Solvent-clean factory primed surfaces before painting. Prepare and prime surfaces that have not been factory primed in accordance with the paint manufacturer's recommendations. Apply the paint system to the outside of the tank in accordance with Section 09 90 00 PAINTS AND COATINGS. Provide color as indicated on the paint schedule or as otherwise approved.

3.4.1.2 Interior Surfaces

**************************************************************************
NOTE: Some state and local health agencies have listings of acceptable paint materials for the interior of potable water tanks. Contact the appropriate state and local authorities to determine if the paint systems are acceptable. If these systems are not acceptable, determine the best acceptable system and revise this specification accordingly. Some states require NSF approval for coatings in contact with potable water. The zinc coating system specified in Section 3.8 of AWWA D102 is not acceptable.
**************************************************************************

Coat tank interior surfaces with the coating conforming to Section 3.2, 3.3, 3.4, 3.5, 3.6, or 3.7 of AWWA D102. System of three coats, 0.10 -
0.15 mm 3.9 - 5.9 mils dry film thickness (DFT) per coat, for total of 0.30 - 0.45 mm 11.7 - 17.7 mils minimum DFT.

3.4.1.3 Touch-Up Painting

Touch up factory painted items as needed. Factory painted items requiring touching up in the field must be thoroughly cleaned of all foreign material, primed and top-coated with the manufacturer's standard factory finish.

3.4.1.4 Field Painting

Paint equipment which did not receive a factory finish as specified in Section 09 90 00 PAINTS AND COATINGS.

3.4.1.5 Corrosion Resistant Metals

Painting of corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel is not required unless otherwise specified.

3.4.2 Field Training

Conduct a training course for designated operating, maintenance and support staff members. The training period, for a total of [8][12][16][_____] hours of normal working time, must start after the system is functionally completed but prior to final acceptance tests. Field training must cover each item contained in the operating and maintenance data.

3.5 MAINTENANCE

Submit a preventive maintenance plan and schedule including routine recommended chemical preventive measures for handling contaminant/biofouling of the carbon adsorption unit under conditions of the application including strong acid/alkali/alternative chemical soaks and instructions for storage and handling of treatment chemicals and waste products.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for fiberglass-reinforced polyester storage tanks and accessories for use in aggressive chemical service at atmospheric pressures and is limited to flat-bottomed, aboveground, vertical, cylindrical tanks.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This section does not cover vertical tanks with dished or conical bottoms, vertical tanks for buried service, pressure vessels, and horizontal tanks for both above-ground and buried services.

Related work specified elsewhere includes:

a. Cast-in-place concrete

b. Anchor bolts (provide calculations that determine bolt types, sizes and quantities required.)
c. Plastic pipe

d. Acid-resistant pipe

e. Chemical valves

f. Liquid-level gages

As a minimum, show on drawings:

a. The physical location of each tank

b. The location of all accessories to be furnished with each tank

c. Concrete-foundation details for each tank

d. Anchoring details for attaching each tank to the foundation

e. A schedule with connections, size, quantity, and location of tanks.

Specify connection usage such as drain, vent, or overflow and location by top or side. Coordinate this schedule with accessories and the locations shown on drawings.

-------------------------------------------------------------------------------------------------

NOTE: If Section 22 00 00 PLUMBING, GENERAL PURPOSE is not included in the project specification, insert applicable requirements thereof and delete the following paragraph.

-------------------------------------------------------------------------------------------------

Section 22 00 00 PLUMBING, GENERAL PURPOSE applies to work specified in this section.

1.1 REFERENCES

-------------------------------------------------------------------------------------------------

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project.
The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

RCBEA 2.63 (2004) Tank and Storage Tank Un-pressurized

1.2 SUBMITTALS

*NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving
Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
  Record Drawing of Existing Conditions
  List of Product Installations; G[, [___]]

SD-02 Shop Drawings
  Coordination Drawings; G[, [___]]
  Equipment Room Layout; G[, [___]]
  Fabrication Drawings; G[, [___]]
  Installation Drawings; G[, [___]]

SD-03 Product Data
  Equipment and Performance Data
  Equipment Foundation Data
  Storage Tanks; G[, [___]]
  Accessories; G[, [___]]

SD-04 Samples
  Manufacturer’s Standard Color Charts for Laminates; G[, [___]]
  Flanged Nozzles; G[, [___]]
1.3 QUALITY CONTROL

Submit a list of product installations for fiberglass-reinforced polyester storage tanks, identifying at least five units, similar to those proposed for use, that have been in successful service for at least 5 years. Identify purchaser, address of installation, service organization, and date of installation.

Submit certificates of conformance at least [30] days before work begins, verifying the following items comply with the standards and specifications:

a. Storage tanks: Provide the manufacturer's certification that storage tanks are suitable for storage of specified chemicals.

b. Installer: provide signed statements that installers have knowledge of the requirements of the applicable standards, including NASA RCBEA GUIDE,
and specifically RCBEA 2.63, and installation practices in order to ensure the tanks are installed in a sound, undamaged condition.

1.4 DELIVERY, STORAGE, AND HANDLING

In order to prevent damage, handle and store the tanks in accordance with the manufacturer's guidelines. Provide verification that the tanks have no damage, surface defects, or poor quality laminates.

All damaged or defective tanks or removable covers will be rejected by the Contracting Officer. Remove immediately from the project site.

Concurrent with delivery of the tanks, submit [three] copies of the manufacturer's Operation and Maintenance Manual.

1.5 PROJECT/SITE CONDITIONS

1.5.1 Record Drawing of Existing Conditions

Submit a record drawing of existing conditions, including underground utilities, at least 30 days before construction work begins.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Fabrication Drawings

Submit fabrication drawings for fiberglass-reinforced polyester storage tanks, including construction and anchorage details, at least 30 days before construction work starts.

Submit the manufacturer's standard color charts for laminates so that a visual inspection of the surface finish and color can be performed.

Submit the manufacturer's catalog data for storage tanks including spare parts.

2.1.2 Loading Conditions

******************************************************************************
NOTE: Show equipment and accessory loads affecting tank shells and tops, if required. Show wind load for exterior tanks and tank top design load when top manways are specified.
******************************************************************************

Provide tanks conforming to the loading conditions specified in project requirements.

2.1.3 Chemical Storage Requirements

Provide design analysis and calculations for fiberglass-reinforced polyester storage tanks, complying with BS EN 13121-3.

******************************************************************************
NOTE: The Project Manager should review NASA RCBEA criteria under section 2.63 (2.63.1, 2.63.2, and 2.63.3) to determine the extent of required
Submit test reports for chemical resistance tests in accordance with ASTM C581.

Submit test reports for the following:

a. Tank integrity
b. Verification of liquid-level indication results
c. Verification of relief device results

Results of previous successful tests are acceptable provided that the laminates tested are representative of the tank material specified for this project.

2.1.4 Capacity and Dimensional Requirements

NOTE: Capacities vary up to 300 kiloliter 75,000 gallons.

Provide the minimum capacity as measured in liter gallons to the top of the straight shell or wall height as indicated.

NOTE: Diameters vary up to 5 meters 16 feet. Wall heights vary up to 14 meters 47 feet.

Ensure that the diameter and straight shell or wall height are as specified.

2.1.4.1 Liquid-Level Gauge

Provide the tank with a liquid-level armored gauge glass sight tube [with flanges], indicating between 10 and 90 percent of tank capacity.

2.2 ASSEMBLY

NOTE: Select either filament-wound or contact-molded construction.

Filament winding is a process for tank fabrication in which continuous strands of fiberglass impregnated with resin are wound over the inner corrosion barrier in a predetermined geometric pattern.

Contact molding is a process for tank fabrication in which the structural reinforcement comprises sprayed, chopped-fiberglass supplemented with woven-glass roving fabric. This process is also known as hand layup, spray layup, pressure molding, or contact pressure molding. The pressure is seldom greater than that required to hold the materials.
together during fabrication.

Tanks up to 1.5 meters 5 feet are less expensive when fabricated by contact-molding methods. Strength requirements in larger tanks make filament-wound structures more economical. Filament winding offers equivalent strength with less shell thickness, and laminate quality is also improved.

**************************************************************************

[ Provide a contact-molded tank, conforming to BS EN 13121-3 ASTM D5948. ]

[Provide a filament-wound tank, conforming to BS EN 13121-3 ASTM D5948. ]

**************************************************************************

NOTE: Select one of the following for the tank top.

**************************************************************************

[ Provide a tank with an open top, with a reinforcing flange in compliance with ISO 7005-2 or a rib [and removable cover]. ]

[Provide a tank with a closed top. ]

**************************************************************************

NOTE: Select one of the following types if the tank is required to have a closed top.

The end of a filament-wound cylindrical container normally appearing convex is called a domed top.

The end of a filament-wound or contact-molded tank normally appearing concave is called a dished top.

**************************************************************************

[ Provide a tank with a [dome] [dished] [flat] closed top. ]

**************************************************************************

NOTE: Select one of the following for top fabrication.

Separate fabrication of the top and shell is most common.

**************************************************************************

[ Provide a closed top [integ rally fabricated with shell] [separately fabricated and laminated to the shell]. ]

**************************************************************************

NOTE: Select one of the following two paragraphs for flat-bottom fabrication.

Integral fabrication offers greater strength and does not rely on laminating procedures to join separate sections.

**************************************************************************

Provide a flat-bottom tank fabricated [integ rally with the shell] [separately and laminated to the shell].
Note: Specify additional special surfaces based on accessories and equipment required.

Provide a tank with bracketed flat surfaces for [an identification plate] [a certification plate] [a liquid-level gage] [mounting lugs].

2.3 ACCESSORIES

Note: Accessories specified are common items for general usage. Consult the manufacturer's literature for other standard and special accessories.

2.3.1 Flanged Nozzles

Note: Standard nozzles are suitable for most applications, but specify conically gusseted nozzles when vibratory or thermal stresses are anticipated.

Provide [standard] [conically gusseted] nozzles.

Conform the flange diameter and drilling to ISO 7005-2, 1050 kilopascal (150 psi) ASME B16.5, at a pressure of 150 pounds per square inch.

2.3.2 Inlet Nozzles

Note: Specify double-flanged inlet nozzles when interior pipe connections are desired.

Provide [single-] [double-]flanged inlet connections.

2.3.3 Outlet Nozzles

Note: Specify double-flanged outlet nozzles when interior pipe connections are desired.

Provide [single-] [double-]flanged outlet connections for a shell side and top, and a [side-bottom] [full] [siphon] [bottom] drain with a bottom elbow.

2.3.4 Vent

Note: Select one of the following types of vents for closed-top and removable-top tanks. Show the vent size on drawings.

Provide a [v-vent] [gooseneck] [mushroom] [flanged nozzle [breather] [combination vacuum break/pressure relief]] vent for tank top.
2.3.5 Flanged Manways

[ A manway is not required.][Provide a [top-flanged] [side-flanged] manway.]

[Conform the flange diameter and drilling to ISO 7005-2, 1050 kilopascal
ASME B16.5, 150 pounds per square inch pressure.]

2.3.6 Removable Cover

[ A cover is not required.][Provide a [domed] [dished] [flat] cover, with [a
lifting ring at the center of the cover][ three lifting lugs spaced 120
degrees apart on the cover.]]

2.3.7 Tie-Down Lugs

**************************************************************************
NOTE: Indicate quantity of lugs and angular spacing
based on manufacturer's recommendations. Specify
lugs on tanks subject to vibratory stresses and
those erected outdoors. Three to six lugs evenly
spaced are standard practice, depending upon tank
size.
**************************************************************************

Provide tie-down lugs as indicated.

2.3.8 Tank Lifting Lugs

Provide [three lifting lugs spaced 120 degrees apart at the top portion of
the straight shell][ one center top lug].

2.3.9 Identification Plate

Provide a phenolic-plastic identification plate with letters at least 50
millimeter 2 inches high, stating the chemical to be stored.

2.3.10 Certification Plate

Provide a stainless-steel certification plate, stating that the tank is
designed for the chemical stored and indicating the concentration, specific
gravity, [______], and maximum temperature of the stored chemical.

PART 3 EXECUTION

3.1 INSTALLATION

Install the tank on a foundation in accordance with the manufacturer's
instructions for the installation of specified system, including special
notices and material safety data sheets, special signage, and data related
to impedances, hazards, and safety precautions. Submit equipment
foundation data to the Contracting Officer before beginning the foundation
work. Ensure that the equipment foundation data includes the equipment
weight and operating loads, horizontal and vertical loads, seismic data,
wind loads, location and projection of anchor bolts, horizontal and vertical
clearances for installation, plan dimensions of foundations and relative
elevations, and other installation requirements such as utility services.
3.1.1 Equipment Location Drawings

3.1.2 Installation Drawings

Submit installation drawings for fiberglass-reinforced polyester storage tanks including all foundation and anchorage details, at least \([30]\) days before start of construction work begins.

In the coordination drawings submittal, include the processes and structural elements of the work. Indicate where conflicts or clearance problems exist between the various functions. Provide drawings that clearly show equipment and performance data furnished by the storage tank manufacturer and that indicate use life, safety features, and details on automated mechanical features.

[ Show structural and fenestration features on the equipment room layout drawings, indicating where a reduction in the available space results from the installation of items. Detail the ductwork and piping.]

3.1.3 Cleaning

After installation has been completed and piping connections have been made, clean the tank and nozzles in accordance with the manufacturer's instructions.

3.2 FIELD QUALITY CONTROL

3.2.1 Inspection

Inspect installed tanks for indications of defective workmanship or improper installation practices. Repair or replace faulty construction and damaged work at no additional cost to the Government.

3.2.2 Hydrostatic Test

After the tank has been installed, and before the piping connections are made and the equipment is attached, block the outlets and fill the straight-shell portion with a chemically compatible fluid. Perform hydrostatic tests to determine if leak-proof storage is provided, and correct deficiencies.

Submit written manufacturer's field reports of test data recorded at the job site for review and final approval no later than \([30]\) calendar days before contract completion. Repair or replace unsatisfactory tanks and retest the tanks at no additional cost to the Government until the tanks are determined to be leak-proof systems.

3.3 CLOSEOUT ACTIVITIES

3.3.1 Operation and Maintenance Manual

Submit \([\blank]\) copies of the operation and maintenance manual at least \([30]\) calendar days before testing the system. Update and resubmit data for final approval no later than \([30]\) calendar days before contract completion. Ensure that the manual includes information for the following:

a. Storage tanks
b. Flanged nozzles

c. Inlet nozzles

d. Outlet nozzles

3.3.2 Record Drawings

Submit record drawings of the completed installation no later than [30] days before completion of the project. Ensure that record drawings include civil site developments, such as new facility and land modifications, external structural changes to aboveground structures, and changes to underground structures and utilities external to facilities.

Submission of the completed drawings certifies accuracy and completeness of the documents.

Ensure that record drawings provide the following information:

a. Location of new lines, conduits, valves, fittings, fire hydrants, meters, terminal points using at least two ties to permanent points (manholes, power poles, curbs, or storm water inlets), or GPS coordinates with accuracy to at least 1 meter 3 feet. An acceptable station and offset system may be used for service lines and fittings only.

b. Location of new lines from property easement lines or edges of pavement at 90 meter 300 feet intervals.

c. Utility routing and interface changes, indicated clearly on the drawings, to scale and defined with sufficient dimensions.

******************************************************************************
NOTE: Insert the appropriate form and jurisdictional authority for the respective agency within the appropriate blanks below if other than the Contracting Officer or Government.
******************************************************************************

Provide support for obtaining surveyed coordinates for facility footprint corner and underground structures and utilities external to facilities by submitting [Form] to the [Contracting Officer] at least 5 working days before foundation construction or open excavation as notification to the [Government].

Prepare record drawing prints at a minimum scale of 1 cm equals 100 meters 1 inch equals 100 feet. Enlarge the scale to show areas requiring additional detail.

Provide record drawings in digital format. Provide geospatially referenced files in ESRI GIS Geodatabase, ESRI GIS Shapefile, Microstation DGN, AutoCAD DWG or DXF file format. Provide information in separate layers/levels as specified by GIS in at least the same degree of separation as the design drawings provided. Ensure that sew items are contained in the same level as like items so that the drawings can be easily converted to GIS layers.

Use the following spatial reference:
NOTE: Insert appropriate survey reference information, and the date of most recent datum.

b. Vertical accuracy: Reference surveys to the North American Vertical Datum (NAVD) [1988] [____]. Include a description of the reference benchmarks from which the NAVD has been determined in the survey.

c. Make lines, letters, and details sharp, clean, and fully legible.

d. Submit one reproducible print and one digital copy in an electronic storage media.

1.2 SUBMITTALS

*NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other
submital items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Approved Detail Drawings; G[, [____]]

SD-03 Product Data
   Emission Monitoring System
   Air Pollution Control Equipment
   Instrumentation and Controls
   Training
   System Performance Test; G[, [____]]

SD-06 Test Reports
   Factory Tests
   System Performance Test;

SD-07 Certificates
1.3 QUALIFICATIONS

1.3.1 Welding

NOTE: If the need exists for more stringent requirements for weldments, delete the first bracketed statement and the last bracketed statement applies. Dust collection equipment covered by the guide specification is not normally manufactured to the requirements of the ASME Boiler and Pressure Vessel code. Welding of these vessels will be governed by Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

[Piping shall be welded in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and welders shall be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. The Contracting Officer shall be notified 24 hours in advance of tests and the tests shall be furnished at the work site if practicable. The Contracting Officer shall be furnished a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators. The welder or welding operator shall apply his assigned symbol near his welds using a rubber stamp or felt-tipped marker with permanent weatherproof ink or other methods approved by the Contracting Officer that do not deform the metal. Structural members shall be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING.]  [Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING.] Nonpressure dust collection vessels shall be welded in accordance with provisions of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.3.2 Contractor

Contractor shall have had a minimum of [2][3][5][_____] years of experience in the construction and maintenance of industrial air pollution control systems.

1.3.3 Manufacturer's Field Representative

Services of a manufacturer's field representative and training engineer, who is experienced in the installation, adjustment, and operation of the equipment furnished, and who has complete knowledge of the proper operation and maintenance of the system, shall be provided. Field representative shall be onsite to supervise the installation, adjustment and compliance testing of the equipment. Field representative shall provide supervision of the system for [_____] days after startup of the system.
1.4 CONSTRUCTION REQUIREMENTS

System shall be suitable for [indoor] [outdoor] installation and shall be provided [with] [without] a weather enclosure. [Unit shall be provided with [_____] mm inch of insulation with a k value of [_____] W/m K Btu/h ft] [Unit shall not be insulated]. System shall be designed for [a wind load of [_____] kph mph] [and] [an internal [negative] [positive] static pressure of [_____] Pa inch of water gauge]. [System shall be designed for a snow load of [_____] kPa psf]. Seismic protection of equipment shall be in accordance with UFC 3-301-01, Section 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT, Section 23 05 48.19 [SEISMIC] BRACING FOR HVAC, and Section 26 05 48.00 10 SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT.

1.5 DELIVERY, STORAGE, AND HANDLING

Store all equipment delivered and placed in storage as recommended by the manufacturer, with protection from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

1.6 EXTRA MATERIALS

**************************************************************************
NOTE: Include items needed for future maintenance and repair, items that might be difficult to obtain and spare parts needed to ensure continued operation of critical equipment.
**************************************************************************

Auxiliaries for maintenance shall be provided with the equipment and shall include all special tools, rigs, jigs, fixtures, equipment, or other devices required for normal operation and service. Any equipment required for routine maintenance such as filter wash facilities, oil or refrigerant removal, and replacement devices shall be provided. Tests or measurement instruments or gauges shall be included. The following shall also be furnished:

[ a. Spare parts for each different item of material and equipment specified including all the of parts recommended by the manufacturer to be replaced after [1 year] [1 year and 3 years] service.]

[ b. [One set of special tools for each type of equipment, including calibration devices, and instruments required for adjustment, calibration, disassembly, operation, and maintenance of the equipment.] [One set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment].

[ c. One or more steel tool cases mounted on the wall in a convenient location complete with flat key locks, two keys, and clips or hooks to hold each special tool.]

[ d. [_____].]

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

The system shall consist of 9.5 mm 3/8 inch [carbon steel] [alloy] [stainless steel] scrubber vessel(s), insulated electrostatic grid(s), transformer-rectifier(s), high voltage control section, pea-sized gravel
media, media circulation system including lift, air blower(s), piping, valves, and seal legs, dust collection and separation system, and controls. Dirty gas shall enter the dry scrubber vessel which shall contain several louvered concentric tubes. The annular space between the inner wall of the vessel and the outer louver wall shall be filled with circulating pea-size gravel media. Prior to entering the scrubber, the dirty gas shall pass an ionization electrode or grid in the two-grid unit where the dust particles are electrostatically charged. In both grid configurations, dirty flue gas shall pass through the circulating gravel media which has been converted to the equivalent of a collecting electrode by the high voltage bed electrical grid. Particulate shall be separated from the gas by both impaction and electrostatic collection, and deposited on the circulating gravel. The cleaned gas shall exit the downstream duct of the scrubber. The dust-laden gravel shall drop into a hopper(s) from which it shall be airlifted to the separation or deentrainment chamber. The dust shall be separated from the gravel by the airlift action and shall exit the top of the deentrainment chamber to the collection and disposal system. The cleaned media shall be returned to the scrubber vessel.

2.2 MATERIALS

2.2.1 Standard Products

Material and equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of the products. Items of equipment shall essentially duplicate equipment that has been in satisfactory use at least 2 years prior to bid opening. Equipment shall be supported by in-service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. In-service organization shall respond to a service call within [_____] hours [_____] days.

2.2.2 General Requirements

Equipment and appurtenances shall be as specified and as shown on the approved detail drawings, and shall be suitable for the service intended. Materials and equipment shall be new and unused, to include testing equipment furnished under the contract. Components that serve the same function and are the same size shall be identical products of the same manufacturer.

Detail drawings contain complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

2.2.3 Nameplates

Each major component of equipment shall have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the equipment. Each piece of equipment shall bear the approval designation and the markings required for that designation. Valves shall be marked in accordance with MSS SP-25 and shall bear a securely attached tag with the manufacturer's name, catalog number and valve identification permanently displayed.

2.2.4 Equipment Guards[ and Access]

**************************************************************************

SECTION 44 10 00 Page 13
NOTE: Catwalk, ladder, stair, and guardrail may be required. If so, select the applicable item, delete the others, and indicate on drawings the selected item.

Belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts so located that any person may come in close proximity thereto, shall be enclosed or guarded to prevent accidental personal injury, in accordance with 29 CFR 1910, Subpart O, Machinery and Machine Guarding. Guards shall be removable and arranged to allow access to the equipment for maintenance. High-temperature equipment and piping so located as to endanger personnel or to create a fire hazard shall be guarded or covered with insulation of type specified for service. [Items such as[ catwalk,][ stair,][ ladder,][ and][ guardrail] shall be provided where shown and shall be in accordance with Section [08 31 00 ACCESS DOORS AND PANELS][05 51 33 METAL LADDERS]]

2.3 GAUGE

NOTE: Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process shall dictate material selection.

Gauge shall conform to the following:

2.3.1 Draft Gauge

ASME B40.100. Tubing for gauges for service above 66 degrees C 150 degrees F shall conform to ASTM B68/B68M; for service below 66 degrees C 150 degrees F, plastic tubing conforming to ASTM D1248 may be used.

2.3.2 Gauges, Pressure and Vacuum

ASME B40.100, range suitable for the related conditions.

2.4 LOW-WATER CUTOFF

NOTE: Low-water cutoff applies to all wet scrubber tanks, reservoirs, and sumps if low level or loss of water can affect scrubber or boiler operation and safety. Coordinate requirement for deenergizing boiler panel to stop firing the boiler if scrubber components are subject to damage from excess heat in a loss of water supply.

Low-water cutoff shall be provided for all scrubber liquid sumps, holding tanks, reservoirs, and mixing tanks. Cut-off shall cause a safety shutdown of the scrubber and shall be provided with auxiliary contacts to be used to sound an alarm. [Low-water shutdown shall require a manual reset before
any equipment can recycle or operate.]

2.5 PIPE, FITTINGS, AND TUBING

Pipe, fittings, and tubing shall conform to the following:

2.5.1 Pipe

**ASTM A53/A53M**, Type S, Grade A, standard weight; or copper pipe, **ASTM B42**.

2.5.2 Nipples

**ASTM A733**, standard weight to match adjacent piping.

2.5.3 Pipe Fittings

2.5.3.1 Steel Pipe Fittings

**ASME B16.9** for butt-welding fittings; **ASME B16.11** for socket-welding fittings; and **ASME B16.5** for flanged fittings.

2.5.3.2 Brass or Bronze Pipe Fittings

**ASME B16.15**, Class A, 862 kPa 125 pound.

2.5.3.3 Malleable-Iron Pipe Fittings

**ASME B16.3**, type to match adjacent piping.

2.5.3.4 Unions

**ASME B16.39**, type to match adjacent piping.

2.5.3.5 Flanges, Cast-Iron and Bronze

**ASME B16.1** and **ASME B16.24**.

2.5.3.6 Pipe Threads

**ASME B1.20.2** **ASME B1.20.1**.

2.5.4 Tube, Copper

2.5.4.1 Tube for Air, Water, Gas, and Drains

**ASTM B68/B68M** or **ASTM B88M** **ASTM B88**.

2.5.4.2 Tube for Refrigeration Systems

**ASTM B280**.

2.6 STEEL SHEET

Steel sheets shall conform to the following:

2.6.1 Zinc Coated (Galvanized)

**ASTM A653/A653M; ASTM A924/A924M** for dust collector casings, housing, and components. Gauges specified are manufacturers' standard gauge.
2.6.2 Low-Carbon

Gauges specified, for dust collector casings, housings, and components, refer to manufacturers' standard gauge.

2.6.3 Corrosion Resistant

ASTM A167, Class 304 or 316. Gauges specified refer to U.S. Standard Gauge.

2.7 AIR TRAPS

Air traps for removal of moisture from plant compressed air supplied to air pollution control equipment shall conform to ASTM F1139.

2.8 THERMOMETERS

Thermometers shall conform to ASME PTC 19.3 TW with wells and temperature range suitable for the use encountered.

2.9 VALVES

Valves shall conform to the following:

2.9.1 Angle Valves

MSS SP-80, Types 1, 2, or 3, Class 125, except that valves over 80 mm 3 inch shall have iron bodies and brass or bronze standard trim with glands or followers in the stuffing boxes. Valves shall have nonmetallic renewable composition discs and raised flat seats designed for 862 kPa 125 psi steam. Wheels shall be secured with hexagonal nuts.

2.9.2 Check Valves

MSS SP-80, Types 1, 2, 3, or 4, Class 125, as required. Valves over 80 mm 3 inch shall have iron bodies and shall be the swing type designed for 862 kPa 125 psi steam. Check valves shall have renewable composition discs or shall have metallic discs of the regrinding type to permit regrinding without removing valve from the line.

2.9.3 Gate Valves

Sizes of 40 mm 1-1/2 inch or less, MSS SP-80, Class 125, Type 1 and 2; 50 mm 2 inch size and over, MSS SP-70, Class 125 or 250, as specified; outside screw and yoke with threaded end (design OT), or flanged end (design OF), as required.

2.9.4 Globe Valves

MSS SP-80, Type 1. Valves over 80 mm 3 inch shall have iron bodies and brass or bronze standard trim and shall have glands or followers in the stuffing boxes. Valves shall have nonmetallic renewable composition discs and raised flat seats designed for 1035 kPa 150 psi steam. Wheels shall be secured to the stems with hexagonal nuts.

2.10 WATER METERS

Water meters shall be the disc type with reinforced disc for hot water above 66 degrees C 150 degrees F, and rubber or carbon disc for cold water, and
shall be constructed of bronze composition or cast iron protected by noncorrosive coating. Moving parts subject to wear shall be easily replaceable. Meters shall conform to the requirements of AWWA C700.

2.11 ELECTRICAL WORK

**************************************************************************

NOTE: Indicate on drawing the type and class of motor enclosure depending on environment in which the motor is to be used.

**************************************************************************

Electrical motor-driven equipment specified shall be provided complete with motors, motor starters, and controls. Electrical equipment and wiring shall be in accordance with [Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM]. [Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION]. [Section 33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION]. Electrical characteristics shall be as indicated or specified. Motor starters shall be provided complete with thermal overload protection and other appurtenances necessary for the motor control specified. Each motor shall be of sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices specified but not shown, shall be provided. Motors shall conform to NEMA MG 1, with enclosures as indicated [except as specified for Petrol Vapor Recovery Unit]. Controls, interlocks, instruments, status indication lights, and other devices required for operation and observation of equipment status shall be assembled on an [open face panel] [enclosed panel with [latched door] [key locked door]]. Panel shall be [factory-assembled, connected to equipment, and mounted on unit] [or] [factory assembled and boxed for field installation]. Instrumentation and control system shall include local control panels and a central control panel located in the facility control room. The control system shall integrate local controls provided with equipment, as specified, so that complete system operation can be monitored and controlled from the control room. The air pollution control system shall include integrated control of all system processes and equipment, and shall contain all necessary instrumentation required for monitoring and operation of the air pollution control system. Control system panels shall graphically display the system. Local control panels shall be provided with selector switches so that equipment can be operated manually for test and maintenance purposes. Suitable safety interlocks shall be incorporated to assure that proper permissive conditions have been met prior to changing the operating status of major system components. Shutdown of the air pollution control equipment system, or portion thereof, shall be automatically initiated, with alarms should unsafe conditions arise during operation of the system. Visible and audible alarms shall be provided on critical functions locally, and at central control room. Controls shall conform to NEMA ICS 1. Enclosures for power and control panels shall conform to NEMA ICS 6.

2.12 DRAFT FANS

**************************************************************************

NOTE: In new installations, coordinate design with boiler or incinerator specification. For retrofit, fans will be sized for air pollution control equipment. For fans operating in corrosive or
erosive environment, provide liners for scroll sheets and rotor blades. References to draft fans will be deleted if inapplicable for the equipment specified.

Centrifugal fans conforming to AMCA 801 [Type I] [Type II] [forced draft] [and] [induced draft] shall be furnished as an integral part of air pollution control equipment design. Fans shall be [centrifugal] [_____] with [backward curved blades] [radial tip blades] [or] [axial flow type]. Each fan shall be sized for an output volume and static pressure rating sufficient for pressure losses, leakages, temperature, and elevation corrections for worst ambient conditions. In addition, fan sizing shall include margins of 10 percent volume and 21 percent static pressure, plus margins of [5] [_____] degrees C [10] [_____] degrees F for forced draft fans and [22] [_____] degrees C [40] [_____] degrees F for induced draft fans. [Induced draft fans shall be provided with outlet dampers]. Noise levels for fans shall not exceed 85 decibels in any octave band at a 914 mm 3 foot station. Fan bearings shall be [air cooled] [or] [water cooled], and backward curved fan blade type with bearings not requiring water cooling may be of the self-aligning antifriction type. [Scroll sheets and rotor blades shall have liners.]

2.12.1 Draft Fan Control

NOTE: Variable speed control, inlet vane control, and inlet damper control are, in descending order of efficiency, capable of control draft fan conditions. The choice is based on economics. However, in erosive services, inlet vane control is not desirable.

Forced draft centrifugal fans shall have [inlet vane control] [variable speed control] where indicated. Induced draft centrifugal fans shall have [inlet vane control] [inlet damper control] [variable speed control]. Axial propeller fans shall have variable propeller pitch control and variable speed drive.] Inlet vanes or dampers shall be suitable for use with air pollution control equipment.

2.12.2 Draft Fan Drives

NOTE: Where motor starters for mechanical equipment are provided in motor control centers, delete the reference to motor starters.

Steam driven boiler auxiliaries will not be used unless the exhaust steam can be utilized completely. Reference to steam drives will be deleted if inapplicable for the equipment specified.

Fan shall be driven by [an electric motor] [or] [a steam turbine]. Electric motor shall be [drip-proof] [totally enclosed nonventilated] [totally enclosed fan-cooled] [totally enclosed fan-cooled], suitable for installation in a Class II, Division 1, Group F, hazardous location conforming to NFPA 70]. [Motor starter shall be magnetic [across-the-line]
[reduced voltage start] type with [general-purpose] [weather-resistant] [water tight] [dust-tight] [explosion-proof] enclosure and shall be furnished with four auxiliary interlock contacts. Steam turbines shall operate properly with a steam inlet pressure of [___] Pa psig and with steam back pressure of [___] Pa psig. Turbines shall have horizontally-split, centerline support casings, water-cooled bearing housings with ring-oiled, babbitt-lined, bronze packed sleeve bearings. Turbines shall also be equipped with a mechanical shaft speed governor and valve, and independent emergency overspeed governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, removable stainless steel steam strainer [without disconnecting piping], any special wrenches and tools required for servicing turbine, and a sentinel warning on the exhaust casings. Turbines shall conform to NEMA SM 23].

2.13 DUCTWORK

**************************************************************************
NOTE: References to ductwork will be deleted if inapplicable for the equipment specified. Ductwork thickness or gauge will depend on both size and pressure.
**************************************************************************

Ductwork shall be [galvanized sheet metal conforming to ASTM A653/A653M] [___] with a minimum thickness of [___] mm [___] gauge [___] inch [___] gauge. Ductwork shall be designed to convey air with a minimum of pressure loss due to friction. Ducts shall be straight and smooth on the inside with laps made in the direction of airflow. Ducts shall be externally braced and shall be so installed and anchored as to be free of vibration. Access and inspection doors shall be provided as indicated, with a minimum of one in each section between dampers or items of equipment. Ducts shall be constructed with long radius elbows having a centerline radius of 1.5 times the duct width, or where the space does not permit the use of long radius elbows, short radius or square elbows with factory-fabricated turning vanes may be used. Duct joints shall be substantially air-tight and shall have adequate strength for the service.

2.14 AIR POLLUTION CONTROL EQUIPMENT

**************************************************************************
NOTE: Delete all equipment requirements not required on the project. Title 40, Part 60 of the Code of Federal Regulations for Protection of Environment (40 CFR 60), state and local codes contain regulations pertaining to air pollution control. 40 CFR 60 contains Standards of Performance for New Stationary Sources. In addition, EPA Test Report No. AP-42 with latest supplements contains emission factors for the specific pollutant emitter (uncontrolled). Determine the degree of required pollutant removal from the gas stream to meet the more stringent of local, state and EPA regulations and indicate whether EPA, state or local regulations apply. With the information thus obtained, determine the most effective and economical air pollution control equipment required. This process will be repeated for each pollutant emitter identifying the pertinent...
regulation. Indicate on drawings for each pollution control equipment electric power requirements including motor sizes, etc., where applicable. Coordinate performance, operation, and control of pollution control equipment with all other related system components to assure total system operation and that safety requirements are met. Indicate on drawings any such items as walkways, guardrails, stairs, and ladders furnished as part of the pollution control equipment, if required.

**************************************************************************

Performance of equipment shall be as indicated in Paragraph SCHEDULES. [Paint spray and wet process gas ductwork shall comply with AIHA Z9.3 and NFPA 91.][ Air and water piping shall comply with ASME B31.1.][ Particulate emission control equipment shall conform to ASME PTC 38.][ Equipment shall be provided with steel walkways, safety rails and stairs, or ladders as indicated. Access shall be by means of [caged ladders][step stairs with handrails]].

a. Submit a complete list of equipment and material, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Spare parts data for each different item of material and equipment specified, after approval of detail drawings and not later than [___] months prior to the date of beneficial occupancy. The data shall include a complete list of parts and supplies, with current unit prices and source of supply.

b. Submit proposed diagrams, instructions, and other sheets, prior to posting. Framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, including equipment, piping, valves, and control sequence, shall be posted where directed. Condensed operating instructions explaining preventative maintenance procedures, methods of checking the system for normal, safe operation, and procedures for safely starting and stopping the system shall be prepared in typed form, framed as specified above for the wiring and control diagrams, and posted beside the diagrams. The framed instructions shall be posted before acceptance testing of the system.

c. Submit detailed manufacturer's data on the instrumentation and controls. Include overall controls, sensors, process controllers, control operators, ladder diagrams, timers, sequence of controls, valves, alarms, signals, interlocks and cut off systems. Data describing in detail the equipment used to monitor emissions, including the sampling probe, filters, sampling pump, moisture separator/drier, tubing, analyzer, analyzer calibration system, data recorder, and alarms. Process and instrumentation diagrams (P&IDs).

2.14.1 Dry Dynamic Precipitator

**************************************************************************

NOTE: Select construction features required including drive component and delete all others. Dry dynamic precipitators may be used for collecting coarse dry particulates from coal crusher, conveyor, and bunker ventilation where the objective is to control material losses and to remove coarse fly-ash.
particulates from boiler flue gases of chain-grate or stoker-fired boilers. It is not effective in removing gaseous pollutants or particles of 7 micrometers and under.

Unit must be a mechanical collector consisting of a motor-driven fan, a fan casing, a hopper or dust bin, fan motor, fan motor starter with overload protection, [fan drive coupling] [belt drive with fan and motor pulleys and adjustable motor base], fan and motor mounting base on hopper, and a [ceiling mounting] [floor mounting] stand for the entire assembly. The fan shall comply with AMCA 99, Section 99-0401, Classification for Spark Resistant Construction, AMCA 210, and AMCA 300.

2.14.1.1 Fan Impeller

Fan Impellers must be steel and designed to provide the static head required for pumping the dirty and cleaned gas streams through the duct systems and related components. Impeller shall be keyed and locked on a cold drawn, turned and polished steel shaft mounted on heavy duty grease or oil lubrication ball or roller bearings. Shaft shall have a diameter and stiffness that will limit deflection at the maximum shaft loading, within the operating range of the fan, to not more than 0.167 mm/meter 0.002 inch/foot of shaft. Shaft shall be provided with a locked key slot for mounting a pulley, a direct drive, or coupling. The entire rotating assembly shall be dynamically balanced at operating speeds. Fans shall be dynamically balanced and factory-tested in accordance with AMCA 204 at the design operating RPM to Fan Application Category BV-3, Balance Quality Grade G6.3 or approved equivalent. Installed vibration levels shall not exceed the levels specified in AMCA 801.

2.14.1.2 Fan Casing

Fan casing shall be abrasion resistant cast iron conforming to ASTM A48/A48M or abrasion resistant steel consisting of a fan support base with back-housing, involute fan discharge scroll with inlet and discharge duct connections, and a dirt discharge port. Scroll shall be provided with readily replaceable wear plates and shall be constructed to permit field positioning the direction of discharge in at least eight different directions. Scroll shall provide means for accumulating and diverting the bulk of the particulate enriched gas stream into the hopper before the gas stream is returned to the inlet to the scroll.

2.14.1.3 Hopper Storage

NOTE: Determine the rate and quantity of pollutant material collected, the final disposition of the material, and the manner and frequency of transport to disposal location. From this, determine the hopper size to be indicated and select the bracketed hopper outlet. Delete those not selected.

Hopper storage capacity shall be as indicated. Unit shall be constructed of not less than 3.4 mm 10 gauge [welded low carbon] [corrosion resistant] steel plate for the vertical sides and bottom which shall be sloped steeper than the slump angle of the material being collected to minimize bridging over at the outlet. Top shall be constructed to support the fan, motor,
and drive without buckling or being resonated by the fan and shall be not
less than 6.4 mm 1/4 inch thick. Hopper shall be provided with an access
door and shall have [a manually-operated rotary lock] [a motor-driven
rotary lock] [a guillotine-type slide gate].

2.14.1.4 Test Connections

Pressure test connections shall be provided at the suction and discharge
ducts connecting to the precipitator.

2.14.2 Wet Dynamic Precipitator

**************************************************************************
NOTE: Select construction features required
including drive component and delete all others.
Wet dynamic precipitators are frequently used for
ventilation air cleaning of coal crushing,
conveying, and storage facilities where the dust
loading is 1 to 4.6 grams per cubic meter 1/2 to 2
grains (weight) per cubic foot of air and the
particles are 50 percent or more of 2 to 7
micrometers size. It will remove some gaseous pollutants.
**************************************************************************

Unit shall be a mechanical collector consisting of a motor-driven fan, a
fan casing with water sprayhead, [a hopper or slurry bin,] fan motor, fan
motor starter with overload protection, [fan drive coupling,] [belt drive
with fan and motor pulleys and adjustable motor base,] [fan and motor
support on [the hopper] [a rigid structural steel base] arranged for [floor
mounting]]. Fan shall comply with AMCA 99,Section 99-0401, Classification
for Spark Resistant Construction, AMCA 210, and AMCA 300.

2.14.2.1 Collector

**************************************************************************
NOTE: Delete inapplicable materials and equipment.
Pipe, fitting, and valve materials listed in this
section are suitable for water service, but not for
corrosive, erosive, and some petrol services. The
designer should select the proper alloy (e.g.,
stainless steel 304, 316, etc.), rubber or other
elastomer lining or plastic for these and other
applications where the chemistry of the process
shall dictate material selection.
**************************************************************************

Collector shall consist of a heavy steel plate fan housing constructed of
low carbon steel. Fan shall have ASTM A240/A240M stainless steel blades
and rivets. Blades shall be fastened to a heavy forged steel hub mounted
on a forged, ground, and polished ASTM A302/A302M stainless steel shaft
supported on ball or roller bearings. Shaft shall have a diameter and
stiffness that will limit deflection at the maximum shaft loading to not
more than 0.167 mm/meter 0.002 inch/foot of shaft. Impeller and driven
units shall be lock-keyed to the shaft with the entire assembly dynamically
balanced at all operating speeds. Fans shall be dynamically balanced and
factory-tested in accordance with AMCA 204 at the design operating RPM to
Fan Application Category BV-3, Balance Quality Grade G6.3 or approved
equivalent. Housing and impeller shall be provided with components that
will provide for uniformly covering rotating and stationary parts with a film of moving water to provide for wetting and capturing of centrifugally impinged particulates. Means shall be provided for separation from the air stream and drainage of the water and particulate slurry from the collector. Installed vibration levels shall not exceed the levels specified in AMCA 801.

2.14.2.2 Hopper Storage

**************************************************************************
NOTE: Determine hopper storage capacity and indicate an open drain or valved outlet. Omit entire paragraph if hopper is not required for an installation piped to drain filtrate to a coal recovery or ash pit.
**************************************************************************

Hopper storage capacity shall be as indicated. Unit shall be constructed of not less than 3.4 mm 10 gauge [welded black] [welded corrosion resistant] steel plate for the vertical sides and sloped bottom. Top shall be constructed to support the fan, motor, and drive without buckling or being resonated by the fan and shall be not less than 6.4 mm 1/4 inch thick. Hopper bottom shall be sloped for complete drainage of slurry of collected material; shall be free of ledges and pockets; and shall provide for full free flushing of particulate when operating wet. Hopper shall be provided with an inspection window, cleanout, and access door. Hopper shall be provided with electric heating coils, modules, or blankets to keep collected material dry and free flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F.

2.14.2.3 Nonstainless Components

Water wetted, nonstainless components shall be coated with a permanently bonded, abrasion and corrosion resistant rubber facing suitable for the operating temperature of the gas stream.

2.14.2.4 Water Supply Components

**************************************************************************
NOTE: If water supply is unlimited, the pressure gauges, rate adjustment, and flow meter within brackets are not needed and should be deleted.
**************************************************************************

Precipitator shall be provided with water supply components sized to meet equipment capacity requirements and shall include:

a. A stainless steel water supply strainer with removable screen, flow control valve [with rate adjustment] [pressure gauge] [low pressure alarm switch] [water meter].

b. Analog solenoid water flow control valve.

c. Adjustable water pressure control switch with contacts to open on low pressure to stop or prevent operation of the fan motor if water pressure is below the minimum required for efficient operation of the collector. [An additional set of contacts to close on low pressure to permit operation of an annunciator alarm.] The adjustable range of the
switch trip shall be from [_____] to [_____] kPa [_____] to [_____] psig.

d. Water pressure gauges with 0 to 690 kPa 0-100 psig range.
e. Adjustable automatic water pressure or water flow rate regulator to provide a steady controlled rate of water flow as required for optimum collector performance.
f. Water flow meter sized for rate required by the collector.

2.14.2.5 Test Connections

Pressure test connections shall be provided at the suction and discharge ducts connecting to the precipitator.

2.14.2.6 Drain Connections

Slurry drain connections shall be screwed or flanged pipe connections sized as recommended by the manufacturer.

2.14.3 Conical Dry Dust Collector

**************************************************************************
NOTE: The conical dry dust collector removes up to 80 percent by weight of particles, 10 micrometers and over, from a gas stream and is used primarily on general industrial dusts and occasionally to clean boiler flue gases since it has a temperature tolerance up to 371 degrees C 700 degrees F. It is not effective in removing gaseous pollutants or particles of 7 micrometers size and under. Its high air friction drop may require a booster fan. It normally is selected for pressure drops in the 890 Pa to 1652 Pa 3-1/2 to 6-1/2 inch water gauge range at operating conditions.
**************************************************************************

Unit shall be a mechanical collector consisting of a top horizontal involute scroll gas inlet and outlet mounted over a vertical cylindrical shell or cone which shall have a narrow angle cone below. Unit shall be specifically designed to impart a high velocity vortex spin to the incoming downflowing gas stream to throw particulates to the wall of the cylinder and cone before turning upward in an internal vortex to the outlet. Replaceable wear plates [are] [are not] required.

2.14.3.1 Scrolls, Cylinder, and Cone

**************************************************************************
NOTE: Delete inapplicable materials and equipment. Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process shall dictate material selection.
**************************************************************************
Scrolls, cylinder, and cone shall all be not less than [3.4 mm 10 gauge] [4.8 mm 3/16 inch] [9.5 mm 3/8 inch] [welded black] [corrosion resistant] steel. Inlet and outlet scrolls shall be connected for [clockwise] [counterclockwise] connection and rotation of the vortex when looking down on the collector. Four equally spaced, welded steel support brackets shall be provided on the bottom of the inlet scroll or on the vertical walls of the cylindrical section of the collector. The collector cone shall not be used for storage. Particulate shall be removed and collected, and cone bottom shall be provided with an air-tight seal. [A guillotine-type slide gauge] [A manually-operated rotary lock] [A motor-driven rotary lock] shall be provided on the [bottom of cone] [bottom of surge tank] [bottom of storage receptacle].

2.14.3.2 Test Connections
Pressure test connections shall be provided at the inlet and outlet ducts connecting to the collector.

2.14.4 Multitube, Centrifugal Dry Dust Collector

**************************************************************************
NOTE: The multitube centrifugal dust collector has similar performance to the conical dry dust collector except it removes more of both coarse and fine particulates. This collector is often used on stoker-fired boiler applications. The pressure drop range is normally 635 Pa to 1144 Pa 2.5 to 4.5 inches water gauge at operating conditions. Sixty degree hopper valley angle is considered adequate for worse case coal/ash scenario. If designer can confirm that application is less demanding, he should consider a lower valley angle 55 degrees or 45 degrees. In certain applications the size of the unit may require some subassembly in the field, negating the restrictions on field assembly.
**************************************************************************

Unit shall be a mechanical collector utilizing a number of parallel vertical or horizontal tubes of small diameter in an enclosure having a single gas inlet and single gas outlet.

2.14.4.1 Inlet Tube Assemblies, Casing and Hopper

Inlet tube assemblies shall be replaceable [cast iron] [wear resistant steel with replaceable cast iron spinner vanes and cones] [wear resistant steel with replaceable spinner vanes and cones]. Casing shall be [3.4 mm 10 gauge] [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [low carbon] [corrosion resistant] steel with the dust released into a [3.4 mm 10 gauge] [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [black] [corrosion resistant] steel sloped bottom dust hopper. Hopper valley angle shall be 60 degrees from the horizontal. The hopper shall be provided with a poke hole and access door. Hopper bottom outlet shall be provided with [a guillotine-type slide gate] [a gravity-type trip gate opened by the weight of the collected material] [a manually-operated rotary lock] [a motor-driven rotary lock]. Unit shall be provided with a welded steel support assembly for field erection with no additional work other than setting and bolting the unit in place.
2.14.4.2 Test Connections

Pressure test connections shall be provided at the inlet and outlet ducts connecting to the collector.

2.14.5 Electrostatic Precipitator (ESP)

**************************************************************************

NOTE: Electrostatic precipitators are highly effective with efficiencies up to 99.9 percent by weight in removing fine particulates down to 0.3 micrometers in size from gas streams having light loading of material by weight. They are frequently applied in gas streams of 371 degrees C 700 degrees F or higher but may require a precleaner such as a dynamic precipitator, conical, or multitube centrifugal to bring the gas stream down to an optimum loading. They require a relatively large space. They have a very low gas flow friction but are quite sensitive to having a uniform distribution of gas flow through the unit. The efficiency may sharply fall under a gas flow above design rate. Efficiency is also affected by dust particle electrical resistivity which can be too high or too low for maximum performance. Frequently in these situations the addition of relatively small quantities of flue gas conditioning agents have been very effective in improving precipitator performance. Depending on the particle electrical resistivity level, flue gas conditioning will be considered a viable option. Commercial systems are available for ammonia, sodium compounds (carbonate and sulfate), and sulfur trioxide flue gas addition. Pulse energization, the modification to a conventional precipitator power supply to include the capability to superimpose a high voltage pulse on the base voltage, is a second enhancement technique for high resistivity particle applications. Intermittent pulsation, the programmed interruption of normal high voltage waveform, is another enhancement technique. Optimization of precipitator energization and rapping systems through the use of microprocessor-based controls results in lower power levels, reduced electrode failure, and overall improved collection efficiency. Examples of control schemes that can be accomplished with properly programmed microprocessors include:

a. Spark Prediction and Advance

b. Back Corona Detection

c. Opacity Feed Back

d. Rapping Optimization

e. Electrical Power Conservation
Reentrainment of collected material can be limited by a proper balance of factors that affect performance, such as gas velocity through the plates; uniformity of gas velocity profile; ratio of plate height to depth; size of lumps of agglomerated material rapped from the collecting plates and discharge electrodes; and others. Control may also be achieved by a system of automatic programmed gas flow dampers coordinated to operate with related rappers for sequential cleaning of each of the chambers.

Power consumption is generally equivalent to the additional power required by other collecting methods. The pressure drop across units is typically less than 127 Pa 0.5 inch water gauge. Caution should be exercised in their use where combustible or explosive coal dusts or oil fumes may be present and could be ignited by a "spark-over" of the high voltage across the electrodes.

**************************************************************************

Unit shall comply with requirements of ICAC EP-1, ICAC EP-7, and ICAC EP-8, and shall remove [aerosols] [and] [particulates] from processed gas stream by impressing a polarized electrostatic charge to the contaminants causing them to be drawn to and deposited upon opposite polarity charged plates. Unit shall contain multiple chambers and be of gas-tight construction. Unit shall be provided with [insulator compartments] [penthouse]. Unit shall be provided with anti-sneak baffles to force all gas flow through ionizing gas passages and to prevent gas bypassing the precipitator sections. Assembly shall consist of discharging electrodes and opposite charged plates, high voltage power pack and controls, a rapping system for knocking dust from the discharge electrodes and collector plates, perforated gas distribution plates, sheet steel enclosure with dust collecting hopper bottom, dirty gas inlet, clean gas outlet, and structural steel frame. Precipitator systems shall include microprocessor based controls [flue gas conditioning systems] [pulse energization] [intermittent energization].

2.14.5.1 Discharge Electrodes

Discharge electrodes shall be [wires and weights] [rigid electrodes] [rigid frame]. Discharge electrodes shall be top supported with the bottom free to expand and contract with gas stream temperature changes. Electrodes shall be laterally restrained to maintain optimum spacing from the plates. Electrodes shall have a stiffness, length, or restraints required to prevent vibration or flutter when the unit is in service.

2.14.5.2 Collecting Plates

Collecting plates shall consist of vertical panels of multiple steel strips hanging edgewise in the horizontal air stream so as to form the equivalent of many vertical splits of the gas stream into many gas passages. The strips shall be convoluted, stiffened or constructed with raised ribs, to provide sufficient stiffness to prevent distortion of the plates and also present vertical ridges to support boundary layer edges to increase plate dust retention. Plates shall be top supported with the bottom free to expand and contract with changes of gas stream temperature. Plate configuration and support system design shall be coordinated with the plate
rapping system design and operation to shed collected material from the plates and to retain a consistent and optimum spacing from the discharge electrodes.

2.14.5.3 Power Supply and Control System

Power supply and control system shall be solid state microprocessor type. Control system shall provide for continuous monitoring and regulating of applied voltage for effective maximum performance of precipitation over the range of plate loadings with minimum sparking and arcing to the plates. Entire system shall be provided with a system of safety interlocks and grounding devices to prevent personnel physical contact with high voltage components. Voltage insulators shall be provided with heaters.

2.14.5.4 Rapping Systems

The rapping systems shall consist of multiple hammers or other impact devices to cause particulate shedding from the collecting plate. Rapping shall automatically be programmed so that a minimum number of collecting plates and discharge electrodes are rapped simultaneously. The unit shall be designed to limit reentrainment of collected material falling from the collecting plates and discharge electrodes during the rapping operation without exceeding the design cleaning efficiency.

2.14.5.5 Inlet and Discharge Ducts

Inlet and discharge ducts shall be provided with turning vanes, deflectors, and baffle plates to provide for uniform distribution of gas flow through all gas passages and in each gas passage in accordance with ICAC EP-7. Pressure test connections shall be provided at the inlet and discharge ducts connecting to the precipitator.

2.14.5.6 Dust Storage Hopper

The unit shall be provided with a [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [low carbon] [corrosion resistant] sloped steel bottom dust storage hopper having the dust holding capacity indicated. The hopper shall be arranged to prevent reentrainment of collected material into the gas stream. The hopper bottom shall be provided with rappers or fluidizing pads and a hopper valley angle of 60 degrees and shall be free of pockets, ribs, fins, or any other obstruction to hold or interfere with free release of collected material to the outlet. The outlet shall be provided with [a guillotine-type slide gate] [a manually-operated rotary lock] [a motor-driven rotary lock]. The hopper shall be provided with a poke hole and gasketed access door and shall have a collected material level indicator for [local indication] [local indication with terminals for wiring to a remote indicator]. [The level indicator shall include a high material level audible alarm.] [The hopper shall be provided with electric heating coils, modules, or blankets to keep collected material dry and free flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F]. [The capacity of the heating coil module or blanket shall be as shown.] [The heating coil module or blanket's size shall be based on the ambient temperature of [_____] degrees C degrees F].

2.14.6 Wet Scrubber

**************************************************************************
NOTE: Select scrubber type based on efficiency

SECTION 44 10 00 Page 28
required. Wet scrubbers are used for the removal of
gaseous pollutants such as sulfur oxides, nitrogen
oxides, and other gaseous materials from boiler flue
gases. Removal of sulfur oxides (flue gas
desulfurization) is covered by Paragraphs "Wet Flue
Gas Desulfurization System" and "Spray Dryer Flue
Gas Desulfurization System". Wet scrubbers will
also remove fumes, mists, dusts, and smoke particles
from laboratory fume hood and welding booth
exhausts. With appropriate adsorbents they can
collect vapors of paint thinners and solvents. They
can handle boiler flue gases as high as 371 degrees C
700 degrees F, but impose a heavy water demand for
 evaporative cooling causing a heavy water vapor
plume from the chimney. This water use also
increases flue and chimney condensation and possible
corrosion damage. Those problems can be minimized
with a heat exchanger with a pump and water coils to
precool the hot flue gas to the scrubber and deliver
the recovered heat to the relatively cool cleaned
gas out of the scrubber, as required. Any surplus
heat can be used for other heating applications.
The scrubber requires a water and chemicals supply
system with problems of slurry or sludge removal;
chemicals storage, mixing, feeding, and monitoring;
and corrosion prevention of wetted parts. Since the
scrubber system is relatively costly to install and
operate, care should be exercised to limit its use
to the function that only it can perform. In
addition to its primary function of removing gaseous
pollutants, it will also remove particulates. In
addition to water sources shown within brackets,
there may be other sources such as recycled water
from waste treatment plant among others. Insert
source within brackets and delete the others.

**************************************************************************
Unit shall comply with ICAC G-1, ICAC WS-1, ICAC WS-3,
and ICAC WS-4 as a
wet scrubber for removing gases, fumes, and particulates from the air
exhausted from [welding] [and] [paint spray] booths [and from [____]].
Scrubber shall be one of the types identified by ICAC WS-3 as a [venturi,]
[spray,] [tray,] [fixed packed bed,] [mobile bed,] [impingement,] [or]
[entrainment] type [or a combination of these types]. Unit shall employ a
small quantity of water or chemical neutralizing water solution to provide
for maximum scouring and pollutant removal of the gas stream. Water demand
rates of less than 0.13 L/second per cubic meter per second one gpm per
1000 cfm of processed gases shall use [potable] [cooling tower blowdown]
[____] water with waste to drain. Water demand in excess of the above
flow rate shall provide for recirculation of the washing liquor. Unit
shall be provided with [an automatic water supply control valve,] [a
float-operated water level control valve,] [a totalizing water meter,]
strainer, and water pressure gauge.

2.14.6.1 Chemical System

**************************************************************************
NOTE: Investigate user agency, facility operation,
and maintenance standards and procedures; analyze
the pollution control equipment's consumption of
materials; confer with equipment suppliers; and determine the optimum time period for reserve capacity. Select the "reserve" time period, and delete all other periods. The above investigation will also determine if the last sentence within the brackets should be retained or deleted.

Each unit requiring neutralizing chemical additives shall be provided with a complete automatic chemical monitoring, control, mixing, feeding, and reserve storage system. The chemical system shall have a reserve capacity for [[24] [36] [48] hours] [[3] [7] [10] days] of continuous scrubber operation at design conditions without requiring servicing. [Components that must be taken out of service for routine maintenance or chemical loading shall be provided in duplicate arranged for transfer by manual operation of switches and valves.]

2.14.6.2 Scrubber

Scrubber shall be fluid-tight construction of [glass fibre reinforced polyester] [rolled low-carbon steel coated with coal-tar enamel] [ASTM A302/A302M stainless steel] [ASTM A240/A240M stainless steel]. Unit shall be provided with leak-tight viewing windows and access doors to permit appraisal of entire operation as well as full access for all service operations or parts replacement. Vanes, baffles, deflectors, or diffuser plates shall provide for uniform gas flow through the processing area. Scrubber shall be factory assembled, piped, and wired on floor mounted welded steel bases as indicated.

2.14.6.3 Recirculation Pumps

NOTE: Determine if facility will require continuous operation or if it can be shut down or if the pollution control equipment can be out of service for extended periods. If continuous operation is required, select wording for duplicate pumps and remove brackets.

Unit requiring recirculation of the scrubbing liquor shall be provided with [direct] electric motor centrifugal pumps [in duplicate] to conform to HI ANSI/HI 3.1-3.5. Pumps shall develop the system pressure head required by the scrubber. Materials, construction, ratings, application, and testing shall conform to the standards and recommendations of HI ANSI/HI 3.1-3.5 for corrosion resistant operation of pumping the scrubber liquor. [A manual selector switch shall be provided for selection of "Lead" and "Lag" operation of the duplicate pumps.] Each pump shall have a discharge pressure gauge appropriate for the pump head and a low pressure limit switch to [start the backup pump] [and] [close a circuit for an alarm]. Pumps shall be provided with corrosion-resistant strainers, valves, and piping suitable for the system and the gas to be processed. [Pumps for metering the feed rate of scrubber chemical additives shall be provided with [manual] [automatic] means for varying the feed rate.]

2.14.6.4 Piping Materials

NOTE: Delete inapplicable materials and equipment.
Pipe, fitting, and valve materials listed in this section are suitable for water service, but not for corrosive, erosive, and some petrol services. The designer should select the proper alloy (e.g., stainless steel 304, 316, etc.), rubber or other elastomer lining or plastic for these and other applications where the chemistry of the process shall dictate material selection.

Piping materials shall be compatible with the scrubber fluids.

2.14.6.5 Scrubber Collector System

Each scrubber requiring the use of chemical additives shall be provided with a system for removing and dewatering the collected material and chemical residues of the scrubber process. Related equipment and controls shall be provided. Pressure test connections shall be provided at the inlet and outlet ducts connecting to the collector.

2.14.7 Dry Fabric Collector for Boiler Flue Gases

NOTE: Dry fabric collectors are highly effective in removing up to 99.9 percent by weight of particulates of submicron size and larger from gas streams of more than 229 mg per cubic meter 0.1 grain (weight) per cubic foot. Emissions will consistently be less than 11 mg per cubic meter 0.005 grain/actual cubic foot. Fabrics are available for gas streams up to 288 degrees C 550 degrees F and are often used for particulate removal from coal handling operations and boiler flue gases. Fibre selection and fabric construction and finish are extremely critical to the performance and service life of a dry fabric collector. Chemical, temperature and abrasion resistance, strength, and dimensional stability are important fibre selection considerations. Fabric weave, weight, finish, and dimensional stability are major fabric requirements. Fabric filters can be harmed by corrosive chemicals. It may be necessary to scrub the gas prior to the dry fabric collector. ICAC F-2 summarizes fibre and fabric selection parameters. The space requirement is rather large and pressure drop is typically in the 1.02 kPa to 1.53 kPa 4 to 6 inch water gauge range. An important consideration is whether the processed stream can be interrupted, such as a nonproduction type welding facility exhaust, or if it must remain in continuous operation, such as for a base boiler plant. If the process is relatively small and the dust loading is relatively light, or if the process is intermittent, it may be desirable and economic to use replaceable deep pocket type or automatic moving media type filters. If the loading is high and process must not be interrupted, a cleanable baghouse type unit may be desired.
Unit shall be type identified as [an unsupported tubular [unibag] [multibag] [side entry] [top entry] type] [a supported filter element [tubular] [or] [envelope] type]. Fabric collectors shall comply with ICAC F-2 and ICAC F-3. The collector provided shall be coordinated with the boiler combustion control and safety system so as to assure that the boilers operate within design conditions throughout entire operating range at design capacity of the collector. The collector shall be an ICAC [standard collector, Type III, medium-to-heavy duty, usually continuous service cleaning gases at [_____] degrees C degrees F] [special or custom-designed collector, Type IV, heavy duty continuous service cleaning gases at [_____] degrees C degrees F].

2.14.7.1 Filter Cleaning

**************************************************************************

NOTE: In the last sentence, three filter cleaning methods are available, any or all of which may be allowed depending upon site conditions and available utilities. Under the present state of the art, the use of compressed air pulse jet cleaning should be limited to systems below 142 cubic meter per second 300,000 acfm (actual cfm). Efforts to reduce flue gas pressure drop in fabric collectors have led to the development of more vigorous cleaning methods, in particular, the use of sonic horns in combination with conventional air exchange cleaning methods, such as reverse air, pulsed jet, or shake/deflate. Up to 60 percent reduction in pressure drop has been realized using sonic horns with no deterioration in particulate emission levels. Pressure level, frequency, power levels, and spatial distribution of horns within the collector compartment are all important specification criteria.

**************************************************************************

Filter element cleaning shall be automatically initiated and executed [on an adjustable programmer time cycle] [by operation of an adjustable high filter pressure drop switch]. Cleaning shall be accomplished by powered vibrator or shaker devices, reverse cleaned air flow with [positive] [negative] air pressure in the unit, a combination of shaker and reverse air flow [or compressed air pulse jet cleaning]. [Filter element cleaning shall include sonic horns.]

2.14.7.2 Filter Enclosure

Filter enclosure shall be fabricated of [4.8 mm 3/16 inch] [6.4 mm 1/4 inch] [low carbon] [corrosion resistant] steel of welded or bolted construction or combinations thereof. Enclosure sheets shall be given supporting strength and rigidity by folding or bending or shall be supported on supplemental structural steel shapes. Unit shall be provided with gas inlet and outlet connections and baffles, vanes, deflectors, or low friction diffuser plates that will insure uniform gas flow to all elements of the fabric system without causing flutter, vibration, or erosion of the fabric. Hinged, latched, and gasketed access doors shall be provided for all parts and areas that require inspection or service. Fabric elements shall be secured and supported by internal rings or equivalent method so that the entire fabric surface is so deployed that gas flow and particulate collection will be uniform over entire working surface. Dust shedding
properties shall be uniform so that entire fabric surface will be equally cleared by a cleaning operation without damage to media other than normal service wear. Media shall be arranged in elements, sections, pockets, or tubes that can be handled, removed, replaced, and secured without special facilities.

2.14.7.3 Collector Cleaning

Units shall be provided with means for isolating a compartment or section for cleaning while other compartments are performing their normal dust removal function. Compartment isolation shall effectively prevent reentrainment of the particulate during the cleaning operation. Unit rating shall be based upon operation with one section out for cleaning. Cleaning operation shall be [operator initiated and executed by manually operating the cleaning cycle on each compartment in sequence until all filters have been cleaned] [operator initiated to have the filters cleaned automatically one compartment at a time until all filters have been cleaned] [automatically initiated by an adjustable filter air pressure drop switch operating at a high pressure set point to initiate the filter cleaning operation] [automatically initiated by a timer to initiate the filter cleaning operation]. Once started, the cleaning operation shall progressively clean one compartment at a time until all filters are cleaned. Removal of collected particulate shall be by discharging from a hopper below. Collector manufacturer shall provide all of the components required for the entire cleaning operation including [manual rappers] [motorized rappers] [rotary air valve] [manual dampers] [motorized dampers] [compressed air surge receiver] [air compressor with receiver, motor drive, and controls] [blast or pulse jet controls, nozzles, and valves] [shaker or flutter blower, motor, drive, and controls]. [Automatic operations shall be provided with a manual override for starting, stopping, interrupting, and restarting operation.]

2.14.7.4 Test Connections

Pressure test connections shall be provided at the inlet and outlet ducts connecting to the collector.

2.14.7.5 Flue Gas Dust Collectors Designed for In-Place Cleaning

Dust collectors designed and constructed for in-place cleaning of the fabric shall be provided with a [3.4] [4.8] [6.4] mm [10 gauge] [3/16 inch] [1/4 inch] [low carbon] [corrosion resistant] steel sloped bottom dust storage hopper having the dust holding capacity as indicated. Collector and hopper system shall be constructed to minimize reentrainment of collected material into the gas stream. The hopper bottom shall be provided with rappers or fluidizing pads and shall have a hopper valley angle of 60 degrees from the horizontal and shall be free of pockets, ribs, fins, or any other obstruction to hold or interfere with free and complete release of all collected material to the outlet. Outlet shall be provided with [a guillotine-type slide gate] [a motor-driven rotary lock] [automatic lock hoppers]. Hopper shall be provided with a poke hole and gasketed access door, and shall have a collected material level indicator for [local indication] [local indication with terminals for wiring to a remote indicator]. Level indicator shall include a high material level audible alarm. [Hopper shall be provided with electric heating coils, modules, or blankets to keep collected material dry and free flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F].

SECTION 44 10 00 Page 33
NOTE: Dry fabric collectors are highly effective in removing up to 99.9 percent by weight of particulates of submicron size and larger from gas streams of more than 229 mg per cubic meter 0.1 grain (weight) per cubic foot. Emissions will consistently be less than 11 mg per cubic meter 0.005 grain/actual cubic foot. Fabrics are available for gas streams up to 288 degrees C 550 degrees F and are often used for particulate removal from coal handling operations and boiler flue gases. Fibre selection and fabric construction and finish are extremely critical to the performance and service life of a dry fabric collector. Chemical, temperature and abrasion resistance, strength, and dimensional stability are important fibre selection considerations. Fabric weave, weight, finish, and dimensional stability are major fabric requirements. Fabric filters can be harmed by corrosive chemicals. It may be necessary to scrub the gas prior to the dry fabric collector. ICAC F-2 summarizes fibre and fabric selection parameters. The space requirement is rather large and pressure drop is typically in the 1.02 kPa to 1.53 kPa 4 to 6 inch water gauge range. An important consideration is whether the processed stream can be interrupted, such as a nonproduction type welding facility exhaust, or if it must remain in continuous operation, such as for a base boiler plant. If the process is relatively small and the dust loading is relatively light, or if the process is intermittent, it may be desirable and economic to use replaceable deep pocket type or automatic moving media type filters. If the loading is high and process must not be interrupted, a cleanable baghouse type unit may be desired.

Unit shall be type identified as [an unsupported tubular [unibag] [multibag] [side entry] [top entry] type.] [a supported filter element [tubular] [or] [envelope] type.] Fabric collector shall comply with ICAC F-2 and ICAC F-3. The collector shall be an ICAC EP-1 [unit, Type I, for light duty, intermittent service cleaning gases at or near room temperature.] [standard collector, Type II, for light-to-medium duty [intermittent] [continuous] service cleaning gases at continuous temperatures from room temperature to 135 degrees C 275 degrees F] [standard collector, Type III, for medium to heavy duty 260 degrees C 500 degrees F] [special or custom designed collector, Type IV, heavy duty continuous service cleaning gases at [_____] degrees C degrees F].

2.14.8.1 Filter Cleaning

NOTE: The choice of filter cleaning methods should be based on site conditions, available utilities, and operational requirements. For example, dust control of coal bunkering is usually intermittent as
related to arrival of coal transporters and does not warrant a fully automatic continuous operation facility. Under the present state-of-the-art, the use of pulse jet cleaning should be limited to systems up to 142 cubic meters per second 300,000 acfm (actual cfm).

Filter cleaning of collector units processing air or gas streams at or near ambient temperatures, shall be [manually initiated and executed by operating the required dampers and cleaning devices] [automatically initiated and executed [on an adjustable or timed cycle] [by operation of an adjustable high filter pressure drop switch]]. [Powered cleaning shall be for [intermittent] [continuous] service employing [powered vibrator or shaker devices] [reverse air flow with atmospheric air and] [reverse cleaned air pressurized air flow with] [positive] [negative] air pressure in the unit [compressed air pulse jet cleaning] [of individual or a few elements] [of an entire compartment].] [Filter element cleaning shall include sonic horns.]

2.14.8.2 Filter Enclosure Construction

The filter enclosure shall be fabricated of [3.4] [4.8] [6.4] mm [10 gauge] [3/16 inch] [1/4 inch] [low carbon] [corrosion resistant] steel of welded or bolted construction or combinations thereof. Enclosure sheets shall be given supporting strength and rigidity by folding or bending or shall be supported on supplemental structural steel shapes. Unit shall be provided with gas inlet and outlet connections and baffles, vanes, deflectors, or low friction diffuser plates that will insure uniform gas flow to all elements of the fabric system without causing flutter, vibration, or erosion of the fabric. Hinged, latched, and gasketed access doors shall be provided for all parts and areas that require inspection or service. Fabric elements shall be secured and supported in a manner to have the entire fabric surface so deployed that gas flow and particulate collection will be uniform over the entire working surface. Dust shedding properties shall be uniform so that the entire fabric surface will be equally cleared by a cleaning operation without damage to the media other than normal service wear. Media shall be arranged in elements, sections, pockets, or tubes that can be handled, removed, replaced, and secured without special facilities.

2.14.8.3 Intermittent and Continuous Service Units

[Intermittent service units shall be equipped with [washable] [cleaning-in-place] fabric filters.] [Continuous service units shall be provided with means for isolation of a compartment or section for cleaning while other compartments are performing their normal dust removal function. Compartment isolation shall effectively prevent reentrainment of particulate during the cleaning operation.] Unit rating shall be based upon operation with one section out for cleaning. Cleaning operation shall be [operator initiated and executed by manually operating the cleaning cycle on each compartment in sequence until all filters have been cleaned] [operator initiated to have the filters cleaned automatically one compartment at a time until all filters have been cleaned] [automatically initiated by an adjustable filter air pressure drop switch operating at a high pressure set point to initiate the filter cleaning operation] [automatically initiated by a timer to initiate filter cleaning operation]. Once started, the cleaning operation shall progressively clean one compartment at a time until all filters are cleaned. Removal of
collected particulate shall be by [raking out] [removal and dumping of a particulate pan or tray] [draining from a hopper below]. Collector manufacturer shall provide all of the components required for the entire cleaning operation including [manual rappers] [motorized rappers] [manual dampers] [motorized dampers] [compressed air surge receiver] [air compressor with receiver, motor, drive, and controls] [blast or pulse jet controls, nozzles, and valves] [shaker or flutter blower, motor, drive, and controls] [traveling ring components]. [Automatic operations shall be provided with a manual override for starting, stopping, interrupting, and restarting operation.]

2.14.8.4 Test Connections

Pressure test connections shall be provided at the inlet and outlet ducts connecting to the collector.

2.14.8.5 Dust Collectors Designed for In-Place Cleaning

Dust collectors designed and constructed for in-place cleaning of the fabric shall be provided with a [3.4 mm [10 gauge] 3/16 inch] [4.8 mm [1/4 inch]] [6.4 mm [1/4 inch]] low carbon corrosion resistant steel sloped bottom dust storage hopper having the dust holding capacity as indicated. Collector and hopper system shall be constructed to minimize reentrainment of collected material into the gas stream. Hopper bottom shall be provided with rappers or fluidizing pads and the hopper valley angle shall be 60 degrees from the horizontal and shall be free of pockets, ribs, fins, or any other obstruction to hold or interfere with free and complete release of all collected material to the outlet. Outlet shall be provided with [a guillotine-type slide gate] [a manually-operated rotary lock] [a motor-driven rotary lock] [automatic lock hoppers]. Hopper shall be provided with a poke hole and gasketed access door, and shall have a collected material level indicator for [local indication] [local indication with terminals for wiring to a remote indicator]. Level indicator shall include a high material level audible alarm. [Hopper shall be provided with electric heating coils, modules, and blankets to keep collected material dry and flowing with the unit installed outdoors and out of service in a local winter outdoor design temperature of [_____] degrees C degrees F].

2.14.9 Gaseous Emissions Control Unit

******************************************************************************
NOTE: The gaseous emissions control units are to be used for cleaning particulate and gaseous solvent materials from the exhaust air at laboratory fume hoods, welding booths, water curtain paint spray booths, and other similar type problems. The fabric prefilter will collect a reasonable amount of particulates and the carbon will adsorb the gaseous vapors. The unit may be used without the prefilter to collect gasoline vapor from small storage tank vents, but the tank should be installed underground or be shaded to minimize boil-off. Project conditions may make regeneration of the carbon desirable. A typical gaseous emission control with carbon regeneration unit consists of two or more adsorber vessels with deep bed (typically 450 to 600 mm 18 to 24 inches) of high grade gas phase activated carbon. The manufacturer should provide
the bed depth as part of his design, and should consider the life cycle cost when sizing the adsorbent unit. The dampers and control valves will be pneumatically operated, based on timer operation or solvent sensor operation. Once the adsorption bed is saturated with solvent vapors, the flow into the adsorber is automatically diverted to the second adsorber. Low pressure steam is used to desorb the saturated adsorber, regenerating the carbon and producing a steam and solvent mixture which is condensed in a shell and tube condenser. Water insoluble solvents should be separated in a decanter for reuse. The system must be complete with adsorber vessels, blower, filter, condenser, and controls. Deposition of the waste effluents is dependent on the specific project and cannot be determined in the guide specification.

**************************************************************************

Unit shall comply with ICAC G-1 and shall consist of a dry type particulate removal precleaner followed by an adsorption unit of activated carbon or other approval adsorbent material.

2.14.9.1 Prefilter

Prefilter shall be [cleanable] [replaceable]. Prefilter shall have a cleaning performance equal to or exceeding ASHRAE 52.2 of 95 percent arrestance by weight, 80 to 90 percent atmospheric dust spot efficiency, and a dust-holding capacity of not less than 530 grams per 1 cubic meter per second 250 grams per 1,000 cfm cell. Media shall comply with UL 900 and shall be provided with a support frame or shall be constructed to be self-supporting without sagging either with or without gas flow. Each cell shall be securely held in place with applied pressure leak-tight joint between the media, media flange, and media collar, and the filter shall be secured to the media bulkhead with latches or clips to permit removal, replacement, and securing without special tools.

2.14.9.2 Adsorbent Unit

Adsorbent section shall consist of a system of trays, hollow panels, canisters, or other means of holding a deep bed of activated carbon conforming to ASTM D2854 and ASTM D2862, or other adsorbent material, to cause the processed gas to pass through a uniform depth of material in the gas flow direction. Trays, panels, and canisters shall be designed to assure that the adsorbent bed will be uniform, full and free of voids or thin spots and supported and contained to prevent movement, pulverizing, abrasion, or dusting of the adsorbent and easy and full recharging without special facilities or tools. Adsorbent units shall be secured leak-tight in a bulkhead forcing all gas to pass through the adsorbent bed.

2.14.9.3 Prefilter and Adsorbent Assemblies

Prefilter and adsorbent assemblies shall be enclosed in a welded, bolted, or riveted sheet metal enclosure that limits both in-leakage or out-leakage of gas. Enclosure access doors or panels shall be bolted, or gasket-sealed and latched to provide independent access to the prefilter and the adsorbent plenums. The enclosure shall be designed for the maximum differential pressure (positive or negative) under any mode of operation.
2.14.9.4 Inlet and Outlet Ducts

Unit shall be provided with inlet and discharge vanes, baffles, diffusers, or other devices to assure uniform gas flow through the processors. Pressure test connections shall be provided at the inlet and outlet ducts connecting to the collector.

2.14.10 Petrol Vapor Recovery Unit

**************************************************************************
NOTE: The petrol vapor recovery unit is intended for use at fuel depots or fuel distribution terminal facilities. It is used to recover fuel vapors by refrigerated condensation of the material from tank and transporter vents. Underground storage tanks at petrol dispensing stations do not commonly require refrigerated petrol recovery units but are equipped to have the unloading fuel displace a like volume of vapor from the underground tank into the transporter through a vent hose and manifold which are integral with the transporter vehicle. The transporter then hauls this vent gas to the local depot for recovery as the transporter is reloaded. Some jurisdictions may require vehicle tank venting back to the storage tank as the vehicle is loaded. Gaseous emission activated carbon emission control units, with and without carbon regeneration, can be used in this application.
**************************************************************************

Unit shall be a complete air-cooled mechanical refrigerated electric-operated unit designed for condensing the fuel vapors vented from gasoline system storage tanks. Recovery process shall be in two steps. The first step shall precool the vent gas to slightly above water freeze point to remove most of the water vapor without a defrost cycle. The second step shall cool the gas to the required vapor pressure with minimum frost collection. System shall include storage capacity and circulation system for defrosting fluid. Refrigerants shall be classified as nontoxic, nonflammable, conforming to ASHRAE 15 & 34, Group 1.

2.14.10.1 Defrosting

[Fuel handling operation will allow defrosting for about [4] [5] [6] hours after midnight.] [Fuel handling operation will not allow time for defrosting and a duplicate cooler shall be provided with automatic controls to alternate the units between cool and defrost modes with status indication of each.]

2.14.10.2 Unit Operation and Control

Unit shall be provided for [complete monitoring and control at the unit] [operation and control at the unit with remote indication of ON-OFF position of unit power supply switch] [operation and control at the unit with remote indication of operating and control of the unit with complete process indication with maintenance and service operation at the unit]. [[Visible] [and] [audible] alarms shall be provided on critical functions [locally] [and at remote station].]
2.14.10.3 Design and Fabrication Requirements

Unit shall be from single supplier and of coordinated design, fully assembled and subjected to factory tests before shipment. Unit shall be skid mounted on a permanent steel base with pick-up lugs and anchor bolt holes for installation on a concrete foundation. Electric power connection, vent gas inlet, return line for condensed hydrocarbons, and drain for aqueous liquids shall be provided. Components shall be installed in a ventilated weather proof enclosure with full accessibility for operation and service through hinged access doors with latches or removable panels. Doors shall be used for access to all operating functions. Cold components and piping of the entire system subject to sweating or frosting shall be insulated. Electrical equipment and installation work shall conform to requirements of hazardous locations for Class I, [Division I,] [Division II,] Group D, of NFPA 70 and NFPA 496, and Type X shall conform to UL 5, UL 674, UL 1203, and UL 823 requirements. Inlet vent gas flow to the unit shall be through a 0.075 mm 200 mesh removable ASTM A240/A240M stainless steel or equal strainer. Refrigeration work shall comply with ASHRAE 15 & 34 and ASME B31.5. Petrol vapor, condensed hydrocarbon returns, and aqueous waste piping shall comply with ASME B31.3.

2.14.11 Gravel Bed Filter

**************************************************************************
NOTE: Electrostatically enhanced gravel beds, combining granular filtration and electrostatic collection, are highly effective with collection efficiencies in excess of 99 percent on submicron particles. Gravel beds without electrostatic enhancement have collection efficiency greater than 95 percent on coarser particulate. They are frequently applied to gas streams in excess of 371 degrees C 700 degrees F and are particularly suitable for the collection of high resistivity particulates with potential fire and explosion hazards. Gravel beds are more compact than electrostatic precipitators or fabric filters for comparable applications. The unit is relatively insensitive to variations in gas flow and temperature excursions, and, in most cases, chemical makeup of the exhaust gas and particulate. Pressure drop across the gravel bed ranges from 763 Pa to 1271 Pa 3 to 5 inches water gauge. Carbon steel is the normal material of construction although high temperature and/or corrosive environments require the use of alloys or stainless steel.
**************************************************************************

The system shall remove particulates from process gas streams through granular filtration in a moving bed of filter media supplemented by electrostatic collection resulting from the application of high voltage power to [an electrical grid located in the bed] [an ionization grid located upstream of the bed in addition to an electrical grid located in the bed].

2.14.12 Wet Flue Gas Desulfurization System
NOTE: A flue gas desulfurization (FGD) system is used to reduce emission of sulfur dioxide from solid waste incinerator and boiler flue gases. It can also reduce other acid gas emissions such as hydrochloric acid and hydrofluoric acid. FGD systems are classified as either wet or dry processes. In the wet process, the flue gas reacts with a sorbent solution, producing a liquid product. The reagent selected will result in either a waste product, which must be disposed of, or a by-product, in which the sulfur recovered is in useable form. In general, the capital cost of regenerative systems may be up to twice the cost of non-regenerable systems.

System shall remove sulfur dioxide, [hydrochloric acid] [hydrofluoric acid] [particulates] [and] [_____] from processed gas stream. System shall be [non-regenerative] [regenerative] and shall use wet scrubbing process. System shall include all equipment required for a complete, operable FGD system, including wet scrubbing system, complete reagent feed system, [waste] [by-product] handling system, and instrumentation and controls for safe, reliable operation of the system.

2.14.12.1 Wet Scrubber System

Wet scrubber shall comply with ICAC G-1, ICAC WS-1, ICAC WS-3, and ICAC WS-4. Scrubber shall be one of the types identified by ICAC WS-3 as a [venturi,] [spray,] [tray,] [fixed packed bed,] [mobile bed,] [impingement,] [or] [entrainment,] type [or a combination of these types]. Scrubber shall be fluid-tight construction of [glass fiber reinforced plastic] [rolled low-carbon steel coated with coal-tar enamel] [ASTM A302/A302M stainless steel] [ASTM A240/A240M stainless steel] [______]. Unit shall be constructed with leak-tight viewing windows and access doors to permit appraisal of scrubbing process as well as full access for all service operations or parts replacement. Vanes, baffles, deflectors, or diffuser plates shall provide for uniform gas flow through the scrubbing chamber. Scrubber internal components shall be designed to minimize scaling and plugging inside the tower. Mist eliminator shall be of fluid-tight construction. Vanes, baffles, or deflectors shall provide for uniform gas flow to the mist eliminator elements. Mist eliminator shall be designed to minimize reentrainment of liquid into the gas stream. Mist eliminator shall be provided with a water washing system to prevent solids buildup on the blades. Washing nozzles shall be sized and oriented to spray entire mist eliminator area. System shall be provided with clean gas reheater upstream of stack to prevent acidic condensation and corrosion in the stack.

2.14.12.2 Reagent Feed System

Reagent feed system shall include all components required for storage of dry reagent, preparation of reagent slurry, delivery and re-circulation of the selected reagent. One reagent feed system shall serve all scrubbers. Reagent feed system shall have a reserve capacity for [[24] [36] [48] hours] [[3] [7] [10] days] of continuous FGD operation at design capacity without servicing. [Components that must be taken out of service for routine maintenance or reagent loading shall be provided in duplicate, arranged for transfer by manual operation of switches and valves.] System shall include all tanks, agitators, pumps, piping, valves and other equipment required by a specific system design. System equipment shall be
of design, material and construction appropriate for scrubbing solution
delivery and for re-circulation of scrubbing effluent. Piping shall be
designed to prevent settling of scrubbing solution inside the pipes.
Design shall include provisions for drainage and clean-out of feed system
components, including pumps and piping.

2.14.12.3 Waste Handling System

Waste handling system shall include all equipment required for pre-disposal
treatment of the scrubbing effluent, including tanks, agitators,
liquid-solid separator, vacuum filter, solid waste holding bin, pumps,
piping, and valves as required.

2.14.12.4 Test connections

Pressure test connections shall be provided at the inlet and outlet ducts
connecting to the scrubber.

2.14.13 Spray Dryer Flue Gas Desulfurization System

**************************************************************************
NOTE: A flue gas desulfurization (FGD) system is
used to reduce emission of sulfur dioxide from solid
waste incinerator and boiler flue gases. It can
also reduce other acid gas emissions such as
hydrochloric acid and hydrofluoric acid. FGD
systems are classified as either wet, wet/dry, or
dry processes. The spray dryer FGD process is a
wet/dry process, in which the flue gas reacts with
an alkaline reagent, usually a lime slurry, and the
reaction product is in dry form. The reagent
selected will result in either a waste product,
which must be disposed of, or a by-product, in which
the sulfur recovered is in useable form. In
general, the capital cost of regenerative systems
may be up to twice the cost of non-regenerable
systems.
**************************************************************************

System shall remove sulfur dioxide, [hydrochloric acid] [hydrofluoric acid]
[particulates] [and] [_____] from processed gas stream. System shall be
non-regenerative and shall use a spray dryer scrubbing process. System
shall include all equipment required for a complete, operating FGD system,
including spray dryer scrubbing system, complete slurry feed system, waste
handling system, particulate collecting unit consisting of [fabric filter
collector,] [electrostatic precipitator,] and instrumentation and controls
for safe, reliable operation of the system.

2.14.13.1 Spray Dryer System

Spray dryer shall comply with ICAC G-1 and ICAC FGD-1. Spray dryer shall
be of gas-tight construction. Unit shall be constructed with leak-tight
viewing windows and access doors to permit appraisal of scrubbing process
as well as full access for all service operations or parts replacement.
Spray dryer system shall include flue gas preheater prior to spray dryer
inlet. Vanes, baffles, deflectors, or diffuser plates shall be designed to
provide complete mixing of flue gas and chemical reagent, and to provide
adequate time for chemical reaction and evaporation of liquid in spray
dryer chamber. Atomizing system shall be [rotary] [or] [dual fluid] and
shall provide uniform dispersion of the chemical reagent in the spray dryer chamber and prevent gas droplet deposition on spray dryer walls. [Dual fluid nozzle atomizers shall use compressed air as the atomizing fluid. A dedicated air compressor system shall be provided for dual fluid atomizing system.] Scrubber internal components shall be designed to minimize scaling inside the tower.

2.14.13.2 Reagent Feed System

Chemical reagent feed system shall include all components required for storage, preparation, delivery and re-circulation of the chemical reagent. One reagent feed system shall serve all scrubbers. Reagent feed system shall have a reserve capacity for [24] [36] [48] hours [3] [7] [10] days of continuous FGD operation at design capacity without servicing. [Components that must be taken out of service for routine maintenance or reagent loading shall be provided in duplicate, arranged for transfer by manual operation of switches and valves.] System shall include all tanks, agitators, filters, pumps, piping, valves and other equipment required by a specific system design. System equipment shall be of design, material and construction appropriate for reagent delivery and for re-circulation of spray dryer effluent. Piping shall be designed to prevent settling of solids inside the pipes. Design shall include provisions for drainage and clean-out of feed system components, including pumps and piping.

2.14.13.3 Particulate Collecting Unit

Particulate collecting unit shall be designed to collect spray dryer products and fly ash remaining in the gas stream exiting the spray dryer. Particulate collection unit shall consist of [fabric filter collector] [electrostatic precipitator]. [Fabric filter collector shall be in accordance with Paragraph "Dry Fabric Collector for Boiler Flue Gases"]. [Electrostatic precipitator shall be in accordance with Paragraph "Electrostatic Precipitator (ESP)"].

2.14.13.4 Test connections

Pressure test connections shall be provided at the inlet and outlet ducts of each spray dryer and fabric filter collector.

2.14.14 Selective Catalytic Reduction (SCR) System

**************************************************************************
NOTE: All fossil fuel burning processes produce nitrogen oxides (NOx). Selective catalytic reduction (SCR) reduces NOx to N2 in the presence of a catalyst. The reducing gas is usually ammonia (NH3), and the catalyst may be composed of various materials, such as oxides of vanadium or tungsten. The catalytic reduction reaction requires temperatures in the range of about 300 to 425 degrees C 600 to 800 degrees F. Selection of the catalyst material and configuration, as well as the operating temperature, depends on the type of fuel being burned. The catalytic reactor will receive a high dust, low dust, or tail end gas stream, depending on its location in the system. In the high dust location, the catalyst is located upstream of an electrostatic precipitator. Location of the SCR system downstream of an electrostatic
precipitator results in a low dust environment for the catalyst. In the tail end location, the SCR system is located downstream of an electrostatic precipitator and/or a flue gas desulfurization system, which provides the cleanest gas to the catalyst. Location of the SCR in the system will have an impact on catalyst life.

Efficiency of conventional SCR equipment in removal of NOx is about 80-90 percent. SCR may be used in conjunction with combustion modifications, such as low NOx burners. A potential complication of SCR using ammonia when high sulfur coal is burned is the formation of ammonium bisulfate. When unreacted ammonia passes through the catalytic reactor, called ammonia slip, it will combine with SO3 present in the flue gas, forming ammonium bisulfate. Ammonium bisulfate, a sticky, corrosive material, will condense on downstream equipment. Ammonia slip is a major design concern when burning high sulfur coal.

System shall be designed to reduce nitrogen oxides from processed gas stream. System shall use ammonia as the reducing agent. System shall include all equipment required for a complete, operable SCR system, including, but not limited to, ammonia delivery system, catalytic reactor [with sootblowers], ash removal system, instrumentation and controls for safe, reliable operation of the system, and other pollution control devices as required.

2.14.14.1 Ammonia Delivery System

Ammonia delivery system shall include all components required for storage, preparation, and delivery of ammonia to the flue gas stream downstream of the economizer, prior to the catalytic reactor. The ammonia delivery system shall be designed to automatically deliver ammonia based on the quantity of NOx detected in the gas stream. Ammonia vaporizers shall be designed to ensure uniform ammonia distribution in the gas stream. Ammonia vaporizers shall be located in ductwork at a sufficient distance upstream of the catalytic reactor to provide complete mixing of ammonia and flue gas prior to the catalytic reactor inlet.

2.14.14.2 Catalytic Reactor

Catalytic reactor shall provide environment for chemical reaction between ammonia and nitrogen oxides, to produce elemental nitrogen and water as the products. Catalytic reactor configuration shall provide for uniform gas flow through all elements of the reactor. Catalytic reactor shall be of gas tight construction. Catalytic reactor shall be located between boiler economizer and boiler air preheater. [Catalytic reactor shall be located [upstream of an electrostatic precipitator] [downstream of an electrostatic precipitator] [downstream of a flue gas desulfurization system] [downstream of an electrostatic precipitator and a flue gas desulfurization system].] [Catalytic reactor shall be provided with sootblowers.] Ammonia slip shall be limited to [_____] ppm.

2.15 EMISSION MONITORING SYSTEM
NOTE: Provide in-situ opacity monitoring equipment where applicable to insure emission compliance of the particulate control equipment.

State and local regulatory authorities should be contacted at an early stage of the project design to determine if they consider the test methods cited to be adequate, and if they have any additional requirements.

Emission monitoring system complete with all components, accessories, analyzers [analyzer calibration system] [and recorders,] [alarms], and free-standing factory assembled panel shall be provided to [monitor opacity, sulfur dioxide, nitric oxide, nitrogen dioxide, and carbon monoxide emissions in boiler flue gases.] [In-situ opacity monitoring.] [____]. System shall [continuously monitor] [time program monitor as indicated] [be manually operated to monitor] the emissions. Submit reports for emissions permit compliance. Emissions shall be indicated [and recorded] in ppm and percent of sample.

2.15.1 Gas Sampling System

Sampling locations for air pollution control equipment performance shall be in accordance with 40 CFR 60, Appendix A. A vacuum pump shall draw a gas sample through a filter probe mounted inside the stack, a prefilter, and a moisture separator/drier. It shall discharge the sample through a flow meter on each analyzer to atmosphere as indicated. Equipment and necessary tubing shall be provided for automatically purging pollutants from sampling tubing, stack probe, and drier tubing, and for automatic regeneration of the drier. Cleaning and drying operation shall be time programmed.

2.15.2 Analyzing System

System shall provide simultaneous measuring and analyzing of sample gas by each analyzer with independent flow meters, valves, piping, and accessories. Each analyzer shall indicate ppm of the measured pollutant. [A recorder shall be provided for each analyzer with 30-day, 125 mm 5 inch strip chart with pressure sensitive stylus.] Each analyzer shall be provided with a visual color coded, panel mounted, high limit alarm with a single audible alarm with silencing button for all alarms. A relay on each analyzer shall be provided for connection to a remote alarm.

2.15.3 System Mounting

Gas sampling, analyzing [, and recording] systems shall be piped, wired, and mounted within a factory fabricated 2.657 mm 12 gauge cold rolled black steel enclosure with angle frame support and key-locked doors for [wall] [floor] mounting. Entire system shall be suitable for 120 Vac, 60 Hz, single-phase electric service.

2.15.4 Calibration

Calibration gas tanks of capacities indicated complete with regulators, valving, and tubing shall be provided for the specified emissions.

2.16 FACTORY APPLIED INSULATION

**************************************************************************

SECTION 44 10 00 Page 44
NOTE: Insert equipment and related piping, casings, and enclosures requiring insulation as applicable.

The following equipment and appurtenances shall be insulated with materials, jacketing, and finishes, as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS:

a. [_____

b. [_____

2.17 PAINTING AND FINISHING

Equipment and component items shall be factory primed and finish coated with the manufacturer's standard finish. Items located outside the building shall have weather resistant finish. Damaged finish surfaces shall be refinished with an identical type of finish used at the factory.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Work shall be installed as indicated and in accordance with manufacturer's diagrams and written instructions. [A factory installation specialist shall be at the site for erection of [electrostatic precipitator,] [baghouse,] [scrubber,] [wet flue gas desulfurization system] [spray dryer flue gas desulfurization system] [selective catalytic reduction system] [and] [petrol vapor recovery unit].] Field applied insulation shall be as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.3 OPERATION AND PERFORMANCE REQUIREMENTS

NOTE: Select the appropriate performance data forms required for the equipment selected. Fill in the data on the forms. Delete or retain the topic items as appropriate. EPA Technical Report AP-42 including Supplements 1 through 9 (and later supplements if issued) will be used to determine the properties or qualities and quantities of uncontrolled emissions from the various polluting equipments, systems, and operations to be corrected under this guide specification. Show in tables on drawings operating performance requirements for fans, pumps, motors, and other auxiliaries, indicating cfm, gpm, hp, etc. Fill out separate table for each air pollution control equipment selected for a given project in accordance with the following guide:

Air pollution control equipment shall process and remove pollutants from exhaust gas streams to produce an effluent that will conform to 40 CFR 50 and other federal, state, and local regulations, without degrading the performance of related system components. The air pollution control equipment installed shall perform the cleaning operation as indicated on the Air Pollution Equipment Performance Data forms attached to this section.

3.4 FRAMED INSTRUCTIONS

Framed instructions containing wiring and control diagrams under glass or in laminated plastic shall be posted where directed. The instructions shall show wiring and control diagrams and complete layout of the entire system. The instructions shall include, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. The framed instructions shall be posted before acceptance testing of the system.

3.5 FIELD QUALITY CONTROL

3.5.1 System Performance Test

Upon completion, and prior to acceptance of the project, the air pollution control equipment and monitoring system shall be tested in accordance with 40 CFR 60, Appendix A and state and local codes by [the Contractor] [an independent testing organization] to demonstrate indicated performance. [A factory startup specialist shall be at the site to direct and monitor startup for testing of [electrostatic precipitator,] [baghouse,] [scrubber,] [wet flue gas desulfurization system] [spray dryer flue gas desulfurization system] [selective catalytic reduction system] [and] [petrol vapor recovery unit,].] Notify the Contracting Officer [_____] days in advance of the test date. [An independent testing organization shall furnish all instruments and personnel required for the tests. ]Submit a proposed performance test procedure, 30 days prior to the proposed test date, containing a complete description of the proposed tests and sample locations, with calibration curves or test results by an independent testing laboratory of each instrument, meter, and gauge to be used in the
tests. The test shall not commence until the procedure has been approved. Electricity and water will be furnished by the Government.

3.5.1.1 Retesting

If any deficiencies are revealed during test, such deficiencies shall be corrected and the tests reconducted.

3.5.1.2 Reporting

Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to provide compliance with the specified performance criteria, upon completion and testing of the installed system. Each test report shall indicate the final position of controls.

3.5.2 Manufacturer's Field Service

Services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the specified equipment shall be provided. The representative shall supervise the installing, adjusting, and [testing] [testing start-up] of the equipment.

3.6 CLOSEOUT ACTIVITIES

3.6.1 Training

**************************************************************************
NOTE: Insert number of hours required to train personnel for the equipment operations.
**************************************************************************

Conduct training course for operating staff as designated by the Contracting Officer. The training period, of a total of [_____] hours of normal working time, shall start after the system is functionally completed, but prior to final acceptance tests. The field instructions shall cover all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations. Submit training course curriculum and training instructions [14] [_____] days prior to the start of training.

3.6.2 Operations and Maintenance

Submit complete copies of operation manual outlining the step-by-step procedures required for system startup, operation, and shutdown. The manuals shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and its basic operating features. Also, submit complete copies of maintenance manual listing routine maintenance procedures, possible breakdowns and repair, and troubleshooting guides. The manuals shall include piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed. Operation and maintenance manuals shall be approved prior to training course.

3.7 SCHEDULES

a. TABLES I and II: List any or all properties of particulate materials such as corrosive, toxic, abrasive, sticky, flammable, explosive, abrasive, friable, spherical fibrous, and hygroscopic.
b. TABLES I and III: Delete reference to particulates if the scrubber is to be installed with a particulate precleaner.

c. TABLE III: Delete reference to water supply data if not applicable for equipment selected.

d. TABLES III and IV: The volume to be listed here is the total volume of exhaust or ventilation air flow with which the pollutant is mixed. Add or delete items under Analysis of Gaseous Pollutants.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for systems to transfer organic contaminants from a contaminated air/gas stream (e.g. landfill off gas, soil vapor extraction, air stripping, process tank vapors, thermal desorption) to activated carbon adsorption media.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This specification only covers offsite disposal or regeneration of activated carbon; it does not cover onsite regeneration

1.1 UNIT PRICES

NOTE: On many hazardous, toxic and radioactive waste (HTRW) projects, the Contractor is required to treat contaminated air/gas, as well as furnish the
equipment. Measurement and payment and unit pricing may be necessary to cover treatment costs. Write the contract to provide an incentive for the Contractor to do the job efficiently. It may be preferable to base payment on the kg lbs of contaminants removed from the air/gas stream entering the carbon vessel. However, if carbon is being used to treat the air from an air stripper, the basis would be the volume of water treated in the air stripper or kg lbs of volatile organic chemicals in the water stream entering the air stripper. Or, if the mass of contaminant decreases during the long term operation of the unit, while at the same time the O&M expenses stay approximately constant, it may be preferable to base the payment on the volume of air/gas treated.

Payment for contaminated air/gas treated will be as described in the Payment Schedule of the Bid Form.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF HEATING, REFRIGERATING AND AIR-CONDITIONING ENGINEERS (ASHRAE)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B40.100 (2013) Pressure Gauges and Gauge Attachments
1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Activated Carbon Adsorption Units Carbon Vessel Fabrication

SD-08 Manufacturer's Instructions
1.4 QUALIFICATIONS

1.4.1 Contractor

1.4.2 Single Source Supplier

Assign to a single supplier full responsibility for furnishing of the activated carbon system. The designated single supplier, however, need not manufacture the system but shall coordinate the selection, assembly, installation, and testing of the entire adsorption system, including preheater, the blower and ductwork specified in other Sections. The supplier shall have [been in the business of manufacturing, fabricating or installing these systems for a minimum of [2] [_____] years] [manufactured and supplied a minimum of [5] [_____] vapor phase carbon adsorption units].

1.4.3 Carbon Vessel Fabricator

**************************************************************************
NOTE: Verification from a registered professional engineer should only be required for large systems which have to be bolted to the foundation. Delete this paragraph for small units which are on forktubes or a flat base and not fastened to the foundation.
**************************************************************************

Provide verification from a Registered Professional Engineer, licensed to practice mechanical or structural engineering, as appropriate, in the State in which the system is to be installed to verify that: 1) The fabrication drawings and pressure calculations for the vessels and appurtenances were done for the site conditions in accordance with the appropriate codes and standards. 2) The erection drawings for the shells and tank foundations and supports were done for the site conditions in accordance with the appropriate codes and standards. Submit certification from this Engineer documenting the verification.

1.5 PARTNERING AND/OR PRE-SUBMITTAL MEETING

**************************************************************************
NOTE: Remove this paragraph when a meeting is not required.
**************************************************************************

A [partnering] [and] [Pre-submittal] meeting will be required. Ensure that involved subcontractors, suppliers, and manufacturers are notified. Furnish the date and time of the meeting to the Contracting Officer for approval.
1.6 DELIVERY, STORAGE, AND HANDLING

Preassemble parts to the largest extent possible, compatible with transportation limitations and equipment protection considerations. Field assembly, if any, shall require merely bolting together of match-marked components. Equipment shall be crated and delivered to protect against damage during shipping. Flange faces shall be protected from damage. All openings shall be covered to prevent entrance of dirt, water and debris. Properly protect all parts so that no damage or deterioration will occur during a prolonged delay from the time of shipment until installation is completed and until the units and equipment are ready for operation. Properly protect finished iron or steel surfaces to prevent rust and corrosion. Protect all equipment, delivered and designated for storage, from the weather (humidity and temperature), dirt and dust, and other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Provide additional information about equipment preceding and following the carbon vessel. This is to provide the vendor with a complete picture of the unit's purpose and operation. Some paragraphs may be eliminated or modified if this Section is to be issued as a performance specification. Others will be eliminated or modified if it is to be issued as a design specification.

Laboratory adsorption studies are seldom done for air/gas adsorption. Estimates are obtained from isothermal data or from vendor computer programs. The ASTM Standards do not provide information on the minimum and maximum values that are acceptable for specifying carbon. Manufacturers may need to be contacted to determine the acceptable values. The characteristics for virgin and regenerated carbon will be different. Verify that the requirements are correct for the type of carbon specified.

**************************************************************************

Provide a vapor phase activated carbon adsorption system as a complete once-through forced flow system. The system shall be capable of reducing the levels of the listed organic contaminants to the values shown in paragraph Performance Requirements. Fill the unit with granular activated carbon for removal of organic contaminants from [landfill gas] [soil vapor extraction air/gas] [air stripping air/gas] [process tank vapor emissions] [low temperature thermal desorption air/gas] [____]. Equipment shall include, but shall not be limited to, vessels containing activated carbon, supporting equipment and accessories. Terminology is in conformance with ASTM D2652. The system shall be complete with [2] [____] parallel trains of [2] [____] carbon vessels in [series] [parallel] [2] [____] carbon vessels [in series] [parallel], activated carbon, [blowers], instruments, controls, valves, piping, pre-heater/cooler and other specified appurtenances. The piping shall be arranged [as shown on the drawings] [____] to allow any of the [2] [____] units to serve as the primary unit and shall also allow any unit to operate alone while the other units are
being emptied and refilled with fresh carbon. The system shall be designed to operate continuously, 24 hours per day, 7 days per week.

2.1.1 Design Requirements

**************************************************************************
NOTE: The most difficult part of designing an activated carbon adsorption system may be determining the contaminant concentration in the air/gas stream to be treated. Many times design estimates are based on limited data. The actual rate, particularly after the unit has operated for a while, may be much different. An approach may be to design the process for easy addition or removal of carbon units as determined after startup.

Determine seismic parameters from paragraph Seismic Requirements, and wind speed from ASCE 7-16, Chapter 1, or UFC-3-301-01. Specify whether the unit will be installed inside or outside and any other conditions that will affect the operation of the unit. Coordinate this Section with other pertinent Sections to ensure that information is presented only once. Verify that the floor and footings are designed to support the equipment.
**************************************************************************

The following requirements shall be met:

a. Minimum equipment design life: [_____] years.

b. Vessel type: [permanent with carbon] [replacement] [interchangeable canisters].

c. Adsorption system design requirements:

(1) Maximum vertical projection: [_____] m ft.

(2) Maximum ground surface coverage: [_____] by [_____] m ft.

d. Seismic parameters: [_____] .

e. Wind speed (maximum): [_____] km/h mph.

f. Ground snow load: [_____] kPa psf.

g. Ambient air temperature:

(1) Maximum: [_____] degrees C degrees F.

(2) Minimum: [_____] degrees C degrees F.

2.1.2 Influent Air/Gas Conditions

**************************************************************************
NOTE: Remove this paragraph if the specification is to be issued as a design specification. Obtain an analysis of the air/gas to be treated giving appropriate information to be inserted in the blank
spaces. The inlet air/gas composition may be
difficult to obtain. If the specification is to be
issued as a performance specification the inlet
composition will need to be estimated.

Oxygen and methane data are useful if the methane
concentration is high enough to have a potential to
be in the explosive range. If the concentration is
well below this range, remove the methane and oxygen
concentration lines. Provide all available
information. All available pertinent site
characterization data should be placed in an
appendix of the technical specifications or on the
drawings, and referenced here. Indicate the detail
to which site characterization has been performed
and indicate where data gaps exist. The information
should also include soil gas data, chemical data,
geotechnical data, sampling locations, and boring
logs. Table must be edited to add contaminants not
listed and delete those that are not applicable.
Verify that carbon will adsorb the organic chemicals
since many organic chemicals do not adsorb well on
carbon.

2.1.3 Performance Requirements

**************************************************************************

NOTE: Remove these paragraphs if the specification
is to be issued as a design specification. Removal
expressed as a percent is dependent on inlet
concentrations which can vary. Ensure that the
desired emission rates can be met before using percent removal.

2.1.3.3 Carbon Replacement

Intervals between carbon replacements shall not be less than [_____] days.

2.1.4 Design Calculations

NOTE: Delete this paragraph when design is done by the Government.

Supply a copy of all the design calculations to the Contracting Officer before initiation of construction.

2.1.5 Conformance to Design

Provide calculations, layouts and drawings of the carbon adsorption system to clearly show the basis for the design; including isotherms, estimated breakthrough volumes, and calculations to show that the entire system will conform to paragraph Performance Requirements.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a
manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least [2] [_____] years prior to bid opening. Materials and equipment shall be supported by a service organization that is located within [_____] km miles of the site.

2.2.2 Nameplates

Major equipment items such as adsorption vessels, blowers and motors shall have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.3 VAPOR PHASE ACTIVATED CARBON

**************************************************************************
NOTE: Performance specifications are recommended to allow the Contractor to install proven "off-the-shelf" units supplied by two or three reputable manufacturers. Determine if the first charge of carbon needs to be virgin carbon for liability requirements. Remove items not required below.
**************************************************************************

Material shall conform to the following list; submit certificates attesting that the activated carbon furnished meets the specified requirements. Also, submit the type of activated carbon, with isotherms for the selected carbon, with each of the volatile organic compounds listed in the effluent requirements for the anticipated temperature range at 50 percent relative humidity. Use design calculations or vendor computer models to estimate the mass of carbon required and the breakthrough curves for the listed organic compounds in the carbon bed.

a. The initial charge of carbon shall be [virgin] [regenerated] [virgin or regenerated] carbon. Subsequent charges shall be [virgin] [regenerated] [virgin or regenerated] carbon.

b. The carbon adsorption system shall be capable of reducing emissions for individual compounds to below the limits specified in SYSTEM DESCRIPTION.

c. Approximate average volatile organic composition of the vapor stream shall be based on estimated influent component levels as specified in SYSTEM DESCRIPTION.

d. Minimum butane working capacity of new activated carbon of [23.8] [_____] percent by weight shall be as determined by ASTM D5228.

e. Minimum iodine number of virgin or reactivated carbon of [1000] [_____] shall be as determined by ASTM D4607.

g. Maximum total ash content of [10] [_____] percent by weight shall be as determined by ASTM D2866.

h. Minimum hardness number of [90] [_____] necessary for the required life in vapor phase applications shall be as determined by ASTM D3802.
i. Activated carbon particle size shall be uniform for consistent pressure drop characteristics. Maximum particle size shall be 4.6 mm 0.2 inch diameter as determined by ASTM D2862.

j. The granular activated carbon shall be of the type that can be accepted for offsite regeneration of the spent activated carbon by an approved carbon regeneration facility.

k. Minimum apparent density of [0.45] g/cc shall be as determined by ASTM D2854.

l. Maximum pressure drop shall be kPa/m inches of water per foot of bed depth, measured in air at 21 degrees C 70 degrees F.

m. US Sieve size shall be [4 x 8].

n. Material shall be free from impurities that affect the serviceability and appearance of the finished product.

2.4 ACTIVATED CARBON ADSORPTION UNITS

NOTE: General rules to the system designer for configuration of a vapor phase activated carbon system are as follows:

a. Two stage series operation to provide longer contact and more complete exhaustion of the carbon is preferred. In series operation, the unit with the freshest carbon at any given time should be in the lag position. For critical operations, lead, lag and standby units should be provided as specified in paragraph SYSTEM DESCRIPTION.

b. Multiple units in parallel operation are frequently used for high flows with low contamination levels when short contact times are adequate. Single units should be used only in installations in which the system can be shut down for change out of the activated carbon adsorption media. Multiple smaller units containing the same amount of carbon and providing equal contact are usually preferable to single large unit.

c. An appropriate piping configuration which can adapt the units for series or parallel operation should be considered. Arrangements that allow conversion from parallel to series and the reverse allow the flexibility to respond to differing conditions.

d. Surface loading ranges between 12 and 24 cu m/min/sq m 40 and 80 cfm/min/sq ft are often used.

e. Minimum bed depth at a given velocity is based on the minimum contact time required to achieve the required removal. Additional bed volume allows more time between carbon changes.
f. The relative humidity of the air/gas entering the carbon unit should be 50 percent or less. If the air/gas entering the unit has entrained water an air/gas-water separator should be used. Without this, the temperature of the air/gas will have to be elevated enough to vaporize the mist and lower the relative humidity to about 50 per cent. At this higher temperature the organic chemical may not adsorb well.

2.4.1 Velocity

NOTE: In an up-flow system the velocity should generally be in the range of 12 to 24 m/sec 40 to 80 feet per minute; this depends on the particle size. In a down-flow system, the flow velocity is only limited by the allowable pressure drop.

The minimum and maximum acceptable flow velocities shall be as follows: 0.25 m/sec at [_____] cu m/sec minimum; and 0.375 m/sec at [_____] cu m/sec maximum 40 ft/min at [_____] scfm minimum; and 80 ft/min at [_____] scfm maximum.

2.4.2 Vapor Distribution/Collection Systems

Vapor distribution/collection systems shall provide effective distribution across the bed throughout the stated capacity range. A system shall be provided to minimize short circuiting or channeling of contaminated air/gas through the carbon vessel. The system shall be designed to evenly distribute the controlled contaminated air/gas flow across the cross section, with the nominal velocity under design conditions not exceeding 0.41 m/sec 80 fpm for up-flow systems. Design of the inlet and outlet shall be adequate to prevent local pressurization in excess of the vessel rating or design.

2.4.3 Shell Design

NOTE: Most carbon vessels are not designed for vacuum. Verify that a vacuum cannot be drawn on the vessel exceeding the manufacturer's recommendation. If the vessel will have internal pressure greater than 103 kPa 15 psig, it may need to be ASME rated. Vessels with less than this pressure may or may not need to be pressure rated depending on special ASME or State/local codes.

2.4.3.1 Corrosion Prevention

Corrosion resistant steel, fiberglass, or other plastic shall be used for shell construction or a steel shell with a corrosion resistant [enamel] [_____] coating. The lining system shall have a corrosion resistant [epoxy or phenolic resin] [_____] coating. Paint kits shall be furnished for use after assembly and finishing.
2.4.3.2 Manways

Minimum manway requirements, for access, addition and removal of carbon shall be [1] [_____] per adsorber and 610 mm 24 in minimum nominal diameter.

2.4.3.3 Insulation

**************************************************************************
NOTE: Insulation is optional. It may be needed if the carbon units are installed outside in cold climates. A high differential pressure across a fan or blower that precedes the carbon unit may result in a high air/gas discharge temperature. Pipes and fittings down stream may not need insulation. Plastic or fiberglass pipes and fittings should not be used if the discharge temperature can exceed that recommended for the material.
**************************************************************************

Insulation [and heat tape] to prevent cooling of the air/gas in the system shall be installed as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. All outside surfaces of the following equipment shall be insulated: [adsorbers] [pipes] [fittings] [stacks] [_____].

2.4.3.4 Vessel

**************************************************************************
NOTE: If the specification is to be issued as a performance specification, remove adsorber diameter and carbon quantity in this paragraph. Delete the minimum bed depth for a performance specification. Small units do not need inlet air/gas distributors. Add a paragraph requiring an outside access ladder if the top of the vessel must be accessed frequently. The number of carbon vessels should conform to those specified in SYSTEM DESCRIPTION.
**************************************************************************

Comply with the following requirements:

a. Minimum Number of Vessels: [2] [______].
b. Minimum Adsorber Diameter: [_____] m ft.
c. Material of Construction: [carbon steel] [______].
e. Minimum Carbon Quantity per Vessel: [_____] kg lbs.
f. Minimum Carbon Bed Depth: 922 mm 36 inches.
g. Flow Direction: [upflow] [downflow].
h. Outlet Collector: [______].
i. Inlet Distributor: Integral
j. Min. Allowable Temperature: [_____] degrees C degrees F.

Each unit shall be [skid-mounted. Skids shall be fabricated of [cast iron] [steel] channels and shall be designed to support the equipment and to distribute the weight in transit and in service without loading on the tank or concrete slab;] [equipped with lifting lugs] and pre-piped internally. Each vessel shall be secured to a structural steel frame suitable for shipment or transport with a forklift or crane and set on a level area for operation. Exterior structural steel surfaces shall be coated with a suitable primer and top coat to resist corrosion due to water spray. Each unit shall have a minimum of one ground connection. Each unit shall be provided with an inlet air/gas distributor, if required. Sampling ports shall be provided on the inlet and outlet pipes of each vessel to allow independent sampling and measurement of breakthrough for each unit.

2.4.3.5 Fire Sprinklers

**************************************************************************
NOTE: A fire suppression system is needed if the carbon manufacturer believes the adsorbed contaminant can react and cause a fire.
**************************************************************************

The carbon vessels shall be equipped with an internal water sprinkler to suppress carbon fires.

2.4.3.6 Seismic Requirements

**************************************************************************
NOTE: Provide seismic requirements, if a government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Remove the bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC properly edited, must be included in the contract documents.
**************************************************************************

Adsorption units shall be supported and braced to resist seismic loads as specified under UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC [as shown on the drawings].

2.4.4 Unit Submittals

2.4.4.1 Layout and Detail Drawings

Drawings showing complete equipment layout, piping, wiring and schematic diagrams, and installation instructions and any other details required to show equipment relationships, clearances for maintenance and operation and to demonstrate that the system has been coordinated and will properly function as a unit. Process flow diagrams and instrumentation diagrams showing all major pieces of process equipment with controls. Details on the carbon adsorber shell including information on vapor diffusion, carbon contact shell dimensions, construction materials and structural and supporting design calculations.
2.4.4.2 Calculations and Modeling

Design calculations or computer modeling results for vapor phase carbon adsorption system indicating removals of each of the organic compounds listed. Demonstration of, or design calculations for, the total head loss through the carbon unit. Isotherm and design calculations or manufacturer's computer models shall be provided to estimate the mass of carbon required and the breakthrough curves. Calculations showing how the vapor phase carbon adsorption system functions with the entire air/gas system including carbon vessel, [regeneration equipment], preheater, instrumentation and controls, dimensions, capacities, make and model, materials of construction, coating systems, pressure drop through each component of the system, including line sizing, valving, pressure and temperature gauges. Structural calculations for fabrication and erection drawings if requested (not needed for drum/canister applications).

2.4.4.3 System Supplier Testing

Submit certificate from system supplier showing that the equipment has been tested and has passed all quality control criteria.

2.5 ACCESSORIES

2.5.1 Blowers

The blowers shall conform to Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS.

2.5.2 Preconditioning Equipment for Inlet Air/Gas Stream

******************************************************************************
NOTE: An air/gas preheater may not be needed if the carbon unit is preceded with a blower. Blowers heat the air/gas which reduces the relative humidity. A blower may raise the temperature of the air/gas more than needed. If this occurs, cooling will be required before entering the carbon unit. If a specific type of preheater is needed, specific information on the type of heater, materials of construction and type of energy source (electricity, steam, natural gas) should be indicated on the drawings or added to the specifications. Either the paragraph on the air/gas preheater or the air/gas cooler or both should be deleted.
******************************************************************************

[A preheater shall be required if the relative humidity is greater than [50] [_____] per cent. The preheater shall be [of the type and size as shown on the schedule on the drawings] [______]. The preheater shall lower the relative humidity of the influent to [50] [_____] percent. Materials of construction and controls and cutoffs shall be provided. The heating element shall be [directly] [indirectly] heated. [The vapor stream leaving a forced draft blower that precedes the carbon vessel shall pass through a heat exchanger that cools the air/gas stream. The heat exchanger shall be of the type and size as shown on the schedule on the drawings. The heat exchanger shall lower the temperature enough to raise the relative humidity to no more than 50 percent.]
2.5.3 Carbon Storage and Transfer System

**************************************************************************
NOTE: Fresh carbon storage vessels and exhausted carbon storage vessels are not usually used in vapor phase systems. In large systems, the carbon is vacuumed or removed by eductor (water) and put into a truck. In smaller systems the carbon is usually removed by vacuum.

If there is no onsite storage, two trucks are needed, one empty to receive the used carbon and one with fresh carbon. Economics should dictate whether to install extra vessels at the site or to have an empty truck accompany the truck with the fresh carbon. It is often desirable to size the vessels to hold a full truck load of activated carbon to reduce shipping costs. On many small systems, the entire vessel containing the used carbon is replaced with a vessel containing fresh carbon. Vessels are sometimes filled from 400 to 450 kg 900 to 1000 pound sacks or 90 kg 200 pound drums. In this situation, no storage tanks are needed. Remove the paragraph on fresh Carbon Storage Tank and Exhausted Carbon Storage Tanks if these will not be required.
**************************************************************************

2.5.3.1 Fresh Carbon Storage Tanks

A fresh carbon storage system shall be provided. Minimum capacity of the system shall provide storage of [_____] kg pounds of dry carbon at a bulk density of [_____] kg/cubic meter pcf.

2.5.3.2 Exhausted Carbon Storage Tanks

An exhausted carbon storage supply system shall be provided. Minimum capacity of the system shall provide storage of [_____] kg pounds of wet carbon saturated with organic chemicals.

2.5.3.3 Sampling Valves

Sampling valves shall be provided at the inlet and outlet of each carbon unit.

2.5.3.4 Piping

Piping shall be in accordance with Section 31 21 00 OFF-GASSING MITIGATION.

2.6 ACTIVATED CARBON INSTRUMENTATION AND CONTROLS

**************************************************************************
NOTE: These paragraphs can be used in conjunction with Sections 25 10 10 UTILITY MONITORING AND CONTROL SYSTEM (UMCS) FRONT END AND INTEGRATION and 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC modified as required for this application. An instrumentation and control Guide Specification for hazardous waste systems is being written.
**************************************************************************
2.6.1 Sensors and Transmitters

******************************************************************************
NOTE: The humidity interlock will prevent condensation of water vapor in the carbon during startup if conditions exist that could allow high humidity air to the carbon unit.
******************************************************************************

Sensors and transmitters shall have a range selected for the application, using the smallest range available from the controls manufacturer that will meet all expected sensed conditions in the sequence of control. Sensors and transmitters shall consist of the following:

2.6.1.1 Relative Humidity Sensors

Relative humidity sensing element shall have a relative humidity sending range from 0 to 100 percent (condensing). The sensor shall be capable of sensing a condensing air stream (100 percent RH) without affecting the sensors calibration or harming the sensor. Sensing elements shall have an accuracy of plus or minus 5 percent of full scale within the range of 20 to 80 percent relative humidity. All sensors shall be mounted in locations that are accessible for calibration and shall be fitted for ease of calibration and re-calibration.

2.6.1.2 Airflow Measuring

******************************************************************************
NOTE: Pitot-tube type flow measuring devices can malfunction if the air/gas contains water droplets.
******************************************************************************

The velocity sensing elements shall be of the [RTD or thermistor type, with linearizing means. The sensing elements shall be distributed across the pipe in the quantity and pattern set forth for measurements and instructions in ASHRAE FUN SIASHRAE FUN IP and SMACNA 1780 for traversing of ducted airflows. The resistance to airflow through the airflow measurement station shall not exceed 2 mm 0.08 inch water gauge at an airflow of 600 m/min 2,000 fpm. Station construction shall be suitable for operation at airflows of up to 1500 m/min 5,000 fpm over a temperature range of 4 to 60 degrees C 40 to 140 degrees F, and accuracy shall be plus or minus 3 percent over a range of 40 to 760 m/min 125 to 2,500 fpm scaled to air volume.] [multiple pitot tube type with averaging manifolds. The sensing elements shall be distributed across the pipe in the quantity and pattern set forth for measurements and instruments in ASHRAE FUN SIASHRAE FUN IP or SMACNA 1780 for the traversing of ducted airflows. The resistance to airflow through the airflow measurement station shall not exceed 2 mm 0.08 inch water gauge at an airflow of 600 m/min 2,000 fpm. Station construction shall be suitable for operation at airflows of up to 1500 m/min 5,000 fpm over a temperature range of 4 to 60 degrees C 40 to 140 degrees F, and accuracy shall be plus or minus 3 percent over a range of 150 to 760 m/min 500 to 2,500 fpm scaled to air volume. This device shall not be used if the required velocity measurement is below 210 m/min 700 fpm.]

2.6.1.3 Pressure Gauges

Pressure gauges shall conform to ASME B40.100.
2.6.1.4 Thermometers

Thermometers shall be dial type, 88 mm 3-1/2 inch diameter, chromium plated case; remote or direct-type bulb as required; plus or minus 0.5 degree C 1 degree F accuracy; white face with black digits graduated in 1 degree C 2 degree F increments. Thermometer wells of the separable socket type shall be provided for each thermometer with direct-type bulb. Range of thermometers shall be [_____] to [_____] degrees C degrees F.

2.6.2 Controllers

Controllers shall have set point, action, proportional band, authority throttling range, ratio, and remote set point adjustment as required to meet requirements of the sequence of control. Controllers shall be mounted on a unit control panel located [in the same room as the system being controlled] [near the carbon vessels].

2.6.2.1 Relative Humidity Controllers

Humidity controllers shall be space-type and shall take full control action for a relative humidity change of plus or minus 5 percent of the setting of the controller. Set point adjustment range shall be approximately [20] [_____] percent to [80] [_____] percent relative humidity. Controllers shall have adjustable throttling ranges. Controllers to be mounted in the interior of piping shall be of the insertion type, fitted with air shields where so recommended by the manufacturer.

2.6.2.2 Alarms

Alarm annunciation shall be by [visual] [and] [audible] indication. Alarm signals shall be locked in and require manual reset. [An auto dialer shall be furnished] [Alarms shall be telemetered to the master control panel in the control room].

2.6.2.3 Relative Humidity Alarms

Relative humidity alarms shall be installed immediately upstream from the carbon vessels to alert the operator of relative humidity exceeding [50] [_____] percent.

2.6.2.4 Pressure Alarms

Pressure [alarms] [indicators] shall be installed on each side of the carbon vessels to alert the operator of excessive pressure drop.

2.6.2.5 Temperature Alarms

**************************************************************************
NOTE: Temperature or carbon monoxide alarms can be used to monitor for fire in the carbon bed.
**************************************************************************

Temperature alarms shall be provided on excursions (drop or rise) of [10] [_____] degrees C [18] [_____] degrees F outside the control range in the duct leaving the carbon vessel.

2.6.2.6 Carbon Monoxide Alarms

Carbon monoxide alarms shall be provided to alert the operator of
concentrations in excess of [100] [_____] ppm in the exit gas.

2.6.2.7 Timing Interlock

A timing interlock shall be provided to delay starting the blower until the preheater has been turned on for [15] [_____] seconds. This interlock shall prevent saturation of the carbon during startup procedures and shall delay blower stops after every shut performed.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with the details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancies before performing the work.

3.2 EQUIPMENT INSTALLATION

Install equipment as shown and in accordance with written instructions of the manufacturer. Each vessel shall be [anchored to a footing isolated from the floor slab] [mounted on a skid base]. Provide anchor brackets, anchor rods or straps to hold the shell to anchors in the footing. Reinforced concrete foundations for each carbon unit shall be designed to support the unit and shall be in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.3 PAINTING FOR CORROSION PREVENTION

Paint equipment which did not receive a factory finish, unless specified otherwise. The paint system applied to the outside of the tank shall be in accordance with Section 09 90 00 PAINTS AND COATINGS. Surfaces that have not been factory primed shall be primed and top coated with the manufacturer's standard factory finish. Factory painting shall conform to manufacturer's standard factory finish. All defects in the finish prior to or during installation of the equipment shall be repaired as specified in Section 09 90 00 PAINTS AND COATINGS. All exposed ferrous surfaces not painted in the factory shall be painted in accordance with Section 09 90 00 PAINTS AND COATINGS. Painting of corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel is not required, unless otherwise specified. All ferrous surfaces shall be coated or painted. Color shall be as indicated on the paint schedule or as otherwise approved.

3.4 POSTED FRAMED INSTRUCTIONS

Post installation instructions, sequences, and precautions, including tolerances for level, horizontal, and vertical alignment as specified. Submit for approval prior to posting: Grouting requirements, including grout spaces and materials; wiring and control diagrams; system layouts and isometrics; instructions and other sheets; operating instructions explaining preventive maintenance procedures and checks to assure the system is operating normally and safely. Methods of checking the system for normal safe operation; procedures for operating the system; and procedures for safely starting and stopping the system shall be prepared in typed form, framed and posted beside the diagrams. Instructions shall be written for any required sampling, carbon transfer and shipping of activated carbon to regeneration or disposal facility. Catalog cuts are not acceptable.
3.5 FIELD QUALITY CONTROL

Submit reports on tests performed to show compliance with instructions. Include in the test reports all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Indicate in each test report the final position of all controls. Performance test data shall be reflected in the operating instructions.

3.5.1 Equipment Tests

After installation of the carbon adsorption system is complete, operating tests shall be carried out to ensure that the unit installed operates properly. All products shall be carefully inspected for defects in workmanship and material; debris and foreign matter shall be cleaned out of all equipment; all operating mechanisms shall be tested to check their proper functioning; and all nuts and bolts shall be checked for tightness. Valves and other equipment which do not operate easily or are otherwise defective shall be repaired or replaced. Tests shall assure that there is no vibration, or noise from any parts. If deficiencies are revealed during tests, such deficiencies shall be corrected and the tests shall be reconducted at the Contractor's expense.

3.5.2 Performance Tests

**************************************************************************
NOTE: Running the unit to exhaustion should only be required if this is expected to occur within the test period. Some vessels may not get to exhaustion for a long period of time. Verify that the sample ports are addressed in Section 31 21 00 OFF-GASSING MITIGATION. Coordinate sampling requirements of this paragraph with the sampling requirements of other units/processes in the entire treatment train.
**************************************************************************

After installation of the activated carbon adsorption system, operating tests shall be carried out to ensure that the system operates properly. This shall include the adsorption units, all accessories and instruments and controls. If any deficiencies are revealed during any tests, such deficiencies shall be corrected and the tests repeated. [Each] [A typical] adsorber shall be run at a constant flow rate of approximately [_____] cubic meters/second scfm [until the maximum emissions as listed in paragraph Chemical Requirements occur] [for [24] [_____] hours]. A complete log of each test run shall be made, giving the following data: date, time of readings and sampling. Total chemicals removed shall be determined by analyses of the inlet and outlet for the chemical requirements listed in paragraph Performance Requirements. Samples shall be taken of the emissions for analysis after [each [_____] cubic meters feet have been run through the adsorber] [_____] hours of operation]. Results of the tests shall be used in determining the capacity and performance of the adsorption unit. Submit the reports to document emissions permit compliance. Sampling and analyses shall be performed in accordance with [_____].

3.5.3 Spent Activated Carbon Sampling and Analyses

Sampling and analyses of the spent activated carbon media shall be
performed in accordance with requirements [for spent carbon transport and requirements of the regeneration facility] [of the RCRA permitted treatment, storage and disposal facility].

3.5.4 Carbon Testing

The carbon to be used during the performance testing shall be tested to ensure it meets the requirements of [____].

3.5.5 Breakthrough Monitoring

******************************************************************************************************************************************
NOTE: Continuous emission monitors are not addressed in this Section. If continuous emission monitors are required, verify that the detector used is specific for the chemicals to be monitored.
******************************************************************************************************************************************

Monitoring the emissions for the chemicals in paragraph Chemical Requirements shall be done once every [7] [____] days to determine when to replace the granular activated carbon. The volume of air/gas that was treated, from the time that the vessel was placed in the upstream position until breakthrough was consistently determined, shall be recorded as the breakthrough volume. Breakthrough volume is the volume of air/gas that was treated before the concentration of any one of the chemicals in paragraph Chemical Requirements was exceeded. The criteria for determining when to replace granular activated carbon may be modified as more data are generated.

3.5.6 Noncompliance with Performance Requirements

Removals shall meet or exceed those specified in the performance requirements of this specification. If at any time during the first [12] [____] months of operation the results of the organic analyses of the air/gas emissions are not in compliance with paragraph Chemical Requirements, except for periods when the carbon is saturated, flow through the unit shall be stopped and the system shall be said to be inoperable. If at any time the operation of the system does not meet the flow rate requirements, instrumentation or control requirements set forth in this contract, flow through the system shall be stopped. Proceed immediately to repair or modify the system for compliance with the contract documents. Repairs or modifications shall be made entirely at the Contractor's expense. Notify the Contracting Officer one day before the system is to be restarted and retested.

3.6 OPERATION AND MAINTENANCE SUPPLIES

3.6.1 PARTS, TOOLS AND HANDLING EQUIPMENT

Submit a complete list of parts, supplies, special tools, instruments and accessories and special lifting and handling devices required for periodic maintenance, repair, adjustment and calibration and recommended spare parts for each different item of material and equipment specified, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [one] [____] and [three] [____] years of service.
3.6.2 EXTRA MATERIALS

Within 30 days of system approval, furnish a spare parts list for each different item of material and equipment specified with the shop drawings submitted. Include in the list parts, supplies, prices and sources schedule. Furnish those spare parts and special tools which are recommended by the manufacturer. Also provide 12 months supply of any expendable items and frequently replaced parts, except for carbon, as identified by the manufacturer. Following completion of the startup and operating period [replenish the spare parts inventory and provide a twelve month supply] [supply the [carbon regeneration] [carbon disposal] facility name, address and price schedule].

3.7 MANUFACTURER'S FIELD SERVICE

Provide the services of the manufacturer's representative, who is experienced in the installation, adjustment and operation of the equipment specified, for a minimum of [16] [_____] hours at the site. The representative shall supervise the installation, adjustment, and testing of the equipment. Prior to startup, the equipment shall be inspected for alignment and connections by a factory representative. The manufacturer's representative shall inspect the final installation and supervise the adjustment and testing of the equipment. Schedule and coordinate the testing to coincide with the later phases of the carbon column testing, to prove out the complete installation in the presence of a Government representative. After completion of all testing, the manufacturer's representative shall assist the plant operators in plant startup.

3.8 CLOSEOUT ACTIVITIES

3.8.1 Operating and Maintenance Manuals

Submit [six] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include in the instructions layout, wiring, and control diagrams of the system as installed. Also the manufacturer's name, model number, service manual, parts list, brief description of all equipment and their basic operation features, and operating instructions for each piece of equipment and bulletins, cut sheets and descriptive data. [Six] [_____] complete copies of maintenance instructions listing routine preventative maintenance procedures, possible breakdowns and repairs, and troubleshooting guides list showing lubricants for each item of mechanical equipment, approximate quantities needed per year and recommended lubrication intervals.

3.9 FIELD TRAINING

Conduct a training course of operating staff as designated by the Contracting Officer. The training period, for a total of [24] [36] hours of normal working time, shall start after the system is functionally complete but prior to final acceptance tests. The field instructions shall cover the topics included in the Operating and Maintenance Manuals. Also provide [16] [_____] hours of training, as directed by the Contracting Officer, following completion of the [one year] [_____] operating period for the follow-in Contractor.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for systems to destroy, by thermal oxidation, organic contaminants contained in an off-gas stream; with options to use concentration system, heat recovery and/or a catalyst to conserve fuel.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1   UNIT PRICES

NOTE: Measurement and payment requirements will be specified for work subject to extreme variation in estimated quantity when unit price bidding is required. This paragraph is not used when quantities can be reasonably calculated from information included in the contract.

Measurement and payment and unit prices for quantities of off-gas treated
will be determined in accordance with the Bid Schedule.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals.
required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SECTION 44 13 51 Page 9
1.4 QUALIFICATIONS

1.4.1 Contractor

Have had a minimum of [2] [3] [5] [_____] years of experience in the construction of industrial air pollution control systems, sanitary wastewater sludge digestion gas systems, landfill off-gas or vapor extraction off-gas handling systems.

1.4.2 Single Source Supplier

Assign to a single supplier full responsibility for the furnishing of the adsorption system. The designated single supplier, however, need not manufacture the system but shall coordinate the selection, assembly, installation, and testing of the entire specified system.

1.4.3 Manufacturer's Field Representative

Provide the services of a manufacturer's field representative and training engineer, who is experienced in the installation, adjustment, and operation of the equipment furnished, and who has complete knowledge of the proper operation and maintenance of the system. Submit names and qualifications of each manufacturer's field representative and training engineer with written certification from the manufacturer that each representative and trainer is technically qualified.

1.4.4 Welders

[Welders must have passed qualification tests using procedures covered in AWS B2.1/B2.1M or ASME BPVC SEC IX and have the appropriate certification.] [Qualifications of welders, and welding and nondestructive testing procedures for piping shall be as specified in Section 40 05 13.96 WELDING PROCESS PIPING.] [Structural members shall be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] Require any welder to retake the test when, in the opinion of the Contracting Officer, the work of the welder creates reasonable doubt as to proficiency.

1.5 REGULATORY REQUIREMENTS

**************************************************************************
NOTE: Add applicable regional, state, or local requirements. Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS includes basic requirements.
**************************************************************************

Abide by the following requirements: [____].
1.6 PARTNERING OR PRE-INSTALLATION CONFERENCE

[Partnering] [Pre-installation] conference [may] [will] be [requested] [required]. Ensure that involved subcontractors, suppliers, and manufacturers are [notified] [represented]. Submit the date and time of the conference to the Contracting Officer for approval.

1.7 DELIVERY, STORAGE, AND HANDLING

Protect from the weather, excessive humidity, excessive temperature variation, and dirt, dust, or other contaminants all equipment delivered and placed in storage. Catalyst material shall be protected in accordance with the manufacturer's recommendations.

1.8 SEQUENCING AND SCHEDULING

**************************************************************************
NOTE: Testing of the thermal oxidation system should be concurrent with the start of gas flow from the landfill, vapor extraction system, or other source.
**************************************************************************

Installation of the thermal oxidizer shall be complete and the system operational prior to completion of the [gas collection system] [vapor extraction system] [landfill cap]. Point source release of untreated off-gas shall be avoided to the maximum extent consistent with completion of the contract. Perform sampling and analyses to demonstrate system performance and emission compliance.

1.9 EXTRA MATERIALS

**************************************************************************
NOTE: Include items needed for future maintenance and repair, items that might be difficult to obtain and spare parts needed to ensure continued operation of critical equipment. Consider whether an initial operating period is included in the contract.
**************************************************************************

[An inventory of all equipment, tools, and items shall be provided to the Contracting Officer at the start of the operating period. The inventory shall be updated monthly. A current inventory shall be delivered to the Contracting Officer when the operating period is complete.] [Concurrent with delivery and installation of the specified equipment, auxiliary equipment and spare parts shall be furnished.] Furnish the following:

a. [Spare parts for each different item of material and equipment specified including all of the parts recommended by the manufacturer to be replaced after [1 year] [1 year and 3 years] service.] [Spare parts, replacement parts and other items duplicated or replaced during the operating period.]

b. For each type of grease, one lever type grease gun or other lubricating device.

c. [One set of special tools for each type of equipment including calibration devices, and instruments required for adjustment, calibration, disassembly, operation, and maintenance of the equipment.]
[One set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment.]

d. One or more steel tool cases mounted on the wall in a convenient location complete with flat key locks, two keys, and clips or hooks to hold each special tool.

e. A [three] [six] month supply of lubricants, [fuel,] [and] [consumable items] at the end of the contract.

f. [_____].

PART 2  PRODUCTS

2.1  SYSTEM DESCRIPTION

Provide a thermal (catalytic) oxidation system as a complete unit process for destruction of organic contaminants carried in the [off-gas] [vapor phase]. Equipment shall include, but shall not be limited to, a complete and operational thermal oxidation system, including supporting equipment and accessories.

2.1.1  Design Requirements

***********************************************************************************************************************************************
NOTE: Find the wind speed and seismic zone for the stack design in ASCE 7-16.
***********************************************************************************************************************************************

Provide the thermal oxidation system in conformance with section 60.18 of 40 CFR 60. Provide vertical and lateral supports for the stack in accordance with NFPA 82 and NFPA 211, as applicable, for the wind forces indicated. Design the system for the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Altitude</td>
<td>[_____] m ft above mean sea level (MSL)</td>
</tr>
<tr>

2.1.3 Performance Requirements

**************************************************************************
NOTE: Coordinate controls with the blower specified in Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS.
**************************************************************************

Select the retention time appropriate for the oxidation device considering any regulated compounds.

Minimum retention time in the combustion chamber shall be [0.5] [1.0] [1.5] [2.0] [2.5] [_____] seconds at [1095] [982] [820] [760] [400] [260] degrees C [2,000] [1,800] [1,500] [1,400] [750] [500] degrees F minimum at maximum flow. The flow rate shall be [constant at [_____] cu m/second scfm] [off and on at [_____] cu m/second scfm maximum, with a turndown range of four to one (4:1)] [variable between [_____] cu m/second scfm minimum and [_____] cu m/second scfm maximum]. Flow rates shall be based on measurement at standard temperature and pressure (STP), 101.3 kPa at 15.5 degrees C 14.7 psia at 60 degrees F. Influent gauge pressure shall vary between [_____] Pa inch H2O minimum, [_____] Pa inch H2O average, and [_____] Pa inch H2O maximum. Inlet temperature shall vary between [_____] degrees C degrees F minimum, [_____] degrees C degrees F average and [_____] degrees C degrees F maximum. Materials of construction shall be compatible with the ambient and operating temperatures and long term exposure to untreated and treated gas constituents.

2.1.4 Off-Gas Composition

**************************************************************************
NOTE: Reduce the dew point to below 50 degrees C 120 degrees F ahead of the thermal oxidizer.
**************************************************************************

If the unit will be classified as a hazardous waste incinerator, required emission limits for specific compounds are given in the National Emission Standard for Hazardous Air Pollutants (NESHAP) Maximum Achievable Control Technology (MACT) Standard. The MACT standard is scheduled to be finalized the end of 1998 and will not appear in hard copies of the 40 CFR 63 until the July 1999 edition is issued by EPA. Until the 1999 CFR is

<table>

</tbody>
</table>
available, it will be necessary for designers to obtain the Federal Register in which the new standard is given.

Establishing and enforcing air regulations is primarily done at the State level; therefore, it is critical that designers research State specific requirements applicable to the unit.

The BDT control device is a combustion device capable of reducing NMOC emissions by 98 weight-percent or an outlet NMOC concentration of 20 ppmv or less. The EPA 98 percent DRE requirement applies to total emissions as determined by stack gas analysis (to include aerosols, particulates, VOCs, etc.), not individual contaminants, and may not be attainable on individual contaminants in long term performance.

Include appropriate off-gas discharge requirements (or DRE) and products of incomplete combustion (if appropriate). Use energy conservation/recovery on long term or high volume devices.

The system shall be capable of oxidation of the organic components of gaseous, solid and aerosol type emissions, as follows. Submit reports for permit compliance.

* Destruction percentage will be determined as follows: \(100\% \times \frac{(\text{Influent mass} - \text{Effluent mass})}{\text{Influent mass}}\).

** Dry basis, as hexane at 3 percent oxygen.

### 2.2 MATERIALS AND EQUIPMENT

**************************************************************************

NOTE: A life cycle cost analysis should be performed before selection of the equipment option: flare, enclosed combustor, thermal oxidizer, catalytic thermal oxidizer, regenerative thermal oxidizer, recuperative thermal oxidizer or catalytic recuperative thermal oxidizer.

**************************************************************************

2.2.1 Standard Products

Materials and equipment shall be the standard products of a manufacturer regularly engaged in the manufacture of such products and shall essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.2.2 General Requirements

Equipment and appurtenances shall be as specified and as shown on the detail drawings, and shall be suitable for the service intended. Materials and equipment shall be new and unused, except for testing equipment. Components that serve the same function and are the same size shall be identical products of the same manufacturer. The system will be rejected upon failure to achieve both the minimum temperature and the minimum retention time specified in paragraph PERFORMANCE REQUIREMENTS.

Provide detail drawings containing complete flow diagrams, piping, wiring, schematic, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings shall show capacities and pressure drop; heat and material balances; make and model; complete list of equipment and materials. Drawings shall show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation.
2.2.3 Nameplates

Each major item of equipment shall have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment. Each piece of equipment shall bear the approval designation and the markings required for that designation. Valves shall be marked in accordance with MSS SP-25 and shall bear a securely attached tag with the manufacturer's name, catalog number and valve identification permanently displayed.

2.2.4 Equipment Guards [and Access]

Belts, chains, couplings, and other moving parts shall be completely enclosed by guards, to prevent accidental personal injury, in accordance with 29 CFR 1910, Subpart O, Machinery and Machine Guarding. Guards shall be removable and arranged to allow access to the equipment for maintenance. Thermal insulation shall enclose high temperature components to prevent ignition of combustible materials and to preclude personnel contact.

2.3 FLARE

******************************************************************************
NOTE: See 40 CFR 60.18 for shroud requirements; edit this paragraph if shroud is not needed.
******************************************************************************

The [candlestick] [open] [ground] flare shall be composed of an open combustion chamber without enclosure or shroud.

2.4 ENCLOSED COMBUSTOR

******************************************************************************
NOTE: Enclosed combustors must demonstrate either 98 percent NMOC reduction or outlet NMOC concentration of 20 ppmv or less.
******************************************************************************

The enclosed combustor shall be composed of a vertical enclosed combustion chamber that maintains a constant temperature by controlling fuel and combustion air.

2.5 THERMAL OXIDIZER

******************************************************************************
NOTE: Catalytic oxidation operates at a reduced temperature and should be considered when the organic carbon is between 150 ppmv and 2,000 ppmv. Review the anticipated off-gas analysis for substances that mask or poison catalysts. Edit this paragraph as required.
******************************************************************************

The thermal oxidizer shall be composed of a horizontal enclosed combustion chamber, with catalyst, that maintains a constant temperature by controlling fuel and combustion air. Catalyst shall be suitable for use under the conditions listed in paragraph SYSTEM DESCRIPTION and shall be fabricated in modules for ease of installation in the combustion chamber.
Thermal oxidizer shall be compatible reduced temperature operation with the catalyst in place and high temperature operation without using the modular catalyst unit.

2.6 REGENERATIVE THERMAL OXIDIZER

**************************************************************************
NOTE: This system is a high temperature operation that recovers energy by cycling exhaust and inlet gases through regenerative heat exchange media.
**************************************************************************

The thermal oxidizer shall be composed of a horizontal enclosed combustion chamber that maintains a constant temperature by controlling fuel and combustion air.

2.7 RECUPERATIVE THERMAL OXIDIZER

**************************************************************************
NOTE: This system consists of a high temperature operation, without catalyst, or low temperature operation, with catalyst, that recovers energy by counter current passing of the exhaust and inlet gases through the heat exchanger. Edit this paragraph as required for job conditions.
**************************************************************************

The thermal oxidizer shall be composed of a horizontal enclosed combustion chamber, with catalyst modules, that maintains a constant temperature by controlling fuel and combustion air. The thermal oxidizer shall be compatible with the temperatures of operation with or without using the modular catalyst unit.

2.8 CONTAMINANT CONCENTRATION SYSTEM

**************************************************************************
NOTE: Fuel costs for dilute or wet off-gas streams are substantially reduced by using a concentration system. Consider a concentration system if the organic carbon is less than 2,000 ppmv.
**************************************************************************

Inlet gas concentration of [total hydrocarbon] [methane] [non methane organic compounds (NMOC)] [_____] shall be increased by a minimum of [ten] [five] [two] times the initial concentration.

2.9 HEAT RECOVERY SYSTEM

**************************************************************************
NOTE: Use media for regenerative systems or heat exchanger for recuperative systems.
**************************************************************************

2.9.1 Media Chambers

Exhaust flow through media chambers shall recycle a minimum of [50] [_____] percent of the heat input at maximum operating conditions (maximum flow and temperature).
2.9.2 Heat Exchanger

The multiple pass, or single pass plate heat exchanger, or tube and shell heat exchanger shall recycle a minimum of [80] [_____] percent of the heat input at maximum operating conditions (maximum flow and temperature).

2.10 FLAME TRAP/ARRESTER

**************************************************************************
NOTE: This is a safety requirement that must be implemented.
**************************************************************************

Flame arrester, in accordance with FM APP GUIDE, shall be provided at the inlet to the oxidation system. The pressure drop across the flame arrester shall be a maximum of [_____] [1.5] kPa [_____] [6] in W.C. at maximum flow. The flame arrester shall have a clean-out cover to facilitate maintenance.

2.11 INLET PROTECTION

**************************************************************************
NOTE: The system should be protected by moisture reduction.
**************************************************************************

2.11.1 Knock-Out Pot

Knock out pot, with a minimum collection efficiency of [98] [98.5] [99] percent, shall be provided.

2.11.2 Mist Eliminator

A mist eliminator, with a minimum collection efficiency of [85] [98] [98.5] [99] [_____] percent of the impinging mist shall be provided.

2.12 IGNITION SYSTEM/BURNER ASSEMBLY

2.12.1 Pilot

**************************************************************************
NOTE: ASCE 25-16 applies to earthquake actuated systems.
**************************************************************************

Automatic gas shutoff system conforming to ASCE 25-16 shall be provided on the pilot supply. The pilot assembly shall be removable and shall be provided with pressure indicator, pressure regulator, solenoid valve, manual shutoff valve and pilot gas pressure manometer port. Pilot inlet nozzle shall be 150# ANSI, stainless steel, flanged.

2.12.2 Igniter

Electronic spark ignition shall be provided. The igniter assembly shall be removable from outside the combustion chamber without disconnecting conduit or wiring.
2.12.3 Burner Assembly

The primary air mixed burner shall be compatible with the specified fuel, shall have multiple small gas ports or jets, and shall be constructed of 304L/316L stainless steel, heat and corrosion resistant alloy steel, ceramic and/or castable refractory. The burner shall be of adequate capacity to maintain the required combustion temperature at the maximum flow with no fuel value in the off-gas.

2.12.4 Refractory Insulation

Removable, cast venturi burner lining assemblies shall be provided with a [1500] [_____] degrees C [2,700] [_____] degrees F rating. Refractory insulation shall be continuous, a minimum of 50 mm 2 inches of ceramic fiber insulation blanket surrounding the combustion cylinder, attached to the wall and floor with Inconel studs and washers, with plate retainers installed around all open edges of the blanket. The refractory insulation shall be coated with a high temperature, surface sealer protectant.

2.13 EXHAUST TREATMENT

2.13.1 Adsorber

**************************************************************************

NOTE: Adsorbers are not commonly required.
**************************************************************************

Exhaust gas shall be treated by an activated carbon adsorption system in accordance with Section 44 13 10.13 VAPOR PHASE ACTIVATED CARBON ADSORPTION UNITS.

2.13.2 Scrubber

**************************************************************************

NOTE: Scrubber is used only for high acid concentrations resulting from chlorine or sulfur in the feed or combustion of nitrogen.
**************************************************************************

Scrubber shall remove [85] [90] [95] [_____] percent of the acid gas formed.

2.14 STACK

2.14.1 Minimum Exit Velocity

The stack exit velocity shall be not less than [_____] m/sec ft/sec.

2.14.2 Minimum Elevation

The stack elevation shall be not less than stated in paragraph Design Requirements.

2.14.3 Lining

Stack shall be lined with ceramic and/or castable refractory.

2.14.4 Lightning Protection

An engineered lightning protection system with grounding shall be provided.
2.14.5 Lugs

Lifting lugs shall be provided at the top of the stack for ease of installation; each lug shall be capable of supporting the entire weight of the stack.

2.14.6 Access

Access to the interior of the stack shall be provided by an insulated, [hinged or supported 0.6 x 0.6 m 24 x 24 inch square or 0.6 m 24 inch diameter, manway] [150 x 150 mm 6 x 6 inch square or 150 mm 6 inch diameter, hand hole] located above the burners.

2.14.7 Ladder

An aluminum or galvanized steel fixed ladder shall be mounted to allow access for removal or replacement of each of the thermocouples. The ladder furnished with the system shall have side rails. Individual rung ladders are not acceptable. Ladder shall conform to 29 CFR 1910, Part 27 Fixed Ladders, except as specified herein. The safety cage shall be provided with locking device to prevent unauthorized access.

2.15 PROVISIONS FOR OBSERVATION AND SAMPLING

2.15.1 Observation Ports

Observation ports or sight glasses with removable tempered glass covers and cooling holes shall be provided. View port diameter shall be a minimum of [75] [50] mm [3] [2] inch. Ports shall be located to allow viewing the pilot flame, the base of the main flame, and a view of each of the thermocouples.

2.15.2 Inlet Sample Port

Inlet sample port [50] [_____] mm [2] [_____] inch minimum diameter, with cap and cooling holes, shall be located upstream of all contributing flows, with the exception of the off-gas.

2.15.3 Outlet Sample Port

Outlet sample port [50] [_____] mm [2] [_____] inch minimum diameter, with cap and cooling holes, shall be located [upstream of the cooling or dilution air inlet] [and] [two stack diameters from the top of stack].

2.15.4 Sampling Equipment

**************************************************************************
NOTE: Add sampler requirements.
**************************************************************************

Provide the following equipment: [____].

2.16 CONTROLS

**************************************************************************
NOTE: Blower controls are in Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS. Omit last sentence if not applicable to the project.
**************************************************************************
Set points, signals and control functions and dampers shall be linked by a central programmable logic controller (PLC) located in the control panel. Control signals shall be 4-20 ma or 0-10 Vdc, compatible with the controller and sensor or control device. Burner control diagnostics shall be included. For parameters specified to be continuously recorded, digital data shall be recorded at intervals not exceeding one minute. Sensors shall be calibrated with standards traceable to NIST and in conformance with NIST SP 250. Each alarm shall be connected to an [auto-dialer] [or] [telemetry] system.

2.16.1 Ultraviolet (UV) Flame Scanner

Ultraviolet scanner shall be furnished, installed and calibrated to provide for safety shutdown on the absence of flame. The signal from each scanner shall incorporate a time delay appropriate to the control sequence. The burner flame scanner shall monitor the burner flame. The pilot flame scanner shall monitor the pilot flame.

2.16.2 Timers

Automatic timers shall provide independent adjustment of the start and duration of each step in the control sequence.

2.16.2.1 Purge Timer

The minimum purge cycle shall be set at four changes of [air] [or] [inert gas]. Purge cycle shall have both automatic and manual start.

2.16.2.2 Igniter Timer

**NOTE: The spark duration adjustment extends the life of the plug, transformer and other pilot components.**

An igniter timer, with [manual] [automatic] adjustment of the spark duration, shall be provided to set the time and duration of the igniter spark during the ignition cycle, and to compensate for the distance of the pilot gas supply from the oxidizer.

2.16.2.3 Pilot Timer

At the end of the purge, the pilot timer shall begin automatic ignition. If the UV sensor fails to sense the pilot flame, the pilot solenoid valve shall close, the pilot flame shall be extinguished, the system shall shut down and the pilot fail alarm shall be activated.

2.16.2.4 Main Flame Timer

The main flame timer shall extend beyond the pilot timer cycle. When the burner flame lights and the temperature exceeds the low temperature set point on the temperature controller, the pilot flame shall be shut off. The system shall shut down, and the main flame fail alarm shall be activated, if the UV sensor fails to sense the pilot flame or the flame temperature does not reach the low temperature set point by the end of the main flame step.
2.16.3  Temperature Sensors, Transmitters and Controllers

Submit detailed manufacturer's data on the overall controls, sensors, process controllers, control operators, ladder diagrams, timers, sequence of controls, values, alarms, signals, interlocks and cut off systems. Data describing in detail the equipment used to monitor emissions, including the sampling probe, filters, off-gas transport tubing, sampling pump, moisture removal system, analyzer calibration systems, and data recorder. Process and instrumentation diagrams (P&IDs).

2.16.3.1  Thermocouples

**************************************************************************
NOTE: Narrow temperature ranges are more responsive than broad ranges because the sensitivity is a percentage of the range.
**************************************************************************

Thermocouples shall conform to ASTM E230/E230M, Type K, suitable for continuous operation and control at temperatures up to [50] [100] [150] [_____] degrees C [80] [180] [260] [_____] degrees F above the temperature specified in the performance requirements and accurate to 0.75 percent of the maximum temperature. Each thermocouple used for control shall be provided with high and low set points and an adjustable time delay before initiation of each control action. A thermocouple located in or immediately downstream of the combustion chamber shall control burner operation and shall [indicate] [and] [record] combustion chamber temperatures. [Three] [_____] additional thermocouple ports shall be spaced at vertical intervals equal to the stack diameter, starting two stack diameters from the top of the stack. Compensating lead wire connecting the thermocouple to the read out shall be 16 gauge with a weatherproof braid.

2.16.3.2  Thermometers

Thermometers shall conform to ASME PTC 19.3 TW, with wells and temperature range suitable for the use encountered.

2.16.3.3  Combustion Chamber Temperature Controller

The combustion temperature control shall [record the combustion chamber temperature] [and] [maintain the temperature between the adjustable high temperature and low temperature set points]. The controller shall control the [damper actuator motors] [blowers]. Control logic shall include auto position signal and automatic switch over capabilities.

a. The system shall shut down and not attempt to restart if the temperature exceeds the allowable combustion chamber temperature range. A high temperature shutdown shall activate the high temperature alarm.

b. During operation, the system shall shut down and not attempt to restart if the temperature falls below the allowable combustion chamber temperature range. During the ignition cycle, if the temperature does not reach or exceed the low temperature shutdown setting, the system shall shut down and not attempt to restart. A low temperature shutdown during operation or during the ignition cycle shall activate the low temperature alarm.
2.16.3.4 Primary Combustion Air Control

NOTE: For this and the following paragraph, refer to Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS for combustion air control.

Fully adjustable air dampers on each burner shall be furnished with remote operation by external lever control, sized to provide a minimum of [100] [115] percent of theoretical stoichiometric air as primary air. Dampers shall allow the operator to adjust the primary air/fuel ratio while burner is in operation.

2.16.3.5 Total Combustion Air Control

[Motor operated louver dampers shall be provided. Actuators shall cause louver to fail open on loss of signal or power.] [Two multistage centrifugal blower trains, each with a suction valve, discharge valve, and discharge check valve shall be provided.]

2.16.3.6 Quenching/Dilution Air Control

Motor operated louver dampers shall be provided. Actuators shall cause louver to fail open on loss of signal or power.

2.17 FLOW METERS, TRANSMITTERS AND FLOW CONTROLLER

The flow control system shall include an automatically actuated main fuel valve with fail-closed feature and limit switches for position indication. The flow rate metering system shall include recording, totaling and alarm capabilities.

2.17.1 Off-Gas Flow Meter

Flow metering for the off-gas shall conform to AGA Report No 3.

2.17.2 Supplemental Fuel Flow Meter

NOTE: Supplemental fuel meters should be sized on peak requirement. Off-gas meters should be based on blower size.

Gas meters shall conform to [AGA ANSI B109.1] [AGA ANSI B109.2] [AGA ANSI B109.3].

2.18 PRESSURE MEASUREMENT AND CONTROL

One differential pressure sensor with large diameter sensing holes shall be furnished. A differential pressure transmitter shall be provided and shall be mounted within 1 m 3 feet of the sensor. A compound vacuum/pressure gauge shall be installed on each blower. The compound gauges shall be furnished with a differential pressure range of [0.1 to 100] [_____] kPa [0.015 to 15] [_____] psig. The piping from the sensor to the transmitter shall be 3 mm 1/8 inch stainless steel tubing with stainless steel drain valves on each pipe, at low points. Piping shall be plumbed so that
condensate will drain back into the pipe. The transmitter shall be equipped with zero and span adjustment, and shall provide a standard volumetric output rate reading to the chart recorder (included with the control system) without the need for separate compensating pressure or temperature transducers. A pressure gauge shall be installed on the discharge side of each blower. The pressure gauges shall be furnished with a range of 0 to 34 kPa 0 to 5 psi. The gauges shall be weatherproof, with 113 mm 4-1/2 inch dials and Type 316 stainless steel Bourdon tubes. The gauges shall be furnished with pressure snubbers and diaphragm seals and valves. Isolation valves shall be installed between the process pipe and the seal. Diaphragm seals shall be furnished with top and bottom housings and diaphragms of Type 316 SS. The diaphragm cavities shall be liquid filled with silicone.

2.18.1 Draft Gauges

Draft gauges shall be Type I, Class 1 or 2, as applicable, conforming to ASME B40.100 with a diaphragm or bellows actuating system and a circular scale. The gauges shall have a zero adjustment screw. Suitable shutoff cocks shall be provided.

2.18.2 Pressure Gauges

Pressure gauges shall conform to ASME B40.100 and be of pressure detecting Class, single Bourdon tube style, and suitable for detecting air pressure.

2.18.3 Pressure Switches

Pressure switches shall be provided to activate the blowers.

2.18.4 Pressure Release

A pressure release valve shall be located on the off-gas line upstream of the oxidizer.

2.19 EXPLOSIMETER

**************************************************************************
NOTE: The fuel concentration should be greater than 30 percent of LEL. Combustion air should be less than 30 percent of LEL.
**************************************************************************

A combustible gas analyzer, with a minimum of four in-line sensors, calibrated to methane shall be located in the control panel.

2.19.1 Lower Explosive Limit (LEL)

The lower explosive limit of the fuel and of the off-gas shall be continuously indicated. The lower explosive limit of the off-gas shall be continuously recorded.

2.19.2 Upper Explosive Limit (UEL)

The upper explosive limit of the combustion air and of the off-gas shall be continuously indicated.
2.20  OXYGEN METERING AND MAKE-UP AIR CONTROL

2.20.1  Oxygen Meter

The upper oxygen level of the combustion air and of the off-gas shall be continuously indicated.

2.20.2  Methane Monitor

The methane level of the combustion air and of the off-gas shall be continuously indicated.

2.21  OPERATING INDICATORS AND ALARMS

Simulated running lights to indicate normal operating conditions and alarms shall be displayed at the control panel.

2.21.1  Visible Alarms

Each visible alarm shall be indicated at the control panel and by a red light at the device.

2.21.2  Audible Alarms

Each audible alarm shall be located at the device.

2.21.3  Remote Alarms

**************************************************************************
NOTE: The Contractor should respond to alarms for the duration of the contract.
**************************************************************************

Remote alarms shall activate the programmable auto dialer. A prerecorded message shall provide specific information to the operator about the alarm condition. At contract close out, the dialer shall be reprogrammed to the number indicated by the Contracting Officer.

2.22  ELECTRICAL WORK

**************************************************************************
NOTE: Hazard classifications in accordance with NFPA 70 should be indicated on the drawings.
**************************************************************************

All electrical equipment, wiring and controls shall comply with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and with NFPA 70, with proper consideration given to environmental considerations such as moisture, dirt, corrosive agents and proper NFPA 70 hazardous area classification. Lightning and surge protection shall be provided.

2.22.1  Motors

Electric motor driven equipment shall be provided complete with starters and alternating current motors conforming to NEMA MG 1. Fractional horsepower motors shall be 115-volt, single-phase, 60 cycle. Integral horsepower motors shall be three-phase, 60 cycle. Motor starters shall be provided complete with properly sized thermal overload protection and other appurtenances necessary for the motor specified. Each motor shall be
designed for operation in ambient temperatures up to 40 degrees C 104 degrees F. Submit manufacturer's certificates attesting that the motors meet the NFPA 70 requirements for the hazardous area classification.

2.22.2 Control Panels

A complete control panel with options for various control schemes and control wiring shall be included. Manual or automatic controls, protective or signal devices and control wiring for the controls and devices required for the operation specified shall be provided. Motor controls shall conform to NEMA ICS 1. Enclosures for power and control panels shall conform to NEMA ICS 6. Panels located outdoors shall be [NEMA 4X] [NEMA 4] and shall be weatherproof.

2.22.3 Resistance Heaters

**************************************************************************
NOTE: The designer should select the most cost effective heat source for the application.
**************************************************************************

Electric resistance pre-heaters and dryers shall be used where indicated on the drawings.

2.23 AUXILIARY FUEL SYSTEM

**************************************************************************
NOTE: The designer should select the most cost effective heat source for the location.
**************************************************************************

2.23.1 Feed Capability

The auxiliary fuel system shall have direct feed capability to the thermal destruction system with meters, pressure gages and controls to maintain the specified operating conditions. Design shall be in conformance with the applicable requirements of NFPA 30 and NFPA 31, NFPA 54 or NFPA 58, as appropriate to the fuel type.

2.23.2 Auxiliary Fuel Regulator

Auxiliary fuel rate shall be controlled by the temperature of the combustion chamber.

2.23.3 Secondary Containment

Fuel storage tanks shall be provided with secondary containment as required by NFPA 30, paragraph 2-3.4 Control of Spillage from Aboveground Tanks.

2.24 VALVES

Design of valve operators and mechanisms shall avoid initial surges and sudden inrushes by gradually allowing flows to increase.

2.24.1 Butterfly Valves

Butterfly valve shall be cast iron body with resilient seat, 316 stainless steel disc and shaft and actuator. Valve shall have fail-safe closing in ease of a power failure. Valve shall have location limit switch for use in
the control system.

2.24.2 Other Valves

Other valves shall conform to API Spec 6D, ANSI Z21.15/CSA 9.1 or ASME B16.33 as appropriate for the type.

2.25 JOINTS

2.25.1 Dielectric Fittings

Dielectric fittings shall be installed between threaded ferrous and nonferrous metallic pipe, fittings and valves. Dielectric fittings shall prevent metal-to-metal contact of dissimilar metallic piping elements and shall be suitable for the required working pressure.

2.25.2 Isolation Joints

Isolation joints shall be installed between non-threaded ferrous and nonferrous metallic pipe, fittings and valves. Isolation joints shall consist of a dielectric sandwich type flange isolation gasket with isolation washers and isolation sleeves for flange bolts. Isolation gaskets shall be full faced with outside diameter equal to the flange outside diameter. Bolt isolation sleeves shall be full length. Units shall be of a shape to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.25.2.1 Sleeve Type Couplings

Sleeve type couplings shall be used for joining plain end pipe sections. Each coupling shall consist of a steel middle ring, two steel followers, two gaskets, and the necessary steel bolts and nuts to compress the gaskets.

2.25.2.2 Split Sleeve Couplings

Split sleeve type couplings may be used in aboveground installations, when approved in special situations, and shall consist of gaskets and housing in two or more sections with the necessary bolts and nuts.

2.25.3 Bolts, Nuts, and Fasteners

Bolts, anchor bolts, nuts, washers, plates, bolt sleeves, and all other types of supports necessary for the installation of the equipment shall be furnished with the equipment and shall be galvanized unless otherwise indicated. Anchor bolts shall be provided with square plates at least 100 by 100 by 9 mm 4 by 4 by 3/8 inch or shall have square heads and washers and be set in the concrete forms with suitable sleeves. Expansion bolts shall have malleable-iron and lead composition elements. Unless otherwise specified, stud, tap, and machine bolts shall be of refined bar iron. All threads shall conform to ASME B1.1. Bolts, anchor bolts, nuts, and washers specified to be galvanized, shall be zinc coated, after being threaded, by the hot-dip process in conformance with ASTM A123/A123M or ASTM A153/A153M. Bolts, anchor bolts, nuts, and washers indicated to be stainless steel shall be Type 316 stainless steel.

2.26 FACTORY TESTS

Skid mount and assemble the thermal oxidation system equipment in the shop, to the maximum practical extent, in the configuration outlined in the
detail drawings and specifications. Perform a factory pressure test at [125] [250] [_____] percent of the rated pressure of the equipment. Perform continuity check and process simulation at the factory before shipping the control panel. Test fire the system with the specified fuel and air and maintained at the temperature specified in paragraph PERFORMANCE REQUIREMENTS for [two] [_____] hours. Submit test reports [with the equipment] [to the Contracting Officer prior to shipment of the equipment].

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 PREPARATION

All equipment and products shall be inspected for defects in workmanship and material. Debris and foreign matter shall be cleaned out of valve openings and seats. Each operating mechanism shall be operated to check proper functioning. Each nut shall be checked for tightness. Valves and other equipment that do not operate easily or are otherwise defective shall be repaired or replaced.

3.3 FOUNDATIONS AND SKID BASES

Foundations for the thermal oxidizer and appurtenances, and pads for skid bases, shall be constructed of concrete, reinforced where necessary, in conformance with the applicable requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE, except as otherwise shown or specified. Concrete surface shall be [75] [_____] mm [3] [_____] inch above grade in outdoor locations. Mounting feet shall be provided so that appropriate anchorage can be provided. Anchor embedment depth and spacing shall be sufficient for seismic attachment to the foundation and for prevention of overturning. Concrete pad shall extend [150] [_____] mm [6] [_____] inch beyond the equipment.

3.4 ERECTION

3.4.1 Welding

**************************************************************************
NOTE: Use second set of brackets when critical pipe welding is required.
**************************************************************************

[Welding procedures shall be as specified in AWS D1.1/D1.1M] [Welding and nondestructive testing procedures for piping shall be as specified in Section 40 05 13.96 WELDING PROCESS PIPING] [Structural members shall be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING].

3.4.2 Painting/Corrosion Prevention

All ferrous surfaces shall be coated or painted. Exposed ferrous surfaces shall be painted in accordance with Section 09 90 00 PAINTS AND COATINGS. Color shall be as indicated on the paint schedule or as otherwise approved.
3.4.2.1 Factory Primed Surfaces

Factory primed surfaces shall be solvent-cleaned before painting.

3.4.2.2 Touch-Up Painting

Factory painted items shall be touched up as needed. Factory painted items requiring touching up in the field shall be thoroughly cleaned of foreign material, primed and top coated with the factory finish.

3.4.2.3 Field Painting

Equipment which did not receive a factory finish shall be prepared, primed and painted, as specified in Section 09 90 00 PAINTS AND COATINGS.

3.4.2.4 Corrosion Resistant Metals

Painting of corrosion resistant materials such as copper, brass, bronze, copper-nickel, and stainless steel is not required unless otherwise specified.

3.5 INSTALLATION

3.5.1 Insulation

Equipment and piping shall be insulated in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

3.5.2 Utilities

**************************************************************************
NOTE: Points of connection are normally shown on the drawings. Occasionally, the name, address and telephone number of each utility company is shown on the drawings. Delete the following paragraphs if the information is shown elsewhere.
**************************************************************************

Fuel and utilities shall be provided at locations shown on the drawings. Verify availability and locations of utilities and compensate the utility company for connection and usage. Fuel, water, sewer, power and any other utility bills shall be paid on receipt.

3.5.2.1 Electricity

The power [utility] [company] is [____], telephone number [____].

3.5.2.2 Water

The water [utility] [company] is [____], telephone number [____].

3.5.2.3 Natural Gas

The natural gas [utility] [company] is [____], telephone number [____].

3.5.3 Fuel System

**************************************************************************
NOTE: Coordinate requirements for the fuel source
**************************************************************************
Fuel system installation and testing shall comply with the applicable requirements of NFPA 30 and NFPA 31, NFPA 54 or NFPA 58, as appropriate to the type of fuel.

3.6 POSTING FRAMED INSTRUCTIONS

NOTE: If the user preference is known, show the location on the drawings and edit this paragraph.

Wiring and control diagrams and typed condensed operating instructions framed under glass or in laminated plastic shall be posted where directed. Diagrams shall show the complete layout, wiring and control of the entire system. Condensed operating instructions shall explain preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. The diagrams and instructions shall be posted before acceptance testing of the system.

3.7 FIELD QUALITY CONTROL/TESTS

3.7.1 Pressure and Leakage Test

NOTE: Testing of pipe and fittings should be specified in the pipe specification. The test pressure for vessels should not exceed the rated pressure.

After installation, test all piping, equipment, joints and connections for gas tightness. Test connections and piping by subjecting the complete system to pneumatic pressure of not less than [105] [_____] kPa [15] [_____] psi [the pressure indicated in the schedule] for 6 hours. During the test, the system must be disconnected from the source of pressure and, with corrections made for barometric and temperature changes, the pressure must remain constant for the test period, as indicated by a test gauge. Test joints using a soapy water solution to detect leaks.

3.7.2 Operational/Performance Tests

NOTE: Coordinate with the blower specification and the design sequence of operation. Testing requirements should be edited to fit the intended mode of operation for the system. Flow rates for operating capacity tests will be inserted in the blank spaces provided.

After installation and pressure testing, the entire off-gas system shall be subjected to [an operational test] [a performance test] to demonstrate satisfactory functional efficiency. Results of the tests shall be used in determining the capacity and performance of the oxidation unit. Correct any deficiencies revealed during the tests and repeat the tests.
3.7.2.1 Constant Flow Tests

**************************************************************************
NOTE: This procedure is appropriate for a system without blowers or with a single constant speed blower.
**************************************************************************

Operate each unit at a constant flow rate of approximately [_____] cubic m/second cubic feet/second (actual) for the capacity test. Take samples of the influent and effluent at [[1] [8] hour] [1 day] [1 week] intervals for analysis.

3.7.2.2 Variable Flow Tests

**************************************************************************
NOTE: This procedure is appropriate for a system with variable speed blowers regulated by a pressure controller.
**************************************************************************

Operate each unit at flow rates varying between [_____] and [_____] cubic m/second [_____] and [_____] cubic feet/second (actual). Take samples of the influent and effluent at the high flow rate and [1 intermediate rate] [[2] [3] [_____] intermediate rates] for analysis.

3.7.2.3 Cyclic Flow Tests

**************************************************************************
NOTE: This procedure is appropriate for a system with constant speed blowers operated by on/off control.
**************************************************************************

Put each unit through a complete cycle of operation [at a constant flow rate of approximately [_____] cubic m/second cubic feet/second (actual)] [through the complete range of flows]. Take samples of the influent and effluent at the beginning and end of each cycle and at [1 intermediate time] [[2] [3] [_____] intermediate times] for analysis.

3.7.3 Sampling and Analyses

Collect samples of influent and effluent off-gas and analyze for the parameters listed in Paragraph OFF-GAS COMPOSITION in accordance with the Sampling and Analysis Plan.

3.7.4 Test Logs and Reports

Provide a complete log of each test, giving the following data: date, time of each reading and each sampling event, fuel use, and total off-gas treated. Upon completion and testing of the installed system, submit test reports, with corresponding logs and in booklet form, showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Indicate the final position of controls on each test report.
3.7.5 Manufacturer's Field Service

Employ services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative must supervise the installation, adjustment, calibration, commissioning, start-up and operational/performance testing of the equipment.

3.8 CLOSEOUT ACTIVITIES

3.8.1 Operating Instructions

Provide complete copies of detailed operating instructions with step-by-step procedures and sequences for system startup, operation and shutdown. The instructions shall include the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and the operating features of each element. The instructions shall include as-built drawings of the piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed. Describe automatic controls, functional logic, control loops, set points and alarm signals. Include flow diagrams in the instructions.

3.8.2 Maintenance Instructions

Provide complete copies of maintenance instructions listing maintenance procedures, possible breakdowns and repairs, and trouble shooting guides.

3.8.3 Field Training

**************************************************************************
NOTE: Complexity of the system and experience of the user operators should be taken into consideration.
**************************************************************************

A field-training course shall be provided for designated operating and maintenance personnel. Submit the training course curriculum and training instructions, [14] [_____] days prior to the start of training. Training shall be provided for a total period of [_____] hours of normal working time and shall start after the system is functionally complete but prior to the [performance] [operational] test. Field training shall cover each item contained in the operating and maintenance manuals, as well as demonstrations of routine maintenance operations.

3.9 MAINTENANCE

**************************************************************************
NOTE: Select the option that is compatible with the Bid Schedule.
**************************************************************************

Manage, operate, maintain, and monitor the off-gas control system [until contract close out] [for at least [one year] [_____] after construction, startup and performance testing are complete]. At a minimum, an operator shall be on site [eight] [_____] hours per week to operate, maintain, and calibrate the equipment and instruments, and to collect samples for analyses. A qualified person shall be on call to respond to emergencies and alarm conditions at the off-gas system within two hours of alarm conditions. Compliance and monitoring records and reports shall be
prepared and maintained for the Contracting Officer and regulatory agencies. The operator shall maintain a log of the actions taken.

NOTE: This guide specification covers the requirements for factory fabricated storage tanks used to contain fire suppressant discharge. Except when used to contain fire suppressant discharge during an emergency, the containment tank must remain empty. The containment tank must be expeditiously emptied after each emergency that discharges fire suppressant, water or fuel. The tank operator will need to use the strapping chart and stick gauge to determine quantity for disposal. The tank is not meant for storing hazardous substances other than emergency discharges that are expeditiously emptied and would not include connections that would allow any discharges to storm or sanitary sewer.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
capacities less than or equal to 227,000 L 60,000 gal. Additional system components/devices necessary to meet state and local regulations must be added by the designer.

The design and installation of underground factory-fabricated storage tanks must be coordinated with Base Environmental.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes
following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY CONTROL

1.3.1 Regulatory Requirements

1.3.1.1 Permitting

Obtain necessary permits in conjunction with the installation of storage tanks as required by federal, state, or local authority.

1.3.1.2 Registration

**************************************************************************
NOTE: The designer must confirm with the DoD Installation the number of days required to obtain the permit documentation.
**************************************************************************

Obtain and complete all tank registration forms required by federal, state, and local authorities. Submit all completed tank registration forms within [30][_____] days after contract award to the Contracting Officer. The Contracting Officer will ensure the Base Environmental staff for the DoD Installation submits the forms to the proper regulatory agencies.

1.3.1.3 Licensed Personnel

Tank installers must be licensed by the state when required by state law or regulations.

1.3.2 Contractor Qualifications

**************************************************************************
NOTE: Include specific local regulatory requirements into the specification as applicable.
**************************************************************************
Each installation Contractor must have successfully completed at least 3 projects of the same or similar scope, and the same size or larger within the last 3 years and demonstrated specific installation experience in regard to underground tank installation. Submit a letter listing prior projects, the date of construction, a point of contact for each prior project, the scope of work of each prior project, and a detailed list of work performed. The letter must also include evidence of prior manufacturer's training, and other related information.

[State certified installers must be provided by the Contractor. ]Each installation Contractor must have taken, if applicable, manufacturer's training courses on the installation of storage tanks and must meet all applicable licensing requirements in the state. Installers must also be trained and certified by the manufacturer to install the equipment and materials[ and must be STI certified].[ Contractor must have Pollution Liability Insurance.]

1.4 DELIVERY, STORAGE, AND HANDLING

Handle, store, and protect system components and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer, upon recommendation by Base Environmental for the DoD Installation. Replace damaged or defective items.

1.5 PROJECT/SITE CONDITIONS

Exposed moving parts, parts that produce high operating temperatures and pressures, parts that may be electrically energized, and parts that may be a hazard to operating personnel must be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Install safety devices so that proper operation of equipment is not impaired.

1.6 WARRANTY

All factory fabricated storage tanks must come with a manufacturer's warranty of a minimum period of 30 years. All warranty paperwork will be completed and submitted by Contractor to both the tank and system component manufacturers, the Contracting Officer, and the Base Environmental for the DoD Installation. This includes all applicable completed manufacturers' equipment installation checklists.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

This section defines the requirements for factory fabricated storage tanks used to contain fire suppressant discharge.

2.1.1 Design Requirements

2.1.1.1 Electrical Work

**************************************************************************

NOTE: Coordinate the ignition temperature of the fuel(s) to be handled with the electrical design. Ignition temperatures will be as defined in NFPA 497. Fuel ignition temperatures will dictate the maximum allowable location classification of the
electrical system components.

******************************************************************************

2.1.1.1  Grounding and Bonding

Grounding and bonding must be in accordance with NFPA 70, NFPA 77, NFPA 780, API RP 540, API RP 2003, IEEE 142, and IEEE 1100. Provide jumpers to overcome the insulating effects of gaskets, paints, or nonmetallic components.

2.1.1.2  Earthwork

******************************************************************************

**NOTE:** The designer developing the earthwork specifications will evaluate the need for a filter fabric to be installed between the native soil and the new backfill material. The intent of a filter fabric would be to prevent the displacement of new backfill material with native soil due to a high water table. If the new backfill material is displaced, it could affect the structural integrity of the tank. If a filter fabric is determined to be necessary, include the requirements for the new fabric in the excavation and backfilling specifications.

******************************************************************************

Excavation and backfilling for tanks must be as specified in Section 31 23 00.00 20 EXCAVATION AND FILL.

2.2  MANUFACTURED UNITS

Provide materials and system components that are standard products of a manufacturer regularly engaged in the manufacturing of such products and that are of a similar material, design and workmanship. Provide materials and system components that have been in satisfactory commercial or industrial use for a minimum 3 years prior to bid opening. The 3 year period must include applications of the system components and materials under similar circumstances and of similar size. Provide materials and system components that have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 3 year period.

Internal parts and components of system components, piping, piping components, and valves that could be exposed to fuel during system operation must not be constructed of zinc coated (galvanized) metal, brass, bronze, or other copper alloys. Do not install cast iron bodied valves in piping systems that could be exposed to fuel during system operation.

2.2.1  Underground Storage Tank

Provide a factory fabricated double wall storage tank. Tank may be either steel with a non-metallic outer jacket or a double wall fiberglass tank. Tank must be designed and manufactured for an underground, horizontal installation. The exterior tank walls must be separated from the interior tank walls by standoffs; thus creating an open or interstitial space. The entire interstitial space must be monitorable for leaks.

******************************************************************************
NOTE: Provide a concrete anchor pad(s) or deadmen for any tank that will be installed in areas subject to high water tables or flooding. Size the pad(s) or deadmen in accordance with API RP 1615. Require the tank to be connected to the pad(s) or deadmen in accordance with the tank manufacturer's recommendations.

Delete the bracketed sentences if concrete anchor pads or deadmen are not required.

**************************************************************************

For tanks requiring concrete anchor pads or concrete deadmen, provide holddown straps and accessories as recommended by the tank manufacturer. Use filler strips between the tank shell and any metal holddown straps that conform to the tank manufacturer's requirements.

2.2.1.1 Double Wall Tank (Steel with Non-Metallic Jacket)

The primary tank must be constructed of steel and jacketed with a non-metallic secondary containment tank. The entire tank assembly must conform to UL 58 Type II and UL 1746 Part III. The UL 58 label must be affixed to the exterior surface of the tank.

2.2.1.2 Double Wall Fiberglass Tank

Provide a UL 1316 compliant fiberglass tank. The tank manufacturer shall be recognized by Underwriters Laboratories as a manufacturer of tanks listed to the UL 1316 standard. The UL 1316 label must be affixed to the exterior surface of the tank.

2.2.1.3 Tank Protective Coatings

2.2.1.3.1 Interior Surfaces

Use an SSPC QP-3 certified coating company to apply interior coating. Coat 100 percent of a metal tank's interior surfaces including all metal piping and metal appurtenances with the manufacturer's standard coating system.

2.2.1.4 Tank Piping Penetrations

**************************************************************************

NOTE: Use tank manholes as the primary point of entry for piping penetrations unless unfeasible. Pipe penetrations into an underground storage tank are the most likely place for a leak to occur. Designing pipe penetrations to enter through a tank manhole allows each of the penetrations to be contained in a manhole containment sump. The piping that penetrates the manhole must be flanged on both sides of the manhole hatch. This will allow the piping to be removed from the manhole and allow removal of the manhole without having to cut the piping.

Where stand alone tank piping penetrations are required, indicate on the drawings the required number, size, and location of each penetration.
Flanged nozzles must be installed in locations with ISO Corrosivity Categories C3, C4, and C5.

Provide a flanged pipe nozzle for each tank piping connection. All unused or spare tank piping penetrations must be sealed with a steel blind flange.

2.2.1.5 Tank Striker/Impact Plates

NOTE: Striker plates under all openings used for manual gauging in steel tanks and all openings in fiberglass tanks.

Provide an interior striker/impact plate under the manual gauging/sampling hatch and each tank manhole and pipe connection. Each plate must be a minimum of 6 mm 1/4 inch in thickness, be larger in diameter than the tank penetration, fit the curvature of the tank bottom, and be completely coated in the same fashion as the interior tank bottom coating. Each plate must be welded or bonded to the tank bottom at the factory (full circumference connection). The welds must be non-destructive tested using the appropriate means.

2.2.1.6 Manual Gauging/Sampling Hatch

Provide a combination gauging and sampling hatch assembly. The assembly must include a bronze top-seal type adapter with a corresponding locking type cap (adapter and cap both externally-mounted to the top of the tank) [and a steel or aluminum stilling well pipe]. The stilling well pipe must be a minimum 100 mm 4 inches in size and extend downward through the top of the tank to within 75 mm 3 inches of the tank bottom. Provide the entire length of pipe inside the tank with 13 mm 1/2 inch wide by 300 mm 12 inches long slots at alternate locations. Coat the pipe in the same fashion as the interior tank bottom coating.

2.2.1.7 Tank Manhole

NOTE: Indicate the number, size, and location of each tank manhole required.

Provide tanks 18,900L 5,000 gallons and smaller with a minimum of one 760 mm 30 inch tank manhole to allow for internal tank access. Provide tanks larger than 18,900 L 5,000 gallons with a minimum of two 915 mm 36 inch tank manholes (one manhole for access).

Provide tanks with a minimum of [2] [1] [_____] manholes. Tank manholes must have an internal diameter of [760 mm 30 inches] [813 mm 32 inches] [915 mm 36 inches]. Provide each manhole with a matching flanged watertight manhole cover. Manhole covers must be UL listed, be constructed of pressed or mild steel, and include a UL listed gasket. Frame and cover assembly must be rated to withstand H-20 highway loading as defined by AASHTO HB-17.
2.2.1.8  Atmospheric Vent

Provide atmospheric, updraft type cap no closer than 5 feet from any building openings. Cap must be constructed of aluminum or carbon steel. Cap must have an internal brass or bronze insect screen, minimum 40-mesh. Cap must prevent rain, snow, or ice from entering the vent piping.

2.2.1.9  Nameplates

**************************************************************************
NOTE: In a salt water environment, substitute acceptable non-corroding metal such as, but not limited to, nickel-copper, 304 stainless steel, or monel. Aluminum is unacceptable. Nomenclature (or system identification) should be established by the designer.

Require melamine plastic nameplates for all NAVFAC projects. Also, for NAVFAC projects, require nameplates to be associated or keyed to system charts and schedules.
**************************************************************************

Attach nameplates to all specified system components defined herein. List on each nameplate the manufacturer's name, address, [contract number,] [acceptance date,] component type or style, model or serial number, catalog number, capacity or size, and the system that is controlled. Construct plates of [anodized aluminum] [stainless steel] [melamine plastic, 3 mm 0.125 inch thick, UV resistance, black with white center core, matte finish surface and square corners] [______]. Install nameplates in prominent locations with nonferrous screws, nonferrous bolts, or permanent adhesive. Minimum size of nameplates must be 25 by 65 mm one by 2.5 inches. Provide manufacturer's storage tank nameplates as required. Lettering must be the normal block style with a minimum 6 mm 0.25 inch height. Accurately align all lettering on nameplates.[ For plastic nameplates, engrave lettering into the white core.][ Key the nameplates to a chart and schedule for each system. Frame charts and schedule under glass, and locate where directed near each system. Furnish two copies of each chart and schedule. Each nameplate description must identify its function.]

2.2.2  Manhole Containment Sump

**************************************************************************
NOTE: Require on the drawings a containment sump to be installed directly above each tank manhole. Do not require the sump to be connected in any way to the surfaces above (e.g., street manhole cover, concrete and similar accessories).

Typical installations include a street manhole cover to be installed directly above each sump in order to allow access to the sump and the tank manhole below. Size the manhole cover large enough to allow the removal of the sump access cover below.
**************************************************************************

Sump must be the factory fabricated, direct-buried type that provides a watertight connection either directly to the exterior of the tank or to a flanged manhole opening. Sump must be constructed of fiberglass reinforced
plastic. Sump construction must be chemically compatible with the type of products being handled within the connecting tank. Sump must allow access to a tank manhole cover without disturbing surrounding backfill. Sump must be larger in diameter than the connecting tank manhole. Sump must be designed to withstand the underground burial loads. Sump assembly must prevent the influx of rainfall drainage or ground water.

2.2.2.1 Piping Penetrations

Sump sides must allow the penetration of carrier pipes, exterior containment pipes, conduits, and vapor pipes as required. Sump penetrations must be booted or sealed to ensure that liquid will not escape from the sump in the event that the liquid level within the sump rises above the pipe penetration. Boots and seals used must be compatible with the fuel to be handled. Boots and seals must be water resistant to the influx of water from outside the sump. Boots and seals must be designed and installed to accommodate the anticipated amount of thermal expansion and contraction in the piping system.

2.2.2.2 Access Cover

**************************************************************************
NOTE: Require watertight covers if high ground water is a problem and frequent access to the manhole below is not necessary. Watertight covers are generally bolted or strapped down. Strapped down covers provide easy access to the sumps without the use of tools. Friction fit covers will prevent the influx of rainwater and are easily removable by hand.**************************************************************************

Where indicated, the entire top of a containment sump must be capped with a [friction fit] [bolted down, watertight] [strapped down, watertight] access cover that allows water to flow away from the manhole. Cover must be constructed of the same material as the sump. Cover must have a larger diameter than the tank manhole cover below. Cover must be lightweight and not exceed 16 kilograms 35 pounds.

2.2.3 Interstitial Space Access Sump

Provide an access sump around the interstitial monitoring pipe to allow for manual monitoring of the interstitial space of the tank in accordance with RP900-17 Section 7.5.7. The monitoring pipe must be capped with a watertight [threaded cap,] [quick release cap,] [or other cap as may be recommended by the manufacturer]. Both the monitoring pipe and the sump will be labeled respectively as the "interstitial monitoring pipe" and "interstitial monitoring pipe access". Label must be affixed to the exterior surface of the tank.

2.3 COMPONENTS

Provide materials and system components that are standard products of a manufacturer regularly engaged in the manufacturing of such products, that are of a similar material, design and workmanship. Provide materials and system components that have been in satisfactory commercial or industrial use for a minimum 3 years prior to bid opening. The 3 year period must include applications of the system components and materials under similar circumstances and of similar size. Provide materials and system components
that have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 3 year period.

Internal parts and components of system components, piping, piping components, and valves that could be exposed to fuel during system operation must not be constructed of zinc coated (galvanized) metal, brass, bronze, or other copper alloys. Do not install cast iron bodied valves in piping systems that could be exposed to fuel during system operation.

2.3.1 Independent Level Alarm System

**************************************************************************
NOTE: Level alarms are recommended to ensure that the tank does not fill by infiltration in the drain line or other means. The containment tanks needs to remain empty so that it can contain fire suppressant discharge during the anticipated fire event.

Include the first bracketed sentence if multiple tanks are to be monitored as part of the design. Alarms for tanks less than 112,500 L 30,000 gallons must be provided by an automatic tank gauging system. Alarms for tanks equal to or greater than 112,500 L 30,000 gallons must be provided by an independent level alarm system (see below) in addition to an automatic tank gauging system.
**************************************************************************

Provide an independent level alarm system that will monitor [2] [___] programmable liquid level setpoints. The system must delineate between each individual setpoint[ as well as each individual tank]. The system must produce an audible and visible alarm in the event of monitoring an alarm condition. Mechanically-actuated float assemblies must be field adjustable. The system must be totally independent of the tank gauging system.

2.3.1.1 Setpoints

**************************************************************************
NOTE: The suggested low-low level alarm setpoint for underground tanks is 5 percent tank capacity.
**************************************************************************

Configure the alarm system's setpoints in accordance with the following.

a. Low Level Setpoint. Produce an audible and visual alarm condition when a tank's liquid level rises above [10] [___] percent capacity.

2.3.1.2 Independent Level Alarm Control Panel

**************************************************************************
NOTE: Indicate on the drawings the location of the system control panel. Panels located outdoors will require NEMA 4 enclosures. Panels located indoors will only require a standard industrial enclosure. Explosion-proof enclosures are typically unavailable.
**************************************************************************
Install the control panel for the alarm system in a [NEMA 4 rated enclosure in accordance with NEMA 250] [standard industrial enclosure]. Panel doors must swing left or right.

2.3.1.2.1 Audible Alarm

Panel must have [internal] [external] speakers that produce a buzzer sound of [70] [_____] decibels or greater in the event of a detected alarm condition.

2.3.1.2.2 Visual Alarm

Panel must have a visual alarm that illuminates in the event of a detected alarm condition. The visual alarm must include either individual lights for each alarm condition or must include a single light and a liquid crystal display (LCD) panel that displaces information regarding each alarm condition.

2.3.1.2.3 Acknowledge Switch

Panel must have a manual acknowledge switch that will deactivate the audible alarm. The acknowledge switch must not deactivate subsequent audible alarms unless depressed manually again for each occurrence. Under no circumstance must this acknowledgement switch extinguish the visual alarms until the alarm condition has been corrected. The acknowledge switch must be an integral component located on the front of the control panel. The switch must be a [push button] [key switch].

2.3.1.2.4 Test Pushbutton

Panel must have a manual test pushbutton that will enable operators to verify that the panel is powered, and the visual and audible alarms are working properly.

2.4 MATERIALS

2.4.1 Piping

Pipe shall be of the sizes indicated and shall conform to the requirements specified.

2.4.1.1 Poly Vinyl Chloride (PVC) Pipe

Submit the pipe manufacturer's resin certification, indicating the cell classification of PVC used to manufacture the pipe, prior to installation of the pipe.

2.4.1.1.1 Type PSM PVC Pipe

ASTM D3034, Type PSM, maximum SDR 35, produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.
2.4.1.1.2 Profile PVC Pipe

ASTM F794, Series 46, produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.1.3 Smooth Wall PVC Pipe

ASTM F679 produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.1.4 Corrugated PVC Pipe

ASTM F949 produced from PVC certified by the Manufacturer as meeting the requirements of ASTM D1784, minimum cell class 12454-B.

2.4.1.2 Polyethylene (PE) Pipe

Submit the pipe manufacturer's resin certification, indicating the cell classification of PE used to manufacture the pipe, prior to installation of the pipe. The minimum cell classification for polyethylene plastic shall apply to each of the seven primary properties of the cell classification limits in accordance with ASTM D3350.

2.4.1.2.1 Smooth Wall PE Pipe

ASTM F714, maximum DR of 21 for pipes 80 to 600 mm 3 to 24 inches in diameter and maximum DR of 26 for pipes 650 to 1200 mm 26 to 48 inches in diameter. Pipe shall be produced from PE certified by the resin producer as meeting the requirements of ASTM D3350, minimum cell class 335434C.

2.4.1.2.2 Corrugated PE Pipe

**************************************************************************
NOTE: Corrugated PE pipe culverts and storm drains shall not be installed beneath airfield pavements unless approved in writing by the major command. Type S pipe has a full circular cross-section, with an outer corrugated pipe wall and a smooth inner liner. Type C pipe has a full circular cross-section, with a corrugated surface both inside and outside. Corrugations may be either annular or helical.
**************************************************************************

AASHTO M 294 Type [S] [C]. For slow crack growth resistance, acceptance of resins shall be determined by using the notched constant ligament-stress (NCLS) test meeting the requirements of AASHTO M 294. Pipe walls shall have the following properties:

<table>
<thead>
<tr>
<th>Nominal Size (mm) (inch)</th>
<th>Minimum Wall Area (square mm/m) (square in/ft)</th>
<th>Minimum Moment of Inertia of Wall Section (mm to the 4th/mm) (in. to the 4th/in.)</th>
</tr>

</tbody>
</table>

2.4.1.3 Steel Reinforced Polyethylene (SRPE) Pipe

SRPE pipe will meet the requirements of ASTM F2562/F2562M 200 - 3000 mm 8 - 120 inch diameter pipe and AASHTO MP 20 (300 - 1525 (12 - 60 inch diameter pipe).
2.4.1.4 Polypropylene (PP) Pipe

Double wall and triple wall pipe with a diameter of 300 to 1525 mm (12 to 60 inches) shall meet the requirements of ASTM F2736, ASTM F2764/F2764M, or ASTM F2881/F2881M.

2.5 ACCESSORIES

2.5.1 Stick Gauge

**************************************************************************
NOTE: Provide each tank with a stick gauge and tank calibration chart. Provide a minimum of one additional gauge for each tank.
**************************************************************************

For each tank, provide [2] [_____] wooden stick gauges. Gauge length must allow the measurement of the entire level in the corresponding tank. Gauges must be compatible with the fuel to be measured (no swelling or damage from fuel contact). Provide gauge with non-sparking caps on each end. Mark gauges in m/mm in 1 mm increments feet/inches in 1/16 inch increments. Marking must be embossed into the stick and painted in a contrasting color impervious to water and hydrocarbon products.

2.5.2 Manual Interstitial Space Monitoring Equipment

Provide all equipment and materials required to monitor the interstitial space.

2.5.2.1 Dip Stick

2.5.3 Tank Strapping Table

**************************************************************************
NOTE: Provide each tank with a tank calibration chart.
**************************************************************************

Reference API MPMS 2.2E is for horizontal tank applications. For tanks smaller than 19,000 L (5,000 gallons), choose tank manufacturer certified strapping tables.

**************************************************************************

Furnish [2] [_____] API MPMS 2.2E [tank manufacturer] certified strapping tables (calibration charts) for each tank. One of the tables must indicate the liquid volume in liters for each 1 mm of tank depth and the other in gallons for each 1/16 inch of tank depth. Strapping table volumes for all tanks 19,000 liters (5,000 gallons) and larger must be determined using physical measurements and not calculated values. For each tank, provide an electronic media file of each strapping table.[ For tanks larger than 19,000 L (5,000 gallons) tank strapping must be performed after installation at the site.]

2.5.4 Concrete Anchor Bolts

Concrete anchors must conform to ASTM A307, Grade C, hot-dipped galvanized.
2.5.5 Bolts and Studs

Carbon steel bolts and studs must conform to ASTM A307, Grade B, hot-dipped galvanized. Stainless steel bolts and studs that conform to ASTM A193/A193M, Grade 8.

2.5.6 Nuts

Carbon steel nuts must conform to ASTM A563, Grade A, hex style, hot-dipped galvanized. Stainless steel nuts must conform to ASTM A194/A194M, Grade 8.

2.5.7 Washers

Provide flat circular washers under each bolt head and each nut. Washer materials must be the same as the connecting bolt and nut. Carbon steel washers must conform to ASTM F844, hot-dipped galvanized. Stainless steel washers must conform to ASTM A194/A194M, Grade 8.

2.5.8 Street Manhole Assembly

**************************************************************************
NOTE: Delete this paragraph if street manhole assemblies are addressed in the Civil specifications.
**************************************************************************

Style A frames are for manholes up to 760 mm 30 inches in diameter. Style B frames are for manholes between 915 and 1070 mm 36 and 42 inches in diameter.

**************************************************************************
NOTE: Round street manhole frames and covers must be the straight traffic type. Frames and covers must be constructed of [cast steel in accordance with ASTM A27/A27M, grade 60-30 as a minimum] [cast iron in accordance with ASTM A48/A48M] [aluminum in accordance with ASTM B26/B26M] [or] [a engineered lightweight laminate material]. Covers must be the solid plate type with a checker pattern. Covers must form a watertight seal with the manhole frame to prevent surface water inflow. Frame and cover assembly must be rated to withstand H-20 highway loading as defined by AASHTO HB-17.

PART 3 EXECUTION

3.1 INSTALLATION

**************************************************************************
NOTE: During design, layout system components to allow adequate access for routine maintenance. Do not rely solely on the Contractor to make these judgments. Show access doors where applicable for maintenance.
**************************************************************************

Install work so that parts requiring periodic inspection, operation, maintenance, and repair are readily accessible. Handle storage tanks with extreme care to prevent damage during placement and install in accordance with the manufacturer's installation instructions and NFPA 30. Inspect the exterior surface of each tank for obvious visual damage prior to and during the placement of each storage tank. Repair surface damage to a storage tank according to manufacturer's requirements before proceeding with the system installation. Provide the termination of fill lines within a tank.
with an antisplash deflector. Provide nylon dielectric bushings on pipe connections to a steel tank.

3.1.1 Underground Storage Tank

Install underground storage tanks in accordance with API RP 1615 except as modified herein. Place tank on a 3 mm per 30 mm 1/8 inch per foot slope with the fill point at the low end and the vent connection at the high end. Locate tank so that discharge pipes slope up uniformly toward the outlet. Install containment sumps prior to any backfill being added above the storage tanks.

3.1.1.1 Steel Underground Storage Tank Handling

Store, handle, and place externally coated steel tanks with care and in a manner that will minimize damage to the coating and will not reduce its protective value. Place coated tanks in position carefully and with a minimum of handling. Prior to backfilling a tank, visually inspect the tank exterior protective coating for damage. Repair any damaged tank coating in accordance with the appropriate UL standard, UL 1746 or UL 58.

3.1.1.2 Steel Underground Storage Tank Installation Procedures

**************************************************************************
NOTE: Provide straps and anchors designed to prevent flotation of underground tanks located in areas with high groundwater level or subject to flooding. Provide electrical isolation strips between hold-down straps and metal tanks. Anchors may be concrete anchor slab under the tank or concrete deadmen. Tailor paragraph to suit design. Underground storage tanks occasionally rely on backfill and top slab to hold the tank in place in addition to the hold down straps and concrete deadmen. When new or existing USTs are exposed, the contractor must take steps to ensure the tank remains safely in place without damage. Manufacturer's suggestions for installation of new tanks must be followed and used on existing tanks until the tank is safe from damage due to a sudden or slow influx of water. Existing hold down straps must be inspected to assure they are adequate for holding the tank in place and compromised hold downs reported to the Resident Engineer with a suggested solution. The recommendations of API 1615 must also be followed.
**************************************************************************

[Set tank on a minimum of 150 mm 6 inches of backfill material. ][Anchor tank to a reinforced concrete anchor pad as indicated using manufacturer's supplied holddown straps. Separate tank from an anchor pad by a minimum of 300 mm 12 inches of backfill material. Coat metal straps, turnbuckles, anchors, and accessories to resist corrosion. ]Uniformly place backfill material around the entire tank and extend to grade level. Inspect tank cathodic protection anodes, if applicable, to ensure integrity during backfill operations.
3.1.1.3  Fiberglass Underground Storage Tank Handling

Handle tank with extreme care to prevent damage during installation and transportation to the site. Any damaged tank must be replaced or repaired and tested under direct supervision and advice of the tank manufacturer, using the manufacturer's written procedures.

3.1.1.4  Fiberglass Underground Storage Tank Installation Procedures

*******************************************************************************
NOTE: Provide straps and anchors designed to prevent flotation of underground tanks located in areas with high groundwater levels or subject to flooding. Anchors may be a concrete anchor slab under the tank or concrete deadmen. Tailor paragraph to suit design. Underground storage tanks occasionally rely on backfill and top slab to hold the tank in place in addition to the hold-down straps and concrete deadmen. When new or existing USTs are exposed, the contractor must take steps to ensure the tank remains safely in place without damage. Manufacturer's suggestions for installation of new tanks must be followed and used on existing tanks until the tank is safe from damage due to a sudden or slow influx of water. Existing hold-down straps must be inspected to assure they are adequate for holding the tank in place and compromised hold downs reported to the Resident Engineer with a suggested solution. The recommendations of API 1615 must also be followed.

Use 12 inches of backfill in Maryland. Maryland requires 12 inches of backfill under a UST.
*******************************************************************************

[Set tank on a minimum of 300 mm 12 inches [150 mm 6 inches] of backfill material. ][Anchor tank to a reinforced concrete anchor pad as indicated through the use of manufacturer's supplied hold-down straps. Separate tank from an anchor pad by a minimum of 300 mm 12 inches of backfill material.]

3.1.2  System Components

Properly level, align, and secure system components in place in accordance with manufacturer's instructions. Provide supports for system components, appurtenances, and pipe as required. Install anchors, bolts, nuts, washers, and screws where required for securing the work in place. Sizes, types, and spacing of anchors and bolts not indicated or specified must be as required for proper installation.

3.2  FIELD QUALITY CONTROL

3.2.1  Underground Storage Tank Tightness Tests

*******************************************************************************
NOTE: Pneumatic tests are the preferred type of tightness tests. Brine level tests will only be specified for Fiberglass tanks. Delete the inapplicable tests.
*******************************************************************************
Perform a tightness test on each underground storage tank on-site just prior to their placement into the ground. Pneumatically pressurize each storage tank's primary chamber to $35 \text{ kPa} = 5 \text{ psig}$ and monitor for a drop in pressure over a 2-hour period during which there must be no drop in pressure in the tank greater than that allowed for thermal expansion and contraction. Following the successful completion of the primary chamber test, bleed the pressure from the primary chamber into the interstitial space. Maintain this pressure while applying soapsuds or equivalent material over the exterior of the tank. While applying the soapsuds, visually inspect the entire tank, including the bottom surfaces, for leaks (bubble formations). Inspection of the bottom surfaces of a tank may be performed by rotating the tank; however, a tank must only be rotated in strict accordance with the manufacturer's recommendations. Do not rotate a tank more than 90 degrees from the upright position. During testing, install a pressure relief device that relieves at the tank manufacturer's suggested pneumatic pressure limit. Gauges used in pneumatic tests must have a scale with a maximum limit of $103 \text{ kPa} = 15 \text{ psig}$.

### 3.2.1.1 Brine Level Test

In lieu of the pneumatic testing procedures described above, a brine level test may be performed on the interstitial space of double-walled Fiberglass tanks (not applicable to steel tanks). For a brine level test, completely fill a Fiberglass tank's interstitial space with a brine solution. Connect a riser pipe to the interstitial space that will allow the solution to rise within the riser at least $300 \text{ mm} = 12 \text{ inches}$. After filling the interstitial space, the tank must set approximately 3 hours. Following the 3-hour period, measure and record the level of solution within the riser. After a subsequent 4-hour period, again measure and record the level of solution within the riser. If the level of solution within the interstitial decreases anytime during the test, the tank is considered leaking and therefore fails the test.

### 3.2.1.2 Repairs

Repair leaks discovered in either the primary chamber or the interstitial space in accordance with the tank manufacturer's instructions. Following any tank repairs, re-test the tank until the tank successfully passes the testing requirements defined herein.

### 3.2.2 Tank Manufacturer's Tests

In addition to the tests required herein, perform any additional tests (i.e., leak tests) on each storage tank that are required by the tank manufacturer's written test procedures. Manufacturer's tests that are redundant to tests already required by this specification will only be performed once per tank. Repair all leaks discovered during the tests in accordance with manufacturer's instructions. Following tank repairs, re-test the tank until the tank successfully passes the manufacturer's testing requirements.

### 3.2.3 Tank Inspection Reports

Prior to system commissioning, a certified inspector must inspect the completed underground tank in accordance with STI SP131 and deliver a full report to the Contracting Officer. The report must include the tank data plate information and photograph of the tank data plate. The paper and electronic copies of the report and UTMs must be provided to the
3.3 DEMONSTRATIONS

Conduct a training session for designated Government personnel in the operation and maintenance procedures related to the system components and systems specified herein. Include pertinent safety operational procedures in the session as well as physical demonstrations of the routine maintenance operations. Furnish instructors who are familiar with the installation/system components and systems, both operational and practical theories, and associated routine maintenance procedures. The training session must consist of a total of [_____] hours of normal working time and must start after the system is functionally completed, but prior to final system acceptance. Coordinate with the Contracting Officer prior to scheduling onsite training and agree on a proposed date for conducting the training session. Notify the Contracting Officer at least 14 working days prior to the proposed training date.

3.4 Tank Fill Tests

Fill each storage tank to verify the tank level alarm system operates properly. Stop filling each tank when the operation of all alarms is verified. Correct and retest any problems with the level alarm system until alarms operate as specified herein.

3.4.6 Operation and Maintenance Manual Updates
3.4.7 System Operation by Contractor

ATTACHMENTS:

Appendix [_____]

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for precipitation/coagulation/flocculation (P/C/F) systems with flow rates ranging from 4 to 940 liters to 250 gallons per minute.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This Section is intended for specification of PCF unit processes and is specifically applicable for remediation of ground water and landfill leachate containing dissolved heavy metals. This guide specification should not be used until thorough, site specific treatability studies (jar testing) have been performed, clearly demonstrating that P/C/F is an appropriate treatment technique that can meet the performance criteria set forth in this Section.

SECTION 46 07 13.13  Page 4
1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN PETROLEUM INSTITUTE (API)

API Std 650 (2013; Errata 1 2013; Addendum 1 2014; Errata 2 2014; Addendum 2 2016; Addendum 3 2018) Welded Tanks for Oil Storage

AMERICAN SOCIETY OF CIVIL ENGINEERS (ASCE)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

1.2 SUBMITTALS

********************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item,

SECTION 46 07 13.13 Page 6
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY CONTROL

*****************************************************************************************************************************************

NOTE: The designer should review all federal, state, and local regulations to determine the applicable regulations which may impact the design of the P/C/F system. Specifically, water regulations should be reviewed to determine the required effluent quality for a specific site. Air regulations should be reviewed to determine if tank covers, vents, and emission control devices are required. Hazardous waste regulations, which cover tank standards and secondary containment, may apply where the groundwater or leachate being treated is classified as a hazardous waste.

*****************************************************************************************************************************************

1.3.1 Regulatory Requirements

Obtain all permits, certifications, and/or meet the regulatory requirements necessary for the configuration, installation, startup, and operation of the treatment plant. Ensure all work meets or exceeds applicable minimum requirements established by federal, state, and local laws and regulations. Notify the Contracting Officer within 30 days of a change in regulatory requirements which may affect the contract. Submit permits, certifications, and/or substantive regulatory requirements before work starts plus copies of applications for permits and certifications not required until later, along with a schedule for obtaining them. Transport, store and handle equipment, raw materials (including reagents/additives), contaminated materials, and treated materials in accordance with Sections 02 81 00 TRANSPORTATION AND DISPOSAL OF HAZARDOUS MATERIALS and 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES.
1.3.2 Qualifications

Contractor and Subcontractors demonstrate that their capabilities and experience with similar P/C/F systems and applications are adequate to supply, install, and operate a P/C/F system to remediate [ground water] [and] [landfill leachate] [_____] by providing descriptions of at least [2] [_____] P/C/F full-scale remediation projects. Provide a field team (consisting of [ground water] [and] [landfill leachate] [_____] unit operators, quality control personnel, health and safety personnel, supervisory engineering, and technical staff) qualified to install and operate the treatment system. Field team personnel are required to have a minimum of [_____] years' experience in the installation and operation of similar treatment systems and show evidence of satisfactory operation for each installation. Welding procedures and welders are required to be qualified in accordance with the code under which the welding is specified to be accomplished. Submit [one] [_____] [copy] [copies] of qualified procedures and list of identification symbols and names of certified welders and welding operators prior to the commencement of welding operations.

1.4 DELIVERY, STORAGE, AND HANDLING

Store and protect from inclement weather, excessive humidity and temperature variation, and dirt, dust or other contaminants, per the recommendations of the equipment manufacturer. The government is not responsible for damage caused by improperly storing materials.

1.5 SITE CONDITIONS

1.5.1 Ambient Conditions

**************************************************************************
NOTE: When temperatures are below freezing, the treatment plant equipment may not function properly and efficiently. The general practice is to avoid the operation of an outdoor treatment plant during extreme winter weather. In places where there is a long winter season or in projects where plant operation is required throughout the year to meet the project schedule, the remediation activities should be performed inside a building with proper heating and ventilation. For outdoor operations, piping and equipment should be designed with freeze protection by insulation and heat-tracing.
**************************************************************************

Ensure the P/C/F system is [operated continuously] [not operated] [_____] during the winter when temperatures reach freezing or below. Install the system [outdoors] [indoors] [_____] . Provide outdoor equipment with [insulation] [_____] and [heat tracing] [_____] . Ensure the system is equipped with sufficient lighting as shown on the drawings for security purposes and for treatment plant operation during inadequate daylight or at night. Refer to Sections 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and 26 56 00 EXTERIOR LIGHTING for proper heating, ventilation, air conditioning, and illumination.

1.5.2 Existing Conditions

**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the second bracketed phrase at the end of this paragraph if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC, properly edited, must be included in the contract documents.

**************************************************************************

Operate the P/C/F system in a [remote] [urban] [industrial] [commercial] [residential] setting. The Contractor is required to become familiar with the existing site conditions, including site location, site configuration, topography, climate, site accessibility, and adjacent land use. Ensure the P/C/F system is designed for a soil bearing capacity of [_____] MPa psf. Provide seismic protection [in accordance with UFC 3-301-01] [as shown on the drawings].

1.6 MAINTENANCE MATERIAL SUBMITTALS

1.6.1 Spare Parts

Submit a list of spare parts with the manufacturer's part number, a current unit price, [date of manufacturer] and source of supply for each different material or equipment specified, after approval of the related submittals and not later than [_____] months prior to the system startup. Include the following information on: 1) parts recommended by the manufacturer to be replaced during the first [_____] years of service, 2) a list of special tools recommended by the manufacturer for each type of equipment furnished including special tools necessary for adjustment, operation, maintenance, and disassembly and 3) spare parts data for each different item of equipment and materials specified. At least two (2) sources of supply are suggested to be submitted.

PART 2 PRODUCTS

**************************************************************************

NOTE: The designer should review the methodologies and results of the previously conducted treatability testing and other predesign information, along with the required effluent quality, to determine the types and sizes of equipment, the chemicals, and chemical dosages to be specified.

As a minimum, the designer should provide a process flow diagram (PFD), a piping and instrumentation diagram (P&ID), an instrument index, a site layout drawing, and an equipment layout drawing. The PFD should depict the P/C/F and ancillary equipment required for the specific water to be treated and display the process design conditions for each unit. Such process design conditions should include consideration of minimum, average, and maximum values of each significant parameter (e.g. pressure, temperature, flow rate, etc.). The P&ID should define all piping and instrumentation of the system and should include descriptive tag names for all piping and fittings including materials of
construction, tag number, and line size. The P&ID drawings should also include tag numbers for all instruments in accordance with ANSI/ISA 5.1. The instrument index should include drawings detailing the types of instruments to be used, their range and scale, related appurtenances, and their associated tag numbers; all such information must be coordinated with the P&ID.

The designer should verify that the appropriate (on/off, proportional, set point, etc.) controller to be used in the P/C/F system for chemical feed control is specified in Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS. The designer should provide a site layout drawing to indicate to an equipment supplier what the general location of the equipment will be and how much space is available for the proposed equipment. The designer should also provide a detailed equipment layout drawing that identifies all the major equipment and their related orientations inside the site plan. This equipment layout drawing should indicate where off-site piping and utility lines enter and/or leave the site. If the equipment layout drawing is only a suggestion or recommendation to the Contractor, the designer should so state on the drawing.

**************************************************************************

2.1 SYSTEM DESCRIPTION

2.1.1 P/C/F System Description

**************************************************************************

NOTE: The system described in this paragraph includes the P/C/F equipment required for a water treatment plant to remove dissolved metals. The system can be a stand-alone system, or it can be a pretreatment system for other systems such as air stripping, advanced oxidation, activated carbon, etc. Ancillary P/C/F equipment which may be required for pre-treatment or post-treatment of the water is also described and includes an equalization unit, an oxidation/reduction unit, a clarification unit, a post-pH adjustment unit, and an effluent holding unit. The precipitation, coagulation, and flocculation units may be supplied by the Contractor as individual pieces of equipment or as a single, integral unit. Typically, if a single unit is supplied, it will incorporate the coagulation, flocculation, and precipitation equipment within a clarification unit. Alternately, a unit may be supplied which performs two of the processes, e.g., precipitation and coagulation within one unit.

This paragraph should be edited to identify only the necessary equipment to suit conditions at the project site. The design team should review treatment objectives, water characterization data, and results of previously conducted treatability
testing and other predesign information to determine the equipment required.

The Precipitation/Coagulation/Flocculation (P/C/F) system is required to be a fully integrated water treatment plant which is designed to remove dissolved heavy metals and solids from [groundwater] [and] [landfill leachate] [____]. The system is required to include equipment for [flow equalization,] wastewater conveyance, precipitation, coagulation, flocculation, clarification, [post-pH adjustment,] and treated effluent storage required to meet the specified performance requirements. Provide the P/C/F system complete with required instruments, controls, and local control panels. Provide a main control center to facilitate the overall control of the treatment plant. Factory or shop preassembled all parts to the maximum extent possible, compatible with transportation limitations and equipment protection considerations. Minimize field assembly to the assembly of match-marked components. Submit installation instructions and framed, typed operating instructions for posting and explaining methods of checking the system for startup and normal safe operations, normal and emergency shutdown operations, and procedures for safely starting and stopping each piece of equipment within the system.

2.1.1.1 Equalization Unit

Provide the equalization unit with [one tank] [____] tanks complete with accessories, mixers, piping, valves, [pumps,] motors, and instrumentation and controls to provide a constant flow and contaminant concentration to the subsequent treatment equipment. Furnish components of the unit as shown on the drawings.

2.1.1.2 Oxidation/Reduction Unit

*[NOTE: Delete this paragraph if the contaminants in the water to be treated do not include metals which require reduction prior to precipitation (e.g., chromium 6+), or metals which require oxidation prior to precipitation (e.g., iron or manganese).*]

[Provide the reduction unit with a mix tank, a mixer, a chemical feed system for acid addition, a chemical feed system for the reducing agent addition, piping, valves, pumps, motors, pH controls, oxidation-reduction potential (ORP) controls, and other instrumentation and controls as indicated on the drawings.] [Provide the oxidation unit with a mix tank, a mixer, a chemical feed system for oxidant addition, piping, valves, pumps, motors, oxidation-reduction potential (ORP) controls, and other instrumentation and controls as indicated on the drawings.]

2.1.1.3 Precipitation Unit

Provide the precipitation unit with a mix tank, a mixer, a chemical feed system for the precipitant addition, piping, valves, pumps, motors, pH controls, and other instrumentation and controls as indicated on the drawings.

2.1.1.4 Coagulation Unit

Provide the coagulation unit with a mix tank, a mixer, a chemical feed
system for the coagulant addition, piping, valves, pumps, motors, and instrumentation and controls as indicated on the drawings.

2.1.1.5 Flocculation Unit

Provide the flocculation unit with a tank with accessories (e.g., nozzles, supports, lifting lugs, etc.), a mixer, a flocculation chemical stream feed system for the coagulant aid addition, piping, valves, pumps, motors, and instrumentation and controls as indicated on the drawings.

2.1.1.6 Clarification Unit

Provide the clarification unit with an inclined plate or tube type settler with all necessary accessories (e.g., inlet distribution system, separator module, skimmer, etc.), [a thickener,] a sludge removal system, piping, valve, pumps, motors, and instrumentation and controls as indicated on the drawings.

2.1.1.7 Post-pH Adjustment Unit

Provide the post-pH adjustment unit complete with piping, chemical feed systems for both acid and base addition, and in-line pH instrumentation and controls as indicated on the drawings.

2.1.1.8 Effluent Holding Unit

Provide [one effluent holding tank] [(_____] effluent holding tanks] to store treated water for testing prior to discharging. Ensure all tanks include piping, valves, sample taps, pumps, and instrumentation and controls as indicated on the drawings.

2.1.2 Performance Requirements

*********************************************************************************************************************************************

NOTE: The designer, in consultation with the appropriate technical team personnel, should use the treatability testing results and other predesign information to set influent parameters, such as maximum and minimum ground water and landfill leachate flow rates, maximum and minimum temperatures, pH, viscosity, density, and maximum and minimum influent metals and solids concentrations. The required effluent quality is typically established by federal, state, or local agency permit or regulation.

The designer should consider that fugitive emissions from landfill leachates or contaminated groundwater may have volatile components. Federal, state, or local air regulations should be consulted to establish allowable air emissions for the P/C/F system.

Performance requirements for the Contractor will indicate that the supplied equipment must be operated to meet the required effluent quality. Performance requirements for the Contractor stated in this paragraph should only apply to the performance of the complete system and not
individual pieces of equipment. Performance criteria and minimum equipment standards for specific equipment should be listed under PART 2 PRODUCTS, where applicable.

Flow rates specified for the P/C/F system should be consistent with the pumping rates required by Section 23 21 23 HYDRONIC PUMPS or 22 13 29 SANITARY SEWERAGE PUMPS.

Provide a P/C/F system capable of processing [ground water] [landfill leachate] [_____] at the conditions provided below:

<table>
<thead>
<tr>
<th>Flow Rate</th>
<th>Maximum</th>
<th>[_____] L gal per minute</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Minimum</td>
<td>[_____] L gal per minute</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Temperatures</th>
<th>Maximum</th>
<th>[_____] degrees C F</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Minimum</td>
<td>[_____] degrees C F</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Influent/Effluent pH</th>
<th>Maximum Influent</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Minimum Influent</td>
<td>[_____]</td>
</tr>
<tr>
<td></td>
<td>Maximum Effluent</td>
<td>[_____]</td>
</tr>
<tr>
<td></td>
<td>Minimum Effluent</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Liquid Properties</th>
<th>Liquid Viscosity</th>
<th>[_____] centipoise lb-sec/(sq. ft.)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Liquid Density</td>
<td>[<em><strong><strong>] gm/ml at [</strong></strong></em>] degrees C F</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Maximum Air Emissions</th>
<th>Particulates</th>
<th>[_____] ppmv</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Volatile Organic Compounds</td>
<td>[_____] ppmv</td>
</tr>
<tr>
<td></td>
<td>[_____]</td>
<td>[_____] ppmv</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Space Availability</th>
<th>Maximum Area</th>
<th>[[<em><strong><strong>] m feet by [</strong></strong></em>] m feet]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Maximum Height</td>
<td>[_____] m feet</td>
</tr>
</tbody>
</table>

Provide a P/C/F system capable of meeting the maximum effluent metals and
solids concentrations achieved in the previously conducted treatability testing (report appended to this specification), as listed below at the indicated maximum concentrations. Influent and effluent solids are as determined in accordance with Part 2000 Physical and Aggregate Properties, and metals as determined in accordance with Part 3000 METALS of AWWA 10084:

<table>
<thead>
<tr>
<th></th>
<th>Maximum Influent Concentration mg/L</th>
<th>Maximum Effluent Concentration mg/L</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Cadmium</td>
<td>[_____]</td>
<td>[_____]</td>

<tr>
<td>TDS</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Ensure the P/C/F system instrumentation and controls have the necessary accuracy and sensitivity to measure and control the operating ranges of the specified equipment. Perform sampling and analysis in accordance with [_____].

2.1.3 Results of Previously Conducted Treatability Studies

********************************************************************************************************************************************************************************************************
NOTE: Treatability testing reports should be appended to this specification to enable the Contractor to make a full evaluation of the testing methodologies used, the results of the testing, and to evaluate the completeness of necessary data gathering. The Contractor will use these treatability testing reports along with the required effluent quality to select the specific P/C/F equipment (including ancillary equipment) required to meet the specified performance requirements.
********************************************************************************************************************************************************************************************************

Even though methodologies and results of the previously conducted treatability studies in Appendix [_____] have demonstrated that P/C/F is capable of meeting the post treatment criteria identified in this section, perform an independent evaluation of these studies and results in accordance with ASTM D2035. Based on the Contractor's own interpretation
of all treatability study results, provide a full scale treatment plant which meets the performance requirements identified in this section.

2.1.4 Utilities

**************************************************************************

NOTE: The locations and details (such as utility point of contact, sizes, capacities, and flows) of the utility hookups should be provided on the drawings for the Contractor to use.
**************************************************************************

Provide the utilities associated with the installation and operation of the treatment plant including, but not limited to: telephone, electricity, water, [gas], sanitary and solid waste facilities. The [telephone] [electricity] [____], [steam] [water] [gas] [sanitary] [____], and [solid waste facilities] [____] are available at the site. Refer to the drawings for hookup locations.

2.1.5 Design Submittal

Submit the following items:

a. Detailed drawings of clarifiers showing the dimensions, nozzle orientation and elevations, interconnecting piping, equipment layout, hydraulic profile, and other details required to demonstrate that the unit has been coordinated and properly functions as part of the overall P/C/F system. Show proposed layout, foundation requirements (to include seismic considerations in seismically active areas and soils assumptions based on site specific geotechnical information), anchorage of equipment and accessories, installation/connection details, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation. Submit manufacturer's descriptive data, specifications, technical literature, utility requirements, performance charts and curves, and catalog cuts for the clarifier.

b. Electrical one-line diagrams for instrumentation and controls, illustrating all electrical components (motor controls, disconnects, starters, selector switches, pushbuttons, pilot lights, conduit, wire, etc.), electrical load analyses, cable and conduit schedules (including conduit designation, materials of construction, descriptions for each conduit of the end points of each conduit segment in a run, wire count by number, type and size, wire length, etc.), and complete control ladder logic diagrams. Coordinate all control ladder logic diagrams between components and ladder rungs to illustrate component tag names for all relays, timers, selector switches, pushbuttons, pilot lights, etc. Number tag wires and terminals. Distinguish terminal designations between terminals contained within differing enclosures such as control panels, equipment enclosures, motor control centers, etc. Ensure all auxiliary relay contacts are illustrated and designated. Number all ladder rungs with cross referencing between all associated rungs. Provide a narrative description that has been fully coordinated with the ladder logic diagrams so as to fully describe all control operations, sequences, interlocks, alarms, and shutdowns for the P/C/F system including, but not limited to, flow control systems, level control systems, pH/ORP control systems, chemical addition control systems, pump/valve controls, alarm and shutdown schemes, PLC input/output points, and all component interlocking. Designate the
locations of all control panels, equipment enclosures, motor control centers, etc. on an equipment layout drawing. Submit manufacturer's descriptive data, specifications, technical literature, utility requirements, performance charts and curves, and catalog cuts for each instrument and control component supplied.

c. A pre-startup test plan identifying the procedures and methods used to verify the integrity, calibration, and operability of the equipment, piping, electrical wiring, and instruments and control systems. Specify acceptance criteria and tolerances to be achieved during the pre-startup testing within the plan.

d. A list of the P/C/F system components and specify its required performance criteria when operated using contaminated water. Ensure the test plan describes the operating procedures to be followed during the test period including detailed descriptions of the measurements, record keeping, sampling and analyses to be performed to document that performance criteria has been achieved. Address full-scale operation of all equipment, piping, electrical wiring, and instruments and control systems included in the P/C/F system within the plan.

e. Manufacturer's certificates attesting that the equipment meets the specified requirements. Date the statement after the award of the contract, state the Contractor's name and address, name the project and location, and list the specific requirements which are being certified. Ensure the certificate indicates the methods of testing used.

f. [Six] [_____] copies of operation and maintenance manuals for the P/C/F system containing the manufacturer's operating and maintenance instructions for each piece of equipment. Provide one complete set prior to the performance of the field test (see Paragraph Tests); submit the remaining sets prior to startup. Furnish each set in loose leaf three-hole ring binders. Inscribe the following identification on the covers: the words "OPERATING AND MAINTENANCE INSTRUCTIONS," name of equipment, name and location of the building, name of the Contractor, and contract number. Place cover sheets before instructions identifying each subject. Use standard letter size paper for instruction sheets, with larger sheets of drawings folding in to approximately the same size. Include, but do not limit the instructions to the following:

(1) System layout detailing piping, piping supports, valves, and controls.

(2) Approved wiring and control ladder logic diagrams prepared in accordance with ANSI/ISA 5.1 including a drawing index, legend and symbols list, and abbreviation and identifiers.

(3) A narrative control sequence describing startup, operation, and normal and emergency shutdown to include the detailed operational narrative described in Paragraph Control System.

(4) Operating instructions for each equipment, instruments and control system including process monitoring requirements and recommendations for operations reporting to document the results of all process monitoring.

(5) Maintenance instructions for each piece of equipment, including
lubrication instructions and a troubleshooting guide to help the operator determine what steps to take to correct anticipated problems that may occur in the system.

(6) Manufacturer's bulletins, cut sheets and descriptive data of equipment; submitted after approval of detail drawings, and not later than [2] [_____] months prior to delivery of the system.

2.2 MANUFACTURED UNITS

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Provide new and unused equipment, except for test equipment. Where two or more pieces of equipment performing the same function are required, they are required to be products of the same manufacturer. Equipment is required to be supported by a service organization that is, in the opinion of the Contracting Officer, capable of providing service, materials, and equipment in an expedient manner.

2.2.2 Tanks

Submit detailed drawings of each tank showing the dimensions, nozzle orientations and elevations, interconnecting piping, equipment layout, hydraulic profile, and any other detail required to demonstrate that the tank has been coordinated and properly function as a part of the overall P/C/F system. On the drawings, show the proposed layout, foundation requirements, anchorage of equipment and accessories, installation/ connection details, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation. Submit manufacturer's descriptive data, specifications, technical literature, and catalog cuts for each tank supplied.

2.2.2.1 General Requirements

**************************************************************************

NOTE: When required by the corrosive nature of stored water, lack of proper maintenance facilities, or by climatic conditions, this paragraph will be modified to provide for corrosion allowance.

Determine basic wind speed from ASCE-7. The designer will choose between the AWWA and API procedures. Use 1200 Pa 25 psf snow load for most heavy snow climates; delete snow load where maximum snow is insignificant. In some cases, local climate and topography will dictate that a value greater than 1200 Pa 25 psf be used for snow loading.

In some application, wastewaters may require closed tanks to contain and/or control air emissions. VOCs from landfill leachate or groundwater from contaminated plumes can require closed tanks for the entire system. Show all process nozzles, spare nozzles, vents, drains, and manholes on the P&ID. If tanks are located inside a room or building, the designer can delete the wind loading requirements.
Use manufacturer's standard size tanks whenever possible. Tank construction material and paints, coatings, or liners are required to be compatible with the wastewater to be stored. Select tank dimensions to fit the available space as shown on the drawings. Unless noted otherwise on the drawings, include flanged fittings for inlet, outlet, overflow, and drain on each tank. Provide manholes when shown on the drawings. Provide hold down lugs to anchor the tank to the base. Provide influent and effluent baffles and weirs to avoid short circuiting. Ensure the tank geometry combined with mixer design to avoid dead spots and excessive turbulence relative to internal tank baffles and mixer orientation. Ensure the system provides for complete mixing. Tanks supplied as part of the P/C/F system are required to meet the following nominal size requirements:

<table>
<thead>
<tr>
<th>Type of tank</th>
<th>Design Hydraulic Retention Time (HRT)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Minimum</td>

Design, fabrication, and erection of the tank in accordance with [AWWA D100] [API Std 650] [AWWA D103] except as modified herein. Minimum equipment design life: [_____] years. Design tanks for a [basic wind speed of [_____] km/hour mph in accordance with ASCE 7 or designed in accordance with [AWWA D100] [AWWA D103] [API Std 650] wind load design, whichever provides the greater pressure.] [snow load of [1200 Pa25 psf] [[_____] kPa psf]] [freeboard of [03m 1 ft] [_____.] Utilize a safety on overturning of elevated tanks under design wind load of 1.33 minimum. When a footing is required, use an inverted truncated pyramid of earth with 2 on 1 side slopes above top of footing in determining overturning stability.

2.2.2.2 Tank Construction Materials

NOTE: Tank shell thickness should be calculated using AWWA D100, AWWA D103, or API 650 procedures. The strength of the materials of construction for each tank should include allowances specified herein.

2.2.2.2.1 Carbon Steel

Carbon steel sheet is required to be hot rolled in accordance with ASTM A283/A283M Grade C with a minimum yield of 476 MPa 40,000 psi; use a minimum thickness of 3.4 mm 10 gauge. Ensure structural steel conforms to ASTM A36/A36M and [AWWA D100] [AWWA D103] [API Std 650] for steel tanks.
2.2.2.2 Polyethylene

Provide polyethylene tanks manufactured in accordance with ASTM C582.

2.2.2.3 Stainless Steel

Ensure stainless steel conforms to the material specification for 304SS, 316SS, 316LSS, 317SS.

2.2.2.4 Structural Steel

Ensure structural steel conform to ASTM A36/A36M.

2.2.2.5 Fiberglass

Provide fiberglass tanks in conformance with ASTM D3299.

2.2.2.3 Corrosion Allowance

******************************************************************************

NOTE: The designer should specify a minimum corrosion allowance for wetted surfaces giving consideration to the types of liquids to be stored, the vapors above the liquids, and the atmospheric environment. It is expected that some tanks in the P/C/F system may have a low pH and some may have a high pH, and others will have contaminants and chemicals at varying concentrations. A corrosion allowance can be calculated using available corrosion rate information from material suppliers or National Association of Corrosion Engineers (NACE) standards. The designer should take into account the changes in temperature over the range of operating conditions and the effects of liquids and vapors on the materials of construction.

******************************************************************************

Corrosion allowance is dependent upon the materials of construction and finish coatings. Corrosion allowances are to be calculated as follows:

For a lined interior finish, corrosion allowances are allowed to be [0.0 mm 0.0 inches] [____]. For a coated or painted interior finish, the corrosion allowance is allowed to be [0.0 mm 0.0 inches] [____]. For tanks with no protective finish, the corrosion finish is required to be [0.0 mm 0.0 inches] [____].

2.2.2.4 Shop Fabrication

Perform all welding in conformance with [AWWA D100] [AWWA D103] [API Std 650] using ASME certified welders. Ensure all shell seams are full penetration using Sub Arc Welding (SAW). Ensure other seams are made with [Gas Metal Arc Welding (GMAC)] [Shielded Metal Arc Welding (SMAC)] [Flux Cored Arc Welding (FCAW)] [Submerged Arc Welding] processes.

2.2.2.5 Bolts

Bolts used in the shell joints are required to meet the requirements of Section 2.2 of AWWA D103. Bolts used in tanks designed under [AWWA D100] [API Std 650] are required to meet the requirements as specified in [AWWA D103] [API Std 650].
2.2.2.6 Gaskets

Ensure all bolted connections use gaskets of suitable chemical resistance for the service. Gaskets used to seal bolted joints in tanks are required to meet the requirements of AWWA D103 Section 2.10.

2.2.2.7 Accessories

2.2.2.7.1 Manholes and Pipe Connections

Manholes and pipe connections are required to meet the minimum requirements of AWWA D100 [AWWA D103] [API Std 650]. Provide the number, type, elevation, orientation, and size of manholes and pipe connections [as shown on the drawings] [provided by Contractor].

2.2.2.7.2 Baffles, Weirs, and Overflow Pipes

******************************************************************************
NOTE: Design each tank with an overflow that will
pipe, channel, or otherwise direct an overflowing
tank to a containment area or to the next tank in
the system. If a weir or exit pipe is plugged and
cannot pass the maximum process flow rate,
wastewater must be contained to prevent spills.
******************************************************************************

Design inlet baffles to dissipate influent flow energy at maximum flow rates and to avoid short circuiting to effluent weirs. Weirs for the tanks are required to consist of an overflow weir and outside drop pipe, adequately supported and capable of discharging the design flow rate with [_____] mm inches of head. [Install the top of the weir [_____] mm inches below [the top edge of the tank] [overflow height].] [as indicated.] Provide all tanks with emergency overflow outlets to direct overflow of wastewater to a containment area. Terminate the overflow pipe 300 to 600 mm 1 to 2 feet above grade and fit it with a flapper valve or screen to prevent ingress of birds, insects, or small animals of any kind. Design internals to meet the requirements of AWWA D100 [AWWA D103] [API Std 650].

2.2.2.7.3 Vents

******************************************************************************
NOTE: Vents on covered tanks should be designed to
allow vapor control systems to be attached. Design
tank vents in accordance with guidelines published
in the American Institute of Chemical Engineers
(AICHE) G3 "Guidelines for Safe Storage and Handling
of High Toxic Hazard Materials" (1988), and API
Publication 2557 "Vapor Collection and Control
Options for Storage and Transfer Operations in the
Petroleum Industry" (1993).
******************************************************************************

On covered tanks, weld the vent to a cover plate on the roof. Provide tank manufacturer's standard type mushroom vent with bird and insect screen. Design vent as specified by AWWA D100 [AWWA D103] [API Std 650]. Size the open area of a vent screen at 50 percent in excess of the [_____] L/second gpm pump-in rate and [_____] L/second gpm pump-out rate. Screening for
vent is required to conform to [AWWA D100] [AWWA D103] [API Std 650] ensuring fail-safe operation in the event that screen frosts over. Ensure the bottom of the screen is sufficiently elevated for snow consideration in the area.

2.2.2.7.4 Ladders and Safety Devices

Provide an outside access ladder on tanks greater than 1.5 m 5 feet in height. Provide ladders and safety devices in accordance with [AWWA D100] [AWWA D103] [API Std 650]. Locate ladders as shown on the drawings. In addition, provide safety cage, rest platforms, roof ladder handrails, and other safety devices as required by federal or local laws or regulations.

2.2.2.7.5 Scaffold and Cable Support

Include attachment rings or hooks on the inside and outside of closed top tanks, at four points at the top of walls, to secure scaffolding and cable support during maintenance activities.

2.2.2.7.6 Miscellaneous Tank Accessories

Ensure miscellaneous tank accessories, such as support legs, saddles, skirts, lifting lugs, etc., conform to [AWWA D100] [AWWA D103] [API Std 650].

2.2.3 Chemical Feed Systems

**************************************************************************
NOTE: The designer must verify that appropriate (on/off, proportional, set point) controller is specified in Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.
**************************************************************************

Provide chemical feed systems in accordance with Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS. Furnish control signals and wiring to the chemical feed controllers in accordance with the requirements of this section.

2.2.4 Mixers

**************************************************************************
NOTE: Different types of mixers can be used for a P/C/F treatment system including: impeller, jet and in-line static mixers. Delete items that are not required. Impeller mixers are divided into three groups: propellers, turbines, and paddles. Turbine and propeller mixers are used for rapid mixing applications while paddle mixers are typically used in flocculation.

Propeller mixers are high speed mixers, operated on low horsepower, which are used primarily for flash mixing applications. Propeller speeds range from 400 rpm to 1750 rpm. When top entry is required, the propeller mixer is mounted angled and off center. Where side entry is recommended, the propeller mixer is mounted horizontally, offset from the centerline of the tank.

SECTION 46 07 13.13 Page 22
Turbine mixers are primarily used in low speed applications where heavy solids may be generated and a large mixing energy input is required to keep the solids in suspension. These type mixers can be used for equalization of the wastewater, flash mixing or flocculation. Turbine speed ranges from 55 to 125 rpm. The turbine mixer is typically mounted vertical, one half to one diameter off the floor of the mixing chamber. In an unbaffled tank the unit is mounted off center. In a baffled tank the unit is mounted on center.

Paddle mixers are low speed mixers whose peripheral paddle speed typically varies from 0.15 to 0.61 m/sec 0.5 to 2.0 feet/second. Paddle mixers are used primarily in flocculation applications.

Jet mixers use hydraulic action for mixing resulting in lower capital and operating costs as compared to impeller mixers. Jet mixers are used only for rapid mixing, and are not suitable for flocculation due to the high pressure liquid ejected at the discharge nozzle, which can break up the floc previously formed.

Static mixers are typically installed downstream of chemical addition points for blending or dispersion applications. They are used in combination with metering pumps and must be sized based on the flow rate. In-line static mixers use hydraulics for mixing instead of impellers, requiring no external power and no maintenance. In-line static mixers have high head losses up to 1 m 3 ft; and the mean temporal velocity gradient G cannot be changed to meet varying requirements.

Mixers are usually sized based on liquid viscosity, liquid temperature and liquid density among other parameters. However for each of the mixing locations, at most sites, it is expected that the viscosity and density will not be significantly different from water; if that is not the case, the designer should specify the requirements that the mixing device must meet.

**************************************************************************

Furnish mixers on each tank or unit as designated on the drawings. On tanks, supply tank baffles, where required by the mixer design, to achieve complete mixing and mixer support as required. Submit detailed drawings of each mixer including dimensions, mounting details, wiring, schematics, and any other details required to demonstrate that the system has been coordinated and properly functions as a unit. Submit manufacturer’s descriptive data, specifications, technical literature, utility requirements, performance charts and curves, and catalog cuts for each mixer supplied.

SECTION 46 07 13.13  Page 23
2.2.4.1 Equalization Unit Mixer

**************************************************************************

NOTE: Because the water level in the equalization tank varies, the designer must specify the minimum water level at which the mixer will be turned off to avoid burning out the mixer motor.
**************************************************************************

Mixers are required to be a [propeller] [turbine] [paddle] [jet] type mixer. Number of mixers: [______].

a. Ensure propeller, turbine, or paddle mixers meet the following requirements. Mounting: [[top] [side] [bottom] entering] [______]. Mixer speed: [constant] [variable] at a maximum rpm of [______]. Variable speed turndown ratios are required to be [4:1] [______]. Design mixer to develop a velocity gradient (G value) not less than [300] [______] sec⁻¹. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [______] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [______]. Impeller construction: [carbon steel] [316 stainless steel] [______]. Design mixer bearings to operate continuously at full load for [100,000 hours] [______] before replacement.

b. Jet mixers are to consist of, but not be limited to, a jet motive pump to circulate liquid in the mixing basin; jet mixing nozzle assembly, retrieval system and in-basin secondary fluid lines. Design jet mixer to obtain a maximum mean velocity of [100] [______] sec⁻¹ or G(t) values of [104] [______]. The jet motive pump is to be driven by submersible non-clog units. Provide motors that operate on 230/460 volt, three phase, 60 hertz power supply. Provide nozzle assembly and piping made of [plastic] [or] [stainless steel] [______] material to prevent corrosion by process liquid.

2.2.4.2 Precipitation Unit Mixer

Achieve mixing by use of a [propeller] [turbine] [jet] [in-line static] type mixer. Number of mixers: [______].

a. Provide propeller or turbine type mixers that meet the following requirements. Mounting: [[top] [side] [bottom] entering] [______]. Mixer speed: [constant] [variable] at a maximum rpm of [______]. Variable speed turndown ratio is required to be [4:1] [______]. Design mixer to develop a maximum velocity gradient (G value) not less than [300] [______] sec⁻¹. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [______] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [______]. Impeller construction: [carbon steel] [316 stainless steel] [______]. Design mixer bearings to operate continuously at full load for [100,000 hours] [______] before replacement.

b. Provide jet mixer consisting of, but not limited to, a jet motive pump to circulate liquid in the mixing basin; jet mixing nozzle assembly, retrieval system and in-basin secondary fluid lines. Design the jet mixer to obtain a mean velocity of [25-100] [______] sec⁻¹ or G(t) values of [103-104] [______]. The jet motive pump is required to be driven by submersible non-clog units. Provide motors that operate on 230/460
volt, three phase, 60 hertz power supply. Provide nozzle assembly and piping made of [plastic] [or] [stainless steel] [_____] material to prevent corrosion by process liquid.

c. Provide in-line static mixers that meet the following requirements.
   Maximum precipitant feed rate: [_____] L/s gpm. Provide in-line static mixers with a helical shaped element which is made of the same material as the housing wall. The sealing edge between the element and housing wall is required to create an integral unit without pieces to fatigue or vibrate. Ensure the in-line static mixers incorporate the required number of elements to provide complete mixing at all design conditions. Size the mixer to fit [_____] mm inches diameter conveying pipe. Materials of construction: [carbon steel] [stainless steel] [polyethylene] [polypropylene] [FRP] [Teflon] [_____].

2.2.4.3 Coagulation Unit Mixer

Achieve mixing by use of a [propeller] [turbine] [jet] [in-line static] type mixer. Number of mixers: [______].

a. Propeller or turbine mixers are required to meet the following requirements. Mounting: [(top) (side) (bottom) entering] [______]. Mixer speed: [constant] [variable] at a maximum rpm of [______]. Variable speed turndown ratio is required to be [4:1] [______]. Design mixer to develop a velocity gradient (G value) not less than [300] [______] sec-1. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [______] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [______]. Impeller construction: [carbon steel] [316 stainless steel] [______]. [Provide][Do not provide] the mixer support with the mixer. Design mixer bearings to operate continuously at full load for [100,000 hours] [______] before replacement.

b. Jet mixers consist of, but are not be limited to, a jet motive pump to circulate liquid in the mixing basin; jet mixing nozzle assembly, retrieval system and in-basin secondary fluid lines. Design jet mixer to obtain a mean velocity of [25-100] [______] sec-1 or G(t) values of [103-104] [______]. The jet motive pump is to be driven by submersible non-clog units. Provide motors that operate on 230/460 volt, three phase, 60 hertz power supply. Provide nozzle assembly and piping made of [plastic] [or] [stainless steel] [______] material to prevent corrosion by process liquid.

c. Provide in-line static mixers that meet the following requirements.
   Maximum coagulant feed rate: [_____] L/s gpm. Provide in-line static mixers that have a helical shaped element which is made of the same material as the housing wall. The sealing edge between the element and housing wall is required to create an integral unit without pieces to fatigue or vibrate. Provide in-line static mixers that incorporate the required number of elements to provide complete mixing at all design conditions. Size the mixer to fit [_____] mm inches diameter conveying pipe. Materials of construction: [carbon steel] [stainless steel] [polyethylene] [polypropylene] [FRP] [Teflon] [______].

2.2.4.4 Flocculation Unit Mixer

Provide mixers that are [turbine] [paddle] type mixers. Number of mixers: [______]. Mounting: [(top) (side) (bottom) entering] [______]. Mixer speed: [constant] [variable] at a maximum rpm of [______]. Variable speed turndown
ratio is required to be [4:1] [____]. Design mixer to develop a maximum velocity gradient (G value) no more than [100] [____] sec-1. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [____] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [____]. Impeller construction: [carbon steel] [316 stainless steel] [____]. [Provide] [Do not provide] mixer support. Design mixer bearings to operate continuously at full load for [100,000 hours] [____] before replacement.

2.2.4.5 Effluent Holding Unit Mixer

Achieve mixing by use of a [propeller] [turbine] [jet] [in-line static] type mixer. Number of mixers: [____].

a. Provide propeller or turbine mixers meeting the following requirements. Mounting: [[top] [side] [bottom] entering] [____]. Mixer speed: [constant] [variable] at a maximum rpm of [____]. Variable speed turndown ratio is required to be [4:1] [____]. Design mixer to develop a velocity gradient (G value) no less than [300] [____] sec-1. Mount mixers [angled and off center] [horizontally offset from the centerline of the tank] [vertical off center] [____] of the mixing chamber. Shaft construction: [carbon steel] [316 stainless steel] [____]. Impeller construction: [carbon steel] [316 stainless steel] [____]. [Include] [Do not include] mixer support. Design mixer bearings to operate continuously at full load for [100,000 hours] [____] before replacement.

b. Provide jet mixers consisting of, but not limited to, a jet motive pump to circulate liquid in the mixing basin; jet mixing nozzle assembly, retrieval system and in-basin secondary fluid lines. Design jet mixer to obtain a mean velocity of [25-100] [____] sec-1 or G(t) values of [103-104] [____]. The jet motive pump is to be driven by submersible non-clog units. Provide motors that operate on 230/460 volt, three phase, 60 hertz power supply. Provide nozzle assembly and piping made of [plastic] [or] [stainless steel] [____] material to prevent corrosion by process liquid.

2.2.5 Clarifiers

******************************************************************************
NOTE: This paragraph specifies only inclined plate or tube settlers. The inclined plate or tube settler requires minimum space, no moving parts (therefore minimizing maintenance), less potential for short circuiting, and generally lower capital and operating costs than conventional clarifiers. For metallic sludges, the overflow rate typically ranges from 2.1 to 4.2 L/s/sq. m 360 to 720 gpm/sq. ft. and generally will not exceed 5.9 L/s/sq. m 1000 gpm/sq. ft.
******************************************************************************

Clarifier is required to be an inclined [plate] [or] [tube] settler designed to meet the following conditions:

a. Influent pH: Maximum [____], Minimum [____].

b. Solids Loading: [____] kg/day lbs/day.
c. Effluent TSS: [_____] mg/L.

Provide for an effective surface overflow rate of [_____] L/m3/m2.s gpd/ft2 and a detention time of [2] [_____] hours at the design flow rate. Clarifiers are required to include, at a minimum, the following accessories: influent distribution system, a separator module consisting of [corrugated plate packs,] [inclined tube packs,] skimmer mechanism with scum collection trough, sludge removal system, effluent collection flumes, access ladder, operating platform, associated piping, fittings, sampling valves, and a sludge hopper.

2.2.5.1 Clarifier Vessel

Construct the bottom and sides of the clarifier vessel 6 mm 1/4 inch minimum thickness carbon steel plate meeting or exceeding ASTM A36/A36M. Provide the vessel complete with inlet, outlet, overflow, and drain connections. The structural steel framework is an integral part of the vessel to ensure it is self-supporting. Design the clarifier for seismic forces in accordance with paragraph Existing Conditions.

2.2.5.2 Influent Distribution and Effluent Collection Systems

The influent distribution system dissipates the entrance energy and equalizes flow to the separator module. Include weirs and baffles to control the local velocities and eliminate short circuiting. Use adjustable weirs along each effluent collection flume to maintain uniform flow distribution.

2.2.5.3 Separator Module

Construct the separator module using [parallel corrugated plates placed [18 mm 1-1/2 inches] [[_____] mm inches] apart] [inclined tubes at [45] [60] [_____] degrees from the horizontal]. The separator module is required to be constructed to be removable for maintenance and inspection. Construct the separator module with corrosion resistant materials. Provide [corrugated plate packs] [tube packs] constructed of [fiberglass reinforced plastic] [polypropylene] [coated steel] [stainless steel] [_____].

2.2.5.4 Skimmer and Sludge Collection/Thickening Devices

The mechanical skimmer and drive is required to continuously collect floating scum and remove it to a collection trough. Equip the sludge holding compartment with a hopper bottom having sides tapering downward at an angle not less than [55] [_____] degrees above horizontal for sludge collection. The sludge hopper is to be mounted in a [fixed] [removable] [_____] position and be equipped with a vibrator pack for sludge thickening. Size the sludge hopper to provide a minimum of [_____] L gallons of sludge storage. Provide a flanged outlet for each hopper which connects to a pump for sludge removal.

2.2.5.5 Miscellaneous

Supply the clarifier with a steel platform around the perimeter complete with ladder, handrail, and toe plates. Paint in conformance with Sections 09 90 00 PAINTS AND COATINGS and 09 97 02 PAINTING: HYDRAULIC STRUCTURES, unless otherwise indicated.
2.2.6 Piping/Valves

Provide piping and valves for chemical feed in accordance with Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS. Install low point drains in interconnecting piping.

2.2.7 Pumps

Provide pumps that meet the following requirements. Provide pumps for specific services and accessories per the following specifications.

2.2.7.1 Water Pumps

**************************************************************************
NOTE: Water pumps include, but are not limited to, the following: equalization transfer pumps, water pumps for chemical dilution, and effluent water recycle and discharge pumps. Water pumps may be horizontal or vertical centrifugal pumps. Delete and/or add paragraphs to meet job requirements.
**************************************************************************

Design water pumps in accordance with Section 23 21 23 HYDRONIC PUMPS.

2.2.7.2 Chemical Metering Pumps

**************************************************************************
NOTE: Chemical metering pumps may be piston, positive displacement diaphragm, or balanced diaphragm pumps. The unit application depends on the pressure involved, corrosiveness of the chemical, feed rate, accuracy required, viscosity and specific gravity of the fluid, other liquid properties, and the type of control.
**************************************************************************

Manufacture and install chemical metering pumps in accordance with Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.

2.2.7.3 Sludge Pumps

**************************************************************************
NOTE: Sludge pumps may be centrifugal, diaphragm (air operated) or progressive cavity. The unit application depends on the pressure involved, the pumping rate (constant or variable), the specific gravity of the sludge and the type of control.
**************************************************************************

Manufacture and install sludge pumps in accordance with Section 22 13 29 SANITARY SEWERAGE PUMPS.

2.2.8 Electrical Equipment

2.2.8.1 General

Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and in conformance with NFPA 70. Install circuits in accordance with Sections 33 71 01 OVERHEAD TRANSMISSION AND

SECTION 46 07 13.13 Page 28
2.2.8.2 Electric Motors

**************************************************************************

NOTE: Electrical motor driven equipment should be provided complete with motors, motor starters, and controls.
**************************************************************************

Provide for each motor a circuit breaker type combination motor circuit protector, complete with properly sized thermal overload protection on each phase, along with a hand-off-automatic (HOA) selector switch; red and green pilot lights; manual reset pushbutton; and all other appurtenances necessary for the motor control specified. Ensure each motor has sufficient capacity to drive the equipment at the specified capacity at or below a 1.0 service factor and without exceeding the nameplate rating of the motor when operating at the specified electrical system voltage and frequency. Each electric motor-driven piece of equipment is required to be driven by a chemical/mill duty, [explosion-proof] [totally-enclosed fan cooled (TFC)] [totally-enclosed non-ventilating (TENV)] [_____] motor rated for continuous duty at a 40 degrees C ambient temperature. Provide motor with a [1.15] [1.0] [_____] service factor. Ensure all motors conform to the respective sections of NEMA MG 1. Three phase motors are required to be squirrel-cage induction type having normal-starting-torque and low-starting-current characteristics. Size motors with sufficient power and torque so that the nameplate power rating, without consideration of the service factor, is not exceeded under any operating condition. Provide adequate thrust bearings in the motor to handle any thrust forces that are transmitted to motor under any operating condition. Three phase motors are required to be rated at 230/460 volts, 60 hertz. Fractional horsepower motors are required to be 115 volts, 60 hertz. Stamp all motor nameplate information on the attached nameplate in accordance with the requirements of NEMA MG 1. Supply motors that have a premium efficiency design, class F insulation, automatic thermal protection of the stator windings, and standard NEMA frame ratings.

2.2.9 Instrumentation And Control

**************************************************************************

NOTE: Instrumentation and control systems are used in water treatment to ensure consistent quality, to optimize process reliability, to assist operating personnel in monitoring process operations, and to minimize operating costs. The measurement and control instruments may range from a simple control panel indicator to a complex, multi-component, programmable logic controller based system.

In developing the scope of the instrumentation and control system design, the designer should consider the following parameters: size of the plant, type and complexity of the treatment process, type of vendor-supplied controls, amount of funds available, current design standards, discharge compliance criteria, special interfaces with other control systems, and the ability of the owner to properly maintain a control system. Generally, the designs of P/C/F systems incorporating manual operation...
would be limited to batch processes in which the control of pumps and chemical addition is accomplished by operator action. The continuous operation of P/C/F systems usually involves more complex control schemes. Chemical addition can be manually or automatically proportioned to flow and/or to other process feedback signals generated by process instrumentation. The degree of automation incorporated into the system design generally depends upon the complexity of the treatment system, the remoteness of the site, the planned level of operator attention, and the duration of the project. Systems designed for unattended operation would require the greatest degree of automated system controls. Control schemes may include the use of remotely located programmable logic controllers, remote data telemetry, and telecommunication systems.

The designer should consider how the P/C/F system will be operated for each site-specific application. The equipment used in a P/C/F system can be supplied to operate either in a batch or a continuous mode of operation. A batch operation may be more economical than continuous operation when wastewater flows are small (less than 0.6 L/s 10 gpm), or are intermittent from sources such as a small landfill leachate recovery system or small ground water pumping wells. When the wastewater flows are larger than 0.6 L/s 10 gpm, continuous operation should be used. In the continuous mode of operation, all equipment would run uninterrupted and the wastewater would be fed to the system at a controlled rate.

If a batch operation is used, the designer must decide whether treatment can be performed in one single tank or if multiple tanks are required. In a single tank, the required chemicals for precipitation, coagulation, and flocculation are added sequentially to the same tank at a mixing intensity appropriate for the chemical being added. Following chemical addition, all mixers would shut down to allow a quiescent time for settling to occur. The settled sludge on the bottom of the tank could be drawn off and the supernatant adjusted for final pH. The water can be stored in this one tank until it is analyzed and discharged, or a separate tank can be used to store the water. This type of system is appropriate for sites that generate small amounts of water where the time to treat one batch does not exceed the time to generate a volume of water to be treated. A flow equalization tank must be provided to receive the water while treatment is occurring in the batch tanks.

Alternatively, if more frequent treatment is required, batch treatment can employ multiple tanks where one volume of water is pumped sequentially
through the precipitation, coagulation, flocculation, and clarification tanks. The equipment used in this system would be the same as for a continuous operation, except that the instrumentation and controls would be designed to allow intermittent pumping, mixing, and chemical addition rather than continuous. In either mode of operation, the controls can be designed to operate the system with 1) manual control, 2) semiautomatic control, or 3) automatic control. The designer must select the control scheme appropriate for the site considering the complexity of the system and personnel availability.

In manual control, the operator will start only one process at a time (e.g., precipitation, coagulation, flocculation, clarification, etc.) and check the results of each before starting next operation. In semiautomatic control, the operator must be present to start the P/C/F system and transition from one process to another will be controlled automatically using either an electronic or pneumatic distributed control system. In automatic control, the entire system will operated without an operator. The normal running of the system is linked to one or more governing factors (tank level, flow rate, etc.) which will start up each system when set points are reached. Maximum reliability of a fully automated system can be obtained by using a logic control system which checks that the orders given have been received and carried out and, if not, stops the operations and alarms the operator. All controls should have manual override.

**************************************************************************

Provide the instrumentation and control system to be [batch] [on-off in response to influent flow] [manual] [semi-automatic] [automatic] [___] with complete electrical power, control and instrumentation as specified or recommended by the equipment manufacturer for the safe operation and supervision of the P/C/F system. Supply the instrumentation and control package for the P/C/F system as indicated on the drawings. Ensure the probes for pH and oxidation reduction potential (ORP), measuring devices, and level sensors specified in the following four subparagraphs are made of materials resistant to chemical attack over a pH range of 2 to 12, and suitable for a temperature range from [0 to 100] [___] degrees C [32 to 212] [_____] degrees F and for the liquid to be monitored. All enclosures for pH, flow, and level sensors and transmitters are to be rated NEMA 4X.

2.2.9.1 pH Monitoring/Control

Provide pH probes [where indicated on drawings] [on the effluent line of each reactor] for the purposes of pH monitoring and/or pH control through an associated control device (PLC, single loop controller, etc.). Ensure installed probes are easily removable without interrupting service. Provide probe materials that are resistant to operating pressures of up to [_____] kPa psi. Interconnect the probes to associated transmitters/indicators that are located preferably in the main control panel. Connect probes to a micro-processor based pH analyzer having a 4 digit readout with 38 mm 1-1/2 inch high letters and an isolated 4 - 20 mA
DC output signal proportional to the pH. Ensure the accuracy of the pH unit is plus or minus 0.5 percent of full scale.

2.2.9.2 ORP Monitoring/Control

Provide an oxidation reduction potential (ORP) probe [where indicated on drawings] [_____] for the purpose of ORP monitoring and/or control. Install probe so it is easily removable without interrupting service. Supply probe materials that are resistant to operating pressures of up to [_____] kPa psi. Interconnect the probes to associated transmitters/indicators that are located [preferably] in the main control panel. Connect the probe to a microprocessor based pH analyzer having a 4 digit readout with 38 mm 1-1/2 inch high letters and an isolated 4 - 20 mA DC output signal proportional to the ORP. Ensure the accuracy of the ORP unit is plus or minus 0.5 percent of full scale.

2.2.9.3 Flow Monitoring/Control

Provide flow measuring devices [where indicated on drawings] [on the influent line] [on the effluent line] for the purpose of flow monitoring and/or control. Install measuring devices in a manner that ensures they are easy to maintain without interrupting service. Supply measuring devices that are resistant to operating pressures of up to [_____] kPa psi. Connect measuring devices to a microprocessor based flow analyzer having a digital readout with 38 mm 1-1/2 inch high letters and an isolated 4 - 20 mA DC output signal proportional to the flow. Ensure the accuracy of the flow monitoring unit provided is plus or minus 0.5 percent of full scale. Coordinate the type of flow meter selected with the application involved as shown on the drawings to assure that the flow meter meets all installation and operational criteria (upstream and downstream distances from appurtenances, minimum and maximum flow velocities, degree of required accuracy, full pipe flow, etc.).

2.2.9.4 Level Monitoring/Control

Provide level indicator gauges of the direct-reading type, equipped with a shutoff valve, on the discharge side of the tank. Provide gauges with 150 mm 6 inch dials that are stem mounted and conform to ASME B40.100. Provide gauges with accuracy of Grade A in accordance with ASME B40.100. Calibrate gauges in kPa psi in not more than 10 kPa 2 psi increments from 0 to 350 kPa 0 to 50 psi in excess of the normal operating pressure at the tank. Provide level (float) switches that are mechanically actuated with Form C contacts. Include a sending unit in all electronic level sensing devices that transmits an analog or discrete signal, as required for the application, to an associated control panel or control device. Provide level monitoring/control sensors [where indicated on drawings] [______]. Locate sensors in a location to be easily removable without interrupting service. Connect analog level sensors to a microprocessor based level indicator and/or controller as required by the application having a 4 digit readout with 38 mm 1-1/2 inch high letters and an isolated 4 - 20 mA DC output signal proportional to the level to be measured.

2.2.9.5 Control System

********************************************************************************
NOTE: The designer should include a detailed operating and control procedure in this paragraph to explain the control philosophy for each component of the P/C/F system. This operating and control

SECTION 46 07 13.13  Page 32
procedure should include all information required for system start-up, continuous operations, and normal and emergency shut-down operations. This procedure should include all operating set points for pump starting/stopping/alarming/shutdown, all normal/alarm/shutdown pH values, all normal/alarm/shutdown ORP values, all normal/alarm/shutdown liquid levels, as well as all other normal/alarm/shutdown values for any other control or processing equipment. This procedure should delineate all normal operational values for each component of the P/C/F system.

Design the control system to operate as shown on the drawings and described in the operating and control procedures provided [below] [as an attachment]. Ensure all alarms and/or shutdowns consist of both visible alarm lights and audible alarm signals on either the main control panel, or on a remote microprocessor controller screen. Ensure the alarms and shutdowns function through a first-out-sequence annunciation. Provide alarms for high and low water and chemical levels, high and low pH values, and high and low ORP values. Provide automatic shutdowns for each system when a control value or an operational system ranges out of normal operational limits where personnel safety is a concern, where mechanical damage can occur to process equipment, or where the process excursion has the potential to violate discharge water quality criteria; such shutdowns can occur for both high and low conditions. Ensure power failures and equipment failures initiate an alarm as well as an orderly and automatic shutdown of the treatment system. [Provide for auto-dialing to an indicated remote location to report each alarm or shutdown that stops the movement of process water through the treatment system or stops chemical feed systems. The Contractor is responsible for providing the associated telephone line for the auto-dialer system.] Provide all control power transformers, relays, adjustable timers, auxiliary contacts, switches, or additional equipment required to interconnect the treatment equipment to a monitoring/control system. Furnish conduit and wiring between control panels, treatment components, and all control devices.

2.2.9.6 Control Panel Enclosures

Ensure all required control panels for the control system are rated NEMA 4X [fiberglass] [stainless steel] and are sized to assure that adequate internal space is available for all components specified and/or required with an allowance of no less than 30 percent spare space. To the greatest extent possible, install all instrument transmitters in or adjacent to the control panel enclosure.

2.2.10 Structural Skids

Where a P/C/F system has structural skids, supply skids fabricated in accordance with Section 05 12 00 STRUCTURAL STEEL. Submit shop details for each structural skid including members (with their connections) not shown on the drawings. Show standard welding symbols on the drawings in accordance with AWS A2.4.

2.2.11 Paint/Coatings

**************************************************************************
NOTE: UFGS 09 97 02 is a guide specification

SECTION 46 07 13.13 Page 33
developed for Civil Works projects.

Perform paint and coatings work in accordance with Sections 09 90 00 PAINTS AND COATINGS[ and 09 97 02 PAINTING: HYDRAULIC STRUCTURES].

2.2.12 Insulation/Heating/Ventilation

NOTE: In cold climates, exposed pipe, valves, pumps and equipment should be insulated and/or heat traced to prevent freezing. Tanks should be insulated and heated to keep the tank contents above freezing temperatures.

Provide insulation for pipes, valves, pumps, tanks, instrumentation and controls, and other equipment in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.2.13 Nameplates

Provide a nameplate on each major item of equipment that includes the manufacturer's name, address, type or style, model or serial number, and catalog number. Secure nameplate to the item of equipment.

2.2.14 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration and maintenance of the equipment, as recommended by the manufacturer. Provide a list of special tools including description, manufacturer, model number, and a source for purchasing replacements if lost.

PART 3 EXECUTION

3.1 EXAMINATION

NOTE: The designer will determine if the examination by the Contracting Officer is to apply to all equipment or only to special items to be inspected.

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before work begins. After equipment is delivered to the site and prior to installation, examine the treatment plant equipment for any damage, defect, or deterioration and verify that all construction equipment used at the site is of sufficient capacity and in good mechanical condition. Document the results of this pre-installation examination and submit to the Contracting Officer for review. Contracting Officer reserves the right to also conduct this examination independently. Based on the examination, the Contracting Officer has the right to reject damaged, defective, or deteriorated equipment. The contractor is required to correct surface damage to equipment following the manufacturer's requirements. Any costs associated with the delay caused by the rejection of equipment is understood to be borne by the Contractor. Provide all specified
preconstruction submittals to the Contracting Officer.

3.2 INSTALLATION

Handle equipment with extreme care to prevent damage during placement. Install equipment, except as otherwise specified, as indicated on the drawings, and in accordance with the manufacturer's written instructions [and under direct supervision of the manufacturer's representative] [_____]. Installation includes furnishing all materials required for initial operation. Properly level, align, and anchor all equipment in place in accordance with the manufacturer's instructions. Provide supports for equipment, appurtenances, and pipes as required. Install piping runs to be straight and evenly supported. Install valves with stems horizontal or above the pipe centerline. Install flanges and unions where valve and equipment maintenance may require disassembly. Provide the P/C/F system complete and ready for operation. Ensure all plumbing work conforms to the requirements of [Section 22 00 00 PLUMBING, GENERAL PURPOSE][______].

3.2.1 Foundations

Construct foundations for tanks, clarifier, and other equipment of reinforced concrete, except as shown or specified herein.

3.2.2 Excavating, Filling, and Grading

Perform excavation, filling, and grading work to conform to the applicable requirements of Section 31 00 00 EARTHWORK.

3.2.3 Cathodic Protection

Provide cathodic protection on steel tanks and clarifiers, conforming to Section 26 42 15 CATHODIC PROTECTION SYSTEM FOR THE INTERIOR OF STEEL WATER TANKS.

3.2.4 Welding

Perform tank welding in accordance with [Section 8 of AWWA D100] [AWWA D103] [API Std 650].

3.2.5 Erection

Perform tank erection in accordance with [Section 10 of AWWA D100] [AWWA D103] [API Std 650].

3.2.6 Field Painting

******************************************************************************
NOTE: UFGS Section 09 97 02 is a guide specification developed for Civil Works projects.
******************************************************************************

Perform field painting in accordance with Sections 09 90 00 PAINTS AND COATINGS[ and 09 97 02 PAINTING: HYDRAULIC STRUCTURES]. Do not paint stainless steel, galvanized steel, and nonferrous surfaces.

3.2.7 Inspections and Testing

Inspect and test tank in accordance with Section 11 of AWWA D100. Mill and shop inspections [are not required] [are required to be performed by an
3.2.8 Radiographic Inspection and Testing

Perform tank radiographic inspection and testing of tanks in accordance with Section 11 of AWWA D100. Radiographic inspections [are not required] [are required to be performed by an approved commercial inspection agency]. Perform all testing before painting.

3.3 FIELD QUALITY CONTROL

3.3.1 Inspection

**************************************************************************

NOTE: The system’s P&ID and the as-built drawings are used to verify that all equipment, piping, and valves are installed according to plans and specifications. The electrical one-line diagrams and wiring diagrams are useful to verify the electrical and instrumentation systems. Grounding of equipment should also be inspected. Vendor’s certified shop drawings and equipment operating manuals should be used to check the equipment installation and operation.

**************************************************************************

After the installation is complete, each component the Contracting Officer inspects to verify that the components of the system are properly installed according to drawings and specifications. Correction of all discrepancies found and work affected by such deficiencies is wholly at the Contractor's expense.

3.3.2 Tests

Ensure each piece of equipment is subject to an operational test, under the supervision of a factory representative. The Contracting Officer maintains the right to observe test. Tests are required to demonstrate that the equipment is not defective and is in safe and satisfactory operating condition. Notify the Contracting Officer [7] [_____] days prior to the dates and times for acceptance tests. Perform a running field test on all equipment in the presence of the Contracting Officer for a minimum of [2] [_____] hours. If any deficiencies are revealed during the tests, correct such deficiencies and repeat the tests. Submit Test Reports in booklet form showing field tests performed to adjust each component and to prove compliance with the specified performance criteria upon completion and testing of the installed system. Identify all test methods used and record all test results. Indicate within each test report the final set point of each control device. Provide test reports for pre-startup testing and startup performance testing; also include test reports showing the results of factory tests performed.

3.3.3 Manufacturer's Service

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative is required to supervise the installation, adjustment, and testing of the equipment. Include up to [5] [7] [10] [_____] days of service.
3.4 SYSTEM STARTUP

**************************************************************************
NOTE: Pre-start-up procedures should be provided for each component of the P/C/F system and procedures should be provided for start-up of the whole system. The startup plan must include pre-start-up checkouts, pre-startup testing, and the actual startup. The following sections describe startup operations of a P/C/F treatment system. The startup procedure follows a planned sequence of events for each component of the system.
**************************************************************************

3.4.1 Hydrostatic Tests

**************************************************************************
NOTE: The test pressure should not exceed 130 percent of the rated pressure. Testing of pipe and fittings should be specified in the same section where the pipe is specified in.
**************************************************************************

After installation, test all tanks for leaks or damage in shipment. Test the tanks hydrostatically to [_____] kPa [psig] as indicated in the schedule or 1.5 times the system operating pressure, whichever is greater. Test the tanks for a period of [24] hours. Furnish testing plugs or caps, all necessary pressure pumps, pipe connections, gauges, other equipment, and all labor required. Repair all damage or leaks in tanks or replace tanks at the Contractors expense. Test the joints of air lines using a soapy water solution to detect leaks.

3.4.2 Pre-startup Checkout

**************************************************************************
NOTE: The pre-startup checkouts are designed to verify the integrity of the system components prior to pre-startup testing.
**************************************************************************

Ensure the following items subjected to the pre-startup checkout:

a. Check foundations to verify that they are placed and sealed properly;

b. Check system to verify that all equipment has been properly installed and connected;

c. Check rotating equipment which requires lubrication to ensure that manufacturer's procedures have been followed;

d. Level and check all equipment for proper alignment, anchored, and static ground wires installed;

e. Check piping, flange bolts, gaskets, and hoses to ensure that connections are tight, and flushed clean;

f. Check valves for position and operability and flushed clean;
g. Check electrical wiring and lighting to verify that wiring has been completed correctly;

h. Perform continuity checks on wiring loops;

i. Check High/Low liquid level alarms on tanks, as well as pump on/off level controls, for proper installation and response;

j. Check chemical feed systems for proper installation;

k. Check chemicals for proper type, required quantity and mixing; fill tanks;

l. Check lockout devices and site security devices checked for proper installation.

3.4.3 Pre-startup Testing

******************************************************************************
NOTE: The pre-startup testing of the system should be performed to verify the integrity of each component and of the whole system prior to actual startup.
******************************************************************************

Subject each component of the system to the pre-startup testing as described below:

a. Pressure test piping and hoses transporting liquid on clean water for at least one hour, with no loss of pressure at 1.5 times the working pressure; pressure test tanks at the maximum hydraulic head using clean water;

b. Test electrical wiring to verify that there is no wiring damage or deterioration that could cause injury to personnel or damage to equipment;

c. Turn power on to test equipment and control systems only after the electrical systems are tested and certified ready for operation;

d. Test lighting and put in service to support work in all areas of the plant;

e. Test rotating equipment such as pumps, mixers, and blowers, if used, for correct direction of rotation by bumping the starter manually;

f. Operate each pump for a minimum of [4] [_____] continual hours at operating or test conditions. Ensure that the units, controls and instrumentation have been installed correctly, and that there is no over-heating, vibration or excessive noise;

g. Depending on the complexity of the control system, testing can proceed from this point to verify that manual and automatic controls function properly and control valves open/close. Fill all tanks and empty to determine if high and low level alarms sound at the prescribed liquid level;

h. Test safety shutdown sequences, controls/alarms and interlocks in the control system to ensure that they are installed properly and
functioning as intended;

i. Label and test each emergency shutoff switch to determine that it works properly;

j. Test electrical "lockout" devices with padlocks to ensure that power has been disconnected;

k. Calibrate instrumentation before systems are put into service. Test all pressure and temperature gauges against standardized gauges. Utilize NIST SP 250 calibration standards where they exist.

3.4.4 Startup Performance Testing

**************************************************************************
NOTE: The startup check and functional performance tests should be performed in accordance with the manufacturer's recommended procedures. The startup should proceed following a startup plan prepared well in advance. Performance testing begins with equipment or components, proceeds through systems, and ends with the complete treatment system passing its performance specifications and contractual requirements testing.
**************************************************************************

Do not initiate startup until after each component of the system has been demonstrated to meet the requirements of the pre-startup testing and until written approval has been received from the Contracting Officer. Once steady state operation is achieved, perform a functional performance test as described in the following startup checklist:

a. Check flow rates, pH, and contaminant levels of the wastewater feeding the reactor tank;

b. Check pump operating points to verify that the actual operating point matches the pump curve specification for flow and pressure;

c. Start/stop pumps from all control mechanisms;

d. Check that current draw and voltage balance match specifications for all phases;

e. Check the reagent feeding systems to verify that the actual chemical feed rate is within the specified accuracy range;

f. Check the pH in the reactor to verify that operating values are within the design range;

g. Adjust the reagent feed rates, and the pH control system as required to achieve maximum metal removals;

h. Monitor the composition of the effluent to verify that it meets the specified performance requirements.

i. Check the clarifier overflow rate to verify that it is within the design range;

j. Check the sludge collecting device to verify that it is operating
properly, and no sludge is overflowing the weir;

k. Check the control system to verify that the system operates within set parameters; and

l. Check the monitoring systems and instruments to verify that they hold calibration.

m. Include [48] [_____] hours of operation processing water from the design influent source at design capacity and meeting effluent requirements with less than 20 percent down time. Before system acceptance, the Contractor is required to correct any deficiencies and complete all performance checks. Replace or upgrade equipment not capable of performing as specified at no additional cost. Submit Proof of Performance and Equipment Certificate of Conformance as specified. Submit a list of the proposed operating conditions for process parameters to be continuously monitored and recorded. Include detailed descriptions of the proof of performance schedule, operating conditions and parameters, influent sources, and required sampling and analyses.

3.4.5 Field Training

**************************************************************************
NOTE: The field training provided by the Contractor must be modified if the process will be operated by the Contractor for the first year.
**************************************************************************

Upon completion of the installation and at a time designated by the Contracting Officer, conduct a field training course for a representative of the Government in the operation and maintenance of equipment furnished under the contract. Ensure these field instructions cover all the items contained in the operation and maintenance instructions. Provide training for a total period of [8] [16] [_____] hours per day for a period of [5] [_____] days of normal working time and start after the system is functionally complete but prior to final acceptance tests. Ensure field instructions cover the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations. Prepare a video tape of the field training course as a permanent record for future training use.

3.4.6 Operation and Maintenance Manual Updates

**************************************************************************
NOTE: The O&M Manual is intended for use by operating personnel and should be adapted to the particular features of the equipment installed; therefore, the document must be written for the operator.
**************************************************************************

Include the following items in the O&M manual:

a. General description of the treatment process;

b. A detailed description of equipment;

c. Process flow diagram;
d. Piping and instrumentation diagrams;
e. Certified drawings for equipment components and equipment layout;
f. Practical operating procedures including performance testing, influent, and effluent concentrations, and trend analysis of influent;
g. A complete set of fully updated and annotated piping and instrument diagrams, process flow diagrams, instrument indexes, control ladder logic diagrams, description of controls, alarms, interlocks, instrument interface, and maintenance procedures;
h. Specialty items such as type of oil and grease, desiccants, tools, analytical instruments, etc.;
i. Initial startup procedures;
j. Emergency and scheduled shutdown procedures;
k. Monitoring and quality control, spill controls;
l. Equipment specifications;
m. A list of modes of failure for each piece of equipment;
n. Fault/failure analysis, and trouble shooting guide;
o. List of spare parts;
p. Process safety and protective equipment requirements; and
q. Record keeping (electronic or other) requirements.

In order to plan all the inspection and maintenance operations required for plant operation, the contract is required to provide a maintenance schedule. Include the following items in the maintenance schedule:

a. Scheduled maintenance procedure for each piece of equipment;
b. Sensor and measurement device calibration frequency;
c. Periodic reports regarding consumption of chemicals such as acid, caustic, polymer, and coagulants;
d. Electronic or other recording data;
e. Personnel training requirements;
f. The time required for each maintenance task;
g. Equipment shutdown and lock and tag requirements during maintenance/repair; and
h. Mothballing and preservation procedures for equipment layaway.

Record the entire schedule and the results of each task for future analysis. Include other items as follows:
a. Spare parts list with suppliers and costs;
b. Plant utility requirements such as electrical, air, drinking water, service water, telephone, and sewer;

c. Detailed safety procedures for chemical handling; and

d. Name, address, and telephone number of technical personnel to contact in case of an emergency related to the treatment system.

Final acceptance of the P/C/F system is contingent upon these documents being supplied, reviewed, and approved by the Contracting Officer.

3.4.7 System Operation by Contractor

Do not initiate the first period of operation until after the Contractor has successfully completed all work and received written approval from the Contracting Officer. Continue to operate the system for a period of [30 days] [6 months] [1 year] [_____] being responsible for operations, process monitoring, maintenance, chemical testing, and record keeping during operation in conformance with this specification.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for prefabricated package wastewater treatment biochemical and aeration systems, including extended aeration, contact stabilization, step aeration, and complete mixing. These facilities are intended for treatment of domestic wastewater only. Special consideration must be given to wastewater containing industrial wastes.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: On the project drawings, show:

1. Type of plant: (Extended Aeration, Contact Stabilization, Step Aeration, or Complete Mixing).

2. Design flow.

3. 5-day BOD loading.

4. Suspended solids loading.
5. Whether a comminutor is needed for facilities 1.09 L/s 25,000 GPD or less in size.

6. Whether mechanical aerator is allowed.

7. Whether plant should be concrete, steel, composite, or a combination.

8. Whether piling is required for foundations.

9. Whether hypochlorinator or whether chlorinator will used for facilities in 4.38 to 6.57 L/s 100,000 to 150,000 GPD range.

10. Whether raw wastewater recirculation box (recirculation to pumping station) is needed.

11. Whether plant is to be of aboveground or belowground construction.

12. Seismic loading (if necessary).

13. Electric power characteristics for motors.

14. Whether automatic operation of air lift pumps are required.

15. Wind load and ice load for rotating sludge collector.

16. Organic loading (5-day BOD).

17. Total suspended solids.

18. Size of hypochlorite mixing chamber if larger capacity than 113.4 L 30 gallons is needed.

19. Size of hypochlorite solution chamber if larger capacity than 208 L 55 gallons is needed.

20. Whether, for extended aeration type plant, eventual conversion to step aeration type is anticipated.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AR" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for...
Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

] 1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Spare Parts

Provide manufacturer recommended spare parts that are identical and interchangeable with original parts. Protect spare parts from corrosion and furnish in clearly marked containers. Spare parts must meet standards recommended by the manufacturer in the manufacturer's operation, maintenance, or instruction manual.

1.4 QUALITY CONTROL

Unless otherwise specified, all materials and equipment must be new and be standard commercial products in regular production by the manufacturer, and suitable for the required service.

1.4.1 Manufacturer's Representative

Procure the services of an engineer representative of the manufacturer of the major portion of the treatment plant who is also familiar with the other equipment furnished. The representative inspects the equipment after erection, make adjustments in placing the equipment in operation, and is present during final inspection, start-up, and acceptance test.

1.4.2 Regulatory Requirements

**************************************************************************

NOTE: Ensure compliance with NPDES permits.
Conduct a regulatory review to determine impact of new and existing permit conditions and regulations. Notify the Contracting Officer of any discrepancies.

1.4.3 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and which essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

1.4.4 List of Prior Installations

Submit a list of installations where plants of similar type as specified have been constructed, including the date of construction and capacity of the plant. Certify that the plant furnished and installed is the latest model and that spare parts are available.

1.4.5 Welding

Weld in accordance with AWS D1.1/D1.1M.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery and Storage

Inspect materials delivered to site for damage. Unload and store with a minimum of handling. Store materials in enclosures or under protective covering. Rubber gaskets which are not to be installed immediately must be stored under cover, out of direct sunlight. Do not store materials directly on the ground. Keep interior of pipes, valves and fittings free of dirt and debris.

1.5.2 Handling

Handle pipe, fittings, valves, and other accessories in such manner as to ensure delivery in sound, undamaged condition. Avoid damage to coatings and linings on pipe and fittings; make repairs if coatings or linings are damaged.

1.6 PROJECT AND SITE CONDITIONS

1.6.1 Environmental Requirements

Comply with applicable local, state, and Federal environmental requirements as directed by the Contracting Officer.

1.7 WARRANTY

Provide a system with a minimum [5] year warranty. Submit the manufacturer's warranty for each piece of equipment.
PART 2   PRODUCTS

2.1   SYSTEM DESCRIPTION

2.1.1   Design Requirements

**************************************************************************
NOTE: Insert values for 5 day BOD loading, total suspended solids (TSS), and design and peak flow rates; values should be based on tests of the wastewater to be treated. A typical influent value for BOD is 200 mg/L.

If effluent standards require a 5-day B.O.D. of less than 10 mg/L, effluent filters are recommended. Tertiary treatment may be required.
**************************************************************************

Provide a Package Wastewater Treatment Plant capable of treating wastewater with the following flow and removal requirements:

a. Average daily design flow of [_____] L/s gallons per day of domestic wastewater

b. Total Suspended Solids removal; [80] [90] [_____] percent

c. 5-day BOD removal; [80] [90] [_____] percent

The influent domestic wastewater has a 5-Day BOD and Total Suspended Solids (TSS) concentration between [200] [400] [_____] mg/L

2.1.2   Package Wastewater Treatment Plant

**************************************************************************
Plant material selection includes steel, concrete, composite. Among the factors to be considered are initial cost, maintenance costs, life expectancy, and possible need for relocation during period of useful life.
**************************************************************************

The Package Wastewater Treatment Plant includes a [comminutor,] aeration chamber, [flow equalization chamber,] clarifier chamber, sludge holding chamber, disinfection chamber, aeration equipment, and other related equipment. Duplicate facilities of equal size having a combined capacity equal to the average design flow specified when one unit is out of service are acceptable.

2.1.3   Components and Systems

**************************************************************************
NOTE: Delete reference to mechanical sludge collection equipment for extended aeration type below 0.66 L/s 15,000 GPD capacity. For facilities below 0.66 L/s 15,000 GPD capacity, hopper bottom only should be specified for settling chambers. For facilities above 4.38 L/s 100,000 GPD capacity, mechanical sludge collectors only should be used in clarifier chambers. For plants between 0.66 L/s and
4.38 L/s 15,000 and 100,000 GPD capacity, either hopper bottom or mechanical sludge collector should be allowed as a Contractor's option.

Delete reference disinfection equipment not used. Hypochlorinator may be specified for facilities 4.38 L/s 100,000 GPD capacity and below. Chlorinator may be specified for facilities 6.57 L/s 150,000 GPD capacity and above. Between 4.38 L/s and 6.57 L/s 100,000 GPD and 150,000 GPD capacity either is suitable. Selection should be made on basis of existing station or base practices, local availability, and comparative costs.

Delete reference to mechanical sludge collector for extended aeration of 4.38 L/s 100,000 GPD capacity and less and for step aeration of 3.0 L/s 67,500 GPD capacity and less.

The Package Wastewater Treatment Plant includes the following equipment: A diffused air aeration system [or mechanical aerator(s)] for the aeration chamber and the sludge holding chamber; [mechanical sludge collection equipment for the clarifier chamber;][ froth control system for the aeration chamber;] sludge pumps in the clarifier chamber and the sludge holding chamber for sludge transfer; scum removal system for the clarifier chamber; [a comminutor at the plant inlet;] a disinfection system, and all necessary piping.

[2.1.4 Concrete Work]

**NOTE:** The applicable requirements for cast-in-place concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE and Section 03 45 33 PRECAST [PRESTRESSED] STRUCTURAL CONCRETE should be incorporated into the appropriate section of the project specification.

Concrete work includes [concrete plant walls, partitions, and bottom;] [support slab for all-steel plant or concrete bottom for steel wall plant;] and concrete pad for equipment support.

2.2 MANUFACTURED UNITS

2.2.1 Process Chambers

**NOTE:** Use appropriate wording depending on whether plant is to be installed above ground (hydrostatic pressures...liquid level) or below ground (soil pressures...operating level).

Delete reference to comminutor and screening basket when not required for the plant. For facilities of 1.09 L/s 25,000 GPD capacity and below, the comminutor and bar screen unit may be omitted, and in lieu thereof, a screening basket provided in the
aeration chamber. For installations in which all wastewater has passed through a comminutor and bar screen upstream of the plant, a comminutor and bar screen unit need not be provided as a part of the plant equipment.

Delete reference to influent distribution channel for extended aeration type.

For a detention time in the aeration chamber, insert values of 18 to 24 hours for extended aeration, 5.0 to 7.5 hours for step aeration, and 30 minutes to 2 hours for contact stabilization systems.

For organic loading in aeration chamber, insert 5.67 kg 12.5 pounds, 5 day BOD for extended aeration, 13.6 to 22.1 kg 30 to 50 pounds, 5-day BOD for step aeration, and 52.16 kg 115 pounds, 5-day BOD for complete mixing systems. Organic loadings used in this specification are those for wastewater strength of 200 mg/L. Organic loadings for higher strength wastewater would be proportional.

Delete the requirement for clarifier chamber detention time when the complete mixing process is specified.

For detention time in the clarifier chamber for extended aeration, insert 4.0 hours for plants of less then 2.19 L/s 50,000 GPD, 3.6 hours for plants from 2.19 L/s 50,000 GPD to 6.57 L/s 150,000 GPD capacity, and 3.0 hours for facilities of 6.57 L/s 150,000 GPD capacity and above. For step aeration, insert 3.0 hours.

Delete reference to mechanical aeration when step aeration or complete mixing is specified, or when not allowed for extended aeration. Mechanical aerator may not be suitable for use in areas having prolonged periods of sub-freezing temperatures when spray may form accumulation of ice. Consideration should be given to temperature and detention time of the liquid and freeboard in the chamber in determining temperatures that may be tolerated. Mechanical aerator is not suitable for extended aeration where eventual conversion to step aeration is contemplated.

For extended aeration, insert 0.013 L/s 300 GPD for 6.57 L/s 150,000 GPD capacity and less; and 0.026 L/s 600 GPD for facilities of more than 6.60 L/s 150,000 GPD capacity. For step aeration, insert 0.026 L/s 600 GPD. For complete mixing, insert 0.02 L/s 50 GPD.

Delete reference to mixing with aeration chamber contents for extended aeration and step aeration.

Delete references to and requirements for seismic
loading when unnecessary to consider seismic loading. For specific environmental loads (wind, seismic) see UFC 3-301-01.

Pass the raw wastewater through a [comminutor] [screening basket] [and an influent distribution channel], aeration chamber of adequate capacity to provide [not less than [_____] hours detention time and] a maximum organic loading not to exceed [_____] kg per 1000 cubic meter [_____] pounds 5-day BOD per 1,000 cubic feet of aeration chamber volume at average design flow rate. A clarifier chamber of adequate capacity to provide [not less than [_____] hours detention time and] a surface settling rate not to exceed [_____] L/s per square meter GPD per square foot at average design flow rate. The settled sludge is [collected by a mechanical sludge collector and] recirculated back to the aeration chamber [where it is rapidly and thoroughly mixed in with the aeration chamber contents,] or wasted to the sludge holding chamber. Size a disinfection chamber to provide a detention time of at least 15 minutes at peak flow and then to an outfall. The sludge holding chamber has a capacity of not less than 0.057 cubic meter 2 cubic feet per capita. Aeration is by [diffused air] [mechanical aeration].

Plant includes an aeration chamber, [equalization chamber,] clarifier chamber, sludge holding chamber, and disinfection chamber. Chambers may be separate or contiguous with a common partition between. Ensure the plant structure and separate chamber structures withstand [hydrostatic pressures and seismic loading] when installed above grade and filled to normal operating liquid level [soil pressures (as indicated by Government-furnished soil borings) when installed below grade, backfilled, and dewatered ]; and seismic loading when installed below grade, backfilled, and filled to normal liquid operating level. The plant and foundation must have sufficient mass to overcome flotation forces when the entire plant is dewatered. Provide for dewatering of individual chambers or compartments and the entire plant.

The Package Wastewater treatment Plant is constructed of [steel] [composite] [concrete] [______]. It must be complete and self-sufficient except for electric power, water supply, and disinfection agent. All structural steel must conform to ASTM A36/A36M. All submerged steel members must have minimum thickness of 6 mm 1/4 inch. Perform cast-in-place concrete in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Precast concrete must be in accordance with [______]. Results of Government-made soil bearing tests will be furnished to the Contractor.

### 2.2.1.1 Aeration Chamber

**NOTE:** A mechanical aerator may not be suitable for use in areas having prolonged periods of sub-freezing temperatures when spray may form accumulation of ice. Consider temperature and detention time of the liquid and freeboard in the tank in determining temperatures that may be tolerated. A mechanical aerator is not suitable for extended aeration type where eventual conversion to step aeration is contemplated.

The aeration chamber will have capacity to provide [a minimum of
[24][_____] hours retention of the average daily flow [a volume of [_____] \( \text{L} \) gallons]. Ensure that the interior configuration of the aeration chamber provides thorough mixing and efficient air dispersion, precludes short-circuiting of the liquid flow, and inhibits solids deposition. Provide a [_____] mm inch diameter influent opening, reinforced with a pipe flange or steel plate and with a suitable connection for the [inlet sewer] [raw wastewater pump discharge pipe]. Provide air diffusers in accordance with paragraph DIFFUSED AIR AERATION EQUIPMENT.

2.2.1.2 Clarifier Chamber

**************************************************************************

NOTE: Delete the first and fourth sentences for extended aeration type facilities above 4.38 L/s 100,000 GPD capacity, step aeration type facilities above 3.0 L/s 67,500 GPD capacity, and for all complete mixing type facilities.

Delete reference to mechanical sludge collection equipment for extended aeration type below 0.66 L/s 15,000 GPD capacity. For facilities below 0.66 L/s 15,000 GPD capacity, hopper bottom only should be specified for clarifiers. For facilities above 4.38 L/s 100,000 GPD capacity, consider mechanical sludge collectors clarifier chambers. For facilities between 0.66 L/s and 4.38 L/s 15,000 and 100,000 GPD capacity, either hopper bottom or mechanical sludge collector may be allowed as a Contractor's option.

In all facilities (except circular facilities with concentric inner clarifier) where the design flow exceeds 4.38 L/s 100,000 GPD, the clarifier chamber should be in multiple units each capable of independent operation and whose combined capacity equals the design flow rate when one unit is out of operation. In fourth sentence, delete first and third optional wordings when design flow is 4.38 L/s 100,000 GPD and below; delete second optional wording when design flow exceeds 4.38 L/s 100,000 GPD.

**************************************************************************

[Provide clarifier chamber with a minimum of 4 hours retention time and a hopper bottom[ when mechanical sludge collection equipment is not provided]. ][The clarifier chamber[, except in circular facilities with a concentric inner tank,] is [in a single unit][ or ][in multiple units] [each of which is capable of independent operation and] whose combined capacity equals the design flow when one unit is out of operation.[ The hopper bottom of the clarifier cannot have slide slopes of less than 1.05 rad 60 degrees from the horizontal; horizontal area of hopper bottom is commensurate with the capability of the sludge pump for efficient sludge withdrawal. In lieu of the above, a flat bottom may be provided with a mechanical sludge scraper in accordance with paragraph SLUDGE AND SCUM COLLECTION AND TRANSFER EQUIPMENT.] Provide means of velocity control at the clarifier chamber inlet. Provide a scum baffle, weir, or other means to prevent scum from passing out with effluent. Provide air lift sludge and scum pumps in accordance with paragraph SLUDGE AND SCUM COLLECTION AND TRANSFER EQUIPMENT.

SECTION 46 07 53 Page 19
2.2.1.3 Sludge Holding Chamber

NOTE: Insert capacity, generally all waste sludge produced in one week of operation.

Provide a sludge holding chamber with a minimum capacity of [_____] cubic meters cubic feet. Provide a supernatant draw-off connection between the sludge-holding chamber and the aeration chamber. Provide an inlet pipe connection or sludge weir for transfer of sludge from the clarifier chamber to the sludge holding chamber. Provide pipe connection(s) in this chamber for waste sludge draw-off. Provide air diffusers in accordance with paragraph DIFFUSED AIR AERATION EQUIPMENT.

2.2.1.4 Disinfection Chamber

Provide a disinfection chamber as an integral part of the plant or an adjacent detached tank. Ensure at least 15 minutes contact time at peak flow rate. Provide baffles to eliminate short-circuiting and ensure complete mixing. Provide disinfection equipment in accordance with paragraph DISINFECTION EQUIPMENT. Provide a flange on the outlet of the tank.

2.2.1.5 Structural Requirements for Steel Tanks

Provide tanks suitable for support by and anchorage to a concrete base. Steel tank walls and bottom are structural steel plate. Use minimum 6 mm 1/4 inch structural steel shapes for reinforcing and bracing are in the thinnest section. Placement of reinforcing and bracing cannot adversely affect the performance characteristics with the aeration tank. All sides, compartment partitions, tank bottoms, braces, and corners are continuously welded inside and out and ground smooth before priming. Ensure that water tightness is provided by means of welding. Ensure that the common partitions are reinforced to withstand pressures resulting from liquid level differentials that would occur when any individual compartment(s) is dewatered while contiguous compartments remain at normal operating liquid level.

2.3 EQUIPMENT

2.3.1 Aeration Equipment

NOTE: Delete reference to mechanical aerator when step aeration type or complete mixing type is specified, or when not allowed.

Aeration will take place by [diffused air] [fixed mechanical aeration]. Ensure that the aeration system supplies a minimum of [3] [_____] cubic meters of air per minute per 100 cubic meters of tank volume [30] [_____] cubic feet of air per minute per 1000 cubic feet of tank volume (cfm/1000 cu. ft.). The aeration equipment will completely mix the contents of the aeration tank and maintain a minimum velocity of 0.18 m/s 0.6 fps.

2.3.1.1 Diffused Air Aeration Equipment
NOTE: Delete reference to coarse bubble type when not allowed. For facilities of 2.19 L/s 50,000 GPD capacity and below, fine bubble diffusers or coarse bubble diffusers are allowed as Contractor's option. For facilities of more than 2.19 L/s 50,000 GPD, use fine bubble diffusers.

Aeration equipment includes diffusers, diffuser holder assembly, air blower assembly, and piping. Provide [fine bubble] [coarse bubble] diffusers. Ensure that the oxygen transfer capacity of the diffuser system is capable of furnishing an adequate supply of oxygen in the aeration tank to meet treatment requirements at the design wastewater load.

2.3.1.1 Air Diffusers

Ensure that the diffuser layout provides sufficient mixing capacity to thoroughly mix the waste water throughout the tank depth. Use fixed-nozzle diffusers, individually attached to the headers by screwed connections, U-bolts, or stainless steel straps and springs. Welded or other nonremovable connections are not acceptable. Ensure an oxygen transfer efficiency of at least 6 percent and a pressure drop not greater than 3.5 kPa 0.5 psi at the design flow rate. Provide diffusers of plastic, stainless steel, rubber, or other corrosion resistant material and seal under no-flow conditions to prevent wastewater from entering the piping system.

2.3.1.1.2 Diffuser Holder Assembly

NOTE: Delete reference to swing-out type when steel plant only is required.

The assembly includes an air control and shut-off valve and all the air piping downstream from this valve. Select a butterfly valve, plug valve, or globe valve suitable for air control with indicator markings for throttling and complete shut-off. The diffuser holder assembly is the [fixed type] [or swing-out type]. Ensure that the spacing of diffuser assemblies in the tank and diffusers on the header is as recommended by the diffuser manufacturer. Provide independently valved and supported headers capable of being independently removed from service without the use of a crane or hoist and without dewatering of the tank.

2.3.1.3 Air Diffusers

Provide a drop-pipe with air diffusers in the chamber with placement of diffusers near the bottom. Ensure that the amount of air supplied to the tank is sufficient to allow aerobic stabilization of solids and in no case less than 0.25 cubic meter per second of air per 1,000 cubic meters 15 CFM of air per 1,000 cubic feet of tank volume.

2.3.1.2 Mechanical Aeration Equipment

NOTE: Delete paragraph and subparagraph when step aeration type or complete mixing type is specified, or when mechanical aerator is not allowed.
Provide a fixed type mechanical aerator. Include a drive assembly, impeller shaft, impeller, and shroud. Provide all accessories necessary for proper operation and to generate the necessary required oxygenation capacity, including flow straightening surge rings or tank baffles.

2.3.1.2.1 Drive Assembly

Provide a fully enclosed for outdoor installation drive assembly including an electric motor, gear reduction unit, and bearings.

a. Motor: Motor is constant speed, totally enclosed, fan-cooled, horizontal type, with solid shaft, suitable for outdoor service, and conforming to NEMA MG 1. Ensure that the motor is of adequate wattage to drive the equipment continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Motor must be suitable for operation with the voltage characteristics indicated. Motor must be protected against overload, low voltage, and unbalanced voltage. Connect vertical motor directly to the gear reduction unit or else connect by a flexible coupling. Connect horizontal to the gear reduction unit by a flexible coupling only. In lieu of a constant speed motor with a gear reduction unit, a two-speed motor may be provided as a means of speed reduction.

b. Gear Reduction Unit: Ensure a minimum AGMA service factor when the unit is operating at full load motor wattage horsepower, 24 hours a day continuous running under moderate shock loads, of 1.5 for speed reducers and 2.0 for gear motors. Ensure a life expectancy of 100,000 hours with the probability of no more than 10 percent failures prior to its expected life. Gearing may be spur, helical, spiral bevel, or a combination. If helical, the helical angle must not exceed 0.314 rad 18 degrees. Worm gearing will not be acceptable. All gears must be AGMA Quality 10 or higher as outlined in AGMA ISO 10064-6, AGMA ISO 17485 or AGMA 2011. Provide a lubrication system for the gears.

c. Bearings must have a minimum rated life expectancy (L-10) of 100,000 hours based on ABMA 11 Standards when operating continuously at the rated full-load motor wattage horsepower and speed under the specified loading conditions. Internal bearings may be either oil or grease lubricated. All grease lubrication pressure lines must be fed from fittings accessibly located above the platform supporting the mechanism. Underwater bearings are not acceptable.

2.3.1.2.2 Impeller Shaft

Ensure that the shaft is of sufficient diameter to withstand the loading imposed by the impeller, using a safety factor of 1.5. The shaft must be removable from the speed reducer.

2.3.1.2.3 Impeller

The aeration blades must be designed to achieve the maximum aeration and pumping effect. The impeller must be readily removable from the shaft.

2.3.1.2.4 Shroud

Equip the aerator with a shroud to prevent the mixed liquor from splashing
and spraying the underside of the supporting platform, walkway, railings, and walls of the aeration tank.

2.3.1.2.5 Mechanical Aerator Supports, Walkways and Rails

Place supports for mechanical aerator mounting plate on the bottom of the chamber or extended from structural steel beams on tank walls. Provide a service walkway to the mechanical aerator and handrails on each side.

2.3.1.3 Screening

******************************************************************************
NOTE: Delete comminutor and subparagraphs when comminutor is not required. For facilities of 1.09 L/s 25,000 GPD capacity and below, the comminutor may be omitted, and a screening basket provided. For installations in which all wastewater has passed through a comminutor and bar screen upstream, a comminutor is not required.
******************************************************************************

Provide a [comminutor] [screening basket] [bar screen] in the influent line immediately upstream of the aeration chamber.

[2.3.1.3.1 Comminutor

Provide a rotating type comminutor capable of cutting all wastewater solids including sticks, rags, and stringy material without clogging the screen or binding, jamming or stalling the moving parts under normal load conditions. Ensure that the comminutor is capable of continuous operation and have a hydraulic capacity at least equal to the treatment facility peak flow rate and at zero flow conditions. Ensure that the screen configuration is such that all wastewater must pass through it before entering the treatment facility. Space screen bars not greater than 6 mm 1/4 inch apart. Provide cutters constructed of tool steel with a surface hardness of at least 35 on Rockwell C scale. Ensure cutters are removable for replacement. Ensure free discharge where the discharge is located above the liquid level in the aeration chamber or controlled discharge when partially submerged.

2.3.1.3.1.1 Comminutor Drive

Provide a comminutor driven by an electric motor, constant speed, totally enclosed, horizontal or vertical type, suitable for outdoor service, and conforming to NEMA MG 1. The motor must be of adequate wattage horsepower to drive the comminutor continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Motor must be suitable for operation with the voltage characteristics as indicated. Motor must be protected against overload, low voltage, and unbalanced voltage.

][2.3.1.3.2 Screening Basket

Provide at the plant influent, a readily removable, fabricated steel screening basket, sized for maximum flow, located so that the total volume of incoming raw wastewater is screened before it enters the plant. Fabricate the basket from 5 mm 3/16 inch diameter 302 stainless steel wire or 10 mm 3/8 inch hot-rolled steel bars with 25 mm one inch space between bars.
2.3.1.3.3 Bar Screen

Provide an inlet bar screen to remove large solids from the incoming raw wastewater. Fabricate the bars from 13 mm 1/2 inch diameter bars spaced 25 mm one inch apart and arranged as shown in the drawings. The bars will be sloped to permit easy cleaning of debris. Furnish a drying deck for the debris.

2.3.2 Sludge and Scum Collection and Transfer Equipment

**************************************************************************

NOTE: For facilities below 0.66 L/s 15,000 GPD capacity, hopper bottom only should be specified for clarifier chambers. For facilities above 4.38 L/s 100,000 GPD capacity, mechanical sludge collectors should be used in clarifier chambers. For facilities between 0.66 L/s and 4.38 L/s 15,000 and 100,000 GPD capacity, either hopper bottom or mechanical sludge collector should be allowed.

Delete reference to mechanical sludge collection equipment for extended aeration facilities below 0.66 L/s 15,000 GPD capacity.
**************************************************************************

Provide equipment to collect sludge from the bottom of the clarifier chamber. Collect sludge through the use of a hopper bottom clarifier chamber or a flat bottom clarifier chamber with a mechanical collector. The equipment will also collect scum from the top of the clarifier. Sludge and scum collection and transfer equipment includes sludge transfer pump(s), [mechanical sludge collection equipment [(if used)],] scum collection and transfer system, and supernatant transfer.

2.3.2.1 Sludge Transfer Pumps

Provide a positive sludge recirculation system. If the sludge clarifier is the hopper bottom type, provide at least one air lift pump in each hopper. If the clarifier contains a mechanical sludge collector, provide an air lift pump at the collector discharge. Each air lift includes a foot piece, eductor, air and vent piping, and control valves. Sludge recirculation air lifts will have recirculation capacity of 0 percent to 150 percent of the design flow. Support pump and equip with a clean-out plug for cleaning and maintenance.

2.3.2.2 Mechanical Sludge Collection Equipment

If the clarifier does not have a hopper bottom, provide a mechanical sludge collector to scrape the entire tank bottom. Mechanical sludge collectors may be either the rotating arm or conveyor type. Drive the collector by an electric motor through an appropriate gear or chain drive. Position motors and drives above the plant high water level or use equipment suitable for submerged service. Ensure motors are totally enclosed and conform to NEMA MG 1. Furnish each motor with a magnetic starter with thermal overload protection and control devices conforming to NEMA ICS 1. Avoid sludge-residence time exceeding 3 hours. Scraper blades will be replaceable. Provide collector drive with overload protection.
2.3.2.3 Scum Collection and Transfer Equipment

2.3.2.3.1 Scum Collection in Hopper Bottom Settling Tanks

Scum collection is accomplished by means of a suction skimmer. Suction skimmer is a 50 mm 2 inch diameter drop pipe supported by a structural steel member and so mounted that it can be raised or lowered with respect to the liquid surface by means of stainless steel adjusting screws with hand knobs or by corrosion-resisting turnbuckles located above the liquid surface. Attach the lower end of drop pipe to a 50 mm 2 inch air lift by means of a flexible hose of chloroprene or other material suitable for use in sewage.

2.3.2.3.2 Scum Collection in Circular Settling Tanks

Scum Collection in Circular Setting Tanks With Mechanical Sludge Collectors: Scum collector assembly includes a blade skimmer and a scum trough. Assembly is continuously move surface scum to the scum trough. The assembly discharges scum with a minimum discharge of water. Blade skimmer includes an arm fabricated of structural steel shapes and attached to a steel blade skimmer or floating redwood skimmer, with an adjustable chloroprene wiper. Scum skimmer is supported by the center shaft and one scraper arm. Scum trough is welded structural steel, minimum thickness 6 mm 1/4 inch, has a connection to the scum airlift pump, and supported from the tank wall or scum baffles. Shape the inclined approach ramp leading to the scum trough to contain the scum as it is moved up the incline to the trough by the scum skimmer.

2.3.2.3.3 Scum Collection in Rectangular Settling Tanks

Scum Collection in Rectangular Setting Tanks With Mechanical Sludge Collectors: Accomplish the scum collection by means of traveling blade or paddle skimmer or by suction skimmer. Attach the traveling blade or paddle skimmer to the traveling sludge collector at surface level and designed to sweep the surface of the settling tank in one direction only with each pass of the sludge collector. Collected scum is discharged into a trough, collector pipe or suction skimmer. Scum trough is steel, 6 mm 1/4 inch minimum thickness, with approach ramp and have a connection to the scum air lift pipe and supported from the tank wall. The collector pipe is steel pipe with a 1.05 rad 60 degree wide slot cut symmetrically above the vertical axis. At maximum intervals of 750 mm 30 inches, a 50 mm 2 inch wide band of full circumference is left for stiffness. End supports includes a rolled steel collar welded to an adjustable steel end plate. Provide a readily renewable grease-resistant, watertight seal and so constructed that it will allow smooth action of the revolving pipe. Ensure that the seal is readily renewable without removing pipe. Secure the end supports to the concrete walls by stainless steel anchor bolts having a minimum diameter of 16 mm 5/8 inch. Collector pipe operator is a manual, lever type, mounted on the collector pipe. Operator is steel pipe having a minimum diameter of 31 mm 1 1/4 inches and secured to the collector pipe with a bolted connection. The operator extends at least 900 mm 3 feet above the top of tank and permits rotation of the collector pipe to at least 0.52 rad 30 degrees of each side of the vertical axis. Ensure that the collector pipe has a suitable means of discharge to the scum airlift pump.

2.3.2.3.4 Scum Recirculation System

Scum transfer is accomplished by means of an airlift pump. Airlift pump consists of a 50 mm 2 inch airlift skimming device. The skimming device
will skim and return floating material to the aeration chamber. Equip the supply airline with a valve to regulate the rate of return. Ensure the scum intake is adjustable providing exact positioning of the skimmer at water level.

2.3.2.4 Supernatant Transfer

When a pump is used for supernatant transfer, provide a positive means of flow regulation. Provide all necessary piping.

[2.3.3 Froth Control System

**************************************************************************
NOTE: Froth removal may be required where nicardia foaming is a potential problem.
**************************************************************************

Provide a froth control system including: pump, piping, manifold, spray nozzles, and valves.

2.3.3.1 Froth Control System Pump

Provide an electric motor operated, self-contained, submersible pump suitable for the required service. Mount the pump with the suction no less than 50 mm 2 inches below the water surface but not so deep that the pump will pick up settled solids. Provide an intake screen around the pump suction. Ensure that the screen openings are no larger than the pump nozzle opening. Provide a watertight motor in accordance with NEMA MG 1. Provide controls, including a magnetic starter with start and stop buttons and a circuit breaker with reset button in conformance with NEMA ICS 1.

2.3.3.2 Spray Nozzles

Provide self-cleaning spray nozzles, that will produce a sharp flat or conical spray at normal pumping rates. Use spray nozzles of corrosion-resisting materials to provide sufficient force at a flow rate of 0.1 L/second 1-1/2 gpm per nozzle to effectively break down accumulated froth. Mount spray nozzles to provide uniform coverage of the chamber.

2.3.3.3 Piping and Valves

Provide a froth spray header of at least 25 mm one inch diameter galvanized steel or PVC pipe and mount above the water surface opposite the air diffusers. Provide for a garden hose connection for wash-down purposes.

2.3.4 Air Blower Assembly

Provide an air blower assembly including: air blowers, blower driver, V-belt drive (for positive displacement blower), housing and accessories. Provide each blower with [a filter-silencer on the suction side,] a check valve, pressure relief valve, and pressure gauge.

2.3.4.1 Air Blower

Provide at least two air blowers with the capacity to produce the plant air requirement at the necessary operating pressure including allowance for pressure drop in air piping, fittings, and accessories. The unit will deliver [_____] cubic meters/second cfm when operating at [_____] kPag psig. Ensure blowers are suitable for continuous operation. Each blower must
have the capacity to provide the total plant air requirement.

2.3.4.2 Blower Driver

The blower drive consists of an electric motor, V-belts, and sheaves. Motor must be suitable for operation with the voltage characteristics as indicated. Blower motor will be weatherproof conforming to NEMA MG 1. Provide a constant speed, totally enclosed, fan-cooled motor, suitable for outdoor service, and conforming to NEMA MG 1. Ensure that the motor is of adequate wattage horsepower to drive the equipment continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Ensure that the motor is suitable for operation with the voltage characteristics as indicated. Protect the motor against overload, low voltage, and unbalanced voltage. Provide any silencing or dampening required.

2.3.4.3 Air Blower and Blower Driver Housing

Mount the blower-driver on a base plate with vibration dampening in a weatherproof, corrosion resistant enclosure. Ensure that the base plate has provisions for adjustment of V-belt tension, and provides the necessary anchoring. Provide louvers or ventilation adequate to provide air for cooling and, if the intake is in the enclosure, for blower supply. Allow access to the blowers and motors for maintenance.

2.3.4.4 Air Blower Accessories

[2.3.4.4.1 Air Filter Silencer

**************************************************************************
NOTE: Optional, consider use of filter-silencers on blowers of 0.094 cubic meters/second 200 cfm or less or separate silencer and air filter as well as a discharge silencer on blowers over 0.094 cubic meters/second 200 cfm.
**************************************************************************

Provide filter-silencer type, cleanable, air filters. If filters are mounted outside, provide weatherproof enclosures. Provide filters having a maximum pressure loss of 25 mm 1.0 inch water gage mm In.W.G. at the maximum capacity of blower when clean. Ensure that the silencing chamber has a peak attenuation in the frequency range 300-1, 1,200 cycles per second.

]2.3.4.4.2 Pressure Relief Valve

Provide a pressure relief valve for each blower on the discharge side. Furnish a valve for a pressure setting of not more than 90 percent of the maximum operating pressure.

2.3.4.4.3 Check Valve

Provide a check valve on the discharge side of each blower.

2.3.4.4.4 Pressure Gage

Provide an air pressure gage on the discharge line from each blower. Gauge scale range to include the full range of expected operation and up to 125 percent, but not more than 150 percent of maximum. Mount the gages in an
easy to read location within the enclosure.

2.3.5 Disinfection Equipment

**************************************************************************

NOTE: Delete the reference to a heater for plants in areas where freezing temperatures are not encountered.

For small facilities of that do not require flow proportional chlorination, a tablet chlorinator offers a safe and effective means of disinfection.

Delete unused disinfection system paragraphs below.

Hypochlorinator may be specified for plants 4.38 L/s 100,000 GPD capacity and below. Chlorinator may be specified for all plants 6.57 L/s 150,000 GPD capacity and above. Make a selection on basis of existing station or base practices, local availability, and comparative costs.

**************************************************************************

Provide the manufacturer's standard disinfection system [Chlorine Tablet Feed] [Chlorinator Assembly] [Hypochlorinator Assembly] [UV Disinfection].

[2.3.5.1 UV Disinfection

Ultra-violet system includes lamps, ballasts, and controls.[ Provide heater.]

] [2.3.5.2 Chlorine Tablet Feed

Provide a tablet chlorinator feeder[, provide heater if required].

] [2.3.5.3 Hypochlorinator Assembly

Provide hypochlorite assembly in accordance with Section 46 31 11 CHLORINE GAS FEED EQUIPMENT. Provide an adjustable capacity system of between 2 to 8 mg/L of chlorine equivalent, with fully automatic and manually adjustable operation[, provide heater if required].

] [2.3.5.4 Chlorinator Assembly

Chlorinator assembly includes chlorinator, scale, chlorine gas manifold, flexible connector, water piping, chlorine solution piping, vent tubing, vacuum signal tubing, diffuser, and housing. Provide chlorinator assembly in accordance with Section 46 31 11 CHLORINE GAS FEED EQUIPMENT. Ensure that the chlorinator has proportional-automatic control. Ensure that the chlorinator receives chlorine gas from chlorine cylinders and water from the water supply system[, provide heater if required]. Discharge the chlorine solution through piping to the diffuser located in the chlorine contact chamber.

] [2.3.6 Flow Measuring Equipment

2.3.6.1 V-notch weir

Use a V-notch weir that can measure flow to plus or minus 2 percent of the actual rate over a five-to-one range.
2.3.6.2 Float Operation

Provide flow measurement of wastewater by an effluent weir and a recorder. The recorder will be of the electrically operated circular or strip chart type and continuously record the flow through the plant in L/second gpm. The recorder will also produce an electrical signal in proportion to the flow for control of the chlorinator. Provide a weatherproof enclosure for the recorder.

2.3.6.3 Ultrasonic Measuring

Measure wastewater flow by an effluent weir and an ultrasonic flow meter with digital recorder. Measurement is noncontact, echo-time measuring-type for use with V-notch weir. Provide reference receivers for instant compensation in gas medium for temperature, atmospheric pressure and humidity changes. Provide a NEMA 4X enclosure for the transmitter and include an indicator and recorder. Ensure the transmitter provides a flow proportional signal if required.

2.3.6.4 Flow Control

Provide adjustable weirs at the inlet and outlet of the disinfection chamber for control of wastewater depth in the plant.

2.4 COMPONENTS

2.4.1 Piping System

2.4.1.1 Air Piping

Air piping includes all piping from the blowers to the diffusers and air lift pumps. Provide gate valves in air piping branches from air main when serving two or more air diffuser drop pipes; provide gate valves as blow-off valves for air mains.

2.4.1.2 Sludge Return, Waste Sludge and Scum Return Piping

Provide valves on air lift discharge piping between the air lift discharge riser and the air separator. Provide gate valves, globe valves, or plug valves in branch piping for return sludge and waste sludge lines when separate return sludge and waste sludge pumps are not used.

2.4.1.3 Froth Control System Piping

Provide valves in suction and discharge piping to froth control pump and in the froth control main line piping.

2.4.1.4 Miscellaneous Piping

Provide a flanged connection to incoming wastewater line. [Provide inlet piping for concrete aeration tanks in sleeve in wall and connected to incoming sewer by means of a grout ring. ]Provide gate valves or shear gates for a tank drain or dewatering piping.

2.4.2 Electrical Control System Components

********************************************************************************

NOTE: Specify outdoor type enclosure except when

SECTION 46 07 53 Page 29
The system includes enclosure; main and branch circuit breakers; starters, contactors, and reset buttons; selector switches, push buttons, and pilot lights; circuit control items for electrical control of the various plant components; and all necessary wiring and tubing. Provide an electrical control system in accordance with NEMA ICS 1. Ensure that all electrical components are in accordance with the requirements of NFPA 70.

Mount electrical controls in [outdoor weatherproof enclosure, NEMA [3R][4X]] [indoor enclosure, NEMA 1 OR NEMA 12]. Wire electrical controls so that the various items of plant equipment can be operated either manually or automatically. Completely wire all electrical control system components and mount in the enclosure at the manufacturer's facility and test prior to shipment from the factory. The electric service available is [_____] volt, [_____] phase, [_____] Hertz, [_____] wire. [Install all push buttons, selector switches, and indicating lights on the outside of the door(s), properly identified with name plates. ]Identify all components on the [outside of enclosure and on the] internal panel.

2.4.2.1 Sequence of Operation

Ensure the electrical control system and its components perform the following automatic functions:

**************************************************************************
NOTE: Delete reference to comminutor when not required.
**************************************************************************

a. The 7-day program timer automatically starts and stops the blowers [comminutor,] [and froth control system pump]. A percentage timer automatically starts and stops blower motors.

b. If operating lead blower should stop, standby blower, acting in response to setting of failure transfer timer, automatically starts and stays in operation until such time as lead blower returns to service. Range of failure transfer timer is such as to prevent the transfer to the standby system from such causes as momentary interruptions of power, loss of power and similar malfunctions. Provide a selector switch to allow manual change in the lead-standby system. Arrange pressure switches in the motor control circuit to cause the system failure transfer circuit to operate when there is a lack of or loss of pressure due to belt slippage or breakage, or air loss, until such time as the fault is corrected. Horn and warning light alarm circuits are energized to indicate that the standby system has replaced the selected lead blower in operation.

c. [Chlorinator is controlled by the flow meter and starts, stops, and proportionally regulates the dosage in response to the received signals. ][[Hypochlorinator][Tablet feeder] starts and stops in response to signals from liquid level sensing probes.]

d. Thermostat automatically places into operation equipment automatically taken out of service by the 7-day timer when the outside air temperature drops below 0 degrees C 32 degrees F or any other predetermined temperature setting.
e. A percentage timer automatically controls the sludge transfer pump, scum transfer pump, and supernatant return pump.

f. Ensure that the froth control system pump is suitably interlocked with blowers so as to automatically start and stop in parallel with the blowers.

2.4.2.2 Circuit Breakers

All circuit breakers must be thermal magnetic type and meet the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.4.2.2.1 Main Circuit Breaker

Ensure that the main circuit breaker has a maximum capacity of 150 percent of the electrical load. The main circuit breaker has an external handle mechanism mounted outside the enclosure to permit operation of this breaker from outside the enclosure. Provide the main circuit breaker with positive locking device to permit locking the operating handle.

2.4.2.2.2 Branch Circuit Breakers

******************************************************************************
NOTE: Delete references to unused components.
******************************************************************************

Provide an E-frame bolt-on type branch circuit breakers mounted on an interior bus bar. Provide branch circuit breakers for each blower, [comminutor, ] [mechanical aerator(s), ] froth control system pump, [sludge collector drive motor, ] [hypochlorinator, ] control circuit, [control circuit transformer, ] flow meter, [chlorinator housing heater, ] [hypochlorinator housing heating device, ] drive motor, lighting circuit(s), and receptacle. Ensure that the panel includes spaces for four additional circuit breakers.

2.4.2.3 Starters, Contactors, and Reset Buttons

Provide magnetic starters for each blower motor, [(each) mechanical aerator motor, ] [comminutor motor, ] and froth control system pump motor, [sludge collector drive motor]. Mount reset buttons for magnetic starters on enclosure doors.

2.4.2.4 Selector Switches, Pushbuttons, and Pilot Lights

Mount selector switches, pushbuttons, and pilot lights on the outside of the enclosure. Provide One Hand-Off-Automatic (H-O-A) selector switch for each motor starter. Provide one selector switch for changing lead blower in the lead-standby system. Provide push buttons for manual (Hand) operation of motors. Provide pilot lights for each H-O-A selector switch: red to indicated motor is running and amber to indicate automatic operation. Connections to the selector switch are such that only the normal automatic regulating control devices will be by-passed when the switch is in the "Hand" position. Connect all safety control devices such as motor overload protection devices in the motor control circuit in both the "Hand" and "Automatic" positions.

2.4.2.5 Circuit Controls

******************************************************************************
Circuit controls include the following: Program timer, 30-minute percentage timer, thermostat, control circuit transformer, and all necessary relays and pressure switches to carry out the sequence of operation as specified above. Program timer is the 7-day type, electric motor driven, with each hour of the day shown. Ensure that the time intervals are adjustable with a minimum switching interval of 4 hours. Percentage timer is 30-minute type. [Provide a transformer to step down incoming service voltage to 120 volts.]

[2.4.2.6 Alarm]

Provide a horn or 150 mm 6 inch bell alarm, battery and necessary circuits to sound alarm:

a. when standby blower(s) has replaced lead blower

b. when power to plant has been interrupted

[ Include an alarm circuit with auxiliary contacts for transmission of signal indicative of either alarm condition to [_____.]

[2.4.2.7 Electrical Wiring]

Wire all control circuits in accordance with the Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.5 MATERIALS

2.5.1 Treatment and Painting

Except as otherwise specified, treat and paint equipment in accordance with the manufacturer's standard practice.

2.5.2 Lubrication

For equipment requiring lubrication, provide means for lubrication of all moving parts and lubricate prior to delivery.

2.5.3 Steel Plates, Shapes, and Bars

For steel plates, shapes, and bars, conform to ASTM A36/A36M or ASTM A276/A276M.
2.5.4 Ductile Iron Pipe and Fittings

For ductile iron pipe, conform to AWWA C151/A21.51, ASME B16.4 and ASME B16.5.

2.5.4.1 Flanged Ductile Iron Pipe

For flanged pipe, conform to AWWA C115/A21.15 with ASME B16.1, Class 125 flanges.

2.5.4.2 Joints

For joints for ductile iron pipe, conform to AWWA C111/A21.11.

2.5.4.3 Fittings for Ductile Iron Pipe

For fittings for ductile iron pipe, conform to AWWA C110/A21.10.

2.5.5 Steel Pipe

For steel pipe, conform to AWWA C200.

2.5.5.1 Flanged Joints

For flanged joints, conform to AWWA C207, Class B Ring Type.

2.5.5.2 Slip Joints

For slip joints, conform to AWWA C200.

2.5.5.3 Mechanical Joints

For mechanical joints, conform to AWWA C200.

2.5.5.4 Welded Joints

For welded joints, conform to AWWA C206.

2.5.5.5 Fittings for Steel Pipe

For steel pipe fittings, conform to AWWA C200.

2.5.6 Galvanized Steel Pipe and Fittings

Galvanized steel pipe will conform to ASTM A53/A53M, standard weight, galvanized. Pipe smaller than 100 mm 4-inch diameter will have screwed joints in accordance with ASME B1.20.2M ASME B1.20.1. Fittings will be galvanized malleable iron in accordance with ASME B16.3. Pipe 100 mm 4-inch diameter and larger has flanged joints and fittings in accordance with AWWA C207.

2.5.7 Polyvinyl Chloride (PVC) Pipe and Fittings

PVC pipe and fittings less than 100 mm 4-inch diameter will be in accordance with ASTM D1785 or ASTM D2241. PVC pipe and fittings 100 mm 4 inch in diameter and larger is in accordance with ASTM D2241 or AWWA C900 and shall have push-on joints.
2.5.7.1 Push-On Joints
Push-on joints will conform to ASTM D3139 or ASTM F477.

2.5.7.2 Solvent Cement
Solvent cement will conform to ASTM D2564.

2.5.8 Pipe Hangers and Supports
Pipe hangers and supports will conform to MSS SP-58.

2.5.9 Valves

2.5.9.1 Angle, Check, and Globe Valves
Angle, check and globe valves will conform to MSS SP-80, Type 3 Globe and Angle, Types 3 and 4 Check.

2.5.9.2 Gate Valves
Gate valves will conform to MSS SP-80 or MSS SP-70.

2.5.9.3 Plug Valves
Bronze plug valves will conform to MSS SP-78. Iron plug valves will conform to API Spec 6D.

2.5.10 Butterfly Valves
Provide butterfly valves conforming to AWWA C504.

2.5.11 Joint Compound
Joint compound for screwed joints will be a stiff mixture of graphite and oil, inert filler and oil, or a graphite compound.

2.5.12 Joint Tape
Joint tape for screw joints will conform to ASTM D3308.

2.5.13 Bolts and Nuts
Bolts and nuts will conform to ASTM A307, Grade B.

2.5.14 Gears

2.6 ACCESSORIES

2.6.1 Chlorine Gas Manifold
Ensure that the chlorine gas manifold is a material resistant to chlorine and suitable for the working pressure involved.
2.6.2 Flexible Connector

Ensure that the flexible connector between the chlorine gas manifold and the chlorinator is extra-heavy Type K seamless copper tube conforming to ASTM B88M ASTM B88.

2.6.3 Water Piping

Water piping is schedule 80 PVC piping with solvent welded joints. Provide a gate valve and check valve conforming to MSS SP-80 and a Y-pattern brass or stainless steel strainer.

2.6.4 Solution Piping

Ensure that the solution piping from chlorinator to diffuser is flexible polyethylene pipe, chlorine solution hose, rigid polyvinylchloride (PVC) pipe, or rigid acrylonitrile-butadiene-styrene (ABS) pipe.

2.6.5 Vent Tubing

Vent tubing is any elastomer or plastic tubing resistant to chlorine or chlorine solutions. Any other material having qualities acceptable for such use may be substituted in place of the elastomer or plastic tubing. Slope the vent line continuously downward to outside of housing without dips or sags. Provide an insect screen at end of line.

2.6.6 Signal Tubing

Signal tubing is Type K soft copper tubing.

2.6.7 Diffuser

Provide a diffuser of rigid PVC or ABS pipe, resistant to chlorine solution. Provide an open channel type diffuser that is perforated and fastened at each end to the tank wall near the bottom in the flow stream of the influent to the chlorine contact tank.

2.6.8 Housing

Enclose the chlorinator scale, piping, and controls in a weatherproof housing constructed of 0.9 mm 20 gage metal with minimum 25 mm one inch insulation. Provide a full access door for easy access to equipment. Mount the housing on top of treatment plant or on a concrete pad adjacent to the chlorine contact tank that projects not less than 150 mm 6 inches beyond outside face of housing. Provide a thermostatically controlled space heater within the housing to maintain a temperature of 21 degrees C 70 degrees F.

2.6.9 Appurtenances and Accessories

2.6.9.1 Walkways, Platforms, and Bridges

**************************************************************************
NOTE: Include handrails around plant perimeter if plant is installed with tank walls at or near grade.
**************************************************************************

Provide access walkways and platforms for access to all equipment for operation and maintenance. Make walkways and platforms nonslip open
grating fabricated from galvanized steel, factory painted mild steel, aluminum, or fiberglass. Provide rigid handrails along the sides of walkways and platforms [and around the perimeter of the entire plant]. Fabricate handrails from aluminum, galvanized steel or painted steel, be 1075 mm 42 inch high, and have two horizontal rails. Provide gates as required for access to equipment. Provide access walkways, platforms, and handrails conforming to Section 05 12 00 STRUCTURAL STEEL.

[2.6.9.2 [Access Stairway] [Access Ladder]]

********************************************************************************
NOTE: Delete references and requirements for access ladder as Contractor's option unless it can be justified on an economic and technical basis. Although more expensive, a stairway is preferable in that it provides safer and easier access to platforms and walkways.

Delete "raised platform floor plate" or "grating" as necessary. Delete references and requirements for raised platform floor plate or for grating as necessary. Grating is recommended where snow or ice accumulation may be anticipated; otherwise, use floor plate.

********************************************************************************

When top of plant is more than 600 mm 24 inches above surrounding ground level, provide an access [stairway] [ladder]. Fabricate stairway of structural steel members. Steps are [raised-pattern floor plate] [grating]. Provide access ladder(s) of steel or aluminum and be 450 mm 18 inches wide minimum, with step bars spaced 300 mm 12 inches on center. Provide ladders anchored at the bottom, top, and intermediate points with brackets 1.8 m 6 feet apart. Ensure that the brackets are the same size as side bars and of such length as to hold ladder 150 mm 6 inch away from walls. Provide curved returns at top of ladder. Aluminum side bars and step bars conform to ASTM B221M ASTM B221.

[2.6.9.3 Handrails]

Provide handrails on stairways, platforms, bridges, and other points of personnel access for operation and inspection. Provide a handrail around the perimeter of the tank if the top of the exposed side wall is less than 1.07 m 3 feet 6 inches above grade. Construct handrails of structural steel section or of standard 38 mm 1 1/2 inch pipe conforming to ASTM A53/A53M.

[2.6.9.4 Raw Wastewater Recirculation Box]

********************************************************************************
NOTE: Delete this paragraph when raw wastewater recirculation box is considered unnecessary. When wastewater is pumped to the treatment plant, the use of a raw wastewater recirculation box (which recirculates a portion of incoming wastewater back to the pumping station) should be considered to provide uniform flow and avoid surges through the plant. Base decision on undesirability of surge effects on the plant vs. economics of the recirculation system.

SECTION 46 07 53 Page 36
Fabricate a raw wastewater recirculation box from 6 mm 1/4 inch steel plate and have suitable sized connections for incoming raw wastewater line, plant influent line, and recirculation line. Provide box with a fixed weir and an adjustable weir or other suitable means of flow regulation so that a portion of the incoming raw wastewater may be recirculated. Provide a removable or hinged cover. Continuously weld the joints inside walls, bottom, and partitions inside and out. After welding, remove weld spatter and extreme roughness. Inlet cannot be less than 200 mm 8 inch size.

2.6.9.5 Influent Flow Division Box

NOTE: Delete this paragraph when not used. Delete for extended aeration type 0.66 L/s 15,000 GPD and below and for all step aeration type and complete mixing type facilities and extended aeration type when complete mixing type facilities and extended aeration type when eventual conversion to step aeration type is contemplated.

With two or more aeration tanks, provide a plant influent flow division box. Fabricate the box of 6 mm 1/4 inch steel plate and have suitably sized connections for incoming raw wastewater line and influent lines to each aeration tank. Ensure that the box for dividing flow between two tanks has a hinged divider plate that will permit adjustment of from zero to 100 percent to either outlet. Divider plate has locking nut and handle. Ensure that the box has a hinged cover with provisions for padlocking. Provide a continuous weld for all inside walls, bottom, and partitions, inside and out. After welding, remove all weld spatter and extreme roughness. Flow division boxes for more than two tanks are as specified herein, except that method of flow division is as recommended by the manufacturer of the plant.

2.6.9.6 Influent Distribution Channel

NOTE: Delete this paragraph for extended aeration type except when eventual conversion to step aeration type is contemplated.

Use first optional wording in fifth sentence for step aeration type and second optional wording for complete mixing type.

Continuously weld the aeration tank influent distribution channel to the side of the tank wall. Ensure that the bottom of the channel is at the same elevation as the liquid surface of the aeration tank. The inlet to the channel is at one point and not less than 200 mm 8 inches in diameter. Fabricate the channel from steel plate of not less than 6 mm 1/4 inch thickness. Provide the channel with [adjustable weirs or stop gates, not less than three in number, spaced the full length of the channel] [multiple discharge openings] for uniform distribution to the aeration tank. Provide weir or stop gates of stainless steel or aluminum. Ensure that the gates have gaskets on the bottom, with wedges or other means to insure a close fit. Guides for the gates are of the same material as the gates. Ensure
that the channel is of such size as to accommodate the peak flow to the plant.

2.6.9.7 Sludge Division Box

Provide a sludge division box to divide return sludge and waste sludge when this method of sludge transfer is used, as specified in paragraph SLUDGE TRANSFER SYSTEM. Fabricate the box of 6 mm 1/4 inch steel plate and have a suitably sized connection for incoming sludge and outlets for return sludge and waste sludge. Provide the box with a hinged plate or adjustable gate that will permit adjustment of flow from zero to 100 percent to either outlet. Plate or gate to have a locking nut and handle. Provide a weir on each outlet. Ensure that the box is adequately [covered] [baffled] to prevent splashing of the sludge. Continuously weld all joints between walls, bottom, and partitions inside and out. After welding, remove all weld spatter and extreme roughness.

2.6.9.8 Clarifier Effluent Weir and Scum Baffle

Provide weir and scum baffles of stainless steel, ASTM A240/A240M, ASTM A36/A36M, or aluminum ASTM B209M ASTM B209 or ASTM B221M ASTM B221, alloy 6061, temper T6. Provide weirs, of a size and section for structural stability to handle peak flows through the plant. The upstream face of the weir plate is flat and smooth. Ensure that the weir plates and baffle supports permit horizontal and vertical adjustment of the weir and baffle. Mount weir plates to fill any voids between the tank and the weir plate.

2.6.9.9 Mixer for Return Sludge Mixing

**************************************************************************
NOTE: Delete this paragraph and subparagraphs thereto except for complete mixing type.
**************************************************************************

2.6.9.9.1 General

Provide a vertical mixer and include a drive assembly, impeller shaft and impeller, and support. The mixer will continuously mix raw wastewater with return sludge so that the mixture is homogeneous.

2.6.9.9.2 Drive Assembly

Mixer driver assembly includes an electric motor connected to a gear reduction unit whose output shaft is directly connected to the mixer impeller shaft. Motor is constant speed, totally enclosed, fan-cooled horizontal type, suitable for outdoor service, and conforming to NEMA MG 1.

Ensure that the motor is of adequate wattage horsepower to drive the equipment continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Ensure that the motor is suitable for operation with the voltage characteristics indicated. Protect the motor against overload, low voltage, and unbalanced voltage. Power transmission from motor to impeller shaft is by means of a vertical or a right angle gear reduction unit. Ensure that the reduction ratio is such as to produce the proper operating speed for the mixer.

Ensure that the gear reduction unit will withstand any loadings produced by
thrust, out-of-balance, and vibration resulting from operating conditions and operate from zero rpm to a speed compatible with the impeller speed. All components must continuously withstand the full load wattage horsepower. All gears are wrought or alloy steel except that worm gears shall be bronze. The gear teeth may be through-hardened, contour-induction-hardened, nitrided, or carburized. Flame-hardened gears will not be acceptable. Provide a lubrication system for the gears.

Ensure that the housing is of high quality, close-grained cast iron or fabricated steel. Bearings may be lubricated with oil or grease. Base plate or mounting lugs are of steel or integrally cast with the gear reduction unit and furnished with leveling anchor bolts with lock nuts.

2.6.9.10 Anchorage

Materials necessary for anchorage of the plant to the concrete support slab are as recommended by the manufacturer of the facility.

2.7 TESTS, INSPECTIONS, AND VERIFICATIONS

2.7.1 Factory Inspection

**************************************************************************
NOTE: Delete the paragraph when concrete plant only is required.
**************************************************************************

Factory inspection includes soundness of welds and water tightness for tanks fabricated at the factory. Inspect the primary and finish shop painting for pin holes or voids.

2.7.2 Quality Assurance

2.7.2.1 Package Wastewater Treatment Plant Layout Drawings

Show the complete assembly of the plant with all components, equipment, and parts, each with an assigned number corresponding to the plant manufacturer's parts list.

2.7.2.2 Package Wastewater Treatment Plant Component Drawings

Show construction details for each component and piece of equipment, including aeration chamber, clarifier chamber, sludge holding chamber, disinfection chamber, blower assembly, diffuser layout, pump assemblies, [comminutor assembly,] [mechanical aerator assembly,] support slab, [disinfection assembly,] appurtenances, and all piping and wiring.

2.7.2.3 Diffuser Layout Drawings

Show construction details for the diffuser layout including diffusers, diffuser holders and diffuser holder assemblies, blower assembly, and air piping layouts.

[2.7.2.4 Mechanical Aerator Drawings

**************************************************************************
NOTE: Delete the bracketed phrase when step aeration type of complete mixing type is specified or when mechanical aerator is not allowed for

SECTION 46 07 53 Page 39
extended aeration type.

Show manufacturer's suggested geometry in sufficient detail for construction.[ Show construction details for the mechanical aerator assembly, including shroud and draft tube (if used).]

2.7.2.5 Excavation and Backfilling

Include specific instructions for excavation and backfilling as interrelated to plant installation and any special concrete work necessary.

2.7.2.6 Package Wastewater Treatment Plant Performance Test Reports

Submit reports of plant performance evaluation tests by the National Sanitation Foundation (NSF). These tests are performed in conformance with the criteria based on the use of the Standard Performance Evaluation Method of the NSF report. [Base the test on the subdivision flow pattern. ]For all units not tested by NSF, reports of independent performance tests are required on the type of plant submitted for the project. These tests are in accordance with the Standard Performance Evaluation Method based on the subdivision flow pattern as established by the NSF.

2.7.2.7 Chamber Tests

NOTE: Delete paragraph sentence when concrete plant only is required.

Submit a test report stating that all chambers of the prefabricated steel plant have been tested (1) as watertight, (2) welds are sound, (3) the finish is smooth, and (4) are shop painted before shipment to the site.

2.7.2.8 Electrical Control System

Ensure that the electrical control system and its components are wired and tested, including motors and controls in accordance with specification requirements for manual and automatic operation of wastewater treatment plant equipment.

2.7.2.9 Mechanical Aerators

NOTE: Delete paragraph when step aeration type or complete mixing type is specified or when mechanical aerator is not allowed.

Submit certification that the aerator has an oxygenation capacity of 1.36 kg 3.0 lb of oxygen per electrical input watt per hour horsepower per hour, when tested under standard conditions in clear tap water at 20 degrees C 68 degrees F and zero D.O. Certification includes description of test procedure, test data, and calculations of oxygenated capacity. Also furnish data to substantiate that the manufacturer's aerator can achieve mixing and adequate velocities for the geometry of the basin as indicated.
2.7.2.10 Materials Not Labeled or Certified

For materials whose compliance with organizational standards or specifications is not regulated by an organization using their own listings or labels as proof of compliance, submit a certificate stating that the material complies with the applicable referenced standard or specification. This statement is in addition to any proof required.

2.7.3 Source Quality Control

******************************************************************************
NOTE: When two or more 22.0 L/s 0.5 MGD or four or more 11 L/s 0.25 MGD Package Wastewater Treatment Plants are contracted for at one time, select the alternative to witness the factory tests.
******************************************************************************

Conduct all factory tests by the manufacturer of the package Package Wastewater Treatment Plant in the presence of the Contracting Officer.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Protection from Moving Parts

Ensure that all belts, chains, couplings, and other moving parts are completely enclosed by guards to prevent accidental personal injury. Guards are removable or so arranged as to allow access to the equipment for maintenance. If equipment is housed in a lockable enclosure, this is sufficient protection and no additional guards are necessary.

3.2 PREPARATION

All work not absolutely required to be performed in the field is performed in a factory under controlled conditions. Fabricate the treatment facility from not less than 6 mm 1/4-inch steel plate with welded joints and reinforced as necessary with steel angles, tees, or other structural members. Construct the units for transportation, installation, and operation without detrimental buckling, distortion, or other defects. Tanks cannot leak when filled with water or wastewater. Excavation, filling, and backfilling is in accordance with Section 31 00 00 EARTHWORK. Install a reinforced concrete foundation pad, of the size and design recommended by the treatment facility manufacturer, in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.2.1 Corrosion Protection

******************************************************************************
NOTE: Specify corrosion protection for metal plants in contact with soil. If other than steel is specified, specify an appropriate protective coating system for the plant material.

Cathodic protection is only recommended in severely corrosive soils or environments.

Identify site specific atmospheric conditions that would produce a corrosive environment for plant

SECTION 46 07 53 Page 41
materials so that the proper protective coatings or corrosion resistant materials can be provided.

For [below ground] [partially above and partially below ground] [above ground] metal plants, provide corrosion protection. Provide an exterior [75 mil polyurethane coating] [_____] [_____] mil coating and cathodic protection that protects the plant from the in situ soil conditions.

3.2.2 Electrical Work

Electrical work is in accordance with the applicable requirements of Section [33 71 01 OVERHEAD TRANSMISSION AND DISTRIBUTION] [33 71 01.00 40 OVERHEAD TRANSMISSION AND DISTRIBUTION] [33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION].

3.3 INSTALLATION

Install the treatment facility and equipment in compliance with the manufacturer's written instructions. Submit drawings containing complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show on the Drawings the proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

3.3.1 Sequence of Operations

Sequence of operations follows the recommendations of the facility manufacturer. Installation of facility cannot begin until the concrete support slab has achieved not less than fifty percent of its maximum strength. Modify backfilling operations as recommended by the instructions of the plant manufacturer. Complete, inspect and receive approval for all welding, corrosion protection, alignment, water tightness testing, painting, and anchoring before any backfilling is done.

3.3.2 Matchmarking

Ensure that all parts and components of the plant are clearly match marked, corresponding to assembly drawings furnished by the manufacturer of the facility.

3.3.3 Piping and Valve Installation

Install piping in a neat manner with all joints tight and with no undue marring of finishes. Ensure that installed piping, valves, and fittings are free from strain and excessive stresses caused by weight or misalignment.

[3.3.4 Clarifier Floor

**************************************************************************
NOTE: Delete requirements for signal transmission to the chlorinator when not used.
**************************************************************************

When a rotating sludge collector is used, work is as hereinbefore specified through placing of tank floor except for sludge cone, which shall be in accordance with recommendations of the facility manufacturer. The tank
floor is then given a screed finish, after which the floor is roughened by scoring with a rake or similar tool. Following installation of the rotating sludge collector mechanism, bring the tank floor to finish grade by means of a cement-mortar grout surfacing swept into place by use of the sludge collector arms, as hereinafter specified. When the collector mechanism has been erected and inspected by the engineer representative of the manufacturer and the arms and blades have been adjusted to give the required clearance above final floor grade, fasten a 50 by 150 mm 2 by 6 inch wooden straight-edge with metal-clad edge to each sweeping arm approximately 6 mm 1/4 inch below the sweeping blades to provide a suitable squeegee.

Cement-mortar grout is composed of one part cement, three parts sand, with sufficient water as required for conditions of placement, and with one teaspoon of powdered aluminum added per bag of cement. Before the cement-mortar grout is placed, thoroughly clean the floor of dirt, soil, or other substances that would prevent the proper bonding of the surfacing to the concrete subfloor. Bring the grout surfacing to finish grade as nearly as possible by hand. Rotate the collector arms with straightedges attached manually to complete the operation. Use of the drive unit for sweeping in the grout surfacing will not be permitted. Make provision to prevent grout from entering the sludge cone; remove immediately any grout which falls in the sludge cone or on the tank walls.

3.3.5 Utilities Service Connections

3.3.5.1 Water Service

**************************************************************************
NOTE: Specify in the appropriate section of project specification the nearest point of connection to the facility, and also type of connection available.

Delete reference to "frost-proof" for facilities in areas where freezing temperatures are not encountered.

Delete reference either to chlorinator or to hypochlorinator.

Delete reference either to chlorinator or to hypochlorinator.
**************************************************************************

The water line is a 25 mm one inch copper water line extending from a point not less than 1.52 m 5 feet from the treatment facility to the [hypochlorinator housing] [chlorinator]. Provide a 25 mm one inch valve in a [frost-proof] valve box below grade. Provide a 19 mm 3/4 inch hose bibb in the [hypochlorinator] [chlorinator] housing.

3.3.5.2 Electrical Service

Provide electric service from a point not less than 1.52 m 5 feet from the treatment plant to the electrical control system enclosure.

3.4 FIELD QUALITY CONTROL

Conduct field inspections and witness field tests specified in this specification. Perform field tests and provide all labor, equipment and
materials required for testing, except that the Government will provide water, fuel, and electric power required for field test, when available. Correct all defective equipment, materials, or workmanship disclosed as a result of the tests given herein at no cost to the Government.

3.4.1 Tests

Before allowing any liquid to discharge into the tanks, ensure that all tanks, chambers, channels, launders, piping and pieces of equipment are clean and free of any debris such as pieces of wood, concrete or leaves. Test all mechanical and electrical units as specified herein. Remedy any defects that occur before or during the tests, make changes or replacement equipment as necessary and retest.

3.4.1.1 Coating Testing

Examine coatings for flaws and test for thickness and holidays. Measure thickness of coatings by a commercial film thickness gauge. Test coatings for pinholes, holidays, and other defects with an electric flaw detector equipped with an audible signal that operates when a pinhole is detected. The detector is a 90-volt wet sponge pinhole detector.

3.4.1.2 Comminutor Tests

**************************************************************************
NOTE: Delete the paragraph when comminutor is not required for facility.
**************************************************************************
Operate the comminutor with liquid flowing through the comminutor. After two hours of operation, check for overheating, noise, vibration, and speed of the motor and comminutor. Check the automatic reversing of the comminutor when an object is lodged in the cutting stream.

3.4.1.3 Mechanical Aerator Tests

**************************************************************************
NOTE: Delete paragraph when step aeration type or complete mixing type is specified or when mechanical aerator is not allowed for extended aeration type.
**************************************************************************
Test the mechanical aerator(s) as soon as practicable after installation, and the aeration tank is ready for use. Operate the aerator under the varying submergence conditions specified in the factory test. During these tests, operate the unit(s) without overheating or excessive vibration and ensure satisfactory operation. Conduct the field tests under the supervision of the facility manufacturer. Supply labor and materials necessary to properly perform the tests. During the tests, take operating data at regular intervals and incorporate in a report. Base data readings on facility meters, gages, and instruments, and include the following: motor amperes, motor kilowatts, bearing temperatures, and lubricating oil pressures and temperatures.

3.4.1.4 Blower-Driven Assembly Operation Tests

Test the blower-driven assembly as soon as practicable after installation. Operate the blower under varying capacities and discharge pressures covering the range of conditions specified. During these tests, ensure
that the units operate without overheating or excessive vibration. Conduct the initial operation of the blower driver and the field tests under the supervision of the facility manufacturer. Supply such labor and materials as may be necessary to properly perform the tests. During the tests, take operating data at regular intervals and incorporate in a report. Base the data readings on facility meters, gages and instruments, and include the following:

a. Air volume

b. Air inlet and discharge pressure and temperature

c. Motor amperes

d. Motor kilowatts

e. Bearing temperatures

f. Stator temperatures

g. Lubricating oil pressures and temperatures

h. Lubricating oil cooling water temperatures

3.4.1.5  Diffusers

Conduct performance capacity and mixing tests on the diffusers in the field according to the manufacturer's instructions.

3.4.1.6  Hypochlorinator Tests

**************************************************************************
NOTE: Delete this paragraph when hypochlorinator is not required.
**************************************************************************

Inspect and adjust the pulley and belt drive for the average flow of feed solution desired. Test the capacity of the feeder for a period of not less than 2 hours nor more than 6 hours. Make the following tests:

a. Check the unit for leaks.

b. Determine the amount of chemical solution used during the test run to ascertain if the unit is functioning within the prescribed limits of the feed rate indication plus 15 percent.

c. Ensure the unit shuts off automatically when the liquid elevation in the chlorine contact tank drops below the contact sensing probes and start when the water rises. The unit starts and stops 10 times out of 10 consecutive starts.

3.4.1.7  Chlorinator Tests

**************************************************************************
NOTE: Delete this paragraph when chlorinator is not required.
**************************************************************************

Operate the unit for a period of not less than 2 hours nor more than 6
hours. Perform the following tests:

a. Check the unit for leaks by using an aqueous ammonia solution on a cotton or cloth swab on a wooden stick held close to all connections of the chlorinator.

b. Determine the amount of chlorine used during the test run to ascertain if the unit is functioning within the prescribed limits of 4 percent of the set feed rate.

c. Stop the chlorinator when the water supply is interrupted or shut off.

d. When the gas supply is exhausted or shut off, there is no back-flow of water into the unit.

3.4.1.8 Air Lift Pump

Test the air lift pump for discharge capacity in liters per second gallons per minute of clean water. Base this on percentage of submergence of the eductor pipe to the total height of the eductor pipe. Test and adjust the air throttling valve to provide the desired discharge rate. Test all joints in the airline for leaks at 689.4 kPa 100 psi pressure.

3.4.1.9 Electrical Control System Tests

The plant manufacturer's representative inspects the installation of the electrical control system with the Contracting Officer and checks circuits and connections to all motors and electrical controls. The manufacturer's representative, upon satisfactory operation of all circuits and controls to the Contracting Officer, submits [three] [_____] copies of a letter certifying that the wiring is complete and in accordance with the intent of the specifications for both manual and automatic operation and proper functioning of the Package Wastewater Treatment Plant.

3.4.2 Inspection

3.4.2.1 Alignment and Leveling

Make inspections to assure that the facility is level within tolerances recommended by the facility manufacturer. Check all facility components and equipment to ensure that they are properly aligned and level.

3.5 SYSTEM STARTUP

A manufacturer's representative will be present at facility start-up. Follow the manufacturer's manual on operation and maintenance step by step, so that as each piece of equipment is put into operation, the manufacturer's representative will explain in detail its function. Once the facility is filled with water or wastewater the follow the furnished flow diagram and check out the on-site inspection.

Adjust equipment as required. Examine the plant to determine if it is structurally sound. Report and correct all defects, submit findings.

3.6 ADJUSTING AND CLEANING

3.6.1 Coating Repair

If welding is required after application of the coating or if the coating
is damaged in any way, repair consists of preparing the affected area in compliance with manufacturer's recommendations and reapplying the coating to that area. If holidays are detected or film thickness is insufficient, prepare the surface and apply additional coats in the affected area in compliance with the manufacturer's instructions.

3.6.2 Adjustments

For items of equipment involving V-belt drives, adjustment of sheave alignment and belt tension is carried out in accordance with product manufacturer's instructions.

3.7 CLOSEOUT ACTIVITIES

3.7.1 Operation and Maintenance Manuals

Post framed instructions containing wiring and control diagrams under glass or in laminated plastic where directed. The instructions show wiring and control diagrams and complete layout of the entire system. The instructions include, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. Post the framed instructions before acceptance testing of the system.

Submit [_____] copies of operation and maintenance manuals for the treatment facility equipment furnished. [One][_____] complete set prior to performance testing and the remainder upon acceptance. Operation manuals detail the step-by-step procedures required for system startup, operation, and shutdown. Operation manuals include the manufacturer's name, model number, parts list, and brief description of all equipment and their basic operating features. Maintenance manuals list routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Maintenance manuals include piping and equipment layout and simplified wiring and control diagrams of the system as installed.

Submit Package Wastewater Treatment Plant Operation and Maintenance Data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

3.7.2 Demonstration

As soon as practicable after completion, perform an operating test of the treatment facility and all equipment to demonstrate that the facility functions properly. After completion of all tests, adjust the facility for proper operation while on-line with the wastewater source in accordance with the manufacturer's written instructions. For the final acceptance, the facility must perform as specified, submit Package Wastewater Treatment Plant acceptance test results.

NOTE: This guide specification covers the requirements for packaged composting toilets that can be used for human waste treatment at remote sites where a power source (AC or DC) is provided but water is not.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN WOOD PROTECTION ASSOCIATION (AWPA)

ASM INTERNATIONAL (ASM)

ASM 06118G (1993) ASM Metals Reference Book (3rd Ed)

ASTM INTERNATIONAL (ASTM)

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Installation; G[, [_____]]

SECTION 46 07 53.19 Page 5
1.3 DELIVERY, STORAGE, AND HANDLING

Protect from the weather, humidity and temperature variations, dirt, dust, and other contaminants equipment delivered and placed in storage.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide the large, continuous composting type composting toilet. Add wastes at the top of the pile so that the composting material will eventually flow by gravity to the finished compost area as the underlying finished compost is removed. The composting toilet shall include the composting chamber, ventilation fan and vent stack, stool with chute, and urinal with piping. These elements and necessary related appurtenances and pieces shall be supplied by a single composting toilet manufacturer.

Submit detail drawings of equipment and material to be provided. Detail drawings containing complete wiring and schematic diagrams and other details required to demonstrate that the system is coordinated and will function properly as a unit.

2.1.1 Design

The composting chamber shall hold a minimum of [_____] cubic meter feet of composting material. The composting chamber shall receive wastes from [_____] stools, and from [_____] urinals. Design the vents, air ducts, and air inlets to the composting chamber so that air can flow from the user compartment into the composting chamber but not in the reverse direction, and so that no air can reach the vent without first passing through the composting material. The toilet shall be designed so that all liquid entering the composting chamber will drain over and through the composting pile, and not along the chamber walls. The toilet shall collect all excess liquid to an easily accessible liquid holding area. The toilet shall [contain a pump for removing excess liquid] [be equipped with a drainage port in the bottom of the liquid holding area that can be connected to a
liquid disposal system. Depending on liquid volume, expected usage, and if a pump is used, the pump shall be a permanently installed [automatic] [manual] variety with automatic control. The toilet shall be designed and constructed so that liquids can enter the composting chamber only through the waste ports. Materials and joints in the toilet shall be impermeable to liquids and not subject to biological, chemical, or physical corrosion. Wood shall be preserved in accordance with AWPA P5.

2.1.2 Performance

The composting toilet shall produce an inert, odor-free compost with a moisture content less than 60 percent. The finished compost shall not produce enough gas to inflate a plastic bag which is 80 percent full of compost after being sealed in the bag for 24 hours at an ambient temperature. The toilet shall prevent the entry of insects in the user compartment and surrounding area through the use of noncorrosive screens over all air and ventilation inlets. Assure that the composting toilet is installed properly and demonstrate that it will operate properly.

2.2 JOINT SEALANTS

Joint sealants shall be resistant to water and biological decomposition in conformance with CID A-A-272.

2.3 LUMBER

Lumber used for the tank support shall be pressure-treated or preserved sanded, two sided (S2S) construction-grade pine or fir without excess crown. The lumber shall be treated for preservation in accordance with AWPA P5.

2.4 DRAIN PIPE

The drain pipe from the urinal to the composting tank shall be at least 32 mm 1-1/4 inches inside diameter (ID) and sloped continuously toward the tank. The pipe shall be made of a corrosion-resistant material. The pipe outlet to the composting tank shall be located such that the urine flows onto or close to the center of the compost pile, to ensure that the urine flows through the pile and does not short-circuit down the tank walls.

2.5 STOOL, CHUTE, SEAT, AND LID

The toilet stool shall be constructed in two pieces, an exterior piece that shall be permanently connected to the floor of the user compartment and an interior piece that is mounted inside the exterior piece and conveys wastes into the toilet chute. The interior piece shall be constructed of high-density polyethylene, fiberglass, or stainless steel (Type 304). The exterior piece shall be constructed of [high-density polyethylene] [fiberglass] [oak] [stainless steel]. The top of the installed toilet stool shall be a minimum of 360 to a maximum of 460 mm 14 to a maximum of 18 inches above the user compartment floor. The minimum diameter of the interior piece opening into the chute shall be 300 mm 12 inches. The toilet chute shall be fabricated from stainless steel (0.4775 to 0.6350 mm 24 to 26 gauge), high-density polyethylene, or fiberglass, and may be fabricated in one piece or in several pieces that are assembled in the field. The chute shall be attached to the composting toilet with a chute/tank connector fabricated from the same material as the chute. The seat and lid shall be fabricated from high-density polyethylene, ABS plastic, hardwood, or stainless steel. The toilet, chute, chute/tank
connector, seat, and lid shall be provided by the composting toilet manufacturer and shall be certified by the manufacturer to be compatible with the manufacturer's composting toilet.

2.6 COMPOSTING VENTILATION SYSTEM

Install a ventilation system to draw air through the composting tank to provide a continuous supply of oxygen to the compost pile, ensuring that aerobic decomposition and dehydration occur. The ventilation system shall also draw off odors or gases generated by the pile. Provide a system with the following components:

2.6.1 Electrically Powered Exhaust Fan

An electrically powered exhaust fan, installed and sized to provide a minimum flow of 0.042 to 0.057 cubic meters/second 90 to 120 cfm of air. The fan shall be as high as possible in the building, but easily accessible for maintenance or replacement. The fan shall not be closer than 760 mm 30 inches to the roof and a maximum of 1.8 m 6 feet from a power disconnect.

If ac power is not available, a 12 volt direct current (dc) fan may be substituted and powered by a solar power generating system. Solar power generating array shall be roof mounted and consist of amorphous photovoltaic thin-film modules with a minimum power output required to operate the fan and recharge the battery at one sun. Array nominal voltage rating shall be 12 volts dc. Storage battery shall consist of sealed, liquid, lead-acid, deep-cycle batteries with absolute style plate technology. This configuration permits the fan to operate at night, and during overcast conditions. The battery storage area shall be secured and ventilated to prevent the buildup of explosive gases. The battery capacity shall provide a minimum of 18 hours continuous operation without recharging. Submit calculations which prove that the photovoltaic thin-film modules and batteries will provide power for the required period.

2.6.2 Interior Vent Pipe

At least 150 mm 6 inches in diameter, extending from the composting tank to support box just under the exterior roof. If elbows are used, they shall have minimal bend and frequency of occurrence. Vent pipe shall be made of a corrosion-resistant material. Pipes shall be installed with the bell down to prevent the entry of water. Joints shall be taped using duct tape.

2.6.3 Exterior Pipe

An exterior pipe extending from the support box to the rain cap. The pipe shall be surrounded with insulation (fiberglass or equivalent R-1.23 (7) R-7 ). The exterior pipe shall extend at least 600 mm 2 feet above the peak or highest point of the roof. Pipes shall be installed with the bell down to prevent the entry of water. Elbows greater than 45 degrees shall not be used. Elbows shall be made of, or coated with, a corrosion-resistant material.

2.6.4 Vent Pipe Roof Sleeves

Made of, or coated with, a corrosion-resistant material.

2.6.5 Slip Joint

A slip joint installed above the fan for the easy removal of the fan. The sleeve of the slip joint shall be long enough to slide down and close the
gap left by the fan when the fan is removed.

2.6.6 Support Box

A support box installed under the roof to connect the interior and exterior vent pipes. The support box shall be made of, or coated with, a corrosion-resistant material.

2.6.7 Roof Jack and Rain Collar

These components must be made of, or coated with, a corrosion-resistant material.

2.6.8 Rain Cap

Mounted on the top of the exterior vent pipe. The rain cap must be made of, or coated with, a corrosion-resistant material.

2.6.9 Braces

Braces installed on the exterior vent pipe if winds greater than 80 km/hour or snow load greater than 900 mm 3 feet can be expected, or if the exterior pipe extends more than 1.2 m 4 feet above the peak of the roof.

2.7 URINALS

One trough urinal shall be installed for each composting unit. This trough shall be made of stainless steel or corrosion-resistant material. The trough shall be at least 660 mm 26 inches long and 200 mm 8 inches deep; the back shall extend at least 890 mm 35 inches above the bottom of the trough to protect the wall in back of the urinal. The urinal shall be mounted at a height of approximately 400 mm 16 inches.

2.8 COMPOST BAFFLES

There shall be two baffles, front and back, to form a compartment to contain the compost pile. The front baffle shall be attached securely; however, sealing is not required.

2.9 LIQUID BAFFLE, DRAIN PORTS, AND SCREENS

A liquid baffle with a screen shall be installed at the front of the compost tank to retain the compost, and permit the passage of water seeping from the compost pile. The screen openings shall be at least 6 mm 1/4 inch to minimize plugging. The screen shall be easily accessible so that it can be checked for plugging and can be cleaned. A drain port shall be provided in front of the liquid baffle to drain any seepage to a wastewater collection or treatment system. The drain port shall be as low as possible in front of the liquid baffle so that no water stands in the bottom of the tank. An overflow drain shall be provided to permit the drainage of water should the drain plug become clogged. The overflow port shall be just below the level of the top of the liquid baffle. The drain line shall be at least 32 mm 1-1/4 inches ID.

2.10 LIQUID DRAIN FITTINGS

Fittings shall be made of corrosion-resistant or impervious material such as polyvinyl chloride, polyethylene, or stainless steel.
2.11 AIR DUCTS

At least 2 air ducts shall be provided to carry air beneath the compost pile. The air ducts shall be constructed of a material impervious to corrosion and to biological decomposition.

2.12 AIR INTAKES

Air intakes shall be provided at the front of the compost tank. Intakes shall be at least 5800 square mm 9 square inches in cross section.

2.13 SIGNS

Signs shall be affixed to the major components of the composting toilet that identify those components. The names on the signs shall be consistent with the identifying names in the operating instructions. Other signs shall be placed securely in the user compartment telling users that trash, cigarettes and matches thrown into the toilet can interfere with the composting process or set the compost pile on fire.

2.14 FIRE EXTINGUISHER

If fire extinguishers are used, they shall be of a type that will not interfere with the composting process (ammonium phosphate type is acceptable).

2.15 COMPOST RAKE

A conventionally sized (approximately 1.5 m 5 foot long handle, 300 mm 12 inch side-toothed end), commercially available garden rake or cultivator (approximately 1.5 m 5 foot long handle, 150 mm 6 inch tined head) shall be supplied for raking the compost pile.

2.16 COMPOST HOLDING TANK

2.16.1 Design

The tank that shall receive and hold the human wastes during composting (the compost holding tank) shall be designed so that wastes enter from the top of the tank, and the composting material and excess liquid are removed from the bottom of the composting pile. The tank may be supplied in one, two, or three pieces; tanks supplied in more than one piece shall be bolted together in place. The tank shall be constructed of [plastic] [layered polyester fiberglass] [stainless steel] or an equivalent material that is impermeable to water and is corrosion-resistant. The inner surfaces of the tank shall be constructed of material that is not susceptible to chemical or biological decomposition and is impervious to the absorption of waste and chemical derivatives. The tank bottom shall slope towards the compost removal and liquid removal areas of the tank. The tank walls and floor shall be designed to resist forces equal to or greater than the hydrostatic forces that would occur if the tank were filled with water with a maximum deflection in the walls or floor of 13 mm 1/2 inch. The tank roof shall resist a 445 N 100 pound load, with a maximum deflection of 13 mm 1/2 inch. The tank shall be equipped with a door that provides access to the bottom of the composting pile and an inspection door opening into the area above the composting pile as specified. The composting tank selected for installation shall be subject to the approval of the Contracting Officer, and shall be based on the detail drawings.
2.16.2 Polyethylene Tank

**************************************************************************
NOTE: When a polyethylene tank is specified, delete paragraphs "Fiberglass Tank" and "Stainless Steel Tank".
**************************************************************************

2.16.2.1 Alternative Standards I

ASTM D1248, Type 1, Class M, Grade 2, Category 3, with the following additional requirements:

a. The resin shall contain [stabilizers] [pigmentation] to resist ultraviolet degradation (for occasional exposure).

b. The [uncolored] [unfilled] resin density range shall be 0.938 to 0.942 grams per mL.

  0.938 to 0.942 grams per mL.

  0.938 to 0.942 grams per mL.

c. The resin shall have a maximum melt index of 5.

2.16.2.2 Alternative Standards II

Alternatively, the following standards apply.

a. Unless otherwise indicated, the plastics technology used shall be in accordance with the definitions given in ASTM D883.

b. The molding resin shall not contain any fillers. All plastics shall contain a minimum of 0.25 percent ultraviolet stabilizer and a maximum of 0.50 percent. Pigments may be added but shall not exceed 1.0 percent of the weight of the molded compost shell.

c. The minimum mechanical properties of the materials are as follows based on molded parts:

<table>
<thead>
<tr>
<th>Property</th>
<th>ASTM</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Density</td>
<td>ASTM D1505</td>
<td>0.935 - 0.940 gm/cc59 lb/cu ft</td>

</tr>
</tbody>
</table>

  690.5-758.4 MN/square meter100,000-110,000 psi.

d. The finished surface of the molded part shall be as free as possible through commercial processing from visual defects such as foreign inclusions, air bubbles, pinholes, and craters. Cut edges shall be trimmed and smooth.
e. Composting tank shells shall be molded to a nominal 10 mm 3/8 inch thickness. Physical dimensions shall be taken externally and shall fall within plus or minus 1 percent of the required dimensions.

2.16.3 Fiberglass Tank

******************************************************************************
NOTE: When a fiberglass tank is specified, delete paragraphs "Polyethylene Tank" and paragraph "Stainless Steel Tank."
******************************************************************************

Fiberglass construction shall follow appropriate industrial standards. The gel coating must be a minimum of 2 mm 1/16 inch thick, impervious to corrosion and microbial degradation. The next layers are 12 to 25 mm 0.5 to 1.0 inch of high-density polyurethane insulation. Saturate the mats with isothalic resin.

2.16.4 Stainless Steel Tank

******************************************************************************
NOTE: When a stainless steel tank is specified, delete paragraphs "Polyethylene Tank" and paragraph "Fiberglass Tank." In general, stainless steel is not recommended due to its corrosivity.
******************************************************************************

Stainless steel tank shall be constructed in accordance with ASM 06118G.

2.17 COMPOST ACCESS DOOR

******************************************************************************
NOTE: Metal hinges are permissible, but it is recommended that an appropriate plastic hinge be substituted because plastic is corrosion-resistant.
******************************************************************************

2.17.1 Design and Construction

The compost holding tank shall be equipped with a door mounted above the finished compost holding area to remove compost and to detect and remove excess liquid. The minimum door opening shall be 0.339 square meters 525 square inches. The door shall be constructed of material that is impermeable to water, corrosion-resistant, and not susceptible to attack by composting organisms. The door shall support a minimum of 1.33 kN 300 pounds with a maximum deflection of 13 mm 1/2 inch. The door opening shall be positioned such that personnel can see all of the finished compost and liquid storage excess liquid without requiring their heads or torsos to enter the composting tank. The door shall be attached to the compost holding tank with stainless steel hinges meeting the standards of ANSI/BHMA A156.1, or a full-length stainless steel piano hinge, or with plastic hinges. The door shall stay in any open position, when required, without braces or other external support or restraint. Normally, the door shall remain closed, and shall be equipped with a stainless steel latch that is easily operated by personnel but that prevents animals from entering the composting chamber.
2.17.2 Surrounding Area

The area around the compost access door shall be designed so that maintenance personnel can remove compost while in a standing position. A dry, stable work platform shall be provided with adequate area for personnel movement and placement of the buckets or bags receiving the removed compost or liquids. Stairs or ramps to the compost removal area shall be designed to allow easy access to the area and safe transportation of compost and liquid containers from the area.

2.18 INSPECTION DOOR

**************************************************************************
NOTE: Metal hinges are permissible, but it is recommended that an appropriate plastic hinge be substituted because plastic is corrosion-resistant.
**************************************************************************

2.18.1 Design and Construction

The compost holding tank shall be equipped with a door near the top of the tank which shall be used to remove debris, to rake the top of the compost pile, to observe the pile surface, to add water, and to perform other necessary operation and maintenance activities on the pile surface. The minimum door opening shall be 0.186 square meters 288 square inches. The door opening shall be constructed of material that is impermeable to water, corrosion-resistant, and not susceptible to attack by composting organisms. The door opening shall be positioned so that personnel can see all of the pile surface from outside the tank and can reach all of the pile surface without requiring their head or torsos to enter the composting tank. The door shall be attached to the compost holding tank with aluminum or stainless steel piano hinge, or with plastic hinges. The door shall be designed to stay in an open position when required, without braces or other external support or restraint. Normally, the door shall remain closed, and shall be equipped with a stainless steel latch that is easily operated by personnel but that prevents animals from entering the composting chamber.

2.18.2 Maintenance Provisions

The area in front of the inspection door shall be designed so that maintenance personnel shall have a stable, level platform to stand upon while inspecting the top of the compost pile. The platform surface shall be constructed at an elevation that shall put the center of the inspection door at eye level of maintenance personnel using the platform. An area in front of the inspection door shall be kept clear of obstructions that would interfere with inserting a 1.8 m 6 foot long rake through the inspection door.

2.19 SOURCE QUALITY CONTROL

2.19.1 Molded Unit Inspection

Each molded unit shall be visually inspected to ensure that it is as free as possible from defects. In addition, test samples shall be taken from a "cut-away" section of the compost tank shell and the following tests performed:
2.19.1.1 Impact Test

ASTM D746 shall be used for this test. Sample shall not shatter at 162.7 J (120 foot pounds) 120 foot pounds at minus 29 degrees C minus 20 degrees F (minimum).

2.19.1.2 Degree of Cross-Linking Test

Using ASTM D2765, a minimum gel of 70 percent must be reported on the inside half of the sample.

2.19.2 Factory Testing

Submit factory test results attesting to manufacturing quality control of the proposed system, at least [_____] days before the Contracting Officer approves or disapproves the composting toilet proposed for installation. Document [_____] installations of composting toilets, essentially identical to the composting toilet installed under this specification, and that those installations have at least [_____] consecutive years of operating experience. Include available operating data for each of the [_____] installations, along with the names, addresses, and telephone numbers of personnel at the [_____] installations that will furnish information upon request regarding questions of interest to the Contracting Officer.

PART 3 EXECUTION

3.1 INSTALLATION

Submit drawings showing proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work, including clearances for maintenance and operation. Install toilet in accordance with the manufacturer's installation instructions and in accordance with the approved submittals. The toilet shall be installed using craftsmen and laborers with demonstrable experience and, where appropriate, certification or license in the required skills. Ensure that composting toilet is in working order.

3.2 CLEANING

The installed composting toilet, enclosure, and appurtenances shall be thoroughly cleaned.

3.3 FRAMED INSTRUCTIONS

Framed operating instructions, under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, shall be posted where directed. Condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal, safe operation, and procedures for starting and maintaining the system safely shall be prepared in typed form, framed as specified for the wiring and control instructions and posted beside the diagrams. Submit proposed diagrams, instructions and other sheets for framed instructions.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Spare Parts

Submit spare parts data, including a complete list of parts and supplies,
with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [1][ and ][3] years of service, after approval of the detail drawing and not later than [____] months prior to the date of beneficial occupancy.

3.4.2 Operation and Maintenance Manuals

Submit operation manual outlining step-by-step procedures required for system operation. Include with the instructions the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Maintenance manual listing routine maintenance procedures, possible breakdowns and repairs. Include with the manual diagrams for the system as installed.

3.4.3 Training Course

Conduct a training course for the operating staff as designated by the Contracting Officer. The training period shall consist of a total of [____] hours of normal working time, and shall start after the system is functionally completed but prior to final acceptance tests. The field instructions shall cover all of the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations. Notify the Contracting Officer at least 14 days in advance of proposed beginning of the training course.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Extra Materials

Furnish a complete set of manufacturer's recommended spare parts, including cutting teeth and combs or other cutting elements, fasteners, screens, seals or bearings, etc. Furnish special tools for the proper operation and maintenance of equipment, installed in a wall-mounted hardwood or metal container.

Submit spare parts data for each different item of material and equipment specified, after approval of the detail drawings, and not later than [_____] months prior to the date of beneficial occupancy. Include in the data package a complete list of parts and supplies, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [1] [and ][3] year(s) of service.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

a. Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products, that conform to the respective publications and other requirements specified and that essentially duplicate equipment that has been in satisfactory use at least 2 years prior to bid opening. Ensure all equipment is
supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

b. To each major item of equipment, securely attach a plate to the item that includes the manufacturer's name, address, and catalog or model number. In lieu of adding a nameplate on the shredder and bar screen, integrally cast the adding a manufacturer's name or trademark onto the shredder, or stamp, or otherwise permanently mark the shredder.

c. Fully enclose moving parts of the equipment, such as drive chains and sprockets, in removable guards. Fully enclose equipment above the level of the sewage-carrying channel in a cast iron or 1.897 mm (14 gauge) sheet steel or wrought-iron housing. Ensure housing is provided with a sufficient number of doors or removable panels to ensure ready access to any part of equipment for repairs, replacements, or cleaning. The joint between the housing and the concrete foundation is required to be leakproof.

d. Submit detail drawings consisting of a complete list of equipment and materials, including manufacturer's descriptive and technical literature, catalog cuts, and installation instructions. Ensure detail drawings contain complete wiring and schematic diagrams, equipment layout and anchorage, and any other details required to demonstrate that the system has been coordinated and is fully functional as a unit.

2.1.1 Bearings

ABMA 9 and ABMA 11.

2.1.2 Iron, Steel, and Miscellaneous Metal

2.1.2.1 Miscellaneous Metal

Provide bolts, nuts, anchors, washers, and other types of supports necessary for the installation of equipment made of steel or wrought iron, galvanized according to the requirements of ASTM A153/A153M.

2.1.2.2 Malleable Iron

ASTM A47/A47M, grade No. 32510, minimum.

2.1.2.3 Structural Steel

ASTM A36/A36M.

2.1.3 Motors, Electric

NEMA 250, NEMA ICS 1, NEMA ICS 3, NEMA ICS 4, NEMA ICS 6 and NEMA MG 1.

2.1.4 Motor Controls

NEMA ICS 2.

2.1.5 Switches, Enclosed

UL 98.
2.2 COMPONENTS

2.2.1 Electrical Work

Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Electrical work must comply with NFPA 70, latest edition. Supply with electrical characteristics as indicated. Provide automatic control and protective or signal devices required for the operation specified, and any control wiring required for controls and devices but not shown on electrical plans, under this section of the specification.

2.2.1.1 Electric Motors

Provide equipment complete with motors of the [open] [totally enclosed] ball-bearing squirrel-cage induction type, with a maximum speed not to exceed 1800 rpm. Provide motors of sufficient capacity to drive equipment at the specified capacity without exceeding rating shown on nameplate attached to the motor.

2.2.1.2 Motor Controls

**************************************************************************
NOTE: For complex automatic controls, the Designer is to review UFGC Section 40 60 00 PROCESS CONTROL and reference it in this paragraph if required.
**************************************************************************

Provide motor controls required to control the motor in the manner indicated or specified with the associated motor and ensure they contain properly sized thermal-overload protective elements. Except where otherwise indicated, provide starters in [general-purpose] [weatherproof] enclosures. Where manual control is specified, provide starter with a start-stop pushbutton in the cover. Where automatic control is specified, provide starter with a hand-off-automatic selector switch in the cover. Provide each starter with an appropriate nameplate or stencil identifying the equipment controlled. [Provide controls in accordance with Section 40 60 00 PROCESS CONTROL.]

2.2.2 Hydraulic Work

Provide hydraulic equipment and application in accordance with [Section 41 24 26 HYDRAULIC POWER SYSTEMS] [and] [Section 35 05 40.14 10 HYDRAULIC POWER SYSTEMS FOR CIVIL WORKS STRUCTURES]. Provide manual or automatic control and protective or signal devices required for the operation specified, and any control wiring or hydraulic connections required for controls and devices but not shown on electrical or hydraulic plans, under this section of the specification.

2.2.2.1 Fluid Motors

Provide equipment complete with fluid motors of the [vane] [piston] type. Ensure motors are of sufficient capacity to drive equipment at the specified rating without exceeding rating shown on the nameplate attached to the motor.

2.2.2.2 Hydraulic Controls

Provide controls in the manner indicated or specified, coordinated with the...
associated equipment, and having properly sized overload protective elements.

2.2.2.3 Fluid Power Valves

SAE J1677.

2.2.2.4 Fluid Tubing

SAE J1677.

2.2.2.5 Hydraulic Fluid

Provide hydraulic fluid in accordance with Section 41 24 26 HYDRAULIC POWER SYSTEMS.

2.3 MANUFACTURED UNITS

2.3.1 Mechanically-Cleaned Bar Screen

A bar screen consists of a stationary bar screen, a screen rake, a rake mechanism operated by [an electric] [a hydraulic] drive unit, and a dead plate and rake-cleaning device, where required. Install equipment so as not to obstruct the flow of sewage to bar screen. Unless otherwise specified, ensure all metal that is submerged in the sewage-carrying channel or that comes in contact with sewage consists of wrought iron, steel, cast iron, or other equally corrosion-resistant metal.

2.3.1.1 Bar Screen

Ensure each bar screen is suitable for installation in a rectangular channel [_____] m [_____]-feet [_____]-inches wide by [_____] m [_____]-feet [_____]-inches deep, and is designed for handling sewage flows as follows:

a. Minimum, [_____] cubic meters/day MGD.

b. Average, [_____] cubic meters/day MGD.

c. Maximum, [_____] cubic meters/day MGD.

2.3.1.2 Screen Rake

Ensure rake is designed to rake up screenings collected on the bar screen and in the openings between bars, and to convey screenings to a [drain platform] [collection trough] [grinder]. Provide rake made of cast iron, steel, or other suitable material not less than [_____] mm inch thick. Space rake teeth to pass between bars of the screen. Ensure rake teeth plate is easily removable and replaceable.

2.3.1.2.1 Rake Mechanism

Provide a revolving-frame, automatic-hoist, endless-chain type mechanism, or screw-drive type mechanism that includes parts and accessories necessary for a complete operating unit. Ensure parts for the mechanism are amply proportioned for stresses that may occur during fabrication, erection, and operation. Provide interchangeable individual parts that are alike in each. Provide shearing pins or an overload-release mechanism for overload protection. Ensure rake speed ranges from [_____] to [_____] m/second feet per minute. Provide rake mechanism with a complete and adequate system of
lubrication to moving parts subject to wear. Provide grease- or oil-lubricated bearings except submerged bearings which are required to be fabricated from alloy-bearing metal designed to operate without any lubrication and to prevent accumulation of deposits.

2.3.1.2.2 Revolving-Frame-Type

A revolving-frame-type rake mechanism consists of two pairs of structural-steel-angle rake arms mounted on a horizontal shaft. Screen rakes are attached to steel crossbars mounted on the outer end of each pair of rake arms. The entire rake mechanism is required to revolve about the horizontal shaft.

2.3.1.2.3 Automatic-Hoist-Type

An automatic-hoist-type rake mechanism consists of a reciprocating rake mounted on a horizontal shaft or frame and guided by steel channels or angles at each end of the frame. The rake and frame are pulled up the slope of the guide rails by two or more cables operating over motor-propelled grooved drums. After screenings are discharged, the rake frame is required to automatically tilt and lower to the bottom of screen.

2.3.1.2.4 Endless-Chain-Type

An automatic-chain-type rake mechanism consists of a drive chain, drive sprockets, and sprocket wheels mounted on a drive shaft, and an idler shaft where required, operating two endless chains with rakes securely attached.

a. Fabricate the drive chain connecting motor sprocket with the drive shaft and the endless chain of malleable iron with heat-treated-steel pins or rivets. Provide a chain tightener or takeup bracket for drive chain. Ensure chains are of suitable size and design to withstand strains imposed.

b. Fabricate the sprockets for the drive and endless chains of semi-steel or cast iron with chilled teeth and rims. Grind the rims and teeth of the sprockets to fit chains. Provide sprockets of the size recommended by the equipment manufacturer. Fabricate shafts of cold-rolled steel, straight and true, and of ample diameter to transmit the power required without undue deflection. Accurately cut the keyways where required. Provide malleable iron or bronze safety collars where required to keep shafting and sprockets in alignment.

2.3.1.2.5 Screw-Drive Type

A screw-drive type rake mechanism consists of a reversing threaded screw-drive and bearing nut attached to rake. Provide all rakes with reciprocating action.

2.3.1.2.6 Rake Mechanism Control Equipment

Start motors by means of [automatic time switch for intermittent operation, adjustable to give 3 to 60 minutes between cycles] [float switch for automatic operation at predetermined levels] [float switch for automatic operation at predetermined rise in head of sewage on the upstream side of the screen bar]. [Provide floats constructed of corrosion-resistant metal.]

a. Endless-Chain-Type-Rake Mechanism: Provide a motor-reversing switch so that direction of travel of the rake mechanism is reversible in the
event of jamming. Provide a motor-reversing switch consisting of a double-throw externally operable switch enclosed in a [raintight] [watertight] enclosure. Mark the switch as follows: "Forward," "Off," "Reverse."

b. Automatic Hoist-Type Rake Mechanism: Provide starters for this type of rake mechanism that are the reversing type. Arrange control devices so that on completion of upward travel of the rake mechanism, motor stops and then reverses, and rake travels to the lower position, at which point motor again stops and automatically adjusts for the next automatic operation.

c. Revolving Frame-Type Rake Mechanism: Provide an emergency stop push-button and a rake limit switch in a weatherproof enclosure, to always stop the rake out of water after discharge of screenings.

d. Bearing Type Rake Mechanism: Control the travel of the rake in a downward or upward direction by proximity switches. Provide for adjustable frequency. Provide rake delay on the [top] [bottom]. Provide [electric] [hydraulic] rake drive. Provide overload protection for down and up stroke. Provide drive with a control panel (minimum NEMA ICS 2) mounted.

e. Rake Wiper: Where required to remove screenings from rake, provide a rake wiping or scraping device at the discharge point of rake. Fabricate device to include either a plate attached to swinging hinged arms or a continuous hinged plate actuated by motion of the rake. Design wiper so that after cleaning of the rake is completed, wiper falls into the proper place ready for the next scraping operation. Control the fall of wiper either mechanically or hydraulically to absorb any shock.

f. Dead Plate or Apron: Provide a wrought iron or steel dead plate where required to prevent any deposited screenings from falling into the downstream side of rake. Ensure provided dead plate is not less than 2.657 mm [12 gauge] metal if required by the design and type of rake mechanism installed, and is rigidly braced if required.

2.3.2 Mechanical Shredder, Cutter, or Grinder

2.3.2.1 Operation Requirements

Provide shredder, cutter, or grinder unit suitable to receive screenings from screening unit specified and to discharge resulting pulp into the sewage flow. Operate machine by means of an electric drive unit designed to cut sewage solids, including sticks, rags, and stringy material without clogging, jamming, or stalling moving parts. Direct connect grinder and drive unit by a flexible or friction-type coupling integrally mounted on a structural steel or cast iron base. Provide grinder with a water-flushing system where required to flush ground solids through the machine. Ensure machine provided has a capacity of grinding [_____] kg pounds of sewage screening per hour.

2.3.2.2 Control Equipment

Arrange control so that shredder motor automatically start when the rake-mechanism motor starts. Provide a relay to allow the shredder to continue to run for a predetermined time after rake mechanism has stopped, and to automatically stop the shredder motor.
2.3.2.3 Cutter Mechanism

The cutter consists of cutting blades or impellers mounted on a revolving shaft or drum in contact with a stationary cutter screen or blade. Provide cutting devices made of tool steel or other material equally suitable for cutting tools. Ensure devices are accurately cut and ground to size to provide sharp cutting edges having extreme resistance to wear.

2.3.2.4 Bearings

Provide bearings of the self-aligning ball or roller type. Design bearings and bearing supports to safely carry and withstand the stresses imposed by the disintegrating action of the grinder.

2.3.2.5 Stuffing Boxes

Wherever the drum shaft passes through the machine housing, provide stuffing boxes of proper depth and construction.

2.3.2.6 Lubrication

Ensure bearings and moving parts, subject to wear, are provided with adequate devices for grease or oil lubrication.

2.4 PAINTING

Thoroughly clean, prime, and give all equipment two finish coats of paint at the factory in accordance with the recommendations of the manufacturer.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

3.2.1 Installation of Concrete Foundations

Use concrete for foundations as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Concrete foundations are required to be integral with, and of same strength as the building floor, unless otherwise specified. For concrete used in foundations that are entirely separated from the surrounding floor, use 17 MPa 2500 psi. When new foundations are constructed on existing concrete, bond new concrete to old as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Furnish foundation bolts, as required, for proper positioning during placement of concrete.

3.2.2 Installation of Equipment

Install all materials and equipment as shown and in accordance with the approved written recommendations of the equipment manufacturer.

3.2.3 Field Painting

Field painting is specified in Section 09 90 00 PAINTS AND COATINGS.
3.3 FIELD QUALITY CONTROL

3.3.1 Tests

After installation of the sewage bar screen and mechanical shredder is complete, conduct operational tests required to demonstrate that the sewage bar screen and mechanical shredder and controls operate in accordance with the requirements of this section of the specifications. At a minimum, operate the rake through [5][10] cycles to ensure the system is operating correctly. Conduct a minimum of [2][5] tests with the rake loaded with debris to simulate actual field conditions. Indicate the final position of controls in each test report.

3.3.2 Manufacturer's Field Services

Obtain the services of the manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. Ensure the representative supervises the installation, adjustment, and testing of the equipment.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Framed Instructions

Provide framed instructions, including wiring and control diagrams, showing the complete layout of the entire system, posted where directed. Pot the framed instructions before acceptance testing of the systems. Prepare condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system in typed form, framed as specified above for the wiring and control diagrams and posted beside the diagrams. Submit proposed diagrams, instructions, and other sheets, prior to posting.

3.4.2 Operating and Maintenance Instructions

Submit operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include within the instructions the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Submit maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include simplified diagrams for the system as installed.

3.4.3 Training

Provide a field training course for designated operating and maintenance staff members. Provide training for a total period of [_____] hours of normal working time and starting after the system is functionally complete but prior to final acceptance tests. Cover all of the items contained in the Operating and Maintenance Instructions in the field training.

-- End of Section Table of Contents --
This guide covers the requirements for grit removal and handling equipment to remove, collect, pump, and wash grit from wastewater. This guide is for treatment of domestic wastewater only.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](##).

**NOTE:** This guide specification is for treatment of domestic wastewater only. Special consideration must be given to wastewater containing industrial wastes.

Show the following information on the project drawings.

1. Size, depth and general configuration of grit separation, chamber, final discharge point, collection, removal, and washing facilities. Give space limitations which may affect optional choices;

2. Percentage of removal of grit required;
3. Electrical characteristics of motor(s) for grit separation, collection, removal, pumping and washing equipment;

4. Flow range in cubic meter per second mgd facility is designed to serve;

5. Type of diffuser holder assembly;

6. Supply of external air quantity in cubic meter per second cfm and pressure in kPa psi;

7. Type of diffuser, whether non-porous nozzle or valve orifice type is used;

8. Source of power for hoist.;

9. Type of velocity control, whether regulator or weir;

10. Applicable wind and ice loadings;

11. Type of grit pump configuration, whether vertical or horizontal;

12. Removal capacity of screw conveyor in cubic meter per second cubic feet per hour;

13. Pitch diameter of flights and liner plate diameter for screw conveyors;

14. Type of wastewater from which grit is to be removed, whether raw wastewater or settled primary sludge;

15. Capacity in cubic meter per second gpm and pressure in kPa psi for the cyclone;

16. Cyclone pressure switch range in kPag psig;

17. Type of walkway, whether raised pattern floor plate or grating, on shallow tank separator; and

18. Whether corrosive conditions exist in wastewater or in atmosphere at installation.

1.2 DEFINITIONS

1.2.1 Grit

The settleable solids load present in wastewater such as sand, gravel, cinders, metal fragments not ameliorated by secondary treatment or sludge removal techniques and capable of producing excessive wear on mechanical equipment.

1.2.2 Grit Separation

The process of separating grit from wastewater by controlling the velocity of the wastewater with aeration to suspend organics or by tank configuration to separate the grit from the organic solids by differential sedimentation and scour.

1.2.3 Grit Collection

The process of gathering the separated grit in a hopper or other point of collection [by mechanical equipment designed for the purpose] [by means of hydraulic flow over an inclined chamber floor].

**************************************************************************
NOTE: Delete the first option when an aerated grit chamber with an inclined bottom is required, delete the second option when an aerated grit chamber with an inclined bottom is not required.
**************************************************************************
1.2.4 Grit Removal

**************************************************************************
NOTE: Delete the first option when washing equipment is not required, delete the second option when washing equipment is required.
**************************************************************************

The process of conveying grit out of the chamber from the point of collection in the chamber to [washing equipment for further processing] [the indicated point of discharge]. Grit removal equipment may accomplish some dewatering.

1.2.5 Grit Washing

The process of further separation of grit by washing putrescible matter from the removed grit by means of sprays or washing the tanks and dewatering with screw conveyors or cyclones. These screw conveyors or cyclones also convey the grit to the indicated point of discharge.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 SPARE PARTS

Furnish spare parts for the equipment specified above in the quantities listed below. The spare parts must be identical and interchangeable with the original parts. Furnish the parts in wooden containers clearly marked with contents on two sides and top. Where the number of spare part units required by the schedule results in a fractional number of units, round off the number furnished to the next highest.

f. In addition, also furnish one dozen shear pins of each size used.

1.5 QUALITY CONTROL

1.5.1 Regulatory Requirements

**************************************************************************
NOTE: Design Grit Removal System in accordance with UFC 3-240-01, "Wastewater Treatment and Collection." Ensure compliance with permits.
**************************************************************************

Conduct regulatory review to determine impact of new and existing permit conditions and regulations, communicate with federal, state, local and DOD agencies.

1.5.2 Qualifications

Ensure welds are in accordance with AWS D1.1/D1.1M using procedures, materials, and equipment of the type required for the work.

1.5.3 Shop Drawings

Submit grit handling equipment drawings showing layout of all equipment. Include construction and erection details for all components of the complete grit separation, collection removal [and washing] system and also show associated connections with plant piping.

1.6 DELIVERY, STORAGE, AND HANDLING

Package equipment and parts for shipment to prevent breakage, damage or problems with calibration, readings or controls. Inspect materials delivered to the site for damage and unload and store with a minimum of handling. Store equipment and materials indoors, off the floor. Area must be dry with adequate ventilation, free from dust or water, and permit easy access for inspection and handling.
1.7 WARRANTY

Provide grit separation equipment with minimum [_____] 5 year warranty. Submit the manufacturer's warranty.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a grit removal system to separate, collect, remove, wash and deposit grit at the indicated point of its discharge, within the area and at the elevations indicated.

2.1.1 Design Requirements

******************************************************************************
NOTE: Delete all references to washing when washing is not included in the grit removal system. The use of any combination of grit removal system for any wastewater treatment facility will be the responsibility of the project engineer. The combinations of equipment for the following systems are several:

1. Aerated grit system.
2. Aerated grit system (inclined bottom chamber).
3. Longitudinal grit system.
4. Vortex type grit system.
5. Detritor grit removal.

Select the grit removal system based on the following factors:

1. Site area availability;
2. Amount of grit anticipated;
3. Type of sewer system, separate or combined;
4. Other selected process i.e., air available if diffused air activated sludge processes; incineration disposal for grit; primary sedimentation process; and

******************************************************************************

2.1.2 Grit Removal System Type

******************************************************************************
NOTE: Choose one of the paragraphs below, AERATED GRIT REMOVAL SYSTEM, INCLINED BOTTOM GRIT REMOVAL SYSTEM, LONGITUDINAL GRIT REMOVAL SYSTEM, VORTEX TYPE GRIT REMOVAL SYSTEM, and DETRITOR GRIT REMOVAL SYSTEM.

Determine which grit removal system is suitable for
the project. Delete paragraphs which describe systems and options which are not included in the project. When it is anticipated that the bottom of a chamber will be utilized for grit storage, a screw conveyor should be used for collecting grit when the depth of the stored grit is expected to exceed the height of a rake or bucket collector. Use a grit pump for removal when a cyclone is included with the washing equipment. Space limitations may preclude the use of inclined removal equipment. Delete reference to screw-type washers when a cyclone is the only washer required. Delete screw conveyor when space limitations prohibit an inclined screw, delete screw conveyor and bucket elevator when cyclone is included in washing equipment.

2.1.2.1 Aerated Grit Removal System

Separate grit in an aerated grit chamber. Collect and remove grit by [horizontal screw conveyor and bucket elevator,] [horizontal screw conveyor and inclined screw conveyor,] [horizontal screw conveyor and grit pump,] [chain and bucket equipment,] [airlift pump]. Use a [cyclone] [and] [screw-type washer].

2.1.2.2 Inclined Bottom Grit Removal System

Separate grit in an inclined bottom aerated grit chamber. Chamber bottom must be inclined to move grit to the point of removal. Remove grit by [screw conveyor] [airlift pump] [bucket elevator] [grit pump]. Use a [cyclone] [and] [screw-type washer].

2.1.2.3 Longitudinal Grit Removal System

Separate grit in a longitudinal grit chamber. Collect and remove grit by [horizontal screw conveyor and bucket elevator,] [horizontal screw conveyor and inclined screw,] [horizontal screw conveyor and grit pump,] [and] [chain and bucket equipment]. Use a [cyclone] [and] [screw-type washer].

2.1.2.4 Vortex Type Grit Removal System

Separate grit in a vortex type grit removal system. Remove grit by a [grit pump] [airlift pump]. Use [cyclone] [and] [screw-type washers].

2.1.2.5 Detritor Grit Removal System

Separate grit in a detritor grit removal system, including a rotating grit-collecting mechanism and a reciprocating grit-washing mechanism. Collect and remove grit by [grit auger and grit pump,] [horizontal screw conveyor and bucket elevator,] [horizontal screw conveyor and inclined screw,] [horizontal screw conveyor and grit pump,] or [chain and bucket equipment]. Use a [cyclone] [and] [screw-type washer].

2.1.3 Performance Requirements

Provide a system capable of separating and removing [_____] percent of [_____] mesh grit having a specific gravity of [2.65] [_____] from a flow ranging from [_____] to [_____] cubic meter per second million gallons per day.
2.1.4 Electrical Requirements

Unless indicated or specified otherwise, electrical components of mechanical equipment, such as motors, motor starters, control (pushbutton) stations, electrical disconnecting (isolating) means, and other devices functioning to control associated mechanical equipment, are included under this section. The work must be complete and operable, and in accordance with NFPA 70 and the requirements of Section 29 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2 ASSEMBLY [OR] FABRICATION

2.3 EQUIPMENT

Unless otherwise specified, provide standard commercial products in regular production by the manufacturers and suitable for the required service. Unless otherwise specified, structural steel must conform to ASTM A36/A36M, hot-dip galvanized in accordance with ASTM A123/A123M or ASTM A153/A153M. Submerged steel must have a minimum thickness of 6 mm 1/4 inch. Unless otherwise specified, cast iron must conform to ASTM A48/A48M. Bronze castings not otherwise specified must conform to ASTM B30. Drives, lubrication, and bearings must be accessible from walkways at or above ground level.

2.3.1 Materials and Equipment

*******************************************************************************
NOTE: Choose this paragraph and its subparagraphs or one of the paragraphs below, LONGITUDINAL GRIT SEPARATION EQUIPMENT, VORTEX TYPE GRIT SEPARATION, and DETRITOR GRIT REMOVAL EQUIPMENT, and its subparagraphs.
*******************************************************************************

2.3.1.1 Aerated Grit Separation Equipment

Include air piping and valves, swing diffuser holder assembly, header pipes, hoist, and diffusers. Provide baffles of structural steel plate 50 mm 2 in, or manufacturer's standard. Provide system with air from an external supply at a maximum rate of [_____] cubic meter per second cfm at [_____] kPa psi.

2.3.1.1.1 Air Piping

Provide manufacturer's recommended piping from air main to diffusers.

2.3.1.1.2 Diffuser Holder Assembly

Provide an upper pivot joint with air control and shut-off valve, a drop pipe with intermediate pivot joint, and a diffuser header. Provide unit with mounting to wall anchorage and a rotating joint, either permanently lubricated or with grease fittings for lubrication. Include gaskets at each pivot bearing to ensure air and water tightness. Provide valve for air control with indicator markings for throttling and complete shut-off, conforming to AWWA C504. Provide connections for the upper and lower hanger pipes. Provide locking device to allow positive locking in any position. Ensure spacing of diffuser assemblies in the basin and diffusers on the header is as recommended by the diffuser manufacturer. Ensure the
diffuser is level. Provide a portable hoist to raise and lower the
diffuser assembly. Use hoist by the same manufacturer, and compatible
with, the diffuser holder assembly. Hoist must be hydraulically operated
and adequately powered to raise the assembly from the tank. Provide means
of locking the diffuser header in a raised position over the tank or the
walkway.

2.3.1.1.3 Diffusers

Provide saddle mounted or thread mounted diffusers as recommended by the
manufacturer. Ensure diffusers are sized for the particular application
for the range of exit velocity and back pressure.

2.3.1.2 Longitudinal Grit Separation Equipment

**************************************************************************
NOTE: Choose one of the following paragraphs
VELOCITY CONTROL REGULATOR or PROPORTIONAL WEIR.

Where corrosive environment is not present, specify
structural steel. Where corrosion can occur and
cost is not a factor, specify stainless steel,
otherwise specify aluminum, or manufacturer standard.
**************************************************************************

Control velocity with a [velocity control regulator] [proportional weir].

2.3.1.2.1 Velocity Control Regulator

Maintain the velocity of flow through a channel of cross sections
indicated. Provide regulator conforming to [AIST PB-229, Type 304
stainless steel] [structural steel] [aluminum conforming to ASTM B209M
ASTM B209 or ASTM B221M ASTM B221, Alloy 6061, Temper T6]. Regulator
opening must be adjustable and provide a range of flows from zero to [_____]cubic meter per second mgd.

2.3.1.2.2 Proportional Weir

Control velocity with a [AIST PB-229, Type 304 stainless steel] [aluminum
conforming to ASTM B209M ASTM B209 or ASTM B221M ASTM B221, Alloy 6061,
Temper T6] [structural steel] proportional weir. Weir will provide a
constant velocity through the grit chamber for a range of flows from
[_____] to [_____] cubic meter per second mgd.

2.3.1.2.3 Framework and Control Sections

**************************************************************************
NOTE: Specify material compatible with material
specified in paragraph VELOCITY CONTROL REGULATOR or
PROPORTIONAL WEIR.
**************************************************************************

Provide compatible fasteners for anchoring or bolting the control device.

2.3.1.3 Vortex Type Grit Separation

2.3.1.3.1 Forced Vortex

Include motor drive assembly, paddle drive tube; [air [lift pump,] piping
and valves,] [vacuum pump] [suction pump]; and control box.[ Provide system air from an external supply at a maximum rate of [_____] cubic meter per second CFM at [_____] kPa psi.]

2.3.1.3.1.1 Mechanical Drive

Ensure sustained operation at the continuous output torque rating without excessive wear and to develop twice the continuous output torque rating without damage to or failure of the drive assembly components.

][2.3.1.3.2 Induced Vortex

Include [air [lift pump,] piping and valves,] [vacuum pump] [suction pump].[ Provide system air from an external supply at a maximum rate of [_____] cubic meter per second CFM at [_____] kPa psi.].

][2.3.1.3.3 Multi-Tray Vortex

Provide manufacturer standard trays and distribution system.

][2.3.1.4 Detritor Grit Removal Equipment

Provide manufacturer's standard system.

]2.3.1.5 Collector Systems

*************************************************************************
NOTE: Choose one paragraph, and its subparagraphs, of the following: SCREW COLLECTOR AND BUCKET ELEVATOR, SCREW [COLLECTOR] [AND] [CONVEYOR] or CHAIN AND BUCKET ELEVATOR COLLECTOR.

Some manufacturers combine a screw collector and a bucket elevator utilizing the bucket chain to drive the screw and using only one drive assembly. This unit may be used in either an aerated grit removal system or a longitudinal grit removal system when the screw conveyor is not more than 15 m 50 feet long or when the amount of grit to be removed does not exceed 0.06 cubic meter per second 120 cubic feet per hour. Delete this paragraph and all subparagraphs when this unit is not allowed as an alternate to the separate units or when the above physical limits will be exceeded.
*************************************************************************

2.3.1.5.1 Screw Collector and Bucket Elevator

Provide a unit utilizing the bucket chain of the elevator as a drive chain for the screw collector. Include screw shafts and bearings, liner plate, chain, sprockets, grit buckets, drive assembly, housing and overload protection. Ensure unit is capable of continuous and intermittent operation with a removal capacity of not less than [_____] cubic meter per second cubic feet per hour of dry grit weighing [1922] [_____] kg per cubic meter [120] [_____] pounds per cubic feet.

2.3.1.5.1.1 Screw Collector Assembly for Combination Unit

**************************************************************************
NOTE: The following table lists the requirements for selecting a screw.

Alternate screw type can be helicoid with short shafts.

**--------------------------------------------------------------------------------**

a. Provide [_____] mm inch diameter screw, half pitch with 10 mm 3/8 inch flights and mounted on [_____] mm inch steel pipe conforming to ASTM A53/A53M and bushed for [_____] mm inch shaft. As an alternate, provide a helicoid type screw conveyor section with 10 mm 3/8 inch steel flights. Screw must be made in the manufacturer's standard lengths.

b. Ensure shafts are cold rolled steel conforming to ASTM A108 and coupling bolts are AIST PB-229, Type 316 stainless steel. Couple driven end to the foot shaft of the bucket elevator. Grease lubricate tail shaft bearings; provide with cast iron, high carbon or heat treated alloy steel bushings. Ensure bearings are rated for a minimum of five years on a continuous service basis.

c. Provide a curved 10 mm by [_____] mm 3/8 by [_____] inch I.D. steel liner plate with edges drilled for plug welding to 13 by 150 mm 1/2 by 6 inch steel straps embedded in the concrete, with a Brinell hardness of 300 to 350.

2.3.1.5.1.2 Bucket Elevator Assembly for Combination Unit

a. Provide bucket chain of ASME B29.400 combination "H" Type Mill C102 having an average ultimate strength of 160 kN 36,000 pounds and weighing no less than 15 kg per meter 9.7 pounds per foot, with chain links of corrosion resisting malleable iron having an average tensile strength of at least 483 MPa 70,000 psi and an average Brinell hardness between 170 and 190.
b. Ensure sprockets are high-test cast iron, having a minimum tensile strength of 138 MPa (20,000 psi) cast in a chill, with a Brinell hardness of not less than 360 with a chill depth of at least 5 mm (3/16 inch), stress relieved before machining. Sprocket teeth must be accurately ground to fit chain. Sprockets must be split construction assembled with cadmium plated nuts and bolts. Driven sprocket and the sprockets on the head shaft and screw shaft must be keyseated with keys and keyseats conforming to ASME B17.1 or ASME B17.2.

c. Ensure shafting is solid, cold-finished steel conforming to ASTM A108, straight and continuous for full width of tank, of sufficient size to transmit the maximum force developed by the drive assembly. Provide keyways where necessary to attach or locate sprockets on shafting. Keys and keyseats must conform to ASME B17.1 and ASME B17.2. Use polished shafting in areas of contact with bearings.

d. Ensure bearings are babbitt-lined, ductile-iron type, self-aligning ball-and-socket type or heat treated ductile-iron self-aligning type, designed to allow minimum field variations without shimming. Provide bearings above water with flush ball-check grease-lubrication fittings. Water lubricate underwater bearings with tops designed to prevent solids accumulation. Equip underwater bearings with flush ball-check grease-lubrication fittings. Ensure all bearings are rated for a minimum of 5 years on a continuous service basis.

e. Fabricate grit buckets of structural steel or malleable iron with hardened lip designed to drain off free water; attached to chains at not more than 1.5 m (5 foot) intervals with heat treated carbon steel pins and rivets having a minimum diameter of 17 mm (11/16 inch).

2.3.1.5.1.3 Drive Assembly for Combination Unit

Include motor; speed reducer; drive sprocket on output shaft of speed reducer; drive chain from drive sprocket to driven sprocket; shear pin; and chain guard. Fully enclose unit and ensure suitability for mounting outside and exposed to the weather.

a. Motor must be suitable for operation with the voltage characteristics as indicated.

b. Ensure chain and belt drives incorporated in the drive assembly have a minimum factor of safety of 4 as applied to ultimate breaking or transmission strength of the chain or belt with respect to the loads transmitted at normal continuous operating load.

2.3.1.5.1.4 Housing

******************************************************************************
NOTE: Specify galvanized steel unless corrosion is considered a problem.
******************************************************************************

Mount 1.8 mm 14 gage [galvanized steel] [AIST PB-229, Type 302 or AIST PB-229, Type 304 stainless steel] on the structural supports and securely fasten to the structural frame with bolts or sheet metal screws of the same material as the housing. Provide suitable openings for chain installation and inspection at convenient locations in the housing.
2.3.1.5.2 Screw [Collector] [and] [Conveyor]

**************************************************************************
NOTE: Choose this paragraph and its subparagraphs, the paragraph above, SCREW COLLECTOR AND BUCKET ELEVATOR, and its subparagraphs, or the paragraph below, CHAIN AND BUCKET ELEVATOR COLLECTOR and its subparagraphs.

NOTE: Screw mechanisms may be used as collectors, conveyors, or both together. Delete "collector and" when screw type collector is not allowed; delete "and conveyor" when screw type conveyor is not allowed; use all optional wording and appropriate pluralizations when both screw collector and conveyor are not allowed.

**************************************************************************
Include screw assembly, motor drive assembly, [liner plates,] [and] [trough,] and appurtenances. Liner plates and troughs may be fiber reinforced plastic instead of steel.

Provide screw [collector] [and] [conveyor] suitable for continuous or intermittent operation and with a removal capacity of not less than [_____] cubic meter per second cubic feet per hour of dry grit weighing [1922] [_____] kg per cubic meter [120] [_____] pounds per cubic foot.

2.3.1.5.2.1 Screw Assembly

**************************************************************************
NOTE: The following table lists the requirements for selecting a screw.

</table>

Alternate screw type can be helicoid with short shafts.

**************************************************************************
a. Provide [horizontal] [inclined] screw of [_____] mm inch diameter, half pitch with 10 mm 3/8 inch flights butt welded or fillet welded both sides and mounted on [_____] mm inch Schedule 80 steel pipe conforming to ASTM A53/A53M and bushed for [_____] mm inch shaft. As an alternate, a helicoid type screw conveyor section with 10 mm 3/8 inch steel flights may be provided with short shafts of solid cold rolled steel conforming to ASTM A108. Screw must be made in manufacturer's standard lengths with a coupling flight connection for ease of installation and removal. Protect outer leading edges of the flighting with a coating of weldment, a minimum of 25 mm one inch wide and 3 mm 1/8 inch thick. If carbon steel flighting is provided with a minimum 10 mm 3/8 inch thickness, it will be acceptable without coating provided that it has a minimum Brinell hardness of 500.

b. Ensure shafting is cold rolled steel conforming to ASTM A108 and coupling bolts are AIST PB-229, Type 316 stainless steel. Provide keyway to attach driven sprockets. Keys and keyseats must conform to ASME B17.1 or ASME B17.2.

c. Ensure driven sprocket is high-test cast iron having a minimum tensile strength of 138 MPa 20,000 psi cast in a chill, and with a Brinell hardness of not less than 360 with a chill depth at least 5 mm 3/16 inch, and stress relieved before machining. Sprocket teeth must be accurately ground to fit chain. Sprocket must be split construction assembled with cadmium-plated nuts and bolts. Key seat sprocket on the screw drive shaft.

d. Grease lubricate tail shaft bearings; provide with cast iron, high carbon or heat treated alloy steel bushings. Ensure bearings are rated for a minimum of 5 years of continuous service.

**NOTE: Delete first optional paragraph below when horizontal screw collector is not allowed: Delete second optional paragraph when inclined screw conveyor is not allowed.**

e. Grease lubricate drive end bearings for horizontal screw; provide bearings with high carbon or heat-treated alloy steel bushings. Ensure bearings are suitable for taking thrust. Provide bearings with lubrication fittings brought to an accessible location. Ensure bearings are rated for a minimum of 5 years of continuous service.

f. Ensure drive end bearings for inclined screw are extra heavy roller bearing pillow blocks, suitable for taking thrust. Grease lubricated ball bearings will be allowed. Ensure bearings have a minimum rated life expectancy (L-10) of 40,000 hours based on American Bearing Manufacturers Association Standards on a continuous service basis.

2.3.1.5.2.2 Motor Drive Assembly

Include an electric-motor-driven speed reducer; drive sprocket on output shaft of speed reducer; drive chain from drive sprocket to driven sprocket; shear pin; and chain guard.

a. Motor must be suitable for operation with the voltage characteristics as indicated.
b. Ensure chain and belt drives incorporated in the drive assembly have a minimum factor of safety of 4 as applied to ultimate breaking or transmission strength of the chain or belt with respect to the loads transmitted at normal continuous operating load.

2.3.1.5.2.3 Liner Plate

*****************************************************************************
NOTE: Specify liner plate for horizontal grit collector and trough for inclined grit conveyor.
*****************************************************************************

Provide curved 10 by [_____] mm 3/8 by [_____] inch I.D. abrasion-resistant steel liner plate with edges drilled for plug welding to 50 by 150 mm 1/2 by 6 inch steel straps embedded in the concrete for the horizontal screw, and a Brinell hardness of 300 to 350.

2.3.1.5.2.4 Steel Trough

*****************************************************************************
NOTE: Specify liner plate for horizontal grit collector and trough for inclined grit conveyor.
*****************************************************************************

Fit abrasion-resistant stainless steel 10 mm 3/8 inch thick trough with a gasket at the inspection opening, a clean-out plate on the lower end and a discharge spout on the upper end. Ensure the upper (drive end) bearings are suitable to take thrust for inclined screw. Ensure trough has a Brinell hardness of 300 to 350.

2.3.1.5.2.5 Structural Supports

*****************************************************************************
NOTE: Delete this paragraph when inclined screw conveyor is not allowed. Specify galvanized steel unless corrosion is considered a problem.
*****************************************************************************

Construct structural supports using minimum 6 mm 1/4 inch thick material[ and based on a safety factor of 4.0 against vertical load and torque]. Use [AIST PB-229, Type 302 or AIST PB-229, Type 304 stainless steel] [galvanized steel] assembly and anchor bolts.

2.3.1.5.3 Chain and Bucket Elevator Collector

*****************************************************************************
NOTE: Choose this paragraph and its subparagraphs or one of the paragraphs above, SCREW COLLECTOR AND BUCKET ELEVATOR and SCREW [COLLECTOR] [AND] [CONVEYOR], and its subparagraphs.
*****************************************************************************

Provide chain and bucket collection and removal assembly suitable for continuous or intermittent operation with a removal capacity of not less than [_____] cubic meter per second cubic feet per hour of dry grit weighing

SECTION 46 23 00 Page 21
which operates at a speed of from 0.04 to 0.05 meter per second 8 to 10 feet per minute. Include housing, motor drive assembly, chain, shafting, sprockets, grit buckets, and overload protection.

2.3.1.5.3.1 Chain and Bucket Assembly

a. Ensure bucket chains are ASME B29.400 combination "H" Type Mill C110 having an average ultimate strength of 134 kN 30,000 pounds and must weigh no less than 7.8 kg per m 5.2 pounds per foot with links of corrosion resisting malleable iron having an average tensile strength of 483 MPa 70,000 psi and an average Brinell hardness between 170 and 190.

b. Ensure sprockets are high-test cast iron, having a minimum tensile strength of 138 MPa 20,000 psi cast in a chill, and a Brinell hardness of not less than 360 with a chill depth of at least 5 mm 3/16 inch and stress relieved before machining. Sprocket teeth must be accurately ground to fit chain. Sprockets must be split construction assembled with cadmium-plated nuts and bolts. Driven sprocket on the head shaft must be of the offset type. Keyseat sprockets on the head shaft. Keys and keyseats must conform to ASME B17.1 or ASME B17.2. [Do not keyseat idler wheel and chain take-up shaft sprocket but, except for number of teeth, must be identical in other respects to the head shaft sprockets. Set-screw idler wheel and take-up shaft sprocket to the shaft.]

c. Ensure bearings babbitt-lined, self-aligning ball-and-socket type or heat treated ductile-iron, self-aligning type. Bolt bearings, except those for bracket-supported driven sprockets, to the tank walls. Ensure bearings are designed to allow minimum field variations without shimming. Bracket supports, except on head shaft driven sprocket, are not be allowed. Provide bearings above water with flush ball-check grease-lubrication fittings. Provide water lubrication to underwater bearings, with tops designed to prevent solids accumulation, and flush ball-check grease-lubrication fittings. Provide self-aligning take-up bearings on take-up shaft arranged to slide between or to be steadied by two cast iron, mild steel or silicon bronze guides, with a minimum range of travel of 250 mm 10 inches and positioned by a stainless steel or silicon bronze threaded power bolt, which must be arranged for locking at any position of the bearing. Ensure bearings are rated for a minimum of 5 years of continuous service.

d. Fabricate grit buckets of structural steel or malleable iron with hardened lip[ and stirring flights fabricated from structural steel angles and plates]. Ensure buckets are designed to drain off free water. Buckets[ and stirring flights] must have replaceable alloy cast iron or malleable iron wearing shoes that can be rotated to distribute
the wear. Attach buckets[ and stirring flights] to the chains at not more than 1.5 m 5 foot intervals with heat treated carbon steel pins and rivets having a minimum diameter of 17 mm 11/16 inch.

**************************************************************************
NOTE: Delete the paragraph below when only bucket elevator is allowed.
**************************************************************************

e. For each collector mechanism, provide [one] [two] industrial type steel rail(s), minimum weight 8 kg per m 16 pounds per yard. Include necessary splice bars, rail clips, and appurtenances. Ensure structural steel return tracks have a minimum thickness of 10 mm 3/8 inch. Support return tracks by steel cross members supported from chamber walls.

2.3.1.5.3.2 Motor Drive Assembly

Include a motor; speed reducer; drive sprocket on output shaft of speed reducer; drive chain from drive sprocket to driven sprocket; shear pin; and chain guard. Ensure unit is fully enclosed and suitable for mounting outside and exposed to the weather.

a. Motor must be suitable for operation with the voltage characteristics as indicated.

b. Ensure chain and belt drives incorporated in the drive assembly have a minimum factor of safety of 4 as applied to the ultimate breaking or transmission strength of the chain or belt with respect to the loads transmitted at normal continuous operating load.

2.3.1.5.3.3 Housing

**************************************************************************
NOTE: Specify galvanized steel unless corrosion is considered a problem.
**************************************************************************

Mount 1.8 mm 14 gage [galvanized steel] [AIST PB-229, Type 302 or AIST PB-229, Type 304 stainless steel] above the operating floor and 5 mm 3/16 inch below the floor, on structural supports and securely fastened to the structural steel frame with bolts or sheet metal screws of the same material as the housing. Ensure the drive unit and head shaft assembly are as indicated on the shop drawings. Provide suitable openings for chain installation and inspection at convenient locations in the housing.

2.3.1.6 Grit Pump

Provide heavy-duty [[vertical] [horizontal], torque flow vortex pump with mechanical variable speed drive] [vertical close-coupled, vacuum primed pump]. Position pump suction and discharge as indicated. Ensure pump is suitable for pumping grit under the following conditions of services:

Capacity: [_____] cubic meter per second gpm

Maximum Solid Size: [_____] mm inches

Range of Head Conditions: [_____] m feet
Amount of Grit in Water: [_____] percent

Final selection of pump operating conditions will depend upon actual cyclone selected. Include casing, impeller shaft, bearings, motor, drive unit, 6.28 rad 360 degree pressure sensors, and anchor bolts.

2.3.1.6.1 Pump Casing

Provide manufacturer standard pump casing. Equip suction and discharge with flanges.

2.3.1.6.2 Radial and Thrust Bearings

Provide a minimum rated life expectancy (L-10) of 40,000 hours based on ABMA 11 when operating continuously at the rated full-load motor wattage horsepower and speed under the specified loading conditions. Internal bearings may be either oil or grease lubricated.

2.3.1.6.3 Pump and Motor Base

Provide manufacturer's standard base.

2.3.1.6.4 Motor

Motor must be suitable for operation with the voltage characteristics as indicated.

2.3.1.6.5 Drive Unit

Provide drive unit with a mechanical variable speed drive with a [_____] to 1 ratio, manually adjustable in infinite steps over the entire range.

2.3.1.6.6 Pressure Switch

Provide a pressure switch in the piping to the cyclone to monitor the pressure buildup. [Wire switch to an alarm which will actuate when pressure exceeds a preset value. Provide industrial type alarm including rotating beacon, 90-decibel horn, and spare contact for remote signal.] Furnish switch for a pressure range of from [_____] to [_____] kPag psig with an adjustable alarm contact.

2.3.1.7 Airlift Pump

Include an air pipe, educator, foot piece, tail pipe, air separator and a vent pipe. Provide zinc-coated Schedule 40 steel pipe to the educator of adequate size to discharge the required amount of liquid without excessive pressure drop. Provide a MSS SP-80 globe valve, MSS SP-72 ball valve, or MSS SP-78 plug air control valve on the air pipe for accurate adjustment of the airlift discharge rate. Ensure tail pipe below the foot piece, the educator pipe, air separator and vent from it are of zinc-coated steel. Fittings must be of zinc-coated malleable iron or cast iron. Provide educator with a clean-out above the water level. Install airlift pump so as to permit easy removal for maintenance.

2.3.1.8 Cyclone

Provide cylindrical-conical cyclone unit with a replaceable, high-density, lining, with a capacity of [_____] cubic meter per second gpm at a maximum feed pressure of [_____] kPa psi and capable of making a separation at
approximately [_____] mesh predicated on a feed solids concentration of not more than one percent solids for grit pumped from the point of removal of the grit chamber. Provide flanged components for feed connections, and transition fittings to adapt to both the feed and overflow connections.

2.3.1.9 Screw Type Washing Equipment

Include washing tank, steel screw conveyor mounted in a housing, drive unit, and supporting substructures.

Provide heavy-duty stainless steel vessel grit washer suitable to capture grit slurry and separate the grit from the organics. The Grit Washer must be suitable for the following conditions of services:

Design Flow of Grit Slurry per unit:  [_____] cubic meter per second gpm

Grit Processing Capacity per unit:  [_____] kg per hr ton per hr

Maximum water content in washed grit:  [_____] percent at design flow

Maximum volatile solids in washed grit:  [_____] percent at design flow

Minimum capture rate of [_____] size grit:  [_____] percent at design flow

Surface overflow rate:  [_____] cubic meter per second per squared meter gpm per square foot

Horsepower of Driver:  [_____] watts HP

2.3.1.9.1 Mechanism

Convey grit from washer settling compartment and discharge by means of a screw conveyor. Mount [_____] mm inch diameter, [half pitch] with 10 mm 3/8 inch flights, incline screw on [_____] mm inch pipe. Provide manufacture's standard screw, ensuring ease of installation and removal.

a. Grease lubricate tail shaft bearings; provide with high carbon or heat treated alloy steel bushings. Ensure bearings are rated for a minimum of 5 years of continuous service.

b. Ensure drive end bearings are extra heavy roller bearing pillow blocks suitable for taking thrust. Grease lubricated ball bearings are acceptable. Ensure bearings have a minimum rated-life expectancy (L-10) of 40,000 hours based on ABMA 11 on a continuous service basis.

2.3.1.9.2 Housing

Construct the washing tank of 6 mm 1/4 inch steel plate, suitably reinforced and mounted on steel supports. Ensure tank provides a settling compartment for grit separation. Provide suitable anchor bolts. Arrange the substructure to support the washing tank and cyclone, include necessary mounting brackets as a component part of the washer.

2.3.1.9.3 Drive Unit

Provide mechanical variable speed drive unit with a [_____] to 1 ratio, manually adjustable in infinite steps over the entire range.

2.3.1.9.4 Motor

Motor must be suitable for operation with the voltage characteristics indicated.

2.3.1.9.5 Overflow Weir

Regulate depth of liquid in the settling compartment by an adjustable weir fitted at the end of the settling tank. Regulate pool depth to a minimum of 150 percent of the spiral diameter.

2.4 COMPONENTS

2.4.1 Motor

Provide motor that is constant speed, totally enclosed, thermally protected horizontal type, suitable for outdoor service, and conforming to NEMA MG 1. Motor must be of adequate wattage horsepower to drive the equipment continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Motor
must be suitable for operation with the voltage characteristics as indicated. Protect motor against overload, low voltage, and unbalanced voltage. Connect motor directly to speed reducer or drive unit through a flexible coupling.

2.4.2 Speed Reduction Unit

Provide speed reducer with a fully enclosed gear reduction unit. Ensure gears used in speed reducer conform to applicable requirements of the following standards. Ensure speed reducer is designed with a minimum AGMA service factor of 2.0 and has an AGMA Service Classification II.

2.4.3 Bearings

Provide anti-friction drive bearings conforming to the following minimum schedule of rated-life expectancy (L-10) based on the ABMA Standards when operating at the normal continuous torque rating of the mechanism.

a. Worm and wheel gear box bearings: L10-100,000 hours

b. Geared motor (direct drive): L10-100,000 hours

c. Intermediate helical and spur gear box bearings: L10- 17,000 hours

d. Geared motor (indirect drive): L10- 17,000 hours

2.4.4 Chain and Belt Drives

Enclose chain and sprockets or V-belt and pulleys connecting motor and speed reducer in a weatherproofed guard. Chain connecting motor and speed reducer must be steel roller type. Sprockets must be hardened ground alloy steel or high-test cast iron, having a minimum tensile strength of 276 MPa 40,000 psi cast in a chill, and must have Brinell hardness of not less than 360 with a chill depth of not less than 5 mm 3/16 inch. Sprocket teeth must be accurately ground to fit the chain. V-belt drives must be adjustable to increase or decrease belt tension. Drive sprocket must be keyed on the output shaft of the speed reducer and provided with shear pin overload protection. Provide a drive chain tightener to adjust and tighten the chain.

2.4.5 Drive Unit

Provide drive unit that is mechanical variable speed drive with ratio indicated, and is manually adjustable over the entire range. The drive unit must be suitable for mounting with motor provided. Include a motor sheave, speed reduction sheave and V-belt. Transmit the required power with multiple belts. Ensure a minimum service factor of 1.5.

2.4.6 Overload Protection and Alarm

Provide waterproof torque actuated overload alarm system, or indicating ammeter overload unit designed to indicate the load on the mechanism at all times, to sound an alarm in case of impending excessive load, and to stop the mechanism when such load is reached. Include an industrial Type 90-decibel horn, rotating beacon, relay and reset button in a weatherproof
metal housing with a removable gasketed cover. Construct horn of corrosion-resisting material and ensure that it is suitable for remote mounting. Provide shut-off switch, for horn and beacon.

2.5 MATERIALS

2.5.1 Finishes

Except as otherwise specified, treat and paint equipment in accordance with the manufacturer's standard practice.

PART 3 EXECUTION

3.1 INSTALLATION

Install grit handling equipment and accessories specified herein in accordance with approved shop drawings and manufacturer's recommendations. Provide all lubricants for initial operation.

3.1.1 Air Piping

Install piping in alignment and support with pipe hangers and supports. Make mechanical joints in accordance with the requirements of AWWA C600. Make flanged joints tight, avoid undue strain on flanges, valves, fittings, and other equipment and accessories. Make screwed joints tight with pipe thread tape, pipe cement and oil, or PTFE powder and oil, applied to the male threads only. Leave no more than 3 threads exposed, ensure threads are full cut. Make up joints for PVC pipe with solvent cement conforming to ASTM D2564 and join in accordance with the Appendix thereto.

3.1.2 Grit Pump

Mount the pump complete with driver and motor on a heavy duty base. Ensure the base is complete with machined undersurface mounting pads and lifting brackets. Install the complete unit in accordance with the recommendations of the manufacturer. Provide oil and grease for initial operation in accordance with the manufacturer's recommendations.

3.1.3 Cyclone

Install in accordance with the manufacturer's instructions to ensure self-regulation and produce a low moisture grit.

3.2 FIELD QUALITY CONTROL

3.2.1 Tests

3.2.1.1 Grit Separation, Collection, Removal and Washing Equipment

Test equipment in operation to demonstrate correct alignment, smooth operation, freedom from vibration and freedom from noise and overheating of moving machinery. Correct all defects.

3.2.1.2 Aerated Grit Equipment

3.2.1.2.1 Air Diffusers

Test for uniformity. Each diffuser must have uniform distribution along the entire header as determined by the method of testing specified.
a. Test using a large easily read scale for measuring the flow of air to
the header system and pressure gauges for measuring pressure at the
third point of the header. Test the header and diffusers in the
aerated grit tank. Use orifice type meter, of proper size, and
installed in accordance with the recommendation of AGA GMC. Before
tests are started, check the calibration of the orifice meter with a
standard displacement type gas meter of not less than [_____] cubic
meter per second cubic feet per hour capacity which has been accurately
calibrated volumetrically in a manner satisfactory to the Contracting
Officer.

b. For uniformity testing, submerge diffusers in tap water to a depth of
0.30 m one foot. Diffuse air at a rate of [_____] cubic meter per
second cubic feet per minute per diffuser for one minute. Then reduce
the airflow to [_____] cubic meter per second cubic feet per minute per
diffuser, observe uniformity. Replace nozzle having unsatisfactory
distribution.

3.2.1.3 Grit Pump

After pump has been installed, conduct such tests as are necessary to
indicate that the pump conforms to the specifications. A 24-hour operating
period of the pump is required before acceptance. Submit sufficient data,
including manufacturer's rating curves showing pump characteristics of head,
wattage brake horsepower, and speed to show that the pump meets all
requirements of the specifications.

3.2.1.4 Performance Tests

***********************************************************************
NOTE: Performance tests consist of determining the
amount of grit entering the chamber and the amount
of grit in the effluent from the chamber and
comparing the two values as a percentage.
***********************************************************************

Provide field test data demonstrating the performance of grit removal
efficiencies as specified. Specified performance must be met before
equipment will be accepted. The contractor is responsible for testing
costs. Submit an acceptable grit removal efficiency test procedure prior
to actual testing.

3.2.1.5 Cyclone

Upon installation, operate equipment for 24 continuous hours at the design
flow specified. During this period, sample cyclone overflow periodically
as directed by the Contracting Officer, but not less than once every four
hours. Dry and test samples as specified by AASHTO T 27 and AASHTO T 11.
If particles average more than 5 percent larger in size than [_____] mesh,
adjust the equipment to meet these specifications.

3.2.2 Manufacturer Field Service

3.2.2.1 Manufacturer's Representative

Provide the services of an engineer representative to supervise the field
installation and start-up of the equipment and accessories, in accordance
with the manufacturer's specifications.
3.3 CLOSEOUT ACTIVITIES

3.3.1 Grit Handling System

Submit grit handling equipment information, including operation and maintenance manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA, for each item of the grit separation, collection, removal and washing system.

NOTE: This guide specification covers the requirements for comminutor for use in sewage treatment plants normally handling domestic sewage.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com).
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**AMERICAN BEARING MANUFACTURERS ASSOCIATION (ABMA)**

**ABMA 9** (2015) Load Ratings and Fatigue Life for Ball Bearings

**ABMA 11** (2014) Load Ratings and Fatigue Life for Roller Bearings

**ASTM INTERNATIONAL (ASTM)**

**NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)**

**NEMA ICS 2** (2000; R 2020) Industrial Control and Systems Controllers, Contactors, and Overload Relays Rated 600 V

**NEMA MG 1** (2016) Motors and Generators - Revision 1: 2018; Includes 2021 Updates to Parts 0, 1, 7, 12, 30, and 31

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item,
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Comminutor; G[, [_____]]

SD-03 Product Data

Spare Parts

Submit after approval of the drawings and not later than [_____] months prior to the date of beneficial occupancy.

Materials and Equipment

Framed Instructions

SD-06 Test Reports

Field Tests

Booklet form.

SD-10 Operation and Maintenance Data

Operating Instructions; G[, [_____]]

[Six] [_____] copies each of the operation and maintenance
1.3 QUALITY CONTROL

1.3.1 Manufacturer's Services

Obtain the services of the manufacturer's representative experienced in the installation, adjustment, and operation of the equipment specified to supervise the installing, adjusting, and testing of the equipment.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect from weather, humidity and temperature variations, dirt and dust, or other contaminants all equipment delivered and placed in storage.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide materials and equipment conforming to the respective publications and other requirements specified and which are the standard products of a manufacturer regularly engaged in the manufacture of the products. Provide items of equipment that essentially duplicate equipment that has been in satisfactory use at least 2 years prior to bid opening. Ensure equipment is supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.1.1 Nameplates

Provide nameplates for major equipment items to include manufacturer's name, address, type or style, catalog number and model or serial number on a plate securely attached to item of equipment. In lieu of nameplate on the comminutor, integrally casting the manufacturer's name or trademark with comminutor, stamping, or otherwise permanently marking is acceptable.

2.1.2 Protection From Moving Parts

Fully enclose moving parts of the equipment, such as drive chains and sprockets, in removable guards. Fully enclose all equipment above the level of the sewage-carrying channel in a cast-iron or 1.720 mm (14 gauge) sheet steel or wrought-iron housing. Provide housing with a sufficient number of doors or removable panels to insure ready access to any part of equipment for repairing, replacing, or cleaning. Ensure all joints between the housing and the concrete foundation are made leakproof.

2.1.3 Design

**************************************************************************

NOTE: Refer to UFC 3-240-02 for design requirements. The following information should be shown on the project drawings covered by the specification as appropriate:

a. Size and type of channel pipe or joint in which comminutor is to be mounted. Specify whether comminutor access openings are located within pits or manholes.

b. Minimum, average, and maximum sewage flows. The
maximum rating of a comminutor should be made with the combs fully submerged.

c. Normal and maximum liquid levels, including flooding level for submersible drive.

d. Allowable head loss at maximum flow. Head loss should not be set too low for it could exclude rotating type comminutors.

e. Whether comminutor has free discharge or controlled discharge.

f. Whether location requires explosion-proof equipment.

g. Electrical power characteristics.

h. Type of drive mounting and elevations pertinent thereto.

i. Channel design, size and type, should be conducted in manner that optimizes channel width and allows for maximum competition among comminutor suppliers. If the channel width is designed too narrow it could exclude rotating type comminutors.

j. Each comminutor device should have a by-pass for maintenance and repair purposes.

**************************************************************************

Provide a comminutor capable of passing a minimum flow of [_____] cubic meters/second million gallons per day (mgd), an average flow of [_____] cubic meters/second mgd, and a maximum flow of [_____] cubic meters/second mgd. Ensure the head loss at maximum flow does not exceed [_____] mm inches of water. Design comminutor for [free] [controlled] discharge. [Design so the downstream submergence is [_____] mm inches at maximum flow for controlled discharge units.] Ensure comminutor is capable of operating satisfactorily at zero flow.

2.2 COMPONENTS

2.2.1 Electric Motor and Controller

Provide electric motors that conform to NEMA MG 1. Provide motor controller that conforms to NEMA ICS 2.

2.2.2 Comminutor

Provide a comminutor of the [rotating] [or] [oscillating] type for use in a sewage treatment plant. Comminutor consists of an electric motor-driven mechanical shredder or cutter with [gear motor] [hydraulic drive] capable of continuous and automatic operation and must reduce sewage solids to particle sizes between 6.4 and 9.5 mm 1/4 and 3/8 inch. The cutting and screening mechanism are required cut or shred all sewage solids including sticks, rags, and stringy material, without removing them from the sewage flow, without clogging the screen, and without binding, jamming, or stalling the moving parts.
Submit drawings indicating clearances required for maintenance and operation, containing complete wiring and schematic diagrams, equipment layout and anchorage, and any other details required to demonstrate that the system has been coordinated and properly function as a unit.

2.2.2.1 Rotating Drum Type

Rotating drum type comminutors are required to include a slotted drum that functions as a screen and support for the rotating cutters, a casing supporting the stationary cutters, and a drive assembly. Evenly spaced cutting teeth pass through a stationary comb section cutting against it as the cutters rotate. Ensure the unit has a smooth, continuously available torque, 360-degree rotation with equal performance in either direction of rotation. Provide casing made of close-grain cast iron or aluminum alloy of adequate strength and rigidity to withstand all loads imposed on it from the operation of the comminutor and drive assembly. Provide casing with manufacturer's recommended concave semi-circular screen of stainless steel attached to it.

2.2.2.2 Rotating Disc or Conical Type

Rotating disc or conical type comminutors include a stationary grid frame cutter-comb support with cutter-combs, rotating cutter plate/screen with adjustable teeth, and a drive assembly. Cutter plates are fixed and keyed to the center drive shaft permitting only one cutter tooth and a cutter comb to be engaged at one time for load power saving. Provide frame, grid, and discs made of close-grained cast iron or aluminum alloy. Construct the conical screen of the manufacturer's recommended stainless steel.

2.2.2.3 Oscillating Type

Oscillating type comminutors include a stationary semi-circular screen, a stationary cutter bar mounted on a support casing, an oscillating cutter bar, and a drive assembly. Ensure cutter bars are adjustable and readily removable for inspection, sharpening, or replacement. Actuate oscillation by mechanical conversion of the driver rotation. Provide a casing made of close-grain cast iron or aluminum alloy of adequate strength and rigidity to withstand all loads imposed on it from the operation of the comminutor and drive assembly. Construct the casing of the manufacturer's recommended semi-circular screen of stainless steel attached to it.

2.2.3 Motor Controller

Mount the control panel where indicated. Ensure the motor controller is rated as indicated and conform to NEMA ICS 2. Ensure the control system includes an automatic motor starter reset for power failure protection [and an automatic drive motor reversal with time delay for jamming protection in the event of hard particle entrapment in the comminutor cutters]. Design the reversing controller to sense jams and reverse motor rotation as often as necessary, while continuing to operate providing partial sweeps on the comminutor arm, with no danger of motor damage. Provide an audible and visual alarm system to signal both field operator and area office in case of malfunction.

2.2.4 Gear Motor

**************************************************************************
NOTE: Totally enclosed motors should be used except in locations where explosive-proof equipment is
**************************************************************************
Provide an electric motor of constant speed, [totally enclosed] [totally enclosed fan cooled] [explosion-proof], capable of operating in air, partially or completely submerged. Ensure motors are UL listed for Class I, Div I, Group D service, horizontal or vertical type, suitable for outdoor use and conforming to NEMA MG 1. The unit is required to be capable of withstanding any loadings produced by the thrust, out-of-balance, and vibrating forces resulting from operating conditions. Supply gears made of be wrought or alloy steel except that worm gears be bronze. Flame hardened gears are not acceptable. Construct housing of close-grained cast iron, fabricated steel, or aluminum alloy.

2.2.5 Gear Motor Mounting

Mount the comminutor gear motor [close-coupled with the comminutor] [on [an open] [a gas tight] stand with universal shaft to the comminutor. Enclose universal shaft in protective piping to elevation indicated. Provide protective piping with a tapped and plugged hole for drainage] [on an extension pipe at the elevation indicated with universal shafting to the comminutor. Equip extension pipe with handholds to allow inspection and repair of shafting].

2.2.6 Hydraulic Drive

Mount hydraulic actuator on the unit and connected to the shaft. Supply pressurized hydraulic fluid using a power unit that includes an oil reservoir, motor-driven positive displacement pump, and all necessary control valves. Ensure the pump motor is constant speed [totally enclosed] [totally enclosed fan cooled] [explosion-proof], vertical type suitable for outdoor service and conform to NEMA MG 1. Protect motor against overload, low voltage, and unbalanced voltage. Provide rubber-covered abrasion-resistant pressure hose with suitable connectors for connecting the power unit to the hydraulic actuator.

2.2.7 Cutting Elements

Fabricate all secured elements, combs, teeth, and bars of a corrosion- and wear-resistant chrome-tungsten type alloy or equal possessing Brinell Hardness of 450 or better. Ensure all elements are readjustable to compensate for wear, and removable for sharpening or replacement.

2.2.8 Bearings

Provide bearings of the antifriction type having a rating-life expectancy (L-10) of 100,000 hours when equipment is operating continuously. [Provide intermediate guide bearings, where required for extended shafting, for adequate support and alignment made of the ball bearing type enclosed in a self-aligning pillow block housing.]

2.2.9 Lubrication

Lubricate and protect all moving parts of the comminutor from flooding according to the manufacturer's recommendations. Ensure bearings are either oil or grease lubricated. Ensure gear reduction unit is oil lubricated. Provide oil lubricated bearings and reduction units with a sight glass or other positive means of determining oil level. Ensure grease-lubrication pressure-line fittings and oil fill and drain lines are
easily accessible when comminutor is in place.

2.3 MATERIALS

Provide materials that conform to the following:

2.3.1 Cast Iron

ASTM A48/A48M Class 30, minimum.

2.3.2 Bearings

ABMA 9 and ABMA 11.

2.3.3 Aluminum Alloy

ASTM B108/B108M.

2.3.4 Miscellaneous Metal

Provide bolts, nuts, anchors, washers, and other types of supports necessary for the installation of equipment made of steel or wrought iron, galvanized according to the requirements of ASTM A153/A153M. Ensure all anchor bolts and nuts for the comminutor, motor, or power unit are Type 316 stainless steel, ASTM F593.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Install materials and equipment as shown and in accordance with the approved written recommendations of the equipment manufacturer.

3.2.1 Installation within a Channel

******************************************************************************

NOTE: Delete this paragraph when comminutor is to be installed in a pipeline.
******************************************************************************

Ensure the comminutor, motor, power unit, guide bearings, and all equipment requiring attachment to structural supporting members are furnished complete with bolts, nuts, anchors, washers, sole plates, or any other type of supports necessary for the installation of the equipment.

3.2.2 Installation within a Pipeline

******************************************************************************

NOTE: Delete this paragraph when comminutor is to be installed in a channel.
******************************************************************************

Provide comminutor with standard flanged or bell and spigot connections for
installation in pipeline.

3.2.3 Electrical Work

Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical characteristics as indicated. Provide manual or automatic control and protective or signal devices required for the operation specified, and any control wiring required for controls and devices but not shown on electrical plans.

3.2.4 Painting

Thoroughly clean, prime, and give two finish coats of paint to all equipment at the factory in accordance with the recommendations of the manufacturer. Ensure all field painting complies with Section 09 90 00 PAINTING, GENERAL.

3.2.5 Special Tools

Furnish special tools for the proper operation and maintenance of equipment. Install in a wall-mounted hardwood or metal container. Furnish a complete set of manufacturer's recommended spare parts including cutting teeth and combs or other cutting elements, fasteners, screens, seals or bearings, etc. Include a complete list of parts and supplies with current unit prices and source of supply in the spare parts data submission.

3.2.6 Framed Instructions

Post, where directed, framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system. Prepare condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system in typed form, framed as specified above for the wiring and control diagrams, and posted beside the diagrams. Submit proposed diagrams, instructions, and other sheets, prior to posting. Post the framed instructions before acceptance testing of the systems.

3.3 FIELD TESTS

After installation of comminutor is complete, conduct operational tests required to demonstrate that the comminutor operates in accordance with the specified requirements. Submit test reports showing all field tests performed on the installed system to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Ensure each test report indicates the final position of controls.

3.3.1 Scheduling

Provide the Contracting Officer [14] [___] calendar days notice of the dates and times scheduled for the tests.

3.3.2 Tests

Test the comminutor mechanism in the operation mode to demonstrate correct alignment, smooth operation, proper adjustment, freedom from vibration, and freedom from noise and overheating of moving machinery. Ensure the test period includes one hour of operation in each specified range and not less than one cycle of automatic stop, reversal, and restart. Measure head
losses at the specified flow ranges during the tests to assure that the requirements are met. Test operate installed controls to assure that operational requirements of paragraph MOTOR CONTROLLER are satisfied. Make two complete cycles to verify that the system continues to function satisfactorily under all requirements.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Training

**************************************************************************
NOTE: Consult equipment manufacturers for recommended time required to train personnel for the proper operation of the unit and insert number of hours.
**************************************************************************

Provide a field training course for operating and supervising staff members. Provide training for a total period of [_____] hours of normal working time and must start after the system is functionally complete but prior to final acceptance tests. Ensure the field instructions cover all of the items contained in the operating and maintenance instructions.

3.4.2 Operating Instructions

Provide manual of operation explaining in detail step-by-step procedures required for system startup, operation, and shutdown. Include parts list, and a brief description of all equipment and operating features in the instructions.

Provide maintenance manuals explaining in detail routine maintenance procedure including inspection, adjustments, lubrication, and cleaning. List possible breakdown, methods of repair, and a troubleshooting guide in the instructions. Include piping layout, equipment layout, and simplified wiring and control diagrams of the system as installed in the instructions for the equipment furnished. One complete set prior to performance testing and the remainder upon acceptance. Identify the manuals by title, equipment and manufacturer. Submit and obtain approval of all manuals prior to the field training course.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for parallel plate, and vertical tube gravity oil-water separators to remove free oil and particulate matter from oily waste water.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Vertical tube coalescers shall not be used on Army projects.

NOTE: When influent conditions require treatment beyond the capability of a parallel plate, vertical tube, or API type gravity separator (e.g. presence of a mechanical or chemical oil-water emulsion), the designer shall prepare specifications to add one or more of the following unit operations to the separation system to comply with discharge criteria:

- Hydrocyclone
- Chemical pretreatment unit
Flocculator
Dissolved air floatation unit
Electrocoagulation unit
Filter membranes
Cartridge filters
Activated carbon absorber
Multimedia filtration
Sludge dewatering equipment

In addition, these separators are not intended as containment devices. Where applicable regulations dictate containment of accidental spills, suitable containment systems shall be designed.

NOTE: The following information shall be shown on the project drawings:

1. Inlet and outlet pipe invert elevations.
2. Sampling ports integral with the influent pipe and effluent pipe, when required.
3. Accessory equipment.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B16.5  (2020) Pipe Flanges and Flanged Fittings
1.2 SYSTEM DESCRIPTION

1.2.1 Applications

**************************************************************************
NOTE: Delete parts of paragraph which are not applicable for project with respect to liquid carrier. Identify oily wastewater source(s) such as machine and paint shops, aircraft maintenance operations, aircraft washrack and rinse (corrosion control) areas, tank farm and fuel transfer areas, runway and fire training areas, bilge and ballast water, accidental spills, and contaminated stormwater runoff.
**************************************************************************

**************************************************************************
NOTE: Pumping of influent will mechanically emulsify oil in water unless a positive displacement pump or other low emulsifying, de-rated pump is used.
**************************************************************************
NOTE: Identify site specific atmospheric conditions that would produce a corrosive environment for oil-water separator materials so that the proper protective coatings or corrosion resistant materials can be provided.

The separator shall remove free oil [and] emulsified oil [and suspended solids] from oil-in-water mixtures of freshwater [freshwater and seawater] [seawater] originating from [_____] operations. The influent oil-in-water mixture will [flow by gravity] [be pumped] to the unit which [will] [will not] be located in an area with a corrosive atmosphere. [The corrosive atmosphere is composed of [_____.]]

1.2.2 Influent Characteristics

NOTE: Insert maximum design flow and wastewater characteristics which have been established by direct measurement and chemical analysis.

Provide oil-water separator designed for a maximum flow of [_____] liters per second gallons per minute. Operating temperatures of the influent oil-in-water mixture will range from [_____] to [_____] degrees C degrees F and ambient air temperatures will range from [_____] to [_____] degrees C degrees F. The specific gravity [gravities] of the [oil] [oils] at operating oil-water temperatures will range from [_____] to [_____]. The specific gravity of the [freshwater] [freshwater and seawater] [seawater] at operating temperatures will range from [_____] to [_____]. The average specific gravity of the suspended solids is [_____.]. The influent is further characterized as follows:

NOTE: List additional types and concentrations of detergents, anti-oxidants, solvents, acids or bases, and heavy metals that may be present in the oil-in-water mixture. If these additional items are present: chemical addition, flocculation and dissolved air flotation, or other appropriate unit operations may be needed for effective treatment of these constituents.

</tbody>
</table>

1.2.3 Performance Requirements

**************************************************************************
NOTE: Make choice based on standards or guidelines established by environmental regulatory agency(ies); or other design considerations, such as unit wastewater treatment process(es) that follow downstream from this separator. Quantity of free oil removed is dependent on characteristics of oil-in-water mixture. The practical minimum concentration achievable is 10 mg/L for a parallel plate separator under ideal conditions.
**************************************************************************

**************************************************************************
NOTE: In general, free oil is defined as dispersed oil globules that rise to the surface of the water in which it is contained. The rate of rise of the oil particle is a function of its size and specific gravity as defined by Stoke's Law. Oil droplets with diameters of greater than 20 microns and specific gravities of 0.95 or less are considered to constitute the free oil form. Smaller oil droplet diameters are attributed to mechanically or chemically emulsified oil.
**************************************************************************

The [grease and oil] [petroleum hydrocarbon] concentration in the effluent from the oil-water separator shall not exceed the following limitations:

<table>
<thead>
<tr>
<th>Contaminants</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Total grease and oil, 30-day average]</td>
<td>[_____] mg/L</td>
</tr>
<tr>
<td>[Total grease and oil, daily maximum]</td>
<td>[_____] mg/L</td>
</tr>
<tr>

</tr>
<tr>
<td>[Petroleum hydrocarbon, daily maximum]</td>
<td>[_____] mg/L</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

To achieve [this goal] [these goals], it will be necessary to remove all free oil droplets equal to or greater than [20][_____] microns.
1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Separator; G[, [______]]

[ Accessory equipment; G[, [______]]

Submit shop drawings for separator [and accessory equipment] including principal dimensions, location of fittings and unit foundation. Include data to verify center of gravity with the unit empty and filled with water.

SD-05 Design Data
Submit analysis, signed by a registered professional engineer, which indicates that at the calculated overflow rate, the separator will be provided with the required square meter square feet of projected plate separation area to achieve the specified performance under laminar flow (i.e. Reynolds number of less than 500) conditions. Calculations shall take into account the rate of flow, potential surge flow, influent concentrations, particle characteristics, fluid temperature, fluid specific gravities, and pH.

SD-06 Test Reports

Shop hydrostatic test; G[, [____]]

Submit results of hydrostatic and dynamic testing.

Inspection

Field hydrostatic test

Preoperational test

In-service test

SD-07 Certificates

Separator corrosion protection; G[, [____]]

Submit written verification on the fabricator's letterhead that surface preparation and coating application were performed in accordance with the manufacturer's printed recommendations for the coating system.

SD-08 Manufacturer's Instructions

Separator system; G[, [____]]

SD-10 Operation and Maintenance Data

Separator system, Data Package 3; G[, [____]]

Accessory equipment, Data Package 3; G[, [____]]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.4 DELIVERY, STORAGE, AND HANDLING

1.4.1 Delivery and Storage

Inspect materials delivered to site for damage; unload and store with minimum handling. Store materials on-site in enclosures or under protective coverings. Protect materials not suitable for outdoor storage to prevent damage during periods of inclement weather, such as subfreezing
temperatures, precipitation, and high winds. Store materials susceptible to deterioration by direct sunlight under cover and avoid damage due to high temperatures. Do not store materials directly on ground. If special precautions are required, prominently and legibly stencil instructions for such precautions on outside of equipment or its crating.

1.4.2 Handling

Handle separator in such a manner as to ensure delivery to final location in sound, undamaged condition. Take special care not to damage interior and exterior surfaces of separator, coalescing plates, [or tubes] and associated supports and pipe coatings or linings. Make satisfactory repairs to damaged materials at no cost to Government. Carry and do not drag materials.

PART 2 PRODUCTS

2.1 MATERIALS

**************************************************************************
NOTE: Insert reinforced concrete or other suitable material if carbon steel is not acceptable. On larger separators (e.g. flow rate greater than $3.16 \text{ L/s}$, 50 gpm, 6 mm 1/4 inch minimum thickness for carbon steel is recommended. Consult manufacturers' data.
**************************************************************************

Use $[3/16]$ mm inch minimum thick carbon steel conforming to ASTM A36/A36M or material having equivalent structural properties and corrosion resistance for separator, hoppers, stationary and adjustable weirs, nozzles, flow distributor and energy dissipator device, bolts, seals, stiffeners, washers, [separator cover] and nuts. Weld in accordance with AWS D1.1/D1.1M to provide watertight separator that will not warp or deform under load. Use welders qualified in accordance with AWS Standard Qualification Procedure. Grind welds smooth and remove weld spatter. Fabricate free of kinks and sharp bends in a manner not to reduce the strength of steel to a value less than that intended by the design. Size and shape of bends shall be uniform. Clean and finish [carbon steel] surfaces as described in paragraph entitled "Separator Corrosion Protection."

2.1.1 Separator Corrosion Protection

2.1.1.1 Steel Separator

After shop conducted hydrostatic tests have been successfully completed, provide a MIL-DTL-24441 coating system to the interior and exterior surfaces of the separator. Prior to shop painting, abrasive blast clean the surfaces in accordance with SSPC SP 10/NACE No. 2 to a surface profile of 0.025 to 0.0625 mm 1 to 2 1/2 mils. Apply primer conforming to MIL-DTL-24441/1, Formula 150 applied to a minimum dry film thickness of 0.075 to 0.10 mm 3 to 4 mils. Apply intermediate coat conforming to MIL-DTL-24441/2, Formula 151 applied to a minimum dry film thickness of 0.075 to 0.10 mm 3 to 4 mils. Apply topcoat conforming to MIL-DTL-24441/3, Formula 152 applied to a minimum dry film thickness of 0.075 to 0.10 mm 3 to 4 mils. Total dry film thickness shall not be less than 0.23 mm 9 mils. Repair and replace areas of the coating system which are found to be damaged or defective upon delivery of equipment to the site or found to be...
defective due to work of the applicator. An interior polytetrafluoroethylene liner with a minimum thickness of 3 mm 1/8 inch may be provided in lieu of paint coating the interior separator surfaces.

2.1.1.2 Other Than Steel Separator

**************************************************************************
NOTE: If other than steel is specified for the separator material, the designer shall specify an appropriate protective coating system for the separator material specified.
**************************************************************************

After shop conducted hydrostatic tests and have been successfully completed, provide a coating system which will protect the separator from the oil-in-water mixture, [atmosphere,] and in situ soil conditions specified herein.

2.1.1.3 Cathodic Protection

**************************************************************************
NOTE: Specify cathodic protection for metal separators in contact with soil. Design cathodic protection in accordance with the current edition of UFC 3-570-02N, "Electrical Engineering Cathodic Protection" and edit the appropriate guide specification for inclusion in the project specification.
**************************************************************************

For [below ground] [partially above and partially below ground] [above ground] metal separators, provide cathodic protection with test stations as specified in Section [26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM] in addition to the protective coating.

2.1.2 Substitutions

**************************************************************************
NOTE: Designer shall check manufacturer's literature to assure construction material option selected is capable of withstanding anticipated forces and moments for the size of separator designed. Navy has experienced some problems with the fiberglass covered plywood and timber units when the fiberglass cracks; due to water seepage, wood has deteriorated causing structural failure.
**************************************************************************

**************************************************************************
NOTE: Insert suitable material if carbon steel is not acceptable. Consult manufacturers' data.
**************************************************************************

Separators constructed of [reinforced fiberglass][or] [reinforced glass fiber resin laminates over a rigid urethane foam core] may be provided in lieu of carbon steel [______]. Provide fiber glass separator with lifting straps. Glass fiber reinforced plastic weirs may be accepted as a suitable weir and baffle material provided that necessary requirements for anchorage
of these items include provisions for contraction and expansion. Surfaces shall be seamless, chemically resistant to oil-in-water mixture, and resistant to ultraviolet deterioration.

2.1.3 External Surfaces

**************************************************************************

NOTE: Include bracketed text as appropriate for below ground or partially below ground installations.
**************************************************************************

External surfaces and appurtenances shall be resistant to corrosion from the in situ soil, [backfill material,] [groundwater,] [and surface runoff] [surface runoff and the surrounding atmosphere] [soil pH] [soil resistivity].

2.1.4 Internal Surfaces

**************************************************************************

NOTE: The solvents in oil allow some plastic composite surfaces to absorb the oil. Once the plastic surfaces become saturated with oil they can become sticky. This is especially critical with plates since solids will tend not to slide down and eventually will clog the area between the parallel plates, resulting in increased maintenance.
**************************************************************************

Parallel plate [or vertical tube] material and orientation shall enhance oil coalescence and solids removal, and be corrosion and chemically resistant to the oil-in-water mixture [and atmosphere] as specified in paragraph entitled "SYSTEM DESCRIPTION."

2.1.5 Hardware

Bolts, stiffeners, washers, nuts, screws, pins, and fittings as required shall be corrosion resistant [and resistant to seawater]. Provide materials that are inherently corrosion resistant and not merely treated with a corrosion-resistant coating, such as provided by the galvanizing process.

2.1.6 Accessibility

**************************************************************************

NOTE: Separators below grade with access manholes and extension tubes to the surface are not recommended because of the obvious problems associated with visual inspection, cleaning, maintenance and safety. The designer is encouraged to provide an open type unit with removable grates, covers, or guard rail in order to minimize safety problems and improve accessibility. The preferred design is a separator with top at or above grade and open to the atmosphere, or if absolutely necessary, a cover which is completely removable. Access for routine sampling of wastewater should be provided. The cover should be designed so that it is easily removable by one person without the use of special hoists or other equipment. A separator that is
completely open will require a guardrail around the top. However, if the designer is faced with an air emission standard (i.e. State of California) the separator may need to be vapor tight and would preclude the use of open separators.

Do not bury tops of separators. Make the entire top area of the separator visible from ground surface. Separators below grade with access manholes and extension tubes to the surface will not be permitted. Use separators with an open top or a completely removable cover. Use open top separators with removable grating unless otherwise shown. Use top cover and grating that is easily removable by two persons. As a minimum provide access hatches over the following areas: parallel plates, oil storage compartments, Influent sampling area, effluent sampling area, oil skimmer, and weirs. Parts subject to wear or requiring adjustment, inspection, cleaning or repair shall be accessible and capable of convenient removal when required.

2.2 SEPARATION CHAMBER

Provide [above ground] [below ground] [partially above and partially below ground] separator to withstand hydraulic and soil loadings under static and dynamic conditions while empty and during operating conditions. Provide adequate support for additional loadings from separator appurtenances including weirs, hoppers, internal supports, parallel plate [or vertical tube] oil coalescers, equipment transportation, and rapid lowering and braking of load during handling operations. Bolt separator [and accessories] to weld-fabricated, structural steel skid base, or mount on manufacturer's standard base.

2.2.1 Lifting Mechanism

UNECESSARILY Long Paragraphs

NOTE: For units fabricated from fiberglass, specify straps. In a salt water environment substitute acceptable non-corroding metal such as but not limited to copper-nickel, 316 stainless steel, or monel. Aluminum is unacceptable. Consult manufacturers' data.

Fit separator with lifting [lugs] [straps] [padeyes] [supports] for handling and installation. Each [lug] [strap] [padeye] [support] shall carry the total dry weight of the separator and attendant appurtenances. Prominently display lifting instructions on [anodized aluminum] [_____] plate located on outside of separator.

2.2.2 Flanges

Use only flat face flanges and drill 1,034 kPa 150 pound ANSI Standard bolt circle and remove burrs. Use flanged piping connections that conform to ASME B16.5, welding neck type.

2.2.3 Weirs

NOTE: Insert suitable material if carbon steel is not acceptable. Consult manufacturers' data.
NOTE: Angle of slope of hopper bottom shall be greater than the angle of repose of the stored material. Volume and angle of repose for solids collected to be determined by designer based on oil-in-water mixture characteristics and frequency of cleaning.

Attach stationary weirs and adjustable weir supports to separator side walls to provide a watertight seal between adjoining compartments and trough to prevent hydraulic short-circuiting. Use carbon steel [_____] for weir plates and baffles. Provide sharp crested weirs of size and section specified by manufacture. Provide slotted holes in weir plates and baffles or supports to permit horizontal and vertical adjustment of weir or baffle. Use nondeteriorating sealant or gaskets for mounting weir plates. Fill voids between separator wall and weir plate with sealant to make watertight.

2.2.4 Low Point Drains

Provide means at low points for dewatering separator.

2.2.5 Identification Plates

NOTE: In a salt water environment substitute acceptable non-corroding metal such as but not limited to copper-nickel, 316 stainless steel, or monel. Aluminum is unacceptable. Nomenclature (or system identification) to be established by designer.

Provide [anodized aluminum] [_____] identification and instruction plates and stamp necessary data. Securely affix plates, in prominent location, to separator with nonferrous screws or bolts of not less than 3 mm 1/8 inch in diameter. Nomenclature shall be [______].

2.2.6 Instruction Plates

Instruction plates shall describe special or required procedures to operate and service equipment, and shall include warnings of hazardous procedures and notice of safety and health requirements. Plates shall be durable and legible throughout equipment life.

2.2.7 Warning Sign

On entrances to the separator (and entrances to the vault) place a permanent sign which states the following: "DO NOT ENTER separator ( OR VAULT ) OR PERFORM HOT WORK ON OR IN separator UNTIL THE ATMOSPHERE HAS BEEN TESTED AND CERTIFIED GAS FREE AND SAFE."

2.3 INLET COMPARTMENT

NOTE: Where a separate sedimentation basin has been provided the volume of the inlet compartment may be reduced. If total solids are less than 100 mg/L,
these elements may be eliminated after adequate benchscale testing has been completed to support this conclusion. Designer shall indicate run of solids removal line from outlet nozzle to a point above grade.

Provide inlet compartment of sufficient volume to effectively reduce influent [suspended] [settleable] solids and dissipate energy. Use inlet compartment that provides a minimum of 45 minutes detention ahead of the oil coalescing compartment. Provide nonclogging flow distributor and energy dissipator device [and the primary solids collection hopper as specified in paragraph entitled "Reduction of Solids"]. Locate [adjustable, primary surface oil overflow weir and] sample ports as recommended by the manufacturer.

2.4 OIL SEPARATION COMPARTMENT

2.4.1 General

The maximum surface loading rate for the oil separation compartment shall be [_____] liters per square meter per day) [_____] gallons per day per square foot. The separator will also provide a minimum detention time within the oil separation compartment of [_____] minutes at design flow. Detention time will recomputed by calculating the volume of the separation zone within the separator and dividing this volume by the design flow rate. For computing detention time, total volume shall be reduced by 20 percent for the space occupied by settled solids (sediment) and accumulated oil at the surface.

2.4.2 Parallel Plates

Provide parallel plates at an angle from 0.70 to 1.05 rad 40 to 60 degrees with respect to longitudinal axis of the plate corrugations and space not less than 19 mm 3/4 inch apart for removal of free oil and settleable solids. Configuration used shall not promote solids buildup on plates which would increase velocities to point of discharging an effluent of unacceptable quality. Maintain laminar flow at maximum design flow rate throughout plate packs including entrance and exit so as to prevent re-entrainment of oil(s) with water. Flow through plate packs shall be in a downflow mode parallel to plate corrugations or cross-flow perpendicular to plate corrugations, so that the oil collects and coalesces at high point of corrugations and rises to top of pack without clogging from oil or settleable solids. Make minimum effective projected surface area ( [_____]square meters [_____]square feet).

NOTE: Vertical tube coalescers shall not be used on Army projects

2.4.3 Vertical Tubes

If vertical tubes are provided, install tubes perpendicular to bottom of tank and align in a pattern to maintain laminar flow at maximum design flow rate through tube packs including entrance and exit to prevent emulsifying the oil(s) with water. Inlet to tube packs shall prevent hydraulic short-circuiting of oil-in-water mixture across the top of the tubes.
2.4.4 Supports

Brace and support individual plates [and tubes] or plate packs [and tube packs] to withstand loads associated with transportation and operation of units, including inplace cleaning. Equip each plate [or tube] pack with lifting lugs or other attachments for handling and installation. Each lug shall carry total weight of plate pack [or tube pack]. Provide adequate structural supports to facilitate inplace cleaning of plate pack [or tube] bundles.

2.4.5 Baffles

Provide oil retention baffle, adjustable surface oil overflow weir with trough, and stationary underflow baffle. Position underflow baffle to prevent resuspension of solids that have accumulated in secondary solids hopper.

2.5 OUTLET COMPARTMENT

Provide outlet compartment of [_____] cubic meter cubic feet, an adjustable overflow effluent weir, a sampling port, and nozzles.

2.6 ACCESSORIES [AND ACCESSORY EQUIPMENT]

**************************************************************************

NOTE: Specific project requirements may include one or more of the following accessories:

Access platforms
Access ladders (with minimum 1050 mm 42 inch extensions above hatch opening with locking device)
Handrailings
Waste oil transfer pump
Oily waste transfer pump
Sludge transfer pump
Sludge or waste oil storage tanks
Immersion heaters
Tank windows
System monitoring and control instrumentation (e.g. oil content monitor, oil-water interface sensors, control panel, pressure gages, high level alarms, oil flooded alarms, tank level indicators)
Sight glasses
Inlet strainer (duplex)
Air vent valve
Pitot tube sampling valve assemblies
Check valves
Manually actuated valves
Motor actuated valves
Explosion proof doors
Separator backwash system

Select and specify as required. For those accessories required in the project, specify detailed requirements (including sizes, ratings, capacities, performance characteristics) in subparagraphs under paragraph entitled "ACCESSORIES [AND ACCESSORY EQUIPMENT]."

**************************************************************************
NOTE: Review applicable Federal, State, and local air pollution and ventilation requirements to determine need for vapor containment.

Provide bolts, stiffeners, washers, nuts, screws, pins, gaskets, and fittings as required for adjustable weirs, [separator covers] and parallel plate packs [or vertical tube packs]. [Provide separator covers with a vapor proof seal for vapor control with [_____] mm inch inside diameter gas vents and suitable access manways to each separator compartment.]

2.7 FABRICATION

NOTE: Specific project requirements may include one or more of the following accessories:

Access platforms
Access ladders (with minimum 1050 mm 42 inch extensions above hatch opening with locking device)
Handrailings
Waste oil transfer pump
Oily waste transfer pump
Sludge transfer pump
Sludge or waste oil storage tanks
Immersion heaters
Tank windows
System monitoring and control instrumentation (e.g. oil content monitor, oil-water interface sensors, control panel, pressure gages, high level alarms, oil flooded alarms, tank level indicators)
Sight glasses
Inlet strainer (duplex)
Air vent valve
Pitot tube sampling valve assemblies
Check valves
Manually actuated valves
Motor actuated valves
Explosion proof doors
Separator backwash system

Select and specify as required. For those accessories required in the project, specify detailed requirements (including sizes, ratings, capacities, performance characteristics) in subparagraphs under paragraph entitled "ACCESSORIES [AND ACCESSORY EQUIPMENT]."

Where the separator is to be mounted in a concrete vault with a hatch cover, the designer shall address, as a minimum, the following:

1. Hatch covers shall provide access to the entire separator.

2. Hatch covers shall lock in the open position.
3. Light weight covers for non-traffic areas.

4. Interior ladder rungs shall not be set away from cover opening so as to require a person to swing in and grab.

******************************************************************************
NOTE: Review applicable Federal, State, and local air pollution and ventilation requirements to determine need for vapor containment.
******************************************************************************

Provide shop fabricated, skid mounted oil-water separator, or other shop fabricated unit approved by the Contracting Officer, which is comprised of a separator containing an inlet compartment, parallel plate [or vertical tube] oil coalescing compartment, outlet compartment [and the following accessories]:

- [Separator Cover [with vapor proof seal]
] [_____]

2.7.1 Shop Hydrostatic Test

Prior to applying coatings, perform hydrostatic test at atmospheric pressure by filling separator with water in the shop for a minimum of 4 hours. Testing shall be conducted after all seams have been cleaned and all welds have been inspected in accordance with ASTM E165/E165M. Acceptance criteria, for the hydrostatic test, is no leakage after 4 hours using a thorough visual inspection for the leaks.

2.7.2 Reduction of Solids

******************************************************************************
NOTE: Designer shall address special influent characteristics as part of the design when using this specification. Special characteristics include, but are not limited to, inflow rate, grit content, viscosity of petroleum product, AFFF foam, heavy metals, and reverse emulsion. Determine need for a solid waste basin preceding the separator and specify solid waste basin requirements when required by site conditions.
******************************************************************************

******************************************************************************
NOTE: If total solids are less than 100 mg/L, these elements may be eliminated after adequate benchscale testing has been completed to support this conclusion. Designer shall indicate run of solids removal line from outlet nozzle to a point above grade.
******************************************************************************

Inlet compartment shall reduce [suspended] [settleable] solids to nonclogging level for parallel plates [or vertical tubes] and provide a uniform oily wastewater hydraulic loading across inlet face of oil coalescing compartment, under laminar flow conditions. Equip compartment with an inlet nozzle with wastewater sampling port, nonclogging flow
distributor and energy dissipator device, [primary solids collection hopper,] [primary solids outlet nozzle,] [oil retention weir,] [adjustable surface oil overflow weir with trough,] [primary oil outlet nozzles]. The oil-water separator shall be preceded by a solid water basin which includes a removable solids or trash basket. Equip the solid water basin with a hoist for servicing the trash basket. Size the basket to retain all solids larger than 75 mm 3 inches in any dimensions. The solid waste basin shall have a minimum storage volume of [945] [_____] liters [250] [_____] gallons.

2.7.3 Oil Coalescing Compartment

**************************************************************************
NOTE: The interpretation of "easily removable" has two meanings in the industry. One is the complete removal of the entire bundle from the separator; the second is removal of individual 300 mm square one foot square bundles. The designer shall adapt the specification to the specific demands of the project.
**************************************************************************

Equip oil coalescing compartment with easily removable and reinstallable, parallel, corrugated plates [or vertical tubes] arranged to optimize separation of free oil from liquid carrier. Use parallel plates [or vertical tubes] that are easily removable without dismantling packs and without confined space entry. Provide adjustable surface oil overflow weir with trough, oil outlet nozzle and stationary underflow baffle, oil retention baffle positioned to prevent discharge of free oil that has been separated from the carrier liquid in inlet and oil coalescing compartments. Provide access to each plate pack [or tube bundle] from top. Each bundle shall be equipped with handles or lifting rings. Plate designs that permit cleaning of plate packs in place are not acceptable.

2.7.4 Wastewater Sampling Port

Equip inlet and outlet compartments, adjustable overflow effluent weir, effluent trough, and wastewater outlet nozzle with wastewater sampling ports permitting easy access for obtaining isokinetic influent and effluent samples.

2.7.5 Connections

Connect the separator at the inlet and outlet pipe invert elevations indicated. Follow equipment manufacturer's recommendation for setting and adjusting top of weir elevations throughout unit.

2.7.6 Storage

**************************************************************************
NOTE: Normally oil storage compartments will be contained inside the separator and the requirement for an adjacent waste oil storage tank will be deleted. However, when conditions warrant, an adjacent waste oil storage tank may be provided. In order to size the waste oil tank, the designer shall contact the activity to determine frequency of waste oil collection performed at the activity. Designer shall check current Federal and State requirements governing the need and installation criteria for secondary containment (e.g. double wall waste oil
tank).

Provide oil and suspended solids collection, storage, and transfer systems as an integral part of the proposed oil-water separator system. As a minimum, the separator oil storage compartment shall have a capacity of not less than 10 percent of the total separator volume. [The adjacent waste oil tank shall have a capacity of [_____] liters gallons.]

PART 3   EXECUTION

3.1   INSPECTION

Inspect each component of separator for compliance with requirements specified in PART 2   PRODUCTS. Redesign or modification of equipment to comply with specified requirements, or necessary redesign or modification following failure to meet specified requirements, shall receive particular attention for adequacy and suitability. This element of inspection shall encompass visual examinations and dimensional measurements. Noncompliance with specified requirements, or presence of one or more defects preventing or lessening maximum efficiency of separator operation, shall constitute cause for rejection.

3.2   INSTALLATION

Lift separator as required without parallel plate packs [or vertical tube packs] in place onto level foundation using lifting mechanism provided. Level separator and bolt to supports to prevent hydrostatic uplift and ensure unit stability. Use a lifting bar through lugs to insert plate packs into separator and place on supports. Caulk around packs and pack supports with sealing compound conforming to ASTM C990 to prevent hydraulic short-circuiting. Avoid abrupt contact between the packs and the separator walls and pack supports to avoid damage. Separator system installation shall be conducted in accordance with manufacturer's recommendations.

3.3   FIELD QUALITY CONTROL

3.3.1   Field Hydrostatic Test

After separator has been leveled and secured to foundation and parallel plate packs [or vertical tube packs] are in place, level effluent overflow weir at elevation specified by manufacturer and hydrostatically test unit at atmospheric or operational pressure (for no leakage) for an additional 8 hours by filling with water. Perform the hydrostatic test prior to backfilling below ground or partially below ground installations.

3.3.2   Preoperational Test

The manufacturer's service representative shall inspect, operate, and test unit before in-service testing by the Contractor.

3.3.2.1   Tests

Tests shall include but not be limited to the following:

a. Soundness (without cracked or otherwise damaged parts).

b. Completeness in all details, as specified.
c. Correctness of setting, alignment, and relative arrangement of each component.

d. Verification of proper operation for all system components.

3.3.2.2 Preoperational Investigation and Test Report

Submit manufacturer's service representative's preoperational test report. Document inspections, operations, adjustments, and tests performed and indicate whether they were acceptable or not. For unacceptable items, describe corrective action taken or recommended. Include detailed descriptions of points inspected, tests and adjustments made, quantitative results obtained if such are specified, and suggestions for precautions to be taken to ensure proper maintenance. Include the manufacturer's certificate that equipment conforms to specified requirements and is ready for permanent operation and that nothing in installation will render manufacturer's warranty null and void.

3.3.3 In-Service Test

After hydrostatic test and preoperational test have been successfully completed and unit has been properly connected to influent and effluent piping, allow influent oil-in-water mixture previously described in paragraph entitled "SYSTEM DESCRIPTION" to flow into separator filled with water. Adjust and level [primary] [and secondary] surface oil overflow weirs to optimize oil skimming and minimize water overflow to oil recovery. Optimize operation of unit within 5 working days. Operate unit for a minimum of ten separator volume changes prior to testing for removal of contaminants and document testing results.

3.3.3.1 Analytical Methods

Test and sample preservation methods for test contaminants shall be in accordance with the latest revisions of AWWA 10084, APHA Standard Methods for the Examination of Water and Wastewater, EPA 600/4-79/020, EPA Methods for Chemical Analysis of Water and Wastes, or those substitute methods approved by the governing regulatory agencies having jurisdiction.

3.3.3.2 Test for Contaminants

Verify the separator efficiency by testing influent and effluent for contaminants described in paragraph entitled "Performance Requirements." If effluent quality is found to be unacceptable, then verify influent to effluent performance in particle size removal at the site. Tests shall be performed by an independent certified testing laboratory.

3.3.3.3 Sampling Procedures

**************************************************************************

NOTE: The separator top hatch covers are used by many manufacturers to satisfy the sampling port requirement. The designer has the option to provide dedicated sampling points integral to the influent pipe and effluent pipe.

**************************************************************************

Within an 8 hour period and at regular intervals collect a minimum of 10 influent and effluent samples from sampling ports provided as part of the separator. Purge each sampling port to remove built-up solids or other
material prior to collecting sample. Collect wastewater samples isokinetically in clean glass containers with polytetrafluoroethylene lined caps. Collect duplicate wastewater samples in separate glass containers. Do not attempt to split sample. Use containers for other contaminants as recommended in references listed in paragraph entitled "Analytical Methods."

3.3.3.4 Acceptance Criteria

**************************************************************************
NOTE: Based on standards or guidelines established by environmental regulatory agency(ies) in which the project is located or based upon wastewater treatment process(es) that follow downstream from this separator, specify the maximum unacceptable limit permitted in order for the separator to be accepted as meeting the performance requirements of this specification.
**************************************************************************

90 percent of the effluent samples taken shall not exceed the specified daily maximum limit for [grease and oil] [petroleum hydrocarbon] contaminants. The remaining samples shall not exceed [_____] mg/L for grease and oil] [_____] mg/L for petroleum hydrocarbon] contaminants. If the separator does not meet requirements of this specification, due to poor workmanship and wrong fabrication dimensions, the unit may be rejected. If the unit is not operating at design efficiency 5 days after installation, Government may reject system. In the event Government rejects unit, Contractor shall remove separator or defective components and replace with acceptable unit or components and test as specified above.

NOTE: This guide specification covers the requirements for chemicals and controlled volume pumps and appurtenances consider Specification 41 31 11 for CHLORINE GAS FEED. THIS SPECIFICATION IS PRIMARILY USED FOR WATER, WASTEWATER AND MECHANICAL PROCESS WATER TREATMENT SYSTEM.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard’s Check Reference feature when you add a Reference Identifier (RID) outside of the Section’s Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification
technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 MAINTENANCE MATERIAL SUBMITTALS

**************************************************************************
NOTE: Designer shall specify any additional devices that are required to be provided by the contractor to ensure the system operator is able to accurately measure the desired analytes being distributed by this system. Delete items below which may not be required for specific project.
**************************************************************************

Concurrent with delivery and installation of the specified equipment, furnish auxiliary equipment and spare parts as follows:

a. Spare parts for each different item of material and equipment specified including all of the parts recommended by the manufacturer to be replaced after [1][ and][ 3] [year] [years] service.

b. For each machine: one extra of each part used that is made from glass, hard rubber, or clear plastic; one extra set of solution-hose connections; one extra set of diaphragms, two filler plug seal washers; two ball checks; two seats; two complete sets of all gaskets; one spare diaphragm for each back pressure regulator; one hydraulic plunger assembly for each different size metering pump; one of each type of material back pressure regulator, with three spare springs and fluorocarbon resin diaphragms for each; one spare diaphragm and air valve for pulsation dampener.

c. For each different size of direct current motor one SCR circuit board with 12 drive motor fuses and 12 SCR controller fuses; overload
replacement elements for each size and type of motor.

d. One set of special tools for each type of equipment including calibration devices, and instruments required for adjustment, calibration, disassembly, operation, and maintenance of the equipment.

e. Two pairs of safety goggles and/or face shields, two chemical resistant aprons, and two pairs of chemical resistant gloves in one or more wall mounted steel cases.

f. One assembly tool for tubular diaphragm.

g. One lever type grease gun or other lubricating device for each type of grease required.

h. One or more steel tool cases mounted on the wall in a convenient location complete with flat key locks, two keys, and clips or hooks to hold each special tool.

i. [_____]}

1.4 DELIVERY, STORAGE, AND HANDLING

Protect material and equipment delivered and placed in storage from the weather, excessive humidity and excessive temperature variation, dirt, dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a chemical feed system consisting of a chemical supply storage tank from which the chemical solution is pumped through piping or tubing, as appropriate, to the point of application. Include with each chemical feed system controlled volume pumps, tanks, mixers, gauges, back pressure regulators, strainers, pressure relief valves, sight glasses and flow metering devices, check valves, and hand valves.

2.1.1 System Requirements

Select and fabricate the pumps in accordance with HI ANSI/HI 7.1-7.5 and HI 9.1-9.5 except as modified herein. Provide pump stands and platforms adequate to support the pumping system.

2.1.2 Performance Requirements

Capacity and features of the chemical feed systems and accessories must be suitable for 24-hour full load service in ambient, non-freezing conditions.

2.1.3 Submittal Data for Chemical Feed System

Submit manufacturer's performance charts, and pump curves. List of materials, list of equipment, including a complete list of parts and supplies with current unit prices and source of supply. List of special tools for each type of equipment furnished including special tools necessary for adjustment, operation, maintenance, and disassembly.
2.1.4 Extended Warranty

provide Manufacturer's Extended Warranty to cover system components for [3][5][_____] years.

2.2 EQUIPMENT

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least [2][5][__] years prior to [bid opening][request for proposal]. Equipment must be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Submit Service Organization Certificates outlining their location and qualifications to the Contracting Office.

2.2.2 Nameplates

Secure a plate to each major item of equipment containing the manufacturer's name, address, type or style, model or serial number, and catalog number.

2.2.3 Controlled Volume Pumps

**************************************************************************
NOTE: See HI 7.1-7.5 to determine the optimum type of metering pumps with capacities between 0.04 liters per hour 0.011 gph and 10,000 liters per hour 2500 gph. Materials for each pump shall be as recommended in Table 9.3 of HI 9.1-9.5 for the material to be pumped. If the system backpressure is not at least 5 psi 0.35 bar greater than the suction pressure, a backpressure valve must be installed in the discharge piping to prevent flow through (downhill pumping) which contributes to pump failure and undesired flow at pump shutdown. System backpressure must not exceed the rated discharge pressure of the pump.
**************************************************************************

Provide controlled volume pumps as defined by HI ANSI/HI 7.1-7.5. Each pump must be capable of delivering chemical solution at any rate from the minimum flow rate to the maximum flow rate and be capable of continuous operation at rated capacity. Accuracy must be plus or minus 2 percent over a 100 to 1 range from the required maximum capacity to the minimum pumping rate. Net positive suction head required cannot exceed 90 percent of the net positive suction head available, as installed. Provide in a configuration as simple as practicable to provide equipment isolation, bypass and reliable service and to be readily accessible for inspection, cleaning, adjustment, repairs, and replacements.

2.2.3.1 Acid Feed System

Provide the following for [hydrochloric][sulfuric][_____] acid solution delivery.
Concentration of material on suction side of pump: Minimum [_____] percent; maximum [_____] percent.

Number of pumps: [_____].

Type of pump: [Packed plunger] [Packed piston] [Mechanically or hydraulically coupled diaphragm].

Configuration: [Simplex] [Duplex] [Multiplex].

Controls: [Automatic] [Semiautomatic] [Manual] rate adjustment.

Feed or flow rate: Minimum [_____] L/ourghph; maximum [_____] L/ourghph.

Back pressure at point of injection: [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPa psig. Regulators must be of [polyvinyl chloride] [or] [_____] construction with [fluorocarbon resin] [or] [chlorosulphonated polyethylene] diaphragms.

Suction valve cartridge: [Single] [Double] [Slurry type] ball check.

Discharge valve cartridge: [Single] [Double] [Slurry type] ball check.

Materials of construction allowed for wetted parts: [Type [304L] [316] [316L] stainless steel,] [PVC,] [hypalon] [nylon,] [fluorocarbon resin,] [chlorosulfonated polyethylene,] [hard rubber,] [and _____].

2.2.3.2 Adsorption Agent Feed Systems

Provide the following for [powdered activated carbon] [_____] slurry delivery.

Concentration of material on suction side of pump: Minimum [_____] percent; maximum [_____] percent.

Number of pumps: [_____].

Type of pump: [Packed plunger] [Packed piston] [Mechanically or hydraulically coupled diaphragm].

Configuration: [Simplex] [Duplex] [Multiplex].

Controls: [Automatic] [Semiautomatic] [Manual] rate adjustment.

Feed or flow rate: Minimum [_____] L/ourghph; maximum [_____] L/ourghph.
Back pressure at point of injection: [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride] or [_____] construction with [fluorocarbon resin] or [chlorosulphonated polyethylene] diaphragms.

Suction valve cartridge: [Single][Double][Slurry type] ball check.

Discharge valve cartridge: [Single][Double][Slurry type] ball check.

Materials of construction allowed for wetted parts: [Type [304L][316][316L] stainless steel,] [PVC,] [hypalon] [nylon,] [fluorocarbon resin,] [chlorosulfonated polyethylene,] [hard rubber,] [______].

### 2.2.3.3 Base Feed System

Provide the following for [sodium carbonate (soda ash)][sodium hydroxide (caustic soda)][______] solution delivery.

| Concentration of material on suction side of pump: | Minimum [_____] percent; maximum [_____] percent. |
| Number of pumps: | [______]. |
| Type of pump: | [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm]. |
| Configuration: | [Simplex][Duplex][Multiplex]. |
| Feed or flow rate: | Minimum [_____] L/hour gph; maximum [_____] L/hour gph. |
| Back pressure at point of injection: | kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at kPapsig. Regulators must be of construction with diaphragms. |
| Suction valve cartridge: | [Single][Double][Slurry type] ball check. |
| Discharge valve cartridge: | [Single][Double][Slurry type] ball check. |
Materials of construction allowed for wetted parts: [Type [304L][316][316L] stainless steel,[ PVC,][ hypalon ][nylon,][ fluorocarbon resin,][ chlorosulfonated polyethylene,][ hard rubber, ____].

2.2.3.4 Biocide Feed System

Provide the following for [copper sulfate][____] solution delivery.

| Concentration of material on suction side of pump: | Minimum [____] percent; maximum [____] percent. |
| Number of pumps: | [____]. |
| Type of pump: | [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm]. |
| Configuration: | [Simplex][Duplex][Multiplex]. |
| Feed or flow rate: | Minimum [____] L/hourgph; maximum [____] L/hourgph. |
| Back pressure at point of injection: | [____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [____] kPapsig. Regulators must be of [polyvinyl chloride][ or ][____] construction with [fluorocarbon resin][ or ] [chlorosulphonated polyethylene] diaphragms. |
| Suction valve cartridge: | [Single][Double][Slurry type] ball check. |
| Discharge valve cartridge: | [Single][Double][Slurry type] ball check. |
| Materials of construction allowed for wetted parts: | [Type [304L][316][316L] stainless steel,[ PVC,][ hypalon ][nylon,][ fluorocarbon resin,][ chlorosulfonated polyethylene,][ hard rubber, ____]. |

2.2.3.5 Coagulant Aid Feed System

Provide the following for [photoelectron][____][solution][slurry] delivery.

| Concentration of material on suction side of pumps: | Minimum [____] percent; maximum [____] percent. |
| Number of pumps: | [____]. |
| Type of pump: | [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm]. |
| Configuration: | [Simplex][Duplex][Multiplex]. |
| Feed or flow rate: | Minimum [_____] L/hour; maximum [_____] L/hour. |
| Back pressure at point of injection: | [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride][ or ][_____] construction with [fluorocarbon resin][ or ][chlorosulfonated polyethylene] diaphragms. |
| Suction valve cartridge: | [Single][Double][Slurry type] ball check. |
| Discharge valve cartridge: | [Single][Double][Slurry type] ball check. |
| Materials of construction allowed for wetted parts: | [Type [304L][316][316L] stainless steel,][ PVC,][hypalon][ nylon,][ fluorocarbon resin,][ chlorosulfonated polyethylene,][ hard rubber][, ____]. |

2.2.3.6 Disinfecting Agent Feed Systems

Provide the following for [ammonium sulfate][hypochlorite][_____] solution delivery.

| Concentration of material on suction side of pump: | Minimum [_____] percent; maximum [_____] percent. |
| Number of pumps: | [_____] |
| Type of pump: | [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm]. |
| Configuration: | [Simplex][Duplex][Multiplex]. |
| Feed or flow rate: | Minimum [_____] L/hour; maximum [_____] L/hour. |
### Back pressure at point of injection:
- [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride][ or ] [_____] construction with [fluorocarbon resin][ or ] [chlorosulphonated polyethylene] diaphragms.

### Suction valve cartridge:
- [Single][Double][Slurry type] ball check.

### Discharge valve cartridge:
- [Single][Double][Slurry type] ball check.

### Materials of construction allowed for wetted parts:
- [Type [304L][316][316L] stainless steel,][ PVC,][ hypalon][ nylon,][ fluorocarbon resin,][ chlorosulfonated polyethylene,][ hard rubber][, _____].

### 2.2.3.7 Miscellaneous Feed System

Provide the following for [poly(diallyldimethylammonium chloride)][calcium chloride][sodium aluminate][sodium metabisulfite (sodium pyrosulfite)][sodium chloride][sodium silicate][monosodium phosphate][disodium phosphate][_____] [solution][slurry] delivery.

### Concentration of material on suction side of pump:
- Minimum [_____] percent; maximum [_____] percent.

### Number of pumps:
- [_____].

### Type of pump:
- [Packed plunger][Packed piston][Mechanically or hydraulically coupled diaphragm].

### Configuration:
- [Simplex][Duplex][Multiplex].

### Controls:

### Feed or flow rate:
- Minimum [_____] L/hourgph; maximum [_____] L/hourgph.

### Back pressure at point of injection:
- [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPapsig. Regulators must be of [polyvinyl chloride][ or ] [_____] construction with [fluorocarbon resin][ or ] [chlorosulphonated polyethylene] diaphragms.

### Suction valve cartridge:
- [Single][Double][Slurry type] ball check.
### Oxidant Feed System

Provide the following for [potassium permanganate][hydrogen peroxide][_____] solution delivery.

<table>
<thead>
<tr>

</tbody>
</table>
Materials of construction allowed for wetted parts: [Type 304L, 316, 316L stainless steel, PVC, hypalon, nylon, fluorocarbon resin, chlorosulfonated polyethylene, hard rubber].

2.2.3.12 Sequestrant Feed Systems

Provide the following for [sodium polyphosphate, glassy (sodium hexametaphosphate), sodium tripolyphosphate] solution delivery.

Concentration on suction side of pump: Minimum [_____] percent; maximum [_____] percent.

Number of pumps: [_____] pump.

Type of pump: [Packed plunger, Packed piston, Mechanically or hydraulically coupled diaphragm].

Configuration: [Simplex, Duplex, Multiplex].

Feed or flow rate: Minimum [_____] L/hour; maximum [_____] L/hour.

Back pressure at point of injection: [_____] kPapsig. Install back pressure regulating valve on the pump discharge and factory adjust to crack open at [_____] kPa psig. Regulators must be of [polyvinyl chloride] or [fluorocarbon resin] or [chlorosulfonated polyethylene] diaphragms.

Suction valve cartridge: [Single, Double, Slurry type] ball check.

Discharge valve cartridge: [Single, Double, Slurry type] ball check.

Materials of construction allowed for wetted parts: [Type 304L, 316, 316L stainless steel, PVC, hypalon, nylon, fluorocarbon resin, chlorosulfonated polyethylene, hard rubber].

2.2.4 Controls

**********************************************************************************************************************************************

NOTE: Proportional control is appropriate for variable flow systems. Batch systems should have manual, pH, ORP, or timer control. Constant pumping rate systems should respond to pump operation or a flow switch, if the pumps are remote from the feed system. Designer should delete any paragraphs below that are not necessary for this specific project.
Provide the chemical metering equipment with the appurtenances and accessories, as required, for flow capacity adjustment. Provide manual range adjustment on all systems.

2.2.4.1 Automatic Control

Provide automatic control with the capability to vary feed rate based on signals from a [flow], [oxidation-reduction potential (ORP)], [or] [pH] meter or controller.

2.2.4.1.1 Flow meter and Controller

Provide flow meter and controller capable of varying the chemical dosage in proportion to the measured flow with the dosage per flow unit manually adjustable.

2.2.4.1.2 Oxidation-Reduction Potential Probe

Provide oxidation-reduction potential probe located where indicated. Supply probe capable of varying the chemical feed rate in response to the deviation from set point.

2.2.4.1.3 pH Probe

Provide pH probe and locate the pH probe where indicated. Supply probe capable of varying the chemical feed rate in response to the deviation from set point.

2.2.4.2 Semiautomatic Control

Provide semiautomatic control with the capability to automatically start and stop the chemical metering equipments. The pump start and stop must respond to [flow switch][ or ] [pump operation][ or ] [timer] status. Install flow switch for semiautomatic operation in the pipe line upstream of chemical injectors.

2.2.4.3 Manual Control

Provide nonautomatic control with the capability for starting or stopping the chemical metering equipment and adjustment of the solution feed rate by the operator.

2.2.5 Drives for Controlled Volume Pumps

**************************************************************************

NOTE: Alternating current motors are preferred where a reliable power supply is accessible. Water power drives are feasible only when the take off can be located at a point with significantly higher pressure than the injection pressure. Designer should delete any paragraphs below that are not necessary for this specific project.

**************************************************************************

Provide with and drive the metering pumps by [water pressure][alternating current electric motor][direct current electric motor][plant air][gasoline engine] drives.
2.2.5.1 Water Pressure Drive

Provide appropriate pressure regulation devices for water pressure drives operated off system water pressures.

2.2.5.2 Electric Motor Drive

Electric motor must be of sufficient capacity to operate the chemical metering equipment under all operating conditions without exceeding their rated nameplate current or power, or their specified temperature limits. Provide motors having starting characteristics and ruggedness necessary under the actual conditions of operations or clean-up procedures used in the areas where they are located. Alternating current motors with power rating of 248.6 W/1/3 hp or less must be 115 volts, single-phase, 60-Hz service; motors with power rating in excess of 248.6 W/1/3 hp must be 460 volts, three-phase, 60-Hz service. Electrical features of direct current motors, including the ratings of the motors, must be compatible with the capabilities and ratings of the rectifier controllers with which they are used.

2.2.5.3 Gasoline Engine Drive

Provide gasoline engines that develop sufficient horsepower to operate the chemical metering equipment continuously under the maximum operation conditions without overheating or overloading when operating at a speed not to exceed [_____] rpm. Provide 4-cycle, vertical, single cylinder, high tension magneto, air cooled type engines. Connect the engine to the pump or mechanical device by V-belts that are fully guarded.

2.2.6 Calibration Standpipes

Provide chemical metering equipment with a calibration standpipe for measuring pump output. The standpipe must allow convenient observation of the change of fluid level for at least 1/2 minute at full stroke and maximum speed settings, and of Schedule 80, clear PVC pipe conforming to ASTM D1785 with Schedule 80 fittings equipped with a flanged connection to the pump manifold and an end cap fitted with a PVC vacuum breaker and ball valve for air venting. The standpipe must have a clear, observable length of at least [300 mm/12 inches] and be permanently calibrated in liters and gallons and fractions thereof, to allow reading of the fluid contents with an accuracy of [1] percent.

2.2.7 Valves

2.2.7.1 Metering Pump Valves

Equip the metering pump with adjustable internal vacuum and pressure relief valve, hydraulic oil refill valve, and automatic air bleed valve. The relief valve must be adjustable over the full pressure range of the pump and preset at the factory.

2.2.7.2 Suction and Discharge Valves

Fit suction and discharge valve cartridges with ball checks that open to full pipe diameter.
2.2.7.3 Back Pressure Valve

Install back pressure regulating valve on the pump discharge and factory adjust to crack open at the indicated pressure. Provide spring opposed diaphragms with loading pressures adjustable by means of a screw in the top works.

2.2.7.4 Pulsation Dampeners

**************************************************************************
NOTE: The pulsation dampener should always be installed as close to the pumps as possible in order to reduce the length of pipe in which pulsating flow occurs. A pulsation dampener is a pneumatically charged diaphragm within a chamber that stores energy carried in the acceleration of the pumped fluid. On the discharge side it will protect sensitive equipment from pulsating flow spikes, and will translate pulsating flow to near linear flow by reducing the peak flow and pressure generated by the metering pump. When a pulsating dampener is used on the suction side of a metering pump, it will improve suction pressure conditions by reducing pressure losses associated with the acceleration of the fluid.
**************************************************************************

Size pulsation dampeners for the displacement of each pump. Pulsation dampeners must have a diaphragm separating the upper chamber from the lower chamber. Charge the upper chamber with compressed air to 50 percent of the expected line pressure. Provide the diaphragm of molded construction and prevent the air charge from being dissolved in the process fluid. The lower chamber must be [plastic] [or] [lined with inert plastic material] to prevent corrosion by the process fluid. Equip the upper chamber with a tire valve type charging valve and air pressure gauge. Provide an air line and air hose with pressure regulator and hand-operated, lever-type valve suitable for charging the pulsation dampers.

2.2.8 Solution Tanks

**************************************************************************
NOTE: This paragraph lists tank specifications. If single wall tanks are preferred, designer must ensure secondary containment is provided within the plans and that containment is separated from other tank containment areas to prevent mixing of chemicals during a spill event. Size dissolving baskets and tank mixers to provide initial mixing and maintain suspensions.
**************************************************************************

Provide tanks that are fully resistant to the effects of the full-strength and fully diluted solution concentrations, and be pressure rated for 1.5 times the weight of solution at full capacity. Each tank must have the capacity listed in the following table and be equipped with a fill nozzle, vent, discharge, level instrument, drain, and two spare connections. Reinforce tanks to withstand all forces when full of solution. Tanks must be completely shop fabricated with no field assembly permitted. Provide drain connections permitting complete drainage of the tank. All gaskets must be fluorocarbon elastomer; nuts and bolts Type 316 stainless steel;
and steel supports either stainless or epoxy coated. Furnish each tank with a calibrated side wall strip to indicate volume. Attach a permanent plastic sign indicating the tank contents to the front of each tank. Fit tanks smaller than 900 mm 36 inches in diameter with removable lids. Fit tanks larger than 900 mm 36 inches in diameter with 600 mm 24 inch manways. Manufacture polyethylene tanks in accordance with ASTM D1998. Manufacture fiberglass tanks in accordance with ASTM D3299 with flanged openings in accordance with ASTM D5421. Line steel tanks with [ceramic], [rubber] or [plastic], as indicated herein. Provide tanks designated to be double walled or provided with secondary containment, as indicated in the tables. Provide dissolving baskets and tank mixers as indicated. Provide floating seals as indicated.

2.2.8.1 Acid Tank

Provide [hydrochloric][sulfuric] acid solution resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Number of tanks:</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum tank capacity:</td>
<td>[_____] litersgal.</td>
</tr>
<tr>
<td>Sign reading:</td>

<tr>
<td>Floating seal:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Containment:</td>
<td>Double wall and secondary containment.</td>
</tr>
</tbody>
</table>

2.2.8.2 Adsorption Agent Tank

Provide [powdered activated carbon][_____] slurry resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Number of tanks:</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum tank capacity:</td>
<td>[_____] litersgal.</td>

</tr>
<tr>
<td>Floating seal:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Containment:</td>
<td>Double wall and secondary containment.</td>
</tr>
</tbody>
</table>

2.2.8.3 Base Tank

Provide [sodium hydroxide (caustic soda)][_____] solution resistant tank and comply with the following:
### Biocide Tank

Provide [copper sulfate][Tolcide(R)][Glutaraldehyde][_____] solution resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of tanks:</td>
<td>[_____]</td>
</tr>

<td>Double wall and secondary containment.</td>
</tr>
</tbody>
</table>

### Coagulant Aid Tank

**************************************************************************
NOTE: Polyelectrolytes degrade with storage.
**************************************************************************

Provide [polyelectrolyte][_____] solution resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of tanks:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Minimum tank capacity:</td>

<td>Mixer:</td>
<td>[Constant][Variable] speed [_____] rpm, maximum.</td>
</tr>
<tr>
<td>Dissolving basket:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Floating seal:</td>
<td>[_____]</td>
</tr>
</tbody>
</table>
2.2.8.6 Disinfecting Agent Tank

Provide [ammonium sulfate][hypochlorite] solution resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Number of tanks:</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum tank capacity:</td>
<td>[_____] litersgal.</td>
</tr>
<tr>

<td>[_____]</td>
</tr>
<tr>
<td>Floating seal:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Containment:</td>
<td>Double wall and secondary containment.</td>
</tr>
</tbody>
</table>

2.2.8.7 Miscellaneous Tanks

Provide [poly(diallyldimethylammonium chloride)][calcium chloride][sodium aluminate][sodium metabisulfite (sodium pyrosulfite)][sodium chlorite][sodium silicate][monosodium phosphate][disodium phosphate] solution resistant tanks and comply with the following:

<table>
<thead>
<tr>
<th>Number of tanks:</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum tank capacity:</td>
<td>[_____] litersgal.</td>
</tr>
<tr>

</tr>
<tr>
<td>Mixer:</td>
<td>[Constant][Variable] speed [_____] rpm, maximum.</td>
</tr>
<tr>
<td>Dissolving basket:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Floating seal:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Containment:</td>
<td>Double wall and secondary containment.</td>
</tr>
</tbody>
</table>

2.2.8.8 Oxidant Tank

Provide [hydrogen peroxide][potassium permanganate] solution resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Number of tanks:</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum tank capacity:</td>
<td>[_____] litersgal.</td>
</tr>
<tr>
<td>Sign reading:</td>
<td>[&quot;DANGER - STRONG OXIDIZER&quot;] [_____]</td>
</tr>
</tbody>
</table>
### 2.2.8.9 Precipitant Tank

Provide [_____] solution resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Number of tanks:</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum tank capacity:</td>
<td>[_____] liters/gal.</td>
</tr>
<tr>
<td>Sign reading:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Mixer:</td>
<td>[Constant][Variable] speed [_____] rpm, maximum.</td>
</tr>
<tr>
<td>Dissolving basket:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Floating seal:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Containment:</td>
<td>Double wall and secondary containment.</td>
</tr>
</tbody>
</table>

### 2.2.8.10 Primary Coagulant Tank

Provide [aluminum sulfate][ferric chloride][ferric sulfate][ferrous sulfate] solution resistant tank and comply with the following:

<table>
<thead>
<tr>
<th>Number of tanks:</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum tank capacity:</td>
<td>[_____] liters/gal.</td>
</tr>
<tr>
<td>Sign reading:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Mixer:</td>
<td>[Constant][Variable] speed [_____] rpm, maximum.</td>
</tr>
<tr>
<td>Dissolving basket:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Floating seal:</td>
<td>[_____]</td>
</tr>
<tr>
<td>Containment:</td>
<td>Double wall and secondary containment.</td>
</tr>
</tbody>
</table>

### 2.2.8.11 Prophylaxis Tank

Provide [hydrofluosilicic acid][sodium fluoride][sodium silicofluoride] solution resistant tank and comply with the following:

| Number of tanks: | [_____] |
Minimum tank capacity: [___] liters/gal.

Sign reading: [___].

Mixer: [Constant][Variable] speed [___] rpm, maximum.

Dissolving basket: [___].

Floating seal: [___].

Containment: Double wall and secondary containment.

2.2.8.12 Sequestrant Tank

**************************************************************************
NOTE: Polyelectrolytes degrade with storage.
**************************************************************************

Provide [sodium polyphosphate, glassy (sodium hexametaphosphate)][sodium tripolyphosphate] solution resistant tank and comply with the following:

Number of tanks: [___].

Minimum tank capacity: [___] liters/gal.

Sign reading: "CAUTION - [SODIUM HEXAMETAPHOSPHATE] [SODIUM TRIPOLYPHOSPHATE] SOLUTION - SLIP HAZARD."

Mixer: [Constant][Variable] speed [___] rpm, maximum.

Dissolving basket: [___].

Floating seal: [___].

Containment: Double wall and secondary containment.

2.2.9 Pressure Gauges

Provide diaphragm type gauges with Bourdon tube and diaphragm compartments filled completely with oil, and made of materials suitable for the application. Install diaphragm seals at each gauge connection to isolate gauges from corrosion, sludge or other hazards of the process fluid. Provide seal material that is compatible with the oil in the gauge and the process fluid.

2.2.10 Injectors

Introduce injectors for chemical solution into the pipeline mains by means of a [hard rubber] [or] [plastic] injection nozzle, or by means of a suitable diffuser tube inserted through a corporation cock. Construct the device for introducing the solution into a pressure main in such a way that accidental breakage of discharge hose or tubing does not cause water to escape from the pipeline, and allows disassembling of the unit without leakage.
2.2.11 Piping

2.2.11.1 Backflow Preventor

Provide backflow prevention devices or air gaps on tank fill lines in accordance with NAPHCC NSPC.

2.2.11.2 Chemical Solution Piping

**************************************************************************
NOTE: Select materials in accordance with EM 1110-1-4008 Liquid Process Piping.
**************************************************************************

Incorporate provisions to allow solution piping to be conveniently and safely bled of trapped air and minimize infiltration of air bubbles. Provide chemical solution piping in accordance with Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING.

2.2.11.2.1 Smaller than 40 mm1-1/2 inch Diameter

Chemical solution piping smaller than 40 mm1-1/2 inch diameter must be [PVC pipe conforming to ASTM D1785 or CPVC pipe conforming to ASTM F441/F441M ] or [rubber hose]. Provide plastic fittings for plastic pipe with [flanged] or [threaded] joints. Make joints for rubber hose using a clamp-type mechanical coupling.

2.2.11.2.2 Piping 40 mm1-1/2 inch Diameter or Greater

Chemical solution piping of 40 mm1-1/2 inch diameter or larger must be [rubber-lined] or [plastic-lined] steel pipe. Steel pipe must have [threads] or [flanges integral with the pipe] or [forged-steel flanges screwed to the pipe barrel].

2.2.11.3 Pipe Lining

Linings for steel pipe smaller than 150 mm6 inches must be not less than 4.8 mm3/16 inch thick. Provide continuous linings free of holidays.

2.2.11.4 Pipe Fittings

For steel pipe provide [flanged conforming to ASME B16.1 or ASME B16.5] or [forged-steel threaded conforming to ASME B16.11] pipe fittings.

2.2.11.5 Plumbing

Provide water piping, drain, waste and vent piping in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.2.12 Electrical Work

**************************************************************************
NOTE: Coordinate hazard areas with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and the drawings.
**************************************************************************

Provide electric motor-driven equipment complete with motor, motor starter, and controls. Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Implement hazard
classifications in accordance with NFPA 70.

2.2.12.1 Motor Starters

Provide motor starters complete with thermal overload protection and other appurtenances necessary for the motor control specified.

2.2.12.2 Control and Protective Devices

Provide manual or automatic control and protective or signal devices required for the operation and any control wiring required for controls and devices. Provide motor controls conforming to NEMA ICS 1 or NEMA ICS 2. Prewire equipment to the maximum practicable extent. Control cabinets must conform to the requirements of UL 50, NEMA 250, [Type 4,][Type 7,][ or ][Type 12].

2.2.13 Equipment Appurtenances

Provide galvanized steel, cadmium plated or Type 316 stainless steel bolts, nuts, anchors, washers and all other types of supports necessary for the installation of the equipment.

2.2.14 Factory Painting

Factory painting must conform to manufacturer's standard factory finish, provided it does not discolor in the presence of hydrogen sulfide fumes, high water vapor atmosphere, alkaline water vapor, and concentrated chlorine (oxidizing) conditions. Coating must be at least 0.05 mm 1.75 mils thick.

2.2.15 Factory Test Report

Factory examine fiberglass tanks in accordance with ASTM E1067/E1067M prior to shipping. Furnish a copy of the corresponding test report with each tank.

2.3 MATERIALS

Submit Safety Data Sheets in conformance with ANSI Z400.1/Z129.1 for each chemical. Provide a [30][90][_____] day supply at the maximum pumping rate for each feeder or pair of duplexed feeders. Submit [two][_____] copies of certification stating that each supplied chemical meets the following requirements.

2.3.1 Acids

AWWA B300 Hydrochloric (muratic acid), AWWA B703 sulphuric (sulfuric acid).

2.3.2 Adsorption Agents

AWWA B600 powdered activated carbon.

2.3.3 Bases

AWWA B501 caustic soda, AWWA B511 potassium hydroxide, AWWA B201 soda ash (sodium carbonate).
2.3.4 Biocides

Glutaraldehyde (10 to 50 percent solution); Tolcide(R) (50 percent solution); AWWA B602 copper sulfate.

2.3.5 Coagulant Aids

NSF/ANSI 60 Anionic polyelectrolytes, NSF/ANSI 60 cationic polyelectrolytes.

2.3.6 Disinfecting Agents

AWWA B302 ammonium sulfate, AWWA B300 hypochlorites.

2.3.7 Miscellaneous

AWWA B451 poly(diallyldimethylammonium chloride), AWWA B452 EPI-DMA polyamines, AWWA B453 polyacrylamide, AWWA B550 calcium chloride, AWWA B405 sodium aluminate, AWWA B601 sodium metabisulfite (Sodium Pyrosulfite), AWWA B303 sodium chlorite, AWWA B404 liquid sodium silicate, AWWA B504 monosodium phosphate, anhydrous, AWWA B408 polyaluminum chloride, AWWA B505 disodium phosphate, anhydrous.

2.3.8 Oxidants

[50][35][_____] percent NSF/ANSI 60 hydrogen peroxide solution, AWWA B603 potassium permanganate [potassium permanganate may be supplied in powder form for onsite preparation] at the discretion of the Contracting Officer.

2.3.9 Precipitants

AWWA B501.

2.3.10 Primary Coagulants

AWWA B403 aluminum sulfate, AWWA B407 liquid ferric chloride, AWWA B406 ferric sulfate, AWWA B402 ferrous sulfate.

2.3.11 Prophylaxis

AWWA B703 hydrofluosilicic acid, AWWA B701 sodium fluoride, AWWA B702 sodium silicofluoride.

2.3.12 Sequestrants

AWWA B502 sodium polyphosphate, glassy (sodium hexametaphosphate), AWWA B503 sodium tripolyphosphate.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Submit detail drawings containing complete piping, wiring, schematic, flow diagrams, and any other details required to demonstrate that the system has
been coordinated and properly functions as a unit. On the drawings show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation.

3.2.1 Chemical Feeding Equipment

Install controlled volume pumps, equipment, and appurtenances to provide a complete and integrated system in accordance with the instruction of the manufacturer and under the direct supervision of the manufacturer's representative.

3.2.2 Gasoline Engines

Install gasoline engines in accordance with NFPA 37.

3.2.3 Pipe, Tubing, Hangers and Supports

Install pipes and tubes in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

3.2.4 Field Painting

Thoroughly clean, prime and top-coat factory painted items requiring touching up in the field with the manufacturer's standard factory finish provided it does not discolor in the presence of hydrogen sulfide fumes, high water vapor atmosphere, alkaline water vapor, and concentrated chlorine (oxidizing) conditions. Paint the equipment which did not receive a factory finish as specified in Section 09 90 00 PAINTS AND COATINGS. Coating must be at least 0.05 mm1.75 mils thick. Provide piping identification as specified in [ASME A13.1][Section 09 90 00 PAINTS AND COATINGS. Mark pipe carrying materials not listed in Section 09 90 00 PAINTS AND COATINGS in accordance with ASME A13.1.]

3.2.5 Framed Instructions

Submit framed instructions for approval prior to postings. Final size must be easy to read by operators 5 feet from instructions. Limit frame size to 11" x 17" size provide multiple frames if needed. Post framed instructions, containing wiring and control diagrams, where directed. Post condensed operating instructions as outlined in paragraph 3.4.2 Operating Instructions. Post the framed instructions before acceptance testing of the systems.

3.3 FIELD QUALITY CONTROL

3.3.1 Testing

After installation of each controlled volume pump, carry out operating tests as specified below to assure that the chemical metering installation operates properly. If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests. Submit reports of all tests in booklet form prior to final acceptance of the installation. Show all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate in each test report the final position of controls.
3.3.1.1 Tank Testing

Clean tanks of loose debris and dry prior to testing. Field test tanks for leaks or damage in shipment. Hydrostatically test tanks to [_____] kPapsig or 1.5 times the system operating pressure, whichever is greater, to detect large leaks and then with the specified chemical to detect small leaks. Test each tank with its solution for a period of 24 hours at which time no visible leakage is evident. Supply all pipes, hoses, pumps, water, power and other equipment required to convey the test liquids and to carry out the tests. Repair damage or leaks in tanks or replace tanks. Replace damaged ceramic tanks.

3.3.1.2 Controlled Volume Pumps - Operational Tests

Test pumps to demonstrate that the pumps are capable of operating without vibration or leakage. Perform testing at the pump's maximum flow rate and at half the flow rate. Demonstrate testing while controlled and operated in all feasible modes with the pumps operated singly and in unison. Plot the response of each pump on curves for the various operating pressures encountered and the results compare to the curves shown on the manufacturer's published pump data. If control characteristic curves are not available at the time of testing, the pump manufacturer's service engineer must generate such curves for each pump; graphically depicting the pump displacement at 25, 50, 75, and 100 percent of motor speed for SCR equipped pumps, and at 25, 50, 75, and 100 percent of maximum stroke position for all pumps. Generate curves only for the specified back pressure.

3.3.1.3 Controlled Volume Pumps - Time, Volume and Pumping Pressure Tests

Test pumps by filling [the standpipe][a portable calibrated standpipe furnished by the Contractor] with chemical and measuring the outage, with all other equipment valved off. Record the time, volume and pumping pressures.

3.3.1.4 System Pressure Tests

**************************************************************************
NOTE: To establish that full service can be provided, fill in the blank with the numerical value of the pressures that can be expected during normal operation of the system.
**************************************************************************

Carry out tests at [_____] and [_____] kPapsig. Manually control back pressure valves for this testing, and reset as necessary after testing. The time to deliver a given quantity of chemical at a given stroke and speed setting must be the same at all pressures.

3.3.1.5 Flow Tests

Test pumps to demonstrate zero L/secondgpm flow at a zero stroke or speed setting. Failure to meet this test is cause for rejection. Test pumps through full range of performance: min. flow [_____] Submit test results to prove pump functions within specified system parameters.

3.3.1.6 Synchronization Tests

Operate the pumps for a period of 4 hours to demonstrate that the double
diaphragm systems do not lose their synchronization. Loss of synchronization is also cause for rejection; repair or replace the pump as necessary to achieve synchronization. Fully retest repaired or replaced equipment.

3.3.2 Chemical Waste

**************************************************************************
NOTE: In selection of chemicals, consider the environmental consequences, including disposal of precipitated solids and other wastes. Select the most appropriate options and edit to fit the situation for drinking water or waste water treatment systems.
**************************************************************************

Neutralize chemicals wasted during testing procedures to achieve a pH value between 6.5 and 9.5 and a chlorine concentration of not more than 1 percent (10,000 mg/L). Route all chemicals wasted during testing procedures [as directed by the Contracting Officer][to the sanitary sewer] [through the treatment process] at a rate that the process can assimilate without upset.

3.3.3 Manufacturer Field Service

Provide the services of a manufacturer's representative who is certified by manufacturer in the installation, adjustment, and operation of the equipment specified. The representative must supervise the installation, adjustment, and testing of the equipment. Submit certificates to Contracting Officer for approval.

3.4 CLOSEOUT ACTIVITIES

3.4.1 FIELD TRAINING

Conduct a field training course for designated operating, maintenance and supervisory staff members. Provide training for a total period of [_____] hours of normal working time and start after the system is functionally complete but prior to final acceptance tests. Cover all of the items contained in the Operating and Maintenance Instructions during field training.

3.4.2 Operating Instructions

Submit complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include in the instructions the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Also include in the instructions as-built drawings of the piping layout, equipment layout, simplified wiring and control diagrams of the system as installed, and flow diagrams.

3.4.3 Maintenance Instructions

Submit complete copies of maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and trouble-shooting guides.

NOTE: This guide specification covers the requirements for liquid phase advanced oxidation processes using titanium dioxide or hydrogen peroxide and/or ozone with or without ultraviolet light.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALIFICATIONS

****************************************************************************************************************************************
NOTE: Designer should edit the subsequent paragraphs and remove requirements not applicable to the project.
****************************************************************************************************************************************

1.3.1 Contractor

Provide documentation of a minimum of [3] [____] years of experience in the construction of water, wastewater, industrial wastewater, or hazardous and toxic waste water treatment facilities. The Contractor is responsible for installation and start-up of the AOP equipment supplied, as well as
operator training.

1.3.2 Equipment Manufacturer

Submit a statement by the equipment manufacturer listing any exception to or deviations from the contract drawings and specifications. Written evidence that equipment and accessories are a product of a qualified and experienced manufacturer. Statement indicating the system is capable of treating the wastes to the levels identified.

1.3.3 Ultraviolet (UV) Oxidation System Supplier

Equipment provided shall duplicate equipment that has been in satisfactory service for a minimum of [2] [_____] years prior to bid opening. The UV oxidation system supplier shall be responsible for furnishing a complete prepackaged system. The supplier need not manufacture the entire system, but shall coordinate the selection, assembly, installation, and testing of the entire system as specified.

1.3.4 Manufacturer's Representative

Provide services, as specified, of a qualified manufacturer's field representative experienced in the installation, adjustment, and operation of the equipment furnished and who has complete knowledge of the proper operation and maintenance of the system. Include a statement indicating the operators designated to train the on site operators have been trained to operate the installed equipment.

1.3.5 Welding

Perform welding following qualified procedures, using performance qualified welders and welding operators. Furnish a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators to the Contracting Officer prior to beginning any work on the AOP equipment.

1.4 REGULATORY REQUIREMENTS

The AOP system shall conform to all federal, state, regional, and local regulations concerning chemical storage, air, noise and water pollution control requirements.

1.5 PRE-SUBMITTAL CONFERENCE

Assemble the primary process designer, AOP equipment and major component suppliers, electrical and mechanical subcontractors, and major component manufacturer's representatives at [the construction site] [_____] prior to preparation of the Contractor's AOP submittal for government approval. This meeting is intended to ensure that facility construction is properly scheduled; power, control, plumbing, space interfaces are verified; and responsibilities coordinated among subcontractor's and suppliers and reflected on the Contractor's AOP submittals.

1.6 DELIVERY, STORAGE, AND HANDLING

**************************************************************************
NOTE: Designer should coordinate with the Contracting Officer and user to determine appropriate locations for equipment storage.
Identify unusual requirements either here or on the drawings.

Deliver equipment free of structural or other damage and place in storage, in accordance with the manufacturer's requirements, protected from structural damage, the weather, excessive humidity and excessive temperature variation; and dirt, dust, or other contaminants that could otherwise damage its components.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

NOTE: This paragraph should be edited to identify the appropriate contaminants of concern as well as those parameters which potentially inhibit the process as indicated in ETL 1110-1-161 ULTRAVIOLET/CHEMICAL OXIDATION dated 29 March 96.

Effluent limitations are generally dictated by regulatory requirements. List the performance requirements in this specification.

If this specification is used as part of a Request for Proposals, the designer should identify maximum values for power and oxidant usage based on bench or pilot studies and include this information in Paragraph Performance Requirements.

Provide the AOP including all items necessary as a complete system for removal of those chemicals identified below to the levels indicated. Equipment includes, but is not limited to, AOP contact vessels, lamps when required, piping to units upstream and downstream of the contact vessels, oxidant feed system, gas emission treatment, controls, accessories and equipment to provide complete and functional system within the limits identified. Analytical and sampling protocols shall be as specified in [____].

2.1.1 Design Requirements

2.1.2 Performance Requirements

Submit performance test results indicating temperature rise through the reactor, oxidant dosage, detention time, catalyst dosage, ultraviolet light dosage, ambient gas monitoring results, and treatment system off gas monitoring and destruction results, equipment and analytical testing methods used, and removal of constituents identified below stated in mass/unit volume treated relative to the influent concentration.

Report in booklet form, upon completion of the installed system. Test report shall include field tests performed to adjust each component and field tests conducted to prove compliance with the specified performance criteria. Test report shall indicate the recommended position of the controls.

### 2.1.3 Treatability Testing

This paragraph should be deleted if previous treatability studies have not been conducted. The system parameters used during the treatability study may not duplicate the system proposed by the Contractor. The previous treatability studies should be properly documented to include the information contained in ETL 1110-1-161.

The previously conducted treatability study information contained in Appendix [___] is provided for the Contractor's information. The study results indicate [ultraviolet oxidation] [peroxone] [___] is capable of meeting the criteria in paragraph PERFORMANCE REQUIREMENTS. Evaluate the applicability and adequacy of the treatability studies and results provided. If deemed necessary by the Contractor, additional studies may be performed at the Contractor's expense to confirm the previously conducted treatability study and results. Based on the Contractor's own interpretation of the previous studies and results, and additional studies and results the Contractor elects to perform, provide a full scale treatment plant which meets the requirements identified.

### 2.2 STANDARD PRODUCTS

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and which essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

### 2.3 NAMEPLATES

Provide each major item of equipment with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment. Nameplates shall be provided for, but not limited to, each contact vessel, pumps, motors, oxidant equipment and accessories, and electrical components such as transformers.

### 2.4 MATERIALS

#### 2.4.1 Plates, Shapes and Bars

Steel shall conform to ASTM A36/A36M; stainless steel shall conform with ASTM A276/A276M, type 316.
2.4.2 Pipe and Fittings

******************************************************************************
NOTE: Designer should coordinate with the oxidizer equipment suppliers to coordinate piping and gasket material requirements.
******************************************************************************

Gasket materials for pipe and fittings shall be silicon, or teflon unless otherwise shown or specified.

2.4.2.1 Stainless Steel Pipe

a. Pipe 100 mm 4 inch and larger shall conform to ASTM A312/A312M, Schedule 40, Type 316L with maximum carbon content of 0.04 percent. Flanged fittings shall conform to ASME B16.5, F316L Class 150 with 2 mm 1/16 inch minimum thickness silicon, teflon, expanded PTFE, PVDF, or viton gaskets. Butt weld fittings shall conform to ASTM A403/A403M and MSS SP-43, Grade 316L, Schedule 10S with full penetration welds.

b. Pipe less than 100 mm 4 inch shall be type TP316, and conform to ASTM A312/A312M Schedule 80S for threaded joints, and Schedule 40S for welded joints. Flanged joints shall conform to ASTM A182/A182M, F316 or F316L, Class 150; dimensions and drilling shall be in accordance with ASME B16.5 with 2 mm 1/16 inch minimum thickness silicone, teflon, expanded PTFE, PVDF, or viton gaskets. Butt weld fittings shall conform to ASTM A774/A774M, ASTM A778/A778M, and ASME B16.9.

c. Liquid tubing 10 mm 3/8 inch and smaller shall be seamless austenitic stainless steel and shall conform to ASTM A269/A269M, Type TP316. Wall thickness shall be adequate for the pressure required. Fittings shall be compression type made from bar stock material conforming to ASTM A276/A276M, Type 316, with forgings conforming with ASTM A182/A182M, Type 316. Assemblies shall consist of tube, fittings and components of one manufacturer.

2.4.2.2 Polyvinyl Chloride (PVC) Pipe

PVC pipe and fittings less than 100 mm 4 inch diameter shall be in accordance with ASTM D1785 or ASTM D2241. PVC pipe and fittings 100 mm 4 inch in diameter and larger shall be in accordance with ASTM D2241. Pipe and joints shall be rated for a working pressure of [_____] kPa psi. Solvent cement joints shall conform to the requirements of ASTM D2564. Flanged joint diameter and drilling shall conform to ASME B16.5, Class 150.

2.4.2.3 Polytetrafluoroethylene (PTFE) Pipe and Tubing

Pipe and fittings shall conform to ASTM D1710, Type I, Grade 1, Class A, with PTFE compression type fittings. Pipe, tubing and associated fittings shall be rated for a minimum working pressure of [_____] kPa psi.

2.4.2.4 Polyvinylidene Fluoride (PVDF) Pipe and Tubing

PVDF pipe, tubing and fittings shall be manufactured from materials conforming to ASTM D3222 for type II homopolymers. Pipe tolerances for outside diameter and wall thickness shall be in accordance with ASTM D1785 for schedule 80 pipe. Tubing and associated fittings shall be rated for a minimum working pressure of [_____] kPa psi.
2.4.2.5 Copper Pipe

Pipe 100 mm 4 inch and smaller shall be standard weight, seamless, cold drawn type conforming to ASTM B88M ASTM B88 Type K, temper H. Fittings shall be cast or wrought copper alloy, solder joint type, conforming with ASME B16.18 or ASME B16.22, as appropriate. Solder used shall be lead free and comply with ASTM B32, grade Sb5, 95-5 tin-antimony or Sn96, 96-4 tin-silver solder.

2.4.3 Pipe Hangers and Supports

Pipe hangers and supports shall conform to MSS SP-58.

2.4.4 Stainless Steel Gas Tubing and Fittings

Stainless steel tubing shall conform to ASTM A778/A778M. Wall thicknesses shall be a minimum of 1.5 mm 0.062 inch for tubing 250 mm 10 inches and smaller, tubing 300 mm 12 inch in diameter shall have a minimum wall thickness of 1.9 mm 0.078 inch, tubing 350 through 450 mm 14 through 18 inch in diameter shall have a minimum wall thickness of 2.7 mm 0.109 inch. Fittings shall conform to ASTM A774/A774M, and be of the same material, grade, schedule or wall thickness as specified for tubing. Joints shall be full penetration butt welded joints or Van Stone type joints using angle face rings with bracing flanges drilled in accordance with ASME B16.5.

2.4.5 Valves

2.4.5.1 Liquid Oxygen (LOX)

LOX valves shall be bronze or Type 316 stainless steel intended for cryogenic extended service. Materials shall be compatible with the piping installed.

2.4.5.2 Gate

Gate valves shall comply with the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.4.5.3 Ball

Ball valves shall comply with the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE. Valves used for hydrogen peroxide service shall be passivated and vented in accordance with the hydrogen peroxide supplier recommendations.

2.4.5.4 Check

Check valves shall comply with the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.4.6 Injectors

******************************************************************************
NOTE: Designer should coordinate pressure requirements with equipment manufacturers to determine if supplemental pumping is required to ensure adequate gas transfer. In certain situations, multiple injectors may be required if large flow variations are expected. Injectors are

SECTION 46 30 13 Page 15
most commonly used on smaller applications such as multiple columns in series where ozone can be injected to the individual columns.

High efficiency venturi type injectors shall be constructed of 316L stainless steel or PVDF at a rated pressure of [_____] kPa psi. Each unit shall have a liquid flow capacity of [_____] L/s gpm, and shall be capable of applying 150 percent of the design gas flow of standard [_____] L/minute cubic feet/hour of a [_____] percent ozone in [air] [oxygen] mixture. Injectors shall be designed to operate with an available pressure head to the injector of [_____] kPa psi, and a back pressure of [_____] kPa psi.

2.4.7 Diffusers

NOTE: Designer should coordinate with diffuser manufacturers to determine the proper flow rate and coverage per diffuser. Rod type diffusers are generally used on larger rectangular tanks versus the dome or disc type which can be used in either circular reactors, or on rectangular units.

Coordinate access requirements with paragraph AOP Reactor Vessel.

Fine bubble diffusers shall be ceramic construction, of the tube, disc or dome type. Ceramic shall be of bonded silica or alumina, and be resistant to degradation by ozone in oxygen concentrations of [16] [_____] percent. Pore size shall be a maximum of [50] [_____] um [0.002] [_____] inch or the manufacturer's standard pore size which will produce bubbles [2] [_____] mm [0.005] [_____] inch in diameter or smaller. Gas flow per diffuser shall be a maximum of standard [_____] L/s cubic feet/minute at a submergence of [_____] m feet. Maximum allowable headloss per diffuser shall be limited to [_____] mm inch. Brackets, holders, bolts, rods, washers and other accessories shall be 316 stainless steel unless otherwise indicated. Gaskets shall be of silicone construction.

2.4.8 Couplings

Fittings, flanges, bolts, nuts and washers shall be the same material as the piping unless otherwise indicated. Sleeve type couplings for ozone service shall be of stainless steel conforming with ASTM A312/A312M, Grade TP316L with ozone resistant gaskets. Couplings for non-ozone ferrous metal piping shall be ASTM A53/A53M, Grade B.

2.4.9 Insulating Joints

Insulating joints shall be provided when ferrous metal piping is joined with non-ferrous metal piping, fitting or valve materials. Insulating flanges shall be installed and have insulating flange gaskets, insulating sleeves for studs, and insulating washers for both sides of flanges. Steel washers shall be installed between the insulating washers and nuts. Couplings shall be of the same pressure rating as the pipe installed.

2.4.10 In Pipeline Static Mixers
NOTE: Static mixers are generally recommended to ensure complete mixing when peroxide is used. Static mixers may also be needed in other processes in the treatment train; if so, coordinate and list those requirements separately or coordinate them with other specification sections to ensure there is no duplication.

In pipeline static mixers shall be installed [at the locations indicated] [upstream of the reaction chamber]. Mixers shall be [installed in a flanged section of piping] [with removable mixing sections] [inserted into the pipeline], have a pressure rating equal to that of the piping installed, have a maximum headloss of [_____] mm inch of water, [at [_____] L/s gpm] while inducing completely turbulent mixing conditions in the pipeline installed. Mixers [and housing] shall be constructed of [Grade 316 stainless steel] [_____] and be compatible with [hydrogen peroxide] [_____] [The static mixer shall be ported for direct application of the applied chemical.]

2.4.11 Bolts, Nuts, Anchors and Fasteners

Bolts, nuts, anchors and fasteners shall be stainless steel in conformance with ASTM F593.

2.5 MANUFACTURED UNITS

NOTE: Edit the following paragraphs to reflect the type of ozone generator feed gas (air or oxygen) that is included in the design package. A cost comparison should be performed prior to selecting the feed gas. Typically, oxygen in a liquid form or generated onsite from ambient air will be used. Air feed ozone generators typically produce ozone concentrations of approximately 2 percent in air, while oxygen feed systems typically produce ozone concentrations of 6 percent or greater in oxygen. VSA systems are generally used for systems that generate greater than 900 kg 2000 pounds per day.

For liquid oxygen (LOX) tanks, smaller than the minimum capacity stated in NFPA 55, state that the requirements indicated in the standard are to be applied to the tank size specified. LOX tanks should not be located inside a treatment facility. This paragraph contains statements describing a complete manufactured unit, usually a standard catalog item; statements may include descriptive requirements for the materials, specific fabrication, finishes, and function. Separate paragraphs for each different item should be used when appropriate. The name used for the manufactured unit must be consistent throughout the specification.

Generally, skid mounted equipment is preferred; however, this may not be possible with larger oxygen generation units (greater than 225 kg 500 pounds per
day). Verify dimensions with manufacturers to ensure the skid mounted units are transportable and do not have an excessively large space requirement over equipment that is field assembled. The following paragraphs may need to be modified to allow assembly, wiring, and plumbing in the field.

Additional information is contained in ETL 1110-1-161.

**************************************************************************

Submit wiring and control diagrams, systems layouts and isometrics, component identification tables, instructions, and other sheets, prior to posting. Condensed operating instructions explaining preventative maintenance procedures, methods of checking the system for safe operation, making adjustments, and procedures for safely starting and stopping the system shall be prepared in typed form, framed and posted beside the diagrams.

2.5.1 Swing Adsorption Oxygen Generation System

The Oxygen Generation System shall be Swing Adsorption type. [Pressure swing adsorption (PSA)] [Vacuum swing adsorption (VSA)] system equipment shall be a complete unit process, including the compressor, [particulate filters,] [aftercooler separator,] heat exchangers, switching valves, instrument air dryer, adsorbent beds, adsorbent material, [oxygen receiver,] controller and other equipment as required by the manufacturer to provide a complete and operational oxygen generation system. [The unit] [Each component] shall be completely wired requiring only [interconnecting wiring between components] [an external connection for a single external power supply and remote monitoring] [and control] be done in the field. [PSA] [VSA] system equipment shall include all work from the outside air inlet to the ozone generator inlet connection. The [PSA] [VSA] system shall be a continuous output system with the following characteristics:

<table>
<thead>
<tr>
<th>Min. oxygen generation capacity</th>
<th>[_____] kg/day lbs/day</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxygen purity (minimum)</td>
<td>[90] [_____] percent</td>
</tr>
<tr>
<td>Temperature to generator (max.)</td>
<td>[30] [<em><strong><strong>] degrees C [86] [</strong></strong></em>] degrees F</td>
</tr>
<tr>
<td>Dewpoint maximum (below 0 degrees)</td>
<td>[60] [<em><strong><strong>] degrees C [76] [</strong></strong></em>] degrees F</td>
</tr>
<tr>
<td>Oxygen utilization efficiency (min.) (Ratio of oxygen delivered to the ozone generator/oxygen present in the air feed to the oxygen)</td>
<td>[40] [_____] percent</td>
</tr>
<tr>

</tr>
</tbody>
</table>
Cooling water supply (max. temperature)  [_____] degrees C F
Cooling water flow rate (maximum)  [_____] L/s gpm

Adsorption vessels shall be designed and constructed in accordance with ASME BPVC SEC VIII D1.

2.5.2  Liquid Oxygen (LOX) Storage and Supply System

**************************************************************************
NOTE: Provide seismic requirements for piping, tanks and related equipment supports, if a Government designer is the Engineer of Record, and show on the drawings. Delete the inappropriate bracketed phrase. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC, properly edited, must be enclosed in the contract documents.
**************************************************************************

LOX storage system and associated equipment shall comply with NFPA 55 and CGA G-4.4. Tanks, vaporizers and regulators shall be suitable for exterior installations. Cleaning for components, equipment, valves, piping and tanks for oxygen service shall be accomplished in accordance with CGA G-4.1, CGA HB. The system shall be rated to withstand a minimum wind speed of [_____] km miles per hour, maximum ambient temperature [_____] degrees C F, minimum ambient temperature [_____] degrees C F, [_____] relative humidity, and [_____] meters feet mean sea level altitude. System shall be supported and braced to resist seismic loads [as specified in UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC] [as indicated].

2.5.2.1  LOX Storage Tanks

**************************************************************************
NOTE: Typically, 304 stainless steel is used for LOX inner tanks less than 6000 L 1500 gallons or 6750 kg 15,000 pounds, while 9 percent nickel units are generally specified for larger tanks principally due to economic considerations. Typical maximum operating pressure for the LOX system will generally be less than 515 kPa 75 psi; significant cost savings can be achieved by reducing the tank pressure requirements, but lower pressure tanks may require a longer lead time to procure since the 1.2/1.7 MPa 175/250 psi tanks are most commonly provided.
**************************************************************************

Bulk LOX storage tanks shall be [_____] kg pound double walled vertical tanks constructed in conformance with [ASME BPVC SEC VIII D1] [_____] rated for a maximum operating pressure of [1.2] [_____] MPa [175] [_____] psi and design temperature between minus 212 and plus 65 degrees C minus 350 and plus 150 degrees F, and seismic parameters defined in previous paragraph. The inner wall shall be constructed of [Grade 304 stainless steel] [9 percent nickel steel] [_____] the outer shell shall be constructed of carbon steel with a minimum outer shell thickness of [10]
[_____] mm [0.375] [_____] inch. Annular area between the inner and outer walls shall be insulated to limit oxygen boil off rate to less than [0.25] [_____] percent of the tank capacity per day at the maximum ambient conditions. Piping shall be copper or 316 stainless steel. Fittings shall be bronze or 316 stainless steel.

2.5.2.2 Vaporizers

**************************************************************************
NOTE: Vaporizers should be designed for the anticipated flow rate to the ozone generator. If vaporizers are oversized, gas temperatures will reach outside ambient temperatures, resulting in higher oxygen gas temperatures during the summer months being fed to the ozone generator, reducing its efficiency. Normal operating pressure for an ozone generator is approximately 103 kPa 15 psi. Resulting pressure at the diffusers is approximately 103 kPa 15 psi less system losses.

In cold climates, heaters may be required to warm the oxygen gas feed to the ozone generator. The actual heating requirements should be coordinated with the ozone generator manufacturer. In cases where ambient temperatures fall below freezing for extended periods, supplementary heating may be necessary.

LOX systems may require a small quantity of nitrogen gas be added to the feed stream to facilitate ozone gas flow through the generator. This may be accomplished by adding a small volume of dried ambient air (about 2 percent).

**************************************************************************
Vaporization equipment shall consist of a minimum of [2] [3] ambient air vaporizers and [single] [double] regulator system complete with automatic switching and a manual bypass. Each vaporizer shall be rated for 100 percent capacity, under continuous operation at a [_____] cubic meters/second SCFM withdrawal rate and also capable of supplying a peak withdrawal rate of [_____] cubic meters/second scfm. The vaporization equipment shall be designed for an inlet pressure of [_____] kPa psi, and a maximum headloss between the tank and ozone generator of [_____] kPa psi. The vaporizer extrusions shall have extra wide spacings between the individual extrusions with a minimum area per extrusion of [1.65] [_____] square meters/meter [5] [_____] sf/ft. [Heaters shall be provided to automatically warm the oxygen feed gas to the ozone generator when the oxygen feed temperature falls to less than [_____] degrees C F. Heaters shall be capable of warming the oxygen feed gas to a temperature range between [10 and 22] [_____] degrees C [50 and 72] [_____] degrees F]. Each vaporizer shall operate for a minimum of [8] [_____] hours at the minimum ambient conditions and continuous withdrawal rate specified. The defrost cycle for each vaporizer shall be a maximum of [8] [_____] hours at the minimum ambient conditions and continuous withdrawal rate specified. Piping between the LOX tank and ozone generator shall be insulated as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.
2.5.2.3 Regulators

Regulators shall be factory tested with outlet pressure field adjustable over a downstream pressure range from [69 to 172] [_____] kPa [10 to 25] [_____] psi, from 0 to 100 percent of the specified oxygen flow rate. Regulators shall be rated at 1030 kPa 150 psi, and constructed of 316 stainless steel.

2.5.3 Ozone Generator Air Feed System

System equipment which processes ambient air directly as the ozone generator feed gas shall be provided by a single supplier, [be of the pressure swing type and] include an air compressor and receiver, aftercooler, [refrigerative dryer], vapor/liquid separator, [coalescing and] [particulate] filters, desiccant air dryer, particulate after filter, switching valves, pressure, temperature and moisture monitors, local controller and other equipment as required by the manufacturer to provide a complete and operational air preparation system. [The equipment shall be skid mounted.] Adsorption vessels shall be designed and constructed in accordance with ASME BPVC SEC VIII D1. Adsorption material shall be [activated alumina] [____]. The unit shall be completely wired requiring only an external connection for a single external power supply and remote monitoring [and control]. The air preparation system supplier shall be responsible for all work from the outside air inlet to the ozone generator inlet connection. The air preparation system shall be a continuous output system with the following characteristics based on 100 percent relative humidity and maximum ambient temperature of [_____] degrees C F:

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum dry air feed to ozonator</td>
<td>[_____] scfm/m</td>
</tr>
<tr>
<td>Operating pressure at stated capacity</td>

2.5.4 Ozone Generator System

**************************************************************************
NOTE: Delete this paragraph if an ozone generator is not used. Horizontal tube, medium frequency generators are the most common; however, since the state of the art is constantly changing, verify that other types of generators are not available or appropriate for the particular application.

Coordinate pressure requirements with paragraph
Ozone Generator Air Feed System. Typical pressure ranges required for ozone systems are dependant upon the final ozone outlet pressure, generally between 69 and 103 kPa 10 and 15 psi plus losses through the equipment.

Ozone generation equipment shall be continuous duty water cooled, multi-tube glass or non-glass multitube dielectric [horizontal tube] [vertical tube] assemblies contained in a pressure vessel [with hinged gas-tight doors] with a rated design pressure of [_____] kPa psi. Each unit shall be provided with [medium] [high] frequency electrical power supply units including input and output transformers, power controller, frequency inverter, harmonic mitigation equipment (if required). The generator shall be provided with complete controls, [compatible with the central control unit,] instrumentation, panels, appurtenances and miscellaneous equipment required for a complete ozone generating system using [oxygen] [air]. All equipment, valves, piping, associated appurtenances shall be suitable for ozone in [oxygen] [air] service. Generator design requirements are as follows:

<table>
<thead>
<tr>
<th>Capacity</th>
<th>[_____] kg lbs/day</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gas flow rate to generator</td>
<td>[_____] cms scfm</td>
</tr>
<tr>
<td>Outlet pressure + 5 percent</td>
<td>[_____] kPa psi</td>
</tr>
<tr>
<td>Ozone concentration</td>
<td>[_____] percent</td>
</tr>
<tr>
<td>Generator vessel design pressure</td>
<td>[_____] kPa psi</td>
</tr>
<tr>
<td>Ozone output concentration turn down</td>
<td>[10:1] [_____]</td>
</tr>
<tr>
<td>Inlet hydrocarbon concentration (max)</td>
<td>[0] [_____] ppm</td>
</tr>
<tr>
<td>Power supply</td>
<td>[480] [_____] volt, 3 phase, 60 hertz</td>
</tr>
</tbody>
</table>

2.5.4.1 Ozone Generator Vessels

All ozone generator metal parts which come into contact with ozone or cooling water shall be constructed of Type 316L stainless steel. The vessel shall be designed to resist an internal pressure of 1.5 times the design pressure, including the tubes and shell. Over pressure protection based on worst case operating conditions shall be provided. The vessels shall be constructed in accordance with ASME BPVC SEC VIII D1 code. Viewing ports shall be provided to allow visual inspection of all internal dielectrics during operation.

2.5.4.2 Dielectric Tubes

Dielectric tubes shall be constructed to resist thermal shock and to evenly distribute the applied electrical charge over the entire dielectric surface.
without arcing. Dielectric tubes shall be formed from either glass or a
non-glass material with a certified voltage breakage strength of 1.5 times
the maximum possible operating voltage under maximum temperature and
applied power conditions. Dielectric tubes shall be protected by fuses or
functionally equivalent devices to prevent shorting dielectric tubes from
damaging the shell and tube structure in the ozone generator.

2.5.5 Ozone Destruct System

**************************************************************************
NOTE: High concentrations of chlorinated organics
may be liberated by systems which use ozone in air
or oxygen. These chlorinated organics may "poison"
a catalyst bed designed only for ozone destruction.
If considerable concentrations of chlorinated
organics are anticipated (greater than 1000 ppm) in
the reactor off gas, a chlorine resistant catalyst
should be specified or a separate specification
section should be used.
**************************************************************************

Ozone off gas destruction equipment shall be thermal assisted catalyst
destruct type units suitable for moist ozone in [oxygen] [air] service.
The catalyst containment unit, piping, ductwork, and other metallic
components shall be constructed of 316 stainless steel. The units shall be
capable of destroying contactor off gas generated by the ozone generators
which feed the AOP reactors. The ozone destruction unit shall have the
capability to function at a minimum turn down ratio of 20 to 1. Each off
gas destruction unit shall be a skid mounted unit consisting of [a
demister,] an electric resistance heater, catalyst trays and containment
vessel [, and a centrifugal blower]. The destruction unit discharge duct
shall be sloped away from the destruct unit to reduce the probability of
catalyst fouling from condensation. Ducts carrying ozone laden off gas
from the AOP reactors shall be sloped to a low point valved drain located
upstream of the ozone destruct system. The ozone destruct system shall
reduce the ozone concentration from the off gas flow to less than [0.10]
[_____] ppm by volume of ozone from zero flow to the maximum off gas flow
rate. Normal operation is defined as [50] [_____] percent of the maximum
off gas flow rate with an ozone concentration of [1.0] [_____] percent by
weight. Ozone destruction equipment shall meet the following requirements:

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum pressure drop through catalyst at maximum flow rate</td>
<td>[<em><strong><strong>] mm of mercury[</strong></strong></em>] inches of water</td>
</tr>
<tr>
<td>Maximum pressure drop through heater at maximum flow rate</td>
<td>[<em><strong><strong>] mm of mercury[</strong></strong></em>] inches of water</td>
</tr>
<tr>
<td>Maximum off gas relative humidity</td>
<td>[_____] percent</td>
</tr>
<tr>
<td>Max. temperature rise across heater</td>
<td>[20] [_____] degrees C[35]</td>
</tr>
<tr>
<td>[_____] degrees F</td>
<td></td>
</tr>
<tr>
<td>Catalyst chamber empty bed contact time</td>
<td>[1.0] [_____] seconds</td>
</tr>
<tr>
<td>Max. ozone concentration into destruct unit</td>
<td>[1.0] [_____] percent by weight</td>
</tr>
<tr>
<td>Off gas flow rate (maximum)</td>
<td>[_____] cubic m/sscfm</td>
</tr>
<tr>
<td>Maximum catalyst bed temperature</td>
<td>[120] [_____] degrees C[250]</td>
</tr>
<tr>
<td>[_____] degrees F</td>
<td></td>
</tr>
</tbody>
</table>
The catalyst shall be non-hazardous [manganese dioxide/copper oxide] [nickel] [_____] based material suitable for catalytic ozone destruction at the specified conditions. The catalyst containment unit shall be provided with a flanged and bolted top or hatch a minimum of 300 mm 12 inch in diameter to facilitate change out of the catalyst material when the catalyst is exhausted.

### 2.5.6 Hydrogen Peroxide System

**NOTE: Edits Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS to provide on-off, set point, or proportional control as appropriate.**

Hydrogen peroxide storage system requirements should be coordinated with suppliers to ensure material compatibility. Floating roof manway area should equal 1 in 2 per 400 L 100 gallons for solutions less than 52 percent, and 2 in 2 per 400 L 100 gallons for solutions greater than 52 percent. Process safety management requirements must be followed any time more than 3375 kg 7500 pounds of H2O2 is stored, or the solution strength is greater than 52 percent; refer to 29 CFR 1910.119 for information.

Hydrogen peroxide storage tanks should be located outside when possible. Polyethylene should not be used for peroxide concentrations greater than 52 percent.

The hydrogen peroxide storage tank shall be constructed of cross linked polyethylene, 316 stainless steel, or 99.5 percent pure aluminum alloys designated in [ASTM B209M] [ASTM B209] as 1060, 5254, 5652. Hydrogen peroxide storage tanks shall be provided with secondary containment [as detailed on the drawings] [_____] with a minimum capacity equal to [110] [_____] percent of the maximum storage tank volume. Hydrogen peroxide storage tanks shall be equipped with [50] [_____] mm [2] [_____] inch female quick fill connection; [600] [_____] mm [24] [_____] inch hinged, weighted and gasketed manway cover; [50] [_____] mm [2] [_____] inch filtered breather vent; liquid level site tube; and [600] [_____] mm [24] [_____] inch free floating roof manway cover. All piping connections shall be flanged. Feed pumps shall conform to the requirements of Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.

### 2.5.7 Redox Potential Meter

The oxidation reduction meter shall be provided [where indicated on the drawings] [on the effluent line of each reactor]. Probe shall be easily removable without interrupting service. Probe materials shall be resistant to ozone as well hydrogen peroxide attack over a pH range of 2 to 12 and operating pressures of up to [_____] kPa psi and suitable for a temperature
range from [0 to 100] [_____] degrees C [32 to 212] [_____] degrees F and suitable for the medium monitored. Probe shall transmit output to an ORP analyzer with digital output. The ORP analyzer shall transmit a [[4 to 20] [_____] mA signal proportional to the ORP] [direct digital reading] to the central control unit.

2.5.8 pH Probe

The pH probe shall be provided [where indicated on the drawings] [on the effluent line of each reactor]. Probe shall be easily removable without interrupting service. Probe materials shall be resistant to ozone as well hydrogen peroxide attack over a pH range of 0 to 14 and operating pressures of up to [_____] kPa psi and suitable for a temperature range from [0 to 100] [_____] degrees C [32 to 212] [_____] degrees F and suitable for the medium monitored. Probe shall transmit output to a pH analyzer with digital output. The pH analyzer shall transmit a [[4 to 20] [_____] mA signal proportional to the pH] [direct digital reading] to the central control unit.

2.5.9 Ozone Monitors

2.5.9.1 Vapor Phase

Separate ozone monitors shall be provided to monitor ozone in ambient air, [at the locations shown on the drawings,] determining the ozone levels downstream of the off gas ozone destruct system, [and the ozone concentration in the ozone generator discharge]. The ambient air monitoring unit intake shall be located [within 455 mm 18 inches above the treatment plant floor] [at the location shown on the drawings] [adjacent to the AOP process equipment]. The ambient air monitors shall be interlocked with the ozone generation system to initiate an alarm condition, and ozone generator shut down when readings exceed preset levels. Analyzers shall be [4 to 20 mA] [direct digital] output ultraviolet adsorption photometer type with built in pressure and temperature compensation. Ozone off gas monitor shall have a minimum of five separate ranges to monitor concentrations between [[0 to 15] [_____] percent,] [[0 to 99,000] [_____] ppm by volume]. Ambient air and off gas destruct monitors shall have a minimum of five separate ranges to monitor concentrations between [0 to 10] [_____] ppm. Each monitor shall be provided with a built-in digital ozone concentration readout at the unit.

2.5.9.2 Liquid Phase

Liquid phase monitors shall be provided [where indicated on the drawings] [on the effluent line of the last reactor]. Sensor shall transmit output to an ozone analyzer with digital display and remote signal transmission to the central control unit. Probe shall transmit output to a liquid phase ozone analyzer with digital output. The liquid phase ozone analyzer shall transmit a [[4 to 20] [_____] mA signal proportional to the ozone concentration] [direct digital reading] to the central control unit.

2.5.10 Temperature Sensors

Temperature sensors shall be dual switch trip point independently adjustable type with a minimum accuracy of 0.5 percent of full scale. Thermal system shall be constructed of 316L stainless steel. Temperature range shall be from [0 to 100] [_____] degrees C [32 to 212] [_____] degrees F and suitable for the medium monitored. Sensor shall transmit output to an analyzer with digital output. The analyzer shall transmit a
Air compressors shall conform to CAGI B19.1. Air compressors shall be factory packaged [rotary screw] [centrifugal] [rotary] [reciprocating] type units. The air compressors shall be packaged in an enclosure with sound attenuating properties which allow a maximum noise level measurement of 75 dBA at the equipment enclosure. Air compressors shall be [water] [air] cooled and rated for continuous operation. Guards shall shield exposed moving parts. Compressor motors and starters shall conform with the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Air compressors shall have the manufacturer's name and address, together with trade name, and catalog number on a nameplate securely attached to the equipment. Any special maintenance instructions (required before startup or shutdown) shall be included in the Operations and Maintenance Manuals. Compressor equipment used for processing ambient air for the ozone generator feed gas shall include the air compressor, receiver with automatic condensate drain, intake air filter and silencer, after cooler, a high efficiency moisture separator, [refrigerative dryer], pressure, temperature and moisture monitors, local controller and other equipment as required by the manufacturer to provide a complete and operational oil free, dry compressed air system. Compressor receivers, air piping, valves and appurtenances unless otherwise specified, shall be in conformance with Section 22 00 00 PLUMBING, GENERAL PURPOSE. Dry contacts and 4 to 20 mA signals shall be provided in the control panel for remote monitoring.

2.5.12 Blowers

Blowers shall conform to [Section 43 11 00.10 OFF-GAS FANS, BLOWERS AND PUMPS] [______]. Dry contacts and 4 to 20 mA signals shall be provided in the control panel for remote monitoring.

2.5.13 Dew Point Monitor

The dew point transmitter shall be of a solid state design housed in a NEMA 4 enclosure as defined in NEMA 250, with an accuracy of plus or minus 3 degrees C over an operating ambient temperature range of minus 10 to plus 60 degrees C, over a dew point range of minus 110 to plus 10 degrees C. The transmitter shall receive the signal from the thin film aluminum metal oxide sensor, convert and send it as a [single 4 to 20 mA DC signal proportional to the dewpoint level] [direct digital reading] to the central control unit. Sensor shall transmit output to an analyzer with digital display.
2.5.14 Pressure Gauges

Water pressure gauges shall be glycerine filled units conforming to the requirements of ASME B40.100.

2.5.15 Sampling Ports

Aqueous and gas phase sampling ports shall be provided [where indicated on the drawings] [upstream and downstream of each reactor vessel]. Sampling ports shall be provided at locations accessible to plant operators. Ports and associated piping shall be constructed of [6] [12] [_____] mm [1/4] [1/2] [_____] inch minimum diameter [PVDF] [316 stainless steel] [teflon] [_____] with [PVDF] [316 stainless steel] [_____] [NPT x hose] ball valves.

2.5.16 Gas Flow Meters

******************************************************************************
*** NOTE: Numerous meters may be required which may necessitate a table be included identifying the flow capacity for each unit. ***
******************************************************************************

Flow meters for ozone or oxygen applications shall have stainless steel body, tube, valves, floats, and knobs with glass windows. Flow meter shall be rated for a flow rate of [_____] cms scfm at a minimum pressure of [345] [_____] kPa [50] [_____] psi. Each flow meter shall be provided with a separate stainless steel valved connection for ease of maintenance. Each pipe penetration through the reactor wall serving a single ozone diffuser or bank of diffusers shall be equipped with a flow meter. The [air] [oxygen] feed stream to the ozone generator shall also be equipped with a flow meter. Each flow meter shall have an easily readable scale in cms scfm with a minimum of ten divisions from zero to 150 percent of the expected flow through the meter. Each meter shall be provided with an analyzer which receives the signal from the flow meter transmitter, converts and sends it as a [single 4 to 20 mA DC signal proportional to the flow rate] [direct digital reading] to the central control unit. Sensor shall transmit output to an analyzer with digital display.

2.5.17 Level Monitoring

Pressure type level sensors, associated analyzers and transmitters shall be provided for each liquid process tank associated with the AOP system. Sensor element shall be removable for servicing or replacement without taking the tank out of service. As a minimum, the following tanks shall be equipped with level monitoring equipment: [reactor vessels,] [hydrogen peroxide storage and feed tanks,] [equalization tank,] [effluent storage and equalization tanks,] [______]. Each level control element shall be of solid state design constructed of materials compatible with the liquid stored. Each controller shall be provided with an analyzer which receives the signal from the level sensor, converts and sends it as a [single 4 to 20 mA DC signal proportional to the liquid level] [direct digital reading] to the central control unit.

2.5.18 Reactor Vessel

******************************************************************************
*** NOTE: Coordinate paragraph Gas Flow Meters requirements for the application; indicate ***
******************************************************************************

SECTION 46 30 13 Page 27
penetration requirements, if a packing support is required; view ports; site glasses; or material options to stainless steel reactors. Also include access requirements for removal and maintenance of diffusers. Coordinate unique concrete material ozone resistance requirements with Section 03 30 00 CAST-IN-PLACE CONCRETE if concrete reactor vessels are used.

Reactors for peroxone systems, where either the ozone or hydrogen peroxide dose is not expected to exceed 25 ppm, may be constructed of fiberglass if appropriate resins are used. Coordinate with tank suppliers regarding specification requirements.

The reactor vessel shall be [circular] [rectangular], fabricated of [316L stainless steel] [concrete conforming to Section [03 30 00 CAST-IN-PLACE CONCRETE] [_____] provided with [_____] mm inch, [_____] kPa psi flanged connections.] Reactor vessels shall have a minimum water depth above the diffusers of [6] [_____] m [18] [_____] feet, with a minimum free board water depth above the liquid level of 600 mm 2 feet. [Reactor shall be designed to accommodate a vacuum of [25] [_____] mm [1] [_____] inch applied to the reactor headspace.] Welding shall be performed in accordance with AWS D1.1/D1.1M by welders certified to have passed qualification tests using procedures covered in AWS B2.1/B2.1M or ASME BPVC SEC IX. Reactors shall be equipped with openings required to ensure maintenance and installation/removal of the following equipment: liquid inlets and outlets, gas inlet supply and off gas collection points, sampling connections, [quartz sheath wipers], [UV lamps], [pH probe], [redox meter], [level switch], site glass liquid level indicator, and other connections as indicated or required. Reactor vessels shall be equipped with a minimum of [one] [_____] viewing port no smaller than [0.5] [_____] mm [1.5] [_____] feet located [0.7] [_____] m [2] [_____] feet minimum above the bottom of the reactor. The viewing port shall be covered with clear plastic material not susceptible to ozone degradation, with a minimum thickness of [10] [_____] mm [3/8] [_____] inch.

2.6 ELECTRICAL

Electrical products shall be in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Reactor vessels containing ultraviolet lamps shall be independently grounded.

2.6.1 Motors

Motors, all motor starters, and any control or signal wiring required for the operation of the specified equipment shall be provided and installed under this section in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM unless otherwise specified herein, in other sections, or indicated on the drawings.

2.6.2 Local Controls and Panels

Manual or automatic controls, protective or signal devices required for the operation specified, and any control wiring required for controls and devices, shall be provided. Enclosures for local power and control panels shall conform to NEMA ICS 6.
2.6.3 Ultraviolet Equipment Electrical Requirements

a. A separate prewired power panel shall be provided for each module.

b. Ground fault detection or independent ground shall be standard with the UV lamp equipment.

c. Control and monitoring components shall be housed in NEMA enclosures. Internal components shall be sealed from the environment. System electronics to be used in an interior environment shall be housed in enclosures conforming to NEMA 250 TYPE 12. System electronics to be used in an exterior and corrosive environment, as defined in NEMA 250, shall be housed in enclosures conforming to NEMA 250 TYPE 4X.

d. Sufficient cooling shall be provided to the medium and high temperature UV bulbs as well as associated ballasts to prevent overheating.

e. Wiring and electrical connections shall be protected against moisture and corrosive gases to prevent electrical shorts or failure. Electrical installation and materials shall conform to NFPA 70. The unit shall be completely wired requiring only an external connection for a single external power supply and remote monitoring and control.

f. Interconnecting, multiconductor, unshielded cables shall be suitable for outdoor installation. Insulation shall be thermoplastic rubber with an operating range of 

\[ \text{minus 60 to 125 degrees C} \quad \text{minus 75 to 260 degrees F} \]

with low temperature flexibility and flame retardants. UV stabilized jacketing shall be resistant to oils, chemicals, fuels, solvents, and to mechanical abuse and abrasion. Cable shall be supplied by the equipment manufacturer and shall be of sufficient length and number for a complete system.

g. Cableways provided shall be stainless steel, 1.98 or 1.59 mm 14 or 16 gauge thick.

2.7 AOP CONTROL SYSTEM

**************************************************************************

NOTE: Delete items within this paragraph that do not apply. Not all UV systems (especially those with low intensity lamps) have light intensity monitors; verify design requirements for type or need of lamps. Hydrogen peroxide monitoring on all but very large plants (larger than 5.7 ML/day 1.5 MGD) will consist of tank level readings and an indication that the chemical feed pump is working. Coordinate with paragraph Alarms and Interlocks if separate audible or visual alarms beyond the control system specified are required, and their location.

If an autodialer is required, reference the controls and instrumentation section of the specification; or if none is included and an autodialer is required, include those requirements in this paragraph.

**************************************************************************

Equipment shall be locally controlled and shall be capable of receiving standard digital or analog control signals from the plant central control system. Status and adjustments to the equipment shall be provided
[locally] [and] [from the plant central control system]. Instruments shall be provided with mounting hardware as appropriate. Transmitters with digital outputs shall be accurate to within [_____] percent. All equipment shall be designed for operation on a 120 volts 60 hertz electrical input. Controls shall be provided to remotely monitor [and adjust] [hydrogen peroxide delivery rate,] [oxygen] [air] [and ozone output,] [_____] [individual lamp failure,] [power on and off status for each lamp [ballast]] [ultraviolet lamp intensity]. [Each lamp shall be provided with a nonresettable elapsed time meter with ability to record operable hours from 0 to 99,999].

2.7.1 Ozonation Control System

The ozonation control system shall be interfaced with the plant central control system. Changes to the ozone generator equipment operating conditions shall be accomplished locally or from the master control panel. The power, control and instrumentation system provided shall be as specified or as recommended by the ozone generator manufacturer for safe operation and supervision of the ozone generator and related gas feed equipment. Schematics and interconnecting wiring diagrams shall be provided for power, control, and instrumentation circuits. Control power transformers, relays, adjustable timers, auxiliary contacts, switches, or additional equipment to interconnect the generator to other auxiliary equipment and master control panel, and control circuits as shown on schematic or instrument control drawings shall be provided. An emergency stop button shall be provided at the local generator control panel. The ozone generator shall be protected from power surges, and variations in power supplied to the equipment.

2.7.2 Hydrogen Peroxide Feed

******************************************************************************
NOTE: Hydrogen peroxide metering rate is generally done manually with an interlock to shut the system down when a flow switch or other interlock at the AOP master control indicates a flow interruption. If a variable flow rate is anticipated, although rarely used, the hydrogen peroxide feed rate can be tied to the influent meter or AOP master control. Coordinate operation with Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.
******************************************************************************

Hydrogen peroxide feed pump and control shall conform to the requirements of Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.

2.7.3 Alarms and Interlocks

******************************************************************************
NOTE: Delete items in this paragraph that are not required.

Coordinate this paragraph with process and instrumentation diagrams (PIDs) and other specification sections. Metering accuracy for hydrogen peroxide is generally done manually. Indicate if separate audible or visual alarms beyond the AOP master control system are required, and their location.
Alarms and interlocks shall be provided to ensure proper operation of the advanced oxidation equipment, and its sequenced shutdown based on potentially unsafe or improper conditions that may exist. The following paragraphs list alarms that (as a minimum) shall be monitored at the central control point, or that will initiate shutdown of the appropriate advanced oxidation equipment components.

2.7.3.1 AOP System

Failure of major equipment components such as lamps, ballasts, or safety interlocks shall initiate system, followed by plant shutdown, if not acknowledged.

a. AOP system alarms and control interlocks shall be provided for the following items:

(1) Lamp failure
(2) Ballast failure
(3) Safety interlocks for open door on reactor vessel or panel
(4) High water temperature in AOP reactor vessel
(5) Low water flow to the reactor vessel
(6) Sleeve wiper failure
(7) High pressure in reactor vessel headspace
(8) [_____].

b. Submit the following data for the AOP System

(1) Manufacturer's descriptive and technical literature; performance charts and curves, catalog cuts for specified equipment including: instrumentation and controls; capacities and pressure drop; model number; and installation instructions.

(2) Materials of construction; inlet and outlet pipe sizes; power demand requirements; and ozone generator cooling water flow rate.

(3) Spare parts data for each piece of equipment, current unit prices and source of supply.

(4) Manufacturer's descriptive and technical literature; performance charts and curves, catalog cuts for specified equipment including: instrumentation and controls; capacities and pressure drop; model number; and installation instructions.

(5) Materials of construction; inlet and outlet pipe sizes; power demand requirements; and ozone generator cooling water flow rate.

(6) Spare parts data for each piece of equipment, current unit prices and source of supply.

(7) Manufacturer's certificates stating that the equipment meets the specified requirements, and has been installed in accordance with the equipment manufacturer's requirements.

2.7.3.2 Metering Pump

Pump failure shall initiate system, followed by plant shutdown, if not acknowledged. Metering Pump alarms and control interlocks shall be
provided for the following items:

a. Hydrogen peroxide feed
b. Catalyst feed
c. Pump failure
d. [______].

2.7.3.3 Hydrogen Peroxide Tank

Hydrogen peroxide tank [alarms] [and control interlocks] shall be provided for the following items:

a. High liquid level
b. Low liquid level
c. Low low liquid level
d. High temperature
e. High pressure
f. [______].

2.7.3.4 Ozone System

Ozone system alarms and control interlocks shall be provided for the following items:

a. High dew point in gas feed to ozone generator
b. Over current to the power supply unit (PSU)
c. Over voltage to the PSU, rectifier, and inverter
d. Over frequency protection
e. High temperature shut down
f. High inlet gas temperature
g. High inlet cooling water temperature
h. High gas pressure to the generator
i. Insufficient gas flow to the generator
j. High outlet ozone gas temperature
k. High moisture level in control cabinet
l. [______].

Major equipment component failure such as over current, over voltage, over frequency, high cooling water temperature or other condition that could damage the equipment or result in effluent non-compliance shall initiate system, followed by plant shutdown, if not acknowledged.

2.7.3.5 Gas Feed System

Gas feed system alarms and control interlocks shall be provided for the following items:

a. High pressure across gas filters
b. High temperature in gas desiccant dryer
c. High pressure downstream of reducing valves
d. Air preparation system failure
e. Ozone monitor failure
f. [______].

Major equipment component failure, such as high cooling water temperature, air preparation failure, or other condition that could damage the air feed or ozone equipment, or result in effluent non-compliance shall initiate system, followed by plant shutdown, if not acknowledged.
2.7.3.6 Ozone Destruct System

Ozone destruct system alarms and control interlocks shall be provided for the following items:

a. High ozone in ambient air space
b. High gas flow rate to destruct unit
c. Low temperature in ozone destruct unit
d. High ozone in destruct unit exhaust gas
e. Ozone destruct system failure
f. High ozone concentration in off gas
g. Destruct system failure
h. [_____].

Health and safety ambient ozone level non-compliance shall initiate ozone system alarm and shutdown, followed by overall plant shutdown, if alarm is not acknowledged (high ambient ozone levels will not shutdown the ozone destruct system concurrently with other processes).

2.7.3.7 Cooling Water System

Cooling water system alarms and control interlocks shall be provided for the following items:

a. Cooling systems failure
b. High water temperature
c. No/low cooling water flow
d. Pump failure
e. [_____].

Major equipment component failure such as no/low cooling water flow, pump failure or other condition that could damage the gas feed, ozone equipment or result in effluent non-compliance shall initiate ozone generator, followed by plant system shutdown, if not acknowledged.

2.7.3.8 Metering Accuracy

Metering accuracy alarms and control interlocks shall be provided for the following items: Ozone and Hydrogen Peroxide

2.7.3.9 Ground Fault

A ground fault protection alarm shall be provided.

2.8 SPECIAL EQUIPMENT AND TOOLS

Provide one set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment. Provide a tube cleaning rack or racks with adequate capacity to hold [50] [100] percent of the dielectric tubes from the ozone generator being serviced. Each rack shall be equipped with locking casters to allow the rack to be easily moved between the ozone generator and the location where the dielectric tube cleaning will occur. Each dielectric shall be provided with an individual padded holder.
PART 3  EXECUTION

3.1  EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work. Compare the limits of work for the equipment supplied to field conditions to ensure the limits previously identified for piping, electrical and control interfaces meet the actual physical requirements at the facility. Bring any discrepancies to the attention of the Contracting Officer for correction.

3.2  PREPARATION

**************************************************************************
NOTE: This paragraph covers actions required to physically prepare the surface, area, or site to incorporate the specified primary products.
**************************************************************************

Provide the reactor vessel, [ozone and feed gas equipment,] [hydrogen peroxide storage and feed system,] [electrical support equipment,] and [_____] with an equipment pad isolated from the floor slab [as detailed on the drawings] [adequate to properly support the equipment]. Reinforced concrete shall be designed and installed in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Prior to placing ozone piping, or other equipment, into service it shall be cleaned by one of the methods specified in CGA G-4.1. Piping and equipment used to store or feed hydrogen peroxide shall be passivated in accordance with the hydrogen peroxide supplier's requirements.

3.3  EQUIPMENT INSTALLATION

Perform the equipment installation as indicated on the drawings, shop drawings, manufacturer's instructions and recommendations. Piping, valves, fittings, and appurtenances shall be installed in accordance with the manufacturers recommendations, as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE, or as otherwise indicated. All valves, fittings, meters and other appurtenances shall be given unique identification numbers corresponding to those used in operation and maintenance manuals, and in AOP submittals prepared. Identification numbers shall be placed on brass identification tags and securely fastened to all valves, fittings, meters and other appurtenances. Tags shall not be less than 38 mm 1-1/2 inches in diameter with depressed black figures 13 mm 1/2 inch high. Piping for wet ozone service shall be PVDF, stainless steel, or PTFE. Piping for dry ozone service shall be PVDF, stainless steel, or PTFE. Oxygen piping shall be copper or stainless steel. Hydrogen peroxide piping shall be stainless steel, PTFE or PVDF. Oxygen piping shall [be insulated in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS] [not be insulated].

3.4  ELECTRICAL WORK

Perform electrical work in accordance with the drawings and applicable requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Equipment shall be appropriate for continuous duty, and installation in a dusty, humid and corrosive environment. Electrical equipment and wiring shall comply with NFPA 70.
3.5 **TOOLS**

Provide tools to the Contracting Officer prior to the onsite training identified in paragraph FIELD TRAINING.

3.6 **PAINTING/CORROSION PROTECTION**

All ferrous surfaces shall be coated or painted. Color shall be as indicated on the paint schedule or as otherwise approved. Factory painted items shall be touched up as needed. Factory painted items requiring touch up in the field shall be thoroughly cleaned of all foreign material, primed and top coated with the manufacturer's standard factory finish in accordance with the manufacturer's recommendations, including dry finish thickness. Equipment which did not receive a factory finish shall be painted in accordance with the requirements indicated in Section 09 90 00 PAINTS AND COATINGS. Painting corrosion resistant metals such as brass, bronze, aluminum, copper, galvanized steel and stainless steel is not required unless otherwise specified.

3.7 **CHEMICALS**

**************************************************************************

NOTE: Coordinate these requirements with other specifications which may address extended operation and maintenance occurring in some HTRW Projects. If other supplies such as catalysts are required, include that information as well.

**************************************************************************

Provide the chemicals needed to do all the operational and start up testing, and completely refill the [oxygen], [hydrogen peroxide], [catalyst], [_____] tanks at the time of contract completion.

3.8 **WELDING**

**************************************************************************

NOTE: Use second set of brackets when critical pipe welding is required.

**************************************************************************

[Piping shall be welded in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and welders shall be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. The Contracting Officer shall be notified 24 hours in advance of tests. Structural members shall be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] [Welding and nondestructive testing procedures for piping shall be as specified in Section 40 05 13.96 WELDING PROCESS PIPING.]

3.9 **SAMPLING AND ANALYSIS**

Perform sampling, analysis, and sample turn around time to demonstrate system performance and effluent compliance. Submit a commissioning/demonstration plan for approval to ensure the equipment meets the standards indicated. Coordinate this plan with other plans and unit operations to ensure they do not conflict and the AOP system is ready for testing. Coordinate and obtain regulatory approvals prior to notifying the contracting officer that the equipment is ready for testing.
3.9.1 Plan Details

The plan shall include a detailed description of proposed sampling and analysis required to document system performance. A plan detailing the sampling locations, frequency, analytical protocols, and duration which will ensure the equipment complies with the standards indicated. Submit the plan to the Contracting Officer [_____] [30] days prior to equipment start up. Coordinate work within this section with other sections to ensure upstream and downstream unit processes are complete and operational prior to startup/commissioning the AOP unit.

3.9.2 Plan Calculations

Include the following calculations in the commissioning/demonstration plan.

a. Headloss calculations through the process units at the design flow rate, including headloss calculations for associated compressed air and pumping systems.

b. Oxidant demand and subsequent AOP unit sizing.

c. Electrical usage rate.

d. Removal performance and material mass balance.

e. Chemical feed requirements and equipment sizing.

f. Diffuser system layout, mass transfer calculations.

3.9.3 Chemical Sampling

The chemical parameters identified in paragraph PERFORMANCE REQUIREMENTS [and ambient and ozone off-gas destruction concentrations] shall be sampled [daily] [____], monitored [at the locations identified on the drawings] [at the locations indicated in the startup/commissioning plan] for [7] [_____] days of continuous 24 hour operation, using analyses with detection limits one order of magnitude lower then the levels indicated in paragraph PERFORMANCE REQUIREMENTS.

3.10 POSTING FRAMED INSTRUCTIONS

Post framed instructions containing wiring and control diagrams, under glass or in laminated plastic, adjacent to the equipment or where otherwise directed before acceptance testing of the system. Condensed operating instructions, prepared in typed form, shall be framed as specified above and posted beside the diagrams. The framed instructions shall be posted before acceptance testing of the systems.

3.11 FIELD TESTS AND INSPECTIONS

**************************************************************************

NOTE: These tests are required for installed or completed work; they are different and separate from those required for materials and products prior to installation or application. Delete tests not applicable or required.

Provide in this section a reference to the plant.
commissioning or start-up specification which includes the processes in the treatment facility.

Accessories such as the [UV equipment,] [ozone generator,] [compressor,] [ozone generator gas feed equipment,] and [_____] shall be factory tested prior to shipment to the job site.

3.11.1 AOP Reactor Vessel

The AOP reactor vessel and attached appurtenances shall be assembled at the factory and an operational test of all components accomplished prior to shipment. Certification that the equipment and components assembled at the factory are operational and meet the specification requirements shall be provided to the Contracting Officer a minimum of [10] [_____] calendar days prior to shipment. Components not assembled at the factory shall be subject to the same tests and inspections prior to onsite leak testing using potable water. Following installation at the project site, and prior to leak testing, the AOP system shall be retested to ensure the equipment and auxiliary components act as a complete and operational system. This shall include operation of all valves, pumps, blowers, analyzers, alarms, meters, interlocks, monitors, level and pump controls, sensors, switches, off gas destruct equipment and all other equipment associated with the AOP system. Testing shall be completed prior to leak testing and written notification provided to the Contracting Officer stating the equipment is working in accordance with the contract documents and manufacturer's recommendations prior to the commencement of leak testing.

3.11.2 Diffuser or Injector System

The entire gas piping system shall be pressure tested with dry air or oxygen at a minimum of [two] [_____] times the normal design pressure for a minimum of 60 minutes and such additional time as required for the Contractor to inspect the piping system for leaks. All leaks shall be repaired and the system shall be retested until no leakage is detected. Ozone shall not be introduced into the system until all leaks have been identified, repaired, and the system retested. [Diffusers] [Injectors] shall be installed in accordance with the suppliers recommendations. After installation, the [diffusers] [injectors] shall be covered with clear water to a depth of approximately [1] [_____] m [3] [_____] feet. Dry air or oxygen shall be released through the [diffusers] [injectors] and the system shall be inspected for uniform air or oxygen distribution throughout the reactors. Following the initial testing at [1] [_____] m [3] [_____] feet, the distribution testing shall be repeated at a water depth of [3] [_____] m [9] [_____] feet to ensure bubble distribution is adequate throughout the reactor. [Diffuser] [Injector] replacement or repositioning shall be accomplished as required to maintain uniform air distribution throughout the reactor. If after repositioning, air distribution throughout the reactor lacks uniformity, additional redistributors or deflectors shall be installed in the reactor as recommended by the [diffuser] [injector] supplier to accomplish uniform flow distribution throughout the reactor.

3.11.3 Leak Testing

Leak testing shall be accomplished at the factory to verify the integrity of the reactor vessels and associated gas and liquid piping. The factory leak test shall be accomplished on the reactor vessel and appurtenances following assembly at the factory. Onsite hydrostatic leak testing shall include all piping between the upstream and downstream processes, and be
accomplished using potable water at a pressure 1.5 times the working pressure, or 350 kPa 50 psi unless otherwise approved by the Contracting Officer. The reactor vessel and appurtenances shall be isolated from the connecting piping and retested for leaks using potable water following assembly at the site. The ozone generator gas connections shall be tested with dry air or oxygen at the maximum pressure allowed by the manufacturer, or as identified in the previous paragraph. Any gas or liquid leaks identified during the aforementioned testing shall be repaired and the system shall be retested until the systems are free of leaks.

3.11.4 Control Panel

A local control panel functionality test shall be performed and approved by the Contracting Officer prior to commencement of leak testing or testing using oxidizers. The central control testing shall be accomplished prior to overall plant startup.

3.11.5 Ozone Generation System

NOTE: The installer or manufacturer should demonstrate the operation and efficiency of the equipment. Power consumption for ozone generation should be less than 10 kWhr per 0.5 kg pound of ozone generated assuming a PSA oxygen feed system is used to generate a 10 percent ozone feed; verify this with multiple equipment suppliers based on the specific ozone application pressures to be used, gas feed, and applied ozone concentration.

The ozone generation system shall be tested to ensure that the actual ozone production, power usage, or water consumption rates meet recommended requirements. Power usage shall be measured after achieving steady state conditions as determined by the ozone generator supplier. Power usage shall be measured at the central motor control center or at each individual component including the [air dryer,] [refrigerant driers,] [desiccant driers,] [oxygen generator,] ozone generator, cooling water pumps, and master control panel. Power usage shall be within [5] [_____] percent of [_____] kWh per kg pound of ozone generated at 100 percent of rated capacity. Cooling water supply shall also be measured. Cooling water consumption rate shall not exceed [_____] L/s gpm at the parameters listed in paragraph Ozone Generator System by more than [5] [_____] percent. If the equipment does not meet the specified consumption rates, make the necessary system revisions to meet the rates specified at no additional cost to the Government. Power usage shall also be evaluated at 25, 50, and 75 percent of the design production rate.

3.12 MANUFACTURER'S SERVICES

NOTE: Use this paragraph when manufacturers are to provide field quality control with onsite personnel for instruction/supervision of the installation or application of their products, or for startup or demonstration.

This paragraph covers requirements of the installer or manufacturer to demonstrate the operation and
Provide a manufacturer qualified service representative, experienced in the installation, adjustment, operation and maintenance of the equipment specified, for a minimum of [3] [_____] days to supervise the installation, adjustment, testing, and to provide instruction in the operation, and maintenance of the equipment. If major components from multiple suppliers are provided, such as an [ozone generator] [air preparation system] [oxygen preparation system] [ozone destruct system] [_____], each supplier shall be required to visit the site a minimum of [1] [_____] times during equipment installation or startup. During the startup and [one] [_____] years operating period, the major equipment suppliers shall be required to be onsite [2] [_____] times to verify that the equipment is installed and operates properly, and to provide trouble shooting and technical assistance.

3.13 FIELD TRAINING

Provide a field training course for designated operating and maintenance staff members. The training shall include operation of individual components as well as the integrated system, maintenance needs and procedures, instrument calibration, safety issues and emergency procedures, control and alarm features, troubleshooting equipment and control problems, and laboratory analytical procedures. Training shall be provided during normal working time and shall start after the system is functionally complete but prior to performance testing. Field training shall cover all of the items contained in the operating and maintenance manuals. Each major equipment vendor including, but not limited to, the ozone generator, ozone destruct system, ozone monitoring system, and gas feed system shall be required to provide two [8] [_____] hour periods of classroom and hands-on operating instruction to the individuals selected by the Contracting Officer. The first period shall be at system startup and the second [as defined by the Contracting Officer] [at the end of the Contractor's operating contract, prior to turning over to the long term facility operator]. Upon completion, submit certificates indicating the designated personnel have received training specified and have successfully operated the installed AOP equipment.

3.14 MAINTENANCE

3.14.1 Extra Materials

**************************************************************************
NOTE: Delete inapplicable portions of these paragraphs. Coordinate this section with other sections of the specifications to ensure there are not conflicts regarding supplying consumables. Verify the duration of the initial operating period, which is generally 1 year.
**************************************************************************

Furnish the initial supplies to fill the vessels, as well as all consumables during the startup, prove out, and initial operation period. At the time the Contractor turns the plant over to the long term Operation and Maintenance Contractor, the vessels storing consumables such as LOX, hydrogen peroxide [and] [_____] shall be refilled within [two] [five] days prior to the plant turn over.
3.14.1.1 Lamps

Provide a complete set of lamps reserved for change out by the equipment supplier following the one year warranty period. This extra set of lamps shall be delivered to the treatment facility 60 days prior to the end of the one year warranty period and installed by the Contractor. Lamp replacement during the one year warranty period shall be provided by the supplier, as needed by the Contractor.

3.14.1.2 Spare Parts

The supplier shall provide, in addition to the lamps specified above, a minimum of ten percent of each of the following items, or a minimum of two, whichever is greater:

a. Lamp ballasts
b. Quartz sleeves
c. End seals
d. Socket connectors
e. O-rings
f. Quartz sleeve cleaners
g. Diffusers
h. Rotometers
i. Generator dielectrics
j. Generator dielectric fuses
k. pH probe element
l. ORP probe element

3.14.2 Maintenance Service

**************************************************************************
NOTE: Delete this paragraph if UV lamps are not used. The designer may want to provide additional information regarding lamp change out if the system is limited to a certain lamp type. Medium pressure lamps have an approximate life of 3 to 4000 hours, while low pressure lamps have an approximate life of 7 to 10000 hours; certain proprietary, high intensity lamps may have a life less than 2000 hours.
**************************************************************************

Changing out lamps, ballasts, and quartz tube wipers, at the frequency recommended by the manufacturer during the one year warranty period or as otherwise required, shall be the Contractor's responsibility. Lamps and ballasts supplied as specified below, shall be provided in addition to the complete set supplied for installation (following the warranty period) and those installed as needed during the warranty period. The ozone generator dielectrics shall be cleaned in accordance with the manufacturer's
recommendations immediately prior to the conclusion of the Contractor's operating period; or after one year, if greater than one year after startup, and at the conclusion of the Contractor's operating period.

3.14.3 Operating Instructions

Submit [six] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system start-up, operation and shutdown, routine maintenance, potential breakdowns and repairs, and troubleshooting. The instructions shall include drawings and schematics of the system as installed. The instructions shall include the manufacturer's name, model number, service manual parts list and brief description of all equipment and their basic operating features. The instructions shall include, but not be limited to, the following:

a. System layout showing piping, valves and controls, process flow diagrams, piping and instrumentation diagrams with all valves, meters, and similar units identified.

b. Approved wiring and control diagrams prepared in accordance with ANSI/ISA 5.1 including a drawing index, legend and symbols list, and abbreviations and identifiers.

c. A control sequence describing startup, how to make adjustments to the equipment during operation, standard and emergency shutdown procedures.

d. Operating and maintenance instructions for each piece of equipment, including lubrication instructions and other periodic maintenance and inspection information as well as trouble shooting guides.

e. Manufacturer's bulletins, cut sheets and descriptive data, parts lists, and recommended spare parts, and sources of supply for all major pieces of equipment.

NOTE: This guide specification covers the requirements for chlorine feeding equipment for the treatment of water or sewage.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature.
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B16.3 (2021) Malleable Iron Threaded Fittings, Classes 150 and 300
ASME B16.11 (2016) Forged Fittings, Socket-Welding and Threaded
ASME BPVC SEC VIII D1 (2019) BPVC Section VIII-Rules for Construction of Pressure Vessels Division 1

ASTM INTERNATIONAL (ASTM)

1.2 SUBMITTALS

***************************************************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

***************************************************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
SD-02 Shop Drawings
  Installation; G[, [____]]

SD-03 Product Data
  Framed Instructions
  Manufacturer's Descriptive Data
  Technical Literature
  Performance Charts And Curves
  Catalog Cuts
  Installation Instructions
  Equipment And Material; G[, [____]]

SD-06 Test Reports

SD-07 Certificates
  Service Organization
  Spare Parts; G[, [____]]

SD-10 Operation and Maintenance Data
  Operating Manuals
  Maintenance Manuals

1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Auxiliary Equipment and Spare Parts

**************************************************************************
Note: Delete any items listed below that are not required. Designer shall specify, in addition to the list provided below, what additional device or devices are required to be provided by the contractor in the performance of this contract to ensure that the user of the equipment is able to measure the desired analytes that are being distributed by this system.
**************************************************************************

Furnish auxiliary equipment and spare parts as follows:

a. One spare flow rate indicator for each machine.

b. One flexible tank connection for each machine, except where the machine is direct cylinder-mounted.

c. Three each of all special gaskets to fit all joints and unions.
d. One set of all necessary hose clamps to suit all hose connections.

e. Fifty cylinder valve gaskets.

f. One \textit{118 mL} \textit{4 ounce} bottle of ammonia.

g. Stationary metal platform scale without wheels, with a capacity of \textit{[2][4][____]} chloride containers of \textit{[1][2][____]} kgpounds size and of the \textit{[dial][beam]} type.

h. \textit{[[1][2][____] air-purifying respirators, with cartridges conforming to 30 CFR 72; Subpart 710.] [[____] self-contained air breathing units.]}\textit{\textit{[1][2][____]}}

i. \textit{[1][2][____] residual-chlorine comparator of a type employing permanent color standards and 13- or 26-millimeter viewing-depth sample tubes, with corrosion-resistant case, a color disk reading from 0.0 mg/L to [____] mg/L, and sufficient DPD tablets for 100 tests. Provideresidual chlorine comparators that meet EPA requirements.}

j. \textit{[1][2][____] emergency repair kit for chlorine cylinders.}

k. \textit{[1][2][____] emergency repair kit for chlorine \textit{[1][____]} metric ton containers.}

1.3.2 Special Tools

For each type of equipment furnished provide:

a. Special tools necessary for adjustment, operation, maintenance, and disassembly.

b. A grease gun or other lubricating device for each type of grease required.

c. One or more steel cases mounted on the wall complete with flat key locks, two keys, and clips or hooks to hold each tool in a convenient location. Provide high-grade, smooth, forged, tools fabricated from alloy tool steel. Provide lever type grease guns. Deliver tools at the same time as the equipment and hand over on completion of the work.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a chlorine feed system for the treatment of sewage effluent or potable water systems. System shall consist of chlorine feed pump, controls, cylinder connections, gauges, meters, etc. as described in the following paragraphs.

2.1.1 Standard Products

Provide \textit{equipment and material} which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that
essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening]2 years prior to issuance of Request for Proposal]. A service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site must be proposed to support all equipment.

2.1.2 Nameplates
Secure a plate to major equipment items containing the manufacturer's name, address, type or style, model or serial number, and catalog number.

2.1.3 Miscellaneous Supports
Provide bolts, nuts, anchors, washers, and all other types of supports necessary for the installation of the equipment which are fabricated of galvanized steel, cadmium plated steel, or Type 316 stainless steel.

2.1.4 Submittal Data
Submit a complete list of equipment and material, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Submit a list of Spare parts data for each different item of material and equipment specified, after approval of the detail drawings and not later than [1][3][_____] months prior to the date of beneficial occupancy. Include in the data a complete list of parts and supplies, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after [1][ and][ 3] year(s) of service.

2.1.5 Material Compatibility
Supply materials that are compatible with the concentration of solutions to which they are exposed. It is the contractor's responsibility to ensure all supplied materials are compatible within all submitted products.

2.1.6 Factory Painting
Use factory paint which conforms to manufacturer's standard factory finish.

2.2 CHLORINE-FEEDING MACHINE
Select components for the machine for the treatment of [water][sewage] by the application of chlorine [solution][gas] against a [positive][negative] head of [_____] mmfeet using the facility's system for operation of the machines under a variation in pressure from [_____] minimum to [_____] maximum kPapsi. The chlorine-feeding system consists of controls and devices necessary for a complete operating system including a chlorine pressure gauge or other device that indicates loss of chlorine pressure, a chlorine pressure-reducing valve, a meter with rate-of-flow, injector, pressure-relief valves, water-pressure gauges, water strainers, backflow preventer and water-pressure regulator if required.

2.2.1 Mounting
Provide each chlorine-feeding machine with means for [direct cylinder mounting][wall mounting][floor mounting on a panel or in a cabinet] so that the chlorine gas feed rate control is under [a vacuum][pressure] when the machine is in operation. [Mix chlorine gas with liquid after being measured through the meter. ]It is essential that the chlorine feeding
machine function accurately regardless of normal variations in pressure in the chlorine cylinders and in the liquid pressure operating the machines.

2.2.2 Protection of Components

Automatically protect the machine against flooding or damage in the event of a failure of the chlorine supply so that under operating conditions it is not possible for water to get back into the chlorine inlet line or dry-gas control parts. Provide parts subject to contact with chlorine made of materials resistant to the action of chlorine at the pressures and concentrations that could be encountered. Construct a system as simple as practicable that provides reliable service and is readily accessible for inspection, cleaning, adjustment, repairs, and replacements.

2.2.3 Capacity

**************************************************************************
NOTE: Choose chlorine feed capacity based on minimum and maximum chlorine requirements required by chemical analysis to treat water fed through the system.
**************************************************************************

Provide Chlorine-feeding machines capable of delivering chlorine from a minimum of [_____] kg/pounds to a maximum of [_____] kg/pounds in 24 hours while operating continuously at rated capacity.

2.2.4 Chlorinator Controls

Provide [fully automatic] [semiautomatic] [program control] [manually-adjusted] type chlorine-feeding machine. [All fully automatic machines are to be equipped to receive standard 4-20 mA control signals.] [Fully automatic controls consist of devices with accessories to adjust continuously the rate of chlorine feed automatically in direct proportion to [flow] [and] [chlorine residual] [to compensate for changes in the chlorine demand] of the [water] [or] [sewage] being chlorinated. Acceptable controls are not to require manual attention other than adjustment of the required chlorine residual.] [Semiautomatic controls consist of devices with accessories to start and stop the chlorine-feeding machine automatically with the starting and stopping of the [water] [or] [sewage] being chlorinated or with a timer mechanism.] [Program control consists of a device with accessories to change the chlorine feed rate of the machine automatically according to a predetermined cycle.] [Manual controls consist of adjustment and indicating devices for regulating the chlorine dosage manually. Provide manually adjusted types that are capable of receiving standard 4-20 mA control signals by the addition of an automatic control device.]

2.2.5 Cylinder Connections

Provide cylinder connections for attaching standard chlorine cylinders to the chlorine-feeding machines. Connections include flexible metal tubing, an auxiliary valve for each chlorine cylinder, a manifold for connecting [2] [4] [_____] cylinders to each chlorine-feeding machine, and other necessary fittings, unless the machine is direct cylinder-mounted.
2.2.6  Switchover Valves

Supply two or more mechanically operated or loss of chlorine supply-operated automatic gas switchover valves to automatically regulate chlorine gas [pressure] [vacuum] and install [in the gas header] [directly on the chlorine cylinders]. Size the switchover valves appropriately and equipped with filters [and traps]. Factory set the switchover [pressure] [vacuum].

2.2.7  Chlorine Pressure Gauges

Supply chlorine pressure gauges, when applicable, of the diaphragm type with the Bourdon tube and diaphragm compartments filled completely with suitable oil. Construct the gauge on the line from the chlorine tank to indicate accurately the pressure of chlorine gas as supplied from the gas tank to the chlorine feeder.

2.2.8  Chlorine Pressure-Reducing Valves

Provide chlorine pressure-reducing valves that reduce the pressure of the gas and maintain the pressure constant for any given setting of rate of feed regardless of changes in the cylinder pressure.

2.2.9  Vacuum and Chlorine Relief

Provide vacuum and chlorine relief to limit the vacuum within the chlorine-feeding machines and provide for the release to a suitable vent to the outside atmosphere of any chlorine gas pressure build-up in the parts of the machine, normally under vacuum, through improper functioning of the equipment. A vacuum sealing valve which seals off the system when excessive vacuum is present may be substituted for the vacuum relief valve.

2.2.10  Chlorine-Metering Devices

Furnish chlorine-metering devices in sufficient numbers to cover properly the range specified. The chlorine feed rate control system must maintain the feed rate within 4 percent of the indicated rate.

2.2.11  Injectors

Provide injectors with the chlorine-feeding machines to receive all chlorine and solution water and to discharge the resulting solution to the points of application. Introduce the chlorine solution into the [water] [or] [sewage] main by means [of a [ceramic] [hard rubber] [or] [plastic] injection nozzle] [of a suitable diffuser tube inserted into the main through a corporation cock].

2.2.12  Alarm Actuators

Equip each chlorine-feeding machine with alarm actuators to indicate loss of vacuum and excess vacuum. Provide alarm actuators for low chlorine gas pressure and high chlorine gas pressure, unless the chlorine-feeding machine is direct-cylinder mounted. [Also, provide a solution water low pressure alarm actuator.]

2.2.13  Pumps

Provide a pump for each chlorine-feeding machine when the minimum water pressure specified is below that required for satisfactory operation of the
machine. Provide hydraulically operated or electric motor-drive pumps. The electric motor will be rated for [____]-volt, [____]-phase, [____]-Hz ac, and a maximum speed of [____] rpm. Equip the pump with a suitable starter in accordance with the type of control specified.

2.3 EVAPORATORS

**************************************************************************
NOTE: Delete this paragraph in its entirety for installations where chlorine withdrawal rates will not exceed chlorine gasification rate.
**************************************************************************

Evaporators are required whenever gas withdrawal rates exceed the rate at which liquid chlorine gasifies at the operating temperature. Provide water immersed tank heat-exchanger evaporators suitable for evaporating liquid chlorine complete with controls and devices for a complete operating system including: Vaporizing chamber, electric water heaters, water temperature thermostat and indicator, high and low water temperature alarm actuators, water-level gauge, automatic make-up water control system, low water alarm actuator, chlorine gas temperature, and pressure gauges, [make-up water visual flow-indicator], ammonia-type flanged connections for chlorine inlet and outlet, drain and vent line connections, and cathodic protection system with ammeter. Provide parts which are subject to contact with chlorine made of materials resistant to the action of chlorine at pressure and concentrations that could be encountered. Construction is to be as simply as practicable to provide reliable service and to be readily accessible for inspection, cleaning, adjustment, repair and replacement.

2.3.1 Capacity

Provide evaporators with a capacity to convert [_____] kg pounds per day of liquid chlorine into gaseous state.

2.3.2 Vaporizing Chamber

Provide a vaporizing chamber constructed of steel and designed to conform to ASME BPVC SEC VIII D1. Test the chamber hydrostatically at 5.5 MPa 800 psig minimum. Protect the gas chamber and water bath tank from cathodic corrosion. Provide insulated, galvanized tank to conform to ASTM A153/A153M.

2.3.3 Water Heaters

Design the water heaters for operation on a 3-phase, 60-Hz current of the voltage indicated. Include a vapor-sealed magnetic contactor for handling the current to the heaters. The holding coil is to be rated for single-phase, 60-Hz current.

2.3.4 Switchover System

Supply a liquid chlorine automatic switchover system to automatically change to reserve supply when the on-line liquid chlorine supply runs out.

2.3.5 Pressure-Relief System

Equip each evaporator with a chlorine pressure relief system located downstream of the gas outlet with the following features:

a. Rupture disk with 1.7 MPa 250 psig minimum rating.
b. Pressure switch protected by a diaphragm seal and actuated at 137.9 kPa (20 psig).

c. Self-reseating pressure relief valve with manufacturer's standard pressure rating, set for a pressure compatible with the respective rupture disk rating figure.

2.4 PIPING

2.4.1 Water Piping

Provide galvanized steel water piping conforming to ASTM A53/A53M or provide copper tubing conforming to ASTM B88M ASTM B88. Malleable-iron unions and fittings for installation of steel pipe are to conform to ASME B16.3.

2.4.2 Chlorine Piping

Provide chlorine solution piping smaller than 40 mm (1-1/2 inches) in diameter made of [PVC pipe conforming to ASTM D1785 or CPVC pipe conforming to ASTM F441/F441M] [rubber hose]. Provide piping of 40 mm (1-1/2 inches) in diameter or larger made of [plastic pipe] [rubber hose] [rubber-lined] [plastic-lined steel pipe]. Line steel pipe smaller than 150 mm (6 inches) with plastic lining not less than 3.2 mm (1/8 inch) thick; and for steel pipe larger than 150 mm (6 inches), it cannot be less than 4.8 mm (3/16 inch) thick.

Provide plastic fittings for plastic pipe with [flanged] [threaded] joints. Provide joints for rubber hose that use a clamp-type mechanical coupling. Provide lined steel pipe that is [threaded] [flanged integral with the pipe] [forged-steel flanges screwed to the pipe barrel]. Provide fittings for steel pipe which are [flanged conforming to ASME B16.1 or ASME B16.5] [forged-steel threaded conforming to ASME B16.11] and are compatible with lined steel pipe.

2.4.2.1 Piping for Dry Chlorine

*************************************************************************
NOTE: Selection of chlorine-gas piping is dependent on the service for which the system is designed. The designer will consult the Chlorine Manual and CI Pamphlet 6, Piping Systems for Dry Chlorine for applicable piping system.
*************************************************************************

Ensure piping for dry chlorine conforms to CI Pamphlet 1 and CI Pamphlet 6. [Ensure steel pipe 19 through 40 mm (3/4 through 1-1/2 inches) in diameter conforms to [ASTM A106/A106M, Schedule 80, Grade A or B][ or][ ASTM A587]. Ensure steel pipe over 40 mm (1-1/2 inches) in diameter conforms to ASTM A53/A53M, Schedule [40][80], Grade [B][ or][ S]. Fittings for steel pipe are to conform to CI Pamphlet 6]. [Provide seamless copper tubing conforming to ASTM B88MASTM B88 in the annealed state with Type K wall thickness or heavier. Provide fittings for copper tubing in accordance with CI Pamphlet 6.] If moisture may be present, provide piping smaller than 40 mm (1-1/2 inches) in diameter made of [polyvinylidene fluoride] [polyvinylidene fluoride lined steel pipe]; if piping is larger than 40 mm (1-1/2 inches) in diameter, provide polyvinylidene fluoride lined steel pipe. For piping for dry or moist chlorine gas under vacuum provide chlorinated polyvinyl chloride piping.
2.4.2.2 Piping for Liquid Chlorine

Specify piping for liquid chlorine free of moisture the same as for dry chlorine gas under pressure. Whenever a portion of the liquid chlorine piping can be isolated between two closed valves, protect that portion with a liquid chlorine expansion chamber.

2.4.3 Cylinder Connections

Use cylinder connections made of flexible metal tubing of required size cadmium-plated copper. Install flexible cylinder connector assembly with lead-gasketed, naval-bronze fittings.

2.5 ELECTRICAL WORK

Provide electric motor-driven equipment, and wiring per Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Ratings will be as indicated. Provide motor starters complete with thermal-overload protection and other appurtenances necessary for motor controls specified. Provide manual or automatic control and protective or signal devices required for controls and devices. Prewire all electrical connections at junction terminal boxes and at contactor-starter unit enclosures.

PART 3 EXECUTION

3.1 INSTALLATION

Submit detail drawings containing complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show on the drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

3.1.1 Chlorine-Feeding Equipment

Install the chlorine feeding machines, [the evaporators] and all equipment appurtenances in accordance with CI Pamphlet 1 and CI Pamphlet 6 so as to provide a complete and integrated system in accordance with the instructions of the manufacturer [and under the direct supervision of the manufacturer's representative].

3.1.2 Pipe, Tubing, Hangers, and Supports

Install pipes and tubes in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

3.2 FIELD QUALITY CONTROL

3.2.1 Tests

After installation of the chlorine-feeding machine [and evaporators] is complete, perform an operating test at design system flow rates and pressures to assure that the chlorine-feeding installation operates properly. Test all piping hydrostatically and for leaks. No leaks are allowed in piping. If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests.

Submit test report in booklet form showing all field tests performed to
adjust each component and all field tests performed to prove compliance
with the specified performance criteria, upon completion and testing of the
installed system. Indicate in each test report the final position of
controls.

3.2.2 Manufacturer Field Service

Provide the services of a manufacturer's representative who is experienced
in the installation, adjustment, and operation of the equipment specified,
to supervise the installation, adjustment, and testing of the equipment.

3.3 Field Painting

Paint equipment which did not receive a factory finish as specified in
Section 09 90 00 PAINTS AND COATINGS. Follow manufacturers'
recommendations for number of coats, primer and paint type and thickness.
Thoroughly clean factory painted items requiring touching up in the field
of all foreign material and prime and topcoat with the manufacturer's
standard factory finish (provided it does not discolor in the presence of
hydrogen sulfide fumes, high water vapor atmosphere, alkaline water vapor,
and concentrated chlorine (oxidizing) condition)s. Provide coating that is
not less than 0.05 mm 1.78 mils thick.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Training

Conduct a field training course for designated operating staff members
conducted by the manufacturer's representative and provided for a total
period of [8][16][____] hours of normal working time. Start after the
system is functionally complete but prior to final acceptance tests. Cover
all of the items contained in the operating and maintenance instructions
during field training.

3.4.2 Operating Manuals

Submit complete copies of operating manuals outlining the step-by-step
procedures required for system startup, operation and shutdown. Include in
the manuals the manufacturer’s name, model number, service manual, parts
list, and brief description of all equipment and their basic operating
features.

3.4.3 Maintenance Manuals

Submit complete copies of maintenance manuals listing routine maintenance
procedures, possible breakdowns and repairs, and troubleshooting guides.
Include in the instructions gas pipe layout, liquid chlorine pipe layout,
dilution liquid pipe layout, equipment layout, and simplified wiring and
control diagrams of the system as installed.

3.4.4 Framed Instructions

Post framed instructions, containing wiring and control diagrams, where
directed. Post operating instructions as discussed in the Operating and
Maintenance Manual. Post the framed instructions before acceptance testing
of the systems.

SECTION 46 43 21
CIRCULAR CLARIFIER EQUIPMENT
02/20

This guide specification covers the requirements for circular clarifiers for use in Water Resource Recovery Facilities (WRRFs). This guide specification may be used to prepare specifications for either primary or secondary clarifiers for the treatment of domestic wastewater only. Special consideration must be given to wastewater containing industrial wastes.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Show the following on the project drawings or provide:

1. Type of clarifier: primary or secondary
2. Dimensions of clarifier tank
3. Whether clarifier is a center feed with peripheral overflow type or a peripheral feed with center overflow type
4. Whether influent enters through side of tank or through center column when clarifier is center feed with peripheral overflow type

5. Whether rapid sludge removal system is to be used and the number and size of the sludge uptake pipes

6. Size of influent well when clarifier is a center feed with peripheral overflow type

7. Size and section of effluent trough when clarifier is a peripheral feed with center overflow type

8. Size and section of weirs and baffles; and anchorage details

9. Sizes of piping, points of connection to plant piping, and types of joints for wall castings and sleeves

This guide specification may be used to prepare specifications for either primary or secondary clarifiers.

PART 1   GENERAL

1.1 REFERENCES

**********************************************************************************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 Pre-Installation Meetings

**************************************************************************
NOTE: Conduct a regulatory review to determine impact of new and existing permit conditions and regulations; coordinate with Environmental Services Group to determine permitting responsibility. Design separator in accordance with UFC 3-240-01. Ensure compliance with NPDES permits.
**************************************************************************

 Coordinate with the Government for environmental concerns and permits. Ensure compliance with permits and requirements.

1.4 DELIVERY, STORAGE, AND HANDLING

 Ensure that the equipment and parts are packaged for shipment to prevent breakage and damage to components. Deliver materials to the site, inspect for damage, unload and store with minimum handling. Store materials off the ground and under a weathertight covering.

1.5 WARRANTY

PART 2   PRODUCTS

2.1   SYSTEM DESCRIPTION

2.1.1   Circular Clarifier

**************************************************************************

NOTE: Construct the concrete section of the project specification in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

When a center feed with peripheral overflow clarifier is not specified for the project, delete references to this type and the requirements for associated components, including scum removal assembly (for this type), center column used as influent pipe, influent well, and (peripheral) weirs and scum baffles.

When a peripheral feed with center overflow clarifier is not specified for the project, delete references to this type and the requirements for associated components, including scum removal assembly (for this type), influent skirt, and effluent trough and weir assembly.

**************************************************************************

Clarifier equipment includes a clarifier mechanism [with effluent trough and weir assembly], [weirs and baffles,] [influent skirt,] and piping. Use structural steel conforming to ASTM A36/A36M. For completely or intermittently submerged steel members use a minimum thickness of 6 mm 1/4 inch. Use cast iron conforming to ASTM A48/A48M, Class 30 minimum.

2.1.1.1   Shop Drawings

Show the complete assembly of the circular clarifier system with all components, mechanisms, and parts; each with an assigned number corresponding to the equipment manufacturer's parts list. Show details for each component of the clarifier mechanism including installation of piping, anchorage, wiring, tank, and tank floor surfacing.

2.1.2   Clarifier Mechanism Design Requirements

**************************************************************************

NOTE: Design clarifier in accordance with UFC 3-240-01.

Delete requirements for and references to rapid sludge removal system when this system is not included in the project.

When a center feed with peripheral overflow clarifier is larger than 11 m 35 feet in diameter or peripheral feed with center overflow clarifier is larger than 18 m 60 feet in diameter, delete requirements for and references to bridge-supported clarifier mechanisms and associated components, including support bridge, center shaft, and scraper arms of structural shapes.
Other items associated with the circular clarifier, but not covered in this section, include (when used) valves, sluice gates, and perimeter handrail. These items should be covered in the appropriate sections of the project specification.

The clarifier mechanism includes a sludge collector assembly [with rapid sludge removal system]; drive assembly; [supporting bridge or] center column and access bridge; operating platform and access walkway; influent [well] [skirt and effluent trough and weir assembly]; scum removal assembly; overload protection and alarm; and electrical control equipment.

The drive assembly rotates the sludge collector assembly, that [moves settled sludge to a centrally located sludge hopper] [concentrates settled sludge ahead of pipes for rapid sludge removal system]. At maximum hydraulic capacity, or no chains, sprockets, bearings (except sleeve bearing when used) or operating mechanism is below the liquid surface or in contact with the liquid. Assemble the mechanism in the shop to ensure proper fitting of parts, match-mark for erection, and disassemble for shipment.

2.1.2.1 Design

NOTE: Insert torque value(s) as follows:

<table>
<thead>
<tr>
<th>Support Mechanism</th>
<th>Diameter (meters feet)</th>
<th>Torque (Joules foot-pounds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bridge-supported</td>
<td>6-8.5 m20-28 feet</td>
<td>2,710 joules2,000 foot-pounds</td>
</tr>
<tr>
<td>Bridge-supported</td>
<td>9-12 m30-40 feet</td>
<td>5,420 joules4,000 foot-pounds</td>
</tr>
<tr>
<td>Bridge-supported (for peripheral feed with center overflow type only)</td>
<td>13-18 m42-60 feet</td>
<td>8,130 joules6,000 foot-pounds</td>
</tr>
<tr>
<td>Center-column-supported</td>
<td>Less than 16.8 mm 55 feet</td>
<td>27,100 joules20,000 foot-pounds</td>
</tr>
<tr>
<td>Center-column-supported</td>
<td>16.8 to 23 m55 to 75 feet</td>
<td>40,650 joules30,000 foot-pounds</td>
</tr>
</tbody>
</table>

This guide specification is written for one
clarifier. If the project includes more than one circular clarifier, all necessary pluralizations should be made or use the word "each."

Insert peripheral speed value(s) as follows:

<table>
<thead>
<tr>
<th>Peripheral Speed</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Clarifier</td>
<td>0.04 to 0.06 meter per second 8 to 12 fpm</td>
</tr>
<tr>
<td>Secondary Clarifier</td>
<td>0.035 to 0.05 meter per second 7 to 10 fpm</td>
</tr>
</tbody>
</table>

Use recommended values from UFC 3-301-01, Structural Engineering, for wind load and ice load.

Provide a clarifier mechanism manufactured for continuous 24-hour service under design load without excessive wear, damage, or failure. Ensure that the operating stresses do not exceed those allowed in AISC 360. Ensure a minimum continuous output torque rating of [_____] joules foot-pounds [for center-column-supported units and [_____] joules foot-pounds for bridge-supported units] with the scraper arms rotating at a constant speed producing a peripheral speed of [_____] meter per second fpm.

Ensure a safety factor of 2.5, to withstand all structural and mechanical stresses brought about by the following loadings: continuous output rated torque load; dead load; wind load of [_____]; ice load of [_____] (except on scum skimmer); and a live load of 2.5 kPa 50 psf on the access bridge [or on access section of supporting bridge]. Under maximum load, deflection of access bridge must not exceed 1/240 of span [; deflection of supporting bridge must not exceed 1/360 span].

2.2 EQUIPMENT

2.2.1 Sludge Collector Assembly

*NOTE: Delete requirements for center shaft and rapid sludge removal system when not included in this project.*

Provide a sludge collector assembly including scraper arms, scraper blades, [and] center drive cage or drum [or center shaft] [, and rapid sludge removal system].

2.2.1.1 Scraper Arms, Blades & Squeegees

*NOTE: Use first bracketed wording in the second sentence when rapid sludge removal system is not included in the project; use second bracketed wording in this sentence when rapid sludge removal system is included.*

Use structural steel, using welded truss construction of triangular or box section [; or structural steel shapes or closed end pile supported either
by steel guy-rods or steel tie-rods or both]. Weld or bolt steel scraper blades, with attached squeegees, to scraper arms and [move settled sludge to a centrally located sludge hopper] [concentrate settled sludge ahead of pipes for rapid sludge removal system]. Connect scraper arms to [center shaft or] center drive cage or drum by bolted or welded connections. Use scraper blades of steel plate with a minimum thickness of 6 mm 1/4 inch. Make squeegees bronze [, fiberglass,] or stainless steel with a minimum thickness of 3 mm 1/8 inch [for metal, 6 mm 1/4 inch for fiberglass], and connect to scraper blades with bronze or stainless steel bolts and nuts with a minimum of 50 mm 2 inches. of vertical adjustment.

2.2.1.2 Center Drive Cage or Drum

Fabricate of structural steel, using a box truss or cylindrical drum construction. Connect center drive cage or drum to drive assembly with machine screws or a bolted connection.

[2.2.1.3 Center Shaft

Construct from a solid steel shaft or steel pipe conforming to ASTM A53/A53M, Schedule 40.

][2.2.1.4 Rapid Sludge Removal System & Piping

Rapid sludge removal system includes [___] mm inch diameter sludge uptake pipes of PVC 1120 or PVC 1220 conforming to ASTM D1784, ASTM D3034, SDR 35 or ASTM D2241, SDR 26, attached to the scraper arms and arranged so that the flow from each can be observed, adjusted, and sampled in the sludge well. Uptake pipe system includes all necessary intermediate clamps and supports and terminates in a suitable fitting or flexible coupling in sludge well. Provide the discharge end of each uptake pipe with an adjustable slip tube or orifice control gate to permit flow adjustment. Sludge well must be of structural steel plate having a minimum thickness of 6 mm 1/4 inch.

]2.2.2 Drive Assembly

**************************************************************************
NOTE: Delete reference to chain drives when clarifier tank is more than 12 m 40 feet in diameter. Check with manufacturer.
**************************************************************************

Include motor, speed reduction and turntable gearing, turntable bearing assembly, drive assembly bearings, and belt drives[ or chain drives, or both]. Drive assembly must permit sustained operation at the continuous output torque rating without excessive wear and develop twice the continuous output torque rating without damage to or failure of drive assembly components.

2.2.2.1 Motor

Provide a motor adequate to drive the sludge collector assembly continuously at the maximum load encountered under any operating condition without overloading or exceeding the nameplate rating of the motor. Provide the starting torque needed to move sludge collector assembly from a dead stop in a dewatered clarifier tank as well as torque needed to move it from a dead stop under the maximum loading specified without overloading.
Motor must be suitable for operation with the voltage characteristics as indicated. Protect motor against overload, low voltage, and unbalanced voltage. Use a constant speed motor, totally-enclosed, fan-cooled, suitable for outdoor service, and conforming to NEMA MG 1. Flexible coupling for connecting shafts of close-coupled motor and speed reducer must conform to the applicable requirements of AGMA 9002, and ANSI/AGMA 9000. Motor position must be adjustable to increase or decrease belt [or chain] tension.

2.2.2.2 Speed Reduction and Turntable Gearing

**************************************************************************
NOTE: Delete references relating to pinion-and-spur-gear reduction unit and intermediate speed reducer when clarifier tank is less than 11 m 35 feet in diameter.
Delete reference to worm-gear reduction unit when clarifier tank is more than 11 m 35 feet in diameter.
**************************************************************************

Speed reduction and turntable gearing for the primary [and intermediate] speed reducer[s] must be a worm or helical or a combination thereof. Gearing for the turntable must be [a worm gear reduction unit] [a pinion-and-spur-gear reduction unit]. Ensure an AGMA service factor as recommended in the applicable AGMA Standards ANSI/AGMA 6113 ANSI/AGMA 6013, ANSI/AGMA 6034 or when drive is operating at full load motor wattage horsepower, 24 hours a day continuous running. Gearing will withstand any loadings produced by thrust, out-of-balance, and vibration resulting from operating conditions and operate from zero rpm to a speed consistent with the maximum peripheral speed. Component parts of the speed reduction and turntable gearing will operate at sustained operation at the continuous output torque rating for the life expectancy specified without excessive wear and develop twice the continuous output torque without damage to or failure of any component part.

2.2.2.1 Gear Lubrication

Provide an oil or grease lubrication system for speed reduction gearing, including means to stop drive motor in event of insufficient lubrication.

2.2.2.3 Gearmotor

Gearmotor, where practicable, may be used in lieu of separate motor and primary speed reducer. Motor component of gearmotor must be as specified in paragraph MOTOR. Speed reducing component of gearmotor must conform to the applicable requirements specified in paragraph SPEED REDUCTION AND TURNTABLE GEARING, and in ANSI/AGMA 6113 ANSI/AGMA 6013 and ANSI/AGMA 6034.
2.2.2.4 Turntable Bearing Assembly

Turntable bearing assembly includes the turntable bearings upon which the turntable and attached sludge collector assembly are supported; the turntable; and the drive assembly/turntable support base. Assembly must withstand all radial and axial loads imposed by drive assembly and sludge collector assembly. Arrange component parts for replacement of balls or rollers, or the bearing raceways, or the complete bearing unit. Bearing raceway material must have adequate strength to withstand all radial and axial loads and must have a Rockwell "C" hardness of not less than 58.

Turntable bearing assembly [for a center-column-supported clarifier mechanism] must support, where applicable, a drive assembly, turntable, spur gear, and one end of the access bridge. [A bridge-supported clarifier mechanism may incorporate a submerged split-case, water-lubricated bottom guide bearing or an intermediate steady bearing where manufacturer's design requires use of such bearing in addition to turntable bearings.] A bottom support bearing is not acceptable. Bearing must run in an oil bath or be grease-lubricated. Turntable and drive assembly/turntable base must be of cast iron, nodular cast iron, or steel; if of steel, these parts must have sufficient thickness to provide the rigidity necessary to maintain alignment of sludge collector assembly. Turntable must be cast integrally with spur gear or be fastened to the spur gear with machine screws or bolts.

2.2.2.5 Drive Assembly Bearings

Load rating and fatigue life for bearings must be based on ABMA 9 and ABMA 11, as applicable. Bearings must be either oil lubricated or grease lubricated.

2.2.2.6 Chain Drives and Belt Drives

Belt drives[ and chain drives] incorporated in drive assembly include V-belt-and-pulley[ and chain-and-sprocket] arrangements, except that belt drives must not be used directly on the[ center shaft or on the] center drive cage or drum. Belt drives[ and chain drives] must have a minimum safety factor of 4 as applied to ultimate breaking or transmission strength of the belt[ or chain] with respect to loads transmitted at twice the continuous output torque rating of the clarifier mechanism.

Key mount the pulleys[, sprockets,] and other motive power transmitting connections. Connect the [drive pulley] [drive sprocket] on the output shaft of the primary speed reducer by a shear-pin hub arrangement to protect the motor against overload[; sprocket must have a bronze bushing with grease lubrication]. Shear-pin hub arrangement must be such that it will not bind or freeze into position. Fabricate guards of steel and make weatherproof.

2.2.3 Scum Removal

**************************************************************************
NOTE: Select the applicable paragraphs(s) from the following:
**************************************************************************

Provide a skimmer assembly and [heated] scum trough. Skimmer assembly will continuously move surface scum to tank periphery and automatically flush the scum into the scum trough with a minimum discharge of water.
2.2.3.1 Skimmer Assembly

**************************************************************************
NOTE: Delete references to and requirements for aluminum wherever a corrosion problem with aluminum may be anticipated.
**************************************************************************

When center feed with peripheral overflow type clarifier is larger than 11 m 35 feet in diameter or peripheral feed/center overflow type clarifier is larger than 18 m 60 feet in diameter, delete requirements for and references to bridge-supported clarifier mechanisms and those components peculiar thereto, including support bridge, center shaft, and scraper arms of structural shapes.
**************************************************************************

Skimmer assembly includes a [fixed] [hinged or pivoting] skimming blade, a hinged or pivoting plow blade with wiper blades, and support legs. Skimming blade must be of structural steel and extend from influent well to scum trough. Plow blade is [structural steel] [aluminum], and is the width of the scum trough. Securely clamp in position grease- and oil-resistant wiper blades. Ensure the plow blade and its hinged or pivoted connections have proper alignment and is in continuous contact between wiper blades, scum trough approach ramp, and scum baffle. Plow blade must have provision for field adjustment in the vertical plane. Provide means to carry plow blade smoothly over the scum trough. Use corrosion-resistant materials for moving parts within the skimming assembly. Support blades, provide bracing where necessary to maintain the rigidity of the assembly. Use structural steel for support legs.

2.2.3.2 Scum Trough

Provide a welded structural steel scum trough, minimum thickness 6 mm 1/4 inch with a flanged connection for the scum discharge pipe, supported from the tank wall. The inclined approach ramp leading to discharge section of scum trough must be shaped to contain the scum as it is moved up the incline to the trough by the plow blade.

]2.2.3.3 Scum Removal Assembly

**************************************************************************
NOTE: Select the applicable paragraphs(s) from the following:
**************************************************************************

When a peripheral feed with center overflow type clarifier is not specified for the project, delete references to the scum removal assembly (for this type).

In cold climates where ice build-up is a problem, require heated scum trough and hinged or pivoting skimming blades in lieu of fixed blades.

**************************************************************************
Scum Trough: Use an adjustable dipping weir type scum trough and include collector pipe and operator.

(1) Provide a steel collector pipe conforming to ASTM A53/A53M Schedule 20 minimum. Pipe must have a 1.05 rad 60 degree wide slot cut symmetrically about the vertical axis, with the horizontal edges of the slot parallel to the longitudinal axis of the pipe. At maximum intervals of 750 mm 30 inches, a 50 mm 2 inch wide band of full circumference must be left for stiffness. The pipe must be plugged on the inboard end and open on the effluent end. End supports include a rolled steel collar welded to an adjustable steel end plate. Provide a grease and oil-resistant, watertight seal, so constructed that it allows smooth motion of the rotating pipe; seal must be readily renewable without removing pipe. Secure end supports to concrete tanks walls by stainless steel anchor bolts of 16 mm 5/8 inch minimum diameter.

(2) Operator: Mount a manual operating lever on the collector pipe. Lever must be steel pipe having a minimum diameter of 31 mm 1 1/4 inches and secured to collector pipe with a chain or bolted connection. Lever must extend at least 0.91 m 3 feet above the top of the tank wall and permit rotation of collector pipe at least 0.52 rad 30 degrees each side of the vertical axis.

2.2.4 Center Column

**************************************************************************
NOTE: When a center feed with peripheral overflow type clarifier is not specified for the project, delete references to this type and the requirements for those components peculiar thereto, including center column used as influent pipe.
**************************************************************************

Use a cylindrical, structural steel, column to support the entire clarifier mechanism, including the inboard end of access bridge. The center column also serves as the influent pipe with large openings at its upper end to direct influent flow into the influent well at a low velocity. Provide an accurate fit between the top of the center column and the drive assembly. Attach the center column to the drive assembly with bolts or machine screws. Provide anchorage for the center column to the tank according to the manufacturer's instructions.

2.2.5 Effluent Trough and Weir Assembly

Assembly must include effluent trough, effluent weirs, and supporting members. For effluent trough use welded structural steel. Attach weir plates to each side of the effluent trough. Weir plates must be structural steel[ or fiberglass]. Bolt weir plates to effluent trough and permit horizontal and vertical adjustment of weir. Ensure proper alignment. Supporting members must be of sufficient cross section to prevent vertical movement due to the flotation forces developed with trough empty and liquid level in tank at base of weir. Supporting assembly must be capable of vertical adjustment to permit leveling of trough.

2.3 MANUFACTURED UNITS

2.3.1 Access Bridge, Walkway, and Operating Platform

Provide an access bridge extends from tank sidewall to the center and
Beyond that is sufficient to support walkway and operating platform. Where the bridge supported unit is used, the supporting bridge must be used as the access bridge. Ensure walkway and operating platform are skidproof. Walkway and operating platform must comply with 29 CFR 1910. Ensure maximum deflection of L/360 when both dead and live loads are applied.

2.3.2 Supporting Bridge

Include two structural steel beams and braces of sufficient depth and thickness to support entire clarifier mechanism within the specified maximum allowable deflection.

2.3.3 Influent Well

Provide an influent well to diffuse the liquid into the tank. The well must project below and 100 mm 4 inches above the water level at maximum hydraulic capacity and radially diffuse and dampen the influent without inhibiting the clarifier process. Provide a flanged connection for the influent pipe.

2.3.4 Influent Skirt

NOTE: Delete references to and requirements for aluminum wherever a corrosion problem with aluminum may be anticipated.

The tangential inlet must be shaped to direct influent liquid through the influent raceway. Influent skirt is [steel sheet] [aluminum sheet, minimum thickness] 1.8 mm 14 gage, with bars or structural shapes at top and bottom for rigidity. [Aluminum must conform to ASTM B209M ASTM B209 or ASTM B221M ASTM B221, Alloy 6061, Temper T6. ]Supporting assembly must be capable of horizontal and vertical adjustment for final location and leveling of influent skirt.

2.4 COMPONENTS

2.4.1 Electrical Control System

Provide an enclosure; main and branch circuit breakers; starter, contactors, and reset buttons; pushbuttons; lockout/tagout disconnects and appurtenances and all necessary wiring. Electrical control system must be in accordance with NEMA ICS 1 and NEMA ICS 2. Design, fabrication, and installation of electrical components must be in accordance with requirements of NFPA 70. Mount electrical controls in a weatherproof enclosure.

2.4.1.1 Circuit Breakers

Circuit breakers must be thermal magnetic type and meet the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Main circuit breaker must have a maximum capacity of 150 percent of the electrical load. The main circuit breakers must be an external handle mechanism, with positive locking device, mounted outside the enclosure to permit operation of breaker from outside the enclosure. Provide branch circuit for each drive motor, control circuit, [trough heating device,] and receptacle. Ensure that the panels include spaces for two additional circuit breakers.
2.4.1.2 Motor Starter [ , Contactors,] and Pushbutton Station

Provide a pushbutton actuated magnetic motor starter with overload and undervoltage protection for the motor. Starter must have thermal overload protection in each phase and short circuit protection. Ensure overload protective devices give adequate protection to motor windings, are of thermal inverse-time-limit type, and include a manual-reset type pushbutton. Use 2-button Start-Stop pushbutton station. [ Provide contactors for trough heating devices.]

2.4.1.3 Overload Protection and Alarm Device

Provide clarifier mechanism with an overload protection and alarm device to indicate load on the mechanism at all times, to sound an alarm in case of impending excessive load, and to stop the mechanism when such load is reached. Device must be of the torque-actuated or indicating-ammeter type, mounted except for alarm, in an enclosure. Include an industrial-type horn or 150 mm 6 inch bell, relay, reset button, test circuit, and an independent On-Off switch. The horn or bell must be constructed of noncorrodible material and be suitable for remote mounting. [ Provide auxiliary contacts in alarm circuit for transmission of signal to existing alarm system.]

2.4.1.4 Wiring

Wire control circuits with 1.8 mm No. 14 gage stranded, 1 mm 2/64 inch insulation machine-tool wire with ring tongue compression type lugs and number tags on both ends of wires. All power circuit wiring must be minimum 2.5 mm No. 12 gage, include all terminations as necessary and be labeled with number tags. Secure wires with either plastic ties or wiring duct, or both. Wires going to components mounted on the enclosure door must be secured in a cable-like bundle and strapped to the door and the enclosure with sufficient slack to allow easy operation of the door. Terminate circuits requiring field connection on panel terminals.

2.4.2 Lubrication

Provide bearings and other moving parts subject to wear with lubrication.

2.4.3 Key Mounted Connections

Where connections between shafts and sprockets, gears, pulleys, and other component parts are specified to be key mounted, keys and keyways must conform to ASME B17.1 or ASME B17.2.

2.4.4 Weir Plates and Scum Baffles

Use [steel] [aluminum conforming to ASTM B209M ASTM B209 or ASTM B221M ASTM B221, Alloy 6061, Temper T6] [ fiberglass]. Ensure weir plates and baffles or their supports permit horizontal and vertical adjustment of the weir and baffle. Seal according to manufacturer's recommendations.

2.5 MATERIALS

2.5.1 Clarifier Piping Connections

The influent connection to the clarifier will be as shown on the drawings and consist of one [_____] mm inch diameter flanged pipe connection. The
effluent connection will be as shown on the drawings and consist of one 
[_____] mm inch diameter flanged pipe connection.

2.5.1.1 Pipe and Fittings

Use manufacturer's standard pipe and fittings.

2.5.2 Anchor and Connecting Bolts, Nuts, and Washers

Use manufacturer's standard anchor and connecting bolts, nuts, and washers. Show bolt sizes and locations on the approved shop drawings for the equipment[, except as otherwise indicated].

2.5.3 Grout Materials

Use grout conforming to ASTM C1107/C1107M.

2.5.4 Materials Protection

Except as otherwise specified, treat and paint equipment in accordance with the manufacturer's standard practice.

2.6 ACCESSORIES

2.6.1 Spare Parts

Provide manufacturer recommended spare parts that are identical and interchangeable with original parts. Protect spare parts from corrosion and furnish in clearly marked containers. Spare parts must meet standards recommended by the manufacturer in the manufacturer operation, maintenance, or instruction manual.

2.6.2 Tools

Provide special tools necessary for the proper maintenance and operation of the equipment together with a properly identified hardwood or metal box for their storage.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 General

Install clarifier equipment in accordance with the manufacturer's instructions. Correctly align equipment components. [After final positioning of center column, provide full bearing under base plate using non-shrink grout.]

3.2 PREPARATION

3.2.1 Surfacing of Clarifier Tank Floor

Perform surfacing operation in accordance with the approved recommendations of the manufacturer of the clarifier equipment, except as otherwise specified.

Immediately before the surfacing operation is begun, clean the floor of all dirt, soil, and other substances which would prevent the proper bonding of
the surfacing to the concrete subfloor. Bring the grout surfacing to finish grade, as near as possible, by hand. If the manufacturer's recommended procedure calls for use of straightedges attached to scraper arms, fasten a 50 by 150 mm 2 by 6 inches metal clad wooden straightedge to each scraper arm approximately 6 mm 1/4 inch below the scraper blade to form a suitable screed; rotate scraper arms manually to complete the surfacing operation; do not use drive unit to move the arms. Prevent grout from entering sludge cone; immediately remove any grout that falls in the sludge cone or on clarifier tank walls. Immediately after surfacing operation is complete, clean clarifier tank floor and circular clarifier equipment of deposits of excess grout.

3.3 INSTALLATION

Install clarifier in accordance with the manufacturer's installation instructions.

3.3.1 Piping

**************************************************************************
NOTE: Delete piping applications not covered in this section. In general, piping external to the clarifier tank that is part of the water resource recovery facility interconnecting piping system should be covered in a separate piping section in the project specification.
**************************************************************************

Install piping in accordance with manufacturer's instructions. Make flanged joints up tight, avoid undue strain on flanges. Align bolt holes for each flanged joint. Use full size bolts for the bolt holes; use of undersized bolts to make up for misalignment of bolt holes or for any other purpose is not be permitted. Install flanged pipe so that adjoining flange faces are not out of parallel to such degree that the flanged joint cannot be made watertight without overstraining the flange. Provide hangers and supports where necessary to support piping. [For buried piping, use push-on joints or mechanical joints, and make in accordance with AWWA C600; for mechanical joints, also follow recommendations of Appendix A to AWWA C111/A21.11].

3.3.2 Weirs

Mount weir plates in accordance with manufacturer's instructions. Use sufficient sealant to fill all voids between tank and weir plates.

3.4 FIELD QUALITY CONTROL

3.4.1 General

Perform all field tests and provide all labor, equipment, and incidentals required for tests. The Contracting Officer will witness field tests and conduct all field inspections. Provide the Contracting Officer ample notice of dates and times scheduled for tests.

3.4.2 Tests

Test circular clarifier mechanism as in operation to demonstrate correct alignment, smooth operation, proper adjustment of flow distribution, freedom from vibration, and freedom from noise and overheating of moving machinery. Include in test at least two full cycles of successful
operational sequences to demonstrate that the system continues to function satisfactorily after meeting all operational requirements.

3.4.3 Repair Painting

Inspect painted surfaces for holidays, scratches, chipping, and other damage. Refinish imperfections by cleaning burrs and rough surfaces and sanding to a smooth finish, prime and repaint.

3.4.4 Manufacturer Field Service

Provide the services of the clarifier equipment manufacturer's representative or technician, experienced in installation and operation of the type of systems being provided, to supervise the erection, start-up, acceptance tests, and final inspection.

3.5 CLOSEOUT ACTIVITIES

3.5.1 System Operation

Provide Circular Clarifier, Data Package 3, including operation and maintenance manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA, providing basic data relating to the design, operation and maintenance of the circular clarifier.

NOTE: This guide specification covers the requirements for air supply and diffusion equipment for sewage treatment plants.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature
to update the issue dates.

References not used in the text will automatically
be deleted from this section of the project
specification when you choose to reconcile
references in the publish print process.

The publications listed below form a part of this specification to the
extent referenced. The publications are referred to within the text by the
basic designation only.

1.2 SUBMITTALS

**************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Equipment Installation

Drawings as specified.

SD-03 Product Data

Materials and Equipment

SD-06 Test Reports

Field Testing

SD-10 Operation and Maintenance Data

Operating and Maintenance Manuals; G[, [_____]]

1.3 QUALITY CONTROL

1.3.1 Qualifications

Welding procedures and welders are required to be qualified in accordance with the code under which the welding is specified to be accomplished.

1.4 MATERIALS SUBMITTALS

Submit a complete list of equipment and materials, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, proposed diagrams, installation instructions and other sheets. Spare parts data for each different item of material and equipment specified, after approval of the related submittals, and not later than [_____] months prior to the date of beneficial occupancy. Include a
complete list of parts and supplies, with current unit prices and source of supply.

1.4.1  Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and which essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment is required to be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

1.4.2  Nameplates

Include on each major item of equipment the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

1.4.3  Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment.

1.4.4  Factory Painting

Unless otherwise specified, clean, prime, and give two coats of machinery enamel to all equipment at the factory. Fiberglass, stainless steel, and galvanized components need not be painted.

1.5  DELIVERY, STORAGE, AND HANDLING

Ensure all equipment delivered and placed in storage is stored with protection from the weather, excessive humidity and excessive temperature variation; and dirt, dust, or other contaminants.

PART 2  PRODUCTS

2.1  SYSTEM DESCRIPTION

An air and gas diffusion system consists of Air Supply Equipment, the Air Distribution System, the Air Diffusers, and other Miscellaneous Equipment, as specified herein.

2.2  EQUIPMENT

2.2.1  Air-Supply Equipment

The air-supply consists of [multi-stage] [_____] [centrifugal] [and] [or] [positive displacement] air blowers and drive units with filters, controls, and appurtenances as indicated or specified.

2.2.1.1  Centrifugal Blowers

*****************************************************************************************************************************************
NOTE: Blowers should be identified on the drawings by type and operating characteristics.
*****************************************************************************************************************************************
2.2.1.1.1 Performance and Design Requirements

Provide blowers that are [multistage] [single stage] centrifugal, oil-free types designed for continuous duty with [closed backward-bladed] [open radial-bladed] impellers. Provide with performance and design requirements as shown.

2.2.1.1.2 Casing

Provide centrifugal blowers of modular design with the casing either vertically or horizontally split and with the required number of compression stages to comply with the specified operating requirements. Machine all horizontally split casings at the split to be tight without a gasket. Vertically split casings are to include rigid cast iron sections held securely between cast iron inlet and outlet heads by steel tie rods. Provide tapped and plugged drains at the lowest points of the casing. Ensure inlet and discharge connections comply with ASME B16.1 [Class 125] [125 pound] [_____] drilled and tapped flanges and are an integral part of the head. Provide casing with lifting eyes capable of supporting blower.

2.2.1.1.3 Impellers

**************************************************************************
NOTE: Other impeller materials, such as steel, are available. Consult with various manufacturers for recommendations.
**************************************************************************

Provide impellers cast of high grade [aluminum alloy] [steel], mounted and keyed to the shaft and secured by a locknut. Install impeller hubs to be butted against each other either directly or through one piece metal spacers. Provide ample clearance between the impeller and casing. Test each impeller by operating at a speed to [20] [%] percent above operating speed and check for cracks using the dye penetrant method or similar method of equal accuracy. Ensure the impeller and shaft assembly are statically and dynamically balanced as a unit. Removing of metal from the impeller by boring is not an acceptable means of balancing the impeller and shaft unit. Vibration is not allowed to exceed 0.025 mm 1.0 mil at the bearing housing with the blower operating. First critical speed is required to be at least 150 percent of maximum operating speed.

2.2.1.1.4 Diffusers

Provide diffuser vanes, cast into each section of the blower casing, to receive air from the impeller and direct the air to the next impeller for multi-stage type blowers.

2.2.1.1.5 Shaft

Provide a shaft of ground and polished high grade [high alloy steel] [carbon steel] [stainless steel] of sufficient diameter to operate below first critical speed.

2.2.1.1.6 Shaft Seals

Provide solid carbon ring shaft seals where the shaft passes through the inlet and discharge heads. Design seals to permit seal inspection or replacement without disconnecting suction or discharge piping.
2.2.1.1.7 Internal Seals
Provide labyrinth type seals between stages.

2.2.1.1.8 Bearings
******************************************************************************
NOTE: Delete inapplicable lubrication method.
Verify bearing L-10 life requirements.
******************************************************************************
Provide each blower with two [pressure oil lubricated sleeve type journal] [splash oil lubricated anti-friction type] bearings. Design bearings for both radial and thrust loads and size for an L-10 life of 5 years continuous operation as defined by ABMA 9 or ABMA 11. Design bearings to allow replacement without disassembling the blower casing or disconnecting piping.

2.2.1.1.9 Pressure Oil Lubrication System
Provide a console mounted pressure lubrication system to oil the sleeve bearings. The lubrication system consists of a main oil pump mounted on and driven by the blower shaft, an auxiliary electric motor driven oil pump, an oil cooler, an oil filter, a 3-minute retention time oil reservoir, and all required switches, temperature sensors, and gauges. Ensure the electric motor driving the auxiliary oil pump has Class F insulation, Type NEMA Design B, in accordance with NEMA MG 1, and is totally enclosed fan cooled; equipped with 120 volts space heaters; and controlled in accordance with NEMA ICS 1. Completely pipe the lubrication system and wire with only interconnecting piping between the console and the pump required in the field.

2.2.1.1.10 Splash Oil Lubrication System
Provide a simple splash lubrication system with each bearing having its own oil reservoir integral with the bearing housing. Maintain proper oil level by a constant level oiler located on each bearing housing. Provide a slinger on the shaft to splash oil into the bearing when the compressor is running. Provide a sight level gauge in the bearing housing. Provide a labyrinth seal combined with an atmospheric vent to prevent oil contamination of the air stream.

2.2.1.1.11 Inlet Guide Vanes
Provide inlet guide vanes for each single stage centrifugal blower.

2.2.1.1.12 Centrifugal Blower Speed Increasing Gears
Provide high speed, single stage centrifugal gears made of hardened, helical, alloy steel, manufactured in accordance with AGMA 6011 with a minimum 1.5 service factor applied to full horsepower rating of blower.

2.2.1.2 Positive Displacement Blowers
******************************************************************************
NOTE: Blowers should be identified on the drawings by type and operating characteristics.
******************************************************************************
2.2.1.2.1 Performance and Design Requirements

Provide positive displacement rotary blowers, oil-free types, designed for continuous duty. Performance and design requirements are to be as shown.

2.2.1.2.2 Casing

Provide a one piece blower casing with separate head plates constructed of close-grained cast iron, suitably ribbed to prevent distortion under the specified operating conditions. Fabricate casing with lifting eyes for installation and maintenance purposes.

2.2.1.2.3 Impeller and Shaft

Provide impeller and shaft constructed of a common ductile iron casting. Provide impellers of the straight, two-lobe involute type that operate without rubbing, liquid seals, or lubrication. Ensure the peak vibration velocity of blower is less than 7.62 mm/second 0.30 inch/second.

2.2.1.2.4 Timing Gears

Positively time impellers by a pair of machined, heat-treated, spur tooth timing gears. Mount timing gears on the impeller shafts on a tapered fit and secured by a locknut.

2.2.1.2.5 Bearings

**************************************************************************
NOTE: Verify bearing L-10 life requirements.
**************************************************************************

Support impeller shaft by antifriction [spherical ball] [roller] bearings sized for a minimum L-10 life of [30,000] [50,000] hours as defined by ABMA 9 or ABMA 11.

2.2.1.2.6 Seals

Provide a lip type oil seal at each bearing to prevent lubricant from leaking into the air stream. Provide labyrinth seals at the point where the shaft passes through the head. Provide ventilation of the impeller side of the oil seals to atmosphere to eliminate any carry-over of lubricant into the air stream.

2.2.1.2.7 Lubrication

**************************************************************************
NOTE: Delete inapplicable lubrication system. Use bracketed sentences if "pressure oil lubricated" is to be used in the lubrication system.
**************************************************************************

Provide drive and bearings of the [grease lubricated type and also provide with a grease fitting] [splash oil lubricated type]. Provide timing gears and gear end bearings of the [pressure oil lubricated type] [splash oil lubricated type]. Regulate oil level by a metering orifice.

[If using a full pressure lubrication system built into positive displacement blower, direct connect to oil pump and include oil strainer, oil reservoir, piping to bearings, and oil spray for gears with piping to...]

SECTION 46 51 00.00 10 Page 13
Design oil vents so that oil vapors do not enter motor. Design system to prevent leakage and dirt contaminants.

2.2.1.3 Drive Connection

**NOTE: Verify cubic meter/second cfm increments for additional sheaves.**

[Connect the blower to the motor by a heavy-duty flexible forged steel spacer coupling, keyed or locked to the shaft.] [Connect the blower to the motor by a V-belt drive capable of transmitting the motor power to the blower. Provide additional sheaves so that the blowers output can be varied in [0.189] [_____] cubic meter/second [40] [_____] cfm increments between minimum and maximum flow conditions.] Cover the drive with an acoustically treated sheet metal guard.

2.2.1.4 Motors

Size motors to be within their rated load under the specified operating conditions. Ensure all motors conform to NEMA MG 1 and are the squirrel cage induction Type NEMA Design B, Class B or F insulated, with a service factor of not less than 1.15. Motors are required to be horizontal foot-mounted, totally enclosed fan-cooled, cast iron or aluminum construction and a quiet series type with a noise level not exceeding 80 dB (A Scale). The motor frame is required to be the standard NEMA assigned frame size supplied for constant speed use on full voltage, fixed frequency line power. Provide resistance temperature detectors (RTD's) embedded in two phases of the stator windings. Provide motor bearings with a minimum L-10 life of 50,000 hours.

2.2.1.5 Power Factor Capacitors

Equip all motors over 3.7 kW 5 hp with power factor correcting capacitors. Furnish capacitors complete with internal fusing and bleed-off resistors. Provide for a corrected power factor of not less than 95 percent at full load. Install capacitors in enclosures coordinated with the individual motor construction with leads terminated in the motor terminal box and identified as capacitor leads. Provide overcurrent device settings within the motor controls that are properly reduced for the motor and capacitor combination.

2.2.1.6 Blower - Motor Base

Provide a full length common base of steel box construction for the blower and drive. Ensure the base is suitable for direct attachment to the foundation. Provide anchor bolts, [anti-vibration strips,] and grout as required for proper installation.

2.2.1.7 Concrete Foundation

Provide a concrete foundation as indicated. Ensure the foundation is entirely separated from the surrounding floor. Provide concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.2.1.8 Filters

************************************************************************************************************************************
NOTE: Consult diffuser manufacturers to verify the percent efficiency required for the diffusers specified. Use of prefilter blanket increases filter life.

Delete the last sentence for warm climate projects.

Provide filters of the [washable dry type,] [disposable dry type,] rated to be at least 90 percent efficient when tested in compliance with ASHRAE 52.2 dust spot method. Ensure filter has at least 0.093 square meter 1 sq. ft. of filter area per 0.0118 cubic meter/second 25 cfm of air flow. Use polyester felt filter material with 25 mm 1 inch pleat separation. For filters located outside of the building, provide a weather hood designed to keep rain, snow, and other foreign articles away from the filter element. Design the weather hood for inlet velocities between the hood and the filter element of 2.54 m/second 500 ft/min or less. Provide a manometer or differential pressure gauge on the filter unit to indicate when the filter element requires cleaning or replacing. [Provide a filter element by-pass with counter-weighted doors to prevent destruction of the element in the event freezing moisture clogs the filter].

2.2.1.9 Accessories

Provide each blower with [inlet] [and] [discharge] silencers. Provide silencers for [standard] [critical] grade silencing. Provide intake silencers of the [chamber] [absorption] type. Provide discharge silencers of the [chamber] [absorption] [combination chamber-absorption] type. Size silencer as recommended by the silencer manufacturer and ensure compatibility with the blower requirements. Ensure silencer connections match the adjacent piping. Provide mounting brackets as required for silencer support. Construct silencer of heavy-duty rolled and welded steel plate with inner liner properly welded to outer shell for purpose of deadening outer shell.

2.2.1.9.2 Acoustical Insulation

Wrap silencers, [interior air piping,] [expansion joints,] [valves,] [and] [drive guards] with 25 mm 1 inch thick high density woven glass fiber mat having a minimum density of 4.6 kg/square meter 15 ounces/square foot and lag with a 0.41 mm 0.016 inch thick aluminum jacket. Comply with EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.

2.2.1.9.3 Gauges

Provide gauges that comply with ASME B40.100. Ensure inlet gauges have a range of [0 to 762 mm] [_____] [0 to 30 inch] [_____] water gauge vacuum. Ensure outlet gauges have a range of [0 to 103 kPa] [_____] [0 to 15 psi] [_____] . Provide all accessories for [control panel] [wall] [pipe] mounting of the gauges.
2.2.1.9.4 Thermometers

Provide thermometers to indicate [inlet air temperature,] [discharge air temperature,] [lubrication oil temperature,] [and] [diffuser point of discharge temperature for three locations within the system]. Thermometers of either red-reading mercury-in-glass type or dial type are acceptable. Provide a scale range covering the full range of expected operation and up to 125 percent, but not more than 150 percent of maximum.

2.2.1.9.5 Temporary Screens

Provide a temporary screen, consisting of 16-mesh wire backed up by 6.4 mm 1/4 inch hardware cloth, at the blower inlet connection. Remove the screens after initial blower start-up and testing.

2.2.1.9.6 Inlet and Discharge Elbows

Provide inlet and discharge elbows of the long sweep type constructed of cast iron with ASME B16.1, Class 125 flanges.

2.2.1.9.7 Expansion Couplings

Provide couplings of the extra heavy gauge rubber, wire reinforced type suitable for temperature range of -29 to plus 121 degrees C -20 to plus 250 degrees F and pressure range from 381 mm 15 inch of mercury vacuum to 103 kPa 15 psig.

2.2.1.10 Manual Control System

**************************************************************************
NOTE: Delete inapplicable control system. NEMA 3R and NEMA 4 Types are exterior panel types.
**************************************************************************

Provide each blower with a control panel containing all starters, circuit breakers, disconnects, and other equipment required for manual starting and stopping of the blower. Ensure controls and motor control centers conform to NEMA ICS 1, NEMA ICS 2, NEMA ICS 3, NEMA ICS 4, NEMA ICS 6, UL 508, and UL 845. Ensure circuit breakers conform to IEEE C37.13. Provide the control panel in a NEMA 250, [Type 12] [Type 3R] [Type 4] enclosure. Ensure all materials and construction complies with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2.1.11 Automatic Control and Monitoring System

**************************************************************************
NOTE: Delete inapplicable control system.
**************************************************************************

Provide each blower with an automatic control and monitoring system to control start-up and shut-down sequences, to indicate various operation parameters, and to actuate blower protective devices. All accessory devices are required to be operated through this system.

2.2.1.11.1 Panel Construction

**************************************************************************
NOTE: NEMA 3R and NEMA 4 Types are exterior panel types.
**************************************************************************
Enclose the automatic control and monitoring system in a NEMA 250, [Type 12] [Type 3R] [Type 4] panel and that is completely wired and tested with internal connections being made on terminal blocks. Provide a power supply to the control panel rated at [_____] volts ac, [_____] phase, 60 Hz to a [_____] amp flange mounted disconnect. Derive internal voltages, including [120] [_____] volts ac, from the [_____] volts ac, supply. Provide control power transformer rated at [_____] volts primary and [_____] volts secondary with kVA rating as recommended by the manufacturer. Ensure instrument and control transformers comply with IEEE C57.13 and NEMA ST 20.

2.2.1.11.2 Automatic Control

a. Provide automatic controls for all machine parts to ensure proper startup and shutdown sequences. Provide a manual-off-automatic switch for each blower. In addition, provide manual control switches for the [auxiliary oil pump,] [unloading valve,] [and] [inlet butterfly valve]. Ensure the manual control switches are active only when the selector switch is in the manual position. When the selector switch is in the automatic position, initiate the control system sequence startup of the blower as follows:

   (1) Start auxiliary oil pump and allow to run for 3 minutes.

   (2) Open unloading valve and close inlet butterfly valve.

   (3) Start main drive motor.

b. When the motor reaches full speed, open the inlet butterfly valve and close the unloading valve. Open the inlet butterfly valve to a minimum set point slightly above the surge point. Control the inlet butterfly valve from then on by a 4 to 20 mA dc signal from the control system to maintain the desired flow. When the shaft-driven main oil pump reaches specified pressure setting, stop the auxiliary oil pump.

c. Upon turning the selector switch to the off position, initiate the control panel sequence shutdown of the blowers as follows:

   (1) Open the unloading valve and close the inlet butterfly valve.

   (2) De-energize the drive motor.

d. When the shaft-driven oil pump pressure drops, start the auxiliary oil pump and allow to run for [30] [_____] minutes to provide for post lubrication and cooling.

2.2.1.11.3 Indicators

Provide the following indicators, mounted on the control panel:

a. Inlet and outlet pressure gauges.

b. Valve position indicators for the unloading valve (open or closed) and the inlet butterfly valve (in percentage open).

c. Inlet air volume in cfm indicator. Provide an ammeter measuring the current draw of the blower motor and calibrated so that a given amount of current draw correspond to the volume of air being handled by the
blower.

d. Lights to indicate the auxiliary oil pump is running and is as required for the protective devices.

2.2.1.11.4 Blower Protective Devices

a. All blower protective devices, upon alarm condition, are required to cause immediate de-energization of the motor, initiation of the automatic shutdown sequence, and provide audible and visual alarm indication. Equip positive displacement blowers with automatic pressure relief valve.

b. Provide bearing temperature protection consisting of encapsulated temperature switches in milled slots directly over each blower bearing, a control relay, a selector switch and test pushbuttons, and a running light. Upon excessively high temperature of any bearing, initiate protective shutdown and indicate which bearing is affected.

c. Provide a protective device to prevent the blower from operating in a surge condition. Initiate automatic blower shutdown sequence when the blower is reduced to surge volume as indicated by motor current draw and give visual indication of reason for shutdown. Provide an override as necessary for blower startup and shutdown.

d. Provide a system to control blower overload by opening and closing the inlet [butterfly valve] [inlet guide vanes on single stage centrifugal blower] based upon the current draw of the motor. The system is required to monitor motor current input to a suitably conditioned and set-point controller.

2.2.1.11.5 Vibration Monitoring

Provide vibration pick-ups for motor and blower bearings. Provide vibration monitoring system on control panel. Equip centrifugal blowers with radial and axial vibration monitoring. Monitor consists of front panel and circuit board and includes switches for display of signal and alarm levels, LED indicators for annunciation of OK and alarm status, calibration and alarm adjustments, and connectors for output signals.

2.2.1.11.6 Control Logic

Provide control logic to monitor dissolved oxygen level signals and select the number and [inlet guide vane setting for single stage centrifugal blowers] [rotation speed of positive displacement blowers] to provide for sufficient air to maintain desired dissolved oxygen level in aeration tank(s).

2.2.2 Air Distribution System

Provide a system, including piping, valves, and supports to distribute air from the blowers to the air diffusers. Ensure the system is of adequate capacity for the intended purpose and is adjustable for balancing of air distribution.

2.2.2.1 Air Main

Supply the air main from the blowers to the air supply assemblies as indicated. Provide eccentric reducers at each change in air main
diameter. Ensure the crown of the air main is maintained at the same elevation for the full length of the tank. Provide fittings as indicated. For air main piping 150 mm 6 inches in diameter and larger, provide ductile iron or Schedule 40 steel pipe. For air main piping less than 150 mm 6 inch in diameter, provide ductile iron or Schedule 40 galvanized steel pipe. Provide hangers and supports as required for a complete installation.

2.2.2.2 Removable Header Air Distribution System

**************************************************************************
NOTE: Delete inapplicable header types and materials of construction.
**************************************************************************

Provide removable header air distribution systems as indicated that consist of an air supply assembly, removable header assembly, and supports. Ensure the system is compatible with the air main and the specified diffusers.

2.2.2.2.1 Air Supply Riser Assembly

**************************************************************************
NOTE: Include this paragraph if distribution system is mounted on a T-wall.
**************************************************************************

Provide an air supply riser assembly for each removable header to connect the drop leg to the air main. The riser assembly consists of a vertical pipe projecting from the air main through a floor sleeve cast in the concrete T-wall, an elbow, a butterfly valve between the elbow and the drop leg, and required supports and anchors.

2.2.2.2.2 Air Supply Lateral Assembly

**************************************************************************
NOTE: Include this paragraph if distribution system is mounted on a Y-wall.
**************************************************************************

Provide an air supply lateral assembly for each removable header to connect the drop leg to the air main. The lateral assembly consists of piping, a butterfly valve, and required supports and anchors.

2.2.2.2.3 Removable Header Assembly

The removable header assembly consists of a drop leg and a header. The upper end of the header assembly contains a 90 degree elbow with face ring and neoprene gasket for connection to the air supply assembly. The connection to the air supply assembly is required to be a [quick coupling flange][grooved coupling system]. Provide a flanged connection for the lower end of the drop leg for connection to the header. Provide welded end caps and a beveled flange on the headers for connection to the drop leg. Provide diffuser connectors for field installation of diffusers. Design the removable header assembly to withstand a vertical load that results in a moment of 56.5 Nm 500 inch-pounds at the diffuser connection without permanent deformation. Provide lifting lugs on the assembly as required for removal of the header. Fabricate the removable header assembly of stainless steel or galvanized steel as follows:

a. Stainless Steel Systems: Fabricate the removable header assembly from
304L stainless steel complying with ASTM A240/A240M. Ensure drop legs and headers have a nominal wall thickness of 2.78 mm 0.1094 inch (12 gauge). Use the header dimensions as indicated with dimensional tolerances complying with ASTM A530/A530M and ASTM A554. Fabricate welded wrought stainless steel fittings and welded stainless steel tubular products in accordance with ASTM A774/A774M and ASTM A778/A778M. Perform all welding in the shop. Add filler wire to all welds to provide a cross section equal to the parent material. Ensure butt welds have full penetration to the interior surface. Ensure all interior weld beads are smooth, evenly distributed, with an interior projection not exceeding 2 mm 1/16 inch. Wire brush outside weld areas with stainless steel brushes. After fabrication, passivate the assembly by pickling and ensure it is completely neutralized. Use nickel plated ductile iron for the quick-coupling flange and equip with a stainless steel hinge pin. Provide anchor bolts made of 303 stainless steel.

b. Galvanized Steel Systems: Fabricate the removable header assembly from Schedule 40 steel pipe conforming to ASTM A53/A53M. Perform all welding in the shop. Ensure all butt welds are full penetration welds with an interior projection not exceeding 2 mm 1/16 inch. Ensure welding conforms to AWS D1.1/D1.1M. Hot-dip galvanized the assembly after fabrication. Provide anchor bolts made of 303 stainless steel. Use nickel plated ductile iron for quick-coupling flange and equip with a stainless steel hinge pin.

2.2.2.2.4 Supports and Guides

Support removable header by two adjustable supports with vee-shaped guides. Fabricate supports from 6 mm 1/4 inch steel plate and provide at least 25 mm 1 inch vertical adjustment. The supports are required to support the weight of the assembly so that the quick-coupling can be easily disconnected.

2.2.2.3 Rotary or Swing Header Air Distribution System

**************************************************************************
NOTE: Delete inapplicable header types and materials of construction.
**************************************************************************

Provide rotary or swing header air distribution systems as indicated consisting of an air supply assembly, rotary or swing-type air header assembly, and supports. Ensure system compatibility with the air main and the specified diffusers.

2.2.2.3.1 Air Supply Assembly

Provide an air supply assembly for each rotary or swing header to connect the upper swing joint to the air main. The assembly consists of the required pipe and fittings, a butterfly valve, and a combination connector and support for the upper swing joint.

2.2.2.3.2 Rotary or Swing Header Assembly

The rotary or swing header assembly consists of an upper swing joint, a knee joint, hanger pipes, and a header. The upper swing joint connects to the air supply assembly and includes connectors for field installation of diffusers. Design the rotary or swing header assembly to withstand a
vertical load that results in a moment of 56.5 Nm 500 in-lb at the diffuser connection without permanent deformation. Provide lifting lugs on the assembly as required to lift the header assembly out of the tank. Fabricate the rotary or swing header assembly of stainless steel systems, carbon steel systems, galvanized steel systems, or fiberglass systems as follows:

a. Stainless Steel Systems: Provide upper swing joint and knee joint of cast stainless steel. Connect between the two sections by means of a stainless steel pin working in a graphite bronze bushing. Provide graphite impregnated cast bronze bearings complying with ASTM B584. Provide seal rings with labyrinth grooves between the two joint sections. Provide a grease fitting to lubricate the seal rings. Provide an adjustable stop to prevent the knee joint from opening beyond 180 degrees. Fabricate the hanger pipes and air headers from 304L stainless steel in accordance with ASTM A240/A240M. Fabricate the upper hanger pipes from Schedule 10S. Fabricate the hanger pipes from Schedule 5S. Fabricate air header pipes from 12 gauge. Provide header dimensions as indicated with dimensional tolerances in accordance with ASTM A530/A530M and ASTM A554. Fabricate welded wrought stainless steel fittings and welded stainless steel tubular products in accordance with ASTM A774/A774M and ASTM A778/A778M. Perform all welding in the shop. Add filler wire to all welds to provide a cross section equal to the parent material. Ensure butt welds have full penetration to the interior surface. Ensure interior weld beads are smooth, evenly distributed, and with an interior projection not exceeding 2 mm 1/16 inch. Wire brush outside weld areas with stainless steel brushes. After fabrication, passivate the assembly by pickling and ensure it is completely neutralized. Weld the hanger pipes to the upper swing joint and knee joint. Flange connect the header pipe to the hanger pipe. Weld diffuser connectors to the header. Provide the header with welded end caps.

b. Carbon Steel Systems: Provide the upper swing joint and knee joint of cast steel. Connect between the two sections by means of a stainless steel pin working in a graphite bronze bushing. Use graphite impregnated cast bronze bearings in accordance with ASTM B584. Provide brass seal rings with labyrinth grooves between the two joint sections. Provide a grease fitting to lubricate the seal rings. Provide an adjustable stop to prevent the knee joint from opening beyond 180 degrees. Fabricate the hanger and header pipes from schedule [40] [80] carbon steel pipe in accordance with ASTM A524/A524M. Provide header dimensions as indicated. Perform welding in the shop. After fabrication, paint the assembly with the manufacturer's standard finish. Weld the hanger pipes to the upper swing joint and knee joint. Connect the header pipe to the hanger pipe. Weld diffuser connectors to the header. Provide the header with welded end caps.

c. Galvanized Steel Systems: Provide the upper swing joint and knee joint made from cast iron. Connect between the two sections by means of a stud equipped with a spring to maintain seal between the faces. Use graphite impregnated bronze seal rings and bearings in accordance with ASTM B584. Provide grease fittings for lubrication. Fabricate the hanger and header pipes from schedule [40] [80] galvanized steel pipe in accordance with ASTM A53/A53M. Provide header dimensions as indicated. The header consists of two lengths of pipe, flange connected to a cast iron tee. Screw connect the hanger pipes to the upper swing joint and knee joint, and flange connected to the header tee. Weld the diffuser connectors to the header. Provide the header
with gasketed, screwed end caps.

d. Fiberglass Systems: Provide the upper swing joint and knee joint of the trunnion sleeve type manufactured of glass reinforced synthetic resin capable of continuously operating in pH levels of 5.0 to 9.0 and at gas temperatures up to 108 degrees C 225 degrees F. Rib all areas of high stress to provide increased strength. Provide each rotating bearing surface with ring type air seals. Hold the assemblies together by a 13 mm 1/2 inch diameter stainless steel rod with locking nuts. Fabricate the hanger and header pipes from reinforced thermosetting resin pipe in accordance with ASTM D2310, Type I, Grade 1, Class F, ASTM D2992, and ASTM D2996. Provide pipe in accordance with the following: 275.8 MPa 40,000 psi minimum hoop stress; 65.5 MPa 9,500 psi minimum tensile strength; 131.0 MPa 19,000 psi minimum axial compression strength; minimum 55 Barcol hardness; 54.75 degree wind angle; 2.8 mm 0.110 inch minimum wall thickness. Provide ultraviolet protection for the pipe material. Provide liner resin that is 85 to 89 percent resin with glass filler and at least 0.51 mm 0.020 inch thick. Use filled epoxy adhesive joints. Provide header dimensions as indicated. Flange connect the hanger to the header.

2.2.2.3.3 Supports and Guides

Provide supports and guides as required for support and leveling of the header.

2.2.2.4 Fixed Header Air Distribution System

**************************************************************************
NOTE: Delete inapplicable header types and materials of construction.
**************************************************************************

Provide a fixed header air distribution as indicated consisting of a drop leg assembly, fixed headers, and supports. Ensure the system is compatible with the air main and the specified diffusers.

2.2.2.4.1 Drop Leg Assembly

Provide a drop leg assembly to connect the fixed headers to the air main. Provide the assembly of the dimensions indicated.

2.2.2.4.2 Fixed Headers

Provide fixed headers of the dimensions and configuration indicated. Provide header connections of a type allowing rotational adjustment of individual header sections of sufficient strength to transmit the longitudinal forces caused by expansion and contraction of the header. Design the headers to allow expansion and contraction up to a maximum temperature of 52 degrees C 125 degrees F without damage to the system. Prevent rotation of the header due to thermal expansion and contraction. Provide fixed headers of stainless steel systems or fiberglass systems as follows:

a. Stainless Steel Systems: Fabricate all welded parts of the system from 304L stainless steel in accordance with ASTM A240/A240M. [Provide stainless steel pipe with a 2D finish in accordance with ASTM A480/A480M.] Provide pipe wall thickness as follows: for 250 mm 10 inch diameter and less, supply 1.59 mm 0.0625 inch (16 gauge) thick pipe; for 300 mm
12 inch diameter, supply 1.98 mm 0.0781 inch (14 gauge) thick pipe; for 350 mm 14 inch through 450 mm 18 inch diameter, supply 2.78 mm 0.1094 inch (12 gauge) thick pipe; for 500 mm 20 inch diameter, supply 3.18 mm 0.1250 inch (11 gauge) thick pipe; for 600 mm 24 inch diameter, supply 3.57 mm 0.1406 inch (10 gauge) thick pipe. Provide header dimensions as indicated with dimensional tolerances in accordance with ASTM A530/A530M and ASTM A554. Fabricate welded stainless steel fittings and welded stainless steel tubular products in accordance with ASTM A774/A774M and ASTM A778/A778M. Perform all welding in the shop. Add filler wire to all welds to provide a cross section equal to the parent material. Ensure butt welds have full penetration to the interior surface. Ensure interior weld beads are smooth, evenly distributed, and with an interior projection not exceeding 2 mm 1/16 inch. Wire brush outside weld area with stainless steel brushes. Prior to fabrication, passivate each part of the assembly by pickling and ensure it is completely neutralized. Provide bolts, washers, follower flanges, and other non-welded parts made of 304 stainless steel. Provide low silicon bronze nuts in accordance with ASTM B98/B98M.

b. Fiberglass Systems: Provide reinforced thermosetting resin pipe in accordance with ASTM D2310, Type I, Grade I, Class F, ASTM D2992, and ASTM D2996. All pipe is required to be in accordance with the following: 65.5 MPa 9,500 psi minimum tensile strength; 110.3 MPa 16,000 psi minimum axial compression strength; minimum 55 Barcol hardness; 54.75 degree wind angle; 2.8 mm 0.110 inch minimum wall thickness. Provide ultraviolet protection for the pipe material. Use liner resin with 85 to 89 percent resin with glass filler and is at least 0.51 mm 0.020 inch thick. Use filled epoxy adhesive joints. Provide header dimensions as indicated. Provide a 25 mm 1 inch drain leg at each end of each section of pipe.

2.2.2.4.3 Support System

Provide a system for support and anchoring of the header. Ensure the system is compatible with the expansion and contraction control design. Ensure the support system provides for a minimum of 100 mm 4 inch vertical adjustment and 25 mm 1 inch lateral adjustment of the header. Contour the system to fit the bottom 90 degrees of the pipe while maintaining a bearing surface at least 50 mm 2 inch wide.

2.2.2.5 Lagoon Air Distribution System

**************************************************************************
NOTE: Delete inapplicable header types and materials of construction.
**************************************************************************

2.2.2.5.1 Fixed Air Distribution Headers

Provide fixed air distribution headers to connect the air main to the lagoon aeration diffuser tubing. Construct header and feeder piping using PVC with flanged or threaded connections. Provide one of the following types of air distribution systems:

a. Dual Header System: The system consists of a dual header supported above the side slopes, one on each side of the lagoon with feeder tubes connecting to each end of the diffuser tubing.

b. Single Header System: The system consists of a single header,
supported above the lagoon bottom in the center of the lagoon with feeder tubes connecting to one end of the diffuser tubing.

2.2.2.5.2 Supports

Provide adjustable supports that allow free longitudinal movement with little or no lateral or vertical movement for the air header piping. Ensure all ferrous metal in the support system is galvanized.

2.2.2.5.3 Airlift Purge System

Provide a plastic airlift, complete with integral plastic air jet. Include air supply tubing and piping connected to the main air header. Provide a control valve on the air supply pipe.

2.2.2.5.4 Gas Cleaning System

Provide a complete system as required for gas cleaning of the air diffusion system. Provide a single valve to control flow to all points.

2.2.3 Diffusers

**************************************************************************
NOTE: Aeration tanks should be identified on the drawings. Diffuser performance requirements should be inserted. Maximum allowable headloss should not exceed 14 inches of water.
**************************************************************************

2.2.3.1 Diffuser Performance

a. Provide an air flow rate of [_____] standard L/second/28.3 cubic meters scfm/1000 cubic feet of tank volume.

b. Provide an oxygen transfer rate of [_____] kg pounds of oxygen per day per 28.3 cubic meters 1000 cubic feet of tank volume at the specified air flow rate in clear water at 20 degrees C 68 degrees F and zero dissolved oxygen.

c. Set maximum allowable headloss in the system to [_____] mm inch of water, excluding submergence.

2.2.3.2 Porous Diffusers

**************************************************************************
NOTE: Delete inapplicable types of diffusers and materials of construction.
**************************************************************************

The mean permeability rating of the porous diffusers will be inserted. The permeability rating is defined as the number of cubic meters per second cfm of air, at 21 degrees C 70 degrees F and 10 to 25 percent relative humidity, that will pass through 0.093 square meter 1 square foot of diffuser area to the atmosphere, under a differential pressure equivalent to 508 pascals 2 inches of water below the plate or within the tube when it is tested dry in a room maintained at a temperature of 21 degrees C 70 degrees F and a relative humidity between 30 and
50 percent. To date, this is the accepted method of measuring the ability of porous diffuser media to diffuse air and provide a desirable rate of oxygen absorption. Lower permeability should produce smaller bubbles, which should result in higher rates of oxygen absorption. Lower permeability rating, however, requires higher air pressure and results in more rapid clogging and higher pressure losses. Consequently, any benefits obtained initially by specifying a permeability rating may be offset by the higher maintenance and operating costs. The best balance between desired oxygen absorption and operating and maintenance cost is afforded by a permeability rating of from 0.203 to 0.406. Non-porous diffusers do not have a permeability rating.

Provide one of the following types of diffusers with a mean permeability rating of [______]:

2.2.3.2.1 Porous Ceramic Discs

Provide porous ceramic plate diffusers composed of silica sand bonded together with a synthetic silicate, fused alumina, or an organic bond; grains of crystalline aluminum oxide bonded with high alumina glass; aluminum silicate grains ceramically bonded at high temperature; crushed porcelain grains bonded together with alumina glass or electrically fused aluminum grains bonded together with alumina glass. Ensure all diffuser plates provide [_____] square mm square inch of horizontal diffuser area.

2.2.3.2.2 Porous Membrane Tubes with Supports

Provide porous membrane media composed of a tubular flexible synthetic membrane sheath that is open at one end and closed at the other. Ensure the tubular sheath fits over a tubular air duct/air plenum frame or is supported by a one-piece semicircular corrosion resistant support rod. Clamp the sheath to a nozzle with a corrosion resistant removable clamp. Ensure the sheath is capable of flexing from its unexpanded shape to its expanded inflated convex hollow cylindrical shape when air is diffused through it to slough foulants. Ensure apertures of the sheath close whenever the air flow is shut off and purge themselves when air is restarted. Supply each diffuser with a check valve for wastewater backflow prevention. Ensure the nozzle is compatible with the diffuser connector on the air header.

2.2.3.2.3 Porous Cloth Media with Plastic Tube Liner

Provide porous cloth media composed of a tubular flexible synthetic fiber cloth sheath that is open at one end and closed at the other. The media fits over a plastic tube liner and is clamped to a cast iron nozzle with a stainless steel clamp. Vinyl coat the cast iron nozzle, except for the threads attaching it to the header. Provide diffuser media [_____] mm inch in length and a diameter of [_____] mm inch.

2.2.3.3 Non-Porous Diffusers

**************************************************************************

Provide one of the following types of diffusers with a mean permeability rating of [_____]:

2.2.3.2.1 Porous Ceramic Discs

Provide porous ceramic plate diffusers composed of silica sand bonded together with a synthetic silicate, fused alumina, or an organic bond; grains of crystalline aluminum oxide bonded with high alumina glass; aluminum silicate grains ceramically bonded at high temperature; crushed porcelain grains bonded together with alumina glass or electrically fused aluminum grains bonded together with alumina glass. Ensure all diffuser plates provide [_____] square mm square inch of horizontal diffuser area.

2.2.3.2.2 Porous Membrane Tubes with Supports

Provide porous membrane media composed of a tubular flexible synthetic membrane sheath that is open at one end and closed at the other. Ensure the tubular sheath fits over a tubular air duct/air plenum frame or is supported by a one-piece semicircular corrosion resistant support rod. Clamp the sheath to a nozzle with a corrosion resistant removable clamp. Ensure the sheath is capable of flexing from its unexpanded shape to its expanded inflated convex hollow cylindrical shape when air is diffused through it to slough foulants. Ensure apertures of the sheath close whenever the air flow is shut off and purge themselves when air is restarted. Supply each diffuser with a check valve for wastewater backflow prevention. Ensure the nozzle is compatible with the diffuser connector on the air header.

2.2.3.2.3 Porous Cloth Media with Plastic Tube Liner

Provide porous cloth media composed of a tubular flexible synthetic fiber cloth sheath that is open at one end and closed at the other. The media fits over a plastic tube liner and is clamped to a cast iron nozzle with a stainless steel clamp. Vinyl coat the cast iron nozzle, except for the threads attaching it to the header. Provide diffuser media [_____] mm inch in length and a diameter of [_____] mm inch.

2.2.3.3 Non-Porous Diffusers

**************************************************************************
2.2.3.3.1 Nozzle-Type Diffusers

Provide one of the following nozzle type diffusers:

a. Diffuser consisting of a molded plastic body with four high velocity, short tube orifices, each discharging at right angles to the adjacent orifice.  [Equip the diffuser with a deflector ring above the discharge orifices and include a control orifice to ensure proper headloss.]

b. Diffuser consisting of molded plastic and including a top piece containing inverted V-shaped air shear slots and an upward sloping air deflector and a bottom piece containing a control orifice and an air header connector.

2.2.3.3.2 Orifice-Type Diffusers

Provide one of the following non-valved orifice type diffusers:

a. Diffuser constructed of stainless steel and consisting of a balancing nozzle, an inverted air reservoir, air exit ports located on horizontal planes on two levels, and a deflector. Ensure the deflector directs the liquid along the diffuser's outer walls.

b. Diffuser consisting of an open bottom, molded plastic, rectangular box containing tapered air release holes. Ensure air entering the diffuser is controlled by a control orifice.

c. Diffuser consisting of an elongated, peaked dome air chamber with steep inverted V-shaped serrations on both sides. Ensure air exiting the header is controlled by an orifice.

2.2.3.3.3 Valved Orifice Diffusers

Provide one of the following valved orifice diffusers:

a. Diffuser consisting of a molded plastic body with an air flow control orifice and a PVC disc cap retained by a stainless steel ring.

b. Diffuser consisting of a stainless steel body containing a control orifice, a polytetrafluoroethylene ball, and a stainless steel deflector disc.

c. Diffuser consisting of a molded plastic body with air release orifices, a ball check valve, and a screw-in cap that allows varying the quantity of orifices through which air can exit.

d. Diffuser consisting of a cone-shaped plastic base with a flexible elastomer cover held in place by a center bolt.

e. Diffuser consisting of a rubber body with a molded control orifice (pinch valve) that is normally closed and is actuated by specific pressures applied to the backside of the diffuser.

2.2.3.4 Lagoon Aeration Diffuser Tubing
NOTE: Delete inapplicable types of diffusers and materials of construction.

**************************************************************************

Use [13] [_____] mm [1/2] [_____] inch inside diameter flexible polyethylene diffuser tubing containing small, precise, orifices or slots in the lower side of the tubing at [38] [_____] mm [1-1/2] [_____] inch maximum spacing. Ensure the orifice is small enough to prevent particulate matter from flowing through the orifice during negative diffuser pressure. Pre-weight the diffuser by a continuous lead strip in the bottom of the tube encapsulated in polyethylene.

2.2.3.5 Spare Diffusers

**************************************************************************

NOTE: The percentage of replacements required will be inserted. A sound policy would require sufficient media to enable the operator to replace all media in any one aeration tank.

**************************************************************************

Furnish not less than [_____] percent of the installed quantity of diffusers as replacements. Furnish diffusers complete with all parts required for installation.

2.2.4 Materials and Equipment

Ensure materials and equipment conform to the following respective publications and other specified requirements.

2.2.4.1 Ductile Iron Pipe and Fittings

Provide ductile iron pipe conforming to AWWA C115/A21.15 or AWWA C151/A21.51. Provide thickness class as follows: Class 51 for pipe up to 100 mm 4 inch diameter and over 750 mm 30 inch diameter; Class 51 for pipe 150 mm 6 inch through 600 mm 24 inch diameter. Provide mechanical joints that conform to AWWA C111/A21.11 as modified by AWWA C151/A21.51. Provide flanged joints that conform to AWWA C115/A21.15. Provide fittings that conform to AWWA C110/A21.10. Ensure all buried piping has standard bituminous coating and lining.

2.2.4.2 Steel Pipe and Fittings

Provide steel pipe 150 mm 6 inch in diameter and larger in accordance with AWWA C200. Provide steel pipe less than 150 mm 6 inch in diameter with threaded end, galvanized, in accordance with ASTM A53/A53M, standard weight. Ensure mechanical joints conform to AWWA C200. Ensure flanged joints conform to AWWA C207. Provide fittings for steel pipe 150 mm 6 inch in diameter and larger in accordance with AWWA C200 and fabricated in accordance with AWWA C208. For steel pipe less than 150 mm 6 inch in diameter, provide galvanized fittings in accordance with ASME B16.3.

2.2.4.3 Polyvinyl Chloride (PVC) Pipe and Fittings

**************************************************************************

NOTE: The Designer must use caution when specifying PVC air piping. PVC pipe and fitting use is normally reserved for low pressure, low temperature
environments where ultraviolet exposure is limited. PVC tends to become brittle with age and even air pressures much lower than the rated pressure class of the pipe can cause catastrophic failure.

Ensure PVC pipe and fittings conforming to ASTM D1785, Schedule [40] [80] [120], or ASTM D2241, SDR [21] [26] [32.5]. Use solvent weld joints conforming to ASTM D2564.

2.2.4.4 Stainless Steel Tubing and Fittings

Unless shown or specified otherwise, provide stainless steel tubing in accordance with the following.

2.2.4.4.1 Stainless Steel Tubing

Ensure stainless steel tubing conforms to ASTM A778/A778M. Provide wall thicknesses as follows: tubing 250 mm 10 inch diameter and less, provide 1.59 mm 0.0625 inch (16 gauge) thick tubing; tubing 300 mm 12 inch diameter, provide 1.98 mm 0.078 inch (14 gauge) thick tubing; tubing 350 mm 14 inch through 450 mm 18 inch diameter, provide 2.78 mm 0.109 inch (12 gauge) thick tubing; tubing 500 mm 20 inch diameter, provide 3.17 mm 0.125 inch (11 gauge) thick tubing; tubing 600 mm 24 inch diameter, provide 3.57 mm 0.140 inch (10 gauge) thick tubing.

2.2.4.4.2 Stainless Steel Tubing Fittings

Provide stainless steel tubing fittings conforming to ASTM A774/A774M, grade and schedule or wall thickness as specified for tubing.

2.2.4.4.3 Stainless Steel Tubing Joints

Fabricate stainless steel tubing joints by shop welding full penetration butt joints or Van Stone joints using angle face rings with backing flanges drilled in accordance with ASME B16.5, Class 125.

2.2.4.5 Pipe Hangers and Supports

Provide pipe hangers and supports conforming to MSS SP-58.

2.2.4.6 Valves

2.2.4.6.1 Butterfly Valves

Ensure butterfly valves and operators conform to AWWA C504, air service class [25A] [____], flanged or mechanical joint ends as required.

2.2.4.6.2 Gate Valves

Ensure gate valves conform to AWWA C500, flanged or mechanical joint ends as required.

2.2.4.6.3 Globe Valves

Ensure globe valves conform to MSS SP-80, Type 3, Class 150.

2.2.4.6.4 Relief and Unloading Valves

Provide combination relief and unloading valves with [carbon steel] [____]
body, that allow blower unloading for startup, and are set for pressure relief at [____] kPa psig.

2.2.4.6.5 Check Valves

Provide check valves of double door type, flange or wafer style, capable of handling 862 kPa 125 psig cold working pressure (CWP) with cast iron body and aluminum bronze internal parts, low torque spring for low pressure air service. Ensure seal material is capable of handling temperatures from -29 to plus 121 degrees C -20 to plus 250 degrees F with tight shutoff capability.

2.2.4.7 Expansion Couplings

Construct expansion couplings for nonsubmerged locations in the aeration system of materials suitable for temperatures up to 121 degrees C 250 degrees F and pressures up to 103 kPa 15 psig. Use couplings of the filled arch type. Provide back-up or retaining rings as required. Yoke couplings to transmit tension loadings. Ensure the compressive and lateral movement of the joint is not impaired by the yoke system.

2.2.5 Hoist

**************************************************************************
NOTE: Coordinate with type of air distribution system specified. Delete steering attachment where not required.
**************************************************************************

Provide portable hoist designed to raise and lower the [removable] [rotary or swing] air distribution system. Hoist is to be furnished by the aeration system manufacturer. Mount the hoist on wheels or casters [and provide a suitable steering attachment]. Power the unit by [hand] [hand pump] [battery operated motor] [air operated motor] [electric motor] [gasoline engine]. Provide a means to hook the hoist in place during the hoisting operation. Equip the lifting arm with a quick latching arrangement to securely grip the air diffusion unit without the use of tools. Provide a hoist of sufficient capacity for the required service.

2.2.6 Metering and Instrumentation

**************************************************************************
NOTE: Insert section number and title or delete sentence and insert metering and instrumentation requirements.
**************************************************************************

Metering and instrumentation is specified in Section [____].

2.2.7 Purge System

**************************************************************************
NOTE: Coordinate specific purge system requirements with equipment manufacturer.
**************************************************************************

Provide a purge system incorporated into the aeration system. Locate purge valves at the low points in the system to allow bleeding off of condensed water that builds up in the air piping. Purge valves may be incorporated...
into an automatic pump system when low points occur below water level.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 EQUIPMENT INSTALLATION

Submit drawings containing complete wiring and schematic diagrams, control diagrams, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show in the drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

3.2.1 Blower Installation

Install blowers as indicated and in accordance with the manufacturer's written instructions.

3.2.2 Air Distribution System Installation

**************************************************************************
NOTE: The range of adjustment of the system on the header is dependent on various design parameters such as header size and basin shape and size. Consult various manufacturers for proper dimension.
**************************************************************************

Install the air distribution system as indicated and in accordance with the manufacturer's written instructions. Perform all excavation, trenching, and backfilling in accordance with the applicable requirements of Section 31 00 00 EARTHWORK. Maintain the crown of the air main at the same elevation. Adjust the system such that all diffusers on a header are within [_____] mm inch of a common horizontal plane.

3.2.3 Diffuser Installation

Install diffusers as indicated and in accordance with the manufacturer's written recommendations.

3.2.4 Framed Instructions

Post framed instructions containing wiring and control diagrams under glass or in laminated plastic where directed. Show wiring and control diagrams and complete layout of the entire system in the instructions. Also include, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. Post the framed instructions acceptance testing of the system.

3.2.5 Welding

**************************************************************************
NOTE: Retain the applicable welding requirements.
**************************************************************************
Weld piping in accordance with qualified procedures using performance qualified welders and welding operators. Ensure the procedures and welders are qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer are acceptable to the extent permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests perform all tests at the work site if practical. Instruct the welder or welding operator to apply his assigned symbol near each weld he makes as a permanent record. Weld structural members in accordance with AWS D1.1/D1.1M.] [Welding and non-destructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING.]

3.2.6 Electrical Work

Ensure all electrical work is performed in accordance with the National Electric Code (NFPA 70, Latest Edition).

3.3 FIELD QUALITY CONTROL

3.3.1 Field Testing

Submit performance test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate the final position of controls in each test report.

3.3.1.1 Blower Test

After the air distribution and diffusion systems have been installed, test each blower at the specified operating conditions to determine compliance with the specifications and proper operation.

3.3.1.2 Piping System Test

Test all piping with air at a minimum of two times the normal design pressure for at least 60 minutes and such additional time as is required for the Contracting Officer to inspect the piping for leaks. Repair all leaks and retest and the system until no leakage is discovered.

3.3.1.3 Diffuser Test

After diffuser installation, cover the diffusers with clear water to a depth of approximately 600 mm 2 feet. Release air through the diffusers and inspect the system for uniform air distribution. Replace diffusers as required to obtain uniformity.

3.3.2 Manufacturer's Services

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. Ensure that the representative supervises the installation, adjustment, and testing of the equipment.
3.4 CLOSEOUT ACTIVITIES

3.4.1 Field Training

Provide a field training course for designated operating and maintenance staff members. Provide training for a total period of [_____] hours of normal working time and start training after the system is functionally complete but prior to final acceptance tests. Cover all of the items contained in the operating and maintenance manuals in the field training.

3.4.2 Operating and Maintenance Manuals

Provide [six] [_____] copies of operation and [six] [_____] copies of maintenance manuals for the equipment furnished. Submit one complete set prior to performance testing and the remainder upon acceptance. Ensure the operating manuals detail the step-by-step procedures required for system startup, operation, and shutdown. Ensure operating manuals include the manufacturer's name, model number, parts list, and brief description of all equipment and their basic operating features. Ensure the maintenance manuals list routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include piping and equipment layout and simplified wiring and control diagrams of the system as installed. Have all manuals approved prior to the field training course.

3.5 PAINTING

Conduct all field painting as specified in Section 09 90 00 PAINTS AND COATINGS.

NOTE: This guide specification covers the requirements for a trickling filter for use in sewage treatment plants normally handling domestic sewage.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Special consideration must be given to sewage carrying industrial wastes containing components detrimental to biodegrading microorganisms. Show the following information on the project drawings or provided by the project designer:

a. Dimensions of filter tank and elevation of base slab.

b. Design flows and loading rate.

c. Available head.
d. Depth of filter bed.
e. Size of inlet piping.
f. Location of vent stack pipes.
g. Design loads for wind and ice where applicable.
h. Clearance of arms above filter surface.
i. Number of distribution arms.
j. Type(s) of filter media to be allowed.
k. Type of filter blocks.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN BEARING MANUFACTURERS ASSOCIATION (ABMA)

ABMA 9 (2015) Load Ratings and Fatigue Life for Ball Bearings

ABMA 11 (2014) Load Ratings and Fatigue Life for Roller Bearings

AMERICAN INSTITUTE OF STEEL CONSTRUCTION (AISC)

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Rotary Distributor; G[, [_____]]

SD-03 Product Data
   Rotary Distributor; G[, [_____]]

Spare Parts
Submit spare parts data after approval of the detail drawings and not later than [_____] months prior to the date of beneficial occupancy.

Plastic Media; G[, [____]]Filter Media

SD-07 Certificates

Size And Grading

Layout Of Filter Block Units

SD-10 Operation and Maintenance Data

Operating and Maintenance Manuals

1.3 EXTRA MATERIALS

Provide spare nozzles, seals, and all other standard spare parts as recommended in the manufacturer’s instruction manuals for each component of the equipment. Include a complete list of parts and supplies, with current unit prices and source of supply.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

A trickling filter includes a rotary distributor, reinforced concrete walls and base, filter media, filter block underdrainage system, and all other components indicated or necessary for proper operation.

2.2 MATERIALS

**************************************************************************

NOTE: Delete materials that are not used.
**************************************************************************

2.2.1 Standard Products

Unless otherwise specified, provide standard commercial products in regular production by the manufacturer and suitable for the required service. [Provide ASTM A36/A36M structural steel.] [Provide ASTM A53/A53M steel pipe for structural members and distributor arms.] [Provide steel members with a minimum thickness of 6 mm 1/4 inch when members will be in contact with sewage, completely or intermittently, during normal operation of the equipment.] [Provide ASTM A48/A48M, Class 30 cast iron.] [Provide ASTM B209 (3003-H14) aluminum alloy for structural members, and provide ASTM B429/B429M (6063-T6) aluminum alloy for pipe.]

2.2.2 Materials Protection

Provide ferrous metal surfaces that can be pickled in accordance with SSPC SP 8. Provide ferrous metal surfaces, including rotating assembly, distributor arms, supports, and attachments that are zinc coated in accordance with ASTM A123/A123M or ASTM A153/A153M, as applicable. Pickle and galvanize the interior and exterior of all fabricated ferrous metal components after fabrication. Insulate components such as gaskets, couplings, or bushings, of a dielectric-type To prevent corrosive action of
bimetallic-type contacts, at connections between dissimilar metals.

2.2.3 FILTER MEDIA

2.2.3.1 Quality

**************************************************************************
NOTE: When plastic media is to be used exclusively, delete all requirements for and reference to other materials. Consider economic and geographic influences when deciding the filter media type. When trickling filters will be used in cold weather conditions, covers, hydraulic controls, and ventilation should be considered to ensure the optimum trickling filter biological performance.
**************************************************************************

[Provide [crushed stone or crushed slag][ or ] [random-dumped or stacked modular plastic] media. Ensure the top 460 mm 18 inches of media has a loss by the 20-cycle sodium sulfate soundness test of ASTM C88 of not more than 10 percent by weight; the balance of the media shall pass a 10-cycle test using the same criteria.] [Provide plastic media that is random-dumped ring type or stacked modular type. Provide random-dumped ring type media of long term heat aging, rigid polypropylene plastic specially manufactured as trickling filter media, with a minimum void volume of 90 percent, and a minimum surface area of 82 square meters per cubic meter 25 square feet per cubic foot.]

[Provide plastic stacked modular type [vertical or crossflow] media of saran, polyvinyl chloride (PVC), fiberglass reinforced resins, or plastic equally resistant to oxidation, ozone aging or effects of ultraviolet exposure, and a minimum void volume and surface area per cubic meters feet volume as required for random-dumped ring type media.] Provide media with a minimum projected life of 25 years in the intended service. Base projected life on case history or simulated aging tests as performed by an independent testing laboratory acceptable to the Contracting Officer. Substantiate such tests by certified test reports. Provide installed media that can provide support for the weight of two workmen working together on any part of the surface of the filter without damage or displacement of the media.

2.2.3.2 Size and Grading

[Conform stone or slag media to the following size distribution and grading and mechanical graded over a vibrating screen with square opening: 100 percent passing 5.0 inch sieve; 95-100 percent by weight retained on 3.0 inch sieve; 2 percent by weight passing the 2.0 inch sieve; and 1 percent by weight passing the 1.0 inch sieve.] [Provide plastic media in accordance with the manufacturer's standard as approved by the Contracting Officer. Provide random-dumped media with a specific gravity between 0.90-0.97 grams per cubic centimeter, a minimum tensile strength of 4500 pounds per square inch, and a minimum modulus of elasticity of 200000 pounds per square inch. Provide stacked modular media with a specific gravity between 1.39-1.50 grams per cubic centimeter, a minimum tensile strength of 6000 pounds per square inch, and a minimum modulus of elasticity of 325000 pounds per square inch. Evaluate the module's bearing capacity in the top layer, intermediate layers, and bottom layers.]
2.3 EQUIPMENT

2.3.1 Standard Products

Unless otherwise specified, provide standard commercial products in regular production by the manufacturer and suitable for the required service.

2.3.2 Rotary Distributor

Provide a rotary distributor suitable for the uniform distribution of sewage over the filter bed at the rates of flow and operating conditions specified herein. Provide a rotary distributor including distributor arms, center column, and other appurtenances necessary for proper operation. Provide a rotary distributor that rotates solely from the reaction of sewage flowing through jets or nozzles in the distributor arms and operates freely and effectively over the entire range of operation. Submit detail drawings containing equipment layout and anchorage, and sufficient details to demonstrate that the rotary distributor will properly function as a unit.

2.3.2.1 Operating Requirements

**************************************************************************
NOTE: Delete ice coating requirements in warm climates.
**************************************************************************

Provide a rotary distributor designed for a filter bed of [_____] mm feet inside diameter. Provide design flows that range from a minimum of [_____] L/second gpm to a maximum of [_____] L/second gpm and with average design loading of [_____] L/second gpm. Provide an available total head at the inlet (above the media surface) of [_____] at the maximum rate of flow. Ensure the maximum velocity in the arms does not exceed 1.22 m/second 4.0 fps. Provide a rotary distributor and each of its component parts that are designed to withstand all structural and mechanical stresses brought about by the following loadings: weight of equipment plus liquid; wind loading; and a live load of [_____] N pounds at any point on the arm; and an ice coating of [_____] mm inch thick. Provide a minimum safety factor of 1.6 based on the yield point of the steel. Provide anchorage of the concrete center pier that is designed to resist, with a 2.0 minimum safety factor, a maximum overturning moment brought about when arms on one side of the distributor are filled with water and those on the other side are empty. Ensure vertical deflections at the end of the distributor arms do not exceed 100 mm 4 inches. Provide arms that have a clearance above the surface of filter bed as indicated. Provide a rotary distributor designed for continuous 24-hour service under the design load without excessive wear, damage, or failure. Ensure stresses developed under the aforementioned operating conditions and loads do not exceed the stresses allowed under AISC 360.

2.3.2.2 Center Column

**************************************************************************
NOTE: Delete bracketed wording pertaining to weirs or dependent on the provisions of weirs when distributors have less than four arms, except when two-compartment arms are used.
**************************************************************************

The trickling filter tank should be constructed in
accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Walls should have standard finish. Horizontal surfaces should have screed finish. Insert the following requirements in the appropriate place: "Construct the hollow concrete center pier, including installation of anchor bolts, in accordance with the recommendations of the manufacturer of the rotary distributor, as approved by the Contracting Officer."

Type IIA cement normally will be specified, but Type V cement will be specified when the soils contain in excess of 0.2 percent water soluble sulfate as SO(4), or waste water contains in excess of 1,000 parts per million sulfates. Alkali reactive aggregates require use of a cement containing less than 0.60 percent alkalis. Type I cement may be permitted when it can be assured that the water soluble sulfates in the soil will be less than 0.1 percent and the waste water will contain less than 150 parts per million sulfates over the design life of the project. Air entrainment admixtures will be used in all types of concrete.

**************************************************************************

Provide a mast-type or turntable-type center column including a stationary assembly, rotating assembly, seal, bearing assembly, lubricating fittings, and anchor bolts. Provide port areas or openings to permit unrestricted flow of sewage from inlet in stationary assembly through rotating assembly into distributor arms.

a. Stationary Assembly: Fabricate elements of the stationary assembly from cast iron, structural steel, steel pipe, or aluminum alloy. Provide a stationary assembly with a [_____] mm inch diameter inlet, and designed for anchorage to the hollow concrete center pier by anchor bolts.

b. Rotating Assembly: Fabricate elements of the rotating assembly from cast iron, structural steel, or aluminum alloy, except as otherwise specified herein. Select cast iron turntables only, when provided. Provide steel for nonstructural applications with a minimum yield point of 207 MPa 30,000 psi. [Provide an adjustable weir to divide the flow between the primary and secondary arms so that only primary arms will operate at minimum flow and that all arms will discharge uniformly at maximum flow. Provide a weir that is accessible for adjustment without dismantling the equipment. Provide a weir in the rotating assembly, unless provided in each secondary arm as specified hereinafter.] Provide a rotating assembly with machined surfaces suitable for installation of distributor arms and a height that provides suitable anchorage for the distributor arm supports.

c. Seal: Provide a mechanical seal or an air gap to prevent the leakage of water between the stationary and rotating assemblies at the maximum hydraulic head. Any type of seal employing mercury as the sealing element is not allowed.

(1) Mechanical Seal: Design the mechanical seal, to withstand the full hydraulic head in the rotating assembly. Provide seals having an annular ring of replaceable grease-resistant neoprene or
tetrafluoroethylene with a low coefficient of friction. Provide seals between horizontal surfaces that are maintained against the seal plate by annular steel weight strips and steel seal clamps. Provide seals between vertical surfaces that are spring loaded in steel retainer rings attached to the rotating assembly.

(2) Air Gap: Provide an air gap, to prevent the liquid from entering the rotor bearing and that requires no auxiliary equipment to maintain the air gap between the fixed feeder pipe or column and the rotating sleeve and/or drum. Provide means to prevent the liquid level in the rotating equipment from rising positively to the elevation of the air gap. Provide a relief device to prevent this that is constructed to force any overflow to discharge on the surface of the filter, visible to the operator and at a point above or apart from normal distribution outlets.

d. Bearings: Ensure radial and axial loads of the rotating assembly and distributor arms are transmitted to the stationary assembly by an anti-friction thrust bearing of the ball or roller type. Provide guide or steady bearings where necessary to maintain alignment. Design bearing so that the rotating assembly maintains its alignment, starts freely, and operates satisfactorily at the minimum head at all conditions of wind and temperature. Ensure bearings are designed for the vertical thrust of the machine full of water and the horizontal thrust due to eccentric loads on the arms. Provide bearings that have a minimum rated life expectancy of 100,000 hours (L-10). When the equipment is operating continuously under specified loading conditions, the load rating and the fatigue life is based on ABMA 9 and ABMA 11, as applicable.

e. Lubrication Fittings: Provide all moving parts subject to wear and all bearings with adequate means for lubrication. Lubrication is by grease or oil, as suitable. Provide greased bearings with fittings for grease gun service. If not easily accessible, provide a bearing lubrication with grease tubing extended to convenient locations. Provide grease fittings that prevent over-lubrication and pressure build-up injurious to bearings. Provide oil reservoirs that are liberal in size and have an opening for filling, an overflow opening at the proper location to prevent overfilling, an oil-level sight glass, and a drain at the lowest point. Provide the manufacturer's recommended lubricant sufficient for 6 months of normal operation.

f. Anchor Bolts: Provide anchor bolts, with necessary hex nuts and washers, fabricated of Type 304 stainless steel. Provide anchor bolts and accessories to secure the stationary assembly to the hollow concrete center pier.

2.3.2.3 Distributor Arms

Provide distributor arms that are attached to the rotating assembly by flanged or screwed connections. Provide arms fabricated of steel pipe, structural steel with a minimum wall thickness of 6 mm 1/4 inch, or aluminum alloy that conforms to ASTM B241/B241M. [When the adjustable flow division weir specified in paragraph Rotating Assembly is not provided in the rotating assembly, provide one adjustable, accessible overflow weir in each secondary arm to cut off flow to that arm at minimum flow and to allow uniform flow of all arms at maximum flow.] Provide the end of each arm with a quick-opening shear gate for flushing. Support the arms from the rotating assembly by cables, steel tie rods with turnbuckles, or a steel
truss. Conform wire strand for cables to ASTM A475. Provide arm supports to support the design loads. Brace arms laterally by means of horizontal steel tie rods with turnbuckles. Provide each arm with openings spaced to distribute the flow uniformly over the filter bed. Provide nozzles and spreaders at each opening and constructed of corrosion-resistant nonferrous material. Design nozzles to provide maximum reactive force with minimum head loss. Ensure spreaders disperse the flow evenly from each opening. Provide spreaders that are easily removable for cleaning and equipped with replaceable orifices permitting variation of flow capacity with different orifices. Provide rectangular-arm distributors that have orifices in the spreaders. Provide orifices of nonclogging design.

2.3.2.4 Center Pier Supply Fittings

Provide the [_____] mm inch supply inlet line junction fitting with a [base tee and riser pipe] [base-plate with short riser pipe and flange] suitable for the rotary distributor center column attachment. Construct center pier supply fittings of ductile iron, or steel conforming to AWWA C151/A21.51 or ASTM A53/A53M, respectively.

2.4 FILTER BLOCKS

Provide an underdrain system that includes rectangular and cut tile blocks, cover blocks for drainage channels, and vent blocks. Conform all blocks to ASTM C159, Type I-H, except provide cover blocks without apertures and provide vent blocks with openings to accommodate vent stacks. Provide cut or angle blocks that are cut on an angle to conform approximately to the wall curvature. Provide filter underdrain blocks that have semicircular inverts or equivalent sections and cover the entire floor of the filter. Provide vent stack pipes of extra strength vitrified clay pipe conforming to ASTM C700 and that are provided as indicated.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Placing Rotary Distributor

**************************************************************************
NOTE: Delete bracketed wording pertaining to weirs or dependent on the provisions of weirs when distributors have less than four arms, except when two-compartment arms are used. Coordinate with paragraph CENTER COLUMN.
**************************************************************************

Provide rotary distributor that is installed in accordance with the recommendations of the manufacturer and by workmen experienced in the installation of this type of equipment. Carefully check all components with galvanized or other corrosion-protective coating and restore any damaged or abraded areas to the original or an equivalent coating. Provide proper alignment of all equipment. Set the anchor bolts in place and the nuts tightened against the shims. Securely bolt the stationary assembly in place. Further check the alignment of equipment after securing to the foundations and, after confirming all alignments, grout the stationary assembly in place using grout that conforms to ASTM C1107/C1107M. Align equipment with associated piping and under no circumstances will "pipe springing" be allowed. Set the weirs in accordance with the directions of
the manufacturer, based on anticipated flows.)

3.1.2 Placing Filter Block

Lay filter underdrain blocks in a dry mortar bed. Provide mortar that contains one part cement conforming to ASTM C150/C150M, Type II, and 4 parts sand conforming to ASTM C144, except for a 1:3 cement-sand mortar bed for the first course of blocks where cover blocks are used. After the blocks are laid and before the stone is placed, dampen the dry mortar bed by sprinkling. Install filter blocks providing an uninterrupted flow through the drainage channels in the blocks to the effluent channel. Lay blocks in true alignment, with cross joints staggered in longitudinal rows at right angles to the center drains. Start the rows of blocks at the edge of the drainage channel and end at a sufficient distance from the filter wall to provide an air passage around the inside periphery of the filter. Provide air ducts comprised of either blocks or stacks for venting air to the atmosphere as shown on the drawings. Provide the manufacturer’s plan layout of filter block units.

3.1.3 Placing Filter Media

Store stone or slag media delivered to the filter site on wood planks or other clean hard surface areas. Do not dump stone and slag directly into the filter. Rescreen and fork the media at the filter site to remove all fines before placement in the filter. Place material by hand to a depth of 300 mm 12 inches above the filter blocks and place all material without damaging or displacing the underdrains. Place the remainder of the material by means of belt conveyors, wheelbarrows, or other equipment recommended by the manufacturer. Place the media in layers not exceeding 450 mm 18 inches in depth. Place filter media as near as practicable in final position to avoid excessive rehandling; take special care to avoid breakage or segregation of different size particles. Dumping the filter media directly from trucks into the filter, dropping the filter media from heights exceeding 1 m 3 feet or throwing the media into the filter is not permitted. If it is determined that an excessive amount of fractured stone or dust is passing into the underdrains, remove and rescreen the filter media at a location outside the filter walls. Walkways or runways over the filter, except for the purpose of installing materials or equipment for the filter, are not be permitted. Storing materials, such as cement or sand, or placing heavy construction equipment within the filter walls will not be permitted. Do not pass concrete, sand, dirt, or other materials deleterious to the filter over the filter by any means. Driving trucks, tractors, or other heavy equipment over the filter during or after construction is not permitted.][ Install plastic filter media in accordance with the recommendations of the media manufacturer.]

3.2 FIELD TESTS AND INSPECTIONS

Provide all labor, equipment, and incidentals required for the tests, except that water required for the field tests will be supplied as set forth in the CONTRACT. Notify the Contracting Officer [_____] days prior to dates and times of field tests. Perform all field tests in the presence of the Contracting Officer. Rectify any deficiencies found and completely retest work affected by such deficiencies. Test the distributor mechanism to demonstrate correct alignment, smooth operation, and uniformity of flow distribution over the filter media.
3.3 CLOSEOUT ACTIVITIES

Submit **operating and maintenance manuals**. Provide manuals that include the manufacturer's name, model number, service manual, parts list, brief description of all equipment and their basic operating features, and simplified wiring diagrams for the system as installed.

1.2  SUBMITTALS

**************************************************************************
NOTE:  Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

   Treatment System Installation; G[, [____]]

**SD-03 Product Data**

   Manufactured Units; G[, [____]]

   Spare Parts; G[, [____]]

   Framed Instructions; G[, [____]]

   Manufacturer's Written Instructions; G[, [____]]

**Welding**

**SD-06 Test Reports**

   Field Tests and Inspections; G[, [____]]

   Furnish test results in booklet form not less than 30 days prior to the date of work completion.

**SD-10 Operation and Maintenance Data**

   Operating and Maintenance Instructions; G[, [____]]

   [Six] [____] [hard] [optical disc] copies.
1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Extra Materials

Submit spare parts data for all materials and for each different item of equipment specified, after approval of the detail drawings, and not later than [3] [_____] months prior to the date of work completion. Include in the data a complete list of parts and supplies, with current unit prices and source of supply.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect from damage, deterioration, weather, humidity and temperature variations, dirt and dust, or other contaminants, equipment in storage as required by the manufacturer.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: A continuous loop reactor or oxidation ditch utilizes biological action to degrade organics in the wastewater. Consideration should be given to wastewaters from industrial facilities to ensure there are no components detrimental to microorganisms. In addition, Army facilities utilizing continuous loop reactors should include pretreatment equipment such as bar screens, comminuters and a grit chamber as required by the process conditions. Final clarification, sludge handling and disinfection equipment is also generally required. These and other possible components of the complete treatment system guide are not covered under this section.

Continuous loop reactors can take on many shapes (racetrack, folded U, concentric multi-channel, etc.) and configurations (serus, parallel, etc.). The designer is required to consider these options for space limitations, construction cost considerations, maintainence cost considerations, etc.

As required for military construction, only sprayed concrete (shotcrete) or placed reinforced concrete will be acceptable for the basin construction. Clay lined or synthetic membrane lined basins (even those protected from erosion) are not acceptable.
**************************************************************************

The work required by this section consists of furnishing and installing a continuous loop reactor (CLR). The system specified is a modified form of the activated sludge process and classified as an extended aeration system. The basin is to be constructed of an [earthen channel with an impervious sprayed concrete surface] [reinforced concrete structure], constructed at the depth and configuration indicated. The basin includes all aeration/mixing equipment, [piping,] [pumps,] [baffles,] [weirs] and [turning walls] necessary for proper performance and operation.
2.1.1 Design Requirements

**************************************************************************
NOTE: Some states and regulatory agencies require a minimum detention time of 24 hours. Check the
governing regulations for activated sludge/extended aeration processes for the project location.

Insert average daily and peak daily flow rates and
the required BOD5 removal efficiency. Typically,
90-95 percent removal can be achieved in a
continuous loop reactor. Comply with UFC 3-240-02
to determine design criteria.
**************************************************************************

Treatment of the wastewater is accomplished by contact with the waste
activated sludge in the CLR for a minimum of [18] hours. Size the
CLR for an average daily flow of [_____] L/second and a peak daily flow
of [_____] L/second. The CLR is required to remove a minimum of
[_____] percent of the influent five day BOD at the average daily flow rate
and influent five day BOD.

2.1.2 Mixing Parameters

The aeration/mixing system selected provides the propelling force for
circulation and mixing of the basin contents. Size the aeration/mixing
unit(s) to maintain an average horizontal velocity of not less than [0.305]
[_____] m/second [1.0] fps throughout the basin and maintain a
uniform mixed liquor suspended solids (MLSS) concentration throughout the
basin at MLSS concentrations up to [5000] mg/L, with one
aeration/mixing device not operating.

2.1.3 Aeration Parameters

**************************************************************************
NOTE: The Actual Oxygen Requirement (AOR) is
calculated by the designer. The oxygen required for
oxidation of BOD and the oxygen required for
nitrification must be included in the AOR. Typical
values are 0.82 kg 1.8 pounds of oxygen per 0.45 kg
1.0 pound of BOD applied and 2.1 kg 4.6 pounds of
oxygen per 0.45 kg 1.0 pound of TKN applied. The
alpha coefficient is defined as the ratio of the oxygen transfer in the wastewater to the oxygen transfer in clean water and may vary from 0.2 to 1.5. The alpha coefficient is a direct multiplier in determining oxygen transfer capabilities and is affected by mixed liquor temperature, liquid depth and basin geometry, the level of turbulence, mixing patterns and the nature of dissolved organics and mineral constituents in the wastewater and even the type of aeration equipment. Fine bubble aeration systems typically have lower alpha values than mechanical aeration systems. Because of this variation in alpha value a default value is not shown below. The Beta coefficient is defined as the ratio of oxygen saturation level for the wastewater (mixed liquor) to the oxygen saturation level for tap water. Theta is a temperature correction.
coefficient for oxygen transfer efficiency (OTE). Values of 1.020 to 1.028 are normally used for diffused air systems, while a value of 1.024 is normally used for mechanical aeration systems.

An OTE of 0.507 mg oxygen per joule 3.0 lb. oxygen/hp-hr under standard conditions is an average value for aeration equipment commonly used in closed loop reactor applications. Designer should contact the aerator manufacturer for the OTE of a particular aerator. An aeration system in this range will provide oxygen transfer for an average power cost. Insert the efficiency value desired for the particular design.

The requirement to maintain a minimum dissolved oxygen concentration of 0.5 mg/L should be omitted if the designer has provided for an anoxic zone within the reactor.

Base the aeration/mixing system selected upon the following process requirements:

a. Actual Oxygen Requirement (AOR) [_____] kg oxygen/day lbs. oxygen/day.

b. Alpha Coefficient [_____].

c. Beta Coefficient [0.95] [_____].

d. Theta Coefficient [1.024] [_____].

Select the aeration/mixing system to provide no less than [_____] mg oxygen/joule lb. oxygen/hp-hr under standard (clean water) conditions [and to maintaining a dissolved oxygen concentration of not less than [0.5] [_____] mg/L anywhere in the CLR]. Provide factory test results for a similar treatment application and configuration to substantiate the OTE.

2.2 MANUFACTURED UNITS

Provide a complete list of equipment and materials, including manufacturer's descriptive and technical literature; performance charts and curves; catalog cuts; installation instructions; and a recommendation on quantities of spare parts to have on hand at all times for each piece of equipment.

2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and which essentially duplicate items that have been in satisfactory use in similar facilities for at least 2 years prior to bid opening. Ensure all aeration/mixing equipment, associated accessories, and appurtenances is supplied by the same manufacturer. Ensure equipment is supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.
2.2.2 Nameplates

Provide pumps, blowers and motors with the manufacturer's name, address, type or style, model or serial number, and catalog number on a stainless steel plate permanently secured to the item of equipment.

2.2.3 Protection of Moving Parts

Completely enclose, chains, couplings, and other moving parts by use of guards to prevent accidental personal injury. Configure guards to be removable or so arranged as to allow access to the equipment for maintenance. If equipment is housed in a lockable housing, ensure housing provides sufficient protection and no additional guards are necessary.

2.3 EQUIPMENT

2.3.1 Disc and Rotor Aerators

**************************************************************************
NOTE: The paragraphs that follow contain optional types of aeration systems which may be used by the designer. Only the paragraphs applying to the selected system should be left and the others removed. However, if the disc and rotor option is selected note that these aerators can normally be substituted, one for the other, in the same basin configuration so that both disc and rotors may be specified.
**************************************************************************

2.3.1.1 Aeration Mechanism

Provide the [disc] [or] [rotor] aeration system as indicated. Provide complete units and include [disc] [or] [rotor] assemblies, shaft, or torque tube, drive unit, bearings, supports and all appurtenances necessary for the proper operation of the equipment. Design the [disc] [or] [rotor] aeration system for continuous operation.

2.3.1.1.1 Disc Assembly

**************************************************************************
NOTE: Twelve individual discs or rotors in an assembly are typical. The diameter of the unit is variable and should be designed based upon basin configuration, oxygen transfer rates, velocity and efficiency requirements.
**************************************************************************

Provide each assembly with individually molded [plastic] [fiberglass] discs, [_____] mm inch in diameter and mounted not less than 150 mm 6 inch on center. Provide the number and spacing of disc assemblies indicated. Secure the disc assemblies to the shaft with a clamp ring, by using a keyed shaft or by another method to hold the assembly tightly, ensure no slippage, and provide continuous proper alignment. Split the discs into two sections for attachment or removal without disassembling the shafting. Supply stainless steel positioning bolts to hold the two halves together on the shaft.
2.3.1.1.2 Rotor Assembly

**************************************************************************
NOTE: Twelve individual discs or rotors in an assembly are typical. The diameter of the unit is variable and should be designed based upon basin configuration, oxygen transfer rates, velocity and efficiency requirements.
**************************************************************************

Each blade assembly consists of [12] [_____] individual or six dual [stainless steel] [plastic] [epoxy coated steel] [hot-dipped galvanized steel] blades, [_____] mm inch in diameter mounted not less than 150 mm 6 inch on center. Provide the number and spacing of rotor assemblies indicated. Secure the blade assemblies to the shaft with a clamp ring, by using a keyed shaft, by compression between the assembly blades and the shaft or by another method to hold the assembly tightly, ensure no slippage, and provide continuous proper alignment. Provide the blades so they are removable by unbolting. Welding blades to the shaft is not allowed.

2.3.1.1.3 Velocity Baffles

Provide velocity baffles at the indicated locations and alignment and in accordance with all structural and installation requirements as recommended by the manufacturer of the aeration mechanism.

2.3.1.1.4 Splash Plates

**************************************************************************
NOTE: If outboard bearings are not required or if they are designed to be wetted, or if protective covering hoods include splash protection delete this paragraph.
**************************************************************************

Mount fabricated [steel] [aluminum] [stainless steel] plates in the vertical concrete walls at the drive assembly and outboard bearings and bolt to the frames as indicated. Ensure the opening in the wall formed by the splash plate is of sufficient width for removal of shafts. Where the shaft passes through the splash plates, provide a rubber gasket seal on both sides to seal water from the service area.

2.3.1.1.5 Disc and Rotor Immersion Requirements

**************************************************************************
NOTE: To maintain the water level within the recommended range it is very important that the effluent weir be sized properly and be manually adjustable.

The immersion depth will vary with the diameter of rotor selected. The depths indicated assume a standard 1220 mm 48 inch diameter unit.
**************************************************************************

To ensure the most efficient operation of the aeration system and to avoid damage to the drive system the [operate disc with a minimum immersion of [300] [_____] mm [12] [_____] inch and a maximum immersion of [535] [_____]
2.3.1.1.6 Shafts and Bearings

Support the [disc] [or] [rotor] assembly at both ends by a shaft fabricated of steel conforming to ASTM A36/A36M. Provide a [solid steel shaft] [steel torque tube shaft with a minimum 9.5 mm 0.375 inch wall thickness]. Furnish each [disc] [or] [rotor] assembly support bearing assemblies. Ensure bearings are waterproof, self-aligning and consist of a cast-iron pillow block set on adjustable anchor plates. Provide grease lubricated bearings with a minimum L-10 life of 100,000 hours in accordance with ABMA 9 or ABMA 11.

2.3.1.1.7 Protective Covering

Provide an [ultraviolet light protected fiberglass] [_____] cover, extending over the length of each aeration unit. Design the cover to protect all adjacent structures from splashing caused by the units. Mount the cover independent of the aeration equipment and install in accordance with the manufacturer's requirements.

2.3.1.2 Drive System

2.3.1.2.1 Reducer

Construct the drive system reducer to maintain alignment of bearings and gearing while absorbing the external loads of the [disc] [or] [rotor] assembly. Design the unit to continuously withstand all internal loadings developed at the full load motor wattage horsepower, including motor starting torques up to 250 percent of motor running torques. Design the unit to also withstand all external loadings produced by torque, out-of-balance and vibration resulting from operating conditions. Provide a speed reducer with lifting lugs. Vent the interior of the gear case by use of an approved breather, constructed to retard the entrance of water vapor.

2.3.1.2.2 Housing

Construct drive to be weatherproof and made of steel in accordance with ASTM A36/A36M or high grade cast-iron in accordance with ASTM A48/A48M. Apply a protective coating that will not peel, crack or discolor at continuous operating temperatures up to 121 degrees C 250 degrees F.

2.3.1.2.3 Rating

Provide drive gearing with a minimum service factor of at least [1.4] [_____] times the rated brake horsepower of the drive motor. Ensure gear
reduction system is suitable for continuous operation and moderate shock loading in accordance with ANSI/AGMA 6113/AGMA 6013 for gear motor reducers or gear motors using helical and spiral bevel gears.

2.3.1.2.4 Bearings

Provide power transmission bearings that are of the antifriction type and have a minimum L-10 life of 100,000 hours at maximum operating speed in accordance with ABMA 9 or ABMA 11. Ensure bearings are fully sealed and protected from water spray.

2.3.1.2.5 Lubrication

******************************************************************************
NOTE: If lubricating pumps are not used delete subparagraph b. and edit accordingly.
******************************************************************************

a. Provide lubrication by [gears running in an oil bath] [an oil slinger] [pumps]. Provide the drive with an oil "dam", spring loaded lip seals or other means of positive protection against lubricant leakage around the output shaft. Also provide an oil level gauge or sight glass and drain fittings. Ensure the thermal rating of the gear reducer exceeds the design load or provide proper cooling.

b. Ensure lubricating pumps are removable for maintenance without disassembly of the drive and/or removal of the motor. Provide either a low pressure or low oil level switch to shut off the unit in the event of insufficient lubrication.

2.3.1.2.6 Couplings

Transmit power from the motor to the gear reduction system by means of [a flexible coupling, direct drive of the non-lubricated type, manufacturer's standard, selected to provide a minimum service factor of 2.0] [sheaves and [V-belts] [chains]. To reduce the output speed, provide removable sheaves.] Cover the assembly with a suitable guard and protect from splashing.

2.3.1.3 Mounting

Provide a base mounted drive system which is separately mounted on a concrete pier or a shaft mounted drive system which is supported by the drive side rotor bearing.

2.3.2 Low Speed Surface Aerators

Furnish and install low speed mechanical surface aerators as indicated. Ensure each supplied unit is complete and include an electric motor, a gear reducer, shaft and impeller driven at a constant speed, and all necessary fasteners, stabilizers, anchoring devices, and other mechanical and structural appurtenances necessary for the mounting and operation of the units. Design the aerators for continuous operation.

2.3.2.1 Impeller Shaft

Construct the shaft of [carbon steel] [_____] and size to withstand all torque loads and bending moments produced by operation of the system. Design the shaft and bearing assembly to allow operation below 80 percent
of its natural frequency without the use of stabilizing devices. Ensure the shaft is constructed so its deflection will not affect the alignment of the antifriction bearings or cause misalignment of the gearing during the mixing/aeration operation. Ensure the shaft supporting the impeller is removable from the drive assembly, without disassembly of the gear box. Use rolling, antifriction type bearings on the impeller shaft which have a minimum L-10 life of 100,000 hours in accordance with ABMA 9 or ABMA 11. Support the entire weight of the shaft and impeller by a thrust bearing integral with the gear reducer. Use a rigid coupling to connect the shaft and turbine assembly to the output shaft of the reducer. Provide bearings on the shaft that are either grease or oil lubricated, and are positively sealed against penetration of moisture, or leakage of lubricant down the shaft. Include provisions for checking the adequacy of lubrication.

2.3.2.2 Impeller

Construct the impeller of [carbon steel] [_____] and positively fasten it to the shaft with all [carbon steel] [_____] hardware. Provide means for adjustment of the impeller. If the adjustment is on the shaft, provide means to prevent the impeller from dropping off the shaft during adjustment. Impeller submergence to ensure the most efficient operation of the aeration system.

2.3.2.3 Drive System

2.3.2.3.1 Reducer

Construct the drive system reducer to maintain alignment of bearings and gearing while absorbing the external loads of the impeller. Design the unit to withstand continuously all internal loadings developed at the full load motor wattage horsepower, including motor starting torques up to 250 percent of motor running torques. Design the unit to also withstand all external loadings produced by torque, thrust, out-of-balance and vibration resulting from operating conditions. Provide the speed reducer with lifting lugs. Vent the interior of the gear case by means of an approved breather, constructed to retard the entrance of water vapor.

2.3.2.3.2 Housing

Construct the drive housing to be waterproof and made of steel in accordance with ASTM A36/A36M or high grade cast-iron conforming to ASTM A48/A48M. Apply a protective coating that will not peel, crack or discolor at continuous operating temperatures up to 121 degrees C 250 degrees F.

2.3.2.3.3 Rating

Provide gearing with a minimum service factor of at least [2.5] [_____] times the rated brake horsepower of the drive motor. Ensure the gear reduction system is suitable for continuous operation and moderate shock loading in accordance with ANSI/AGMA 6113AGMA 6013 for motor reducers or gear motors using helical and spiral bevel gears.

2.3.2.3.4 Bearings

Use power transmission bearings of the antifriction type which have a minimum L-10 life of 100,000 hours at maximum operating speed in accordance with ABMA 9 or ABMA 11. Ensure bearings are fully sealed and protected from water spray.
2.3.2.3.5 Lubrication

**************************************************************************
NOTE: If lubricating pumps are not used delete subparagraph b. and edit accordingly.
**************************************************************************

a. Provide for lubrication by [gears running in an oil bath] [an oil slinger] [pumps]. Provide drive with an oil "dam" or other means of positive protection against lubricant leakage around the output shaft. Also provide an oil level gauge or sight glass and drain fittings. Ensure the thermal rating of the gear reducer exceeds the design load. If this is not the case, then provide a proper means of cooling.

b. Ensure lubricating pumps are removable for maintenance without disassembly of the drive and/or removal of the motor. Provide either a low pressure or low oil level switch to shut off the unit in the event of insufficient lubrication.

2.3.2.3.6 Couplings

Transmit power from the motor to the gear reduction system by a non-lubricated coupling which is direct driven. Use manufacturer's standard couplings selected to provide a minimum service factor of 2.0.

2.3.2.4 Mounting

**************************************************************************
NOTE: To maintain the water level within the recommended range it is very important that the effluent weir be sized properly and be manually adjustable. Verify immersion depth with potential manufacturers.
**************************************************************************

Construct a [structural bridge of steel conforming to ASTM A36/A36M] [concrete bridge] and support assembly designed to mount each aeration unit as indicated. Structurally anchor the bridge assembly to the basin walls. To ensure the most efficient operation of the aeration system, mount the aerator with the top of the impeller blades [50] [_____] mm [2] [_____] inch above the minimum water surface elevation. Ensure the blades are not submerged more than [200] [_____] mm [8] [_____] inch at the maximum water surface elevation.

2.3.2.5 Protective Covering

The manufacturer is required to supply an [ultraviolet light protected fiberglass] [_____] cover for each aeration unit. Design the cover to protect all adjacent structures from splashing caused by the unit. Mount the cover independent of the aeration equipment and be install it in accordance with the manufacturer's requirements.

2.3.3 Submerged Turbine Draft Tube Aerators

Furnish and install the submerged turbine draft tube aeration system as indicated. Provide the unit complete to include blowers, drive unit, turbine aerator unit and supports, draft tube assembly, and all appurtenances necessary for the proper operation of the equipment. Design
the aerators for continuous operation.

2.3.3.1 Impeller Shaft

Construct the shaft of [carbon steel] [_____] and size it to withstand all torque loads and bending moments produced by operation of the system. Design the shaft and bearing assembly to allow operation below 80 percent of its natural frequency without the use of stabilizing devices. Construct the shaft so that its deflection will not affect the alignment of the antifriction bearings or cause misalignment of the gearing during the mixing/aeration operation. Ensure the shaft supporting the impeller is removable from the drive assembly, without disassembly of the gear box. Use rolling, antifriction type bearings on the impeller shaft with a minimum L-10 life of 100,000 hours in accordance with ABMA 9 or ABMA 11. Support the entire weight of the shaft and turbine by means of a thrust bearing installed integrally with the gear reducer. Use a rigid coupling to connect the shaft and turbine assembly to the output shaft of the reducer. Provide bearings on the shaft that are either grease or oil lubricated and are positively sealed against penetration of moisture or leakage of lubricant down the shaft. Provide means for checking the adequacy of lubrication.

2.3.3.2 Impeller

Construct the impeller of [carbon steel] [_____] and positively fasten it to the shaft with all [carbon steel] [_____] hardware. The impeller is required to be removable from the shaft. Means for adjustment of the impeller. If the adjustment is on the shaft, provide a means to prevent the impeller from dropping off the shaft during adjustment.

2.3.3.3 Drive System

2.3.3.3.1 Reducer

Construct the drive system reducer to maintain alignment of bearings and gearing while absorbing the external loads of the impeller. Design the unit to continuously withstand all internal loadings developed at the full load motor wattage horsepower, including motor starting torques up to 250 percent of motor running torques. Design the unit to withstand all external loadings produced by torque, thrust, out-of-balance and vibration resulting from operating conditions. Provide lifting lugs with the speed reducer. Vent the interior of the gear case using an approved breather, constructed to retard the entrance of water vapor.

2.3.3.3.2 Housing

Provide a weatherproof drive housing constructed of steel in accordance with ASTM A36/A36M or high grade cast-iron conforming to ASTM A48/A48M. Apply a protective coating that will not peel, crack or discolor at continuous operating temperatures up to 121 degrees C 250 degrees F.

2.3.3.3.3 Rating

Ensure the gearing has a minimum service factor of at least [2.0] [_____] times the rated brake horsepower of the drive motor. Ensure the gear reduction system is suitable for continuous operation and moderate shock loading in accordance with ANSI/AGMA 6113AGMA 6013 for motor reducers or gear motors using helical and spiral bevel gears.
2.3.3.3.4  Bearsings

Provide power transmission bearings that are antifriction type and have a minimum L-10 life of 100,000 hours at maximum operating speed in accordance with ABMA 9 or ABMA 11. Ensure bearings used are fully sealed and protected from water spray.

2.3.3.3.5  Lubrication

**************************************************************************
NOTE: If lubricating pumps are not used delete subparagraph b. and edit accordingly.
**************************************************************************

a. Provide lubrication by [gears running in an oil bath] [an oil slinger] [pumps]. Provide drive with an oil "dam" or other means of positive protection against lubricant leakage around the output shaft. Also provide an oil level gauge or sight glass and drain fittings. Ensure the thermal rating of the gear reducer exceed the design load or provide proper cooling.

b. Ensure all lubricating pumps are removable for maintenance without disassembly of the drive and/or removal of the motor. Provide either a low pressure or low oil level switch to shut off the unit in the event of insufficient lubrication.

2.3.3.3.6  Couplings

Transmit power from the motor to the gear reduction system by using a non-lubricated coupling, direct driven. Ensure all couplings are the manufacturer's standard and select to provide a minimum service factor of 2.0.

2.3.3.4  Draft Tube

Each draft tube consists of upper and lower sections of epoxy coated steel. The upper section consists of the suction cone, supports for connection to the turbine support assembly, air distribution assembly, deflection-limiting system, flow direction baffles, and supports for connection to the bottom section. The bottom section is required to be [_____] mm feet long, sufficient to carry the design flow with minimal pressure drop. Shape bottom section to carry the wastewater to a sufficient depth to dissolve the required oxygen and direct the flow forward in the channel. The draft tube is required to be [_____] mm inch in diameter with a 6 mm 1/4 inch minimum wall thickness, and equipped with grout rings as shown.

2.3.3.5  Mounting

Construct a [structural bridge of steel conforming to ASTM A36/A36M] [concrete bridge] and support assembly designed to mount each aerator as indicated. The bridge assembly is required to be sufficient to support the turbine aerator, suction cone, air sparge assembly and the flow directional baffle assembly.

2.3.3.6  Air Supply Equipment

Provide blower(s) that conform to Section 46 51 00.00 10 AIR AND GAS DIFFUSION SYSTEM.
2.3.4 Jet Aeration

**************************************************************************

NOTE: Jet aeration systems require that preliminary treatment system be included upstream of the CLR to remove grit and other larger particles to reduce the likelihood of plugging the nozzles.

The aeration equipment covered in this specification is listed below along with some general requirements for their use. For further assistance in determining the applicability of the CLR, refer to UFC 3-230-14A and for design criteria refer to UFC 3-240-02.

a. Disc or Rotor (Brush) Aerators: This type of aeration system creates surface agitation to provide oxygen transfer and imparts a horizontal velocity by the rotation of the unit. The channel may be constructed with either sloped or vertical side walls. Typically the channels are constructed 2.4 m 8 feet to 3.7 m 12 feet deep. Channels greater than 2 m 7 feet deep may require a velocity baffle downstream of the aeration unit to help impart a downward velocity to the wastewater and improve mixing along the channel bottom. The CLR should not be constructed with a sidewater depth greater than 4.3 m 14 feet if disc or brush aerators are specified. In addition, turning walls are recommended at each bend to maintain channel velocities around the corners.

b. Low Speed Surface Aerators: This type of aeration system creates surface agitation to provide oxygen transfer and imparts a velocity to the wastewater by the swirling action created by the impeller. The aerators must be placed at the turns in the channel to achieve effective horizontal velocity. At bends where aerators are not located, turning walls are recommended to maintain channel velocities around the corners. Floating aerators should not be considered for use in a CLR application due to the area required for the pontoons. The channel may be constructed with either sloped or vertical side walls. With this equipment, vertical side walls are recommended at the turns. Channel depths will vary from 2 to 5 m 6 to 16 feet). Draft tubes should be provided when recommended by the manufacturer.

c. Submerged Turbine Aerators: Submerged turbine aerators used in CLR's utilize a downward pumping impeller to force an air and water mixture through a draft tube that extends below the bottom of the basin and through a barrier wall extending across the basin. The barrier wall may be constructed of concrete, compacted clay or reinforced earth. The turbine's impeller should be located at a depth of
approximately 20 percent of the basin sidewater depth. The air is discharged through a sparge ring below the impeller and becomes entrained in the downward flow of water through the draft tube. The system requires an air blower, as well as the turbine unit. However, the system offers turn down flexibility because the turbine and blower are operated independent of each other. Sloped or vertical walls are acceptable with this system and the basin should have a single side water depth within the range of 2.4 to 5 m 8 to 16 foot sidewater depth. In addition, turning walls are recommended at each bend to maintain channel velocities around the corners.

d. Jet Aeration: Jet aeration combines air flow and pumped liquid in a vortex jet nozzle which is discharged just above the channel floor. The jet system consists of a recirculation pumping system and an air blower, each feeding headers that discharge through the jet nozzles. The typical configuration utilizes a concrete basin with a 3.7 to 6 m 12 to 20 foot sidewater depth, preferably with vertical side walls. In addition, turning walls are recommended at each bend to maintain channel velocities around the corners. The jet nozzles can be fixed or they can be mounted on removable or swing headers to facilitate maintenance. Removable and swing header systems will require the construction of thrust blocks located behind the nozzles to prevent any deflection caused by the jet action.

e. Diffused Aeration/Low Speed Mixer System: In this system, a coarse, medium or fine bubble diffused aeration system is used in conjunction with a submerged low speed mixing unit that supplies the horizontal velocity. The propeller type mixer, mounted on guide rails, is positioned immediately upstream of the diffusers. Vertical or sloping side walls are acceptable with basin sidewater depth ranging between 3.7 to 6 m 12 to 20 foot. In addition, turning walls are recommended at each bend to maintain channel velocities around the corners. Vertical side walls are recommended in the area of the diffusers to maximize oxygen transfer. Consideration should also be given to providing a removable or swing header system to facilitate maintenance of the diffusers.

f. System Choice: Since the configuration of the channel will vary with the type of equipment selected, the choice of aeration system must be decided upon first. Each aeration system listed above is specified herein. Only the paragraphs applying to the aeration system selected should be included in the specification. All paragraphs and subparagraphs for the other aeration systems should be deleted.
Provide the jet aeration system as indicated. The system includes air-liquid jet manifolds, [vertical propeller] [submerged centrifugal] pumps, pneumatic backflush system, air blowers, and all in-basin air and liquid piping and supports. Design the jet aeration system for continuous operation.

2.3.4.1 Submerged Jets

NOTE: The nozzle size will affect the performance of the system by changing the water and air mixture. The standard nozzle size is 40 mm 1-1/2 inches, however, the process requirements should be checked to determine proper nozzle size. The number and size of nozzles is site specific and is effected by the tank size, solids concentration, oxygen demand requirements and other factors. Designer should contact the equipment manufacturer for information on nozzle sizing.

The jet aeration system consists of [fiberglass reinforced plastic] [_____] jet nozzles, oriented in a common direction and attached to a common manifold. The manifold consists of separate liquid and air piping so that the air and liquid do not mix prior to reaching the mixing chamber of the jet. The liquid portion of the manifold is required to provide uniform distribution of mixed liquor from the inlet of the manifold to each of the jets. The jets consist of 2 nozzles and a mixing chamber constructed integrally with the manifold. The primary jet directs the mixed liquor into the mixing chamber where air is introduced and combined with the liquid. The air-liquid mixture then discharges into the secondary nozzle and, hence horizontally into the basin. Carefully mold the two nozzles to maintain proper alignment and tolerances. To reduce the likelihood of plugging, each jet nozzle has a minimum intake and discharge diameter of 40 mm 1-1/2 inches. Construct the manifold assembly of [fiberglass reinforced plastic] [epoxy coated carbon steel] [____]. Design the manifold to withstand all normal stresses encountered in shipping, handling and operation.

2.3.4.2 Recirculation Pumps

NOTE: Select the applicable pump from the following paragraphs:

2.3.4.2.1 Vertical Propeller Pump

NOTE: Vertical propeller pump manufacturer design manuals should be consulted to determine spacing of pumps to avoid influence of the pump suction.

Pumps should be identified on the drawings by a number. Insert the identification number in part b. of this paragraph; part b. should be repeated as necessary for pumps of the same type with different...
operating characteristics.

a. General: Install the pumping system as indicated and ensure it is suitable for outdoor installation. Design the unit, consisting of vertical shaft, [single] [multistage] propeller type pump and motor to operate safely in the reverse direction of rotation, due to water returning through the pump. Carry the weight of the revolving parts of the pump, including the unbalanced hydraulic thrust of the propeller, by means of a thrust bearing in the motor. Support the pump from a base plate by means of a vertical column having horizontal discharge located below the base plate.

b. Pump Characteristics: Provide pump number(s) [_____] having the following operating characteristics:

(1) Pump Service.

(2) Design Operating Point: [_____] L/second gpm flow, [_____] mm feet head, [_____] percent efficiency.

(3) Maximum Operating Point: [_____] L/second gpm flow, [_____] mm feet head, [_____] percent efficiency.

(4) Minimum Operating Point: [_____] L/second gpm flow, [_____] mm feet head, [_____] percent efficiency.

(5) Propeller Type: [_____].

(6) Discharge Diameter: [_____] mm inch.

(7) Bell Diameter: [_____] mm inch.

(8) Column Length: [_____] mm feet.

(9) Operating Speed: [_____] rpm.

(10) Minimum Bell Submergence: [_____] mm inch.

(11) Pump Control: [_____].

c. Pump Column and Discharge Elbow: Construct the pump supporting column of steel pipe with a minimum [6] [_____] mm [1/4] [_____] inch thickness. Use a flanged discharge opening for connection to the discharge pipe. Use long radius discharge elbows made of [welded steel] [cast-iron].

d. Base Plate: Suspend the pumping unit from a base plate of adequate structural design to support the weight of the complete unit filled with water. Fabricate the base plate of cast iron or steel and size to allow the entire pump to be removed, with the discharge flange attached. Use stainless steel base plate mounting hardware. Locate the packing box on or above the base plate to provide for easy maintenance. Mount the motor above the pump.

e. Suction Bell and Impeller Housing: Construct the suction bell and impeller housing of [ductile] [cast] iron [_____] and design for easy removal of the propeller and lower bearing. Provide the suction bell with a flared inlet designed to reduce entrance loss and provide with
flanges to adequately support the lower bearing and support the weight of the propeller and propeller shaft.

f. Propeller: Construct the pump propeller using [bronze] [_____] and balance propeller statically and dynamically to reduce vibration and wear.

g. Propeller Shaft: Size the propeller shaft to operate without objectionable distortion or vibration in both forward and reverse rotation. Fabricate the propeller shaft using [stainless steel] [_____] and direct couple propeller shaft to the line shaft. Ensure the propeller shaft is adjustable with reference to the bowl. Construct the line shaft of [carbon steel] [_____] and extend as one unit to the motor shaft. Enclose the line shaft in a water-tight steel column.

h. Bearings: Ensure the pump is equipped with a [bronze] [_____] sleeve bearing immediately above the propeller, and a [bronze] [_____] lower support bearing below the propeller. For line shafts greater than 3 m 10 feet in length, also provide [bronze] [_____] intermediate shaft bearings. Install the intermediate shaft bearings inside the water-tight steel column. At the top of the line shaft, include a [bronze] [_____] tension bearing with a tension nut and tension ring. Ensure all bearings are easily replaceable and spaced to provide adequate support for the shaft and to prevent vibration. Use bearings with an L-10 life of 100,000 hours in accordance with ABMA 9 or ABMA 11.

i. Lubrication: Equip the pump with an automatic lubricating system which supplies grease lubricant to all but the lower support bearings. Grease pack the lower support bearings.

2.3.4.2.2 Submersible Centrifugal Pumps

Provide submersible centrifugal pumps used for the jet aeration system in accordance with Section 22 13 29 SANITARY SEWERAGE PUMPS.

2.3.4.2.3 Self-Priming Centrifugal Pumps

Provide self-priming centrifugal pumps used for the jet aeration system in accordance with Section 22 13 29 SANITARY SEWERAGE PUMPS.

2.3.4.2.4 Vertical Turbine Pumps

**************************************************************************
NOTE: Vertical turbine pump manufacturer design manuals should be consulted to determine spacing of pumps to avoid influence of the pump suctions.
**************************************************************************

Provide vertical turbine pumps used for the jet aeration system in accordance with Section 23 21 23 HYDRONIC PUMPS.

2.3.4.2.5 Pump Suction Screens

Mount a [stainless steel] [_____] screen to the suction of the pump. Provide a screen sized to ensure nothing larger than 25 mm 1 inch in diameter to pass.
2.3.4.3 Blowers

Provide blowers in accordance with Section 46 51 00.00 10 AIR AND GAS DIFFUSION SYSTEM.

2.3.5 Diffused Aeration/Slow Speed Mixer System

Furnish and install the diffused aeration/slow speed mixer system as indicated. Provide a complete system including air supply, distribution and diffuser equipment designed to satisfy the oxygen requirement, and the adequate number of submersible mixing units to create and maintain a horizontal velocity in the basin and maintain solids suspension. The air supply and distribution system includes blowers, piping, valves, diffusers, supports and all necessary appurtenances to ensure proper operation of the equipment. The mixing units consist of a propeller driven by a [submersible electric motor] [hydraulic system], a support structure that allows the unit to be easily removed from the basin, and all cables and appurtenances necessary to ensure proper operation of the equipment. Design the combined system for continuous operation.

2.3.5.1 Diffused Aeration System

Provide the diffused aeration and blower system as specified in Section 46 51 00.00 10 AIR AND GAS DIFFUSION SYSTEM.

2.3.5.2 Slow Speed Mixer (With Submersible Electric Motor)

**************************************************************************
NOTE: Designer will allow bids on either hydraulic motors or electric motors unless job requirements warrant eliminating one of the options.
**************************************************************************

Ensure all components of the mixer, including the motor, are capable of continuous underwater operation while the mixer blade is either completely submerged or partly submerged. In addition, ensure all components of the mixer, including motor, are capable of continuous operation in air, completely unsubmerged, for a minimum of [2] [_____] hours.

2.3.5.2.1 Mixer Propeller

Construct the propeller of [ASTM A167, Type 304 stainless steel] [cast-iron] [molded fiberglass] [_____] and shape so that no solids, fibrous material and other material found in normal wastewater applications collects on the blades. Dynamically balance the propeller to [5.3] [_____] N/meter [0.03] [_____] pounds/inch and [internally key it for engagement with the shaft] [ensure it slides onto the shaft and is securely fastened with a screw washer and sleeve] [______].

2.3.5.2.2 Drive System

Provide each mixer be direct-driven, close-coupled, completely submersible units. Use mixer motors that are squirrel-cage induction, shell type design, housed in an air-filled, watertight chamber. Insulate the stator winding with moisture-resistant Class F insulation in accordance with NEMA MG 1 and design for continuous duty. Ensure the cable entry is an integral part of the stator casing and is leakproof. In addition, machine all mating surfaces where water tight sealing is required and fit with [nitrile] [_____] rubber O-rings.
2.3.5.2.3 Shafts and Seals

Ensure the mixer motor shaft is integral with the propeller shaft and rotates on two permanently lubricated bearings. Provide ball bearings with a minimum L-10 life of 100,000 hours as defined by ABMA 9 or ABMA 11. Provide each mixer with a tandem mechanical rotating shaft seal system on the propeller shaft. Provide lapped end face type seals and run them in an oil reservoir. The inner seal is required to contain one stationary and one positively driven rotating ceramic ring. The outer seal is required to contain one stationary and one positively driven rotating tungsten carbide ring.

2.3.5.2.4 Mounting

Configure mixer capable of being raised and lowered from the basin for ease of repair and maintenance. Mount the mixer on and guide by a sliding bracket constructed to withstand all thrust created by the mixer. Provide a lifting cable and winch mechanism to permit raising and lowering of the mixer on the sliding bracket.

2.3.5.3 Slow Speed Mixer (With Hydraulic Motors)

Each hydraulic horizontal mixer consists of a hydraulic power unit and motor, a direct drive shaft and propeller, hydraulic lines, and all mounting and support brackets to provide for proper operation. In addition, all components of the mixer are required to capable of continuous operation in air, completely unsubmerged, for a minimum of [2] [_____] hours.

2.3.5.3.1 Mixer Propeller

Construct the propeller of [cast-iron] [molded fiberglass] [_____] and shaped so that no solids, fibrous material and other material found in normal wastewater applications collects on the blades. Dynamically balance the propeller to [5.3] [_____] N/meter [0.03] [_____] pounds/inch and [internally key it for engagement with the shaft] [ensure it slides onto the shaft and is securely fastened with a screw washer and sleeve] [_____]..

2.3.5.3.2 Drive System

a. Hydraulic Motor: Provide hydraulic motor of the low speed, high torque, fixed displacement type to drive the propeller. Ensure the hydraulic motor is capable of withstanding end thrust loads of not less than 4.45 kN 1000 pounds either into or out from the motor. Ensure hydraulic motor is rated for a B-10 life of not less than 100,000 hours in accordance with ABMA 9 or ABMA 11. Connect the hydraulic motor to the hydraulic pump with a hose having a continuous pressure rating of not less than 20.7 MPa 3000 psi.

b. Hydraulic Pump: Enclose the hydraulic pump in the hydraulic reservoir and mount directly to the electric motor adapter. Ensure the hydraulic pump has a continuous pressure rating of not less than 13.8 MPa 2000 psi. Ensure the hydraulic fluid flow control mechanism lock and is fully adjustable to allow for infinitely variable speed control.

c. Reservoir and Accessories: Construct the hydraulic reservoir of steel. Include a filler/breather assembly, and a fluid level/temperature gauge and clean-out cover. Connect the hydraulic
reservoir to the hydraulic motor with a hose having a continuous pressure rating greater than the rating of the hydraulic pump but not less than 20.7 MPa (3000 psi).

2.3.5.3.3 Mounting

Provide mixer capable of being raised and lowered from the basin for ease of repair and maintenance. Mount the mixer on and guide by a sliding bracket constructed to withstand all thrust created by the mixer. Provide a lifting cable and winch mechanism to permit raising and lowering of the mixer on the sliding bracket.

2.3.6 Lubrication Requirements

Provide an adequate means of lubrication for all moving parts subject to wear. Except as otherwise specified, lubricate using grease or oil. Provide grease fittings for all grease-type bearings. If bearings are not easily accessible, provide grease tubing in a convenient location. Provide bearings with relief ports to prevent build-up of pressures which might damage the bearings or seals. Size oil reservoirs liberally and provide with an opening for filling, an overflow opening at the proper location to prevent overfilling, and a drain opening at the lowest point. Vent reservoirs to prevent pressure build-up.

2.3.7 Electric Motors

Utilize a squirrel-cage induction motor suitable for continuous duty. Provide motor with a non-overloading power rating for any conditions under which the driven equipment function.

2.3.7.1 Frame

Select the motor frame size in accordance with NEMA MG 1. Ensure that motors of the same rating, mounting, and characteristics are interchangeable.

2.3.7.2 Design

Induction motors are required to be Design B as defined in NEMA MG 1, with normal torque and low starting current.

2.3.7.3 Enclosure

Provide a totally enclosed fan cooled enclosure.

2.3.7.4 Terminal Boxes

Size cast-iron terminal boxes for the space required, for the allowable bending radius and stiffness of the motor supply cables, and for terminating a grounding conductor. Provide gaskets for the terminal boxes and threaded conduit entrances or hubs. Ensure terminal boxes are rotatable for connection from any one of four directions at 90 degree intervals with a motor lead seal and separator gasket provided between the motor frame and terminal box.

2.3.7.5 Bearings

Provide grease lubricated, shielded, antifriction steel ball bearings and grease with a moisture resistant grease. Ensure all grease fittings and
excess grease purge plugs are readily accessible and locate externally so that bearing lubricant can be changed without removing fan housing or dismantling the motor.

2.3.7.6 Windings

Provide nonhygroscopic, epoxy coated motor windings.

2.3.7.7 Motor Characteristics

Ensure motor rotors receive a standard dynamic balance. Ensure the maximum amplitude (peak to peak) of motor vibration, as measured at the bearing housing, and the method of measurement are in accordance with NEMA MG 1. Ensure motor characteristics such as wattage, horsepower, speed, rpm, voltage and phase requirements and insulation class are provided as indicated.

2.3.7.8 Motor Controls

NEMA ICS 1.

2.3.8 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration and maintenance of the equipment.

2.4 MATERIALS

Ensure materials and equipment conform to the following requirements.

2.4.1 Steel Plates, Shapes and Bars

ASTM A36/A36M.

2.4.2 Pipe

Furnish and install piping as indicated and ensure it is in accordance with the applicable standard specification.

2.4.2.1 Steel Pipe

ASTM A53/A53M, all pipe sizes.

a. Flanged Joints: ASTM A707/A707M.

d. Welded Joints: AWS D1.1/D1.1M.

e. Bolts: ASTM A307, Grade B.

f. Fittings: ASTM A420/A420M.

2.4.2.2 Ductile-Iron Pipe

AWWA C115/A21.15, all pipe sizes.

e. Bolts and Nuts: ASTM A307, Grade B.

f. Coatings and Linings: Provide bituminous coating on all buried piping.

2.4.2.3 Polyvinyl Chloride (PVC) Pipe and Fittings

Provide PVC pipe and fittings less than 102 mm 4-inch diameter in accordance with ASTM D1785 or ASTM D2241. Provide PVC pipe and fittings 102 mm 4 inch in diameter and larger in accordance with ASTM D2241 and ensure they have push-on joints.

2.4.3 Pipe Hangers and Supports

MSS SP-58.

2.4.4 Valves

2.4.4.1 Gate Valves

Gate valves are required to withstand a working pressure of not less than 1.03 MPa 150 psi. Ensure valves have a clear waterway equal to the full diameter of the valve, and are opened by turning counterclockwise. On operating nut or wheel handle, provide an arrow, cast in metal, indicating the direction of opening. For valves used for buried service, provide with non-rising stem (NRS), 50 mm 2 inch square nut operated with joints applicable to the pipe or installation. Furnish buried valves with extension stems comprised of socket, extension stem and operating nut, that are long enough to bring operating nut to within 150 mm 6 inch of grade. Furnish one 1.2 m 4 foot "T" handle valve wrench for each quantity of six buried valves. For gate valves which are exposed or installed inside, provide outside screw and yoke (OS&Y), handwheel operated with flanged ends unless otherwise indicated. Flanges are not to be buried. Provide a approved pit for all flanged connections.

a. Valves smaller than 75 mm 3 inch are required to be all bronze conforming to MSS SP-80, Type 1, Class 150.

b. Valves 75 to 305 mm 3 to 12 inch in size are required to be resilient-seated gate valves conforming to AWWA C509.

c. Valves 355 mm 14 inch and larger are required to be iron body, bronze mounted conforming to AWWA C500. Provide solid wedge type valves. Equip valves with gearing to reduce operating effort. Equip all valves installed in horizontal lines in the horizontal position with stems horizontal with bronze track, roller and scrapers to support the weight of the gate for its full length of travel. Fit valves installed in vertical pipe lines with stems horizontal with slides to assist the
travel of the gate assembly.

2.4.4.2 Plug Valves

Plug valves are required to be eccentric type capable of withstanding a minimum working pressure of 1.03 MPa 150 psi. Provide flange valve conforming to ASME B16.1, Class 125. Provide mechanical or push-on type rubber gasket joint ends conforming to AWWA C110/A21.10 and AWWA C111/A21.11. Ensure port area for valves is at least 80 percent of full pipe area. Valve bodies, plugs or discs, seats, shafts, shaft seals and actuators are required to conform to AWWA C504. Valves are required to open counterclockwise and the operating nut or wheel have an arrow, cast in metal, indicating the direction of opening. Ensure valves meet all performance, leakage, and hydrostatic tests required by AWWA C504. On request, furnish a certified statement from the manufacturer that proof-of-design tests were carried out as described in AWWA C504 and all requirements were successfully met.

2.4.4.3 Check Valves

Check valves are required to permit free flow of sewage forward and provide a positive check against backflow. Check valves are required to withstand a minimum working pressure of 1.03 MPa 150 psi or as indicated. Provide iron body check valves. Directly cast on the body the manufacturer's name, initials, or trademark and also the size of the valve, working pressure, and direction of flow. Flanges are required to be the 56 kg 125 pound type complying with ASME B16.1.

a. Provide ball check valves with flanged or threaded ends and the non-slam type. Construct ball of stainless steel unless otherwise specified.

b. Ensure swing check valves comply with AWWA C508, are bronze mounted, and have flanged ends. Equip check valves with [outside lever and spring] [______].

2.4.5 Joint Compound

For joint compound for threaded joints, use a stiff mixture of graphite and oil, inert filler and oil, or a graphite compound.

2.4.6 Joint Tape

Ensure joint tape for threaded joints complies with ASTM D3308.

PART 3 EXECUTION

3.1 EXAMINATION

Verify all dimensions in the field, and advise the Contracting Officer of any discrepancy in the contract documents before performing the work.

3.2 TREATMENT SYSTEM INSTALLATION

Submit drawings containing complete wiring and schematic diagrams; equipment layout and anchorage; and any other details required to demonstrate that the system has been coordinated and functions as a unit. Drawings are to show the proposed layout and anchorage of equipment in appurtenances and equipment relationship to other parts of the work.
including clearances required for maintenance and operation. Submit all submittals for this system at the same time. It is not acceptable to piecemeal submittals.

Perform all excavation, filling, and backfilling in accordance with Section 31 00 00 EARTHWORK. Install reinforced concrete, of the size and design indicated, in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.2.1 Welding

Weld piping in accordance with AWS D1.1/D1.1M using welders certified to have passed tests using procedures in accordance with AWS B2.1/B2.1M or ASME BPVC SEC IX. Ensure the welder or welding operator applies the assigned personal symbol near each weld made, as a permanent record. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. Welding and nondestructive testing procedures are specified in Section 40 05 13.96 WELDING PROCESS PIPING.

Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests and perform the tests at the work site if practicable.

3.2.2 Pipe and Valve Installation

Install piping with all joints tight and with no undue marring of finishes. Ensure installed piping, valves, and fittings is free from strain and excessive stresses caused by weight or misalignment.

3.2.2.1 Flanged Joints

Tighten bolts uniformly to prevent overstressing flanges and misalignment.

3.2.2.2 Screwed Joints

Make screwed joints tight with joint compound, applied to the male threads only, or with joint tape.

3.2.2.3 Push-On Joints for PVC Pipe

Bevel pipe ends to facilitate assembly. Mark pipe to indicate when the pipe is fully seated. Lubricate gaskets to prevent displacement. Exercise care to ensure that the gasket remains in proper position in the bell or coupling while joints are made.

3.2.2.4 Solvent-Weld Joints for PVC Pipe

Weld joints in accordance with the manufacturer's written instructions.

3.2.2.5 Valves

Installed and locate valves for easy access for operation.

3.2.3 Equipment Installation

Install equipment in accordance with the manufacturer's written instructions.
3.2.4 Electrical Work

Perform electrical work in accordance with the applicable requirements of Section [______].

3.2.5 Painting

Paint all metal surfaces, except aluminum, bronze, brass, galvanized steel, and stainless steel. Perform surface preparation and painting in the field. Finish manufactured items, such as motors and switchboards, per with the manufacturer's standard finish.

3.2.5.1 Preparation and Application

Prepare ferrous metal surfaces in accordance with SSPC SP 6/NACE No.3 and painted with a three coat MIL-DTL-24441 epoxy painted to achieve a total dry film thickness of 150 microns (6 mils). The contractor may substitute Master Painter's Institute (MPI) #120 Epoxy, High build, Self-Priming, Low Gloss, for MIL-DTL-24441.

3.2.5.2 Coating Examination

Examine all coatings for flaws and test for thickness and holidays. Measure the thickness of coatings wet and dry using a commercial film thickness gauge. Notify the Contracting Officer in advance of any painting. Do not apply additional coats until the previous coat has been approved. Perform all repair or additional coatings at no additional cost to the government.

3.2.5.3 Coating Repair

If welding is required after application of the coating or if the coating is damaged in any way, repair by preparing the affected area in compliance with SSPC SP 6/NACE No.3 and reapply the coating to that area. If holidays are detected or film thickness is insufficient, prepare the surface and apply additional coats in the affected area in compliance with the manufacturer's instructions.

3.3 FIELD QUALITY CONTROL

3.3.1 Field Tests And Inspections

Supply water required for the field tests. Give the Contracting Officer [14] [_____] days prior notice of the dates and times for acceptance tests to allow the Contracting Officer the ability to witness all field tests. Rectify any deficiencies found. All work affected by such deficiencies required to be completely retested at the Contractor's expense.

3.3.1.1 Basin Leakage Test

After completion of the installation and as soon as practical, conduct a leakage test on the CLR basin. Fill the basin with clean water and leave standing for 24 hours. Basin leakage is not allowed to exceed 25 mm 1 inch drop in water surface elevation in 24 hours. Repair leaks encountered and retest the basin. Ensure the basin is watertight prior to proceeding with the tests specified below.
3.3.1.2 Operating Tests

After completion of the installation and as soon as practical, perform an operating test of the CLR and all equipment to demonstrate that the system functions properly. Include all manufacturer's recommended tests for equipment vibration, horizontal and vertical alignment and structural integrity. Check and verify wattage horsepower [and air flow rates] against the manufacturer's design data for the specified equipment. Ensure the aerator wattage horsepower meets nameplate plus or minus five percent. After completion of all tests, adjust the system for proper operation in accordance with the manufacturer's written instructions and the operating and maintenance instructions.

3.3.1.3 Velocity Test

After completion of the basin leakage and operating tests, conduct a velocity test on the basin. Record velocity cross-sections at a distance of 3 m 10 feet upstream of the shaft centerline of each aerator. Cross-sections consist of a minimum of 16 velocity measurements equidistantly spaced so that the distance between measurement points does not exceed 1.2 m 4 feet vertically or horizontally. Begin measurement points at approximately 0.6 m 2 feet from walls. The average velocity at each cross-section is not to be less than 0.3 m/s 1.0 fps. Where average velocities are found to be less than that specified, make modifications to the system as needed to produce the required velocities at no extra cost to the Government.

3.3.1.4 Standard Oxygen Transfer Efficiency Test (S.O.T.E.)

After completion of the velocity test, perform an S.O.T.E. test in accordance with ASCE 2-06. The aeration system oxygenation capacity is not allowed to be less than [1.4] [_____] kg [3] [_____] pounds of oxygen per watt horsepower per hour with [_____] aeration units operating at a combined power draw of [_____] watts horsepower. Repeat tests in the same water until ten tests have been run or until the total dissolved solids (TDS) exceed 2000 mg/L. Plot a minimum to maximum power curve from the results. Base power input on wire power. Use a nationally recognized independent testing laboratory for all tests.

3.3.1.5 Reporting Test Results

Upon completion and testing of the installed system, submit test reports that show all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria. Indicate the final position of controls in each test report. Report results in accordance with paragraph 9.0 "REPORTING" of ASCE 2-06.

3.3.2 Manufacturer's Services

3.3.2.1 Supervise Installation, Adjustment, and Testing

Obtain the services of the manufacturer's representative experienced in the installation, adjustment, and operation of the equipment specified to supervise the installation, adjustment and testing of the equipment in accordance with manufacturer's written instructions.

3.3.2.2 Field Training

Conduct a training course for the operating staff as designated by the
Contracting Officer. Provide a training period consisting of a total of [_____] hours of normal working time and start after the system is functionally complete but prior to final acceptance tests. Ensure all field instruction covers all of the items contained in the Operating and Maintenance Instructions, as well as demonstrations of routine maintenance operations. Notify the Contracting Officer at least 14 days prior to date of proposed conduction of the training course.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Framed Instructions

Submit approved wiring and control diagrams showing the complete layout of the entire system, including equipment, piping valves, and control sequence, framed under glass or in approved laminated plastic, for posting where directed. In addition, prepare in typed form condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system. Frame as specified above for the wiring and control diagrams and post beside the diagrams. Post the framed instructions before acceptance testing of the systems.

3.4.2 Operating And Maintenance Instructions

Furnish instructions including the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Permanently bind each set and include a hard cover. Inscribe the following identification on the covers: the words "OPERATING AND MAINTENANCE INSTRUCTIONS," name and location of the facility, name of the Contractor, and contract number. Ensure information includes, but is not necessarily limited to, the following:

a. System layout showing piping, valves, and controls.

b. Approved wiring and control diagrams.

c. A control sequence describing startup, operation, and shutdown.

d. Operating and maintenance instructions for each piece of equipment, including lubrication instructions and troubleshooting guide.

e. Manufacturer's bulletins, cut sheets and descriptive data, parts lists, and recommended spare parts.

f. Simplified diagrams for the system as installed.

NOTE: This guide specification covers the requirements for filtration systems with capacity less than 750 liters 200 gallons per minute.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1   REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature.
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that
require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Filtration System; G[, [_____]}

Include complete wiring and schematic diagrams; equipment layout and anchorage; and any other details required to demonstrate that the system has been coordinated and will properly function as a unit.

1.3 MAINTENANCE MATERIAL SUBMITTALS

1.3.1 Extra Materials

Provide standard spare parts as recommended in the manufacturer's instruction manuals for each component of the equipment. Submit spare parts data for each different item of material and equipment specified. Include in the data a complete list of parts and supplies, with current unit prices and source of supply.

1.4 QUALIFICATIONS

Submit qualifications of the installer, and the manufacturer's and media supplier's representatives.

1.4.1 Installer

Installers are required to have a minimum of [_____] years' experience in the installation of a minimum of [_____] similar filtration systems and are required to show evidence of satisfactory operation for each installation.

1.4.2 Manufacturer's Representative

Ensure a representative of the filtration system manufacturer, who is familiar with the design and experienced in the installation, adjustment, and operation of the equipment specified is present at the jobsite during installation of the filtration system.

1.4.3 Media Supplier Representative

Ensure a representative of the media supplier who is experienced in the installation of the specified filtration media is present at the jobsite during media installation.

1.5 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from weather, excessive humidity, excessive temperature variation, and dirt, dust, or other contaminants.
PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide a [pressure] [continuous backwash] [traveling bridge] [cartridge] [bag] filtration system. Design, construct and install the filtration system to comply with the following design conditions. Supply auxiliary systems and equipment required to maintain complete and workable filter systems including, but not limited to, required piping between units, auxiliary equipment for plumbing and power, and controls and interfaces between auxiliary equipment and the filter. Chemical additives [are] [are not] allowed to enhance the filtration system. Construct the installation [indoors] [outdoors]. [_____] volts of electricity, [_____] Pa psi air pressure, and [_____] Pa psi water pressure is available for installation.

2.1.1 Influent Flow Characteristics

**************************************************************************

2.1.3 Cartridge and Bag Influent

**************************************************************************
NOTE: This paragraph describes influent flow characteristics for cartridge and bag filtration systems. In addition to the information listed below, concentrations of Target Compound List (TCL) and Target Analyte List (TAL) compounds in the waste stream should be included in the influent stream characteristics paragraph. This information will

SECTION 46 61 00 Page 13
help ensure that the bag or cartridge filtration materials are compatible with the waste stream.

2.1.4 Cartridge and Bag Design Criteria

**************************************************************************
NOTE: This paragraph specifies minimum design requirements for cartridge and bag filtration systems.
**************************************************************************

Total Number Operating Units | [_____]
2.2  EQUIPMENT

2.2.1  Materials and Equipment

**************************************************************************

NOTE: Pipes, valves, pumps, and appurtenances are generally supplied as part of the package filtration system, but the designer must specify those sites requiring special materials of construction, sizing, etc., based on the influent stream characteristics.

**************************************************************************

Ensure all recyclable materials conform to EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING.

2.2.1.1  Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Provide equipment that is supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.2.1.2  Nameplates

Provide each major item of equipment with the manufacturer's name, address, type of style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.2.1.3  Protection of Moving Parts

Completely enclose by guards belts, chains, couplings, and other moving parts to prevent accidental personal injury. Fabricate guards to be removable or arranged in a way to allow access to the equipment for maintenance. If equipment is housed in a lockable housing, ensure the housing provides sufficient protection and no additional guards are necessary.
2.2.1.4 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment.

2.2.1.5 Steel Plates, Shapes and Bars

ASTM A36/A36M.

2.2.1.6 Pipe and Fittings

Provide pipe and fittings that conform to the standards specified below.

2.2.1.6.1 Steel Pipe

ASTM A53/A53M.

a. Flanged Joints: ASTM A707/A707M.

b. Welded Joints: AWS D1.1/D1.1M.

c. Bolts: ASTM A307, Grade B.

d. Fittings: ASTM A420/A420M.

2.2.1.6.2 Ductile Iron Pipe

AWWA C115/A21.15.

e. Bolts and Nuts: ASTM A307, Grade B.

2.2.1.6.3 Stainless Steel Pipe

ASTM A312/A312M, Schedule 40, Type 316 or Type 304.

c. Fittings: ASME B16.3.

d. Bolts: ASTM A193/A193M, Class 1, Grade B8.

2.2.1.6.4 Polyvinyl Chloride (PVC) Pipe

Provide PVC pipe and fittings less the 100 mm 4 inch diameter in accordance with ASTM D1785 or ASTM D2241. Provide PVC pipe and fittings 100 mm 4 inch in diameter or larger in accordance with ASTM D2241 with push-on joints.

2.2.1.7 Pipe Hangers and Supports
MSS SP-58.

2.2.1.8 Valves

2.2.1.8.1 Steel Valves
ASTM A216/A216M, Grade WCB.

2.2.1.8.2 Cast Iron Valves
ASTM A126, Class B.

b. Gate Valves: MSS SP-70.
c. Plug Valves: MSS SP-78.
e. Ball Valves: MSS SP-72.

2.2.1.8.3 PVC Valves
ASTM D1784, Class 12454-B (formerly designated Type I, Grade 1).

2.2.1.9 Other Materials

2.2.1.9.1 Polypropylene Support Material

**************************************************************************
NOTE: The polypropylene requirements are applicable to use for support materials for bag and cartridge filters.
**************************************************************************

ASTM C1147.

2.2.1.9.2 Joint Compound
Use joint compound for threaded joints made from a stiff mixture of graphite and oil, inert filler and oil, or a graphite compound.

2.2.1.9.3 Joint Tape
Provide joint tape for threaded joints that complies with ASTM D3308.
2.2.2 Electrical Equipment

2.2.2.1 Electrical Work

[Provide electrical motor-driven equipment specified complete with [motors] [motors and motor starters] and controls.] [Motor starters complete with properly sized thermal overload protection and other appurtenances necessary for the motor specified.] Perform electrical work as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices.

2.2.2.2 Electric Motors

Provide motors that conform to NEMA MG 1. Provide motors with nameplate horsepower equal or greater than 380 watts 1/2 hp that are suitable for 480 volt, 3 phase operating service, unless otherwise specified. Provide motors of greater than 760 watts 1 hp that are high efficiency type as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2.2.3 Motor Controls

Provide controls that conform to NEMA ICS 1.

2.2.2.4 Electrical Power Control

**************************************************************************
NOTE: Generally, the filter manufacturer will supply a standard control system with the package unit. To allow maximum flexibility, the control system should be specified only to the extent necessary to achieve project needs. The following sub paragraphs provide specification for several control system components the designer may require the manufacturer to incorporate into the package system. Delete paragraphs not required.
**************************************************************************

2.2.2.4.1 General Requirements

Provide a [manual] [semi-automatic] [automatic] [_____] complete electrical power, control, and instrumentation system as specified or recommended by the equipment manufacturer for the safe operation and supervision of the filter units and related equipment, except those items specified to be furnished under other sections. Provide schematics and interconnection wiring diagrams for power, control, and instrumentation circuits to equipment specified. Provide terminal blocks (plus 25 percent spare terminals) in panels to terminate field and interconnection wiring.

2.2.2.4.2 Control System

Provide control power transformers, relays, adjustable timers, auxiliary contacts, switches, or additional equipment as required to interconnect the filter equipment to a remote plant monitoring system, and control circuits as shown on schematic or instrument control system drawings. Furnish conduit wiring between control panels and control devices as part of this specification. Submit a description of the control system including, but not be limited to, the following items:
a. Product information for sensors/transducers and field instruments.

b. Programmable Controller System Information
   (1) System Description
   (2) Hardware Description
   (3) Software Description

c. Panels, Consoles, and Cabinets Information
   (1) Layout Drawings
   (2) Panel schematic and internal point-to-point wiring interconnect and/or piping diagrams
   (3) Electrical control schematics in accordance with NFPA standards for all circuits indicated in the specifications or on the Contract Drawings. "Typical" wiring diagrams are acceptable but the use of tables or charts to describe wire numbers is not acceptable. Label wires and shown on the submittal drawings.
   (4) Plan showing equipment layout.
   (5) Stock lists or Bill of Materials for each panel including tag number, functional name, manufacturer's name, manufacturer's model number, and quantity for components mounted in and on the panel, console, or cabinet.

d. Field wiring and piping diagrams and point-to-point wiring diagrams including interconnections between field devices, panels, control stations, lighting panels, and motor starters.

e. Instrument loop diagrams for analog display, control and I/O loops prepared using ISA standard symbols.

f. System Software Documentation to include the following as a minimum:
   (1) Complete hard copies of ladder diagram programming.
   (2) Complete listing of external and internal I/O address assignments, register assignments, and preset constant values along with functional point descriptions. Also list unused/undefined I/O and data table registers available.
   (3) Complete hard copies of program documentation for all types of programs.
   (4) Detailed system memory map defining memory segments used and spare memory segments available for system memory, I/O tables, Data Tables, and control program.
   (5) Complete database listing.
   (6) User's manual describing procedures and providing examples for use of programming terminal, accessories, and system utility routines to perform control, program modification, program verification,
diagnostics, program documentation, loading and backup, and other required system support functions.

2.2.2.5 Remote Alarm and Process Variable Monitoring

******************************************************************************
NOTE: Coordination with remote systems, such as Supervisory Control and Data Acquisition (SCADA) System and annunciators, must be specified in this paragraph and must include the method of transmission to remote locations for the process variables to be monitored for each unique application. If remote alarm and process variable monitoring is not used, this paragraph must be deleted.
******************************************************************************

2.2.2.6 Bolts, Nuts, Anchors, and Washers

Provide steel bolts, nuts, anchors, and washers, galvanized in accordance with ASTM A153/A153M.

2.2.2.7 Valves

Transfer water to and from the filtration unit by a means of [ball valve] [butterfly valve] [globe valve] [air solenoid] [_____] for [automatic] [semiautomatic] [manual] operation. Design the valve mechanisms such that gradually increasing flows are attained as ports are opened and initial surges and sudden inrushes of water are avoided. Include a dial pointer to indicate each step of the operation.

2.2.2.8 Pumps

Supply air compressors where insufficient head is available to move the [influent] [effluent] [backwash] [wash] water. Ensure the pump complies with the requirements of Section 23 21 23 HYDRONIC PUMPS.

2.2.2.9 Air Compressors

Supply pump in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.2.2.10 Pressure Gauges

Show or schedule gauge sizes and scale ranges on the Contract Drawings. Provide gauges that comply with ASME B40.100 Type 2A, as a minimum. Provide compound gauges on the suction side of pumps and standard pressure gauge on the discharge side of pumps. Use gauges with clear acrylic or shatterproof glass windows and shock-resistant cases. Set the design operations to fall at the midpoint of the graduated scale. Equally space major divisions and show in whole integers. Engrave scale units on the scale face. Limit pointer travel to not less than 200 degrees nor more than 270 degrees arc. Provide gauge accuracy of plus or minus 0.5 percent of span. Provide each gauge, except those for hydraulic systems, with a process shutoff valve.

2.2.2.11 Gauge Panel

Provide a gauge panel on which [1] [2] [_____] nominal pressure gauges to sense unit inlet and outlet pressures and [1] [2] [_____] pressure switch
are mounted. Wire the pressure sensor switch to a control panel which sounds an alarm when the differential pressure exceeds the [maximum differential pressure specified in Paragraphs Design Criteria or Cartridge and Bag Design Criteria (as applicable)] [maximum differential pressure specified by the manufacturer].

2.2.2.12 Tank Requirements

******************************************************************************
NOTE: Further requirements for tanks specific to each filtration process are presented in the applicable paragraph.
******************************************************************************

2.2.2.12.1 Parameters

Provide specified tanks in accordance with the following general requirements, unless otherwise indicated. Provide each tank with flanged fittings for inlet, outlet, overflow and drain. Provide the size, elevation and orientation in accordance with construction drawings. Provide hold down lugs to anchor the tank to the base.

2.2.2.12.2 Tank Construction Materials

******************************************************************************
NOTE: Tank construction materials must be compatible with the materials to be handled. This requirement is applicable for all tanks (e.g., filter tanks, backwash tanks, chemical feed, polymer supply, etc.).
******************************************************************************

Provide tank construction material compatible with the material to be handled. Provide tanks constructed of polyethylene, polypropylene, and fiberglass reinforced plastic (FRP) that conform to applicable material and construction provisions of ASTM C582, ASTM D3299, and ASTM D4097. Provide tanks constructed of steel that conform with applicable material and construction provisions of AWWA D100. Fabricate carbon steel tanks with ASTM A283/A283M carbon steel Grade C or D and protected with [an appropriate interior coating system for the intended service] [vinyl ester epoxy] [_____] in accordance with applicable requirements in Section 09 90 00 PAINTS AND COATINGS. Fabricate stainless steel tanks of Type 304 stainless steel conforming to ASTM A167 with structural support conforming to ASTM A276/A276M. Provide exterior painting or coating in accordance with Paragraph PAINTING.

2.2.2.12.3 Site Glasses

Provide a [_____] mm inch diameter observation port in the tank wall. Locate the observation port [at the surface of the filter media] [at the media interface] [_____].

2.2.3 Media

Provide filter materials that conform to the requirements of AWWA B100. Perform a sieve analysis in accordance with ASTM C136/C136M and AWWA B100. Determine specific gravity in accordance with ASTM C127 for support media and ASTM C128 for [silica sand] [anthracite coal] [high-density media]. Submit characteristics of each filter media material.
2.2.3.1 High-Density Sand

Provide high-density sand composed from [garnet] [ilmenite] [_____] with a specific gravity of [3.6] [4.0] [4.2] [_____] , uniformity coefficient less than or equal to [_____] , and an effective size between [_____] and [_____] . Ensure ninety-five percent of the material is larger than or equal to [_____] .

2.2.3.2 Silica Sand

Provide silica sand with an effective size between [_____] and [_____] , uniformity coefficient less than or equal to [_____] , and a specific gravity of [2.55] [2.60] [2.65] [_____] . Ensure ninety-five percent of the material is larger than or equal to [_____] .

2.2.3.3 Anthracite Coal

Provide anthracite coal with a specific gravity of [1.45] [1.50] [1.55] [1.73] [_____] , uniformity coefficient of [_____] , and an effective size between [_____] and [_____] . Ensure ninety-five percent of the material is larger than or equal to [_____] . The anthracite media is required to be clean and free from thin or scaly pieces, with a calcium carbonate and magnesium carbonate hardness of [_____] .

2.2.3.4 Support Media

Provide support gravel consisting of hard, rounded stones with an average specific gravity of not less than [_____] . Ensure not more than [_____] percent by weight has a specific gravity of [_____] or less. Ensure gravel contains not more than [_____] percent by weight of thin, flat, or elongated pieces (pieces in which the largest dimension exceeds three times the smallest dimension), and is free from shale, mica, clay, sand, loam, and organic impurities of any kind.

2.2.4 Continuous Backwash Filtration System

2.2.4.1 Equipment Capacity

Provide each unit with a moving bed, continuous backwash [upflow] [downflow] granular media filter, having a capacity to filter [_____] L/minute gpm of water at the operating conditions identified in Paragraph Design Criteria.

2.2.4.2 Filter Tank

**************************************************************************
NOTE: Provide seismic details if a Government designer (either Government Agency Office or A/E) is the engineer of record, and show on the drawings. Delete the bracketed phrase, in the last sentence, if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.
**************************************************************************

Provide a cylindrical, sloped-bottom filter tank with the dimensions shown and constructed of [epoxy coated carbon steel] [type 304 stainless steel]
fiberglass reinforced plastic] [_____] construction, free from physical imperfections. Construct the tank with a minimum number of pieces and a minimum thickness of metal parts exposed to the water of [____]. Fit the tank with lifting lugs to facilitate handling and placement. Provide the filter tank with sufficient support to withstand wind speed in excess of [_____] km/hour mph and design for seismic forces in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC [as shown on the drawings].

2.2.4.3 Filter Media

Provide silica sand filter media at a total depth of [_____] m feet. Ensure all media conforms to the requirements of AWWA B100.

2.2.4.4 Influent Dosing System

******************************************************************************
NOTE: Each continuous backwash filter manufacturer has a particular influent dosing system. The influent dosing system should be specified only to the extent necessary to achieve the project objectives.
******************************************************************************

Provide an influent dosing system capable of delivering the influent stream uniformly over the entire media bed. Introduce the influent water to the [bottom] [top] of the filter tank. Construct all components of the dosing system of [stainless steel] [fiberglass reinforced plastic] [____].

2.2.4.5 Effluent Collection System

Collect effluent by [discharge of filtrate overflow over an effluent weir constructed of [stainless steel] [fiberglass reinforced plastic] [____] and placed and sized dimensionally as shown on the Construction Drawings.] [a filtrate line connected to a filtrate chamber consisting of a cylinder with a wedgewire screen periphery and hood. Construct the screen of stainless steel trapezoidal bars having an opening smaller than the finest media grain. Configure and size dimensionally the effluent collection system as shown on the Construction Drawings.] [____] discharge effluent through a [_____] mm inch diameter [stainless steel] [fiberglass reinforced] [_____] pipe.

2.2.4.6 Media Cleaning System

The media cleaning system consists of a sand lift, sand washer, sand distribution equipment and reject collection system.

2.2.4.6.1 Sand Lift

The sand lift consists of [Type 304] [Type 304L] stainless steel eductor pipe. The pipe mounts [externally] [internally] and fixed [by welding] [by means of a [_____] ANSI gasketed flange] [_____] to the filter vessel. Supply compressed air at [_____] to [_____] cubic meters cubic feet per minute at [_____] Pa psig to the eductor pipe. Provide a suction rate that is sufficient to result in internal recycling of the media once every [_____] hours.
NOTE: Delete cross-sectional area sizing requirements if the sand washer unit is external to the filter tank.

The sand washer consists of a chamber constructed of [Type 304 stainless steel] [acrylic] [fiberglass reinforced plastic] [______]. Provide a sloped floor to clear the sand from the bottom of the chamber. Equip the chamber with [______] baffles attached to its walls with a slope sufficient to cause the descending sand to strike the opposing chamber wall before dropping to the next level. Size the cross-sectional area to assure sufficient velocity of upflowing water to transport separated solids into the wash chamber and out the reject pipe.

Return the cleaned sand to the bed via a [sand distribution cylinder] [sand distribution cone] [return pipe] [washbox skirt] [______], constructed of [fiberglass reinforced plastic] [Type 304 stainless steel] [______] placed and sized as shown. Return the sand so that the media distributes evenly in a cone on top of the media bed.

The reject collection system consists of a stainless steel reject weir and a [______] diameter reject nozzle. Position the reject weir to achieve the desired differential head between the effluent water and the reject water. Design the reject collection system to allow no more than [2] [10] [20] [______] percent reject water.

Control filter operation by the liquid level in the filter tank using a proportional, displacer-type liquid level sensor. Provide an automatic effluent control [globe] [ball] [______] valve with a pneumatic positioner to regulate the degree of opening in response to a [______] to [______] pneumatic signal. Ensure that an increase in signal air pressure increases the degree of valve opening. Ensure the flow control system is self-contained and does not require manual adjustments.

The pneumatic controls consist of a pressure gauge and a flowmeter. Mount the pressure gauge on the panel with a [______] to [______] Pa psi range and a [______] mm inch face. Provide a flowmeter of the variable area type with a stainless steel indicator. Provide the meter with a metering valve, [______] mm inch scale, and a range of [______] to [______] cubic meters cubic feet per minute. Mount both devices on a hinged panel visible through a window in the control enclosure.

Supply a headloss switch to signal when the media bed is beginning to foul. Rate the switch contacts at [______] amps and connect to [an alarm] [process controls] [purge valve] [______].
2.2.4.8 Equipment Control Panel

The equipment manufacturer is required to furnish a control panel containing all necessary timers, contact switches, internal wiring, completely assembled and mounted in a NEMA [4] [4X] [12] [_____] enclosure. The control panel provides for [automatically starting and stopping pumps] [manual operation of the control valves] [_____]. Mount the control panel on the filter unit and provide electrical wiring and connections external to the unit.

2.2.4.9 Flowmeters

Equip influent and effluent lines with [kennison nozzle] [parshall flume] [shuntflo stream] [sonic] [_____] flowmeters.

2.2.5 Traveling Bridge Filter

2.2.5.1 Tank

Provide a tank [_____] wide by [_____] long by [_____] deep constructed of [_____] thick [mild steel] [carbon steel] [_____]. Construct the assembled tank to allow loading and unloading as a unit and equip with lifting lugs. Furnish integral supports so that the body of the tank, when installed, are [_____] mm inches above the concrete slab. Place the supports to allow for full inspection of the underside of the tank. Construct tank in accordance with Paragraph Tank Requirements and prepared in accordance with the requirements of Paragraph PAINTING and Paragraph MATERIALS PROTECTION.

2.2.5.2 Filter Bed

2.2.5.2.1 Cell Dividers

Provide a filter bed [_____] wide by [_____] long and consisting of a series of self-supporting lateral partitions (cell dividers) which divide the filter into a multitude of [_____] wide compartments. Arrange each compartment for connection to a separate backwash port. Fabricate the divider sheets of [glass fiber reinforced plastic binder] [Type 304 stainless steel] [_____] with a finished thickness of [_____]. Ensure all divider sheets are without voids and/or air pockets. Cell sheets are not allowed to twist, curve or bend.

2.2.5.2.2 Porous Plate

Provide a porous plate supporting underdrain constructed of [fused aluminum oxide] [polyethylene] [_____] to a thickness of [_____] that is factory installed. Provide for a maximum pore diameter of [_____] microns. Provide sheets with a porosity between [_____] and [_____] and a minimum flexural strength of [_____] Pa psi. The plate allows a flow of [_____] L gallons per minute per [_____] mm inch water column pressure. Seal the porous plate completely with a [polyurethane] [silicone] [_____] sealant during installation. Provide a sealant with, at a minimum, [_____] hardness and [_____] tensile strength that does not contain asbestos fibers.

2.2.5.3 Voids Distribution

Provide media with uniform voids distribution from coarse to fine in the direction of flow. Ensure all filter materials conform to the requirements of AWWA B100.
2.2.5.4 Rails

Provide [_____] kg lb ASCE rails with stainless steel splice plates and hardware mounted on the two main filter walls. Provide Type 304 stainless steel caps factory installed on each rail. Install and have a factory service engineer field adjust carriage rail stops fabricated from 300 Series stainless steel.

2.2.5.5 Carriage Mechanism

2.2.5.5.1 Carriage Frame

Traveling carriage or bridge systems contain and support the [positive drive mechanism] [pumps] [automatic backwash system] [washwater removal system] [motors] [limit switches] [______]. Fabricate the carriage frame of welded steel construction. Provide a separate maintenance platform.

2.2.5.5.2 Carriage Drive

The carriage drive unit consists of a gear reducer, sprockets, stainless steel drive shaft, a NEMA B design single speed [_____] watt TCFC motor for three phase, [_____] hertz, [_____] volt power supply, provided with a sealed conduit box. Design the drive unit so that a torque limiting device is not required and has a strength of [______]. Ensure all gear reducers are AGRA approved. Provide the drive shaft of sufficient size to adequately and safely withstand bending and torsional loads of starting and operating. Fully enclose all gearing in an oil-tight cast iron housing with the gears running in oil and anti-friction type bearings.

2.2.5.5.3 Carriage Wheels

Provide double flanged wheels of hardened Type 304 stainless steel. Provide self-aligning bearings with lubrication fittings. Provide wheels capable of compensating for minor misalignment of rails by sliding on the shaft. Do not use horizontally mounted wheels within the tank to align the carriage. Do not use caster-type wheels.

2.2.5.6 Automatic Backwash System

**************************************************************************
NOTE: If adjustable compression springs are not required, delete the second sentence.
**************************************************************************

Attach a fabricated backwash support frame to the traveling carriage on the effluent chamber side. Furnish adjustable stainless steel compression springs mounted between the carriage weldment and the backwash frame to allow adjustment of the backwash valve from outside the tank while the filter is in use. Mount a backwash shoe on the frame that can independently follow any irregularities of the matching backwash surface along the effluent ports. Construct the shoe of a material softer than the mating backwash surface (strip). Control the shoe flexible movement by using 300 series stainless steel springs. Attach the shoe to the piping by means of a flexible hose. Connect the piping to the backwash pump and include a throttle valve to achieve the correct pumping rate. Factory bolt the backwash surface (strip) to the effluent header by means of countersunk Type 304 stainless steel fasteners.
2.2.5.7 Washwater Removal System

Fabricate the washwater hood from [[304] [316L] stainless steel] [fiberglass reinforced plastic] [_____]_. Ensure the hood permits the uniform expansion of the filter media. Fabricate the hood width to be [_____] times the cell width. Install a [stainless steel] [PVC] [_____] manifold in the upper portion of the washwater hood and connect to the washwater pump. Provide the washwater hood with a [high density polyethylene] [304 stainless steel] [_____] raking device and a minimum of two vent pipes extending to [_____] above the overflow weir.

2.2.5.8 Washwater Launders

Construct the washwater launders from [_____] mm inch [A36 steel] [fiberglass reinforced plastic] [_____] with a [_____] mm inch depth and [_____] mm inch width as an integral part of the filter tank wall. Ensure both backwash and washwater pumping systems are capable of discharging into the launder. Provide a "V" notch weir plate to calibrate and balance the flow of the washwater pumping system.

2.2.5.9 Equipment Control

2.2.5.9.1 Automatic Controls

Furnish automatic controls for the filter operation as an integral part of the carriage mechanism. Mount the automatic controls on the end of the filter tank. Factory assemble the carriage mechanism and attaching components and test for mechanical and electrical operation prior to shipment.

2.2.5.9.2 Control Panel

Provide the control panel with a hinged door for access to the control equipment. Mount "Hand-off-auto" selector switches with indicating lights for each pump motor and the carriage motor on the front of the panel door. Provide a main disconnect switch to de-energize the control panel with a pendulum handle operator extending through the control panel door. Provide a ground fault protected convenience outlet. Fabricate the enclosure from NEMA [3R] [4X] [_____]_, [painted steel] [Type 300 series stainless steel] construction, factory wired and tested. The pump and carriage motor controls consisting of magnetic contactors with thermal overcurrent protective devices.

2.2.5.9.3 Motors

Include controls, a timing device, relays and magnetic motor starters for each pump motor and carriage motor in the panel. Actuate these motors automatically by a predetermined increase in hydraulic head, or by the timing device to control the interval between each cleaning cycle. [Terminate the cleaning cycle by a signal from the low water sensing electrode. Control the "off time" of the cleaning cycle by a reset timer with a range of 1 minute to 60 hours. When the timer times out, actuate the motors. During the "on time", de-energize the timer and reset for starting "off time" at the end of the cycle. Should high water occur "off time", start the motors by a relay actuated from the high water electrode signal, with a corresponding resetting of the timer.] [Continue the washing cycle, when activated, for one complete pass of the filter bed. Under normal operation, ensure the carriage does not come to rest other than at either end of the filter.]
2.2.5.9.4 Backwash Mechanism

Wire the control sequence for the backwash mechanism so the backwash mechanism stops at either end of the filter upon termination of the backwash cycle, which is also at the low operating probe signal. Install a low water shutoff probe to prevent pumping the filter tank below the minimum water level point. Furnish additional electrodes to protect the submersible pumps by giving a signal prior to reaching the overflow point.

2.2.5.9.5 Electrification System

Provide a stretch cable electrification system. Construct the cable of [_____] diameter stainless steel. Provide a stainless steel turnbuckle at one end for cable tension adjustment. Equip the electrification system with a number of non-friction nylon trolley carriers which support the electrical flat cable used to power the carriage. Connect the electrification system to a NEMA [4X] [3R] [_____] [Type 300 series stainless steel] [fiberglass reinforced plastic] equivalent junction box.

2.2.5.9.6 Factory Tests

Submit test reports of all factory tests specified in the above paragraphs and throughout this specification.

2.2.5.10 Auxiliary Equipment

2.2.5.10.1 Pumps

Power the backwash and washwater systems by a submersible pump suspended from the filter carriage. Any pumps other than dual submersible pumps are not acceptable. Furnish each pump capable of providing a minimum pumping rate of [_____] at a head of [_____]. Equip the pumps with stainless steel shafts, and abrasive-resistant impellers. Supply pumps in accordance with the requirements of Section 23 21 23 HYDRONIC PUMPS.

2.2.5.10.2 Weirs

Construct the influent and effluent weirs of sufficient length so that the flow does not exceed [_____] cubic feet per minute per weir length at the average daily flow. Install the influent weir [_____] mm inch above the effluent weir. Install the effluent weir [_____] mm inch above the top of the cell dividers. Fabricate the weirs of Type 304 stainless steel to be [_____] deep with [_____] mm inch adjustment. Mount the weirs on [_____] mm inch mild steel plate with Type 304 stainless steel hardware on [_____] mm inch centers sealed with a neoprene rubber gasket. Install the overflow weir a minimum of [_____] mm inch above the effluent weir. Fabricate the weir to be the full width of the filter. Do not allow the overflow to discharge into the backwash channel.

2.2.5.10.3 Backwash Channel and Washwater Trough

Fabricate the bottom surface of the washwater trough to be at least [_____] m feet above the overflow weir. Construct the backwash channel of [stainless steel] [fiberglass reinforced plastic] [_____] . Provide a tank drain in the backwash channel.
2.2.6 Pressure Filters

2.2.6.1 Pressure Filter Tank

**************************************************************************
NOTE: Delete the partition wall requirement if the vessel will not be divided into multiple filter cells.
**************************************************************************

Construct the pressure filter tank to have a diameter of [_____] m feet, a height of [_____] m feet, straight shell length of [_____] m feet and oriented [horizontally] [vertically]. Provide each vessel with [_____] partition wall to divide the vessel into [_____] filter cells. Construct the filter vessels of welded steel and test to withstand a hydrostatic pressure of [_____] Pa psi in excess of the working pressure of [_____] Pa psi. Design and fabricate the vessel in accordance with the ASME BPVC SEC VIII D1 and stamp and certify as such. Provide lifting lugs, supports, connections and appurtenances as detailed on the drawings. Construct the filter tank in accordance with Paragraph Tank Requirements and prepared in accordance with the requirements of Paragraph PAINTING and Paragraph MATERIALS PROTECTION.

2.2.6.2 Underdrain System

Furnish each filter with [pipe laterals with nozzles] [pipe laterals with orifices] [a porous plate] [_____] underdrain system. Provide underdrain of standard manufacturer's design particular to the supplied filter unit and furnished with the constructed package unit. Design the underdrain system to withstand all loads due to design pressures, design loading rates, and loads from the media to be installed in the filter tank.

2.2.6.3 Pressure Filters Media

Ensure the media provides uniform voids distribution from coarse to fine in the direction of flow. Ensure filter materials conform to the requirements of AWWA B100.

2.2.6.4 Distributor/Collector

Provide each filter with an influent distributor/backwash collector of the [central manifold] [lateral arm] [_____] type. Fabricate the influent distributor and waste water collector as an integral part of the filter tank. Construct the system from [steel] [aluminum] [fiberglass] [_____] of the manufacturer's standard design.

2.2.6.5 Surface Wash Agitators

**************************************************************************
NOTE: Since surface wash systems vary greatly, additional information regarding the strength, construction, method of connection and nozzle size and type may be required to adequately specify surface wash agitators. The designer is required to add this information and any other additional information necessary for adequate specification.
**************************************************************************

Provide each filter with a [straight line] [S-shaped] [_____], [single]
[double] arm [rotary] [fixed] agitator constructed of [stainless steel] [brass-bronze] [_____] components. Design the agitator to create the most efficient degree of agitation to all portions of the filter. Ensure each agitator is capable of discharging [_____] L cubic feet per minute of water at an operating pressure of [_____] Pa psi. Maximum increase in bed expansion from surface wash is [_____] percent.

2.2.6.6 Air Scour System

2.2.6.6.1 Air Wash Distribution

Provide each tank with a separate air wash distributor. The distributor consists of a [brass] [red brass] [____:], [____] mm inch air header with [____] mm inch slotted [brass] [red brass] laterals on approximately [____] mm inch center. [Introduce air to the media bed through the underdrain system.] [Introduce air at the top of the [gravel support layer] [underdrain].] A headloss up the wall of the filter of [_____] L per minute per square meter cubic feet per minute per square foot at [_____] mm inch of water column is acceptable.

2.2.6.6.2 Air Blower

Supply a positive displacement air blower for supplemental air wash. Provide the blower with a minimum capacity of [_____] L cubic feet per minute at [_____] Pa psi discharge pressure and supply in accordance with the requirements of Section 22 00 00 PLUMBING, GENERAL PURPOSE.

2.2.6.7 Equipment Control

2.2.6.7.1 Control Valves

Ensure the filter influent, backwash, waste, rinse, and surface wash valves allow for automatic operation of each filter unit.

2.2.6.7.2 Effluent Rate Controllers

Provide each filter with an effluent rate of flow controller consisting of a [flanged venturi tube] [butterfly valve] [electronic differential pressure transmitter] [____:].

2.2.6.7.3 Backwash Controller

Provide one backwash rate of flow controller consisting of a [flanged venturi tube] [butterfly valve] [electronic differential pressure transmitter] [____:].

2.2.6.8 Equipment Control Panel

Supply a control panel with a NEMA [4X] [12] [_____] enclosure to contain all necessary timers, lights, contact switches, internal wiring, etc. and associated equipment to allow for the completely automatic operation of the system. Provide the control panel for [automatically starting and stopping pumps] [manual operation of the control valves] [[manual] [automatic] [_____] backwash initiation] [____:]. Initiate backwash by [elapsed time] [high head loss] [high turbidity] [manual initiation] [____:]. Furnish the panel completely assembled, wired, and tested at the factory prior to shipment. Provide the panel with required switches for manual operation as required.
2.2.6.9 Backwash Tank

**************************************************************************
NOTE: The designer should consider the size of the facility in determining whether a separate specification section for the backwash tank is warranted or if the following paragraph is adequate.
**************************************************************************

Furnish the backwash tank with a capacity of [_____] to backwash the system at the manufacturer's recommended rate, pressure and frequency. Construct the tank in accordance with the requirements of Paragraph Tank Requirements.

2.2.7 Cartridge Filter

2.2.7.1 Equipment Capacity

Supply [_____] filtration units. [_____] units are required to be on-line, [_____] units are required to be on standby. On-line and standby units are required to have the capacity to treat the entire waste stream as specified in Paragraph Cartridge and Bag Design Criteria.

2.2.7.2 Filter Material

Filter material consists of [acetate] [acrylic] [glass] [nylon] [polyester] [polypropylene] [rayon] [saran] [cotton] [fluorocarbon] [teflon] [polyethylene] [_____] construction.

2.2.7.3 Cartridge Style

Cartridge style are to be [double open end industrial] [single open ended (SOE) flat closed end to fit housings with 020 O-ring posts] [SOE flat closed end with external 222 O-rings] [double open end with internal O-rings] [SOE flat closed end with external 226 O-rings] [SOE fin end with external 226 O-rings] [SOE fin end with external 222 O-rings] [SOE fin end with external 120 O-rings].

2.2.7.4 Gasket or O-Ring Material

Provide the gaskets or O-rings fabricated from [silicone] [buna-n] [white silicone] [white buna-n] [viton-a] [EPDM] [teflon].

2.2.7.5 Pore Size/Rating

Provide filter pore sizes of [0.1] [0.2] [0.45] [1] [3] [10] [30] [50] [75] [100] [200] [_____] microns.

2.2.7.6 Filter Cartridge Dimensions

The filter cartridge is required to be the standard length of 250 mm 10 inch. Provide the cartridge inside diameter of [_____] . Provide the cartridge outside diameter of [_____] .

2.2.7.7 Core Material

Provide cartridge core material made of [tinned steel] [polypropylene] [304 stainless steel] [316 stainless steel] [_____] .
2.2.7.8 Filter Housing

2.2.7.8.1 Material of Construction

**************************************************************************
** NOTE: Where flange options are specified, the designer must account for clearance of flanged fittings during installation. **
**************************************************************************

Construct the filter housing head, shell, and associated internal and external connections and internal and external hardware of [304 stainless steel] [316 stainless steel] [carbon steel] [teflon] [polypropylene] [fiberglass reinforced plastic] [acrylic]. Prefabricate the housing and deliver to the site in such a condition that the unit can be fastened in the location designated on the design drawings. Provide the filter housing with the following dimensions and inlet, outlet, and system control connections:

<table>
<thead>
<tr>
<th>Diameter</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overall Height</td>
<td>[_____]</td>
</tr>
<tr>
<td>Inlet/Outlet</td>
<td>[<em><strong><strong>] [NPT] [Flange] [ANSI 150 lb] raised face, [threaded flanges] [</strong></strong></em>]</td>
</tr>
<tr>
<td>Body/Sump Drain</td>
<td>[<em><strong><strong>] [NPT] [Flange] [</strong></strong></em>]</td>
</tr>
<tr>
<td>Vent</td>
<td>[<em><strong><strong>] [NPT] [Flange] [</strong></strong></em>]</td>
</tr>
<tr>
<td>Gauge</td>
<td>[<em><strong><strong>] [NPT] [Flange] [</strong></strong></em>]</td>
</tr>
</tbody>
</table>

2.2.7.8.2 Shell O-Ring Material

Provide filter housing shell O-ring material composed of [buna-n] [silicon] [neoprene] [viton-a] [ethylene] [propylene] [_____] material.

2.2.8 Bag Filter

2.2.8.1 Equipment Capacity

Supply [_____] filtration units. [_____] units are set to be on-line, [_____] are set to be standby. Each on-line and standby unit is required to have the capacity to treat the entire waste stream as specified in Paragraph Cartridge and Bag Design Criteria.

2.2.8.2 Filter Material

Provide filter material consisting of [acetate] [acrylic] [glass] [nylon] [polyester] [polypropylene] [rayon] [saran] [cotton] [fluorocarbon] [teflon] [polyethylene] [_____] construction.

2.2.8.3 Gasket Material

Provide a single gasket cover seal for each bag element. Provide [silicone] [buna-n] [white silicone] [white buna-n] [viton-a] [EPDM] [teflon] as material of construction.
2.2.8.4  Pore Size/Rating

Provide bag pore size of [0.1] [0.2] [0.45] [1] [3] [10] [30] [50] [75] [100] [200] [_____] microns.

2.2.8.5  Bag Surface Area

Provide bag surface area of [______].

2.2.8.6  Bag Support

Support material fabricated from [tinned steel] [polypropylene] [304 stainless steel] [316 stainless steel] [_____].

2.2.8.7  Filter Housing

2.2.8.7.1 Material of Construction

**************************************************************************

NOTE: Where flange options are specified, the designer must account for clearance of flanged fittings during installation.

**************************************************************************

Construct the filter housing head, shell, and associated internal and external connections and internal and external hardware of [304 stainless steel] [316 stainless steel] [carbon steel] [teflon] [polypropylene] [fiberglass reinforced plastic] [acrylic]. Prefabricate the housing and deliver to the site in such a condition that the unit can be fastened in the location designated on the design drawings. Provide filter housing having the following dimensions and inlet, outlet, and system control connections:

<table>
<thead>
<tr>
<th>Diameter</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overall Height</td>
<td>[_____]</td>
</tr>
<tr>
<td>Inlet/Outlet</td>
<td>[<em><strong><strong>] [NPT] [Flange] [ANSI 150 lb] raised face, [threaded flanges] [</strong></strong></em>]</td>
</tr>
<tr>
<td>Body/Sump Drain</td>
<td>[<em><strong><strong>] [NPT] [Flange] [</strong></strong></em>]</td>
</tr>
<tr>
<td>Vent</td>
<td>[<em><strong><strong>] [NPT] [Flange] [</strong></strong></em>]</td>
</tr>
<tr>
<td>Gauge</td>
<td>[<em><strong><strong>] [NPT] [Flange] [</strong></strong></em>]</td>
</tr>
</tbody>
</table>

2.2.8.7.2 Shell O-Ring Material

Provide filter housing shell O-ring material made of [buna-n] [silicon] [neoprene] [viton-a] [ethylene] [propylene] [_____] material.

2.2.9  Sample Ports

Locate two sample ports, at a minimum, on each unit; one to sample the influent and one to sample the effluent. Fabricate so the sample ports are readily accessible and of the manufacturer's standard design and placement.
2.2.10 Turbidimeter

**************************************************************************
NOTE: Delete the interface screening requirement if turbidity monitoring will not be performed at the media interface and for bag and cartridge filters.
**************************************************************************

Install a turbidimeter for automatically testing the turbidity of the water in the [influent line] [effluent line] [media interface] for each filter unit. Obtain [influent] [effluent] samples directly from the piping. Collect interface samples from a screen located within the media bed [___] mm [inch] above the media interface. House the turbidimeter in a NEMA [4x] [12] [___] enclosure located within [___] from the sensor. Turbidimeter is required to be programmable to read in NTU, FTU, and engineering units and provide a measurement range from [___] NTU to [___] NTU.

2.2.11 Drain Line

Locate a drain line to facilitate the removal of water from the filter tank. Ensure the drain line is readily accessible and of the manufacturer's standard design and placement.

2.2.12 Chemical Feed

Provide chemical feed systems in accordance with the requirements of Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.

2.2.13 Materials Protection

Treat the interior and exterior of fabricated ferrous metal components after fabrication to prevent corrosion. Sandblast the surfaces of the filter tanks and completely factory finish paint prior to shipment. Use insulating components such as gaskets, couplings, or bushing or dielectric-type which prevent corrosion of bimetallic-type contacts, at connections between dissimilar metals.

2.2.14 Access Walkways, Platforms, Ladders And Handrails

**************************************************************************
NOTE: Drawings should provide for the location of access walkways, platforms, ladders and handrails.
**************************************************************************

Provide walkways, platforms and ladders for access to equipment for operation and maintenance in accordance with Section 05 50 13 MISCELLANEOUS METAL FABRICATIONS. Walkways and platforms are required to be nonslip open grating fabricated from [galvanized steel] [aluminum] [fiberglass] [___]. Provide rigid handrails and kick-plates along the sides of walkways and platforms. Fabricate handrails from [galvanized steel] [aluminum] [___], to be [___] high, and to have two horizontal rails. Provide gates as required for access to equipment. Set the last rung of the ladder on top at the same level as the top of the tank. Ensure construction conforms to ASSP A1264.1 and ALI A14.3.
PART 3  EXECUTION

3.1  EXAMINATION

Verify all dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.

3.2  INSTALLATION

3.2.1  Fabrication

Any work not required to be performed in the field is to be performed in a factory under controlled conditions.

3.2.2  System Installation

Install the system such that proper wastewater flow through the unit and required effluent conditions as specified in Paragraphs Design Criteria or Cartridge and Bag Design Criteria (as applicable) is achieved and maintained. Perform all electrical work in accordance with the applicable requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.2.3  Painting

Perform painting in accordance with applicable requirements provided in Section 09 90 00 PAINTS AND COATINGS, and additional requirements provided herein.

3.2.3.1  Metal surfaces

Paint all metal surfaces except aluminum, bronze, brass, galvanized steel, and stainless steel. Surface prepare and paint in the shop or in the field as indicated. Finish manufactured items, such as motors and switchboards, with the manufacturer's standard finish.

3.2.3.2  Preparation and Application

Prepare ferrous metal surfaces in accordance with SSPC SP 6/NACE No.3 and paint with two or three coats of MIL-DTL-24441 epoxy paint to achieve a total dry film thickness of 150 microns (6 mils). Master Painter's Institute (MPI) #120 Epoxy, High Build, Self-Priming, Low Gloss, is an acceptable replacement to MIL-DTL-24441.

3.2.3.3  Coating Testing

Examine coating for flaws and tested for thickness. Measure the thickness of coatings wet and dry using a commercial film thickness gauge. Notify the Contracting Officer in advance of any painting. Do not apply additional coats until the previous coat has been approved. Repair or add additional coats at no additional cost to the government.

3.2.3.4  Coating Repair

If welding is required after application of the coating or if the coating is damaged in any way, prepare the affected area in compliance with SSPC SP 6/NACE No.3 and reapply the coating to that area. If holidays are detected or film thickness is insufficient, prepare the surface and apply additional coats in the affected area in compliance with the manufacturer's instructions.
3.2.4 Valve And Pipe Installation

3.2.4.1 Valves

Install valves as nearly as possible in the position shown in the Contractor provided Shop Drawing. Install and support valves in their respective position free from distortion and strain on appurtenances during handling and installation. Inspect material for defects in workmanship and material. Debris and foreign material from valve openings and seats; operate operating mechanisms to check their proper functioning, and check nuts and bolts for tightness. Valves and other equipment which do not operate easily or are otherwise defective are to be repaired or replaced at no additional cost.

3.2.4.2 Piping

Install piping to accurate lines and grades. Use temporary supports that are sufficiently rigid to prevent shifting or distortion of the pipe. Make provision for expansion where necessary. Pitch piping toward low points, and provide for draining at these low points. Use a sufficient number of unions or flanges allow for the dismantling of all water pipe, valves, and equipment. Install piping including cleaning, cutting, threading and jointing, in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

3.2.5 Filter Tank

3.2.5.1 Installation

Install the filter tank in accordance with the recommendations of the manufacturer and by workers experienced in the installation of this type of equipment. Check Components with corrosion protective coating and restore any damaged or abraded areas to the original or an equivalent coating.

3.2.5.2 Erection of Equipment

Properly align equipment. Turn unit to a vertical position and set in place. Set the anchor bolts in place and tighten the nuts against the shims. After the foundation alignments have been approved, bolt the stationary assembly securely in place. Check the alignment of equipment after securing to the foundations. Remove bracing and shipping from the bottom and/or interior of the tank. Connect piping as indicated. Close valves.

3.2.6 Underdrain

**************************************************************************
NOTE: Prefabricated package systems may have the underdrain installed. This paragraph should only be included where the underdrain is to be installed in the field.
**************************************************************************

Install the underdrain in accordance with approved shop drawings and requirements of the manufacturer, including instructions of the manufacturer's representative. Clean and wash the filter tank prior to installation of the underdrain. Replace broken or defective components. Do not modify the manufacturer-supplied underdrain. Following
installation, completely clean the underdrain system and wash free of loose materials and debris. Restore any damaged surfaces to the original or equivalent coating. Do not subject to internal water pressure or testing of the system for a minimum of [_____] days after completion of installation. Maintain the underdrain system in clean condition until installation of filter media.

3.2.7 Support Media

**************************************************************************
NOTE: The need for a supporting layer of gravel will depend on the selected underdrain. If the underdrain does not require a gravel layer, delete this paragraph. Also, delete this paragraph for traveling bridge, continuous backwash, cartridge and bag filters.
**************************************************************************

Provide gravel size and layer thickness as follows:

<table>
<thead>
<tr>
<th>Gravel Layer</th>
<th>Layer Thickness</th>
<th>Size Limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bottom</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Second</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Third</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Top layer</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Place the gravel by hand to avoid movement to the underdrain system and to ensure free passage of water from the underdrain. Complete each gravel layer before the next layer above is started. Remove gravel that becomes mixed and replace in layers as specified. Obtain the correct thickness of each layer as follows: Before the gravel is placed, mark the top of each layer on the side of the filter. Then level the top of each layer against a water surface held at the appropriate mark. No particles are allowed to be less than half submerged, and nowhere are places to be left where additional gravel can be placed without the particles extending more than 1/2 their volume above the water surface. Blackwash the support gravel after it has been placed, in accordance with AWWA B100.

3.2.8 Filter Media Installation

**************************************************************************
NOTE: Media installation may be performed by the manufacturer supplying the filter system for package treatment systems. This paragraph should be used only when the media will be installed in the field. Delete the freeboard requirement for filtration systems which do not require bed expansion during backwashing.
**************************************************************************

Install media under the supervision of the filter equipment supplier. Before installing the filter media, check all piping connections and ensure
filter components are in good condition and proper position. Place media to the depths [required by the manufacturer] [as follows:

<table>
<thead>
<tr>
<th>Media Type</th>
<th>Layer Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sand</td>
<td>[_____]</td>
</tr>
<tr>
<td>Anthracite</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Leave a minimum freeboard of [_____] between the top of the media and the top of the tank.

3.2.8.1 Media Layers

Complete each layer of media before the next layer above is started. Deposit each layer of media so as not to disturb the level surface of the layer below. Remove and replace media which is made dirty before or after placement.

3.2.8.2 Cleaning of Media

Backwash, scrape, and skim the filter media in accordance with AWWA B100 to remove excess fine material upon completion of placement of each layer. Perform the number of washes, the wash rate and duration of wash to achieve the specified gradation for each layer in accordance with the recommendations of the filter media supplier.

3.2.9 Identification Systems

3.2.9.1 Identification Tags

******************************************************************************
NOTE: Delete when identification tags are not considered necessary on small projects.
******************************************************************************

Install identification tags made of brass, engraved laminated plastic, or engraved anodized aluminum, indicating service and valve number on valves, except those valves installed on supplies at plumbing fixtures. Size tags to be 35 mm 1-3/8 inch minimum diameter, and stamp and engrave all markings. Provide black indentations, for reading clarity. Attach tags to valves with No. 12 AWG, copper wire, chrome-plated beaded chain, or plastic straps designed for that purpose.

3.2.9.2 Color Coding

******************************************************************************
NOTE: Color coding for piping identification as required by using agency will be developed and inserted in the Color Code Schedule in Section 09 90 00 PAINTS AND COATINGS.
******************************************************************************

Color code piping identification as specified in Section 09 90 00 PAINTS AND COATINGS.
3.2.10 Vent Line Installation

**************************************************************************
NOTE: This paragraph only applies to cartridge and bag filters.
**************************************************************************

Install the vent line according to the manufacturer's standard design and placement. Locate the vent line in position to reduce system operating pressure prior to replacement of filter elements.

3.3 FIELD QUALITY CONTROL

**************************************************************************
NOTE: If the Contractor will be responsible for obtaining water for filter acceptance testing, such requirement should be indicated in the following paragraph.
**************************************************************************

Perform field tests in the presence of the Contracting Officer and provide labor, equipment, and incidentals required for the tests. Provide for disposal of all waste residuals resulting from the tests. Notify the Contracting Officer [_____] days prior to the date and time for the acceptance tests. Rectify any deficiencies found and retest any work affected by such deficiencies.

3.3.1 Initial Operation

Following completion of installation of the treatment systems and after the Contractor and manufacturer's representative agree the system is ready for operation, operate the system over an initial operating period not to exceed [_____] days. Demonstrate proper operation of the equipment, including, but not limited to, the ability of the system to produce the minimum specified effluent requirements detailed in Paragraphs Design Criteria or Cartridge and Bag Design Criteria (as applicable), proper operation of the media cleaning equipment, and the control system ability to provide the correct operational logic to optimize the filtration process.

3.3.2 Acceptance Testing

Commence acceptance testing not sooner than [_____] days and not later than [_____] days following approval of the initial operation. Demonstrate within the acceptance the ability of the filtration system to meet the specified effluent requirements when operating at the design flow rate and demonstrate the ability of the control system to provide the correct operational logic to optimize the filtration process. Conduct the tests over [_____] days of continuous operation. Collect [_____] effluent samples during each [_____] hour period. Do not take samples less than [_____] hours nor more than [_____] hours apart. Analyze the samples for [turbidity] [total suspended solids] [effluent particle size] [_____] by standard methods as described in [______]. For the filtration system to qualify for process acceptance, the average value of each of the filtered water effluent parameters monitored during the continuous testing is required to not exceed the values of the specified parameters. In the event that the specified filtered water quality requirements are not met during the period that acceptance testing is conducted, the defective equipment or operation must be modified or replaced and the testing repeated. The schedule for retesting is subject to approval by the
Contracting Officer.

Submit test reports in booklet form showing field tests performed to adjust each component and to prove compliance with the specified performance criteria. Indicate the final position of controls in each test report.

3.4 CLOSEOUT ACTIVITIES

3.4.1 Posting Framed Instructions

Post frame instructions containing wiring and control diagrams under glass or in laminated plastic where directed. Frame condensed operating instructions, prepared in typed form, as specified above and post beside the diagrams. Submit proposed diagrams and instruction prior to posting. Post the framed instructions before acceptance testing of the system.

3.4.2 Field Training

Provide a field training course for designated operating and maintenance staff members. Provide training for a total period of [_____] hours of normal working time and start after the system is functionally complete but prior to final acceptance test. Cover all of the items contained in the Operating and Maintenance Instructions in the field training. Ensure the instructions include, but are not necessarily limited to the following:

a. System layout showing piping, valves and controls and installation requirements.

b. Approved wiring, logic, and control diagrams prepared in accordance with ANSI/ISA 5.1 including a drawing index, legend and symbols list, and abbreviations and identifiers.

c. A control sequence describing startup, operation, and shutdown; including the functional and operational description of the control system covering the procedures for programming, operation, startup, shut-down, and calibration.

d. Operating and maintenance instructions for each piece of equipment, including checkout, troubleshooting, and servicing.

e. Manufacturer's bulletins, cut sheets and descriptive data, parts list, and recommended spare parts.

3.4.3 Operating And Maintenance Instructions

Provide operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include the manufacturer's name, model number, service manual, parts list, and brief description of equipment and their basic operating features in the instructions. Also, provide maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and trouble shooting guides. Include simplified diagrams for the system as installed. Show valves numbered and tagged in the manual and provide a schematic indicating the number of each valve. Permanently bind each set and provide with a hard cover. Inscribe the following identification on the covers: the words "OPERATING AND MAINTENANCE INSTRUCTIONS," name and location of the facility, name of the Contractor, and contract number.

NOTE: This guide specification covers the requirements for ultraviolet (UV) disinfection equipment for treatment of wastewater.

Adhere to [UFC 1-300-02](#) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](#).

PART 1 GENERAL

NOTE: This specification should be used to allow the Contractor to install proven "off-the-shelf" units supplied by reputable vendors. This guide specification includes technical requirements for ultraviolet disinfection equipment and controls. This specification will not be used for disinfection of water or industrial wastes.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide.
specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)

ANSI C82.4 (2017) Lamp Ballasts - Ballasts for High-Intensity-Discharge and Low-Pressure Sodium Lamps

NEMA 250 (2020) Enclosures for Electrical Equipment (1000 Volts Maximum)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2020; ERTA 20-1 2020; ERTA 20-2 2020; TIA 20-1; TIA 20-2; TIA 20-3; TIA 20-4) National Electrical Code

U.S. DEPARTMENT OF DEFENSE (DOD)

UFC 3-240-01 (2020; with Change 2, 2021) Wastewater Collection and Treatment

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or
complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Layout; G[, [______]]

SD-03 Product Data
   Framed Instructions

SD-10 Operation and Maintenance Data

Instruction Plan; G[, [_____]]

Operating and Maintenance Manuals; G[, [_____]]

[Six] [_____] complete [hard] [optical disc] copies of operating instructions and maintenance instructions. Each manual must have an index listing the contents and tab separators between sections. [Manuals must be bound in sturdy three-ring, loose-leaf binders.]

1.3 ADMINISTRATIVE REQUIREMENT

1.3.1 Preconstruction Conference

A preconstruction conference is required and all subcontractors, suppliers, and UV equipment manufacturer are required to attend.

1.4 MAINTENANCE MATERIAL SUBMITTAL

1.4.1 Extra Materials

Supply all new spare parts that are exact replacements and separately packaged. Submit the parts list including recommended spare parts and maintenance supplies with current unit prices and source of supply for each item of operable equipment. Include parts recommended by the manufacturer to be replaced after 1 and 3 years of service. List special tools, instruments, accessories, and special lifting and handling devices required for periodic maintenance, repair, adjustment, and calibration.

Include with the package bill of materials with quantity, item description, and part number. Furnish the following spare parts and safety equipment:

a. One completely assembled lamp module.
b. Ten percent of the total number of the system lamps.
c. Five percent of the total number of the system ballasts.
d. Ten percent of the total number of the system lamp sleeves.
e. Ten sets of lamp end seals.
f. Ten sets of lamp socket connectors.
g. [Four] [_____] personnel safety shields which block out UV wavelengths between 200 and 400 nm.

1.5 QUALITY ASSURANCE

1.5.1 Qualifications

1.5.1.1 Contractor Qualifications

Possess a minimum of [2] [_____] years of experience in the construction of water, wastewater, and/or industrial wastewater facilities.

1.5.1.2 Manufacturer's Qualifications

Manufacturer is required to demonstrate experience in the production of substantially similar equipment, and is required to show evidence of
satisfactory operation of identical equipment to that proposed in at least 3 installations for a period not less than one year disinfecting secondary effluent with similar effluent flow and characteristics to the treatment plant in this contract.

1.5.1.3 Equipment Parts

Manufactured parts to standard sizes and gauges so that repair parts furnished at any time can be installed in the field. Ensure that like parts of duplicate units are fully interchangeable.

1.6 DELIVERY, STORAGE, AND HANDLING

Protect from damage, deterioration, weather, excessive humidity, excessive temperature variation, dirt, dust, and contaminants equipment and materials delivered, handled, and placed in storage, from the time of shipment until installation is completed and the equipment and materials are ready for operation. Mark and store equipment to permit easy identification and inspection. Tag each item of the equipment or mark it as identified in the delivery schedule or on the shop drawings. Include with each shipment complete packing lists and bills of materials.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide an ultraviolet (UV) disinfection system complete and operational with controls and accessories as shown and as specified. Provide equipment suitable for outdoor open channel, gravity flow installation including, but not limited to, the following components, and appurtenances necessary for the interconnection of components, in the quantities required:

a. UV lamp module with support rack and bracket.
b. UV system instrumentation, controls, and power distribution.
c. Wireway and interconnecting cables.
d. Water level control device.
e. UV intensity monitoring system.
f. Elapsed time meter.
g. Cleaning system.
h. Spare parts.

2.1.1 Operation of Existing Facility

**************************************************************************
NOTE: Include the following paragraph only where UV disinfection system is replacing another disinfection system at the existing wastewater treatment plant.
**************************************************************************

Maintain the continuous flow of wastewater and disinfection until the new system is tested, approved and fully operational. No discharge of untreated wastewater, reduction in existing hydraulic capacity or organic treatment capacity is allowed.

2.1.2 Design Conditions

**************************************************************************
NOTE: Determine or estimate plant flows, total
**************************************************************************
suspended solids (TSS), UV transmittance, and influent microorganism count. A value for UV transmittance must be determined from an independent laboratory. Occasionally, a wastewater quality may be encountered which exceeds the experience of design engineers (e.g. due to an unfamiliar process design, a familiar but poorly operated process, an under-designed plant, an unusual influent to the treatment plant, etc.). In these cases, a pilot study should be conducted to provide information required for design. Channels must be designed for peak design flow.

The reports listed below in subparagraphs a. thru f. need to be tailored by the designer to meet state standards where the process is being permitted.

Ultraviolet equipment are required to disinfect wastewater effluent with the following characteristics:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Initial</th>
<th>Design</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peak flow, cubic meter per sec Mgd</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Average flow, cu. meter/sec Mgd</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Minimum flow, cu. meter/sec Mgd</td>
<td>[_____]</td>
<td></td>
</tr>
<tr>
<td>Total suspended solids (TSS), mg/L</td>
<td>[_____]</td>
<td></td>
</tr>
<tr>
<td>Average turbidity, NTU</td>
<td>[_____]</td>
<td></td>
</tr>
<tr>
<td>UV transmittance at 253.7 nanometers (nm), through a 1 cm cell</td>
<td>[_____]</td>
<td></td>
</tr>
<tr>
<td>Influent [fecal coliform], MPN/100 mL</td>
<td>[_____]</td>
<td></td>
</tr>
</tbody>
</table>

Submit the following reports confirming compliance with the design conditions characteristics:

a. Results of tests done by an independent testing laboratory showing effective hydraulic design of the reactor, including headloss calculations.

b. Documentation showing that the type of ballast required for the particular lamp supplied for the system have performed successfully for a period of not less than one year.

c. Hydraulic calculations demonstrating compliance with the specified hydraulic characteristics.

d. Residence time distribution (RTD) data plotted as concentration versus time, and as cumulative tracer passed versus time in accordance with UFC 3-240-01. The Contracting Officer reserves the right to require separate tests to be conducted on a system identical in design to the
proposed system if the hydraulic test data submitted by the manufacturer is determined to be unacceptable.

e. In the test unit used in the development of the RTD curves, use a number of lamps based on achieving the stated treatment adjectives for a worst case realistic influent scenario for the system. Utilize the same lamps, electronic lamp controller, ballast and automatic level controller as that proposed in the full scale system.

2.1.3 Performance Requirements

**************************************************************************

NOTE: Typical values for nominal average intensity, UV density and theoretical retention time are 5100 microwatts per square cm, 3.35 watts per liter, and 7 seconds, respectively. Nominal average intensity will vary between manufacturers. Density depends upon the design of the particular UV system and the number of lamp banks. Retention time depends upon the channel geometry and number of lamp banks. Insert values per specified equipment manufacturer's calculations.

**************************************************************************

2.1.3.1 Inactivation

**************************************************************************

NOTE: Predominate effluent criteria used in performance requirements for UV systems is for whole body contact: 200 most probable number (MPN)/100 ml of fecal coliforms, with a maximum 7-day average of 400 MPN/100 ml. Some states have different microbe and disinfection standards; therefore, determine the site specific disinfection requirements from the state permitting authority.

**************************************************************************

Provide a system capable of reducing the influent [fecal coliform] [_____] count to [200 MPN/100 mL] [_____] on a 30 day geometric mean of daily samples.

2.1.3.2 UV Dose

**************************************************************************

NOTE: Conventional units for UV dosage are microwatt-seconds per square cm. The standard dosage of UV radiation is determined by the effluent; unfiltered effluent may require a 30,000 dosage while a dosage of 16,000 to 20,000 is more typical of filtered effluent to achieve a disinfection safety factor of 2.0. Insert value per equipment manufacturer's recommendation.

**************************************************************************

Use a UV dosage not less than [_____] microwatt-seconds per square cm based on peak design flow conditions, lamp output at 65 percent of its initial level after 1 year (8750 hours) of lamp operation without fouling on the lamp sleeves, and minimum UV transmittance as stated in paragraph Design Conditions.
2.1.3.3 Nominal Average Intensity

Ensure the nominal average intensity within the channel is not less than [_____] microwatts per square cm at a transmittance of 70 percent after 100 hour burn-in of lamps and with no fouling on the lamp sleeves.

2.1.3.4 UV Density

Ensure the UV density of the channel is not less than that required in the test runs, lab analysis, channel configuration, and residence times.

2.1.3.5 Retention Time

Ensure that the actual retention time (t) of the effluent within the system determined by hydraulic analysis is not less than 0.9 times the theoretical retention time (T). Ensure the theoretical retention time (T) is not less than [_____] seconds at the peak design flowrate.

2.1.3.6 Plug Flow

The flow characteristics through the system are expected to closely simulate ideal plug flow conditions under the full operating flow range. The Morrill Dispersion Index, defined as the time required for 90 percent of the salt and dye traces to pass, divided by the time required for 10 percent to pass, is to be less than 2.0. The ratio of the time required for 50 percent of tracer to pass to the mean residence time is required to have a value between 0.9 and 1.1. The ratio of the time of initial tracer appearance to the theoretical residence time is required to have a value greater than 0.5.

2.1.3.7 Dispersion

Ensure the dispersion coefficient, which accounts for the deviation of the channel's hydraulic behavior from that of perfect plug flow, is less than 100 square cm per second. Ensure the dispersion number (ratio of the dispersion coefficient to the product of flow velocity and channel length) is less than 0.1.

2.1.3.8 Turbulence

Flow through the system is required to be turbulent with a Reynolds Number greater than 4,000 at average flow.

2.1.3.9 Channel Volume

Make full use of the channel volume throughout the flow range. Ensure the ratio of the mean residence time (theta) to theoretical residence time (T) is greater than 0.9.

2.1.3.10 Headloss

Ensure the headloss caused by each bank of horizontal lamp modules is such that at the peak flow rate no lamp is exposed to the atmosphere and the maximum depth over the uppermost lamp sleeves is 40 mm 1.5 inch. The headloss through vertical lamp banks is not allowed to exceed 150 mm 6 inch.
2.1.3.11 Cross Sectional Area

Ensure the cross-sectional area occupied by the lamp module frame at the entrance and exit of each bank is no greater than 35 percent of the cross-sectional area occupied by the effluent in the channel.

2.1.3.12 Aspect Ratio

Provide a minimum aspect ratio (ratio of channel length to hydraulic radius) of 15 per lamp bank.

2.2 EQUIPMENT

2.2.1 UV System Equipment

Submit product data to include: design calculations relevant to the type of system proposed indicating removal performance including dose; nominal average intensity within each reactor; UV density; theoretical retention time of effluent within the system; dispersion coefficient; maximum headloss caused by each bank of lamp modules; lamp module cross-sectional area; aspect ratio of lamp bank; installation list; manufacturer's illustrations; and a statement by the equipment manufacturer listing any exception to or deviations from the contract drawings and specifications.

2.2.1.1 Layout

The physical layout of the system shown is based on equipment manufactured by [_____]. Submit drawings showing fabrication methods, assembly, accessories, installation details and point-to-point wiring diagrams; instrumentation and controls; equipment; dimensions; make and model; materials of construction and installation instructions. In the drawing, indicate clearances required for maintenance and operation and include complete wiring and schematic diagrams, equipment layout, dimensions, templates and directions for the installation of anchor bolts and other anchorages and any other details required to demonstrate that the system has been coordinated and will properly function as a unit.

If UV equipment proposed is sufficiently different than that shown, submit detailed, modified layout drawings and descriptions for approval by the Contracting Officer within 5 working days following Notice to Proceed. Also obtain approval, if applicable, from the State permitting authority for the sufficiently different equipment and layout proposed within [15] [_____] working days following Notice to Proceed.

2.2.1.2 Equipment Construction

2.2.1.2.1 UV Lamp Module

a. Module consists of lamps with each lamp placed in an individual sleeve. Module is required to be capable of being withdrawn as a unit and replaced without interrupting operation of any other module, to be self-supporting in the channel, and to be capable of supporting a weight of 90 kg 200 pounds.

b. Horizontal lamp module a have lamps in sleeves sealed and supported in a NEMA 6P stainless steel frame. Electrical wires which carry power to the lamps and ballasts are required to be completely enclosed in the frame and isolated from the wastewater. The frame is required to be capable of protecting lamps and sleeves from foreign material or debris.
within the channel.

c. Vertically oriented modules have lamps installed in a weatherproof, watertight enclosure. Fit sleeve to the enclosure using compression fitting and neoprene gasket. Wiring is required to include numbered terminal strips which correspond to the numbering in the main power panel. Fit lamp enclosure with a waterproof wiring connector to allow the enclosure to be disconnected and removed from the channel. Install lamp connection above the waterline or ensure it is waterproof. Provide a safety interlock switch to turn off power to the lamps when module enclosure covers are opened. Provide a Class B, ground fault circuit interrupter for each enclosure to turn off power if water enters the enclosure. Arrange lamps so that they can be replaced without disassembling or removing lamp module.

d. Ensure system allows for complete system shutdown or by-pass.

e. Ensure system allows for continuous disinfection while replacing lamps, sleeves, and ballasts; and while cleaning the lamp sleeves.

f. Individual lamp modules weighing 25 kg 55 pounds or less are required to be removable without requiring mechanical lifting devices. Systems with individual lamp modules weighing over 25 kg 55 pounds are to be provided with a mechanical lifting device as [specified] [indicated].

2.2.1.2.2 UV Lamps

a. Supply low-pressure mercury vapor type lamps of the hot-cathode, instant-start design in which the coiled filamentary cathodes are heated by the arc current. Provide a clamped design filament that withstands shock and vibration.

b. Ensure lamps have the following characteristics:

(1) 90 percent of UV radiation within the wavelengths of 233.7 to 273.7 nm.

(2) Produce a minimum UV intensity of 190 microwatts per square cm at a distance of 1 meter.

(3) Maximum power input of 65 watts (not including ballast losses).

(4) Have a minimum arc length of 1475 mm 58 inches.

(5) Rated to produce zero levels of ozone.

(6) Have a minimum UV output of 26.7 watts at 100 hours.

c. Provide a lamp base made of metal and ceramic, resistant to UV light and ozone. Ensure lamp tube is capable of transmitting 90 percent of the radiation produced therein.

d. Ensure that changing lamps does not require removal of the sleeve from the lamp module frame. Ensure lamp ballasts are capable of being replaced by plant operating personnel.

e. Ensure system uses lamps available from at least 2 currently active lamp manufacturers without modifications to the system.
2.2.1.2.3 UV Lamp Sleeve

a. Provide a sleeve consisting of clear fused quartz circular tubing rated for transmittance of 89 percent or more and not be subject to solarization over its life. Provide a nominal wall thickness between 0.8 and 2.09 mm (20 and 53 inch).

b. Configure sleeve such that one end of each sleeve is closed and the other end is sealed by a lamp end seal and compressed O-ring. The closed end of the sleeve is required to be held in place by means of a retaining O-ring. No part of the sleeve is allowed to come in contact with any steel in the frame.

2.2.1.2.4 Lamp End Seal and Lamp Holder

a. Configure sleeve so the open end of the lamp sleeve is sealed by means of a stainless steel nut which compresses an external sleeve O-ring seal. Ensure the sleeve unit has a surface which allows a positive hand grip for tightening without the use of any tools for removal.

b. Hold the lamp holder in place in such a way as to isolate and seal the lamp from the module frame and other lamps in the module. Configure the lamp sleeve such that in the event of a fracture, the seal prevents moisture from entering the module frame and the electrical connections to other lamps in the module. Incorporate UV resistant materials into the lamp holder to prevent lamp sleeve from touching steel.

2.2.1.2.5 UV Lamp Module Support Rack

Fabricate rack from stainless steel construction that does not allow UV light to radiate above the channel when the lamp modules are energized and fully immersed in the effluent.

2.2.1.3 Lamp Array Configuration

2.2.1.3.1 Horizontal

Arrange horizontal lamp configurations in a uniform array with lamps parallel to each other and to the flow. Space lamps evenly in horizontal and vertical rows with centerline spacings equal in both directions. Pattern the single array to be continuous and symmetrical throughout each reactor.

2.2.1.3.2 Vertical

Configure vertical lamps in a staggered uniform array with lamps parallel to each other, but perpendicular to the flow. Space lamps evenly with alternating rows offset by one-half the uniform centerline spacing.

2.2.1.4 Water Level Control

**************************************************************************
NOTE: If more than 1 channel is required, there needs to be a positive method of flow distribution to each channel. The downstream level control device is designed to build-up negligible head at peak flow rates and may not distribute flow equally to all channels. The equipment manufacturer should be consulted for recommended methods of flow.

SECTION 46 66 56 Page 13
distribution in multiple channels.

**Automatic Slide/Sluice Gates:** These gates are required, two per channel, if the UV system is to operate in an automatic mode for multiple channel configurations. These gates are not necessarily supplied by the UV equipment manufacturer. Additionally, it is the gate manufacturer's responsibility to properly install and set up each gate, such that a gate closed limit switch, one per gate, is transmitted to the UV Control Center. Each gate must be able to receive one opening and one closing signal from dry 10 amp contacts located in the Control Center. To insure disinfection under all conditions, gate interlocking, both mechanical and electrical, is required to prevent all gates from being closed at any given time. These interlocks are the responsibility of the gate manufacturer.

During automatic operation, if channels are to be placed in and out of service, accommodations should be made to drain the channel when the channel is not in service. Channels, when out of service, must be completely isolated and not allow any leakage through slide gates or valves to enter final effluent.

**************************************************************************

a. Place a level control device [at the discharge end] [both ends] of each channel. Level control device is required to maintain constant channel water level within tolerances required to keep lamps submerged and prevent excessive water layer over the top lamps.

b. [Pivot the automatic level controller above the effluent water surface so that each unit opens across the width of the channel. Adjust counterweights using counterbalance weight at startup for the full flow range. Counterweights are not to require adjustment after initial setting. Use stainless steel, Lexan, Delrin bearings, counterweights of carbon steel with galvanized finish and corrosion resistant seal of neoprene or other suitable elastomer.] [Use stainless steel for fixed weirs.] [______].

c. Install a water level sensor within the channel to provide an alarm indication and/or automatic system shutdown in the event the water level drop below the uppermost part of the top row of horizontal lamps. Provide alarm contacts for remote annunciation.

2.2.2 Electrical

2.2.2.1 Parameters

a. Divide the system into the proper number of parallel electrical subsystems for the peak design flow.

b. Power each electrical subsystem from a distribution center and include ground fault circuit detection, circuit protection, modules, and interconnecting cables.
c. Supply one power panel for each module and prewire by the manufacturer, except for the final connection of the individual modules to the power panel.

d. Provide standard ground fault detection with the UV equipment manufacturer.

e. House control and monitoring components and power supply in NEMA enclosures. Seal internal components from the environment. House system electronics to be used in an interior environment in enclosures conforming to NEMA 250 Type 12. House system electronics to be used in an exterior and corrosive environment, as defined in NEMA 250, in enclosures conforming to NEMA 250, Type 4X.

f. Provide sufficient cooling to ballasts. Ensure magnetic ballasts have a minimum allowable air flow per ballast of 0.014 cu. m/s 30 cfm.

g. Protect wiring and electrical connections against moisture to prevent electrical shorts or failure. Ensure electrical installation and materials conform to NFPA 70. Completely wired the unit requiring only an external connection for a single external power supply and remote control.

h. Ensure controls and designations conform to NEMA ICS 1.

2.2.2.2 Interconnect Cables

a. Multiconductor unshielded cable suitable for outdoor installation.

b. Thermoplastic rubber insulation with operating range of minus 60 to 125 degrees C minus 76 to 52 degrees F with low temperature flexibility and flame retardants.

c. UV stabilized jacketing resistant to oils, chemicals, fuels, solvents, and to mechanical abuse and abrasion.

d. Cable supplied by the equipment manufacturer in sufficient length and number for a complete system.

e. Cable of a modular repairable type to allow for field replacement and repair of its components by plant operators.

2.2.2.3 Connectors and Receptors

Waterproof Type S.O. cable connectors for in-line connection. Design to allow fast and easy positive coupling and uncoupling. Mount connector out of possible flood-prone environments. Use "snap-on" style connectors having no threads that allow for visual confirmation that the connection is locked in place.

2.2.2.4 Ballasts

Supply ballasts that conform to ANSI C82.4; are coordinated to the ballast supplies; are rated for [120] [208] [240] [277] [480] [volts] [the voltage indicated]; and have a power factor of not less than 90 percent at a crest factor of 2.0 or less, and a voltage range of not less than plus or minus 10 percent. Ensure ballasts are suitable for operating at [minus 15] [minus 30] [minus 40] degrees C [5] [minus 22] [minus 40] degrees F and above. Locate and/or enclose magnetic ballasts in an environment not
susceptible to the effects of heat, cold and moisture. Use modular design ballasts allowing for quick disconnect and replacement by operators.

2.2.2.5 Cableway

If required by the equipment manufacturer, install cable in weatherproof and submersible cableway. Fabricate the cableway of stainless steel, 1.98 or 1.59 mm thick 14 or 16 gauge. Ensure cableway is gasketed and completely watertight under a submerged condition.

2.2.2.6 Instrumentation and System Controls

2.2.2.6.1 Controls

Provide equipment of the fully automatic program control type capable of receiving standard 4-20 mA control signals from the plant effluent flowmeter. Control of 2 or more banks of modules by turning lamp banks on and off in proportion to flow variations. Provide controls capable of continuously adjusting the UV intensity automatically in proportion to wastewater flow. Provide controls that require no manual attention other than adjustment of the required UV intensity.

2.2.2.6.2 Lamp Status Indicators

a. Provide indicators that indicate the status whether ON/OFF of each lamp in the module being powered.

b. Provide indicators to indicate the status "POWER ON", only, in each module.

c. Ensure the lamp monitoring system indicates the geometric location of each individual lamp and operating status of each lamp by means of a neon lamp or alpha-numeric data display (LED or LCD). Upon lamp failure, illuminate the corresponding lamp and activate contact closure for remote alarm annunciation. Provide contact closure for remote annunciation to indicate lamp module failure due to ground fault interruption.

2.2.2.6.3 UV Intensity Detection System

a. Provide a submersible UV sensor to continuously sense the UV intensity produced in each bank of lamp modules. Ensure the sensor measure only the germicidal portion of the light emitted by the lamps within the channel between 254.5 and 255.0 nm. Display the UV intensity on the intensity meter. Locate each UV intensity probe at a point of minimum expected intensity within the lamp array. Mount the probe to any lamp in the array using a clip-on and self-aligning mount to assure the proper spacing from the tube without necessity of hand tools. Factory calibrate the probe with verification in the field prior to startup. The UV equipment manufacturer is required to provide justification for the sensor location.

b. Provide one UV intensity meter per bank of lamp modules. The meter is required to indicate safe intensity, low intensity, and unsafe intensity by means of color codes on the meter face, or have a 0 to 100 percent scale. Clearly label the UV intensity meter and locate on the remote control panel.

c. Provide a nonresettable elapsed time meter per bank of lamp modules.
Ensure the meter records hours of UV bank operation from 0 to 99,999 hours.

d. Provide one hand/off/auto switch for each UV bank and for each automatic slide gate shown and specified.

e. Time delay alarms to prevent nuisance alarms.

2.2.2.6.4 Minor Alarms

Provide minor alarms and dry contacts to indicate that maintenance attention is required. Include the following minor alarms:

a. Low warning UV intensity.
b. Individual lamp failure.

2.2.2.6.5 Major Alarms

Provide major alarms and dry contacts to indicate an extreme condition in which the disinfection performance may be jeopardized. Include the following major alarms:

a. Low UV intensity.
b. Lamp failure of 2 or more adjacent lamps.
c. Multiple lamp failure.
d. Module failure.

2.2.2.6.6 Flow Pacing

**************************************************************************
NOTE: If the system consists of 2 or more banks of lamps, the system can be flow-paced using a signal from an effluent flow monitoring device in the plant.
**************************************************************************

a. Provide a flow pacing system to turn the UV banks on and off in relationship to the signal received from the plant effluent flowmeter. Ensure the flow pacing sequence is as recommended by the UV equipment manufacturer. Where lamp dimming is used, provide a controller to allow plant operator to ratio the flow to UV dosage and UV intensity. Where on/off control is used, ensure the system allows the operator to vary the flowrate setting and allow the operator the option to operate individual banks in either the manual or automatic mode. Provide logic and time delays to regulate the UV bank ON/OFF cycle to prevent excessive cycling on both startup and shutdown of the UV bank. Multicycle lamps may be specified in applications which demand up to 100,000 annual cycles.

b. The normal mode of operation places each effluent channel continuously in service.

2.2.3 Cleaning System

2.2.3.1 General Requirements

Provide cleaning equipment and cleaning solutions. Provide a cleaning system that is [a permanent in-channel installation] [an out-of-channel installation] [a portable cleaning installation with basin] for cleaning individual lamp sleeves or entire lamp modules.
2.2.3.2 Cleaning Tank

Fabricate portable cleaning tank of stainless steel and equip with air blower (compressor), lamp module rack, hose connections and drains. Ensure tank holds at least [3 horizontal modules] [1 vertical module] and is equipped with hard rubber casters. Provide sealed cover for tank to prevent spilling. Equip unit with disconnect switch, a grounded plug and 3 m 10 feet of outdoor cable.

2.2.3.3 Cleaning Rack

Provide a cleaning rack mounted above the portable cleaning tank to hold one horizontal module above the cleaning liquid for hand wiping of the sleeves.

2.2.3.4 Cleaning Fluid

Provide sleeve conditioner and cleaning solution 12 months of normal operation. Supply conditioner and cleaning solution in containers not greater than 20 L 5 gallon capacity.

2.3 MATERIALS

All metal in contact with plant effluent is required to be either Type 316 or Type 304 stainless steel, passivated. Wiring which may be exposed to UV light is required to be a material that resists degradation by UV light. Material exposed to UV light is required to be stainless steel, passivated; quartz; polytetrafluoroethylene or other UV resistant material.

2.3.1 Standard Products

Provide material and equipment which are the standard product of a manufacturer regularly engaged in the manufacture of the product and which essentially duplicate equipment that has been in satisfactory operation for at least 2 years prior to bid opening. Submit written evidence that equipment and accessories are products of a qualified and experienced manufacturer. Ensure equipment is supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.3.2 Nameplates

Provide major equipment items with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

2.4 ANCHOR BOLTS

Provide stainless steel anchor bolts of the size required and with ample strength for the purpose intended by the Contractor. Embed anchor bolts directly during placement of concrete at depths sufficient to account for potential concrete spalling or deterioration.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify dimensions in
the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Perform installation in accordance with the drawings, shop drawings, and manufacturer's instructions and recommendations.

3.3 FIELD QUALITY CONTROL

3.3.1 Operating Test

After Contractor and Contracting Officer have mutually agreed that the equipment installation is complete and ready for continuous operation, conduct an operating test of the equipment and controls in the presence of the Contracting Officer to demonstrate satisfactory operation.

Include in the book form test report all field tests performed to adjust each component and field tests conducted to prove compliance with the specified performance criteria. Ensure the test report indicates the final position of controls.

3.3.2 Performance Testing

a. Begin performance testing after the UV equipment has been installed and field tested. Collect samples at times when the flow through the plant is at or near the peak flow rating from one section of the channel. Where multiple systems are supplied, the plant flow is required to be at or near the peak flow rating of at least one system or one section of the UV system.

b. Analyze the samples collected for the following, using standard testing methods or procedures:

(1) [Fecal coliform] [_____] in MPN/100 mL just prior to UV disinfection.

(2) [Fecal coliform] [_____] in MPN/100 mL just after UV disinfection.

(3) Total suspended solids prior to disinfection.

(4) Percent UV transmittance at 254 nm with 1 cm cell length prior to disinfection.

c. Continue performance testing for 14 days and collect samples 3 times per 24 hour period. Record the data obtained in booklet form. Ensure test reports indicate the final position of controls.

d. The effluent quality exiting the UV unit is required to be equal to or better than the specification requirement. Continue retesting for at least 2 consecutive days or until satisfactory bacteriological results have been obtained.

e. Submit statements signed by responsible official or representatives of the manufacturer attesting to conformance to the specified requirements. Date the statements after performance testing has been completed, include the name the project, and list the specific requirements which are being certified.
3.3.3 Manufacturer's Representative

Provide the services of a qualified manufacturer's field service representative to supervise the installation, adjustment, testing of equipment and instruct plant operators in the care, operation, and maintenance of the equipment.

3.3.4 Site Visits

Manufacturer's representative is required to assist in the proper installation and checking of the equipment for a period of time necessary to insure a completed installation. Submit a written report of the results of each visit by the manufacturer's representative, including purpose and time of visit, tasks performed and results obtained.

The representative is required to, for a period not less than three full days, start up the equipment, supervise initial operations, perform the required field tests and instruct plant operators in the proper care, operation and maintenance of the equipment. Upon request of the Government, at any time during the 1-year warranty period, the representative will recheck the system, recalibrate and adjust equipment, answer plant operator's questions and review operation and maintenance procedures.

3.4 ADJUSTING AND CLEANING

Test, calibrate, adjust and operate to verify its satisfactory operation. Clean equipment of dirt, dust and foreign matter.

3.5 CLOSEOUT ACTIVITIES

3.5.1 Operating and Maintenance Manuals

a. Submit operating instructions outlining the step-by-step procedures required for system startup, normal operation, short- and long-term deactivation, and shutdown. Include an introduction and overall equipment description, purpose, functions, and simplified theory of operation in the beginning of the instructions. Include the manufacturer's name, model number, service manual, parts list, and brief description of each piece of equipment and its basic operating features in the instructions. Include component layouts, simplified wiring, and control diagrams for the system as installed. Ensure performance test data is reflected in the operating instructions.

b. Submit maintenance instructions listing routine maintenance procedures, calibration procedures, possible breakdowns and repairs and troubleshooting guides, prior to the start of the training course.

3.5.2 Field Training

Include a combination of classroom and hands-on training at the site. Instruct designated maintenance and operations personnel in the recommended corrective and preventive maintenance procedures for the equipment. Submit the proposed lesson plan of field instruction, 30 days prior to commencement of scheduled training. Cover each item contained in the operating and maintenance manuals in the field training.
3.5.2.1 Instruction Plan

Prepare a lesson plan which includes the elements presented in the outline specified below. Identify specific components and procedures in the proposed lesson plan. Detail specific instruction topics. Reference and attach to the proposed lesson plan training aids to be utilized in the instruction where applicable. Describe any hands-on demonstrations planned for the instruction and estimated duration of each segment of the training in the lesson plan.

3.5.2.2 Training Outline

Include in the instruction, as a minimum, the following elements presented in the following outline:

a. Equipment operation.
b. Detailed component description.
c. Equipment preventative maintenance.
d. Equipment troubleshooting.
e. Equipment corrective maintenance.
f. Hands-on demonstrations.

3.5.2.3 Framed Instructions

Post framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, where directed. Prepare condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system in typed form and post beside the diagrams. Post the framed instructions before acceptance testing of the systems.

NOTE: This guide specification covers the requirements for sludge collecting equipment.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

1.1  REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ALUMINUM ASSOCIATION (AA)

AA ANSI H35.2M (2017) Dimensional Tolerances for Aluminum Mill Products

AMERICAN BEARING MANUFACTURERS ASSOCIATION (ABMA)

NATIONAL ASSOCIATION OF ARCHITECTURAL METAL MANUFACTURERS (NAAMM)

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Installation

SD-03 Product Data
Sludge Collectors for Rectangular Tanks
Collectors for Circular and Square Tanks
Spare Parts
Framed Instructions
Qualifications

SD-06 Test Reports
Testing

SD-10 Operation and Maintenance Data
Operating and Maintenance Manuals; G[, [_____]}

       [Six] [____] [hard] [optical disc] copies of operation and
       [six] [_____] copies of maintenance manuals for the equipment
       furnished. One complete set prior to performance testing and the
       remainder upon acceptance.

1.3 QUALIFICATIONS

Qualify procedures and welders in accordance with the code under which the welding is specified to be accomplished. Submit qualified procedures and list of names and identification symbols of qualified welders and welding operators, prior to welding operations.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect all equipment, delivered and placed in storage, from the weather, excessive humidity and excessive temperature variation; and dirt, dust, or other contaminants.

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

2.1.1 Standard Products

Provide materials and equipment which are the standard products of a
manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.1.2 Nameplates

Each major item of equipment shall have the manufacturer's name, address, type or style, model or serial number, and catalog number if applicable on a plate secured to the item of equipment.

2.1.3 Special Tools

Provide one set of special tools, calibration devices, and instruments required for operation, calibration, and maintenance of the equipment.

2.1.4 Spare Parts

Submit spare parts data for each different item of material and equipment specified, after approval of the related submittals and not later than [___] months prior to the date of beneficial occupancy. Include in the data a complete list of parts and supplies, with current unit prices and source of supply.

2.2 MATERIALS

**************************************************************************
NOTE: Steel components are often specified galvanized where not submerged or intermittently wetted to minimize painting and paint maintenance.
**************************************************************************

2.2.1 Steel Plates, Shapes, and Bars

Steel plates, shapes, and bars shall be ASTM A36/A36M, minimum 6 mm 1/4 inch thickness unless otherwise specified.

2.2.2 Malleable Iron

Malleable iron shall conform to ASTM A47/A47M.

2.2.3 Iron Castings

Iron castings shall conform to ASTM A48/A48M.

2.2.4 Aluminum for Structural and Rolled Shapes

Aluminum for structural and rolled shapes shall conform to AA H35.1/35.1M, alloy 6061-T6, and AA ANSI H35.2M.

2.2.5 Aluminum for Extruded Shapes

Aluminum for extruded shapes shall conform to AA H35.1/35.1M, alloy 6063-T6.

2.2.6 High Strength Bolts

High strength bolts shall conform to ASTM A325M ASTM A325 with suitable nuts and washers conforming to ASTM A354; galvanized, ASTM A153/A153M.
2.2.7 Anchor Bolts

Anchor bolts shall conform to ASTM A307; galvanized, ASTM A153/A153M.

2.2.8 Fiberglass Reinforced Polyester Plastic (FRP)

2.2.8.1 Molded FRP

Fiberglass reinforced polyester plastic shall be 6 mm 1/4 inch thick and shall be molded by the matched die method to produce uniform, smooth surfaces. Through the use of "low profile" resin systems, all surfaces shall be smooth, resin rich, free of voids and porosity, without dry spots, crazes, or unreinforced areas, and shall provide for increased corrosion resistance and weathering.

2.2.8.2 FRP Laminate

Laminate shall have a glass content of 30 plus or minus 2 percent using Type "E" glass with chrome or silane finish. Powdered reinforcements shall consist of 47.5 plus or minus 1 percent of resin mixture. Resin mixture shall be of the "low profile" type. Final laminate thickness shall be within plus or minus 10 percent of the specified thickness.

2.2.8.3 Physical Properties

Physical properties of fiberglass reinforced polyester plastic shall be as follows:

a. Minimum Tensile Strength: 96.5 MPa 14,000 psi conforming to ASTM D638.

b. Minimum Flexural Strength: 172.4 MPa 25,000 psi conforming to ASTM D790.

c. Minimum Flexural Modulus: 0.9 by 10 to the sixth power conforming to ASTM D790.

d. Minimum Impact, Notches, Izod: 720 Joules/meter 13.5 ft-lb per inch conforming to ASTM D256, Method A.

e. Maximum Average Coefficient of Thermal Expansion: 29 by 10 to the negative sixth power mm per mm, per degree K 16 by 10 to the negative sixth power inch per inch, per degree F.

f. Maximum Water Absorption: 0.02 percent in 24 hours conforming to ASTM D570.

2.2.8.4 Resin Sealing

Where plates of nonstandard length or mounting hole configuration are required, machined or cut edges shall be resin sealed.

2.3 HANDRAILS

**************************************************************************
NOTE: Handrails specified are the utilitarian type. Drawings will show design requirements, locations, and general configuration of railing. Where railing is to be fabricated of material other than pipe, this paragraph must be rewritten for type
chosen and the drawings must show configuration and design requirement for type of railing selected.

**************************************************************************
Handrails shall be 1065 mm 42 inches high with two horizontal rails. Handrails shall be fabricated of Schedule 40 [galvanized] steel pipe conforming to ASTM A53/A53M or Schedule 40 [mill finished] [anodized] aluminum pipe conforming to ASTM B429/B429M. Pipe size shall be [40] [50] mm [1-1/2] [2] inch NPS. To maximize extent practicable, railing shall be shop fabricated. Rigid joints shall be flush-finished welded assembly. Joints shall be reinforced with tight fitting interior sleeves and shall be assembled by welding rails and posts to flush-type fittings, or by mitering and welding joining rails to posts. Expansion joints shall be located at lengths of rails as recommended by the manufacturer. Expansion joints shall be the inner-sleeved slip joint type with one end of the sleeve secured to the railing. Expansion joints and splices shall be located near the intersection of rails and posts. Bends in railing shall be smooth and made in a manner that will not crush or deform the railing. All welds shall be ground smooth and railings shall be free of burrs and sharp corners and edges. Removable sections shall be as indicated.

2.4 FLOOR GRATING AND FRAMES

[Carbon Steel] [Aluminum] [Stainless Steel] grating shall be designed in accordance with [NAAMM MBG 531] [NAAMM MBG 531] to meet the indicated load requirements. Edges shall be banded with bars 6 mm 1/4 inch less in height than bearing bars for grating sizes above 19 mm 3/4 inch. Banding bars shall be flush with the top of bearing grating. Frames shall be of welded steel construction finished to match the grating. [Floor gratings and frames shall be galvanized after fabrication.]

2.5 FLOOR PLATES

**************************************************************************
NOTE: Specific pattern should not be indicated unless required for matching purposes or to meet design requirements.
**************************************************************************
Aluminum floor plates shall conform with ASTM B632/B632M, other aluminum floor plates shall be 6 mm 1/4 inch thick, [raised thread steel] [pattern indicated] [galvanized] [slip-resistant, carbon steel conforming with ASTM A283/A283M having a minimum static coefficient of friction of 0.50 when tested in accordance with ASTM D2047. Wearing surface shall be aluminum oxide or silicon carbide].

2.6 LUMBER

Red Cypress shall conform to NHLA Rules, clear, S4S finish. Redwood shall conform to RIS Grade Use, clear all heart, S4S finish.

2.7 MOTORS

Motors shall conform to NEMA MG 1.
2.8 COLLECTORS FOR CIRCULAR AND SQUARE TANKS

2.8.1 Drive Unit

Drive unit shall consist of a gear reducer and motor, direct or flexible coupled. Drive unit shall have a [cast iron housing] [or] [fabricated steel housing with integral hardened steel raceway] and shall be designed in compliance with ABMA 9 and ABMA 11, ANSI/AGMA 2001 and ANSI/AGMA 6034. The continuous torque rating of the spur gear assembly shall be based upon the smaller of the values developed by ANSI/AGMA 2001 and considered as the rated torque capacity the entire gear will develop continuously over a 20-year period. Drive unit shall be rated as follows:

<table>
<thead>
<tr>
<th>Approximate Rotational Speed</th>
<th>[_____] rpm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continuous Operating Torque</td>
<td>[_____] N-m ft-lb</td>
</tr>
<tr>
<td>Alarm Torque</td>
<td>[_____] N-m ft-lb</td>
</tr>
<tr>
<td>Shut-off Torque</td>
<td>[_____] N-m ft-lb</td>
</tr>
<tr>
<td>Momentary Peak Torque</td>
<td>[_____] N-m ft-lb</td>
</tr>
</tbody>
</table>

2.8.2 Bridge Supported Drive

The reduction unit shall be one of the following types:

2.8.2.1 Primary Worm Gear Type

A unit consisting of a primary worm gear speed reducer coupled with a final reduction gear. The final gear shall be mounted on a ball bearing assembly with the balls running in replaceable hardened alloy steel races. All bearings for this type of unit shall be antifriction type and shall run in an oil bath. The reduction unit shall have housings effectively sealed against contaminants. An oil filling and level check pipe shall be provided.

2.8.2.2 Chain and Sprocket Drive Type

A unit consisting of a chain and sprocket drive, connected to a worm and worm gear final reduction unit. All bearings for this type unit shall be tapered roller type.

2.8.3 Bridge Supported Drive Torque Tube

A steel torque tube shall be bolted to the final reduction gear and shall support and rotate the sludge collection arms.

2.8.4 Center Pier-Supported Drive Reduction Unit

The primary speed reducer shall be of the helical or worm gear type, coupled to the intermediate speed reducer directly or by a standard steel roller chain and steel sprockets. Chain and sprockets shall be protected by chain guards. The intermediate speed reducer shall consist of a worm and worm gear or planetary gear, keyed to a shaft which drives the internal spur gear. The final speed reducer shall be a spur gear designed to withstand the maximum torque loads imposed on the clarifier mechanism.
Bearings shall be antifriction type. Bearings in cast iron units shall run in replaceable hardened alloy steel races. All gears shall run in an oil bath. Oil seals and oil fill, drain, and level check systems shall be provided. Chains shall be lubricated as recommended by the manufacturer. A drive cage, with provision to connect to the final reduction unit, shall be provided. The drive cage shall be fabricated from structural steel members and shall be designed to withstand the momentary peak torque of the collector without permanent deformation of the members. The drive cage shall have provision for attachment of sludge removal arms.

2.8.5 Electric Motor

Motor shall operate on [_____] volts ac, [_____] phase, 60 Hz and shall be totally enclosed fan cooled with a minimum [1.15] [_____] service factor. Equipment vendor shall size motor to be of sufficient size for duty to be performed and shall not exceed full load rating under the most severe conditions expected. Necessary adjustments shall be made to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed. Each motor shall be furnished with a magnetic full-voltage starter conforming to NEMA ICS 1. The starter shall be in weatherproof cast metal enclosure. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor. Controls shall be mounted in starter cover or in separate weatherproof cast metal enclosure.

2.8.6 Overload Protection

The drive unit shall be provided with an overload protection system, enclosed in a weatherproof housing. The system shall consist of two micro-switches actuated by the movement of the worm shaft in the worm gear housing. The switches shall be adjusted to sound an alarm when the torque reaches [120] [_____] percent of the continuous operating torque and to stop the drive motor when the torque load reaches [140] [_____] percent of the continuous operating torque. The system shall visually indicate overload points. A shear pin assembly shall be provided to serve as back-up overload protection and set to fail at [160 to 180] [_____] percent of continuous operating torque.

2.8.7 Influent

2.8.7.1 Siphon Feed Influent/Support Column

**************************************************************************
NOTE: Siphon feed influent is most commonly associated with center pier supported mechanisms.
**************************************************************************

A combination influent and support column shall support the drive, collector mechanism, and access bridge and shall serve as the center influent pipe. The column shall be fabricated from steel plate and shall be anchored to the concrete. The column shall be a minimum of [_____] mm feet-inches in diameter and shall have a series of openings near the upper end to direct flow into the influent feedwell at low velocity.

2.8.7.2 Siphon Feed Influent Feedwell

**************************************************************************
NOTE: Use 76 mm per second 0.25 fps for primary collectors and 46 mm per second 0.15 fps for
**************************************************************************
secondary collectors.

The influent feedwell shall be fabricated from steel plate sections with bolted connections and shall be supported from the center cage. The feedwell shall be of adequate size and design to diffuse the flow into the tank. Feedwell design shall be such that the flow-through velocity does not exceed \([46 \text{ mm/second}] [0.15 \text{ fps}]\) at maximum flow. Baffled ports shall be provided at the water surface in the feedwell to permit the escape of scum.

2.8.7.3 Side Feed Influent Feedwell

**NOTE:** Side feed influent is most commonly associated with bridge supported mechanisms.

The influent feedwell shall be fabricated from steel plate with necessary stiffening members. The feedwell shall be supported by structural steel members which span the tank and are attached to brackets mounted on the tank wall above design water level. Feedwell shall be designed to diffuse the flow into the tank and shall have baffled ports at the water surface to permit the escape of scum. A flanged pipe connection and an influent pipe from the tank side shall be provided.

2.8.7.4 Influent Feedwell for Thickeners

**NOTE:** Energy dissipating feedwells may not be required for all thickeners.

The influent feedwell shall be fabricated from steel plate with necessary stiffening members. The feedwell shall be of energy dissipating design having 3 internal peripheral horizontal shelves with tangential inlet ducts to provide counterflows of influent which shear on each other as they are displaced inward beyond the shelves. The feedwell shall be supported by structural steel members which span the tank and are attached to brackets mounted on the tank wall. A flanged pipe nozzle and influent pipe from the tank side shall be provided. A cleanout shall be provided at the point where the flow splits prior to entering the influent feedwell.

2.8.7.5 Peripheral Feed Influent

The peripheral feed system shall consist of an influent channel and either an orifice and baffle system or a downcomer pipe system. The influent channel shall be constructed of [concrete] [steel plate] at the periphery of the tank and in conjunction with the effluent channel. Influent and effluent channels shall be designed for proper flow distribution and collection. The orifice and baffle system shall consist of orifice openings in the floor of the influent channel, a steel plate orifice baffle for each orifice, and a steel plate influent skirt to prevent short circuiting. Orifice dimensions and spacing shall be as determined by the manufacturer for even flow distribution. The orifice baffles shall contain no restriction less than the diameter of the orifice or greater than the orifice diameter plus 25 mm 1 inch. The influent skirt shall extend 1.5 m 5 feet below the water surface or 300 mm 1 foot below the influent channel bottom, whichever is greater. Sufficient clearance shall be provided.
between the bottom of the influent skirt and the tank floor to permit operation of the collector mechanism. The downcomer pipe system shall consist of steel drop pipes spaced evenly around the influent channel. The bottom of the drop pipe shall have a fiberglass 90 degree bend and flared discharge nozzle oriented toward the center of the tank.

2.8.8 Scraper Sludge Removal

Unit shall be [one] [two] [_____] structural steel scraper arms, equipped with blades or scrapers designed to move settled sludge to a hopper at the center of the tank, shall be provided. Adjustable [spring brass] [PVC] [galvanized steel] squeegees shall be provided for each scraper blade. The squeegees shall project \(40 \text{ mm}\) \(1-1/2\) inches below the scraper blade and shall be adjustably secured by [brass] [or] [stainless steel] bolts and nuts.

2.8.9 Hydraulic Sludge Removal

**************************************************************************
NOTE: Hydraulic sludge removal is most commonly associated with activated sludge systems.
**************************************************************************

Hydraulic sludge removal shall be accomplished by the use of the header and manifold system or the uptake pipe system.

2.8.9.1 Header

The header shall be designed to continuously remove the required proportional settled solids volume to effect uniform withdrawal over the entire tank diameter, collecting larger volumes of sludge at greater distances from the tank center. The mechanism shall collect the sludge from the tank bottom and transmit it through the header to the manifold, removal being accomplished by hydrostatic pressure. Maximum peripheral speed of the header shall not exceed \(0.061\) [_____] meters/second [12] [_____] fpm and maximum allowable head loss from the clarifier water level to the sludge pipe connection at the pier bottom shall be [_____] mm feet. The header shall be fabricated from steel plate, shall be rectangular, and shall vary in size from a minimum at the outer end to a maximum at the center of the tank. Stepped and constant cross sectional area type headers are not acceptable. The header shall be parallel to the tank bottom, and the longitudinal cross sectional axis shall be mounted at an angle of 45 degrees to provide a peaked top. The leading edge of the header shall extend downward \(50 \text{ mm}\) \(2\) inches to provide an equalizing vane as an integral part of the header and to direct the sludge into the area of influence of the orifice. A \(3.175 \text{ mm} 10\) gauge steel scraper with a neoprene blade shall be provided to clean the tank bottom around the manifold and direct the sludge to the first orifice. Inlet orifices shall be spaced along the length of the header such that in a single revolution the header will clean the entire tank bottom. Maximum orifice spacing shall be [775] [_____] mm [30] [_____] inches. Orifices shall be accurately drilled in the header. The header shall be supported from the center cage by steel tie-bars with turnbuckles, clevises, and locknuts. The support system shall hold the header in alignment both horizontally and vertically. A suitable counterweight shall be provided to counterbalance the header.

2.8.9.2 Manifold

The sludge collection manifold shall be fabricated from steel plate. Two
seals shall be provided to ensure that the sludge enters the manifold only through the headers. The bottom plate shall be anchored to the tank bottom, aligned, and grouted in place.

2.8.10 Uptake Pipe System

**************************************************************************
NOTE: Provide sufficient quantity of nozzles for a maximum of 1 to 1.5 meter 3 to 5 foot spacing.
**************************************************************************

The system shall consist of a sludge discharge column within the influent column; [two] [_____] truss-type sludge collection arms, supported from and driven by the drive cage; V-plow blades and squeegees attached to the sludge collection arms; a minimum of [_____] suction nozzles per arm, supported by the sludge collection arms, and piping to a sitewell; and either sludge control boxes or variable orifice slip tubes inside the sitewell.

a. The sludge discharge column shall be fabricated from steel plate and shall extend from the sludge sitewell to the bottom of the stationary influent column where it shall connect to the sludge discharge pipe under the tank bottom.

b. The sludge collection arms shall be welded truss construction requiring no tie rods for support. The V-plow blades shall have [spring brass] [_____] squeegees with [brass] [_____] fasteners. The blades shall completely rake the bottom [twice] [_____] per revolution.

c. The suction nozzles shall be a minimum of [_____] mm inches in diameter. Suction piping shall be Schedule 80 PVC and shall be sized for a flow velocity not less than 0.16 meters/second 0.5 fps at minimum flow to prohibit solids settling in the piping. Fittings shall be Type 304 stainless steel or Schedule 80 PVC and shall have bell-type ends with O-ring seals.

d. The sitewell shall be approximately [_____] mm feet square by [_____] mm feet deep, fabricated from steel plate, and shall contain either sludge control boxes or variable orifice slip tubes. A neoprene seal shall be provided between the sitewell and influent column. Sludge control boxes shall be integral with the sitewell. Sludge being withdrawn from each section of the arm shall be controlled by a submerged orifice sludge control box to allow pacing of the recycled rate. Each box shall have a manually controlled PVC gate valve with positioning stem and position indicator. Variable orifice slip tubes shall be of steel or PVC pipe construction and shall permit throttling of individual sludge lines by rotating the slip tubes.

e. Sludge flow shall be induced by means of hydraulic head differential between the tank water level and the sludge control boxes or variable orifice slip tubes at a head of [_____] mm feet. The total sludge drawoff shall be dependent on and controlled solely by the pumping rate from outside the mechanism.

2.8.11 Corner Scrapers for Square Tanks

A corner blade shall be provided on [one] [each] sludge scraper arm. Corner scraper blades shall consist of a straight blade attached to two horizontal members mounted on the main scraper arm. The scraper mechanism
shall be pivoted on special underwater bearings and shall be actuated by a
counterweight or spring to keep the end of the arm in contact with the side
of the tank. Steel guide plates for the tank corners shall be provided to
direct the path of the corner blades. A carrier wheel shall be provided on
the outer end of each corner blade. Springs, cable, and chain shall be
stainless steel, galvanized steel, or other corrosion-resistant material.

2.8.12 Scum Removal for Tank Water Surface

**************************************************************************
NOTE: Use of dual skimmer arms and wide scum
beach/box improves scum removal performance.
**************************************************************************

Scum removal shall consist of a [single] [dual] skimming device, a scum
baffle, and [one] [two] skimmer blade ramp(s) and scum box(es).

a. The skimmer shall sweep the water surface of the tank and automatically
move the scum up the skimmer blade ramp and into the scum box. The
skimming devices shall be supported by structural steel members
attached to the [sludge collection arms and counterweight] [torque
tube]. The skimmer shall not rely on the scum baffle for support. The
scum scraper blade shall be neoprene.

b. The scum baffle shall be fabricated from [steel plate] [or] [fiberglass
reinforced polyester plastic]. [Fiberglass scum baffle plates shall be
in standard lengths not to exceed 3600 mm 12 feet] Connections between
baffle sections shall be constructed in a manner that will not
interfere with smooth contact of the skimmer. All supports and
connectors required for a complete installation shall be provided.

c. Scum boxes shall be of the dimensions indicated and shall be fabricated
from steel plate. The assembly shall have a scum sump, vertical steel
sides, and a sloping skimmer blade ramp. A flexible connector shall be
provided between the scum outlet piping and the tank wall. [An
automatic flushing device, which will open as the scraper passes shall
be provided.]

2.8.13 Influent Channel Scum Removal

**************************************************************************
NOTE: Influent channel scum removal is required
only on peripheral feed collectors. Delete the
inapplicable system.
**************************************************************************

In addition to the tank water surface scum removal, a system shall be
provided for removal of scum from the influent channel. The system shall
consist of [an additional scraper blade attached to the main tank skimmer,]
[or] [an influent channel spray nozzle system designed to move the scum to
the scum box,] a scum box, and a motorized telescopic scum control valve.
All controls required for the system shall be provided.

2.8.14 Bridge

2.8.14.1 Bridge Design and Construction

The bridge shall be fabricated from structural steel and shall be
all-welded construction. The bridge shall be either truss or beam type
design. Maximum allowable deflection of the bridge shall be 1/360 of the span length under a live load of 2.9 kPa (60 psf). The bridge walkway shall be [floor plate] [grating]. Handrail with a 100 mm (4 inch) high toe plate, shall be provided on both sides of the walkway. If truss-type bridge construction is used, the truss members may be used as handrail.

2.8.14.2 Bridge for Bridge-Supported Drives

The bridge shall span the entire tank diameter and shall be supported by and anchored to the tank wall. The bridge shall support the drive and collector mechanism and provide access for maintenance. The access walkway shall be at least 900 mm (3 feet) wide. At least 775 mm (2 feet 6 inches) clearance shall be provided between the drive unit and the handrails on all sides where maintenance is required.

2.8.14.3 Bridge for Center Pier-Supported Drives

The bridge shall be supported on one end by the tank wall and on the other end by the drive unit. The access walkway shall be at least 900 mm (3 feet) wide and shall extend to a point 775 mm (2 feet 6 inches) beyond the drive assembly. At least 775 mm (2 feet 6 inches) clearance shall be provided between the drive unit and the handrails on all sides where maintenance is required.

2.8.15 Effluent

2.8.15.1 Weir Plates

******************************************************************************
NOTE: Sludge collectors which require additional linear footage of weir, beyond weir trough circumference length can utilize finger weir or weir pans to increase length up to two and one-half times length of single circumferential weir. Manufacturer of this type should be required to have at least five years experience in furnishing weir pan systems.
******************************************************************************

Weir plates shall be [fabricated from steel plate] [or] [fiberglass reinforced polyester plastic]. Weir plates shall be of the dimensions indicated. Vee notches in fiberglass weir plates shall be molded in the plate; cut edges are not acceptable. Weir plates shall be mounted in a manner to be watertight and to provide a minimum of 50 mm (2 inches) vertical adjustment.

2.8.15.2 Effluent Trough and Drop Box

******************************************************************************
NOTE: The effluent trough and drop box may be cast of concrete with the tank wall and deleted from this specification.
******************************************************************************

The effluent trough and drop box shall be fabricated from [steel plate] [or] [fiberglass reinforced polyester plastic]. Trough and drop box dimensions shall be as indicated. Joints between sections shall be watertight. Support assemblies of adequate strength to prevent trough or box distortion through filling and draining of the tank shall be provided.
2.9 SLUDGE COLLECTORS FOR RECTANGULAR TANKS

2.9.1 Chain and Flight Scraper Type Collectors

The sludge collector shall include chain, flight and wear shoes, sprockets, shafts, wall bearings, return tracks with support brackets, tee rails, drive unit complete with reducer, motor and overload device, and all associated attachment and anchor bolts. Chains for primary tank collectors shall run over four sets of sprocket wheels at a design speed of [_____] fpm, so that the flights will clean the sludge from the tank bottom and skim the surface on the return run, concentrating scum in front of the scum pipe. Chains for intermediate tank collectors shall run over three sets of sprocket wheels at a design speed of [_____] fpm, so that the flights will clean the sludge from the tank bottom and route it to the sludge collection trough. Cross collectors shall run at twice the speed of the longitudinal collectors. Collector components shall be selected based upon the following criteria: operation under dry tank conditions; friction factor for dry steel on dry steel shall be 0.33; friction factor for polyurethane on dry steel shall be 0.25; bearing friction shall be 5 percent of shaft assembly.

2.9.1.1 Metallic Chains

Metallic chains shall be manufactured of corrosion-resistant processed metal having an average tensile strength of [551.6] [_____] MPa [80,000] [_____] psi and a hardness range of 179-229 Brinell. The chains shall be 7205 heavy pintle type with 150 mm 6 inch [_____] pitch, weighing [7.6] [_____] kg/m [5.1] [_____] lb/ft, and with plain and attachment links assembled with 19 mm 3/4 inch diameter hardened steel pins and rivets. The chain shall have an allowable working load of [15.7] [_____] kN [3,540] [_____] pounds and each assembled strand shall be proof tested at a minimum of [83.6] [_____] kN [18,800] [_____] pounds to detect and remove defective castings. Rigid attachments shall be provided for full depth of the flight and attached with four 10 mm 3/8 inch diameter bolts. Chain sections shall be matched within 5 mm in 3 meters 3/16 inch in 10 feet, tagged, and wired together in pairs.

2.9.1.2 Nonmetallic Chains

Nonmetallic chains shall have 152 mm 6 inch [_____] pitch links manufactured of acetal resin and connected with pins manufactured of reinforced nylon resin. The pins shall be of T-head or T-end construction to prevent rotation and shall be held in place without the use of pinlocks or cotters. The chain shall have a working load of [8.0] [_____] kN [1,800] [_____] pounds. Rigid attachments shall be provided full depth of the flights and attached with four 10 mm 3/8 inch diameter bolts.

2.9.1.3 Drive Chains

Drive chains shall be H-78 mill type manufactured of a corrosion resistant processed metal, shall consist of 66.27 mm 2.609 inch [_____] pitch links, and shall have an allowable working load of [10.4] [_____] kN [2,350] [_____] pounds. Each assembled strand shall be proof tested at a minimum of [44.5] [_____] kN [10,000] [_____] pounds to detect and remove defective castings. A hot-dip galvanized chain tightener shall be provided to take up unnecessary slack in the drive chain.
2.9.1.4 Wood Flights

Wood flights shall be [50 by 150 mm 2 by 6 inch] [75 by 200 mm 3 by 8 inch] nominal size and spaced approximately [3000] [_____] mm [10] [_____] feet on centers. Flights shall be redwood or red cypress. All flights shall be accurately drilled and notched at the factory to ensure proper alignment.

2.9.1.5 Fiberglass Flights

Fiberglass flights shall be [50 by 150 mm 2 by 6 inch] [75 by 200 mm 3 by 8 inch] nominal size, especially designed for sludge collector service. The scraper shall have continuous fiberglass filaments running the full length of the member and shall include a scraper lip on the leading edge to ensure cleaning of the tank floor. The scraper shall include filler blocks for bolting the member to the chain attachment links. Flight spacing shall be approximately [3] [_____] m [10] [_____] feet. Buoyant flight design will not be acceptable.

2.9.1.6 Wearing Shoes

Each flight shall be provided with 13 mm 1/2 inch thick polyurethane wearing shoes to run on the floor rails and return tracks. Wearing shoes shall be reversible, providing two usable wearing surfaces.

2.9.1.7 Rails

Two 11 kg 25 pound ASCE tee rails shall be furnished and installed in the tank floor in accordance with manufacturer's written recommendations.

2.9.1.8 Return Tracks

Return tracks shall be [76.2 by 50.8 by 9.5 mm 3 by 2 by 3/8 inch] [_____] thick steel angles with 6 mm 1/4 inch thick steel support brackets. Each bracket shall be designed to cantilever the return track off the tank wall. Support brackets shall be spaced approximately 3000 mm 10 feet apart and fastened to the tank wall by a minimum of two anchors.

2.9.1.9 Sprockets

Sprockets shall have chilled tooth bearing surfaces with a hardness of not less than 360 Brinell and chill depth of at least 4.8 mm 3/16 inch. Driving sprockets shall be keyed firmly to the headshaft. Corner shafts shall have one sprocket setscrewed and one running loose on the shaft. Collector chain sprockets shall be of the double-life type and of split construction. Headshaft sprockets shall be not less than [_____] mm inch pitch diameter and shall have not less than [_____] teeth. All other collector chain sprockets shall be not less than [_____] mm inch pitch diameter and have not less than [_____] teeth. Traction wheels, idler wheels, or other substitutions for sprockets will not be acceptable. The drive sprocket shall be fitted with a bronze bushing and shall be provided with a shear pin device to provide for full protection of equipment in case of excessive loading. The driving sprocket on the reducer shaft shall be not less than [_____] mm inch pitch diameter and shall have not less than [_____] teeth. The driven sprocket on the collector headshaft shall be split construction, shall not be less than [_____] mm inch pitch diameter, and shall have not less than [_____] teeth.
2.9.1.10 Shafts

Shaft sizing shall be compatible with the tank dimensions and sprocket location. Maximum shaft deflection shall be 4 mm/meter (3/64 in/ft) of shaft length. Shafting shall be straight and true, solid, cold-finished steel and shall be held in alignment with set collars. Shafting shall contain keyways with fitted keys where necessary and shall be of sufficient size to transmit the power required. Shafting shall extend the full width of the tank and shall turn in bearings mounted on the tank walls. Shafting shall be shipped to the project site as complete subassemblies with sprockets, bearings, and set collars in place.

2.9.1.11 Bearings

Underwater bearings shall be of cast iron construction, babbitted, and of the water-lubricated, ball and socket, self-aligning type designed to prevent the accumulation of settled solids on their surfaces. The bearings shall be bolted directly to the tank wall in a manner to permit easy adjustment. Take-up bearings shall provide not less than 250 mm (10 inches) of horizontal travel. Take-up bearings shall be of cantilevered design, with a fabricated steel support base, and shall have cadmium plated take-up screws. Take-up bearings shall be designed so that no recesses in the concrete are required to maintain clearances.

2.9.1.12 Drive Unit

The drive unit shall consist of a motor, speed reducer, and electrical control equipment to power the sludge collector. Where a drive unit operates two separate collectors, suitable clutches shall be provided to permit independent operation of each collector. The drive unit for primary collectors shall be rated for [_____] N-m ft-lb torque, based on dry tank conditions. The drive unit for intermediate collectors shall be rated for [_____] N-m ft-lb torque, based on dry tank conditions. The torque rating of the gear assembly shall be based on the smaller of the values developed by ANSI/AGMA 2001 and considered as the rated torque capacity the entire gear will develop continuously over a 20-year period. The drive unit shall be designed in accordance with ABMA 9 and ABMA 11 and ANSI/AGMA 2001 and ANSI/AGMA 6034.

a. The motor shall be totally-enclosed, fan-cooled; ball bearing, constant speed; and of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. The motor shall conform to NEMA standards and be suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. The motor shall be directly connected to the speed reducer by a flexible coupling. V-belt drives shall not be acceptable. Necessary adjustments shall be made to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. The drive unit speed reducer shall be of the [helical] [worm] gear type, fully housed, running in oil, with antifriction bearings throughout.

c. Each motor shall be furnished with a magnetic full-voltage starter conforming to NEMA ICS 1. The starter shall be in weatherproof cast metal enclosure. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor. Controls shall be mounted in starter cover or in separate weatherproof cast
metal enclosure. [If motors have reversing starters, a jog type switch shall be provided such that mechanism is activated in the reverse direction only as long as button is pushed down. Multiple collectors operated by same drive unit shall have jaw type disengaging clutches.] [Sludge-collector motors shall be provided with nonreversing starters and 2-button start-stop pushbutton stations.]

2.9.1.13 Overload Protection System

A shear pin assembly shall be provided to serve as overload protection and set to fully protect the equipment.

2.9.1.14 Cross Collector

Cross collector shall be either the helical coil or the conveyor type and shall be designed to scrape and convey the collected sludge from the sludge channel to a sludge sump. Materials used in the construction of the cross collector shall be of the same type and quality as those used in the main sludge collector. Helical coil shall consist of a helical steel blade mounted on a steel shaft, driven by a sprocket-connected drive. Conveyor shall be similar in operation to the conveyor used in the main sludge collector.

2.9.2 Traveling Bridge Type Collectors

Traveling bridge collector shall be a complete bridge assembly supported on ASCE type rails. The bridge assembly shall consist of a traveling bridge with walkway, bridge drive, sludge removal system, support rail and anchorage parts, and electrical control panel with necessary controls for the operation of the mechanism. The drive train shall be designed to withstand maximum horizontal loads placed on the bridge and sludge removal system. All parts of each mechanism shall be proportioned for stresses that may occur during fabrication, erection, and operation. The bridge shall have a travel speed of [_____] meters/second fpm and a reverse speed of [_____] meters/second fpm.

2.9.2.1 Bridge Construction

**************************************************************************
NOTE: Beam bridges are normally provided for tank widths between 4.5 and 13.75 m 15 and 45 feet. Truss bridges are normally provided for widths greater than 13.75 m 45 feet.
**************************************************************************

The bridge shall be designed to span the entire width of the tank and to withstand all dead loads required for the proper operation of the mechanism, a [_____] N pound sludge load per foot of blade length, and a 2394 Pa 50 psf live load on the walkway. Maximum deflection under all loads shall not exceed 1/360 of the span length. The walkway shall be covered with [floor plate] [grating] and shall be a minimum of 750 mm 30 inches wide. [The bridge shall be constructed of parallel beams with lateral bracing as required.] [The bridge shall be constructed of 2 parallel trusses fabricated from structural steel and diagonal supports welded to the upper and lower chords.]

2.9.2.2 Bridge Drive

**************************************************************************
NOTE: Gear and rack drivers are desirable in climates that have freezing rain and snow.

The bridge drive shall consist of a drive assembly, wheels, rails, drive shaft, [rack and pinion,] and controls.

a. The drive assembly shall consist of a [single speed] [dual speed] [variable speed] drive, gear reducer, drive chain, and drive and driven sprockets. All gearing shall be fully enclosed in an oil-tight housing with the gears running in oil. Bearings shall be anti-friction type. Drive chain shall be roller chain type. The motor shall be totally-enclosed, fan-cooled; ball bearing; and of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. The motor shall conform to NEMA standards and be suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. V-belt drives shall not be acceptable. Necessary adjustments shall be made to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. Each motor shall be furnished with a magnetic full-voltage starter conforming to NEMA ICS 1. The starter shall be in weatherproof cast metal enclosure. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor. Controls shall be mounted in starter cover or in separate weatherproof cast metal enclosure.

c. The drive shaft shall be of sufficient size to adequately and safely withstand all bending and torsional loads of starting and operating. The drive shaft shall be supported by multiple, grease lubricated bearings. Two load-bearing wheels shall be provided, one flanged and one flangeless, running on roller bearings mounted on idler shafts at each end of the bridge. Running rails shall be 18 kg 40 pound [_____] ASCE with standard rail splices and shall be anchored to the tank wall. Four rail stops shall be provided, located at travel extremes. The bridge shall be driven by gears with a 75 mm 3 inch pitch, keyed to the ends of the drive shaft. The gears shall mesh with a steel rack anchored to the top of the tank wall.

2.9.2.3 Scraper Sludge Removal, Blades, and Supports

NOTE: Scraper type traveling bridge collectors are normally used for primary basins where the volume of sludge is low and the main requirement is to increase the sludge concentration.

Scraper blades shall consist of a minimum 300 12 inch deep structural steel channel, polyurethane wear shoes, and neoprene strips acting as squeegees on the tank bottom. The scraper blade assembly shall be positioned and guided by two or more rigid structural steel support assemblies attached to the bridge. The scraper blade assemblies shall attach through pivot joints and bearings to the support assemblies. The scraper assembly shall retract above the water surface for maintenance and inspection.
2.9.2.4 Scraper Sludge Removal Cross Collector

NOTE: Cross collectors are normally desirable on long basins. Spacing of cross collectors is dependent upon the type of sludge encountered.

A screw cross collector consisting of a drive unit with an overload alarm, vertical drive torque shaft, underwater gear box, helical screw, bearings, and anchors shall be provided. The drive unit shall consist of a motor and gear reducer connected to a vertical drive shaft through a flexible coupling. The motor shall be totally-enclosed, fan-cooled; ball bearing, constant speed; and of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. The motor shall conform to NEMA standards and be suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. Vendor shall size motor of sufficient size for duty to be performed without exceeding full load under most severe conditions expected. Necessary adjustments shall be made to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

a. The gear reducer shall be of the worm gear type with anti-friction bearings and completely immersed in oil in a sealed housing.

b. A replaceable switch, with normally open and normally closed contacts to be actuated upon shear pin failure shall be provided. The drive unit shall be designed to rotate the screw at a speed of [_____] rpm. The underwater gear box shall be pressure lubricated and shall have bearings and seals designed for submerged operation. Grease lubrication lines shall be provided from each submerged bearing to an accessible location. The helical screw shall have [_____] mm / inch diameter blades of 4.8 mm / 3/16 inch thick steel plate welded to a hollow steel core. The screw shall be supported by end bearings [and intermediate bearings].

c. Each motor shall be furnished with a magnetic full-voltage starter conforming to NEMA ICS 1. The starter shall be in weatherproof cast metal enclosure. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor. Controls shall be mounted in starter cover or in separate weatherproof cast metal enclosure.

d. An automatic control system shall be provided for operation of the collector, enclosed in a NEMA 250, Type 3R control panel and mounted on the bridge. All electrical components shall be prewired and factory tested. An electric overload system, consisting of suitable relays and an indicating meter plainly showing the overload points, shall be provided. The overload system shall sound an alarm when the load reaches full load torque capacity of the drive motor and shall de-energize the motor. A torque sensing and indicating device shall be provided to indicate percentage of maximum torque being developed.

2.9.2.5 Vacuum Sludge Removal

NOTE: Vacuum and siphon sludge removal systems are normally used for secondary basins in activated
sludge systems where large volumes of sludge are to be removed.

The traveling bridge shall have [_____] sludge pick-up heads, each [_____] mm feet, inches long, suspended from the bridge. The pick-up heads shall have continuous slot orifices or shall include neoprene sludge guides covering all settling areas to divert the sludge to large diameter inlet ports. The vacuum system shall be powered by [_____] self-priming centrifugal solids handling pumps mounted on the bridge. The pumps shall be capable of pumping [_____] L/second gpm per pump at a static head of [_____] mm feet.

a. The pump motor shall be totally-enclosed, fan-cooled; ball bearing, constant speed; and of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. The motor shall conform to NEMA standards and be suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. The motor shall be directly connected to the speed reducer by a flexible coupling. V-belt drives shall not be acceptable. Necessary adjustments shall be made to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. Each motor shall be furnished with a magnetic full-voltage starter conforming to NEMA ICS 1. The starter shall be in weatherproof cast metal enclosure. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor. Controls shall be mounted in starter cover or in separate weatherproof cast metal enclosure.

c. A manual control system shall be provided for operation of the collector, enclosed in a NEMA 250, Type 3R control panel and mounted on the bridge. All electrical components shall be prewired and factory tested. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor.

2.9.2.6 Siphon Sludge Removal

2.9.2.6.1 Sludge Removal Siphons

The traveling bridges shall be provided with [_____] sludge removal siphons, [each consisting of a horizontal pipe header with uniformly spaced inlet ports] [each having one large diameter pick-up port and neoprene sludge guides covering all settling areas to divert sludge to the inlet ports]. The siphon discharge shall be submerged in the sludge trough.

2.9.2.6.2 Vacuum Priming System

[A portable vacuum pump shall be provided for siphon priming. The pump shall be manually connected to a male hose cock on the siphon pipe. The connection between the pump and siphon pipe shall be manually turned to "OFF" as the pipe is primed.] [A bridge mounted vacuum pump shall be provided for siphon priming. The pump shall be piped to a vacuum header through a vacuum canister. The vacuum header shall be terminated by hand-operated valve to allow vacuum header purging after the priming operation. Each connection between the vacuum header and siphon pipes shall be manually turned to "OFF" as the pipe is primed.]
2.9.2.6.3 Siphon Flow Control

The sludge removal rate of each siphon pipe shall be controlled by an eccentric plug valve, manually operated from the bridge by a handwheel. The valve shall be sized to provide no restriction or change of shape in the siphon pipe when in the full open position. The throttling status of each valve shall be manually adjusted and independently maintained by a pneumatic control circuit. The control circuit shall automatically allow the siphon pipes to purge daily at maximum velocity and then return flows to the preset quantities.

The sludge removal rate of the siphons shall be controlled by a control box at the discharge end of the traveling bridge. The control box shall be of sufficient depth to allow filling the box to the water level in the tank. Discharge from the control box shall be regulated by a manually operated sluice gate.

2.9.2.7 Airlift Pump Sludge Removal

The traveling bridge shall have [_____] sludge pick-up heads, each [_____] mm feet, inches long, suspended from the bridge. The pick-up heads shall include neoprene sludge guides covering all settling areas to divert the sludge to large diameter inlet ports. The drop pipes shall be sized for a maximum sludge removal rate of 100 percent of the average daily flow. The airlift shall provide a pumping rate of [_____] L/second gpm per pump at a static head of [_____] mm feet. The airlift system shall be powered by a positive displacement blower or centrifugal compressor, depending on air volume required. The compressor shall be mounted on the bridge.

a. The compressor motor shall be totally-enclosed, fan-cooled; ball bearing, constant speed; and of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. The motor shall conform to NEMA standards and be suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] service factor. The motor shall be directly connected to the speed reducer by a flexible coupling or V-belt drive. Necessary adjustments shall be made to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. Each motor shall be furnished with a magnetic full-voltage starter conforming to NEMA ICS 1. The starter shall be in weatherproof cast metal enclosure. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor. Controls shall be mounted in starter cover or in separate weatherproof cast metal enclosure.

c. A manual control system shall be provided for operation of the collector, enclosed in a NEMA 250 1 Type 3R control panel and mounted on the bridge. All electrical components shall be prewired and factory tested. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor.

2.9.2.8 Power Supply Stretch Cable System

A stretch cable system, consisting of a stainless steel cable stretched between two anchor posts, shall be provided. The cable shall be provided with a number of pulleys which support the electrical cable used to power
the collector. The electrical cable shall be looped in coils with each coil being attached to a separate pulley. Upon traveling to the end of the basin, the coils shall be extended to form a draped electrical cable supported by the pulleys, and as the cable returns, the loops shall be retracted by the action of the bridge.

2.9.2.9 Power Supply Trolley Track System

A trolley track system, which allows the electrical cable to uncoil and retract as the bridge moves, shall be provided.

2.9.2.10 Power Supply Cable Reel System

A cable reel system capable of unwinding and rewinding the power cable while maintaining a constant tension on the cable shall be provided. A strain relief device shall be provided to protect the fixed end of the cable.

2.9.2.11 Control System for Bridge Drive

**************************************************************************
NOTE: NEMA Class 250, Type 4X is recommended where corrosive gases, dust, or water hosedown are environmental factors. NEMA 4X type is not ventilated.
**************************************************************************

An automatic control system shall be provided for operation of the collector, enclosed in a NEMA 250, Type 3R control panel and mounted on the bridge. All electrical components shall be prewired and factory tested. An electric overload system, consisting of suitable relays and an indicating meter plainly showing the overload points, shall be provided. The overload system shall sound an alarm when the load reaches full load torque capacity of the drive motor and shall de-energize the motor. A torque sensing and indicating device, mounted on the bridge, shall be provided to indicate percentage of maximum torque being developed.

2.9.3 Center Track Airlift Pump Type Collectors

**************************************************************************
NOTE: Center track airlift pump type collectors are normally limited to basins no larger than 12 m 40 feet long and 6 m 20 feet wide.
**************************************************************************

The collector shall consist of a support beam and track assembly, carriage assembly, motor and gear reducer, drive chain and sprockets, sludge pick-up assembly, and compressor. All moving parts shall be above the water level. Lubrication and adjustment points shall be readily accessible. The system shall be designed to handle a horizontal load (drag) of [438] [_____] N [30] [_____] pounds per lineal meter foot on the scraper blade and all stresses which may occur in fabrication, shipping, erection, and operation. The unit shall have a traverse speed of [_____] mm/second fpm in both directions.

2.9.3.1 Support Beam and Track Assembly

The support beam and integral track shall constitute a single box structure spanning the length of the basin. The track shall be located inside the
support beam for weather protection. The assembly shall be of sufficient rigidity to withstand both horizontal and vertical loads without supplemental stiffening members. A mounting assembly shall be provided for attaching the beam and track to the basin wall at the correct height.

2.9.3.2 Carriage Assembly

A carriage assembly shall be provided to traverse the track assembly. The assembly shall have four flanged support wheels to travel along the track. The assembly shall also have four additional wheels to oppose moment resulting from drag on the scraper blade.

2.9.3.3 Drive Assembly

The drive assembly shall consist of a motor and gear reducer driving a continuous chain through a shear pin protected drive sprocket. The motor shall be single speed, [_____] volts ac, [_____] phase, 60 Hz. The motor and gear reducer shall be mounted directly on the support beam. The drive sprocket, chain, and driven sprocket shall be totally enclosed in the support beam assembly. A means shall be provided for adjusting chain tension at the driven sprocket. There shall be no direct linkage between the drive chain and the carriage. The chain shall run continuously in one direction with reciprocating motion of the carriage imparted by a fitting on the chain which will engage the carriage at two different points. There shall be a brief dwell time at each end of the travel. Engagement of the carriage shall not produce eccentric loads on the chain.

a. The motor shall be totally-enclosed, fan-cooled; ball bearing, constant speed; and of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. The motor shall conform to NEMA standards and be suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. Necessary adjustments shall be made to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. Each motor shall be furnished with a magnetic full-voltage starter conforming to NEMA ICS 1. The starter shall be in weatherproof cast metal enclosure. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor. Controls shall be mounted in starter cover or in separate weatherproof cast metal enclosure.

2.9.3.4 Airlift Pump

**************************************************************************
NOTE: Airlift pumps are made of noncorrosive materials. Air lines are removable with multiorifice diffuser discharge end. Airlift pump must be properly reinforced to handle structural and dynamic loads. Capacity, submergence, and air requirements should be calculated for each airlift pump. Priming pump vacuum is heavy-duty industrial vacuum with minimum liquid volume of 23 liters 6 gallons, double filtration system, and automatic water level shutoff float.
**************************************************************************

Each collector shall have a sludge pick-up head [_____] mm feet, inches
long, suspended from the carriage. The pick-up head shall include neoprene sludge guides covering all settling areas to divert the sludge to large diameter inlet ports. The drop pipe shall be sized for a maximum sludge removal rate of 100 percent of the average daily flow. The airlift shall provide a pumping rate of [_____] L/second gpm per pump at a static head of [_____] mm feet. The airlift system shall be powered by positive displacement blowers or centrifugal compressors, depending on air volume required. A pair of compressors shall feed a common air manifold to provide air supply for [_____] collectors as shown. Required check valves, shut-off valves, and regulating valves shall be provided as required for isolation, regulation, and balancing.

a. The compressor motor shall be totally-enclosed, fan-cooled; ball bearing, constant speed; and of ample power for starting and continuously operating the mechanism under most severe expected operating conditions without overloading. The motor shall conform to NEMA standards and be suitable for operation on [_____] volts ac [_____] phase, 60 Hz with [1.15] [_____] service factor. The motor shall be directly connected to the blower by a flexible coupling or V-belt drive. Necessary adjustments shall be made to wiring, disconnect devices, and branch circuit protection to accommodate equipment actually installed.

b. Each motor shall be furnished with a magnetic full-voltage starter conforming to NEMA ICS 1. The starter shall be in weatherproof cast metal enclosure. A separate pole with manually reset thermal-overload protection shall be provided in each ungrounded conductor. Controls shall be mounted in starter cover or in separate weatherproof cast metal enclosure.

2.9.3.5 Controls

******************************************************************************
NOTE: NEMA Class 250, Type 4X is recommended where corrosive gases, dust, or water hosedown are environmental factors. NEMA 4X type is not ventilated.
******************************************************************************

An automatic control system shall be provided for operation of the collector. Controls shall be enclosed in a NEMA 250, Type 3R control panel and shall be mounted on the support beam. All electrical components shall be prewired and factory tested.

2.9.4 Floating Bridge Siphon-Type Collectors

The collector shall consist of a floating bridge, bridge drive and idler stand, siphons and sludge removal system, float system, control system, and necessary support structures and anchorage. The collector shall be capable of removing settled solids from the tank floor and discharging them into a sludge trough. The flow rate of the mechanism shall be controlled over a range of [_____] L/second gpm to [_____] L/second gpm per collector bridge assembly by individually adjustable siphon pipes.

2.9.4.1 Floating Bridge

The floating assembly shall be designed and constructed to comply with the hydraulic conditions of the system. The bridge shall consist of rigidly interlaced aluminum beams, stainless siphon pipes, and fiberglass floats,
all designed to support the entire mechanism and maintain a minimum floating clearance of 50 mm (2 inches) from the floor of the collector basin. The beams shall be furnished of sufficient size to support the floats and the siphon pipes. Stainless steel brackets and pipe clamps shall be furnished to securely mount all of the siphon pipes in the proper position to the support beams. The floats shall be securely mounted to the siphon pipes to provide uniform travel of the bridge in both directions, the full length of the collector basin. The floats shall be designed for the general hydraulic conditions and shall each consist of closed cell polyurethane foam encased in a fiberglass enclosure and supported by structural aluminum angle. Recyclable materials shall conform to EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING. Aluminum tow brackets shall be secured to the siphon pipes and furnished with stainless steel mounting hardware of adequate quantity and size to withstand the loading and tension applied to the towing cable when the collector reverses direction. Inboard and outboard end trucks and guide wheel assemblies shall be secured to the floats or support beams and designed to allow for thermal expansion and contraction of the floating bridge. Wheels shall be noncorrosive material.

2.9.4.2 Bridge Drive Assembly and Idler Stand

Each floating bridge shall be towed along the longitudinal length of the basin by a stainless steel, stranded wire cable. The cable shall be of adequate size to tow the entire structure and span the length of the tank with a minimum of catenary. Drive cable shall be affixed to floating bridge assembly through tow bridle assembly. The bridge drive shall consist of a reducer driven by a constant torque, variable speed dc electric motor, [single] [_____] phase, 60 Hz, [120] [_____] volts, totally enclosed, suitable for continuous duty. The reducer shall be housed in an oil- and dust-tight casing, equipped with anti-friction bearings, and designed for splash-type lubrication. Switches permitting directional change of the unit shall be provided on the drive base assembly. An idler stand complete with adjustable base and sheave shall be provided at the opposite end of the tank. A complete corrosion-resistant enclosure shall be provided for each drive and idler assembly.

2.9.4.3 Sludge Removal System

******************************************************************************
NOTE: Assemblies, parts, and connectors in submerged service should be made of 304/316 stainless steel or fiberglass, rather than aluminum.
******************************************************************************

The total sludge removal capacity range of the vacuum sludge removal system shall be adjustable from [_____] L/second gpm to [_____] L/second gpm. All siphon piping and headers shall be constructed of stainless steel with vacuum tight welded joints. The piping assembly structure shall be designed to adequately support itself on the tank floor with the basin dewatered. Orifices of adequate size and spacing shall be provided in each header pipe. The entrance velocity at each orifice shall be designed to create an angular zone in influence, to permit all sludge on the basin floor to be cleaned at the end of each cycle. Each siphon pipe shall be independent from the others and independently controlled. Each siphon pipe shall terminate and discharge into a sludge control device. The submerged siphon piping shall be stainless steel on the exterior surface in accordance with collector manufacturer's recommendations to protect the pipe from oxygen cell corrosion. Individual sludge control for each siphon
shall be furnished as an integral part of the siphon collector. The control shall be corrosion resistant and adequately supported. The control device shall be suspended from the floating structure and secured to the siphon piping. The flow rate shall be adjustable by manually setting the adjustable discharge opening using a rising stem operator. The sludge control device shall be constructed to prevent air from breaking the siphon during priming. The siphon collector shall be designed to permit priming of each suction header. A priming device consisting of a portable, wet-dry vacuum pump with handle and wheels shall be furnished. Valves shall be provided for each siphon pipe and shall be capable of holding 635 mm 25 inches of mercury with zero leakage. Flexible single ply rubber priming hose and quick disconnect couplings shall be provided with each unit. The vacuum pump shall be industrial wet/dry type, [single] [_____] phase, 60 Hz, [120] [_____] volts ac. One priming pump shall be provided per pair of siphon collector mechanisms.

2.9.4.4 Control Panel

A control panel shall be furnished by the collector manufacturer, and shall contain all controls necessary for the operation of the collector. All of the components shall be factory installed in a NEMA 250, Type 4 [4X] [3R] enclosure, factory prewired to numbered terminal strips within the enclosure and factory tested. Manual override controls for collector travel shall be included, in addition to the automatic operations. A reversing mechanism shall be furnished, with time delay relays to change the collector direction of travel automatically. A SCR controller shall be provided to vary the speed of the collector at between [1.2] [_____] m/minute [4] [_____] fpm and [3.7] [_____] m/minute [12] [_____] fpm for both directions of the bridge travel. Limit switches with internal heaters and stainless steel limit switch actuators shall be furnished to reverse the movement of the collector. One limit switch shall be securely mounted to the bridge drive, and the other limit switch shall be securely mounted to the idler stand. Microswitch shall be affixed to overclutch clutch to activate alarm and shut down.

2.9.4.5 Automatic Programmer

A programmer shall be provided in the control panel to automatically adjust rate of collector travel. Upon reversing direction of the collector, the programmer shall allow collector rate of travel to increase automatically for manually preset distance and then return to preset normal rate of travel. The programmer shall have a manual override. A single phase, 60 Hz, [120] [_____] volts ac solid state, encapsulated, proximity switch shall be provided as an integral part of the programming control.

2.9.5 Scum Removal

A retracting surface skimmer shall be provided to remove scum from the tank. The mechanism shall be attached to the bridge and shall have a blade extending the width of the tank or as required. The skimmer shall operate while the bridge is traveling in one direction only and shall retract for the return trip of the bridge. A beaching type scum trough shall be provided across one end of the basin. The trough shall be constructed of [steel plate] [or] [fiberglass] to the dimensions indicated. All hardware required for trough installation shall be provided.

2.9.6 Effluent Removal

**************************************************************************
NOTE: Coordinate with paragraph WEIR PLATES.

**************************************************************************

Weir plates shall be [fabricated steel plate] [or] [fiberglass reinforced polyester plastic] of the dimensions indicated. Vee notches in fiberglass weir plates shall be molded in the plate; cut edges are not acceptable. Weir plates shall be mounted in a manner to be watertight and to provide a minimum of 50 mm 2 inches vertical adjustment. The effluent trough shall be fabricated from [steel plate] [or] [fiberglass reinforced polyester plastic] to the dimensions indicated. Joints between sections shall be watertight. Support assemblies of adequate strength shall be provided to prevent trough distortion through filling and draining of the tank.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 FACTORY PAINTING

All ferrous metal equipment, except stainless steel and galvanized steel, shall be cleaned, primed, and given two coats of machinery enamel at the factory. Field painting shall be in accordance with Section 09 90 00 PAINTS AND COATINGS.

3.3 FRAMED INSTRUCTIONS

Post framed instructions, containing wiring and control diagrams under glass or in laminated plastic, where directed. The instructions shall show wiring and control diagrams and complete layout of the entire system. The instructions shall also include, in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system. Submit a copy of the posted instructions proposed to be used. The framed instructions shall be posted before acceptance testing of the system.

3.4 EQUIPMENT INSTALLATION

3.4.1 Installation

Install equipment as indicated and in accordance with the manufacturer's written instructions. Submit drawings containing complete wiring and schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Drawings shall show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation.

Furnish grease and oil, of grades recommended by the manufacturer, as part of the installation and as required for initial operation.

3.4.2 Adjusting

Make field adjustments as required for proper operation of the equipment.
3.4.3 Testing

3.4.3.1 Operational Test

Each mechanism shall be subjected to an operational test, under the observation of the Contracting Officer. The test shall demonstrate that the equipment is not defective and is in safe and satisfactory operating condition. Submit performance test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate in each test report the final position of controls.

3.4.3.2 Torque Test

A torque test shall be conducted on one mechanism selected by the Contracting Officer. The test shall be conducted under the supervision of a factory serviceman and shall be observed by the Contracting Officer. The purpose of the test is to verify the structural integrity and adequacy of the mechanism and drive. The torque test shall consist of securing all rake arms at multiple points by cables to anchor bolts installed in the tank floor at locations recommended by the manufacturer. A torque load shall be applied to the drive by hand if possible. The magnitude of the applied load shall be measured by a calibrated pressure reading, the plunger and rod area, and the distance of the line of action of each cylinder from the centerline of the mechanism. Reading shall be taken at 100, 120, and 140 percent of continuous operating torque. The test loads shall be applied such that the torque overload device can be used to indicate the alarm and motor shut-off torque values of the drive.

3.4.3.3 Retesting

If any deficiencies are revealed during any test, such deficiencies shall be corrected and the tests shall be reconducted.

3.4.4 Tank Bottom

Finish the tank bottom in such a manner that full contact will be obtained between the [sludge scrapers] [flights] [manifold] and the surface.

3.5 WELDING

*********************************************************************************************************************************************
NOTE: If the need exists for more stringent pipe welding requirements, delete the sentences in the first set of brackets.
*********************************************************************************************************************************************

[Piping shall be welded in accordance with qualified procedures using performance qualified welders and welding operators. Procedures and welders shall be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. The Contracting Officer shall be notified 24 hours in advance of tests and the tests shall be performed at the work site if practical. The welder or welding operator shall apply his assigned symbol near each weld he makes as a permanent record. Structural members shall be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING.] [Welding and nondestructive testing procedures for piping shall be as specified in Section 40 05 13.96]
WELDING PROCESS PIPING.]

3.6 MANUFACTURER'S SERVICES

Provide the services of a manufacturer's representative who is experienced in the installation, adjustment, and operation of the equipment specified. The representative shall supervise the installation, adjustment, and testing of the equipment.

3.7 CLOSEOUT ACTIVITIES

3.7.1 Field Training

A field training course shall be provided for designated operating and maintenance staff members. Training shall be provided for a total period of [_____] hours of normal working time and shall start after the system is functionally complete but prior to final acceptance tests. Field training shall cover all of the items contained in the Operating and Maintenance Manuals.

3.7.2 Operating and Maintenance Manuals

Detail in the Operation manuals the step-by-step procedures required for system startup, operation, and shutdown. Include in the Operation manuals the manufacturer's name, model number, parts list, and brief description of all equipment and their basic operating features. List in the Maintenance manuals routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include in the Maintenance manuals piping and equipment layout and simplified wiring and control diagrams of the system as installed. Manuals shall be approved prior to the field training course.

3.6 REMOVAL OF USED OIL

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for turbine oil for hydroelectric power plants. Requirements in this section assume a complete or significant change out of power plant oil. For contracts procuring smaller amounts of supplemental oil, testing requirements may be lessened depending on risk-tolerance, and it might be cost-effective for all testing to be performed by the Government rather than the Contractor.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: It is advised to consult with the technical proponent of the specification prior to its use. Corps Districts/Project offices can contact the Hydroelectric Design Center for assistance and/or request additional information/clarification related to the information contained in the entire document (POC: Catherine Campbell 503-808-4255 or Catherine.L.Campbell@usace.army.mil).
NOTE: Initial compatibility testing is more involved than per-delivery compatibility testing. Initial compatibility testing is to demonstrate that the chemistry of the new name-brand oil is itself compatible specifically with the in-service oil at the plant in question. Per-delivery compatibility testing is to confirm the delivered oil is in fact the correct oil, and to confirm that no contamination occurred during delivery which affected compatibility. Often the initial compatibility testing is performed by the Government, for instance using oil samples which are sent in together with bids for a job. For a very large job such as a major powerhouse rehabilitation, where the turbine oil replacement is only a fraction of the cost, it might be advantageous to require the Contractor to perform the initial compatibility testing. Initial compatibility testing should include all Tier 1 and Tier 2 tests in ASTM D7155-18 "Standard Practice for Evaluating Compatibility of Mixtures of Turbine Oil" plus Viscosity and Acid Number from Tier 3, and RPVOT, Rust Prevention, and Copper Corrosion from Tier 4. This testing should be performed even if the oil being purchased for the complete plant oil replacement is the same name brand of oil which was purchased for the previous complete plant oil replacement, to ensure that even the same name-brand oil is still compatible with in-service oil. (A name brand can have a change in the proprietary recipe without notification to the Government.) Initial test results can take up to four weeks even expedited. If multiple bids/brands might be accepted, testing on bidder-submitted samples by the Government may exceed GPC (Government purchase card) limits depending on number of samples/bids. If testing is to be done at this stage, it is recommended to solicit quotes ahead of time to allow for timely testing and adequate competition. The testing duration should also be taken into account when soliciting the contract.

Note that for significant quantities of oil, such as a railcar at at time (20,000-24,000 gallons), and especially if the Contractor is filtering the oil pre-delivery, the lead time between placing a task order and getting a delivery can be 12-16 weeks.

This specification assumes use of traditional Group 1 and 2 mineral oils. If a synthetic EAL is desired, for instance during a major rehabilitation in an environmentally sensitive area, replacing turbines, and with opportunity to replace any incompatible oil-wetted materials (seals, paint), please contact the PROPONENT. There are efforts both pending and underway to develop, research, test, and vet potentially feasible EALs, for example
by the Centre for Energy Advancement through
Technological Innovation (CEATI) Hydraulic Plant
Life Interest Group (HPLIG). At this time, however,
the most viable candidates for performance in
hydropower units are also entirely incompatible with
in-service oils, as well as incompatible with
several materials.

**************************************************************************
**************************************************************************

NOTE: The 17/15/12 cleanliness level and 100 ppm
water content PPM level in this spec assume that all
the oil is being changed in a Powerhouse at once, in
which case it is typically more convenient for the
Government to have the Contractor perform filtration
and dehydration such that new oil does not require
any purification by the Project prior to use. (For
digital governors, the offline "kidney-loop" filter
dedicated to the governor sump can further polish
the governor oil up to 15/13/10, if governor sump
has breathers to exclude contamination from the
air.) If only supplemental oil is needed or the
Project wishes to handle purifying, the cleanliness
and water requirements should be changed to FIO or
removed.

Two recommended ways of oil procurement are through
a SATOC (Single Award Task Order Contract) or a DLA
(Defense Logistics Agency) purchase. A SATOC allows
for issuing task orders each time the powerhouse is
ready to accept another "batch" of oil. DLA
purchases allow for specification of a name brand
product. Extra storage may be key to having enough
flexibility to deliver only the new oil from the
clean lubrication oil tank in the oil storage room
to the powerhouse for makeup oil and to fill empty
units, while holding all oil that is drained back to
the dirty lubrication oil tank in the oil storage
room to be trucked away. During this transition,
the Project's own lube oil purifier would be
entirely idle, with no oil being moved from the
dirty tank to the clean tank. This offers
tremendous savings and simplicity over constructing
a parallel oil delivery system to keep the new and
old oils separate. To get extra storage room for
incoming and outgoing oil, it may be beneficial to
empty out the transformer oil tanks, wasting any
residual oil, testing for PCBs (hopefully none) and
wiping those tanks down to accept lube oil, at least
temporarily. At the end of the contract, it may be
desirable to empty and wipe down at least the dirty
transformer oil storage tank again, to be ready in
case a sudden urgent need to drain a transformer
comes up. To change all the oil in the powerhouse
this way, it is strongly recommended for the new oil
being delivered to be clean enough to go straight to
the units. Ordering "batches" of oil in railcar
quantities (20-24k gallons) to the extent possible
will get the Government a better price. In a case
where extreme caution is prudent, oil can be delivered to temporary Contractor-provided storage containers, and only moved into Government tanks after post-delivery oil samples pass all required lab tests.

For change out of all the oil in a Powerhouse, it is highly recommended to flush the system first; see EM 1110-2-1424 LUBRICANTS AND HYDRAULIC FLUIDS. Contact the Hydroelectric Design Center for questions, concerns, and support for flushing specifications.

1.1 SUMMARY

NOTE: When changing the oil in a Powerhouse, there will typically be some waste. It is highly desirable to have flexibility in the contract to allow the last delivery order to be an unknown amount smaller than a full truckload, though typically that will mean a higher per-gallon price for the final delivery.

It is desirable to have zinc-free turbine oil. Zinc-free oil is more environmentally friendly. Also zinc additives like "ZDDP", while effective, can break down under certain conditions into undesirable compounds. Over time, ZDDP + Water + Heat $\Rightarrow$ Sulfuric Acid + Hydrogen Sulfide. This can pose a risk, for example in a poorly ventilated area such as the bottom of a damp regulating outlet tower in a reservoir with hydraulic-operated gates and a submerged oil heater in the sump. Typically for hydropower applications, zinc or ZDDP as an anti-wear additive is not needed due to relatively mild conditions, though there are some exceptions such as when speed-increasing gears are part of the equipment being lubricated by the same turbine oil. (Even in these cases, "extreme pressure" additives should be avoided due to being more chemically aggressive and unnecessary.) Note that some oils may have "EP" in the name brand without actually having the aggressive additives.

For turbine bearings and governors in powerhouses, however, compatibility requirements have sometimes led to the choice of non-zinc-free oils.

Typically if an oil is zinc-free, its Product Data Sheet (PDS) will explicitly claim "zinc-free".

There are times when a particular name brand of oil is justified and this is known prior to advertisement because comprehensive compatibility checks were done beforehand for a complete oil replacement, or the quantity of top-off oil does not justify experimenting with anything other than the
existing name brand. This specification has bracketed choices which allow for a name brand to be indicated if approved.

**************************************************************************

NOTE: Depending on initial oil compatibility testing strategy and/or whether a name brand is justified, consult with contracting regarding whether the language about "...bidders must submit one gallon of proposed turbine oil with proposals" in the second paragraph belongs here and/or in Instructions to Offerors.

**************************************************************************

This specification includes [zinc and ]chlorine-free rust and oxidation inhibited (R&O) mineral oils for use in hydraulic turbine and generator bearings, Kaplan turbine hubs, hydraulic-turbine governors, and other applications, where high grade turbine oil having anti-corrosion and anti oxidation properties is required. In addition, this specification covers delivery and installation of up to [_____] gallons of approved [(ISO viscosity grade 68)](ISO viscosity grade 100) turbine oil for [_____] Powerhouse. Laboratory test results for [each railcar of oil ordered and for ]each truck of oil delivered are required.[ Oil is to be delivered at the unusual cleanliness level of 17/15/12(c) and with less than 100 ppm of water.]

Because compatibility is a critical feature of replacement turbine oil, bidders must submit one gallon of proposed turbine oil with proposals. The Government will have compatibility tests performed at its own cost. Any oils which fail to demonstrate compatibility with the in-service oil at [_____] Powerhouse per ASTM D7155-18, including all tests in Tiers 1 and 2 and select tests from Tiers 3 and 4 (ASTM D445 or ASTM D7042, ASTM D664 or ASTM D974, ASTM D2272, ASTM D665, and ASTM D130) will be ineligible. The tests will be performed with the following six ratios:

- 100 percent new oil to 0 percent in-service oil
- 90 percent new oil to 10 percent in-service oil
- 50 percent new oil to 50 percent in-service oil
- 10 percent new oil to 90 percent in-service oil
- 5 percent new oil to 95 percent in-service oil
- 0 percent new oil to 100 percent in-service oil

Potential bidders may wish to have their own tests conducted prior to bidding, and may request a one-gallon sample of in-service oil for that purpose.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only. The year refers to the basic date of issuance of the standard or code. All Codes and Standards are to include published Interpretations and Interim Amendments or Revisions by the Standard or Code Authorities referenced must be current as of date of contract.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "HDC" for the Hydroelectric Design Center MCX in Portland District, "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Oil Test Independent Laboratory Qualifications; G,HDC

Oil Delivery Truck [And Temporary Contractor-Provided Clean Oil Storage Tank ]Cleaning Methods; G,HDC

Filtration Procedure(s); G,OPS,HDC

OIL SAMPLING PLAN; G,OPS,HDC

Oil Spill Prevention Procedure; G,OPS,ECC,HDC

Oil Vendor Qualifications; G,HDC
Oil Delivery and Removal Procedure; G,OPS,ECC,HDC

SD-04 Samples

One Gallon Of Oil From Each Onsite Tank Or Truck; G,OPS

SD-06 Test Reports

[ INITIAL COMPATIBILITY TESTING; G,HDC ]

Data Of Chemical And Physical Characteristics, Per Delivery; G,HDC

Compatibility Testing Results, Per Delivery; G,HDC

SD-07 Certificates

[ Certification Of Brand Name Product; G,HDC ]

Certification Of Clean Oil Delivery Truck, Per Delivery; G,HDC,OPS

Chain Of Custody, Per Delivery; G,OPS

1.4 OIL TEST INDEPENDENT LABORATORY QUALIFICATIONS

Submit for approval the qualifications of the proposed oil testing laboratory, within 60 days of Award. The laboratory must be independent of [oil manufacturer] [ExxonMobil] [Shell] [Chevron] and independent of the Contractor. The laboratory must be ISO ISO/IEC 17025 certified, and must have a minimum of 3 years of experience performing the ASTM D7155-18 Tier 1 Visual Appearance compatibility testing (note that this Tier 1 testing is not certified by ISO). Examples of qualifying laboratories are:

TestOil, 20338 Progress Drive, Cleveland, OH 44149, (216) 251-2510

SGS Herguth Laboratories, 101 Corporate Place, Vallejo, CA 94590, (800) 645-5227

Lubrication Engineers, 1919 E. Tulsa Street, Wichita, KS 67216, (800) 537-7683

1.5 OIL DELIVERY

*******************************
NOTE: Quarantining the oil in Contractor storage reduces the risk taken on by the Government. In a case where the oil fails compatibility, any tanks that held the incompatible oil will need to be thoroughly cleaned prior to accepting more oil. By utilizing Contractor-provided storage tanks, it can be ensured that the Government tanks will not be contaminated by incompatible oil. This also puts the entire chain of custody of any rejected oil in the hands of the Contractor.

However, using Contractor-provided temporary oil storage also adds cost and increases the need for oil spill prevention measures. It may be an added burden for the Project to inspect daily for leaks, for instance. There are various ways to reduce
everyone's risk, depending on the partnering relationship, costs, and quantity of oil. For example, if several railcars (20-24k gallons of oil) are being ordered, and the distributor has a tank farm with rail spurs, they may be able to hold a railcar from the manufacturer pending a set of test results to be approved by the Government. Then the distributor takes custody of the oil from the manufacturer, pumps it into clean tanks for filtration, submits cleanliness measurements to the Government, then pumps it into clean trucks for delivery, takes a sample from the truck at delivery, pumps it into the Government's clean tank, where it is quarantined pending acceptable test results from that sample. This way, Government acceptance of the oil depends only on factors which were in the Contractor's control. However, the Contractor must have confidence in their process, because rejection will mean the oil must be removed from the Government's tank and replaced at no additional cost to the Government. Also in this case the Government's tank should be cleaned, pumping or vacuuming out all oil and using squeegees and/or lint-free rags to wipe surfaces clean. Cleaning Government tanks prior to accepting the first delivery of new oil into them is good practice in any case. If other on-site work is already required in the contract, it might be worth requiring the Contractor to perform this work, which likely includes tanks which are confined spaces.

In any case, the samples used for final Government acceptance of the oil should be taken after the oil is onsite at the Powerhouse, to avoid accepting oil which is then contaminated during delivery. (One exception might be a tote which was filled and shipped directly from the oil manufacturer, which is sealed with no opportunity for contamination between the manufacturer and the Project.)

[All oil deliveries will be held in Contractor-provided temporary onsite storage for up to one week after submittal of lab test results in order to allow for review and approval. ][Oil will be held in Government storage tank pending acceptable test results. If test results are unacceptable, remove the oil from the Government tank and replace it within 12 weeks at no additional cost to the Government.] Particular lab test results required include both property testing and compatibility testing as specified below.

1.5.1 OIL DELIVERY TRUCK [AND TEMPORARY CONTRACTOR-PROVIDED CLEAN OIL STORAGE TANK ]CLEANING METHODS

Submit for approval the methods which will be used to clean oil delivery trucks and the qualifications of the truck cleaning company, within 60 days of Notice of Award. Include a description of how the cleaning procedure results in zero residue and therefore minimizes risk of contamination of new oil. Include a description of what documentation will be offered to serve as certification that a delivery truck was cleaned. Cleaning methods
must include but not be limited to the steps outlined in paragraph 1.5.1.1 or approved equivalent procedure.

Once the delivery truck, hoses, and pump(s) have been cleaned the first time per these specifications, if no products other than [the approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68] have been transported by this equipment as evidenced by the manifests, then additional cleaning is not needed between loads.

1.5.1.1 Oil Delivery Truck [and Temporary Contractor-Provided Clean Oil Storage Tank] Cleaning

(a) Drain each compartment and discharge line.

(b) Use clean unused #2 diesel fuel in the cleaning process, using either spinner ball or spray head.

(c) For tanks or single-compartment trucks, place 50 to 60 gallons of clean diesel fuel into the compartment. For triple-compartment trucks, place 10-15 gallons of clean diesel fuel into each compartment.

(d) Attach spinner ball or spray head to man-way on top of compartment. Attach the discharge hose to the discharge port of the compartment. Circulate the diesel fuel through the discharge hose to the spinner ball or spray head. Repeat this for a minimum of 30 minutes. If there are multiple discharge ports, clean each discharge port (i.e., circulate the diesel fuel through each discharge port during the cleaning process).

(e) After cleaning process is complete, discharge the diesel fuel through the discharge hose to a proper container.

(f) After cleaning, check the compartment for residual product, emulsion, dirt, strong odor, or foreign debris. If compartment does not look clean, repeat flushing procedure.

(g) After cleaning, drain all discharge ports on the transport, including all manifold points of discharge and all internal valves opened, and check for residual product or diesel fuel. Slight elevation of the transport front will facilitate drainage. Total residual diesel fuel remaining in the entire transport or tank must not be more than 5 gallons.

(h) Use a nitrogen or dry compressed-air blowdown.

1.5.1.2 Onboard Hose Cleaning

(a) Drain and flush all hoses used to deliver product with clean diesel fuel. Inspect, and repeat as needed until clean.

(b) Drain diesel fuel from hoses and blow dry with nitrogen or air.

1.5.1.3 Onboard Pump Cleaning

(a) Clean pump to be visibly free of dirt, water, or other contamination.

(b) Pump a minimum of 4 gallons of [approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68]. Oil used for pump flushing may be of any viscosity.
1.5.2 DELIVERY HOSE REQUIREMENTS

Hoses must have a rated pressure of no less than 125 psi or 150 percent of the relief valve setting on the delivery pump system, whichever is greater. Delivery hose must be not less than 2 inches in nominal diameter. Hoses must be cleaned by a rag or pig to remove any loose visible contamination including dirt, sludge, varnish, lint, metal or any other visually observable debris. Before connecting the hoses allow the Government to visually check to confirm that the cleaning has occurred.

[1.5.3 FILTRATION PROCEDURE(S)

**************************************************************************
NOTE: There is good evidence that filtration does eventually remove anti-foam additives from the oil regardless of the method used. Certainly it is preferable to filter oil that is above 50 degrees F and relatively dry. All other things being equal, higher flow rates seem to be beneficial in slowing removal of anti-foam additives. See also notes at paragraph 2.3.1 Properties and 2.4 DEGRADATION.
**************************************************************************

Submit filtration procedure(s) no later than 30 days prior to filtering any oil. Procedures must follow oil manufacturer's recommendations and must include, but not be limited to, flow rates, temperatures, and filter information such as manufacturer, media, micron & Beta ratings. As applicable, differentiate between procedures for pre-delivery filtration at Contractor facility, pre-delivery filtration in delivery truck, onsite filtration in Contractor-provided temporary storage tank, and filtration during delivery through a filter cart.

]1.5.4 OIL SAMPLING PLAN

Obtain all samples per ASTM D4057 or ASTM D4177. See also paragraph 3.1 OIL TESTING AND SAMPLES. Submit for approval an oil sampling plan including but not limited to the following:

(a) Description of method of delivery (e.g. truck capacity, number of compartments) and onsite storage (e.g. Contractor-provided temporary double-walled storage tank) for each delivery of [_____] gallons of new [approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68].

(b) Procedure to take oil samples for acceptance testing and for the Government (e.g. truck driver will pull sample with equal parts of oil coming from each oil compartment, with Government witness, and will label the container with the date and product name).

Procedure to provide clean sample bottles to the Government for in-service oil from [_____] Power Plant for compatibility testing (e.g. shipped directly from testing lab).

1.5.5 OIL SPILL PREVENTION PROCEDURE

**************************************************************************
NOTE: A spill prevention RESPONSE plan (who to call, cleanup) should also be submitted per the
**************************************************************************
environmental specification complying with site specific environmental concerns and requirements. Any other requirements or plans per the environmental specification or PDT's ECC should also be submitted. Compliance with the Clean Water Act is a HIGH priority.

**************************************************************************

Submit an Oil Spill Prevention Procedure no later than 30 days prior to delivery, including but not limited to containment around the delivery truck, product data for oil spill prevention materials to be brought onsite, planned placement of oil socks/diapers, taping plastic around any hose connections, and plugging any drains being crossed by the hoses. The work must also include spill prevention for the truck, hoses, and any temporary storage tanks through which the oil is delivered, stored, and removed. Spill prevention must be in compliance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. Spill prevention must be set up and observed by the Government prior to delivering or removing any oil.

1.6 OIL VENDOR QUALIFICATIONS

Submit qualifications certifying that the oil vendor:

(a) Is an Authorized Distributor of [approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68], as indicated either on the distributor locator website or by a letter from [oil manufacturer][ExxonMobil][Shell][Chevron]

(b) Has the ability to provide consistent timely turnaround on oil sample test results, as evidenced by a contracted relationship with, or a letter of commitment, from a qualified testing lab or labs.

PART 2 PRODUCTS

[2.1 INITIAL COMPATIBILITY TESTING

**************************************************************************

NOTE: As was noted above, compatibility between new oil and in-service oils must be evaluated and determined by lab testing. Only oils found to be compatible may be mixed with in-service oil or used as replacement oil. The compatibility testing is necessary, even when both base oils are mineral oils such as Group 1 and Group 2 oils, because the new oils currently readily available on the market may have been formulated with different additives, which may not be fully compatible with additives of the in-service oils. Compatibility testing for oil purchases of any significant volume is necessary even when replacing in-kind, as formulas change over the years. This paragraph is included in brackets in case the decision has been made to have initial compatibility testing performed by the Contractor. "Equivalency" of another product cannot be established without repeating all of this testing, because oil manufacturer's additive package "recipes" are proprietary. If there is a need to switch from one new oil to another new oil mid-way through the contract (for instance due to
manufacturer stopping production of original product), this testing must be conducted between new oil #1 and new oil #2 as well as between new oil #2 and the in-service oil.

**************************************************************************

Do not purchase any oil, other than in quantities required to perform testing, prior to Government approval of initial compatibility testing results from an approved independent oil testing laboratory. Coordinate with the Contracting Officer to provide sample container(s) to the proper address and to have sample(s) of in-service oil shipped to the laboratory for evaluation of compatibility between the two oils. Perform compatibility evaluation in accordance with ASTM D7155-18, including the following tests for each of the six mixtures listed below:

From Tier 1 Visual Appearance, all tests.
From Tier 2 Interfacial Properties, all tests.
From Tier 3 Physical/Chemical Properties, ASTM D445 or ASTM D7042, and ASTM D664 or ASTM D974.
From Tier 4 Performance Properties, ASTM D2272, ASTM D665 and ASTM D130.

Oils which fail to demonstrate compatibility with the in-service oil at [_____] Powerhouse per ASTM D7155-18 will not be approved for purchase. Perform all the tests listed above with each of the following six ratios:

100 percent new oil to 0 percent in-service oil
90 percent new oil to 10 percent in-service oil
50 percent new oil to 50 percent in-service oil
10 percent new oil to 90 percent in-service oil
5 percent new oil to 95 percent in-service oil
0 percent new oil to 100 percent in-service oil

Do not purchase any oil other than the exact name brand of oil which has been approved by the Government as being compatible with in-service oil. No "equivalent" products are acceptable for this requirement.

]2.2 CERTIFICATION OF BRAND NAME PRODUCT

Submit certification such as a letter with the manufacturer's certificate of analysis, Product Data Sheet (PDS), and Material Safety Data Sheet (MSDS) attachments that the product to be delivered per these specifications is the exact brand name specified. No "equivalent" products are acceptable for this requirement.

]2.3 GENERAL REQUIREMENTS

2.3.1 Properties

**************************************************************************

NOTE: In recent years, it has become apparent from test results that filtering oil to the desired cleanliness levels DOES remove anti-foam additive. Cleanliness levels are more important than foam for equipment life. It may be necessary to check whether oil level sensors are susceptible to false readings in case of foam (e.g. ultrasonic, laser). Removal of anti-foam additive affects the foam.
"tendency", meaning how much foam is formed, but should not significantly affect foam "stability", or how long the foam lasts. Therefore, if the Contractor is to filter new oil, the foam tendency test results must be FIO (though the foam stability test results are still "G"). If the Contractor is not required to filter new oil prior to delivery, then the foam tendency results are "G" (as well as the stability results) but the cleanliness and water content results are FIO.

Provide turbine oil which is a blend of virgin petroleum-based stocks plus additives, free of [zinc and ]chlorine, resulting in high-grade turbine oil having anti-rust and anti-oxidation properties suitable for use in hydraulic turbines, generator bearings, Kaplan turbine hubs and related applications. Chemical and physical characteristics of oil must meet or exceed the requirements listed in TABLE 1, [with the exception that foam tendency results are FIO] [with the exception that cleanliness and water content results are FIO]. Determine oil characteristics by tests conducted in accordance with the tests methods as noted in the table.

2.3.2 Chemical And Physical Characteristics

The turbine oil must conform to the requirements established in TABLE 1 when tested according to the standards indicated. Submit certified test data showing that the oil meets or exceeds characteristics values specified in TABLE 1.

************ NOTE: This table must be tailored depending on the actual oil chosen, in particular with respect to the RPVOT value and Acid Number. If there is a wide range of allowable turbine oils, add a requirement that the values for these characteristics must be within either 10 percent of the manufacturer's published value or within the manufacturer's quality control limits (in case values are not published) for new, unused oil. ************

### 2.4 DEGRADATION

**************************************************************************

**NOTE:** In recent years, contracts for turbine oil replacement have required that the Contractor deliver oil to 17/15/12 cleanliness, and also test delivered oil for properties & characteristics. Results from this have shown that filtration will affect "foam tendency" significantly due to removal of anti-foam additives (especially if oil is...
filtered with high water content). But even though the removal of anti-foam additives will tend to allow more foam to be generated (tendency), that foam should still subside when the oil is at rest - in other words, "foam stability" should NOT be significantly affected by the removal of the anti-foam additive.

The physical and chemical properties of the oil, with the exception of foam tendency, must not be degraded (changed from the specified values) by filtration through two-micron mechanical type filters, by centrifugal purification, two-micron coalescing filters, balanced charge agglomeration or by vacuum type purifier, all of which have been designed for turbine oil.

2.5 HOMOGENEITY

Additive agents must remain uniformly distributed throughout the oil at all temperatures above the pour point and up to 120 degrees C 250 degrees F. When the oil is cooled below the pour point, it must regain homogeneity while standing at temperatures of 5 degrees C 10 degrees F above the pour point, and retain clear and bright appearance.

PART 3 EXECUTION

3.1 OIL TESTING AND SAMPLES

NOTE: Actual testing plans, pre-advertisement, pre-award, and/or during contract, can vary depending on the details of the situation. Please consult with the proponent.

Due to the cost to perform testing on oil, it is recommended to provide an estimate to the number of tests required throughout the life of the contract.

3.1.1 Data of Chemical and Physical Characteristics, Per Delivery

As a rough estimate for information only, [_____] of these submittals are expected to be required overall.

Furnish certified test data, for the [approved oil] name brand (if justified) e.g. Mobil DTE, Shell Turbo T68), showing results for all the values specified in TABLE 1. The certified test data must be submitted for approval within five business days after the delivery unless otherwise approved. This testing is required for each delivery of oil; differentiate the submittals using an identifier such as a delivery date and powerhouse name. A new submittal is required for each delivery.

3.1.2 Compatibility Testing Results, Per Delivery

As a rough estimate for information only, [_____] of these submittals are expected to be required overall.

Furnish certified test data, showing compatibility results for each delivery of oil per ASTM D7155-18 Tier 1, visual rating, using blends of in-service oil and new oil the ratios 100/0, 90/10, 50/50, 10/90, 5/95 and
include results for all six samples (the two "neat" oil samples and the four mixtures). Each compatibility test requires a sample of the powerhouse's in-service oil, which will be furnished by the Government, in a Contractor-furnished one-gallon sample container. Use one gallon of new oil from each delivery, which is a blend of oil from each container used in the delivery, e.g. if oil is delivered by a tanker truck with one extra tank, the gallon used for this testing should be half from the truck and half from the extra tank. The certified test data must be submitted for approval within ten business days after each delivery of oil unless otherwise approved. This testing is required for each delivery of oil; differentiate the submittals using an identifier such as a delivery date and powerhouse name.

3.1.3 One Gallon of Oil From Each Onsite Tank or Truck

As a rough estimate for information only, [_____] of these one-gallon samples are expected to be required overall.

The Contractor must submit a one-gallon sample of the oil from each container in the truck at each delivery. Sample is to be obtained in a manner specified in ASTM D4057 or ASTM D4177. Contractor may submit a single gallon of evenly mixed oil from all containers if desired - e.g. if oil is delivered by a tanker truck with one extra tank, a single gallon, comprised of a half-gallon from the truck, and a half-gallon from the extra tank, may be submitted rather than two separate gallons. This sampling is required for each delivery of oil; differentiate the samples using an identifier such as a delivery date on the sample container.

3.2 FILTRATION

In all cases, including at Contractor's facility if applicable, warm oil to a minimum of 50 degrees Fahrenheit prior to filtration.

3.3 DELIVERY OF NEW OIL

Deliver new oil in accordance with specifications and in coordination with the Contracting Officer for the delivery schedule. Spill prevention must be set up and observed by the Government prior to delivering any oil.

3.3.1 Oil Delivery and Removal Procedure

[Coordinate with the Contracting Officer regarding best location for oil delivery and removal trucks onsite.][Park oil delivery and removal trucks as close as possible to the oil fill/discharge cabinet in the erection bay.][ Use a filtration cart with calibrated particle counter during each oil delivery. Deliver new oil at a minimum of 50 degrees Fahrenheit through the filtration cart. ]Submit a detailed Oil Delivery and Removal Procedure for new oil deliveries and for the used oil removal[, including but not limited to product data on the filtration cart, product data on the filters themselves, product data on the particle counter, and calibration certificate for the particle counter per ISO 11171]. Include details regarding how used oil will be removed and disposed of. Set up oil delivery truck inside erected truck spill containment. Set up spill containment for the hoses prior to connecting and routing the hoses. All spill prevention equipment and provisions must be approved by the Contracting Officer prior to delivering oil. Take samples at each delivery of new oil as specified herein.
3.3.2 Chain of Custody, Per Delivery

Upon delivery of oil, provide a chain of custody report that includes documentation such as the bill of lading. Reports must track the oil, referenced by its batch number, from its origin to final delivery signed and dated by a designated representative. In the event of a failed compatibility test, this will be used to investigate when the oil was contaminated. Submit chain of custody at each delivery; use dates to differentiate among submittals.

3.3.3 Certification of Clean Oil Delivery Truck, Per Delivery

As a rough estimate for information only, [_____] of these submittals are expected to be required overall.

Prior to pumping oil into a powerhouse, submit certification that the truck used for that particular delivery was cleaned per the approved procedure, and that only [approved oil][name brand (if justified) e.g. Mobil DTE, Shell Turbo T68] has since been introduced into the truck. [This may be submitted electronically at the time the truck is being filled with oil for this contract, or may be submitted physically at the time of delivery.] Note that rejection of truck cleanliness constitutes rejection of oil delivery, unless otherwise approved in writing by the Contracting Officer.

3.3.4 Temporary Onsite Oil Storage

Provide means of temporary new oil storage to hold approximately [_____] gallons of new oil or leave oil truck tankers on site as new oil storage while compatibility testing is performed. Provide means of temporary used oil storage to hold approximately [_____] gallons of used oil, and remove used oil once the Project is ready to dispose of it. Oil containment measures must be provided with any form of temporary storage except in the instance of a double-walled tank. Coordinate with Project personnel for staging locations.

Upon Government approval of oil delivered to temporary onsite storage, Contractor must pump approved oil into the Government's storage tank.

3.4 INSPECTION AND ACCEPTANCE

******************************************************************************

NOTE: The Corps' Districts/Projects may perform Quality Assurance (QA) tests on samples taken at the delivery point. The QA tests should include, as a minimum, the viscosity, acid number, elemental spectroscopy, and oxidation stability. Any of the other tests in TABLE 1 are beneficial and should be considered in addition to the minimum QA tests. Samples should be taken from each bulk shipment and from not less than 10 percent of the drums taken at random from drum shipments. Such samples should be not less than 4 L 1 gal, which may be stored in more than one sample container, and a portion of each sample should be saved for later confirmation tests in the event that the results from the first tests indicate that the oil does not meet the specification requirements.

******************************************************************************
At the point of oil delivery, the Government will obtain samples in a manner specified in ASTM D4057, and may perform such tests as are deemed necessary to determine whether the oil meets compatibility requirements as well as the specifications values listed in TABLE 1. The delivered oil must remain in a storage tank (if applicable) and cannot be used until the test results are received from the laboratory. Should the oil fail to meet requirements, or show results incompatible with being the specified name brand required, or be so contaminated at the delivery point that it fails compatibility testing with in-service oil, the Contractor is responsible for removing oil[, cleaning Government tanks used to store that oil,] and disposing of the rejected oil and replacing the oil at no additional cost to the Government, within 3 months of initial delivery.

[3.5 TANK CLEANING]

[In the event that new oil was allowed to be stored in the Government's storage tank at the power plant, and that oil subsequently fails to meet criteria and is rejected by the Government, clean the Government tanks after removal of rejected oil.]

[Clean the two xx,xxx-gallon transformer oil storage tanks. ] [Clean the xx,xxx-gallon Clean Lube Oil Storage Tank prior to any oil deliveries. ] [Clean the xx,xxx-gallon Dirty Lube Oil Storage Tank after all used oil has been removed from the powerhouse. ] Tanks must be thoroughly manually cleaned by the Contractor. The Contractor is to physically clean and wipe out all residues from the tanks using oil-absorbent and lint-free cloths to remove all visible dirt, varnish, and debris, to the point that no residual contamination can be detected on clean lint-free white cloths. If desired, the Contractor may propose for the Contracting Officer's approval, use of their own equipment other than cloths as a first cleaning, such as a vacuum, squeegee system or pump. This may be necessary to remove oil from the very bottom of tanks. In any case, the final cleaning must be performed manually with oil absorbent and lint-free cloths. In this process, the Contractor must coordinate work with the Contracting Officer, perform all work in accordance with [SECTION 01 11 01.00 XX SUPPLEMENTARY REQUIREMENTS], and comply with all confined space requirements and procedures. The plan must be a complete plan in accordance with 29 CFR 1910 and EM 385-1-1. Cleaning of tanks is to be considered completed when inspected and approved by the Contracting Officer.

[3.6 REMOVAL OF USED OIL]

******************************************************************************
NOTE: Removal of used oil typically requires about a week's notice. The truck used to remove oil is typically completely separate from the delivery truck, and is subcontracted out. It is desirable for the contract to have flexibility regarding the total number of truckloads to be removed, and to allow for a final oil removal with less than a truckload, which will affect pricing for that load.
******************************************************************************

Remove and properly dispose of up to [_____] 8,000-gallon truckloads of used oil from the Powerhouse. With the truck parked inside the powerhouse as close as possible to the oil [supply/discharge cabinet connections][storage tanks] as directed by the Government. Approximately [_____] gallons at a time of existing used oil will be pumped to the truck. Dispose of oil offsite in accordance with applicable laws and
regulations. Coordinate with the Government prior to arriving on-site for final staging locations.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for large scale solar photovoltaics (PV) systems, and related equipment and materials. Large scale is considered greater than one megawatt capacity and grid connected.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Show the following information on the project drawings:

1. Mounting surface features.

2. Locations of solar PV modules, inverters, combiner and junction boxes, conduits and raceways, and other related equipment and materials.

3. Circuit wiring diagram of solar PV system.

4. Troubleshooting instructions.

1.2 RELATED REQUIREMENTS

**************************************************************************
NOTE: Include Section 26 08 00, APPARATUS INSPECTION AND TESTING on all projects involving medium voltage and specialized power distribution equipment.

SECTION 48 14 00 Page 7
[ Section 26 08 00, APPARATUS INSPECTION AND TESTING apply to this section with additions and modifications specified herein. ]

NOTE: To expedite interconnection and activity, solicit local utility point of contact, if known.

Coordinate with local utility interconnection and activity. [Point of contact [______].]

1.3 1.3 DEFINITIONS

a. Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in the IEEE Stds Dictionary.

b. Unless otherwise specified or indicated, solar energy conversion terms used in these specifications, and on the drawings, are as defined in ASTM E772.

1.4 1.4 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed
item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

NOTE: Permits are assumed to be obtained by firm holding design responsibility. Ensure this is clarified in contract bid package.

1.5 MAINTENANCE MATERIAL SUBMITTALS

Comply with requirements specified in Section 01 78 00 CLOSEOUT SUBMITTALS.

1.6 QUALITY ASSURANCE

1.6.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.6.2 Drawings

Submit minimum of three (3) hard copies of drawings for government approval prior to manufacturing and equipment construction or integration. Submit shop drawings at a minimum of 11 by 17 inches in size using a minimum scale...
of 1/4 inch per foot, for the exception of drawings not requiring scale. Submit site plan drawings and riser diagram and general notes at a minimum of 24 by 36 inches. Submit Installation and Assembly Details at a minimum of 24 by 36 inches. Submit at minimum scale of 1/2 inch per foot for overview and 2 inches per foot for detail.

1.6.2.1 1.6.2.1 Product Drawings

Submit complete detailed product drawings for the solar PV system consisting of shop drawings and product data sheets. Include in the shop drawings [one][three] [four] wire diagrams, utility interconnection diagrams, switchboard and switchgear drawings layout and arrangement of PV modules, support and mounting mechanism, inverters, combiner boxes, AC and DC disconnects, equipment enclosures, conduits, monitors, meters, and all other accessories associated with the installation of the PV system. Provide equipment dimensions, weights and structural mounting details.

Provide design Calculations. Include nameplate data, size, and capacity of each PV module. Include all assumptions such as applicable wind speed, snow and seismic loads. Include applicable federal, military, industry, and technical society publication references.

1.6.2.2 1.6.2.2 Installation and Assembly Drawings and Details

Submit site plan drawings, components and interconnection wiring and general notes, and installation and assembly Details drawings prior to start of construction. Drawings shall include sufficient detail for all parts of the work to enable the Government to check conformity with the requirements of the contract documents. Include in the site plan drawings: topographic and utility survey; bore logs; soils report; site plan(s); site construction details; structural drawings; structural construction details; site electrical plan; and site electrical construction details. Include in the installation and assembly drawings and details: parts lists; assembly drawings; interconnection wiring diagrams; wire and cable schedules; wire and cable termination schedules; instrument plan; instrument and control wire, conduit and cable schedules; instrument wire and cable termination schedule; control diagrams; control sequence of operation; seismic restraint details; and wind restraint details.

1.6.2.3 1.6.2.4 "As-Built" and Record Drawings

After completion of construction, submit As-Built Drawings prepared and certified by the construction contractor, showing in red ink, on-site changes to the original construction details and all underground utilities measured from field benchmarks, accurate to within 1" of centerline of the utility. Immediately record for inclusion into the as-built drawings all modifications to original drawings made during installation. Indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. "As-built" Drawings shall be prepared on a minimum of 24 by 36 inches vellum using red ink.

After submittal and approval of "As-built" Drawings, submit Record Drawings, prepared and by the project engineer(s) and architect(s), of the original design drawings reflecting all design changes and contractor noted changes in the "As-Built" drawings.

1.6.3 1.6.3 Standard Materials and Products

Provide materials and equipment that are products of manufacturers
regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products with satisfactory commercial or industrial use for [2][_____] years prior to bid opening, and past performance documentation with consistent design and bill of materials. Include applications of equipment and materials under similar circumstances and of similar size. Where [two][_____] or more items of the same class of equipment are required, products will be from a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in the technical section.

Proof of compliance with requirements of UL, where material or equipment is specified to comply. The label of or listing in UL Electrical Construction Directory will be acceptable evidence. In lieu of the label or listing, a written certificate from an approved nationally recognized testing laboratory (NRTL) equipped to perform such services, stating that the items have been tested and conform to the requirements and testing methods of Underwriters Laboratories may be submitted.

1.6.3.1 Alternative Qualifications

Products having less than a [2][_____] -year field service record will be acceptable if a certified record of satisfactory field operation of not less than [6,000][_____] hours, exclusive of the manufacturers' factory or laboratory tests, is furnished. These alternative qualifications do not apply to materials in Section 2.2 of Section 26 31 00 FACILITY-SCALE SOLAR PHOTOVOLTAIC (PV) SYSTEMS.

1.6.3.2 Material and Equipment Manufacturing Date

Do not use products manufactured more than [3][_____] years prior to date of delivery to site, unless specified otherwise.

1.6.4 Operations and Maintenance Data

Submit operation and maintenance Data Package 5 in accordance with Section 01 78 23, OPERATION AND MAINTENANCE DATA and as specified herein.

1.6.5 Commissioning Agents

Commissioning Agents Qualifications: Engage commissioning service personnel, that specialize in the types of inspections and tests to be performed.

1.6.6 Installers

Demonstrate that installers have successfully installed at least [four][_____] projects that, in aggregate, equal or exceed the size of the proposed project. Provide references for each of these referenced projects.

1.6.7 Qualified Testing Organization

Engage the services of a qualified testing organization to provide inspection, testing, calibration, and adjustment of the solar PV system and equipment listed herein. The organization must be independent of the supplier, manufacturer, and installer of the equipment. The organization must be a First Tier Contractor.

The organization must have been regularly engaged in the testing of electrical materials, devices, installations, and systems for a minimum of
[5][_____] years. The organization must have a calibration program, and test instruments used to be calibrated in accordance with NETA ATS.

1.6.8 1.6.8 Permitting

The [Owner][Contractor] is responsible for obtaining all necessary development permits and regulatory and utility service provider approvals prior to construction.

The [Owner][Contractor] is responsible for obtaining all necessary electrical and building permits and inspections.

1.6.9 1.6.9 Training

Provide training by a factory trained instructor to provide full instructions to designated Government personnel in the operation, maintenance and programming of the specified systems and equipment. Include safety training for first responders including fire department[,][_____][ and ][_____] representatives.

Submit Training documentation along with the proposed training date[s], at least [14][_____] days prior to date[s] of proposed training course. Provide training session for [six][_____] personnel specifically oriented to installed equipment, system layout, and user operations.

1.7 1.7 DELIVERY, STORAGE, AND HANDLING

Store solar PV panel modules in the original packaging according to the manufacturer's guidance, and remain in packaging until day of installation. If a solar PV module is removed from its packaging, store according to the manufacturer's guidance. Do not store solar PV panel modules on-site for more than [12][_____] months.

1.8 1.8 WARRANTY

Warrant the overall system for both parts and labor for a minimum period of [5][_____] years. Provide the following component specific warranties:

a. Photovoltaic Modules: Minimum warranty period of 25-year for linear minimum output and 10-years for workmanship, material, visual, and manufacturing defects from the date of manufacture followed by an additional fifteen (15) years at not more than 20 percent power loss.

b. Ground Mounting Structure: Mounting structure system hardware to be free from defects in the material and workmanship for a minimum period of [10][_____] years.

c. Combiner Boxes: Combiner boxes to be free from defects in material and workmanship for a period of [5][_____] years.

d. Inverters: Inverters to be from defects in material and workmanship for a minimum period of [20][_____] years.

Provide a list of all applicable warranties for all equipment and components. Include warranty information, names, addresses, telephone numbers, and procedures for filing a claim and obtaining warranty services.
1.8.1 Inverter Software Upgrades

Provide and install, at no cost or charge, any inverter software upgrades that become available during the warranty period.

1.8.2 Warranty Exclusions

The warranty shall cover all system malfunctions and failures except those resulting from misuse, abuse, neglect, fire, vandalism, acts of nature, or other causes beyond the control of the Contractor or manufacturer.

1.9 CERTIFICATIONS

Provide Seismic Certification and Wind Certification, prepared by a licensed professional engineer or National Recognized Testing Laboratory, (NRTL) for all components and assembled systems in accordance with ICC IBC, ASCE 7-10 state and local building codes. Seismic and wind certifications shall demonstrate system shall withstand wind and seismic requirements as installed and remain remain online and functional after a seismic or wind event.

1.10 HEALTH AND SAFETY REQUIREMENTS

Section 01 35 26, GOVERNMENTAL SAFETY REQUIREMENTS applies to this section with additions and modifications specified herein.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Provide utility scale solar PV system feeding AC power to utility grid in accordance with IEEE 1547 and local utility regulations. The PV system must comply with these specifications, all applicable codes and standards, all construction documents, and all local authorities having jurisdiction.

Installation shall consist of either a fixed-axis, single- or dual-axis utility scale-ground mount system. Tracking requirements must comply with local siting requirements regarding reflectivity restrictions and airspace safety requirements. Support structures shall either be individual modules or where applicable, groups of panels configured for shade structures. Provide all necessary accessories for a complete, secure, and operational solar PV system. Commercial-grade and residential-grade rooftop systems are excluded from this UFGS.

2.1.1 System Requirements

2.1.1.1 System Characteristics

The system characteristics include [_____] minimum rated [kW] [MW] DC output, [_____] minimum [kWh] [MWh] AC per year, [_____] system voltage, and [fixed axis] [tracking [one-][two-]axis] ground-mounted at full load rated power [1][_____] percent mean ambient summer operating temperature. Rate all electrical equipment for the current and voltage ratings appropriate for the application.

The system must be rated for outdoor installation. Provide system equipment capable of operating under the location's maximum and minimum documented temperatures during summer and winter times. The entire system must be rated and warranted to withstand and operate under these conditions.
2.1.1.2 Capacity Ratings

Specify rated PV system capacity in direct current (DC) [kilo][mega]watts peak under both Standard Test Conditions (STC) and Photovoltaics for Utility Scale Applications (PVUSA) Test Conditions (PTC) ratings.

a. The STC rating assumes direct current referred as "[k][M]Wdc-STC". It is also referred as [kilo][mega]watts peak, or "[k][M]Wp". Specific PV module manufacturer maximum and minimum power data must be specified for this rating. The STC rating is based on 1,000 watts/m² solar irradiance, 25 degrees C cell temperature, air mass equal to 1.5, and ASTM G173 standard spectrum.

b. The PTC rating is based on 1,000 watts/m² solar irradiance, 20 degrees C ambient temperature and 1 meter/second wind speed at 10 meters above ground level.

2.1.1.3 System Wiring

******************************************************************************
NOTE: The possible exposure to a corrosive environment should be carefully examined. Even when the correct conductor size and the selected joining (connecting) method have satisfied all the IEEE 837 test requirements, it may be prudent to choose a larger conductor size to compensate for some gradual reduction in the conductor cross section during the design life of the installation where the soil environment tends to promote corrosion. Coordinate soil environment with Geotechnical Engineer.
******************************************************************************

System wiring shall conform to Section 26 05 00.00 40 COMMON WORK RESULTS FOR ELECTRICAL and must be in accordance with Section 690 of NFPA 70. The conductors used must have a temperature rating of [90] degrees C or higher and be sized according to the appropriate DC or AC voltage application. Cabling exposed to sunlight must be UV resistant. [All wiring must be copper conductor if Navy eventually takes ownership of system.]

Provide conduits in accordance with Section 26 05 00.00 40 COMMON WORK RESULTS FOR ELECTRICAL. Use galvanized rigid steel conduit above grade and mount on UV resistant high-density polyethylene (HDPE) supports. Conduit below grade must be Schedule 40 PVC, minimum.

2.1.1.4 Site Design

Provide adequate space for personnel, vehicles and equipment throughout the PV array to facilitate installation, inspection and maintenance access to all modules.

2.2 PHOTOVOLTAIC MODULES

******************************************************************************
NOTE: Include in this section specifying CEC information and requirements for projects abiding by California Energy Commission.
******************************************************************************
Utilize PV modules with crystalline silicon, ribbon sheet, or thin film technology and conform to Section 26 31 00 FACILITY-SCALE SOLAR PHOTOVOLTAIC (PV) SYSTEMS. Include bypass diodes with each PV module installed in the module junction box.

2.2.1 2.2.1 Compliance

The PV modules must comply with the Buy American Act and must be listed on the California Energy Commission's PTC list and must qualify for eligibility under the California Solar Initiative (CSI) Program. The system must comply with IEC 61215 or IEC 61646.

2.2.2 2.2.2 Electrical Characteristics

Provide high-power type PV module(s), with typical peak power of not less than [315] watts, +/- [3] percent power tolerance, under Standard Test Conditions (STC). The AC output must not be less than [80] percent of the DC kWp rating. The individual current harmonics and TRD shall not exceed the limits specified in IEEE 1547.

The operating voltage corresponding to the power output mentioned above should be at least [54] volts. The open circuit voltage of the PV modules under STC should be at least [64] volts. Operate PV module at an ambient temperature range of [minus 40] degrees C to [plus 85] degrees C with [100] percent relative humidity.

2.2.3 2.2.3 Terminal Box

Include a terminal box on the module having a provision for opening for replacing the cable, if required.

2.2.4 2.2.4 Nameplate

Include the following on the module nameplate so as to be clearly visible:

a. Name of the Manufacturer or distinctive logo;

b. Model or Type Number;

c. Serial Number;

d. Year of make;

e. Peak wattage rating;

f. Peak voltage; and

g. Peak current.

2.3 2.3 INVERTERS

Provide solid state type inverter unit capable of accepting the output of the photovoltaic panels and providing rated output as indicated. Provide the inverter with monopole, negative grounded, and positive grounded array configuration capabilities.
2.3.1 Listings

Provide inverter listed on the California Energy Commission's PTC list and must qualify for eligibility under the CSI Program. The inverter must be UL 1741 listed and conform to IEEE 1547A and NFPA 70 standards.

2.3.2 Ratings

Rate the inverter's output as [250][500][_____] kW, [600][1,000][_____] Vdc, 3 phase, [320-600][420-850][_____] maximum power point tracking (MPPT) voltage range. The peak inverter power conversion efficiency must be [95][97][_____] percent or greater.

Operate inverter at an ambient temperature range of [minus 20][_____] degrees C[minus 4][_____] degrees F to [plus 50][_____] degrees C[plus 122][_____] degrees F with [95][_____] percent humidity (non-condensing).

2.3.3 Safeties and Protection

Equip each inverter with the following safeties and Protection:

a. DC input disconnect;

b. Surge protection;

c. Ground fault interrupter;

d. Isolation transformer;

e. AC output disconnect; and

f. Data Monitoring Equipment/System.

The inverter must be able to sustain an overload across its output terminals up to the [150][_____] percent load, while supplying any load within its rating and without reducing its output voltage. Fuse power semiconductors in the inverter with fast acting fuses to prevent cascading failures. Provide each fuse with a blown fuse and alarm indicating diodes on the control panel.

2.3.4 Features

Include each inverter with the following:

a. Automatic operation including start-up, shutdown, self-diagnosis, and fault detection;

b. Digital Signal Processor (DSP) based controls with self-diagnostics and [remote][local] display of operating status;

c. Over- and under-voltage and frequency protection, shutting down the inverter in compliance with UL 1741; and

d. Anti-islanding protection to prevent back-feeding inverter generated power to the grid in the event of a utility outage.

Provide inverter in [floor-mount][wall-mount][support structure mount], NEMA [1][3R][4][4X][6][6P], [steel][aluminum][stainless steel][polymeric] enclosure in accordance with NEMA 250.
2.4 2.4 COMBINER BOXES

Provide combiner box(es) in [wall-mount][pole-mount], NEMA [3R][4X][____], [steel][aluminum][stainless steel] enclosure in accordance with NEMA 250. Include in the combiner box(es) fuses and a bus to combine the outputs of the strings. Each combiner box must be UL 1741 listed and operate at an ambient temperature range of [minus 25][____] degrees C[minus 13][____] degrees F to [plus 57][____] degrees C[plus 135][____] degrees F.

Provide combiner box capable of at least [12][____] inputs and an input fuse rating of [15][____] amps. Include output circuit disconnecting means listed for intended use and purpose.

Provide combiner box output terminals for paralleling two conductors for the PV positive and negative, as well as the equipment ground conductors. Run set of wires from the combiner box to the inverter. Combiner output must be compatible with inverter input.

2.5 2.5 GROUND MOUNTING STRUCTURES

Provide array ground mounting structure for PV modules that provides the designed panel tilt. The mounting system must be [ground][tracking] mounting type [, [two][four] rails][, [one][two] axis], and be [UL 2703][UL Subject 3703] listed.

Design all structural components in a manner commensurate with attaining a minimum [30][____] year design life. Array mounting hardware must be compatible with the site considerations and environment. Aluminum and stainless steel components and hardware are preferred.

2.5.1 2.5.1 Wind and Seismic Ratings

The mounting system and overall installation must be capable to withstand winds of Category [1][2][3][4] or [5] as defined by the Saffir-Simpson Hurrican Wind Scale for all attachment points and consistent with the manufacturer's installation instructions. Provide wind certifications for all components and assemblies.

All structures and structural elements must be suitable for Seismic Design Category [____] in accordance with UFC 3-301-01, ICC IBC, ASCE 7-10, and all other applicable building codes and standards pertaining to the erection of such structures.

2.6 2.6 CAST-IN-PLACE CONCRETE

Provide concrete foundations for ground mounting structural members as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE and in accordance with manufacturer's recommendations.

Provide mounting assembly and connections where system is to be installed on a concrete structure.

2.7 2.7 METERING AND POWER MONITORING

Provide and install a revenue grade alternating current (AC) Interval Data Recording (IDR) meter, located on the output side of the inverter, complete with industry standard telemetry for communications with Ethernet, cellular or other common output capabilities. Meter must conform to the Owner's[Navy's][, Electrical Company] metering requirements.[ If the power is
tied into the Navy's internal electrical grid, then advanced metering infrastructure (AMI) meters are to be installed. Provide new AMI meters that are compatible with installation's current AMI system.]

2.7.1 2.7.1 Meter Characteristics

The meter must be UL listed and have an operating temperature range of [minus 20][_____] degrees C[minus 4][_____] degrees F to [plus 70][_____] degrees C[plus 158][_____] degrees F with a humidity range of [95][_____] percent relative humidity (RH) non-condensing. Provide the meter conforming to ANSI C12.1.

Provide meter capable of measuring kWh, Demand, Instantaneous power, volts, amps, watts, VAR and VA per phase.

2.7.2 2.7.2 Power Monitoring System

[Provide and connect][Connect] meter to a power monitoring/data collection system recording solar production through Time of Use (TOU) increments applicable to the installation and utility standards, with a minimum [15][_____] minute intervals and [30][_____] day memory.

2.8 2.8 POSTED OPERATING INSTRUCTIONS

Provide posted operating instructions for solar PV system equipment laminated between thermoplastic sheets. After operating instructions are approved, install where directed.

2.9 2.9 MANUFACTURER'S NAMEPLATE

Provide on each equipment item, including PV panels, a nameplate bearing all manufacturer's information securely affixed in a conspicuous place. Nameplates exposed to weather are to be ASTM A240/A240MType 316 stainless steel with stamped engraving.

2.10 2.10 FIELD FABRICATED NAMEPLATES

**************************************************************************
NOTE: Use of the following paragraph where nameplates are fabricated to identify specific equipment designated on drawings.
**************************************************************************

Provide field fabricated nameplates in accordance with ASTM D709 as specified or as indicated on the drawings. Minimum size of nameplates is 25 by 65 mm 1 by 2.5 inches. Lettering is a minimum of 6.35 mm 0.25 inch high normal block style.

2.11 2.11 WARNING SIGNS

Provide clearly visible warning signs for arc flash protection in accordance with UFC 3-501-01 and NFPA 70E for all electrical equipment and components that are required to examine, adjust, service, or maintain while energized.

2.12 2.12 CABLE TAGS IN MANHOLES, HANDHOLES, AND VAULTS

Provide machine printed polyethylene cable tags for each cable entering or leaving manholes, handholes, and vaults. Do not provide handwritten tags.
2.13 GROUNDING AND BONDING

NFPA 70, IEEE 80, IEEE 142, IEEE 242, and IEEE C2, except that grounds and grounding systems shall have a resistance to solid earth ground not exceeding 5 ohms.

2.13.1 Ground Rods

2.13.2 Ground Plates

Provide grounding plates made of [copper-clad steel][iron][stainless steel] [solid copper] conforming to UL 96.

2.13.3 Ground and Bonding Conductors

Equipment grounding conductors shall be insulated stranded copper, except that sizes No. 10 AWG and smaller shall be solid copper. Insulation color shall be continuous green for all equipment grounding conductors, except that wire sizes No. 4 AWG and larger shall be identified per NFPA 70NEC.

Bonding conductors shall be bare stranded copper, except that sizes No. 10 AWG and smaller shall be bare solid copper. Bonding conductors shall be stranded for final connection to motors, transformers, and vibrating equipment.

2.13.4 Ground Connections

Below Grade and Inaccessible Locations: Exothermic-welded type connectors.

Above Grade:

a. Bonding Jumpers: Listed for use with aluminum and copper conductors. For wire sizes No. 8 AWG and larger, use compression-type connectors. For wire sizes smaller than No. 8 AWG, use mechanical type lugs. Connectors or lugs shall use [zinc-plated] [cadmium-plated] steel bolts, nuts, and washers. Bolts shall be torqued to the values recommended by the manufacturer.

b. Connection to Building Steel: Exothermic-welded type connectors.

c. Connection to Grounding Bus Bars: Listed for use with aluminum and copper conductors. Use mechanical type lugs, with [zinc-plated] [cadmium-plated] steel bolts, nuts, and washers. Bolts shall be torqued to the values recommended by the manufacturer.

d. Connection to Equipment Rack and Cabinet Ground Bars: Listed for use with aluminum and copper conductors. Use mechanical type lugs, with [zinc-plated] [cadmium-plated] steel bolts, nuts, and washers. Bolts shall be torqued to the values recommended by the manufacturer.

2.14 Lightning Protection System

Provide Lightning Protection System and components in accordance with Section 26 41 00 LIGHTNING PROTECTION SYSTEM.
PART 3 EXECUTION

**NOTE:** Use and coordinate paint and coating requirements with Section 09 90 00, PAINTS AND COATINGS when provided in the job. Use the second bracketed option when Section 09 90 00 is not provided or when requirements are beyond what is specified in Section 09 90 00.

3.1 3.1 INSTALLATION

3.1.1 3.1.1 Site Preparation

Prepare the site for system installation by removing vegetation, grading for adequate drainage and avoid standing water on site, and excavating and compacting foundations for individual module installation. Provide access roads, pathways, fencing and other improvements as necessary for site access and security. Provide vegetation barrier to keep surrounding area free from array-shading vegetation as required.

Provide walking and vehicle space throughout the PV array to facilitate installation, inspection, and maintenance access to all modules in accordance with NFPA 70 and IEEE C2. Maintain a minimum ground clearance of [3][_____] m/[10][_____] ft 3 maround arrays. Maintain a minimum ground clearance of [1][_____] m/[3][_____] ft below arrays for all site-specific conditions including possible array-shading vegetation, ground/vegetation maintenance, and/or array-shading snowfall.

3.1.2 3.1.2 Equipment Installation

Install all equipment and all required wiring for a complete and operational system. Follow manufacturer's guidelines for the installation of the array components, including mounting hardware and PV modules. Provide required conductor terminations to devices for a complete system to function as specified and indicated. Complete installation must comply with all local building codes, manufacturer's instructions, and applicable industry standards.

3.1.3 3.1.3 Conductor Installation

Furnish and install conductors required to connect incoming and outgoing circuits. Install conductors with conduits, boxes, and terminal cabinets in a totally enclosed installation. Install buried cable per Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Comply with IEEE 1547 for interconnection with utility providers. Color-code all conductors per Section 26 05 19.10 10, INSULATED WIRE AND CABLE and as recommended by the equipment manufacturer.

Rate all enclosures for electrical connections and interconnections for [NEMA 6 in accordance with NEMA 250] or [IP67 in accordance with ANSI IEC 60529].

3.2 3.2 GROUNDING

Ensure PV system grounding installation is in accordance with NFPA 70 and IEEE C2.
3.2.1  Grounding Electrodes

Provide ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Connect grounding conductors to ground rods by exothermic weld[ or compression connector].

3.3  FOUNDATIONS OF EQUIPMENT AND ASSEMBLIES

[Conduct soil borings and provide recommended foundation design by a licensed geotechnical engineer.] [Design foundation in accordance with foundation design recommendations.] Construct equipment foundations.

3.3.1  Ground Mounted Structures

Provide reinforced concrete foundations for ground mounted structures. Provide 4" reinforced concrete housekeeping pads for electrical equipment other than PV structures.

Provide excavating and backfilling in accordance with Section 31 00 00 EARTHWORK. Perform concrete work in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Coordinate provision of utility warning and identification tape with backfill operation. Provide tapes above buried lines at a depth of 8 to 12 inches below finish grade.

3.4  FIELD APPLIED PAINTING

Apply field painting as specified in Section 09 90 00 PAINTS AND COATINGS.

3.5  FIELD FABRICATED NAMEPLATE MOUNTING

Provide equipment nameplates as indicated.

3.6  WARNING SIGN MOUNTING

Provide the number of warning signs required to be readable from each accessible side. Locate and space signs in accordance with NFPA 70E.

3.7  CABLE TAG INSTALLATION

Install cable tags in manholes, handholes, and vaults as specified, including each splice. Locate tags over any fireproofing, if any, and clearly visible on cabling without disturbance in manholes, handholes, and vaults.

Identify and label all cables per NFPA 70 and Section 26 05 00.00 40, COMMON WORK RESULTS FOR ELECTRICAL.

3.8  FACTORY SYSTEM TESTING

[Provide testing of the complete system in accordance with IEEE 1547.1A. IEEE 1547 allows for type testing to be performed on complete systems, multifunction relays, discrete devices, or any combination. If type testing is performed on anything other than a fully integrated system, some of the component times may not be available. In these cases, production and/or commissioning tests shall be conducted to fully demonstrate the ability of the complete system to comply with the timing required by IEEE 1547.]
3.9  3.9  FIELD QUALITY CONTROL

3.9.1  3.9.1  Manufacturer's Field Service

Provide the services of factory trained and approved field service engineer during system installation, testing and commissioning.

3.10  3.10  COMMISSIONING

**************************************************************************
NOTE: Sections 01 91 00.15 10 and 01 91 00.15 20, TOTAL BUILDING COMMISSIONING, are intended for building systems, however, the basic requirements are applicable to PV commissioning processes. Section 01 91 00.15 10 or 01 91 00.15 20 will need to be tailored for PV systems when compiling project specifications.
**************************************************************************

Conduct Commissioning, after the system is installed and is ready for operation, in accordance with Section [01 91 00.15 10][01 91 00.15 20] TOTAL BUILDING COMMISSIONING, item (6) renewable energy generation, to verify that the completed and installed system meets the requirements of IEEE 1547. Tailor for non-building systems.

3.10.1  3.10.1  Commissioning Agent Qualification

Individual qualified in testing protective equipment (e.g., professional engineer, factory-certified technician, licensed electrician with experience in testing protective equipment) must perform or directly supervise commissioning tests.

3.10.2  3.10.2  Commissioning Plan and Schedule

Develop and implement a commissioning plan and commissioning schedule in accordance with Section [01 91 00.15 10][01 91 00.15 20] TOTAL BUILDING COMMISSIONING.

3.10.3  3.10.3  Start-up Pre-functional Checklists

Carry out a checklist of startup requirements and conduct a series of safety tests to ensure proper installation, safe operation, and performance conforming to specification.

3.10.4  3.10.4  Functional Performance Testing

Prepare test procedures and conduct functional performance testing of the installed system. Include the following test requirements:

a. All inverter startup tests as specified by the inverter manufacturer in the inverter operation manual;

b. Actual power;

c. Loss of grid;

d. Grid resume;

e. Data monitoring check out;
f. $V_{oc}$ measurement of every source circuit and log it;
g. Verify tightness of all wiring terminations;
h. Verify proper markings and labeling of all wire terminations and enclosures;
i. Verify startup/shut down procedures;
j. Verify system [5][_____] minutes delay upon restart;
k. Verify PV array quick connectors are fully mated and wires are neatly secured;
l. Verify no debris on the modules, no damaged or broken modules;
m. Verification and inspections (see IEEE 1547.1 7.2)
n. Field-conducted type and production tests (see IEEE 1547 7.3))
o. Unintentional islanding functionality test (see IEEE 1547.1)
p. Cease-to-energize functionality test (see IEEE 1547.1)
q. Unintentional islanding functionality test (see IEEE 1547.1)
r. Revised settings (see IEEE 1547.1 7.6)

3.10.5 Functional Performance Testing Results

Coordinate, observe and record the results of the functional performance testing. Coordinate retesting as necessary until satisfactory performance is verified. Verify the intended operation of individual components and system interactions under various conditions and modes of operation.

Document items of non-compliance in materials, installation or operation. Immediately address observed non-conformance and deficiencies in terms of notification to responsible parties, and provide recommended actions to correct deficiencies.

3.10.6 Final Commissioning Report

Prepare and submit final commissioning report. Summarize all of the tasks, findings, conclusions, and recommendations of the commissioning process in accordance with IEC 62446. Include the results of all tests and a listing of the final settings.

3.11 FINAL ACCEPTANCE

The acceptance of the solar PV system occurs only after all deficiencies identified by the functional acceptance tests and commissioning report are corrected[, and the system operates successfully during a [30][_____] day initial testing period].

The Contracting Officer must sign appropriate certificates, if equipment and systems are operating satisfactorily in accordance with the
specifications, stating the system's operation has been tested and accepted at the end of the final start-up and testing.

3.12 3.12 CLOSEOUT ACTIVITIES

3.12.1 3.12.1 Demonstration

Demonstrate, upon completion of functional acceptance tests, that all circuits and devices are in proper operating condition and performing as intended.

3.12.2 3.12.2 Training

Furnish training service by a factory-trained representative for a period of [5] calendar days. Document that each qualified employee has received the required training in accordance with 29 CFR 1910. Maintain all training documentation in a central location for the entire employee's employment duration. Minimum documentation data includes employee's name, training name, and date(s) of training.

3.2 FIELD QUALITY CONTROL
3.2.1 Field Inspection
3.2.2 Tests
3.2.2.1 Piping Test
3.2.2.2 Operation Tests
3.2.3 Manufacturer's Field Services

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for medium-temperature (38-82 degrees C 100-180 degrees F), liquid-flat-plate or evacuated tube collector loop systems, heat storage tanks, pumps, controls and related equipment and materials.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Applications of the solar systems may be domestic hot water, space heating, swimming pool heating, process fluid heating, spa water heating, air conditioning for solar cooling and heating, agricultural process heating, or other commercial and industrial uses.

NOTE: The following information shall be shown on the project drawings:

1. Control equipment operation matrix.
2. Control operations sequence.

3. Details of soft-drawn copper-tubing connectors to top and bottom headers of solar-collector panel.

4. System diagram.

5. Panel array layout and locations.

6. System equipment locations.

7. Equipment piping details.

8. Mounting details.

9. Schedules in accordance with UFC 3-400-01, "Renewable Energy Systems - Facility".

PART 1   GENERAL

1.1 REFERENCES

 **************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section with additions and modifications specified herein.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed
item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Solar Energy Systems; G[, [_____]]

Include collector structural supports, solar collector control sequences, and instrument mounting and interconnections.

SD-03 Product Data

Piping; G[, [_____]]

Instrumentation; G[, [_____]]

Valves; G[, [_____]]

Piping Specialties; G[, [_____]]

Pumps; G[, [_____]]

Solar Storage Tanks; G[, [_____]]

Solar Collectors; G[, [_____]]

For the selected collectors, include test results per ASHRAE 93.

Heat Exchangers; G[, [_____]]

Compression Tanks; G[, [_____]]

Solar-Boosted Domestic Water Heaters; G[, [_____]]

Collector Heat Transfer Fluid; G[, [_____]]

Insulation Around Piping and Storage Tanks; G[, [_____]]

For each pump, include manufacturer's data including pump speed and characteristic impeller performance curves. Indicate capacity versus head, efficiency, and brake power for the full range from shut-off to free delivery.

SD-06 Test Reports

NOTE: Underground tanks are not a recommended method for thermal storage. A design with thermal storage within a building is more ideal for efficiency.
Underground Solar Storage Tanks Holiday Test; G[, [_____]]
Submit a factory holiday test certificate for each tank.}

SD-07 Certificates
Solar Energy System Installation; G[, [_____]]
Submit technical representative's certification that the solar energy system installation has been done as recommended by the manufacturer.

SD-08 Manufacturer's Instructions
Solar Energy Systems; G[, [_____]]

SD-10 Operation and Maintenance Data
Solar Energy Systems, Data Package 3; G[, [_____]]
Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals
Posted Operating Instructions for Solar Energy System; G[, [_____]]

1.4 QUALITY ASSURANCE
For brazing and soldering procedure qualification, conform to ASME B31.1; for preparation and procedures for joints, conform to ASME B31.1 and CDA A4015.

1.4.1 Operation and Maintenance Data
Submit Solar Energy Systems data package for the following items in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

a. Troubleshooting guide for solar energy systems
b. Solar collector warranty
c. Operation instructions
d. Preventive maintenance and inspection data, including a schedule for system operators.
e. Project drawings.

1.5 SOLAR COLLECTOR WARRANTY
**************************************************************************
NOTE: Warranties on Navy construction: Warranties for equipment, materials, or design furnished, or workmanship performed by the Contractor or any subcontractor or supplier, has a duration of one year from the date of final acceptance of the work. An exception is in normal commercial practice longer warranty period for particular construction are given.
A warranty duration of longer than a year, and not covered normally by the industry, requires a Level III Contracting Officer's written determination documenting that the extra warranty protection is needed.

The warranty clause for solar collectors in this guide specification has been approved by NAVFACENGCOM HQ in accordance with the requirements of the Naval Facilities Acquisition Supplement (NFAS). NFAS can be found at the following link: https://portal.navfac.navy.mil/portal/page/portal/navfac/navfac_forbusinesses

This clause may be used without any HQ approval or request for waiver.

Furnish ten year manufacturer's warranty against defects in materials and workmanship.

1.6 POSTED OPERATING INSTRUCTIONS

Provide for piping identification codes and diagrams of solar energy systems, operating instructions, control matrix, and troubleshooting instructions.

1.7 HEALTH AND SAFETY RECOMMENDATIONS

Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS, applies to this section with additions and modifications specified herein.

PART 2 PRODUCTS

2.1 SOLAR ENERGY SYSTEMS

NOTE: SRCC OG-300 applies to residential and light commercial systems of 119 gallons or less. SRCC OG-100 applies to the collectors only.

[S SRC C OG-300 listed] [SRCC OG-100 Collector certification], and provide necessary materials to fabricate solar energy systems in accordance with this section. At the Contractor's option, provide factory-prefabricated solar equipment packages which include heat exchanger, compression and storage tanks, pumps and controls and which meet the requirements of this section or are certified by an ANSI-accredited certification body to SRCC STD 300 or other applicable ANSI standard.

2.2 PIPING

2.2.1 Copper Pipe

ASTM B88/MAS TM B88, minimum Type L, hard drawn copper tubing, except that the connection tubes of collectors may be soft-drawn.

2.2.2 Bronze Flanges and Flanged Fittings

2.2.3 Solder-Joint Fittings

ASME B16.22, wrought copper.

2.2.4 Unions

2.2.5 Dielectric Union

Provide insulated union with a galvanized steel female pipe-threaded end and a copper solder joint end conforming to ASME B16.39, Class 1. Provide a dry insulation barrier, impervious to water and capable of withstanding a 600 volt breakdown test and limiting galvanic current to one percent of the short circuit current in a corresponding bimetallic joint.

2.2.6 Expansion Joints

2.2.6.1 Bellow Expansion Joints

**************************************************************************
NOTE: In corrosive atmospheric conditions such as oceanic air, use only nickel-chromium-iron alloy bellows.
**************************************************************************

Corrugated, [unreinforced] [or] [with [reinforcing] [or] [equalizing] rings], and [single-bellow] [double-bellow] expansion joints. Construct bellows of [copper alloy] [nickel-chromium-iron alloy, conforming to ASTM B168] [or] [stainless steel].

2.2.6.2 Guided Slip-Tube Expansion Joints

[Ring packing with seal to allow repacking under pressure] [Permanent packless seal], [internally] [internally and externally] guided, and [single] [double] slip-tube. Provide drain port in the housing. [For packless seal, provide a Type 304 or 321 stainless steel bellows with laminated or multi-ply construction.]

2.3 VALVES

[Provide end connections as indicated.] Valves shall open when turned counterclockwise.

2.3.1 Gate Valves

MSS SP-80, bronze, Class 150; [Type 1, solid wedge non-rising stem] [or] [Type 2, solid wedge, inside screw rising stem]; with solder, threaded, or flanged ends.

2.3.2 Globe and Angle Valves

MSS SP-80, bronze, Class 150; [Type 1, metal disc integral seat] [or] [Type 2, non-metallic disc, integral seat]; with solder, threaded, or flanged ends.
2.3.3 Ball Valves

MSS SP-72 for flanged or butt-welding ends or MSS SP-110 for threaded, socket-welding, solder joint, grooved and flanged ends.

2.3.4 Balancing Cocks, Flow Rate Control and Meter

Bronze, solder, threaded, or flanged ends. Provide square head, flow indicator arc or check pressure ports for differential flow metering device. Provide valve construction with rating of 116 degrees C at 862 kPa 240 degrees F at 125 psi.

2.3.5 Check Valves

**************************************************************************
NOTE: When thermal siphon is a problem, such as an active flow indicator during nighttime or poor system performance, use only spring-loaded check valves with elastomer seals.
**************************************************************************

MSS SP-80, bronze, Class 150; [Type 3, swing check, metal disc to metal seat] [or] [Type 4, swing check, non-metallic disc to metal seat]. [Provide spring-loaded construction with elastomer seals.]

2.3.6 Water Pressure-Reducing Valves

ASSE 1003 with ASSE seal, self contained, direct acting, and single seat diaphragm.

2.3.7 Control Valves

UL listed. Provide valves actuated by electric motors. Construct valves to permit replacing valve seals without draining the system. Provide bronze body construction and stainless steel valve stems, with rating of 4 to 166 degrees C at 862 kPa 40 to 240 degrees F at 125 psi. Include external position indicators and steel enclosures to protect operating components.

2.3.7.1 Shutoff and Diverting Control Valves

Bronze valves with 100 percent shutoff, stainless steel butterfly or ball, and elastomer seats and seals.

2.3.7.2 Non-Shutoff Mixing Valves

ASSE 1017, MSS SP-25 marking modulating, [brass] [or] [brass] body construction, stainless steel valve stems, and thermostatically controlled.

2.3.7.3 Valve Operators

Provide electric [two-position] [or] [proportioning] operators, with oil-immersed gear trains. Two-position operators may be single-direction with [spring-return] [or] [reversing] construction. [For [reversing] [and] [proportioning] operators, provide limit switches to limit the lever in either direction unless the operator is the stalling type.] Operators shall function properly with a 10 percent plus or minus change in the line voltage feeding the equipment. Totally enclose operators and gear trains in dustproof housings of pressed steel or metal castings with rigid conduit.
connections. Equip valve operators with a spring yield device so that when in the closed position it will maintain on the valve disc a pressure equivalent to the pressure rating of the valve.

2.3.8 Air Vents and Relief Valves

2.3.8.1 Air Vents

CID A-A-60001, float construction for pressures up to 862 kPa 125 psi.

2.3.8.2 Relief Valves

ASME labeled valves with a relief setting 200 percent higher than the normal operating pressure. Provide nonferrous or stainless steel valve seats and moving parts exposed to fluid, compatible with the operating conditions.

2.4 PIPING SPECIALTIES

2.4.1 Bolts and Nuts

Stainless steel; ASTM A193/A193M for bolts and ASTM A194/A194M for nuts.

2.4.2 Gaskets

**************************************************************************
NOTE: For cold weather region of below minus 10 degrees C 14 degrees F, consider gaskets made of rubber in accordance with ASTM D3667 (for flat plate solar collectors) or ASTM D3832 (for evacuated tube solar collectors), Type C.
**************************************************************************

[Fluorinated elastomers, ethylene-propylene-diene-terpolymer (EPDM) or silicone] [ASTM D3667, Type C rubber] [ASTM D3832, Type C rubber], compatible with flange faces.

2.4.3 Brazing Metal

AWS A5.8/A5.8M, 15 percent silver-base alloy, minimum melting point 816 degrees C 1,500 degrees F, for copper pipes rated at maximum 862 kPa and 177 degrees C 125 psi and 350 degrees F. Provide cadmium free filler metals.

2.4.4 Solder Metal

ASTM B32, Alloy Grade Sb5, Sn95, or Sn96, with minimum melting 221 degrees C 430 degrees F.

2.4.5 Strainers

Class 125; Style Y pattern; threaded or soldered ends, for 50 mm 2 inches and smaller; and flanged ends in accordance with ASME B16.1, for 65 mm 2 1/2 inches and larger.

2.4.6 Piping Identification Labels

Plastic slip-on or adhesive backed labels conforming to ASME A13.1.
2.4.7 Hangers and Supports

MSS SP-58, as required by MSS SP-69.

2.5 [BOOSTER] [AND] [CIRCULATING] PUMPS

**************************************************************************
NOTE: If silicone based fluids are used, rotary pumps should be used to avoid seepage problems.
**************************************************************************

[Section 23 21 23 HYDRONIC PUMPS, centrifugal] [CID A-A-50561, rotary][; pump styles as indicated]. Provide flanged inlets and outlets, mechanical seals, flexible couplings, and electronically commutated motors (ECM). Select pumps to operate not more than 5 percent below and on the shut-off side of the maximum efficiency point of the impeller curve. Provide bronze or cast iron body construction, bronze or stainless steel fitted.

2.6 COMPRESSION TANKS

ASME BPVC SEC VIII, steel construction with ASME label for 862 kPa (gage) 125 psig working pressure. Hot-dip galvanize interior and exterior surfaces of tanks after fabrication. Provide cast iron or steel saddles or supports. Provide tanks with drain, fill, air charging and system connections, and liquid level gage.

2.7 SOLAR STORAGE TANKS

**************************************************************************
NOTE: Small mixing pumps and shrouds to enhance tube bundle heat exchanger performance in the tanks are an exception and should be used only where required. The corrosive nature of some water supplies may require copper lining. For better stratification (hot water on the top, cold water on the bottom), vertical solar tanks should be used. Up to 18,950 liters 5,000 gallon capacity, solar storage tanks may be unpressurized, internally stainless-steel-lined, factory insulated, and covered with enamel steel outer jackets for indoor applications or fiberglass jackets for outer and underground applications. Solar storage tanks, if intended for an usable life in excess of 5 years, should not be pressurized. Unpressurized stainless steel tanks should last in excess of 20 years; other unpressurized tanks should last up to 15 years; pressurized steel tanks with copper heat exchangers may last only 3 to 8 years, due to galvanic corrosion. Recommend 122 liters 3 gallons of storage capacity for each square meter foot of collector surface facing the sun.
**************************************************************************

Except as modified herein, FS F-T-2907; [stone lined (cement lined)] [glass lined] [stainless steel] [Type 18-8 stainless steel lined] [or] [baked-on phenolic] steel tank with ASME label for [862 kPa (gage)] [125 psig] [____]. Do not use baffles or perforated pipes in tank construction. For the steel tank, include [collector loop heat-exchanger bundle] [and] [domestic hot water] [and] [space heating] heat-exchanger bundle.
2.7.1 Underground Tanks
UL listed, [double-walled,] fiberglass coated steel tanks. Provide exterior surfaces of steel tanks with a glass reinforced isophthalic polyester resin of sufficient thickness to resist 35,000-volt Holiday test. Provide automatic monitoring system with audible alarms to continuously monitor leaks.

2.7.2 Tank Insulations and Jackets
Comply with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Separate aboveground tanks from supports with insulation.

2.8 HEAT EXCHANGERS

**************************************************************************
NOTE: Where potable fluids are not used, double wall and vented construction provides fail-safe leak detection without attendance by any operator. If the operator is not present, sound alarms may not be heard, and visual indicators may not be observed in some cases. For many years, industrial applications commonly use shell-and-tube or tube-in-tube heat exchangers. In recent years, some industrial applications use plate-and-frame heat exchangers as options. Plate-and-frame construction requires much less space, i.e., from one tenth to one half of the space required by shell-and-tube construction. Plate-and-frame heat exchangers generally have high heat transfer rates. Electropolished stainless steel plates may be specified to minimize fouling. Titanium or nickel-brazed stainless steel heat exchangers should be used in spas due to high temperature water and high chlorination.
**************************************************************************

ASME BPVC SEC VIII, construction with ASME label for 1034 kPa (gage) 150 psig working pressure and 2068 kPa (gage) 300 psig factory-rating pressure. [Provide automatic monitoring system with audible alarms to continuously monitor leaks.] [Provide relief vent with a visual indicator to detect leaks by the change of coloring in the heat transfer fluid.]

2.8.1 Plate-and-Frame Construction

[Stainless steel] [or] [monel] plates and carbon steel frames, with baked epoxy-enamel, and shroud. Provide stainless steel side bolts and nozzles. Provide one piece molded [nitrile rubber] [ethylene-propylene rubber viton] [neoprene] [or] [butyl] gaskets. Fabricate heat exchangers with design results of heat transfer coefficients greater than 5680 watt per square meter degree C 1,000 Btu per square foot per hour per degree F.

2.8.2 [Shell and Tube] [or] [Tube in Tube] Construction

[Double wall vented], [straight tube] [or] ["U" tube] [as indicated]. Low temperature water [mixture] shall pass through tubes. High temperature water [mixture] shall pass through shells. Fabricate tubes from [16 mm 5/8 inch] [or] [20 mm 3/4 inch] od [stainless steel] [or] [seamless No. 20 BWG cupro-nickel (90-10)]. Provide tube bundles removable through flanged
openings.

2.9 **SOLAR COLLECTORS**

**************************************************************************

NOTE: In accordance with ASHRAE 93 and ASHRAE 96, a solar collector is "a device designed to absorb incident solar radiation and to transfer the energy to a liquid passing through it." Use the liquid flat-plate collector for system design, including cooling applications up to 141 kW 40 tons. Use ASHRAE 93 for glazed collectors and ASHRAE 96 for unglazed collectors. The State of Florida requires all solar collectors to be certified by FSEC (Florida Solar Energy Center). If the project site is not in Florida and the state and local regulations do not prohibit FSEC certified collector, the use of FSEC collector may be considered as an option. Provide lightning protection as required by the local environment. A collector in which the internal risers and headers are in a reverse return arrangement will have uniform flow and uniform heating, but it will be too restrictive to limit only this arrangement. When inlet and outlet tubes are not located conveniently on the collector, the collector will take up additional space, resulting in more exposed roof area between the collector.

**************************************************************************

[ASHRAE 93] [ASHRAE 96] [SRCC OG-100 and SRCC CRIS listed] [or] [Florida Solar Energy Center (FSEC) certified]; liquid flat-plate collectors and evacuated tube collectors. Provide factory fabricated and assembled, [single glazed] [double glazed] [triple glazed] [or] [unglazed] panels. [Internal manifold collectors may be used if manufacturer standard.] Include the following design features:

2.9.1 Collector Sizes

Maximum filled weight not to exceed 24.40 kg per square meter five pounds per square foot of gross collector area.

2.9.2 Minimum Performance Parameters

**************************************************************************

NOTE: In accordance with ASHRAE 93 and ASHRAE 96, instantaneous collector efficiency is "the amount of energy removed by the transfer liquid per unit of gross collector area during the specified time period divided by the total solar radiation incident on the collector per unit area (solar flux) during the same time period, under steady-state or quasi-steady-state (the state of the solar collector test when the flow rate and temperature of the liquid entering the collector are constant but the exit liquid temperature changes gradually due to the normal change in irradiation that occurs with time for clear sky conditions) conditions." Read ASHRAE 93 and ASHRAE 96 for further details and unit
measurements.

Provide total collector flow rate in accordance with manufacturer's recommendations. Provide instantaneous collector efficiency as follows:

<table>
<thead>
<tr>
<th>Minimum Instantaneous Collector Efficiency, Percent</th>
<th>Inlet Fluid Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>74</td>
<td>0</td>
</tr>
<tr>
<td>54</td>
<td>0.03</td>
</tr>
<tr>
<td>40</td>
<td>0.05</td>
</tr>
</tbody>
</table>

Determine inlet fluid parameter (IFP) in accordance with the following formula:

\[ \text{IFP} = \frac{A - B}{C} \]

Where:

\( A \) = Liquid inlet temperature in collector
\( B \) = Ambient air temperature
\( C \) = Solar flux

2.9.3 Absorber

Fabricate of [aluminum] [stainless-steel] [copper tubes on copper sheet or aluminium] [or] [copper tubes with copper or aluminum fins]. Provide the absorber rated for [1034 kPa (gage)] [150 psig] [_____] with working pressure of [862 kPa (gage)] [125 psig][_____].

2.9.4 Absorber Plate Coating

Provide selective or semi-selective absorber coating with minimum absorptivity 0.90, maximum emissivity 0.12, and minimum breakdown temperature at [204 degrees C] [400 degrees F][_____]..

2.9.5 Collector Case

Fabricate from at least 20 gage [galvanized steel] [or] [ASTM B209MASTM B209 alloy or equivalent aluminum]. Paint collector box with durable baked enamel or powder coat. In the back of case, provide insulation with a heat transfer factor of maximum 0.57 watts per degree C per square meter 0.1 Btu per hour per degree F per square foot. Use only insulation without out-gassing or other breakdown at or under stagnation temperature, such as rigid mineral fiber panels. Fabricate cover frame and glazing channel of [galvanized sheet steel] [stainless steel] [or] [extruded aluminum]. Provide preformed gaskets of EPDM or silicone as specified.

2.9.6 Collector Cover (Glazing Material)

ASTM C1048, Kind FT, fully tempered glass; Condition A, uncoated surfaces; Type I, transparent glass; Class 1, clear; Quality q3, glazing select; [3] [5] [or] [4] mm [1/8] [3/16] [or] [5/32] inch float glass.
2.9.7 Collector Identification

On each collector, provide the following information:

a. Manufacturer's name or trademark
b. Model name or number
c. Certifying agency label and rating.

2.9.8 Other Components

Provide collectors for the complete removal of internal moisture which may develop in the collectors. [Collector weep holes or desiccants with air vents may be used. If desiccants are used, provide 8 mesh silica gel with approximately 10,000 cycles of regeneration.]

2.9.9 Hail Protection

Manufacturer's hail protection performance measured according to ASTM E822, or equivalent.

2.10 COLLECTOR SUPPORTS

[As indicated.] [Provide a commercial integrated structural system, supplied by a single manufacturer, consisting of formed aluminum or galvanized or plated steel channels, perforated with round or square holes, and corrosion resistant brackets, clamps, bolts and nuts.]

2.11 COLLECTOR HEAT TRANSFER FLUID

**************************************************************************

NOTE: In lieu of the collector heat transfer fluid, the use of water in a drainback concept may be acceptable. Recommend to use only non-toxic heat transfer fluid.
**************************************************************************

Conform to the following:

a. Liquid useful temperature range of [-40] to [204][_____] degrees C [400][_____] degrees F.

b. Non-ionic, high dielectric, non-aqueous, non-reactive, stable fluid which does not corrode copper, aluminum, iron, or steel, or attack plastics.

c. Flash point exceeding 193 degrees C 380 degrees F.

d. Fluid stability of five years.

e. Maximum acute oral toxicity of 5 grams per kilogram 5000 ppm.

2.12 SOLAR-BOOSTED DOMESTIC WATER HEATERS

2.13 INSULATION

Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

2.14 INSTRUMENTATION

Use corrosion resistant materials for wetted parts of instruments.

2.14.1 Solar Controller

UL listed. Solid-state or electrical only, with overvoltage protection.

2.14.1.1 Differential Temperature Control

Factory assembled and packaged device.

2.14.1.2 High Limit Control

Provide high temperature cut-off to limit upper half of the storage tank temperature to be [71] [82] [_____] degrees C [160] [180] [_____] degrees F.

2.14.1.3 Swimming Pool Control

**************************************************************************
NOTE: Delete this paragraph if the project is not for a swimming pool.
**************************************************************************
Provide adjustable thermostatic setting to prevent pool overheating, with range from [13] [_____] to [29] [_____] degrees C [56] [_____] to [85] [_____] degrees F. Turn solar heater on when solar collectors are 2.77 degrees C 5 degrees F hotter than pool temperature. When pool temperature is above the thermostatic setting, drain water from the panels.

2.14.1.4 Controller Enclosure

NEMA 250; Weathertight rated to NEMA 4X.

2.14.2 Differential Thermostat

**************************************************************************
NOTE: Use this only in large systems, generally not residential. It is recommended that the differential thermostat be 4.40 degrees C 8 degrees F turn on and 1.70 to 2.80 degrees C 3 to 5 degrees F turn off.
**************************************************************************
Provide UL-listed differential thermostat for controlling the magnetic starter, not in the same circuit as pump motor. [For integral collector freeze protection, provide two independent contact relays [, rated ten amperes at 120 Vac].] [Provide a switch with ON, OFF, and AUTO positions.] Provide weathertight enclosures.

2.14.3 Sensors

**************************************************************************
NOTE: Delete this paragraph if solar collectors are unglazed.
**************************************************************************
Construct sensors to withstand stagnation temperatures of glazed solar collectors. Provide primary and alternate collector sensors attached to an absorber plate. Provide [copper] [brass] wells which can be inserted into the collector tube, storage tank, or [____]. Sensors may be strapped onto pipes and covered with insulation.

2.14.4 Pressure Gages

ASME B40.100, brass body, and minimum 90 mm 3 1/2 inch diameter dial face.

2.14.5 Tank Gages

CID A-A-50568; Type [I, buoyant force;] [II, diaphragm;] [or] [III, purge, bubble-pipe].

2.14.6 Thermometers

ASTM E1, [liquid-in-glass type] [dial type, liquid-filled tube and bulb]. For pipe and tank applications, provide separate sockets fabricated of brass, copper, or stainless steel and rated for 862 kPa 125 psi working pressure.

2.14.7 Test Ports

Solid brass, 6 mm 1/4 inch fitting to receive either a temperature or pressure probe 3 mm 1/8 inch outside diameter, two valve cores of neoprene, fitted with color coded and marked cap with gasket, and rated for 6894 kPa (gage) 1,000 psig.

2.14.8 Monitoring System

NOTE: For small systems such as family housing, do not use monitoring system, due to high initial cost and the labor to maintain it.

a. [Solar Differential Controller with] Kilojoule Btu Meter: [Controller conforming to UL 873 with] Sensing and Monitoring device to measure and display the heat energy produced by the solar system, with minimum sensitivity of 0.5 percent over the entire scale. Provide electromechanical kJ Btu counter plus digital-panel meter indicating sensor temperatures, differential temperature, flow rate, and watt Btu per minute or hour.

b. [Water] [and] [Heat Transfer Fluid] Leak Detection: UL-listed system consisting of a sensor probe, control panel, and LED indicators for [water; yellow,] [and] [heat transfer fluid; red,] with audible alarm at minimum 75 dB sound level; reference 10 exponential minus 12 watts.

2.15 SOLAR COLLECTOR CONTROL SEQUENCES

As indicated.
PART 3   EXECUTION

3.1   INSTALLATION

3.1.1   Solar Collector System

**************************************************************************
NOTE: Disinfect domestic water systems, if connected with solar collector panels. Provide disinfection provisions in either Section 22 00 00 PLUMBING, GENERAL PURPOSE or another appropriate project section.
**************************************************************************

Install the solar collector system in accordance with this section and the printed instructions of the manufacturer. [Disinfect domestic water systems, if connected with collector panels, in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.] Prior to system start-up, protect collector from direct sunlight.

3.1.2   Piping Installation

Accurately cut pipe to measurements established on site and work into place without springing or forcing. Locate piping out of the way of windows, doors, openings, light fixtures, electrical conduit, equipment, and other piping. Provide for expansion and contraction. Do not bury, conceal, or insulate until piping has been inspected, and tested. Locate joints where they may be readily inspected. Provide flexibility in piping connected to equipment for thermal stresses and vibration. Support and anchor piping connected to equipment to prevent strain from thermal movement and weight from being imposed on equipment. [Provide seismic restraints in accordance with SMACNA 1981.] Install hangers and supports in accordance with MSS SP-69 and MSS SP-58, unless otherwise indicated.

3.1.2.1   Fittings

Provide long-radius ells wherever possible to reduce pressure drops. Do not bend pipes, miter pipe to form elbows, use bushings, or notch straight runs to form full-sized tees. Provide union for disconnection of valves and equipment for which a means of disconnection is not otherwise provided. Provide reducing fittings for changes of pipe size.

3.1.2.2   Measurements

Determine and establish measurements for piping at the job site and accurately cut pipe and tubing lengths accordingly. Where possible, install full pipe lengths. Do not use couplings to join random lengths.

3.1.2.3   Cleaning

Thoroughly clean interior of water piping before joining by blowing clear with either steam or compressed air. Maintain cleanliness of piping throughout installation. Provide caps or plugs on ends of cleaned piping as necessary to maintain cleanliness.

3.1.2.4   Panel Connections to Headers

Connect panels to top and bottom headers with soft-drawn long bend "S" or "U" copper tubes brazed with 15-percent silver solder. Provide tube bender
only. Hand-formed tubing will not be acceptable. Install bottom headers behind the panels to protect the header insulation from abuse. For panels with internal headers, provide copper couplings and soldering.

3.1.2.5 Header Thermal Expansion and Contraction

Install slip tube or bellows type expansion joints. Limit thermal expansion of collector headers to [6] mm for 93 degrees C \([1/4]\) inch for 200 degrees F maximum rise.

3.1.2.6 Flanged Joints

Provide flanged joints for making flanged connections to flanged pumps and other flanged piping components. Install joints so that flanged faces bear uniformly. Engage bolts so that there is complete threading through the nuts and tighten until bolts are equally torqued.

3.1.2.7 Sleeves

Provide schedule 10 galvanized steel sleeves for pipe and tubing passing through floors, roofs, walls and partitions of either concrete or masonry construction, except that sleeves are not required for floor slabs on grade. After piping has been installed, pack oakum into the space between the pipe or tubing and the sleeve and seal both ends with insulating cement.

3.1.2.8 Flashing

[Section 07 60 00 FLASHING AND SHEET METAL.] Provide watertight flashing for pipe and tubing extending through the roof.

3.1.2.9 Escutcheons

Provide chrome plated steel escutcheons for uninsulated pipe and tubing passing through floors, walls and ceilings.

3.1.2.10 Drain Lines

Provide drain lines from air vents and relief valves to the nearest [roof drains] [floor drains] [disposal points as directed].

3.1.2.11 Insulation and Identification

Insulate piping in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. [Frostproof air vents by insulating or shielding from night sky reverse radiation.] After piping has been insulated, apply identification labels and arrows in accordance with ASME A13.1. Apply identification over the insulation jacket of piping. Provide two copies of the piping identification code framed under glass and install where directed. Where insulation shall be exposed to the exterior of a building, sunlight, or the elements, insulation shall be shielded from the elements with appropriate aluminum, stainless steel, or UV-inhibited PVC jacketing.

3.1.2.12 Excavating and Backfilling

Provide in accordance with Section 31 00 00 EARTHWORK. Coordinate provision of utility warning and identification tape with backfill operation. Provide tapes above buried lines at a depth of 200 to 300 mm 8 to 12 inches below finish grade.
3.1.3 Instrumentation

Install instruments as recommended by the control manufacturers. [For the monitoring system to detect [water] [and] [heat transfer fluid], locate the sensor probe in the lowest corner of double-wall [tank] [and] [heat exchanger].] Locate control panels [inside mechanical room] [______].

3.2 FIELD QUALITY CONTROL

3.2.1 Field Inspection

Prior to initial operation, inspect the piping system for conformance to drawings, specifications and ASME B31.1. Inspect the following information on each collector:

a. Manufacturer's name or trademark

b. Model name or number

c. Certifying agency label and rating.

3.2.2 Tests

Provide equipment and apparatus required for performing tests. Correct defects disclosed by the tests and repeat tests. Conduct testing in the presence of the [Contracting Officer] [QC Representative].

3.2.2.1 Piping Test

**************************************************************************

NOTE: Use pneumatic test if non-aqueous heat transfer fluid are used, to avoid contamination of fluids with water and to eliminate seepage problems.

**************************************************************************

[Pneumatically test new piping for leakage using air at a pressure of 138 kPa (gage) 20 psig or] [Test new water piping for leakage using water at a pressure of at least 690 kPa (gage) 100 psig or] 1.5 times the system pressure. Install a calibrated test pressure gage in the system to indicate loss in pressure occurring during the test. Apply and maintain the test pressure for one hour, during which time there shall be no evidence of leakage, as detected by a reduction in test pressure. Should a reduction occur, locate leaks, repair, and repeat the test.

3.2.2.2 Operation Tests

**************************************************************************

NOTE: Insert appropriate Section number and title in blank below using format per UFC 1-300-02.

**************************************************************************

Perform tests on mechanical systems, including pumps, controls, controlled valves, and other components in accordance with manufacturer's written recommendations. Test entire system in accordance with [Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC] [______] and ASTM E1160.

3.2.3 Manufacturer's Field Services

Furnish the services of a technical representative of the collector
manufacturer, at the job site during each phase of inspection, installation, and testing. For solar collectors, furnish the services of a manufacturer's representative to instruct Government personnel for one manday, in the operating and maintenance of equipment. Notify the Contracting Officer in writing, prior to scheduling instructions.

NOTE: This guide specification covers the requirements for wind generator systems. 

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information. 

Remove information and requirements not required in respective project, whether or not brackets are present. 

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR). 

PART 1 GENERAL 

1.1 REFERENCES 

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title. 

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**AMERICAN INSTITUTE OF STEEL CONSTRUCTION (AISC)**

**AMERICAN SOCIETY OF CIVIL ENGINEERS (ASCE)**

**AMERICAN SOCIETY OF SAFETY PROFESSIONALS (ASSP)**

ASSP Z359 (2013) Fall Protection Code

**AMERICAN WIND ENERGY ASSOCIATION (AWEA)**

AWEA O&M RP (2013) AWEA Operations and Maintenance Recommended Practices

**INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)**

IEEE 242 (2001; Errata 2003) Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems - Buff Book

IEEE 519 (2014) Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems

IEEE 1547 (2018) Interconnection and Interoperability of Distributed Energy Resources with Associated Electric Power Systems Interfaces
1.2 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE 100.

Unless otherwise specified or indicated, wind turbine terms used in these specifications, and on the drawings, are as defined in IEC 61400-SER.

1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 Pre-Installation Meetings

Comply with Section 01 30 00 ADMINISTRATIVE REQUIREMENTS and hold a pre-installation meeting [no earlier than] [1][2][_____] weeks prior to start of installation work.

1.3.2 Scheduling

Provide a delivery and installation schedule to the CO [no later than] [30][60][_____] days prior to start of installation work to allow internal coordination.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**************************************************************************

NOTE: Permits are assumed to be obtained by firm holding design responsibility. Ensure this is clarified in contract bid package.

**************************************************************************

SD-01 Preconstruction Submittals

Commissioning Plan; G[, [_____]]

Commissioning Schedule; G[, [_____]]

SD-02 Shop Drawings

**************************************************************************

NOTE: Submittal is for diagrams and instructions from a manufacturer or fabricator for use in producing the product and as aids to the Contractor for integrating the product or system into the project and prepared by or for the Contractor to show how multiple systems and interdisciplinary work will be coordinated.

**************************************************************************

Shop Drawings, Drawings, Schedules; G[, [_____]}

SECTION 48 15 00 Page 7
NOTE: Control diagram and software documentation to include software/Contractor's manual, program listing, and applicable hierarchy diagrams. The software manual must describe the functions for all wind turbine system control and monitoring software and must include all instructions necessary for proper loading, testing, debugging, and operations. Software description must include the following as a minimum: general system descriptions, including control system operating philosophies, sequence of operations, and interface definitions; explanation of program error messages; Data format, entry retrieval, archiving, and trending capabilities.

Site Plan Drawings; G[, [_____]]
Riser Diagram; G[, [_____]]
Installation ands Assembly Drawings and Details; G[, [_____]]

SD-03 Product Data

Wind Turbine System; G[, [_____]]
Sample Warranty Certificate; G[, [_____]]
Manufacturer Data Sheet; G[, [_____]]

Submit for all materials to be provided. Submit data sufficient to indicate conformance to specified requirements.

SD-05 Design Data

Wind Turbine System; G[, [_____]]
Towers/Support Structures; G[, [_____]]
Foundations; G[, [_____]]
Visual Impact Analysis & Mitigation; G[, [_____]]
Static Loading and Dynamic Response Analysis; G[, [_____]]
Noise Analysis & Mitigation; G[, [_____]]
Wildlife Impact Analysis & Mitigation ; G[, [_____]]

Special tools if required must be identified by part number and function/description.

SD-11 Closeout Submittals
Training Materials; G[, [____]]
Training Course; G[, [____]]
Commissioning Report; G[, [____]]
Decommissioning Plan; G[, [____]]
Warranty; G[, [____]]
As-built Drawings; G[, [____]]
1.5 OPERATION AND MAINTENANCE MANUALS

**************************************************************************
NOTE: Review AWEA website for updated O&M requirements for wind turbines.
**************************************************************************

Submit Operation and Maintenance (O&M) Data specifically applicable to this contract and a complete and concise depiction of the provided equipment, product, or system, stressing and enhancing the importance of system interactions, troubleshooting, and long-term preventative maintenance and operation in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA, Data Package 5. Comply with AWEA O&M RP.

Include manufacturer's standard wind turbine system operations manuals that integrate operational instructions for the installed equipment. The wind turbine system manual must fully describe all wind turbine system operational aspects including, but not limited to:

a. Control and monitoring configuration and instruction.
b. System performance capabilities and equipment specifications.
c. System startup, shutdown, and emergency procedures.
d. Definition and use of all system, command, and applicable software.
e. Alarms and alarm presentation.
f. Recovery and restart procedures.
g. Contractor commands.
h. Detailed step-by-step instructions must be provided for user interfaces, such as control consoles, indicating/control panels, and peripheral devices.

1.5.1 Preventative Maintenance Manuals

Preventative Maintenance Manuals must include as a minimum, the applicable visual examinations, software and hardware tests, and diagnostic routines and resultant adjustment procedures necessary for periodic maintenance of control equipment. Instructions on how to load and use the test and diagnostic program and special or standard test equipment must be an integral part of the manuals.

1.5.1.1 Corrective Maintenance Manuals

Corrective Maintenance Manuals must include as a minimum, detailed logic diagrams and flow charts must also be provided, as necessary, for trouble-shooting analysis and field repair actions. For mechanical items required field repairs, information on tolerances, clearances, and wear limits, and maximum bolt down torques must be supplied. Information on the loading and use of special off-line diagnostic program tools, tests equipment, and any cautions or warnings that must be observed to protect personnel and equipment, must also be included.
1.5.2 Spare Parts

Provide a spare parts list (Data Package 5) and Special Tools and Equipment list required for maintaining total system availability at [95] percent. Parts list must include, as a minimum, part description, recommended quantity, shelf life, storage conditions, manufacturer, model number, and estimated delivery times. Parts must be identified on a list or drawing in sufficient detail for procurement of any repairable or replaceable part. These parts must be identified by their individual by the industrial, generic part numbers, and must have second source referencing whenever possible.

1.6 QUALITY ASSURANCE

1.6.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.6.2 Qualifications

Provide materials and equipment that are standard products of manufacturers regularly engaged in the manufacture of such products, which are of a similar material, design and workmanship. Standard products must have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year use must include applications of equipment and materials under similar circumstances and of similar size. The product must have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2 year period.

1.6.3 Drawings

Submit minimum of three hard copies of drawings for government approval prior to manufacturing and equipment construction or integration. Submit Shop Drawings, Drawings, Schedules at a minimum of 11 by 17 inches in size using a minimum scale of 1/4 inch per foot, for the exception of drawings not requiring scale. Submit site plan drawings and Riser Diagram and general design notes at a minimum of 24 by 36 inches. Submit Installation ands Assembly Drawings and Details at a minimum of 24 by 36 inches. Submit installation details at minimum scale of 1/2 inch per foot for overview and 2 inches per foot for detail.

1.6.3.1 Product Drawings

Submit complete detailed product drawings for the wind turbine system consisting of Shop Drawings, Drawings, Schedules and Manufacturer Data Sheet. Include in the shop drawings [one][three][four] wire diagrams, utility interconnection diagrams, switchboard and switchgear drawings, equipment enclosures, conduits, monitors, meters, and all other accessories associated with the installation of the PV system. Provide equipment dimensions, weights and structural mounting details.

Include nameplate data, size, and capacity of each wind turbine. Include
all assumptions such as applicable wind speed, snow and seismic loads. Include applicable federal, military, industry, and technical society publication references.

1.6.3.2 Installation and Assembly Drawings and Details

Submit site plan drawings, Riser Diagram and general notes and Installation and Assembly Drawings and Details prior to start of construction. Include sufficient drawing detail for all parts of the work to enable the Government to check conformity with the requirements of the contract documents. Include in the site plan drawings: topographic and utility survey; bore logs; soils report; site plan(s); site construction details; structural drawings; structural construction details; site electrical plan; and site electrical construction details. Include in the installation and assembly drawings and details: parts lists; assembly drawings; interconnection wiring diagrams; wire and cable schedules; wire and cable termination schedules; instrument plan; instrument and control wire, conduit and cable schedules; instrument wire and cable termination schedule; control diagrams; control sequence of operation; seismic restraint details; and wind restraint details.

1.6.3.3 "As-Built" and Record Drawings

After completion of construction, submit "As-built" Drawings prepared and certified by the construction contractor, showing in red ink, on-site changes to the original construction details and all underground utilities measured from field benchmarks, accurate to within 1" of centerline of the utility. Immediately record for inclusion into the as-built drawings all modifications to original drawings made during installation. Indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Prepare "As-built" Drawings on a minimum of 24 by 36 inches vellum using red ink.

After submittal and approval of "As-built" Drawings, submit Record Drawings, prepared by the project engineer(s) and architect(s), of the original design drawings reflecting all design changes and contractor noted changes in the "As-Built" drawings.

1.6.4 Factory Acceptance Testing

Prepare Work Plan and Factory Test Plan. Conduct Factory Acceptance Testing during manufacturing of the wind generators as follows:

a. Tower: mil certificate for steel plates, dimensional inspection report, non-destructive test report, coating inspection report, non-conformance reports, inspection certificate from certifying agency;

b. Electrical Parts: generator, wind turbine generator transformer, converter system, and controller;

c. Nacelle: gear box, lubrication system, main shaft installation, yaw drives and system; blade pitch system, cooling system; and major castings.

Prepare Factory Test Reports after completion of testing.

1.6.4.1 Work Plan

Submit [6][_____] copies of schedules of dates for factory tests,
installation, field tests, and operator training for the UPS system. Furnish a list of instrumentation equipment for factory and field test reports.

1.6.4.2 Factory Test Plan

Submit [6][_____] copies of factory test plans and procedures at least [21][_____] calendar days prior to the tests being conducted. Provide detailed description of test procedures, including test equipment and setups, to be used to ensure the UPS meets the performance specification and explain the test methods to be used. As a minimum, the test procedures to include the test required under the paragraph entitled "Factory Testing."

1.6.4.3 Factory Tests Report

Submit [6][_____] copies of factory test report within [45][_____] calendar days after completion of tests. Receive approval of test prior to shipping unit. Factory test reports must be signed by an official authorized to certify on behalf of the UPS manufacturer of that the system meets specified requirements in accordance with the requirements set forth in paragraph entitled "Factory Testing". Provide test reports in booklet form tabulating factory tests and measurements performed, upon completion and testing of the installed system. Reports to state the Contractor's name and address, the name of the project and location, and list the specific requirements which are being certified.

1.7 DELIVERY, STORAGE, AND HANDLING

Handle, store, and protect equipment and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer. Replace damaged or defective items.

1.8 PROJECT/SITE CONDITIONS

1.8.1 Environmental Requirements

**************************************************************************
NOTE: An initial visual, noise, and wildlife analysis may occur in initial planning stage for site down-select; however, site specific analysis is required for the final site design and selected turbines.
**************************************************************************

The wind turbine system must conform to applicable federal, state, regional, and local regulations regarding visual impact, noise pollution control, and wildlife impact. Perform and submit Noise Analysis & Mitigation, Visual Impact Analysis & Mitigation, and Wildlife Impact Analysis & Mitigation to [Contracting Officer][_____] for review and approval prior to mobilization in accordance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.

1.8.2 Existing Conditions

Location [_____]  
Elevation [_____] meters [_____] feet above sea level.
1.8.2.1 Available Utilities

**NOTE: Early utility interconnect coordination is critical, as is an approved power agreement.**

Utility power is presently supplied by [utility] from a [_____]kV line transformed down to [_____]kV for local distribution. Coordinate with the utility company for the available fault current value at the new wind farm transformer located at [TBD], and to design the wind turbine system to meet or exceed the available fault current values at the individual wind turbine points of connection (step-up transformer at the base of each turbine).

1.8.2.2 Wind Resource Data

The prevailing wind is from the [compass direction] with average annual wind speeds estimated to be [_____] m/s [_____] mph at [60][_____] meters [197][_____] ft above ground level at the preferred locations for these new wind turbines. Peak 15 minute average wind has been recorded from the [compass direction] at [25][_____] m/s [56][_____] mph. Summary average annual wind data results from past wind resource assessments are included in Attachment 1 of this specification. Validate the site(s) wind resource characteristics and design wind turbine system specifically for site conditions.

Validate the Wind Farm system's components and design parameters with respect to wind loading and survival wind speed. [Additional wind resource assessment data is available upon request.] The wind turbine system will be designed to maintain structural integrity and safe operation under specified environmental conditions, without damage to life or property for the [20][_____] year life of the wind turbine system.

1.8.2.3 Site Equipment Limitations

**NOTE: Reference any known site limitations, such as bridge weight limitations, height restrictions, etc.**

Identify and provide any special crane requirements for shipping, off-loading and erection of the wind turbine and its components.
1.9 WARRANTY

Wind turbine system must provide reliable operation, free from breakdowns (not excluding normal maintenance), for the design life of the wind turbine system [20] years.

1.10 CERTIFICATIONS

Provide Seismic Certification and Wind Certification, prepared by a licensed professional engineer or National Recognized Testing Laboratory (NRTL) for all components and assembled systems in accordance with ICC IBC, ASCE 7-16 state and local building codes. Seismic and wind certifications shall demonstrate system shall withstand wind and seismic requirements as installed and remain online and functional after a seismic or wind event.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

The wind turbine system must be furnished as totally coordinated assemblies which, after site installation and testing, shall comply with the design and performance requirements of this specification.

2.2 DESIGN REQUIREMENTS

All materials used in construction must be noncombustible wherever practical, and must be new materials.

Analysis of all required erection equipment loadings (i.e., on gin poles, winches, cranes, cables, earth anchors) must be performed as required for erection and/or maintenance purposes. Reference IEC 61400-SER and wind turbine manufacturer's standards. Provide UV resistant exposed cables and stainless steel cable ties.

2.2.1 General Requirements

General requirements for the wind turbine system includes:

a. The wind turbine system should consist of a horizontal. axis, upwind active yaw control configurations, with a minimum of three rotor blades.

b. Rotor controls must be supplied to provide an active variable pitch (power/torque) air-foil design.

c. Operational RPM's must be variable, no less than [minus 10][_____] percent to [plus 5][_____] percent of synchronous RPM's.

**************************************************************************
NOTE: 80 meter hub height has been the standard.
Newer technology is allowing higher hub heights.
Ensure correct hub height is used for specification and permitting.
**************************************************************************

d. Wind turbine hub height of [80][_____] meters [263][_____] feet maximum, due to FAA height and other design issues, and energy production requirements.

SECTION 48 15 00 Page 15
e. Rotor diameter of [_____] meters [_____] feet minimum to [_____] meters
   [_____] feet maximum.

f. Low-voltage ride-through capability (see IEEE draft standard and/or
   European REE and EON grid code requirements.)

g. Reactive power support capability of [0.96][_____] inductive to
   [0.98][_____] capacitive power factor range, or approved equal.

2.2.2 Controls

The wind turbine controls will utilize standard "soft start" technologies to
minimize the impact to electrical power systems. The design must
include active power factor and load leveling controls to help reduce the
need for supplemental active VAR control and to stabilize and/or minimize
the system frequency/power changes due to wind variability respectively.
The design requirements for the wind turbine subsystem components must be
as described below.

2.2.3 Enclosures

All wind turbine equipment, controls, terminations, etc., supplied with the
wind turbine system, which are intended to be located outside the nacelle,
must be located in NEMA 12 (or equal) gasketed minimum rated enclosures for
improved corrosion and environmental protection. If temperature control is
required within the wind turbine control enclosures, provide all equipment,
devices, and controls necessary to maintain the required temperature.

2.2.4 Rotors

Wind turbine rotors must consist of nonmetallic composite airfoils of a
design resistant to abrasion related efficiency losses and must be non-EMI
conductive/reflective. The rotor design must be optimized to provide
maximum wind turbine output performance based on the specific wind regime
characteristics[ given in the supplied wind data]. Further, the rotor
controls must be designed to provide a minimum of one level of safety
beyond the primary systems.

2.2.5 Reduction Gear Assemblies

High-efficiency, reduction gear assemblies (if required) must be supplied
that are designed for low temperature rise, low levels of vibration, long
life, and low noise emissions. Further, the gear assembly designs must
provide reliable operation, free from breakdowns (not excluding normal
maintenance), for the design life of the wind turbine system[ ([20][_____] years)].

2.2.6 Bearings and Seals

The drive train must utilize tapered roller bearing technology, wherever
possible, to maintain parallelism and axial tolerance of the drive train
during all operating conditions.

Maintenance-free sealing must be installed on all shafts to prevent leaking
of gear lubrication and intrusion of dirt and dust.
2.2.7 Foundations

Determine soil and foundation load requirements and comply with applicable requirements of ASCE/AWEA RP2011.

2.2.8 Towers/Support Structures

The tower must be a free-standing construction consisting of tubular steel (or approved equal), with provisions for safely climbing and servicing the turbine. The tower must be provided with a catwalk or maintenance platform just below or within the turbine to provide for turbine servicing as per manufacturer's standard design. Determine proper height of tower assembly for optimum operation of the wind turbines. Tower construction using self-erecting crane systems are encouraged, and should be considered in cases where the height limitations of the installation may severely limit the performance of the offered system. Establish and maintain all precautions with regards to wind turbine installation and safeguarding the cranes for all possible wind conditions. Comply with IEC 61400-3, ASCE/AWEA RP2011, and wind turbine manufacturer's standards.

All tower components including, but not limited to, or tube elements, anchors, supports, rails, ladders, etc., will be of a corrosion resistant steel construction, or coated with certified [10]-year surface coatings as per Section 09 90 00 PAINTS AND COATINGS.

2.2.8.1 Wind Ratings

The wind turbine system must be capable to withstand winds of Category [1][2][3][4] or [5] as defined by the Saffir-Simpson Hurricane Wind Scale. Provide wind certifications for all components and assemblies.

The tower assembly (and all associated components subject to fluctuating/cyclic loading) must be designed to withstand all operating conditions for the specific wind region characteristics based on, but not limited to, the supplied wind data. Static loading and dynamic response analysis must be submitted for review, for all loads imposed on the wind turbine system. The analysis must also include all required erection equipment loadings (i.e., on gin poles, winches, cranes, cables, earth anchors), as required for erection and/or maintenance purposes.

2.2.8.2 Seismic Ratings

All structures and structural elements must be suitable for Seismic Design Category [_____] in accordance with ICC IBC, ASCE 7-16, and all other applicable building codes and standards pertaining to the erection of such structures.

All bolted connections must meet AISC 325 standards for loading and torque specifications.

2.2.9 Brakes

A brake system, active yaw control, and/or airfoil system, in combination with brakes, must be supplied as required to support:

a. Manual shutdown during design wind conditions;

b. Over-speed shutdown;
c. Parking for maintenance; and
d. Loss of electrical grid power during rated wind operations.

Main shaft type braking is the preferred technology, although other types
of technologies are not excluded provided they can be shown to meet the
functional and performance requirements defined herein. The braking system
must provide maintenance-free braking operations for a minimum of five
years (i.e., no new brake pads), with significant use of pitch and yaw
controls to minimize braking requirements. The braking system must be
configured to prevent any type of runaway conditions that could exist
whether grid power is available or not. The braking system must be capable
of providing sufficient braking force for parking, normal stopping, and
emergency stopping of the wind turbine system, as described below. A
braking system other than those described below may be submitted for "or
equal" substitute based upon performance.

2.2.9.1 Parking Brakes

A parking brake must be supplied capable of preventing rotor rotation at
wind speeds up to the survival wind speed and/or as required for
maintenance support, and capable of being used when there is no power.

2.2.9.2 Normal Stopping Brake System

A normal stopping brake system (or equal) must be supplied to dissipate the
kinetic energy of the rotating machinery at the design over speed
condition, while suffering no irreparable damage. The braking system must
include fail-safe automatic operational mode in the event of a power out
condition (i.e., loss of utility power while operating at rated wind speed).

2.2.9.3 Emergency Brake

An emergency brake must be supplied that is designated to meet the same
requirements of the normal stopping brake above. In addition, upon
activation, the emergency brake must alarm and require manual resetting
prior to resuming automatic operation of the wind turbine.

2.2.10 Electrical Systems

Perform an independent stability and reliability study with a focus on
determining the impacts to the installation's site facilities. Operate the
wind-farm in strict adherence to IEEE 519 guidelines for controlling
voltage, current, and harmonic distortions. Operate the wind-farm with all
the power conditioning equipment necessary to maintain a stable power
factor. Operate the wind-farm in a manner that does not diminish the
capacity of existing installation facilities. Operate the wind-farm with
appropriate controls and equipment that will automatically separate the
wind-farm from the installation, or the installation and the Utility so
that installation's site operations are not compromised in the event of
equipment, and/or system failures. Operate the wind-farm with standing
agreements cooperating jointly in maintenance processes and procedures.

2.2.10.1 Equipment

All generators, motors, and related electrical systems must meet the
requirements of NFPA 70, IEEE C2, and/or IEC requirements for all
construction. Wind turbine generators must be high-efficiency, continuous
rated machines, with a minimum of Class F insulation and temperature rise.
The generator efficiency will be a minimum of 90 percent for all loads greater than 10 percent of rated load. The generator must include embedded temperature protection with solid state sensors.

2.2.10.2 Power Distribution

Isolation breakers must be provided for key system assemblies to facilitate maintenance without interruption operation of other wind turbine systems. All fuses, circuit breakers, power supplies/regulators, and line conditioners necessary for wind turbine operations within the specified service conditions must be provided for all wind turbine equipment and assemblies. Power to the wind turbine control and monitoring subsystems must be distributed from a central point within one of the wind turbine system cabinets located within each nacelle. Voltage and current requirements must be identified and documented in the submittals to facilitate the design and transformer sizing.

2.2.10.3 Overcurrent Protection and Disconnect

A circuit breaker must be installed as the primary means disconnecting the wind turbine incoming power cables/lines from the wind turbine system. The circuit breaker must be capable of being locked in the open position and located conveniently for maintenance and operating personnel. The rating of the circuit breaker must be sized per NFPA 70 for the maximum rated load current expected at the wind turbine. All electrical equipment supplied must be rated or protected to withstand and/or interrupt (without damage) the maximum available fault current expected at the point of connection to the wind turbine system. The fault current available at the wind farm site is initially estimated at approximately ______ kAIC symmetrical at ______ kVAC at each tower base, to be more closely determined during wind farm electrical modeling and design.

2.2.10.4 Step-up Transformer

A step-up transformer may be required and must be provided by others if the wind turbine output does not match the planned collector/distribution system voltage of [34.5][_____] kV (where the turbine is to be interconnected), or if the planned system is not suitable for the wind turbine standard design requirements. Modify as appropriate for step-up transformer requirements in accordance with Section 33 73 00.00 40 UTILITY TRANSFORMERS.

2.2.10.5 Surge Suppression

External power input connections must be surge protected against IEEE C62.41 Category B transients.

2.2.10.6 Harmonics

The wind turbine generated harmonics measured at the wind generator system ac output must not exceed the levels required to conform with IEEE 519.

2.2.10.7 Grounding

**************************************************************************

NOTE: The possible exposure to a corrosive environment should be carefully examined. Even when the correct conductor size and the selected joining
(connecting) method have satisfied all the IEEE 837 test requirements, it may be prudent to choose a larger conductor size to compensate for some gradual reduction in the conductor cross section during the design life of the installation where the soil environment tends to promote corrosion. Coordinate soil environment with Geotechnical Engineer.

Grounding must conform to NFPA 70, IEEE 80, IEEE 142, IEEE 242 and IEEE C2, except that grounds and grounding systems shall have a resistance to solid earth ground not exceeding 5 ohms. Provide ground grid for maximum permissible touch and step voltages as per IEEE 80.

Provide inner ring electrode around the foundation and bond it through the foundation to the turbine tower. Provide additional ring electrodes of gradually increasing depth and diameter in order to reduce touch and step voltages at the edges of the system. Provide a Groundings System Analysis.

NOTE: The possible exposure to a corrosive environment should be carefully examined. Even when the correct conductor size and the selected joining (connecting) method have satisfied all the IEEE 837 test requirements, it may be prudent to choose a larger conductor size to compensate for some gradual reduction in the conductor cross section during the design life of the installation where the soil environment tends to promote corrosion. Coordinate soil environment with Geotechnical Engineer.

2.2.10.8 Equipment Labeling

Install permanent labels on all major switches, controls, electrical panels, cabinets, disconnects, motor starters, major equipment, or components. Weatherproof labels must be either laminated black phenolic plastic with white engraved letters, or engraved (or embossed) stainless steel nameplates. Lettering for panels and equipment must be minimum \[12\] \[\text{mm} \quad \text{[1/2]}\] \[\text{inch}\] high. Labels must be permanently installed by gluing or screwing to equipment covers. Labels must show panel or load name and circuit fed from.

2.2.10.9 Power Factor (PF) Correction

Active pf control must be installed as a integral portion of each wind turbine electrical system, and must include control provisions to maintain a minimum power factor of \[0.95\] [\text{[minimum \text{range of 0.9 to 1.0]}}\). Additional (supplemental) pf correction equipment utilizing capacitor technologies is not excluded (i.e. must be integrated and cannot be included in lieu of active pf control); however, the capacitors must incorporate provisions for disconnection and safe controlled bleed off of electrical energy to support safe maintenance, as required.

2.2.11 Control and Monitoring Systems

Wind turbine control and monitoring system electronics (both local and remote) must be microprocessor-based, provide control of all critical functions, and include (but not be limited to) fail-safe automatic shutdown
in the event of any component malfunction, rotor over speed condition, or excess vibrations. The system must be designed with on-line diagnostic capabilities to allow technicians to trouble-shoot subsystem problems down to the module or board level. Provide controls for manual and automatic indicated wind turbine starts. Contractor control panels will be supplied both at ground level and within the nacelle control compartment; and each will be equipped with all the vendor standard control switches, indicators, and metering necessary to support normal wind turbine operations. In addition, the Contractor panel(s) will include a serial communications interface or Ethernet port to communicate directly to the wind turbine microprocessor control system via [IBM][_____] compatible, portable laptop computer.

The wind turbine control system must provide normal operations monitoring to start and stop the wind turbine based on available wind, and to support automatic shutdown in the event an abnormal operating condition occurs. Automatic shutdown must be provided for the system failures identified above as a minimum.

2.2.11.1 Control System Modularity

All system controls and indicators must be solid state, modular, plug-in construction, so that any module may easily be removed from the system and replaced without breaking or making solder type connections. Subassemblies and modules performing identical functions must be interchangeable without making wiring changes. The number of types and sizes of modules must be kept to a minimum, in order to reduce the extent and cost of required spare parts.

2.2.11.2 Variable Speed/Load Leveling

To maximize reliability, impact on energy security, and reduce life cycle costs, the wind turbine generator control systems are preferred that include active variable speed technologies (variable rotor, pitch, and/or rotor-generator speeds) and active machine damping to reduce/limit peak torque effects due to wind gusts and/or grid supply fluctuations.

2.2.11.3 Assembly Wiring

Internal assembly wiring, including jumpers, must be color coded or permanently labeled using heat shrinkable, sleeve type markers [Brady B321][_____] or approved equal, as indicated on system schematics. Label identifications must be typed or printed. Wiring terminal strips must be provided and clearly identified for all equipment. Power and signal terminal strips must be separated. Provide [20][_____] percent spare terminals for all electrical connections where possible.

Label all furnished cables, cable terminations and connections. Cables and connections must be located in easily accessible areas. Signal and power wiring must be routed in separate bundles and kept separate by providing separate terminal blocks and connectors. Wires must be terminated using calibrated crimp ring lugs. Internal wiring and cabling must conform to NFPA 70 and IEC 61400-1.

2.2.11.4 Ground Level Controls

Provide a standard ground level control panel(s) with the following functional characteristics as a minimum:
a. Allow local manual isolation of, or set it in a safe maintenance mode for, the wind turbine unit both from the normal power supply and from remote Contractor initiated controls to support safe maintenance activities.

b. Allow local ground level manual controls to initiate shutdown of the wind turbine system.

c. Supplied to allow the Contractor to access the standard diagnostic functions, provide software and interface to allow direct connection of a portable, laptop computer to directly access the master microprocessor system (or control interface/PLC, etc.). [The new system must be capable of being integrated with (i.e., interface directly to), and/or be an extension of, the existing wind farm monitoring and control system.]

d. Allow ground level monitoring (without the need of the serial communications interface) of the following status and metered functions as a minimum (or equivalent functions):

1. Discrete indicators (lights or approved equal),
   - (a) Wind turbine system READY,
   - (b) Wind turbine system FAULT,
   - (c) Wind turbine system ON LINE;

2. Meters/selectable Liquid Crystal Displays (LCDs) (for approval);

3. Grid Voltage,
   - (a) Line to Line volts - Phases AB, BC, and CA;

4. Wind turbine output power,
   - (a) Kilowatts and kilowatt hours;

5. Power Factor,
   - (a) Percent PF showing 0.5 - 1 - 0.5 (both leading/lagging);

6. Rotor RPM;

7. Pitch monitoring for active pitch turbines;

8. Manual start/stop;

9. Emergency stop (latching mushroom head switch with shield);

10. Automatic and emergency shutdown indicators (lights or approved equal) with shutdown/manual reset; and

11. Local/remote selector.

2.2.11.5 Remote Monitoring and Control Work Stations

**************************************************************************
NOTE: Review Agency network security requirements

SECTION 48 15 00 Page 22
if an Agency remote terminal is desired.

Wind farm remote monitoring and control (SCADA) workstations are to be installed at the remote facilities/rooms as shown in the contract drawings as part of the wind farm/turbines project. The remote monitoring system must include two desktop computers, with modems, running Windows operating systems, and interfacing with the wind turbines using standard turbine manufacturer's supplied software. The new wind turbines must have remote control and monitoring software installed on the wind turbine workstations, and must be able to be accessed via fiber optic connection to support internet access through the SCADA computer for monitoring and reporting of Wind Farm power production. The workstations must be able to access the wind turbines for remote monitoring and control via fiber optic cable system. No DOS based software allowed in the installation of the new systems.

The new wind turbines must also have communications accessibility via dedicated external fiber optic cable, DSL connection, satellite connection, or other for manufacturer's warranty purposes, depending on the requirements of the wind turbine manufacturer. Determine, supply and define the SCADA system, for the Installation Contractor to install, to support the above wind turbine communications and monitoring hardware and software (Procure the fiber optic cable and related components). Provide Definition and Use of All System, Command, and Application Software.

2.2.11.6 Local Nacelle Monitoring and Controls

Provide manufacturer's standard wind turbine system monitoring, controls, and alarms within the nacelle/base at the Contractor control panel with ability to remote monitor as required. All controls, meters, LCD displays, etc., must be located within NEMA 12 (or equal) gasketed enclosures. The nacelle Contractor panel will include service switches to prevent the operation of the turbine from the base control panel when service personnel are in the nacelle, as well as the basic Contractor functions identified in subparagraph, GROUND LEVEL CONTROLS of this section. In addition, system failures, malfunctions, and/or warning indications must be provided as identified below (as a minimum):

a. Loss of enclosure cooling (if cooling is required);

b. Under/over voltage;

c. Under/over frequency;

d. Out of phase sequence;

e. Phase current unbalance;

f. Excess vibration;

g. Generator problem,

(1) Generator excess power,

(2) Generator over current,

(3) Generator over temperature,
(4) Generator over speed,
(5) Generator cooling failure;

h. Yaw system failure;
i. Cable over twist (if cables are used);
j. Hydraulic system failure;
k. Loss of gear box oil pressure;
l. Gear box over temperature;
m. Pitch control system failure (as required); and
n. Communications systems failure.

2.2.12 Cable Over Twist Protection

If the proposed system utilizes cables between the yaw deck and the tower, the wind turbine system must incorporate the necessary cable twist sensors to detect and determine the net number of nacelle rotations to prevent cable damage due to over twist. In the event a cable over twist is sensed, the wind turbine system controls must operate to safely bring the rotor to a complete stop, untwist the cable by counter yawing, and restart the wind turbine system. This system must be tolerant of total power outages and not lose track of previous twist information.

2.3 PERFORMANCE REQUIREMENTS

The wind turbine system output performance must meet the minimum criteria given in paragraph, DESIGN REQUIREMENTS of this section (less 2.5 percent tolerance). The minimum annual gross energy production required to meet this specification was calculated using historical data and corresponding distribution with long-term annual average wind speed of [_____] m/s
[_____] mph at [_____] meters [_____] feet AGL, tower/hub height of [_____] meters [_____] feet, wind shear of [_____] between [_____] and [_____] meters [_____] and [_____] feet, altitude curve of [1.06][_____] kg/m$^3$
[6.617][_____] lb/ft$^3 \times 10^{-2}$ air density.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Perform pre-performance and performance tests, inspections, and verifications in accordance with IEC 61400-SER.

Submit all manufacturer's standard airfoil performance and mechanical stress/strength tests data under the maximum expected operating conditions.

All wind turbines controls must be tested to standard manufacturing and systems tests and must include but not be limited to:
a. Rotor controls (if required);
b. Yaw control (if required;)
c. Cooling system controls (if required);
d. Safety and shutdown systems; and
e. Braking systems.

Prepare and submit for review and approval a test plan and procedures for factory and site testing. Tests must include an integrated control systems test where a minimum of the wind turbine generator and associated controls must be tested as a complete or mock assembly. These tests must be subject to witness by the Contracting Officer (or designated representative). Notify the Contracting Officer at least [30] working days in advance of the tests. Should the Contracting Officer elect not to have a representative present during factory tests conducted by Contractor, the Contractor must still conduct such factory tests and inspections and submit test data and reports.

Data must be reported as taken during testing. Data format must be such that it can be included in performance test data submitted to the Contracting Officer.

Furnish the Contracting Officer [two] copies of all shop and field test reports (and/or certificate of compliance) and [two] additional information copies of these reports, clearly identified as such.

PART 3 EXECUTION

3.1 SITE PREPARATION

Evaluate and ensure site is accessible for the size and weight of planned equipment and facilities. Coordinate transportation routes to site.

Prepare site and lay down areas in accordance with approved contract documents.

3.2 WIND TURBINE SYSTEM PREPARATION

Ensure the wind turbine systems, remote work stations, control, power monitoring equipment, and all ancillary installed equipment are operational in accordance with this specifications section. All testing, both on site and at the factory, must be organized and supported by approved Commissioning plans. Submit a Commissioning Plan and procedures to the Contracting Officer for approval no later than [20] business days after approval of the final design. The plan must state what equipment configuration will be tested, when it will be tested, which tests will be run, any special test equipment required, any required simulation software, and who will conduct and witness the tests as a minimum. The test procedures must define the operating steps and expected results to demonstrate compliance with the requirements of this specifications section. The Commissioning Report must record all test results and describe nonconformance events and corrective actions.

Ensure that the wind turbine components and associated subsystem must be tested by the manufacturer before shipment to verify proper assembly and function of all components/subsystems, and to ensure that the final assembled unit meets or exceeds the requirements of this specifications section. Component tests will be performed and/or Manufacturer's Factory certificates of compliance will be submitted indicating the equipment has been fully tested and meets the manufacturer's standard design requirements. These tests must include (as a minimum):

a. Full Load Generator Tests - Full load test must be performed using the
full load nameplate rating of the wind turbine generator unit. Full load testing must validate the vibration, temperature rise, and voltage and current outputs are within standard manufacturing limits (and/or meet) the manufacture's specifications.

b. Generator Insulation Tests - Generator insulation resistance and high potential tests must be performed with an insulation tester. Stator readings must be taken at the generator circuit breaker/switch. All results of insulation tests must be recorded. Readings must be within the standard manufacturing limits specified by the generator manufacturer.

c. Gearbox/Transmission Full Load Tests - Full load testing must validate the vibration, temperature rise, sealing, audible noise, gear tooth patterns, and lubrication systems are within the limits specified by the manufacturer. Full load test must be performed using the full load nameplate rating of the transmission or wind turbine generator unit (whichever is greater).

All factory component tests described above may be performed at the manufacturing facility.

3.3 ERECTION

Determine all hoisting and rigging and other installation requirements, and must make arrangements, if appropriate, for rent or purchase of any of these special installation tools.

Comply with ASSP Z359 Fall Protection Code during all construction, operations, and maintenance actions.

3.4 INSTALLATION

Install, test and commission wind turbine system. Provide detailed instructions and necessary oversight for installing all wind turbine system equipment. Notify the [CO][COR] of any errors in installation ensure that any and all installation errors are corrected in accordance with the manufacturer's instructions and specifications. Certify that the wind turbine system and wind turbine equipment are ready to operate. The Contracting Officer must receive [30] [_____] working days' notice of the scheduled start up of the wind turbine system, with validation of the final schedule [21] [_____] days prior to startup.

The scope of the Contractor's installation of the wind energy system must include, but not be limited to, the following activities:

a. Wind towers installation and setup support, including for hoisting, rigging, leveling, etc.;

b. Nacelle and rotor installations;

c. Control, monitoring, and terminal cabinet installations; and

d. Wiring connections/hookup.

3.5 SYSTEM INTERFACES

Wind turbine control and monitoring system is not authorized to interface with installation information network without approved software and
hardware, and either an Authorization to Operate (ATO), Interim ATO (IATO), or Interim Authorization to Test (IATT). Permanent connection is not allowed without an Approval to Connect (ATC) or Interim ATC (IATC) authorization. Comply with IEEE 1547.

3.5.1 Power System Interface

The wind farm generator connections to the site power grid will be field located as shown in the contract drawings. Validate proper voltage drop of system after completion of the wind turbine Contractor submittals. Locate the wind turbine system ground level controls to enable safe manual ground level shutdown.

3.5.2 Dispatch Interface

The remote monitoring and control system must be integrated to allow the [UTILITY] [Contractor's] [User's] power dispatch, via the master workstations at the remote facilities, to monitor and control Wind Farm status and record aggregate power output and wind turbine status from the Wind Farm system.

3.5.3 Control System Interface

The wind turbine system must be supplied with a standard fiber optic, DSL, satellite or 56 kbit/s to 115 kbit/s minimum serial interface communications interface [by others] to link standard wind turbine control and monitoring functions with the existing remote monitoring/control system. The wind turbine communications interface will be capable of driving control signals, from the final locations recommended for the wind turbines to the remote facility workstations. The communications interface must include all the standard software drivers, installation and operation documentation, and programming support necessary to allow easy integration directly with the [Contractor's] [user's] workstations located at the remote.

3.6 FINISHING, CLEANING, AND PAINTING

All surface finishes, cleaning, and painting must conform with Section 09 90 00 PAINTS AND COATINGS. All exposed surfaces that protect material must be UV resistant to maintain appearances through the design life of the system.

3.7 EQUIPMENT IDENTIFICATION

Each piece of equipment must be identified so that it can be easily correlated with the documentation. The means of identification must be uniform throughout the system. The identification mark must be permanently affixed to the part it identifies. This requirement includes internal wiring, terminal strips, input/output cables and connectors, input/output modules, power supplies, and other subsystem components and subassemblies.

3.8 NAMEPLATES

Each major piece of wind turbine system equipment must be furnished with a permanently attached 316 stainless steel nameplate, which contains a minimum of the following information:

a. Tag number;

b. Manufacturer name;
c. Model number;
d. Serial number; and
e. Purchase order number.

Each nameplate must be fully visible when the equipment is in operating
condition and consist of a self-adhesive label having [_____] [6][_____] mm
[1/4][_____] in embossed letters. Shipping container must be labeled with
the same data.

3.9 FIELD QUALITY CONTROL

3.9.1 Manufacturer's Field Service

Provide the services of factory trained and approved field service engineer
during system installation, testing, and commissioning.

3.9.2 Start Up Services

Carry out a checklist of startup requirements and conduct a series of
safety tests to ensure proper installation, safe operation, and performance
up to specification. Develop a Commissioning Report detailing all
procedures, testing, and results.

After installation, prepare the new wind turbine systems for final testing
and commissioning. The wind turbine systems must be fully debugged and
operating in accordance with all requirements of this specifications
section. Final start-up services must include, but will not be limited to,
the following:

a. Final functional checks of all installed wind turbine systems,
   automated control modes, and associated controls and instrumentation.

b. Final verification and calibration of all wind turbine system control
   and instrumentation signals and digital readouts.

c. Final verification of the proper operation of all controlled shutdown
   functions and capabilities; and both automatic and ground level
   supported operating, monitoring, and related control functions.

d. Alarm systems.

3.9.3 Functional Acceptance Testing

After installation, conduct functional acceptance testing of the equipment
and all accessories furnished to verify their proper performance under
conditions of actual operation. Notify the CO at least [30][_____] working
days in advance of the tests. Compliance with all requirements of this
specifications section and all applicable standards (as amended) must be
verified by an on-site startup/operational test.

3.9.4 Operational Testing

Support complete on-line operational testing on site to formally commission
wind turbine operations, validate warranties, perform training, and
initiate maintenance schedules. The wind turbine manufacturer will support
the Installation Contractor who will be responsible for developing and
implementing approved operational test procedures for testing all of the
wind turbine operational and failure/failsafe systems. A certificate of
completion must be provided at the conclusion of system's construction,
installation, and commissioning. Coordinate all formal correspondence and
reporting required for approval of the test plan. Project implementation
must require the installation, testing, and operation of the wind turbine
generating units in parallel with the installation's [_____] kV
distribution system. Installation and start-up support service submittals,
test plan documents, and test schedule information must be submitted for
review and approval.

Perform and submit field data reports for the following:

a. Verification of proper electrical power connection to all wind turbine
   system components.

b. Verification of proper termination of all system interconnect wiring
   and signal transmitter calibrations.

c. Verification of proper wind turbine system monitoring, controls, and
   environmental support system functionality.

d. Functional checks of all analog and digital signals, modems, and data
   communications systems associated with the wind turbine system.

e. Verification of wind turbine equipment alignments, torques and
   adjustments, and vibration block installations.

f. Functional checks (and correction if necessary) of all lubrication and
   cooling system levels and operations, shaft seals, and or other system
   fluid leaks.

g. All variations to documentation must be documented and submitted
   immediately to the CO and/or the COR.

3.10 COMMISSIONING

**************************************************************************
NOTE: Section [01 91 00.15 10] [01 91 00.15 20]
TOTAL BUILDING COMMISSIONING is intended for
building systems, however, the basic requirements
are applicable to PV commissioning processes.
Section [01 91 00.15 10][01 91 00.15 20] will need
to be tailored for PV systems when compiling project
specifications.
**************************************************************************

Conduct Commissioning, after the system is installed and is ready for
operation, in accordance with Section [01 91 00.15 10] [01 91 00.15 20]
TOTAL BUILDING COMMISSIONING, item (6)renewable energy generation, to
verify that the completed and installed system meets the requirements of
IEEE 1547. Tailor for non-building systems.

3.10.1 Commissioning Agent

Individual qualified in testing protective equipment (e.g., professional
engineer, factory-certified technician, licensed electrician with
experience in testing protective equipment) must perform or directly
supervise commissioning tests. Provide Commissioning Agents Qualifications.
3.10.2 Commissioning Plan and Schedule

Develop and implement a commissioning plan and commissioning schedule in accordance with Section [01 91 00.15 10] [01 91 00.15 20] TOTAL BUILDING COMMISSIONING.

3.10.3 Start-up Pre-functional Checklists

Carry out a checklist of startup requirements and conduct a series of safety tests to ensure proper installation, safe operation, and performance conforming to specification.

3.10.4 Functional Performance Testing

Prepare test procedures and conduct functional performance testing of the installed system. Test on completion each individual wind turbine generator and then test on completion the complete wind power system plant. Test the complete wind power system for a minimum duration of 200 hours, of which 150 hours should be generator time with 85 percent availability.

Provide testing of the following:

a. Collector System
b. Collector and Substation Equipment
c. Ground Grid
d. Main Power Transformers
e. Circuit Breakers
f. Arrestors
g. Switches and Switchgear
h. Instrument Transformers
i. Wind Plant Relays
j. Wind Plant Energization
k. Turbine Transformer
l. Overhead Collection Circuits
m. Fiber Optics and Secondary Cables
n. Medium Voltage Cable Systems
o. Power Performance
p. Nacelle Anemometer Verification
q. Acoustic Noise
r. SCADA and Controls
s. Back Up/Black Start Generator(s)

t. Grid Synchronization and Interface

3.10.5 Functional Performance Testing Results

Coordinate, observe and record the results of the functional performance testing. Coordinate retesting as necessary until satisfactory performance is verified. Verify the intended operation of individual components and system interactions under various conditions and modes of operation.

Document items of non-compliance in materials, installation or operation. Immediately address observed non-conformance and deficiencies in terms of notification to responsible parties, and provide recommended actions to correct deficiencies.

3.10.6 Final Commissioning Report

Prepare and submit final commissioning report. Summarize all of the tasks, findings, conclusions, and recommendations of the commissioning process in accordance with IEC 61400-SER. Include the results of all tests and a listing of the final settings.

3.11 CLOSEOUT ACTIVITIES

3.11.1 Demonstration

Provide hands on demonstration of wind turbine systems and controls as part of the training session. Minimum demonstration areas must include pre-startup inspections, system startup, grid connection; operations, operator initiated shutdown, emergency shutdown, and extreme conditions procedures.

Demonstrate, upon completion of functional acceptance tests, that all circuits and devices are in proper operating condition and performing as intended.

3.11.2 Training

Provide a [1][3][5] day comprehensive training course covering operations and maintenance, critical spares, and unique tools requirements, with complete training materials, at construction completion.

Provide recommendations and sources for advanced maintenance personnel training and certification programs.

3.11.3 Spare Parts

Provide a spare parts list in accordance with the manufacturer's recommendations that will ensure [95][___] percent system availability for from one (1) year to two (2) years of operation for each wind turbine unit, (according to options awarded). The list must include/identify all required gaskets, seals, sealing materials required for maintaining the weather tight integrity of the wind turbine tower and nacelle.

3.11.4 Special Tools and Equipment

Identify special tools and equipment designed specifically for the wind
turbine equipment operation and maintenance. Special tools and devices, including any metric wrenches or other hand tools that are not standard in the United States, required for operation and maintenance of the equipment furnished under this specifications section, must be listed and clearly identified with the name of the equipment.

3.11.5 Site Restoration

Clean and restore temporary work areas to pre-existing conditions.

3.11.6 Decommissioning Plan

Provide a decommissioning plan to Contracting Officer for approval. Decommissioning plan must include actions necessary to restoring site and access roads to natural conditions and option to evaluate structure and components for life extension upgrades.

3.11.7 Warranty

Provide system and major component Warranty in accordance with Section 01 78 00 CLOSEOUT SUBMITTALS

3.12 OPERATION

3.12.1 Normal Operations

The wind turbine system must be operating in an automatic, unmanned mode, unless a failure alarm is detected in the wind farm control system, or maintenance is being performed on the system. Wind turbine system controls must be provided to optimize wind turbine system outputs under normal wind conditions, as described in paragraph, EXISTING CONDITIONS of this section. Standard wind turbine controls must be designed to keep the wind generating system operational within its normal operating limits over the design life of the wind farm system, producing efficient, optimized, electrical power. Should the wind turbine or its control system malfunction, the protection system/safety schemes must maintain it in a non-hazardous condition. Acceptable safety schemes must include braking, blade pitching, spoilers, and active yawing, as required by the turbine generator manufacturer. Provide wind turbine Operations Manuals, Alarms and Alarm Presentation, System Startup, Shutdown, and Emergency Procedures, and Contractor Commands (Control Consoles, Indicating/Control Panels, and Peripheral Devices).

3.12.2 Pre-Startup Inspections

Pre-startup inspections must be performed prior to initiating wind turbine system operations. To support automatic operations, the inspections will only be required following maintenance and/or abnormal shutdowns brought on by the automatic shutdown features of the controls. Pre-starting inspection will be performed using manufacturer's instructions and procedures to ensure that the wind turbine system is ready for on-line operations. The necessary instructions, procedures, checklists, etc. must be supplied as part of the documentation submittals as required herein.

3.12.3 Connection to Grid

To connect grid power to the associated wind turbine unit, coordinate with utility company grid operations to close the wind turbine switchgear breakers either manually at the site or remotely via the Contractor
stations. Compliance with interconnection agreement requirements is mandatory.

3.12.4 Initiate Wind Turbine Operations

Once grid power is supplied to the wind turbine, the wind turbine control system will begin its internal system diagnostics, as necessary, to prepare the control system for active operations. All faults normally detected by the control system, or occurring as a result of automatic shutdown, will have to be manually reset prior to allowing active operations. When the fault indications have been reset, the controls will output a wind turbine "READY" indicator to notify that the wind turbine is ready to activate soft start operations.

3.12.5 Normal Operations

Final wind turbine connection to the grid for normal on-line operation will occur when the he ON-LINE command is initiated, either from the Contractor's panel or remotely via the serial communications/control link. Normal operation must include normal pitch, speed, and voltage controls to automatically optimize output while operating within normal wind speed parameters. ON-LINE operations will invoke normal operation where the wind turbines will begin soft start (solid state soft start, reduced voltage starting, or equal) operations (to reduce the impact of connecting the wind turbine to the grid) if adequate wind is available.

3.12.6 Normal Shutdown

All Normal shutdowns must result in immediate orderly shutdown, including a functional disconnect of the wind turbine generator from the grid at the wind turbine output control (or equal). The wind turbine control system must remain operational to maintain full control of the wind turbine shutdown (application of normal braking, required rotor and blade pitch operations, active yawing, etc.) as necessary to effect safe (non-damaging) shutdown of the wind turbine unit. Prior to beginning maintenance operations, shut down the system, applying the parking brake, open the switchgear breaker supplying the wind turbine system, open the wind turbine local disconnect breaker, and set the wind turbine operations switch into the LOCAL mode.

3.12.7 Emergency Shutdown

Emergency shutdown procedures/functions must be included as an integral part of the wind turbine basic operating capabilities. The emergency shutdown system must operate to disconnect the wind turbine from the grid and apply appropriate braking actions, require rotor and blade pitch operations, active yawing, etc., as necessary to effect safe (non-damaging) shutdown of the wind turbine unit in emergency, extreme operating conditions, survival wind speeds or a loss of grid power while operating. These include, but are not limited to, loss of grid power, breaker trip, over speed, contractor control, and other anomalies. Provide Recovery and Restart Procedures.

3.12.8 Extreme Operating Conditions

Peak wind speed, high temperature, and earthquakes all constitute extreme operating conditions, which may exist whether the wind turbine is in operation or not. The wind turbine system design analysis must consider the effects of extreme operating conditions; and the resulting design
configuration must include the necessary safety elements to mitigate damage from the extremes (and still effect safe shutdown). Contractor inspection and manual reset is expected before any operation following an extreme event.

3.13 MAINTENANCE

Contractor to create maintenance schedule and perform system and component maintenance in accordance with equipment manufacturers' recommendations and AWEA O&M RP. Provide a Recommended Multi-Year Operations and Maintenance (O&M) Requirements Schedule.

NOTE: This guide specification covers the requirements for landfill gas systems as utility grade renewable power generation source.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Use this UFGS in conjunction with UFC 3-460-01 "Design: Petroleum Fuel Facilities". Include in this specification any additional equipment/devices necessary to meet state and local regulations.

The specification is written around ASME's standard Class 150 rating. For applications requiring higher pressure ratings (e.g., Class 300, etc.), the designer will have to modify this specification appropriately.

1.2  1.2 RELATED REQUIREMENTS

**************************************************************************
NOTE: To apply this guide specification to other divisions of the project specification, insert the appropriate division number and title. Ensure that the appropriate sections having electrical equipment include the following paragraph:

Delete sections in the paragraph that are not in the job. The requirements of this specification section are being incorporated into the other specification sections that reference it with the intent of phasing out this section. As the requirements of this section are incorporated into each specification section, that section should be added to the list in the paragraph below. Do not use this section, and delete reference to it, if the only sections used in the job are listed below.

**************************************************************************
This section applies to certain sections of Division 13, SPECIAL CONSTRUCTION, and Divisions 22, PLUMBING. This section applies to all sections of Division 26 and 33, ELECTRICAL and UTILITIES, of this project specification unless specified otherwise in the individual sections.

1.3  1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL
PROCEDURES.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

********************************************************************************

NOTE: Permits are assumed to be obtained by firm holding design responsibility. Ensure this is clarified in contract bid package.

1.4 1.4 QUALITY ASSURANCE

1.4.1 1.4.1 Material and Equipment Qualifications

Provide materials and equipment that are standard products of a manufacturer regularly engaged in the manufacturing of such products, that are of a similar material, design and workmanship. Materials and equipment must have been in satisfactory commercial or industrial use for a minimum two years prior to bid opening. The two year period must include applications of the equipment and materials under similar circumstances and of similar size. Materials and equipment must have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the two year period.

1.4.2 1.4.2 Nameplates

**************************************************************************
SECTION 48 16 00  Page 8
NOTE: In a salt water environment, substitute acceptable non-corroding metal such as, but not limited to, nickel-copper, 304 stainless steel, or monel. Aluminum is unacceptable. Nomenclature (or system identification) should be established by the designer.

Require melamine plastic nameplates for all NAVFAC projects. Also for NAVFAC projects, require nameplates to be associated or keyed to system charts and schedules.

Attach nameplates to all specified equipment, thermometers, gauges, and valves defined herein. List on each nameplate the manufacturer's name, address, contract number, acceptance date, component type or style, model or serial number, catalog number, capacity or size, and the system that is controlled. Construct plates of stainless steel. Install nameplates in prominent locations with nonferrous screws, nonferrous bolts, or permanent adhesive. Minimum size of nameplates must be 25 by 65 mm/1 by 2-1/2 inches. Lettering must be the normal block style with a minimum 6 mm/1/4 inch height. Accurately align all lettering on nameplates.

1.5 DELIVERY, STORAGE, AND HANDLING

Handle, store, and protect equipment and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer. Replace damaged or defective items.

1.6 WARRANTY

Warranty overall landfill gas collection, processing, control, and generation system to be free from material, workmanship, and manufacturing defects (excluding normal maintenance), for a period of [5] years.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

The landfill gas system includes the following:

a. Landfill gas and condensate piping and accessories;
b. Condensate pump stations;
c. Condensate knockouts;
d. Blowers;
e. Propane stations;
f. Skid mounted flare systems;
g. **Gas condensers**;
h. Gas dryer systems;
i. Aftercoolers;
j. Gas turbines;
k. Microturbines;
l. **Internal combustion engines**;
m. Filtration systems;
n. Landfill gas analyzers; and
o. Control systems.

2.2 Design Conditions

Equipment specified herein must be designed to for:

a. Elevation [_____] meters/[_____] feet.

b. Minimum/maximum ambient temperature [_____] / [_____] degrees C/[_____] / [_____] degrees F.

c. Landfill gas and condensate to be handled.

d. Maintaining a [75] percent collection efficiency.

e. Raw gas inlet conditions of:
   
   LFG flow: [_____] liters/minute/[_____] SCFM.
   
   LFG temperature: [_____] / [_____] degrees C/[_____] / [_____] degrees F.
   
   Relative humidity: [100] percent.
   
   Raw gas composition:
   
   [_____] percent methane
   
   [_____] percent carbon dioxide
   
   [_____] percent nitrogen
   
   [_____] percent oxygen
f. Treated gas conditions of:

******************************************************************************
NOTE: Specify for end use. I.e. on site power
generation equipment requirements, direct use, or
distribution.
******************************************************************************

Sulfur (hydrogen sulfide, sulfur dioxide) less than [57] mg/MJ/[60]
microgram/BTU.

Halides (chlorine/fluorine) less than [19] mg/MJ/[20] microgram/BTU.

Ammonia less than [2.81] mg/MJ/[2.96] microgram/BTU.

Particulates less than [10] microns.

Siloxanes less than [0.56] mg/MJ/[60] microgram/BTU.

Moisture less than [80] percent relative humidity at lowest
 temperature.

2.3 MATERIALS

Internal parts and components of equipment, piping, piping components, and
valves that could be exposed to landfill gas and/or condensate during
system operation must not be constructed of zinc coated (galvanized)
metal. Do not install cast iron bodied valves in piping systems that could
be exposed to landfill gas and/or condensate during system operation.

2.3.1 Nitrile Butadiene (Buna-N)

Provide Buna-N material that conforms to SAE AMS3275.

2.3.2 Acrylonitrile Butadiene Rubber (NBR)

Provide NBR material that conforms to SAE AMS3275.

2.4 ELECTRICAL WORK

******************************************************************************
NOTE: Show electrical characteristics, motor
starter type(s), enclosure type, and maximum rpm in
the equipment schedules on the drawings.
******************************************************************************

Where reduced-voltage motor starters are recommended
by the manufacturer or required otherwise, specify
and coordinate the type(s) required in Section
26 20 00 INTERIOR DISTRIBUTION SYSTEM.
Reduced-voltage starting is required when full
voltage starting will interfere with other
electrical equipment and circuits and when
recommended by the manufacturer. Where adjustable
speed drives (ASD) are specified, reference Section
26 29 23 ADJUSTABLE SPEED DRIVE SYSTEMS UNDER 600
VOLTS. The methods for calculating the economy of
using an adjustable speed drive is described in UFC
3-520-01 DESIGN: INTERIOR ELECTRICAL SYSTEMS.
Coordinate the ignition temperature of the fuel(s) to be handled with the electrical design. Ignition temperatures will be as defined in NFPA 497M. Fuel ignition temperatures will dictate the maximum allowable temperature rating of the electrical equipment. Coordinate the area classification and the electrical design with UFC 03-460-01.

2.4.1 2.4.1 General

Provide motors, motor starters, controllers, integral disconnects, contactors, controls, and control wiring with their respective pieces of equipment, except controllers indicated as part of motor control centers. Provide electrical equipment, including motors and wiring, as specified in [Section 26 05 00.00 20 BASIC ELECTRICAL MATERIALS AND METHODS] [Section 26 05 00.00 40 COMMON WORK RESULTS FOR ELECTRICAL]. Provide switches and devices necessary for controlling and protecting electrical equipment. Provide motor starters complete with thermal overload protection and other necessary appurtenances. Comply with API RP 540 and API RP 2003.

2.4.2 2.4.2 Motors

Provide motors in accordance with NEMA MG 1 and of sufficient size to drive the load at the specified capacity without exceeding the nameplate rating of the motor when operating at proper electrical system voltage. Provide high efficiency type, single-phase, fractional-horsepower alternating-current motors, including motors that are part of a system, in accordance with NEMA MG 11. Provide polyphase, squirrel-cage medium induction motors, including motors that are part of a system, that meet the efficiency ratings for premium efficiency motors in accordance with NEMA MG 1. Motors must be rated for continuous duty with the enclosure specified. Motor duty requirements must allow for maximum frequency start-stop operation and minimum encountered interval between start and stop. Motor torque must be capable of accelerating the connected load within 20 seconds with 80 percent of the rated voltage maintained at motor terminals during one starting period. Motor bearings must be fitted with grease supply fittings and grease relief to outside of the enclosure. Comply with IEEE 112.

2.4.3 2.4.3 Motor Controllers

Where two-speed or variable-speed motors are indicated, solid-state variable-speed controllers may be provided to accomplish the same function. Use solid-state variable-speed controllers for motors rated 7.45 kW/10 hp or less and adjustable frequency drives for larger motors. Controllers and contactor must have a maximum of 120-volt control circuits and must have auxiliary contacts for use with the controls provided. For packaged equipment, the manufacturer must provide controllers including the required monitors and timed restart.

2.4.4 2.4.4 Underground Wiring

Provide underground electrical wiring in PVC conduit, as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION.
2.4.5 Grounding and Bonding

Grounding and bonding must be in accordance with NFPA 70, NFPA 77, NFPA 780, IEEE 1100, IEEE 142. Provide jumpers to overcome the insulating effects of gaskets, paints, or nonmetallic components.

2.5 GAS COLLECTION AND CONTROL SYSTEM

Landfill gas collection and control system (GCCS) to comply with 40 CFR 60.752.

Provide piping, accessories, and valving in accordance with in Section 33 51 15 NATURAL-GAS / LIQUEFIED PETROLEUM GAS DISTRIBUTION PIPELINES.

2.6 CONDENSATE PUMP STATIONS

******************************************************************************
NOTE: Refer to NAVFAC Standard Design 140-40-05 TRUCK UNLOADING SYSTEM and UFC 3-460-01 for detailed information of an off-loading assembly.
******************************************************************************

Assembly must be a complete, packaged, factory fabricated for use in the landfill, transferring condensate or leachate from landfill gas header and subheader piping. Assembly must include automatic level control of condensate or leachate and must pump to a point of disposal.

2.6.1 Condensate Pump Station and Enclosure

Provide pump station that is fully enclosed, weatherproof, polyethylene or PVC construction with an intermediate storage reservoir. Provide with quick connect/disconnect fittings and corrosion resistant components. Assembly must have a vault for access and maintenance. Comply with NEMA 250.

2.6.2 Condensate Pumps

Provide electric centrifugal or submersible type condensate pump sized and designed for condensate service.

2.6.3 Service Nameplate

In addition to the equipment identification nameplate, provide pump station service nameplate, of type 18-8 stainless steel or monel, securely attached by stainless steel pins at an accessible and conspicuous point on the pump station. Tagging in letters 6 mm/1/4-inch high must bear the equipment number as shown on the drawings. The pump station service nameplate must be stamped with the following information:

a. Manufacturer's name;

b. Pump serial number;

c. Capacity, [_____] L/s/[_____]gpm;

d. Pumping head, [_____] m/[_____] ft;

e. Pumped fluid maximum specific gravity;

f. Revolutions per minute; and
2.7 **CONDENSATE KNOCKOUTS**

Provide complete packaged assembly, factory fabricated, for use in-line with the landfill gas pipelines to remove condensate from the landfill gas stream. Assembly must include automatic condensate level control and must pump to a point of disposal. Provide cleanout and monitoring ports.

2.7.1 Condensate Knockout Enclosure

The knockout must have a fully enclosed, weatherproof, polyethylene or PVC construction with an intermediate storage reservoir. Provide with quick connect/disconnect fittings and corrosion resistant components.

2.7.2 Condensate Pumps

Pumps must be an electric centrifugal or submersible type. Comply with API STD 610.

2.7.3 Service Nameplate

Provide a knockout service nameplate, of type 18-8 stainless steel or monel, attached by stainless steel pins at an accessible point on the knockout, must be furnished in addition to the identification nameplate. The knockout service nameplate must be stamped with the following information:

a. Manufacturer's name;

b. Pump serial number;

c. Capacity, [_____] L/s/[_____]gpm;

d. Pumping head, [_____] m/[_____] ft;

e. Maximum specific gravity of fluid to be pumped;

f. Revolutions per minute; and

g. Driver horsepower.

2.7.4 Identification Nameplate

Provide a knockout identification nameplate of Type 18-8 stainless steel or monel and securely attached by stainless steel pins to a conspicuous place on the knockout. Tagging in letters 6 mm/1/4-inch high must bear the equipment number as shown on the drawings.

2.8 **BLOWERS**

Provide positive displacement blowers, completely assembled with strainer, silencers, check valves, pressure relief valves, shaft seals, and intake and discharge pressure gauges. Provide with variable frequency drive for LFG flow control. Provide actuated fail-safe valve on intake and discharge side for blower isolation during normal and emergency shutdown operations.
2.9 2.9  PROPYANE STATIONS

Provide propane station compatible with flare pilot system requirements and integrated into the main station control panel. Size propane storage for 6 [_____] months of operation. Comply with ASME BPVC SEC VIII D1, ASME Boiler and Pressure Vessel Code, NFPA 58, and piping as specified in 33 51 15 NATURAL-GAS / LIQUEFIED PETROEUM GAS DISTRIBUTION PIPELINES.

2.10 2.10  SKID MOUNTED FLARE SYSTEMS

**************************************************************************

NOTE: Check local air quality board for more stringent emissions requirements.
**************************************************************************

Provide a skid mounted flare system for use in landfill gas destruction. Assembly must include burners, louvers, weather protection, insulation, access ladder and platform, heat shields, purge blower, flame arrester/thermal valve, wind shields, pilot light system, flame sensor, modulation control valves, and controls. The flare control system shall be completely assembled and tested prior to shipment by the flare supplier at the supplier's own fabrication facility.

Flare system must be capable of continuous stable combustion operation with [30] to [50] percent methane at the maximum required flow rate. Flare must have a minimum exhaust gas retention time of [0.5] [1.0] [_____] seconds at a minimum temperature of [760] to [980] degrees C/[1400] to [1800] degrees F.

The flare shall be capable of achieving a minimum destruction efficiency of >98 percent of total non-methane organic compounds (NMOCs) by weight and 99 percent destruction of hydrogen sulfide. Flare shall be designed to comply with and operate in compliance of 40 CFR 60.18.

2.10.1 2.10.1 Skid Mounted Flare Construction

Flare construction must be carbon steel with a stainless steel weather and heat protection at the top of the flare.

2.10.2 2.10.2 Flare Insulation

Insulate flare with 100 mm/4 inch ceramic fiber blanket insulation to achieve a not to exceed skin temperature of 121 degrees C/250 degrees F.

2.10.3 2.10.3 Burner and Propane Pilot

Burner must be stainless steel construction. Propane pilot must be stainless steel construction. Provide thermocouple flame recognition system and purge system.

2.10.4 2.10.4 Manifold

Provide low pressure type manifold with flame arrester and safety shutdown valve.

2.11 2.11  GAS DRYER SYSTEMS

Provide a complete packaged gas dryer system for use in landfill gas piping to remove water vapor and condition the landfill gas to a quality acceptable for use specified microturbines and combustion engines.
2.11.1  Gas Dryer Construction

Provide modular construction gas dryer with stainless steel wetted parts, heat exchanger tubes, and moisture separator. Gas dryer system must be mounted on a structural solid steel base.

2.11.2  Refrigeration System

The refrigerant used must not contain CFC. The refrigeration system must include:

a. Liquid line dryer;
b. Suction line dryer;
c. Site glass;
d. Crank case heater;
e. Isolation valves for compressor and evaporator;
f. Condenser and liquid receiver;
g. Condenser pressure relief valve;
h. Compressor discharge check valve;
i. Separator/filter; and
j. Dew point sensor and readout.

2.12  AFTERCOOLERS

**************************************************************************
NOTE: Piston type differential pressure gauges do not require calibration. Suggest showing on the drawings a pressure gauge installed on the high pressure side of the differential pressure gauge. The pressure gauge should have a scale range from 0 to 2068 kPa (300 psi).
**************************************************************************

Provide an aftercooler after the blower. Aftercooler cores must be made of stainless steel to resist attacks from acids of sulfur, chlorine and fluorine. Provide condensate collection and piping.

2.13  GAS TURBINES

**************************************************************************
NOTE: Indicate the location and approximate configuration of each station. Mount all the control equipment on a single equipment rack next to the corresponding receiving/dispensing equipment. Include the sequence of operation for each station on the drawings.
**************************************************************************

Provide a gas turbine based [grid parallel] [dual mode] [grid isolated]
generator system designed for landfill gas fuel meeting the following criteria:

b. Nominal heat (HHV) [_____] BTU/kWh;
c. Nominal heat (LHV) [_____] BTU/kWh;
d. Nominal electrical power [_____] kWh;
e. Voltage [_____] VAC;
f. Frequency [_____] Hz;
g. Service 3 phase, wye, 4 wire;
h. Grid isolation +- [0.50] percent nominal voltages and +- [0.50] percent nominal frequency;
i. Transient handling +- [10] percent nominal voltages maximum and +- [5] percent frequency max; and
j. Meets or exceeds [CARB] emissions standards.
l. Minimum design life of [80,000] hours with overhauls.

2.14 MICROTURBINES

MICROTURBINES provide microturbine based generator [grid parallel] [dual mode] [grid isolated] system designed for landfill gas fuel. Microturbine shall have recuperator and integrated heat recovery.

b. Nominal heat (HHV) [_____] BTU/kWh;
c. Nominal heat (LHV) [_____] BTU/kWh;
d. Nominal electrical power [_____] kWh;
e. Voltage [_____] VAC;
f. Frequency [_____] Hz;
g. Service 3 phase, wye, 4 wire;
h. Grid isolation +- [0.50] percent nominal voltages and +- [0.50] percent nominal frequency;
i. Transient handling +- [10] percent nominal voltages maximum and +- [5] percent frequency max; and
j. Meets or exceeds [CARB] emissions standards.
1. Minimum design life of [80,000] hours with overhauls.

2.15 INTERNAL COMBUSTION ENGINE

Provide a internal combustion engine based [grid parallel] [dual mode] [grid isolated] generator system designed for landfill gas fuel.

b. Nominal heat (HHV) [_____] BTU/kWh;
c. Nominal heat (LHV) [_____] BTU/kWh;
d. Nominal electrical power [_____] kWh;
e. Voltage [_____] VAC;
f. Frequency [_____] Hz;
g. Service 3 phase, wye, 4 wire;
h. Grid isolation +- [0.50] percent nominal voltages and +- [0.50] percent nominal frequency;
i. Transient handling +- [10] percent nominal voltages maximum and +- [5] percent frequency max; and

j. Meets or exceeds [CARB] emissions standards.
l. Minimum design life of [80,000] hours with overhauls.

2.16 FILTRATION SYSTEMS

Provide filtration system to remove particulates and other contaminants as required to comply with specified generation system specifications.

2.17 LANDFILL GAS ANALYZERS

**************************************************************************
NOTE: Methane may seep into building structures/enclosed spaces.
**************************************************************************

Provide methane sensor/alarm within enclosed structures.

2.18 CONTROL SYSTEMS

Control systems must have all necessary sensors, interlocks, relays, alarms, and user interfaces to allow for continuous monitoring and [grid parallel] [dual mode] [grid isolated] operations. Use gas analyzer output to adjust generator speed and air/fuel ratio set point for emissions compliance and power output optimization.
Provide critical shutdown alarms for:

a. Shutdown oxygen level - [4] percent or greater, by volume;
b. Low methane level - less than [30] percent by volume;
c. Flare failure;
d. Blower fault;
e. Blower inlet and exit bearing temperatures greater than [100] degrees C/[212] degrees F;
f. Emergency stop;
g. Power loss;
h. Condensate tank high level;
g. Gas dryer failure; and

Provide non-critical alarms for:

a. High oxygen levels - greater than [2] percent by volume;
b. Low propane supply pressure;
c. Low flare temperature;
d. Landfill gas temperature at wellhead - greater than [60] degrees C/[140] degrees F; and
e. Methane detection within enclosed structures.

[Provide automated trouble notification system for critical shutdown [and non-critical] alarms.]

PART 3 EXECUTION

3.1 SITE PREPARATION

Evaluate and ensure site is accessible for the size and weight of planning equipment and facilities. Prepare site and lay down areas in accordance with approved contract documents.

3.2 INSTALLATION

Installation, workmanship, fabrication, assembly, erection, examination, inspection, and testing must be in accordance with ASME B31.3 and NFPA 30, NFPA 70 except as modified herein. Safety rules as specified in NFPA 30 and NFPA 407 must be strictly observed. When work is not in progress, securely close open ends of pipe and fittings with expansion plugs so that water, earth, or other substances cannot enter the pipe or fittings. Comply with UL 913.
3.2.1  3.2.1  Equipment

Properly level, align, and secure equipment in place in accordance with manufacturer's instructions. Provide supports for equipment, appurtenances, and pipe as required. Provide floor-mounted pumps and other floor mounted equipment with mechanical vibration isolators or a vibration isolation foundation. Install anchors, bolts, nuts, washers, and screws where required for securing the work in place. Sizes, types, and spacings of anchors and bolts not indicated or specified must be as required for proper installation.

3.3  3.3  SYSTEM COMMISSIONING

System commissioning must conform to Section [01 91 00.15 10] [01 91 00.15 20] TOTAL BUILDING COMMISSIONING.

3.4  3.4  DEMONSTRATIONS

Conduct a training session for designated Government personnel in the operation and maintenance procedures related to the equipment/systems specified herein. Include pertinent safety operational procedures in the session as well as physical demonstrations of the routine maintenance operations. Furnish instructors who are familiar with the installation/equipment/systems, both operational and practical theories, and associated routine maintenance procedures. The training session must consist of a total of 8 hours of normal working time and must start after the system is functionally completed, but prior to final system acceptance. Submit a letter, at least 14 working days prior to the proposed training date, scheduling a proposed date for conducting the on-site training.

-- End of Section --
