manuals

Corrective Maintenance Manuals must include as a minimum, detailed logic diagrams and flow charts must also be provided, as necessary, for trouble-shooting analysis and field repair actions. For mechanical items required field repairs, information on tolerances, clearances, and wear limits, and maximum bolt down torques must be supplied. Information on the loading and use of special off-line diagnostic program tools, tests equipment, and any cautions or warnings that must be observed to protect personnel and equipment, must also be included.

1.5.2 Spare Parts

Provide a spare parts list (Data Package 5) and Special Tools and Equipment list required for maintaining total system availability at [95] percent. Parts list must include, as a minimum, part description, recommended
quantity, shelf life, storage conditions, manufacturer, model number, and estimated delivery times. Parts must be identified on a list or drawing in sufficient detail for procurement of any repairable or replaceable part. These parts must be identified by their individual by the industrial, generic part numbers, and must have second source referencing whenever possible.

1.6 QUALITY ASSURANCE

1.6.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.6.2 Qualifications

Provide materials and equipment that are standard products of manufacturers regularly engaged in the manufacture of such products, which are of a similar material, design and workmanship. Standard products must have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year use must include applications of equipment and materials under similar circumstances and of similar size. The product must have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2 year period.

1.6.3 Drawings

Submit minimum of three hard copies of drawings for government approval prior to manufacturing and equipment construction or integration. Submit Shop Drawings, Drawings, Schedules at a minimum of 11 by 17 inches in size using a minimum scale of 1/4 inch per foot, for the exception of drawings not requiring scale. Submit site plan drawings and Riser Diagram and general design notes at a minimum of 24 by 36 inches. Submit Installation and Assembly Drawings and Details at a minimum of 24 by 36 inches. Submit installation details at minimum scale of 1/2 inch per foot for overview and 2 inches per foot for detail.

1.6.3.1 Product Drawings

Submit complete detailed product drawings for the wind turbine system consisting of Shop Drawings, Drawings, Schedules and Manufacturer Data Sheet. Include in the shop drawings [one][three][four] wire diagrams, utility interconnection diagrams, switchboard and switchgear drawings, equipment enclosures, conduits, monitors, meters, and all other accessories associated with the installation of the PV system. Provide equipment dimensions, weights and structural mounting details.

Include nameplate data, size, and capacity of each wind turbine. Include all assumptions such as applicable wind speed, snow and seismic loads. Include applicable federal, military, industry, and technical society publication references.
1.6.3.2 Installation and Assembly Drawings and Details

Submit site plan drawings, Riser Diagram and general notes and Installation and Assembly Drawings and Details prior to start of construction. Include sufficient drawing detail for all parts of the work to enable the Government to check conformity with the requirements of the contract documents. Include in the site plan drawings: topographic and utility survey; bore logs; soils report; site plan(s); site construction details; structural drawings; structural construction details; site electrical plan; and site electrical construction details. Include in the installation and assembly drawings and details: parts lists; assembly drawings; interconnection wiring diagrams; wire and cable schedules; wire and cable termination schedules; instrument plan; instrument and control wire, conduit and cable schedules; instrument wire and cable termination schedule; control diagrams; control sequence of operation; seismic restraint details; and wind restraint details.

1.6.3.3 "As-Built" and Record Drawings

After completion of construction, submit "As-built" Drawings prepared and certified by the construction contractor, showing in red ink, on-site changes to the original construction details and all underground utilities measured from field benchmarks, accurate to within 1" of centerline of the utility. Immediately record for inclusion into the as-built drawings all modifications to original drawings made during installation. Indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Prepare "As-built" Drawings on a minimum of 24 by 36 inches vellum using red ink.

After submittal and approval of "As-built" Drawings, submit Record Drawings, prepared and by the project engineer(s) and architect(s), of the original design drawings reflecting all design changes and contractor noted changes in the "As-Built" drawings.

1.6.4 Factory Acceptance Testing

Prepare Work Plan and Factory Test Plan. Conduct Factory Acceptance Testing during manufacturing of the wind generators as follows:

a. Tower: mil certificate for steel plates, dimensional inspection report, non-destructive test report, coating inspection report, non-conformance reports, inspection certificate from certifying agency;

b. Electrical Parts: generator, wind turbine generator transformer, converter system, and controller;

c. Nacelle: gear box, lubrication system, main shaft installation, yaw drives and system; blade pitch system, cooling system; and major castings.

Prepare Factory Test Reports after completion of testing.

1.6.4.1 Work Plan

Submit [6][_____] copies of schedules of dates for factory tests, installation, field tests, and operator training for the UPS system. Furnish a list of instrumentation equipment for factory and field test reports.
1.6.4.2 Factory Test Plan

Submit [6][_____] copies of factory test plans and procedures at least [21][_____] calendar days prior to the tests being conducted. Provide detailed description of test procedures, including test equipment and setups, to be used to ensure the UPS meets the performance specification and explain the test methods to be used. As a minimum, the test procedures to include the test required under the paragraph entitled "Factory Testing."

1.6.4.3 Factory Tests Report

Submit [6][_____] copies of factory test report within [45][_____] calendar days after completion of tests. Receive approval of test prior to shipping unit. Factory test reports must be signed by an official authorized to certify on behalf of the UPS manufacturer of that the system meets specified requirements in accordance with the requirements set forth in paragraph entitled "Factory Testing". Provide test reports in booklet form tabulating factory tests and measurements performed, upon completion and testing of the installed system. Reports to state the Contractor's name and address, the name of the project and location, and list the specific requirements which are being certified.

1.7 DELIVERY, STORAGE, AND HANDLING

Handle, store, and protect equipment and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer. Replace damaged or defective items.

1.8 PROJECT/SITE CONDITIONS

1.8.1 Environmental Requirements

**************************************************************************
NOTE: An initial visual, noise, and wildlife analysis may occur in initial planning stage for site down-select; however, site specific analysis is required for the final site design and selected turbines.
**************************************************************************

The wind turbine system must conform to applicable federal, state, regional, and local regulations regarding visual impact, noise pollution control, and wildlife impact. Perform and submit Noise Analysis & Mitigation, Visual Impact Analysis & Mitigation, and Wildlife Impact Analysis & Mitigation to [Contracting Officer][_____] for review and approval prior to mobilization in accordance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.

Rainfall  [___] in. mean total annual rainfall

1.8.2.1 Available Utilities

**************************************************************************
NOTE: Early utility interconnect coordination is critical, as is an approved power agreement.
**************************************************************************

Utility power is presently supplied by [utility] from a [_____]kV line transformed down to [_____]kV for local distribution. Coordinate with the utility company for the available fault current value at the new wind farm transformer located at [TBD], and to design the wind turbine system to meet or exceed the available fault current values at the individual wind turbine points of connection (step-up transformer at the base of each turbine).

1.8.2.2 Wind Resource Data

The prevailing wind is from the [compass direction] with average annual wind speeds estimated to be [_____] m/s [_____] mph at [60][_____] meters [197][_____] ft above ground level at the preferred locations for these new wind turbines. Peak 15 minute average wind has been recorded from the [compass direction] at [25][_____] m/s [56][_____] mph. Summary average annual wind data results from past wind resource assessments are included in Attachment 1 of this specification. Validate the site(s) wind resource characteristics and design wind turbine system specifically for site conditions.

Validate the Wind Farm system's components and design parameters with respect to wind loading and survival wind speed. [Additional wind resource assessment data is available upon request.] The wind turbine system will be designed to maintain structural integrity and safe operation under specified environmental conditions, without damage to life or property for the [20][_____] year life of the wind turbine system.

1.8.2.3 Site Equipment Limitations

**************************************************************************
NOTE: Reference any known site limitations, such as bridge weight limitations, height restrictions, etc.
**************************************************************************

Identify and provide any special crane requirements for shipping, off-loading and erection of the wind turbine and its components.

1.9 WARRANTY

Wind turbine system must provide reliable operation, free from breakdowns (not excluding normal maintenance), for the design life of the wind turbine system [20][_____] years.
1.10 CERTIFICATIONS

Provide Seismic Certification and Wind Certification, prepared by a licensed professional engineer or National Recognized Testing Laboratory, (NRTL) for all components and assembled systems in accordance with ICC IBC, ASCE 7-16 state and local building codes. Seismic and wind certifications shall demonstrate system shall withstand wind and seismic requirements as installed and remain online and functional after a seismic or wind event.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

The wind turbine system must be furnished as totally coordinated assemblies which, after site installation and testing, shall comply with the design and performance requirements of this specification.

2.2 DESIGN REQUIREMENTS

All materials used in construction must be noncombustible wherever practical, and must be new materials.

Analysis of all required erection equipment loadings (i.e., on gin poles, winches, cranes, cables, earth anchors) must be performed as required for erection and/or maintenance purposes. Reference IEC 61400-SER and wind turbine manufacturer's standards. Provide UV resistant exposed cables and stainless steel cable ties.

2.2.1 General Requirements

General requirements for the wind turbine system includes:

a. The wind turbine system should consist of a [horizontal] [vertical]. axis, upwind active yaw control configurations, with a minimum of three rotor blades.

b. Rotor controls must be supplied to provide an active variable pitch (power/torque) air-foil design.

c. Operational RPM's must be variable, no less than [minus 10][_____] percent to [plus 5][_____] percent of synchronous RPM's.

**************************************************************************
NOTE: 80 meter hub height has been the standard.
Newer technology is allowing higher hub heights.
Ensure correct hub height is used for specification and permitting.
**************************************************************************

d. Wind turbine hub height of [80][_____] meters [263][_____] feet maximum, due to FAA height and other design issues, and energy production requirements.

e. Rotor diameter of [_____] meters [_____] feet minimum to [_____] meters [_____] feet maximum.

f. Low-voltage ride-through capability (see IEEE draft standard and/or European REE and EON grid code requirements.)
g. Reactive power support capability of [0.96][_____] inductive to [0.98][_____] capacitive power factor range, or approved equal.

2.2.2 Controls

The wind turbine controls will utilize standard "soft start" technologies to minimize the impact to electrical power systems. The design must include active power factor and load leveling controls to help reduce the need for supplemental active VAR control and to stabilize and/or minimize the system frequency/power changes due to wind variability respectively. The design requirements for the wind turbine subsystem components must be as described below.

2.2.3 Enclosures

All wind turbine equipment, controls, terminations, etc., supplied with the wind turbine system, which are intended to be located outside the nacelle, must be located in NEMA 12 (or equal) gasketed minimum rated enclosures for improved corrosion and environmental protection. If temperature control is required within the wind turbine control enclosures, provide all equipment, devices, and controls necessary to maintain the required temperature.

2.2.4 Rotors

Wind turbine rotors must consist of nonmetallic composite airfoils of a design resistant to abrasion related efficiency losses and must be non-EMI conductive/reflective. The rotor design must be optimized to provide maximum wind turbine output performance based on the specific wind regime characteristics[ given in the supplied wind data]. Further, the rotor controls must be designed to provide a minimum of one level of safety beyond the primary systems.

2.2.5 Reduction Gear Assemblies

High-efficiency, reduction gear assemblies (if required) must be supplied that are designed for low temperature rise, low levels of vibration, long life, and low noise emissions. Further, the gear assembly designs must provide reliable operation, free from breakdowns (not excluding normal maintenance), for the design life of the wind turbine system[ ([20][_____] years)].

2.2.6 Bearings and Seals

The drive train must utilize tapered roller bearing technology, wherever possible, to maintain parallelism and axial tolerance of the drive train during all operating conditions.

Maintenance-free sealing must be installed on all shafts to prevent leaking of gear lubrication and intrusion of dirt and dust.

2.2.7 Foundations

Determine soil and foundation load requirements and comply with applicable requirements of ASCE/AWEA RP2011.

2.2.8 Towers/Support Structures

The tower must be a free-standing construction consisting of tubular steel
(or approved equal), with provisions for safely climbing and servicing the
turbine. The tower must be provided with a catwalk or maintenance platform
just below or within the turbine to provide for turbine servicing as per
manufacturer's standard design. Determine proper height of tower assembly
for optimum operation of the wind turbines. Tower construction using self
erecting crane systems are encouraged, and should be considered in cases
where the height limitations of the installation may severely limit the
performance of the offered system. Establish and maintain all precautions
with regards to wind turbine installation and safeguarding the cranes for
all possible wind conditions. Comply with IEC 61400-SER, ASCE/AWEA RP2011,
and wind turbine manufacturer's standards.

All tower components including, but not limited to, or tube elements,
anchors, supports, rails, ladders, etc., will be of a corrosion resistant
steel construction, or coated with certified [10]-year surface coatings as
per Section 09 90 00 PAINTS AND COATINGS.

2.2.8.1 Wind Ratings

The wind turbine system must be capable to withstand winds of Category
[1][2][3][4] or [5] as defined by the Saffir-Simpson Hurricane Wind Scale.
Provide wind certifications for all components and assemblies.

The tower assembly (and all associated components subject to
fluctuating/cyclic loading) must be designed to withstand all operating
conditions for the specific wind region characteristics based on, but not
limited to, the supplied wind data. Static loading and dynamic response
analysis must be submitted for review, for all loads imposed on the wind
turbine system. The analysis must also include all required erection
equipment loadings (i.e., on gin poles, winches, cranes, cables, earth
anchors), as required for erection and/or maintenance purposes.

2.2.8.2 Seismic Ratings

All structures and structural elements must be suitable for Seismic Design
Category [_____] in accordance with ICC IBC, ASCE 7-16, and all other
applicable building codes and standards pertaining to the erection of such
structures.

All bolted connections must meet AISC 325 standards for loading and torque
specifications.

2.2.9 Brakes

A brake system, active yaw control, and/or airfoil system, in combination
with brakes, must be supplied as required to support:

a. Manual shutdown during design wind conditions;

b. Over-speed shutdown;

c. Parking for maintenance; and

d. Loss of electrical grid power during rated wind operations.

Main shaft type braking is the preferred technology, although other types
of technologies are not excluded provided they can be shown to meet the
functional and performance requirements defined herein. The braking system
must provide maintenance-free braking operations for a minimum of five
years (i.e., no new brake pads), with significant use of pitch and yaw controls to minimize braking requirements. The braking system must be configured to prevent any type of runaway conditions that could exist whether grid power is available or not. The braking system must be capable of providing sufficient braking force for parking, normal stopping, and emergency stopping of the wind turbine system, as described below. A braking system other than those described below may be submitted for "or equal" substitute based upon performance.

2.2.9.1 Parking Brakes

A parking brake must be supplied capable of preventing rotor rotation at wind speeds up to the survival wind speed and/or as required for maintenance support, and capable of being used when there is no power.

2.2.9.2 Normal Stopping Brake System

A normal stopping brake system (or equal) must be supplied to dissipate the kinetic energy of the rotating machinery at the design over speed condition, while suffering no irreparable damage. The braking system must include fail-safe automatic operational mode in the event of a power out condition (i.e., loss of utility power while operating at rated wind speed).

2.2.9.3 Emergency Brake

An emergency brake must be supplied that is designated to meet the same requirements of the normal stopping brake above. In addition, upon activation, the emergency brake must alarm and require manual resetting prior to resuming automatic operation of the wind turbine.

2.2.10 Electrical Systems

Perform an independent stability and reliability study with a focus on determining the impacts to the installation's site facilities. Operate the wind-farm in strict adherence to IEEE 519 guidelines for controlling voltage, current, and harmonic distortions. Operate the wind-farm with all the power conditioning equipment necessary to maintain a stable power factor. Operate the wind-farm in a manner that does not diminish the capacity of existing installation facilities. Operate the wind-farm with appropriate controls and equipment that will automatically separate the wind-farm from the installation, or the installation and the Utility so that installation's site operations are not compromised in the event of equipment, and/or system failures. Operate the wind-farm with standing agreements cooperating jointly in maintenance processes and procedures.

2.2.10.1 Equipment

All generators, motors, and related electrical systems must meet the requirements of NFPA 70, IEEE C2, and/or IEC requirements for all construction. Wind turbine generators must be high-efficiency, continuous rated machines, with a minimum of Class F insulation and temperature rise. The generator efficiency will be a minimum of 90 percent for all loads greater than 10 percent of rated load. The generator must include embedded temperature protection with solid state sensors.

2.2.10.2 Power Distribution

Isolation breakers must be provided for key system assemblies to facilitate maintenance without interruption operation of other wind turbine systems.
All fuses, circuit breakers, power supplies/regulators, and line conditioners necessary for wind turbine operations within the specified service conditions must be provided for all wind turbine equipment and assemblies. Power to the wind turbine control and monitoring subsystems must be distributed from a central point within one of the wind turbine system cabinets located within each nacelle. Voltage and current requirements must be identified and documented in the submittals to facilitate the design and transformer sizing.

2.2.10.3 Overcurrent Protection and Disconnect

A [circuit breaker][switch] must be installed as the primary means disconnecting the wind turbine incoming power cables/lines from the wind turbine system. The [circuit breaker][switch] must be capable of being locked in the open position and located conveniently for maintenance and operating personnel. The rating of the [circuit breaker][switch] must be sized per NFPA 70 for the maximum rated load current expected at the wind turbine. All electrical equipment supplied must be rated or protected to withstand and/or interrupt (without damage) the maximum available fault current expected at the point of connection to the wind turbine system. The fault current available at the wind farm site is initially estimated at approximately [_____] kAIC symmetrical at [_____] kVAC at each tower base, to be more closely determined during wind farm electrical modeling and design.

2.2.10.4 Step-up Transformer

A step-up transformer may be required and must be provided by others if the wind turbine output does not match the planned collector/distribution system voltage of [34.5][_____] kV (where the turbine is to be interconnected), or if the planned system is not suitable for the wind turbine standard design requirements. Modify as appropriate for step-up transformer requirements in accordance with Section 33 73 00.00 40 UTILITY TRANSFORMERS.

2.2.10.5 Surge Suppression

External power input connections must be surge protected against IEEE C62.41 Category B transients.

2.2.10.6 Harmonics

The wind turbine generated harmonics measured at the wind generator system ac output must not exceed the levels required to conform with IEEE 519.

2.2.10.7 Grounding

**************************************************************************
NOTE: The possible exposure to a corrosive environment should be carefully examined. Even when the correct conductor size and the selected joining (connecting) method have satisfied all the IEEE 837 test requirements, it may be prudent to choose a larger conductor size to compensate for some gradual reduction in the conductor cross section during the design life of the installation where the soil environment tends to promote corrosion. Coordinate soil environment with Geotechnical Engineer.
**************************************************************************
Grounding must conform to NFPA 70, IEEE 80, IEEE 142, IEEE 242 and IEEE C2, except that grounds and grounding systems shall have a resistance to solid earth ground not exceeding 5 ohms. Provide ground grid for maximum permissible touch and step voltages as per IEEE 80.

Provide inner ring electrode around the foundation and bond it through the foundation to the turbine tower. Provide additional ring electrodes of gradually increasing depth and diameter in order to reduce touch and step voltages at the edges of the system. Provide a Groundings System Analysis.

**************************************************************************
NOTE: The possible exposure to a corrosive environment should be carefully examined. Even when the correct conductor size and the selected joining (connecting) method have satisfied all the IEEE 837 test requirements, it may be prudent to choose a larger conductor size to compensate for some gradual reduction in the conductor cross section during the design life of the installation where the soil environment tends to promote corrosion. Coordinate soil environment with Geotechnical Engineer.
**************************************************************************

2.2.10.8 Equipment Labeling

Install permanent labels on all major switches, controls, electrical panels, cabinets, disconnects, motor starters, major equipment, or components. Weatherproof labels must be either laminated black phenolic plastic with white engraved letters, or engraved (or embossed) stainless steel nameplates. Lettering for panels and equipment must be minimum [12][_____] mm [1/2][_____] inch high. Labels must be permanently installed by gluing or screwing to equipment covers. Labels must show panel or load name and circuit fed from.

2.2.10.9 Power Factor (PF) Correction

Active pf control must be installed as a integral portion of each wind turbine electrical system, and must include control provisions to maintain a minimum power factor of [0.95][_____] at rated load (adjustable range of 0.9 to 1.0). Additional (supplemental) pf correction equipment utilizing capacitor technologies is not excluded (i.e. must be integrated and cannot be included in lieu of active pf control); however, the capacitors must incorporate provisions for disconnection and safe controlled bleed off of electrical energy to support safe maintenance, as required.

2.2.11 Control and Monitoring Systems

Wind turbine control and monitoring system electronics (both local and remote) must be microprocessor-based, provide control of all critical functions, and include (but not be limited to) fail-safe automatic shutdown in the event of any component malfunction, rotor over speed condition, or excess vibrations. The system must be designed with on-line diagnostic capabilities to allow technicians to trouble-shoot subsystem problems down to the module or board level. Provide controls for manual and automatic indicated wind turbine starts. Contractor control panels will be supplied both at ground level and within the nacelle control compartment; and each will be equipped with all the vendor standard control switches, indicators, and metering necessary to support normal wind turbine operations. In
addition, the Contractor panel(s) will include a serial communications interface or Ethernet port to communicate directly to the wind turbine microprocessor control system via [IBM] compatible, portable laptop computer.

The wind turbine control system must provide normal operations monitoring to start and stop the wind turbine based on available wind, and to support automatic shutdown in the event an abnormal operating condition occurs. Automatic shutdown must be provided for the system failures identified above as a minimum.

2.2.11.1 Control System Modularity

All system controls and indicators must be solid state, modular, plug-in construction, so that any module may easily be removed from the system and replaced without breaking or making solder type connections. Subassemblies and modules performing identical functions must be interchangeable without making wiring changes. The number of types and sizes of modules must be kept to a minimum, in order to reduce the extent and cost of required spare parts.

2.2.11.2 Variable Speed/Load Leveling

To maximize reliability, impact on energy security, and reduce life cycle costs, the wind turbine generator control systems are preferred that include active variable speed technologies (variable rotor, pitch, and/or rotor-generator speeds) and active machine damping to reduce/limit peak torque effects due to wind gusts and/or grid supply fluctuations.

2.2.11.3 Assembly Wiring

Internal assembly wiring, including jumpers, must be color coded or permanently labeled using heat shrinkable, sleeve type markers [Brady B321] or approved equal, as indicated on system schematics. Label identifications must be typed or printed. Wiring terminal strips must be provided and clearly identified for all equipment. Power and signal terminal strips must be separated. Provide [20] percent spare terminals for all electrical connections where possible.

Label all furnished cables, cable terminations and connections. Cables and connections must be located in easily accessible areas. Signal and power wiring must be routed in separate bundles and kept separate by providing separate terminal blocks and connectors. Wires must be terminated using calibrated crimp ring lugs. Internal wiring and cabling must conform to NFPA 70 and IEC 61400-SER.

2.2.11.4 Ground Level Controls

Provide a standard ground level control panel(s) with the following functional characteristics as a minimum:

a. Allow local manual isolation of, or set it in a safe maintenance mode for, the wind turbine unit both from the normal power supply and from remote Contractor initiated controls to support safe maintenance activities.

b. Allow local ground level manual controls to initiate shutdown of the wind turbine system.
c. Supplied to allow the Contractor to access the standard diagnostic functions, provide software and interface to allow direct connection of a portable, laptop computer to directly access the master microprocessor system (or control interface/PLC, etc.). [The new system must be capable of being integrated with (i.e., interface directly to), and/or be an extension of, the existing wind farm monitoring and control system.]

d. Allow ground level monitoring (without the need of the serial communications interface) of the following status and metered functions as a minimum (or equivalent functions):

(1) Discrete indicators (lights or approved equal),
   (a) Wind turbine system READY,
   (b) Wind turbine system FAULT,
   (c) Wind turbine system ON LINE;

(2) Meters/selectable Liquid Crystal Displays (LCDs) (for approval);

(3) Grid Voltage,
   (a) Line to Line volts - Phases AB, BC, and CA;

(4) Wind turbine output power,
   (a) Kilowatts and kilowatt hours;

(5) Power Factor,
   (a) Percent PF showing 0.5 - 1 - 0.5 (both leading/lagging);

(6) Rotor RPM;

(7) Pitch monitoring for active pitch turbines;

(8) Manual start/stop;

(9) Emergency stop (latching mushroom head switch with shield);

(10) Automatic and emergency shutdown indicators (lights or approved equal) with shutdown/manual reset; and

(11) Local/remote selector.

2.2.11.5 Remote Monitoring and Control Work Stations

**************************************************************************
NOTE: Review Agency network security requirements if an Agency remote terminal is desired.
**************************************************************************

Wind farm remote monitoring and control (SCADA) workstations are to be installed at the remote facilities/rooms as shown in the contract drawings as part of the wind farm/turbines project. The remote monitoring system must include two desktop computers, with modems, running Windows operating systems, and interfacing with the wind turbines using standard turbine
manufacturer's supplied software. The new wind turbines must have remote control and monitoring software installed on the wind turbine workstations, and must be able to be accessed via fiber optic connection to support internet access through the SCADA computer for monitoring and reporting of Wind Farm power production. The workstations must be able to access the wind turbines for remote monitoring and control via fiber optic cable system. No DOS based software allowed in the installation of the new systems.

The new wind turbines must also have communications accessibility via dedicated external fiber optic cable, DSL connection, satellite connection, or other for manufacturer's warranty purposes, depending on the requirements of the wind turbine manufacturer. Determine, supply and define the SCADA system, for the Installation Contractor to install, to support the above wind turbine communications and monitoring hardware and software (Procure the fiber optic cable and related components). Provide Definition and Use of All System, Command, and Application Software.

2.2.11.6 Local Nacelle Monitoring and Controls

Provide manufacturer's standard wind turbine system monitoring, controls, and alarms within the nacelle/base at the Contractor control panel with ability to remote monitor as required. All controls, meters, LCD displays, etc., must be located within NEMA 12 (or equal) gasketed enclosures. The nacelle Contractor panel will include service switches to prevent the operation of the turbine from the base control panel when service personnel are in the nacelle, as well as the basic Contractor functions identified in subparagraph, GROUND LEVEL CONTROLS of this section. In addition, system failures, malfunctions, and/or warning indications must be provided as identified below (as a minimum):

a. Loss of enclosure cooling (if cooling is required);
b. Under/over voltage;
c. Under/over frequency;
d. Out of phase sequence;
e. Phase current unbalance;
f. Excess vibration;
g. Generator problem,
   (1) Generator excess power,
   (2) Generator over current,
   (3) Generator over temperature,
   (4) Generator over speed,
   (5) Generator cooling failure;
h. Yaw system failure;
i. Cable over twist (if cables are used);
j. Hydraulic system failure;
k. Loss of gear box oil pressure;
l. Gear box over temperature;
m. Pitch control system failure (as required); and
n. Communications systems failure.

2.2.12 Cable Over Twist Protection

If the proposed system utilizes cables between the yaw deck and the tower, the wind turbine system must incorporate the necessary cable twist sensors to detect and determine the net number of nacelle rotations to prevent cable damage due to over twist. In the event a cable over twist is sensed, the wind turbine system controls must operate to safely bring the rotor to a complete stop, untwist the cable by counter yawing, and restart the wind turbine system. This system must be tolerant of total power outages and not lose track of previous twist information.

2.3 PERFORMANCE REQUIREMENTS

The wind turbine system output performance must meet the minimum criteria given in paragraph, DESIGN REQUIREMENTS of this section (less 2.5 percent tolerance). The minimum annual gross energy production required to meet this specification was calculated using historical data and corresponding distribution with long-term annual average wind speed of [___] m/s [___] mph at [___] meters [___] feet AGL, tower/hub height of [___] meters [___] feet, wind sheer of [___] between [___] and [___] meters [___] and [___] feet, altitude curve of [1.06][___] kg/m³ [6.617][___] lb/ft³ x 10⁻² air density.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Perform pre-performance and performance tests, inspections, and verifications in accordance with IEC 61400-SER.

Submit all manufacturer's standard airfoil performance and mechanical stress/strength tests data under the maximum expected operating conditions.

All wind turbines controls must be tested to standard manufacturing and systems tests and must include but not be limited to:

a. Rotor controls (if required);
b. Yaw control (if required);
c. Cooling system controls (if required);
d. Safety and shutdown systems; and
e. Braking systems.

Prepare and submit for review and approval a test plan and procedures for factory and site testing. Tests must include an integrated control systems test where a minimum of the wind turbine generator and associated controls must be tested as a complete or mock assembly. These tests must be subject to witness by the Contracting Officer (or designated representative).
Notify the Contracting Officer at least [30] working days in advance of the tests. Should the Contracting Officer elect not to have a representative present during factory tests conducted by Contractor, the Contractor must still conduct such factory tests and inspections and submit test data and reports.

Data must be reported as taken during testing. Data format must be such that it can be included in performance test data submitted to the Contracting Officer.

Furnish the Contracting Officer [two] copies of all shop and field test reports (and/or certificate of compliance) and [two] additional information copies of these reports, clearly identified as such.

PART 3 EXECUTION

3.1 SITE PREPARATION

Evaluate and ensure site is accessible for the size and weight of planned equipment and facilities. Coordinate transportation routes to site.

Prepare site and lay down areas in accordance with approved contract documents.

3.2 WIND TURBINE SYSTEM PREPARATION

Ensure the wind turbine systems, remote work stations, control, power monitoring equipment, and all ancillary installed equipment are operational in accordance with this specifications section. All testing, both on site and at the factory, must be organized and supported by approved Commissioning plans. Submit a Commissioning Plan and procedures to the Contracting Officer for approval no later than [20] business days after approval of the final design. The plan must state what equipment configuration will be tested, when it will be tested, which tests will be run, any special test equipment required, any required simulation software, and who will conduct and witness the tests as a minimum. The test procedures must define the operating steps and expected results to demonstrate compliance with the requirements of this specifications section. The Commissioning Report must record all test results and describe nonconformance events and corrective actions.

Ensure that the wind turbine components and associated subsystem must be tested by the manufacturer before shipment to verify proper assembly and function of all components/subsystems, and to ensure that the final assembled unit meets or exceeds the requirements of this specifications section. Component tests will be performed and/or Manufacturer's Factory certificates of compliance will be submitted indicating the equipment has been fully tested and meets the manufacture's standard design requirements. These tests must include (as a minimum):

a. Full Load Generator Tests - Full load test must be performed using the full load nameplate rating of the wind turbine generator unit. Full load testing must validate the vibration, temperature rise, and voltage and current outputs are within standard manufacturing limits (and/or meet) the manufacture's specifications.

b. Generator Insulation Tests - Generator insulation resistance and high potential tests must be performed with an insulation tester. Stator readings must be taken at the generator circuit breaker-switch. All
results of insulation tests must be recorded. Readings must be within the standard manufacturing limits specified by the generator manufacturer.

c. Gearbox/Transmission Full Load Tests - Full load testing must validate the vibration, temperature rise, sealing, audible noise, gear tooth patterns, and lubrication systems are within the limits specified by the manufacturer. Full load test must be performed using the full load nameplate rating of the transmission or wind turbine generator unit (whichever is greater).

All factory component tests described above may be performed at the manufacturing facility.

3.3 ERECTION

Determine all hoisting and rigging and other installation requirements, and must make arrangements, if appropriate, for rent or purchase of any of these special installation tools.

Comply with **ASSP Z359** Fall Protection Code during all construction, operations, and maintenance actions.

3.4 INSTALLATION

Install, test and commission wind turbine system. Provide detailed instructions and necessary oversight for installing all wind turbine system equipment. Notify the [CO][COR] of any errors in installation ensure that any and all installation errors are corrected in accordance with the manufacturer's instructions and specifications. Certify that the wind turbine system and wind turbine equipment are ready to operate. The Contracting Officer must receive [30][_____] working days' notice of the scheduled start up of the wind turbine system, with validation of the final schedule [21][_____] days prior to startup.

The scope of the Contractor's installation of the wind energy system must include, but not be limited to, the following activities:

a. Wind towers installation and setup support, including for hoisting, rigging, leveling, etc.;

b. Nacelle and rotor installations;

c. Control, monitoring, and terminal cabinet installations; and

d. Wiring connections/hookup.

3.5 SYSTEM INTERFACES

Wind turbine control and monitoring system is not authorized to interface with installation information network without approved software and hardware, and either an Authorization to Operate (ATO), Interim ATO (IATO), or Interim Authorization to Test (IATT). Permanent connection is not allowed without an Approval to Connect (ATC) or Interim ATC (IATC) authorization. Comply with **IEEE 1547**.

3.5.1 Power System Interface

The wind farm generator connections to the site power grid will be field
located as shown in the contract drawings. Validate proper voltage drop of system after completion of the wind turbine Contractor submittals. Locate the wind turbine system ground level controls to enable safe manual ground level shutdown.

3.5.2 Dispatch Interface

The remote monitoring and control system must be integrated to allow the [UTILITY][Contractor's][User's] power dispatch, via the master workstations at the remote facilities, to monitor and control Wind Farm status and record aggregate power output and wind turbine status from the Wind Farm system.

3.5.3 Control System Interface

The wind turbine system must be supplied with a standard fiber optic, DSL, satellite or 56 kbit/s to 115 kbit/s minimum serial interface communications interface [by others] to link standard wind turbine control and monitoring functions with the existing remote monitoring/control system. The wind turbine communications interface will be capable of driving control signals, from the final locations recommended for the wind turbines to the remote facility workstations. The communications interface must include all the standard software drivers, installation and operation documentation, and programming support necessary to allow easy integration directly with the [Contractor's][user's] workstations located at the remote.

3.6 FINISHING, CLEANING, AND PAINTING

All surface finishes, cleaning, and painting must conform with Section 09 90 00 PAINTS AND COATINGS. All exposed surfaces that protect material must be UV resistant to maintain appearances through the design life of the system.

3.7 EQUIPMENT IDENTIFICATION

Each piece of equipment must be identified so that it can be easily correlated with the documentation. The means of identification must be uniform throughout the system. The identification mark must be permanently affixed to the part it identifies. This requirement includes internal wiring, terminal strips, input/output cables and connectors, input/output modules, power supplies, and other subsystem components and subassemblies.

3.8 NAMEPLATES

Each major piece of wind turbine system equipment must be furnished with a permanently attached 316 stainless steel nameplate, which contains a minimum of the following information:

a. Tag number;
b. Manufacturer name;
c. Model number;
d. Serial number; and
e. Purchase order number.

Each nameplate must be fully visible when the equipment is in operating
condition and consist of a self-adhesive label having [_____] [6][_____] mm [1/4][_____] in embossed letters. Shipping container must be labeled with the same data.

3.9 FIELD QUALITY CONTROL

3.9.1 Manufacturer's Field Service

Provide the services of factory trained and approved field service engineer during system installation, testing, and commissioning.

3.9.2 Start Up Services

Carry out a checklist of startup requirements and conduct a series of safety tests to ensure proper installation, safe operation, and performance up to specification. Develop a Commissioning Report detailing all procedures, testing, and results.

After installation, prepare the new wind turbine systems for final testing and commissioning. The wind turbine systems must be fully debugged and operating in accordance with all requirements of this specifications section. Final start-up services must include, but will not be limited to, the following:

a. Final functional checks of all installed wind turbine systems, automated control modes, and associated controls and instrumentation.

b. Final verification and calibration of all wind turbine system control and instrumentation signals and digital readouts.

c. Final verification of the proper operation of all controlled shutdown functions and capabilities; and both automatic and ground level supported operating, monitoring, and related control functions.

d. Alarm systems.

3.9.3 Functional Acceptance Testing

After installation, conduct functional acceptance testing of the equipment and all accessories furnished to verify their proper performance under conditions of actual operation. Notify the CO at least [30][_____] working days in advance of the tests. Compliance with all requirements of this specifications section and all applicable standards (as amended) must be verified by an on-site startup/operational test.

3.9.4 Operational Testing

Support complete on-line operational testing on site to formally commission wind turbine operations, validate warranties, perform training, and initiate maintenance schedules. The wind turbine manufacturer will support the Installation Contractor who will be responsible for developing and implementing approved operational test procedures for testing all of the wind turbine operational and failure/failsafe systems. A certificate of completion must be provided at the conclusion of system's construction, installation, and commissioning. Coordinate all formal correspondence and reporting required for approval of the test plan. Project implementation must require the installation, testing, and operation of the wind turbine generating units in parallel with the installation's [_____] kV distribution system. Installation and start-up support service submittals,
Perform and submit field data reports for the following:

a. Verification of proper electrical power connection to all wind turbine system components.

b. Verification of proper termination of all system interconnect wiring and signal transmitter calibrations.

c. Verification of proper wind turbine system monitoring, controls, and environmental support system functionality.

d. Functional checks of all analog and digital signals, modems, and data communications systems associated with the wind turbine system.

e. Verification of wind turbine equipment alignments, torques and adjustments, and vibration block installations.

f. Functional checks (and correction if necessary) of all lubrication and cooling system levels and operations, shaft seals, and or other system fluid leaks.

g. All variations to documentation must be documented and submitted immediately to the CO and/or the COR.

3.10 COMMISSIONING

**************************************************************************
NOTE: Section 01 91 00.15 BUILDING COMMISSIONING is intended for building systems, however, the basic requirements are applicable to PV commissioning processes. Section 01 91 00.15 will need to be tailored for PV systems when compiling project specifications.
**************************************************************************

Conduct Commissioning, after the system is installed and is ready for operation, in accordance with Section 01 91 00.15 BUILDING COMMISSIONING, item (6) renewable energy generation, to verify that the completed and installed system meets the requirements of IEEE 1547. Tailor for non-building systems.

3.10.1 Commissioning Agent

Individual qualified in testing protective equipment (e.g., professional engineer, factory-certified technician, licensed electrician with experience in testing protective equipment) must perform or directly supervise commissioning tests. Provide Commissioning Agents Qualifications.

3.10.2 Commissioning Plan and Schedule

Develop and implement a commissioning plan and commissioning schedule in accordance with Section 01 91 00.15 BUILDING COMMISSIONING.

3.10.3 Start-up Pre-functional Checklists

Carry out a checklist of startup requirements and conduct a series of
safety tests to ensure proper installation, safe operation, and performance conforming to specification.

3.10.4 Functional Performance Testing

Prepare test procedures and conduct functional performance testing of the installed system. Test on completion each individual wind turbine generator and then test on completion the complete wind power system plant. Test the complete wind power system for a minimum duration of 200 hours, of which 150 hours should be generator time with 85 percent availability.

Provide testing of the following:

a. Collector System
b. Collector and Substation Equipment
c. Ground Grid
d. Main Power Transformers
e. Circuit Breakers
f. Arrestors
g. Switches and Switchgear
h. Instrument Transformers
i. Wind Plant Relays
j. Wind Plant Energization
k. Turbine Transformer
l. Overhead Collection Circuits
m. Fiber Optics and Secondary Cables
n. Medium Voltage Cable Systems
o. Power Performance
p. Nacelle Anemometer Verification
q. Acoustic Noise
r. SCADA and Controls
s. Back Up/Black Start Generator(s)
t. Grid Synchronization and Interface

3.10.5 Functional Performance Testing Results

Coordinate, observe and record the results of the functional performance testing. Coordinate retesting as necessary until satisfactory performance is verified. Verify the intended operation of individual components and
system interactions under various conditions and modes of operation.

Document items of non-compliance in materials, installation or operation. Immediately address observed non-conformance and deficiencies in terms of notification to responsible parties, and provide recommended actions to correct deficiencies.

3.10.6 Final Commissioning Report

Prepare and submit final commissioning report. Summarize all of the tasks, findings, conclusions, and recommendations of the commissioning process in accordance with IEC 61400-SER. Include the results of all tests and a listing of the final settings.

3.11 CLOSEOUT ACTIVITIES

3.11.1 Demonstration

Provide hands on demonstration of wind turbine systems and controls as part of the training session. Minimum demonstration areas must include pre-startup inspections, system startup, grid connection; operations, operator initiated shutdown, emergency shutdown, and extreme conditions procedures.

Demonstrate, upon completion of functional acceptance tests, that all circuits and devices are in proper operating condition and performing as intended.

3.11.2 Training

Provide a [1][3][5] day comprehensive training course covering operations and maintenance, critical spares, and unique tools requirements, with complete training materials, at construction completion.

Provide recommendations and sources for advanced maintenance personnel training and certification programs.

3.11.3 Spare Parts

Provide a spare parts list in accordance with the manufacturer's recommendations that will ensure [95][_____] percent system availability for from one year to 2 years of operation for each wind turbine unit, (according to options awarded). The list must include/identify all required gaskets, seals, sealing materials required for maintaining the weather tight integrity of the wind turbine tower and nacelle.

3.11.4 Special Tools and Equipment

Identify special tools and equipment designed specifically for the wind turbine equipment operation and maintenance. Special tools and devices, including any metric wrenches or other hand tools that are not standard in the United States, required for operation and maintenance of the equipment furnished under this specifications section, must be listed and clearly identified with the name of the equipment.

3.11.5 Site Restoration

Clean and restore temporary work areas to pre-existing conditions.
3.11.6 Decommissioning Plan

Provide a decommissioning plan to Contracting Officer for approval. Decommissioning plan must include actions necessary to restoring site and access roads to natural conditions and option to evaluate structure and components for life extension upgrades.

3.11.7 Warranty

Provide system and major component Warranty in accordance with Section 01 78 00 CLOSEOUT SUBMITTALS

3.12 OPERATION

3.12.1 Normal Operations

The wind turbine system must be operating in an automatic, unmanned mode, unless a failure alarm is detected in the wind farm control system, or maintenance is being performed on the system. Wind turbine system controls must be provided to optimize wind turbine system outputs under normal wind conditions, as described in paragraph, EXISTING CONDITIONS of this section. Standard wind turbine controls must be designed to keep the wind generating system operational within its normal operating limits over the design life of the wind farm system, producing efficient, optimized, electrical power. Should the wind turbine or its control system malfunction, the protection system/safety schemes must maintain it in a non-hazardous condition. Acceptable safety schemes must include braking, blade pitching, spoilers, and active yawing, as required by the turbine generator manufacturer. Provide wind turbine Operations Manuals, Alarms and Alarm Presentation, System Startup, Shutdown, and Emergency Procedures, and Contractor Commands (Control Consoles, Indicating/Control Panels, and Peripheral Devices).

3.12.2 Pre-Startup Inspections

Pre-startup inspections must be performed prior to initiating wind turbine system operations. To support automatic operations, the inspections will only be required following maintenance and/or abnormal shutdowns brought on by the automatic shutdown features of the controls. Pre-starting inspection will be performed using manufacturer's instructions and procedures to ensure that the wind turbine system is ready for on-line operations. The necessary instructions, procedures, checklists, etc. must be supplied as part of the documentation submittals as required herein.

3.12.3 Connection to Grid

To connect grid power to the associated wind turbine unit, coordinate with utility company grid operations to close the wind turbine switchgear breakers either manually at the site or remotely via the Contractor stations. Compliance with interconnection agreement requirements is mandatory.

3.12.4 Initiate Wind Turbine Operations

Once grid power is supplied to the wind turbine, the wind turbine control system will begin its internal system diagnostics, as necessary, to prepare the control system for active operations. All faults normally detected by the control system, or occurring as a result of automatic shutdown, will have to be manually reset prior to allowing active operations. When the
fault indications have been reset, the controls will output a wind turbine "READY" indicator to notify that the wind turbine is ready to activate soft start operations.

3.12.5 Normal Operations

Final wind turbine connection to the grid for normal on-line operation will occur when the ON-LINE command is initiated, either from the Contractor's panel or remotely via the serial communications/control link. Normal operation must include normal pitch, speed, and voltage controls to automatically optimize output while operating within normal wind speed parameters. ON-LINE operations will invoke normal operation where the wind turbines will begin soft start (solid state soft start, reduced voltage starting, or equal) operations (to reduce the impact of connecting the wind turbine to the grid) if adequate wind is available.

3.12.6 Normal Shutdown

All Normal shutdowns must result in immediate orderly shutdown, including a functional disconnect of the wind turbine generator from the grid at the wind turbine output control (or equal). The wind turbine control system must remain operational to maintain full control of the wind turbine shutdown (application of normal braking, required rotor and blade pitch operations, active yawing, etc.) as necessary to effect safe (non-damaging) shutdown of the wind turbine unit. Prior to beginning maintenance operations, shut down the system, applying the parking brake, open the switchgear breaker supplying the wind turbine system, open the wind turbine local disconnect breaker, and set the wind turbine operations switch into the LOCAL mode.

3.12.7 Emergency Shutdown

Emergency shutdown procedures/functions must be included as an integral part of the wind turbine basic operating capabilities. The emergency shutdown system must operate to disconnect the wind turbine from the grid and apply appropriate braking actions, require rotor and blade pitch operations, active yawing, etc., as necessary to effect safe (non-damaging) shutdown of the wind turbine unit in emergency, extreme operating conditions, survival wind speeds or a loss of grid power while operating. These include, but are not limited to, loss of grid power, breaker trip, over speed, contractor control, and other anomalies. Provide Recovery and Restart Procedures.

3.12.8 Extreme Operating Conditions

Peak wind speed, high temperature, and earthquakes all constitute extreme operating conditions, which may exist whether the wind turbine is in operation or not. The wind turbine system design analysis must consider the effects of extreme operating conditions; and the resulting design configuration must include the necessary safety elements to mitigate damage from the extremes (and still effect safe shutdown). Contractor inspection and manual reset is expected before any operation following an extreme event.

3.13 MAINTENANCE
Contractor to create maintenance schedule and perform system and component maintenance in accordance with equipment manufacturers’ recommendations and AWEA O&M RP. Provide a Recommended Multi-Year Operations and Maintenance (O&M) Requirements Schedule.

1.2 RELATED REQUIREMENTS

**NOTE: To apply this guide specification to other**
divisions of the project specification, insert the appropriate division number and title. Ensure that the appropriate sections having electrical equipment include the following paragraph:

Delete sections in the paragraph that are not in the job. The requirements of this specification section are being incorporated into the other specification sections that reference it with the intent of phasing out this section. As the requirements of this section are incorporated into each specification section, that section should be added to the list in the paragraph below. Do not use this section, and delete reference to it, if the only sections used in the job are listed below.

**************************************************************************
This section applies to certain sections of Division 13, SPECIAL CONSTRUCTION, and Divisions 22, PLUMBING. This section applies to all sections of Division 26 and 33, ELECTRICAL and UTILITIES, of this project specification unless specified otherwise in the individual sections.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item
for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

NOTE: Permits are assumed to be obtained by firm holding design responsibility. Ensure this is clarified in contract bid package.

1.4 QUALITY ASSURANCE

1.4.1 Material and Equipment Qualifications

Provide materials and equipment that are standard products of a manufacturer regularly engaged in the manufacturing of such products, that are of a similar material, design and workmanship. Materials and equipment must have been in satisfactory commercial or industrial use for a minimum two years prior to bid opening. The two year period must include applications of the equipment and materials under similar circumstances and of similar size. Materials and equipment must have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the two year period.

1.4.2 Nameplates

**************************************************************************
NOTE: In a salt water environment, substitute acceptable non-corroding metal such as, but not limited to, nickel-copper, 304 stainless steel, or monel. Aluminum is unacceptable. Nomenclature (or
system identification) should be established by the designer.

Require melamine plastic nameplates for all NAVFAC projects. Also for NAVFAC projects, require nameplates to be associated or keyed to system charts and schedules.

**************************************************************************

Attach nameplates to all specified equipment, thermometers, gauges, and valves defined herein. List on each nameplate the manufacturer's name, address, contract number, acceptance date, component type or style, model or serial number, catalog number, capacity or size, and the system that is controlled. Construct plates of stainless steel. Install nameplates in prominent locations with nonferrous screws, nonferrous bolts, or permanent adhesive. Minimum size of nameplates must be 25 by 65 mm/1 by 2-1/2 inches. Lettering must be the normal block style with a minimum 6 mm/1/4 inch height. Accurately align all lettering on nameplates.

1.5 DELIVERY, STORAGE, AND HANDLING

Handle, store, and protect equipment and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer. Replace damaged or defective items.

1.6 WARRANTY

Warranty overall landfill gas collection, processing, control, and generation system to be free from material, workmanship, and manufacturing defects (excluding normal maintenance), for a period of [5] years.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

The landfill gas system includes the following:

   a. Landfill gas and condensate piping and accessories;

   b. Condensate pump stations;

   c. Condensate knockouts;
d. Blowers;
e. Propane stations;
f. Skid mounted flare systems;
g. *Gas condensers*;
h. Gas dryer systems;
i. Aftercoolers;
j. Gas turbines;
k. Microturbines;
l. *Internal combustion engines*;
m. Filtration systems;
n. Landfill gas analyzers; and
o. Control systems.

2.2 Design Conditions

Equipment specified herein must be designed to for:

a. Elevation [_____] meters/[_____] feet.

b. Minimum/maximum ambient temperature [_____] / [_____] degrees C/[_____] / [_____] degrees F.

c. Landfill gas and condensate to be handled.

d. Maintaining a [75] percent collection efficiency.

e. Raw gas inlet conditions of:

   - LFG flow: [_____] liters/minute/[_____] SCFM.
   - LFG temperature: [_____] / [_____] degrees C/[_____] / [_____] degrees F.
   - Relative humidity: [100] percent.

   Raw gas composition:

   - [_____] percent methane
   - [_____] percent carbon dioxide
   - [_____] percent nitrogen
   - [_____] percent oxygen

f. Treated gas conditions of:

**************************************************************************
2.3 MATERIALS

Internal parts and components of equipment, piping, piping components, and valves that could be exposed to landfill gas and/or condensate during system operation must not be constructed of zinc coated (galvanized) metal. Do not install cast iron bodied valves in piping systems that could be exposed to landfill gas and/or condensate during system operation.

2.3.1 Nitrile Butadiene (Buna-N)

Provide Buna-N material that conforms to SAE AMS3275.

2.3.2 Acrylonitrile Butadiene Rubber (NBR)

Provide NBR material that conforms to SAE AMS3275.

2.4 ELECTRICAL WORK

NOTE: Show electrical characteristics, motor starter type(s), enclosure type, and maximum rpm in the equipment schedules on the drawings.

Where reduced-voltage motor starters are recommended by the manufacturer or required otherwise, specify and coordinate the type(s) required in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Reduced-voltage starting is required when full voltage starting will interfere with other electrical equipment and circuits and when recommended by the manufacturer. Where adjustable speed drives (ASD) are specified, reference Section 26 29 23 ADJUSTABLE SPEED DRIVE SYSTEMS UNDER 600 VOLTS. The methods for calculating the economy of using an adjustable speed drive is described in UFC 3-520-01 DESIGN: INTERIOR ELECTRICAL SYSTEMS.

Coordinate the ignition temperature of the fuel(s) to be handled with the electrical design. Ignition temperatures will be as defined in NFPA 497M.
ignition temperatures will dictate the maximum allowable temperature rating of the electrical equipment. Coordinate the area classification and the electrical design with UFC 03-460-01.

2.4.1 General

Provide motors, motor starters, controllers, integral disconnects, contactors, controls, and control wiring with their respective pieces of equipment, except controllers indicated as part of motor control centers. Provide electrical equipment, including motors and wiring. Provide switches and devices necessary for controlling and protecting electrical equipment. Provide motor starters complete with thermal overload protection and other necessary appurtenances. Comply with API RP 540 and API RP 2003.

2.4.2 Motors

Provide motors in accordance with NEMA MG 1 and of sufficient size to drive the load at the specified capacity without exceeding the nameplate rating of the motor when operating at proper electrical system voltage. Provide high efficiency type, single-phase, fractional-horsepower alternating-current motors, including motors that are part of a system, in accordance with NEMA MG 11. Provide polyphase, squirrel-cage medium induction motors, including motors that are part of a system, that meet the efficiency ratings for premium efficiency motors in accordance with NEMA MG 1. Motors must be rated for continuous duty with the enclosure specified. Motor duty requirements must allow for maximum frequency start-stop operation and minimum encountered interval between start and stop. Motor torque must be capable of accelerating the connected load within 20 seconds with 80 percent of the rated voltage maintained at motor terminals during one starting period. Motor bearings must be fitted with grease supply fittings and grease relief to outside of the enclosure. Comply with IEEE 112.

2.4.3 Motor Controllers

Where two-speed or variable-speed motors are indicated, solid-state variable-speed controllers may be provided to accomplish the same function. Use solid-state variable-speed controllers for motors rated 7.45 kW/10 hp or less and adjustable frequency drives for larger motors. Controllers and contactor must have a maximum of 120-volt control circuits and must have auxiliary contacts for use with the controls provided. For packaged equipment, the manufacturer must provide controllers including the required monitors and timed restart.

2.4.4 Underground Wiring

Provide underground electrical wiring in PVC conduit, as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.

2.4.5 Grounding and Bonding

Grounding and bonding must be in accordance with NFPA 70, NFPA 77, NFPA 780, IEEE 1100, IEEE 142. Provide jumpers to overcome the insulating effects of gaskets, paints, or nonmetallic components.
2.5 GAS COLLECTION AND CONTROL SYSTEM

Landfill gas collection and control system (GCCS) to comply with 40 CFR 60.752.

Provide piping, accessories, and valving in accordance with in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES.

2.6 CONDENSATE PUMP STATIONS

**************************************************************************
NOTE: Refer to NAVFAC Standard Design 140-40-05 TRUCK UNLOADING SYSTEM and UFC 3-460-01 for detailed information of an off-loading assembly.
**************************************************************************

Assembly must be a complete, packaged, factory fabricated for use in the landfill, transferring condensate or leachate from landfill gas header and subheader piping. Assembly must include automatic level control of condensate or leachate and must pump to a point of disposal.

2.6.1 Condensate Pump Station and Enclosure

Provide pump station that is fully enclosed, weatherproof, polyethylene or PVC construction with an intermediate storage reservoir. Provide with quick connect/disconnect fittings and corrosion resistant components. Assembly must have a vault for access and maintenance. Comply with NEMA 250.

2.6.2 Condensate Pumps

Provide electric centrifugal or submersible type condensate pump sized and designed for condensate service.

2.6.3 Service Nameplate

In addition to the equipment identification nameplate, provide pump station service nameplate, of type 18-8 stainless steel or monel, securely attached by stainless steel pins at an accessible and conspicuous point on the pump station. Tagging in letters 6 mm/1/4-inch high must bear the equipment number as shown on the drawings. The pump station service nameplate must be stamped with the following information:

a. Manufacturer's name;

b. Pump serial number;

c. Capacity, [_____] L/s/[_____]gpm;

d. Pumping head, [_____] m/[_____] ft;

e. Pumped fluid maximum specific gravity;

f. Revolutions per minute; and

g. Driver horsepower.

2.7 CONDENSATE KNOCKOUTS

Provide complete packaged assembly, factory fabricated, for use in-line
with the landfill gas pipelines to remove condensate from the landfill gas stream. Assembly must include automatic condensate level control and must pump to a point of disposal. Provide cleanout and monitoring ports.

2.7.1 Condensate Knockout Enclosure

The knockout must have a fully enclosed, weatherproof, polyethylene or PVC construction with an intermediate storage reservoir. Provide with quick connect/disconnect fittings and corrosion resistant components.

2.7.2 Condensate Pumps

Pumps must be an electric centrifugal or submersible type. Comply with API STD 610.

2.7.3 Service Nameplate

Provide a knockout service nameplate, of type 18-8 stainless steel or monel, attached by stainless steel pins at an accessible point on the knockout, must be furnished in addition to the identification nameplate. The knockout service nameplate must be stamped with the following information:

a. Manufacturer's name;
b. Pump serial number;
c. Capacity, [_____] L/s/[_____]gpm;
d. Pumping head, [_____] m/[_____] ft;
e. Maximum specific gravity of fluid to be pumped;
f. Revolutions per minute; and
g. Driver horsepower.

2.7.4 Identification Nameplate

Provide a knockout identification nameplate of Type 18-8 stainless steel or monel and securely attached by stainless steel pins to a conspicuous place on the knockout. Tagging in letters 6 mm/1/4-inch high must bear the equipment number as shown on the drawings.

2.8 BLOWERS

Provide positive displacement blowers, completely assembled with strainer, silencers, check valves, pressure relief valves, shaft seals, and intake and discharge pressure gauges. Provide with variable frequency drive for LFG flow control. Provide actuated fail-safe valve on intake and discharge side for blower isolation during normal and emergency shutdown operations.

2.9 PROPANE STATIONS

Provide propane station compatible with flare pilot system requirements and integrated into the main station control panel. Size propane storage for 6 [_____] months of operation. Comply with ASME BPVC SEC VIII D1, ASME Boiler and Pressure Vessel Code, NFPA 58, and piping as specified in 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES.
2.10 SKID MOUNTED FLARE SYSTEMS

**************************************************************************
NOTE: Check local air quality board for more stringent emissions requirements.
**************************************************************************

Provide a skid mounted flare system for use in landfill gas destruction. Assembly must include burners, louvers, weather protection, insulation, access ladder and platform, heat shields, purge blower, flame arrester/thermal valve, wind shields, pilot light system, flame sensor, modulation control valves, and controls. Completely assemble flare control system and test prior to shipment by the flare supplier at the supplier's own fabrication facility.

Flare system must be capable of continuous stable combustion operation with [30] to [50] percent methane at the maximum required flow rate. Flare must have a minimum exhaust gas retention time of [0.5] [1.0] [_____] seconds at a minimum temperature of [760] to [980] degrees C/[1400] to [1800] degrees F.

The flare must be capable of achieving a minimum destruction efficiency of >98 percent of total non-methane organic compounds (NMOCs) by weight and 99 percent destruction of hydrogen sulfide. Design flare to comply with and operate in compliance of 40 CFR 60.18.

2.10.1 Skid Mounted Flare Construction

Flare construction must be carbon steel with a stainless steel weather and heat protection at the top of the flare.

2.10.2 Flare Insulation

Insulate flare with 100 mm/4 inch ceramic fiber blanket insulation to achieve a not to exceed skin temperature of 121 degrees C/250 degrees F.

2.10.3 Burner and Propane Pilot

Burner must be stainless steel construction. Propane pilot must be stainless steel construction. Provide thermocouple flame recognition system and purge system.

2.10.4 Manifold

Provide low pressure type manifold with flame arrester and safety shutdown valve.

2.11 GAS DRYER SYSTEMS

Provide a complete packaged gas dryer system for use in landfill gas piping to remove water vapor and condition the landfill gas to a quality acceptable for use specified microturbines and combustion engines.

2.11.1 Gas Dryer Construction

Provide modular construction gas dryer with stainless steel wetted parts, heat exchanger tubes, and moisture separator. Gas dryer system must be mounted on a structural solid steel base.
2.11.2 Refrigeration System

The refrigerant used must not contain CFC. The refrigeration system must include:

a. Liquid line dryer;
b. Suction line dryer;
c. Site glass;
d. Crank case heater;
e. Isolation valves for compressor and evaporator;
f. Condenser and liquid receiver;
g. Condenser pressure relief valve;
h. Compressor discharge check valve;
i. Separator/filter; and
j. Dew point sensor and readout.

2.12 AFTERCOOLERS

**************************************************************************
NOTE: Piston type differential pressure gauges do not require calibration. Suggest showing on the drawings a pressure gauge installed on the high pressure side of the differential pressure gauge. The pressure gauge should have a scale range from 0 to 2068 kPa (300 psi).
**************************************************************************

Provide an aftercooler after the blower. Aftercooler cores must be made of stainless steel to resist attacks from acids of sulfur, chlorine and fluorine. Provide condensate collection and piping.

2.13 GAS TURBINES

**************************************************************************
NOTE: Indicate the location and approximate configuration of each station. Mount all the control equipment on a single equipment rack next to the corresponding receiving/dispensing equipment. Include the sequence of operation for each station on the drawings.
**************************************************************************

Provide a gas turbine based [grid parallel] [dual mode] [grid isolated] generator system designed for landfill gas fuel meeting the following criteria:

b. Nominal heat (HHV) [_____] BTU/kWh;
c. Nominal heat (LHV) [_____] BTU/kWh;
d. Nominal electrical power [_____] kWh;
e. Voltage [_____] VAC;
f. Frequency [_____] Hz;
g. Service 3 phase, wye, 4 wire;
h. Grid isolation +- [0.50] percent nominal voltages and +- [0.50] percent nominal frequency;
i. Transient handling +- [10] percent nominal voltages maximum and +- [5] percent frequency max; and
j. Meets or exceeds [CARB] emissions standards.
l. Minimum design life of [80,000] hours with overhauls.

2.14 MICROTURBINES

Provide microturbine based generator [grid parallel] [dual mode] [grid isolated] system designed for landfill gas fuel. Microturbine must have recuperator and integrated heat recovery.

b. Nominal heat (HHV) [_____] BTU/kWh;
c. Nominal heat (LHV) [_____] BTU/kWh;
d. Nominal electrical power [_____] kWh;
e. Voltage [_____] VAC;
f. Frequency [_____] Hz;
g. Service 3 phase, wye, 4 wire;
h. Grid isolation +- [0.50] percent nominal voltages and +- [0.50] percent nominal frequency;
i. Transient handling +- [10] percent nominal voltages maximum and +- [5] percent frequency max; and
j. Meets or exceeds [CARB] emissions standards.
l. Minimum design life of [80,000] hours with overhauls.

2.15 INTERNAL COMBUSTION ENGINE

Provide an internal combustion engine based [grid parallel] [dual mode] [grid isolated] generator system designed for landfill gas fuel.
b. Nominal heat (HHV) [_____] BTU/kWh;
c. Nominal heat (LHV) [_____] BTU/kWh;
d. Nominal electrical power [_____] kWh;
e. Voltage [_____] VAC;
f. Frequency [_____] Hz;
g. Service 3 phase, wye, 4 wire;
h. Grid isolation +- [0.50] percent nominal voltages and +- [0.50] percent nominal frequency;
i. Transient handling +- [10] percent nominal voltages maximum and +- [5] percent frequency max; and 
j. Meets or exceeds [CARB] emissions standards.
l. Minimum design life of [80,000] hours with overhauls.

2.16 FILTRATION SYSTEMS

Provide filtration system to remove particulates and other contaminants as required to comply with specified generation system specifications.

2.17 LANDFILL GAS ANALYZERS

**************************************************************************
NOTE: Methane may seep into building structures/enclosed spaces.
**************************************************************************

Provide methane sensor/alarm within enclosed structures.

2.18 CONTROL SYSTEMS

Control systems must have all necessary sensors, interlocks, relays, alarms, and user interfaces to allow for continuous monitoring and [grid parallel ][dual mode ][grid isolated ]operations. Use gas analyzer output to adjust generator speed and air/fuel ratio set point for emissions compliance and power output optimization.

Provide critical shutdown alarms for:

a. Shutdown oxygen level - [4] percent or greater, by volume;
b. Low methane level - less than [30] percent by volume;
c. Flare failure;
d. Blower fault;
e. Blower inlet and exit bearing temperatures greater than \([100] \text{ degrees C/}[212] \text{ degrees F}\);
f. Emergency stop;
g. Power loss;
h. Condensate tank high level;
g. Gas dryer failure; and
h. Enclosed structure methane level greater than \([4] \text{ percent by volume}\).

Provide non-critical alarms for:
a. High oxygen levels - greater than \([2] \text{ percent by volume}\);
b. Low propane supply pressure;
c. Low flare temperature;
d. Landfill gas temperature at wellhead - greater than \([60] \text{ degrees C/}[140] \text{ degrees F}\); and
e. Methane detection within enclosed structures.

[Provide automated trouble notification system for critical shutdown [and non-critical] alarms.]

PART 3   EXECUTION

3.1 SITE PREPARATION

Evaluate and ensure site is accessible for the size and weight of planning equipment and facilities. Prepare site and lay down areas in accordance with approved contract documents.

3.2 INSTALLATION

Installation, workmanship, fabrication, assembly, erection, examination, inspection, and testing must be in accordance with ASME B31.3 and NFPA 30, NFPA 70 except as modified herein. Safety rules as specified in NFPA 30 and NFPA 407 must be strictly observed. When work is not in progress, securely close open ends of pipe and fittings with expansion plugs so that water, earth, or other substances cannot enter the pipe or fittings. Comply with UL 913.

3.2.1 Equipment

Properly level, align, and secure equipment in place in accordance with manufacturer's instructions. Provide supports for equipment, appurtenances, and pipe as required. Provide floor-mounted pumps and other floor mounted equipment with mechanical vibration isolators or a vibration isolation foundation. Install anchors, bolts, nuts, washers, and screws where required for securing the work in place. Sizes, types, and spacings
of anchors and bolts not indicated or specified must be as required for proper installation.

3.3 SYSTEM COMMISSIONING

System commissioning must conform to Section 01 91 00.15 BUILDING COMMISSIONING.

3.4 DEMONSTRATIONS

Conduct a training session for designated Government personnel in the operation and maintenance procedures related to the equipment/systems specified herein. Include pertinent safety operational procedures in the session as well as physical demonstrations of the routine maintenance operations. Furnish instructors who are familiar with the installation/equipment/systems, both operational and practical theories, and associated routine maintenance procedures. The training session must consist of a total of 8 hours of normal working time and must start after the system is functionally completed, but prior to final system acceptance. Submit a letter, at least 14 working days prior to the proposed training date, scheduling a proposed date for conducting the on-site training.

-- End of Section --
