- MIL-DTL-24441 Epoxy Coats 350 g/l 2.8 lbs/gal max. VOC
- NSF certified coatings should be monitored for compliance with required regulations.

The designer shall review state and local, regulations and determine whether the coating in this Section complies with restrictions on volatile organic components (VOC) and other chemical constituents.

**************************************************************************

NOTE: Designs of tank linings for existing tanks should be based on recent inspections. Wherever possible, a coating inspection, or coating condition survey (CCS), as described in Section 09 97 13.27 HIGH PERFORMANCE COATING FOR STEEL STRUCTURES, should be accomplished prior to designing a coating project for water tank interiors. Without a competent inspection, there is no reliable way to determine the type or condition of the existing coating system. Without knowing the existing conditions, proper (effective and financially supportable) surface preparation or coating system selection cannot be made. It is not always cost effective to replace the entire coating system in a water tank, however, this is the tendency in preparing a design without inspection results.

**************************************************************************

NOTE: Previous versions of industrial coating guide specifications have included a requirement for surfaces to be abrasive blasted to SSPC 7/NACE No.4, inspected, and repaired, prior to coating. That requirement is not included in this specification,
and if required for a repair project, it should be included in the structural repair Section of the project specification. Tailor the requirement to the needs of cleaning that will be required in preparation for repairs, and note that the abrasive blasting for inspection should be accomplished in such a manner that it does not conflict with any surface condition requirements in this Section. For repair projects, specify appropriate portions of the steel surfacing requirements (according to NACE RP0178) from Section 33 16 15 WATER STORAGE STEEL TANKS.

**************************************************************************
NOTE: Designers are encouraged to contact J. H. Brandon, NAVFAC LANT 1613G, 757-322-4645, brandonjh@efdlant.navfac.navy.mil prior to beginning a new Navy design.
**************************************************************************

**************************************************************************
NOTE: Designers are encouraged to contact the Air Force Civil Engineering Corrosion Program Manager at AFCEC/COSM, 139 Barnes Drive, Suite 1, Tyndall AFB, FL 32403, Tel 850-283-6070, prior to beginning new Air Force design.
**************************************************************************

PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

Definitions are provided throughout this Section, generally in the paragraph where used, and denoted by capital letters. The following definitions are used throughout this Section:

a. CEILING - interior tank surfaces that extend from the horizontal plane at the designated maximum water line upward, including the upper portion of the tank shell (walls), columns, structural steel, the underside of the roof plates and other steel components in this area.

b. BOWL - interior tank surfaces that extend from the horizontal plane at the designated maximum water line downward, including the tank walls, columns, piping, pipe supports, bottom plates, and other steel components in this area.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will
review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-05, Design Data

Environmental Control System

SD-06 Test Reports

Metallic Abrasive Qualification Test Reports
Coating Sample Test Reports
Abrasive Sample Test Reports
Inspection Report Forms

SD-08 Manufacturer's Instructions

Roof Joint Sealant Instructions
1.4 QUALITY ASSURANCE

1.4.1 Contract Errors, Omissions, and Other Discrepancies

Submit all errors, omissions, and other discrepancies in contract documents the Contracting Officer within 30 days of contract award for all work covered in this Section, other than the work that will not be uncovered until a later date. All such discrepancies shall be addressed and resolved, and the Coating Work Plan modified, prior to beginning the Initial and Follow-Up phases of work. Discrepancies that become apparent only after work is uncovered shall be identified at the earliest discoverable time and submitted for resolution. Schedule time (Float) should be built into the project schedule at those points where old work is to be uncovered or where access is not available during the first 30 days after award, to allow for resolution of contract discrepancies.

1.4.2 Corrective Action (CA)

CA shall be included in the Quality Control Plan.

1.4.2.1 Corrective Action Procedures

Develop procedures for determining the root cause of each non-compliance, developing a plan to eliminate the root cause so that the non-compliance does not recur, and following up to ensure that the root cause was eliminated. Develop Corrective Action Request (CAR) forms for initiating CA, and for tracking and documenting each step.

1.4.2.2 Implement Corrective Action

The Contractor shall take action to identify and eliminate the root cause of each non-compliance so as to prevent recurrence. These procedures shall apply to non-compliance in the work, and to non-compliance in the QC System. Corrective actions shall be appropriate to the effects of the non-compliance encountered. Each CAR shall be serialized, tracked in a Log to completion and acceptance by the Contracting Officer, and retained in project records. The Corrective Action Log, showing status of each CAR, shall be submitted to the Contracting Officer monthly. A CAR may be initiated by either the Contractor or the Contracting Officer. The Contracting Officer must approve each CAR at the root cause identification stage, the plan for elimination stage, and the close out stage after verification that the root cause has been eliminated.

1.4.3 Coating Work Plan

**************************************************************************
NOTE: For maintenance painting, add requirement for pre-work determination of the existing surface profile. If paint removal is specified in another Section, such as a blast cleaning prior to inspection or repair, or in the lead removal
This work plan shall be considered as part of the Quality Control Plan.

Provide procedures for reviewing contract documents immediately after award to identify errors, omissions, and discrepancies so that any such issues can be resolved prior to project planning and development of detailed procedures.

Provide procedures for verification of key processes during Initial Phase to ensure that contract requirements can be met. Key processes shall include surface preparation, coating application and curing, inspection, and documentation, and any other process that might adversely impact orderly progression of work.

Provide procedures for all phases of coating operations, including planned work, rework, repair, inspection, and documentation. Address mobilization and setup, surface preparation, coating application, coating initial cure, tracking and correction of non-compliant work, and demobilization. Coordinate work processes with health and safety plans and confined space entry plans. For each process, provide procedures that include appropriate work instructions, material and equipment requirements, personnel qualifications, controls, and process verification procedures. Provide procedures for inspecting work to verify and document compliance with contract requirements, including inspection forms and checklists, and acceptance and rejection criteria.

Provide procedures for determining the existing surface profile under paint, and procedures for ensuring that the profile is not increased beyond the maximum profile specified herein.

Provide procedures for correcting non-compliant work. Detailed procedures are required in advance to avoid delays in meeting overcoat windows as well as to avoid delays in production. Provide procedures for repairing defects in the coating film, such as runs, drips, sags, holidays, overspray, as well as how to correct coating thickness non-compliance, any other areas of repair or rework that might be adversely affected by delays in preparing and approving new procedures.

If a procedure is based on a proposed or approved request for deviation, the deviation shall be referenced. Changes to procedures shall be noted by submittal number and date approved, clearly delineating old requirements and new requirements, so that the records provide a continuous log of requirements and procedures.

1.4.4 Design Data

1.4.4.1 Environmental Control System

Submit design details of the proposed environmental control system to include ventilation, humidity control, and temperature regulation. Provide calculations for humidity control during separate surface preparation and coating application procedures, ventilation requirements during coating application, and maximum allowable coating application rates to coincide with ventilation. Include basis of design data on local conditions. Provide equipment layout sketches and procedures showing function of each
piece of equipment and fail-safe measures. A Certified Industrial Hygienist shall approve calculations, work procedures and personal protective equipment.

1.4.5 Test Reports

1.4.5.1 Metallic Abrasive Qualification Test Reports

Submit results for abrasive as required in paragraph 4 REQUIREMENTS of SSPC AB 3. Submit test results from independent laboratory of representative samples of each abrasive to be used on the jobsite. Samples must have been tested within the last three years. Note that this testing is for the purpose of prequalifying the abrasive.

1.4.5.2 Recycled Metallic Abrasive Field Test Reports (Daily and Weekly)

Submit test results from independent laboratory of daily and weekly Quality Control testing required by SSPC AB 2, as modified in paragraph ABRASIVE.

1.4.6 Qualifications

1.4.6.1 Qualifications of Certified Industrial Hygienist (CIH)

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party CIH. Submit documentation that hygienist is certified by the American Board of Industrial Hygiene in comprehensive practice, including certification number and date of certification/recertification. Provide evidence of experience with hazards involved in industrial coating application work.

1.4.6.2 Qualifications of Certified Protective Coatings Specialist (PCS)

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party PCS. Submit documentation that specialist is certified by SSPC: The Society for Protective Coatings (SSPC) as a PCS, including certification number and date of certification/recertification. If the PCS is employed by the same coating inspection company to which the coating inspector is employed, this does not violate the independent third-party requirements. The PCS shall remain certified during the entire project, and the Contracting Officer shall be notified of any change in certification status within 10 days of the change. The PCS shall not be the designated coating inspector.

1.4.6.3 Qualifications of Coating Inspection Company

Submit documentation that the coating inspection company that will be performing all coating inspection functions is certified by SSPC to the requirements of SSPC QP 5 prior to contract award, and shall remain certified while accomplishing any coating inspection functions. The coating inspection company must remain so certified for the duration of the project. If a coating inspection company's certification expires, the firm will not be allowed to perform any inspection functions, and all surface preparation and coating application work must stop, until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply. Notify the Contracting Officer of any change in coating inspection company certification status.
1.4.6.4 Qualifications of QC Specialist Coating Inspector

Submit documentation that each coating inspector is employed, and qualified to SSPC QP 5, Level III, by the selected coating inspection company. Each inspector shall remain employed by the coating inspection company while performing any coating inspection functions.

1.4.6.5 Qualifications Of Individuals Performing Abrasive Blasting

Submit name, address, and telephone number of each person that will be performing abrasive blasting. Submit documentation that each blaster is qualified by SSPC to the SSPC C-7 Dry Abrasive Blaster Qualification Program. Each blaster shall remain qualified during the entire period of abrasive blasting, and the Contracting Officer shall be notified of any change in qualification status.

1.4.6.6 Qualifications of Testing Laboratory for Coatings

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party laboratory selected to perform testing of coating samples for compliance with specification requirements. Submit documentation that laboratory is regularly engaged in testing of paint samples for conformance with specifications, and that employees performing testing are qualified.

1.4.6.7 Qualifications of Testing Laboratory for Abrasive

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party laboratory selected to perform testing of abrasive for compliance with specification requirements. Submit documentation that laboratory has experience in testing samples of abrasive for conformance with specifications, and that employees performing testing are qualified.

1.4.6.8 Qualifications of Coating Contractors

***********************************************************************************************
NOTE: If project involves removal of paint containing hazardous materials, add requirement for SSPC QP-2 certification in section of specification where the hazardous paint removal is specified, generally Section 02 83 00 LEAD REMEDIATION.
***********************************************************************************************

***********************************************************************************************
NOTE: Solicitations requiring certification for prequalification should point out the existence and location of the certification requirement on the PROJECT INFORMATION FORM. This requirement must be pointed out in the solicitation documents for the "prior to contract award" requirement to be enforceable. Certification is a special responsibility requirement pursuant to FAR 9.104-2 Special Standards. This is analogous to requiring bidders to have a specified level of experience or expertise and GAO has sustained these types of special requirements.
***********************************************************************************************
All Contractors and Subcontractors that perform surface preparation or coating application shall be certified to either ISO 9001 or SSPC QP 1 and SSPC QS 1 prior to contract award, and shall remain certified while accomplishing any surface preparation or coating application. The painting Contractors and painting Subcontractors must remain so certified for the duration of the project. If a Contractor's or Subcontractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply. Notify the Contracting Officer of any change in Contractor certification status.

1.4.6.9 Roof Joint Sealant Materials

Provide manufacturer's certification of conformance to contract requirements[, and is certified in accordance with NSF/ANSI 61].

1.4.6.10 Roof Joint Sealant Compatibility

Provide manufacturer's certification that the selected joint sealant is compatible with the epoxy primer and is suitable for application directly to prepared steel surfaces.

1.4.6.11 Epoxy Coating Materials

Provide manufacturer's certification that the epoxy lining materials are [currently approved by the Naval Sea Systems Command and listed on the Qualified Products Lists (QPL) for the specified materials][certified in accordance with NSF/ANSI 61 for tanks of the size being coated].

1.4.6.12 Non-metallic Abrasive

Provide manufacturer's certification that the materials are currently approved by the Naval Sea Systems Command and listed on the Qualified Products Lists (QPL) for the specified materials.

1.4.6.13 Metallic Abrasive

Provide manufacturer's certification of conformance to contract requirements and provide copies of test results.

1.4.7 Protective Coating Specialist (PCS)

The PCS shall be considered a QC Specialist and shall report to the QC Manager, as specified in Section 01 45 00 QUALITY CONTROL. The PCS shall approve all submittals prior to submission to the QC Manager for approval or submission to the government for approval.

1.4.8 Pre-Application Meeting

After approval of submittals but prior to the initiation of coating work, Contractor representatives, including at a minimum, project superintendent and QC manager, paint foreman, coating inspector, and PCS shall have a pre-application coating preparatory meeting. This meeting shall be in addition to the pre-construction conference. Specific items addressed shall include: corrective action requirements and procedures, coating work plan, safety plan, coordination with other Sections, inspection standards, inspection requirements and tools, test procedures, environmental control system, safety plan, and test logs. Notify Contracting Officer at least
ten days prior to meeting.

1.5 PRODUCT DATA

1.5.1 Roof Joint Sealant Instructions

Submit manufacturer's printed instructions including detailed mixing and application procedures, minimum and maximum application temperatures, and curing procedures. Include Safety Data Sheets (SDS) for materials to be used at the job site in accordance with 29 CFR 1926.59.

1.5.2 Coating System Instructions

Submit manufacturer's printed instructions including detailed mixing and application procedures, number and types of coats required, minimum and maximum application temperatures, and curing procedures. Include Safety Data Sheets (SDS) for materials to be used at the job site in accordance with 29 CFR 1926.59.

1.6 DELIVERY AND STORAGE

Ship, store, and handle materials in accordance with SSPC PA 1, and as modified in this Section. Maintain temperature in storage spaces between 5 and 24 degrees C 40 and 75 degrees F, and air temperature more than 3 degrees C 5 degrees F above the dew-point at all times. Inspect materials for damage and return non-compliant materials to manufacturer. Remove materials with expired shelf life from government property immediately and notify the Contracting Officer. Expired materials may be returned to manufacturer, tested, and if compliant, issued a shelf life extension.

If materials are approaching shelf life expiration and an extension is desired, samples may be sent to the manufacturer, along with complete records of storage conditions, with a request for shelf life extension. If the manufacturer finds the samples and storage data suitable for shelf life extension, the manufacturer may issue an extension, referencing the product evaluation and the review of storage records. Products may not be extended longer than allowed in the product specification.

1.7 COATING HAZARDS

**************************************************************************
NOTE: This specification Section should be used with 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS.
**************************************************************************

Ensure that employees are trained in all aspects of the safety plan. Specified coatings may have potential health hazards if ingested or improperly handled. The coating manufacturer's written safety precautions shall be followed throughout mixing, application, and curing of the coatings. During tank cleaning, cleanup, surface preparation, and paint application phases, ensure that employees are protected from toxic and hazardous chemical agents which exceed concentrations in 29 CFR 1910.1000. Comply with respiratory protection requirements in 29 CFR 1910.134. The CIH shall approve work procedures and personal protective equipment.

1.8 WORK SEQUENCE

Coat tank interior following leak testing.
1.9 JOB SITE REFERENCES

**************************************************************************
NOTE: Include any other job site related references that might be added during design.
**************************************************************************

Make available to the Contracting Officer at least one copy each of ASTM D3276, ASTM D3925, ASTM D4285, ASTM D7127, NACE SP0188, SSPC SP COM, SSPC SP 1, SSPC 7/NACE No.4, SSPC SP 10/NACE No. 2, SSPC PA 1, SSPC PA 2, SSPC Guide 12, SSPC VIS 1, SSPC QP 1, SSPC QS 1, and an SSPC Certified Contractor Evaluation Form at the job site.

PART 2 PRODUCTS

2.1 ROOF JOINT SEALANT

Industrial grade, two component, minimum 95 percent solids by volume, polysulfide type caulking material that has a minimum history of 10 years acceptable service in water tanks. Sealant shall be compatible with the epoxy primer and suitable for direct application to prepared steel surfaces. Sealant shall contain no more than 0.06 percent by dry weight Lead, no more than 0.06 percent by dry weight Cadmium, and no more than 0.00 percent by dry weight Chromium.[ Sealant shall be certified in accordance with NSF/ANSI 61.]

2.2 COATING SYSTEM

**************************************************************************
NOTE: Include bracketed text for new construction only.
**************************************************************************

Alternate systems or products will not be considered. All primer, intermediate, and topcoat materials shall be manufactured by one manufacturer. [The entire coating system is intended to be applied in the field. Alternatively, surface preparation may be accomplished in the shop, following all temperature, humidity, and testing requirements listed herein, followed by an application of a hold-primer. Upon completion of field fabrication, all shop-applied coatings shall be removed, surfaces prepared to SSPC SP 10/NACE No. 2, and the specified coating system applied. Adjust all shop preparation to avoid conflicts with final surface preparation requirements.]

[2.2.1 NSF Certified Polyamide Epoxy Coating System

**************************************************************************
NOTE: Choose the NSF Certified Polyamide Epoxy coating System where required. Remove Table I when NSF coating specified.
**************************************************************************

Select a commercially available, three coat polyamide epoxy coating system that is certified in accordance with NSF/ANSI 61 for contact with potable water in water storage tanks of the size being coated. The coating system shall be suitable for application in three even coats of 50-100 microns 3-5 mils dry film thickness (DFT), for a total minimum of 225 microns 9 mils DFT.
[2.2.2] MIL-DTL-24441 Epoxy System for Potable Water Tanks

**************************************************************************
NOTE:  Choose this system, MIL-DTL-24441 Type III (/20 and /22), for potable water where certification to NSF/ANSI 61 is not required.  Edit Table I to match.
**************************************************************************

The epoxy coating materials shall be approved by the Naval Sea Systems Command and listed on their current Qualified Products List (QPL) for the specified materials.

2.2.2.1 Epoxy Primer Coat

Epoxy polyamide, MIL-DTL-24441/20 (Formula 150, Type III, Green).

2.2.2.2 Epoxy Intermediate Coat

Epoxy polyamide, MIL-DTL-24441/22 (Formula 152, Type III, White (Tinted)).
Tint to approximately SAE AMS-STD-595A color number 27778 parchment using pigment dispersions prepared for epoxy paint tinting. Manufacturer shall tint material and appropriately label. All other requirements of this Military Specification apply.

2.2.2.3 Epoxy Topcoat

Epoxy polyamide, MIL-DTL-24441 (Formula 152, Type III, White).

[2.2.3] MIL-DTL-24441 Epoxy System for Non-potable Water Tanks

**************************************************************************
NOTE:  Choose this system, MIL-DTL-24441 Type IV (/29 and /31), for non-potable water.  Type IV materials are not suitable for potable water due to Benzyl alcohol.  Edit Table I to match.
**************************************************************************

The epoxy coating materials shall be approved by the Naval Sea Systems Command and listed on their current Qualified Products List (QPL) for the specified materials.

2.2.3.1 Epoxy Primer Coat

Epoxy polyamide, MIL-DTL-24441/29 (Formula 150, Type IV, Green).

2.2.3.2 Epoxy Intermediate Coat

Epoxy polyamide, MIL-DTL-24441/31 (Formula 152, Type IV, White (Tinted)).
Tint to approximately SAE AMS-STD-595A color number 27778 parchment using pigment dispersions prepared for epoxy paint tinting. Manufacturer shall tint material and appropriately label. All other requirements of this Military Specification apply.

2.2.3.3 Epoxy Topcoat

Epoxy polyamide, MIL-DTL-24441/31 (Formula 152, Type IV, White). All other requirements of this Military Specification apply.
2.3 COATING SAMPLE COLLECTION AND SHIPPING KIT

**************************************************************************
NOTE: Delete bracketed text, and remove "AND SHIPING KIT" from the title of this Article, when NSF/ANSI 61 coating system is chosen.
**************************************************************************

Provide a kit that contains one liter quart can for the base of each coating material, an appropriately sized can for each activator, dipping cups for each component to be sampled, a shipping box sized for the samples to be shipped, and packing material. Mark cans for the appropriate component. Provide shipping documents, including either pre-paid shipping or a shipper number that can be used by the QC Manager to arrange pickup, addressed to the approved coating testing laboratory.

2.4 ABRASIVE SAMPLE COLLECTION AND SHIPPING KIT

Provide a kit that contains one suitable plastic bag or container for each sample to be collected. Mark containers for the appropriate component. Provide shipping documents, including either pre-paid shipping or a shipper number that can be used by the QC Manager to arrange pickup, addressed to the approved coating testing laboratory.

2.5 TEST KITS

2.5.1 Test Kit for Measuring Chloride, Sulfate and Nitrate Ions on Steel and Coated Surfaces

Provide test kits called CHLOR*TEST CSN Salts, as manufactured by CHLOR*RID International Inc. of Chandler, Arizona (www.chlor-rid.com) or equal. An "equal" test kit shall meet the following requirements:

a. Kit contains all materials, supplies, tools and instructions for field testing and on-site quantitative evaluation of chloride, sulfate and nitrate ions;

b. Kit extract solution is acidic, factory pre-measured, pre-packaged, and of uniform concentration;

c. Kit components and solutions are mercury free and environmentally friendly;

d. Kit contains new materials and solutions for each test extraction;

e. Extraction test container (vessel, sleeve, cell, etc.) creates a sealed, encapsulated environment during salt ion extraction;

f. Test extract container is suitable for testing the following steel surfaces: horizontal (up/down configuration), vertical, flat, curved, smooth, pitted, and rough;

g. All salt ion concentrations are directly measured in micrograms per square centimeter.

2.5.2 Test Kit for Identifying Amine Blush on Epoxy Surfaces

After coating and/or primer has hardened and prior to applying the next coat, test for unreacted amines using the AMINE BLUSH CHECK, manufactured
by Elcometer, Rochester Hills, Michigan, or equal. To be considered for approval as an "equal" test kit it shall meet the following requirements:

a. Be a completely self-contained field test kit with all materials, supplies, tools and instructions to perform tests and indicate the presence of unreacted amines;

b. Use an identifiable, consistent, uniform, pre-packaged, factory pre-measured indicating solution;

c. Kit contains no mercury or lead and is environmentally friendly;

d. Kit contains a solution of an unreacted amine for the purpose of "self checking" the indicator solution;

2.6 ABRASIVE

The referenced abrasive specifications have maximum limits for soluble salts contamination, however, this maximum level of contamination does not guarantee that contamination will not be transferred to the steel surface during abrasive blasting. Other factors such as on-site handling and recycling can allow contamination of abrasive. Contractors are cautioned to verify that the chosen abrasive, along with work and storage processes, allow the final surface cleanliness requirements to be achieved. Successful testing of chlorides in abrasive does not negate the final acceptance testing of steel surfaces.

**************************************************************************
NOTE: The following paragraph is mandatory for all NAVFAC PAC projects. All other agencies may use it after checking applicability.
**************************************************************************

[ Interpret MIL-A-22262 to include the meaning that abrasive material contains a maximum one percent by weight of any toxic substance listed in either Table Z-1, Z-2, or Z-3 or 29 CFR 1910-SUBPART Z, with the exception of inert or nuisance dust materials, arsenic, beryllium, cadmium, cobalt, lead, mercury, rhodium, silver, tellurium, thallium, and uranium. ]

**************************************************************************
NOTE: Reduce allowable gross gamma radioactivity to 5 picocuries per gram for all NAVFAC PAC projects. Reduce in other areas if states or localities require.
**************************************************************************

2.6.1 Non-metallic Abrasive

Conform to MIL-A-22262, Type I (Inorganic materials)[ except that the gross gamma radioactivity shall not exceed 5 picocuries per gram]. Abrasive shall be approved by the Naval Sea Systems Command and listed on the appropriate Qualified Products List (QPL) for the specified materials. Use sampling procedures and testing frequencies as prescribed in MIL-A-22262. Use abrasive that is specifically selected and graded to provide a sharp, angular profile to the specified depth. Do not use ungraded abrasive. Make adjustments to processes or abrasive gradation to achieve specified surface profile. Recycled non-metallic abrasive shall meet all requirements of the specification each time that it is placed in the blast pot.
2.6.2 Metallic Abrasive

2.6.2.1 New and Remanufactured Steel Grit

Conform to the chemical and physical properties of SSPC AB 3 Class 1 (Steel) only[, except that the gross gamma radioactivity shall not exceed 5 picocuries per gram]. Class 2 (Iron) abrasive shall not be used.

To develop a suitable work mix from new steel abrasive, a minimum of 200 - 400 recycles is required, therefore, it is advantageous for a Contractor to use remanufactured steel grit or grit reclaimed from a previous project. Such grit shall be considered to conform if it can be traced to new grit conforming to SSPC AB 3 Class 1 and it meets all cleanliness requirements of SSPC AB 3 Class 1 when brought to the current jobsite. Submit one representative sample of this work mix to the laboratory for testing, along with samples of new material. Acceptance and use of this work mix shall not be used to justify any deviation from surface preparation requirements.

2.6.2.2 Recycled Steel Grit

Conform to the chemical and physical properties of SSPC AB 2

PART 3 EXECUTION

Perform all work, rework, and repair in accordance with approved procedures in the Coating Work Plan.

[3.1 REMOVAL OF COATINGS CONTAINING HAZARDOUS MATERIALS]

**************************************************************************
NOTE: Include Section 02 83 00 LEAD REMEDIATION in any project specification that requires removal or disturbance of coating containing hazardous materials in conjunction with a coating project. Include a contractor qualification requirement similar to the article entitled "Qualifications of Coating Contractors" in Part 1 of this Section, except that the contractor shall be qualified to SSPC QP-2. The removal of coatings containing hazardous materials and application of new coating system can be accomplished in a continuous operation if the contractor provides appropriate coordination of removal, cleaning, and coating application. It is specified as two separate operations to allow separate contractors to accomplish different phases of project. With the use of SSPC QP-1 and QP-2 requirements in contracts, the same contractor will generally be accomplishing both phases of work, and will probably want to perform both phases as a single operation to avoid preparing surfaces twice. To accomplish the coating removal and recoating in a continuous operation, the contractor’s plan must be scrutinized for appropriate controls on the removal process, and on the surface preparation/coating application process. Delete this paragraph if no paint containing hazardous material is to be removed.
**************************************************************************
Coatings containing hazardous materials and identified for disturbance during surface preparation, including removal, shall be handled in accordance with Section 02 83 00 LEAD REMEDIATION. Coordinate surface preparation requirements from Section 02 83 00 LEAD REMEDIATION with this Section.

3.2 COATING AND ABRASIVE SAMPLE COLLECTION AND TESTING

Sample and test materials delivered to the jobsite. Notify Contracting Officer three days in advance of sampling. The QC Manager, and either the PCS or coating inspector, shall witness all sampling.

3.2.1 Coating Sample Collection

**************************************************************************
NOTE: Delete bracketed text when NSF/ANSI 61 coating system is chosen.
**************************************************************************
Provide a sample collection kit as required in paragraph COATING SAMPLE COLLECTION AND SHIPPING KIT. From each lot, obtain a one liter quart sample of each base material, and proportional samples of each activator based on mix ratio, by random selection from sealed containers in accordance with ASTM D3925. Prior to sampling, mix contents of each sealed container to ensure uniformity. As an alternative to collecting small samples from kits, entire kits may be randomly selected and shipped to laboratory, observing all requirements for witnessing and traceability. For purposes of quality conformance inspection, a lot is defined as that quantity of materials from a single, uniform batch produced and offered for delivery at one time. A batch is defined as that quantity of material processed by the manufacturer at one time and identified by number on the label. Identify samples by designated name, specification number, lot number, project contract number, sample date, intended use, and quantity involved. The QC Manager will take possession of the packaged samples, contact the shipping company to arrange for pickup, and relinquish the samples only to the shipping representative for shipment to the approved laboratory for testing as required by the paragraph entitled "Coating Sample Test Reports."

3.2.2 Abrasive Sample Collection

Provide suitably sized containers for each sample to be taken. Provide a sample collection kit as required in paragraph ABRASIVE SAMPLE COLLECTION AND SHIPPING KIT. For purposes of quality conformance inspection, a lot shall consist of all abrasive materials of the same type from a single, uniform batch produced and offered for delivery at one time. Obtain samples of each abrasive lot using the sampling techniques and schedule of MIL-A-22262. The addition of any substance to a batch shall constitute a new lot. Identify samples by designated name, specification number, lot number, project contract number, sample date, intended use, and quantity involved. The QC Manager will take possession of the packaged samples, contact the shipping company to arrange for pickup, and relinquish the samples only to the shipping representative for shipment to the approved laboratory for testing as required by the paragraph ABRASIVE SAMPLE TEST REPORTS.
3.2.3 Coating Sample Test Reports

NOTE: Delete this Article and modify SUBMITTALS in Part 1 when NSF/ANSI 61 coating system is chosen.

Submit test results for each lot of coating material delivered to the jobsite. Test samples of primer, intermediate, and topcoat materials for compliance with requirements of Table I. Reject entire lot represented by samples that fail one or more tests, select new lots, and test samples.

3.2.4 Abrasive Sample Test Reports

Submit test results for each lot of abrasive delivered to the jobsite. Test samples of metallic abrasive to the requirements of paragraph REQUIREMENTS of SSPC AB 3, except paragraph 4.1.5 DURABILITY. Test samples of non-metallic abrasive as required in paragraph QUALITY CONFORMANCE INSPECTION of MIL-A-22262. Reject entire lot represented by samples that fail one or more tests, select new lots, and test samples.

3.3 SLUDGE REMOVAL AND TANK CLEANING

Remove sludge and clean storage tanks in accordance with [______].

3.4 LIGHTING

Provide lighting for all work areas as prescribed in SSPC Guide 12.

3.5 ENVIRONMENTAL CONDITIONS

3.5.1 Control System Requirements

Provide and utilize dehumidification and ventilation equipment to control humidity, temperature, and vapor levels in tank from beginning of abrasive blasting through coating application and for four days after the last coating is applied. System shall maintain vapor concentrations at or below 10 percent of Lower Explosive Limit (LEL). System may incorporate any combination of solid desiccant and direct expansion refrigeration equipment. No liquid, granular, calcium chloride, or lithium chloride drying systems will be accepted. Use only electric, indirect fired combustion, indirect friction, or steam coil auxiliary heaters. System shall be compatible with removal of dust and solvent vapors, and shall have fail-safe measures to ensure reliability during operations.

3.5.2 Automated Monitoring Requirements

Provide continuous monitoring of DH equipment, and temperature, relative humidity, and dew point data at pertinent points on the structure, during surface preparation, coating application, and initial cure. Locate sensors to provide pertinent data for the surface preparation and coat application being performed. Make data available to the Contracting Officer through Internet access. Provide monitoring equipment to perform as follows:

a. Data is collected in the field unit in one minute increments, and available for download (on-site) in a standard format. Contractor shall collect this data and make available to the Contracting Officer;

b. Monitoring equipment shall have backup power such that data collection...
and transmission to web server will be uninterrupted during the entire period of the dehumidification requirement;

c. Monitoring equipment shall have capability to measure surface temperatures at a minimum of four locations anywhere on a 150 foot diameter by 50 foot high tank;

d. Monitoring equipment shall have capability to measure interior and exterior dry bulb temperature (DB), relative humidity (RH), and dewpoint temperature (DP);

e. Data shall be available continuously through secure internet connection, using widely available web browsers;

f. Internet accessible data shall be collected and stored in maximum 15 minute increments, and lag time between data collection and online availability shall be no greater than 70 minutes;

g. Internet accessible data shall be available for viewing online in tabular format, and graphical format using selected data;

h. Internet accessible data shall be available for download in user-defined segments, or entire project to date, in a standard format usable by Microsoft Excel and other spreadsheet programs.

i. Internet-based controls shall provide alerts to pre-designated parties through email messaging;

j. Internet-based controls shall monitor data uploads from field unit and issue alert if data not initiated within 60 minutes of last upload;

k. Internet-based controls shall monitor operation of DH equipment and issues alert when power remains off for more than 15 seconds, or if pre-determined temperature, RH, or DP conditions are exceeded;

The requirements listed here were developed around the Munters Exactaire Monitoring System, as this was the only monitoring system having Internet connectivity known to be commercially available. There is no requirement for connectivity of the monitoring system to control the DH equipment, therefore, any combination of equipment having the required functionality will be accepted.

3.5.3 Humidity Control for Surface Preparation and Primer Application

Provide and utilize dehumidification equipment to maintain relative humidity at appropriate level to prevent prepared steel surfaces from corroding at all times during abrasive blasting through primer application. Failure of humidity control system, or failure to maintain proper conditions, during surface preparation stage may allow surface rusting, which will be rejected and require rework. All surfaces to be coated must meet all requirements at time of primer application. Failure of humidity control system during primer application stage will be cause for removal and replacement of all materials applied and cured while conditions were not as prescribed above.

3.5.4 Humidity Control for Application of Intermediate and Topcoats and Initial Curing

Provide and utilize dehumidification equipment to maintain relative
humidity at the coldest steel surface in tank below 55 percent at all times
during coating application, and during the first four days of initial
curing after application of topcoat. This measurement is not the same as
measuring the relative humidity of ambient air in the tank, and will
require either electronic equipment to monitor relative humidity at the
steel surface, or complex calculations to convert relative humidity of air
in tank to relative humidity at steel surface. An approved alternative
method of monitoring dehumidification that requires less sophisticated
equipment or calculations is to maintain a minimum dew point depression of
10 degrees C 18 degrees F below coldest steel surface temperature. This is
in lieu of specific relative humidity and dew point requirements in this
Section. Failure to maintain specified humidity control during this phase
will be cause for extension of humidity controlled cure time to ensure four
consecutive days at specified relative humidity at steel surfaces.
Formation of condensation in coating application stage prior to the
indicated dry-hard time will be cause for removal and replacement of all
materials contacted by condensation.

3.6 EQUIPMENT USED IN TANK

Equipment used in the tank after surface preparation begins shall not leave
any oily residue from exhaust or other sources. Internal combustion driven
equipment, other than that powered by natural or bottled gas, shall not be
used.

3.7 SURFACES TO BE COATED

Prepare and coat interior tank surfaces, including [CEILING], [BOWL] [spot
repair of [_____] spots of [_____] square meters square feet] [____].

3.8 SURFACE PREPARATION

3.8.1 Abrasive Blasting Equipment

Use abrasive blasting equipment of conventional air, force-feed, or
pressure type. Maintain a minimum pressure of 650 kPa 95 psig at nozzle.
Confirm that air supply for abrasive blasting is free of oil and moisture
when tested in accordance with ASTM D4285. Test air quality at each
startup, but in no case less often than every five operating hours.

3.8.2 Operational Evaluation of Abrasive

Test abrasive for salt contamination and oil contamination as required by
the appropriate abrasive specification daily at startup and every five
operating hours thereafter.

3.8.3 Surface Standard

Inspect surfaces to be coated, and select plate with similar properties and
surface characteristics for use as a surface standard. Blast clean one or
more 300 mm 1 foot square steel panels as specified in paragraph SURFACE
PREPARATION. Record blast nozzle type and size, air pressure at nozzle and
compressor, distance of nozzle from panel, and angle of blast to establish
procedures for blast cleaning. Measure surface profile in accordance with
ASTM D7127. When the surface standard complies with all specified
requirements, seal with a clearcoat protectant. Use the surface standard
for comparison to abrasive blasted surfaces throughout the course of work.
3.8.4 Pre-Preparation Testing for Surface Contamination

Perform testing, abrasive blasting, and testing in the prescribed order.

3.8.4.1 Pre-Preparation Testing for Oil and Grease Contamination

**************************************************************************
NOTE: When specifying maintenance painting, use a water based pH neutral degreaser to avoid damaging existing coating.
**************************************************************************

Inspect all surfaces for oil and/or grease contamination using two or more of the following inspection techniques: 1) Visual inspection, 2) WATER BREAK TEST, 3) BLACK LIGHT TEST, and 4) CLOTH RUB TEST. Reject oil and/or grease contaminated surfaces, clean [using a water based pH neutral degreaser ]in accordance with SSPC SP 1, and recheck for contamination until surfaces are free of oil and grease.

WATER BREAK TEST - Spray atomized mist of distilled water onto surface, and observe for water beading. If water "wets" surface rather than beading up, surface can be considered free of oil or grease contamination. Beading of water (water forms droplets) is evidence of oil or grease contamination.

BLACK LIGHT TEST - Inspect surfaces for oil and grease contamination using the light specified in the paragraph BLACK LIGHT. Use light no more than 15 inches from surface unless testing indicates that the specific oil or grease found in tank fluoresce at a greater distance. Use light in tank that is completely sealed from light infiltration, under a hood, or at night. Any fluorescing on steel surfaces is indication of petroleum oil/grease contamination. Use either WATER BREAK TEST or CLOTH RUB TEST to confirm both contaminated and non-contaminated areas detected by BLACK LIGHT TEST. The BLACK LIGHT TEST may not be used during inspection of prepared surfaces for oil and grease contamination unless proven to fluoresce the oil and/or grease found in the specific tank and documented during testing prior to abrasive blasting. Generally, only petroleum oil/grease will fluoresce, however, some may not fluoresce sufficiently to be recognized and other methods, such as the WATER BREAK TEST or CLOTH RUB TEST, must be used to confirm findings of the BLACK LIGHT TEST.

CLOTH RUB TEST - Rub a clean, white, lint free, cotton cloth onto surface and observe for discoloration. To confirm oil or grease contamination in lightly stained areas, a non-staining solvent may be used to aid in oil or grease extraction. Any visible discoloration is evidence of oil or grease contamination.

3.8.4.2 Pre-Preparation Testing for Soluble Salts Contamination

Test surfaces for soluble salts, and wash as required, prior to abrasive blasting. Soluble salt testing is also required in paragraph PRE-APPLICATION TESTING FOR SOLUBLE SALTS CONTAMINATION as a final acceptance test of prepared surfaces after abrasive blasting, and successful completion of this phase does not negate that requirement. This phase is recommended since pre-preparation testing and washing are generally more advantageous than attempting to remove soluble salt contamination after abrasive blasting. Effective removal of soluble salts will require removal of any barrier to the steel surface, including rust. This procedure may necessitate combinations of wet abrasive blasting, high pressure water rinsing, and cleaning using a solution of water washing and
soluble salts remover. The soluble salts remover shall be acidic, biodegradable, nontoxic, noncorrosive, and after application, will not interfere with primer adhesion. Delays between testing and preparation, or testing and coating application, may allow for the formation of new contamination. Use potable water, or potable water modified with soluble salt remover, for all washing or wet abrasive blasting. Test methods and equipment used in this phase are selected at the Contractor’s discretion.

3.8.5 Abrasive Blasting

**************************************************************************
NOTE: The issue of maximum profile on new structures is an important one. Once a profile is established, it is nearly impossible to reduce it, therefore, the initial profile will dictate the profile for the life of the structure.

The specified 2-3 mil surface profile is the preferred depth for preparing for the primer. On steel that was previously prepared to a deeper depth and coated, a depth of 4 mils can be tolerated with an additional mil of primer thickness.

To validate contractor claims of pre-existing profile greater than allowed, test an appropriate number of representative spots with abrasive that removes paint but does not affect profile, such as bicarbonate of soda, or other soft abrasive, or waterblasting, etc.

**************************************************************************

Abrasive blast steel surfaces to near-white metal in accordance with SSPC SP 10/NACE No. 2. Prepared surfaces shall conform to SSPC VIS 1 and shall match the prepared test-panels. Provide a 50 to 75 micron 2 to 3 mil surface profile. Reject profile greater than 75 microns 3 mils, discontinue abrasive blasting, and modify processes and materials to provide the specified profile. Measure surface profile in accordance with ASTM D7127, using Rmax as the measure of profile height. Record all measurements required in this standard. Measure profile at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 100 square meters 1000 square feet or part thereof. When surfaces are reblasted for any reason, retest profile as specified. Following abrasive blasting, remove dust and debris by vacuum cleaning. Do not attempt to wipe surface clean.

3.8.6 Disposal of Used Abrasive

Dispose of used abrasive off Government property in accordance with Federal, State and Local mandated regulations.

3.8.7 Pre-Application Testing For Surface Contamination

3.8.7.1 Pre-Application Testing for Oil and Grease Contamination

Ensure tank surfaces are free of contamination as described in paragraph PRE-PREPARATION TESTING FOR OIL AND GREASE CONTAMINATION.

3.8.7.2 Pre-Application Testing for Soluble Salts Contamination

**************************************************************************
NOTE: In new tanks, require 30 percent of tests to be accomplished at welds. In tanks that have been in service, corroded areas should be tested for high chlorides.

Test surfaces for chloride contamination using the Test Kit described in paragraph TEST KIT FOR MEASURING CHLORIDE, SULFATE AND NITRATE IONS ON STEEL AND COATED SURFACES. Test all surfaces at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 200 square meters 2000 square feet or part thereof. [Concentrate testing of bare steel at areas of coating failure to bare steel and areas of corrosion pitting. ][Perform 30 percent of tests on bare steel at welds, divided equally between horizontal and vertical welds. ]One or more readings greater than nondetectable for chlorides, sulfates, or nitrates is evidence of soluble salt contamination. Reject contaminated surfaces, wash as discussed in paragraph PRE-PREPARATION TESTING FOR SOLUBLE SALTS CONTAMINATION, allow to dry, and re-test until all required tests show allowable results. Reblast tested areas using vacuum equipped blast equipment. Label all test tubes and retain for test verification.

3.8.7.3 Pre-Application Testing for Surface Cleanliness

Apply coatings to dust free surfaces. To test surfaces, apply strip of clear adhesive tape to surface and rub onto surface with finger. When removed, the tape should show little or no dust, blast abrasive, or other contaminant. Reject contaminated surfaces, clean by vacuum cleaning, and retest. Test surfaces at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 100 square meters 1000 square feet or part thereof. Provide two additional tests for each failed test or questionable test. Attach test tapes to Daily Inspection Reports.

3.9 MIXING AND APPLICATION OF SEALANT AND COATING SYSTEM

3.9.1 Preparation of Sealant and Coating Materials for Application

Each of the different products, sealant, primer, intermediate, and topcoat, is a two-component material supplied in separate containers.

3.9.1.1 Mixing

Mix in accordance with manufacturer's instructions, which may differ for each product. Do not mix partial kits, or alter mix ratios. Mix materials in same temperature and humidity conditions specified in paragraph DELIVERY AND STORAGE. Allow mixed material to stand for the required induction time based on its temperature.

3.9.1.2 Pot Life

Apply mixed products within stated pot life for each product. Stop applying when material becomes difficult to apply in a smooth, uniform wet film. Do not add solvent to extend pot life. Add all required solvent at time of mixing. Pot life is based on standard conditions at 21 degrees C 70 degrees F and 50 percent relative humidity. For every 10 degrees C 18 degrees F rise in temperature, pot life is reduced by approximately half, and for every 10 degrees C 18 degrees F drop, it is approximately doubled. Usable pot life depends on the temperature of the material at the time of mixing and the sustained temperature at the time of application. Other
factors such as the shape of the container and volume of mixed material may also affect pot life. In hot climates, precooling or exterior icing of components for at least 24 hours to a minimum of 10 degrees C 50 degrees F will extend pot life. Following are approximate pot life times:

<table>
<thead>
<tr>
<th>Material</th>
<th>Pot Life Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sealant</td>
<td>As specified by manufacturer</td>
</tr>
<tr>
<td>Epoxy Primer and Intermediate Coat Materials</td>
<td>4 hours</td>
</tr>
</tbody>
</table>

3.9.1.3 Application Conditions and Recoat Windows

NOTE: These requirements are provided in an attempt to prevent the significant number of intercoat delamination failures that are frequently found on industrial structures. The very strict requirements on application conditions and recoat windows may require work during abnormal hours, including weekends. Contractor work hours should allow for such during coating application.

NOTE: Cold-weather application is not covered by this specification. If a project is designed for coating in cold weather, then the enclosure and heating requirements may be significant. It is not intended that contractors be forced to apply coatings in cold weather, however, the underlying premise is that coatings must be applied within the specified temperature ranges. A cold-weather specification should not be used to simply save money, as the coating system will generally not have the same longevity as one applied within 60-100 degrees F.

The application condition requirements for the coating system are very time and temperature sensitive, and are intended to avoid the delamination problems frequently found on industrial structures. Plan coating application to ensure that specified temperature, humidity, and condensation conditions are met. If conditions do not allow for orderly application of sealant, primer, stripe coat, intermediate coat and topcoat, use appropriate means of controlling air and surface temperatures, as required. Partial or total enclosures, insulation, heating or cooling, or other appropriate measures may be required to control conditions to allow for orderly application of all required coats.

Maintain air and steel surface temperature between 16 and 38 degrees C 60 and 100 degrees F during application and the first four hours of cure for epoxy coats. Maintain steel surface temperature more than 3 degrees C 5 degrees F above the dew-point of the ambient air for the same period.

Use Table entitled "RECOAT WINDOWS" to determine appropriate recoat windows for each coat after the initial coat. Apply each coat during appropriate RECOAT WINDOW of preceding coat. If a RECOAT WINDOW is missed, the minimum and maximum primer and intermediate coat thickness may be adjusted to accommodate a FILL COAT, however, requirements for total epoxy coating thickness and total coating thickness will not be modified. Missing more than one RECOAT WINDOW may require complete removal of coating if maximum
total coating thickness requirements cannot be achieved.

If coating is not applied during RECOAT WINDOW, or if surface temperature exceeds 49 degrees C 120 degrees F between applications, provide GLOSS REMOVAL, apply next coat within 24 hours. If next planned coat is topcoat, apply FILL COAT if required to fill sanding marks. Sanding marks from GLOSS REMOVAL of intermediate coat reflecting through topcoat will be considered as non-compliant. Apply FILL COAT within 24 hours of GLOSS REMOVAL, then apply topcoat within RECOAT WINDOW of FILL COAT.

<table>
<thead>
<tr>
<th>RECOAT WINDOWS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature degrees C</td>
</tr>
<tr>
<td>RECOAT WINDOW (Hrs.)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>RECOAT WINDOWS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature degrees F</td>
</tr>
<tr>
<td>RECOAT WINDOW (Hrs.)</td>
</tr>
</tbody>
</table>

The temperature ranges shown in the table above are for determining recoat windows. Choose recoat window based on the highest surface temperature that was sustained for one or more hours between coats. This applies to the entire time between coats. Measure and record air and surface temperatures on hourly basis to determine appropriate recoat windows. If surface temperature goes above 38 degrees C 100 degrees F, measure and record temperatures every half hour.

FILL COAT - Where indicated, apply coat of intermediate coat epoxy, at 50 to 75 microns 2 to 3 mils DFT, then apply next specified full coat within recoat window of FILL COAT. A FILL COAT may be used to adjust coating thickness to comply with requirements or to fill sanding marks in intermediate coat.

GLOSS REMOVAL - Where required, hand sand in a linear fashion to remove gloss using 120-200 grit wet/dry sandpaper, followed by solvent wiping with a clean rag soaked with denatured alcohol to remove all dust. GLOSS REMOVAL of primer coat is to scarify surface and shall consist of removal of approximately 25 microns 1 mil of coating. If steel is exposed during GLOSS REMOVAL, repair in accordance with paragraph PROCEDURE FOR HOLIDAY AND SPOT REPAIRS OF NEWLY APPLIED COATING. GLOSS REMOVAL of intermediate coat may include removal of up to 3 mils of coating to avoid excess thickness, prior to application of FILL COAT.

3.9.2 Amine Blush Testing of Epoxy Coat Prior to Overcoating

Test epoxy surfaces prior to application of roof joint sealant, epoxy coat, or polyurethane topcoat for amine blush contamination using the Test Kit described in paragraph TEST KIT FOR IDENTIFYING AMINE BLUSH ON EPOXY SURFACES. Test all surfaces at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 200 square meters 2000 square feet or part thereof. If one or more tests show positive results for amine blush contamination, either treat all surfaces using the approved amine blush removal procedure or increase testing to ensure that
all contamination is located, and then treat identified contamination using the approved procedure.

3.9.3 Application of Coating System and Roof Joint Sealant

Apply coatings in accordance with SSPC PA 1 and as specified herein. Apply sealant and coatings to surfaces that meet all stated surface preparation requirements.

After application of primer coat and prior to application of each subsequent coat, perform testing prescribed in paragraph PRE-APPLICATION TESTING FOR SURFACE CONTAMINATION, as necessary, to ensure minimal intercoat contamination. This testing may be reduced to one half of the prescribed rate for bare steel if the testing indicates no contamination when sampling is evenly distributed over surfaces being tested. If contamination is found between coats, revert to the specified testing rate. Generally, oil and grease contamination and soluble salts contamination are not encountered if subsequent coats are applied within specified recoat windows and the quality of air entering tank is controlled. Concern for intercoat contamination should be continually prevalent, and spot testing should be accomplished to verify satisfactory conditions. Where visual examination or spot testing indicates contamination, perform sufficient testing to verify non-contamination, or to define extent of contamination for appropriate treatment.

Apply each coat in a consistent wet film, at 90 degrees to previous coat. Ensure that primer and intermediate coat "cold joints" are no less than 150 mm six inches from welds. Apply stripe coat by brush. For convenience, stripe coat material may be delivered by spray if followed immediately with brush-out and approved procedures include appropriate controls on thickness. Apply all other coats by spray application. Use appropriate controls to prevent airborne coating fog from drifting beyond [three][_____] meters [15][_____] feet from the tank perimeter] [the tank berm]. The cleanliness, temperature, recoat windows, and airborne paint containment requirements may necessitate the use of portable shelters or other appropriate controls.

**************************************************************************
NOTE: Maximum thickness measurements are to limit internal stresses in each coat and in total system. Internal stresses of epoxy and polyurethane coatings on steel can be significant, and unless limited through thickness, can cause premature failure as the coating ages. Such failures as shrinkage cracking and delamination, either from the substrate or between coats, are common. This system is not expected to receive a maintenance overcoat.
**************************************************************************

Apply coatings at the following specified thickness:

<table>
<thead>
<tr>
<th>Coat</th>
<th>Minimum DFT (Microns)</th>
<th>Maximum DFT (Microns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primer</td>
<td>75</td>
<td>125</td>
</tr>
<tr>
<td>Intermediate</td>
<td>75</td>
<td>125</td>
</tr>
</tbody>
</table>
Measure coating thickness in accordance with SSPC PA 2 to confirm that coating application is within the specified range and within the tolerances of that standard. For non-compliant areas, increase number of test areas to identify all non-compliant application as required by SSPC PA 2. Add coating as required to correct underruns, and remove coating with excess thickness to bare steel and reapply as specified in paragraph PROCEDURE FOR HOLIDAY AND SPOT REPAIRS OF NEWLY APPLIED COATING.

3.9.3.1 Application of Roof Joint Sealant

Apply sealant to the roof-to-shell joint, to all roof plate lap joints, and to roof-to-rafter joints up to 25 mm 1 inch gap to exclude moisture from these marginally prepared crevice areas. Allow sealant to cure according to manufacturer's instructions prior to application of the stripe coat.

3.9.3.2 Application of Stripe Coat

Apply stripe coat of epoxy primer material prior to application of general primer coat on CEILING. Apply stripe coat of epoxy intermediate coat material after application of general primer coat on BOWL. Where stripe coat is applied to areas of joint sealant, allow appropriate curing time for joint sealant. Apply stripe coat by brush, working the material into corners, crevices, pitted areas, and welds, and onto outside corners and angles. Where roof-to-rafter joints exceed 25 mm 1 inch gap and roof joint sealant was not applied, use appropriate application tools to provide "best effort" coating of all exposed steel surfaces in the gap. Mini-rollers or other tools may be required.

3.9.3.3 Application of Primer

Apply primer coat within RECOAT WINDOW of stripe coat.

3.9.3.4 Application of Intermediate Coat

Apply intermediate coat within RECOAT WINDOW of primer coat.

3.9.3.5 Application of Topcoat

Apply topcoat within RECOAT WINDOW of intermediate coat.
3.9.4 Holiday Testing

No sooner than 48 hours after application of the topcoat, perform holiday testing in accordance with the low voltage wet sponge method of NACE SP0188. Repair holidays per paragraph entitled "Procedure for Holiday and Spot Repairs of Newly Applied Coating."

3.9.5 Procedure for Holiday and Spot Repairs of Newly Applied Coating

Repair coating film defects at the earliest practicable time, preferably before application of the succeeding coat. Observe all requirements for soluble salts contamination, cleanliness between coats, and application conditions. Prepare defective area in accordance with SSPC SP 10/NACE No. 2, and feather coating as required to leave 100 mm 4 inches of each succeeding coat feathered and abraded. Do not abrade the polyurethane topcoat. Protect adjacent areas from damage and overspray. Remove dust and solvent wipe the prepared area plus an additional 100 mm 4 inches beyond the prepared area with clean denatured alcohol. Apply each coat within RECOAT WINDOW of preceding coat. Within four hours of preparation, apply primer to prepared steel and feather onto prepared primer. Apply intermediate coat to primed area and feather to prepared intermediate area. Apply topcoat to intermediate coat and feather to prepared topcoat. Apply each repair coat to approximate thickness of surrounding coating system. If one percent or more of the total surface area, or more than one spot per 200 square meters 2000 square feet, of the BOWL area requires repair to any coat or coats, including feathered areas, the entire BOWL coating system shall be removed and reapplied. If 5 percent or more of the total surface area, or more than one spot per 100 square meters 1000 square feet, of the CEILING area requires repair to any coat or coats, including feathered areas, the entire CEILING coating system shall be removed and reapplied.

3.9.6 Tank Occupancy After Coating Application

Use clean canvas, or other approved, shoe covers when walking on coated surfaces, regardless of curing time allowed. For heavily trafficked areas, provide cushioned mats for additional protection.

3.9.7 Extended Cure of Coating System Prior to Immersion Service

Allow a cure time of at least 14 days after the final coating material has been applied before introducing water into tank.

3.10 PROJECT IDENTIFICATION

At the completion of the tank work, stencil coating information on the exterior of the tank adjacent to the main manway opening[, and adjacent to the access ladder on the lower portion of the leg for an elevated tank. Information should be easily accessible from the ground, and if there is not room on the leg to place the information, place it on the riser, facing the access ladder]. Stenciling shall be in 3/4 to one inch Helvetica style letters of contrasting color using acrylic stencil paint:

Date Interior coated:
Project Number:
Contractor:
Address:
Coating System
Surface Prep: SSPC SP ____ Profile: _____
3.11 FIELD QUALITY CONTROL

Project documentation, including inspection and testing records, shall be used to determine the Contractor's compliance with contract requirements and approved procedures. The Contractor's certifications of completion, for both invoices and for project completion, shall be based on documented evidence of compliance with all requirements and approved Coating Work Plan procedures. Track inspections and tests in the Test Plan & Log.

3.11.1 Coating Inspector

The coating inspector shall be considered a QC Specialist and shall report to the QC Manager, as specified in Section 01 45 00 QUALITY CONTROL. The Coating Inspector shall be present during all pre-preparation testing, surface preparation, coating application, initial cure of the coating system, during all coating repair work, and during completion activities as specified in Section 01 45 00 QUALITY CONTROL. The Coating Inspector shall provide complete documentation of conditions and occurrences on the job site, and be aware of conditions and occurrences that are potentially detrimental to the coating system. The requirements for inspection listed in this Section are in addition to the QC inspection and reporting requirements specified in Section 01 45 00 QUALITY CONTROL.

3.11.2 Field Inspection

3.11.2.1 Inspection Requirements

Perform field inspection in accordance with ASTM D3276 and the approved Coating Work Plan. Document Contractor's compliance with the approved Coating Work Plan.

Provide all tools and instruments required to perform the required testing, as well as any tools or instruments that the inspector considers necessary to perform the required inspections and tests. Document each inspection and test, including required hold points and other required inspections and tests, as well as those inspections and tests deemed prudent from on-site evaluation to document a particular process or condition, as follows:

a. Location or area;
b. Purpose (required or special);
c. Method;
d. Criteria for evaluation;
e. Results;
f. Determination of compliance;
g. List of required rework;
h. Observations.

Collect and record Environmental Conditions as described in ASTM D3276 on a 24 hour basis, as follows:

a. During surface preparation, every two hours or when changes occur;
b. During coating application and the first four days of initial cure, every hour, or when changes occur;
c. Note location, time, and temperature of the highest and lowest surface
temperatures each day;

- Use a non-contact thermometer to locate temperature extremes, then verify with contact thermometers.

NOTE: Data collected on Environmental conditions in paragraph AUTOMATED MONITORING REQUIREMENTS may be used for overnight data, however, the data must be constantly verified as to location of sensors and validity of data with respect to the coating work being accomplished.

Document all equipment used in inspections and testing, including manufacturer, model number, serial number, last calibration date and future calibration date, and results of on-site calibration performed. Work documented using data from equipment found to be out of calibration shall be considered as non-compliant since last calibration or calibration check, as required.

3.11.2.2 Inspection Report Forms

Develop project-specific report forms as required to report measurement and test results and observations being complete and compliant with contract requirements. This includes all direct requirements of the contract documents and indirect requirements of referenced documents. Show acceptance criteria with each requirement and indication of compliance of each inspected item. Annotation of non-compliance shall be conspicuous so as to facilitate identification and transfer to the Rework Log. Report forms shall include requirements and acceptance and rejection criteria, and shall be legible and presented so that entered data can be quickly compared to the appropriate requirement.

3.11.2.3 Daily Inspection Reports

Submit one copy of daily inspection report completed each day when performing work under this Section, to the Contracting Officer. Note all non-compliance issues, and all issues that were reported for rework in accordance with QC procedures of Section 01 45 00 QUALITY CONTROL. Each report shall be signed by the coating inspector and the QC Manager. Submit report within 24 hours of date recorded on the report.

3.11.2.4 Inspection Logbook

A continuous record of all activity related to this Section shall be maintained in an Inspection Logbook on a daily basis. The logbook shall be hard or spiral bound with consecutively numbered pages, and shall be used to record all information provided in the Daily Inspection Reports, as well as other pertinent observations and information. The Coating Inspector's Logbook that is sold by NACE is satisfactory. Submit the original Inspection Logbook to the Contracting Officer upon completion of the project and prior to final payment.

3.11.3 Inspection Equipment

All equipment shall be in good condition, operational within its design range, and calibrated as required by the specified standard for use of each device.

3.11.3.1 Black Light

Use a black light having a 365 nanometer intensity of 4,000 microwatts per square centimeter minimum at 380 mm 15 inches. The Spectroline BIB-150P
from Spectronics Corporation satisfies this requirement.

3.12 FINAL CLEANUP

Following completion of the work, remove debris, equipment, and materials from the site. Remove temporary connections to Government or Contractor furnished water and electrical services. Restore existing facilities in and around the work areas to their original condition.

PART 2 PRODUCTS

2.1 COATING SYSTEM
2.1.1 Epoxy Primer, Intermediate, and Topcoats
2.1.1.1 Epoxy Primer Coat
2.1.1.2 Epoxy Intermediate Coat
2.1.1.3 Epoxy Topcoat
2.2 JOINT SEALANT
2.3 COATING FIELD COLLECTION KIT
2.4 ABRASIVE FIELD COLLECTION KIT
2.5 INSPECTION TEST KITS
2.5.1 Test Kit for Measuring Chloride, Sulfate, and Nitrate Ions on Steel and Coated Surfaces
2.5.2 Test Kit for Measuring Chlorides in Abrasives
2.5.3 Test Kit for Identifying Amine Blush on Epoxy Surfaces
2.6 ABRASIVE
2.6.1 Ferrous Metallic Abrasive
2.6.1.1 New and Remanufactured Steel Grit
2.6.1.2 Recycled Steel Grit
2.6.2 Non-Metallic Abrasive

PART 3 EXECUTION

3.1 REMOVAL OF COATINGS CONTAINING HAZARDOUS MATERIALS
3.2 DOOR SHEET ACCESS WAY
3.3 FIELD SAMPLE COLLECTION AND TESTING
3.3.1 Coating Field Sample Collection
3.3.2 Abrasive Field Sample Collection
3.3.3 Coating Field Test Reports
3.3.4 Abrasive Field Test Reports
3.4 FUEL REMOVAL AND TANK CLEANING
3.5 LIGHTING
3.6 ENVIRONMENTAL CONDITIONS
3.6.1 Tank Containment
3.6.2 Control System Requirements
3.6.2.1 Automated Monitoring Requirements
3.6.2.2 Humidity Control for Surface Preparation and Primer Application
3.6.2.3 Humidity Control for Application of Intermediate and Topcoats and Initial Curing
3.7 EQUIPMENT USED IN TANK

SECTION 09 97 13.17 Page 2
3.8 SURFACES TO BE COATED

3.9 SURFACE PREPARATION
  3.9.1 Abrasive Blasting Equipment
  3.9.2 Operational Evaluation of Abrasive
  3.9.3 Surface Standard
  3.9.4 Pre-Preparation Testing for Surface Contamination
    3.9.4.1 Pre-Preparation Testing for Oil and Grease Contamination
    3.9.4.2 Pre-Preparation Testing for Soluble Salts Contamination
  3.9.5 Abrasive Blasting
  3.9.6 Disposal of Used Abrasive
  3.9.7 Pre-Application Testing for Surface Contamination
    3.9.7.1 Pre-Application Testing for Oil and Grease Contamination
    3.9.7.2 Pre-Application Testing for Soluble Salts Contamination
    3.9.7.3 Pre-Application Testing for Surface Cleanliness

3.10 MIXING AND APPLICATION OF COATING SYSTEM AND SEALANT
  3.10.1 Preparation of Sealant and Coating Materials for Application
    3.10.1.1 Mixing
    3.10.1.2 Pot Life
    3.10.1.3 Application Conditions and Recoat Windows
  3.10.2 Amine Blush Testing of Epoxy Coat Prior to Overcoating
  3.10.3 Application of Coating System and Joint Sealant
    3.10.3.1 Application of STRIPE COAT
    3.10.3.2 Application of Primer
    3.10.3.3 Application of Intermediate Coat
    3.10.3.4 Application of Topcoat
    3.10.3.5 Application of Joint Sealant
  3.10.4 Holiday Testing
  3.10.5 Tank Occupancy After Coating Application
  3.10.6 Procedure for Holiday and Spot Repairs of Newly Applied Coating
  3.10.7 Extended Cure of Coating System Prior to Immersion Service

3.11 PROJECT IDENTIFICATION

3.12 FIELD QUALITY CONTROL
  3.12.1 Field Inspection
    3.12.1.1 Inspection and Documentation Requirements
    3.12.1.2 Inspection Report Form
    3.12.1.3 Daily Inspection Reports
    3.12.1.4 Inspection Logbook
    3.12.1.5 Inspection Equipment
      3.12.1.5.1 Black Light
  3.12.2 Coatings Contractor QC Coatings Inspector's Field Responsibilities
  3.12.3 Quality Assurance Coatings Inspector's Field Responsibilities

3.13 FINAL CLEANUP

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for a three-coat epoxy system for interior coating of newly constructed, bulk fuel storage tanks. For maintenance coating design, see notes herein. Severe corrosion and corrosion pitting are not addressed in this specification.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This specification should be edited by an AMPP (Association for Materials Protection and Performance) (previously SSPC) certified Protective Coatings Specialist (PCS) that has five or more years of experience preparing coating specifications.

The designer should not alter the products and processes specified herein without thorough knowledge of the need for the changes and the implications of those changes.
NOTE: SSPC and NACE have merged to become AMPP. The merger was still in progress at the time this section was released.

**************************************************************************
**************************************************************************
NOTE: The metric standard for measuring coating thickness is microns (25.4 microns=1 mil; use nominal 25 microns=1 mil).

**************************************************************************
**************************************************************************
NOTE: This specification is for a three-coat, thin film system, which is compliant with Environmental Protective Agency (EPA) volatile organic compound (VOC) regulations as of June 2000.

- Epoxy Coats 350 grams per liter (g/l) 2.8 pounds per gallon (lbs/gal) maximum VOC

The designer must review state and local regulations and determine whether the coating in this Section complies with restrictions on VOC and other chemical constituents.

**************************************************************************
**************************************************************************
NOTE: Tailor the SURFACE PREPARATION paragraph and subparagraphs to the needs of cleaning that will be required in preparation for repairs, and note that the abrasive blasting for inspection should be accomplished in such a manner that it does not conflict with any surface condition requirements in this Section, such as creating excessive surface profile that may require excessive primer thickness. For repair projects, specify appropriate portions of the steel surfacing requirements (according to NACE RP0178) from Section 33 56 21.17 SINGLE WALL ABOVE GROUND FIXED ROOF STEEL POL STORAGE TANK.

**************************************************************************
**************************************************************************
NOTE: Designs for fuel tank linings should be based on recent inspections. Wherever possible, a coating inspection, or coating condition survey (CCS), as described in Section 09 97 13.27 HIGH PERFORMANCE COATING FOR STEEL STRUCTURES, should be accomplished prior to designing a coating project for fuel tank interiors. Without a competent inspection, there is no reliable way to determine the type or condition of the existing coating system. If existing conditions are not known, proper (effective and financially supportable) surface preparation or coating system selection cannot be made. It is not always cost effective to replace the entire coating system in a fuel tank; however, this is the tendency in preparing a design without inspection results.
Do not provide general overcoat to a fuel tank lining unless recommended in a CCS to add corrosion protection. Provide complete removal and replacement, or repairs to existing coating, as deemed appropriate. Overcoating the interior of a tank is generally a liability unless extraordinary measures are taken to ensure adhesion to the old coating, regardless of whether it is epoxy or urethane.

NOTE: Designers are encouraged to contact Robert Jamond (robert.jamond@navy.mil) prior to beginning a new Navy design.

NOTE: Designers are encouraged to contact the Air Force Civil Engineer Reachback Center (afcec.rbc@us.af.mil) prior to beginning a new Air Force design.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 DEFINITIONS

Definitions are generally provided throughout this Section in the paragraphs where used and denoted by capital letters. The following definitions are used throughout this Section:

a. ROOF - Interior tank surfaces that extend from the horizontal plane at the designated maximum fuel line upward, including the upper portion of the tank shell (walls), columns, structural steel, the underside of the roof plates, and other steel components in this area.

b. SHELL - Interior tank surfaces that extend along the vertical tank walls between the horizontal planes approximately 1 meter 40 inches above the shell-to-bottom joint upward to the horizontal plane at the designated fuel line, including columns, wall plates, and other steel components in this area.

c. BOTTOM - Interior tank surfaces below the horizontal plane approximately 1 meter 40 inches above the shell-to-bottom joint, including columns, wall plates, piping, pipe supports, bottom plates, and other steel components in this area.

d. INDEPENDENT THIRD-PARTY - Impartial third-party not a part or affiliated with Contractor or subcontractor principal or subsidiary businesses, and not a materials supplier.
e. STRIPE COAT - An additional corrosion protection measure on edges, outside corners, crevices, bolt heads, welds, and other irregular surfaces, including minor surface preparation on sharp edges.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

- Contract Errors, Omissions, and Other Discrepancies
- Corrective Action Procedures
- Corrective Action Request (CAR) Form
Coatings Work Plan
Inspection Report Form

SD-05, Design Data
Environmental Control System
Use of Door Sheet Access Way

SD-06 Test Reports
Coatings Qualification Test Reports
Joint Sealant Qualification Test Reports
Non-Metallic Abrasive Qualification Test Reports
Ferrous Metallic Abrasive Qualification Test Reports
Coating Field Test Reports
Abrasive Field Test Reports
Recycled Ferrous Metallic Abrasive Field Test Reports (Daily and Weekly)

Daily Inspection Reports

SD-07 Certificates
Qualifications of Certified Industrial Hygienist (CIH)
Qualifications of Certified Protective Coatings Specialist (PCS)
Qualifications of Coatings Inspection Company
Qualifications of Quality Assurance Coatings Inspector
Qualifications of Coatings Contractors
Qualifications of Individuals Performing Abrasive Blasting
Qualifications of Individuals Applying Coatings
Qualifications of Testing Laboratory for Coatings
Qualifications of Testing Laboratory for Abrasive
Coating Materials Certificate of Conformance
Joint Sealant Materials Certificate of Conformance
Joint Sealant Compatibility
Non-Metallic Abrasive Certificate of Conformance
Ferrous Metallic Abrasive Certificate of Conformance
1.4 QUALITY ASSURANCE

1.4.1 Contract Errors, Omissions, and Other Discrepancies

Submit all errors, omissions, and other discrepancies in contract documents the Contracting Officer within 30 days of contract award for all work covered in this Section, other than the work that will not be uncovered until a later date. All such discrepancies must be addressed and resolved, and the Coatings Work Plan modified, prior to beginning the Initial and Follow-Up phases of work. Discrepancies that become apparent only after work is uncovered must be identified at the earliest discoverable time and submitted for resolution. Schedule time (float) must be built into the project schedule at those points where old work is to be uncovered or where access is not available during the first 30 days after award, to allow for resolution of contract discrepancies.

1.4.2 Corrective Action (CA)

CA must be included in the Contractor Quality Control Plan as outlined in Section 01 45 00 QUALITY CONTROL.

1.4.2.1 Corrective Action Procedures

Develop procedures for determining the root cause of each non-compliance, developing a plan to eliminate the root cause so that the non-compliance does not recur, and following up to ensure that the root cause was eliminated.

1.4.2.2 Corrective Action Request (CAR) Form

Develop Corrective Action Request (CAR) forms for initiating CA and for tracking and documenting each step. The CAR should be included with the Corrective Action Procedures. A CAR must be initiated by either the Contractor or the Contracting Officer. The Protective Coatings Specialist (PCS) must approve each CAR at the root cause identification stage, the plan for elimination stage, and the close out stage after verification that the root cause has been eliminated.

1.4.2.3 Corrective Action Log

When a CAR is initiated, the Contractor must take action to identify and eliminate the root cause of each non-compliance so as to prevent recurrence. These actions must apply to non-compliance in the work, and to non-compliance in the Quality Control (QC) System. Corrective actions must be appropriate to the effects of the non-compliance encountered. The
corrective action must be documented in a report that is serialized and tracked in the Corrective Action Log until project completion and acceptance by the Contracting Officer. All corrective action reports must be retained in project records. The Corrective Action Log, showing status of each CAR, must be submitted to the Contracting Officer monthly.

1.4.3 Coatings Work Plan

**************************************************************************
NOTE: For maintenance painting, add requirement for pre-work determination of the existing surface profile. If paint removal is specified in another Section, such as a blast cleaning prior to inspection or repair, or in the lead removal Section, include this evaluation of existing profile such that the paint removal operation does not create excessive profile.
**************************************************************************

**************************************************************************
NOTE: Choose the options pertaining to the floating pan that apply to the project. The pan must be removed for any significant coating work on the SHELL and ROOF, and for all but minor repairs on the BOTTOM.
**************************************************************************

**************************************************************************
NOTE: If there is a possibility that generating non-detectable soluble salt levels per PRE-APPLICATION TESTING FOR SOLUBLE SALTS CONTAMINATION could cause delays in surface preparation, the Coatings Work Plan must include a section that would provide guidance on the strategy to be pursued should greater-than-zero soluble salt levels be detected.
**************************************************************************

**************************************************************************
NOTE: Ensure coordination between all parties, including the welder, weld inspector, coatings Contractor, Quality Assurance Coatings Inspector, and Coatings Contractor QC Coatings Inspector, on weld preparation and surface profile requirements.
**************************************************************************

The Coatings Work Plan must be considered as part of the Contractor Quality Control Plan as outlined in Section 01 45 00 QUALITY CONTROL.

The Coatings Work Plan must be submitted and approved by the PCS prior to mobilization. The Coatings Work Plan must explain in detail all procedures including, but not limited to, all sequential processes, quality control for each process, quality assurance for each process, and safety considerations. Subsections must include at least the following:

a. Purpose;

b. Introduction[ (including the scope of work (SOW) project program)];
c. Safety, fire, and health information;
d. Contractor and worker qualifications with certifications;
e. Project management organization and documents;
f. Timeline in a Gantt chart;
g. Project document references;
h. Reference to all applicable standards (e.g., AMPP, NACE, SSPC, ISO, and ASTM);
i. Coatings manufacturer's supporting documentation;
j. Descriptions and explanations of any exceptions from the coating manufacturer;
k. Coating and blasting equipment, model names, and, if applicable, calibration dates;
l. Containment design and details;
m. Environmental testing;
n. Material delivery, storage, and handling details;
o. Surface preparation[ (include procedures for if the pre-existing anchor profile is greater than 100 microns 4 mils as specified in paragraph ABRASIVE BLASTING)];
p. Pre-application test panel validation for field-applied external coating as outlined in SURFACE STANDARD;
q. Coating materials, mixing, application, recoat windows, and coating curing times, if applicable;
r. Coating repairs and rework;
s. Non-conformance;
t. Spent material handling and effluent discharge containment and disposal;
u. Inspection test plan (as outlined in FIELD INSPECTION, and including inspection hold points, both Quality Assurance and Coating Contractor QC Coatings Inspector's responsibilities, and daily documentation and delivery);
v. Instruments and test kits;
w. Soluble salt testing (include procedures that must be used if greater-than-zero soluble salt levels are not able to be removed from the steel surface);
x. Warranty (in writing, signed by the Contractor and the coating manufacturer's representative);
y. Demobilization;
z. PCS and PM approval;

1.4.4 Design Data

1.4.4.1 Environmental Control System

Submit design details of the proposed environmental control system to include ventilation, humidity control, and temperature regulation. Provide calculations for humidity control during separate surface preparation and coating application procedures, ventilation requirements during coating application, and maximum allowable coating application rates to coincide with ventilation. Include basis of design data on local conditions. Provide equipment layout sketches and procedures showing function of each piece of equipment and fail-safe measures. A Certified Industrial Hygienist must approve calculations, work procedures, and personal protective equipment.

1.4.4.2 Use of Door Sheet Access Way

If use of a door sheet access way is desired, submit design drawings and calculations that address all aspects of the door sheet opening in accordance with API Std 653 and API Std 650, including cutting of door sheet, tank stabilization, door sheet replacement, weld testing, and final acceptance. A registered engineer must approve all calculations and procedures prior to submittal for government approval.

1.4.5 Test Reports

1.4.5.1 Coatings Qualification Test Reports

Submit qualification test results from an INDEPENDENT THIRD-PARTY laboratory of representative samples of each coating material. U.S. Department of Defense laboratories are considered to be independent laboratories. Samples must have been tested within the last three years.

The purpose of qualification testing is to pre-qualify the coating materials to MIL-TRL-24441. Submit test results for materials in conformance to the requirements of MIL-TRL-24441. Note that this is the same testing that is required for listing on the Qualified Products List (QPL). The coating materials must remain on the QPL for the entire project.

1.4.5.2 Joint Sealant Qualification Test Reports

Submit qualification test results from an INDEPENDENT THIRD-PARTY laboratory of representative samples of joint sealant material that will be used on this project. Samples must have been tested within the last three years. Submit results of conformance to ASTM C920.

1.4.5.3 Ferrous Metallic Abrasive Qualification Test Reports

Submit results for abrasive as required in paragraph 4 REQUIREMENTS of SSPC AB 3. Submit test results from an INDEPENDENT THIRD-PARTY laboratory of representative samples of each abrasive to be used on the jobsite. Samples must have been tested within the last three years. Note that this testing is for the purpose of pre-qualifying the abrasive.

1.4.5.4 Non-Metallic Abrasive Qualification Test Reports

Submit results for abrasive as required in paragraph 4 REQUIREMENTS of
SSPC AB 1. Submit test results from an INDEPENDENT THIRD-PARTY laboratory of representative samples of each abrasive to be used on the jobsite. Samples must have been tested within the last three years. Note that this testing is for the purpose of pre-qualifying the abrasive.

1.4.5.5 Recycled Ferrous Metallic Abrasive Field Test Reports (Daily and Weekly)

Submit test results from an INDEPENDENT THIRD-PARTY laboratory of daily and weekly Quality Control testing required by SSPC AB 2, as modified in paragraph ABRASIVE.

1.4.6 Qualifications

1.4.6.1 Qualifications of Certified Industrial Hygienist (CIH)

Submit name, address, telephone number, fax number, and e-mail address of the INDEPENDENT THIRD-PARTY CIH. Submit documentation that the hygienist is certified by the American Board of Industrial Hygiene in comprehensive practice, including certification number and date of certification/recertification. The CIH must remain certified during the entire project, and the Contracting Officer must be notified of any change in certification status within 10 days of the change. If a CIH's certification expires, the hygienist will not be allowed to perform any hygienist functions, and all hygienist work must stop, until the certification is reissued or another CIH is approved. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply. Provide evidence of experience with hazards involved in industrial coating application work.

1.4.6.2 Qualifications of Certified Protective Coatings Specialist (PCS)

Submit name, address, telephone number, fax number, and e-mail address of the INDEPENDENT THIRD-PARTY PCS. Submit documentation that specialist is certified by the Association for Materials Protection and Performance (AMPP) (formerly SSPC: The Society for Protective Coatings (SSPC)) as a PCS, including certification number and date of certification/recertification. If the PCS is employed by the same coatings inspection company to which the Quality Assurance Coatings Inspector is employed, this does not violate the INDEPENDENT THIRD-PARTY requirements. The PCS must remain certified during the entire project, and the Contracting Officer shall be notified of any change in certification status within 10 days of the change. If a PCS's certification expires, the PCS will not be allowed to perform any PCS functions, and all coatings work must stop, until the certification is reissued or another PCS is approved. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply. The PCS must not be the designated Quality Assurance Coatings Inspector. The PCS's responsibilities are outlined in PROTECTIVE COATINGS SPECIALIST (PCS).

1.4.6.3 Qualifications of Coatings Inspection Company

Submit documentation that the coatings inspection company that will be performing all quality assurance coatings inspection functions is certified by AMPP to the requirements of SSPC QP 5 prior to contract award. The coatings inspection company that is submitted and approved, must remain and cannot be changed through completion of the contract. The coatings
inspection company must remain SSPC QP 5 certified for the duration of the coating work and the Contracting Officer must be notified of any change in certification status within 10 days of the change. If a coatings inspection company's certification expires, the firm will not be allowed to perform any inspection functions, and all surface preparation and coating application work must stop, until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply. Notify the Contracting Officer of all scheduled and unannounced on-site audits from AMPP and furnish a copy of all audit reports. The coatings inspection company must not engage in any activities that may conflict with their independence of judgment and integrity in relation to their inspection activities. In particular, they must not be engaged in the manufacture, supply, application, surface preparation, purchase, or maintenance of the applied coating in this project.

1.4.6.4 Qualifications of Quality Assurance Coatings Inspector

**************************************************************************
NOTE: Although the Quality Assurance Coatings Inspector may be a certified NACE CIP Level III inspector, the Quality Assurance Coatings Inspector must be a certified QP 5 Level II inspector, with a minimum of a NACE CIP Level II certification, employed by the coatings inspection company.
**************************************************************************

Submit documentation that each Quality Assurance Coatings Inspector is employed by the SSPC QP 5 company and is qualified to a minimum certification of NACE CIP Level II. Each inspector must remain employed by the coatings inspection company while performing any coatings inspection functions. The Quality Assurance Coatings Inspector's responsibilities are outlined in QUALITY ASSURANCE COATINGS INSPECTOR'S FIELD RESPONSIBILITIES. The roles of the Quality Assurance Coatings Inspector are in addition to, and distinct from, the role of the QC Coatings Inspector employed by the coatings Contractor.

1.4.6.5 Qualifications of Coatings Contractors

**************************************************************************
NOTE: If project involves removal of paint containing hazardous materials, add requirement for SSPC QP 2 certification in section of specification where the hazardous paint removal is specified, generally Section 02 83 00 LEAD REMEDIATION.
**************************************************************************

**************************************************************************
NOTE: Solicitations requiring certification for pre-qualification must point out the existence and location of the certification requirement on the PROJECT INFORMATION FORM. This requirement must be pointed out in the solicitation documents for the "prior to contract award" requirement to be enforceable. Certification is a special responsibility requirement pursuant to FAR 9.104-2 Special Standards. This is analogous to requiring bidders to have a specified level of experience or expertise and GAO has sustained these types of
special requirements.
**************************************************************************
All Contractors and Subcontractors that perform surface preparation or coating application must be certified to both SSPC QP 1 and SSPC QS 1 prior to contract award, and must remain certified while accomplishing any surface preparation or coating application. If a Contractor's or Subcontractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply. Notify the Contracting Officer of any change in Contractor certification status. Notify the Contracting Officer of all scheduled and unannounced on-site audits from AMPP and furnish a copy of all audit reports.

For projects located outside the United States, Guam, and Puerto Rico, the certifications for the coatings Contractor (SSPC QP 1 and SSPC QS 1) can be substituted if the coatings Contractor meets all of the below requirements:

a. ISO 9001 certified;

b. Eight years of experience with industrial coatings;

c. Evidence of recent work that has Contractor Performance Assessment Report System (CPARS) ratings, and other quality/performance ratings, that are equivalent to, or exceed, "Above Average";

d. Evidence of an INDEPENDENT THIRD-PARTY audit from AMPP demonstrating equivalency to SSPC QP 1 and SSPC QS 1 within the last two years.
[ e. Evidence of an INDEPENDENT THIRD-PARTY audit from AMPP demonstrating equivalency to SSPC QP 2 within the last two years.]

The coatings Contractors and coatings Subcontractors must be certified to ISO 9001 prior to contract award and must remain so certified for the duration of the project. If a Contractor's or Subcontractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply. Notify the Contracting Officer of any change in Contractor certification status. Notify the Contracting Officer of all scheduled and unannounced on-site inspections from the ISO certifying organization and furnish a copy of all inspection reports.

1.4.6.6 Qualifications of Individuals Performing Abrasive Blasting

Submit name, address, and telephone number of each person that will be performing abrasive blasting. Submit documentation that each blaster is qualified by AMPP to the SSPC C7 Abrasive Blaster Qualification Program or CAS Coating Application Specialist Level 2 Certification Program (Interim Status). Each blaster must remain qualified during the entire period of abrasive blasting, and the Contracting Officer shall be notified of any change in qualification status within 10 days of the change. If a blaster's qualification expires, the blaster will not be allowed to perform any blasting functions until the qualification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive qualification will not be considered and liquidated damages will
apply.

1.4.6.7 Qualifications of Individuals Applying Coatings

Submit name, address, and telephone number of each person that will be applying coatings. Submit documentation that each applicator is qualified by AMPP to the SSPC CAS Coating Application Specialist Level 2 Certification Program (Interim Status) or SSPC C12 Spray Application Certification. Each applicator must remain certified during the entire period of coating application, and the Contracting Officer must be notified of any change in qualification status within 10 days of the change. If an applicator's qualification expires, the applicator will not be allowed to perform any coatings application functions until the qualification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive qualification will not be considered and liquidated damages will apply.

1.4.6.8 Qualifications of Testing Laboratory for Coatings

Submit name, address, telephone number, fax number, and e-mail address of the INDEPENDENT THIRD-PARTY laboratory or laboratories selected to perform testing of coating samples for qualification testing and for field sample testing for compliance with this Section. Submit documentation that the laboratory is regularly engaged in testing of paint samples for conformance with specifications and that the employees performing testing are qualified.

1.4.6.9 Qualifications of Testing Laboratory for Abrasive

Submit name, address, telephone number, fax number, and e-mail address of the INDEPENDENT THIRD-PARTY laboratory or laboratories selected to perform testing of abrasive for compliance with this Section. Submit documentation that the laboratory has experience in testing samples of abrasive for conformance with specifications and that the employees performing testing are qualified.

1.4.6.10 Coating Materials Certificate of Conformance

Provide manufacturer's certification of conformance to MIL-DTL-24441.

1.4.6.11 Joint Sealant Materials Certificate of Conformance

Provide manufacturer's certification of conformance to ASTM C920 and as modified in this Section.

1.4.6.12 Joint Sealant Compatibility

Provide manufacturer's certification that the selected joint sealant is compatible with the epoxy topcoat.

1.4.6.13 Ferrous Metallic Abrasive Certificate of Conformance

Provide manufacturer's certification of conformance that the materials are currently in conformance with SSPC AB 3 and as modified in this Section, and have been tested within the last three years.

1.4.6.14 Non-Metallic Abrasive Certificate of Conformance

Provide manufacturer's certification of conformance that the materials are currently in conformance with SSPC AB 1 and as modified in this Section,
and have been tested within the last three years.

1.4.7 QA and QC Personnel

1.4.7.1 QC Manager

The QC Manager is as defined in Section 01 45 00 QUALITY CONTROL.

1.4.7.2 Protective Coatings Specialist (PCS)

The PCS must be considered a QC Specialist and must report to the QC Manager, as specified in Section 01 45 00 QUALITY CONTROL. The PCS must approve all submittals prior to submission to the QC Manager for approval or submission to the government for approval.

The PCS's responsibilities include, but are not limited to, the following:

a. Obtain, review, and understand all project documentation including, but not limited to, this Section, scope of work (SOW) project program, Coatings Work Plan, inspection and testing plan (ITP), and all submittals before the project starts, during the project, and all coatings related re-work;

b. Attend all pre-job coatings meetings (in-person, phone, or virtually);

c. Attend pre-final coatings walk-through (mandatory) and attend final coatings walk-through (as required).

1.4.7.3 Quality Assurance Coatings Inspector

The Quality Assurance Coatings Inspector must be considered a QC Specialist and must report to the QC Manager, as specified in Section 01 45 00 QUALITY CONTROL. The Quality Assurance Coatings Inspector must be present during all pre-preparation testing, surface preparation, coating application, initial cure of the coating system, during all coating repair work, and during completion activities. The Quality Assurance Coatings Inspector must provide complete documentation of conditions and occurrences on the job site, and be aware of conditions and occurrences that are potentially detrimental to the coating system. The requirements for inspection listed in this Section are in addition to the QC inspection and reporting requirements specified in Section 01 45 00 QUALITY CONTROL. The responsibilities of the Quality Assurance Coatings Inspector are defined in QUALITY ASSURANCE COATING INSPECTOR’S FIELD RESPONSIBILITIES. These responsibilities are separate and distinct from the responsibilities of the Coatings Contractor QC Coatings Inspector.

1.4.7.4 Coatings Contractor QC Coatings Inspector

The Coatings Contractor QC Coatings Inspector must stop non-compliant work. The responsibilities of the Coatings Contractor QC Coatings Inspector are defined in COATINGS CONTRACTOR QC COATINGS INSPECTOR'S FIELD RESPONSIBILITIES. These responsibilities are separate and distinct from the responsibilities of the Quality Assurance Coatings Inspector.

1.4.8 Pre-Application Meeting

After approval of submittals, but prior to the initiation of coatings work, Contractor representatives, including at a minimum, project superintendent, QC manager, paint foreman, Quality Assurance Coatings Inspector, and PCS,
must have a pre-application coating preparatory meeting. This meeting must be in addition to the pre-construction conference. Specific items addressed must include: corrective action requirements and procedures, coatings work plan, safety plan, coordination with other Sections, inspection standards, inspection requirements and tools, test procedures, environmental control system, and test logs. Notify Contracting Officer at least ten days prior to meeting.

1.5 PRODUCT DATA

1.5.1 Joint Sealant Instructions

Submit manufacturer's printed instructions including detailed mixing and application procedures, minimum and maximum application temperatures, and curing procedures. Include Safety Data Sheets (SDS) for materials to be used at the job site in accordance with 29 CFR 1926.59.

1.5.2 Coating System Instructions

Submit manufacturer's printed instructions including detailed mixing and application procedures, number and types of coats required, minimum and maximum application temperatures, and curing procedures. Include Safety Data Sheets (SDS) for materials to be used at the job site in accordance with 29 CFR 1926.59.

1.6 DELIVERY AND STORAGE

Ship, store, and handle materials in accordance with SSPC PA 1, and as modified in this Section. Maintain temperature in storage spaces between 5 and 24 degrees C 40 and 75 degrees F, and air temperature more than 3 degrees C 5 degrees F above the dew-point at all times. Inspect materials for damage prior to use and return non-compliant materials to manufacturer. Remove materials with expired shelf life from government property immediately and notify the Contracting Officer.

If materials are approaching shelf life expiration and an extension is desired, samples must be sent to the manufacturer, along with complete records of storage conditions, with a request for shelf life extension. If the manufacturer finds the samples and storage data suitable for shelf life extension, the manufacturer must issue an extension, referencing the product evaluation and the review of storage records. Products must not be extended longer than allowed in the product specification.

1.7 COATING HAZARDS

**************************************************************************
NOTE: This specification Section must be used with Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS.
**************************************************************************

Ensure that employees are trained in all aspects of the safety plan. Specified coatings may have potential health hazards if ingested or improperly handled. The coating manufacturer's written safety precautions must be followed throughout mixing, application, and curing of the coatings. During tank cleaning, cleanup, surface preparation, and paint application phases, ensure that employees are protected from toxic and hazardous chemical agents which exceed concentrations in 29 CFR 1910.1000. Comply with respiratory protection requirements in 29 CFR 1910.134. The CIH must approve work procedures and personal protective equipment.

SECTION 09 97 13.17 Page 21
1.8 WORK SEQUENCE

******************************
NOTE: Modify tank construction specification to indicate that floating pan will be installed over coated bottom and that the coating must be fully protected during pan installation with protective mats. Any required repairs must be done according to paragraph PROCEDURE FOR HOLIDAY AND SPOT REPAIRS OF NEWLY APPLIED COATING.
******************************

[Coat tank interior following tank tightness testing.] [Coat tank interior before installation of floating pan.]

1.9 JOB SITE REFERENCES

******************************
NOTE: Include any other job-site-related references that might be added during design.
******************************

Make available to the Contracting Officer at least one copy each of API Std 653, ASTM C920, ASTM D3276, ASTM D3925, ASTM D4285, ASTM D4417, ASTM D4940, NACE SP0178 and companion visual comparator, NACE SP0188, SSPC AB 1, SSPC AB 2, SSPC AB 3, SSPC SP COM, SSPC SP 1, SSPC SP 10/NACE No. 2, SSPC SP 11, SSPC PA 1, SSPC PA 2, SSPC Guide 12, SSPC VIS 1, SSPC QP 1, [SSPC QP 2, ]SSPC QS 1, and an SSPC Certified Contractor Evaluation Form at the job site.

PART 2 PRODUCTS

2.1 COATING SYSTEM

******************************
NOTE: Include bracketed text for new construction only.
******************************

Coating systems must be as specified herein; alternate systems will not be considered. All primer, intermediate, and topcoat materials must be manufactured by one manufacturer and supplied by one supplier.[ The entire coating system is intended to be applied in the field. Alternatively, surface preparation may be accomplished in the shop, following all temperature, humidity, and testing requirements listed herein, followed by an application of a hold-primer. Upon completion of field fabrication, all shop-applied coatings must be removed, surfaces prepared to SSPC SP 10/NACE No. 2, and the specified coating system applied. Adjust all shop preparation to avoid conflicts with final surface preparation requirements.]

2.1.1 Epoxy Primer, Intermediate, and Topcoats

The epoxy coating materials must be approved by the Naval Sea Systems Command and listed on their current Qualified Products List (QPL) for the specified materials.
2.1.1.1 Epoxy Primer Coat

Epoxy polyamide, MIL-DTL-24441/29 (Formula 150, Type IV, Green).

2.1.1.2 Epoxy Intermediate Coat

Epoxy polyamide, MIL-DTL-24441/31 (Formula 152, Type IV, White (Tinted)).
Tint to approximately SAE AMS-STD-595A color number 27778 parchment using pigment dispersions prepared for epoxy paint tinting. Manufacturer shall tint material and appropriately label. All other requirements of this Military Specification apply.

2.1.1.3 Epoxy Topcoat

Epoxy polyamide, MIL-DTL-24441/31 (Formula 152, Type IV, White).

2.2 JOINT SEALANT

Industrial grade, two component, minimum 95 percent solids by volume, polysulfide type caulking material that has a minimum history of 10 years acceptable service in fuel tanks. Sealant must be compatible with the coating and suitable for direct application to prepared steel surfaces. Sealant must contain no more than 0.06 percent by dry weight lead, no more than 0.06 percent by dry weight cadmium, and no chromium. Joint sealant must be qualified to ASTM C920, Type M, Grade NS or P.

2.3 COATING FIELD COLLECTION KIT

Provide a kit for each sample to be collected. Each kit must contain: a one liter quart can for the base of the coating material; one appropriately sized can for the activator of the coating material; dipping cups for each component to be sampled; a shipping box sized for the samples to be shipped; and packing materials. Mark cans for the appropriate coating material and component (base or activator), including manufacturer's name, address, batch numbers, batch size shipped to the project site, and date of manufacture. Provide shipping documents, including either pre-paid shipping labels or a shipping number that can be used by the QC Manager to arrange pickup, addressed to the INDEPENDENT THIRD-PARTY coating testing laboratory.

2.4 ABRASIVE FIELD COLLECTION KIT

Provide a kit for each sample to be collected. Each kit must contain one suitable plastic bag or container for each sample to be collected. Mark containers with manufacturer's name, address, batch number, batch size, and date of manufacture. Provide shipping documents, including either pre-paid shipping labels or a shipping number that can be used by the QC Manager to arrange pickup, addressed to the approved coating testing laboratory.

2.5 INSPECTION TEST KITS

2.5.1 Test Kit for Measuring Chloride, Sulfate, and Nitrate Ions on Steel and Coated Surfaces

Provide test kits that meet all of the following requirements:

a. Contains all materials, supplies, tools, and instructions for field testing and on-site quantitative evaluation of chloride, sulfate, and nitrate ions;
b. Extract solution is acidic, factory pre-measured, pre-packaged, and of uniform concentration;

c. Components and solutions are mercury free and environmentally friendly;

d. Contains new materials and solutions for each test extraction;

e. Contains an extraction test container (vessel, sleeve, cell) creates a sealed, encapsulated environment during salt ion extraction;

f. Contains a test extract container is suitable for testing the following steel surfaces: horizontal (up/down configuration), vertical, flat, curved, smooth, pitted, and rough;

g. All salt ion concentrations are directly measured in micrograms per square centimeter.

2.5.2 Test Kit for Measuring Chlorides in Abrasives

Provide test kits that meet all of the following requirements:

a. Is a completely self-contained test kit with all materials, supplies, tools, and instructions to take tests and identify results;

b. Uses identifiable, consistent, factory pre-measured test extract solution;

c. Provides for testing equal volumes of abrasive and test solution;

d. Provides for taking direct measurements of the chloride ion in parts per million (PPM), without using conversion charts or tables;

e. Provides all new components for extraction and titration for each test;

f. Provides a factory sealed titration device for each test;

g. Uses the extract sampling container as the titration container.

2.5.3 Test Kit for Identifying Amine Blush on Epoxy Surfaces

Provide test kits that meet all of the following requirements:

a. Is a completely self-contained field test kit with all materials, supplies, tools, and instructions to perform tests and indicate the presence of unreacted amines;

b. Uses an identifiable, consistent, uniform, pre-packaged, factory pre-measured indicating solution;

c. Contains no mercury or lead and is environmentally friendly;

d. Contains a solution of an unreacted amine for the purpose of "self checking" the indicator solution;

2.6 ABRASIVE

Use abrasive that is specifically selected to provide a sharp, angular profile to the specified depth. Abrasive must meet all requirements of
this Section each time that it is placed in the blast pot. A maximum limit for soluble salt contamination (chloride) is specified herein; however, this maximum level of contamination does not guarantee that contamination will not be transferred to the steel surface during abrasive blasting. Other factors, such as on-site handling and recycling, can allow contamination of abrasive that can be transferred to the steel surface. Contractors are cautioned to verify that the chosen abrasive, along with work and storage processes, allow the final surface cleanliness requirements to be achieved. Successful testing of contamination in abrasive does not negate the final acceptance testing of steel surfaces.

**************************************************************************
NOTE: The following paragraph is mandatory for all NAVFAC PAC projects. All other agencies may use it after checking applicability.
**************************************************************************

[Abrasive material used must contain a maximum of one percent by weight of any toxic substance listed in either Table Z-1, Z-2, or Z-3 of 29 CFR 1910-SUBPART Z, with the exception of inert or nuisance dust materials, arsenic, beryllium, cadmium, cobalt, lead, mercury, rhodium, silver, tellurium, thallium, and uranium.]

**************************************************************************
NOTE: Reduce allowable gross gamma radioactivity to 5 picocuries per gram for all NAVFAC PAC projects. Reduce in other areas if states or localities require.
**************************************************************************

(Gross gamma radioactivity must not exceed 5 picocuries per gram.)

2.6.1 Ferrous Metallic Abrasive

2.6.1.1 New and Remanufactured Steel Grit

New and remanufactured steel grit abrasive must conform to the chemical and physical properties of SSPC AB 3 Class 1 (Steel) only; Class 2 (Iron) abrasive must not be used. Modify the requirements of SSPC AB 3 to substitute the requirement in paragraph 4.2.2 CONDUCTIVITY for one chloride test as measured using the test kit described in this Section (paragraph TEST KIT FOR MEASURING CHLORIDES IN ABRASIVES). The maximum allowable chloride content is 25 parts per million (PPM).

To develop a suitable work mix from new steel abrasive, a minimum of 200 to 400 recycles is required; therefore, it may be advantageous for a Contractor to use remanufactured steel grit or grit reclaimed from a previous project. Such grit must be traced to new grit conforming to SSPC AB 3 Class 1 and it meets all cleanliness requirements of SSPC AB 3 Class 1 when brought to the current jobsite. Submit one representative sample of this work mix to the INDEPENDENT THIRD-PARTY laboratory for testing, along with samples of new material. Acceptance and use of this work mix must not be used to justify any deviation from surface preparation requirements.

2.6.1.2 Recycled Steel Grit

Recycled steel grit abrasive media must conform to the chemical and physical properties of SSPC AB 2 except that:
a. The maximum allowable chromium and cadmium content of the work mix must be 0.1 percent by weight when tested in accordance with ASTM D3718 for chromium and ASTM D3335 for cadmium. Modify the requirements of SSPC AB 2 to add requirement for one chromate test and one cadmium test for each "LEAD" test required.

b. The maximum allowable chloride content is 25 parts per million (PPM) as measured with the test kit described in paragraph TEST KIT FOR MEASURING CHLORIDES IN ABRASIVES. Modify the requirements of SSPC AB 2 to substitute requirement for one chloride test for each "WATER SOLUBLE CONTAMINANTS" test.

2.6.2 Non-Metallic Abrasive

Non-metallic abrasive must be graded to the appropriate surface profile range and must conform to the chemical and physical properties of SSPC AB 1, Class A except that:

a. The maximum allowable chromium and cadmium content of the work mix must be less than 0.1 percent by weight when tested in accordance with ASTM D3718 for chromium and ASTM D3335 for cadmium.

b. Must contain less than 7 PPM chlorides when tested with the kit provided in paragraph TEST KIT FOR MEASURING CHLORIDES IN ABRASIVES.

PART 3 EXECUTION

Perform all work, rework, and repair in accordance with approved procedures in the Coatings Work Plan. The Coatings Work Plan must be submitted and approved by the PCS prior to mobilization, in accordance with the paragraph COATINGS WORK PLAN.

[3.1 REMOVAL OF COATINGS CONTAINING HAZARDOUS MATERIALS

**************************************************************************
NOTE: Include Section 02 83 00 LEAD REMEDIATION in any project specification that requires removal or disturbance of coating containing hazardous materials in conjunction with a coating project. Include a contractor qualification requirement similar to the article entitled "Qualifications of Coatings Contractors" in Part 1 of this Section, except that the contractor must be qualified to SSPC QP 2, Category A. Coatings containing hazardous materials can be removed and the new coating applied can be accomplished in a continuous operation if the contractor provides appropriate coordination of removal, cleaning, and coating application. It is specified as two separate operations to allow separate contractors to accomplish different phases of the project. With the use of SSPC QP 1 and QP 2 requirements in contracts, the same contractor will generally be accomplishing both phases of the work, and will probably want to perform both phases as a single operation to avoid preparing the surfaces twice. To accomplish the coating removal and recoating in a continuous operation, the contractor's plan must be scrutinized for
appropriate controls on the removal process, and on
the surface preparation/coating application
process. Delete this paragraph if no paint
containing hazardous material is to be removed.

Coatings containing hazardous materials and identified for disturbance
during surface preparation, including removal, must be handled in
accordance with Section 02 83 00 LEAD REMEDIATION. Coordinate surface
preparation requirements from Section 02 83 00 LEAD REMEDIATION with this
Section.

][3.2 DOOR SHEET ACCESS WAY

NOTE: Tanks must be evaluated during inspection and
design for appropriateness of cutting out a door
sheet. If there is a reason not to allow a door
sheet to be cut into a particular tank, delete this
paragraph and the related paragraph in Part 1.

A door sheet may be cut out of a tank to facilitate personnel and equipment
access. The door sheet must be removed in accordance with API Std 653 and
API Std 650, including all structural, welding, testing, and evaluation
requirements. The door sheet must be installed, tested, and accepted prior
to commencement of surface preparation. The door sheet and surrounding
areas must be surfaced in accordance with Section 4 of NACE SP0178, and
accompanying Visual Comparator, to the condition described and shown for
NACE Weld Surface Preparation Designation "C" welds for interior surfaces
and "D" Welds for exterior surfaces. The Contractor is responsible for
cutting out the door sheet, stabilizing the tank or openings while the door
sheet is out, replacing the door sheet, and testing the replaced door sheet
using qualified engineering and testing services. Perform tank tightness
testing before surface preparation where a door sheet access way was
installed for this project. Hydrostatic testing must be performed prior to
commencement of surface preparation.

]3.3 FIELD SAMPLE COLLECTION AND TESTING

Sample and test materials delivered to the jobsite as required in TEST
REPORTS and subsequent subparagraphs. Notify the Contracting Officer three
days in advance of sampling. The QC Manager, and either the PCS or Quality
Assurance Coatings Inspector, shall witness all sampling.

3.3.1 Coating Field Sample Collection

Coatings that are on the MIL-DTL-24441 QPL require one sample to be
collected. This sample must be collected and set aside for the duration of
the project, and must be tested if unforeseen coatings issues arise or if
testing is requested by the Contracting Officer. Coatings that are not on
the MIL-DTL-24441 QPL require a random field sample from each lot of
coating material used on-site in accordance with ASTM D3925. Each random
sample must be tested.

For sampling, utilize sample collection kits as outlined in the paragraph
COATING FIELD SAMPLE COLLECTION KIT. Each sample must consist of one liter
quart sample of each batch of each base material, and a sample of the
activator that is proportional to the mix ratio of the coating type. Prior
to sampling, mix contents of each sealed container to ensure uniformity. As an alternative to collecting small samples from kits, entire kits may be randomly selected and shipped to the INDEPENDENT THIRD-PARTY laboratory, observing all requirements for witnessing and traceability. For purposes of quality conformance inspection, a lot is defined as that quantity of materials from a single, uniform batch produced and offered for delivery at one time. A batch is defined as that quantity of material processed by the manufacturer at one time and identified by number on the label. Identify samples by designated name, specification number, batch number, project contract number, sample date, intended use, and quantity involved. If testing is required, the QC Manager will take possession of the packaged samples, contact the shipping company to arrange for pickup, and ship one complete sample of each material in question (including base and activator) with all batch information to the INDEPENDENT THIRD-PARTY laboratory for testing as required in paragraph COATING FIELD TESTING REPORTS.

3.3.2 Abrasive Field Sample Collection

Utilize the sample collection kits as required in paragraph ABRASIVE FIELD SAMPLE COLLECTION KIT to obtain samples from each lot of abrasive delivered to site using the sampling techniques and schedule of one sample per every 50 bags for ferrous metallic abrasive, paragraph 4 REQUIREMENTS FOR RECYCLED WORK MIX ABRASIVES of SSPC AB 2 for recycled ferrous metallic abrasives, or paragraph 5.3 SAMPLING FOR QUALITY CONTROL TESTS of SSPC AB 1 for non-metallic abrasives.

For purposes of quality conformance inspection, a lot must consist of all abrasive materials of the same type from a single, uniform batch produced and offered for delivery at one time. The addition of any substance to a batch must constitute a new lot. Identify samples by designated name, specification number, lot number, project contract number, sample date, intended use, and quantity involved. The QC manager will take possession of the packaged samples, contact the shipping company to arrange for pickup, and relinquish the samples only to the shipping representative for shipment to the approved laboratory for testing required in paragraph ABRASIVE FIELD SAMPLE TEST REPORTS.

3.3.3 Coating Field Test Reports

Submit test results for each sample that requires testing in paragraph COATING FIELD SAMPLE COLLECTION. Test samples of primer, intermediate, and topcoat materials for compliance with requirements of MIL-DTL-24441. Reject entire lot represented by samples that fail one or more tests, select new lots, and test samples.

3.3.4 Abrasive Field Test Reports

Submit test results for each lot of abrasive delivered to the jobsite. Test samples of ferrous metallic abrasive to the requirements of paragraph 5.2 TEST PARAMETERS of SSPC AB 3, excluding paragraph 5.2.4 DURABILITY. Test samples of recycled ferrous metallic abrasives to the requirements of paragraph 4 REQUIREMENTS FOR RECYCLED WORK MIX ABRASIVES of SSPC AB 2. Test samples of non-metallic abrasive to the requirements of paragraph 5.3 SAMPLING FOR QUALITY CONTROL TESTS of SSPC AB 1. Reject entire lot represented by samples that fail one or more tests, select new lots, and test samples.
3.4 FUEL REMOVAL AND TANK CLEANING

Remove fuel and clean storage tanks in accordance with Section 33 01 50.55 CLEANING PETROLEUM STORAGE TANKS.

3.5 LIGHTING

Provide lighting for all work areas as prescribed in SSPC Guide 12.

3.6 ENVIRONMENTAL CONDITIONS

3.6.1 Tank Containment

NOTE: Delete this requirement where exterior containment is not required. Containment aids in maintaining environmental conditions by moderating extreme conditions.

Maintain exterior tank containment in full working condition during interior surface preparation, coating application, and initial curing to aid in maintaining interior environmental conditions.

3.6.2 Control System Requirements

Provide and utilize dehumidification and ventilation equipment to control humidity, temperature, and vapor levels in tank from beginning of abrasive blasting through coating application and for four days after the last coating is applied. System must maintain vapor concentrations at or below 10 percent of Lower Explosive Limit (LEL). System may incorporate any combination of solid desiccant and direct expansion refrigeration equipment. No liquid, granular, calcium chloride, or lithium chloride drying systems will be accepted. Use only electric, indirect fired combustion, indirect friction, or steam coil auxiliary heaters. System must be compatible with removal of dust and solvent vapors, and must have fail-safe measures to ensure reliability during operations.

3.6.2.1 Automated Monitoring Requirements

Provide continuous monitoring of dehumidification equipment, temperature, relative humidity, and dew point data at pertinent points on the structure, during surface preparation, coating application, and initial cure. This data does not suffice for documentation of conformity to surface conditions during application and cure of coating. Locate sensors to provide pertinent data for the surface preparation and coat application being performed. Describe the location plan, including required moves, in the Coatings Work Plan. Provide monitoring equipment to perform as follows:

a. Data is collected in the field unit in 15-minute increments and available for download (on-site) in a standard database format. Contractor must collect these data and make available to the Contracting Officer, Quality Assurance Coatings Inspector, and QC Manager;

b. Monitoring equipment must have backup power such that data collection will be uninterrupted during the entire period of the dehumidification requirement;
c. Monitoring equipment must have capability to measure surface temperatures at a minimum of four locations anywhere on a structure, regardless of the size of the structure;

d. Monitoring equipment must have capability to measure interior and exterior dry bulb temperature (DB), relative humidity (RH), and dewpoint temperature (DP);

There is no requirement for connectivity of the monitoring system to control the dehumidification equipment; therefore, any combination of equipment having the required functionality will be accepted.

3.6.2.2 Humidity Control for Surface Preparation and Primer Application

Provide and utilize dehumidification equipment to maintain relative humidity at appropriate level to prevent prepared steel surfaces from corroding at all times during abrasive blasting through primer application. Failure of humidity control system, or failure to maintain proper conditions, during surface preparation stage may allow surface rusting, which will be rejected and require rework. All surfaces to be coated must meet all requirements at time of primer application. Failure of humidity control system during primer application stage will be cause for removal and replacement of all materials applied and cured while conditions were not as prescribed above.

3.6.2.3 Humidity Control for Application of Intermediate and Topcoats and Initial Curing

Provide and utilize dehumidification equipment to maintain relative humidity at the coldest steel surface in tank below 55 percent at all times during coating application, and during the first four days of initial curing after application of topcoat. This measurement is not the same as measuring the relative humidity of ambient air in the tank, and will require either electronic equipment to monitor relative humidity at the steel surface, or complex calculations to convert relative humidity of air in tank to relative humidity at steel surface. An approved alternative method of monitoring dehumidification that requires less sophisticated equipment or calculations is to maintain a minimum dew point depression of 10 degrees C (18 degrees F) below coldest steel surface temperature. This is in lieu of specific relative humidity and dew point requirements in this Section. Failure to maintain specified humidity control during this phase will be cause for extension of humidity controlled cure time to ensure four consecutive days at specified relative humidity at steel surfaces. Formation of condensation in coating application stage prior to the indicated dry-hard time will be cause for removal and replacement of all materials contacted by condensation.

3.7 EQUIPMENT USED IN TANK

Equipment used in the tank after surface preparation begins must not leave any oily residue from exhaust or other sources. Internal combustion driven equipment, other than that powered by natural or bottled gas, must not be used.

3.8 SURFACES TO BE COATED

**************************************************************************
NOTE: See UFC 3-460-01 for new coating systems and UFC 3-460-03 for coating system repairs for guidance
**************************************************************************
on which interior tank surfaces should be coated.

**************************************************************************

NOTE: A "spot repair" is any repair requiring surface preparation to the bare metal surface.

**************************************************************************

Prepare and coat interior tank surfaces, including [BOTTOM], [SHELL], [ROOF] spot repair of [_____] spots of [_____] square meters square feet. Remove interior piping to ensure complete coverage of the bottom and underside of pipe supports. [Do not coat aluminum floating pan.]

3.9 SURFACE PREPARATION

**************************************************************************

NOTE: When editing this specification for maintenance coating work for which SSPC-SP WJ-1/NACE WJ-1, SSPC-SP WJ-2/NACE WJ-2, SSPC-SP WJ-3/NACE WJ-3, or SSPC-SP WJ-4/NACE WJ-4 preparation is to be allowed, include note for the contractor to use potable water, monitor the quality of the water, and adjust water quality to assure appropriate surface preparation and final surface requirements. There are many problems that might arise from both dissolved and suspended material. A common occurrence is water with high chlorides, even in potable water, which may leave unacceptable contamination on cleaned surfaces, and must not be suitable for waterjetting.

**************************************************************************

Prepare steel surfaces in accordance with SSPC PA 1 and as specified herein.

3.9.1 Abrasive Blasting Equipment

Use abrasive blasting equipment of conventional air, force-feed, or pressure type. Maintain a minimum pressure of 650 kPa 95 psig at nozzle. Confirm that air supply for abrasive blasting is free of oil and moisture when tested in accordance with ASTM D4285. Test air quality at each startup, but in no case, less often than every five operating hours.

3.9.2 Operational Evaluation of Abrasive

Test abrasive for salt contamination and oil contamination as required in SSPC AB 1 for non-metallic abrasives, SSPC AB 2 for recycled ferrous abrasives, and SSPC AB 3 for ferrous abrasives. Modify the schedule of testing to be daily, at startup, and every five operating hours thereafter.

3.9.3 Surface Standard

Inspect surfaces to be coated, and select plate with similar properties and surface characteristics for use as a surface standard. Blast clean one or more 300 mm 1 foot square steel panels as specified in paragraph SURFACE PREPARATION. Record blast nozzle type and size, air pressure at nozzle and compressor, distance of nozzle from panel, and angle of blast to establish procedures for blast cleaning. Measure surface profile in accordance with ASTM D4417, Method C. When the surface standard complies with all specified requirements, seal with a clearcoat protectant. Use the surface

SECTION 09 97 13.17 Page 31
standard for comparison to abrasive blasted surfaces throughout the course of work.

3.9.4 Pre-Preparation Testing for Surface Contamination

Perform testing, abrasive blasting, and testing in the prescribed order.

3.9.4.1 Pre-Preparation Testing for Oil and Grease Contamination

**************************************************************************
NOTE: When specifying maintenance painting, use a water based, pH-neutral degreaser to avoid damaging existing coating.
**************************************************************************

a. Inspect all surfaces for oil or grease contamination using two or more of the following inspection techniques: 1) Visual inspection, 2) WATER BREAK TEST, 3) BLACK LIGHT TEST, and 4) CLOTH RUB TEST. Reject oil- or grease-contaminated surfaces, clean [using a water based, pH-neutral degreaser] in accordance with SSPC SP 1, and recheck for contamination until surfaces are free of oil and grease.

b. WATER BREAK TEST - Spray atomized mist of distilled water onto surface and observe for water beading. If water wets surface rather than beading up, surface can be considered free of oil or grease contamination. Beading of water (water forms droplets) is evidence of oil or grease contamination.

c. BLACK LIGHT TEST - Inspect surfaces for oil and grease contamination using the light specified in the paragraph BLACK LIGHT. Use light no more than 381 mm 15 inches from surface unless testing indicates that the specific oil or grease found in tank fluoresces at a greater distance. Use light in tank that is completely sealed from light infiltration, under a hood, or at night. Any fluorescing on steel surfaces is indication of petroleum oil/grease contamination. Use either WATER BREAK TEST or CLOTH RUB TEST to confirm both contaminated and non-contaminated areas detected by BLACK LIGHT TEST. The BLACK LIGHT TEST must not be used during inspection of prepared surfaces for oil and grease contamination unless proven to fluoresce the oil and grease found in the specific tank and documented during testing prior to abrasive blasting. Generally, only petroleum oil/grease will fluoresce; however, some may not fluoresce sufficiently to be recognized and other methods, such as the WATER BREAK TEST or CLOTH RUB TEST, must be used to confirm findings of the BLACK LIGHT TEST.

d. CLOTH RUB TEST - Rub a clean, white, lint-free, cotton cloth onto the surface and observe for discoloration. To confirm oil or grease contamination in lightly stained areas, a non-staining solvent must be used to aid in oil or grease extraction. Any visible discoloration is evidence of oil or grease contamination.

3.9.4.2 Pre-Preparation Testing for Soluble Salts Contamination

**************************************************************************
NOTE: The testing for chlorides, sulfates, and nitrates (CSN) is especially important if there was evidence of corrosion production or if the bare surface has been contaminated prior to surface preparation.
**************************************************************************
Test surfaces for soluble salts, and wash as required, prior to abrasive blasting. This phase is required since pre-preparation testing and washing are generally more advantageous than attempting to remove soluble salt contamination after abrasive blasting. The purpose of soluble salts testing prior to surface preparation is to establish a baseline reading. Test all surfaces at rate of three tests for the first 100 square meters 1000 square feet, plus one test for each additional 200 square meters 2000 square feet, or part thereof.[ Concentrate testing of bare steel at areas of coating failure to bare steel and areas of corrosion pitting.][ Perform 30 percent of tests on bare steel at welds, divided equally between horizontal and vertical welds.] One or more readings greater than non-detectable for chlorides, sulfates, or nitrates is evidence of soluble salt contamination. Reject contaminated surfaces, wash as described below, allow to dry, and re-test until all required tests show allowable results. Re-blast tested areas using vacuum equipped blast equipment. Label all test tubes and retain for test verification. Soluble salts testing is also required in paragraph PRE-APPLICATION TESTING FOR SOLUBLE SALTS CONTAMINATION as a final acceptance test of prepared surfaces after abrasive blasting, and successful completion of this phase does not negate that requirement. Effective removal of soluble salts will require removal of any barrier to the steel surface, including rust. This procedure may necessitate combinations of wet abrasive blasting, high pressure water rinsing, and cleaning using a solution of water and soluble salts remover. The soluble salts remover shall be acidic, biodegradable, non-toxic, non-corrosive, and after application, will not interfere with primer adhesion. Delays between testing and preparation, or testing and coating application, may allow for the formation of new contamination. Use potable water, or potable water modified with soluble salt remover, for all washing or wet abrasive blasting. Test methods and equipment used in this phase are as stated in the Coatings Work Plan.

3.9.5 Abrasive Blasting

NOTE: The issue of maximum profile on new structures is an important one. Once a profile is established, it is nearly impossible to reduce it; therefore, the initial profile will dictate the profile for the life of the structure.

The specified 2-4 mil surface profile is the preferred depth for preparing for the primer. On steel that was previously prepared to a deeper depth and coated, a depth of 4 mils can be tolerated with an additional mil of primer thickness.

It is the responsibility of the coatings Contractor to achieve the profile required by properly selecting the appropriate abrasive size. Harder, smaller abrasives can result in lower (shallower) profile depth.

If higher (deeper) pre-existing profile height is anticipated or encountered, both the PCS and the coating manufacturer must provide approval in writing to coat the higher surface profile. The government will not be responsible for the cost of
additional coating materials for higher than specified surface profiles. Procedures for coating higher pre-existing surface profiles and gathering specific approvals must be included in the Coatings Work Plan.

Abrasive blast steel surfaces to near-white metal in accordance with SSPC SP 10/NACE No. 2. Prepared surfaces shall conform to SSPC VIS 1 and shall match the prepared test-panels as specified in paragraph SURFACE STANDARD. Provide a 50 to 100 micron 2 to 4 mil surface profile. Reject profile greater than 100 microns 4 mils, discontinue abrasive blasting, and modify processes and materials to provide the specified profile. Measure surface profile in accordance with ASTM D4417, Method A and Method C. The appearance of the surface after blasting must have the appearance of a Sand or Grit comparator. A rounded profile shape or peened surface is not acceptable. Record all measurements required in this standard. Measure profile at rate of three test areas for the first 100 square meters 1000 square feet plus one test area for each additional 100 square meters 1000 square feet or part thereof. When surfaces are re-blasted for any reason, retest profile as specified. Following abrasive blasting, remove dust and debris by vacuum cleaning. Dust and debris tend to collect at welds, plate overlaps, and surface irregularities. Do not attempt to wipe surface clean.

On previously coated and prepared surfaces, determine and establish the average existing surface profile. If the pre-existing surface profile is greater than 100 microns 4 mils, or than what is allowable by the coating system instructions, the contractor must acquire written approval by the manufacturer to utilize a higher anchor profile. The manufacturer's supporting letter must state that the additional profile will not degrade coating performance in any way and will be warranted the same. Abrasive blast the steel surfaces to near-white metal in accordance with SSPC SP 10/NACE No. 2 using abrasive and technique which does not increase the existing profile. Provide a surface profile of at least 100 microns 4 mils but no additional profile than that existing. Reject profile greater than existing, discontinue abrasive blasting, and modify processes and materials to provide the specified agreed existing profile. Prepared surfaces must conform to SSPC VIS 1 and must match the prepared test-panels as specified in paragraph SURFACE STANDARD. Measure surface profile in accordance with ASTM D4417, Method A and Method C. The appearance of the surface after blasting must have the appearance of a Sand or Grit comparator. A rounded profile shape or peened surface is not acceptable. Record all measurements required in this standard. Measure profile at rate of three test areas for the first 100 square meters 1000 square feet plus one test area for each additional 100 square meters 1000 square feet or part thereof. Provide two additional measurements for each non-compliant measurement. When surfaces are re-blasted for any reason, retest profile as specified. Following abrasive blasting, remove dust and debris by vacuum cleaning. Dust and debris tend to collect at welds, plate overlaps, and surface irregularities. Do not attempt to wipe surface clean. On previously coated and prepared surfaces, profiles higher than 100 microns 4 mils should be anticipated and these procedures must be included in the Coatings Work Plan.

For maintenance coating the use of SSPC-SP WJ-1/NACE WJ-1, SSPC-SP WJ-2/NACE WJ-2, SSPC-SP WJ-3/NACE WJ-3, or SSPC-SP WJ-4/NACE WJ-4 preparation is acceptable. Potable water must be used. The quality of the water must be monitored. The water quality must be adjusted to assure appropriate surface preparation and final surface requirements. Water must
not contain dissolved or suspended material. High chlorides, even in potable water, can leave unacceptable contamination on cleaned surfaces, and must not be suitable for waterjetting.

3.9.6 Disposal of Used Abrasive

Dispose of used abrasive off Government property in accordance with Federal, State, and Local mandated regulations.

3.9.7 Pre-Application Testing for Surface Contamination

3.9.7.1 Pre-Application Testing for Oil and Grease Contamination

Ensure tank surfaces are free of contamination as described in paragraph PRE-PREPAREATION TESTING FOR OIL AND GREASE CONTAMINATION.

3.9.7.2 Pre-Application Testing for Soluble Salts Contamination

**************************************************************************
NOTE: In new tanks, require 30 percent of tests to be accomplished at welds. In tanks that have been in service, corroded areas must be tested for high chlorides.
**************************************************************************

**************************************************************************
NOTE: The testing for chlorides, sulfates, and nitrates (CSN) is especially important if there was evidence of corrosion production or if the bare surface has been contaminated prior to surface preparation.
**************************************************************************

Test surfaces for soluble salts contamination using the test kit described in paragraph TEST KIT FOR MEASURING CHLORIDE, SULFATE, AND NITRATE IONS ON STEEL AND COATED SURFACES. Test all surfaces at rate of three tests for the first 100 square meters 1000 square feet; plus one test for each additional 200 square meters 2000 square feet; or part thereof.[Concentrate testing of bare steel where areas of coating failure to bare steel and areas of corrosion pitting were located.][Perform 30 percent of tests on bare steel at welds, divided equally between horizontal and vertical welds.] Label all test tubes and retain for test verification. One or more readings greater than non-detectable for chlorides, sulfates, or nitrates is evidence of soluble salt contamination. Reject contaminated surfaces, wash as required in paragraph PRE-PREPAREATION TESTING FOR SOLUBLE SALTS CONTAMINATION, allow to dry, and re-test until all required tests show acceptable results. Re-blast tested areas using vacuum equipped blast equipment. An atmospheric event, such as a coastal storm blowing onshore, can bring chloride contamination. Following an atmospheric event, spot testing must be accomplished to verify satisfactory conditions and to avoid intercoat contamination. Where visual examination or spot testing indicates contamination, perform sufficient testing to verify non-contamination, or to define extent of contamination for appropriate treatment.

3.9.7.3 Pre-Application Testing for Surface Cleanliness

Apply coatings to dust free surfaces. To test surfaces, use ISO 8502-3. Use a kit that is compliant with ISO 8502-3. If the test does not result
in a rating of 2 or better, then reject contaminated surfaces, clean by vacuum cleaning, and retest. Test surfaces at rate of three tests for the first 100 square meters 1000 square feet, plus one test for each additional 100 square meters 1000 square feet, or part thereof. Provide two additional tests for each failed test or questionable test. Document test results in the Daily Inspection Report and attach tape to the Daily Inspection Log.

Ferrous abrasives may become magnetized and difficult to remove from the steel substrate. If ferrous abrasives are used, additional visual inspection must be performed to ensure no surface contamination by the abrasive is present.

3.10 MIXING AND APPLICATION OF COATING SYSTEM AND SEALANT

3.10.1 Preparation of Sealant and Coating Materials for Application

Each of the different products, primer, intermediate, topcoat, and sealant, is a two-component material supplied in separate containers.

3.10.1.1 Mixing

Mix in accordance with coating system instructions, which may differ for each product. Do not mix partial kits unless standardized measuring cups are utilized. Do not alter mix ratios. All mixing processes must be witnessed by the Quality Assurance Coatings Inspector. Mix materials in same temperature and humidity conditions specified in paragraph DELIVERY AND STORAGE. Allow mixed material to stand for the required induction time based on its temperature.

3.10.1.2 Pot Life

Apply mixed products within stated pot life for each product. Stop applying when material becomes difficult to apply in a smooth, uniform wet film. Do not add solvent to extend pot life. All required solvent at time of mixing. Pot life is based on standard conditions at 21 degrees C 70 degrees F and 50 percent relative humidity. For every 10 degrees C 18 degrees F rise in temperature, pot life is reduced by approximately half, and for every 10 degrees C 18 degrees F drop, it is approximately doubled. Usable pot life depends on the temperature of the material at the time of mixing and the sustained temperature at the time of application. Other factors such as the shape of the container and volume of mixed material may also affect pot life. In hot climates, pre-cooling or exterior icing of components for at least 24 hours to a minimum of 10 degrees C 50 degrees F will extend pot life. The approximate pot life time for the epoxy primer and intermediate coat materials is four hours. The approximate pot life time for the sealant materials is as specified by the manufacturer.

3.10.1.3 Application Conditions and Recoat Windows

**************************************************************************
NOTE: These requirements are provided in an attempt to prevent the significant number of intercoat delamination failures that are frequently found on industrial structures. The very strict requirements on application conditions and recoat windows may require work during abnormal hours, including weekends. Contractor work hours must allow for such during coating application.

SECTION 09 97 13.17 Page 36
NOTE: Cold-weather application is not covered by this specification. If a project is designed for coating in cold weather, then the enclosure and heating requirements may be significant. It is not intended that contractors be forced to apply coatings in cold weather; however, the underlying premise is that coatings must be applied within the specified temperature ranges. A cold-weather specification must not be used to simply save money, as the coating system will generally not have the same longevity as one applied within 60-100 degrees F.

The application condition requirements for the coating system are very time and temperature sensitive, and are intended to avoid the delamination problems frequently found on industrial structures.

a. Plan coating application to ensure that specified temperature, humidity, and condensation conditions are met. If conditions do not allow for orderly application of primer, STRIPE COAT, intermediate coat, topcoat, and sealant, use appropriate means of controlling air and surface temperatures, as required. Partial or total enclosures, insulation, heating or cooling, or other appropriate measures may be required to control conditions to allow for orderly application of all required coats.

b. Maintain air and steel surface temperature within the range allowable by the manufacturer's PDS during application and the first four hours of cure for each epoxy coat. Maintain steel surface temperature more than 3 degrees C 5 degrees F above the dew-point of the ambient air for the same period. These conditions may require environmental controls through containment.

c. If coating is not applied during recoat window specified by the coating manufacturer, or if surface temperature exceeds the temperature recommended in the manufacturer's PDS between applications, provide GLOSS REMOVAL. If next planned coat is topcoat, apply FILL COAT if required to fill sanding marks. Sanding marks from GLOSS REMOVAL of intermediate coat reflecting through topcoat will be considered as non-compliant. Apply FILL COAT within 24 hours of GLOSS REMOVAL, then apply topcoat within RECOAT WINDOW of FILL COAT. The topcoat must be free of defects and be of uniform appearance in accordance with SSPC PA 1. Lack of hiding by the finish coat must require additional applications to obtain uniform appearance.

d. FILL COAT - Where indicated, apply coat of intermediate coat epoxy, at 50 to 75 microns 2 to 3 mils DFT, then apply next specified full coat within recoat window of FILL COAT. A FILL COAT may be used to adjust coating thickness to comply with requirements or to fill sanding marks in intermediate coat.

e. GLOSS REMOVAL - Where required, hand sand in a circular fashion to remove gloss using 120-200 grit wet/dry sandpaper, followed by solvent wiping with a clean rag soaked with denatured alcohol to remove all dust. GLOSS REMOVAL of primer or intermediate coats is to scarify
surface. If steel is exposed during GLOSS REMOVAL, repair in accordance with PROCEDURE FOR HOLIDAY AND SPOT REPAIRS OF NEWLY APPLIED COATING. GLOSS REMOVAL of the topcoat may include removal of up to 75 microns 3 mils of coating to avoid excess thickness, prior to application of FILL COAT.

3.10.2 Amine Blush Testing of Epoxy Coat Prior to Overcoating

Test epoxy surfaces prior to application of each epoxy coat or sealant for amine blush contamination using the test kit described in paragraph TEST KIT FOR IDENTIFYING AMINE BLUSH ON EPOXY SURFACES. Test all surfaces at rate of three tests for the first 100 square meters 1000 square feet, plus one test for each additional 200 square meters 2000 square feet, or part thereof. If one or more tests show positive results for amine blush contamination, either treat all surfaces using the approved amine blush removal procedure or increase testing to ensure that all contamination is located, and then treat identified contamination using the approved procedure.

3.10.3 Application of Coating System and Joint Sealant

Apply coatings in accordance with SSPC PA 1, SSPC PA Guide 11 and as specified herein. Apply coatings and sealant to surfaces that meet all stated surface preparation requirements.

a. Apply each coat in a consistent wet film, at 90 degrees to previous coat. Ensure that primer and intermediate overlaps are no less than 150 mm 6 inches from welds. Apply STRIPE COAT by brush, working the material into corners, crevices, pitted areas, and welds, and onto outside corners and angles. For convenience, STRIPE COAT material may be delivered by spray if followed immediately with brush-out and approved procedures include appropriate controls on thickness. Apply all other coats by spray application. Use appropriate controls to prevent airborne coating fog from drifting beyond [3] [15] meters [1000] feet from the tank perimeter [the tank berm]. The cleanliness, temperature, recoat windows, and airborne paint containment requirements may necessitate the use of portable shelters or other appropriate controls.

b. After application of primer coat, and prior to application of each subsequent coat, perform testing prescribed in paragraph PRE-APPLICATION TESTING FOR SURFACE CONTAMINATION to ensure minimal intercoat contamination. If contamination is detected, wash per SSPC SP 1 and re-inspect. This testing may be reduced to one half of the prescribed rate for bare steel if the testing indicates no contamination when sampling is evenly distributed over surfaces being tested. If contamination is found between coats, revert to the specified testing rate. Generally, oil and grease contamination and soluble salts contamination are not encountered if subsequent coats are applied within specified recoat windows and the quality of air entering tank is controlled. Spot testing must be accomplished to verify satisfactory conditions and to avoid intercoat contamination. Where visual examination or spot testing indicates contamination, perform sufficient testing to verify non-contamination or to define extent of contamination for appropriate treatment.

**************************************************************************

NOTE: Maximum thickness measurements are to limit internal stresses in each coat and in total system.

SECTION 09 97 13.17 Page 38
Internal stresses of epoxy coatings on steel can be significant, and unless limited through thickness, can cause premature failure as the coating ages. Such failures as shrinkage cracking and delamination, either from the substrate or between coats, are common. This system is not expected to receive a maintenance overcoat.

Apply coatings at the following specified thickness and in the following order:

<table>
<thead>
<tr>
<th>Coat</th>
<th>Minimum DFT (Microns)</th>
<th>Maximum DFT (Microns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primer</td>
<td>75</td>
<td>125</td>
</tr>
<tr>
<td>Intermediate</td>
<td>75</td>
<td>125</td>
</tr>
<tr>
<td>Top</td>
<td>75</td>
<td>125</td>
</tr>
<tr>
<td>Total system</td>
<td>225</td>
<td>375</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Coat</th>
<th>Minimum DFT (Mils)</th>
<th>Maximum DFT (Mils)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primer</td>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>Intermediate</td>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>Top</td>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>Total system</td>
<td>9</td>
<td>15</td>
</tr>
</tbody>
</table>

Measure coating thickness in accordance with SSPC PA 2 to confirm that coating application is within the specified range and within the tolerances of that standard. For non-compliant areas, increase number of test areas to identify all non-compliant application as required by SSPC PA 2. Add coating as required to correct low DFT areas, and remove coating with excess thickness to bare steel and reapply as specified in PROCEDURE FOR HOLIDAY AND SPOT REPAIRS OF NEWLY APPLIED COATING.

3.10.3.1 Application of STRIPE COAT

Apply STRIPE COAT of epoxy primer material prior to application of general primer coat on ROOF and SHELL. Apply STRIPE COAT of epoxy intermediate coat material after application of general primer coat on BOTTOM. A STRIPE COAT must be applied to areas where joint sealant will be applied. This application must be consistent with APPLICATION OF COATING SYSTEM AND JOINT SEALANT. The STRIPE COAT must be in a contrasting color to the to preceding and subsequent coats and extend a width of no less than 38 mm 1.5 inches on each side of the feature being protected.

3.10.3.2 Application of Primer

Apply primer coat within recoat window of STRIPE COAT.
3.10.3.3 Application of Intermediate Coat

Apply intermediate coat within recoat window of primer coat.

3.10.3.4 Application of Topcoat

Make all required repairs to primer and intermediate coats as specified in PROCEDURE FOR HOLIDAY AND SPOT REPAIRS OF NEWLY APPLIED COATING prior to applying topcoat. Apply topcoat within recoat window of intermediate coat. Consult manufacturer for application procedures for anticipated temperature and humidity conditions. Touch-up blemishes and defects within recoat window of epoxy topcoat.

3.10.3.5 Application of Joint Sealant

After a full coating system has been installed, holiday tested, and repaired as necessary, apply sealant to the roof-to-shell joint, to all roof plate lap joints, and to roof-to-rafter joints up to 25 mm 1 inch gap to exclude moisture from these marginally prepared crevice areas.

3.10.4 Holiday Testing

When the coating is dry to handle, but before the joint sealant is applied, perform holiday testing in accordance with the low voltage wet sponge method of NACE SP0188. Dry to handle is defined as curing to the degree that the surface will not be marred or damaged by normal foot traffic. Repair holidays per PROCEDURE FOR HOLIDAY AND SPOT REPAIRS OF NEWLY APPLIED COATING.

3.10.5 Tank Occupancy After Coating Application

Verify the coating has reached a cured state that will allow foot traffic. Use clean canvas, or other approved, shoe covers when walking on coated surfaces, regardless of curing time allowed. Provide cushioned mats for all traffic areas.

3.10.6 Procedure for Holiday and Spot Repairs of Newly Applied Coating

Repair coating film defects at the earliest practicable time, and before application of the succeeding coat. Any holiday found must have a STRIPE COAT applied in the area prior to application of the finish coat. Observe all requirements for soluble salts contamination, cleanliness between coats, and application conditions. Prepare defective area in accordance with SSPC SP 10/NACE No. 2, and feather coating as required to leave 100 mm 4 inches of each succeeding coat feathered and abraded. If spot repair locations are less than 0.5 percent of the surface area and no greater than 150 mm 6 inches in diameter, prepare surface to SSPC SP 10/NACE No. 2 vacuum blasting or SSPC SP 11 using an impact tool to create an acceptable profile. Do not abrade the epoxy topcoat. Protect adjacent areas from damage and overspray. Remove dust and solvent wipe the prepared area plus an additional 100 mm 4 inches beyond the prepared area with clean denatured alcohol. Apply each coat within recoat window of preceding coat. Within four hours of preparation, apply primer to prepared steel and feather onto prepared primer. Apply intermediate coat to primed area and feather to prepared intermediate area. Apply topcoat to intermediate coat and feather to prepared topcoat. Apply each repair coat to approximate thickness of surrounding coating system. If one percent or more of the total surface area, or more than one spot per 200 square meters 2000 square feet, of the
BOTTOM area requires repair to any coat or coats, including feathered areas, the entire BOTTOM coating system must be removed and reapplied. The limit on BOTTOM repairs includes repairs made before and after floating pan installation. If 5 percent or more of the total surface area, or more than one spot per 100 square meters 1000 square feet, of the ROOF area requires repair to any coat or coats, including feathered areas, the entire ROOF coating system must be removed and reapplied. Repairs on the SHELL are not limited.

3.10.7 Extended Cure of Coating System Prior to Immersion Service

Allow a cure time of at least 14 days after the final coating material has been applied before introducing water or fuel into tank. [Allow a cure time of 12 days after the final coating material has been applied before beginning installation of the floating pan.]

3.11 PROJECT IDENTIFICATION

At the completion of the tank work, stencil the following information on the exterior of the tank adjacent to the main manway opening in 3/4- to one-inch Helvetica style letters of contrasting color using acrylic stencil paint:

Date Interior coated:
Project Number:
Contractor:
Address:
Coating System
Surface Prep: SSPC SP ____ Profile: _____
Primer: ______________ Thickness: ___
Intermediate: ________ Thickness: ___
Topcoat: _____________ Thickness: ___
Total Thickness: ______

3.12 FIELD QUALITY CONTROL

Project documentation, including inspection and testing records, must be used to determine the Contractor's compliance with contract requirements and approved procedures. The Contractor's certifications of completion, for both invoices and for project completion, shall be based on documented evidence of compliance with all requirements and approved Coatings Work Plan procedures. Track inspections and tests in the Test Plan & Log.

3.12.1 Field Inspection

3.12.1.1 Inspection and Documentation Requirements

a. Perform field inspection in accordance with ASTM D3276 and the approved Coatings Work Plan.

b. Provide all tools and instruments required to perform the required testing, as well as any tools or instruments that the inspector considers necessary to perform the required inspections and tests. Document each inspection and test, including required hold points and other required inspections and tests, as well as those inspections and tests deemed prudent from on-site evaluation to document a particular process or condition, as follows:

(1) Location or area;
(2) Purpose (required or special);

(3) Method;

(4) Criteria for evaluation;

(5) Results;

(6) Determination of compliance;

(7) List of required rework;

(8) Observations.

c. Collect and record environmental conditions as described in ASTM D3276 on a 24 hour basis, as follows:

(1) During surface preparation, every hour, or when changes occur;

(2) During coating application and the first four days of initial cure, every hour, or when changes occur;

(3) Note location, time, and temperature of the highest and lowest surface temperatures each day;

(4) Use a non-contact thermometer to locate temperature extremes, then verify with contact thermometers.

d. Data collected on environmental conditions in AUTOMATED MONITORING REQUIREMENTS may be used for overnight data; however, the data must be constantly verified as to location of sensors and validity of data with respect to the coating work being accomplished.

e. Document all equipment used in inspections and testing, including manufacturer, model number, serial number, last calibration date and future calibration date, and results of on-site calibration performed. Work documented using data from equipment found to be out of calibration must be considered as non-compliant since last calibration or calibration check, as required.

3.12.1.2 Inspection Report Form

Develop project-specific report forms, as required, to report measurement and test results and observations being complete and compliant with contract requirements. This includes all direct requirements of the contract documents and indirect requirements of referenced documents. Show acceptance criteria with each requirement and indication of compliance of each inspected item. Annotation of non-compliance must be conspicuous so as to facilitate identification and transfer to the Rework Log. Report forms must include requirements and acceptance and rejection criteria, and must be legible and presented so that entered data can be quickly compared to the appropriate requirement. The data may be in any format, but must be legible and presented so that entered data can be quickly compared to the appropriate requirement.
3.12.1.3 Daily Inspection Reports

Submit one copy of daily inspection report completed each day when performing work under this Section, to the Contracting Officer. Note all non-compliance issues, and all issues that were reported for rework, in accordance with QC procedures of Section 01 45 00 QUALITY CONTROL. Each report must be signed by the Quality Assurance Coatings Inspector and the QC Manager. Submit report within 24 hours of date recorded on the report.

3.12.1.4 Inspection Logbook

A continuous record of all activity related to this Section must use an electronic reporting program as outlined in Table I and be maintained on a daily basis. The computer / software package must be used to record all information provided in the Daily Inspection Reports, as well as other pertinent observations and information including photo documentation where appropriate.

In areas where photography is not allowed, the computer must come with verification that the camera / photo capability has been removed. Alternatively, a continuous record of all activity related to this Section must be maintained in an Inspection Logbook on a daily basis. The logbook must be hard or spiral-bound book or digital program with consecutively numbered pages, and must be used to record all information provided in the Daily Inspection Reports, as well as other pertinent observations and information. Submit the original Inspection Logbook to the Contracting Officer upon completion of the project and prior to final payment.

3.12.1.5 Inspection Equipment

All equipment must be in good condition, operational within its design range, and calibrated as required by the specified standard for use of each device.

3.12.1.5.1 Black Light

Use a black light having a 365-nanometer intensity of 4,000 microwatts per square centimeter minimum at 380 mm 15 inches.

3.12.2 Coatings Contractor QC Coatings Inspector's Field Responsibilities

The Coatings Contractor QC Coatings Inspector responsibilities include complete documentation of all daily inspection and production activities for the entire coatings project as outlined in the Coatings Work Plan, scope of work (SOW) project program, and this Section. This includes, but is not limited to, the following:

a. Attending and documenting the pre-job meeting and acquiring the scope of work (SOW) project program, inspection and testing plan (ITP), schedule, and a list of who will receive the QC daily inspection reports;

b. Performing a project site walk-through with the Quality Assurance Evaluator (QAE) or asset owner, Coatings Contractor QC, QC Manager, and Quality Assurance Coatings Inspector, inspecting at least the following:

(1) Asset(s) to be coated;

(2) Equipment and placement of equipment;
(3) Materials delivery and storage;

(4) Facility operational requirements during the project.

c. Perform all daily and hold point inspections including, but not limited to, the following:

(1) Check equipment, including blotter test to verify compressed air cleanliness;

(2) Perform non-visible contaminants testing (in accordance with PRE-PREPARATION TESTING FOR SOLUBLE SALT CONTAMINATION and PRE-APPLICATION TESTING FOR SOLUBLE SALT CONTAMINATION);

(3) Perform visible contaminants testing (in accordance with PRE-PREPARATION TESTING FOR OIL AND GREASE CONTAMINATION and PRE-APPLICATION TESTING FOR OIL AND GREASE CONTAMINATION);

(4) Obtain environmental readings;

(5) Perform abrasive field testing per SSPC AB 1, SSPC AB 2, or SSPC AB 3;

(6) Perform surface preparation monitoring and testing;

(7) Perform surface cleanliness testing;

(8) Perform dust quantity testing;

(9) Record materials storage documentation (record all coating and abrasive materials information, batch numbers, segregation, and storage temperature);

(10) Witness all coatings materials mixing and record mix materials temperatures, with verification of time of coatings pot life;

(11) Verify, witness, and record application method;

(12) Perform random wet film thickness (WFT) readings;

(13) Perform inspection of coatings application;

(14) Obtain dry film thickness (DFT) readings per SSPC PA 2;

(15) Perform holiday testing in accordance with HOLIDAY TESTING;

(16) Observe label asset identification (label stickers);

(17) Write Correction Action Reports (CAR), if needed;

(18) Write Non-Conformance Reports (NCR), if needed.

d. Writing a daily detailed summary of the work shift inspections, testing, and the day's events, including any meetings and prevalent conversations. The final daily report must include a project summary that must be part of the last daily coatings inspection report.

e. The Coatings Contractor QC Coatings Inspector must stop all
3.12.3 Quality Assurance Coatings Inspector's Field Responsibilities

The Quality Assurance Coatings Inspector's field responsibilities include complete documentation of all on-site work associated with the coatings project. These responsibilities include, but are not limited to, the following:

a. Attending and documenting the pre-job meeting and acquiring the scope of work (SOW) project program, ITP, schedule, and a list of who will receive the QC daily inspection reports;

b. Performing a project site walk-through with the QAE or asset owner, prime Contractor, and coatings Contractor (QC Coatings Inspector and QC Manager), inspecting at least the following:

   (1) Asset(s) to be coated;
   (2) Equipment and placement of equipment;
   (3) Materials delivery and storage;
   (4) Facility operational requirements during the project.

c. Verifying all daily and hold point inspections performed by the Coatings Contractor QC Coatings Inspector or QC Manager by performing mirror inspections including, but not limited to, the following:

   (1) Verify equipment check, including blotter test to verify compressed air cleanliness;
   (2) Verify visible contaminants testing;
   (3) Take environmental readings;
   (4) Perform surface preparation monitoring and testing;
   (5) Perform surface cleanliness testing;
   (6) Perform dust quantity test;
   (7) Record materials storage documentation (record all coating and abrasive materials information, batch numbers, segregation, and storage temperature);
   (8) Witness all coatings materials mixing and record mix materials temperatures, with verification of time of coatings pot life;
   (9) Verify, witness, and record application method;
   (10) Inspect coatings application;
   (11) Perform dry film thickness (DFT) readings per SSPC PA 2;
   (12) Inspect asset identification (label stickers);
   (13) Write Correction Action Reports (CAR), if needed;
(14) Write Non-Conformance Reports (NCR), if needed.

d. The following testing is witnessed by the Quality Assurance Coatings Inspector and performed by the Coatings Contractor QC Coatings Inspector or QC Manager:

(1) Wet film thickness (WFT) readings by coatings applicator(s);

(2) Non-visible contaminants testing for chlorides, sulfates, and nitrates (CSN);

(3) Abrasive field testing per SSPC AB 1, SSPC AB 2, or SSPC AB 3;

(4) Holiday testing.

e. Writing a daily detailed summary of the work shift inspections, testing, and the day's events, including any meetings and prevalent conversations. The final daily report must include a project summary that will be part of the last daily coatings inspection report.

3.13 FINAL CLEANUP

Following completion of the work, remove debris, equipment, and materials from the site. Remove all foreign matter such as blast media, dust, dirt, debris, grease, and oils. Wipe all dry to handle coated surfaces with damp lint-free cloth. Remove temporary connections to Government- or Contractor- furnished water and electrical services. Restore existing facilities in and around the work areas to their original condition.
Table I
QA/QC Reporting Program Requirements

Administrative Controls:

Administrators must be able to turn on and off unique access to specific jobs and contracts.

Administrators must be able to remotely enable and disable access for users.

Administrators must be able to associate contract specific documents and specification limits quickly and easily.

Administrators must be able to associate PDS, SDS, blueprints, scope of work, and contracts uniquely to each job.

Objectivity Controls:

Data entry fields must be by multi-selectable choices, numeric keypads, pickers and skip logic to ensure repeatable data entry in a way that makes running analytics and metrics easy and objective.

Retrievable storage must be provided for all job-related reports and documents for a minimum time of five years from completion of the job or project. Archiving of the documents after five years will be the responsibility of the Government.

Document Library:

All reports must be in searchable and annotatable Portable Document Format (PDF).

Annotations and modifications must be locked and associated with the document. Only the Administrator has rights to modify or delete annotations or allow modifications to the document library especially all related inspection reports.

Customization:

The program must be capable of being customized to specific jobs, contracts or specifications.

daily inspection checklist

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for coating of new, and repairs to existing, steel towers.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Due to the complexity of coating design for maintenance coating, this document is more of a compendium of "potential" requirements rather than a guide specification, and it should be edited for use only by personnel that are competent in coating design. For maintenance coating design, there is significant information that must be collected, tested, and evaluated to provide a satisfactory design. The scope of this information, particularly a coating condition survey (CCS), is discussed herein. Work covered by this specification includes replacement of structural members, coating/recoating of tower structure and minor electrical work.

SECTION 09 97 13.25
MAINTENANCE, REPAIR, AND COATING OF TALL ANTENNA TOWERS
05/11, CHG 1: 08/17
NOTE: New towers should be coated using one of the following systems in priority order:

First choice
Primer - Hot dip galvanizing
Intermediate - MIL-DTL-24441/29
Topcoat - MIL-PRF-85285 Type II

Second choice
Surface Preparation - SSPC SP-5
Primer - Spray metalizing (shop applied)
Sealer - MIL-DTL-24441/29 (thinned 50 percent)
Intermediate - MIL-DTL-24441/29
Topcoat - MIL-PRF-85285 Type II

Third choice
Surface Preparation - SSPC SP 5
Primer - DOD-PRF-24648 Type II, Class 1, Comp B
Inorganic zinc (shop applied)
Intermediate - MIL-DTL-24441/29
Topcoat - MIL-PRF-85285 Type II

New towers should be shop-coated in a shop that has SSPC QP 3 Certification, shipped to site, erected, and touched-up.

**************************************************************************
NOTE: The fact that most high antenna towers were either galvanized or treated with a high-performance zinc primer requires considerable attention to the design to ensure that only the required work is scoped, and that the specified work does not damage sound zinc (galvanizing or other zinc primers) surfaces. While the coatings continue to age and degrade, the galvanized surfaces are generally found to be in good condition. A properly executed coating condition survey (CCS) will provide details of the condition of the entire coating system.
**************************************************************************

NOTE: For purposes of this specification, the term "maintenance coating" refers to maintenance overcoating as opposed to complete removal of coatings and recoating. For maintenance coating designs, or to determine if maintenance overcoating is appropriate, a coating condition survey (CCS) should be accomplished. The CCS should be accomplished by personnel from a business that routinely performs coating evaluations, and the individual investigator should be Certified by SSPC as a Protective Coatings Specialist. The CCS should be sufficiently detailed to provide all technical information about the coatings, and structures to be coated, required to properly design the project. At a minimum, the CCS should provide a detailed report of:
1. Existing coating conditions, including condition of coating film, and the existence of potentially hazardous substances that may impact coating management (i.e. lead, cadmium, chromium);

2. Analysis of remaining coating life, suitability of overcoating, and technical requirements for overcoating;

3. Technical recommendations for the most cost effective management of existing coating systems, including any hazardous materials present in paint film; and

4. Any other information of interest to the coating system management that should be identifiable by an individual trained and experienced in the field of coating analysis, coating failure analysis, and coating design.

The scope of the CCS should be tailored to the specific project, and it should be recognized that while multiple coating failures or deficiencies may look similar to the untrained eye, the risks of generalizing to save evaluation costs are potentially very high. The cost of large-scale failure of the overcoating, and complete replacement of the coating system, is far more than the cost of a CCS for all but the smallest projects.

The risks of overcoating can usually be avoided by designing project to remove all existing coatings to bare metal, then providing appropriate surface preparation and coating application. However, the extra costs of the coating removal, especially if containing hazardous material, along with the cost of surface preparation to SSPC SP 10 Abrasive Blast to Near-White Metal, may be exorbitant compared to the costs of maintenance overcoating where the existing coating system is in fair-to-good condition.

Additionally, NAVFAC Design Policy Letter DPL-09B-0001, Lead-containing Paint on Non-residential Structures of 26 Mar 92 provides guidance for managing paints containing lead and other hazardous materials in place. The fact that lead was highly used as a primer is indicative of its value to the corrosion control industry. Premature removal of sound lead primer is not considered to be a good management practice.

Activities should consider an annual CCS to survey all structures to be authorized for design in the coming year. When accomplished for multiple projects, the per-structure cost will decrease. By accomplishing this survey prior to design, the basis for design is fully identified.

The CCS can also be a very useful tool when used to
screen structures for maintenance painting requirements. A CCS can be scoped to provide a general inspection of many structures to screen for near-term overcoating or recoating requirements, and subsequent investigation can be made to provide appropriate details for project planning and design.

It should be pointed out that the aesthetic features of a coating do not define the coating condition; they only describe how the coating looks. Many coating systems have been replaced when only the topcoat is in need of "refurbishment." Likewise, many structures such as water tanks and fuel tanks have had complete coating replacement when only the roof coating needed replacement. A CCS can identify the weak components as well as the satisfactory components, and propose solutions to make maximum use of existing resources.

The Society for Protective Coatings (formerly Steel Structures Painting Council) (SSPC), has published a Technology Update titled SSPC TU 3 Maintenance Overcoating. This document should be used as a guide for scoping the CCS, for accomplishing the CCS, and for designing the coating work.

**************************************************************************

1.3 DESCRIPTION OF WORK

[ Provide a brief description of the work to be covered by this specification. ]

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will
review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

1.5 SAFETY

The Contractor shall submit an Accident Prevention Plan as per Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS.

1.6 DELIVERY, STORAGE AND HANDLING

1.6.1 Coating Materials

Ship, store and handle materials in accordance with SSPC PA 1. Maintain temperature in storage spaces between 5 and 24 degrees C 40 and 75 degrees F. Maintain ambient air temperature more than 3 degrees C 5 degrees F above the dew-point at all times. During mixing of polyurethane materials, maintain relative humidity below 90 percent.

1.6.2 Structural and Miscellaneous Materials

Handle, store, and protect materials in accordance with the manufacturer's recommendations. Replace damaged items with new items, or repair as approved by the Contracting Officer.

1.7 EXISTING TOWER CONDITIONS

**************************************************************************
NOTE: Include and reference Section 02 83 00 LEAD REMEDIATION if any of the existing lead paint system is to be removed. Include and reference Section 02 83 00 LEAD REMEDIATION if any structural elements are replaced which are painted with a lead based coating system.
**************************************************************************

Include detailed information, from the CCS, on the condition of the tower including type of paint system, percentage of deterioration of the paint and structure, any hazardous contents of the paint such as Lead or Chromate, and any other pertinent information about exiting conditions.

1.8 COATING HAZARDS

**************************************************************************
NOTE: This specification section is based on assumption that section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS will be included in project, otherwise,
requirements for preparation and submittal of a safety plan, respiratory protection plan, etc. must be included in this specification section.

**************************************************************************
**************************************************************************

Ensure that employees are trained in all aspects of the safety plan. Specified coatings may have potential health hazards if ingested or improperly handled. The coatings manufacturer's written safety precautions shall be followed throughout the mixing, application, and curing of the coatings. During tank cleaning, cleanup, surface preparation, and paint application phases, ensure that employees are adequately protected from toxic and hazardous chemical agents which exceed the concentrations in OSHA 29 CFR 1910.1000, [OSHA 29 CFR 1910.1018, 29 CFR 1926.1127 and OSHA 29 CFR 1926.62]. Comply with respiratory protection requirements in OSHA 29 CFR 1910.134. Obtain the services of a certified industrial hygienist to review and approve the operations as to correctness of work procedures and personal protective equipment.

1.9 JOB SITE REFERENCES

Make available to the Contracting Officer at least one copy each of ASTM D3925, ASTM D4285, ASTM D4417, NACE SP0288, SSPC SP COM, SSPC SP 1[, SSPC 7/NACE No.4][, SSPC SP 10/NACE No. 2], SSPC PA 1, SSPC PA 2, SSPC Guide 12, [SSPC AB 2, ] and SSPC VIS 1 at the job site.

1.10 PRE-APPLICATION MEETING

As an alternative to a Pre-Application Meeting (PAM), a Pre-Application Test Period (PATP) may be specified. Either one will have some positive effect on the project by getting the appropriate people together. A PATP is a meeting, with the added benefit of some actual onsite evaluation of processes and procedures. This activity should be scheduled just prior to coating work beginning but after all submittals are approved. In either case, the work plan and safety plan should be fully discussed. The Coating Manufacturer's representative may be included for a large or complicated project.

Prior to any surface preparation or coating operations, Contractor representatives, including at a minimum, project superintendent and QC manager, paint foreman, Contracting Officer representatives, coating inspector[,] and coating systems manufacturer's representative] shall have a pre-application tank coating preparatory meeting. This meeting shall be in addition to the pre-construction conference. Specific items to be addressed shall include: the work plan, the safety plan, inspection standards, inspector qualifications and tools, test procedures, environmental control system, safety plan, and test logs. Notify the Contracting Officer 10 days prior to meeting.

SECTION 09 97 13.25 Page 15
1.11 QUALITY ASSURANCE

1.11.1 Drawings: Steel, Stainless Steel, Aluminum Fabrication

Submit fabrication drawings for approval prior to fabrication. Prepare in accordance with AISC 326 and AISC 325. Drawings shall not be reproductions of contract drawings. Include complete information for the fabrication and erection of the structure's components, including the location, type, and size of bolts, welds, member sizes and lengths, connection details, blocks, copes, and cuts. Use AWS standard welding symbols.

1.11.2 Design Data: Coating System

Submit manufacturer's printed instructions including detailed mixing and application procedures, number and types of coats required, minimum and maximum application temperatures, and curing procedures. Include Safety Data Sheets (SDS) for materials to be used at the job site in accordance with 29 CFR 1926.59.

1.11.3 Certificates

1.11.3.1 Work Plan

A specific written plan describing in detail all phases of structural repair, electrical repair, and coating operations. For coating work, address work sequencing, surface preparation, coating application, recoat and cure time projections, as well as how each step will be controlled, tested, and evaluated. Address safety measures, work scheduling around weather, and record keeping.

1.11.3.2 Qualifications of Certified Industrial Hygienist (CIH)

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party CIH. Submit documentation that hygienist is certified by the American Board of Industrial Hygiene in comprehensive practice, including certification number and date of certification/recertification. Provide evidence of experience with hazards involved in industrial coating application work.

1.11.3.3 Qualifications of Testing Laboratory for Coatings

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party laboratory selected to perform testing of the coating samples for compliance with specification requirements. Submit documentation that laboratory is regularly engaged in testing of paint samples for conformance with specifications, and that persons performing analyses are qualified.

1.11.3.4 Qualifications of Testing Laboratory for Abrasive Media

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party laboratory selected to perform the testing of the abrasive media samples for compliance with specification requirements. Submit documentation that laboratory has experience in testing samples of abrasive media for conformance with specifications, and that persons performing analyses are qualified.
1.11.3.5 Qualifications of Coating Contractors

NOTE: For projects in continental US, Hawaii, Alaska, and Puerto Rico, require SSPC Certification. Use in other locations where qualified US contractor is desired. If project involves removal of paint containing hazardous materials, add requirement for SSPC QP-2 certification in appropriate section of specification, generally where the hazardous paint removal is specified.

NOTE: Solicitations requiring SSPC Certification should point out the existence and location of the certification requirement. SSPC Certification is a special responsibility requirement pursuant to FAR 9.104-2 Special Standards. This is analogous to requiring bidders to have a specified level of experience or expertise and GAO has sustained these types of special requirements.

All contractors and subcontractors that perform surface preparation or coating application shall be certified by the Society for Protective Coatings (formerly Steel Structures Painting Council) (SSPC) to the requirements of SSPC QP 1 prior to contract award, and shall remain certified while accomplishing any surface preparation or coating application. The painting contractors and painting subcontractors must remain so certified for the duration of the project. If a contractor's or subcontractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered, and liquidated damages will apply. Notify the Contracting Officer of any change in contractor certification status.

NOTE: When using the contractor qualification clause rather than the SSPC Certification requirement, edit to require appropriate experience.

Submit the name, address, telephone number, FAX number, and e-mail address of the agency that will be performing all surface preparation and coating application. Submit evidence that key personnel have successfully performed surface preparation and application of coatings on [industrial steel structures] [_____] on a minimum of three separate projects within the past three years. List information by individual and include the following:

a. Name of individual and proposed position for this work.

b. Information about each previous assignment including:
   Position or responsibility
   Employer (if other than the Contractor)
   Name of facility owner
1.11.3.6  Qualifications of Painting Shop

**************************************************************************
NOTE: For construction of new tower or where shop fabrication of significant components is feasible, consider requirement for SSPC QP3 Certification (enclosed shop) for shop performing coating preparation and application. Include appropriate NACE inspection of all coating work in shop.
**************************************************************************

[ SSPC QP 3 (enclosed shop) ]

1.11.3.7  Abrasive Media

Certify conformance to contract requirements and provide copies of test results required by MIL-A-22262 or SSPC AB 3 for material chosen.

1.11.3.8  Coating System Compatibility

Provide certification from each manufacturer of components of the coating system, epoxy primer, epoxy intermediate, and polyurethane topcoat, that the supplied coating material is suitable for use in the specified coating system. Each manufacturer shall identify the specific products, including manufacturer's name, which their product may be used with. The certification shall provide the name of the manufacturer that will provide technical support for the entire system. When all coating materials are manufactured by one manufacturer, this certification is not required.

1.11.4  Test Reports

1.11.4.1  Non-metallic Abrasive Media

Submit test results from independent laboratory of representative sample of abrasive media. Sample must have been tested within the last three years. Submit results as required in article entitled "QUALIFICATION INSPECTION" of MIL-A-22262, and as revised by article entitled "ABRASIVE MEDIA" herein. Note that requirement for "QUALIFICATION INSPECTION" is a pre-qualification requirement, and involves the same testing required for listing in the Qualified Products List of the respective material. See appropriate Military Specification for specific test requirements.

1.11.4.2  Coatings

Submit test results from independent laboratory of representative samples of each coating material. Samples must have been tested within the last three years. Submit results for epoxy materials as required in article entitled "QUALIFICATION INSPECTION" of MIL-DTL-24441, and as revised by article entitled "COATING SYSTEM" herein. Submit results for polyurethane materials as required in article entitled "QUALIFICATION INSPECTION" of MIL-PRF-85285, and as revised by article entitled "COATING SYSTEM" herein.
Note that requirement for "QUALIFICATION INSPECTION" is a pre-qualification requirement, and involves the same testing required for listing in the Qualified Products List of the respective material. See appropriate Military Specification for specific test requirements.

1.11.4.3 **Metallic Abrasive Media**

Submit test results from independent laboratory testing of sample of each batch delivered to job site.

1.11.4.4 **Daily Inspection Checklist**

Submit one copy of daily inspection checklist, completed each day when performing work under this section, to the Contracting Officer. Submit within 24 hours of date recorded on the checklist.

1.11.4.5 **Recycled Metallic Abrasive Media**

Submit test results from independent laboratory of daily and weekly Quality Control testing required by SSPC AB 2, as modified in article entitled "ABRASIVE MEDIA."

**PART 2 PRODUCTS**

2.1 **STEEL**

New steel shall be galvanized.

2.1.1 **Structural and Miscellaneous Steel**

*ASTM A36/A36M*, hot dip galvanized.

2.1.2 **Steel Tubing and Pipe**

*ASTM A500/A500M*, Grade B, hot dip galvanized.

2.2 **STAINLESS STEEL**

*ASTM A666*, Type 316, Stainless steel shall not be galvanized.

2.2.1 **Band Clamps**

*ASTM A666*, Type 316.

2.3 **ALUMINUM**

2.3.1 **Plates and Shapes**

*ASTM B209*, Type 6061-T6; *ASTM B308/B308M*

2.3.2 **Stranded Conductor**

**************************************************************************

NOTE: Include this paragraph for leg riser cables for VLF and LF transmission towers.

**************************************************************************

2.4 BOLTS, NUTS, AND WASHERS

Provide the following unless indicated otherwise.

2.4.1 Structural Steel

2.4.1.1 Bolts

**************************************************************************
NOTE: Do not galvanize ASTM A490M ASTM A490 bolts.
**************************************************************************

ASTM A325, Type 1, hot dip galvanized. Bolts shall have a maximum Rockwell hardness of 32. The bolt heads and the nuts of the supplied fasteners must be marked with the manufacturer's identification mark, the strength, grade and type specified by ASTM specifications.

2.4.1.2 Nuts

[Provide galvanized ASTM A563 nuts, Grade and Style as specified in the applicable ASTM standard.][Provide ASTM A563, hot dip galvanized nuts with a locking pin set in the nut. The locking pin shall slide along the bolt threads, and by reversing the direction of the locking pin, the nut shall be removed without damaging the nut or bolt. Provide noncorrosive locking pins.]

2.4.1.3 Washers

ASTM F436, hot dip galvanized steel.

[2.4.1.4 Load Indicator Washers

**************************************************************************
NOTE: Include this paragraph when needed to ensure that AISC (American Institute of Steel Construction) required bolt pretension load.
**************************************************************************

ASTM F959/F959M, hot dip galvanized steel.

]2.4 Stainless Steel

2.4.2.1 Bolts

ASTM F593, type 304

2.4.2.2 Nuts

ASTM F594, type 304

2.4.2.3 Washers

ASTM A320/A320M, except provide type 304
2.4.3 Aluminum

2.4.3.1 Bolts
ASTM F468

2.4.3.2 Nuts
ASTM F467

2.4.3.3 Washers
ASTM F1077

2.5 GALVANIZING

ASTM A123/A123M or ASTM A153/A153M, as applicable, unless specified otherwise. GALVANIZED SURFACES SHALL NOT BE "PASSIVATED" OR "STABILIZED".

2.5.1 Galvanizing Repair Compound

ASTM A780/A780M, cold galvanizing repair compound.

2.6 WELDING

[AWS D1.1/D1.1M for steel][AWS D1.2/D1.2M for aluminum.]

2.6.1 Exothermic Weld Kits

Exothermic weld kits specifically designed by the manufacturer for welding the types of materials and shapes provided.

2.7 COATING SYSTEM

Alternate systems or products will not be considered.

[2.7.1 Sealer for Thermal Spray Metallizing

Epoxy polyamide, MIL-DTL-24441/31 (Formula 152, Type IV, White (thinned 50 percent using solvent recommended by manufacturer)). Modify requirements to include maximum allowable lead content of 0.06 percent by wt. as tested by ASTM D3335, maximum Cadmium content of 0.06 percent by wt. as tested by ASTM D3335, and maximum allowable Chromium content of 0.00 percent by wt. as tested by ASTM D3718. All other requirements of this Military Specification apply.

][2.7.2 Zinc Rich Epoxy Primer Coat

**************************************************************************
NOTE: Use this organic zinc-rich coating for repair to existing zinc primer, for repair of inorganic zinc primer, or for small projects where the tower is not to be galvanized or thermal spray metalized.
**************************************************************************

Epoxy polyamide, MIL-DTL-24441/19 (Formula 159, Type II). Modify requirements to include maximum allowable lead content of 0.06 percent by wt. as tested by ASTM D3335, maximum Cadmium content of 0.06 percent by wt. as tested by ASTM D3335, and maximum allowable Chromium content of 0.00
percent by wt. as tested by ASTM D3718. All other requirements of this Military Specification apply.

2.7.3 Epoxy Intermediate Coat

Epoxy polyamide, MIL-DTL-24441/31 (Formula 152, Type IV, White (Tinted)). Tint to approximately SAE AMS-STD-595A color number 27778 parchment using pigment dispersions prepared for epoxy paint tinting. Manufacturer shall tint material and appropriately label. Modify requirements to include maximum allowable lead content of 0.06 percent by wt. as tested by ASTM D3335, maximum Cadmium content of 0.06 percent by wt. as tested by ASTM D3335, and maximum allowable Chromium content of 0.00 percent by wt. as tested by ASTM D3718. All other requirements of this Military Specification apply.

2.7.4 Polyurethane Topcoat

******************************************************************************
NOTE: Colors listed are as specified by FAA
Advisory Circular AC 70/7460-1H, Obstruction Marking
and Lighting. Always specify contrasting colors
between coats.
******************************************************************************

Polyurethane coating topcoat of MIL-PRF-85285, Type II, White
SAE AMS-STD-595A color number 17875, and Orange color number 12197.

Modify paragraph 3.6.4 of MIL-PRF-85285, Viscosity and Pot Life, as follows:

The viscosity of the admixed coating, when tested in accordance with
ASTM D1200 through a No. 4 Ford cup, shall be as follows:

<table>
<thead>
<tr>
<th>Time from mix (minimum)</th>
<th>Maximum time through a No. 4 Ford cup</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initially</td>
<td>30 seconds</td>
</tr>
<tr>
<td>2 hours</td>
<td>60 seconds</td>
</tr>
<tr>
<td>4 hours</td>
<td>No gel</td>
</tr>
</tbody>
</table>

Modify paragraph 3.7.1 of MIL-PRF-85285, Drying Time, as follows:

When applied by spray techniques and when tested in accordance with
ASTM D1640/D1640M, the coating shall be set-to-touch within four hours
and dry-hard within eight hours (see 4.6 and table I).

All other requirements of this Military Specification apply.

2.8 SOLUBLE SALTS TEST KITS

2.8.1 Test Kit for Measuring Chlorides on Steel Surfaces

Provide test kits called CHLOR*TEST, as manufactured by CHLOR*RID
International Inc. of Chandler, Arizona (www.chlor-rid.com) or equal. To
be considered for approval as an "equal" test kit, each proposed test kit
shall:

a. Be a completely self-contained test kit with all materials, supplies,
tools and instructions to take tests and identity results;
b. Use identifiable, consistent, factory pre-measured test extract solution;
c. Provide for testing of any steel surface, regardless of orientation;
d. Provide for testing flat, curved, smooth, pitted and rough surfaces;
e. Provide for taking direct measurements of the chloride ion in micrograms per square centimeter without using conversion charts or tables;
f. Be environmentally friendly and not contain any forms of mercury;
g. Provide all new components for extraction and titration for each test;
h. Provide an encapsulated environment while extracting chlorides;
i. Provide a factory sealed titration device for each test;
j. Use the extract sampling container as the titration container.

2.8.2 Test Kit for Measuring Chlorides in Abrasives

Provide test kits called CHLOR*TEST-A, as manufactured by CHLOR*RID International Inc. of Chandler, Arizona (www.chlor-rid.com), or equal. To be considered for approval as an "equal" test kit, each proposed test kit shall:

a. Be a completely self-contained test kit with all materials, supplies, tools and instructions to take tests and identify results;
b. Use identifiable, consistent, factory pre-measured test extract solution;
c. Provide for testing equal volumes of abrasive and test solution;
d. Provide for taking direct measurements of the chloride ion in parts per million (PPM), without using conversion charts or tables;
e. Provide all new components for extraction and titration for each test;
f. Provide a factory sealed titration device for each test;
g. Use the extract sampling container as the titration container.

2.9 ABRASIVE MEDIA

The referenced abrasives specifications have been modified to place additional requirements on testing for soluble salts contamination. Other factors such as on-site handling and recycling can allow contamination of abrasives. Successful testing of chlorides in abrasives does not negate the final acceptance testing of steel surfaces.

**************************************************************************
NOTE: Following paragraph is mandatory for all NAVFAC PAC projects. All other agencies may use it after checking applicability.
Interpret MIL-A-22262 to include the meaning that abrasive material contains a maximum one percent by weight of any toxic substance listed in either Table Z-1, Z-2, or Z-3 or OSHA 29 CFR 1910-SUBPART Z, with the exception of inert or nuisance dust materials, arsenic, beryllium, cadmium, cobalt, lead, mercury, rhodium, silver, tellurium, thallium, and uranium.

2.9.1 Non-metallic Abrasive Media

Abrasive media shall conform to MIL-A-22262, Type I (Inorganic materials) except that:

a. The maximum allowable chloride content is 7 parts per million (ppm) as measured with the test kit described in article entitled "Test Kit for Measuring Chlorides in Abrasives."

b. The gross gamma radioactivity shall not exceed 5 picocuries per gram.

Use sampling procedures and testing frequencies as prescribed in MIL-A-22262. Use abrasive media that is specifically selected and graded to provide a sharp, angular profile to the specified depth. Do not use ungraded media. Make adjustments to processes or media gradation to achieve specified surface profile. Do not use recycled non-metallic abrasive media.

2.9.2 Metallic Abrasive Media

Use abrasive media that is specifically selected and graded to provide a sharp, angular profile to the specified depth. Make adjustments to processes, media gradation, or media hardness to achieve specified surface profile.

2.9.2.1 New and Remanufactured Metallic Abrasive Media

Abrasive media shall conform to the chemical and physical properties of SSPC AB 3, except that:

a. The maximum allowable chloride content is 7 parts per million (ppm) as measured with the test kit described in article entitled "Test Kit for Measuring Chlorides in Abrasives." Modify the requirements of SSPC AB 3 to substitute requirement for one chloride test for each "WATER SOLUBLE CONTAMINANTS" test required.

b. Hardness of steel grit shall be chosen to match requirements of abrasive blasting work.

[ c. The gross gamma radioactivity shall not exceed 5 picocuries per gram.]

2.9.2.2 Recycled Metallic Abrasive Media

Abrasive media shall conform to the chemical and physical properties of SSPC AB 2 except that:

a. The maximum allowable chloride content is 7 parts per million (ppm) as measured with the test kit described in article entitled "Test Kit for Measuring Chlorides in Abrasives." Modify the requirements of SSPC AB 2 to substitute requirement for one chloride test for each "WATER SOLUBLE CONTAMINANTS" test required.
b. The maximum allowable Chromium and Cadmium content of the work mix shall be 0.1 percent by wt. when tested in accordance with ASTM D3718 for Chromium and ASTM D3335 for Cadmium. Modify the requirements of SSPC AB 2 to add requirement for one Chromate test and one Cadmium test for each "LEAD" test required.

PART 3 EXECUTION

3.1 STRUCTURAL [REPAIRS][MODIFICATIONS]

3.1.1 Fabrication

By mechanics skilled in the trade and in accordance with the manufacturer's directions. Metalwork shall be well formed to shape and size, with sharp lines, angles, and true curves. Work shall be fabricated to allow for expansion and contraction of materials. Provide welding and bracing of adequate strength and durability, with tight, flush joints, dressed smooth and clean. Prior to erection, members shall be identified with a painted erection mark.

3.1.1.1 Measurements

**************************************************************************
NOTE: The designer shall indicate on the drawings all field measurements required to perform work.
**************************************************************************

Before fabrication, verify all measurements to ensure coordination of new members to existing tower structure.

3.1.1.2 Metal Surfaces

Shall be clean and free from mill scale, flake rust and rust pitting; well formed and finished to shape and size, with sharp lines, angles, and smooth surfaces. Shearing and punching shall leave clean true lines and surfaces. Weld permanent connections. Welds shall be used and finished flush and smooth on surfaces that will be exposed after installation.

3.1.1.3 Construction

Thickness of metal and details of assembly and supports shall be as indicated. Joints exposed to weather shall be formed to exclude water.

3.1.1.4 Fastening

Provide the necessary brackets so that the work can be assembled in a neat and substantial manner. Holes for bolts and screws shall be drilled. Joints exposed to the weather shall be formed to exclude water. Conceal fastenings where possible.

3.1.1.5 Shop Fabrication

Fabrication and assembly shall be done in the shop to the greatest extent possible.

3.1.2 Galvanizing

New metal, except stainless steel, shall be galvanized. Galvanize after fabrication. Repair galvanizing damaged by handling, transporting,
cutting, welding, or bolting. Do not heat surfaces to which repair paint has been applied. Coat inside of holes drilled in existing steel structure with cold galvanizing repair compound within 1 hour of drilling.

3.1.3 Welding

Perform welding, welding inspection, and corrective welding, in accordance with AWS D1.1/D1.1M for steel and AWS D1.2/D1.2M for aluminum. Existing tower steel shall be stripped to bare metal prior to welding. Weld in a manner to prevent permanent distortion of the connected parts. Weld continuously along the entire area of contact. Provide AWS qualified welders, welding operators and tackers.

[3.1.3.1 Exothermic Welding

**************************************************************************
NOTE: Include paragraph when grounding screens or ground wires are present.
**************************************************************************

Use exothermic weld kits for connections of #3/0 AWG bare copper grounding wire.

]3.1.4 Connections

**************************************************************************
NOTE: Use AISC 360 for designs using AISC 325 (allowable stress) and for designs using AISC M020L (load and resistance factor).
**************************************************************************

Except as modified in this section, connections not detailed shall be designed in accordance with AISC 360. Build connections into existing work. Punch, subpunch and ream, or drill bolt holes. Bolts, nuts, and washers shall be clean of dirt and rust, and lubricated immediately prior to installation.

[3.1.4.1 Bolts

**************************************************************************
NOTE: All structural connections shall be fully tensioned.
**************************************************************************

ASTM A325 bolts shall be fully tensioned to 70 percent of their minimum tensile strength. Provide load indicator washers in all high strength bolted connections. Direct tension indicator tightening, or installation of alternate design fasteners, shall be the only acceptable tightening methods. Bolts shall be installed in connection holes and initially brought to a snug tight fit. After the initial tightening procedure, bolts shall then be fully tensioned, progressing from the most rigid part of a connection to the free edges.

]3.1.4.2 Stainless Steel Fasteners

ASTM F593 bolts shall be tightened to a "snug tight" fit. "Snug tight" is the tightness that exists when plies in a joint are in firm contact. If firm contact of joint plies cannot be obtained with a few impacts of an impact wrench, or the full effort of a man using a spud wrench, contact the
Contracting Officer for further instructions.

[3.1.4.3 Installation of Load Indicator Washers (LIW)]

**************************************************************************
NOTE: Use with all structural connections.
**************************************************************************

ASTM F959/F959M. Where possible, the LIW shall be installed under the bolt head and the nut shall be tightened. If the LIW is installed adjacent to the turned element, provide a flat ASTM F436 washer between the LIW and nut when the nut is turned for tightening, and between the LIW and bolt head when the bolt head is turned for tightening.

3.2 COATING SAMPLING AND FIELD TESTING

3.2.1 Coating Sample Collection

Notify Contracting Officer three days in advance of sampling. The Contracting Officer and either the QC Manager or NACE Coating Inspector shall witness all sampling. Obtain a one liter quart sample of each batch of each base material, and proportional samples of each activator based on mix ratio, by random selection from sealed containers in accordance with ASTM D3925. Prior to sampling, mix contents of sealed container to ensure uniformity. A batch is defined as that quantity of material processed by the manufacturer at one time and identified by number on the label. Identify samples by designated name, specification number, batch number, project contract number, sample date, intended use, and quantity involved. Ship samples to an approved laboratory for testing as required by paragraph entitled "Testing of Coating Samples."

3.2.2 Coating Sample Testing

Test samples of all primer, intermediate, and topcoat materials for compliance with requirements of Table I. Reject samples that fail tests, reselect, and retest samples.

3.3 SURFACES TO BE COATED

**************************************************************************
NOTE: Where general corrosion and light pitting is found, an additional 50 to 100 microns 2 to 4 mil DFT coat of the intermediate epoxy material should be brush applied over the corroded areas. This will increase the total coating thickness in these areas by 75 microns 3 mils DFT. This will provide additional barrier protection to these areas that are especially prone to corrosion. An engineering evaluation must be made to determine the methods of repairing the corroded areas, such as welding and grinding.
**************************************************************************

Coat all exposed surfaces, including ladders, railings, [_____], and other exterior appurtenances.

3.3.1 Protection of Items not to be Painted
NOTE: List staging, grates, railings etc. that can be easily removed, given a better paint job in a shop and then reassembled.

Remove or protect all objects not to be abrasive blasted or painted. Items that are to be removed or protected are listed below:

a. [____]

3.4 ACCEPTABLE INSTALLERS

Contractors qualified in accordance with this section shall perform all surface preparation and coating application.

3.5 LIGHTING

Provide lighting for all work areas as prescribed in SSPC Guide 12.

3.6 CONTAINMENT SYSTEM

NOTE: This paragraph (and subparagraphs) should not be used for blast containment. Such containment should be specified in Section 02 83 00 LEAD REMEDIATION. Coordinate this paragraph with limitations paragraph entitled APPLICATION OF COATING SYSTEM.

The contractor shall design and provide a containment system for the capture, containment, collection, storage and disposal of the waste materials generated by the work under this contract. Waste materials covered by this paragraph shall not include any material or residue from removal of coatings containing lead, chromium, cadmium, PCB, or any other hazardous material. Submit design drawings and calculations designed by a registered engineer, including an analysis of the load which will be added to the structure by the containment system and waste materials. The review and acceptance of the containment system shall in no way relieve the contractor of any responsibility for obtaining the degree of capture, containment, and collection. It is the contractors responsibility to insure the feasibility and workability of the containment system. The contractor shall perform his operations and work schedule in a manner as to minimize leakage of the containment system. The containment system shall be properly maintained and shall not deviate from the approved drawings, without the Contracting Officers approval. If at any time during the execution of the work, the containment system fails to function satisfactorily in the opinion of the Contracting Officer, the contractor shall suspend all operations, except those required to minimize adverse impact on the environment or government property. Operations shall not resume until modifications have been made to correct the cause of the failure. Modifications shall be approved by the Contracting Officer.

3.6.1 Containment System Plans

Drawings shall be a minimum of 22 inch by 36 inch with proper lettering. General notes shall be placed in the space above the title box. Show the containment system in plan and elevation views, including details of hangers and clips. Permanent attachments or fasteners to the tower shall
not be allowed. Identify all containment system components on the plan sheets. Drawings shall indicate the maximum permissible loads of blast materials, waste material, and wind speeds. Indicate all framework, work platforms, scaffolding, curtains, screens, tarps, method of securement, etc.

3.7 Removal of Coatings Containing Hazardous Materials

Coatings containing hazardous materials and identified for disturbance during surface preparation, including removal, shall be removed in accordance with Section 02 83 00 LEAD REMEDIATION. Dispose of waste products including contaminated blasting grit, water, and the like. Coatings specified may have potential health hazards if ingested or improperly handled. Follow manufacturer's written safety precautions throughout the mixing, application, and cure of the coatings.

3.8 SURFACE PREPARATION

3.8.1 Abrasive Blasting Equipment

Use abrasive blasting equipment of conventional air, force-feed, or pressure type. Maintain a minimum pressure of 650 kPa 95 psig at nozzle. Filter air supply so that air is free of oil and moisture in accordance with ASTM D4285. Test compressed air quality at each startup, but in no case less often than every five operating hours.

3.8.2 Abrasives for Soluble Salts Contamination

Test abrasive media for chloride contamination using test kit as described in article entitled "Test Kit for Measuring Chlorides in Abrasives." The maximum allowable chloride concentration is 7 ppm. Collect composite samples using techniques described in MIL-A-22262 article entitled "QUALITY CONFORMANCE INSPECTION." Test abrasive media immediately prior to use, and in no case more than 24 hours prior to use.

3.8.2.1 Pre-Preparation Testing of Abrasive Media Shipped in Bulk Containers

For bulk containers containing 1350 kg 3000 pounds or less, test one composite sample from each container. Reject entire container for non-conforming test. For bulk containers over 1350 kg 3000 pounds, test one composite sample for each 1350 kg 3000 pounds, one sample from each compartment, as appropriate. Reject entire container or compartment for non-conforming test.

3.8.2.2 Abrasive Media Shipped in Bags (Nominal 50-110 lb.)

Maintain palletized grouping as provided from supplier. Test composite sample from one bag of each pallet, but no less than one sample each 1350 kg 3000 pounds of abrasive. Reject entire pallet for nonconforming test. If palletized grouping is not maintained, sample and test one bag for every 450 kg 1000 pounds of abrasive. Reject each 450 kg 1000 pounds represented by a nonconforming test. If bags are stamped with Lot number, test composite samples from each of two bags per lot. Reject entire lot for nonconforming test.

3.8.2.3 Operational Testing of Recycled Metallic Abrasive Media

For batch processing of abrasive, test composite sample of each batch. Reprocess entire batch for non-conforming test. For continuous processing, test composite sample once per cycle, but no less that one sample every
four hours. For non-conforming test during continuous processing, discontinue processing, check equipment for correct operation, and check surfaces prepared with non-conforming abrasive media as prescribed in Article entitled "Pre-Application Testing For Surface Contamination." Make adjustments to equipment or to processing as required to correct problem, and resume blasting when testing indicates that equipment is operating properly.

3.8.3 Clean[ and Repair]

NOTE: For maintenance projects, allow for inspection and repair of surfaces, as required. Brush-off blasting to remove both loose rust and pack rust facilitates chloride testing and removal as well as inspection of surface condition. Tailor this paragraph to the needs of cleaning that will be required in preparation for repairs.

Brush-off blast all surfaces in accordance with SSPC 7/NACE No.4 to remove all corrosion products, including surface rust and pack rust. After abrasive blasting, remove abrasive and dust from surfaces by brushing, blowing with dry compressed air, and remove all loose material from vicinity of areas to be painted.[ Examine tank for defects. Repair defects found, such as cracks or splits, by welding. Grind off rough surfaces on weld seams, sharp edges, and corners to a radius of not less than three mm 1/8 inch. Weld sharp depressions or deep pits and grind-off smooth.]

3.8.4 Surface Standard

Inspect surfaces to be coated, and select plate with similar characteristics and surface characteristics for use as a surface standard. Blast clean one or more 300 mm 1 foot square steel panels. Surface preparation and profile shall be as specified in paragraph entitled "SURFACE PREPARATION." Record blast nozzle type and size, air pressure at nozzle and compressor, distance of nozzle from panel, and angle of blast to establish procedures for blast cleaning. Measure surface profile in accordance with ASTM D4417. Seal surface standard with a clearcoat protectant, or keep wrapped and sealed in vapor-tight material, for use as a standard of comparison for steel surfaces throughout the course of work.

3.8.5 Pre-Preparation Testing for Surface Contamination

Perform testing, abrasive blasting, and testing in the prescribed order.

3.8.5.1 Pre-Preparation Testing for Oil and Grease Contamination

Ensure surfaces are oil-free by visual examination. Check entire structure with water misted onto surface. Any beading of water is indication of oil or grease contamination. Clean contaminated surfaces in accordance with SSPC SP 1 and recheck for contamination until surfaces are grease and oil-free.

3.8.5.2 Pre-Preparation Testing for Soluble Salts Contamination

Test surfaces for soluble salts, and wash as required, prior to abrasive blasting. Soluble salt testing is also required as a final acceptance test.
of prepared surfaces after abrasive blasting, and successful completion of
this phase does not negate that requirement. This phase is recommended
since pre-preparation testing and washing are generally more advantageous
than attempting to remove soluble salt contamination after abrasive
blasting. Effective removal of soluble salts will require removal of any
barrier to the steel surface, including rust. This procedure may
necessitate the use of wet abrasive blasting, high pressure water washing,
or water washing with a soluble salt remover that is biodegradable,
noncorrosive, nontoxic, and leaves no film. Delays between testing and
preparation, or testing and coating application, may allow for the
formation of new contamination. Use potable water, or potable water
modified with soluble salt remover, for all washing or wet abrasive
blasting. Test methods and equipment used in this phase are selected at
the Contractor's discretion.

3.8.6 Abrasive Blasting

Abrasive blast steel surfaces to near-white metal in accordance with
SSPC SP 10/NACE No. 2. Near-white metal surfaces shall conform to
SSPC VIS 1 and shall match the prepared test-panels. Provide a 50 to 75
micron 2 to 3 mil surface profile. Surface profile greater than 75 microns
3 mils will not be accepted. Measure surface profile in accordance with
ASTM D4417. Time interval between abrasive blasting and application of
primer shall not exceed eight hours. After abrasive blasting, clean
surfaces of dust and debris by brushing, blowing with oil-free and
moisture-free compressed air, or vacuuming.

3.8.7 Disposal of Used Abrasive

**************************************************************************
NOTE: For recoating of existing tower structures
which contain or may contain any hazardous material
in existing coating, add requirement for testing of
used abrasive for hazardous waste.
**************************************************************************

Dispose of used abrasive at a landfill off Government property in
accordance with applicable regulations.[ Test used abrasive in accordance
with EPA test procedures manual EPA 530/F-93/004 and 40 CFR 261 to
determine if it is a hazardous waste using TCLP for metals. Handle and
dispose of abrasive determined to be hazardous waste in accordance with
40 CFR 266, and 40 CFR 268. Dispose in accordance with Section 02 83 00
LEAD REMEDIATION. Payment for disposal of hazardous waste will not be made
until a completed manifest from treatment or disposal facility is returned,
and a copy furnished to the Government.]

3.8.8 Pre-Application Testing For Surface Contamination

3.8.8.1 Pre-Application Testing for Oil and Grease Contamination

Ensure surfaces are oil-free by visual examination. Check questionable
areas and random areas for beading of water misted onto surface. Clean
contaminated surfaces in accordance with SSPC SP 1 and recheck for
contamination until surfaces are oil-free. Reblast tested and cleaned
areas as required.
3.8.8.2 Pre-Application Testing for Soluble Salts Contamination

Test surfaces for chloride contamination using the Test Kit described in article entitled "Test Kit for Measuring Chlorides on Steel Surfaces." Test all surfaces at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 300 square meters 3000 square feet or part thereof.[ Concentrate testing of bare steel at areas of coating failure to bare steel and areas of corrosion pitting.][ Perform 30 percent of tests on bare steel at welds, divided equally between horizontal and vertical welds.] One or more readings greater than 5 micrograms per square centimeter of chlorides shall be cause for rejection of surface. Wash all surfaces as discussed in article entitled "Pre-Preparation Testing for Soluble Salts Contamination," allow to dry, and re-test until all required tests show allowable results. Reblast tested and cleaned areas as required. Label all test tubes and retain for test verification.

3.8.8.3 Pre-Application Testing for Surface Cleanliness

Apply coatings to dust free surfaces. To test surfaces, apply strip of clear adhesive tape to surface and rub onto surface with finger. When removed, the tape should show little or no dust, blast abrasive, or other contaminant. Clean contaminated surfaces and retest. Test surfaces at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 300 square meters 3000 square feet or part thereof.

3.9 MIXING AND APPLICATION OF COATING SYSTEM

3.9.1 Preparation of Coating Materials for Application

Each of the epoxy and polyurethane products, [sealer, ][primer], intermediate, and topcoat, is a two-component coating supplied in separate containers.

3.9.1.1 Mixing [Sealer, ][Primer, ]Intermediate, and Topcoat Materials

Mix in accordance with manufacturer's instructions, which may differ for each product. Do not mix partial kits or alter mix ratios. Mix all coating materials in same temperature and humidity conditions specified in article entitled "DELIVERY AND STORAGE." Allow epoxy material to stand for required induction time based on its temperature. Keep coating material containers covered at all times after mixing and during application to prevent contamination. The polyurethane coating material is moisture sensitive and any introduction of moisture or water into the material during mixing or application will shorten usable pot life.

3.9.1.2 Pot Life

Apply mixed products within stated pot life for each product. Stop applying when material becomes difficult to apply in a smooth, uniform wet film. Do not add solvent to extend pot life. Add all required solvent at time of mixing. Pot life is based on standard conditions at 21 degrees C 70 degrees F and 50 percent relative humidity. For every 10 degrees C 18 degrees F rise in temperature, pot life is reduced by approximately half, and for every 10 degrees C 18 degrees F drop it is approximately doubled. Other factors such as the shape of the container and volume of mixed material may also affect pot life. Precooling or exterior icing of components for at least 24 hours to a minimum of 10 degrees C 50 degrees F in hot climates will extend pot life. High humidity at time of mixing and
application shortens pot life of the Polyurethane topcoat material. Following are approximate pot life times at 21 degrees C 70 degrees F:

Epoxy materials 4 hours
Polyurethane materials 2 hours.

3.9.1.3 Application Conditions and Recoat Windows

The overcoating requirements for the coating system are very time and temperature sensitive. If ambient conditions do not allow for orderly application of primer, stripe coat, intermediate coat and topcoat, use appropriate means of controlling surface temperatures, as required. Partial or total enclosures may be required, as well as other measures, to control conditions to allow for orderly application of all required coats.

Apply coating only when ambient air and steel temperatures are between 16 and 38 degrees C 60 and 100 degrees F, and steel surface temperature is more than 3 degrees C 5 degrees F above the dew-point of the ambient air during application and the first four hours for epoxy and the first eight hours for polyurethane. Do not apply coatings above 38 degrees C 100 degrees F or below 16 degrees C 60 degrees F.

Use Table entitled "RECOAT WINDOWS" to determine appropriate recoat windows for each coat after the initial coat. Apply each coating during appropriate RECOAT WINDOW.

If coating is not applied during RECOAT WINDOW, apply during EXTENDED RECOAT WINDOW. Application of any epoxy coat within the EXTENDED RECOAT WINDOW requires application of a TACK COAT prior to applying any full coat. Perform cure test immediately prior to application of TACK COAT to determine condition of applied coating. If CURE TEST indicates that surface is fully cured, provide GLOSS REMOVAL prior to application of TACK COAT.

If coating is not applied during EXTENDED RECOAT WINDOW, wash surface with water and detergent, rinse clean with fresh water and allow surface to dry thoroughly, provide GLOSS REMOVAL, apply TACK COAT, where applicable, within 24 hours, and apply next full coat within TACK COAT RECOAT WINDOW.

</table>
The temperature ranges shown in the table above are for determining recoat windows. Choose recoat window based on the highest surface temperature that was sustained for one or more hours between coats. This applies to the entire time between coats. Measure and record air and surface temperatures on hourly basis to determine appropriate recoat windows. If surface temperature goes above 38 degrees C 100 degrees F, measure and record temperatures every half hour.

CURE TEST - Where indicated, test surface for cure using high-flash aromatic Naphtha only (cas #64742-95-6). Do not use aliphatic VMP Naphtha. Wipe surface with rag saturated with Naphtha, and check for surface tackiness, loss of gloss, or other indications that solvent has softened surface. If softening is found on 95 percent of test sites, this is indication that coating has not fully cured, and GLOSS REMOVAL is not required if TACK COAT is applied within three hours and full coat is applied within the TACK COAT RECOAT WINDOW. Test surfaces at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 300 square meters 3000 square feet or part thereof.

TACK COAT - Where indicated, apply coat of intermediate coat epoxy, at 25 to 50 microns 1 to 2 mils WFT, then apply next specified full coat within TACK COAT RECOAT WINDOW. Thin TACK COAT material approximately 25 percent by volume, using appropriate epoxy thinner.

GLOSS REMOVAL - Where indicated, remove all gloss by brush-off abrasive blasting in accordance with SSPC 7/NACE No.4 or by hand sanding with 150-200 grit wet/dry sandpaper, pressure wash or wipe down with a clean rag soaked with denatured alcohol to remove dust. If zinc primer coat is brush-off abrasive blasted, touch-up or overcoat as required to restore zinc coating to 100 percent coverage of steel surfaces, to the specified primer coat thickness.

3.9.2 Application of Coating System

**************************************************************************
NOTE: For new tower construction where coating is applied in shop, the stripe coat should be applied by brush, and all other coats by spray. Although mitt application is an acceptable practice in the tower maintenance painting industry, the quality of the finished paint film by mitt application is questionable. Where painting is required due to severity of exposure, consideration should be given to excluding mitt application, particularly for primers.
**************************************************************************

**************************************************************************
NOTE: Establish reasonable limits on particulate fallout area and airborne coating droplets. the specified coatings do not "dry" during a fall, therefore, anything in the path of windblown coating droplets will get coated.
**************************************************************************

Apply coatings in accordance with SSPC PA 1 and as specified herein. Apply coatings to surfaces that meet all stated surface preparation requirements.
After application of primer coat and prior to application of each subsequent coat, perform testing prescribed in article entitled "Pre-Application Testing For Surface Contamination," as necessary, to ensure minimal intercoat contamination. This testing may be reduced to one half of the prescribed rate for bare steel if the testing indicates no contamination when sampling is evenly distributed over surfaces being tested. If contamination is found between coats, revert to the specified testing rate. Generally, oil and grease contamination and soluble salts contamination are not encountered if subsequent coats are applied within specified recoat windows and unusual atmospheric events do not occur. Such atmospheric events as a coastal storm blowing onshore can bring unusual chloride contamination. Concern for intercoat contamination should be continually prevalent, and spot testing should be accomplished to verify satisfactory conditions. Where visual examination or spot testing indicates contamination, perform sufficient testing to verify non-contamination, or to define extent of contamination for appropriate treatment.

Apply each coat in a consistent wet film, at 90 degrees to previous coat. Ensure that primer and intermediate coat "cold joints" are no less than 150 mm six inches from welds. Apply stripe coat by brush. Apply all other coats by [spray ][brush, roller, or mitt] application. Use appropriate controls to prevent airborne coating fog from drifting beyond[three][_____] meters [15][_____] feet from the structure perimeter]. Cover or protect all surfaces that will not be coated. The cleanliness, temperature, recoat windows, and airborne paint containment requirements may necessitate the use of enclosures, portable shelters, or other appropriate controls.

3.9.2.1 Sealer Coat for Spray Metalizing

Apply sealer coat at 25 to 50 microns 1 to 2 mils dry film thickness (DFT).

3.9.2.2 Application of Primer

**************************************************************************
NOTE: This paragraph applies to application of organic zinc-rich primer (MIL-DTL-24441), either in the shop or when applied in field as spot primer. This paragraph also applies to application of Inorganic zinc-rich primer (DOD-P-24648.)

Delete primer and stripe coat if tower is hot dip galvanized or spray metallized.
**************************************************************************

Apply primer coat at 50 to 100 microns 2 to 4 mils dry film thickness (DFT). Maintain paint supply container height within 1 meter 3 feet of the paint nozzle when applying zinc primer. Maintain constant agitation of paint pot to ensure that zinc does not settle in container.

3.9.2.3 Application of Stripe Coat

Apply a stripe coat of succeeding coat epoxy material within RECOAT WINDOW of primer coat. Apply by brush, working material into corners, crevices, angles, and welds, and onto outside corners and angles.
3.9.2.4 Application of Intermediate Coat

Apply intermediate coat within RECOAT WINDOW of [sealer][primer] coat. Apply intermediate coat 75 to 125 microns 3 to 5 mils DFT. Check coating thickness prior to application of topcoat. If additional coating film is required, use intermediate coating material to provide desired thickness, then apply topcoat.

3.9.2.5 Application of Topcoat

**************************************************************************
NOTE: Adjust total system to compensate for galvanizing or spray metallizing, or for existing coating, as necessary.
**************************************************************************

Make all required repairs to primer and intermediate coats as specified in paragraph entitled "Procedure for Making Spot Repairs" prior to applying topcoat. Apply topcoat within RECOAT WINDOW of intermediate coat. Apply polyurethane topcoat 40 to 60 microns 1-1/2 to 2-1/2 mils DFT. Total system of primer, intermediate, and topcoat shall not be less than 225 microns 9 mils DFT. Apply additional topcoat, if necessary, to obtain required minimum total system thickness.

3.9.2.6 Procedure for Making Spot Repairs

Use this procedure only with written approval from the Contracting Officer. Observe all requirements for soluble salts contamination and cleanliness between coats. Apply each coat within RECOAT WINDOW of preceeding coat. Prepare defective area in accordance with SSPC SP 10/NACE No. 2, and feather coating as required to leave 100 mm 4 inches of each succeeding coat feathered and abraded. Protect adjacent areas from damage and overspray. Remove dust and solvent wipe the prepared area plus an additional 75 mm 3 inches beyond the prepared area with clean denatured alcohol. Within four hours of preparation, apply zinc-rich primer to prepared steel and feather onto prepared primer. Apply intermediate coat to primed area and feather to prepared intermediate area. Apply topcoat by spray to intermediate coat and feather to prepared topcoat. Apply each repair coat to approximate thickness of surrounding coating system.

3.10 FIELD TESTS AND INSPECTION

3.10.1 NACE Coating Inspector

**************************************************************************
NOTE: Include requirement for NACE Coating inspector in Section 01 45 00 QUALITY CONTROL, as a QC Specialist. Use NACE Certified inspector for most projects, NACE Basic inspector for small projects.
**************************************************************************

For Navy projects, make modifications to Section 01 45 00 QUALITY CONTROL as follows:

1. Requirements of the NACE Coating Inspector should be as follows:

"The NACE [Certified][Basic] Coating Inspector shall be an independent third party hired directly by the
prime construction contractor as an integral part of the prime construction contractor's Quality Control Organization. This inspector shall have no business relationships (owner, partner, operating officer, distributor, salesman, or technical representative, inspector) with any subcontractors involved with this project; or with any manufacturers, suppliers or installers for any material or equipment provided as part of this project."

2. The scope and duration of the NACE coating inspector should be as follows:

"The NACE Coating Inspector shall be present during all pre-preparation testing, surface preparation, coating application, initial cure of coating system, and during all repair work."

3. A submittal should be required as follows:

"Submit name, address, telephone number, FAX number, and e-mail address of the proposed coating inspector. Submit documentation that inspector is a [Certified][Basic] Coating Inspector under the National Association of Corrosion Engineers (NACE) Coating Inspector Training and Certification Program (NCITCP), including NACE inspector identification number, date of qualification, and expiration date."

For Army projects, make modifications to Section 01 45 00 QUALITY CONTROL as follows:

Add NACE Coating Inspector to paragraph CQC PERSONNEL and its associated Experience Matrix. The NACE Coating Inspector should be directly employed by the prime contractor. Use the following for the Qualifications column:

"[Certified][Basic] Coating Inspector under the National Association of Corrosion Engineers (NACE) Coating Inspector Training and Certification Program (NCITCP)"

The NACE Coating Inspector shall be present during all pre-preparation testing, surface preparation, coating application, initial cure of coating system, and during all repair work.

3.10.2 Field Inspection

The NACE Coating Inspector shall accomplish field inspection. Use the Daily Inspection Checklist forms attached to the end of this section, or a similar checklist with all pertinent data included. Record all surface preparation and coating application work accomplished, environmental conditions during this work, and results of regular inspections. Record all deviations from specifications. Accomplish testing in accordance with NACE SP0288 and as required herein.
3.10.2.1 Thickness Testing

Following application of each coat, inspect surfaces in presence of the Contracting Officer for pinholes, blisters, inadequate coating thickness, and other defects. Repair imperfections found. Measure dry film thickness in accordance with SSPC PA 2. Provide additional coating where required.

3.10.3 Hold Points for Quality Control Inspections

Provide appropriate QC inspections at the following hold-points:
<table>

3.11 ELECTRICAL WORK

3.11.1 Terminating Aluminum Stranded Conductors

a. Use particular care in making up joints and terminations. Remove surface oxides by cleaning with a wire brush or emery cloth. Apply joint compound to conductors, and use UL-listed solid aluminum connectors for connecting aluminum to aluminum conductors.

b. Terminate aluminum conductors to existing steel tower structure using a circumferential compression type, aluminum bodied terminal lug UL listed for AL/CU and steel Belleville spring washers, flat washers, bolts, and nuts. Belleville spring washers shall be cadmium-plated hardened steel. Surface of existing steel where connection is to be made shall be stripped free of paint. Special care shall be taken to avoid destruction of underlying galvanized surface. Install the Belleville spring washers with the crown up toward the nut or bolt head, with the concave side of the Belleville bearing on a heavy-duty, wide series flat washer of larger diameter than the Belleville. Tighten nuts sufficient to flatten Belleville and leave in that position. Lubricate hardware with joint compound prior to making connection. Wire brush and apply joint compound to conductor prior to inserting in lug.
c. Terminate aluminum conductors to aluminum bus by using all-aluminum nuts, bolts, washers, and lugs. Wire brush and apply joint compound to conductor prior to inserting in lug. Lubricate hardware with joint compound prior to making connection; if bus contact surface is unplated, scratch-brush and coat with joint compound (without grit).

3.12 FINAL CLEANUP

Following completion of the work, remove debris, equipment, and materials from the site. Remove temporary connections to Government or Contractor furnished water and electrical services. Restore existing facilities in and around the work areas to their original condition.

**NOTES:**

1. Modify paragraph 3.6.4 Viscosity and Pot Life, of MIL-PRF-85285 as follows:

   The viscosity of the admixed coating, when tested in accordance with ASTM D1200 through a No. 4 Ford cup, shall be as follows:

<table>
<thead>
<tr>
<th>Time from mix (minimum)</th>
<th>Maximum time through a No. 4 Ford Cup</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initially</td>
<td>30 seconds</td>
</tr>
<tr>
<td>2 hours</td>
<td>60 seconds</td>
</tr>
<tr>
<td>4 hours</td>
<td>No gel</td>
</tr>
</tbody>
</table>

2. Modify paragraph 3.7.1 Drying Time, of MIL-PRF-85285. When applied by spray techniques and when tested in accordance with ASTM D1640/D1640M, the coating shall be set-to-touch within four hours and dry-hard within eight hours (see 4.6 and table I).

**GENERAL NOTES:**

Test methods as specified in MIL-PRF-85285, except those marked with "*". Where "Conform" is indicated, refer to specific requirements of MIL-PRF-85285.

    3.9.2.5 Inspection Equipment
3.10 FINAL CLEANUP

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for zinc-rich epoxy/epoxy/polyurethane coating systems for the following:

1. New steel components in atmospheric service (non-immersion) which require the highest performance available to address severe environments, or where life-cycle costs are justified to avoid facility shutdowns for future re-coatings; or where finish application degradation, such as peeling, which jeopardizes assets within a facility. This includes, but is not limited to, aboveground fuel tanks, water tanks, and piping; components identified in UFC 4-211-01 Aircraft Maintenance Hangars, cranes, and towers.

2. New structures and coating of existing structures where all existing coating material is being removed to bare metal.

3. Repairing and coating of galvanized surfaces. Repair galvanizing with the zinc-rich primer, and apply general coats of intermediate and topcoat to all surfaces.

Coordinate surface preparation and coating systems with applicable Division 05 and Division 08 UFGS Sections.

Adhere to [UFC 1-300-02](#) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in
Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: To determine the requirements for maintenance of an existing coating, a coating inspection, or coating condition survey (CCS), as described herein, should be accomplished prior to designing the coating project. Without a competent inspection, there is no reliable way to determine the type or condition of the existing coating system. Without knowing the existing conditions, proper (effective and financially supportable) surface preparation or coating system selection cannot be made.

NOTE: This specification should be edited by an SSPC certified Protective Coatings Specialist (PCS) that has five or more years of experience preparing coating specifications.

The designer should not alter the products and processes specified herein without thorough knowledge of the need for the changes and the implications of those changes.

NOTE: The metric standard for measuring coating thickness is microns (25.4 microns=1 mil - use nominal 25 microns=1 mil).

NOTE: This specification is for an industry standard, 3 Coat, thin film, coating system that is compliant with EPA VOC regulations as of June 2000:

- Epoxy coats 350 g/l 2.8 lbs/gal max. VOC
- Polyurethane Topcoat 350 g/l 2.8 lbs/gal max. VOC

The designer shall review state and local regulations and determine whether the coating in this Section complies with restrictions on volatile organic components (VOC) and other chemical constituents.

NOTE: Previous versions of this specification have included a requirement for surfaces to be abrasive blasted to SSPC 7/NACE No.4, inspected, and repaired, prior to coating. That requirement has
been removed from this specification, and if required for a repair project, it should be included in the structural repair Section of the project specification. Tailor the paragraph to the needs of cleaning that will be required in preparation for repairs, and note that the abrasive blasting for inspection should be accomplished in such a manner that it does not conflict with any surface condition requirements in this Section, such as creating excessive surface profile that may require excessive primer thickness. For repair projects, specify appropriate portions of the steel surfacing requirements (according to NACE RP0178) from Section 33 56 21.17 SINGLE WALL ABOVE GROUND FIXED ROOF STEEL POL STORAGE TANK.

**************************************************************************
**************************************************************************

NOTE: For purposes of this specification, the term "maintenance coating" refers to maintenance overcoating as opposed to complete removal of coatings and recoating. For maintenance coating designs, or to determine if maintenance overcoating is appropriate, a coating condition survey (CCS) should be accomplished. The CCS should be accomplished by personnel from a business that routinely performs coating evaluations, and the individual investigator should be Certified by SSPC as a Protective Coatings Specialist. The CCS should be sufficiently detailed to provide all technical information about the coatings, and structures to be coated, required to properly design the project. At a minimum, the CCS should provide a detailed report of:

1. Existing coating conditions, including condition of coating film, and the existence of potentially hazardous substances that may impact coating management (i.e. lead, cadmium, chromium);

2. Analysis of remaining coating life, suitability of overcoating, and technical requirements for overcoating;

3. Technical recommendations for the most cost effective management of existing coating systems, including any hazardous materials present in paint film; and

4. Any other information of interest to the coating system management that should be identifiable by an individual trained and experienced in the field of coating analysis, coating failure analysis, and coating design.

The scope of the CCS should be tailored to the specific project, and it should be recognized that while multiple coating failures or deficiencies may look similar to the untrained eye, the risks of
generalizing to save evaluation costs are potentially very high. The cost of large-scale failure of the overcoating, and complete replacement of the coating system, is far more than the cost of a CCS for all but the smallest projects.

The risks of overcoating can usually be avoided by designing project to remove all existing coatings to bare metal, then providing appropriate surface preparation and coating application. However, the extra costs of the coating removal, especially if containing hazardous material, along with the cost of surface preparation to SSPC SP 10 Abrasive Blast to Near-White Metal, may be exorbitant compared to the costs of maintenance overcoating where the existing coating system is in fair-to-good condition.

Additionally, NAVFAC Design Policy Letter DPL-09B-0001, Lead-containing Paint on Non-residential Structures of 26 Mar 92 provides guidance for managing paints containing lead and other hazardous materials in place. The fact that lead was highly used as a primer is indicative of its value to the corrosion control industry. Premature removal of sound lead primer is not considered to be a good management practice.

Activities should consider an annual CCS to survey all structures to be authorized for design in the coming year. When accomplished for multiple projects, the per-structure cost will decrease. By accomplishing this survey prior to design, the basis for design is fully identified.

The CCS can also be a very useful tool when used to screen structures for maintenance painting requirements. A CCS can be scoped to provide a general inspection of many structures to screen for near-term overcoating or recoating requirements, and subsequent investigation can be made to provide appropriate details for project planning and design.

It should be pointed out that the aesthetic features of a coating do not define the coating condition; they only describe how the coating looks. Many coating systems have been replaced when only the topcoat is in need of "refurbishment." Likewise, many structures such as water tanks and fuel tanks have had complete coating replacement when only the roof coating needed replacement. A CCS can identify the weak components as well as the satisfactory components, and propose solutions to make maximum use of existing resources.

SSPC: The Society for Protective Coatings (SSPC), has published a Technology Update titled SSPC TU 3 Maintenance Overcoating. This document should be used as a guide for scoping the CCS, for accomplishing the CCS, and for designing the coating
work.

**************************************************************************

NOTE: Designers are encouraged to contact Robert Jamond (robert.jamond@navy.mil) prior to beginning a new Navy design.

**************************************************************************

NOTE: Designers are encouraged to contact the Air Force Civil Engineer Reachback Center (afcec.rbc@us.af.mil) prior to beginning a new Air Force design.

**************************************************************************

PART 1   GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 DEFINITIONS

Definitions are provided throughout this Section, generally in the paragraph where used, and denoted by capital letters.

1.3 SUBMITTALS
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Contract Errors, Omissions, and Other Discrepancies

Submit all errors, omissions, and other discrepancies in contract documents to the Contracting Officer within 30 days of contract award for all work covered in this Section, other than the work that will not be uncovered...
until a later date. All such discrepancies shall be addressed and resolved, and the Coating Work Plan modified, prior to beginning the Initial and Follow-Up phases of work. Discrepancies that become apparent only after work is uncovered shall be identified at the earliest discoverable time and submitted for resolution. Schedule time (Float) should be built into the project schedule at those points where old work is to be uncovered or where access is not available during the first 30 days after award, to allow for resolution of contract discrepancies.

1.4.2 Corrective Action (CA)

CA shall be included in the Quality Control Plan.

1.4.2.1 Corrective Action Procedures

Develop procedures for determining the root cause of each non-compliance, developing a plan to eliminate the root cause so that the non-compliance does not recur, and following up to ensure that the root cause was eliminated. Develop Corrective Action Request (CAR) forms for initiating CA, and for tracking and documenting each step.

1.4.2.2 Implement Corrective Action

The Contractor shall take action to identify and eliminate the root cause of each non-compliance so as to prevent recurrence. These procedures shall apply to non-compliance in the work, and to non-compliance in the QC System. Corrective actions shall be appropriate to the effects of the non-compliance encountered. Each CAR shall be serialized, tracked in a Log to completion and acceptance by the Contracting Officer, and retained in project records. The Corrective Action Log, showing status of each CAR, shall be submitted to the Contracting Officer monthly. A CAR may be initiated by either the Contractor or the Contracting Officer. The Contracting Officer must approve each CAR at the root cause identification stage, the plan for elimination stage, and the close out stage after verification that the root cause has been eliminated.

1.4.3 Coating Work Plan

**************************************************************************
NOTE: For maintenance painting, add requirement for pre-work determination of the existing surface profile. If paint removal is specified in another Section, such as a blast cleaning prior to inspection or repair, or in the lead removal Section, include this evaluation of existing profile such that the paint removal operation does not create excessive profile.
**************************************************************************

This work plan shall be considered as part of the Quality Control Plan.

Provide procedures for reviewing contract documents immediately after award to identify errors, omissions, and discrepancies so that any such issues can be resolved prior to project planning and development of detailed procedures.

Provide procedures for verification of key processes during Initial Phase to ensure that contract requirements can be met. Key processes shall include surface preparation, coating application and curing, inspection,
and documentation, and any other process that might adversely impact orderly progression of work.

Provide procedures for all phases of coating operations, including planned work, rework, repair, inspection, and documentation. Address mobilization and setup, surface preparation, coating application, coating initial cure, tracking and correction of noncompliant work, and demobilization. Coordinate work processes with health and safety plans and confined space entry plans. For each process, provide procedures that include appropriate work instructions, material and equipment requirements, personnel qualifications, controls, and process verification procedures. Provide procedures for inspecting work to verify and document compliance with contract requirements, including inspection forms and checklists, and acceptance and rejection criteria.

Provide procedures for determining the existing surface profile under paint, and procedures for ensuring that the profile is not increased beyond the maximum profile specified herein.

Provide procedures for correcting noncompliant work. Detailed procedures are required in advance to avoid delays in meeting overcoat windows as well as to avoid delays in production. Provide procedures for repairing defects in the coating film, such as runs, drips, sags, holidays, overspray, as well as how to handle correct coating thickness noncompliance, any other areas of repair or rework that might be adversely affected by delays in preparing and approving new procedures.

If a procedure is based on a proposed or approved request for deviation, the deviation shall be referenced. Changes to procedures shall be noted by submittal number and date approved, clearly delineating old requirements and new requirements, so that the records provide a continuous log of requirements and procedures.

1.4.4 Design Data

1.4.4.1 Containment System

Submit complete design drawings and calculations for the scaffolding and containment system, including an analysis of the loads which will be added to the structure by the containment system and waste materials. A registered engineer shall approve calculations and scaffold system design.

1.4.5 Test Reports

1.4.5.1 Joint Sealant Qualification Test Reports

Submit test results from independent laboratory of representative samples of joint sealant material. Samples must have been tested within the last three years. Submit results as required in paragraph QUALITY ASSURANCE PROVISIONS of ASTM C920. Note that testing in accordance with QUALITY ASSURANCE PROVISIONS is a pre-qualification requirement.

1.4.5.2 Coatings Qualification Test Reports

Submit test results from independent laboratory of representative samples of each coating material. U.S. Department of Defense laboratories are considered to be independent laboratories for purposes of compliance with "QUALIFICATION INSPECTION" requirements herein. Samples must have been tested within the last three years. Submit results for epoxy materials as
required in paragraph QUALIFICATION INSPECTION of MIL-DTL-24441, and as revised by paragraph COATING SYSTEM herein. Submit results for polyurethane materials as required in paragraph QUALIFICATION INSPECTION of MIL-PRF-85285, and as revised by paragraph COATING SYSTEM herein. Note that requirement for QUALIFICATION INSPECTION is a pre-qualification requirement, and involves the same testing required for listing in the Qualified Products List of the respective material. See appropriate Military Specification for specific test requirements.

1.4.5.3 Metallic Abrasive Qualification Test Reports

Submit results for abrasive as required in paragraph 4 REQUIREMENTS of SSPC AB 3. Submit test results from independent laboratory of representative samples of each abrasive to be used on the jobsite. Samples must have been tested within the last three years. Note that this testing is for the purpose of prequalifying the abrasive.

1.4.5.4 Recycled Metallic Abrasive Field Test Reports (Daily and Weekly)

Submit test results from independent laboratory of daily and weekly Quality Control testing required by SSPC AB 2, as modified in paragraph ABRASIVE.

1.4.6 Qualifications

1.4.6.1 Qualifications of Certified Industrial Hygienist (CIH)

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party CIH. Submit documentation that hygienist is certified by the American Board of Industrial Hygiene in comprehensive practice, including certification number and date of certification/recertification. Provide evidence of experience with hazards involved in industrial coating application work.

1.4.6.2 Qualifications of Certified Protective Coatings Specialist (PCS)

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party PCS. Submit documentation that specialist is certified by SSPC: The Society for Protective Coatings (SSPC) as a PCS, including certification number and date of certification/recertification. If the PCS is employed by the same coating inspection company to which the coating inspector is employed, this does not violate the independent third-party requirements. The PCS shall remain certified during the entire project, and the Contracting Officer shall be notified of any change in certification status within 10 days of the change. The PCS shall not be the designated coating inspector.

1.4.6.3 Qualifications of Coating Inspection Company

Submit documentation that the coating inspection company that will be performing all coating inspection functions is certified by SSPC to the requirements of SSPC QP 5 prior to contract award, and shall remain certified while accomplishing any coating inspection functions. The coating inspection company must remain so certified for the duration of the project. If a coating inspection company's certification expires, the firm will not be allowed to perform any inspection functions, and all surface preparation and coating application work must stop, until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply. Notify the Contracting Officer...
Officer of any change in coating inspection company certification status.

1.4.6.4 Qualifications of QC Specialist Coating Inspector

Submit documentation that each coating inspector is employed, and qualified to SSPC QP 5, Level III, by the selected coating inspection company. Each inspector shall remain employed by the coating inspection company while performing any coating inspection functions.

1.4.6.5 Qualifications Of Individuals Performing Abrasive Blasting

Submit name, address, and telephone number of each person that will be performing abrasive blasting. Submit documentation that each blaster is qualified by SSPC to the SSPC C-7 Dry Abrasive Blaster Qualification Program. Each blaster shall remain qualified during the entire period of abrasive blasting, and the Contracting Officer shall be notified of any change in qualification status.

1.4.6.6 Qualifications of Testing Laboratory for Coatings

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party laboratory selected to perform testing of coating samples for compliance with specification requirements. Submit documentation that laboratory is regularly engaged in testing of paint samples for conformance with specifications, and that persons performing analyses are qualified.

1.4.6.7 Qualifications of Testing Laboratory for Abrasive

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party laboratory selected to perform testing of abrasive for compliance with specification requirements. Submit documentation that laboratory has experience in testing samples of abrasive for conformance with specifications, and that persons performing analyses are qualified.

1.4.6.8 Qualifications of Coating Contractors

**************************************************************************
NOTE: If project involves removal of paint containing hazardous materials, add requirement for SSPC QP-2 certification in section of specification where the hazardous paint removal is specified, generally Section 02 83 00 LEAD REMEDIATION.
**************************************************************************

**************************************************************************
NOTE: Solicitations requiring certification for prequalification should point out the existence and location of the certification requirement on the PROJECT INFORMATION FORM. This requirement must be pointed out in the solicitation documents for the "prior to contract award" requirement to be enforceable. Certification is a special responsibility requirement pursuant to FAR 9.104-2 Special Standards. This is analogous to requiring bidders to have a specified level of experience or expertise and GAO has sustained these types of special requirements.
**************************************************************************
All Contractors and Subcontractors that perform surface preparation or coating application shall be certified to either ISO 9001 or SSPC QS 1 and SSPC QS 1 prior to contract award, and shall remain certified while accomplishing any surface preparation or coating application. The painting Contractors and painting Subcontractors must remain so certified for the duration of the project. If a Contractor's or Subcontractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply. Notify the Contracting Officer of any change in Contractor certification status.

1.4.6.9 Joint Sealant Materials

Provide manufacturer's certification of conformance to contract requirements.

1.4.6.10 Coating Materials

Provide manufacturer's certification of conformance to contract requirements.

1.4.6.11 Coating System Component Compatibility

Provide certification from each manufacturer of components of the coating system, epoxy primer, epoxy intermediate, and polyurethane topcoat, that the supplied coating material is suitable for use in the specified coating system. Each manufacturer shall identify the specific products, including manufacturer's name, which their product may be used with. The certification shall provide the name of the manufacturer that will provide technical support for the entire system. When all coating materials are manufactured by one manufacturer, this certification is not required.

1.4.6.12 Non-metallic Abrasive

Provide manufacturer's certification that the materials are currently approved by the Naval Sea Systems Command and listed on the Qualified Products Lists (QPL) for the specified materials.

1.4.6.13 Metallic Abrasive

Provide manufacturer's certification of conformance to contract requirements and provide copies of test results.

1.4.7 Protective Coating Specialist (PCS)

The PCS shall be considered a QC Specialist and shall report to the QC Manager, as specified in Section 01 45 00 QUALITY CONTROL. The PCS shall approve all submittals prior to submission to the QC Manager for approval or submission to the government for approval.

1.4.8 Pre-Application Meeting

After approval of submittals but prior to the initiation of coating work, Contractor representatives, including at a minimum, project superintendent and QC manager, paint foreman, coating inspector, and PCS shall have a pre-application coating preparatory meeting. This meeting shall be in
addition to the pre-construction conference. Specific items addressed shall include: corrective action requirements and procedures, coating work plan, safety plan, coordination with other Sections, inspection standards, inspection requirements and tools, test procedures, environmental control system, safety plan, and test logs. Notify Contracting Officer at least ten days prior to meeting.

1.5 PRODUCT DATA

1.5.1 Joint Sealant Instructions

Submit manufacturer's printed instructions including detailed application procedures, minimum and maximum application temperatures, and curing procedures. Include Safety Data Sheets (SDS) for materials to be used at the job site in accordance with 29 CFR 1926.59.

1.5.2 Coating System Instructions

Submit manufacturer's printed instructions including detailed mixing and application procedures, number and types of coats required, minimum and maximum application temperatures, and curing procedures. Include Safety Data Sheets (SDS) for materials to be used at the job site in accordance with 29 CFR 1926.59.

1.6 DELIVERY AND STORAGE

Ship, store, and handle materials in accordance with SSPC PA 1, and as modified in this Section. Maintain temperature in storage spaces between 5 and 29 degrees C 40 and 85 degrees F, and air temperature more than 3 degrees C above the dew-point at all times. Inspect materials for damage prior to use and return non-compliant materials to manufacturer. Remove materials with expired shelf life from government property immediately and notify the Contracting Officer.

If materials are approaching shelf life expiration and an extension is desired, samples may be sent to the manufacturer, along with complete records of storage conditions, with a request for shelf life extension. If the manufacturer finds the samples and storage data suitable for shelf life extension, the manufacturer may issue an extension, referencing the product evaluation and the review of storage records. Products may not be extended longer than allowed in the product specification.

1.7 COATING HAZARDS

**************************************************************************
NOTE: This specification Section should be used with Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS".
**************************************************************************

Ensure that employees are trained in all aspects of the safety plan. Specified coatings may have potential health hazards if ingested or improperly handled. The coating manufacturer's written safety precautions shall be followed throughout mixing, application, and curing of the coatings. During all cleaning, cleanup, surface preparation, and paint application phases, ensure that employees are protected from toxic and hazardous chemical agents which exceed concentrations in 29 CFR 1910.1000. Comply with respiratory protection requirements in 29 CFR 1910.134. The CIH shall approve work procedures and personal protective equipment.
1.8 JOB SITE REFERENCES

**************************************************************************
NOTE: Include any other jobsite related references that might be added during design.
**************************************************************************

Make available to the Contracting Officer at least one copy each of ASTM D3276, ASTM D3925, ASTM D4285, ASTM D7127, SSPC SP COM, SSPC SP 1, SSPC 7/NACE No. 4, SSPC SP 10/NACE No. 2, SSPC PA 1, SSPC PA 2, SSPC Guide 6, SSPC VIS 1, SSPC QP 1, SSPC QS 1, and an SSPC Certified Contractor Evaluation Form at the job site.

PART 2 PRODUCTS

2.1 JOINT SEALANT

TT-S-00230, Type II, Class B

2.2 COATING SYSTEM

**************************************************************************
NOTE: Use the first bracketed paragraph for entirely field applied systems.

Use the second bracketed paragraph option for applied coatings systems applied entirely in the shop, where required such as, but not limited to, exterior and interior ferrous metal components identified in UFC 4-211-01 Aircraft Maintenance Hangars.

Refer to Part 3 of this Section for surface preparation.

Coordinate with applicable Division 05 UFGS Sections and Division 08 UFGS Sections.
**************************************************************************

Alternate systems or products will not be considered. Provide a complete system (primer, intermediate coat, top coat) material from one supplier.

[ Apply the entire coating system in the field. Remove all shop-applied primer prior to final field surface preparation and coating system application. Adjust all shop preparation to avoid conflicts with final surface preparation requirements.

][Prepare surface and apply the complete coating system in the shop. Follow all temperature, humidity, and testing requirements listed herein.

] The Military specification epoxy and polyurethane products specified in this Section do not require approval for listing on the QPL prior to contract award, as indicated in paragraph 3.2 of MIL-DTL-24441 and paragraph 3.1 of MIL-PRF-85285. Testing of products by an independent laboratory to the QUALIFICATION INSPECTION requirements of MIL-DTL-24441 and MIL-PRF-85285 prior to contract award is required. See specific submittal requirements in paragraph QUALITY ASSURANCE.
2.2.1 Zinc-Rich Epoxy Primer Coat

Epoxy polyamide, MIL-DTL-24441/19 (Formula 159, Type III).

2.2.2 Epoxy Intermediate Coat

Epoxy polyamide, MIL-DTL-24441/31 (Formula 152, Type IV, White (Tinted)). Tint to approximately SAE AMS-STD-595A color number 27778 parchment using pigment dispersions prepared for epoxy paint tinting. Manufacturer shall tint material and appropriately label. All other requirements of this Military Specification apply.

2.2.3 Polyurethane Topcoat

******************************************************************************
NOTE: Check with the activity to determine the desired topcoat color and finish. Generally, use white for Navy projects and beige for Air Force projects. Color number 17925 is white, and 27769 is beige. FAA Safety colors are White 17875 and Orange 12197. Always specify contrasting colors between coats. Finish schedule must reflect color selected below.
******************************************************************************

Modify paragraph 3.6.4 of MIL-PRF-85285, Viscosity and Pot Life, as follows:

The viscosity of the admixed coating, when tested in accordance with ASTM D1200 through a No. 4 Ford cup, shall be as follows:

<table>
<thead>
<tr>
<th>Time from mix (minimum)</th>
<th>Maximum time through a No. 4 Ford cup</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initially</td>
<td>30 seconds</td>
</tr>
<tr>
<td>2 hours</td>
<td>60 seconds</td>
</tr>
<tr>
<td>4 hours</td>
<td>No gel</td>
</tr>
</tbody>
</table>

Modify paragraph 3.7.1 of MIL-PRF-85285, Drying Time, as follows:

When applied by spray techniques and when tested in accordance with ASTM D1640/D1640M, the coating shall be set-to-touch within four hours and dry-hard within eight hours (see 4.6 and table I).

[2.3 COLOR IDENTIFICATION OF FUEL HANDLING AND STORAGE FACILITIES]

Piping, conduit, and tank identification shall be in accordance with MIL-STD-161. Mark direction of fluids in accordance with MIL-STD-161. The NATO symbol for JP-8 is F-34.
2.4 COATING SAMPLE COLLECTION AND SHIPPING KIT

Provide a kit that contains one liter quart can for the base of each coating material, an appropriately sized can for each activator, dipping cups for each component to be sampled, a shipping box sized for the samples to be shipped, and packing material. Mark cans for the appropriate component. Provide shipping documents, including either pre-paid shipping or a shipper number that can be used by the QC Manager to arrange pickup, addressed to the approved coating testing laboratory.

2.5 ABRASIVE SAMPLE COLLECTION AND SHIPPING KIT

Provide a kit that contains one suitable plastic bag or container for each sample to be collected. Mark containers for the appropriate component. Provide shipping documents, including either pre-paid shipping or a shipper number that can be used by the QC Manager to arrange pickup, addressed to the approved coating testing laboratory.

2.6 TEST KITS

2.6.1 Test Kit for Measuring Chloride, Sulfate and Nitrate Ions on Steel and Coated Surfaces

Provide test kits that meet all of the following requirements:

a. Contains all materials, supplies, tools, and instructions for field testing and on-site quantitative evaluation of chloride, sulfate, and nitrate ions;

b. Extract solution is acidic, factory pre-measured, pre-packaged, and of uniform concentration;

c. Components and solutions are mercury free and environmentally friendly;

d. Contains new materials and solutions for each test extraction;

e. Contains an extraction test container (vessel, sleeve, cell) that creates a sealed, encapsulated environment during salt ion extraction;

f. Contains a test extract container suitable for testing the following steel surfaces: horizontal (up/down configuration), vertical, flat, curved, smooth, pitted, and rough;

g. All salt ion concentrations are directly measured in micrograms per square centimeter.

2.6.2 Test Kit for Identifying Amine Blush on Epoxy Surfaces

Provide test kits that meet all of the following requirements:

a. Is a completely self-contained field test kit with all materials, supplies, tools, and instructions to perform tests and indicate the presence of unreacted amines;

b. Uses an identifiable, consistent, uniform, pre-packaged, factory pre-measured indicating solution;

c. Contains no mercury or lead and is environmentally friendly;
d. Contains a solution of an unreacted amine for the purpose of "self checking" the indicator solution;

2.7 ABRASIVE

The referenced abrasive specifications have maximum limits for soluble salts contamination, however, this maximum level of contamination does not guarantee that contamination will not be transferred to the steel surface during abrasive blasting. Other factors such as on-site handling and recycling can allow contamination of abrasive. Contractors are cautioned to verify that the chosen abrasive, along with work and storage processes, allow the final surface cleanliness requirements to be achieved. Successful testing of chlorides in abrasive does not negate the final acceptance testing of steel surfaces.

**************************************************************************
NOTE: The following paragraph is mandatory for all NAVFAC PAC projects. All other agencies may use it after checking applicability.
**************************************************************************

[Intepret MIL-A-22262 to include the meaning that abrasive material contains a maximum one percent by weight of any toxic substance listed in either Table Z-1, Z-2, or Z-3 or 29 CFR 1910-SUBPART Z, with the exception of inert or nuisance dust materials, arsenic, beryllium, cadmium, cobalt, lead, mercury, rhodium, silver, tellurium, thallium, and uranium.]

**************************************************************************
NOTE: Reduce allowable gross gamma radioactivity to 5 picocuries per gram for all NAVFAC PAC projects. Reduce in other areas if states or localities require.
**************************************************************************

2.7.1 Non-metallic Abrasive

Conform to MIL-A-22262, Type I (Inorganic materials) except that the gross gamma radioactivity shall not exceed 5 picocuries per gram. Abrasive shall be approved by the Naval Sea Systems Command and listed on the appropriate Qualified Products List (QPL) for the specified materials. Use sampling procedures and testing frequencies as prescribed in MIL-A-22262. Use abrasive that is specifically selected and graded to provide a sharp, angular profile to the specified depth. Do not use ungraded abrasive. Make adjustments to processes or abrasive gradation to achieve specified surface profile. Recycled non-metallic abrasive shall meet all requirements of the specification each time that it is placed in the blast pot.

2.7.2 Metallic Abrasive

2.7.2.1 New and Remanufactured Steel Grit

Conform to the chemical and physical properties of SSPC AB 3 Class 1 (Steel) only, except that the gross gamma radioactivity shall not exceed 5 picocuries per gram. Class 2 (Iron) abrasive shall not be used.

To develop a suitable work mix from new steel abrasive, a minimum of 200 - 400 recycles is required, therefore, it is advantageous for a Contractor to use remanufactured steel grit or grit reclaimed from a previous project.
Such grit shall be considered to conform if it can be traced to new grit conforming to SSPC AB 3 Class 1 and it meets all cleanliness requirements of SSPC AB 3 Class 1 when brought to the current jobsite. Submit one representative sample of this work mix to the laboratory for testing, along with samples of new material. Acceptance and use of this work mix shall not be used to justify any deviation from surface preparation requirements.

2.7.2.2 Recycled Steel Grit

Conform to the chemical and physical properties of SSPC AB 2

2.8 WHITE ALUMINUM OXIDE NON-SKID GRIT

Size #60, dust free (washed and dry), minimum 99 percent pure, having the following sieve analysis when tested in accordance with ASTM E11 using a 1000 gram 2.2 pound sample:

<table>

</table>

PART 3 EXECUTION

Perform all work, rework, and repair in accordance with approved procedures in the Coating Work Plan.

[3.1 REMOVAL OF COATINGS CONTAINING HAZARDOUS MATERIALS

**************************************************************************

NOTE: Include Section 02 83 00 LEAD REMEDIATION in any project specification that requires removal or disturbance of coating containing hazardous materials. Include a contractor qualification requirement similar to the article entitled "Qualifications of Coating Contractors" in Part 1 of this Section, except that the contractor shall be qualified to SSPC QP-2, Category A. The removal of coatings containing hazardous materials and application of new coating system can be accomplished in a continuous operation if the contractor provides appropriate coordination of removal, cleaning, and coating application. It is specified as two separate operations to allow separate contractors to accomplish different phases of project. With the use of SSPC QP-1 and QP-2 requirements in contracts, the same contractor will generally be accomplishing both phases of work, and will probably want to perform both phases as a single operation so as not to have to prepare surface twice. To accomplish the coating removal and recoating in a continuous operation, the contractors plan must be scrutinized for appropriate controls on the removal process, and on the surface.
Coatings containing hazardous materials and identified for disturbance during surface preparation, including removal, shall be handled in accordance with Section 02 83 00 LEAD REMEDIATION. Coordinate surface preparation requirements from Section 02 83 00 LEAD REMEDIATION with this Section.

3.2 COATING AND ABRASIVE SAMPLE COLLECTION AND TESTING

Sample and test materials delivered to the jobsite. Notify Contracting Officer three days in advance of sampling. The QC Manager and either the PCS or coating inspector shall witness all sampling.

3.2.1 Coating Sample Collection

Provide a sample collection kit as required in paragraph COATING SAMPLE COLLECTION AND SHIPPING KIT. From each lot, obtain a one liter quart sample of each base material, and proportional samples of each activator based on mix ratio, by random selection from sealed containers in accordance with ASTM D3925. Prior to sampling, mix contents of each sealed container to ensure uniformity. As an alternative to collecting small samples from kits, entire kits may be randomly selected and shipped to laboratory, observing all requirements for witnessing and traceability. For purposes of quality conformance inspection, a lot is defined as that quantity of materials from a single, uniform batch produced and offered for delivery at one time. A batch is defined as that quantity of material processed by the manufacturer at one time and identified by number on the label. Identify samples by designated name, specification number, batch number, project contract number, sample date, intended use, and quantity involved. The QC manager will take possession of the packaged samples, contact the shipping company to arrange for pickup, and relinquish the samples only to the shipping representative for shipment to the approved laboratory for testing as required by the paragraph COATING SAMPLE TEST REPORTS.

3.2.2 Abrasive Sample Collection

Provide a sample collection kit as required in paragraph ABRASIVE SAMPLE COLLECTION AND SHIPPING KIT. For purposes of quality conformance inspection, a lot shall consist of all abrasive materials of the same type from a single, uniform batch produced and offered for delivery at one time. Obtain samples of each abrasive lot using the sampling techniques and schedule of MIL-A-22262. The addition of any substance to a batch shall constitute a new lot. Identify samples by designated name, specification number, lot number, project contract number, sample date, intended use, and quantity involved. The QC manager will take possession of the packaged samples, contact the shipping company to arrange for pickup, and relinquish the samples only to the shipping representative for shipment to the approved laboratory for testing as required by the paragraph ABRASIVE SAMPLE TEST REPORTS.

3.2.3 Coating Sample Test Reports

Submit test results for each lot of coating material delivered to the jobsite. Test samples of primer, intermediate, and topcoat materials for
compliance with requirements of Table I. Reject entire lot represented by samples that fail one or more tests, select new lots, and test samples.

3.2.4 Abrasive Sample Test Reports

Submit test results for each lot of abrasive delivered to the jobsite. Test samples of metallic abrasive to the requirements of paragraph REQUIREMENTS of SSPC AB 3, except paragraph 4.1.5 DURABILITY. Test samples of non-metallic abrasive as required in paragraph QUALITY CONFORMANCE INSPECTION of MIL-A-22262. Reject entire lot represented by samples that fail one or more tests, select new lots, and test samples.

3.3 SURFACES TO BE COATED

Coat exterior surfaces of [tank ][structure ][____][including steel roof, shell, legs, stair, railing, and other exterior appurtenances].

3.4 LIGHTING

Provide lighting for all work areas as prescribed in SSPC Guide 12.

3.5 ENVIRONMENTAL CONDITIONS

3.5.1 Containment

**************************************************************************
NOTE: Containment was a design option in previous versions where site congestion dictated control of dust and paint overspray. Experience has shown, however, that containment also provides cost-effective control of environmental conditions, and the better conditions result in a better coating product.

SSPC Guide 6, has four classes of containment, from Class 1 being the highest level of control. Generally Classes 1 and 2 are only required for removal of hazardous materials, while Class 3 is probably satisfactory for most coating operations. Class 4 requires minimal "knockdown" of airborne debris, and is not generally usable as an airborne particulate control measure.

**************************************************************************

Design and provide a containment system for the capture, containment, collection, storage and disposal of the waste materials generated by the work under this Section, to meet the requirements of SSPC Guide 6, Class [1][2][3]. Vapor concentrations shall be kept at or below 10 percent of Lower Explosive Limit (LEL) at all times. Containment may be designed as fixed containment for complete structure or portable containment for sections of structure, however, containment shall remain in any one place from beginning of abrasive blasting through initial cure of coating. Waste materials covered by this paragraph shall not include any material or residue from removal of coatings containing lead, chromium, cadmium, PCB, or any other hazardous material.

It is the Contractors responsibility to insure the feasibility and workability of the containment system. The Contractor shall perform his operations and work schedule in a manner as to minimize leakage of the
containment system. The containment system shall be properly maintained and shall not deviate from the approved drawings. If the containment system fails to function satisfactorily, the Contractor shall suspend all operations, except those required to minimize adverse impact on the environment or government property. Operations shall not resume until modifications have been made to correct the cause of the failure.

3.5.2 Automated Monitoring Requirements

Provide continuous monitoring of temperature, relative humidity, and dew point data at pertinent points on the structure, during surface preparation, coating application, and initial cure. Locate sensors to provide pertinent data for the surface preparation and coat application being performed. Monitor any heating, cooling, or dehumidification equipment used. Make data available to the Contracting Officer through Internet access. Provide monitoring equipment to perform as follows:

a. Data is collected in the field unit in one minute increments, and available for download (on-site) in a standard format. Contractor shall collect this data and make available to the Contracting Officer;

b. Monitoring equipment shall have backup power such that data collection and transmission to web server will be uninterrupted during the entire period of the dehumidification requirement;

c. Monitoring equipment shall have capability to measure surface temperatures at a minimum of four locations anywhere on a 150 foot diameter by 50 foot high tank;

d. Monitoring equipment shall have capability to measure interior and exterior dry bulb temperature (DB), relative humidity (RH), and dewpoint temperature (DP);

e. Data shall be available continuously through secure Internet connection, using widely available web browsers;

f. Internet accessible data shall be collected and stored in maximum 15 minute increments, and lag time between data collection and online availability shall be no greater than 70 minutes;

g. Internet accessible data shall be available for viewing online in tabular format, and graphical format using selected data;

h. Internet accessible data shall be available for download in user-defined segments, or entire project to date, in a standard format usable by Microsoft Excel and other spreadsheet programs.

i. Internet-based controls shall provide alerts to pre-designated parties through email messaging;

j. Internet-based controls shall monitor data uploads from field unit and issue alert if data not initiated within 60 minutes of last upload;

k. Internet-based controls shall monitor operation of DH equipment and issues alert when power remains off for more than 15 seconds, or if pre-determined temperature, RH, or DP conditions are exceeded;

The requirements listed here were developed around the Munters Exactaire Monitoring System, as this was the only monitoring system having Internet
connectivity known to be commercially available. There is no requirement for connectivity of the monitoring system to control the DH equipment; therefore, any combination of equipment having the required functionality will be accepted.

3.6 SURFACE PREPARATION

**************************************************************************
NOTE: When editing this specification for maintenance coating work where Water jet cleaning is to be allowed, include note for the contractor to use potable water, monitor the quality of the water, and adjust water quality to assure appropriate surface preparation and final surface requirements. Refer to SSPC-SP WJ-1/NACE WJ-1 Waterjet Cleaning of Metals - Clean to Bare Substrate, SSPC-SP WJ-2/NACE WJ-2 Waterjet Cleaning of Metals - Very Thorough Cleaning, SSPC-SP WJ-3/NACE WJ-3 Waterjet Cleaning of Metals - Thorough Cleaning, and SSPC-SP WJ-4/NACE WJ-4 Waterjet Cleaning of Metals - Light Cleaning. There are many problems that might arise from both dissolved and suspended material. A common occurrence is water with high-chlorides, even in potable water, which may leave unacceptable contamination on cleaned surfaces, and may not be suitable for water jetting.**************************************************************************

3.6.1 Abrasive Blasting Equipment

Use abrasive blasting equipment of conventional air, force-feed, or pressure type. Maintain a minimum pressure of 650 kPa (95 psi) at nozzle. Confirm that air supply for abrasive blasting is free of oil and moisture when tested in accordance with ASTM D4285. Test air quality at each startup, but in no case less often than every five operating hours.

3.6.2 Operational Evaluation of Abrasive

Test abrasive for salt contamination and oil contamination as required by the appropriate abrasive specification daily at startup and every five operating hours thereafter.

3.6.3 Surface Standard

Inspect surfaces to be coated, and select plate with similar properties and surface characteristics for use as a surface standard. Blast clean one or more 300 mm (one foot) square steel panels as specified in paragraph SURFACE PREPARATION. Record blast nozzle type and size, air pressure at nozzle and compressor, distance of nozzle from panel, and angle of blast to establish procedures for blast cleaning. Measure surface profile in accordance with ASTM D7127. When the surface standard complies with all specified requirements, seal with a clearcoat protectant. Use the surface standard for comparison to abrasive blasted surfaces throughout the course of work.

3.6.4 Pre-Preparation Testing for Surface Contamination

Perform testing, abrasive blasting, and testing in the prescribed order.
3.6.4.1 Pre-Preparation Testing for Oil and Grease Contamination

**NOTE:** When specifying maintenance painting, use a water based pH neutral degreaser to avoid damaging existing coating.

Inspect all surfaces for oil and/or grease contamination using two or more of the following inspection techniques: 1) Visual inspection, 2) WATER BREAK TEST, 3) CLOTH RUB TEST. Reject oil and/or grease contaminated surfaces, clean in accordance with SSPC SP 1, and recheck for contamination until surfaces are free of oil and grease.

WATER BREAK TEST - Spray atomized mist of distilled water onto surface, and observe for water beading. If water "wets" surface rather than beading up, surface can be considered free of oil or grease contamination. Beading of water (water forms droplets) is evidence of oil or grease contamination.

CLOTH RUB TEST - Rub a clean, white, lint free, cotton cloth onto surface and observe for discoloration. To confirm oil or grease contamination in lightly stained areas, a non-staining solvent may be used to aid in oil or grease extraction. Any visible discoloration is evidence of oil or grease contamination.

3.6.4.2 Pre-Preparation Testing for Soluble Salts Contamination

Test surfaces for soluble salts, and wash as required, prior to abrasive blasting. Soluble salt testing is also required in paragraph PRE-APPLICATION TESTING FOR SOLUBLE SALTS CONTAMINATION as a final acceptance test of prepared surfaces after abrasive blasting, and successful completion of this phase does not negate that requirement. This phase is recommended since pre-preparation testing and washing are generally more advantageous than attempting to remove soluble salt contamination after abrasive blasting. Effective removal of soluble salts will require removal of any barrier to the steel surface, including rust. This procedure may necessitate combinations of wet abrasive blasting, high pressure water rinsing, and cleaning using a solution of water washing and soluble salts remover. The soluble salts remover shall be acidic, biodegradable, nontoxic, noncorrosive, and after application, will not interfere with primer adhesion. Delays between testing and preparation, or testing and coating application, may allow for the formation of new contamination. Use potable water, or potable water modified with soluble salt remover, for all washing or wet abrasive blasting. Test methods and equipment used in this phase are selected at the Contractor's discretion.

3.6.5 Abrasive Blasting

**NOTE:** The issue of maximum profile on new structures is an important one. Once a profile is established, it is nearly impossible to reduce it, therefore, the initial profile will dictate the profile for the life of the structure.

The specified 2-3 mil surface profile is the preferred depth for preparing for zinc primer. On steel that was previously prepared to a deeper depth.
and coated, it is not feasible to reduce the deeper depth to the preferred depth. A depth of 4 mils can be tolerated with an additional mil of zinc primer thickness.

Designers must be aware that profile found to be in excess of 3 mils may require additional funding to add extra coating material.

To validate contractor claims of pre-existing profile greater than allowed, test an appropriate number of representative spots with abrasive that removes paint but does not affect profile, such as bicarbonate of soda, or other soft abrasive, or waterblasting, etc.

Abrasive blast steel surfaces to near-white metal in accordance with SSPC SP 10/NACE No. 2. Prepared surfaces shall conform to SSPC VIS 1 and shall match the prepared test-panels. Provide a 50 to 75 micron 2 to 3 mil surface profile. Reject profile greater than 75 microns 3 mils, discontinue abrasive blasting, and modify processes and materials to provide the specified profile. Measure surface profile in accordance with ASTM D7127, using Rmax as the measure of profile height. Record all measurements required in this standard. Measure profile at rate of three test areas for the first 100 square meters 1000 square feet plus one test area for each additional 100 square meters 1000 square feet or part thereof. When surfaces are reblasted for any reason, retest profile as specified. Following abrasive blasting, remove dust and debris by vacuum cleaning. Do not attempt to wipe surface clean.

3.6.6 Disposal of Used Abrasive

Dispose of used abrasive off Government property in accordance with Federal, State, and Local mandated regulations.

3.6.7 Pre-Application Testing For Surface Contamination

3.6.7.1 Pre-Application Testing for Oil and Grease Contamination

Ensure surfaces are free of contamination as described in paragraph PRE-PREPARATION TESTING FOR OIL AND GREASE CONTAMINATION, except that only questionable areas need be checked for beading of water misted onto surface.

3.6.7.2 Pre-Application Testing for Soluble Salts Contamination

NOTE: On new structures, require 30 percent of tests to be accomplished at welds. On structures that have been in service, corroded areas should also be tested for high chlorides.

Test surfaces for chloride contamination using the Test Kit described in TEST KIT FOR MEASURING CHLORIDE, SULFATE AND NITRATE IONS ON STEEL AND COATED SURFACES. Test all surfaces at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 200 square meters 2000 square feet or part thereof. (Concentrate testing of bare steel at areas of coating failure to bare steel and areas of corrosion...
pitting. ] Perform 30 percent of tests on bare steel at welds, divided equally between horizontal and vertical welds. ] One or more readings greater than 3 micrograms per square centimeter of chlorides or 10 micrograms per square centimeter of sulfates or 5 micrograms per square centimeter of nitrates is evidence of soluble salt contamination. Reject contaminated surfaces, wash as discussed in paragraph PRE-PREPARATION TESTING FOR SOLUBLE SALTS CONTAMINATION, allow to dry, and re-test until all required tests show allowable results. Reblast tested and cleaned areas as required. Label all test tubes and retain for test verification.

3.6.7.3 Pre-Application Testing for Surface Cleanliness

Apply coatings to dust free surfaces. To test surfaces, apply strip of clear adhesive tape to surface and rub onto surface with finger. When removed, the tape should show little or no dust, blast abrasive, or other contaminant. Reject contaminated surfaces and retest. Test surfaces at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 100 square meters 1000 square feet or part thereof. Provide two additional tests for each failed test or questionable test. Attach test tapes to Daily Inspection Reports.

3.7 MIXING AND APPLICATION OF SEALANT AND COATING SYSTEM

3.7.1 Preparation of Sealant and Coating Materials for Application

Each of the sealant, primer, intermediate, and topcoat materials is a two-component material supplied in separate containers.

3.7.1.1 Mixing Sealant, Primer and Intermediate Coat Materials

Mix in accordance with manufacturer's instructions, which may differ for each product. Do not mix partial kits, or alter mix ratios. Mix materials in same temperature and humidity conditions specified in paragraph DELIVERY AND STORAGE. Allow mixed material to stand for the required induction time based on its temperature.

3.7.1.2 Mixing Topcoat Material

Do not mix partial kits, or alter mix ratios. Mix polyurethane coating materials in same temperature conditions specified in paragraph DELIVERY AND STORAGE. The polyurethane coating material is moisture sensitive and any introduction of moisture or water into the material during mixing or application will shorten usable pot life. Use a mixer that does not create a vortex. Do not add solvent without specific written recommendation from the manufacturer. No induction time is required, only thorough agitation of the mixed material.

3.7.1.3 Pot Life

Apply mixed products within stated pot life for each product. Stop applying when material becomes difficult to apply in a smooth, uniform wet film. Add all required solvent at time of mixing. Do not add solvent to extend pot life. Pot life is based on standard conditions at 21 degrees C 70 degrees F and 50 percent relative humidity. For every 10 degrees C 18 degrees F rise in temperature, pot life is reduced by approximately half, and for every 10 degrees C 18 degrees F drop it is approximately doubled. Usable pot life depends on the temperature of the material at the time of mixing and the sustained temperature at the time of application. Other factors such as the shape of the container and volume of mixed material may
also affect pot life. Precooling or exterior icing of components for at least 24 hours to a minimum of 10 degrees C 50 degrees F in hot climates will extend pot life. High humidity at time of mixing and application shortens pot life of the Polyurethane topcoat material. Following are approximate pot life times:

Sealant As specified by manufacturer
Epoxy primer and intermediate materials 4 hours
Polyurethane topcoat materials 2 hours.

3.7.1.4 Application Conditions and Reccoat Windows

**************************************************************************
NOTE: These new requirements are provided in an attempt to prevent the significant number of intercoat delamination failures that are frequently found on industrial structures. The very strict requirements on application conditions and reccoat windows may require work during abnormal hours, including weekends. Contractor work hours should allow for such during coating application.
**************************************************************************

**************************************************************************
NOTE: Cold-weather application is not covered by this specification. If a project is designed for coating in cold weather, then the enclosure and heating requirements may be significant. It is not intended that contractors be forced to apply coatings in cold weather, however, the underlying premise is that coatings must be applied within the specified temperature ranges. A cold-weather specification should not be used to simply save money, as the coating system will generally not have the same longevity as one applied within 60-100 degrees F.
**************************************************************************

The application condition requirements for the coating system are very time and temperature sensitive, and are intended to avoid the delamination problems frequently found on industrial structures. Plan coating application to ensure that specified temperature, humidity, and condensation conditions are met. If conditions do not allow for orderly application of sealant, primer, stripe coat, intermediate coat and topcoat, use appropriate means of controlling air and surface temperatures, as required. Partial or total enclosures, insulation, heating or cooling, or other appropriate measures may be required to control conditions to allow for orderly application of all required coats.

Maintain air and steel surface temperature between 16 and 38 degrees C 60 and 100 degrees F during application and the first four hours of cure for epoxy coats and the first eight hours of cure for polyurethane coats. Maintain steel surface temperature more than 3 degrees C 5 degrees F above the dew-point of the ambient air for the same period.

Use Table entitled "RECOAT WINDOWS" to determine appropriate reccoat windows for each coat after the initial coat. Apply each coat during appropriate RECOAT WINDOW of preceding coat. If a RECOAT WINDOW is missed, the minimum and maximum primer and intermediate coat thickness may be adjusted to
accommodate a FILL COAT, however, requirements for total epoxy coating thickness and total coating thickness will not be modified. Missing more than one RECOAT WINDOW may require complete removal of coating if maximum total coating thickness requirements cannot be achieved.

If coating is not applied during RECOAT WINDOW, or if surface temperature exceeds 49 degrees C 120 degrees F between applications, provide GLOSS REMOVAL, apply next coat within 24 hours. If next planned coat is topcoat, apply FILL COAT if required to fill sanding marks. Sanding marks from GLOSS REMOVAL of intermediate coat reflecting through topcoat will be considered as noncompliant. Apply FILL COAT within 24 hours of GLOSS REMOVAL, then apply topcoat within RECOAT WINDOW of FILL COAT.

<table>
<thead>
<tr>
<th>RECOAT WINDOWS</th>

RECOAT WINDOWS

<table>
<thead>
<tr>
<th>RECOAT WINDOW (Hrs.)</th>
<th>8-48</th>
<th>6-48</th>
<th>4-36</th>
<th>3-24</th>
<th>2-12</th>
<th>1-2</th>
</tr>
</thead>
</table>

The temperature ranges shown in the table above are for determining recoat windows. Choose recoat window based on the highest surface temperature that was sustained for one or more hours between coats. This applies to the entire time between coats. Measure and record air and surface temperatures on hourly basis to determine appropriate recoat windows. If surface temperature goes above 38 degrees C (100 degrees F), measure and record temperatures every half hour.

FILL COAT - Where indicated, apply coat of intermediate coat epoxy, at 50 to 75 microns 2 to 3 mils DFT, then apply next specified full coat within recoat window of FILL COAT. A FILL COAT may be used to adjust coating thickness to comply with requirements or to fill sanding marks in intermediate coat.

GLOSS REMOVAL - Where required, hand sand in a linear fashion to remove gloss using 120-200 grit wet/dry sandpaper, followed by solvent wiping with a clean rag soaked with denatured alcohol to remove all dust. GLOSS REMOVAL of primer coat is to scarify surface and shall consist of removal of approximately 25 microns 1 mil of coating. If steel is exposed during GLOSS REMOVAL, repair in accordance with paragraph PROCEDURE FOR HOLIDAY AND SPOT REPAIRS OF NEWLY APPLIED COATING. GLOSS REMOVAL of intermediate coat may include removal of up to 75 microns 3 mils of coating to avoid excess thickness, prior to application of FILL COAT.

3.7.2 Amine Blush Testing of Epoxy Coat Prior to Overcoating

Test epoxy surfaces prior to application of roof joint sealant, epoxy coat, or polyurethane topcoat for amine blush contamination using the Test Kit described in paragraph TEST KIT FOR IDENTIFYING AMINE BLUSH ON EPOXY SURFACES. Test all surfaces at rate of three tests for the first 100 square meters 1000 square feet plus one test for each additional 200 square meters 2000 square feet or part thereof. Remove any identified contamination using an approved procedure.

3.7.3 Application of Coating System and Joint Sealant

Apply coatings in accordance with SSPC PA 1 and as specified herein. Apply coatings to surfaces that meet all stated surface preparation requirements.

After application of primer coat and prior to application of each subsequent coat, perform testing prescribed in paragraph PRE-APPLICATION TESTING FOR SURFACE CONTAMINATION, as necessary, to ensure minimal intercoat contamination. This testing may be reduced to one half of the prescribed rate for bare steel if the testing indicates no contamination when sampling is evenly distributed over surfaces being tested. If contamination is found between coats, revert to the specified testing rate. Generally, oil and grease contamination and soluble salts contamination are not encountered if subsequent coats are applied within specified recoat windows and unusual atmospheric events do not occur. Such atmospheric events as a coastal storm blowing onshore can bring unusual chloride contamination. Concern for intercoat contamination should be continually prevalent, and spot testing should be accomplished to verify...
satisfactory conditions. Where visual examination or spot testing indicates contamination, perform sufficient testing to verify non-contamination, or to define extent of contamination for appropriate treatment.

Apply each coat in a consistent wet film, at 90 degrees to previous coat. Ensure that primer and intermediate coat "cold joints" are no less than 150 mm six inches from welds. Apply stripe coat by brush. For convenience, stripe coat material may be delivered by spray if followed immediately with brush-out and approved procedures include appropriate controls on thickness. Apply all other coats by spray application. Use appropriate controls to prevent airborne coating fog from drifting beyond \[\text{three}][\text{_____}] \text{meters} [\text{15}][\text{_____}] \text{feet} \text{from the structure perimeter}] \text{the tank berm}]. Cover or protect all surfaces that will not be coated. The cleanliness, temperature, recoat windows, and airborne paint containment requirements may necessitate the use of enclosures, portable shelters, or other appropriate controls.

**************************************************************************

**NOTE:** Maximum thickness measurements are to limit internal stresses in each coat and in total system. Internal stresses of epoxy and polyurethane coatings on steel can be significant, and unless limited through thickness, can cause premature failure as the coating ages. Such failures as shrinkage cracking and delamination, either from the substrate or between coats, are common. This system is limited to 12 mils to allow for maintenance overcoating without creating excessive film build.

**************************************************************************

Apply coatings at the following specified thickness:

3.7.3.1 Application of Primer

Apply primer coat, maintaining paint supply container height within 1 meter
3 feet of the paint nozzle for applying zinc primer. Maintain constant agitation of paint pot to ensure that zinc does not settle in container.

3.7.3.2 Application of Stripe Coat

Apply a stripe coat of intermediate coat epoxy material within RECOAT WINDOW of primer, allowing sufficient dry time to allow application of intermediate coat within RECOAT WINDOW of primer. Apply by brush, working material into corners, crevices, angles, and welds, and onto outside corners and angles.

3.7.3.3 Application of Intermediate Coat

Apply intermediate coat within RECOAT WINDOW of primer coat.

3.7.3.4 Non-skid for Stairs and Top

Where non-skid is required, apply a second intermediate coat, and immediately follow with application of non-skid grit, broadcast at the rate of 2 pounds per 100 square feet, and backroll. Apply topcoat as specified.

3.7.3.5 Application of Topcoat

Make all required repairs to primer and intermediate coats as specified in paragraph entitled "Procedure for Holiday and Spot Repairs of Newly Applied Coating" prior to applying topcoat. Apply topcoat within RECOAT WINDOW of intermediate coat. The polyurethane topcoat may require multiple passes to achieve desired aesthetics and required thickness. Consult manufacturer for thinning and application procedures for anticipated temperature, humidity, and wind conditions. Touch-up blemishes and defects within recoat window of polyurethane topcoat. Retain sample of polyurethane topcoat, from the same batch used to coat structure, to make touch-ups that might be required later.

3.7.3.6 Application of Joint Sealant

Apply joint sealant to back-to-back steel joints that are less that 3/8 inches wide and are not seal welded. Apply sealant to top and bottom, or each side, of narrow joints. Apply sealant within 48 hours of application of the topcoat, and touch-up with topcoat after appropriate cure of the sealant.

3.7.3.7 Procedure for Holiday and Spot Repairs of Newly Applied Coating

Repair coating film defects at the earliest practicable time, preferably before application of the succeeding coat. Observe all requirements for soluble salts contamination, cleanliness between coats, and application conditions. Prepare defective area in accordance with SSPC SP 10/NACE No. 2, and feather coating as required to leave 100 mm 4 inches of each succeeding coat feathered and abraded. Protect adjacent areas from damage and overspray. Remove dust and solvent wipe the prepared area plus an additional 100 mm 4 inches beyond the prepared area with clean denatured alcohol. Apply each coat within RECOAT WINDOW of preceeding coat. Within four hours of preparation, apply zinc-rich primer to prepared steel and feather onto prepared primer. Apply intermediate coat to primed area and feather to prepared intermediate area. Apply topcoat to intermediate coat and feather to prepared topcoat. Apply each repair coat to approximate thickness of surrounding coating system.
3.7.3.8 Structure Occupancy After Coating Application

Use clean canvas or other approved shoe covers when walking on coated surfaces, regardless of curing time allowed. For heavily trafficked areas, provide cushioned mats for additional protection.

3.8 PROJECT IDENTIFICATION

At the completion of the work, stencil the following information on the [structure ][tank exterior adjacent to the main manway opening ] in 3/4 to one inch Helvetica style letters of contrasting color using acrylic stencil paint:

Date exterior coated:
Project Number:
Contractor:
Address:

Coating System
Surface Prep: SSPC SP ____ Profile: _____
Primer: ______________ Thickness: ___
Intermediate: __________ Thickness: ___
Topcoat: ______________ Thickness: ___
Total Thickness: ________

3.9 FIELD QUALITY CONTROL

For marking of tank surfaces, use chalk for marking bare steel, and water based markers for marking coated surfaces, and remove marks prior to coating. Do not use any wax or grease based markers, or any other markers that leave a residue or stain.

3.9.1 Coating Inspector

The coating inspector shall be considered a QC Specialist and shall report to the QC Manager, as specified in Section 01 45 00 QUALITY CONTROL. The Coating Inspector shall be present during all pre-preparation testing, surface preparation, coating application, initial cure of the coating system, during all coating repair work, and during completion activities as specified in Section 01 45 00 QUALITY CONTROL. The Coating Inspector shall provide complete documentation of conditions and occurrences on the job site, and be aware of conditions and occurrences that are potentially detrimental to the coating system. The requirements for inspection listed in this Section are in addition to the QC inspection and reporting requirements specified in Section 01 45 00 QUALITY CONTROL.

3.9.2 Field Inspection

3.9.2.1 Inspection Requirements

Perform field inspection in accordance with ASTM D3276 and the approved Coating Work Plan. Document Contractor's compliance with the approved Coating Work Plan.

Provide all tools and instruments required to perform the required testing, as well as any tools or instruments that the inspector considers necessary to perform the required inspections and tests. Document each inspection and test, including required hold points and other required inspections and tests, as well as those inspections and tests deemed prudent from on-site evaluation to document a particular process or condition, as follows:
a. Location or area;
b. Purpose (required or special);
c. Method;
d. Criteria for evaluation;
e. Results;
f. Determination of compliance;
g. List of required rework;
h. Observations.

Collect and record Environmental Conditions as described in ASTM D3276 on a 24 hour basis, as follows:

a. During surface preparation, every two hours or when changes occur;
b. During coating application and the first four days of initial cure, every hour, or when changes occur;
c. Note location, time, and temperature of the highest and lowest surface temperatures each day;
d. Use a non-contact thermometer to locate temperature extremes, then verify with contact thermometers.

Document all equipment used in inspections and testing, including manufacturer, model number, serial number, last calibration date and future calibration date, and results of on-site calibration performed.

Document Contractors compliance with the approved Coating Work Plan.

3.9.2.2 Inspection Report Forms

Develop project-specific report forms as required to report measurements, test results, and observations being complete and and conforming to contract requirements. This includes all direct requirements of the contract documents and indirect requirements of referenced documents. Show acceptance criteria with each requirement and indication of conformity of each inspected item. The data may be in any format, but must be legible and presented so that entered data can be quickly compared to the appropriate requirement.

3.9.2.3 Daily Inspection Reports

Submit one copy of daily inspection report completed each day when performing work under this Section, to the Contracting Officer. Note all non-compliance issues, and all issues that were reported for rework in accordance with QC procedures of Section 01 45 00 QUALITY CONTROL. Each report shall be signed by the coating inspector and the QC Manager. Submit report within 24 hours of date recorded on the report.

3.9.2.4 Inspection Logbook

A continuous record of all activity related to this Section shall be maintained in an Inspection Logbook on a daily basis. The logbook shall be hard or spiral bound with consecutively numbered pages, and shall be used to record all information provided in the Daily Inspection Reports, as well as other pertinent observations and information. The Coating Inspector's Logbook that is sold by NACE is satisfactory. Submit the original Inspection Logbook to the Contracting Officer upon completion of the
project and prior to final payment.

3.9.2.5 Inspection Equipment

All equipment shall be in good condition, operational within its design range, and calibrated as required by the specified standard for use of each device.

3.10 FINAL CLEANUP

Following completion of the work, remove debris, equipment, and materials from the site. Remove temporary connections to Government or Contractor furnished water and electrical services. Restore existing facilities in and around the work areas to their original condition.

**NOTES:**

(1) Modify paragraph 3.6.4 Viscosity and Pot Life, of MIL-PRF-85285 as follows:

The viscosity of the admixed coating, when tested in accordance with ASTM D1200 through a No. 4 Ford cup, shall be as follows:

<table>
<thead>
<tr>
<th>Time from mix (minimum)</th>
<th>Maximum time through a No. 4 Ford Cup</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initially</td>
<td>30 seconds</td>
</tr>
<tr>
<td>2 hours</td>
<td>60 seconds</td>
</tr>
<tr>
<td>4 hours</td>
<td>No gel</td>
</tr>
</tbody>
</table>

(2) Modify paragraph 3.7.1 Drying Time, of MIL-PRF-85285. When applied by spray techniques and when tested in accordance with ASTM D1640/D1640M, the coating shall be set-to-touch within four hours and dry-hard within eight hours (see 4.6 and table I).
<table>
<thead>
<tr>
<th>Test</th>
<th>Component A</th>
<th>Component B</th>
<th>Mixed</th>
</tr>
</thead>
</table>

**GENERAL NOTES:**
Test methods as specified in MIL-PRF-85285, except those marked with "*".
Where "Conform" is indicated, refer to specific requirements of MIL-PRF-85285.

NOTE: This guide specification covers the requirements for exterior protection tape wrapping systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification covers the requirements and application methods for tape wrapping systems that establish exterior protection of buried steel piping and steel bulkhead tie rods which rest above the reference level, 600 mm 2 feet below Mean Low Water (M.L.W) or Mean Lower Low Water (M.L.L.W.), and for tape coating of buried steel pipe covered with an adhesive thermoplastic resin coating system, a thermosetting epoxy coating system, or a polyethylene-butyl adhesive system. These protective systems are suitable for steel surfaces which have continuous operating temperatures not exceeding 60 degrees C 140 degrees F. An adhesive thermoplastic resin coating system is available in a high temperature system capable of service up to 88 degrees C 190 degrees F (see
PART 1   GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN WATER WORKS ASSOCIATION (AWWA)

AWWA C209 (2019) Cold-Applied Tape Coatings for the Exterior of Special Sections, Connections and Fitting for Steel Water Pipelines

AWWA C213 (2022) Fusion-Bonded Epoxy Coatings and Linings for Steel Water Pipe and Fittings

AWWA C214 (2020) Tape Coating Systems for the Exterior of Steel Water Pipelines

AWWA C215 (2022) Extruded Polyolefin Coatings for Steel Water Pipe

NACE INTERNATIONAL (NACE)

NACE SP0274 (1974; R 2011) High Voltage Electrical Inspection of Pipeline Coatings

U.S. DEPARTMENT OF DEFENSE (DOD)

MIL-I-631 (1961; Rev D; Am 6 1987; Notice 1 2021) Insulation, Electrical, Synthetic-Resin Composition, Nonrigid
1.2 DEFINITIONS

1.2.1 Coating

A continuous, uniformly thick layer formed on a surface by the mechanical application of a liquid, mastic, powdered, or extruded film material. Some types of application require elevated temperatures.

1.2.2 Coating System

One or more coatings applied to a properly prepared steel surface. If only one coating, that coating is applied directly to the steel surface; if more than one coating, each coating is applied in one operation over the previously applied and cured coating. For some applications, the first coating is a primer. Coatings of a particular system function together as a collective entity to protect the steel surface from corrosion. Coating system may be either liquid or tape applied.

1.2.3 Tape

Prefabricated laminate of plastic film backing with a homogeneous sealant layer or a pressure-sensitive adhesive layer produced in sheets, pads, or rolls wound on hollow cores. Tape applications do not require elevated temperatures.

1.2.4 Tape Coating System

One or more layers of tape applied cold over a properly prepared and primed steel surface. Tape on the primed surface protects the steel surface from corrosion.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

SECTION 09 97 13.28 Page 5
The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Electrical-flaw Detector

[Mastics]

[Rock Shield]
PART 2   PRODUCTS

2.1   MATERIALS

2.1.1   Tape Coating System (TCS)

******************************************************************************
NOTE: Use of M.L.W. or M.L.L.W. should be based upon the usage by a particular Activity. Selection may be based on the datum for each Activity contained in Table 1-4, "Tide Data for Naval Activities"; of DM-26.1 "Harbor and Coastal Facilities." If the design does not include tie rods, delete those portions of the first sentences that refer to tie rods, M.L.W., and M.L.L.W.
******************************************************************************

******************************************************************************
NOTE: Factory-applied coating with field machine-applied coatings at joints and damaged areas is the preferred method. If the work is a small retrofit or repair, factory applied coatings may be too restrictive. Irregular surfaces such as tees, valve bodies, and flanges are done by hand.
******************************************************************************

******************************************************************************
NOTE: The thicknesses of inner and combined tape are designed for moderately, and severely corrosive soil environments. For lightly corrosive soil environment use thickness specified for moderately corrosive soil environment.
******************************************************************************

******************************************************************************
NOTE: Tape applied at a temperature below 10 degrees C 50 degrees F should be suitable for cold weather application down to minus 12 degrees C 10 degrees F. Delete if application is going to be above 10 degrees C 50 degrees F.
******************************************************************************

Prefabricated tape with adhesive primer [for bulkhead tie rods and turnbuckles][and ][for use on [pipe, ]couplings, damaged areas and fittings]. The tape wrapping system shall conform to AWWA C209 and to MIL-I-631, Class I for fungus resistance, except that the fungus rating shall lie between zero and one for all specimens. The overall thickness of the tape wrap protection shall be not less than [0.75] [1.12] [_____] mm [30] [45] [_____] mils.[ The tape system shall be suitable to be applied at temperatures below 10 degrees C 50 degrees F and above minus 12 degrees C 10 degrees F.]

2.1.2   Adhesive Thermoplastic Resin Coating System (ATRCS)

Steel pipe factory-applied coating system conforming to AWWA C215 and coating manufacturer's instructions shall consist of a continuously extruded polyethylene coating[, capable of withstand operating temperatures up to 88 degrees C 190 degrees F,] applied on an adhesive undercoat.
2.1.3  **Thermosetting Epoxy Coating System (TECS)**

******************************************************************************
NOTE: Use only epoxy coatings where petroleum fuels are expected.
******************************************************************************

Factory-applied steel pipe system conforming to AWWA C213. Provide field-applied epoxy coating in accordance with manufacturer's recommendations and AWWA C213.

2.1.4  **Polyethylene-Butyl Adhesive Coating System (PBACS)**

Factory-applied steel pipe system of extruded butyl adhesive compound, 0.18 mm 7 mils minimum thickness, covered with overlapping layers of extruded polyethylene wrapping, one mm 38 mils minimum thickness, in accordance with AWWA C214.

[2.1.5  **Mastics**

******************************************************************************
NOTE: Mastic coatings are brush applied. Mastics are used on irregular surfaces such as bolted flanges and valve bodies where the tape will not directly contact exposed surfaces. Show surfaces that will require mastic coatings on drawings. Delete if surfaces are smooth and round.
******************************************************************************

Apply a coating of manufacturer approved mastic protection to irregular surfaces. Mastic shall be compatible with coating system.[ Apply the tape system over mastic.] Mastic layer thickness shall conform to coating manufacturer's recommendation.

][2.1.6  **Rock Shield**

******************************************************************************
NOTE: Rock shields are used where coarse rock backfill or rocky soil conditions may damage the tape coating.
******************************************************************************

Provide rock shield over completed coating system as recommended by coating manufacturer.

]PART 3   EXECUTION

3.1  INSTALLATION

3.1.1  TCS

3.1.1.1  **Surface Preparation**

Surfaces shall be clean and dry. Wire brush weld beads, and remove weld spatters. Remove heavy rust or mill scale with wire brush.
3.1.1.2 Application

Remove paper from Kraft paper-protected material before placing in final position. Reinforce coating at sling points with roofing felt or other approved heavy shielding material, or handle with nylon or canvas slings. Apply polyvinylchloride-butyl rubber laminated tape or pressure-sensitive organic plastic tape and its adhesive primer by single machine operation.

a. Pipe: Spirally wrap straight runs in one layer, lapping the tape as applied. Overlap shall conform to recommendations of the tape manufacturer. When an outerwrap is used, overlap of outerwrap shall bridge joints of the tape. Apply at each end of straight runs a double wrap of one full width of tape at right angles to the axis in such a manner so as to seal ends of spiral wrapping.

b. Pipe Joints and Couplings and Damaged Areas of Coatings: Clean joint areas which are to be taped, of burrs and rust. Smooth down or cut away damaged coating when not firmly bonded to pipe. Spirally wrap with a two-layer wrapping system, overlapping coating surface at least 75 mm 3 inches. Initially stretch tape sufficiently to conform to the surface to which it is applied, using one layer half-lapped for tape 50 mm 2 inches or less in width or one layer lapped at least 25 mm one inch for tape more than 50 mm 2 inches wide. Apply a second layer, lapped as above, with tension as tape comes off roll, and press to conform to shape of component. For other irregular surfaces such as bolted flanges valve bodies where tape coating system containing mastics is to be provided, apply with brush.

c. Tie Rods and Tie Rod Fittings: Spirally wrap with a two-layer coating system. Apply tape to tie rods by lapping each layer of tape using a half-lap for tape 50 mm 2 inches or less in width or at least a 25 mm one inch lap for tape more than 50 mm 2 inches wide. For tie rod fittings, initially stretch tape sufficiently to conform to the surface to which it is applied, using one layer half-lapped for tape 50 mm 2 inches or less in width or one layer lapped at least 25 mm one inch for tape more than 50 mm 2 inches wide. Apply a second layer, lapped as before, with a tension as tape comes off the roll, and press to conform to the shape of component.

3.1.2 Joints, and Other Irregular Surfaces For ATRCS

Prepare surface as described in paragraph entitled "TCS." Wrap tape as specified in paragraph entitled "TCS"; except, apply the tape half-lapped, and prime extruded polyethylene coating and adhesive undercoat surfaces to be tape wrapped with a compatible primer as recommended by the tape manufacturer and approved by the extruded polyethylene coating applicator for use on the polyethylene coating.

3.1.2.1 Damaged Areas

Repair damaged areas of the extruded polyethylene coating by tape wrapping as specified under the paragraph, entitled "Tape Coating System" except press residual material from the extruded polyethylene coating into the break, or trim off. Prime areas to be taped prior to applying half-lapped tape.

3.1.3 TECS

**************************************************************************

SECTION 09 97 13.28 Page 9
NOTE: Use only epoxy coatings where petroleum products are expected.

Install in accordance with the manufacturer's instructions and AWWA C213.

3.1.3.1 Joints

Clean both sides of weld area by wire brushing, and remove dust, moisture, and other contaminants. Apply primer recommended by coating manufacturer after cleaning of joints.

3.1.3.2 Damaged Areas

Remove damaged coating by abrading, filing, or wire brushing. Clean area to be repaired free of dust, moisture, and other contaminants. Cover with a primer and a coating recommended by coating manufacturer. Apply coating over cleaned surface, and extend approximately 75 mm 3 inches beyond damaged area.

3.1.4 Joints and Other Irregular Surfaces For PBACS

Clean both sides of weld area by wire brushing, and remove dust, moisture, and other contaminants. Apply primer recommended by tape manufacturer and acceptable to coating manufacturer on cleaned area. Apply tape spirally with a 50-percent overlap in accordance with the tape manufacturer's instructions.

3.1.4.1 Damaged Areas

Remove rough or protruding polyethylene from damaged area by abrading, filing, or cutting the material. Clean area to be repaired free of dust, moisture, and other contaminants. Cover with tape recommended by coating manufacturer and primer recommended by tape manufacturer. Apply primer over cleaned surface, and extend approximately 75 mm 3 inches beyond damaged area. Apply tape over primer, and extend 25 mm one inch beyond damaged area. Apply additional primer over tape patch. Spirally wrap additional tape around pipe with a 50-percent overlap to cover tape patch, and extend a minimum of 50 mm 2 inches beyond the edge of the patch.

3.2 FIELD QUALITY CONTROL

**************************************************************************

NOTE: Require a certified inspector where the scope and cost of the project warrants. When editing Section 01 45 00 QUALITY CONTROL, ensure that the qualification of inspector required below is coordinated.

**************************************************************************

Conform to AWWA C214 [ and AWWA C213].[ Inspection shall be performed by a National Association of Corrosion Engineers (NACE) certified inspector.]

3.2.1 Field Inspection

Examine material surface preparation and application procedures performed in the field.
3.2.2 Field Test

Test the protective system for holes, voids, cracks, and other visually undetectable damage that may occur during handling and installation in accordance with NACE Standard NACE SP0274. In critical applications no holidays will be permitted. In non critical applications up to 10 holidays per meter 3 holidays per linear feet of the pipe may be accepted. Test with an approved electrical-flaw detector in accordance with the detector manufacturer's printed instructions. Prepare inspector's certificate for each inspection and test. Repair areas where arcing occurs and retest.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for metallic type conductive/spark resistant concrete floor finish for ordnance and other similar structures over a bonded floor topping with a thickness of 2 inches or greater or a monolithic base slab. For other installation procedures, edit specification accordingly.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Do not use the type of floor finish specified in this section in hospitals, laboratories, or other similar occupancies where sanitation is a primary consideration. This guide specification does not cover tile or fluid-applied conductive flooring. Such systems may be found in Section 09 65 00 RESILIENT FLOORING or Section 09 67 23.14 CHEMICAL RESISTANT RESINOUS FLOORING.

NOTE: This is a very specialized product and must
be well researched before this specification is used. Check with using activity to ensure that this type of floor finish is chemically compatible with explosives and solvents contemplated for use in proposed facility.

**************************************************************************

NOTE:  On the drawings, show:

1. Extent of metallic type conductive and spark resistant concrete floor finish.

2. Required slopes, floor drains, and appropriate details.

**************************************************************************

PART 1   GENERAL

1.1     REFERENCES

**************************************************************************

NOTE:  This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN CONCRETE INSTITUTE (ACI)

ACI 117 (2010; Errata 2011) Specifications for Tolerances for Concrete Construction and Materials and Commentary

ACI 302.1R (2015) Guide for Concrete Floor and Slab Construction

ASTM INTERNATIONAL (ASTM)

ASTM C33/C33M (2023) Standard Specification for Concrete Aggregates
1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
- Graded Iron
- Curing Compound
- Water Reducing Admixture
- High Range Water Reducing Admixture

SD-04 Samples

- Curing of Floor Finish

SD-10 Operation and Maintenance Data
- Conductive Spark-Resistant Floor Finish, Data Package 1; G[, _____]

1.3 PERFORMANCE REQUIREMENTS
1.3.1 Conductivity

**************************************************************************
NOTE: Include requirement for minimum resistance when electrical convenience outlets are provided around or above floor area. This usually occurs only in work and equipment assembly areas. Use 5000
ohms for 120 volt service, 10,000 ohms for 240 volt service, and 20,000 ohms for 440 volt service. If electrical service is greater than 440 volts, consult NAVSEA for guidance.

Floor finish must have a [minimum electrical resistance of [5,000] [10,000] [20,000] ohms and a] maximum average electrical resistance of 1,000,000 ohms. Measure electrical resistances on conditioned sample slab and on conditioned project slab using method of test specified herein.

1.3.2 Spark Resistance

Floor finish must produce no spark when tested using method of test specified herein.

1.4 ENVIRONMENTAL CONDITIONS

Do not start work unless environmental conditions conform to manufacturer's printed instructions. Maintain recommended environmental conditions without interruption during application and curing processes.

1.5 MANUFACTURER'S REPRESENTATIVE

NOTE: The requirements for the presence of a qualified technical representative of the metallic surfacing material manufacturer should be retained only for applications where strict compliance with installation procedures is considered to be critical.

Have manufacturer's technical representative present during start-up of each phase of work including inspection of grounding materials, preparation of base slab, mixing and placing concrete topping, application of dusted-on metallic surfacing, curing and testing.

1.6 DELIVERY, STORAGE, AND HANDLING

Deliver manufactured materials in manufacturer's original unbroken packages or containers plainly labeled with manufacturer's names, brands, lot numbers, and product expiration date. Use moisture-resistant containers. Store materials in dry, weathertight enclosures and handle in a manner that will prevent inclusion of foreign materials or damage by dampness.

1.7 CONDUCTIVE AND SPARK-RESISTANT FLOOR FINISH SAMPLE

NOTE: If the design thickness of the topping is less than 50 mm 2 inches, insert design thickness in the blank and remove the 50 mm 2 inch requirement.

Before work is started, prepare, test, and submit sample of conductive and spark-resistant floor finish, 1.22 meters 4 feet square and [50][_____] mm [2][_____] inches thick. Cast sample on 12 mm 1/2 inch thick plywood base covered with polyethylene film. Mix and apply topping in accordance with this specification, including troweling, curing, and protection.
Test floor finish sample for compliance with the conductivity and spark resistance requirements specified herein. Perform testing using an approved independent testing laboratory.

PART 2 PRODUCTS

2.1 FLOOR FINISH MATERIALS

2.1.1 Portland Cement

ASTM C150/C150M, Type I [or II]. Submit test report showing compliance with ASTM C150/C150M.

2.1.2 Aggregate

ASTM C33/C33M, except as specified below. Provide pea gravel, silica, traprock, or other approved materials of equivalent hardness. Conform to the following gradation:

<table>
<thead>
<tr>
<th>Mesh</th>
<th>Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.5 mm 3/8 inch</td>
<td>100</td>
</tr>
<tr>
<td>4.75 mm No. 4</td>
<td>95-100</td>
</tr>
<tr>
<td>2.36 mm No. 8</td>
<td>65-80</td>
</tr>
<tr>
<td>1.18 mm No. 16</td>
<td>45-65</td>
</tr>
<tr>
<td>0.60 mm No. 30</td>
<td>25-45</td>
</tr>
<tr>
<td>0.30 mm No. 50</td>
<td>5-15</td>
</tr>
<tr>
<td>0.15 mm No. 100</td>
<td>0-5</td>
</tr>
</tbody>
</table>

Submit test report showing compliance with ASTM C33/C33M.

2.1.3 Admixtures

**************************************************************************
NOTE: Specify these admixtures where increased slump is beneficial with respect to ease of placement, consolidation, metallic hardener application, or where a delay of initial set is desirable due to high temperature and low humidity conditions.
**************************************************************************

ASTM C494/C494M. Water reducing, normal setting (Type A); water reducing admixture (Type D); or high range water reducing admixture (Type F). Admixtures must not contain more than 0.05 percent chloride ions. Submit product data for water reducing admixture and high range water reducing admixtures. Submit test report showing compliance with ASTM C494/C494M.

2.1.4 Water

Provide water complying with the requirements of ASTM C1602/C1602M.
Provide [potable] water for mixing, free of injurious amounts of oil, acid, salt, or alkali. Submit test report showing water complies with ASTM C1602/C1602M.

2.2 GROUNDING MATERIALS

**************************************************************************
NOTE: Ground rods should be specified for slabs on grade. Grounding studs should be specified for suspended slabs. Division 3, "Concrete" sections of project specification should specify that ground rods or grounding studs be maintained in position to prevent misalignment before and during placement of structural concrete.
**************************************************************************

2.2.1 Ground Rods

**************************************************************************
NOTE: Specify hard copper or copper clad steel rods for normal conditions. Specify brass or stainless steel rods where electrolytic corrosion will be encountered.
**************************************************************************

[Hard copper][Copper-clad steel][Brass][Stainless steel] not less than 20 mm 0.75 inch in diameter, 3 meters 10 feet long. Die stamp each ground rod near top with name or trademark of manufacturer and length of rod in meters feet.

2.2.2 Grounding Studs

Hard copper, or brass, 12 mm 1/2 inch diameter and of such length as to project into structural concrete base slab not less than 75 mm 3 inches when installed.

2.2.3 Grounding Connector Disks

Approximately 50 to 100 mm 2 to 4 inch diameter or 50 to 100 mm 2 to 4 inch square pieces of copper or brass hardware cloth, 4 mesh, 1.2 mm 0.047 inch wire diameter.

2.3 METALLIC SURFACING MATERIAL

2.3.1 Graded Iron Mixture

A factory-prepared dry mixture of graded iron particles, cement, and chemicals; suitable for application by the dusted-on method; and free from nonferrous metal particles, oils, grease, soluble alkaline compounds, rust and materials intended to disguise rust, and any other contaminants. Submit product data for graded iron mixture.

Submit conductive spark-resistant floor finish, Data Package 1, in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

2.3.2 Water Content

Provide water absorbent metallic aggregate containing not more than 0.075 percent water soluble materials.
2.3.3 Cement Dispersing Agent

Combine a cement-dispersing agent, a pozzolanic material capable of combining with free lime to form a water insoluble compound, and an approved binder with metallic aggregate.

2.3.4 Purity

Do not add material to factory-prepared product at job site.

2.4 CURING COMPOUND

A product of the manufacturer of the metallic surfacing material or a type recommended by the manufacturer of the metallic surfacing material. Submit product data for curing compound.

PART 3 EXECUTION

3.1 INSTALLATION OF GROUNDING MATERIALS

Provide at least one ground [rod] [or] [stud] for each 37 square meters 400 square feet or less of floor area. Place grounding materials at least 50 mm 2 inches clear and free of pipes, conduits, sleeves, anchor bolts, floor drains, or other metal building material that projects through floor finish. Place tops of [rods] or [studs] at an elevation not more than 10 mm 3/8 inch below top surface of finish floor. Do not allow [rods] or [studs] to project above finish floor elevation. Center grounding connector disks on top of [rods] [or] [studs]. Braze disks to tops of [rods] [or] [studs]. Connect each ground [rod] [or] [stud] electrically to concrete slab reinforcement steel. Connect using a copper or brass braided strap. Braze to both reinforcing steel and ground [rod] [or] [stud].

3.1.1 Ground Rods

Drive ground rods vertically into earth. The maximum resistance to ground of driven ground rod must not exceed 25 ohms when tested in accordance with paragraph GROUNDING TESTS.

3.1.2 Ground Studs

**************************************************************************
NOTE: The last sentence presumes ground studs used with an existing concrete base slab. Other site conditions require a different design and wording.
**************************************************************************

Connect studs together electrically using a continuous No. 6 AWG copper wire brazed to each stud and to a common ground wire connected electrically to an approved ground. Place stud interconnecting wire on, shape, and fasten to existing concrete base slab to prevent wire from lifting when concrete topping is placed.

3.2 PREPARATION OF BASE SLAB

**************************************************************************
NOTE: This guide specification is based on use of a bonded floor topping with thickness of 50 mm 2 inches or greater or a monolithic base slab. For other
**************************************************************************

SECTION 09 97 23 Page 10
installation procedures, edit specification accordingly. For a monolithic base slab delete paragraphs PREPARATION OF BASE SLAB, CLEANING, BOND COAT, PROPORTIONING AND MIXING OF CONCRETE TOPPING, PROPORTIONING AND MIXING.

3.2.1 Cleaning

NOTE: Choose from one of the following three paragraphs. Use first paragraph for wet cured slabs less than 3 days old. Use second paragraph for cured slabs between 3 days and a week old. Use third paragraph for cured slabs more than a week old.

Wash dirt and debris from surface of base slab.

Remove dirt, oil, grease, laitance or other foreign matter from surface of base slab. Scrub surface and rinse thoroughly with clean water. Keep base slab wet for a period of not less than 12 hours preceding application of topping.

Remove dirt, oil, grease, laitance or other foreign matter from surface of base slab. Scrub surface with a 10 percent muriatic acid solution and rinse thoroughly with clean water. After rinsing, a litmus test of the wet surface must indicate no trace of acid solution.

3.2.2 Bond Coat

Remove excess water or dry slab until there is no free water. Apply a cement paste, latex, latex cement, or epoxy bond coat.

3.3 PROPORTIONING AND MIXING OF CONCRETE TOPPING

NOTE: Where bonded topping or base slab is of very low slump (less than 75 mm 3 inches) consider deletion of reference to excess water. Metallic surfacing material, which is a dry shake material, will require sufficient water to adequately mix with concrete topping or base slab.

3.3.1 Proportioning

NOTE: Use either compressive strength option or specified mix design.

[Proportion concrete topping mix to provide a 28-day compressive strength of 34.5 kPa 5,000 psi, with a maximum slump of 75 mm 3 inches or less. If high range water reducing admixture is used, slump may be increased to 200 mm 8 inches.][Proportion concrete topping mixture by volume with one part portland cement and 2 3/4 parts 10 mm 3/8 inch maximum size aggregate. Use a maximum water-cement ratio of 0.45 including moisture contained in aggregates.] Topping mix may be modified, as approved, to conform to
requirements of manufacturer of metallic surfacing material. Submit concrete mix design for topping slab.

3.3.2 Mixing

Perform mixing in mechanical mixers of a type in which quantities of water can be controlled accurately and uniformly. Introduce and mix aggregates so that materials are distributed uniformly throughout the mass. Add water gradually. After cement, aggregates, and water are in mixer drum, mix for two minutes. Ready-mixed concrete must conform to ASTM C94/C94M. Do not retemper topping mixture with water. Additional dosage with high range water reducing admixture may be permitted with prior approval of the Contracting Officer as to methods and procedures. Use only admixture specified and approved in proposed mix design.

3.4 PLACING, FINISHING, AND CURING

3.4.1 Placing Concrete Topping

**************************************************************************
NOTE: For bonded toppings, use as thick a bonded topping as design constraints will allow. A 25 mm one inch bonded topping is extremely difficult to install. Bonded toppings of 50 mm 2 inches to a maximum of 75 mm 3 inches are much easier to construct. Generally, the thinner the bonded topping, the more problems that will be encountered during construction and in future use. When using a monolithic base slab delete this paragraph.
**************************************************************************

Place, compact and strike-off topping mixture to the full depth of the [50] [_____] mm [2] [_____] inch screed strips. Tamp thoroughly with a grill-faced tamper (do not use a flat-faced tamper) or vibrate with a small vibrator to compact concrete topping, force out entrapped air, and ensure maximum density. Take extreme care in placing and tamping so that grounding system will not be damaged or misaligned. Form a slight cup-shaped pocket or depression, about 75 mm 3 inches in diameter and 20 mm 3/4 inch in depth in topping finish surrounding grounding connector disks on tops of [rods] [and] [studs]. Keep disk free of topping mix by protecting disk with a plastic sheet. After compacting, screeding and leveling floor surface, remove excess water by an approved method. Mechanically float surface.

[3.4.2 Placing and Finishing Base Slab

**************************************************************************
NOTE: Use this paragraph for monolithic slab placement.
**************************************************************************

Where metallic surfacing is to be placed directly upon base slab, place slab in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. Take extreme care in placing and consolidating concrete so that grounding system is not damaged or misaligned. Form a slight cup-shaped pocket or depression, about 75 mm 3 inches in diameter and 20 mm 3/4 inch in depth in the finish surrounding grounding connector disks on the tops of the [rods] [and] [studs]. Keep disk free of concrete and mortar by protecting disk with plastic sheet. After placing, consolidating, striking off and
leveling, remove excess water by an approved method. Mechanically float the surface.

3.4.3 Metallic Surfacing

Before opening, shake surfacing material containers to ensure uniformity of ingredients. After floating floor surface, dust dry metallic surfacing material uniformly on surface at a rate of not less than 4.4 kilograms per square meter 0.9 pound per square foot of surface. When metallic aggregate has absorbed surface moisture, mechanically float surface. After floating, uniformly dust on surface remaining dry metallic surfacing material to achieve a total rate of not less than 8.8 kilograms per square meter 1.8 pound per square foot of surfacing material for the two dusting operations. Apply second shake at right angles to first for even application. Repeat floating operation. Submit manufacturer's instructions for application of metallic surfacing.

3.4.4 Finishing

**************************************************************************
NOTE: Use 6 mm in 3 meters 1/4 inch in 10 feet unless operational requirements dictate the flatter floor. For floors where floor flatness is critical, use the bracketed paragraph in place of the first paragraph. The numbers provided in brackets are typical numbers, but A/E should research and select F numbers high enough to get desired results but not so high as to cause undue cost increases and construction problems. Ff/FL 20/15 is equivalent to 8 mm in 5.05 mm 5/16 inches in 10 feet. This test method is not suitable for unshored deck. Fitted partitions need FL greater than or equal to 25.
**************************************************************************

Finish floor to a smooth surface, free from blemishes. Test floor surface with a straight edge to ensure a tolerance of plus or minus [ 6 mm 1/4 inch ] [ 3 mm 1/8 inch ] in 3 meters 10 feet.

[ Construct in accordance with one of the methods recommended in ACI 302.1R, Table 7.15.3, "Typical Composite Ff/FL Values for Various Construction Methods." ACI 117 for tolerance tested by ASTM E1155. ]

a. Specified Conventional Value:

Floor Flatness (Ff) [20] [_____] [13] [_____] minimum
Floor Levelness (FL) [15] [_____] [10] [_____] minimum

b. Specified Industrial:

Floor Flatness (Ff) [30] [_____] [15] [_____] minimum
Floor Levelness (FL) [20] [_____] [10] [_____] minimum

Test slab within 24 hours of the final troweling. Provide tests to Contracting Officer within 12 hours after collecting the data. Floor flatness inspector is required to provide a tolerance report which must include:

a. Key plan showing location of data collected.
b. Results required by ASTM E1155.

Take extreme care so that conductive metallic aggregate contained in surfacing material is in full and firm contact with disks attached to top of grounding [rods][ and ][studs]. Do not float or trowel surfaces excessively in a manner that buries metallic aggregate or contaminates surfacing material during floating and trowelling operations. Protect flooring from contamination by subgrade material, tracked or spilled concrete, sand, stone, or other material during finishing operations. Remove flooring contaminated and replace with new flooring. Match approved finish floor sample in all respects.

3.4.5 Curing and Protection

Cure and protect floor finish for not less than 30 days unless a longer period is recommended by the manufacturer's printed instructions. Strip floor finish of conductive curing compounds only in those areas where acceptance tests will be performed. Strip non-conductive curing compounds completely. Submit manufacture's printed instructions for curing the floor finish.

3.5 FIELD TESTS

Conduct testing in the presence of the Contracting Officer.

3.5.1 Grounding Tests

Test ground [studs][ and ][rods] and interconnecting ground wire before the concrete slab is placed and again before the topping finish is placed. Before final wiring is connected to the ground rods, test each rod or group of rods for ground resistance using a portable ground testing megohmmeter developing an A.C. voltage. Equip the instrument with a meter reading directly in ohms. Use two reference ground rods of 20 mm 3/4 inch copper clad steel, not less than 1.2 meters 4 feet in length, driven 1 meter 3 1/2 feet deep. Install rods in a straight line from the ground being tested. Connect No. 14 AWG stranded wire leads with at least 600-volt insulation to the ground being tested and the two reference grounds and to proper binding posts on the instrument. Where there is more than one ground within a circle of 3 meters 10 feet at a particular location, use reference rods as driven for the "first" test for tests on the other rods without changing their location.

3.5.2 Acceptance Tests

Make tests for conductivity and spark resistance of metallic finish after floor finish has been cured and dried for 30 days. Perform at least one test for each 37 square meters 400 square feet or less of floor area for conductivity and for spark resistance. Submit test reports showing compliance with the conductivity and spark test criteria.

3.5.2.1 Conductivity Tests

Conduct conductivity tests of finished floor surface in accordance with ASTM F150. For compliance, the average of maximum resistances must be within the limits specified with no value greater than 5 megohms.

3.5.2.2 Spark Tests
Determine spark resistance of finished floor surfaces in a darkened space by stroking the floor vigorously with a 300 mm 12 inch metal file in a 1.8 meter 6 foot arc. Perform spark test five times in each 37 square meters 400 square feet or less of flooring area. Areas with no visible spark production will be accepted as having necessary spark resistance.

NOTE: This guide specification covers the requirements for sealing, waterproofing and anti-spall protection of concrete where freezing temperatures may cause damage.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The coating treatment can be linseed oil-mineral spirits compound for old concrete or linseed oil emulsion used as a curing compound on new concrete. It is used on roads, bridge decks, sidewalks, curbs, parking ramps, floors, walkways and other such concrete construction. Check with local air pollution control districts to see if these treatments are allowed.

NOTE: The extent and location of the work should be indicated on the project drawings, or included in the project specifications.
PART 1 GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

1.2 DELIVERY, STORAGE AND HANDLING

Deliver the [linseed oil-mineral spirit compound] [linseed oil emulsion] in original sealed containers that show the designated name, specification number, batch number, date of manufacture, manufacturer's directions, and name of manufacturer. [Linseed oil-mineral spirits compound has a flash point of about 38 degrees C 100 degrees F and is readily flammable. Carefully guard against fire. Store wiping rags containing this material in metal cans with tight lids.]

1.3 ENVIRONMENTAL CONDITIONS

Apply coating when air and concrete temperature are between 2 degrees C 35 degrees F and 38 degrees C 100 degrees F.

1.4 TRAFFIC CONTROL

Allow no traffic, except sealing equipment, on the treated surface until dry.
1.5 EQUIPMENT

1.5.1 [Spray Equipment]

**************************************************************************

NOTE: Choose this paragraph for medium and large jobs or the paragraph below entitled "Brushes and Rollers," for small jobs.

**************************************************************************

Portable, truck mounted, or self-contained, mechanized spray equipment with nozzles designed to produce a flat, overlapping fan-shaped spray pattern. Clean tank interior and spray system prior to use.

1.5.2 [Brushes and Rollers]

Use brush with sufficient body and length of bristle to spread the compound in a uniform film. Use rollers of a type which do not leave a stippled texture.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Linseed Oil-Mineral Spirits Compound

**************************************************************************

NOTE: The linseed oil-mineral spirits sealer compound is usually applied to old concrete. Do not use it as a curing compound on new concrete. Check local state highway specifications for guidance.

**************************************************************************

A blend of 60 percent boiled linseed oil and 40 percent mineral spirits conforming to ASTM D235, Type I, by volume.

2.1.2 Linseed Oil Emulsion

**************************************************************************

NOTE: Linseed oil emulsion is usually applied to new concrete as a curing compound. It may be hard to find so check local availability before specifying.

**************************************************************************

ASTM C309, Type 1.

PART 3 EXECUTION

3.1 SURFACE PREPARATION

**************************************************************************

NOTE: For surfaces with moderate amounts of dirt, rubber, or paint use the first bracketed sentence. For surfaces contaminated with oil, grease, or membrane forming compounds, use the second bracketed sentence.

**************************************************************************
Prepare hardened concrete surfaces to permit sealer penetration. [Use airblasting, sandblasting, waterblasting or other approved methods.] [Sandblast first then waterblast.] Immediately before sealer application, remove dust by airblasting.

3.2  APPLICATION

3.2.1  Rate of Application

3.2.1.1  Hardened Concrete

Two coat application of linseed oil-mineral spirits compound:

a. First Coat:  One liter per 8.75 square meters one gallon per 360 square feet.

b. Second Coat: One liter per 15 square meters one gallon per 600 square feet. Apply the second coat as soon as the first coat is dry to the touch.

3.2.1.2  Fresh Concrete

Apply one coat linseed oil emulsion before permanent set at the rate of one liter per 5 square meters one gallon per 200 square feet.

3.2.2  Method of Application

************************************************************************************************************
NOTE: Choose the first bracketed option for medium and large jobs. Choose the second bracketed option for small jobs.
************************************************************************************************************

Apply using [spray] [brush and roller] technique.

NOTE: This guide specification covers the requirements for corrosion inhibiting coatings for concrete surfaces.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

AASHTO T 260 (2021) Standard Method of Test for Sampling and Testing for Chloride Ion in Concrete and Concrete Raw Materials

AMERICAN CONCRETE INSTITUTE (ACI)

ASTM INTERNATIONAL (ASTM)

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office.
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

List of Proposed Subcontractors; G[, [_____]]

List of Proposed Products; G[, [_____]]

Health and Safety Plan; G[, [_____]]

Reinforcement Corrosion Rate Testing Procedures and Equipment; G[, [_____]]

Environmental Protection Plan; G[, [_____]]

Structure Repair Areas Prior to Inhibitor System Application; G[, [_____]]

Structure Testing Locations; G[, [_____]]

Structure Reinforcing Steel Test Wire Installation Locations and Installation Details; G[, [_____]]

SD-03 Product Data

Vapor Phase Corrosion Inhibitor; G[, [_____]]

Ionic Corrosion Inhibitor; G[, [_____]]

Surface Sealant; G[, [_____]]

Structure Repair Materials; G[, [_____]]
1.3 QUALITY ASSURANCE

1.3.1 Qualifications

Submit Applicator's Certificate documenting a minimum of 5-years of experience in the application and testing of vapor phase and ionic corrosion inhibitors, including the test methods described herein. Submit a list of proposed subcontractors, including qualification statements, for review and approval if subcontractors will be utilized on the project.

1.3.2 Minimum Performance Requirements

1.3.2.1 Structure Life Extension

Submit Manufacturer's certificate that the proposed corrosion inhibitor system application will extend the structure service life a minimum of 10 years.

1.3.2.2 Corrosion Rate Reduction of Reinforcing Steel

Submit test data in the Final Acceptance Test Report that demonstrates a minimum reduction in reinforcement corrosion rate of 50 percent from the
pre-application testing corrosion rate.

1.3.2.3 Water Penetration Rate Reduction of Concrete

Submit test data in the Final Acceptance Test Report that demonstrates a minimum reduction of 80 percent in the water penetration rate of concrete from the pre-application testing penetration rate.

1.3.2.4 Pullout Strength Increase of Concrete

Submit test data in the Final Acceptance Test Report that demonstrates a minimum increase of 3.4 MPa 500 psi in the pullout strength of the concrete from the pre-application testing strength.

1.3.3 Evidence of Acceptable Variation Certificate

Submit documentation of any variations from this section that certifies the variation will not prevent the inhibitor system application from achieving the minimum performance requirement.

1.4 REGULATORY REQUIREMENTS

1.4.1 Environmental Protection

Submit an environmental protection plan for the corrosion inhibitor system application project that addresses all requirements of the SDS for the products utilized and assures compliance with all applicable regulations.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver corrosion inhibitor products in sealed and properly labeled containers. Store and handle products in accordance with the manufacturer's instructions. Submit manufacturer's storage and handling instructions as part of the product data submittal.

1.6 SAFETY METHODS

Comply with all applicable OSHA and local authority standards for personal protection, including the required record keeping and training. Submit compliance plan as part of the Health and safety plan submittal.

1.7 ENVIRONMENTAL CONDITIONS

1.7.1 Weather and Substrate Conditions

Consider present and forecasted weather conditions for each structure prior to product application. Do not apply inhibitor system if rain is forecasted during the application or within 4 hours after the application is completed. The substrate temperature, air temperature, humidity and other environmental conditions must be within the limits recommended by the manufacturer for proper application. Document all relevant environmental conditions and include in the Daily Checklist submittals.

1.8 EQUIPMENT, TOOLS, AND MACHINES

Apply the inhibitor system utilizing methods, tools, and equipment approved by the manufacturer. Application equipment may include brushes, rollers, power rollers, spray equipment, squeegees, brooms, and pressure injection systems. Include the proposed application equipment and methods in the
Corrosion Inhibitor Selection and Application Plan submittal.

1.9 SEQUENCING AND SCHEDULING

1.9.1 Structure Repair Areas Prior To Inhibitor System Application

Repair damaged and delaminated concrete areas and cracks in accordance with Section 03 01 00 REHABILITATION OF CONCRETE. Exothermically weld or pin braze a test wire to the reinforcing steel where reinforcing steel is exposed during the repair process. Prepare the surface of the wire attachment area in accordance with the coating manufacturer's recommended procedures and apply a 100 percent solids epoxy coating to the test wire attachment location that covers all bare wire and affected areas of the reinforcement. Allow the coating to cure in accordance with the manufacturer's instructions prior to proceeding with placement of structure repair materials. Terminate the test wire in an enclosure. Prepare and submit shop drawings showing the location of all repair areas and proposed test wire installations. The submittal shall include a list of all proposed repair materials, repair material SDS, and manufacturer's recommended application procedures. The Designer of Record will review and approve the structure reinforcing steel test wire installation locations and installation details required prior to installation.

1.9.2 Surface Preparation of Concrete

Remove all existing coatings, laitance, contaminants, and any other substances that could interfere with the inhibitor penetration. Select removal methods appropriate for the structure and materials to be removed. Include proposed removal methods in the Corrosion Inhibitor Selection and Application Plan submittal.

1.9.3 Pre-Application Testing

1.9.3.1 Reinforcement Corrosion Rate Testing Procedures And Equipment

Measure and document the corrosion rate of the reinforcing steel prior to inhibitor application. Document the location of test wires or reinforcing steel connections utilized for the corrosion rate measurements and each measurement location. Document the specific conditions of concrete moisture and surface temperature during the test. Identify a minimum of two separate test areas for each structure to be treated. Include a minimum of 25 measurement points in each test area. Utilize a combination of half-cell potential measurements collected in accordance with ASTM C876 and linear polarization resistance measurements collected in accordance with ASTM G59 to determine the corrosion rate of the reinforcing steel. Submit a list of all proposed corrosion rate testing procedures and test equipment within 2 weeks of the contract award. Alternate corrosion rate measurement techniques, such as electrochemical impedance spectroscopy (EIS) must be submitted to the Designer of Record for review and approval prior to testing. Report the corrosion rate in microamperes per square centimeter of reinforcing steel surface area in the test or in micrometers of steel loss per year.

1.9.3.2 Chloride Content of Cement

Measure the total chloride ion content of the structure's concrete sand/cement paste at the depth of the first course of reinforcing steel in accordance with AASHTO T 260. A pre-project test application of inhibitor is required for total chloride levels above 3,000 ppm in accordance with
paragraph PRE-PROJECT TEST APPLICATION OF INHIBITOR. Include the chloride ion testing results and identify areas where pre-project test applications are required, if any, in the Corrosion Inhibitor Selection and Application Plan submittal.

1.9.3.2.1 Pre-Project Test Application of Inhibitor

A pre-project test application of inhibitor is required for structures with total chloride levels above 3,000 ppm. Apply the test application to a representative section of the high-chloride structure area to be treated. Follow the application procedures included in the Corrosion Inhibitor Selection and Application Plan and PART 3 EXECUTION. Include all pre-application and post-application testing in order to ensure the minimum performance requirements can be achieved. Prepare and submit a Pre-Project Test Application Report to the Designer of Record for review and approval prior to proceeding with inhibitor application to high-chloride structures.

1.9.3.3 pH of Concrete

Extract an approximate 25 mm 1 in. diameter core of concrete to a minimum depth of the first course of reinforcing steel. Apply a multiple range pH indicator dye to the core in accordance with the dye manufacturer's procedures. Report the depth from the concrete surface at which a pH value of 11 or greater is indicated. Include the pH testing data in the Corrosion Inhibitor Selection and Application Plan submittal.

1.9.3.4 Water Penetration Rate of Concrete

Measure the water penetration rate of the concrete surface in accordance with the Initial Surface Absorption Test described in ACI 228.2R for at least two locations within the area to be treated with the inhibitor system. Include the results of the testing in the Corrosion Inhibitor Selection and Application Plan submittal.

1.9.3.5 Pullout Strength of Concrete

Measure the pullout strength of the concrete in accordance with ASTM C900 at a minimum of two locations in the area to be treated with the inhibitor system. Include the test results in the Corrosion Inhibitor Selection and Application Plan submittal.

1.9.4 Corrosion Inhibitor Selection and Application Plan

Prepare and submit a specific plan for structure corrosion inhibitor system application areas included in the project. At a minimum, include the product selections, structure areas to be treated, surface preparation requirements, application methods, application sequence and timing, and application rates that are based on the pre-application testing results. Include all pre-application testing data and analysis in the plan. Include shop drawings identifying the structure testing locations. Identify areas that require pre-project test applications based on excessive chloride ion levels. Submit the Corrosion Inhibitor Selection and Application Plan for review by the Designer of Record.

1.9.5 Corrosion Inhibitor Application

Apply the corrosion inhibitor system in accordance with the approved plan. Monitor and record the quantity of inhibitor applied to the surface, application method, surface temperature, and any other data or observations...
required by the plan. Inspect the surface for residue upon completion of
the inhibitor application to ensure all of the inhibitor has penetrated the
cement surface. Apply a light spray of water if necessary to aid
inhibitor penetration. After the corrosion inhibitor application and
penetration is complete clean the concrete surface of any remaining residue
in accordance with the manufacturer's recommendations.

1.9.6  Post-Application Testing and Minimum Performance Requirements

Perform post-application testing a minimum of 60 days after completion of
the corrosion inhibitor system application. Perform post-application
testing utilizing the same instrumentation and test procedures at the same
locations as those utilized during the pre-application testing. Include
the post-application testing results in the Final Acceptance Test Report.
The minimum acceptable performance criteria are included in paragraph
MINIMUM PERFORMANCE REQUIREMENTS.

1.9.6.1  Corrosion Rate of Reinforcing Steel

Compare the pre-application test results and the post-application test
results to determine the extent of corrosion rate reduction.

1.9.6.2  Water Penetration Rate of Concrete

Compare the pre-application test results and the post-application test
results to determine the reduction in water penetration rate.

1.9.6.3  Pullout Strength of Concrete

Compare the pre-application test results and the post-application test
results to determine the increase in pullout strength.

PART 2   PRODUCTS

2.1  SYSTEM DESCRIPTION

The corrosion inhibitor system will consist of an organic vapor phase
inhibitor, an ionic inhibitor or a combination of both inhibitors. Apply
the organic vapor phase inhibitor first when a combination of inhibitors is
utilized. In addition to the inhibitor system a reactive silicone surface
sealant or surface protection coating will be applied. Submit a list of
proposed products for the corrosion inhibitor system application. Include
product Safety Data Sheets (SDS), warranty information and the
manufacturer's recommended special application procedures for extreme
temperatures and testing procedures in the submittal.

2.2  MATERIALS

2.2.1  Penetrating Vapor Phase Corrosion Inhibitor

A solution of organic amine carboxylate compounds that migrate in the gas
phase through the cement pores to form a corrosion inhibiting film on the
reinforcing steel surface.

2.2.2  Penetrating Ionic Corrosion Inhibitor

A solution containing chemically reactive water-soluble inorganic silicates
designed to act as an anodic inhibitor on the surface of the reinforcing
steel.
2.2.3 **Surface Sealant**

A chemically reactive water dispersion of a silane/siloxane mixture that forms an insoluble cross-linked silicone membrane within the concrete matrix.

2.2.4 **Structure Reinforcing Steel Test Wire**

Type THWN stranded copper conductor, not less than No. 10 AWG, of sufficient length to extend from the structure connection to the test wire enclosure without splicing. Terminate structure test wires in the test wire enclosure with solderless copper lugs.

2.2.5 **Structure Reinforcing Steel Test Wire Enclosure**

A surface/wall or post mounted enclosure to suit field conditions. Enclosure and cover constructed of non-metallic materials or hot-dip galvanized steel containing an insulated terminal board. Mounting post, where necessary, constructed of galvanized rigid conduit fitted with insulating bushings to protect the test wire from damage.

**PART 3 EXECUTION**

3.1 **DAILY CHECKLISTS**

Complete a checklist for each day of work on the structures included in the project. Record, at a minimum, the following information on the daily checklist: concrete surface temperature immediately prior to and after inhibitor application, or every 2 hours if there is a possibility of extreme temperature; concrete surface cleaning and preparation equipment and methods; concrete relative moisture immediately prior to inhibitor application; time of application and application equipment for each component; rate of application of each component; extent of surface treated; application method utilized; tests performed; testing locations; and any other requirements identified in the Corrosion Inhibitor Selection and Application Plan.

3.2 **SURFACE PREPARATION**

Examine all surfaces for cleanliness prior to application. Clean surfaces of visible contamination, coatings, sealants, debris, oils and fuels, and other similar materials. Treatment areas may be damp but no water ponding is permitted on flat horizontal surfaces. Measure and record concrete surface temperature immediately prior to inhibitor application. Do not apply inhibitor if concrete surface temperature is below 2 degrees C 35 degrees F. Consult the manufacturer for special application procedures if the concrete surface temperature is in excess of 38 degrees C 100 degrees F. Submit the special application procedures to the Designer of Record for review prior to application. Prepare the concrete surface for inhibitor application in accordance with the manufacturer's recommendations. Provide protection for equipment and structures in close proximity to the inhibitor application area to guard against overspray or product spillage. Use plastic sheeting to protect glass and decorative structure components and equipment from unintended inhibitor contact.

3.3 **APPLICATION OF VAPOR PHASE CORROSION INHIBITOR**

Apply the vapor phase inhibitor to the structure surface at the rate
identified utilizing the methods, tools and equipment identified in the Corrosion Inhibitor Selection and Application Plan. Verify that the recommended amount of inhibitor has penetrated the structure surface. Multiple applications may be required to achieve the recommended application rate. Do not overspray or allow the inhibitor product to be lost due to run off. Replace any lost product with sufficient additional product to achieve the recommended application rate. Apply a light spray of water to the treated surface after each application to assist the inhibitor penetration into the concrete. Inspect the treated surface following application. Minimal to no residue should remain following the application. Clean the concrete surface of any residue in accordance with the manufacturer's recommendations. Perform post-application testing identified in this section.

3.4 APPLICATION OF IONIC CORROSION INHIBITOR

Apply the ionic inhibitor to the structure surface at the rate identified utilizing the methods, tools and equipment identified in the Corrosion Inhibitor Selection and Application Plan. Verify that the recommended amount of inhibitor has penetrated the structure surface. Multiple applications may be required to achieve the recommended application rate. Do not overspray or allow the inhibitor product to be lost due to run off. Replace any lost product with sufficient additional product to achieve the recommended application rate. Inspect the treated surface following application. Minimal to no residue should remain following the application. Clean the concrete surface of any residue in accordance with the manufacturer's recommendations. Perform post-application testing identified in this section.

3.5 APPLICATION OF COMBINED VAPOR PHASE AND IONIC CORROSION INHIBITOR SYSTEM

Apply the vapor phase organic inhibitor first when a combination of vapor phase and ionic inhibitors are used together on the same structure. Follow the manufacturer's recommendations regarding the time period between application of the vapor phase inhibitor and the ionic phase inhibitor. Utilize the application specifications identified above for each type of inhibitor. Perform post-application testing identified in this section.

3.6 APPLICATION OF SURFACE PROTECTION COATING

3.6.1 Surface Sealant

Prepare the concrete surface in accordance with the manufacturer's recommendations. Apply surface sealants to the structure surface at the rate identified utilizing the methods, tools and equipment identified in the Corrosion Inhibitor Selection and Application Plan. Verify that the recommended amount of sealant has penetrated the structure surface. Multiple applications may be required to achieve the recommended application rate.

3.6.2 Protective and Decorative Coatings

Inspect and clean the concrete surface of residue that may interfere with the bonding of a surface protective or decorative coating. Separate specifications will be provided when protective and decorative coatings are included in the project. Perform post-application testing prior to the application of the protective and decorative coatings.
3.7 FINAL ACCEPTANCE TEST REPORT AND MAINTENANCE TEST PROCEDURE

Prepare and submit a Final Acceptance Test Report. Include, at a minimum, the following: as-built drawings showing all structure repair areas, test wire installation locations, pre-application test locations, inhibitor application areas, and post application test locations; all post-application test results; post-application test data analysis and evaluation of acceptance criteria for corrosion rate reduction of the reinforcing steel, water penetration rate reduction of the concrete, and pullout strength increase of the concrete; a statement that the corrosion inhibitor system application will extend the life of the structure a minimum of 10 years; and recommended maintenance testing procedures and frequency to ensure compliance with the minimum 10 year structure life extension requirement.

1.2 DEFINITIONS

NOTE: The designer has the option to require that visual display units for a project be provided by one manufacturer when appropriate. It is the designer's responsibility to determine if all products being specified for a project are available from a minimum of three manufacturers. Not all manufacturers produce the variety of visual display units offered in this specification.

Alternate frame methods such as: self-edge for fabric or vinyl covered tackboards, vinyl edge on tackboards, and markerboards are options but are not available from all manufacturers. Designer must research available sources.

The term visual display unit when used herein includes presentation boards, markerboards, tackboards, board cases, display track systems, horizontal sliding units, copyboards, interactive whiteboards, and projection screens; submit manufacturer's descriptive data and catalog cuts plus manufacturer's installation instructions, and cleaning and maintenance instructions. Provide visual display units from manufacturer's standard product line. Submit certificate of compliance signed by Contractor attesting that visual display units conform to the requirements specified.

1.3 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required
as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 CERTIFICATIONS

1.4.1 Indoor Air Quality

1.4.1.1 Indoor Air Quality for Visual Display Products

**************************************************************************
NOTE: The Government’s preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, it must be verified there is a certified product available that is both cost effective and appropriate for the project. The requirements of this paragraph are invoked when the designer of record confirms local/regional availability of Greenguard or SCS products and includes the bracketed requirements for indoor air quality certified products in Part 2 of this Section.
**************************************************************************

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the building site in the manufacturer's original unopened containers and store them in a clean dry area with temperature maintained above 10 degrees C 50 degrees F. Stack materials according to manufacturer's recommendations. Allow visual display units to acclimate to the building temperature for 24 hours prior to installation.

1.6 WARRANTY

Provide manufacturer's warranty to repair or replace defective materials and workmanship for period of [one year][____][ years] from date of final acceptance of the work.

PART 2 PRODUCTS

2.1 MATERIALS

For each type, submit a section of core material and backing showing the lamination of porcelain enamel coating on steel, colored cork, natural cork, woven fabric, non-woven fabric, or vinyl wall covering, as applicable. Submit a sample of hardwood, plastic laminate finish, or glass type, as applicable. Provide minimum 102 by 102 mm 4 by 4 inch samples, or larger, showing range of color.

Submit manufacturers' descriptive product data for [each type of] visual
display unit indicated. Include manufacturers' literature, finishes, profiles and thicknesses of materials.

Submit manufacturers' operations and maintenance data for [each type of] visual display unit in accordance with Section 01 78 23 OPERATIONS AND MAINTENANCE DATA.

2.1.1 Porcelain Enamel

Provide markerboard writing surface composed of porcelain enamel fused to a nominal \(0.378 \text{ mm 28 gauge}\) thick steel, laminated to a minimum \(6 \text{ mm 1/4 inch}\) thick core material with a steel or foil backing sheet. Writing surface must be capable of supporting paper by means of magnets. Markerboard surface for display track system may be a powder paint dry erase surface adhered to a nominal \(1.214 \text{ mm 18 gauge}\) thick steel.

2.1.2 Cork

Provide a continuous resilient sheet made from soft, clean, granulated cork relatively free from hardback and dust and bonded with a binder suitable for the purpose intended; wearing surface to be free from streaks, spots, cracks or other imperfections that would impair its usefulness or appearance. Provide seasoned material and a clean cut made not less than \(13 \text{ mm 1/2 inch}\) from the edge and must show no evidence of soft sticky binder.

2.1.2.1 Colored Cork

Provide colored cork composed of pure cork and natural color pigments that are combined under heat and pressure with linseed oil. Colored cork must be colored throughout and be washable. The burlap backing must be deeply imbedded and keyed to the work sheet being partially concealed in it and meeting the requirements of ASTM F148.

2.1.2.2 Natural Cork

Provide a light tan natural cork composed of a single layer of pure grain natural cork without backing or facing. Cork sheets must have a tensile strength of not less than \(275 \text{ kPa 40 psi}\) when tested in accordance with ASTM F152.

2.1.3 Woven Fabric

**************************************************************************
NOTE: A multi-colored, patterned, textured fabric will aid in hiding pin and tack holes.

Fabric other than manufacturer's standard may be used; however there may be an upcharge cost and minimum quantity requirements. Provide minimum generic specifications to obtain fabric required.
**************************************************************************

Provide [plain] weave fabric with [100 percent polyester] fiber content and [496 grams plus or minus 16 grams per linear meter 16 oz. plus or minus 0.5 oz. per lineal yard] for \(1524 \text{ mm 60 inch}\) wide fabric \([_____]\) minimum total weight. Fabric must have a Class A flame spread rating of 0-50 and smoke development rating of 0-450 in accordance with ASTM E84.
2.1.4  Non-Woven Fabric

Provide a non-woven, hooktape compatible fabric with a [backed] [100 percent polyester][,][100 percent polyolefin][or][100 percent nylon] [_____] fiber content and [341 grams plus or minus 14 grams per linear meter 11 oz. plus or minus 0.5 oz. per lineal yard for 1524 mm 60 inch wide fabric] [_____] minimum total weight. Fabric must have a Class A flame spread rating of 0-50 and smoke development rating of 0-450 in accordance with ASTM E84.

2.1.5  Vinyl Wall Covering

**************************************************************************
NOTE: A multi-colored, textured, vinyl wall covering will aid in hiding pin and tack holes.

Vinyl wall covering other than manufacturer's standard may be used; however, there may be an upcharge cost and minimum quantity requirements. Provide minimum generic specifications to obtain fabric required.
**************************************************************************

Provide vinyl wall covering conforming to ASTM F793/F793M, Category V with a Class A flame spread rating of 0-50 and smoke development rating of 0-450 in accordance with ASTM E84.

2.1.6  Aluminum

Provide a minimum 1.5 mm 0.06 inch thick, 6063-T5 or 6063-T6 aluminum alloy frame extrusion conforming to ASTM B221M ASTM B221. Exposed aluminum must have [anodized, satin finish][_____] Use straight, single lengths wherever possible and keep joints to a minimum. Provide mitered corners with a hairline closure. Submit sections of frame, map rail, and marker rail, and [two] [_____] map hooks.

2.1.7  Hardwood

Provide exposed oak, walnut or mahogany hardwood with manufacturer's standard durable factory-applied stain and lacquer finish for frames, cabinets, and cases.

2.1.8  Glass

Provide tempered glass in accordance with ANSI Z97.1 and ASTM C1048, Kind FT (fully tempered), Condition A (uncoated), Type I, Class I (clear), thickness as specified.

2.1.8.1  Glass with Interlayer Color Coating

Provide glass markerboard writing surface composed of tempered, low-iron, extra clear, safety writing glass with polished edges. Provide glass with an interlayer color coating with a durable paint/glass bond that is fade resistant, water resistant, and heat resistant.

2.1.8.2  Magnetic Glass

Provide magnetic glass markerboard writing surface composed of tempered,
low-iron, extra clear, safety writing glass with polished edges and steel backing permanently adhered to the back of the glass.

2.2 PRESENTATION BOARD

**************************************************************************
NOTE: A presentation board with an integral pull down projection screen is recommended if projection surface is required. Some units are not available with projection screens. Hot spots may occur if writing surface is used as a projection surface.

The type of doors, double or single, is dependent on the size of the presentation board.
**************************************************************************

Provide wall hung cabinet presentation board with lockable [double doors] [single door] [with] [without] a projection screen [that pulls down over the markerboard writing surface in the cabinet interior]. Attach doors to cabinet with piano hinges and include a catch or closure to keep doors closed when not in use. Provide a porcelain enamel markerboard writing surface on the interior of the cabinet with marker rail, a flip chart that can be hung on an interior door panel, and fabric covered tack surface on the interior door panels. Provide cabinet of [oak hardwood] [walnut hardwood] [mahogany hardwood] [plastic laminate] [____], with [rectilinear] [bullnose or radius] [traditional] [____] edge detailing.

Dry erase markings must be removable with a felt eraser or dry cloth without ghosting. Provide each unit with an eraser and four different color compatible dry erase markers, and two keys.

2.3 MARKERBOARD

**************************************************************************
NOTE: Hot spots may occur if this product is used as a projection screen. A visual display unit with pull down projection screen should be specified if a projection surface is required.

Not all marker rails are available in the same material as the frame, determine if this is a requirement to acquire desired design aesthetics.

Indicate if a full length marker rail is needed to meet user requirements. A full length marker rail is not available from all manufacturers. This requirement may increase the cost and add lead time. Generally the full length marker rail is the same length material as the frame.

Specify the map rail if there is a requirement to display maps, drawings, or large sheets of paper. Not all markerboards are available with map rail and map rail accessories.

If necessary, add requirements for graphics. Graphics can include such items as a grid, ruled lines or logo.

Full wall application of markerboard writing surface
is an option. Designer must modify the following paragraph to meet specific requirements and must verify that application is in compliance with National Fire Protection Association (NFPA) Life Safety Code 101.

**************************************************************************

NOTE: Retain the last bracketed sentence requiring products with indoor air quality certification when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness.

**************************************************************************

2.3.1 Porcelain Markerboard

Provide a factory assembled markerboard with a porcelain enamel[, magnetic] writing surface. Unit to be comprised of one piece, without joints whenever possible. When markerboard dimensions require delivery in separate sections, components must be prefitted at the factory, disassembled for delivery and jointed at the site. Provide [hardwood oak][hardwood walnut][hardwood mahogany][aluminum][_____] frame with marker rail [constructed of the same material as the frame] and [extending the full length of the markerboard] ____ inches long. The markerboard [does not include a map rail.] [includes a map rail with a tackable insert extending the full length of the markerboard, map hooks and clips for holding sheets of paper. Provide two map hooks for each 1219 mm 4 feet of map rail.] Dry erase markings must be removable with a felt eraser or dry cloth without ghosting. Supply each unit with an eraser and four different color compatible dry erase markers. [Provide magnetic glass markerboard with [10] ____ rare earth magnets.] [Provide markerboards that meet the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type).] [Provide certification of indoor air quality for markerboards.] [Provide high resolution graphics[reverse surface applied][printed on paper for insert behind glass][surface applied, direct print][_____] where required.]

2.3.2 Glass Markerboards with Interlayer Color Coating

Provide markerboard with a smooth finish[, magnetic glass] writing surface units to be comprised of one piece, without joints whenever possible. When markerboard dimensions require delivery in separate sections, components must be prefitted at the factory, disassembled for delivery and jointed at the site. [Extend marker rail the full length of the markerboard.] Marker rail is ____ inches long. The markerboard [does not include a map rail.] [includes a map rail with a tackable insert extending the full length of the markerboard, map hooks and clips for holding sheets of paper. Provide two map hooks for each 1219 mm 4 feet of map rail.] Dry erase markings must be removable with a felt eraser or dry erase cloth without ghosting. Supply each unit with an eraser and four different color compatible dry erase markers. [Provide magnetic glass markerboard with [10] ____ rare earth magnets.] [Provide markerboards that meet the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type).] [Provide certification of indoor air quality for markerboards.] [Provide high resolution graphics[reverse surface applied][printed on paper for insert behind glass][surface applied, direct print][_____] where required.
2.4 TACKBOARDS

**************************************************************************

NOTE: Retain the last sentence below requiring products with indoor air quality certification when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness.

**************************************************************************

[Provide tackboards that meet the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type).][ Provide certification or validation of indoor air quality for tackboards.]

2.4.1 Cork

**************************************************************************

NOTE: Tackboards with 6 mm 1/4 inch thick cork are more durable and higher in cost than tackboards with 3 mm 1/8 inch thick cork. Tackboards constructed with insulation board or fiberboard are generally less durable and less expensive than tackboards constructed of a hardboard. Cost of natural cork tackboards is generally less than colored cork tackboards.

**************************************************************************

Provide tackboard consisting of a minimum [3 mm 1/8 inch thick colored cork with burlap backing laminated to a minimum 10 mm 3/8 inch thick insulation board or fiber board] [6 mm 1/4 inch thick colored cork with burlap backing laminated to a minimum 6 mm 1/4 inch thick hardboard] [3 mm 1/8 inch thick natural cork laminated to a minimum 10 mm 3/8 inch thick insulation board or fiber board] [6 mm 1/4 inch thick natural cork laminated to a minimum 6 mm 1/4 inch thick hardboard], and [a] [hardwood oak] [hardwood walnut] [hardwood mahogany] [an] [aluminum] [_____] frame.

2.4.2 Vinyl Covered

Provide tackboard consisting of vinyl wall covering laminated to a minimum [3 mm 1/8 inch thick cork laminated to a minimum 10 mm 3/8 inch thick insulation board or fiberboard] [6 mm 1/4 inch thick cork laminated to a minimum 6 mm 1/4 inch thick hardboard or particleboard] [13 mm 1/2 inch thick insulation board or fiberboard], and [a][hardwood oak] [hardwood walnut] [hardwood mahogany] [an] [aluminum] [_____] frame.

2.4.3 Fabric Covered

Provide tackboard consisting of a [woven] [non-woven] fabric covering laminated to a minimum [3 mm 1/8 inch thick cork laminated to a minimum 10 mm 3/8 inch thick insulation board or fiberboard] [6 mm 1/4 inch thick cork laminated to a minimum 6 mm 1/4 inch thick hardboard or particleboard] [13 mm 1/2 inch thick insulation board or fiberboard], and [a][an] [hardwood oak] [hardwood walnut] [hardwood mahogany] [an] [aluminum] [_____] frame.
2.5 BOARD CASE

Provide [surface] [recess] mounted board case with [hinged minimum 5 mm 3/16 inch thick] [sliding minimum 6 mm 1/4 inch thick] tempered glass doors that are lockable. Provide [a][an] [aluminum][hardwood oak][hardwood walnut][hardwood mahogany][_____] case with mitered corners reinforced for rigidity. Provide doors [equipped with continuous piano hinges. Door glass framed with the case material, and reinforced at all corners. Door framing does not depend upon the glass for rigidity. Multiple door cases with an elbow catch] [sliding aluminum "H" molding at top and bottom of case]. The interior side of the back panel is tackable and composed of [a minimum 6 mm 1/4 inch colored cork] [a minimum 6 mm 1/4 inch natural cork] [a vinyl wall covering laminated to a minimum 6 mm 1/4 inch cork] [_____] laminated to a minimum 6 mm 1/4 inch fiberboard]. Provide two keys for each unit.

2.6 DISPLAY TRACK SYSTEM

**************************************************************************
NOTE: Track systems with more than one level have increased component capacity. Not all components can be located on all levels, coordinate locations with manufacturer recommendations.
**************************************************************************

Method of display is a flexible and interchangeable system that consists of lightweight presentation components suspended from a wall mounted, linear, horizontal track. Track has [one] [two] [_____] levels to attach components. Track allows attached components to slide horizontally. Presentation components are capable of being lifted from the track and being relocated to allow for reconfiguration. Components must be capable of being installed on the track without the use of tools for installation, removal, and reconfiguration. The presentation components consist of a [retractable projection screen,] [tilted projection screen (top tilts forward),] [reversible panel with dry erase markerboard on one side and woven fabric covered tack surface on the other,] [_____] [removable shelf,] [panel with adjustable flip chart,] [_____] and [display rail for setting presentation materials or a holder for displaying maps, presentation boards, drawings and other paper display materials up to a 3 mm 1/8 inch thickness]. Install and locate components on track in accordance with manufacturer's written recommendations. Provide markerboards with a marker rail. Markerboard surface accepts magnets. Dry erase markings are removable with a felt eraser or dry cloth without ghosting. Provide each unit with an eraser and four different color compatible dry erase markers.

2.7 HORIZONTAL SLIDING UNITS

**************************************************************************
NOTE: Specify the number and types of panels. Identify which panels must be installed in which track.
**************************************************************************

Provide horizontal sliding unit composed of a fixed back panel, sliding panels, an aluminum track assembly, map rail and marker rail. Provide unit with [2] [3] [4] [_____] tracks. The fixed back panel is [markerboard] [tackboard]. Provide unit with [_____] markerboard sliding panel and [_____] tackboard sliding panel. The track assembly and exposed members,
including panel edging and marker rail, are made of extruded aluminum. Reinforce frame assembly at corners. Sliding panels are suspended from the top and slide over the aluminum track using molded nylon ball bearing rollers at the top of the track and nylon guide rollers at the bottom of the track to eliminate vibration and to provide quiet and smooth operation of the panels. Sliding panels have finger pulls at each end. Provide a map rail with a tackable insert extending the length of the horizontal sliding unit. The map rail has map hooks with clips for holding sheets of paper. Provide two map hooks for each 1220 mm (4 feet) of map rail. Marker rail extends the full length of the horizontal sliding unit. Dry erase markings are removable with a felt eraser or dry cloth without ghosting. Provide each unit with an eraser and four different color compatible dry erase markers.

2.8 COPYBOARD

**************************************************************************************
NOTE: Models are available that have copy feature only and do not operate with a PC.

Copyboards are used to document and print information directly from the writing surface.

Specify PC ready or PC interface if required.

Coordinate PC requirements for PC ready and PC interface units with user to assure the Government furnished and Government installed PC and printer will be compatible with copyboard PC requirements.

Some models that have PC interface do not have a built-in printer since printer capability is obtained through interfacing with the PC and printer.

Coordinate copyboard requirements and locations with electrical engineer to assure that electrical outlets or hardwiring at the appropriate locations are included in the design.

**************************************************************************************

Provide wall mounted copyboard, 120V, UL listed, with [2] [_____] sided rotating screens, and [a built-in printer that prints letter size copies] [and] [capability to save and print to a Government furnished and Government installed PC and printer]. Copyboard surface [has grid lines] [and] accepts dry erase markers. Dry erase markings are removable with a felt eraser or dry cloth without ghosting. [Copyboard has PC interface] [or] [is PC ready]. [Provide PC interface kit for each PC ready unit.] Copyboards [are hardwired] [have an electrical cord that plugs into an electrical wall outlet]. Comply with electrical work requirements in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide each copyboard with an eraser and three different color compatible dry erase markers.

2.9 INTERACTIVE WHITEBOARDS

**************************************************************************************
NOTE: Models are intended to be a collaboration system using a touchscreen/interactive panel.
Coordinate connectivity to local area network (LAN) and verify with the Government the need to address cybersecurity and Risk Management Framework (RMF).

Include size, resolution, input/output requirements, aspect ratio, touch points, and other salient points.

Provide interactive whiteboards are composed of a wall mounted interactive touch screen/panel with infrared touch technology. System includes keyboard, conference camera, [short throw projector] [[connection to local area network (LAN)] and built-in wireless], remote control, pen, and audio. [Provide a system compatible with Government furnished and Government installed PC and printer][Provide a system that includes a printer and that is compatible with a Government furnished and Government installed PC]. Interactive whiteboards [are hardwired] [have an electrical cord that plugs into an electrical wall outlet]. Comply with electrical work requirements in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.10 PROJECTION SCREEN

NOTE: The designer must make appropriate selections based on the type of projection screen required. Not all options are available for all screens. Designer must research available sources and edit accordingly.

A selection needs to be made between a standard screen and tab tensioned screen. The tab tensioned screens have better picture quality since the viewing screen is flat, they are recommended when the primary use for the screen is for computer generated images.

If required, specify extra drop to lower picture area. Identify length of extra drop and if extra drop must be white or black.

Seams may be required dependent on size of screen.

Coordinate projection screen requirements and locations with electrical engineer to assure that electrical outlets and hardwiring at the appropriate locations are included in the design.

NOTE: Retain the last bracketed sentence requiring products with indoor air quality certification when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness.

Provide [wall mounted] [ceiling mounted] [recessed mounted] motorized projection screen with 120V motor that is lubricated for life, quick reversal type, has overload protector, integral gears, and preset accessible limit switches. [Provide recessed mounted projection screens
with an operable closure door and access panel.] Provide flame retartant, mildew resistant, [glass beaded] [white matte] [_____] screen [with [white] [black] masking borders] [that is tab tensioned. Tab tensioned screens have a vinyl surface that is stretchable]. Bottom of screen fabric is weighted with a metal rod. Provide roller of rigid metal at least [76] [127] [_____] mm [3] [5] [_____] inches in diameter mounted on sound absorbing supports. Motor is [end mounted] [or] [motor-in-roller] design. Provide screen with a 3 position control switch to stop or reverse screen at any point. Install the switch in a flush electrical box with cover plate, location(s) as shown on the Electrical drawings. All conduit and wiring from the control switch to the projection screen is furnished and installed by the Contractor. [Provide ceiling recessed case of [extruded aluminum] [or] [wood with metal lined motor compartment]]. [Provide [wall] [ceiling] mounted case of [aluminum] [or] [steel] [or] [wood. Wood case is finished in [plastic laminate] [light oak] [medium oak] [walnut] [cherry] [mahogany] [_____]]. Screen is UL listed. Comply with electrical work requirements in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. [Provide projection screens that meet the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type).]

[Provide certification of indoor air quality for projection screens.]

2.11 COLOR

**************************************************************************
NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an architect or interior designer. Color must be selected from manufacturers standard colors or identified as a manufacturers color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings a note must be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

**************************************************************************

Provide finish colors for required items [as specified in Section 09 06 00 SCHEDULES FOR FINISHES][as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers].
PART 3 EXECUTION

3.1 PLACEMENT SCHEDULE

**************************************************************************
NOTE: Identify location and mounting height of visual display units.

Identify size and type of visual display units only once in the contract documents.

Include additional information for the display track system. Specify the length of the wall track, and type and number of presentation components required per room.
**************************************************************************

[Location, size and mounting height of visual display units as shown on the drawings.] [Provide visual display units as follows:

<table>
<thead>
<tr>
<th>Room Name and Number</th>
<th>Board Type</th>
<th>Board Size</th>
<th>Wall Location</th>
<th>Mounting Height</th>
</tr>
</thead>
<tbody>
<tr>
<td>(_____)</td>
<td>(_____)</td>
<td>(_____)</td>
<td>(_____)</td>
<td>(_____)</td>
</tr>
</tbody>
</table>

Mounting height is defined as distance from finished floor to top of the visual display unit frame.

3.2 INSTALLATION

**************************************************************************
NOTE: Provide reinforcing at partitions to support visual display units.
**************************************************************************

Do not install items that show visual evidence of biological growth. Perform installation and assembly in accordance with manufacturer's printed installation instructions. Use concealed fasteners. Attach visual display units to the walls with suitable devices to anchor each unit. Furnish and install trim items, accessories and miscellaneous items in total, including but not limited to hardware, grounds, clips, backing materials, adhesives, brackets, and anchorages incidental to or necessary for a sound, secure, complete and finished installation. Do not initiate installation until completion of room painting and finishing operations. Install visual display units in locations and at mounting heights indicated. Install visual display units level and plumb, and if applicable align doors and adjust hardware. Repair or replace damaged units as directed by the Contracting Officer.

3.3 CLEANING

Clean writing surfaces in accordance with manufacturer's cleaning instructions.

  3.1.2 Protection and Cleaning
3.2 FIELD PAINTED FINISH

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for common types of exterior signs, dimensional building letters, and metal plaques.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Reference this specification and drawings to the standards of UFC 3-120-01, Sign Standards that includes graphics, lettering style and other key components.

NOTE: Army facilities not excluded by TI 800-01 Design Criteria will be accessible in accordance with 36 CFR, Part 1191, Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities.

Drawings will indicate location, dimensions,
elevations, schedules, content, details and such other information as required to indicate the extent of the work. The same terminology or titles used in the specification, for the different types of signage, will be used on the drawings and schedules.

Designer must coordinate and incorporate existing signage policy and designs, as required, for new projects on existing facilities.

This section covers some of the more common exterior sign types. When other sign types are to be used, specifications will be modified accordingly.

Product selections must be based on aesthetic values, appearance, and cost as related to project needs.

Additional Guidance on the development of signage systems is available in USACE EP 310-1-6a and 6b, Sign Standards Manual. The document is available from the USACE Publications Depot, 2803 52nd Avenue, Hyattsville, MD 20781, 301-394-0081/82/83/84.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 GENERAL REQUIREMENTS

All exterior signage must be provided by a single manufacturer. Exterior signage must be of the design, detail, sizes, types, and message content shown on the drawings, must conform to the requirements specified, and must be provided at the locations indicated. Submit exterior signage schedule in electronic media with spreadsheet format. Spread sheet must include sign location, sign type, and message. Signs must be complete with lettering, framing as detailed, and related components for a complete installation. Each sample must consist of a complete sign panel with letters and symbols. Samples may be installed in the work, provided each sample is identified and location recorded. Submit [three] [_____] color samples for each material requiring color and 305 mm 12 inch square sample of sign face color sample.

1.2.1 Wind Load Requirements

Exterior signage must be designed to withstand [_____] km/h mph windload. Submit design analysis and supporting calculations performed in support of specified signage.

1.2.2 Character Proportions and Heights

Letters and numbers on indicated signs for handicapped-accessible buildings must have a width-to-height ratio between 3:5 and 1:1 and a stroke-width-to-height ratio between 1:5 and 1:10. Characters and numbers on indicated signs must be sized according to the viewing distance from which they are to be read. The minimum height is measured using an upper case letter "X". Lower case characters are permitted.
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Approved Detail Drawings; G[, [______]]

SD-03 Product Data

Modular Exterior Signage System Installation Exterior Signage; G[, [______]]

Wind Load Requirements
1.4 QUALIFICATIONS

Signs, plaques, and dimensional letters must be the standard product of a manufacturer regularly engaged in the manufacture of the products. Items of equipment must essentially duplicate equipment that has been in satisfactory use at least 2 years prior to bid opening.

1.5 DELIVERY AND STORAGE

Materials must be wrapped for shipment and storage, delivered to the jobsite in manufacturer's original packaging, and stored in a clean, dry area in accordance with manufacturer's instructions.

1.6 WARRANTY

Manufacturer's standard performance guarantees or warranties that extend beyond a one year period must be provided.

1.7 EXTRA STOCK

**************************************************************************
NOTE: A sufficient number of message panels/bars and letters for future use for changes and message replacement must be specified.
**************************************************************************

Provide [_____] extra interchangeable message panels and extra stock of the following: [_____] message bars of each color and size for sign types [______]. [_____] pressure-sensitive letters in each color and size for sign type [______]. [_____] changeable message strips for sign type [______].

PART 2 PRODUCTS

2.1 MODULAR EXTERIOR SIGNAGE SYSTEM

**************************************************************************
NOTE: Omit signage systems not required for project.
**************************************************************************

Signage for Navy projects should be designed in accordance with the Activity's Base Exterior Architectural Guide or Base Signage Guide. Check with activity concerning standards on safety regulatory signs (i.e. fire and radiation).

Enamel finish is more economical than anodized, but may not perform as well; therefore, may not be cost effective. Designer should investigate local conditions to make determination.
Exterior signage must consist of a system of coordinated directional, identification, and regulatory type signs located where shown. Dimensions, details, materials, message content, and design of signage must be as shown. Submit manufacturer's descriptive data and catalog cuts.

2.1.1 Free-Standing Base Mount Pylon/Monolith Type Signs

**************************************************************************
NOTE: Drawings should show mounting heights and mounting details.
**************************************************************************

2.1.1.1 Framing

Interior framing must consist of [aluminum] [or] [galvanized steel] tube columns welded to companion plates. Perimeter framing must consist of [aluminum] [or] [steel] angle framing welded to the post and plate system as designed. Framing members must be designed to permit [access to electrical equipment] [and] [panel removal]. Mounting must be provided as shown. Framing members of steel must be finished with semi-gloss baked enamel or two-component acrylic polyurethane. Openings must be sealed from moisture and made tamper-proof.

2.1.1.2 Exterior Sheeting Panels

**************************************************************************
NOTE: If panels are to be nonremovable, use aluminum panels to permit welding to frame. Details will be used as applicable for locations for welding.
In project locations with Environmental Severity Classifications (ESC) C3 thru C5, do not use galvanized or enameled steel products for panels, brackets, posts, fasteners, or hardware; use anodized aluminum or fiberglass for panels. Also use anodized aluminum or stainless steel for brackets and posts, and use stainless steel for fasteners and hardware. See UFC 1-200-01 for determination of ESC for project locations.
**************************************************************************

Modular panels must be provided in sizes shown on drawings. Panels must be fabricated a minimum of [2.3 mm 0.090 inch thick [aluminum] [steel]] [3.2 mm 0.125 inch thick fiberglass reinforced plastic (FRP)]. [Panels must be heliarc welded to framing system [____].] Top and end panels must be removable and must be secured by 5 mm 3/16 inch socket head jack nuts. Finish for metal panels must be [semi-gloss baked enamel] [two-component acrylic polyurethane] [anodized conforming to AA DAF45].

2.1.1.3 Mounting

Mount by securing to concrete foundation as indicated.

2.1.1.4 Finishes

Base finish must be [semi-gloss baked enamel] [or] [two-component acrylic polyurethane] [anodized conforming to AA DAF45] [____]. Metal panel system finish must be [baked enamel or two-component acrylic polyurethane]
2.1.2 Panel And Post/Panel Type Signs

**************************************************************************
**NOTE: Show details of sign foundations on drawings. Include provision for concealed entry of electric service to internally illuminated signs through foundation to post.**************************************************************************

2.1.2.1 Posts

One-piece [aluminum] [or] [galvanized steel] posts must be provided with minimum 3.2 mm 0.125 inch wall thickness. Posts must be designed to accept panel framing system described. The post must be designed to permit attachment of panel framing system without exposed fasteners. Caps must be provided for each post.

2.1.2.2 Panel Framing System

Panel framing consisting of aluminum sections and interlocking track components must be designed to interlock with posts with concealed fasteners.

2.1.2.3 Panels

Modular message panels must be provided in sizes shown on drawings. Panels must be fabricated a minimum of [[2.0] [2.3] [3.2] mm [0.080] [0.090] [0.125] inch aluminum] [3.2 mm 0.125 inch acrylic] [3.2 mm 0.125 inch fiberglass reinforced plastic (FRP)]. [Panels must be designed to be interchangeable.] [Panels with metal return sheeting must have welded corners, ground smooth.] [Panels must be heliarc welded to framing system.] [Face panels must be removable to provide access to electrical components.]

2.1.2.4 Finishes

Post finish must be [semi-gloss baked enamel] [or] [two-component acrylic polyurethane] [anodized conforming to AA DAF45 [____]]. Metal panel system finish must be [baked enamel or two-component acrylic polyurethane] [anodized conforming to AA DAF45 [____], as shown].

2.1.2.5 Mounting

[Provide permanent mounting by embedding posts in concrete foundation as indicated.] [Provide removable mounting by [[a steel] [an aluminum]] [[sleeve] [flange]] embedded in concrete as indicated.]

2.1.3 Changeable Letter Directories

**************************************************************************
**NOTE: The directories specified are standard changeable-letter type. Message strip types are also available. Cork board can be substituted for molded backing to provide bulletin boards. Lettering is available in sets of upper case, lower case, and numerals or as individual characters. Melamine plastic (MP) header plates are a tough**************************************************************************
phenolic core material that is suitable for non-direct sun exterior usage and is recommended for raised lettering and braille.

**************************************************************************

2.1.3.1 Frame and Trim

Aluminum alloy finish must be [____].

2.1.3.2 Header Plates

[Header plate must consist of background metal matching frame and having raised letters attached through the back.] [Header plate must consist of acrylic with raised acrylic letters.] [Header plate must consist of MP plastic with raised letters.]

2.1.3.3 Door Glazing

Door glazing must be [clear safety or tempered glass minimum 6 mm 1/4 inch thick.] [clear acrylic sheet 4.8 mm 3/16 inch thick.] [clear polycarbonate sheet [4.8] [6.4] mm [3/16] [1/4] inch thick.]

2.1.3.4 Door Construction

Door frame must be of same material and finish as surrounding frame. Corners must be mitered [, reinforced] [, welded], and assembled with concealed fasteners. Hinges must be standard with manufacturer, in finish to match frames and trim. Glazing must be set in frame with resilient glazing channels.

2.1.3.5 Door Locks

Door locks must be manufacturer's standard and must be keyed alike.

2.1.3.6 Fabrication

Frames and trim must be assembled with corners [reinforced] [welded] and mitered to hairline fit, with no exposed fasteners. Removable changeable directory panel must consist of [6 mm 1/4 inch thick white acrylic with clear acrylic letter tracks] [exterior grade plywood] [aluminum] [rubber] back with [vinyl] [polycarbonate] [corkboard] covering backgrooved 6 mm 1/4 inch on centers to receive letters.

2.1.3.7 Finishes

Post finish must be [semi-gloss baked enamel] [or] [two-component acrylic polyurethane] [anodized conforming to AA DAF45] [____]. Metal panel system finish must be [baked enamel or two-component acrylic polyurethane] [anodized conforming to AA DAF45 [____], as shown].

2.1.3.8 Mounting

Directories must be mounted to supporting structures with concealed fasteners in accordance with manufacturer's instructions.

2.1.3.9 Changeable Letters

**************************************************************************

NOTE: Allow for changes and message replacement by

SECTION 10 14 00.10  Page 11
specifying a sufficient number of letters for future use. For other lettering types, special equipment may be required to apply messages. If so, be sure to include the equipment and operating instructions. In areas where vandalism is a problem, acrylic solvent may be used to glue letters to the background. This limits changing of the message.

Changeable letters must be upper-case or upper and lower-case [helvetica medium] [______]. Tabbed vinyl letters and numbers must be furnished in accordance with the [drawings] [and] [schedule].

2.2 ILLUMINATION

**************************************************************************
NOTE: Coordinate illumination with Division 26 and available electric service.

Exterior signs with the message "EMERGENCY" should be connected to an emergency power source.

**************************************************************************
Concealed lighting must be provided within panel framing members. Lighting must be controlled by a photocell device. [Top] [Back] lighting must be provided by [T-12 slimline lamps, [120] [277] [______] volt, 60-hertz, single-phase, Type 1, or Type 2 ballast] [______]. Ballast must be integrally mounted, high power factor and rated for use down to minus 29 degrees C minus 20 degrees F ambient starting temperature. Ballast and wiring within the sign must be in metal raceways. Electrical equipment must be UL or FM listed and comply with NFPA 70. Illumination must be evenly distributed. A switch on the interior of the sign must be provided to turn off power in the sign. Switch must be readily accessible when sign is open.

2.3 GRAPHICS FOR EXTERIOR SIGNAGE SYSTEMS

2.3.1 Graphics

**************************************************************************
NOTE: Choose the appropriate paragraph for the graphics application. The process of silk-screening for large areas, type, etc. does not weather properly without proper protective overspray protection with UV inhibitors.

**************************************************************************
Signage graphics must conform to the following:

[ a. [Cast] [Custom fabricated] [Plate] aluminum letters, [6] [13] [______] mm [1/4] [1/2] [______] inch thick must be provided and fastened to the message panel with concealed fasteners. Letters must project [______] mm inches from face of panel.]

[ b. Pressure sensitive precision cut vinyl letters [with reflecting surface] [______] must be provided.]

[ c. Message must be applied to panel using the silkscreen process.
Silkscreened images must be executed with photo screens prepared from original art. Handcut screens will not be accepted. Original art must be defined as artwork that is a first generation pattern of the original specified art. Edges and corners must be clean. Rounded corners, cut or ragged edges, edge buildup, bleeding or surfaces pinholes will not be accepted.

[ d. Message letters must be cut out from panel. Panel cutouts must be backed with [2.0 mm 0.080 inch FRP] [3.2 mm 0.125 inch acrylic] where cutouts occur.]

[ e. Message must be cut out from panel. Acrylic letters [3] [6] [13] mm [1/8] [1/4] [1/2] inch thick must be projected through the cutout area and chemically welded to 3.2 mm 0.125 inch thick acrylic backup sheet.]

[ f. Message must be embedded in FRP sheet and completely covered with thermosetting polyester resin. Message must be embedded minimum 0.8 mm 1/32 inch. Sheets must be processed in one piece, in one process, to prevent delamination.]

[ g. Message must be applied using the frisket method. Photomechanically reproduced graphic masks must be applied to the sign face which has been coated with the graphics color. A background must then be applied to the exposed surfaces. Handcut masks will not be accepted. Edges that are nicked, cut, or ragged will not be acceptable. A protective overcoat containing UV-resistant additives must be applied.]

[ h. Message must be engraved in non-corrosive, three-ply fiberglass laminate. Message must be core color or paint filled multiple colors.]

2.3.2 Messages

**************************************************************************
NOTE: Choose typeface consistent with total signage system and Activity Standards. Show message content, sizes, and colors on drawings or in a message schedule.
**************************************************************************

See [drawings] [and] [schedule] for message content. Typeface: [Helvetica medium] [____]. Type size [____] [as indicated].

2.4 METAL PLAQUES

Design and location of plaques must be as indicated.

2.4.1 Cast Metal Plaques

2.4.1.1 Fabrication

Cast metal plaques must have the logo, emblem and artwork cast in the [bas relief] [flat relief] [____] technique. Plaques must be fabricated from [prime aluminum] [bronze] [yellow brass].

2.4.1.2 Size

Plaque size must be [____] [as indicated].

SECTION 10 14 00.10 Page 13
2.4.1.3 Border

Border must be [flat band] [plain edge] [bevel] [custom ornamental as indicated] [______].

2.4.1.4 Background

Background texture must be [leather] [fine pebble] [______].

2.4.1.5 Mounting

Mounting must be [concealed] [rosettes and anchors] [rosettes and toggle bolts] [invisible] [______].

2.4.1.6 Finish

Finishes must consist of [aluminum light colored sandblasted background. Letters must be satin polished and entire plaque must be sprayed with two coats of clear lacquer.] [aluminum with background sprayed dark gunmetal colored lacquer. Letters must be satin polished and entire plaque sprayed with two coats clear lacquer.] [bronze with dark finish oxidized background. Letters must be satin polished and entire plaque sprayed with two coats of clear lacquer.] [aluminum] [bronze] with sprayed background. Letters must be satin polished.]

2.4.2 Chemically Etched Metal Plaques

2.4.2.1 Fabrication

Plaque must be chemically [single-] [double-] etched one-piece [brass] [bronze] [______] [0.8128] [1.6256] [3.175] [6.35] mm [0.032] [0.064] [0.125] [0.250] inch thick.

2.4.2.2 Size

Plaque size must be [______] [as shown].

2.4.2.3 Finish

[Single-etched raised areas must be in [gold-tone] [silver-tone] [bronze-tone] finish and recessed areas must be colorfilled.] [Double-etched raised areas must be [gold-tone] [silver-tone] and recessed textured areas must be [gold-tone] [silver-tone] colorfilled.]

2.4.3 Frost and Surface Oxidized Plaques

2.4.3.1 Fabrication

Plaque must be frosted and surface oxidized one - piece [anodized aluminum] [brass] [bronze] [stainless steel] [1.02] [3.175] mm [0.040] [0.125] inch thick.

2.4.3.2 Size

Plaque size must be [______] [as shown].

2.4.3.3 Finish

[Material finish must be [satin] [polished].] [Frosted areas must be
oxidized [black for aluminum or stainless steel] [or] [black or brown, for brass or bronze].]

2.5 DIMENSIONAL BUILDING LETTERS

**************************************************************************
NOTE: These letters are for direct application to exterior building surfaces. Drawings must show mounting type details.
**************************************************************************

2.5.1 Fabrication

Letters must be fabricated from [cast aluminum] [cast bronze] [2.29 mm 0.090 inch aluminum sheet] [3.17 mm 0.125 inch aluminum sheet] [extruded aluminum] [_____] letters must be cleaned by chemical etching or cleaned ultrasonically in a special degreasing bath. Letters must be packaged for protection until installation.

2.5.2 Typeface

Typeface must be [helvetica medium] [_____] [as indicated].

2.5.3 Size

Letter size must be [_____] [as indicated].

2.5.4 Finish

[Anodized aluminum] [Baked enamel or two-component acrylic polyurethane] [[Polished] [Oxidized] bronze with clear coat] finish must be provided.

2.5.5 Mounting

[Threaded studs] [Steel U-bracket, cap screws, and expansion bolts] of number and size as recommended by manufacturer, must be used for concealed anchorage. Letters which project from the building line must have stud spacer sleeves. Letters, studs, and sleeves must be of the same material. Supply templates for mounting.

2.6 ALUMINUM ALLOY PRODUCTS

Aluminum alloy products must conform to ASTM B209M ASTM B209 for sheet or plate, ASTM B221M ASTM B221 for extrusions and ASTM B26/B26M or ASTM B108/B108M for castings. Aluminum extrusions must be provided at least 3 mm 1/8 inch thick and aluminum plate or sheet at least 16 gauge thick. Welding for aluminum products must conform to AWS C1.1M/C1.1.

2.7 ANODIC COATING

**************************************************************************
NOTE: Edit the following requirements as necessary for the project.
**************************************************************************

Anodized finish must conform to AA DAF45 as follows:

[ Clear (natural) designation AA-M10-C22-A31, Architectural Class II 0.010 mm 0.4 mil or thicker.]
2.8 ORGANIC COATING

**************************************************************************
NOTE: Edit this paragraph to include only types and finishes being used.
**************************************************************************

Clean, prime and give surfaces a [semi-gloss baked enamel] [or] [two-component acrylic polyurethane] finish in accordance with NAAMM AMP 500, AMP 505, with total dry film thickness not less than 0.030 mm 1.2 mils.

2.9 STEEL PRODUCTS

Structural steel products must conform to ASTM A36/A36M. Sheet and strip steel products must conform to ASTM A1011/A1011M. Welding for steel products must conform to AWS D1.2/D1.2M.

2.10 CAST BRONZE

Fabricate components with sharp corners, flat faces, and accurate profiles. Remove and polish burrs and rough spots. Finish faces to a uniform high luster. Cast bronze must be in accordance with ASTM B62.

2.11 VINYL SHEETING FOR GRAPHICS

Vinyl sheeting must be 5 to 7 year premium type and must be in accordance with the flammability requirements of ASTM E84 and must be a minimum 0.08 mm 0.003 inch film thickness. Film must include a precoated pressure sensitive adhesive backing, Class 1, or positionable pressure sensitive adhesive backing, Class 3.

2.12 GLASS

Glass must be in accordance with ASTM C1036, Type I, Class 1, Quality q3 and ANSI Z97.1.

2.13 FIBER-REINFORCED POLYESTER (FRP) PANELS

Fiber-reinforced polyester (FRP) must be in accordance with ASTM D3841, Type II, Grade 1, Class 124, [_____] [as indicated].

2.14 ACRYLIC SHEET

Acrylic sheet must be in accordance with the flammability requirements of ASTM E84 and must conform to ANSI Z97.1.

2.15 POLYCARBONATE SHEET

Polycarbonate sheet must conform to SAE AMS3611.
2.16 ANCHORS AND FASTENERS

Exposed anchor and fastener materials must be compatible with metal to which applied and must match in color and finish and must be non-rusting, non-corroding, and non-staining. Exposed fasteners must be tamper-proof.

2.17 SHOP FABRICATION AND MANUFACTURE

2.17.1 Factory Workmanship

Work must be assembled in the shop, as far as practical, ready for installation at the site. Work that cannot be shop assembled must be given a trial fit in the shop to ensure proper field assembly. Holes for bolts and screws must be drilled or punched. Drilling and punching must produce clean, true lines and surfaces. Welding to or on structural steel must be in accordance with AWS D1.1/D1.1M. Welding must be continuous along the entire area of contact. Exposed welds must be ground smooth. Exposed surfaces of work must have a smooth finish and exposed riveting must be flush. Fastenings must be concealed where practical. Items specified to be galvanized must be by hot-dip process after fabrication if practical. Galvanization must be in accordance with ASTM A123/A123M and ASTM A653/A653M, as applicable. Other metallic coatings of steel sheet must be in accordance with ASTM A924/A924M. Joints exposed to the weather must be formed to exclude water. Drainage and weep holes must be included as required to prevent condensation buildup.

2.17.2 Dissimilar Materials

NOTE: If signs are to have extensive metal parts or are to be anchored to structural steel, include this paragraph. Otherwise edit as appropriate.

Where dissimilar metals are in contact, or where aluminum is in contact with concrete, mortar, masonry, wet or pressure-treated wood, or absorptive materials subject to wetting, the surfaces must be protected with a coat of asphalt varnish or a coat of zinc-molybdate primer to prevent galvanic or corrosive action.

2.17.3 Shop Painting

Surfaces of miscellaneous metal work, except nonferrous metal, corrosion resisting steel, and zinc-coated work, must be given one coat of zinc-molybdate primer or an approved rust-resisting treatment and metallic primer in accordance with manufacturer's standard practice. Surfaces of items to be embedded in concrete must not be painted. Upon completion of work, damaged surfaces must be recoated.

2.18 COLOR, FINISH, AND CONTRAST

NOTE: Color must be specified in this paragraph unless identified elsewhere in finish paragraphs. Delete color portion if covered elsewhere.

Editing of color reference sentence(s) must be coordinated with the Government. Generally the 09 06 00 SCHEDULES FOR FINISHES or drawing is used.
when the project is designed by an Architect or Interior designer. Color must be selected from manufacturers standard colors or identified as a manufacturers color in this specification only when the project is very simple and has minimal finishes. Coordinate choice of colors with manufacturer’s information as regards to color fastness. Coordinate color selections with installation standards, if one exists.

When the Government directs that color be located in the drawings a note must be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

**************************************************************************

Color must be [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES.] [as indicated on the drawings.] [selected from manufacturers standard colors.] [______.] Color listed is not intended to limit the selection of equal colors from other manufacturers.] For buildings required to be handicapped-accessible, the characters and background of signs must be eggshell, matte, or other non-glare finish. Characters and symbols must contrast with their background – either light characters on a dark background or dark characters on a light background.

PART 3 EXECUTION

3.1 INSTALLATION

Signs, plaques, or dimensional letters must be installed in accordance with approved manufacturer's instructions at locations shown on the approved detail drawings; submit drawings showing elevations of each type of sign; dimensions, details, and methods of mounting or anchoring; shape and thickness of materials; and details of construction. A schedule showing the location, each sign type, and message must be included. Circuits installed underground must conform to the requirements of Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Steel conduits installed underground and illuminated signage mounted directly on buildings must be in conformance with the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Signs must be installed plumb and true at mounting heights indicated, and by method shown or specified. Signs mounted on other surfaces must not be installed until finishes on such surfaces have been completed. Submit manufacturer's installation instructions and cleaning instructions.
3.1.1 Anchorage

Anchorage and fastener materials must be in accordance with approved manufacturer's instructions for the indicated substrate. Anchorage not otherwise specified or indicated must include slotted inserts, expansion shields, and powder-driven fasteners when approved for concrete; toggle bolts and through bolts for masonry; machine carriage bolts for steel; lag bolts and screws for wood.

3.1.2 Protection and Cleaning

The work must be protected against damage during construction. Hardware and electrical equipment must be adjusted for proper operation. Glass, frames, and other sign surfaces must be cleaned in accordance with manufacturer's instructions. After signs are completed and inspected, cover all project identification, directional, and other signs which may mislead the public. Covering must be maintained until instructed to be removed by the Contracting Officer or until the facility is to be opened for business. Submit [six] [_____] copies of maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. The instructions must include simplified diagrams for the equipment as installed. Signs must be cleaned, as required, at time of cover removal.

3.2 FIELD PAINTED FINISH

Miscellaneous metals and frames must be field painted in accordance with Section 09 90 00 PAINTS AND COATINGS. Anodized metals, masonry, and glass must be protected from paint. Finish must be free of scratches or other blemishes.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for common types of signs, dimensional letters, and metal plaques used inside buildings.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This section covers some of the more common interior sign types. When other sign types are to be used, such as elevator-related signs, occupancy load signs and structural load limit signs, specifications will be modified accordingly. Buildings will be accessible in accordance with 36 CFR, Part 1191, Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Architectural Barriers Act (ARA) Accessibility Guidelines except for Army buildings excluded by TI 800-01 Design Criteria.

Reference UFC 3-120-01 available at Unified Federal Criteria Design: Sign Standard for design,
construction and placement of signs.

In combination with this specification, drawings and attachments will include a location plan, dimensions, elevations, schedules, content, details and such other information as required to indicate the extent of the work. The same terminology and designations used in the specification will be used on the drawings, schedules and attachments.

Product selections must be based on quality, functionality, aesthetic values, appearance, and cost as related to project needs.

Use of personal names on interior signage is discouraged. If personal names are required, changeable message strips will be used. Consider coordination of interior signage within this specification with signage required on individual workstations which is specified in Section 12 59 00 SYSTEMS FURNITURE.

Interior stairwell signage will be provided in accordance with Life Safety Code NFPA 101, Chapter 5, and applicable occupancy chapters. Clearly define interstitial spaces or other doorways within stairwell that do not lead to a horizontal exitway with signage that states "Not an Exit".

Permanent information on room identification signs includes the room number on all room identification signs, symbol and message on toilet rooms, message on janitor closets, mechanical/electrical and communications rooms, and message identifying stairs, when those identification signs are placed at doorways to permanent spaces.

Where appropriate for MEDICAL FACILITIES, include the following requirements for signage:

1. Room numbering for spaces within the medical facility will be determined jointly by the using facility and the design team. See UFC 4-510-01 Design: Medical Military Facilities. Room numbering will be consistent throughout the facility. For inpatient medical facilities, rooms with audiovisual nurse call must have a unique user room number, since audiovisual nurse call is tied into a digital paging system. For outpatient clinics, rooms with tonevisual nurse call, do not need a unique user room number, since tonevisual nurse call is hardwired to a panel located at a nursing station. Room numbering should address the following issues:

   a. Wayfinding within clinics and other departments (user room #).

   b. Facility Maintenance (architectural room #).
c. Audiovisual Nurse Call (inpatient) (unique user room #).

d. Tonevisual Nurse Call (outpatient) (user room #).

2. The use of symbols/graphics on interior signage will be limited. International symbols and graphics will be used where needed. Symbols are not required to be raised. Recommended symbols include men/women symbol for toilet rooms and showers, men/women symbol with wheelchair for accessible toilets, men/women symbol with key for locker rooms, telephone symbol for public telephone areas, information symbol (?), radiation symbol, biohazard symbol, and the international symbol for accessibility.

3. Arrow placement order on interior signage will comply with UFC 4-510-01 Design: Medical Military Facilities. Left pointing arrows at top of sign, followed by up pointing arrows, then right pointing arrows at bottom of sign. Messages per arrow direction will be organized alphabetically. Example follows:

- EMERGENCY
- Pediatrics
- Radiology
- Orthopedic Clinic
- Admissions

4. Signage schedule should be provided in electronic spreadsheet format. Schedule will include architectural room number, user room number, type of sign, message, symbol (if needed), color, and mounting location.

5. Building directories and accompanying orientation maps for the medical facility will be determined jointly by the using facility and the design team. Orientation maps, if required, will be included as part of the interior signage package, and should be of the same manufacturer. Include international symbols for information (?), parking areas (upper case P within circle), public toilet rooms, public telephones, and graphic north arrow on orientation maps. Orientation map is to be positioned so that building left is viewer's left.

6. Large, easy to read signs over reception counters, check-in counters, information desks, or departments will be provided. Signs should be either ceiling mounted or affixed to soffit directly above counters.

7. Room identification signs should be 203 mm by 203 mm 8 by 8 inch or 229 mm by 229 mm 9 by 9 inch.
Justification of room number and message will be flush left.

8. Fire evacuation signs will be provided in accordance with the local Fire Marshal, if required.

9. Overhead directional signs should not block fire exit signs.

10. Signage will clearly define all staff, public, or patient toilet rooms.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard’s Check Reference feature when you add a RID outside of the Section’s Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard’s Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a
code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

[1.3 EXTRA MATERIALS

Provide [_____] extra frames and extra stock of the following: [_____] blank plates of each color and size for [all sign types included in project][_____.] [_____] changeable message strips for sign type [_____]. Provide [_____] paper inserts and [laser print templates to support end-user printing copy] [one][_____] copy of the software for user produced signs and inserts after project completion] [and equipment necessary for removal of signage parts and pieces.]
1.4 QUALITY ASSURANCE

1.4.1 Samples

Submit interior signage samples of each of the following sign types showing typical quality, workmanship and color: [all sign types included in project] [Room Identification and Directional Signage System] [Room Identification with Patient Information], [Stair Signage], [Exit Door Tactile Sign], [Door Tags], [Building Directories], [Metal Plaques], [Dimensional Building Letters], [Pressure Sensitive Letters]. Approved samples may be installed in the work, provided each sample is identified and location recorded.

1.4.2 Detail Drawings

Submit detail drawings showing elevations of each type of sign, dimensions, details and methods of mounting or anchoring, mounting height, shape and thickness of materials, and details of construction. Include a schedule showing the location, each sign type, and message.

1.4.3 Sign Fabricator

Sign Fabricator to follow room number strategies created by designer. The room numbering system to be reviewed and approved by the Contracting Officer and command end users during the shop drawing phase, and prior to fabrication.

1.4.4 Cybersecurity

a. The Risk Management Framework (RMF) is the process by which information systems are accredited for operation by a designated official from the Using Military Department. It is the standard process under which all DoD information systems achieve and maintain their Authority To Operate. The cybersecurity process is documented in DOD 8510.01 and NIST SP 800-82. Refer to UFC 4-010-06 and DODI 8500.01 for additional requirements.

b. All systems that are IP addressable or interface with the Assured Network required certification to operate. Coordinate with the Government to initiate and complete the accreditation process.

c. Cybersecurity requires input from the system vendor or provider and support from the local IMD. The local IMD-IA office is the point of contact for all Cyber Security requirements. The local CMIO is the point of contact for all clinical and functional system requirements.

1.5 DELIVERY, STORAGE, AND HANDLING

Package materials to prevent damage and deterioration during shipment, handling, storage and installation. Deliver products to the jobsite in manufacturer's original packaging and store in a clean, dry area in accordance with manufacturer's instructions.

1.6 WARRANTY

Provide manufacturer's warranty to repair or replace defective interior signage materials and workmanship for a period of [2] [_____] years from date of final acceptance of the work.
PART 2   PRODUCTS

**************************************************************************
NOTE: Delete signage systems, directories, etc., not required for project. Coordinate electrical requirements with Division 26 and building electrical design.
**************************************************************************

2.1 ROOM IDENTIFICATION AND DIRECTIONAL SIGNAGE SYSTEM

**************************************************************************
NOTE: Depending on the complexity of the project consider a modular signage system or a panel sign system. A modular sign system is one comprised of extruded aluminum structural rails and end caps. Each part of the sign is inserted into these rails separately. Modular signs are easily updatable in the field and do not require the whole sign to be removed to make changes. Panel signs are made up of a single backer unit, each portion of the sign is permanently attached to this backer unit. These signs are typically more affordable however any changes to the sign requires that the entire sign is removed and remade, except when using changeable inserts. Coordinate project requirements and specific signage system with user.

For the purpose of this specification, message strips are made of vinyl with applied or direct print characters or messages that slide into the aluminum extrusions of a modular sign. Inserts are paper or acetate that allow ease in changing and updating as required. These inserts are under a non-glare acrylic window.
**************************************************************************

Provide signs, plaques, directories, and dimensional building letters that are standard products of manufacturers regularly engaged in the manufacture of such products that essentially duplicate signs that have been in satisfactory use at least 2 years prior to bid opening. Obtain signage from a single manufacturer with edges and corners of finished letter forms and graphics true and clean.

[2.1.1 Panel Sign Systems]

Provide [direct print acrylic with applied [tactile] [second surface] graphics, sign is fabricated of 10 mm 0.375 inch acrylic in two layers with smooth edge conforming to ANSI Z97.1] [decorative laminate face with applied [tactile] graphics, sign is fabricated of a balanced core sandwiched between 0.89 mm 0.035 inch standard grade high pressure laminated faces]. Provide signs that can accept [images] [raised copy and Braille with printable message inserts] [printable message inserts]. Provide paper or acetate inserts with a 2 mm 0.080 inch thick non glare acrylic window to allow sign to be updated.[____]

[2.1.2 Modular Sign Systems]

Provide manufactured pre-engineered component-based sign system, consisting
of a combination of aluminum extrusions and injection molded parts, pre-engineered and designed to create an updatable sign system that allows for easy and inexpensive updates and changes. Provide system with incremental widths and heights that permit the assembly of multiple inserts of variable size to create a single sign. Provide a tamper-resistant sign which requires a special tool to change inserts composed of [extruded aluminum for applied graphics] [rigid plastic for applied graphics] [extruded aluminum with slots for secondary inserts]. [Provide continuous [extruded aluminum] [_____] [[interlocking] [removable]] endcaps in [[square] [radius] [bevel] [contour]] [3 mm 1/8 inch] [6 mm 1/4 inch] [_____] thick] profile. Sign inserts are required to be [front] [side] loading.

2.1.3 Standard Room Signs

Provide signs that include tactile letters, symbols and Braille for interior rooms or spaces where the sign is not likely to change over time. Tactile text descriptions are required for pictograms that are provided to identify a permanent room. Examples include interior signs that label restrooms, stairs, room numbers or letters, and room names. These permanent room signs can include paper inserts for updatable information.

2.1.3.1 Tactile Letters, Symbols and Braille

Provide ADA compliant material per 36 CFR 1191 which is raised 0.79 mm 1/32 inch from the first surface, has a minimum 16 mm 5/8 inch in height and is an ADA acceptable font. The color of the tactile letters is required to contrast with the sign face color per ADA standards. The ADA required Braille has a minimum durometer reading of 90. All raised letters, numbers and symbols are to comply.

2.1.4 Directional Signs

Directional signs provide arrows with messages which point to critical destinations such as departments, offices, or other pertinent destinations. These can be a panel sign system with a series of permanently attached messages or a modular system with updatable inserts. Directional signs have header panels with applied or direct print messages.

2.1.5 Message Inserts

**************************************************************************
NOTE: The insert preparation method most appropriate to each building should be chosen, and the same method should be used consistently throughout the building. Requirements for sign-making equipment or software will be determined jointly by the using facility and the designer. If using other than standard paper, require extra stock be provided.
**************************************************************************

Provide updatable message inserts covered with a clear matte 0.38 mm 0.015 inch vinyl protective overlay. The insert is [typeset message laser printed on paper card stock] [large format color print on white photo paper] [direct printed clear acetate over large format color print on white photo paper]. [ Provide[ paper and] software with message template for creating text and symbols for computers identified for Government production of paper inserts after project completion.] Manufacturer is
required to offer online ordering capabilities to facilitate and expedite ordering packages of replacement, color-coated paper inserts. [Furnish one [suction][_____] device to assist in removing face sheet.][Provide sliding inserts that slide horizontally exposing different graphic information as identified on the drawings.]

2.1.6 Type of Mounting for Signs

Provide surface mounted signs mounted with [concealed mechanical fastening through the holders] [countersunk mounting holes in plaques and mounting screws]. Secure inserts in holders [with flexible plastic clips] [when captured by side profiles of extruded aluminum holders]. [Mount framed plaques with manufacturer's standard (1/6 inch) 1.59 mm thick closed cell vinyl foam with adhesive backing. Adhesive must be transparent, long aging, high tech formulation on two sides of the vinyl foam. Double-faced tape consisting of acrylic adhesive on polyurethane foam used in conjunction with silicone adhesive [magnetic tape].] Provide signs with aluminum ceiling/projecting mount attachment extrusion to secure to ceiling or wall surface, along with mating ceiling/projecting mount track extrusion for hanging, projecting, and double-sided signs. Provide mounting for ceiling/projecting mount attachment extrusion by mechanical fasteners, selected based on wall or ceiling conditions. Mount track extrusion hinges over width of mount attachment and secured with 3.5 by 0.06 mm (6-32 inch) by 6 mm (1/4 inch) cone point stainless steel set screws.

2.1.7 Character Proportions and Heights

Letters and numbers on signs conform to 36 CFR 1191.

2.2 ROOM IDENTIFICATION SIGN WITH PATIENT INFORMATION

**************************************************************************
NOTE: Maintain this Article if designing a medical facility with in-patient rooms. Use this sign instead of room sign at the entrance to patient rooms.
**************************************************************************

2.2.1 Sign Faces

Provide sign faces of clear acrylic or PETG plastic with 3 mm 0.125 inch thickness minimum, with dimensions of sign face being [manufacturer's standard] [as indicated]. Sign faces can be direct printed and contain two window openings for acrylic inserts; include a space for ADA compliant room tactile and Braille. Sign faces may also have approved printed logos for brand recognition.

2.2.2 Sign Backs

Provide sign backs of acrylic or PETG plastic that is welded to the sign face and has two window openings for inserts. The window openings are minimum 5 mm 0.1875 inch in depth. The dimensions of the sign back are equal to the sign face.

2.2.3 Room Identification Tactile Letters

Provide ADA compliant material per 36 CFR 1191 which is raised 0.79 mm 1/32 inch from the first surface, has a minimum 16 mm 5/8 inch in height and is an ADA acceptable font. The color of the tactile letters is required to
contrast with the sign face color per ADA standards. The ADA required Braille has a minimum durometer reading of 90.

2.2.4 Risk Management Alert Inserts (RM)

Provide all signs with RM inserts. The RM inserts are required to fit into one of the two window openings in the sign back and be visible through one of the two window openings of the sign face. The tabs can be in the same position on all the RM inserts and labeled differently.

2.2.5 Isolation Precaution Signage Inserts (IP)

Provide all signs with 5 IP inserts. The IP inserts are required to fit into the larger of the two window openings in the sign back and be visible through the corresponding window opening of the sign face. Stagger the tabs on each of the inserts.

2.3 STAIR SIGNAGE

Provide signs on stairs serving three or more stories with special signage within the enclosure at each floor landing conforming to NFPA 101. Indicate the floor level, the terminus of the top and bottom of the stair enclosure, and the identification of the stair enclosure. Also, state the floor level of, and the direction to, exit discharge. Locate the signage inside the enclosure in a position that is visible when the door is in the open or closed position and install in conformance with 36 CFR 1191. Provide tactile for floor level designation in accordance with ICC A117.1.

2.4 EXIT DOOR TACTILE SIGN

Provide tactile sign with the message EXIT at each exit door that requires an exit sign to conform with NFPA 101. Sign tactile message is to comply with ICC/ANSI A117.1.

2.5 BUILDING DIRECTORIES

Provide building directories as lobby directories or floor directories, with a changeable directory listing consisting of the areas, which can include departments, offices, personnel and other destinations located within the facility as well as a map with "you are here" locations. Provide dimensions, details, and materials of sign and message content as indicated on the drawings.

2.5.1 Header Panel

Header panel has [background metal to match frame] [acrylic with raised acrylic letters] [ES/MP plastic with raised letters] [____].

2.5.2 Directory Graphics

**************************************************************************
NOTE: All artwork is the responsibility of the sign fabricator for graphic content and nomenclature.
The concept design and final solution will be developed with the Government's review and final approval.
**************************************************************************

Provide graphics and text that are first generation from camera ready art.
2.5.2.1 Orientation Map

Provide a color-coded floor plan graphic outline for each building level. Individual building functions and public accessible departments are identified using a unique color and numerical "address" number. Building and department names are tied to the floor plan's numerical address.

2.5.2.2 Monitor Graphic Display

The orientation map for each level of the building is displayed at all times, along with the Department listing of names. The Government will verify their preference to list the names in alphabetical order, followed by the plan "address", or an alternate sequence.

2.5.2.3 Other Graphics

Graphic artwork is used to indicate the location of elevators, stairways, public restrooms, and information stations. Graphic artwork includes the macro-wayfinding terminology and locations, i.e. 1A, 1B, 2A, & 2B, or alternate language developed by the Government for wayfinding destinations.

2.5.3 Doors

2.5.3.1 Door Glazing

Provide door glazing with 6 mm 1/4 inch thick polished [clear] [tinted] glass, fully tempered in accordance with ASTM C1048 (Kind FT) and ANSI 297.1.

2.5.3.2 Door Construction

Provide extruded aluminum door frame of same finish as surrounding frame; mitered corners [, welded], and assembled with concealed fasteners. Provide continuous concealed hinges in [finish to match frames and trim] [stainless steel]. Set glazing in frame with clear silicone adhesive.

2.5.3.3 Door Locks

Provide manufacturer's standard door locks; keyed alike. Provide two sets of keys.

2.5.4 Fabrication

Provide extruded aluminum frames and trim with welded corners and mitered to a hairline fit, with no exposed fasteners.

2.5.5 Illuminated Units

**************************************************************************
NOTE: Coordinate illumination with Division 26 and building electrical design.
**************************************************************************

Provide illuminated directory units with concealed internal [top] [back] lighting with [LED] [_____] light source, internal wiring, and lead at wire for connection. [Units using LED light sources must have integral LED drivers. Units with remote LED drivers are not acceptable.] Electrical work complies with NFPA 70; UL or FM listed. Directory consists of [backlit photo negative directory strips and a black background.][screen printed or

SECTION 10 14 00.20 Page 16
vinyl copy applied to acrylic, metal, or high-pressure plastic laminate strips] [vinyl or screen printed lettering on plastic film held in interchangeable plastic carriers] [screen printed or vinyl copy laminated to magnetic tape] [updatable photo paper insert, printed and laminated] [changeable aluminum bands, painted and direct printed] [changeable aluminum insert slots that accept a user-printed cardstock insert]. Design of unit as indicated on the drawings. Provide unit with tinted [tempered safety solar glass][_____] door.

2.5.5.1 Construction

The directory is [25][51][102] mm [1][2][4][_____] inch[es] deep frame constructed of [aluminum with [[satin [black][painted][dark bronze]]][natural satin] [_____] anodized finish]] [_____] [wood with [natural] [stained] finish]. Unit is [[semi][fully] recessed][surface][_____] mounted. Unit has a [76][_____] mm [3][_____] inch header size and lettering as shown. Unit has a [10][_____] mm [3/8][_____] inch face door frame with concealed hinges and locking system or other secure method. Door frame matches [directory material and finish][_____] .

2.5.5.2 Message Strips

Message strips are [photo negative type updatable photo paper by user][sized in accordance with manufacturer's standard][as indicated on the drawings][_____] . Provide letters and numbers in accordance with the drawings.

2.5.6 Non-Illuminated Unit

Directory consists of a non-illuminated unit with [machine or laser engraved copy in interchangeable acrylic, metal, or high-pressure plastic laminate strips] [screen printed or vinyl copy applied to acrylic, metal, or high-pressure plastic laminate strips] [vinyl or screen printed lettering on plastic film held in interchangeable plastic carriers] [screen printed or vinyl copy laminated to magnetic tape][updatable photo paper insert, printed and laminated] [changeable aluminum bands, painted and direct printed] [changeable aluminum insert slots that accept a user-printed cardstock insert]. Design of unit as indicated on the drawings.

2.5.6.1 Construction

The directory is [25][51][102] mm [1][2][4][_____] inch[es] deep frame constructed of [aluminum with [[satin [black][painted][dark bronze]]][natural satin] [_____] anodized finish]] [_____] [wood with [natural] [stained] finish]. Unit is [[semi][fully] recessed][surface][_____] mounted. Unit has a [76][_____] mm [3][_____] inch header size and lettering as shown. Unit has a [10][_____] mm [3/8][_____] inch face door frame with concealed hinges and locking system or other secure method. Door frame matches [directory material and finish][_____] .

2.5.6.2 Message Strips

Message strips are [updatable by user][sized in accordance with manufacturer's standard][as indicated on the drawings][_____] . Provide letters and numbers in accordance with the drawings.
2.5.7 Electronic Directory System

**************************************************************************
NOTE: The electronic directory system is a limited usage item and must be fully justified prior to being specified. Coordinate power and data requirements with electrical drawings. When system is integrated into building or other electronic controls, coordinate with the requirements of UFC 4-010-06 CYBERSECURITY OF FACILITY-RELATED CONTROL SYSTEMS and include the appropriate, edited Division 25 INTEGRATED AUTOMATION UFGS sections in the project.
**************************************************************************

Coordinate electronic directory system requirements with Division 25 INTEGRATED AUTOMATION UFGSs. Provide [non-interactive][interactive] electronic directory. Provide electronic directory system as a complete turnkey system consisting of digital display, hardware, software connected through the local area network (LAN) to a [server][cloud]. Electrical equipment is UL listed and complies with NFPA 70. Unit is [free-standing][wall mounted].

2.5.7.1 Hardware Requirements

Provide hardware as standard products of manufacturers regularly engaged in the production of electronic directory and digital wayfinding solutions. Hardware is [surface-mounted], [recessed], [free-standing kiosk] or [component system with mounting bracket]. [Landscape] [Portrait] orientation. Provide commercial grade, HD or UHD resolution flat panel LCD monitors. Provide commercial grade touch interfaces that can be serviced independently of the monitor itself. Enclosures and kiosks fabricated in a US based facility.

2.5.7.2 Accessibility Requirements

Provide an electronic display [with interactivity] that meets the following ADA requirements: Directory does not protrude more than 102 mm 4 inches from the wall, maintains a maximum touchable height of 1219 mm 48 inches with a reach of 254 mm 10 inches installed at a minimum of 686 mm 27 inches off the floor, and supports ADA compliance for hearing impaired by providing text based or video based messaging for any calling functionality.

2.5.7.3 Wayfinding Requirements

Provide mapping with animated wayfinding capable of sending maps digitally to users via SMS or QR codes.

2.5.7.4 Management and Support Requirements

All management of the digital directory is provided centrally through a password authenticated server. All listings and content must be backed up to a secondary or "cloud-based" location for redundancy. Providers of directory solutions must be capable of offering full initial input of tenant data, creation of all wayfinding maps, and any modifications to design through service or support offers.

**************************************************************************
NOTE: The comprehensive sign documents include a
"Door Tag" sign type that reflects the architectural floor plan room number. These signs are used by facilities for reference to system schedules and are not for public wayfinding purpose.

2.6 DOOR TAGS

Provide one door tag plate for each room entry door. In size [as indicated on drawings][______]. Provide room number [to match architectural floor plan room number][as determined by Contracting Officer].

2.6.1 Engraved Copy

Machine engrave letters, numbers, symbols, and other graphics into panel sign on face to produce precisely formed copy and sharp images, incised to uniform depth. Melamine plastic engraving stock used for ADA compliant graphic is three-ply lamination contrasting color core meeting ASTM D635.

2.7 METAL PLAQUES

2.7.1 Cast Metal Plaques

2.7.1.1 Fabrication

Provide cast metal plaques with the logo, emblem and artwork cast in the [bas relief] [flat relief] [_____] technique; fabricated from [prime aluminum] [bronze] [brass] [______].

2.7.1.2 Border

Border is [flat band][single line][straight edge][single line bevel][double line][bevel][custom ornamental][______].

2.7.1.3 Finish

<table>
<thead>
<tr>
<th>Letter Finish</th>
<th>[satin] [polished]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Background Finish</td>
<td>[light][dark] aluminum][[dark][_____] bronze]</td>
</tr>
<tr>
<td>Background Texture</td>
<td>[leather][pebble][smooth][sculpted][_____]</td>
</tr>
</tbody>
</table>

2.7.1.4 Mounting

Provide [concealed] [rosettes and anchors] [rosettes and toggle bolts] [______] mounting.

2.7.2 Chemically Etched Metal Plaques

2.7.2.1 Fabrication

Plaque is chemically etched one-piece or photochemically engraved metal sheet or plate [aluminum][stainless steel][brass][commercial bronze][zinc][magnesium][______] [0.032][0.064][0.125][0.250][______] inch thick.
2.7.2.2 Finish

[Single-etched raised areas are [gold-tone] [silver-tone] [bronze-tone] finish and recessed areas are color filled.] [Double-etched raised areas are [gold-tone] [silver-tone] and recessed textured areas are [gold-tone] [silver-tone] color filled.]

2.8 DIMENSIONAL BUILDING LETTERS

**************************************************************************
NOTE: These letters are for direct application to interior building surfaces. Drawings must show mounting type details.
**************************************************************************

2.8.1 Fabrication

Letters are [cast][cutout][fabricated channel][molded plastic][aluminum][bronze][brass][acrylic][____]. Package letters for protection until installation.

2.8.2 Size

Letter size is [_____] [as indicated]. Provide letter thickness that is [manufacturer's standard for the size of letter][____].

2.8.3 Finish

Provide [[mill][clear anodized]][[light][medium][dark] anodized bronze] [[polished] bronze with clear coat] [baked enamel] [powder coat][two-component acrylic polyurethane] finish.

2.8.4 Mounting

(Threaded studs)[Steel U-bracket, cap screws, and expansion bolts][concealed screw through structural rail] of number and size recommended by manufacturer; concealed anchorage. Letters which project from the mounting surface have [stud spacer sleeves] [____]. Letters, studs, and sleeves are of the same material. Supply templates for mounting.

2.9 PRESSURE SENSITIVE LETTERS

**************************************************************************
NOTE: Use pressure sensitive letters for direct application to building interior surfaces such as glass and doors. Be sure surface of material will accept adhesion of letters. Show locations, message content, sizes, and colors on drawings or in a message schedule.
**************************************************************************

2.9.1 Fabrication

Ensure that vinyl letter edges and corners of finished letterforms and graphics are true and clean. Do not use letterforms and graphics with rounded positive or negative corners, nicked, cut, or ragged edges.
2.9.2 Size
Letter size: [as indicated][____].

2.10 MATERIALS

2.10.1 Aluminum Alloy Products

Aluminum extrusions are at least 3 mm 1/8 inch thick, and aluminum plate or sheet are at least 1.3 mm 0.0508 inch thick. Extrusions conform to ASTM B221M ASTM B221; plate and sheet conforms to ASTM B209M ASTM B209. Where anodic coatings are specified, alloy conforms to AA PK-1 alloy designation 514.0. Exposed anodized aluminum finishes are as shown. Welding for aluminum products conforms to AWS D1.2/D1.2M.

2.10.2 Anodic Coating

Anodized finish conforms to AA DAF45 as follows:

a. [Clear (natural) designation AA-M10-C22-A31, Architectural Class II 0.010 mm 0.4 mil or thicker.]
b. [Integral color anodized designation AA-M10-C22-A32, Architectural Class 0.010 to 0.018 mm 0.4 to 0.7 mil.]
c. [Electrolytically deposited color-anodized designation AA-M10-C22-A34, Architectural Class II 0.010 to 0.018 mm 0.4 to 0.7 mil.]

2.10.3 Organic Coating

Organic coating conforms to AAMA 2604, with total dry film thickness not less than 0.030 mm 1.2 mils.

2.10.4 Plastic Laminate Sheet

ANSI/NEMA LD 3, general purpose HGS grade, 1.22 mm 0.048 inch nominal thickness.

2.10.5 Fabrication and Manufacture

2.10.5.1 Factory Workmanship

Holes for bolts and screws are drilled or punched. Drilling and punching produces clean, true lines and surfaces. Exposed surfaces of work have a smooth finish; exposed riveting is flush. Conceal fastenings where practicable.

2.10.5.2 Dissimilar Materials

Where dissimilar metals are in contact, protect surfaces prevent galvanic or corrosive action.

2.10.6 Typeface

[ADA-ABA compliant font for Room Signs][Helvetica Regular][____].

2.11 GRAPHICS

**************************************************************************

SECTION 10 14 00.20 Page 21
NOTE: Edit the following requirements as necessary for the project. Graphics methods that are easily vandalized, such as vinyl first surface copy and acrylic characters bonded to acrylic will not be permitted. The direct print first surface copy method is generally used for mass produced signs. Surface applied graphics that can be easily picked off or peeled will not be accepted.

Provide signage graphics for modular signs to the following:

[2.11.1 Subsurface Copy]

Copy is transferred to the back face of clear acrylic sheeting forming the panel face to produce precisely formed opaque image. This method bonds all sign elements (color, graphics, lettering, Braille and substrate) into a single unit.

[2.11.2 First Surface Copy Direct Print (Non-Tactile)]

Message may be applied to panel using a direct print process. Original art is defined as artwork that is a first generation reproduction of the specified art. Provide clean edges and corners.

[2.11.3 Photopolymer]

Integral graphics and Braille achieved by photomechanical stratification processes. Provide photopolymer used for ADA compliant graphics of the type that has a minimum durometer reading of 90. Tactile graphics are raised 0.79 mm 1/32 inch from the first surface of plaque by photomechanical stratification process.

[2.11.4 Engraved Copy]

Machine engrave letters, numbers, symbols, and other graphics into panel sign on face to produce precisely formed copy and sharp images, incised to uniform depth. Melamine plastic engraving stock used for ADA compliant graphic is three-ply lamination contrasting color core meeting ASTM D635.

[2.11.5 Graphic Blast Raised Copy]

Background is sandblasted to a uniform depth of 0.79 mm 1/32 inch leaving raised text and Braille. Background is factory-finished with polyurethane paint.

[2.11.6 [Cast][Fabricated][Solid] Aluminum Letters]

Provide [3][6][_____] mm [1/8][1/4][_____] inch thick and fasten to the message panel with concealed fasteners.

2.12 COLOR, FINISH, AND CONTRAST

NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an architect or interior designer. Color must be selected from
manufacturers' standard colors or identified as a manufacturers' standard color in this specification only when the project is very simple and has minimal finishes.

When the government directs that color be located in the drawings a note must be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

Signage background color should be in high contrast with signage copy. Dark background with light copy is preferred.

**************************************************************************

Provide color [as specified in Section 09 06 00 SCHEDULES FOR FINISHES] [as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers]. Finish of eggshell, matte, or other non-glare finish for all signs as required in handicapped-accessible buildings.

]3.2   INSTALLATION

Install signs plumb and true and in accordance with approved manufacturer's instructions at locations shown on the [detail drawings] [schedule below] [attachments]. Submit operating instructions outlining the step-by-step procedures required for system operation. The instructions include simplified diagrams for the system as installed, the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Provide each set permanently bound with a hard cover. The following identification must be inscribed on the covers: "OPERATING AND MAINTENANCE INSTRUCTIONS", name
and location of the facility, name of the Contractor, and contract number. Submit in accordance with Section 01 78 23 OPERATING AND MAINTENANCE DATA. Mounting height and mounting location complies with 36 CFR 1191. Install required blocking. Do not install signs on doors or other surfaces until finishes on such surfaces have been installed. Signs installed on glass surfaces are installed with matching blank back-up plates in accordance with manufacturer's instructions. [Provide illuminated signage in conformance with the requirements of Section 26 51 00 INTERIOR LIGHTING.]

Do not install items that show visual evidence of biological growth.

3.2.1 Anchorage

Provide anchorage in accordance with approved manufacturer's instructions. Anchorage not otherwise specified or shown includes slotted inserts, expansion shields, and powder-driven fasteners when approved for concrete; toggle bolts and through bolts for masonry; machine carriage bolts for steel; lag bolts and screws for wood. Provide exposed anchor and fastener materials compatible with metal to which applied with matching color and finish.

a. Signs mounted to painted gypsum board surfaces must be removable for painting maintenance.

b. Mount signs to lay-in ceiling grids with clip connections to ceiling tees.

c. Install signs mounted on metal surfaces with magnetic tape.

d. Install signs mounted on fabric surfaces with hook and loop tape or pin mount.

e. Install signs to workstation panels with panel clips.

3.2.2 Protection and Cleaning

Protect the work against damage during construction. Adjust hardware and electrical equipment for proper operation. Clean glass, frames, and other sign surfaces at completion of signage installation in accordance with the manufacturer's written instructions.

NOTE: This guide specification covers the requirements for traffic signs and sign posts.

The use of state DOT specifications and standard detail drawings is encouraged.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 GENERAL

**************************************************************************

NOTE: If the project is located in a state that has their own MUTCD, signage must conform to the state DOT MUTCD. State DOT MUTCD's should be in substantial conformance with the national MUTCD. Where local standards are more stringent than the MUTCD, the local standards should be followed.

**************************************************************************

All signs must be in accordance with the MUTCD. Any signs not detailed on the drawings must be in accordance with the FHWA SHS.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
   Traffic Sign Posts
   FHWA Acceptance Letter
   Traffic Sign Retroreflective Sheeting

SD-04 Samples
   Flexible Posts

PART 2 PRODUCTS

2.1 TRAFFIC SIGN POSTS

**************************************************************************

NOTE: Sign posts located within the clear zone of roads and streets must be a breakaway or yielding design meeting the crashworthiness criteria of NCHRP 350 or the Manual for Assessing Safety of Hardware (MASH) or must be shielded by guardrail, barrier, or an energy absorbing system meeting the requirements of NRCRP 350 or AASHTO MASH. FHWA acceptance letters for various breakaway supports for signs are available on the FHWA Safety Program webpage.

Ensure details of sign posts are included in the drawings. Breakaway support anchor posts may extend no more than 100 mm 4 inches above grade to lessen the probability of snagging the undercarriage of a vehicle after a support has broken away from its base. Extend anchor posts at least 450 mm 18 inches below grade.

**************************************************************************

2.1.1 Steel Flanged Channel Section (U-Shape)

Fabricate steel posts from steel conforming to ASTM A36/A36M or ASTM A499 and with a minimum yield strength of 207 MPa 30 ksi and a minimum tensile strength of 345 MPa 50 ksi. Punch or drill 7.9 to 9.5 mm 5/16 to 3/8 inch diameter holes spaced at 25.4 or 50.8 mm 1 or 2 inch centers along the centerline of the web prior to galvanizing for the entire length of the post. Galvanize posts after punching in accordance with ASTM A123/A123M.

2.1.2 Perforated Steel Tube

Fabricate steel posts from steel conforming to either ASTM A653/A653M, structural steel, Grade 340 50, Class 1, coating designation G90 or ASTM A1011/A1011M, structural steel, Grade 340 50, hot-dip galvanized after punching in accordance with ASTM A123/A123M. Prepunch holes approximately
11.1 mm 7/16 inch in diameter spaced at approximately 25.4 mm 1 inch centers along each side of the tube for the entire length of the post.

2.1.3 Steel Tube

**************************************************************************

NOTE: Fill in the required Test Level (TL) if triangular slip bases are used.

NOTE: Sign supports are tested at two levels under NCHRP 350. TL-2 includes four tests conducted at speeds of 35 and 70 km/hr. TL-3 includes four tests conducted at speeds of 35 and 100 km/hr.

Sign supports are tested at three levels under MASH. TL-1 includes three tests conducted at speeds of 30 and 50 km/hr. TL-2 includes three tests conducted at speeds of 30 and 70 km/hr. TL-3 includes three tests conducted at speeds of 30 and 100 km/hr.

**************************************************************************

Conform to ASTM A500/A500M, Grade B or C, and hot-dip galvanized in accordance with ASTM A123/A123M. [Manufactured triangular slip bases must be approved by the Federal Highway Administration (FHWA) for use under the provisions of NCHRP 350, TL-[_____] or AASHTO MASH, TL-[_____] . Submit a copy of the FHWA Acceptance Letter.]

2.1.4 Structural Steel H Section

Conform to ASTM A709/A709M, Grade 345 50 or 345W 50W. Galvanize posts, fuse plate and splice plate after fabrication in accordance with ASTM A123/A123M.

2.1.4.1 Slip Base, Fuse Plate and Splice Plate

Conform to ASTM A36/A36M, minimum yield strength 345 MPa 50,000 psi.

2.1.4.2 High-Strength Bolts, Nuts and Washers

High strength bolts must conform to ASTM F3125/F3125M. Nuts must conform to ASTM A563M ASTM A563. Washers must conform to ASTM F436/F436M. High strength bolts, nuts and washers must be zinc coated.

2.1.5 Wood

**************************************************************************

NOTE: Wood species and preservative type conforming to applicable state DOT standards and specifications may be specified in lieu of the requirements below.

**************************************************************************

Wood posts must be dry no. 1 grade Douglas fir, southern or Ponderosa pine, hemlock, spruce, or western larch conforming to AASHTO M 168. Treat the posts with water-borne preservative according to AASHTO M 133, AWPA T1 and AWPA U1.
2.2 FLAT ALUMINUM SIGN PANELS

Aluminum sign panels must conform to ASTM B209M ASTM B209, alloy-temper 6061-T6 or 5052-H38. The blanks must be free from laminations, blisters, open seams, pits, holes, other defects that may affect their appearance or use. The thickness must be uniform and the blank commercially flat.

2.3 EXTRUDED ALUMINUM SIGN PANELS

**************************************************************************
NOTE: Extruded aluminum sign panels are used for large signs.
**************************************************************************

Conform to ASTM B221M ASTM B221, alloy 6063-T6. The maximum allowable deviation from flat on the face is 4.2 mm per meter 0.05 inches per foot. [Aluminum edge molding must be in accordance with ASTM A320/A320M or SAE J405d austenitic steel, minimum yield strength of 207 MPa 30,000 psi.]

2.4 TRAFFIC SIGN RETROREFLECTIVE SHEETING

All background sheeting applied to flat sheet and extruded panel signs must be in accordance with ASTM D4956, Type III, IV, VII, VIII, IX or XI retroreflective sheeting and must have Class 1, 3, or 4 adhesive backing. Retroreflective sheeting must be high intensity that is an unmetallized micro prismatic reflective material.

Retroreflective sheeting must have sufficient adhesion, strength and flexibility such that the sheeting can be handled, processed and applied according to the manufacturer's recommendations without appreciable stretching, tearing, cracking or other damage.

2.4.1 Legend and Border

Apply retroreflective sheeting as legend and border in accordance with ASTM D4956, Type IX, XI, or AASHTO M 268 Type C or D, Class 1. Retroreflective sheeting must be an unmetallized cube corner microprismatic reflective material. Retroreflective sheeting applied as legend and border for specific signing applications, without a datum mark on the surface of the sheeting, must be evaluated for rotational sensitivity in accordance with AASHTO M 268, Section 3.3.1 and fabricated in accordance with AASHTO M 268, Section 3.3.2.

2.4.2 Screen Printed Transparent Colored Areas

For screen printed transparent colored areas or transparent colored overlay films on white sheeting, the coefficient of retroreflection (RA) must be no less than 70 percent of the original values for the corresponding color.

2.4.3 Adhesive Performance

Adhesive performance for retroreflective sheeting must be in accordance with ASTM D4956. The sheeting surface must be in condition to be readily screen processed and compatible with transparent overlay films, plus recommended transparent and opaque screen process colors. Furnish manufacturer's information as to the type of solvent or solvents that may be used to clean the surface of the sheeting without detrimental loss of
2.5 LETTERS, NUMERALS, ARROWS, SYMBOLS, AND BORDERS

Apply letters, numerals, arrows, symbols, and borders on the retroreflective sheeting or opaque background of the sign using the direct or reverse screen process. Apply messages and borders of a color darker than the background to the paint or the retroreflective sheeting using the direct process. Messages and borders must be of a color lighter than the sign background and applied using the reverse screen process. Use opaque or transparent colors, inks, and paints of the type and quality recommended by the retroreflective sheeting manufacturer in the screen process. Perform the screening in a manner that results in a uniform color and tone, with sharply defined edges of legends and borders and without blemishes on the sign background that will affect intended use. Air dry or bake the signs after screening according to the manufacturer's recommendations to provide a smooth hard finish. Reject any signs with blister's or other blemishes.

2.6 DELINEATOR POSTS

2.6.1 Steel Posts

Fabricate posts from steel conforming to ASTM A36/A36M or ASTM A499 and having a minimum yield strength of 207 MPa 30 ksi and a minimum tensile strength of 345 MPa 50 ksi. Galvanize posts after punching in accordance with ASTM A123/A123M.

2.6.2 Flexible Posts

**************************************************************************
NOTE: Indicate the color of post on the drawings.
**************************************************************************

Provide [one-piece driveable] [or] [two-piece with driveable steel anchor] flexible posts. Posts must be impact-resistant, integrally colored UV stabilized polymer or polycarbonate extrusion or fiberglass reinforced composite material. Other materials are subject to approval by the Contracting Officer's Representative. Include a retroreflective sheeting plate with each post as indicated.

2.7 DELINEATOR RETROREFLECTORS

2.7.1 Circular Prismatic Reflectors

Retroreflectors attached to steel posts must be a 75 mm 3-inch minimum diameter acrylic plastic lens with prismatic optical elements and a smooth, clear, transparent face. Fabricate the back from similar material and fuse to the lens around the entire perimeter to form a homogeneous unit. Permanently seal the units against the intrusion of dust, water, or air. Mount the retroreflector unit in a housing fabricated from 1.6 mm 0.063-inch aluminum alloy or similar, or from cold-rolled, hot dip, galvanized steel, having a thickness of 1.6 mm 0.064 inches. Provide the indicated color.

2.7.2 Retroreflective Sheeting

A retroreflective sheeting plate must be applied to each flexible post by the post manufacturer and must be in accordance with ASTM D4956, Type III, IV, V, VII, VIII, IX or XI retroreflective sheeting. Retroreflective
sheeting must be high intensity that is an unmetallized cube corner micro
prismatic reflective material. Provide the size and color of the
retroreflective sheeting plate as indicated.

2.8 HARDWARE

Bolts, nuts, post clips, lock and flat washers must be either aluminum
alloy or commercial quality stainless steel, hot-dip galvanized or cadmium
plated after fabrication. [Bolts/nuts must be an approved tamper resistant
design.] Provide fiber washers of commercial quality.

2.9 CONCRETE

ASTM C94/C94M, using 19 mm 3/4 inch maximum aggregate, and having minimum
compressive strength of 21 MPa 3000 psi at 28 days.

PART 3 EXECUTION

3.1 SIGN POSTS

**************************************************************************
NOTE: Sign supports located within the roadway
clear zone must be designed to yield, fracture, or
separate when impacted by a vehicle. Although the
clear roadside concept is still the goal of the
designer, compromises are often required in urban or
restricted environment areas. Chapter 10 of the
AASHTO Roadside Design Guide provides guidance for
roadside safety in urban or restricted area. In
these areas, sign supports located within the
enhanced lateral offset should be designed to yield,
fRACTure, or separate when impacted by a vehicle.
**************************************************************************

3.1.1 [Steel Flanged Channel Section] [Perforated Square Steel Tube] [Round
Steel Tube]

Sign posts consist of a base post and sign post. [Drive steel sign base
posts with a suitable driving head. Attach sign posts to base posts.
Replace any base posts damaged during driving or otherwise at no additional
cost to the Government.] [Embed steel sign base posts in concrete as
indicated.] [Install manufactured triangular slip bases in accordance with
the manufacturer's instructions.]

3.1.2 Structural Steel H Section Posts

**************************************************************************
NOTE: Ensure the drawings indicate the procedure
for tightening bolts and the required torque.
**************************************************************************

Tighten all breakaway assembly bolts in a systematic manner to the
prescribed torque indicated. Loosen each breakaway assembly bolt and
re-tighten to the required torque in the same order as the initial
tightening. Burr the threads at the nut using a center punch to prevent
the nut from loosening. Tighten nuts on hinge plate bolts to the required
minimum bolt tension values indicated.
3.1.3 Wood

Drill holes in the post as indicated.

3.2 SIGN PANELS

Clean, degrease and etch the face of metal panels using methods recommended by the retroreflective sheeting manufacturer. After cleaning and degreasing, apply retroreflective sheeting material to the sign panels as recommended by the manufacturer. Perform shearing, cutting and punching prior to preparing the blanks for application of reflective material. Do not field drill holes in any part of the panel. Use nylon washers recommended by the sign sheeting manufacturer between the bolt heads and sign faces on flat sheet aluminum signs. Replace any damaged sign panels at no additional cost to the Government.

3.3 DELINEATORS

******************************************************************************
NOTE: Flexible delineators driven into the soil require a manufacturer's installation tool to install.
******************************************************************************

Drive steel delineator posts into the ground in a manner that will not damage the post. Attach flexible delineator posts to steel anchors [or drive into the soil in accordance with the manufacturer's instructions]. Demonstrate the method of installation for the Contracting Officer's Representative to verify that posts will be installed without being damaged.

3.4 LOCATION AND POSITION OF SIGNS

******************************************************************************
NOTE: Some State DOT single post sign mounting details bend the sign panel. If this type of mounting detail is used, delete the requirement for flat sign face surface.
******************************************************************************

Locate and erect all signs in accordance with the drawings and MUTCD. Vertically mount signs at right angles to the direction of, and facing, the traffic that they are intended to serve. Where mirror reflection from the sign face is encountered to such a degree as to reduce legibility, turn the sign slightly away from the road. Turn signs that are placed 9 m 30 feet or more from the pavement edge toward the road. On curved alignments, determine the angle of placement by the direction of approaching traffic rather than by the roadway edge at the point where the sign is located. Mounted signs must present a smooth flat surface varying no more than 10 mm 3/8 inch from a 1.2 m 4-foot straightedge placed in any position on the face of the sign after erection. Mount signs on traffic signal posts with strap or clamp type sign supports. Each installed sign will be inspected by the Contracting Officer's representative prior to acceptance by the Government.

NOTE: This guide specification covers the requirements for ceiling-hung, floor anchored, and overhead-braced toilet partitions.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](#).

**PART 1   GENERAL**

**NOTE:** Army facilities will meet the requirements of **UFC 3-101-01** and will be accessible in accordance with 36 CFR 1191, Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities.

Partition napkin disposal, toilet-tissue dispenser, grab bars, and other similar toilet-room accessories are specified in a separate section. Coordinate partition cutouts and reinforcement as required for the specified accessories.

If ceiling-hung toilet partitions are required for
the project, coordinate with metal fabrications and shop drawings for installation of indicated supporting members.

Include in the drawings:

Locations and dimensions of the partitions, doors, pilasters, screens, and door swings.

Heights of the bottoms of enclosures and screens above the floor

Method of support to be employed, using details where needed for clarity.

Provisions for attaching hardware to partitions.

A schedule to identify the finish and color to be used.

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality

1.3.1.1 Laminated Plastic and Solid Phenolic Products

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body.

1.4 REGULATORY REQUIREMENTS

Comply with to ICC A117.1 code for access for the handicapped operation of toilet compartment door and hardware.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver materials in the manufacturer's original unopened packages with the brand, item identification, and project reference clearly marked. Store components in a dry location that is adequately ventilated; free from dust, water, other contaminants, and damage during delivery, storage, and construction.

1.6 WARRANTY

Provide manufacturer's warranty to repair or replace defective materials and workmanship for a period of [one year][____] [years] from date of final acceptance of the work.
NOTE: Painted metal (Finish 1) toilet enclosures, urinal screens, and room entrance screens are suitable for use in installations where the partitions are subjected to normal usage and exposure conditions. Solid phenolic black core (Finish 4), solid phenolic color through core (Finish 4A), solid polyethylene (Finish 5), and homogeneous filled acrylic (Finish 6) should be used unless not economically feasible. Composite materials are generally not recyclable at the end of their useful life. Any plastic or metal materials used must contain recycled materials as indicated. Plastic laminate clad (Finish 3) toilet partitions will not be used where severe water conditions will be encountered, such as where cleaning is to be performed by spraying water.

Where toilet partitions are indicated for hard usage or severe exposure areas, finishes other than painted metal (Finish 1) or plastic laminate clad (Finish 3) should be specified when their high initial cost can be justified through life cycle cost. The least expensive painted metal finish is generally the least durable of the finishes listed in CID A-A-60003. Plastic laminate clad (Finish 3) costs more than the painted metal and less than stainless steel (Finish 2), solid phenolic (Finish 4 or 4A), or solid polyethylene (Finish 5), or homogeneous filled acrylic (Finish 6). Plastic laminate clad (Finish 3) finishes are hard and smooth; resistant to wear, scratches, periodic moisture, impact, acids and alkalis, and cigarette burns.

Next to stainless steel (Finish 2), solid phenolic (Finish 4 and 4A), solid polyethylene (Finish 5), and homogeneous filled acrylic (Finish 6) are the most durable finishes available. When finishes other than painted metal (Finish 1) are being considered, plastic laminate clad (Finish 3) should be the next logical choice, followed by solid phenolic (Finish 4 and 4A), solid polyethylene (Finish 5), homogeneous filled acrylic (Finish 6) and stainless steel (Finish 2). Solid polyethylene (Finish 5), stainless steel (Finish 2), homogeneous filled acrylic (Finish 6), and solid phenolic (Finish 4 and 4A) are highly resistant to humidity, steam, detergents, cleaning chemicals and corrosion. Interior fire and smoke finish classification must be addressed when materials other than metal partitions are being considered. Edit the following paragraphs for styles and finishes.

Generally, floor-supported enclosures, Style A, will be used; and overhead braced enclosures, Style C, and overhead braced-alcove, Style F, will be used.
when pilasters cannot be anchored into minimum 76 mm 3 inches thick structural concrete. Ceiling hung enclosures, Style B, will be used only when the additional cost is justified for reasons of sanitation or appearance. Ceiling hung enclosures, Style B, are not recommended by manufacturers when ceiling height is greater than 2.59 m 8 feet 6 inches. Urinal screens, when deemed necessary, may be any of the 6 styles available, but the floor to ceiling hung screen, Style D, is the most justifiable for reasons of cost and sanitation. Type II, Style D, room entrance screens are generally the most durable style due to the floor to ceiling post support design. Edit as needed to meet project requirements.

If ceiling hung enclosures are to be used, details showing the structural steel channel support system should be shown on the drawings. This section should be coordinated with Section 10 28 13 TOILET ACCESSORIES and the drawings regarding toilet enclosures which will have partition-mounted accessories attached to the panels.

Screens and enclosures that are thicker than standard panels last longer, especially in high-use

**************************************************************************
2.1 SYSTEM REQUIREMENTS

Provide a complete and usable toilet partition system, including toilet enclosures, room entrance screens, urinal screens, system of panels, hardware, and support components. Furnish the partition system from a single manufacturer, with a standard product as shown in the most recent catalog data. Submit Fabrication Drawings for toilet partitions and urinal screens consisting of fabrication and assembly details to be performed in the factory. Submit manufacturer's Cleaning and Maintenance Instructions in accordance with Section 01 78 23 OPERATIONS AND MAINTENANCE DATA.

2.1.1 Plastic Identification

**************************************************************************
NOTE: The marking system indicated below is intended to provide assistance in identification of products for making subsequent decisions as to handling, recycling, or disposal.
**************************************************************************

Verify that plastic products to be incorporated into the project are labeled in accordance with ASTM D7611/D7611M. Where products are not labeled, provide product data indicating polymeric information in the Operation and Maintenance Manual.

2.2 MATERIALS

2.2.1 Painted Metal (Finish 1)

Provide galvanized steel sheet cold-rolled, stretcher-level, commercial quality material, conforming to ASTM A653/A653M, with a Flame Spread Index of 0 and a Smoke Developed Index of 0. Surface preparation for painting to comply with [ASTM D6386, method for baked enamel] [or] [ASTM D7803 for powder coat].

2.2.2 Stainless Steel Sheet (Finish 2)

Provide stainless steel sheet conforming to ASTM A666, 300 series commercial stainless steel sheet suitable for exposed applications with a Flame Spread Index of 0 and a Smoke Developed Index of 0. Provide smooth material, without creases or ripples. Provide face sheet of minimum of 1.22 mm 0.048 inch (1.27 mm (18 gauge) thickness. Provide with [No. 4 finish] [manufacturer's standard textured finish][____].

2.2.3 Plastic Laminate Clad (Finish 3)

Provide decorative matte finish plastic laminate bonded to resin impregnated particle board core with non-toxic adhesive, with a Flame spread Index of 75 or less and a Smoked Developed Index of 450 or less.

2.2.4 Phenolic Core (Finish 4) (Finish 4A)

Provide compressed cellulose fibers impregnated with resins. Provide smooth material without creases or ripples, with a Flame Spread Index of 75 or less and a Smoke Developed Index of 450 or less. The surface laminate is fused to the resin-impregnated core.

2.2.5 Solid Polyethylene Panels (Finish 5)

Provide high density polyethylene (HDPE) suitable for exposed application. Waterproof, non-absorbent and graffiti resistant textured surface with a Flame Spread Index of 75 or less, and a Smoke Developed Index of 450 or less.
2.2.6 Homogenous Filled Acrylic (Finish 6)

Cast, 100 percent acrylic solid polymer material composed of acrylic polymer, mineral fillers, and pigments that meets the following minimum performance requirements.

2.2.7 Sound-Deadening Cores

**************************************************************************
NOTE: Leave this paragraph only if selecting Painted Metal (Finish 1) or Stainless Steel (Finish 2) partitions. All others do not have a sound deadening core.
**************************************************************************

Provide sound deadening consisting of treated kraft paper honeycomb cores with a cell size of not more than 25 mm 1 inch. Provide resin-material content weighing not less than 11 percent of the finished core weight. Face expanded cores on both sides with kraft paper.
2.2.8 Anchoring Devices and Fasteners

Provide steel anchoring devices and fasteners hot-dipped galvanized after fabrication, in conformance with ASTM A385/A385M and ASTM A123/A123M. Conceal all galvanized anchoring devices.

2.2.9 Brackets

Provide two-ear panel wall brackets, T-style, 25 mm 1 inch stock. Provide stirrup style panel-to-pilaster brackets.

2.2.10 Hardware and Fittings

2.2.10.1 General Requirements

Provide hardware for the toilet partition system that complies with CID A-A-60003 for the specified type and style of partitions. Provide hardware finish highly resistant to alkalis, urine, and other common toilet room acids. Comply with 36 CFR 1191 of latching devices and hinges for handicap compartments; provide [chrome-plated steel] [ or ] [stainless steel] devices and hinges with door latches that operate without either tight grasping or twisting of the wrist of the operator. Submit three samples of each item, including anchoring devices and fasteners. Approved hardware samples may be installed in the work if properly identified.

2.2.10.2 Finishes

[a. Provide chrome plating that complies with ASTM B456.
[b. Provide finish that complies with SAE AMS2460, Class I, Type [I][II].
[c. Provide aluminum with clear anodic coating that complies with AA DAF45.
[d. Provide corrosion-resistant steel with a No. 4 finish.
[e. Provide stainless steel with a No. 4 finish.
[f. Provide exposed fasteners that match the hardware and fittings.

2.2.11 Door Hardware

2.2.11.1 Hinges

Provide adjustable hinges to hold in-swinging doors open at any angle up to 90 degrees and outswinging doors up to 10 degrees. Provide
self-lubricating hinges with the indicated swing. Provide hinges that [are surface-mounted type] [are cutout-insert type] [are exposed pivot] [are semi-concealed] [and] [have the following type of return movement:

[a. Gravity return movement ]
[b. Spring-action cam return movement]
[c. Torsion-rod return movement]

2.2.11.2 Latch and Pull

Provide latch and pull that is a combination rubber-faced door strike and keeper equipped with emergency access. [Provide [surface mounted] [concealed] latch].

2.2.11.3 Coat Hooks

Provide coat hooks that are combination units with hooks and rubber tipped pins.

2.3 PARTITION PANELS AND DOORS

Fabricate partition panels, and pilasters of materials and construction listed:

Provide [[painted metal partition] [stainless steel partition] panels and doors in finished thickness of no less than 25 mm 1 inch and pilasters no less than 32 mm 1-1/4 inches, both with face sheets no less than [0.79 mm 0.031 inch] [0.97 mm 0.038 inch]]. [Phenolic partition panels not less than 13 mm 1/2 inch thick and door and pilasters not less than 19 mm 3/4 inch thick] [plastic laminated partition and door panels no less than [22 mm 7/8 inch] [25 mm 1 inch] thick and pilaster no less than 32 mm 1 1/4 inch thick] [plastic (HDPE) partition panels, doors and pilasters not less than 25 mm 1 inch thick] [homogenous filled acrylic partition panels and doors no less than 13 mm 1/2 inch thick and pilasters no less than 25 mm 1 inch thick].

[Provide painted metal toilet partitions and screens with recycled content of 27 percent minimum. Provide data identifying percentage of recycled content for painted steel partitions and screens. ] [Provide stainless steel toilet partitions and screens with recycled content of 50 percent minimum. Provide data identifying percentage of recycled content for stainless steel partitions and screens.] [Provide plastic laminate toilet partitions and screens with recycled content of 45 percent minimum. Provide data identifying percentage of recycled content for plastic laminate partitions and screens.] [Provide solid polyethylene toilet partitions and screens with recycled content of 30 percent minimum.]. [Provide homogeneous filled acrylic with recycled content of 6 percent minimum]. [Provide solid phenolic toilet partitions and screens with recycled content of 10 percent minimum]. [ Provide data identifying percentage of recycled content for solid phenolic partitions and screens.]

**************************************************************************

NOTE: Based on research, certain base materials such as plastic laminate clad and solid phenolic, black core are available from US national manufacturers as a reduced VOC product certified by Greenguard or SCS Global Services. Retain one of the last bracketed sentences requiring products with
indoor air quality certification when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness.

[Provide plastic laminate clad and solid phenolic, black core toilet partitions and urinal screens to meet the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type)].  [Provide certification of indoor air quality for plastic laminate clad partitions and screens.  ][Provide certification of indoor air quality for solid phenolic, black core partitions and screens.]

2.3.1 Toilet Enclosures

Provide toilet enclosures that comply with CID A-A-60003, Type I, Style [A, floor supported] [B, ceiling hung] [C, overhead braced] [F, overhead braced-alcove].  Furnish width, length, and height of toilet enclosures as shown.  Finish surface of panels are [painted metal (Finish 1)] [stainless steel (Finish 2)] [plastic laminate clad (Finish 3)] [solid phenolic, black core (Finish 4)] [solid phenolic, color through the core (Finish 4A)] [solid polyethylene (Finish 5)] [homogenous filled acrylic (Finish 6)] [_____] ; water resistant; graffiti resistant; non-absorbent radius beveled edges.  Reinforce panels indicated to receive toilet paper holders or grab bars for mounting of the items required, and provide cut outs for through partition toilet accessories.  Provide grab bars to withstand a bending stress, shear stress, shear force, and a tensile force induced by 1112 N 250 lbf.  Grab bars cannot rotate within their fittings.

2.3.2 Room Entrance Screens

NOTE: Delete the following paragraphs when screens are not required.

Length and height of room entrance screens will be shown on the drawings, using standard size panels and pilasters to the maximum extent practicable.

Provide room entrance screens that comply with CID A-A-60003, Type II, Style [A, floor anchored] [B, ceiling hung braced] [C, overhead braced] [D, wall hung] [_____] .  Provide finish surface of screens to be [painted metal (Finish 1)] [stainless steel (Finish 2)] [plastic laminate clad (Finish 3)] [solid phenolic, black core (Finish 4)] [solid phenolic, color through the core (Finish 4A)] [solid polyethylene (Finish 5)] [homogenous filled acrylic (Finish 6)] [_____] ; water resistant; graffiti resistant; non-absorbent with radius beveled edges.  Furnish length and height of screens as shown.  Provide thickness to match toilet compartment panel construction.  Fabricate screens from the same types of panels, pilasters, and fittings as the toilet partitions.

2.3.3 Urinal Screens

NOTE: Use of urinal screens between individual urinals will be dependent on the function of the
facility. Use of urinal screens will normally be limited to those applications where sanitary protection is required, such as between a urinal and an immediately adjacent lavatory. Style A screens should normally be between 610 to 914 mm 24 to 36 inches wide. Style E screens should normally be between 457 to 610 mm 18 to 24 inches wide. Wall hung, Style E, urinal screens will be used only where the supporting construction is masonry or concrete. Where high use is expected, choose the last bracketed sentence.

Provide urinal screens that comply with CID A-A-60003, Type III, Style [A, floor supported] [B, ceiling hung] [C, overhead braced] [D, floor to ceiling hung] [E, floor to ceiling post supported] [F, wall hung]. Provide finish for surface of screens as [painted metal (Finish 1)][stainless steel (Finish 2)][plastic laminate clad (Finish 3)][solid phenolic, black core (Finish 4)][solid polyethylene (Finish 5)] [homogenous filled acrylic (Finish 6)][____]; water resistant; graffiti resistant; non-absorbent with radius beveled edges; with manufacturer's standard post design of materials matching the thickness and construction of pilasters. Furnish width and height of urinal screens as shown. Provide thickness to match toilet compartment panel construction. Secure wall hung urinal screens with [a minimum of three wall stirrup brackets.] [1067 mm 42 inches long, continuous flanges.] Fabricate screens from the same types of panels and pilasters as the toilet partitions. Use corrosion-resistant steel fittings and fasteners.

2.4 CEILING-HUNG PARTITIONS

NOTE: Delete this paragraph if ceiling-mounted partitions are not required.

Provide pilasters in size indicated that are manufacturer's standard corrosion resistant anchoring assemblies complete with leveling adjustment nuts at pilasters for connection to structural support above finished ceiling. Design anchoring device to transmit the strain and loading on the pilaster directly to the structural support above without putting strain or loading on the finished ceiling. Provide sleeves or caps at tops of pilasters to conceal anchorage.

2.5 FLOOR-ANCHORED PARTITIONS

NOTE: Delete this paragraph if floor-supported partitions are not required.

Provide pilasters in size indicated that are manufacturer's standard corrosion resistant anchoring assemblies complete with leveling adjustment nuts and pilasters for structural connection to floor. Provide anchoring device at the bottom of the pilaster consisting of a steel bar not less than 13 mm by 22 mm 1/2 by 7/8 inch welded to the reinforced face sheets and having not less than two 10 mm 3/8 inch round anchorage devices for securing to the floor slab. Provide anchorage devices complete with threaded rods, expansion shields, lock washers, and leveling-adjustment
nests. Provide shoes at pilasters to conceal anchorage.

2.6 OVERHEAD-BRACED PARTITIONS

**************************************************************************
NOTE: Delete this paragraph if overhead-braced partitions are not required.
**************************************************************************

Provide pilasters in sizes indicated that are manufacturer's standard corrosion-resistant supports, leveling mechanism, and anchors at pilasters to suit floor conditions. Provide shoes at pilasters to conceal supports and leveling mechanism. Provide anchoring device at the bottom of the pilaster consisting of a channel-shaped floor stirrup fabricated from not less than 2 mm 0.0635 inch thick material and a leveling bolt. Secure the stirrup to the pilaster with not less than a 5 mm 3/16 inch bolt and nut after the pilaster is leveled. Secure the stirrup to the floor with not less than two lead expansion shields and sheetmetal screws. Fabricate overhead brace from a continuous extruded aluminum tube not less than 25 mm 1 inch wide by 38 mm 1-1/2 inch high, 3 mm 0.125 inch wall thickness. Finish is AA-C22A31 in accordance with AA DAF45. Set and secure brace into the top of each pilaster. Provide shoes at pilasters to conceal supports and leveling mechanism.

2.7 PILASTER SHOES

Provide shoes at pilasters to conceal floor-mounted anchorage. Provide [aluminum] [stainless steel] [one piece molded HDPE] [_____] pilaster shoes. Height is a minimum 76 mm 3 inches.

2.8 HARDWARE

Provide hardware for the toilet partition system that complies with CID A-A-60003 for the specified type and style of partitions. [Provide hardware pre-drilled by manufacturer.] Use a hardware finish that is highly resistant to alkalis, urine, and other common toilet room acids. [Hardware includes: chrome plated nonferrous cast pivot hinges, gravity type, adjustable for door close positioning; nylon bearings; [black anodized] [chrome plated] [_____] aluminum door latch; door strike and keeper with rubber bumper; and cast alloy chrome plated coat hook and bumper, [_____.].] Provide latching devices and hinges for handicap compartments complying with 36 CFR 1191 and [chrome-plated steel] [or] [stainless steel] door latches that operate without either tight grasping or twisting of the wrist of the operator. [Use stainless steel, tamper proof type screws and bolts. Wall mounting brackets are continuous, full height, [aluminum] [stainless steel] [heavy duty plastic] [____], in accordance with toilet compartment manufacturer's instructions.] Provide floor-mounted anchorage consisting of corrosion-resistant anchoring assemblies with threaded rods, lock washers, and leveling adjustment nuts at pilasters for structural connection to floor.

2.9 COLORS AND FINISHES

2.9.1 Colors

**************************************************************************
NOTE: In areas where a high degree of damage, corrosion, and frequent replacement has been experienced or where, for reasons of sanitation or
appearance, additional cost is justified, partition finishes should be selected on the basis of Life Cycle Cost Analysis (LCC). The LCC analysis should be performed for a period of not less than ten years. For any project requiring non-combustible partitions, panels, screens, or door finishes, exclude finish No. 5.

Editing of color reference sentence(s) must be coordinated with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an architect or interior designer. Color must be selected from manufacturers' standard colors or identified as a manufacturers' color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings a note must be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

**************************************************************************
Provide color [as specified in Section 09 06 00 SCHEDULES FOR FINISHES.][as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.]

[Color of pilaster shoes matches the core of solid plastic compartments and screens.] Submit three samples showing color and a finished edge on two adjacent sides and core construction, each not less than 305 mm 12 inch square.

2.9.2 Finishes

2.9.2.1 Finishes No. 1 Through No. 3

Provide partitions, panels, screen, and door finishes that comply with CID A-A-60003 finished with [Painted Metal (Finish 1)][Stainless Steel (Finish 2)][Plastic Laminate Clad (Finish 3)].

2.9.2.2 Finishes No. 4, No 4A and No. 5

Provide manufacturer's standard [black core (Finish 4)][color through the core (Finish 4A)] [or] [solid polyethylene (Finish 5)] formed under high
pressure rendering a single component section not less than 25 mm (1 inch) thick. Colors extend throughout the panel thickness.

2.9.2.3 Finish No. 6

Provide homogeneous filled acrylic (Finish 6) with through body colors meeting CSA B45.5-17/IAPMO Z124.

PART 3 EXECUTION

3.1 PREPARATION

Take field measurements prior to the preparation of drawing and fabrication to ensure proper fits. Verify that field measurements, surfaces, substrates and conditions are as required, and ready to receive work. Verify correct spacing of plumbing fixtures. Verify correct location of built in framing, anchorage, and bracing. Report in writing to Contracting Officer prevailing conditions that adversely affect satisfactory execution of the work of this section. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 METAL PARTITION FABRICATION

a. Fabricate metal partition panels, doors, screens, and pilasters required for the project from galvanized-steel face sheets with formed edges. Laminate face sheets via pressure to the sound-deadening core with edges sealed with a continuous locking strip and corners mitered and welded. Ground all welds smooth. Provide concealed reinforcement for installation of hardware, fittings, and accessories. Surface of face sheets must be free from wave, warp, or buckle.

b. Before application of an enamel coating system, solvent-clean galvanized-steel surfaces to remove processing compounds, oils, and other contaminants harmful to coating-system adhesion. After cleaning, coat the surfaces with a metal-pretreatment phosphate coating. After pretreatment, finish exposed galvanized-steel surfaces with a baked-enamel coating system as specified.

c. Provide an enamel coating system consisting of a factory-applied baked acrylic enamel coating system. Provide a coating system that is a durable, washable, stain-resistant, and mar-resistant finish.

3.3 INSTALLATION

**************************************************************************
NOTE: Toilet partitions in barracks, and other hard usage areas, as well as those partitions on which grab bars are to be mounted, will be bolted to walls. Through-bolting will be specified for these applications; except, toggle bolts may be specified when through-bolting would be exposed in a finished room or would otherwise be unsuitable.

Select anchorage devices for types of wall construction as required.
**************************************************************************

Do not install items that show visual evidence of biological growth. Install partitions rigid, straight, plumb, and level, with the panels
centered between the fixtures. Provide a panel clearance of not more than 13 mm/1/2 inch and secure the panels to walls and pilasters with continuous full height wall brackets. Locate wall brackets so that holes for wall bolts occur in masonry or tile joints. Secure panels to pilasters with brackets matching the wall brackets. Provide for adjustment due to minor floor variations. Locate head rail joints at pilaster center lines. Install adjacent components for consistency of line and plane. Equip each door with hinges, one door latch, and one coat hook and bumper. Align hardware to uniform clearance at vertical edges of doors.

a. Secure panels to hollow plastered walls with toggle bolts using not less than M6x1 1/4-20 screws of the length required for the wall thickness. Provide toggle bolts with a load-carrying strength of not less than 2668.9 N 600 pounds per anchor.

b. Secure panels to ceramic tile on hollow plastered walls or hollow concrete-masonry walls with toggle bolts using not less than M6x1 1/4-20 screws of the length required for the wall thickness. Provide toggle bolts with a load-carrying strength of not less than 2668.9 N 600 pounds per anchor.

c. Secure panels to solid masonry or concrete with lead or brass expansion shields designed for use with not less than M6x1 1/4-20 screws, with a shield length of not less than 38 mm 1-1/2 inches. Provide expansion shields with a load-carrying strength of not less than 2668.9 N 600 pounds per anchor.

d. Submit Installation Drawings for toilet partitions, room entrance screens, and urinal screens showing plans, elevations, details of construction, hardware, reinforcing and blocking, fittings, mountings and escutcheons. Indicate on drawings the type of partition, location, mounting height, cutouts, and reinforcement required for toilet-room accessories.

3.4 CEILING-HUNG PARTITIONS

**************************************************************************
NOTE: Delete this paragraph if ceiling-mounted partitions are not required.
**************************************************************************

Secure pilasters to the structural support above with the anchorage device specified. Make all leveling devices readily accessible for leveling, plumbing, and tightening the installation. Level the bottoms of doors with bottoms of pilasters when doors are in a closed position.

3.5 FLOOR-ANCHORED PARTITIONS

**************************************************************************
NOTE: Delete this paragraph if floor-anchored partitions are not required.
**************************************************************************

Secure pilasters to the floor with the anchorage device specified. Make all leveling devices readily accessible for leveling, plumbing, and tightening the installation. Level tops of doors with tops of pilasters when doors are in a closed position. Expansion shields have a minimum 51 mm 2 inch penetration into the concrete slab.
3.6 OVERHEAD-BRACED PARTITIONS

**************************************************************************
NOTE: Delete this paragraph if overhead-braced partitions are not required.
**************************************************************************
Secure pilasters to the floor with the anchorage device specified. Make all leveling devices readily accessible for leveling, plumbing, and tightening the installation. Secure overhead brace to the pilaster face with not less than two fasteners per face. Expansion shields have a minimum 51 mm 2 inch penetration into the concrete slab. Make tops of doors parallel with the overhead brace when doors are in a closed position.

3.7 FINAL ADJUSTMENT

After completion of the installation, make final adjustments to the pilaster-leveling devices, door hardware, and other working parts of the partition assembly. Doors have a uniform vertical edge clearance of approximately 5 mm 3/16 inch and rest open at approximately 30 degrees when unlatched.

3.8 CLEANING

Touch up baked enamel and powder coat finish with the same color of paint that was used for the finish. Clean all surfaces and adjacent surfaces soiled as a result of the work, in an approved manner compliant with the manufacturer's recommended cleaning and protection from damage procedures until accepted. Remove all equipment, tools, surplus materials, and work debris from the site.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the provision and installation of hospital cubicle tracks.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Cubicle tracks may be mounted directly to ceiling or suspended from hangers. Hanger option should be chosen when ceiling heights are over 2700 mm 9 feet to reduce curtain length. Use I-beam section where accumulation of dirt on track (which would impede carrier movement) would be a problem.

On the drawings, show:

1. Ceiling height
2. Anchorage system
3. Anchorage spacing and locations
4. If both heavy and light duty tracks are used,
indicate locations of each.

***********************************************************************

PART 1   GENERAL

1.1 REFERENCES

***********************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

***********************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ALUMINUM ASSOCIATION (AA)

AA DAF45 (2003; Reaffirmed 2009) Designation System for Aluminum Finishes

ASTM INTERNATIONAL (ASTM)

1.2 SUBMITTALS

***********************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals.
required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

SD-08 Manufacturer's Instructions

SD-10 Operation and Maintenance Data

1.3 DRAWING REQUIREMENTS

Submit cubicle track layout drawings. Include [ceiling, surface-mounted installation details], [suspended track installation details], and [overlay drawing showing other trades installation within area].
1.4 DELIVERY AND STORAGE

Deliver cubicle tracks to site in unopened containers clearly labeled with manufacturer's name and contents. Store in safe, dry, and clean location. Do not open containers until contents are to be installed.

1.5 QUALITY CONTROL

Allow smooth, rapid, and complete screening with no gaps at corners or ends of track. The track of a standard 2400 by 2400 mm 8 by 8 foot cubicle shall have no joints. Form corner bends in a single continuous piece on a 300 mm 12 inch radius to exactly 90 degrees. Other track lengths to 4800 mm 16 feet shall have no joints.

PART 2 PRODUCTS

2.1 CUBICLE TRACK SYSTEM

******************************************************************************
NOTE: Heavy duty track can be mounted either on ceilings directly or from hangers. The hanger option should be chosen when ceiling heights are over 2700 mm 9 feet to reduce curtain length.
******************************************************************************

Heavy-duty type, [ceiling surface mounted][hanger mounted]. Bends shall be minimum 450 mm 18 inches radius.

2.1.1 Extruded Aluminum Tracks

******************************************************************************
NOTE: Use I-beam section where accumulation of dirt on track (which would impede carrier movement) would be a problem. I-beam types of track generally use the one piece.
******************************************************************************

ASTM B221M ASTM B221 and ASTM B456; alloy 6063-TS, channel shape minimum 32 mm wide by 29 mm deep, 1 1/4 inch wide by 1 1/8 inch deep, 1.25 mm 0.050 inch minimum wall thickness. Inside raceway to be smooth for interior carriers and must be able to receive a double coated wheel carrier with hook. Finish as designated for aluminum finishes in AA DAF45.

2.2 CARRIER UNIT

Silent type with double canted wheel carrier. Wheels shall have nylon on stainless steel [chrome plated brass] [chromium plated steel] hooks with swivel to support the curtain. Carriers shall be removable only through access aperture or through end-cap that provides room for insertion or removal of carrier. Provide 2.2 carriers for every 300 mm foot of track length, plus one additional carrier. Provide a safety loading unit at one end of the channel track consisting of a section of channel track equipped with a hinge and end latch to permit lowering for installation or removal of curtains from hooks without the use of a step-ladder and without removing carriers from track. Rivet moveable end of safety loading unit to be riveted to the hinge. Latching end of safety loading unit with a double locking fail-proof locking device for safety. Safety loading unit to be 1200 mm four feet in length of an 2400 mm 8 foot ceiling installation so
latch end lowers to 1200 mm **four feet** from floor, for installation or removal of curtain without the use of a step-ladder. Increase length of safety loading unit to be increased according to ceiling height. Provide a key wand for every 20 units.

2.3 **END STOP AND PULL-OUT**

Fabricate from aluminum or nylon with an anodized finish matching the track finish.

2.4 **FASTENERS**

Stainless steel.

2.5 **FINISH**

Satin, clear anodized.

**PART 3 EXECUTION**

3.1 **INSTALLATION**

Verify dimensions prior to installation. Install cubicle track after painting and finishing operations are complete. Provide labor and all materials indicated, specified or necessary for a complete finished installation. Install track plumb, level and true, and securely anchored to the ceiling to form a neat, rigid installation. Remove damaged or defective components and replace with new components.

3.1.1 **Installation Details**

**************************************************************************

**NOTE:** The types of ceilings to which the cubicle tracks or hangers will be fastened will differ. Therefore, in addition to showing the location of cubicle tracks on the drawings, the type of fastener or fasteners permitted for securing the tracks or hangers to the particular ceiling type for this project must be shown.

**************************************************************************

**************************************************************************

**NOTE:** Generally, use hangers when room heights are 2700 mm **9 feet** or more. Where hangers are used, indicate them on the drawings. Locate them:

1. At offsets or bends of 45 degrees or more.
2. At rises in track.
3. At 900 mm **3 feet** on center, maximum, on straight cubicle tracks over 2400 mm **8 feet** long.
4. At termination of track if not at wall or other attachable vertical surface.

**************************************************************************

Install heavy-duty cubicle tracks[ ceiling surface mounted][ suspended from hangers]. Install cubicle tracks where indicated. Install carrier units at
150 mm 6 inches on center maximum. Install end cap at each end of the track and pull-out at the end where curtains are stacked to permit insertion and removal of carrier units. Securely fasten end stops to prevent their being forced out by striking weight of carrier units.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Wire Mesh Partitions

Show layout, details, materials, dimensions, finishes, and all information necessary for fabrication and installation.

SD-03 Product Data

Wire Mesh Partitions

Submit for each type of partition, door, and window.

[ Recycled Content for Metal Post and Framing Materials; S ]

][ Recycled Content for Wire Materials; S

1.3 DELIVERY, STORAGE, AND HANDLING

Deliver materials in manufacturer's original, unopened containers or packaging with labels intact and legible. Deliver, store, and handle materials so as to prevent damage. Replace damaged or defective materials with new.

1.4 DESCRIPTION OF WORK

Wire mesh partitions must be [all wire type] [sheet metal base type], [normal duty for normal industrial use] [heavy duty for extra heavy industrial use]. Provide partitions complete with fasteners, capping bars, adjustable floor sockets, bracing, doors, [service windows,] hardware, and other items necessary for a complete, useable, and rigid installation.
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is available from US national manufacturers above the minimum recycled content percentages shown below. Some manufacturers and regions have higher percentages. Based on research, select or insert desired minimum percentages into the empty set of brackets.

Metal post and framing materials listed below must contain a minimum of [15][_____] percent post-consumer recycled content and wire materials must contain a minimum of [50][_____] percent post-industrial recycled content. Provide data identifying percentage of recycled content for metal post and framing materials. Also provide data identifying percentage of recycled content for wire materials.

2.1.1 Steel Shapes, Plates, and Bars

ASTM A36/A36M.

2.1.2 Cold-Formed Steel

AISI SG03-3.

2.1.3 Wire Mesh

Carbon steel wire, woven diamond mesh, intermediate crimped.

2.1.4 Floor Sockets

Cast or forged steel or ductile iron, adjustable, approximately 64 mm 2-1/2 inches high.

2.2 NORMAL DUTY PARTITIONS

2.2.1 Wire Mesh

10 gage wire, 38 mm 1-1/2 inch mesh.

2.2.2 Vertical Frames

32 by 16 mm 1-1/4 by 5/8 inch cold-rolled C section channels or 32 by 16 by 3 mm 1-1/4 by 5/8 by 1/8 inch channels. Provide only C channels where frames are installed toe to toe without posts.]
2.2.3 Horizontal Frames

25 by 16 mm by 5/8 inch channels.

2.2.4 Center Reinforcing Bar

One 25 by 13 by 3 mm 1 by 1/2 by 1/8 inch channel with all wires woven through, or two 25 by 10 by 3 mm 1 by 3/8 by 1/8 inch channels bolted together with mesh in between.

2.2.5 Capping Bar

56 by 25 by 3 mm 2-1/4 by one by 1/8 inch channel or 50 by 6 mm 2 by 1/4 inch flat bar.

2.2.6 Corner Posts

Structural steel angles, 32 by 32 by 3 mm 1-1/4 by 1-1/4 by 1/8 inch.

2.2.7 Line Posts

Unless otherwise indicated, provide partitions more than 3600 mm 12 feet high with flat bar line posts bolted between vertical frame channels. Sizes of posts must be as follows:

<table>
<thead>
<tr>
<th>Partition Height</th>
<th>Size of Posts</th>
</tr>
</thead>
<tbody>
<tr>
<td>3600 to 4400 mm</td>

2.2.8 Hinged Doors

Frames must be 32 by 13 by 3 mm 1-1/4 by 1/2 by 1/8 inch channels with 32 by 3 mm 1-1/4 by 1/8 inch flat bar cover on top and bottom rails and on hinge stile and a 35 by 20 by 3 mm 1-3/8 by 3/4 by 1/8 inch angle riveted to the lock stile. Provide 1 1/2 pairs of regular weight, wrought steel, non-removable pin, butt hinges riveted or welded to the door and the door opening frame for each door.

2.2.9 Sheet Metal Base

Hot- or cold-rolled sheet steel, not lighter than 16 gage.
2.3 HEAVY DUTY PARTITIONS

2.3.1 Wire Mesh

6 gage wire, 50 mm 2 inch mesh.

2.3.2 Panel Frames

38 by 20 by 3 mm 1-1/2 by 3/4 by 1/8 inch steel channels.

2.3.3 Center Reinforcing Bar

One 38 by 20 by 3 mm 1-1/2 by 3/4 by 1/8 inch channel with all wires woven through, or two 32 by 10 by 3 mm 1-1/4 by 3/8 by 1/8 inch channels bolted together with mesh in between.

2.3.4 Capping Bar

Structural steel channel, 75 mm by 1.9 kg 3 inch by 4.1 pounds.

2.3.5 Corner Posts

Structural steel angles, 45 by 45 by 3 mm 1-3/4 by 1-3/4 by 1/8 inch.

2.3.6 Line Posts

Unless otherwise indicated, provide partitions with flat bar line posts bolted between vertical frame channels. Sizes of posts must be as follows:

<table>
<thead>
<tr>

2.3.7 Hinged Doors

Frames must be 38 by 20 by 3 mm 1-1/2 by 3/4 by 1/8 inch channels with 38 by 3 mm 1-1/2 by 1/8 inch flat bar cover on top and bottom rails and on hinge stile and a 41 by 22 by 3 mm 1-5/8 by 7/8 by 1/8 inch angle riveted to the lock stile. Provide 1-1/2 pairs of heavyweight, wrought steel, non-removable pin, butt hinges riveted or welded to the door and the door opening frame for each door.

2.4 SLIDING DOORS

Frames must be 38 by 20 by 3 mm 1-1/2 by 3/4 by 1/8 inch channels with 38
by 3 mm 1-1/2 by 1/8 inch flat bar cover all around. Provide two four-wheel, roller bearing hangers and steel box track for each door.

2.5 DOOR OPENING FRAMES

Provide frames the same size and shape as the vertical frames for the mesh panels.

2.6 LOCKS

Provide each door with a mortise type lock with a six-pin tumbler lock cylinder on the outside and a recessed knob on the inside.

2.7 SERVICE WINDOWS

Slide up type, mounted in standard mesh panel reinforced with channel tracks. Opening must be 600 mm wide by 450 mm high 24 inches wide by 15 inches high unless otherwise indicated. Provide two spring loaded latches, operable only from the inside, to lock window in open and closed positions. [Form shelf of 12 gage sheet steel, 300 mm deep by 625 mm wide 12 inches deep by 25 inches wide, unless otherwise indicated.]

2.8 FABRICATION

2.8.1 Standard Panels

Wire must be woven into diamond mesh, intermediate crimped, and securely clinched to frames. Joints must be mortised and tenoned. Wire must be continuous at center reinforcing bars, either woven through a single channel or bolted between two channels. Panel vertical frames must have [6 mm 1/4 inch bolt holes 300 mm 12 inches o.c. for normal duty partitions] [10 mm3/8 inch bolt holes 450 mm 18 inches o.c. for heavy duty partitions].

2.8.2 Sheet Metal Base Panels

Upper portion must be as specified for standard panels, except that the wire must be clinched into the center reinforcing bar. Form sheet steel to fit between the panel frames and securely bolt to the frames.

2.8.3 Doors [and Service Windows]

Construction must be similar to that specified for panels. Wire mesh must be the same as that used in the adjacent partition panels.

2.8.4 Finish

Thoroughly clean ferrous metal, treat with phosphate, and paint with [green] [black] [gray] enamel in the shop.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Wire Mesh Partitions

Install plumb, level, and true to line, within a tolerance of 3 mm in 3 m 1/8 inch in 10 feet or the height or run of the partition, if less than 3 meters 10 feet. Anchor floor sockets to the floor with expansion bolts. Bolt vertical frames and posts together with [6 mm bolts 300 mm o.c.1/4
inch bolts 12 inches o.c. for normal duty partitions] [10 mm bolts 450 mm o.c. 3/8 inch bolts 18 inches o.c. for heavy duty partitions]. Secure top frames to a continuous capping bar with 6 mm 1/4 inch diameter U bolts not more than 650 mm 28 inches o.c.

3.1.2 Doors [and Service Windows]

Install in accordance with the manufacturers' recommendations. Adjust as required so that doors [, windows,] and hardware operate freely and properly.

3.1.3 Bracing

Brace free standing partitions more than 6 meters 20 feet in length, at intervals not greater than 6 meters 20 feet [with a steel channel brace connected to the capping bar and anchored to the building wall or framing member] [with a structural steel I section or tube post welded to a 225 by 225 mm 9 by 9 inch steel base plate anchored to the floor with 4 expansion bolts] [or as indicated].

3.1.4 Touch-Up

Clean and paint scratches, abrasions, and other damage to shop painted surfaces to match the shop-applied finish.

Repair minor surface rust areas. Clean and prime with rust inhibitive primer paint. Apply final paint to match shop-applied finishes.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for demountable and movable partitions.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Partition layouts on the drawings must show partition dimensions, nominal sizes for doors, glazing panels, sound-resistance when required, details and any other information pertinent to partition layouts. Partition layout should be designed to allow for maximum reusability. Minimize the number of panel sizes specified on a project to increase flexibility of panel re-use.

Designer should require materials, products, and innovative construction methods and techniques which are environmentally sensitive, take advantage of recycling and conserve natural resources.
1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN NATIONAL STANDARDS INSTITUTE (ANSI)

ASTM INTERNATIONAL (ASTM)

ASTM E72 (2022) Conducting Strength Tests of Panels for Building Construction

ASTM E413 (2022) Classification for Rating Sound Insulation
1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions
in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list, and corresponding submittal
items in the text, to reflect only the submittals
required for the project. The Guide Specification
technical editors have classified those items that
require Government approval, due to their complexity
or criticality, with a "G." Generally, other
submittal items can be reviewed by the Contractor's
Quality Control System. Only add a "G" to an item,
if the submittal is sufficiently important or
complex in context of the project.

For Army projects, fill in the empty brackets
following the "G" classification, with a code of up
to three characters to indicate the approving
authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for
UFGS

Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SECTION 10 22 19  Page 6
1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality Certifications

1.3.1.1 Gypsum Wall Systems

****************************************************************************************************************************************
NOTE: The Government’s preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, it must be verified there is a certified product available that is both cost effective and appropriate for the project. The requirements of this paragraph are invoked when the designer of record confirms local/regional availability of Greenguard or SCS products and includes the bracketed requirements for indoor air quality certified products in Part 2 of this Section.
****************************************************************************************************************************************

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body.

1.3.1.2 Adhesives and Sealants

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.4 QUALITY ASSURANCE

Manufacturer must have a minimum of [10] [_____] years of documented successful experience in designing and manufacturing partitions conforming to the requirements in this section. Provide product from a single manufacturer.

Partition installer must have a minimum of [5] [_____] years of documented successful experience in the installation of partitions similar to the requirements in this section. When required by the manufacturer, partitions must be installed by an authorized dealer with a certified installation crew.
1.5 DELIVERY, STORAGE, AND HANDLING

Deliver materials to project site in accordance with manufacturer's instructions in original unopened and undamaged packages. Store in a clean, dry, and secure place free from damage during construction activities. Packages must contain labels indicating the manufacturer's name, brand name, size, finish and placement location.

1.6 PROJECT/SITE CONDITIONS

Temperature and humidity conditions within the area to receive partitions must be maintained as close as possible to the final occupancy standards. Maintain a minimum of 16 degrees C 60 degrees F and a relative humidity level of no higher than 70% continuously. Do not begin installation until the building envelope provides complete protection from the weather.

1.7 WARRANTY

**************************************************************************
NOTE: When site assembled demountable partitions are specified, the following warranty paragraph may be deleted in lieu of being covered under the one year standard construction warranty.
**************************************************************************

Warrant the partition system for a period of [10] years, and warrant fabrics and other covering materials for 3 years. Warranties must be signed by the authorized representative of the manufacturer. Warranties accompanied by document authenticating the signer as an authorized representative of the guarantor must be presented to the Contracting Officer upon the completion of the project. Guarantee that the partition system and installation are free from any defects in material and workmanship from the date of delivery.

PART 2 PRODUCTS

**************************************************************************
NOTE: Demountable and movable partitions should be used in areas susceptible to future partition rearrangement and substitution. Compared to traditional drywall construction, installation of these partitions are faster and eliminate the cost and mess of cutting and fitting flooring and ceilings around fixed walls. They offer maximum flexibility and reusability to accommodate frequent and quick relocation with minimal downtime, loss of materials, and damage or modification to panels or to adjoining structures such as ceilings, fixed walls and floors. These partitions can be specified as non-progressive allowing the removal of individual panels from any location without disturbing adjoining units. The partitions are point accessible meaning instant access of panels allows for electrical, telephone and communication lines to be installed quickly and easily. Furniture support is an optional added feature that makes these partition systems similar to systems furniture panels.
Terminology of partition systems within industry varies greatly including the terms "demountable", "movable", "modular", and "relocatable". For the purpose of this specification the terms demountable" and "movable" are used.

Demountable partitions are site assembled and are often used for aesthetic purposes with finishes other than paint and glazing. Panels are easy to change out when a different finish is desired, but more effort is required to relocate partitions than movable partitions. Also, electrical and communications are site installed.

Movable partitions are factory assembled, also known as unitized. They provide better quality control and a more uniform appearance. They can be installed and relocated very quickly and require less labor by an electrician because the partitions can be prewired with boxes.

2.1 SYSTEM DESCRIPTION

2.1.1 Burning Characteristics

Submit certification attesting that partition system has a Class A (under 25) Flame Spread Rating in conformance with ASTM E84.

NOTE: Performance requirements listed below are optional choices for designer; edit accordingly.

2.1.2 Acoustical Performance

Submit certification attesting that sound-rated partition assemblies have a minimum Sound Transmission Coefficient (STC) of [[36] [42] [44] [_____] for solid panel] [[30] [_____] for glass panel]. Determine STC range in accordance with Sound Transmission Test by Two-Room Method and reported in accordance with ASTM E90 and ASTM E413 for frequency data. Tested assembly must have been assembled in the same manner that the partitions will be installed on the project.

2.1.3 Structural Performance

Submit test results from an independent laboratory certifying the following results.

2.1.3.1 Transverse-Load Capacity

Provide partitions capable of [sustaining 24.4 kg/sq. m 5 psf minimum transverse load] [supporting furniture systems components] with lateral panel deflection no greater than [[1/120] [1/240] for solid panel] [1/175 for glass panel] when tested in accordance with ASTM E72.

2.1.3.2 Load-Bearing Capability

Provide proof load of not less than [136 kg 300 lb concentrated] [0.041
kg/linear mm 3.2 lb/linear inch distributed] [_____] when tested according to ANSI/BIFMA X5.6.

2.1.3.3 Non-Load Bearing Capability

Wall system is designed for non-load bearing capability.

2.1.4 Electrical and Communication Capability

Electrical components, devices, systems and accessories must meet requirements of NFPA 70. Provide a partition system that accommodates electrical switches, outlets, voice/data cabling and jacks, and other components [at multiple heights in the panel] within the internal panel cavity. Surface mounted components will not be accepted. Provide [standard] [_____] size light switch boxes, electrical boxes, double gang outlet boxes for voice/data jacks, switches, outlets, faceplates, and conduit at mounting heights and locations as indicated on the electrical drawings. Coordinate finish of switches, outlets, and faceplates with building and other componentry finishes. [Factory install all electrical components and accessories for partitions. Panels with factory installed electrical wiring must be UL listed or labeled and meet the requirements of UL 183. The label or listing of Underwriter's Laboratories, Inc. will be accepted as evidence that the material or equipment conforms to the applicable standards, and must be marked for intended use. In lieu of this label or listing, submit a statement from a nationally recognized, adequately equipped testing agency indicating that the items have been tested in accordance with the required procedures of UL and that the material and equipment comply with contract requirements.] Building electrical power will be [ceiling] [wall] [base] [access floor] [_____] fed. Coordinate the building and partition system electrical power. Electrical work must conform to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2 PARTITION SYSTEM

Provide a partition system consisting of a series of individual, floor-supported, [[floor-to-ceiling] [partial height]] [[site assembled] [factory assembled]] panels as shown. [Provide a system that is non-progressive, allowing for removal and re-installation of panels, including door frames, at any position, without disturbing adjacent panels]. Provide panel faces that are removable, reusable, and attached to the panel frame without the use of screws or other mechanical fasteners. Provide a top channel that holds panels in place and accommodates floor-to-ceiling variations. System must be capable of attaching to multiple standard ceiling types in a non-marring manner. Provide floor attachment without mechanical fastening. Installation, modifications, and removal of the system must not damage adjacent building surfaces and elements, including floors, walls, ceilings, columns and window mullions. All system connectors to fixed building components must be removable, and reusable, and non-marring. Solid panels must be capable of field cutting to accommodate variations in floor and ceiling levels, end filler conditions, and other existing building conditions. The partition system must be complete with accessories to meet performance requirements.

Construct a Mock-up on site minimum 2430 x 2430 mm 8 x 8 foot [_____] in size for each color and type of panel specified after finish samples are approved, and prior to installation of partitions. Show partition construction and method of attachment to walls, floor, and ceiling. Review of the mock-up may result in adjustments to the product, layout and
finishes. Once approved, use the mock-up as a standard of workmanship within the facility. Remove mock-ups when directed. Approved mock-ups may become part of the completed work if approved by the Contracting Officer.

Submit product data for partition system, to include catalog cuts, brochures, product information, and other necessary literature to indicate compliance with specifications.

2.3 MATERIALS AND COMPONENTS

2.3.1 Panels

**************************************************************************
NOTE: Use materials with recycled content, calculated on the basis of post-industrial or post-consumer percentage content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Section allows establishing recycled content requirements based on either the gypsum board product in its entirety, or on the paper facing and gypsum core separately. Research shows the product is available among US national manufacturers above the minimum recycled content percentages stated.

Choose first 2 sentences in the second paragraph below when using panels with recycled gypsum products.

Only choose the second set of optional sentences of the second paragraph if the desire is only to use gypsum products that contain recycled paper faces.

Only choose the third set of optional sentence of the second paragraph if the desire is only to use gypsum products that contain recycled gypsum cores.

**************************************************************************

Provide panel faces constructed of [steel] [gypsum board [minimum 13 mm 1/2 inch] [_____] thick conforming to ASTM C1396/C1396M, gypsum backing board conforming to ASTM C1396/C1396M] [wood composite] [fiber composite]. Include panels with [tongue-and-groove] [panel clips] [panel connectors] at joints to align panels. Provide concealed integrated slots to mount furniture components, accessories and equipment at multiple elevations. Maximum total load for bracket supports on one or both wall surfaces must not exceed 5500 N 1240 lb. Provide panels that are manufacturer's standard construction with fillers and bracing as required. Provide panel thickness of minimum[ 57 mm 2 1/4 inch] [ 88.90 mm 3 1/2 inches] [ 101.60 mm 4 inches

SECTION 10 22 19 Page 11
] [_____.] [Provide panel face thickness of minimum 38 mm 1/2 inch] [_____.] Submit three sets of Assembly Manuals describing assembly and reconfiguration procedures.

[Provide gypsum board with a minimum of 5 percent post-consumer recycled content, or a minimum of 20 percent post-industrial recycled content. Provide data identifying percentage of recycled content for gypsum board.] [Provide gypsum products with paper facings that contain a minimum of 100 percent post-consumer recycled paper content. Provide data identifying percentage of recycled content for paper facing.] [Provide gypsum cores containing a minimum of 95 percent post-industrial recycled gypsum content. Provide data identifying percentage of recycled content for gypsum cores.] Provide gypsum wall board and panels that the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification or validation of indoor air quality for gypsum board.

2.3.1.1 Adhesives

Provide sealants and non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) that meet either emissions requirements of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type) or VOC content requirements of SCAQMD Rule 1168 or GS-36. Provide certification or validation of indoor air quality for aerosol adhesives used on the interior of the building (inside of the weatherproofing system).

2.3.2 Framing System

Provide framing system that consists of extruded aluminum or roll-formed steel components which include ceiling runners, floor track, [studs or posts,] bracing, and suitable treated fasteners to prevent corrosion. Provide a rigid, stable partition system when the frame is assembled with the panels.

2.3.3 Glass and Glazing

******************************************************************************
NOTE: Coordinate glass requirements with Section 08 81 00 GLAZING.
******************************************************************************

Provide glass and glazing for partitions that are fully contained within the partition system and in locations as shown on the drawings. Provide [tempered] [laminated] glass that is [clear] [patterned] and complies with ANSI Z97.1 and ASTM C1048. [Provide [wood] [metal] mullions (muntins).] [All glass must be factory installed.] No protruding glazing beads or removable stops will be visible. [Provide glass and glazing in accordance with Section 08 81 00 GLAZING.]

2.3.4 Doors and Frames

******************************************************************************
NOTE: Single doors are normally available 910 mm wide x 2030 mm or 2135 mm high 3 feet wide x 6 feet 8 inches or 7 feet high. Some manufacturers offer other sizes.
******************************************************************************

SECTION 10 22 19 Page 12
Provide demountable partitions complete with [[single] [double]] [[sliding] [butt-hinged] [pivot-hinged]] doors and frames as shown on the drawings. Provide doors and frames that are fully contained with the panels and use standard panel connection methods. Provide 45 mm 1-3/4 inch thick flush type [hollow metal] [solid core] [wood veneer] [plastic laminate] [[tempered] [laminated] glass slab] [[tempered] [laminated] combination glass with [[wood]] [_____]] doors of manufacturer's standard construction. Door frames must be compatible in appearance with other trim components and allow for variations in floor level. [Provide doors in accordance with Section 08 14 16 FLUSH WOOD DOORS.]

**NOTE:** Verify keying requirements with the owner/tenant and include in specification if applicable.

2.3.5 Door Hardware

Door hardware to be [supplied and installed by partition manufacturer] [supplied by others and installed by partition manufacturer] [______]. Provide hardware for doors in accordance with Section 08 71 00 DOOR HARDWARE. Provide hardware cutouts and reinforcement as required in doors and frames for hardware furnished.

2.3.6 Glazing Frames

Assemble glazing frames from minimum 1.7 mm 0.065 inch thick extruded anodized aluminum parts or minimum 1.2 mm 0.0478 inch cold-rolled steel and vinyl components. Indicate sizes and configurations of glazed openings on the drawings.

2.3.7 Trim

Provide [base] [ceiling] [panel] trim without exposed fasteners nominal [ 100 mm 4 inch] [______] high, with [recessed] [projected] [flush] [_____] profile.

2.4 FINISHES

**NOTE:** Coordinate the editing of color reference sentence(s) with the Government. Generally Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an Architect or Interior designer. Select color from manufacturers standard colors or identified as a manufacturers color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings, add a note that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word
"color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is acceptable. Note there is often a minimum order requirement which will affect future orders.

Provide panel finish of [factory-applied powder coat steel] [factory applied vinyl wallcovering finish, Type II (Medium Duty), UL Class A conforming to ASTM E84] [fabric] [tackable fabric] [high pressure laminate] [wood veneer] [factory primed gypsum board for field paint] [factory painted gypsum board] [tackable wallboard] [magnetic marker board] [marker board] [back painted glass] [____]. Provide exposed metal trim finish of [aluminum [satin clear] [[light] [medium] [dark] bronze]] [factory-applied powder coat] [factory primed for field paint] [steel] [____]. Non-metal panel trim to [match panel] [match exposed trim] [____]. Non-metal base and ceiling trim to [match exposed trim] [match panel] [____]. Provide [factory primed for field paint] [factory-applied powder coat] [wood veneer] [plastic laminate] [____] doors. Painting must conform to the requirements of Section 09 90 00 PAINTS AND COATINGS. Provide color of all partition component finishes [in accordance with Section 09 06 00 SCHEDULE FOR FINISHES] [as indicated on the drawings] [____]. Submit all exposed Partition System Samples to include panel and component finishes and electrical components such as faceplates. Samples must be actual samples and a minimum of 75 by 75 mm 3 by 3 inches in size.

PART 3 EXECUTION

3.1 EXAMINATION

Verify field dimensions before fabrication of partition system and record on installation drawings. Coordinate fabrication and installation schedule with construction schedule to avoid delay in the work. Examine and verify that site conditions are in agreement with the design package and manufacturer's requirements.

3.2 PREPARATION

Verify floor and ceiling dimensions in accordance with approved shop drawings prior to starting the work. Floor under partitions must be level to within 3 mm in 3048 mm 1/8 inch in 10 feet, non-accumulative. Correct conditions which may adversely affect the partition installation before installing partitions. Finishing operations, such as painting, carpeting, and ceiling grid installation, must be completed prior to partition installation.

3.3 INSTALLATION

Do not install items that show visual evidence of biological growth. Install partitions using certified installers in accordance with manufacturer's recommended installation instructions. Install partitions in conformance with details in the drawings and approved installation drawings. Assemble and erect the system with the least possible drilling and cutting of existing construction. Provide a complete partition installation with accessories to meet specified requirements and the capability of disassembly by means of ordinary tools. Provide concealed fastening devices and pressure-fit components that will not mar the floor,
wall and ceiling surfaces and are free of exposed screws, nuts, rivets or bolts. Install panels rigid, straight and plumb, with horizontal lines level and aligned. Provide a complete installation with continuous light and sound seals at connections to ceilings, floors, fixed walls and abutting surfaces. Coordinate the partition system installation with the work of other trades that are affected. Provide dimensions on drawings verifying conformance to life safety code and electrical switch, outlet, infeed and jumper placements.

3.3.1 Doors and Windows

Hang doors to [swing] [slide] freely and fit hardware precisely. Install glass for glazed openings on shims in a vinyl or polyurethane foam gasket. Install glass stops without exposed fastenings.

3.3.2 Trim

Install trim in accordance with manufacturer's recommendations. [For site assembled partitions install wall base in the longest lengths possible. Joints must be fitted tight. Miter internal corners and scribe base to fit to door frames and other obstructions.] [Provide partition base covers that snap on.] Base must tightly adhere to wall surfaces.

3.4 ADJUSTMENTS

Repair or replace damaged partition finishes and components and damaged floor, wall and ceiling finishes to the original conditions.

3.5 CLEANING

Upon completion of installation, clean partition components and finishes in accordance with partition manufacturer's recommendations. Do not use alkaline or abrasive agents. Avoid scratching or marring partition finish surfaces. Submit three sets of Maintenance Manuals describing proper cleaning and minor repair procedures.

3.6 PROTECTION

Protect partitions from damage through the duration of construction activities.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for accordion folding partitions, manually and/or electrically operated.

Accordion partitions are folding partitions with independent covers enclosing a dead-air space and separated by an internal mechanism operating laterally across the face of the opening to a stack or closed position. Do not confuse accordion partitions with serpentine folding partitions which contain no internal operating mechanism or dead-air space between independent covers.

Folding partitions may be a sight barrier (noninsulated), or sound barrier (with sound liner), or both. Accordion-folding partitions have fabric covers which are joined to reflect a pantographic movement of the door surfaces when the door is either manually or electrically operated.

This section does not include folding or operable walls and partitions whose rigid panels are individually moved or hinged along their vertical edges to fold in serpentine fashion.

Associated work found in other sections includes:

Steel supporting members or hanger rods, [Section 05 50 13 MISCELLANEOUS METAL FABRICATIONS][Section 05 51 33 METAL LADDERS][Section 05 52 00 METAL RAILINGS][Section 05 51 00 METAL STAIRS].

Wood blocking, rough bucks, and headers, Section 06 10 00 ROUGH CARPENTRY.

Wood trim, wood or hardboard ceiling guard, or soffits, Section 06 20 00 FINISH CARPENTRY.

Lock cylinders, Section 08 71 00 DOOR HARDWARE.
Operator field connections to power sources and inner connection to control switches, Division 16, "Electrical."

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************

NOTE: The following information should be shown on the drawings:

1. Location, size, and folding area of accordion partitions.

2. Direction of operation, header conditions indicating height, track anchorage, track channel, and jamb conditions.

3. Partition supporting structure. The structural support for the partition is not part of this section; it must be indicated and specified separately.

4. A schedule of partitions by type, sizes, and stack space and identified by mark number or letter

5. For electrically operated partitions, show power source and desired switch location.

**************************************************************************

PART 1 GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature
when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**ASTM INTERNATIONAL (ASTM)**

ASTM A653/A653M (2023) Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

ASTM C423 (2023) Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method

ASTM D751 (2006; R 2011) Coated Fabrics

ASTM E413 (2022) Classification for Rating Sound Insulation

CALIFORNIA DEPARTMENT OF PUBLIC HEALTH (CDPH)

CHEMICAL FABRICS AND FILM ASSOCIATION (CFFA)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2023; ERTA 4 2023; ERTA 5 2023; ERTA 6 2023) National Electrical Code

NFPA 286 (2024) Standard Methods of Fire Tests for Evaluating Contribution of Wall and Ceiling Interior Finish to Room Fire Growth

SCIENTIFIC CERTIFICATION SYSTEMS (SCS)

SCS SCS Global Services (SCS) Indoor Advantage

UNDERWRITERS LABORATORIES (UL)

UL 10B (2008; Reprint May 2020) Fire Tests of Door Assemblies

UL 2818 (2022) GREENGUARD Certification Program For Chemical Emissions For Building Materials, Finishes And Furnishings

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the
UFGS

District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only.  When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Manufacturer's Qualifications; G[, [____]]
Manufacturer's Sample Warranty
Statement of Code Compliance; G[, [____]]
Statement of Standards Conformity; G[, [____]]
Verification of Field Measurements; G[, [____]]

[ Existing Electrical Data
]

SD-02 Shop Drawings

Submit Fabrication Drawings for Accordion Folding Partitions consisting of fabrication and assembly details to be performed in the factory.

Submit Installation Drawings for the following items in accordance with paragraph INSTALLATION, of this section.

Accordion Folding Partition Layouts; G[, [____]]
Suspension System; G[, [____]]
Finish Hardware; G[, [____]]
Jamb Panels; G[, [____]]
Accessories; G[, [____]]

[ Electrical Operators; G[, [____]]
]

Wiring Diagrams; G[, [____]]
Submit drawings for the system that include dimensions and weight of stacked partition, layout of the work including stacking area, track and jamb fastening methods, seal details, and installation details. Submit wiring diagram and installation details for electrical operator.

Electrical Operators, Data Package 5; G[, [______]]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.
NOTE: The Government’s preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, it must be verified there is a certified product available that is both cost effective and appropriate for the project. Retain the following Section when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness. In addition, when this Section is retained requiring Greenguard or SCS products, also include the Indoor Air Quality Certificates in SD-07 submittals of this section.

1.3.1 Indoor Air Quality Certification

1.3.1.1 Indoor Air Quality for Fabrics and Wallcoverings

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.4 PRE-INSTALLATION REQUIREMENTS

1.4.1 Preconstruction Requirements

No less than 30 calendar days prior to the scheduled commencement of installation of Accordion Folding Partitions, submit the following to the Contracting Officer:

Manufacturer's Qualifications
Manufacturer's Sample Warranty
Statement of Code Compliance
Statement of Standards Conformity
Verification of Field Measurements and Existing Electrical Data
Fabrication Drawings and Installation Drawings

1.4.2 Product Data

Submit the following information for review:
Finish Hardware
Jamb Panels and Accessories
Sound Seals and Sweepstrips
Ceiling Guard, Meeting Posts, Rolling Post
Pull-In Latch

[ Electrical Operator and Switches

1.4.3 Manufacturer's Guarantee

Provide Manufacturer's Guarantee for partitions against defects in material and workmanship for a period of two years from date of installation. In addition, provide ten year guarantee for the pantographs, trolleys and tracks from date of acceptance for beneficial use.

1.5 DELIVERY, HANDLING AND STORAGE

Deliver materials to project site in manufacturer's original, unopened, and undamaged packages with labels legible and intact. Labels must indicate the manufacturer, brand name, size, finish, and placement location. Store folding partitions and accessories in unopened packages in a manner that will prevent damage. Handle partition materials in accordance with manufacturer's instructions.

PART 2 PRODUCTS

2.1 FOLDING PARTITIONS

Provide full accordion type partitions, factory finished, supported from overhead track without floor guides, and complete with all hardware, track, and accessories necessary for operation. Provide partition framework with a mechanism that gives stability and maintains uniform spacing of partition folds in all partition positions. Provide completely concealed framework with a [vinyl-coated fabric covering][____]. Provide partitions [manually] [and] [electrically] operated, [bi-parting] [and] [one-way] type as indicated. Provide patterns and colors of [fabric][____] [approved by the Contracting Officer] [as indicated ]. [ Provide manufacturer's standard pendant pull on leading edge of manually operated partitions over 3600 mm 12 feet high.]

2.2 MATERIALS

2.2.1 Aluminum Extrusions

ASTM B221MASTM B221, Alloy 3003.

*********************************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.
Research shows the product is available from US national manufacturers above the minimum recycled content percentages shown below. Some manufacturers and regions have higher percentages. Based on research, select or insert desired minimum percentages into the empty set of brackets.

**************************************************************************
[ Provide aluminum components that contain a minimum of [30][_____] percent recycled content. Provide data identifying percentage of recycled content for aluminum components.

]2.2.2 Steel Sheets

ASTM A653/A653M, [Z 180G90 coating designation].

**************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is available from US national manufacturers above the minimum recycled content percentages shown below. Some manufacturers and regions have higher percentages. Based on research, select or insert desired minimum percentages into the empty set of brackets.

**************************************************************************
[ Provide steel components that contain a minimum of [10][_____] percent recycled content. Provide data identifying percentage of recycled content for steel components.

]2.2.3 Fabric Covering

**************************************************************************

NOTE: Specify minimum total weight and minimum coating weight for the fabric covering type selected using the listing below:

| Total Weight (kilograms per square meter): | Type I - 0.237; Type II - 0.442; Type III - 0.748 |
| Coating Weight (kilograms per square meter): | Type I - 0.170; Type II - 0.237; Type III - 0.407 |
| Total Weight (ounces per square yard): | Type I - 7; Type II - 13; Type III - 22 |
| Coating Weight (ounces per square yard): | Type I - 5; Type II - 7; Type III - 12 |

**************************************************************************

CFFA-W-101-D, Type II. Fabrics and wallcoverings must meet emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification or validation of indoor air quality for fabrics and wallcoverings.
2.2.4 Seals and Sweepstrips

**************************************************************************
NOTE: Accordion partitions need a floor and ceiling seal to avoid gaps that will lower the advertised sound transmission rating. For any partition that requires a sound rating, use seals and ceiling guards provided by the manufacturer of the partition. Provide a baffle in the ceiling plenum above the partition with a STC rating equal to the partition. Provide a floor surface that will allow the bottom sweep to make a positive seal.
**************************************************************************

Provide perimeter seals of manufacturer's standard product, without crack or craze when subjected to severe usage.

2.2.5 Ceiling Guards

Furnish partitions with ceiling guards or integral track and ceiling guards as recommended by the manufacturer.

2.3 PERFORMANCE REQUIREMENTS

2.3.1 Fire Endurance

**************************************************************************
NOTE: Select flame spread and smoke developed criteria to suit project.
**************************************************************************

For partitions more than 5.6 square meters 60 square feet in area, provide fabric and lining with flame spread rating of 25 or less, fuel contribution rating of 15 or less, smoke generation of 50 or less when tested in accordance with ASTM E84. Complete assembly must also meet or surpass the requirements of NFPA 101 and UL 10B.

2.3.2 Laboratory Acoustical Requirements

**************************************************************************
NOTE: Specify sound transmission class as determined by project requirements. The requested rating should be between 35 and 45 STC. 39 and 40 STC are widely available. If more is required, another type of moveable partition should be used. Specify a panel weight of no less than 14 kg per square meter 3 psf for STC of 35, 24 kg per square meter 5 psf for STC of 45.
**************************************************************************

Provide certificates verifying folding partitions have been tested in accordance with ASTM C423 and ASTM E90 by a laboratory accredited by the U.S. Bureau of Standards and have attained a sound transmission class (STC) of not less than [40] [_____] in a fully extended position. Partition tested must be of the same construction, materials, and model number as the partition to be provided and be fully operable. Test specimen must be not less than [12 square meters in area] [4200 by 2700 mm] [126 square feet in area] [14 feet by 9 feet]. Panel weight must be [14] [24] kg per square meter [3] [5] lbs per square ft.
2.4 ELECTRICAL OPERATORS

**************************************************************************
NOTE: Specify electrical operators for those partitions whose size and weight preclude manual operation. Refer to manufacturers' literature. Indicate those partitions requiring electrical operation on the project drawings. Delete this paragraph when electrically operated partitions are not required in the project.
**************************************************************************

Provide manufacturer's recommended standard electrical operator for [each partition] [partitions indicated]. Provide wiring diagrams.

2.5 FABRICATION

2.5.1 Framework

Fabricate framework, including posts, pantographs, hinges, hinge plates, and rods from either extruded aluminum or ferrous metal. Arrange frames requiring pantographs for horizontal pantograph action with pantographs located at top and bottom of the frame. Provide pantographs spaced not over 1200 mm 4 feet apart. Provide intermediate pantograph at center of doors less than 2400 mm 8 feet high unless the door has vertical metal reinforcing. The pantographs must operate smoothly with positive folding action and have a control device to prevent flattening of the folds when the panel is fully extended. Ferrous metal must be either cadmium plated or zinc coated. Posts, at the option of the door manufacturer, may have phosphate treatment and manufacturer's shop finish paint.

2.5.2 Suspension System

Provide a suspension system consisting of steel or aluminum track and trolleys designed to support the weight of the partition. Provide steel track of 1.5 mm 16 gage minimum, phosphate treated and finished, or zinc or cadmium coated. Provide extruded aluminum track with minimum thickness of 3 mm 1/8 inch. Tracks may have an integral ceiling guard. Trolleys must have at least two ball bearing nylon or steel tired wheels spaced according to manufacturer's design criteria and four at an end post.

2.5.3 Covering

Covering fabrics must conform to the requirements of ASTM D751 and NFPA 286. Attach fabric to the framework with fasteners that permit easy removal of the cover but prevent sagging or separation. Position vertical seams in the bottoms of valleys and reinforce. Provide top and bottom edges of cover fabrics with 12 mm 1/2 inch minimum turned hems.

2.5.4 Sound Insulation

Provide sound insulation as necessary to achieve the specified sound transmission mission class, conforming to ASTM E413.

2.5.5 Air Release

Provide an air release system which allows trapped air within the partition...
to be released during the stacking process.

2.5.6 Seals

Provide perimeter seals as necessary to produce the sound transmission class specified [and to pass the visual field test specified].

2.5.7 Hardware

Provide hardware of the heavy-duty type standard with the manufacturer. Provide pulls and latches for all partitions. Provide partitions with [keyed locks] [privacy latches] [magnetic contact latches] [foot bolts].

2.5.8 Accessories

Provide [multiple meeting posts] [rolling posts] [switches] [ceiling guards] [recessed tracks] [curved tracks] as indicated.

PART 3 EXECUTION

3.1 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

3.1.1 Existing Work

**************************************************************************
NOTE:  Show the structural support necessary to accommodate the size and weight of the partition. ASTM E557 has design as well as installation criteria.
**************************************************************************

Check openings scheduled to receive accordion folding partitions for correct dimensions.

Install partitions in accordance with the approved Accordion Folding Partition Layouts, manufacturer's directions, and ASTM E557. Provide structural support for the track support elements as indicated.

Submit to the Contracting Officer a certification of the following:

Statement of Code Compliance for the completed partition installation.
Statement of Standards Conformity

[3.1.2 Electrical Operators

**************************************************************************
NOTE: Delete this paragraph when electrically operated partitions are not required.
**************************************************************************

Conform Electrical components and installation to the requirements of NFPA 70. Provide the partition manufacturer's standard drive and control components required to operate the partition properly. Power source is as indicated.
3.1.3 Adjustment

[Adjust manually operated partitions to open and close from any position with a maximum horizontal force of 130 N 30 pounds applied to pendant pull, box or handle. ] [Adjust drive components and limit switches of electrically operated partitions to ensure the partitions operate properly upon activation of the control switch.]

3.2 FIELD TESTS

3.2.1 Operational Test

Operate partition at least three times to demonstrate that partition is capable of being moved from the stored position to the fully extended position smoothly and quietly [and without overloading the drive components]. [Activate the emergency release mechanism and demonstrate proper operation of the partition in the manual mode.] Adjust partitions which do not operate properly and retest.

3.2.2 Visual Test

**************************************************************************
NOTE: Delete this paragraph when light leakage will not be objectionable.
**************************************************************************

Conduct visual field tests for light leakage with all room lights turned on in the space on one side of the partition. Darken space on the other side of the partition. Light leakage from the lighted space to the darkened space is not acceptable. If light leakage does occur, adjust the partition to correct the problem and retest.

3.2.3 Acoustical Test

**************************************************************************
NOTE: Delete this paragraph in projects requiring STC ratings of less than 40. Noise Isolation Class (NIC) is a number that can measured, and usually runs up to 10 points below laboratory results, i.e. lab STC 40, field NIC 30. This test is rarely necessary.
**************************************************************************

Field sound performance: provide partition testing by an independent certified acoustical consultant in accordance with ASTM E336, and achieve a Noise Isolation Class (NIC) of [_____] plus or minus two. Adjust or modify partitions which do not comply, and retest.

3.3 CLEANING

Clean any soiled parts of the partition according to manufacturer's instructions.

3.4 SUPPORT SERVICE

Equipment and component maintenance must be supported by a service organization which is reasonably convenient to the site of installation.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for coiling partitions, manually and/or electrically operated.

Coiling partitions are partitions with independent covers enclosing a dead-air space and separated by an internal mechanism operating laterally across the face of the opening to a coiled closed position.

Coiling partitions may be a sight barrier (noninsulated), or sound barrier (with sound liner), or both. Coiling partitions have fabric or metal panel covers which are joined to reflect a pantographic movement of the door surfaces when the door is either manually or electrically operated.

This section does not include folding or operable walls and partitions whose rigid panels are individually moved or hinged along their vertical edges to fold in serpentine fashion.

Associated work found in other sections includes:

Steel supporting members or hanger rods, [Section 05 50 13 MISCELLANEOUS METAL FABRICATIONS][Section 05 51 33 METAL LADDERS][Section 05 52 00 METAL RAILINGS][Section 05 51 00 METAL STAIRS].

Wood blocking, rough bucks, and headers, Section 06 10 00 ROUGH CARPENTRY.

Wood trim, wood or hardboard ceiling guard, or soffits, Section 06 20 00 FINISH CARPENTRY.

Lock cylinders, Section 08 71 00 DOOR HARDWARE.

Operator field connections to power sources and inner connection to control switches, Division 16, "Electrical."
Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************

NOTE: The following information should be shown on the drawings:

1. Location, size, and coiling area of coiling partitions.

2. Direction of operation, header conditions indicating height, track anchorage, track channel, and jamb conditions.

3. Partition supporting structure. The structural support for the partition is not part of this section; it must be indicated and specified separately.

4. A schedule of partitions by type, sizes, and stack space and identified by mark number or letter.

5. For electrically operated partitions, show power source and desired switch location.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Manufacturer's Qualifications; G[, [_____]]
Manufacturer's Sample Warranty
Statement of Code Compliance; G[, [_____]]
Statement of Standards Conformity; G[, [_____]]
Verification of Field Measurements; G[, [_____]]

Existing Electrical Data

SD-02 Shop Drawings

Submit Fabrication Drawings for coiling partitions consisting of fabrication and assembly details to be performed in the factory.

Submit Installation Drawings for the following items in accordance with paragraph INSTALLATION, of this section.

Coiling Partition Layouts; G[, [_____]]
Suspension System; G[, [_____]]
Finish Hardware; G[, [_____]]
Jamb Panels; G[, [_____]]
Accessories; G[, [_____]]

Electrical Operators; G[, [_____]]

Submit drawings for the system that include dimensions and weight of stacked partition, layout of the work including stacking area, track and jamb fastening methods, seal details, and installation details.[ Submit wiring diagram and installation details for electrical operator.]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals

Manufacturer's Guarantee

1.3 PRE-INSTALLATION REQUIREMENTS

1.3.1 Preconstruction Requirements

No less than 30 calendar days prior to the scheduled commencement of installation of coiling partitions, submit the following to the Contracting Officer:

Manufacturer's Qualifications

Manufacturer's Sample Warranty

Statement of Code Compliance

Statement of Standards Conformity
Verification of Field Measurements and Existing Electrical Data
Fabrication Drawings and Installation Drawings

1.3.2 Product Data

Submit the following information for review:

- Finish Hardware
- Jamb Panels and Accessories
- Sound Seals and Sweepstrips
- Ceiling Guard
- Meeting Posts
- Rolling Post
- Pull-In Latch
- Electrical Operator
- Switches

1.3.3 Manufacturer's Guarantee

Provide Manufacturer's Guarantee for partitions against defects in material and workmanship for a period of two years from date of installation. In addition, provide ten year guarantee for the pantographs, trolleys and tracks from date of acceptance for beneficial use.

1.4 DELIVERY, HANDLING AND STORAGE

Deliver materials to project site in manufacturer's original, unopened, and undamaged packages with labels legible and intact. Labels must indicate the manufacturer, brand name, size, finish, and placement location. Store coiling partitions and accessories in unopened packages in a manner that will prevent damage. Handle partition materials in accordance with manufacturer's instructions.

PART 2 PRODUCTS

2.1 COILING PARTITIONS

Provide full coiling type partitions, factory finished, supported from overhead track without floor guides, and complete with all hardware, track, and accessories necessary for operation. Provide partition framework with a mechanism that gives stability and maintains uniform spacing of partition folds in all partition positions. Provide completely concealed framework with a [vinyl-coated fabric covering][____]. Provide partitions [manually] [and] [electrically] operated, [bi-parting] [and] [one-way] type as indicated. Provide patterns and colors of [fabric][____] [approved by the Contracting Officer] [as indicated ]. [Provide manufacturer's standard pendant pull on leading edge of manually operated partitions over 3600 mm 12 feet high.]
2.2 MATERIALS

2.2.1 Aluminum Extrusions

ASTM B221M ASTM B221, Alloy 3003.

2.2.2 Steel Sheets

ASTM A653/A653M, [Z 180G90 coating designation].

**************************************************************************
NOTE: If a fabric covering is required, include the following section.
**************************************************************************

[2.2.3 Fabric Covering

**************************************************************************
NOTE: Specify minimum total weight and minimum coating weight for the fabric covering type selected using the listing below:

  Total Weight (kilograms per square meter):  Type I - 0.237; Type II - 0.442; Type III - 0.748
  Coating Weight (kilograms per square meter):  Type I - 0.170; Type II - 0.237; Type III - 0.407
  Total Weight (ounces per square yard):  Type I - 7; Type II - 13; Type III - 22
  Coating Weight (ounces per square yard):  Type I - 5; Type II - 7; Type III - 12
**************************************************************************

CFFA-W-101-D, Type II. Fabrics and wallcoverings must meet emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide validation of indoor air quality for fabrics and wallcoverings.

]2.2.4 Seals and Sweepstrips

**************************************************************************
NOTE: Ceilings partitions need a floor and ceiling seal to avoid gaps that will lower the advertised sound transmission rating. For any partition that requires a sound rating, use seals and ceiling guards provided by the manufacturer of the partition. Provide a baffle in the ceiling plenum above the partition with a STC rating equal to the partition. Provide a floor surface that will allow the bottom sweep to make a positive seal.
**************************************************************************

Provide perimeter seals of manufacturer's standard product, without crack or craze when subjected to severe usage.

2.2.5 Ceiling Guards

Furnish partitions with ceiling guards or integral track and ceiling guards as recommended by the manufacturer.
2.3  PERFORMANCE REQUIREMENTS

2.3.1  Fire Endurance

**************************************************************************
NOTE: Select flame spread and smoke developed criteria to suit project.
**************************************************************************
For partitions more than 5.6 square meters 60 square feet in area, provide fabric and lining with flame spread rating of 25 or less, fuel contribution rating of 15 or less, smoke generation of 50 or less when tested in accordance with ASTM E84. Complete assembly must also meet or surpass the requirements of NFPA 101 and UL 10B.

2.3.2  Laboratory Acoustical Requirements

**************************************************************************
NOTE: Specify sound transmission class as determined by project requirements. The requested rating should be between 35 and 45 STC. 39 and 40 STC are widely available. If more is required, another type of moveable partition should be used. Specify a panel weight of no less than 14 kg per square meter 3 psf for STC of 35, 24 kg per square meter 5 psf for STC of 45.
**************************************************************************
Provide certificates verifying coiling partitions have been tested in accordance with ASTM C423 and ASTM E90 by a laboratory accredited by the U.S. Bureau of Standards and have attained a sound transmission class (STC) of not less than [40] [_____] in a fully extended position. Partition tested must be of the same construction, materials, and model number as the partition to be provided and be fully operable. Test specimen must be not less than [12 square meters in area] [4200 by 2700 mm] [126 square feet in area] [14 feet by 9 feet]. Panel weight must be [14] [24] kg per square meter [3] [5] lbs per square ft.

[2.4  ELECTRICAL OPERATORS

**************************************************************************
NOTE: Specify electrical operators for those partitions whose size and weight preclude manual operation. Refer to manufacturers' literature. Indicate those partitions requiring electrical operation on the project drawings. Delete this paragraph when electrically operated partitions are not required in the project.
**************************************************************************
Provide manufacturer's recommended standard electrical operator for [each partition] [partitions indicated]. Provide wiring diagrams.

]2.5  FABRICATION

2.5.1  Framework

Fabricate framework, including posts, pantographs, hinges, hinge plates, and rods from either extruded aluminum or ferrous metal. Arrange frames
requiring pantographs for horizontal pantograph action with pantographs located at top and bottom of the frame. Provide pantographs spaced not over 1200 mm 4 feet apart. Provide intermediate pantograph at center of doors less than 2400 mm 8 feet high unless the door has vertical metal reinforcing. The pantographs must operate smoothly with positive coiling action and have a control device to prevent flattening of the folds when the panel is fully extended. Ferrous metal must be either cadmium plated or zinc coated. Posts, at the option of the door manufacturer, may have phosphate treatment and manufacturer's shop finish paint.

2.5.2 Suspension System

Provide a suspension system consisting of steel or aluminum track and trolleys designed to support the weight of the partition. Provide steel track of 1.5 mm 16 gage minimum, phosphate treated and finished, or zinc or cadmium coated. Provide extruded aluminum track with minimum thickness of 3 mm 1/8 inch. Tracks may have an integral ceiling guard. Trolleys must have at least two ball bearing nylon or steel tired wheels spaced according to manufacturer's design criteria and four at an end post.

2.5.3 Covering

Covering fabrics must conform to the requirements of ASTM D751 and NFPA 286.

Attach fabric to the framework with fasteners that permit easy removal of the cover but prevent sagging or separation. Position vertical seams in the bottoms of valleys and reinforce. Provide top and bottom edges of cover fabrics with 12 mm 1/2 inch minimum turned hems.

2.5.4 Sound Insulation

Provide sound insulation as necessary to achieve the specified sound transmission mission class, conforming to ASTM E413.

2.5.5 Air Release

Provide an air release system which allows trapped air within the partition to be released during the stacking process.

2.5.6 Seals

Provide perimeter seals as necessary to produce the sound transmission class specified [and to pass the visual field test specified].

2.5.7 Hardware

Provide hardware of the heavy-duty type standard with the manufacturer. Provide pulls and latches for all partitions. Provide partitions with [keyed locks] [privacy latches] [magnetic contact latches] [foot bolts].

2.5.8 Accessories

Provide [multiple meeting posts] [rolling posts] [switches] [ceiling guards] [recessed tracks] [curved tracks] as indicated.
PART 3  EXECUTION

3.1  INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

3.1.1  Existing Work

**************************************************************************
NOTE: Show the structural support necessary to accommodate the size and weight of the partition. ASTM E557 has design as well as installation criteria.
**************************************************************************

Check openings scheduled to receive coiling partitions for correct dimensions.

Install partitions in accordance with the approved coiling Partition Layouts, manufacturer's directions, and ASTM E557. Provide structural support for the track support elements as indicated.

Submit to the Contracting Officer a certification of the following:

Statement of Code Compliance for the completed partition installation.

Statement of Standards Conformity

[3.1.2  Electrical Operators

**************************************************************************
NOTE: Delete this paragraph when electrically operated partitions are not required.
**************************************************************************

Conform Electrical components and installation to the requirements of NFPA 70. Provide the partition manufacturer's standard drive and control components required to operate the partition properly. Power source is as indicated.

]3.1.3  Adjustment

[Adjust manually operated partitions to open and close from any position with a maximum horizontal force of 130 N 30 pounds applied to pendant pull, box or handle.] [Adjust drive components and limit switches of electrically operated partitions to ensure the partitions operate properly upon activation of the control switch.]

3.2  FIELD TESTS

3.2.1  Operational Test

Operate partition at least three times to demonstrate that partition is capable of being moved from the stored position to the fully extended position smoothly and quietly [and without overloading the drive components]. [Activate the emergency release mechanism and demonstrate proper operation of the partition in the manual mode.] Adjust partitions which do not operate properly and retest.
3.2.2  Visual Test

**************************************************************************
NOTE: Delete this paragraph when light leakage will not be objectionable.
**************************************************************************

Conduct visual field tests for light leakage with all room lights turned on in the space on one side of the partition. Darken space on the other side of the partition. Light leakage from the lighted space to the darkened space is not acceptable. If light leakage does occur, adjust the partition to correct the problem and retest.

3.2.3  Acoustical Test

**************************************************************************
NOTE: Delete this paragraph in projects requiring STC ratings of less than 40. Noise Isolation Class (NIC) is a number that can measured, and usually runs up to 10 points below laboratory results, i.e. lab STC 40, field NIC 30. This test is rarely necessary.
**************************************************************************

Field sound performance: provide partition testing by an independent certified acoustical consultant in accordance with ASTM E336, and achieve a Noise Isolation Class (NIC) of [_____] plus or minus two. Adjust or modify partitions which do not comply, and retest.

3.3  CLEANING

Clean any soiled parts of the partition according to manufacturer's instructions.

3.4  SUPPORT SERVICE

Equipment and component maintenance must be supported by a service organization which is reasonably convenient to the site of installation.

NOTE: This guide specification covers the requirements for folding panel partitions, also referred to as operable partitions.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Designer should require materials, products, and innovative construction methods and techniques which are environmentally sensitive, take advantage of recycling and conserve natural resources.

Associated work found in other sections includes:

Steel supporting members or hanger rods, Section 05 50 13 MISCELLANEOUS METAL FABRICATIONS.

Wood blocking, rough bucks, and headers, Section 06 10 00 ROUGH CARPENTRY.

Wood trim, wood or hardboard ceiling guard, or
soffits, Section 06 20 00 FINISH CARPENTRY.

Lock cylinders, Section 08 71 00 DOOR HARDWARE.

Operator field connections to power sources and inner connection to control switches, Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

The following information should be shown on the drawings:

1. Location, size, and folding area of folding panel partitions.

2. Direction of operation, header conditions indicating height, track anchorage, track channel, and jamb conditions.

3. Partition supporting structure. The structural support for the partition is not part of this section; it must be indicated and specified separately.

4. A schedule of folding panel partitions by type (manually or electrically operated), sizes, and stack space and identified by mark number or letter.

5. For electrically operated partitions, show power source and desired switch location.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.
ASTM INTERNATIONAL (ASTM)

ASTM A653/A653M (2023) Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

ASTM C423 (2023) Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method

ASTM D751 (2006; R 2011) Coated Fabrics

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office.
following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

*******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-07 Certificates
   Indoor Air Quality for Finish Covering; S
   Installer Qualifications
   Manufacturer's Qualifications

SECTION 10 22 39  Page 7
1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality Certification

1.3.1.1 Finish Covering

**************************************************************************
NOTE: The Government's preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, it must be verified there is a certified product available that is both cost effective and appropriate for the project. The requirements of this paragraph are invoked when the designer of record confirms local/regional availability of Greenguard or SCS products and includes the bracketed requirements for indoor air quality certified products in Part 2 of this Section.
**************************************************************************

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.4 QUALITY ASSURANCE

1.4.1 Coordination Drawings

Provide reflected ceiling plans, applicable details and other drawings as required to suit conditions, drawn to scale, for the following coordinated items, using input from adjacent materials/systems installers, field measurements and verification of conditions:

a. Partition track, track supports and [seismic] bracing, switches, [turning space,] and storage layout.

b. Suspended ceiling system components and structural members used for attachment.

c. Items penetrating finished ceiling in vicinity of folding panel partition location.

[ d. Accessories located within the folding panel partitions.]
1.4.2 Installer Qualifications

Installer must have a minimum of [5][_____] years of documented successful experience in the installation of folding panel partitions. When required by manufacturer, folding panel partitions must be installed by an authorized dealer with a certified crew.

1.4.3 Manufacturer's Qualifications

Manufacturer must have a minimum of [10][_____] years of documented successful experience in designing and manufacturing folding panel partitions conforming to the requirements specified in this Section.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the jobsite in the manufacturer's original, unopened, and undamaged packages with labels legible and intact. Provide labels to indicate the manufacturer, brand name, size, finish, and placement location. Store partitions and accessories in unopened packages in a manner to prevent damage. Handle partition materials in accordance with manufacturer's instructions. Protect materials from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

1.6 WARRANTY

Provide manufacturer's warranty to repair or replace defective materials and workmanship for specified warranty periods from date of final acceptance of the work as follows:

1.6.1 Warranty Periods
a. Structural: [10][_____] years
b. Plastic and Wood Materials: [3][_____] 
c. Fabric Materials: [1 year][3][_____] years
d. Electrical Components: [1 year][5][_____] years

PART 2 PRODUC TS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: The designer will edit this specification for manual or electric operation of folding panel (operable) partitions as required for the project.
**************************************************************************

Provide [manual][ and ][electric] operation, [acoustical] folding panel partitions, factory finished, supported from overhead track [with][without] floor gliders, as shown on the drawings including all hardware, seals, track and rollers as needed to close the specified opening.

Submit detail coordination drawings and installation drawings of each folding panel partition indicated. Include elevations, dimensions, clearances, details of construction and anchorage, and details of joints and connections.

Submit manufacturers' descriptive product data for [each type of] folding
panel partition indicated. Include manufacturers' literature, finishes, profiles and thicknesses of materials.

Submit manufacturers' operations and maintenance data for [each type of] folding panel partition in accordance with Section 01 78 23 OPERATIONS AND MAINTENANCE DATA.

2.1.1 Manual Operation

Manual operation must be a force no greater than \([89]\) \([\text{____}_]\) N \([20]\) \([\text{____}_]\) lbf to start movement at the rate of \(1.02 \text{ m/s} 3.33 \text{ ft/s} (200 \text{ ft/min})\). Use a removable handle to extend and retract the bottom operable seals; vertical movement of seals must be \([51]\) \([\text{____}_]\) mm \([2]\) \([\text{____}_]\) inches. Provide closure to the lead wall with the use of a flexible bulb; accomplish final closing by means of a lever exerting pressure against the wall.

2.1.2 Electric Operation

Design the pressure-sensitive leading edge so that a force of \([17.8]\) \([\text{____}_]\) N \([4]\) \([\text{____}_]\) lbf stops the forward motion; system must stop the partition movement if people or objects are in the path of the partition when it is being extended or in the pocket area when the panels are being folded. Provide a weight-sensitive floor mat in the storage pocket to prevent partition movement with as little as \(2.3 \text{ kg} 5 \text{ lbs}\) of weight applied. Wall mount the electric control.

2.1.3 Performance Requirements

2.1.3.1 Fire Resistance Ratings

**************************************************************************
NOTE: Select flame spread and smoke developed criteria to suit project.
**************************************************************************

Provide covering and lining with flame spread rating of 25 or less, fuel contribution rating of 15 or less, smoke generation of 50 or less in accordance with NFPA 101 when tested in accordance with ASTM E84. [Provide 1 hour fire rating, for operable panel assemblies[, including pass doors,] when tested in accordance with UL 10B, or NFPA 252.] Submit flame and smoke development tests reports. Provide door and partition finishes with a Class A rating when tested in accordance with ASTM E84.

2.1.3.2 Laboratory Acoustical Requirements

**************************************************************************
NOTE: Specify sound transmission class as determined by project requirements. The requested rating should be between 35 and 54 STC. 39 and 40 STC are widely available. If more is required, another type of moveable partition should be used. Specify a panel weight of no less than \(24.4-34.2 \text{ kg per square meter} 5-7 \text{ psf}\) for STC of 35, \(34.3-43.9 \text{ kg per square meter} 7-9 \text{ psf}\) for STC of 45.

Folding panel partitions are available in \(75 \text{ mm} 3\text{ inch}\) and \(100 \text{ mm} 4\text{ inch}\) nominal thicknesses. The STC rating for \(75 \text{ mm} 3\text{ inch}\) thick panels is less than a \(100 \text{ mm} 4\text{ inch}\) panel and some fabrication types (steel frame) do not come in a \(75 \text{ mm} 3\text{ inch}\) thick
The designer will confirm that STC and NRC rating requirements are met if selecting a 75 mm 3 inch nominal thickness panel.

Provide partitions tested in accordance with ASTM E90, by a laboratory accredited by the U.S. Bureau of Standards, that have attained a sound transmission class (STC) of not less than [39] [40] [_____] in a fully extended position, with a Noise Reduction Coefficient (NRC) of [0.25-0.30 for napped, tufted or looped fabric] [0.65-0.75 for perforated steel in accordance with ASTM C423] [_____]. Provide documentation that the partition tested is the same construction, materials, and model number as the partition to be provided and be fully operable. Test specimen is not less than [11.7 square meters in area] [4.27 by 2.74 m] [126 square feet in area] [14 feet by 9 feet]. Provide a minimum panel weight of 26 kg/square meter 5.5 per square foot for STC up to 40, 36 kg/square meter 7.5 psf for STC up to 45, 41 kg/square meter 8.5 per square foot for STC up to 50, and 48 kg/square meter 10.0 per square foot for STC up to 53. Design panel thickness [(76 mm 3 inch nominal)] [(102 mm 4 inch nominal)] and composition to provide the required STC rating in accordance with ASTM E90 and ASTM E413. Submit acoustical test reports in accordance with ASTM E90, ASTM C423 and ASTM E413.

2.1.3.3 Electrical Components, Devices and Accessories

Listed and labeled as defined in NFPA 70 by qualified testing agency, and marked for intended location and application.

2.2 MATERIALS

Provide heavy-duty type hardware standard with the manufacturer. Provide pulls and latches for all partitions. Provide partitions with [keyed locks][privacy latches][magnetic contact latches]. Provide [(clear][bronze] anodized aluminum][chrome plated][painted][_____] finish hardware. Provide horizontal and vertical trim painted [off white] [brown] [grey] [_____] with matching rubber.

2.3 FOLDING PANEL PARTITIONS

Provide folding panel partitions using top hung ball bearing carriers which support modular panels.

a. Provide partitions made up of a series of rigid panels, each panel being a one-piece assembly. Unless otherwise specified, use the least number of panels. The mechanical seal of the panel must actuate with a single operating action.

b. Provide [paired(centerfold)] [single (omni directional)] [continuously hinged(center folded) for electric operated only] type panels as indicated.

2.3.1 Panels

NOTE: Steel skin should be a minimum of 0.6 mm 24 gage for 1219 mm 48 inch panels, and 0.8 mm 22 gage for 1372 mm 54 inches, or larger panels. 1219 mm 48 inch panels are standard panel size and usually do not exceed 1372 mm 54 inches due to limitations of
cladding finish materials. Gypsum board is used for tackable surfaces.

Provide panels of [steel skin,] [reinforced aluminum,] [medium density fiberboard] [glass] [wood] [gypsum board,] laminated to appropriate structural acoustical backing, mounted in full perimeter protective frame. Steel for the panel frames must be [manufacturer's standard] [a minimum of [_____] mm (gauge) thick steel with minimum 0.76 mm 22 gauge thick face panels mechanically fasten to the frame]. Provide [aluminum frames for glass panels, with alloy and temper recommended by aluminum producer and furnished for type of use, corrosion resistance, and finish indicated] [wood frames, for glass panels, clear vertical-grain, straight, kiln-dried, [fire retardant treated]]. Frame must enclose and protect all edges of the surface material. Provide panels not more than 1.2 m 4 feet wide, except for end closure panels, and full height to track. Panels must lock in place to form a stable, rigid partition; low profile hinges may not project more than 6 mm 1/4 inch maximum from panel edge. Panel surfacing must wrap around the vertical panel edges without vertical trim.

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content percentages shown below.

Provide steel components that contain a minimum of 10 percent recycled content. Provide data identifying percentage of recycled content for steel components.

Provide aluminum components that contain a minimum of 30 percent recycled content. Provide data identifying percentage of recycled content for aluminum components.

2.3.2 Partition System

NOTE: Wood veneer and glass are finish options for folding panel partitions.

Provide finish covering material minimum [1372 mm 54 inches] [_____] wide, [vertically-ribbed acoustical material of 100 percent polyolefin] [Type II vinyl with a minimum total weight of [441 grams/square m 13 ounces/square yard and 620 grams/linear m 20 ounces/linear yard] [_____] in accordance with CFPA-W-101-D, and conforming to ASTM D751 and NFPA 286.] Provide [vinyl containing a non-mercury based mildewcide and manufactured without the use of cadmium-based stabilizers][acrylic backed fabric of [100 percent polyolefin] [_____]].[ Provide non-allergenic stain and mildew resistant fabric that does not rot or support growth of bacteria]. Provide finish covering that meets emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification of indoor air quality for finish covering.
Glass and glazing type as specified in Section 08 81 00 GLAZING. Glaze operable panels in the factory where practical for applications indicated. Comply with manufacturer's written instructions.

Wood veneer laminated to [non combustible] [fire retardant-treated wood] core with moisture-resistant adhesive. Apply finish to wood species indicated with [transparent finish] [transparent finish over stain].

High pressure decorative laminate.

Paint, manufacturer's standard [factory] [field] painted finish.

2.3.3 Track

Provide recess [extruded aluminum] [enamel finish steel] track as shown. Provide aluminum that conforms to [ASTM B221] [ASTM B221M]. Provide steel that conforms to ASTM A653/A653M. Provide track that is the manufacturer's standard product designed for the weight of the finished partition, including door. Provide track sections in the maximum lengths practicable, and not less than 1.8 m 6 feet long except for narrow doors and at ends of runs where short length and "drop-out service" sections of track are required. Provide suitable joint devices such as interlocking keys at each joint to provide permanent alignment of track.

2.3.4 Suspension System

Provide a suspension system consisting of [steel][heavy duty extruded aluminum] track connected to the structural support by threaded rods, and trolleys designed to support the weight of the partition. Provide steel track of 4.6 mm 7 gauge minimum, phosphate treated or painted. Provide extruded aluminum track with minimum thickness of 3 mm 1/8 inch. Provide center hung panel with 1 trolley with four ball bearing nylon or steel tired wheels per panel. Provide 2 trolleys per panel with 2 ball bearing polymer or steel tired wheels.

2.4 ACCESSORIES

2.4.1 Pass Doors

Provide ADA/ABA compliant pass door of the same [materials,] [construction,] [acoustical qualities,] [fire rating,] finish and thickness as the basic panels. Pass door panel legs require bottom thresholds. Provide pass door leaf with perimeter trim to protect face finish and to provide visual identification as required by International Building Code. Pass door leaf incorporates a self-adjusting retractable bottom seal providing sound control when door is closed. Hinges finished to match other exposed hardware.

2.4.1.1 Pass Door Hardware

a. [Mechanically operated floor seal on panels containing pass doors]. [Sweep floor seals]

b. [Automatic door closer]. [Concealed door closer].

c. Latchset: Passage set.

d. Lock: [Key operated lock with cylinder [keyed to master key system]
operable from both sides of the door. Include two keys per lock.
[Deadlock to receive cylinder, operable from both sides of door.] [See
Section 08 71 00 DOOR HARDWARE for lock cylinder and keying
requirements.]
e. Exit Sign: [Passive screen printed]. [Recessed, self-illuminated].
f. Prepped for door window side light.
g. Door Viewer: Installed with view in direction of swing.
h. [Panic][Fire Exit] hardware for emergency exit with lock override
feature.

2.4.2 Metal Soffit

Provide soffit when steel or aluminum track is recessed. Provide metal
soffit of adequate thickness to protect the ceiling from damage by door
operation and with the door manufacturer's standard neutral-color applied
finish. Provide soffit on aluminum track that is an integral part of the
track.

2.4.3 Tackboard

Provide tackboard with [steel][aluminum] frame. Provide minimum 6 mm 1/4
inch thickness, tacking surface covered with self-sealing decorative
vinyl. Provide tacking surfaces laminated to rigid backing substrate.

2.4.4 Markerboards

Provide markerboards with [aluminum] [steel] frame with writing surface of
[cast acrylic plastic with color fused to surface][porcelain steel]
[tempered glass]. Markerboard must [not protrude more than 3 mm 1/8 inch
beyond panel face][be flush]. Color: [white][_____].

2.5 SEALS AND SWEEPSTRIPS

******************************************************************************
NOTE: Partitions need a floor and ceiling seal to
avoid gaps that will lower the advertised sound
transmission rating. For any partition that
requires a sound rating, use seals and ceiling
guards provided by the manufacturer of the
partition. Provide a baffle in the ceiling plenum
above the partition with a STC rating equal to the
partition. Provide a floor surface that will allow
the bottom sweep to make a positive seal. Panels
need vertical and end seals.
******************************************************************************

Provide perimeter seals or sound insulation, of manufacturer's standard
product, to achieve the sound transmission class specified [and to pass the
visual field test specified], without crack or craze when subjected to
severe usage. [Provide mechanical seal top and bottom of the fire rated
panel.] [Provide mechanical bottom seal that can be raised or lowered for
positive control.] Provide manufacturer's vertical seals between panels to
ensure acoustical [and fire] rating. Bottom seals consist of a vinyl sweep
mechanical seal which expands in place, or provide panels which can be
lowered by a removable operating device. Provide vertical seal between
panels which is anodized, architectural grade, aluminum extrusion with [vinyl] [____] sound seal. Sweep strips must be vinyl or other material that will not crack or craze with severe usage. Provide sweep strip STC to the specified rating.

[2.6 ELECTRICAL OPERATORS]

**************************************************************************

NOTE: Specify electrical operators for those partitions whose size and weight preclude manual operation. Refer to manufacturers' literature. Indicate those partitions requiring electrical operation on the project drawings. Delete this paragraph when electrically operated partitions are not required in the project.

**************************************************************************

Provide manufacturer's recommended standard electrical operator for [each partition] [partitions indicated]. Submit wiring diagrams.

Electrical Operators must comply with NFPA 70. Factory-assembled electric operation system of size and capacity recommended and provided by folding panel manufacturer for partition specified; with electric motor and factory-prewired motor controls, speed reducer, chain drive, control stations, control devices, and accessories required for operation. Include wiring from control stations to motor. Coordinate operator wiring requirements and electrical characteristics with building electrical system. Control equipment must comply with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6.

2.6.1 Motor Electrical Characteristics

Motor will be able to operate 50-60 hz., and [115][208][230][460][____] volts, [single phase][polyphase] with [manufacturer's standard][____] horsepower to operate partition effectively.

2.6.2 Control Stations

Two single key operated, constant-pressure control stations located remotely from each other on opposite sides and opposite ends of partition run. Wire in series to require simultaneous activation of both key stations to operate partition. Each three-position control station labeled "Open," "Close," and "[Off] [Stop]." Furnish two keys per station.

2.6.3 Obstruction-Detection Devices

Equip each motorized operable panel partition with indicated automatic safety sensor that causes operator to immediately [shut off motor] [stop and reverse direction].

2.6.4 Limit Switches

Adjustable switches, interlocked with motor controls and set to automatically stop operable panel partition at fully extended and fully stacked positions.

2.6.5 Emergency Release Mechanism

Quick disconnect-release of electric-motor drive system, permitting manual
2.6.6 Electric Interlock

Equip each motorized folding panel partition with electric interlocks at locations indicated, to prevent operation of folding panel partition under the following conditions:

a. On storage pocket door, to prevent operation if door is not in fully open position.

b. On partitions at location of convergence by another partition, to prevent operation if merging partitions are in place.

2.7 COLOR

**************************
NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally the Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an Architect or Interior designer. Color will be selected from manufacturers standard colors or identified in this spec only when the project has minimal finishes.

When the government directs that color be located in the drawings, add a Note stating: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

**************************
Provide partition system samples in sizes indicated below and colors [as specified in Section 09 06 00 SCHEDULES FOR FINISHES.] [as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.]

2.7.1 Sample Size

c. Panel Edge and Chair Rail Materials: Manufacturer's standard size, not less than 150 mm [6] [_____] inches long.

PART 3 EXECUTION

3.1 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth. Install in accordance with the approved installation drawings and the manufacturer's written installation instructions.

3.1.1 Preparation Work

**************************************************************************
NOTE: Show the structural support necessary to accommodate the size and weight of the partition. ASTM E557 has design as well as installation criteria.
**************************************************************************

Verify dimensions and condition of openings scheduled to receive folding panel partitions. Install partitions in accordance with the approved partition layouts, manufacturer's directions, and ASTM E557. Provide structural support for the track support elements as indicated.

3.1.2 Electrical Operators

**************************************************************************
NOTE: Delete this paragraph when electrically operated partitions are not required.
**************************************************************************

Conform electrical components and installation to the requirements of NFPA 70 and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide the partition manufacturer's standard drive and control components required to operate the partition. Power source as indicated on the electrical drawings.

3.1.3 Adjustment

[Adjust manually operated partitions to open and close from any position with a maximum horizontal force as specified in paragraph MANUAL OPERATION applied to pendant pull, box or handle.] [Adjust drive components and limit switches of electrically operated partitions to ensure the partitions operate properly upon activation of the control switch.]

3.2 FIELD TESTS

3.2.1 Operational Test

In the presence of the Contracting Officer, operate partition at least three times to demonstrate that partition is capable of being moved from the stored position to the fully extended position smoothly and quietly [and without overloading the drive components]. Activate [the emergency release mechanism and demonstrate proper operation of the partition in the manual mode] [mechanical seals top and bottom]. Adjust partitions which do not operate properly and retest.
3.2.2 Visual Test

NOTE: Delete this paragraph when light leakage will not be objectionable.

Conduct visual field tests for light leakage with all room lights turned on in the space on one side of the partition. Darken space on the other side of the partition. Light leakage from the lighted space to the darkened space is not acceptable. If light leakage does occur, adjust the partition to correct the problem and retest.

NOTE: Delete this paragraph in projects requiring STC ratings of less than 40. Noise Isolation Class (NIC) is a number that can be measured, and usually runs up to 10 points below laboratory results, i.e. lab STC 40, field NIC 30. This test is expensive and rarely necessary.

3.2.3.1 Sub Title

Provide partition testing by an independent certified acoustical consultant in accordance with ASTM E336, and achieve a Noise Isolation Class (NIC) of [_____] plus or minus two. Adjust and/or modify partitions which do not comply, and retest. Submit field sound test reports.

3.3 CLEANING

Clean any soiled parts of the partition in accordance with manufacturer's written instructions.

NOTE: This guide specification covers the requirements for sliding partitions.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Designer should require materials, products, and innovative construction methods and techniques which are environmentally sensitive, take advantage of recycling and conserve natural resources.

Associated work found in other sections includes:

Steel supporting members or hanger rods, Section 08 31 00 ACCESS DOORS AND PANELS.

Wood blocking, rough bucks, and headers, Section 06 10 00 ROUGH CARPENTRY.

Wood trim, wood or hardboard ceiling guard, or soffits, Section 06 20 00 FINISH CARPENTRY.
Lock cylinders, Section 08 71 00 DOOR HARDWARE.

Operator field connections to power sources and inner connection to control switches, Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

The following information should be shown on the drawings:

1. Location, size, and pocket area of sliding panel partitions.

2. Direction of operation, header conditions indicating height, track anchorage, track channel, and jamb conditions.

3. Partition supporting structure. The structural support for the partition is not part of this section; it must be indicated and specified separately.

4. A schedule of sliding partitions by type (manually or electrically operated), sizes, and stack space and identified by mark number or letter.

5. For electrically operated partitions, show power source and desired switch location.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Flame and Smoke Development Tests

**SD-07 Certificates**

Materials
NOTE: The Government’s preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, it must be verified there is a certified product available that is both cost effective and appropriate for the project. Retain the bracketed Section below when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness. In addition, when this Section is retained requiring Greenguard or SCS products, also include the Indoor Air Quality Certificates in SD-07 submittals of this section.

[1.3 INDOOR AIR QUALITY CERTIFICATION]

1.3.1 Fabrics and Wallcoverings

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

]1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the jobsite in the manufacturer's original, unopened, and undamaged packages with labels legible and intact. Provide labels to indicate the manufacturer, brand name, size, finish, and placement location. Store partitions and accessories in unopened packages in a manner that will prevent damage. Handle partition materials in accordance with manufacturer's instructions. Protect materials from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

1.5 WARRANTY

Provide Manufacturer's standard performance guarantees or warranties that extend beyond a 1 year period. In addition, provide guarantee of the pantographs, trolleys and tracks for 10 years from date of acceptance for
PART 2   PRODUCTS

2.1  SYSTEM DESCRIPTION

**************************************************************************
NOTE: The designer will edit this specification for manual or electric operation of sliding panel partitions as required for the project.
**************************************************************************

a. Provide [manual] [and] [electric] operation, acoustical sliding partitions, factory finished, supported from overhead track [without] [with] floor guides, as shown on the drawings including all hardware, seals, track and rollers as needed to close the specified opening.

b. No less than 30 calendar days prior to the scheduled commencement of installation submit the following to the Contracting Officer:

   Manufacturer's Qualifications
   Manufacturer's Sample Warranty
   Statement of Code Compliance
   Statement of Standards Conformity
   Verification of Field Measurements
   Existing Electrical Data
   Fabrication Drawings
   Installation Instructions

c. Submit drawings to demonstrate that the system has been coordinated and will properly function as a unit. Show layout of the work; track and jamb fastening methods; seal and installation details; and equipment relationship to other parts of the work including clearances for maintenance and operation.

2.1.1  Manual Operation

For the manual operation provide a force no greater than [89] [_____] N [20] [_____] lbf to start movement at the rate of 1.02 m/s 3.33 ft/s (200 ft/min). Use a removable handle to extend and retract the bottom operable seals; vertical movement of seals must be [50] [_____] mm [2] [_____] inches. Use a flexible bulb for closure to the lead wall; accomplish final closing by means of a lever exerting pressure against the wall.

2.1.2  Electric Operation

Design the pressure-sensitive leading edge so that a force of [17.8] [_____] N [4] [_____] lbf will stop the forward motion; system must stop the partition movement if people or objects are in the path of the partition when it is being extended or in the pocket area, when the panels are being folded. Provide a weight-sensitive floor mat in the storage pocket to prevent partition movement with as little as 2.3 kg 5 lbs of weight applied. Wall mount the electric control.

2.1.3  Performance Requirements

2.1.3.1  Fire Endurance

**************************************************************************
NOTE: Select flame spread and smoke developed criteria to suit project.

******************************************************************************
For partitions more than 5.6 square meters 60 square feet in area, provide covering and lining with flame spread rating of 25 or less, fuel contribution rating of 15 or less, smoke generation of 50 or less in accordance with NFPA 101 when tested in accordance with ASTM E84. [1 hour fire rating, UL 10B, or NFPA 252.] Submit flame and smoke development tests reports. Door and partition finishes must have a Class A rating when tested in accordance with ASTM E84.

2.1.3.2 Laboratory Acoustical Requirements

******************************************************************************
NOTE: Specify sound transmission class as determined by project requirements. The requested rating should be between 35 and 54 STC. 39 and 40 STC are widely available. If more is required, another type of moveable partition should be used. Specify a panel weight of no less than 14 kg per square meter 3 psf for STC of 35, 24 kg per square meter 5 psf for STC of 45.

******************************************************************************
Provide partitions tested in accordance with ASTM E90, by a laboratory accredited by the U.S. Bureau of Standards, that have attained a sound transmission class (STC) of not less than [39] [40] [_____] in a fully extended position, with a Noise Reduction Coefficient (NRC) of [0.25-0.30 for napped, tufted or looped fabric] [0.65-0.75 for perforated steel in accordance with ASTM C423] [______]. Partition tested must be of the same construction, materials, and model number as the partition to be provided and be fully operable. Test specimen must be not less than [12 square meters in area] [4200 by 2700 mm] [126 square feet in area] [14 by 9 feet], with a panel weight minimum of 26 kg/square meter 5.5 psf for STC up to 40, 36 kg/square meter 7.5 psf for STC up to 45, and 41 kg/square meter 8.5 psf for STC up to 50, 48 kg/square meter 10.0 psf for STC up to 53. Panel thickness (100 mm 4 inch nominal) and composition designed to provide the required STC rating in accordance with ASTM E90 and ASTM E413.

2.2 MATERIALS

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 year prior to bid opening. Submit Certificate attesting that the materials meet the requirements specified. Equipment must be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Provide heavy-duty type hardware standard with the manufacturer, pulls and latches for all partitions, and partitions with [keyed locks] [privacy latches] [magnetic contact latches] [foot bolts]. Provide [anodized aluminum [clear] [bronze]] [chrome plated] [brass plated metal] [painted] [_____] finish hardware.

2.3 SLIDING PARTITIONS

Provide sliding partitions using top hung ball bearing carriers which support modular panels:
a. Made up of a series of rigid panels, each panel being a one-piece assembly. Unless otherwise specified, use the least number of panels. Actuate the mechanical seal of the panel with a single operating action.

b. [Paired] [Single] [Omni-directional] [Continuously hinged] type as indicated.

2.3.1 Panels

**************************************************************************
NOTE: Steel skin should be a minimum of 0.6 mm 24 gage for 1200 mm 48 inch panels, and 0.8 mm 22 gage for 1500 mm 60 inches panels.
**************************************************************************

Provide panels of [steel skin,] [reinforced aluminum,] [particleboard,] [wood] [_____] [tackable base,] laminated to appropriate structural acoustical backing, mounted in full perimeter protective frame. Steel for the panel frames must be a minimum of [_____] mm gauge thick steel with minimum 0.80 mm 22 gauge thick face panels spot welded to the frame. Frame must enclose and protect all edges of the surface material. Panels must be less than 1.2 m 4 feet wide, except for end closure panels, and be full height to track. Panels must lock in place to form a stable, rigid partition; low profile hinges may not project more than 6 mm 1/4 inch maximum from panel edge. Wrap panel surfacing around the vertical panel edges without vertical trim.

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is available from US national manufacturers above the minimum recycled content percentages shown below. Some manufacturers and regions have higher percentages. Based on research, select or insert desired minimum percentages into the empty set of brackets.

**************************************************************************
Provide steel components that contain a minimum of [10][_____] percent post-consumer recycled content. Provide data identifying percentage of recycled content for steel components.]

Provide aluminum components that contain a minimum of [30][_____] percent post-consumer recycled content. Provide data identifying percentage of recycled content for aluminum components.]

2.3.2 Finish Covering

**************************************************************************
NOTE: Wood veneer and framed tempered glass are finish options for sliding partitions.
**************************************************************************
Finish material must be minimum [1371 mm 54 inches] [_____] wide, [vertically-ribbed acoustical material of 100 percent polyolefin] [Type II vinyl with a minimum total weight of [441 grams/square m 13 ounces/square yard and 620 grams/linear m 20 ounces/linear yard] [_____] in accordance with CFFA-W-101-D, and conforming to ASTM D751 and NFPA 286.] Provide [vinyl containing a non-mercury based mildewcide and manufactured without the use of cadmium-based stabilizers] [acrylic backed fabric of [100 percent polyolefin] [_____]]. Provide non-allergenic stain and mildew resistant fabric which will not rot or support growth of bacteria. Fabrics and wallcoverings must meet emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification or validation of indoor air quality for fabrics and wallcoverings.

2.3.3 Track

Provide recess [extruded aluminum] [enamel finish steel] track as shown. [Aluminum must conform to [ASTM B221] [ASTM B221M].] [Steel must conform to ASTM A653/A653M.] Use manufacturer's standard track product designed for the weight of the finished partition, including door. Provide track sections in the maximum lengths practicable, and not less than 1.8 m 6 feet long except for narrow doors and at ends of runs where short length is required. Provide suitable joint devices such as interlocking keys at each joint to provide permanent alignment of track.

2.3.4 Suspension System

Provide a suspension system consisting of [steel] [heavy duty extruded aluminum] track connected to the structural support by threaded rods, and trolleys designed to support the weight of the partition. [Provide steel track of 5 mm 7 gage minimum, phosphate treated or painted.] [Provide extruded aluminum track with minimum thickness of 3 mm 1/8 inch.] [Provide center hung panel with 1 trolley with four ball bearing nylon or steel tired wheels per panel.] [Provide 2 trolleys per panel with 2 ball bearing polymer or steel tired wheels.]

2.3.5 Tackboard

Provide tackboard with [steel] [aluminum] frame; a minimum 6 mm 1/4 inch thickness, tacking surface covered with self-sealing decorative vinyl and tacking surfaces laminated to rigid backing substrate.

2.3.6 Markerboards

Provide markerboards with [aluminum] [steel] frame with writing surface of [cast acrylic plastic with color fused to surface] [porcelain steel]. Markerboard may not protrude more than 3 mm 1/8 inch beyond panel face. Color: [white] [_____].

2.4 ACCESSORIES

2.4.1 Doors

Provide non-fire rated, manually operated doors with vinyl sweep top seals which compress against the bottom of the top track.

2.4.2 Ceiling Guards

Furnish partitions with ceiling guards or integral track and ceiling guards...
as recommended by the manufacturer.

2.4.3 Metal Soffit

Provide soffit when steel track is recessed. Provide metal soffit of adequate thickness to protect the ceiling from damage by door operation and with the door manufacturer's standard neutral-color applied finish. Soffit on aluminum track must be an integral part of the track.

2.5 SEALS AND SWEEPSTRIPS

**************************************************************************

NOTE: Partitions need a floor and ceiling seal to avoid gaps that will lower the advertised sound transmission rating. For any partition that requires a sound rating, use seals and ceiling guards provided by the manufacturer of the partition. Provide a baffle in the ceiling plenum above the partition with a STC rating equal to the partition. Provide a floor surface that will allow the bottom sweep to make a positive seal. Panels need vertical and end seals.

**************************************************************************

Provide perimeter seals or sound insulation, of manufacturer's standard product, to achieve the sound transmission class specified [and to pass the visual field test specified], without crack or craze when subjected to severe usage. [Provide mechanical seal top and bottom of the fire rated panel.] [Provide mechanical bottom seal that can be raised or lowered for positive control.] Provide manufacturer's vertical seals between panels to ensure acoustical [and fire] rating. Use bottom seals consisting of a vinyl sweep mechanical seal that expands in place, or provide panels that can be lowered by a removable operating device. Vertical seal between panels must be anodized, architectural grade, aluminum extrusion with [vinyl] [_____] sound seal. Provide vinyl sweep strips or other material which will not crack or craze with severe usage. Provide sweep strip STC of the specified rating.

[2.6 ELECTRICAL OPERATORS

**************************************************************************

NOTE: Specify electrical operators for those partitions whose size and weight preclude manual operation. Refer to manufacturers' literature. Indicate those partitions requiring electrical operation on the project drawings. Delete this paragraph when electrically operated partitions are not required in the project.

**************************************************************************

Provide manufacturer's recommended standard electrical operator for [each partition] [partitions indicated]. Provide wiring diagrams.

]2.7 COLOR

**************************************************************************

NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally Section 09 06 00 SCHEDULES FOR FINISHES or drawing

SECTION 10 22 43 Page 13
is used when the project is designed by an Architect or Interior designer. Color will be selected from manufacturers standard colors or identified in this spec only when the project has minimal finishes.

When the government directs that color be located in the drawings, add a Note stating: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

******************************************************************************

Color [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [as indicated] [selected from manufacturers standard colors] [_____] [{ Color listed is not intended to limit selection of equal colors from other manufacturers}]

Submit [three] [_____] color samples of specified surfaces and finishes to match those specified. Finish and color requirements are not limited to manufacturer's standard selections in order to meet these requirements. Also submit Certificate attesting that partitions have specified acoustical and flame retardant properties, as determined by test.

PART 3    EXECUTION

3.1    INSTALLATION

Install in accordance with the manufacturer's approved instructions. Do not install building construction materials that show visual evidence of biological growth.

3.1.1    Preparation Work

******************************************************************************

NOTE: Show the structural support necessary to accommodate the size and weight of the partition.
ASTM E557 has design as well as installation criteria.
******************************************************************************

Verify dimensions and condition of openings scheduled to receive folding panel partitions. Install partitions in accordance with the approved partition layouts, manufacturer's directions, and ASTM E557. Provide structural support for the track support elements as indicated.
[3.1.2 Electrical Operators]

**************************************************************************
NOTE: Delete this paragraph when electrically operated partitions are not required.
**************************************************************************

Conform electrical components and installation to the requirements of NFPA 70 and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide the partition manufacturer's standard drive and control components required to operate the partition. Power source is as indicated.

[3.1.3 Adjustment]

[Adjust manually operated partitions to open and close from any position with a maximum horizontal force as specified in paragraph Manual Operation applied to pendant pull, box or handle.] [Adjust drive components and limit switches of electrically operated partitions to ensure the partitions operate properly upon activation of the control switch.]

3.2 FIELD TESTS

3.2.1 Operational Test

In the presence of the Contracting Officer, operate partition at least three times to demonstrate that partition is capable of being moved from the stored position to the fully extended position smoothly and quietly [and without overloading the drive components]. [Activate the emergency release mechanism and demonstrate proper operation of the partition in the manual mode.] [Activate mechanical seals top and bottom.] Adjust partitions which do not operate properly and retest.

3.2.2 Visual Test

**************************************************************************
NOTE: Delete this paragraph when light leakage will not be objectionable.
**************************************************************************

Conduct visual field tests for light leakage with all room lights turned on in the space on one side of the partition. Darken space on the other side of the partition. Light leakage from the lighted space to the darkened space is not acceptable. If light leakage does occur, adjust the partition to correct the problem and retest.

3.2.3 Acoustical Test

**************************************************************************
NOTE: Delete this paragraph in projects requiring STC ratings of less than 40. Noise Isolation Class (NIC) is a number that can be measured, and usually runs up to 10 points below laboratory results, i.e. lab STC 40, field NIC 30. This test is expensive and rarely necessary.
**************************************************************************

Field sound performance: provide partition testing by an independent certified acoustical consultant in accordance with ASTM E336, and achieve a Noise Isolation Class (NIC) of [_____] plus or minus two. Adjust or modify
partitions which do not comply, and retest.

3.3 CLEANING

Clean any soiled parts of the partition in accordance with manufacturer's printed instructions.

3.4 OPERATION AND MAINTENANCE

3.4.1 Operating Instructions

Submit six complete copies of operating instructions outlining the procedures required for electrically operated partitions. The instructions must include the manufacturer's name, model number, service manual, parts list, brief description of all equipment and operating features, a complete list of parts and supplies, with current unit prices and source of supply, and a list of the parts recommended by the manufacturer to be replaced after 1 year and 3 years of service.

3.4.2 Maintenance

Submit six complete copies of maintenance instructions explaining routine maintenance procedures including inspection, adjustments, lubrication, and cleaning; list possible breakdown, methods of repair, and include a troubleshooting guide. Include instructions for equipment layout and simplified wiring and control diagrams of the system as installed.

Submit Data Package 1 for sliding partitions, and Data Package 5 for electrical operators in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

NOTE: This guide specification covers the requirements for corner guards, wall guards, door protectors, and wall panels.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: Army facilities not excluded by TI 800-01 Design Criteria will be accessible in accordance with 36 CFR, Part 1191, Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities.

Drawings should show basic profiles and details but should not be so explicit as to become proprietary in nature. The following information must be shown on the project drawings:

1. Locations of crash rails and corner guards.
2. Locations of wall covering and panels, and door
protectors.

3. Mounting and anchorage details, and dimensions.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ALUMINUM ASSOCIATION (AA)

AA DAF45 (2003; Reaffirmed 2009) Designation System for Aluminum Finishes

ASTM INTERNATIONAL (ASTM)

CALIFORNIA DEPARTMENT OF PUBLIC HEALTH (CDPH)

GREEN SEAL (GS)

GS-36 (2013) Adhesives for Commercial Use

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other
submital items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality

1.3.1.1 Wall Covering and Panels

Provide sheet and high impact resistant resilient materials certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this section. Provide current product certification documentation from certification body.

1.3.1.2 Adhesives and Sealants

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that
products meet the requirements of this section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the project site in manufacturer's original unopened containers with seals unbroken and labels and trademarks intact. Keep materials dry, protected from weather and damage, and stored under cover. Store materials at approximately 21 degrees C, 70 degrees F for at least 48 hours prior to installation.

1.5 WARRANTY

Provide manufacturer's warranty to repair or replace defective materials and workmanship for a 1 year period of [one year] [____] [years] from date of final acceptance of the work.

PART 2   PRODUCTS

2.1 STANDARD PRODUCTS

**************************************************************************

NOTE: All paragraphs must be carefully edited because of the broad number of possible requirements and the diverse combinations available with these products.

Some manufacturers will meet ASTM D256 and some ASTM F476, research to determine the specific test to what is specified.

**************************************************************************

To the maximum extent possible, provide wall and door protection items that are standard products of a single manufacturer and furnished as detailed. Drawings show general configuration of products required[, and items differing in minor details from those shown are acceptable].

Submit detailed shop drawings of each wall and door protection item indicated. Include elevations, dimensions, clearances, details of construction and anchorage, and details of joints and connections.

Submit manufacturers' descriptive product data for each wall and door protection item indicated. Include manufacturers' literature, finishes, profiles and thicknesses of materials.

Submit manufacturers' operations and maintenance data for each wall and door protection item indicated in accordance with Section 01 78 23 OPERATIONS AND MAINTENANCE DATA.

2.1.1 Resilient Material

Provide resilient material consisting of high impact resistant extruded [PVC free][acrylic vinyl][ or ][injection molded thermal plastic] conforming to the following:
2.1.1.1 Minimum Impact Resistance

[Minimum impact resistance must be 3,857 kg/m 18 ft-lbs/sq. inch when tested in accordance with ASTM D256, (Izod impact, ft-lbs per sq inch notched).][Minimum impact resistance must be 10,633.4 kg/m 49.62 ft-lbs/sq. inch when tested in accordance with ASTM F476.]

2.1.1.2 Fire Resistance Rating

Provide the following surface burning characteristics when tested and labeled in accordance with ASTM E84 by a qualified testing agency: maximum flame spread of 25 and a smoke developed rating of 450 or less. Provide material rated as self extinguishing when tested in accordance with ASTM D635. Provide resilient material used for protection on fire rated doors and frames listed by the qualified testing agency performing the tests. Provide resilient material installed on fire rated wood/steel door and frame assemblies tested on similar type assemblies. Test results of material tested on any other combination of door/frame assembly are not acceptable.

2.1.1.3 Integral Color

Provide colored components having integral color and matched in accordance with SAE J1545 to within plus or minus 1.0 on the CIE-LCH scales.

2.1.1.4 Chemical and Stain Resistance

Provide materials resistant to chemicals and stains reagents in accordance with ASTM D543.

2.1.1.5 Fungal and Bacterial Resistance

Provide materials resistant to fungi and bacteria in accordance with ASTM G21, as applicable.

2.2 CORNER GUARDS

**************************************************************************
NOTE: For medical facilities, corner guards must extend from floor to ceiling.
**************************************************************************

2.2.1 Resilient Corner Guards

Provide [flush mounted] [surface mounted] corner guards, radius formed to profile shown. Provide corner guards that [extend from floor to ceiling.] [are [____] mm [____]feet high.] Furnish mounting hardware, cushions, and base plates. Provide assembly consisting of a snap-on corner guard formed from high impact resistant resilient material, mounted on a continuous aluminum retainer. Extruded aluminum retainer conforms to ASTM B221, alloy 6063, temper T5 or T6. Provide aluminum components that contain a minimum of 35 percent recycled content. Provide data identifying percentage of recycled content for aluminum component of corner guards. Flush mounted type guards act as a stop for adjacent wall finish material. Furnish factory fabricated end closure caps for top and bottom of surface mounted corner guards. Provide flush mounted corner guards installed in fire rated wall that maintain the rating of the wall. Manufacturer to provide insulating materials that are an integral part of the corner guard system. Provide exposed metal portions of fire rated assemblies with a paintable
2.2.2 Stainless Steel Corner Guards

**************************************************************************

NOTE: 1.59 mm 16 gauge stainless steel corner guards are the standard for most manufactures, it is very durable and able to stand up well to abuse in many situations. Depending on the amount of abuse a corner guard is expected to take, select a higher gauge. Some examples of higher abuse spaces include clean rooms, warehouses or manufacturing plants.

**************************************************************************

Provide stainless steel base material that contains a minimum of 60 percent recycled content. Provide data identifying percentage of recycled content for steel component of corner guards. Fabricate stainless steel base material of 1.98 mm 14 gauge][ 1.59 mm 16 gauge][ 1.27 mm 18 gauge][ 0.95 mm 20 gauge] thick material conforming to ASTM A167, type 430 or 304. Provide corner guards that [extend from floor to ceiling.] [are ______ mm [_____] feet high.] Form corner guard to dimensions shown.

2.3 WALL GUARDS

**************************************************************************

NOTE: Bed locators are used in healthcare facilities, specifically inside patient rooms. They help protect the wall from damage by positioning the patient bed in the right location. Remove references to bed locator if not editing this specification for a healthcare facility. For the intent of this specification wall guards include crash rails, bed locators, handrails and chair rails.

**************************************************************************

Provide product with prefabricated end closure caps, inside and outside corners, concealed splices, cushions, mounting hardware and other accessories standard with the manufacturer. Extruded continuous aluminum retainers must conform to ASTM B221, alloy 6063, temper T5 or T6. Provide aluminum components that contain a minimum of 35 percent recycled content. Provide data identifying percentage of recycled content for aluminum component of wall guards, combination handrail/wall guard and handrails. Field adjust all end caps and corners to assure close alignment.

2.3.1 Crash Rails and [Bed Locators]

Provide crash rails with snap-on covers of high impact resistant resilient material, minimum 2 mm 0.078 inch thick, mounted over [51] [_____] mm [2] [_____] inch wide aluminum, minimum 2 mm 0.062 inch thick retainer, anchored to wall at maximum 610 mm 24 inches on center. Provide aluminum components that contain a minimum of 35 percent recycled content. Provide data identifying percentage of recycled content for aluminum component of crash rail/bed locators.

2.3.2 Combination Handrail and Crash Rails

Provide combination handrail and crash rails with snap-on covers of high impact resistant resilient material, minimum 2 mm 0.078 inch thick, on a continuous, extruded aluminum retainer, minimum 1.83 mm 0.072 inch thick
anchored to wall at maximum 813 mm 32 inches on center. Provide aluminum components that contain a minimum of 35 percent recycled content. Provide data identifying percentage of recycled content for aluminum component of combination handrail/crash rail.

2.3.3 Handrails

Provide handrails with snap-on covers of high impact resistant resilient material, minimum 2 mm 0.078 inch thick on a continuous extruded aluminum retainer, minimum 2 mm 0.072 inch thick anchored to wall at maximum 813 mm 32 inches on center. Provide aluminum components that contain a minimum of 35 percent recycled content. Provide data identifying percentage of recycled content for aluminum component of handrails. Provide aluminum components with prefabricated end closure caps, inside and outside corners, concealed splices, cushions, mounting hardware and other accessories standard with the manufacturer. Provide end caps and corners that are field adjustable to assure close alignment with handrails.

2.3.4 Chair Rails

Provide chair rails with a snap-on cover of high impact resistant resilient material, minimum 1.78 mm 0.070 inch thick, on a continuous extruded aluminum retainer, minimum 1.52 mm 0.060 inch thick anchored to wall at maximum 813 mm 32 inches on center. Provide chair rails with slices, cushions, mounting hardware and other accessories standard with the manufacturer. Field adjust all end caps and corners to assure close alignment with chair rails.

2.4 DOOR PROTECTORS

Provide [door] [door envelope] [door knob] [and] [door frame] protection items with [high impact resistant acrylic vinyl or polyvinyl chloride resilient material, minimum [2 mm 0.060 inch thick for doors] [and] [1.02 mm 0.040 inch thick for door frames]][1.59 mm 16 gauge, type 304 stainless steel for door]. Coordinate door and door frame protection material requirements with door and frame suppliers to insure fit for all components and color matching with other resilient materials. Provide adhesive as recommended by resilient material manufacturer.

2.5 WALL COVERING AND PANELS

**************************************************************************

NOTE: Recommended locations for various thicknesses of rigid wall covering and panels are as follows: 1 mm 0.040 inch thick for lobbies and elevator areas, 1.02 to 1.52 mm 0.040 to 0.060 inch thick for service corridors, and 1.91 mm 0.075 inch thick for loading dock areas. A 10 mm 0.375 inch thick composite wall panel is recommended for installation over existing substrates such as ceramic tile, masonry block, or damaged plaster/drywall.

**************************************************************************

Provide wall covering and panels consisting of high impact [PVC free resilient material][rigid acrylic vinyl or polyvinyl chloride resilient material]. Panel sizes are[ 1219 mm by 2438 mm][ 4 by 8 feet] [1219 mm by 3048 mm][ 4 by 10 feet]. Provide wall covering material used on the interior of the building (defined as inside of the weatherproofing system) that meets either emissions requirements of CDPH SECTION 01350 (limit
requirements for either office or classroom spaces regardless of space type) the VOC content requirements of SCAQMD Rule 1168, or VOC content requirements of GS-36. Provide certification of indoor air quality for wall covering/panels.

2.5.1 Rigid Vinyl Acrylic Wall Covering

Provide [1.02 mm][0.040 inch][1.52 mm][0.060 inch][1.91 mm][0.075 inch][10 mm][0.375 inch] thick wall covering.

2.5.2 High Impact Wall Panels

Provide wall panel face and edge thickness that are [_____] [1.02 mm][0.040 inch]. Factory bond panel face to a 10 mm 0.375 inch thick fiberboard core. Laminate the backside of the panel with a moisture resistant vapor barrier.

2.5.3 Rigid Vinyl Acrylic Digital Wall Covering

Provide wall covering thickness of minimum 1.02 mm 0.040 inch with high definition graphic file reverse printed on clear sheet and sealed with protective backer. Provide image as [selected from manufacturer standard.][custom artwork with copyright clearance.][in accordance with Section 09 06 00 SCHEDULES FOR FINISHES.][as indicated on drawings.]

2.6 TRIM, FASTENERS AND ANCHORS

Provide [vinyl][aluminum][PVC free] trim, fasteners and anchors for each specific installation as indicated.

2.7 FINISH

Submit samples indicating color and texture of materials requiring color and finish.

2.7.1 Aluminum Finish

Provide aluminum finish accordance with AA DAF45; exposed aluminum with designation [AA-C22A31 chemically etched medium matte, with clear anodic coating] [AA-C22A32 chemically etched medium matte with integrally colored anodic coating]. Provide Class II architectural coating that is 0.010 mm 0.4 mil thick. Provide concealed aluminum with mill finish as fabricated, uniform in natural color and free from surface blemishes.

2.7.2 Stainless Steel Finish

Provide stainless steel finish in accordance with ASTM A167, Type 302 or 304, finish number 4.

2.7.3 Resilient Material Finish

**************************************************************************
NOTE: Coordinate resilient finishes with manufacturers. Certain finishes and textures are not available from some manufacturers.
**************************************************************************

Provide resilient material finish of [embossed [velour] [stipple] [_____]]

SECTION 10 26 00 Page 12
2.8 ADHESIVES

Provide adhesive for resilient material in accordance with manufacturers recommendations. Provide sealants and non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) that meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) the VOC content requirements of SCAQMD Rule 1168, or VOC content requirements of GS-36. Provide certification of indoor air quality for adhesives.

2.9 COLOR

******************************************************************************

NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an Architect or Interior designer. Color must be selected from manufacturers standard colors or identified as a manufacturers color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings a note must be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval.
Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.
******************************************************************************

Provide color [as specified in Section 09 06 00 SCHEDULES FOR FINISHES.] [as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.]

PART 3 EXECUTION

3.1 INSTALLATION

Do not install items that show visual evidence of biological growth. Install items on surfaces that are clean, smooth, and free of obstructions.
3.1.1 Corner Guards and Wall Guards

a. Mount guards [as indicated] on external corners of interior walls, partitions and columns and in accordance with manufacturer's written installation instructions.

b. For wall guards, space brackets at no more than 914 mm 3 feet on centers and anchor to the wall in accordance with the manufacturer's written installation instructions.

3.1.1.1 Stainless Steel Guards

**************************************************************************
NOTE: For mounting of stainless steel corner guards tape is an option if holes are not wanted in the substrate, screws would be a more durable solution.
**************************************************************************

a. Mount guards [as indicated] on external corners of interior walls, partitions and columns and in accordance with manufacturer's recommendations.

b. Where corner guards are installed on walls, partitions or columns finished with plaster or ceramic tile, [anchor corner guards as indicated] [provide continuous 1.59 mm 16 gauge thick, perforated, galvanized z-shape steel anchors welded to back edges of corner guards and [wired to metal studs][expansion bolted to concrete or masonry with four 10 mm 3/8 inch diameter bolts, spaced 406 mm 16 inches on centers]]. Coat back surfaces of corner guards, where shown, with a non-flammable, sound deadening material. Overlap corner guards on finish plaster surfaces.

c. Where corner guards are installed on exposed structural glazed facing tile units or masonry wall, partitions or columns, [anchor corner guards as indicated] [anchor corner guards to existing walls with 6 mm 1/4 inch oval head stainless steel countersunk expansion or toggle bolts][anchor corner guards with four nominal 1 mm 0.0516 inch thick, adjustable galvanized steel anchors, spaced as shown]. Grout spaces solid between guards and backing with portland cement and sand mortar.

d. Where corner guards are installed on gypsum board, clean surfaces and anchor guards with a neoprene solvent-type contact adhesive specifically manufactured for use on gypsum board construction. Remove excess adhesive from the guard edges and allow to cure undisturbed for 24 hours.

e. For wall guards, space brackets at no more than 914 mm 3 feet on center and anchor to the wall in accordance with the manufacturer's installation instructions.

3.1.2 Door Protectors

Install protectors after frames are in place, but prior to hanging of doors, in accordance with manufacturer's written instructions. Apply adhesives in controlled environment in accordance with manufacturer's written instructions. Install protection for fire doors and frames in accordance with NFPA 80.
3.1.3 Wall Coverings and Panels

Install as indicated in accordance with manufacturer's written instructions.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for toilet accessories suitable for a wide variety of applications.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: For Army construction, buildings not excluded by the TI 800-01 Design Criteria will be accessible in accordance with 36 CFR, Part 1191, Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities.

Drawings will indicate location, dimensions, elevations, schedules, details, and such other information as required to indicate the extent of the work.

Product selections will be based on aesthetic values and cost as related to project needs.
1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN NATIONAL STANDARDS INSTITUTE (ANSI)

ASTM INTERNATIONAL (ASTM)

U.S. DEPARTMENT OF DEFENSE (DOD)

MIL-STD-1691 (1994; Rev F) Construction and Material Schedule for Military Medical and Dental Facilities

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other
Submit submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Product Schedule; G[, [____]]

Submit product Schedule indicating types, quantities, sizes, and installation locations by room for each toilet accessory item required. Identify locations using room designations indicated on the drawings.

Submit Data Package 1 for each toilet accessory item, and Data Package 2 for each electrical toilet accessory item, in accordance with Section 01 78 23 OPERATIONS AND MAINTENANCE DATA.

1.3 CERTIFICATIONS

**************************************************************************
NOTE: Insert the certification below for baby changing stations if baby changing stations are included in the project.
**************************************************************************

1.3.1 Baby Changing Stations

Provide certification that baby changing stations meet the performance criteria of ASTM F2285.

Provide certification that baby changing stations meet the requirements of ANSI Z535.4 Product Safety Signs and Labels.

Provide certification that baby changing stations meet the requirements of

1.4 DELIVERY, STORAGE, AND HANDLING

Wrap toilet accessories for shipment and storage, then deliver to the jobsite in manufacturer's original packaging, and store in a clean, dry area protected from construction damage and vandalism.

1.5 WARRANTY

Provide manufacturer's warranty to repair or replace defective materials and workmanship for a period of [one year][_____] [years] from date of final acceptance of the work..

PART 2 PRODUCTS

******************************************************************************

NOTE: Only those accessories and finishes normally suitable for military construction are included in this guide specification. When other accessories and finishes are required to meet the needs of the project, the specifier must add them. Maximum use should be made of recessed accessories in areas of hard usage.

******************************************************************************

2.1 ACCESSORY ITEMS

******************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows these products are available among US national manufacturers above the minimum recycled content percentages shown below.

******************************************************************************

Provide toilet accessories where indicated in accordance with Contractor-provided product schedule. Conform to the requirements for accessory items specified herein which are based on MIL-STD-1691 Joint Schedule Numbers (JSN).[ Porcelain type, tile-wall accessories are specified in Section 09 30 10 CERAMIC, QUARRY, AND GLASS TILING.] Provide each accessory item complete with the necessary mounting plates of sturdy construction with corrosion resistant surface.

Provide stainless steel products listed herein manufactured from materials containing a minimum of 50 percent recycled content. Provide data identifying percentage of recycled content for stainless steel toilet accessories.

2.1.1 Anchors and Fasteners

******************************************************************************

NOTE: Tamperproof fasteners will be specified for accessories which have exposed fasteners in areas
used by neuropsychiatric patients or prisoners and where theft or vandalism would be a problem. This guide specification places the responsibility with the Contractor for providing, subject to Government approval, fasteners and anchors of the type, size and number required to adequately secure the accessory items. Specific requirements for critical or unusual applications may refer to details on the drawings, or the specifications may be expanded to include the necessary requirements.

**************************************************************************

Provide corrosion-resistant anchors and fasteners capable of developing a restraining force commensurate with the strength of the accessory to be mounted and suited for use with the supporting construction. Provide [tamperproof design] [oval heads] exposed fasteners with finish to match the accessory. Provide fasteners proposed for use for each type of wall construction and mounting.

2.1.2 Finishes

Except where noted otherwise, provide the following finishes on metal:

<table>

</tbody>
</table>

[2.1.3 Item A4995 Table, Diaper Changing, Wall Mounted]

Wall mounted diaper changing table. Construct unit of high density polyethylene plastic impervious to odors, mold and mildew; support a static load of minimum 136 kg 300 pounds. Provide unit to project out from wall approximately 114 mm 4-1/2 inches when in closed position. Provide contour shaped unit with safety strap. Mounting hardware included.

Approximate open dimensions: 508 mm 20 inches wide by 914 mm 36 inches long by 127 mm 5 inches deep. Approximate closed dimensions: 102 mm 4 inches deep by 914 mm 36 inches long by 533 mm 21 inches high.

[2.1.4 Item A5030 Bench, Stall, Shower, Built-In]

Wall mounted shower seat. Frame made of 1.27 mm 18 gauge stainless steel with satin finish. Seat made of one piece of 13 mm 1/2 inch thick nonporous solid phenolic with slots to permit water to drain, secured to frame with stainless steel carriage bolts and acorn nuts. Mounting hardware included. Seat to support a minimum static load of 113 kg 250 pounds. Hinge seat to fold up when not in use. Seat complies with ADA guidelines.

Approximate size: 864 mm 34 inches wide by 559 mm 22 inches deep by 13 mm 1/2 inch thick.

[2.1.5 Item A5047 Cabinet, Medicine]

Medicine cabinet constructed of heavy gauge stainless steel and have a
mirror mounted in swinging door, a minimum of three shelves, magnetic catch and full length piano hinge. Mirror is 6 mm 1/4 inch thick first quality float glass electrolytically copper-plated and guaranteed against silver spoilage for 15 years. Cabinet door can be inverted to change from left to right hand swing. Unit has concealed mounting holes. Mounting hardware included.

Approximate size: 432 mm 17 inches wide by 635 mm 25 inches high by 102 mm 4 inches deep.

][2.1.6 Item A5074 Soap Dish, Recessed, SS, Psychiatric

Recessed mounted soap dish. Soap dish made of stainless steel with matte finish, drawn one-piece seamless construction. Back of unit has welded anchor nuts to receive threaded studs, which are provided with unit. Rim of unit beveled to insure tight fit to wall surface. Soap dish has raised dimples that allow water to drain away and provide a gripping surface to retain soap.

Approximate size: 178 mm 7 inches wide by 127 mm 5 inches high by 76 mm 3 inches deep.

][2.1.7 Item A5080 Dispenser, Paper Towel, SS, Surface Mounted

Surface mounted unit constructed of stainless steel with satin finish, welded construction, and have full length piano hinge, tumbler lock, refill indicator. Unit has smooth corners, free of burrs and sharp edges. Unit has a capacity of 400 single fold paper towels.

Approximate size: 279 mm 11 inches wide by 203 mm 8 inches high by 152 mm 6 inches deep.

][2.1.8 Item A5081 Dispenser, Paper Towel, SS, Recessed, Psychiatric

Recessed paper towel dispenser made of stainless steel with brushed finish and satin interior. Unit has no loose or protruding parts and have concealed mounting, anchored to wall with welded anchor nuts. Edges of unit beveled to insure a tight fit to wall surface.

Approximate size: 457 mm 18 inches wide by 102 mm 4 inches deep by 203 mm 8 inches high.

][2.1.9 Item A5082 Dispenser, Paper Towel, Sensor, Hands Free

Surface mounted paper towel dispenser with hands free operation. Unit made of high impact plastic in a dark translucent color. Unit has the capacity of one standard 203 mm 8 inch wide by 203 mm 8 inch diameter 800 ft roll with optional paper length settings. Unit is battery operated by four "D" size alkaline batteries, and have low battery indicator light, or optional AC power adapter. Unit has keyed lock.

Approximate size: 305 mm 12 inches wide by 381 mm 15 inches high by 254 mm 10 inches deep.

][2.1.10 Item A5083 Dispenser, Paper Towel, Recessed

Recess mounted paper towel dispenser. Unit constructed of heavy gauge stainless steel with satin finish, all welded construction, have full length piano hinge and tumbler lock. Unit dispenses 300 C-fold or 400
multifold paper towels and be self-feeding until supply is depleted. Towel dispensing slot is snag-free. Unit is ADA compliant.

Approximate size: 305 mm 12 inches wide by 432 mm 17 inches high by 102 mm 4 inches deep.

[2.1.11 Item A5084 Dryer, Hands Free, Forced Air, Automatic

Surface mounted high speed automatic hand dryer. Unit made of stainless steel with satin finish. Electronic sensor automatically turns dryer on when hands are held under the air outlet opening and cuts off when hands are removed, or after approximately 1-1/2 minutes after dryer turns on. Motor is 5/8 HP. Heating element raises the air temperature to approximately 135 degrees and be vandal proof. Unit meets UL requirements.

Unit requires individual 15 amp circuit.

[2.1.12 Item A5090 Disposal, Sanitary Napkin, SS, Surface Mounted

Surface mounted sanitary napkin receptacle. Unit made of stainless steel with satin finish and all welded construction. Unit has piano hinge attached at the top and an integral finger depression for opening. For use with disposable paper liners, available separately. Unit may be attached to wall or toilet partition.

Approximate size: 178 mm 7 inches wide by 102 mm 4 inches deep by 254 mm 10 inches high.

[2.1.13 Item A5109 Grab Bar, 32 mm 1-1/4 Inch Diameter, SS, 2 Wall, W/C Accessible

Grab bar of 32 mm 1-1/4 inch diameter satin finish stainless steel with peened gripping surface for use in toilet stall/room. Snap-on flange covers for concealed mounting are stainless steel and equipped with two screw holes for attachment to wall. Grab bars designed to meet and exceed ADA requirements for structural strength. Grab bars designed to withstand loads of 408 kg 900 pounds when properly installed. Clearance from wall to grab bar is 38 mm 1-1/2 inches to meet ADA and ANSI codes.

[2.1.14 Item A5110 Grab Bar, 32 mm 1-1/4 Inch Diameter, SS, 2 Wall, Shower Use

Grab bar of 32 mm 1-1/4 inch diameter satin finish stainless steel with peened gripping surface. Snap-on flange covers for concealed mounting stainless steel. Bent ends of tubing pass through the flanges and are Heliarc welded for maximum strength. Grab bars designed to meet and exceed ADA requirements for structural strength. Grab bars designed to withstand loads of 408 kg 900 pounds when properly installed. Clearance from wall to grab bar is 38 mm 1-1/2 inches to meet ADA and ANSI codes.

[2.1.15 Item A5112 Grab Bar, Psychiatric

Grab bar of 38 mm 1-1/2 inch diameter stainless steel with exposed surfaces in satin finish. Grab bar is 914 mm 36 inches long, with stainless steel closure plate welded on bottom to prevent an open tie-off gap between the bar and the wall. Flanges are completely Heliarc welded to tube end. Bent ends of tubing pass through the flanges and Heliarc welded for maximum strength.
2.1.16 Item A5115 Grab Bar, Flip-Up, Heavy Duty

Flip up grab bar, 762 mm 30 inches long, made of 32 mm 1-1/4 inch diameter stainless steel with satin finish with peened or knurled grip. Hinge made from heavy duty cast alloy. All exposed surfaces to have satin finish. Grab bars designed to meet and exceed ADA requirements. Locking mechanism holds the grab bar in the vertical position when not in use. Bar operates with less than 2.27 kg 5 pounds of force. Bar designed to withstand more than 113 kg 250 pounds of downward force when properly installed.

2.1.17 Item A5135 Shelf, Utility W/ Mop/Broom Holders, SS, Surf Mounted

Surface mounted mop/broom holder with shelf made of 1.27 mm 18 gauge stainless steel with all exposed surfaces in satin finish. Unit has shelf 203 mm 8 inches deep with shelf support brackets of satin finish stainless steel welded to mounting base, and a minimum of 3 hooks/3 holders. Mop holders have spring-loaded rubber cams and hold mop or broom handle with a diameter between 16 mm 5/8 inch and 25 mm 1 inch.

Approximate size: 914 mm 36 inches wide by 203 mm 8 inches deep.

2.1.18 Item A5140 Hook, Garment, Security

Surface mounted safety hook made of stainless steel and secured to wall with tamper resistant mounting screws, exposed mounting. Mounting hardware to be included. Hook designed to snap down when it exceeds load limit.

2.1.19 Item A5145 Hook, Garment, Double, SS, Surface Mounted

Surface mounted double garment hook made of stainless steel with satin finish. For use on door back or wall. Hook comes with concealed mounting bracket secured to concealed wall plate. Mounting hardware included. Flange size is approximately 51 mm 2 inches by 51 mm 2 inches.

2.1.20 Item A5150 Hook, Garment, Triple, Surface Mounted

Surface mounted garment hook. Unit has three metal hooks with a backplate made of medium oak woodgrain or anodized or polished aluminum finished panel. For mounting directly on wall or to panel.

Approximate maximum weight capacity: 16 kg 35 pounds.

Approximate size: 457 mm 18 inches wide by 102 mm 4 inches high by 19 mm 3/4 inch deep.

2.1.21 Item A5160 Shelf, 203 mm 8 Inch Depth, SS, Surface Mounted

Surface mounted shelf of 1.27 mm 18 gauge stainless steel with all exposed surfaces in satin finish. Shelf has minimum depth of 203 mm 8 inches. Center bracket and end brackets of stainless steel, welded to shelf. Shelf length [as indicated on drawings.] [305 mm 12 inches.] [406 mm 16 inches.] [457 mm 18 inches.] [610 mm 24 inches.] [762 mm 30 inches.] [914 mm 36 inches.] [1219 mm 48 inches.]

Shelves over 610 mm 24 inches long have center bracket for support.

2.1.22 Item A5162 Shelf, Fold Down, Stainless Steel

Fold down utility shelf of 1.27 mm 18 gauge stainless steel. Top surface of shelf has raised rim. Equipped with heavy-duty internal spring. Edges
and corners radiused and burr free. Shelf automatically returns to upright position when not in use. Shelf holds 45 kg 100 pounds. Mount on wall or toilet partition. Mounting hardware included.

2.1.23  **Item A5165** Shelf, 127 mm 5 Inch Depth, SS, Surface Mounted

Surface mounted shelf of 1.27 mm 18 gauge stainless steel with all exposed surfaces in satin finish. Shelf has minimum depth of 127 mm 5 inches. Center bracket and end brackets of stainless steel, welded to shelf. Shelf length [as indicated on drawings.][is][305 mm 12 inches.][406 mm 16 inches.][457 mm 18 inches.][610 mm 24 inches.][762 mm 30 inches.][914 mm 36 inches.][1219 mm 48 inches.] Shelves over 610 mm 24 inches long have center bracket for support.

2.1.24  **Item A5166** Shelf, 305 mm 12 Inch Depth, SS, Surface Mounted

Surface mounted shelf of 1.27 mm 18 gauge stainless steel with all exposed surfaces in satin finish. Shelf has a minimum depth of 305 mm 12 inches. Shelf is available in various widths. Center bracket and end brackets of stainless steel, welded to shelf. Shelf length [as indicated on drawings.][is][305 mm 12 inches.][406 mm 16 inches.][457 mm 18 inches.][610 mm 24 inches.][762 mm 30 inches.][914 mm 36 inches.][1219 mm 48 inches.] Shelves over 610 mm 24 inches long have center bracket for support.

2.1.25  **Item A5170** Rod, Shower Curtain, 25 mm 1 Inch Diameter, W/Curtain & Hooks

Shower Curtain Rod with concealed mounting. Shower curtain rod made of satin finish stainless steel, 25 mm 1 inch diameter, with flanges included, and have white vinyl shower curtain, 1829 mm 72 inches high, and stainless steel curtain hooks. Shower curtain has corrosion resistant grommets, reinforced heading, and treated with antibacterial and flame retardant agents. Shower hooks are stainless steel. Length as indicated on drawings.

2.1.26  **Item A5175** Soap Dish, With Bar, SS, Recessed

Recessed mounted heavy duty stainless steel soap dish with soap lip and bar, of drawn one-piece seamless construction. Exposed surfaces to be satin finish. Soap dish has raised dimples on soap shelf to prevent soap from slipping. Unit includes dry wall clamp and mounting hardware.

Approximate size: 178 mm 7 inches wide by 127 mm 5 inches high by 70 mm 2-3/4 inches deep.

2.1.27  **Item A5195** Dispenser, Toilet Tissue, SS, 1-Roll, Surface Mounted

Concealed surface mounted single roll toilet tissue dispenser of satin finish stainless steel. Spindle to be free-spinning for non-controlled delivery, chrome-plated high impact resistant plastic and equipped with heavy-duty internal spring. Unit accommodates standard core toilet paper roll up to 140 mm 5-1/2 inches diameter. Mounting hardware included.

Approximate size: 197 mm 7-3/4 inches wide by 51 mm 2 inches high by 102 mm 4 inches deep.

2.1.28  **Item A5196** Dispenser, Toilet Tissue, Psychiatric

Recessed toilet tissue roll holder. Unit constructed of stainless steel
with satin finish. Rim of holder to be beveled to insure tight fit to wall surface. Back mounting plate of galvanized steel to have welded anchor nuts to receive threaded studs. All mounting hardware included.

][2.1.29 Item A5200 Dispenser, Toilet Tissue, SS, 2-Roll, Surface Mounted

Concealed surface mounted, double roll, toilet tissue dispenser of stainless steel. Unit holds and dispenses two standard 133 mm 5-1/4 inch diameter rolls of toilet tissue. Spindles are free-spinning for non-controlled delivery, chrome-plated plastic equipped with heavy-duty internal springs.

Approximate size: 178 mm 7 inches diameter by 102 mm 4 inches deep.

][2.1.30 Item A5202 Dispenser, Toilet Paper w/Utility Shelf, SS, 2-Roll

Concealed surface mounted, double roll, toilet tissue dispenser and utility shelf of satin finish stainless steel. Mounting brackets to be welded to shelf. Unit holds two standard 133 mm 5-1/4 inch diameter rolls of toilet tissue. Spindles are free-spinning for non-controlled delivery, high impact-resistant plastic equipped with internal springs. Edges of shelf is 13 mm 1/2 inch, with hemmed lip on front edge for safety.

Approximate size of shelf: 457 mm 18 inches wide by 127 mm 5 inches deep.

][2.1.31 Item A5205 Bar, Towel, 25 mm (1 inch) Diameter, SS, Surface Mounted

Surface mounted satin finish stainless steel towel bar of 25 mm 1 inch diameter. Support posts fabricated of heavy solid cast brass with satin finish. Stainless steel set screw keeps bar from rotating in posts. Clearance between towel bar and wall is 38 mm 1-1/2 inches.

][2.1.32 Item A5207 Bar, Towel, 25 mm 1-Inch Diameter, SS, Surface Mounted, Psychiatric

Concealed surface mounted 25 mm 1 inch diameter satin finish stainless steel towel bar with peened gripping surface. Flanges for concealed mounting made of stainless steel. Bent ends of tubing pass through flanges and be Heliarc welded to tubing. Mounting kits and concealed anchoring devices are available from the manufacturers for different types of installations. Clearance between towel bar and wall is 38 mm 1-1/2 inches. Towel bar installed to meet or exceed ADA guidelines.

][2.1.33 Item L1200 Cabinet, Specimen, Pass-Through, CRS

Pass-through specimen cabinet of all welded stainless steel construction with burr-free edges and all exposed surfaces in satin finish. Flanges of one-piece seamless stainless steel in satin finish. Each door is spring-loaded and secured to cabinet with full-length stainless steel piano hinge. Doors equipped with pull knob, international decal identifying usage, and interlocking mechanism which prevents both doors from being open simultaneously. Unit has spill tray of stainless steel with welded seams.

Approximate size: 330 mm 13 inches wide by 305 mm 12 inches high by 152 mm 6 inches deep.
PART 3   EXECUTION

3.1   INSTALLATION

Do not install items that show visual evidence of biological growth. Provide the same finish for the surfaces of fastening devices exposed after installation as the attached accessory. Provide oval exposed screw heads. Install accessories at the location and height indicated. Protect exposed surfaces of accessories with strippable plastic or by other means until the installation is accepted. After acceptance of accessories, remove and dispose of strippable plastic protection. Coordinate accessory manufacturer's mounting details with other trades as their work progresses. [Use sealants for brackets, plates, anchoring devices and similar items in showers (a silicone sealant as specified in Section 07 92 00 JOINT SEALANTS) as they are set to provide a watertight installation.] After installation, thoroughly clean exposed surfaces and restore damaged work to its original condition or replace with new work.

3.1.1   Recessed Accessories

Fasten accessories with wood screws to studs, blocking or rough frame in wood construction. Set anchors in mortar in masonry construction. Fasten to metal studs or framing with sheet metal screws in metal construction.

3.1.2   Surface Mounted Accessories

******************************************************************************
NOTE: Shelf support brackets and through-bolting of accessories should be required and indicated on the project drawings when rough usage of accessories is anticipated. Attachment by through-bolting should be indicated for shelf brackets and mirrors.
******************************************************************************

Mount on concealed backplates, unless specified otherwise. Conceal fasteners on accessories without backplates. Install accessories with corrosion-resistant fasteners as required by the construction. Install backplates in the same manner, or provide with lugs or anchors set in mortar, as required by the construction. Fasten accessories mounted on gypsum board and plaster walls without solid backing into the metal or wood studs, or to backplates secured to metal studs.

3.2   CLEANING

Clean material in accordance with manufacturer’s recommendations. Do not use alkaline or abrasive agents. Take precautions to avoid scratching or marring exposed surfaces.

NOTE: This guide specification covers the requirements for portable fire extinguishers, including wall brackets, accessories, maintenance servicing and inspection tagging requirements.

Portable fire extinguishers cannot be purchased by military construction contracts.

Associated work found in other sections includes non-portable fire protection systems, alarms and related accessories.

Consult with the local AHJ (Authority Having Jurisdiction) during design stage. Indicate on drawings the locations for proper placement and each type of portable extinguisher located within the installation.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.
The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

- Fire Extinguishers; G[, [____]]
- Accessories; G[, [____]]
- Cabinets; G[, [____]]
- Wall Brackets; G[, [____]]
- Schedule; G[, [____]]

**SD-03 Product Data**

- Fire Extinguishers; G[, [____]]
- Accessories; G[, [____]]
- Cabinets; G[, [____]]
- Wall Brackets; G[, [____]]
- Replacement Parts List; G[, [____]]

**SD-04 Samples**

- Equipment Samples; G[, [____]]

**SD-07 Certificates**

- Fire Extinguishers Certifications; G[, [____]]
- Manufacturer's Warranty with Inspection Tag; G[, [____]]

1.3 DELIVERY, STORAGE, AND HANDLING

Protect materials from weather, soil, and damage during delivery, storage, and construction.

Deliver materials in their original packages, containers, or bundles.
bearing the brand name and the name and type of the material.

[ Provide portable fire extinguishers in compliance with NFPA 505 for all ancillary vehicles where Fire Safety Standard for Powered Industrial Trucks, including type designations, special conditions relating to areas of use, conversions, maintenance, or specific operations apply.]

1.3.1 Samples

**************************************************************************
NOTE: Consider requesting the samples that are critical only.
**************************************************************************

Provide the following equipment samples: One of each type of fire extinguisher being installed; one full-sized sample of each type of cabinet being installed; three samples of wall brackets and accessories of each type being used.

Use approved samples for installation, with proper identification and storage.

1.4 WARRANTY

**************************************************************************
NOTE: Warranties for fire extinguishers are typically 6 years.
**************************************************************************

Guarantee that Fire Extinguishers are free of defects in materials, fabrication, finish, and installation and that they will remain so for a period of not less than [_____] years after completion.

Submit the manufacturer's warranty with inspection tag.

1.5 PROJECT SCHEDULE

For fire extinguishers. Coordinate final fire extinguisher schedule with fire protection cabinet schedule to ensure proper fit and function. Use same designations indicated on Drawings.

PART 2 PRODUCTS

Submit fabrication drawings consisting of fabrication and assembly details performed in the factory and product data for the following items: Fire Extinguishers; Accessories, cabinets, Wall Brackets.

2.1 SYSTEM DESCRIPTION

2.1.1 Types

**************************************************************************
NOTE: Select one or more of the following types of pressurized fire extinguishers, as required:
**************************************************************************

Water and Foam – Water extinguishers are for Class A fires only (paper, wood, cloth).

Foam extinguishers are for Class A and B fires only
(common combustibles, flammable liquids and gases).

Carbon Dioxide - Carbon Dioxide extinguishers can be used on Class B and C fires (flammable liquids and gases, live electrical equipment).

Dry Chemical - Dry Chemical extinguishers can be used on Class A, B, and C fires (all the above elements) (not recommended for computers or sensitive electrical equipment - use clean agent or Carbon Dioxide).

Wet Chemical - Wet Chemical extinguishers are primarily for cooking media fires (high temperature oils and fats) (some may also be used on Class A fires in commercial kitchens).

Clean Agent - Newer Clean Agent extinguishers have replaced former halogenated extinguishers with less ozone depleting halocarbon agents, for Class B and C fires, with some larger units available for use on Class A, B, and C fires.

Dry Powder - Dry Powder extinguishers are for Class D or combustible metal fires only.

Water Mist - Water Mist extinguishers are primarily for Class A fires, although they are also safe for use in Class C fires.

The International Fire Code is a good source for explanations of the various fire extinguishers requirements.

**************************************************************************

Submit fire extinguishers certifications showing compliance with local codes and regulations.

[Provide [stored-pressure] [cartridge] [hand-pump] water type fire extinguishers.

][Provide [foam] type fire extinguishers.

][Provide carbon-dioxide type fire extinguishers compliant with UL 154.

][Provide dry chemical type fire extinguishers compliant with UL 299.

][Provide wet chemical type fire extinguishers compliant with UL 8.

][Provide clean agent type fire extinguishers compliant with UL 2129.

][Provide dry powder type fire extinguishers.

][Provide water mist type fire extinguishers compliant with UL 626.
2.1.2 Material

**************************************************************************
NOTE: Select one or more of the following for the shell material. Check manufacturers to ensure that the material and extinguisher type are compatible.
**************************************************************************
Provide [corrosion-resistant steel] [aluminum] [enameled steel] [_____] extinguisher shell.

2.1.3 Size

**************************************************************************
NOTE: Select one or more of the following for the size of the extinguisher. Size as indicated. The heavier the extinguisher, the more difficult it will be to lift and carry.
**************************************************************************
[ 9.5 liter 2 1/2 gallons extinguishers.
][1.1 kilogram 2 1/2 pounds extinguishers.

2.1.4 Accessories

**************************************************************************
NOTE: Select items as applicable. Indicate appropriate UL rating.
**************************************************************************
[ Forged brass valve
][ Fusible plug
][ Safety release
][ Antifreeze
][ Pressure gage

2.2 EQUIPMENT

2.2.1 Cabinets

**************************************************************************
NOTE: Include the following paragraphs if fire extinguishers are designated as cabinet mounted. If fire extinguishers are to be hung on wall brackets only, then delete cabinet requirements.
**************************************************************************

2.2.1.1 Material

**************************************************************************
NOTE: Select one of the following materials for cabinets.

Provide [enameled steel] [corrosion-resistant steel] [aluminum] cabinets.

2.2.1.2 Type

NOTE: Select one of the following types.

[ Provide [recessed] [trimless] [surface] type cabinets.
][Provide [recessed] [trimless] [surface] bubble type cabinets.
][Provide a fire rated cabinet, listed and labeled to comply with ASTM E814 for fire resistance wall rating.]

NOTE: Coordinate type and capacity of fire extinguishers with fire protection cabinets to ensure fit and function. According to NFPA 10, maximum mounting height for fire extinguishers weighing 18 kg 40 lb or less is 1.5 meters 60 inches from finished floor to top of extinguisher; for those weighing more, it is 1 meter 42 inches from finished floor to top of extinguisher.

2.2.1.3 Size

Dimension cabinets to accommodate the specified fire extinguishers.

2.2.2 Wall Brackets

NOTE: Delete the paragraph heading and the following paragraphs if cabinets are specified.
Select one of the following.

Provide [running-board][ spring-clip][ wall-hook] fire extinguisher wall brackets.

Provide wall bracket and accessories as approved.

2.2.2.1 Identification

Provide lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated by the drawings.

Identify bracket-mounted fire extinguishers with the words "FIRE EXTINGUISHER" in red letter decals applied to mounting surface.

Orientation: [Vertical][Horizontal].
PART 3   EXECUTION

3.1  INSTALLATION

**************************************************************************
NOTE: For Class A light-hazard occupancies, such as office buildings, use a Class A extinguisher within a 25 meter 75 foot travel distance with one unit of 1A rating for every 280 square meter 3,000 square feet of floor area; ordinary hazard occupancies such as warehouses and department stores: 25 meter 75 foot travel distance with one unit of 2A rating for every 280 square meter 3,000 square feet; and extra hazard occupancies such as woodworking and spray painting locations: 25 meter 75 foot travel distance with one unit of 3A rating for every 280 square meter 3,000 square feet.

For Class B light-hazard occupancies, use a Class B extinguisher within 15 meter 50 foot travel distance with one unit of 4B rating; ordinary hazard occupancies: 15 meter 50 foot travel distance with one unit of 8B rating; extra hazard occupancies: 15 meter 50 foot travel distance with one unit of 12B rating. For deep-layer flammable-liquid fire hazards such as dip tanks, one unit of Class B extinguishing potential is required for each 0.1 square meter square foot of the largest individual hazard unless an approved automatic system is installed.

Class C extinguishers, where there are electrical hazards, are distributed on the same basis as Class B extinguishers.

Coordinate types and locations with the Life Safety Drawings. Comply with ADA-ABA Guidelines, mounting height for fire extinguishers is not to exceed 1.2 meters 48 inches to the handle.
**************************************************************************

Install Fire Extinguishers where indicated on the drawings. Verify exact locations prior to installation.

Provide extinguishers which are fully charged and ready for operation upon installation. Provide extinguishers complete with Manufacturer's Warranty with Inspection Tag attached.

Install fire extinguishers in locations indicated and in compliance with requirements of authorities having jurisdiction.

Comply with the manufacturer's recommendations for all installations.

3.2  PROTECTION

3.2.1  Repairing

Remove and replace damaged and unacceptable portions of completed work with
new work at no additional cost to the Government.

Submit replacement parts list indicating specified items replacement part, replacement cost, and name, address and contact for replacement parts distributor.

3.2.2 Cleaning

Clean all surfaces of the work, and adjacent surfaces which are soiled as a result of the work. Remove from the site all construction equipment, tools, surplus materials and rubbish resulting from the work.

1.3 DELIVERY, HANDLING, AND STORAGE

Deliver lockers and associated materials in their original packages, containers, or bundles bearing the manufacturer's name and the name of the material. Protect from weather, soil, and damage during delivery, storage, and construction.

1.4 FIELD MEASUREMENTS

To ensure proper fits, make field measurements prior to the preparation of drawings and fabrication. Verify correct location

1.5 QUALITY ASSURANCE

1.5.1 Color Chips

Provide a minimum of three color chips, not less than 75 mm 3 inches square, of each color [scheduled] [indicated].

Government may request performance-characteristic tests on assembled lockers. Tests and results must conform to FS AA-L-00486. Lockers not conforming will be rejected.

PART 2 PRODUCTS

2.1 TYPES

**************************************************************************

NOTE: Locker type and quantities must be indicated.
Locker must have the following type and size in the location and quantities indicated. Locker finish colors will be as scheduled.

2.1.1 Single-tier Lockers

Single-tier lockers must be as follows:

**************************************************************************
NOTE: Delete the paragraph heading and the following paragraphs if single-tier lockers are not required.
Select from the following for single-tier lockers with legs to suit the project. Delete inapplicable paragraphs.
**************************************************************************

[ Type STL-1: Single-tier locker 380 millimeter wide, 380 millimeter deep, and 1830 millimeter high 15 inches wide, 15 inches deep, and 72 inches high, attached to 150 millimeter 6-inch high legs]

[ Type STL-2: Single-tier locker 380 millimeter wide, 457 millimeter deep, and 1830 millimeter high 15 inches wide, 18 inches deep, and 72 inches high, attached to 150 millimeter 6-inch high legs]

[ Type STL-3: Single-tier locker 457 millimeter wide, 533 millimeter deep, and 1830 millimeter high 18 inches wide, 21 inches deep, and 72 inches high, attached to 150 millimeter 6-inch high legs]

[ Type STL-4: Single-tier locker 457 millimeter wide, 610 millimeter deep, and 1830 millimeter high 18 inches wide, 24 inches deep, and 72 inches high, attached to 150 millimeter 6-inch high legs]

**************************************************************************
NOTE: Select from the following for single-tier lockers with a closed base to suit the project. Delete inapplicable paragraphs.
**************************************************************************

[ Type STC-1: Single-tier locker 380 millimeter wide, 380 millimeter deep, and 1830 millimeter high 15 inches wide, 15 inches deep, and 72 inches high, attached to 150 millimeter 6-inch closed base]

[ Type STC-2: Single-tier locker 380 millimeter wide, 457 millimeter deep, and 1830 millimeter high 15 inches wide, 18 inches deep, and 72 inches high, attached to 150 millimeter 6-inch high closed base]

[ Type STC-3: Single-tier locker 457 millimeter wide, 533 millimeter deep, and 1830 millimeter high 18 inches wide, 21 inches deep, and 72 inches high, attached to 150 millimeter 6-inch high closed base]

[ Type STC-4: Single-tier locker 457 millimeter wide, 610 millimeter deep, and 1830 millimeter high 18 inches wide, 24 inches deep, and 72 inches high, attached to 150 millimeter 6-inch high closed base]
lockers without a base to be installed on a prebuilt base. Base must be detailed on the drawings.

**************************************************************************

Type STW-2: Single-tier locker 380 millimeter wide, 457 millimeter deep, and 1830 millimeter 15 inches wide, 18 inches deep, and 72 inches high, without base]

Type STW-3: Single-tier locker 457 millimeter wide, 533 millimeter deep, and 1830 millimeter 18 inches wide, 21 inches deep, and 72 inches high, without base]

Type STW-4: Single-tier locker 457 millimeter wide, 610 millimeter deep and 1830 millimeter 18 inches wide, 24 inches deep, and 72 inches high, without base]

2.1.2 Double-Tier

Double-tier lockers must be as follows:

**************************************************************************

NOTE: Delete the paragraph heading and the following paragraphs if double-tier lockers are not required.

Select from the following for double-tier lockers with legs to suit the project. Delete inapplicable paragraphs.

**************************************************************************

Type DTL-1: Double-tier locker 380 millimeter wide, 380 millimeter deep, and 1830 millimeter 15 inches wide, 15 inches deep, and 72 inches high, attached to 150 millimeter 6-inch high legs

Type DTL-2: Double-tier locker 380 millimeter wide, 457 millimeter deep, and 1830 millimeter 15 inches wide, 18 inches deep, and 72 inches high, attached to 150 millimeter 6-inch high legs

**************************************************************************

NOTE: Select from the following for double-tier lockers with a closed base to suit the project. Delete inapplicable paragraphs.

**************************************************************************

Type DTC-1: Double-tier locker 380 millimeter wide, 380 millimeter deep, and 1830 millimeter 15 inches wide, 15 inches deep, and 72 inches high, attached to a 150 millimeter 6-inch high closed base

Type DTC-2: Double-tier locker 380 millimeter wide, 457 millimeter deep, and 1830 millimeter 15 inches wide, 18 inches deep, and 72 inches high, attached to a 150 millimeter 6-inch high closed base

**************************************************************************

NOTE: Select from the following for double-tier lockers without a base to be installed on a prebuilt base. Base details must be detailed.

**************************************************************************
2.2 MATERIAL

2.2.1 [Galvanized] Steel Sheet

**************************************************************************
NOTE: Choose one of the following options.
**************************************************************************

**************************************************************************
NOTE: Delete the word "Galvanized" in paragraph title and choose the first optional paragraph for normal applications where moisture is not a problem.
**************************************************************************

[[ASTM A1008/A1008M] [ASTM A568/A568M], commercial quality, minimized spangle material. Prepare material surfaces for [baked enamel] [_____] finishing in accordance with FS AA-L-00486. [Fabricate locker bodies from not less than 0.607 millimeter 0.0239-inch thick steel sheet.][Minimum uncoated sheet thickness [as specified] [_____].]]

**************************************************************************
NOTE: Include the word "Galvanized" in the paragraph title and choose this option for lockers located in high moisture areas such as shower rooms.
**************************************************************************

[[ASTM A653/A653M and ASTM A924/A924M], commercial quality, minimized spangle, galvanized steel sheet with not less than 2275 G60 zinc coating. Prepare surface of sheet for painting in accordance with ASTM D6386, Method A. Minimum uncoated sheet thickness [as specified] [_____].]

2.2.2 Chromium Coating

Nickel and chromium electrodeposited on the specified base metal. Conform to ASTM B456, SC-3, as applicable to the base metal.

2.2.3 Finish

**************************************************************************
NOTE: Standard finish in FS AA-L-00486 is gray, baked enamel. Use the first paragraph when baked enamel finish is required. Use the second paragraph for epoxy-based primer and topcoat coatings.
**************************************************************************

[FS AA-L-00486.]

2.2.3.1 Color
As selected.

2.3 COMPONENTS

**************************************************************************
NOTE: Delete items from the following paragraphs that are not required on the project.
**************************************************************************

2.3.1 Built-In Locks

**************************************************************************
NOTE: FS AA-L-00486 includes built-in locks as standard items. It includes built-in key locks and built-in combination locks. It also includes a padlock eye in the door latching mechanism. If built-in locks are required, use the first paragraph and delete the second.
**************************************************************************

[FS AA-L-00486. Provide locking devices as [built-in key locks] [built-in combination locks] [and] [a padlock eye in the door latching mechanism].][Submit Lock Control Chart showing each lock required for the project, the locker identification plate number, and the lock combination.]

**************************************************************************
NOTE: If built-in locks are not required, use the following and delete the above.
**************************************************************************

[Built-in locks are not required.]

2.3.2 Coat Hooks

FS AA-L-00486, [chromium] [zinc] plated.

2.3.3 Hanger Rods

FS AA-L-00486.

2.3.4 Door Handles

**************************************************************************
NOTE: FS AA-L-00486 allows aluminum alloy, zinc alloy or steel handles. Aluminum handles are required to have satin anodized finish. Zinc alloy and steel handles are required to have chromium or nickel plated finish.
**************************************************************************

FS AA-L-00486. [Provide zinc alloy or steel handles with a chromium coating.]

2.3.5 Doors

FS AA-L-00486, not less than 1.5 mm 0.0598 inch thick steel sheet.
2.3.5.1 Hinges

In addition to the requirements of FS AA-L-00486, provide 5-knuckle hinges, minimum 50 mm 2 inches high. Fabricate knuckle hinges from not less than 2 mm 0.0787 inch thick steel sheet. [A full height piano hinge may be provided if standard with the manufacturer.] Weld or bolt hinges to the door frame. Weld, bolt, or rivet hinges to the door.

2.3.5.2 Latching Mechanisms

FS AA-L-00486.

2.3.6 Latch Strikes

FS AA-L-00486. Fabricate from not less than 2 mm 0.0787 inch thick steel sheet, except latch strike may be continuous from top to bottom and fabricated as part of the door framing.

2.3.7 Silencers

FS AA-L-00486.

2.3.8 Back and Side Panels, Tops, and Bottoms

FS AA-L-00486, not less than 1.2 mm 0.0474 inch thick steel sheet.

2.3.9 Sloping Locker Tops

Provide sloping locker tops in addition to the locker-section flat tops. Sloping tops must be continuous in length. Provide fillers or closures at the exposed end of sloping tops. Fabricate sloping tops from not less than 1.214 millimeter 0.0478-inch thick steel sheet.

2.3.10 Shelves

FS AA-L-00486. Fabricate from not less than 1.5 mm 0.0598 inch thick steel sheet.

2.3.11 [Base Panels]

******************************************************************************
NOTE: Base panels must be specified if required.
If none are required, delete this paragraph.
******************************************************************************

FS AA-L-00486.

2.3.12 Legs

******************************************************************************
NOTE: FS AA-L-00486 normally includes legs unless specified otherwise.
******************************************************************************

[FS AA-L-00486.] [Provide lockers without legs, as indicated.]

2.3.13 Number Plates

******************************************************************************
NOTE: Choose one of the following.

Requirements for number plates are included in FS AA-L-00486. Select material requirement and range of numbers.

[FS AA-L-00486. [Aluminum] [Brass] [Zinc]. Provide consecutive numbers from [_____] to [______].]

NOTE: If number plates are not required, use this paragraph and delete the above.

[Number plates are not required.]

2.3.14 Label Holders

If label holders are required, identify the system of numbering. Otherwise, delete.

FS AA-L-00486.

2.3.15 Fastening Devices

Provide bolts, nuts, and rivets as specified in FS AA-L-00486.

PART 3 EXECUTION

3.1 ASSEMBLY AND INSTALLATION

Assemble lockers according to the locker manufacturer's instructions. Align lockers horizontally and vertically. Secure lockers to wall [and base] with screws as indicated. Bolt adjacent lockers together. Adjust doors to operate freely without sticking or binding and to ensure they close tightly.

3.2 NUMBERING SYSTEM

If lockers require number plates, identify the system of numbering. Otherwise, delete this paragraph.

Install number plates on lockers consecutively [with odd numbers on top and even numbers on bottom] [as indicated] [______].

3.3 FIELD QUALITY CONTROL

3.3.1 Testing

Government may request performance-characteristic tests on assembled lockers in accordance with FS AA-L-00486. Lockers not conforming will be
rejected.

3.3.2 Repairing

Remove and replace damaged and unacceptable portions of completed work with new.

3.3.3 Cleaning

Clean surfaces of the work, and adjacent surfaces soiled as a result of the work, in an approved manner. Remove equipment, surplus materials, and rubbish from the site.

NOTE: This guide specification covers the requirements for hand loaded steel shelving units.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Show the following information on the project drawings.

1. Location, length, and type of shelving units.
2. Aisle layout
3. Loading and accessories
4. Mounting and anchorage requirements or details.

PART 1   GENERAL

1.1  REFERENCES
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

MATERIAL HANDLING INDUSTRY OF AMERICA (MHI)

1.2 DEFINITIONS

For the purposes of this specification the shelf category, "medium weight," "heavy weight," will be as follows. Load is given per shelf in kilograms for evenly distributed load. This does not limit the shelf size, only the shelving category.

<table>
<thead>
<tr>
<th>Shelf Size</th>
<th>Type Medium Duty</th>
<th>Type Heavy Duty</th>
</tr>
</thead>
<tbody>
<tr>
<td>450 by 900 mm</td>
<td>320</td>
<td>590</td>
</tr>
<tr>
<td>450 by 1200 mm</td>
<td>230</td>
<td>410</td>
</tr>
</tbody>
</table>
### Minimum Evenly Distributed Load Per Shelf in Pounds

<table>
<thead>
<tr>
<th>Shelf Size</th>
<th>Type Medium Duty</th>
<th>Type Heavy Duty</th>
</tr>
</thead>
<tbody>
<tr>
<td>18 by 36 in.</td>
<td>700</td>
<td>1300</td>
</tr>
<tr>
<td>18 by 48 in.</td>
<td>500</td>
<td>900</td>
</tr>
</tbody>
</table>

#### 1.3 SUBMITTALS

**NOTE**: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials in original packages, containers or bundles bearing the brand name and identification of the manufacturer. Store inside under cover. Protect surfaces from damage.

PART 2 PRODUCTS

2.1 MANUFACTURED UNITS

**MHI MH28.1.** Provide shelving units [indicated] [scheduled]. Provide shelving units designed for full dead and live load, designated [medium duty] [heavy duty]. [Provide units with base plates for floor anchorage indicated.] [Provide wall connections for units over 2500 mm 8 feet 3 inches to top shelf.] [Provide floor and wall anchorages for units in Seismic Zone 3 or 4. Provide door and drawer earthquake stops.] [Provide wall connections for drawer units if necessary.]

2.2 ACCESSORIES

a. Drawers, 180 kg 400 pound capacity, and mounting brackets
b. Partitions and dividers
c. Label holder [56 by 20 mm] [75 by 125 mm] [2 1/4 by 3/4 inches] [3 by 5 inches].

2.3 FINISH

**************************************************************************
NOTE: Specify special finish only if the conditions of use are particularly harsh. Any finish other than the manufacturer’s standard will be very expensive.
**************************************************************************

Provide the shelving units in the manufacturer's standard colors [as indicated] [as chosen by the Contracting Officer]. Clean metal by multiple stage phosphatizing and sealing process, for rust resistance and paint...
adhesion. Provide electrostatically applied enamel finish coats, baked hard for a minimum of 30 minutes at 149 degrees C 300 degrees F. [Provide special finish meeting the flexibility, adhesion, and impact standards below.]

2.4 SOURCe QUALITY CONTROL

   a. MHI MH28.1, for tests of shelf capacity, lateral stability and shelf connections.

   [b. Finish flexibility, ASTM D522/D522M, Method A, 3 mm 1/8 inch diameter, 180 degree bend, no evidence of fracturing to the naked eye.]

   [c. Finish adhesion, ASTM D3359, Method B. There shall be no film removed by tape applied to 11 parallel cuts space 3 mm 1/8 inch apart plus 11 similar cuts at right angles.]

   [d. Impact resistant finish, ASTM D2794, no loss of adhesion after direct and reverse impact equal to 1.5 times metal thickness in mm, expressed in N.m inch pounds.]

PART 3 EXECUTION

3.1 EXAMINATION

Before installation, examine shelving units for dents and scratches. Replace damaged shelving.

3.2 INSTALLATION

Install shelving according to manufacturer's installation instructions. [Make wall and floor connections as indicated.]

3.3 PROTECTION

Cover and protect shelving from damage during the completion of construction. Remove prior to acceptance of project.

3.4 [SCHEDULE

**************************************************************************
NOTE: Put on contract drawings by preference.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ARCHITECTURAL MANUFACTURERS ASSOCIATION (AAMA)

AAMA 611  (2014) Voluntary Specification for Anodized Architectural Aluminum

ASTM INTERNATIONAL (ASTM)

ASTM A653/A653M  (2023) Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

1.2 DEFINITIONS

1.2.1 Tropical Cyclones

Tropical Cyclone is a terminology for storms of cyclonic atmospheric conditions originating over tropical waters. The following are international classifications for tropical cyclones:

a. Tropical disturbance: Thunderstorms in the tropics for 24 hours or more.
b. Tropical depression: Wind speed 61 km/hr 38 miles per hour (33 knots) or less.
c. Tropical storm: Wind speed range of 63 to 117 km/hr 39 to 73 miles per hour (34 to 63 knots).
d. Hurricane: Wind speed 119 km/hr 74 miles per hour or more (64 knots).

1.2.2 Weather Warnings

Weather warnings are issued for expected wind velocities. The following are international terminologies issued for weather warnings:

a. Gale warnings: Issued for expected wind velocity of 63-87 km/hr 39-54 miles per hour (34-47 knots).
b. Storm warnings: Issued for expected wind velocity of 89-117 km/hr 55-73 miles per hour (48-63 knots).
c. Hurricane watch: Issued for hurricane conditions within 36 hours.
d. Hurricane warning: Issued for sustained winds of 119 km/hr 74 miles per hour (64 knots) expected in 24 hours or less.

1.2.3 Wind Velocities

Wind velocities for tropical cyclones and weather warnings are measurements taken 10 meters 32 feet 10 inches above ground level.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or
complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Roll shutters

Accordion shutters

Hinged louvered shutters

Removable shutters

Submit plans coordinated with shutter schedule, elevations of shutter units, half-sized sections, thickness and gages of materials, fastenings, method of anchorage, size and spacings of anchors, and location of hardware. Include frame and mullion details, details of installation, and connection to other work, including details of adjacent window and wall construction.

Schedule of shutters

Identification numbers, locations, sizes, and types of shutters.

SD-03 Product Data

Roll shutters

Accordion shutters
Hinged louvered shutters

Removable shutters

Submit for shutters and accessories.

SD-04 Samples

Shutters; G[, [_____]]

Where colors are not indicated, submit no less than [3] [_____] different samples of the manufacturer's standard colors for selection.

SD-10 Operation and Maintenance Data

Shutters; ; G[, [_____]]

Submit data package in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

[ SD-11 Closeout Submittals

Removable shutter location drawings

Submit preliminary shutter location drawings following removable shutter work. Deliver two [_____] sets of the final drawings and originals to the Contracting Officer. The two drawings shall be framed and plastic glazed.]

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver products to the project site in undamaged condition. Store products out of contact with the ground, under weathertight covering, and protect against damage. Damaged shutters shall be repaired to an "as new" condition as approved by the Contracting Officer. If shutters cannot be repaired, the Contractor shall replace the damaged units.

</tbody>
</table>

The above velocity pressures are provided as a guide and are based on ASCE 7-16 at a height of 10 m 33 feet above ground level for a building less than 18 m 60 feet or less in height. The building is a fully enclosed, Category II, and sited on level ground.

2. Load Information Sources:
UFGS

Storm shutters shall be fabricated and reinforced to withstand a minimum wind load \([1][1.4][2][3.8][5.5][_____] \text{kPa} [20][30][40][80][115][_____] \text{pounds per square foot}. The maximum allowable deflection is \(1/30\) of the opening width or \(50 \text{ mm} 2 \text{ inches}\), whichever is less. The maximum deflection shall be a minimum of \(25 \text{ mm} 1 \text{ inch}\) from the window glass.

1.6 [STORM READINESS REQUIREMENTS]

1.6.1 Removable Shutter Location Drawings

Provide shutter location drawings for the custodian to install the removable shutters in designated locations during a weather warning period. Prepare drawings if there is more than one panel size or the total number of panels exceeds five.

a. The removable shutter location drawings must include a floor plan and a shutter schedule.

b. The drawings will be computer generated quality.

c. Maximum drawing sheet size will be "A1" size, 841 mm by 594 mm "D" size, 24 by 36 inches.

]PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Aluminum

AAMA/WDMA/CSA 101/I.S.2/A440 and ASTM B221M ASTM B221.

2.1.2 Polyvinyl Chloride (PVC)

ASTM D4216.

2.2 SHUTTERS

2.2.1 Roll Shutters

2.2.1.1 Slats

[a. Aluminum slats. Extruded aluminum 6063-T6, double wall slats, curved profile \(12.7 \text{ mm} 0.50 \text{ inch} [_____] \text{ thick and} 50 \text{ mm} 2 \text{ inches} [_____] \text{ wide}, with bottom bars complete with weatherseal. Maximum wall thickness of \(1.3 \text{ mm} 0.50 \text{ inch}]\)
[b. Polyvinyl Chloride (PVC) Slats. Reinforced double wall extruded slats, curved profile of 12 mm 0.50 inch [_____] thick and 50 mm 2 inches [_____] wide with bottom slat or bar complete with weather seal. Minimum wall thickness of one mm 0.04 inch. Color shall be uniform through the thickness of the PVC slats.]

2.2.1.2 Housing

Aluminum one mm 0.04 inch thick with cast aluminum end frame covers.

2.2.1.3 Frame and Tracks

Extruded aluminum alloy, 6063-T6, standard with the manufacturer.

2.2.1.4 [ Structural Supports

Provide storm bar assembly of [_____] [purlins] [, header frames] [and] [mullions] of aluminum tube extrusions, 6063-T5, as indicated. Finish shall be the same as the frame and tracks.

2.2.1.5 Reel and Counterbalance Assembly

a. Extruded aluminum reel, 6063-T.

b. Spring barrel or shaft shall be corrosion resistant metal of sufficient strength with maximum deflection of 0.7 mm per 300 mm 0.03 inch per foot of span. Barrel or shaft shall house oil-tempered, helically wound steel spring. Springs shall be adjustable.

2.2.1.6 Locking Device

The operation of the roll shutter shall automatically hold the shutters in a closed position. [Provide non-key locking device to hold shutter in closed position.] The shutter shall be closed from the [inside] [outside].

2.2.1.7 [ Manual Operation

a. Manual Strap Operator shall be a [recoil strap, 3-1 strap crank] [____]. [Locate the operator as indicated.]

b. Pole Crank Operator shall be fully encased with self-lubricating hardened steel gears. The crank shall be [fixed] [removable] and located as indicated.

2.2.1.8 [ Electrical Operation

**************************************************************************
NOTE: Verify with the Fire Protection Engineer on existing requirements when using electrical operating shutters without manual releases.
**************************************************************************

a. Motor will be [110] [120] volt, 60 Hz UL listed, thermally protected.

b. Provide for manual override operation in the event of power failure.

c. Provide conduit, wiring, and mounting of controls in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.
2.2.1.9 Accessories

Provide shutters complete with hardware, stainless steel fasteners, anchors, and other items necessary for complete installation, resist windloads and corrosion for proper operation.

2.2.2 Accordion Shutters

c. Locking device. Provide heavy duty non-key locking device. Accordion shutters shall be locked from the [inside] [outside].

d. Accessories. Stainless steel wheel carriers, heavy duty nylon wheels, nylon guides, stainless steel fasteners, and other accessories for complete installation, resist design windloads, and proper shutter operation.

2.2.3 Hinged Louvered Shutters

a. Louvered Panels. ASTM B221M ASTM B221. Aluminum alloy, 6063-T5/T6. Extruded louvered blades and frames shall have minimum thickness of 1.2 mm 0.05 inch. Allow minimum space between horizontal louver blades.

b. Storm Bars. Storm bars shall be of same material as louvers or fabricated of metal compatible with the louvered panels. Storm bars shall be secured with locking device.

c. Accessories. Provide hinges, holders, fasteners, and other accessories to resist design windloads and for proper shutter operations. Accessories shall be stainless steel.

2.2.4 Removable Shutters

**************************************************************************
**NOTE: Clips are not acceptable in certain areas in Florida. Verify approval requirements with local governmental agencies.**
**************************************************************************

Provide material gages of frames [, clips] and panel assemblies to meet wind velocity requirements as recommended by the manufacturer.

a. Panels. Fabricate to sizes indicated on drawings of aluminum alloy of 3003-H16. Panel thickness shall be [0.7] [1] [1.2] [1.5] mm [0.030] [0.040] [0.050] [0.060] inches [______].

c. Accessories. [Provide spring tempered stainless steel clips.] [Removal shutters shall be installed with stainless steel fasteners.]

d. Shutter Identification Notations. Provide 50 mm 2 inch high
identifying notations on removable panels corresponding to the identifying notations on the shutter locations drawings.

2.3 FINISHES

2.3.1 Aluminum Surfaces

**************************************************************************
NOTE: Specify Architectural Class I finish in highly corrosive environments.
**************************************************************************

Provide exposed aluminum with [mill finish] [factory finish of anodic coating or organic coating].

[a. Anodic Coating: AAMA 611

[Clear (natural), designation AA-M10-C22-A41, Architectural Class I (0.02 mm 0.7 mil or thicker).]

[Integral color-anodized, designation AA-M10-C22-A42, Architectural Class I (0.02 mm 0.07 mil or thicker).]

[Electrolytically deposited color-anodized, designation AA-M10-C22-A44, Architectural Class I (0.02 mm 0.7 mil or thicker).] The finish color shall be [_____] [as indicated].]

[b. Organic Coating

**************************************************************************
NOTE: Specify high-performance finish as an option to Class I anodized.
**************************************************************************

Clean and prime aluminum surfaces. [Powder coated] finish shall be a high performance finish in accordance with AAMA 2604 with total dry film thickness of not less than 0.03 mm 1.2 mil. The finish color shall be [_____] [as indicated].]

2.3.2 Concealed Metal Surfaces

a. Concealed [metal surfaces shall be stainless steel] [ferrous metal surface shall be hot dipped galvanized].

b. Surfaces to receive a finish shall have a zinc coating, a phosphate treatment, and a shop prime coat of rust-inhibitive paint. The galvanized coating shall conform to ASTM A653/A653M, coating designation products. The prime coat shall be compatible with phosphate treatments and applied by dipping or spraying.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Field Measurement

Field measure for exact dimensions to fabricate shutters [within openings] [and] [on exterior surface of wall].
3.1.2 [Windows]

Verify location of operable window sash to lock shutters from inside the building.

3.2 INSTALLATION

3.2.1 Method of Installation

Install shutters on exterior wall surfaces [and soffits] with stainless steel fasteners and in accordance with manufacturer's printed instructions. Locate the fasteners a minimum of 75 mm 3 inches from the [concrete masonry] [and] [concrete] edge. [as indicated.]

3.2.2 Dissimilar Materials

Where aluminum surfaces are in contact or fastened to masonry, concrete, wood, or dissimilar metals, except stainless steel or zinc, the aluminum surface shall be protected from dissimilar materials as recommended in the Appendix to AAMA/WDMA/CSA 101/I.S.2/A440. Surfaces in contact with sealants after installation shall not be coated with any type of protective material.

3.2.3 [Field Quality Control]

The manufacturer's technical representative shall visit the site as necessary during installation of shutters. Inspections shall be conducted in the presence of the Contracting Officer. An inspection report shall be submitted to the Contracting Officer within 2 working days. The inspection report shall note compliance with manufacturer's instructions and requirements, work quality, deficiencies, and recommended corrective actions.

3.3 ADJUSTING

Test every shutter for ease of operations and lock position in the presence of the Contracting Officer. Lubricate and adjust the roll, accordion, and hinged shutters to operate freely. Adjust the frames of removable shutters to receive the panels.

3.4 SCHEDULE

Metric measurements in this section are based on mathematical conversion of English unit measurement, and not on metric measurement commonly agreed to by the manufacturers or other parties. The English and metric units for the measurements specified are as follows:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for general requirements and common works result for foodservice equipment [for all land-based naval facilities].

Adhere to UFCS-1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Use this section in conjunction with Section 11 06 40.13 FOOD SERVICE EQUIPMENT SCHEDULE; and other foodservice related sections within the project scope, to address general guidelines for the work results expected. Other food service sections include, but are not limited to:

Section 11 41 11 - REFRIGERATED AND FROZEN FOOD STORAGE EQUIPMENT

Section 11 42 00 - FOOD PREPARATION EQUIPMENT

Section 11 44 00 - FOOD COOKING EQUIPMENT

Section 11 46 00 - FOOD DISPENSING EQUIPMENT
Section 11 47 00 - ICE MACHINES
Section 11 48 00 - CLEANING AND DISPOSAL EQUIPMENT
Section 12 35 39 - COMMERCIAL KITCHEN CASEWORK.

PART 1   GENERAL

1.1   REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**NOTE:** This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 GENERAL REQUIREMENTS

**************************************************************************
NOTE: Indicate the configuration and layout for all food service equipment, with interior elevations and equipment identified by number. Show "Food Service Equipment Schedule" on the drawings using the same identification numbers as indicated in Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE. Ensure that all Contractor built-to-order items, per Food Service Equipment Schedule", are shown and coordinated with the specifications.

Designer must coordinate with other sections for final connection of equipment.

NOTE: Details of particular equipment and installations are provided on Naval Food Service Division drawings. Use these NAVFSD drawings as a basis for the project details. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.
**************************************************************************

Provide detailed Food Service Equipment Schedule conforming to DOD 4000.25-1-M.

**************************************************************************
NOTE: If specifying or scheduling major equipment edit and include the following paragraph. Smaller countertop, food prep equipment specified in Section 11 42 00 FOOD PREPARATION EQUIPMENT is not ENERGY STAR labeled.
**************************************************************************

Provide [Major electrically or gas powered] equipment specified within this section, [and] [Section 11 41 11 REFRIGERATED AND FROZEN FOOD STORAGE EQUIPMENT.] [Section 11 44 00 FOOD COOKING EQUIPMENT,][Section 11 46 00 FOOD DISPENSING EQUIPMENT,] [Section 11 47 00 ICE MACHINES,] conforming to EPA Energy Star requirements and labeling. Special purpose equipment must
conform to NSF/ANSI 169, NSF/ANSI 59, and NSF/ANSI 8.[ Provide
documentation conforming to Energy Star as required in Section 01 33 29
SUSTAINABILITY REQUIREMENTS AND REPORTING.]

1.2.1 Mechanical General Requirements

**************************************************************************

NOTE: Designate plumbing fixtures as "P" items on
plumbing drawings with specific requirements added
to Section 22 00 00 PLUMBING, GENERAL PURPOSE.
**************************************************************************

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to
this section. Stainless steel plumbing fixtures must conform to
ASME A112.19.3/CSA B45.4

Section 23 63 00.00 COLD STORAGE REFRIGERATION SYSTEMS applies to this
section.

Section 22 00 00 PLUMBING, GENERAL PURPOSE applies to this section.
Coordinate the location of drainage receptacles with food preparation
equipment requiring plumbing connections. All plastics and piping system
components must conform to NSF/ANSI 14. Materials must conform to
NSF/ANSI 51. Refrigeration equipment must conform to ANSI/ASHRAE 15 & 34,
NSF/ANSI 37, NSF/ANSI 6, NSF/ANSI 7, UL 207, and UL 471.

1.2.1.1 American Gas Association Laboratories Standards

Gas-burning equipment must be designed for operation with the type of gas
specified and be approved by CSA. Acceptable evidence of meeting the
requirements of the applicable CSA Directory standards must be either CSA
mark on equipment, a photostatic copy of the CSA appliance certificate, a
listing of the specific food service equipment or appliance in the
CSA Directory, or a certified test report from a nationally recognized
independent testing laboratory, indicating that the specified equipment has
been tested and conforms to the requirements of the applicable CSA
standards.

1.2.2 Electrical General Requirements

All electrical work must conform to NFPA 70, and NEMA 250. Motors and
controllers must conform to the requirements of NEMA ICS 2, NEMA ICS 6,
NEMA MG 1, NEMA MG 2 and UL 763.

**************************************************************************

NOTE: Select the following for Army.
**************************************************************************

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, applies to this system.

[1.2.3 Electromagnetic Interference Suppression

**************************************************************************

NOTE: Electromagnetic interference suppression is
required only when there is a probability of radio
frequency interference with the using activities
radio communications systems.
**************************************************************************
Provide in accord with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.

][1.2.4 Fungus Treatment of Electrical Components

**************************************************************************
NOTE: Fungus treatment of electrical components is required only in extremely humid and tropical climates.
**************************************************************************

Provide fungus treatment of all electrical components.

]1.3 DESCRIPTION OF WORK

The work includes [furnishing and] [installing] [modifying existing] food service preparation equipment and related work. Verify all existing dimensions, contract drawings, product data and all related conditions prior to commencing rough-in work. Advise the Contracting Officer of all discrepancies prior to ordering equipment. Submit Contractor's Field Verification Data prior to the preconstruction meeting addressing the following:

  a. Field verify all horizontal and vertical dimensions.
  b. Review contract drawings and submittal data for accuracy and completeness.
  c. Field check installed utility capacity and location.
  d. Review critical systems/components for application and capacities such as for exhaust hoods, refrigeration systems, fire suppression systems, gas, water, and steam/condensate line sizes and manifold configurations.
  e. Coordinate and verify delivery for access through finished openings and vertical handling limitation within the building.

Provide rough-in and connect utilities to equipment in accord with requirements specified in other sections of this specification and in accord with the physical dimensions, capacities, manufacturer's instructions, and other requirements of the equipment furnished.

1.3.1 Design Requirements

**************************************************************************
NOTE: On the drawings, show:

1. A 1:50 1/4 inch scale floor plan with layout of all food service equipment and Naval Equipment Symbols.

2. Food Service Equipment Schedule laid out in accord with NAVSUP41, current US Army Quartermaster Center and School equipment schedule specified design requirements, including Energy Star Labeled model list.

3. Floor, wall, and ceiling penetrations.

4. Raised bases, retainer curbs, or depressions.
5. Recessed, grated floor drains required for equipment.

6. Insulated floors, including under-floor perforated drains and vent pipes.

7. Disconnect switches.

8. Electrical chases and raceways and plumbing chases.

9. Utility connections to building water, sanitary, electrical, and other utility systems. Convenience outlets at point of use for plug-in equipment.

10. All Contractor built-to-order items, per Food Service Equipment Schedule, shown and coordinated with the specifications.

Submit detail drawings for all food service and storage equipment. Drawings must be 1:50 1/4 inch scale minimum.

Submit a complete Food Service Equipment Schedule, material data, and drawings as specified. Provide detail drawings showing complete wiring, piping, and schematic diagrams, and any other details required to demonstrate that the system is coordinated and properly functions as a unit. Drawings must show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work, including clearances for maintenance and operation.

a. Detail drawings by Contractor must be separate drawings and be the Contractor's standard sheet size, but not smaller than the contract drawings, indicating food service equipment and cold storage assemblies with itemized schedule, special conditions drawings indicating size and location of slab depressions, cores, wall openings, blockouts, ceiling pockets, blocking grounds, ceiling, wall, access panels, rough-in plumbing/mechanical systems and rough-in electrical systems.

b. Prepare and submit detail drawings that show the size, type, and location of equipment drain lines, and floor drains. Indicate drain lines from equipment, distances of drain lines and floor drain receptacles from equipment and aisles, and elevation views of drain piping and floor drains.

c. Detail drawings by manufacturer must be separate drawings; manufacturer's standard size and indicate item number, name, and quantity, construction details, sections, and elevations, adjacent walls, columns, and equipment, plumbing and electrical schematics, and fabricated fixtures with single electrical or plumbing connection, and service access panels required for maintenance or replacement of mechanical or electrical components.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-01 Preconstruction Submittals**

Contractor's Field Verification Data; G[, [_____]]

Manufacturer's Qualifications; G[, [_____]]

**SD-02 Shop Drawings**

Detail Drawings; G[, [_____]]

Food Service Equipment Schedule; G[, [_____]]

Food Service Equipment Utilities Coordination Plan; G[, [_____]]

Custom Fabricated Equipment; G[, [_____]]

Installation Instructions and Diagrams; G[, [_____]]
SD-03 Product Data

Food Service Equipment
Food Preparation Equipment

Contractor's Warranty for Installation; G[, [______]]

1.5 QUALITY ASSURANCE

**************************************************************************
NOTE: Selected equipment must conform to efficiency requirements as defined in Public Law (PL) 109-58 - "Energy Policy Act of 2005 (EPAct05)" for energy efficiency procurement and as specified by FEMP and ENERGY STAR. Equipment selected will have as a
minimum the efficiency rating determined in "Energy-Efficient Products" at
http://www1.eere.energy.gov/femp/procurement.

Equipment having a lower efficiency may be specified if the designer determines the equipment to be more life-cycle cost effective. Indicate the equipment operating characteristics, including rated energy efficiency, on the drawings.

1.5.1 Energy Star Labeled Model List

Provide documentation certifying that products provided are PL 109-58 compliant by meeting or exceeding Energy Star or FEMP efficiency requirements as defined at "Energy-Efficient Products at http://www1.eere.energy.gov/femp/procurement. Indicate Energy Efficiency Rating. Custom fabricated items, which do not bear the Energy Star label must be accompanied by energy efficiency data and submitted to the Contracting Officer for review.

1.5.2 National Sanitation Foundation Standards

Provide acceptable evidence of meeting the requirements of the applicable National Sanitation Foundation (NSF) equipment standards as listed in NSF Food Equipment displaying the NSF seal for the year the equipment was manufactured, a certification issued for special or specific food service equipment by NSF under their special one time contract evaluation and certification, or a certified test report from an independent testing laboratory, approved by the Office of the Surgeon General, indicating that the specific food service equipment has been tested and conforms to the applicable NSF standards.

1.5.3 Standard Products

Materials and equipment must be the standard products of manufacturer regularly engaged in the manufacture of the products and be essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Applications must be for equipment and materials under similar circumstances and of similar size. When two or more of the same products are supplied they must be products of one manufacturer. Equipment must be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

1.5.4 Nameplates

Provide each item of equipment bearing a stainless steel, aluminum, or engraved polyester nameplate, as standard with the manufacturer, located in a conspicuous position and permanently fastened to the equipment. Make name or identification plates the size standard with the manufacturer for the particular piece of equipment provided. Name plates must indicate the name of the manufacturer/trade name, serial number, make, and model number, pertinent ratings, operating characteristics, and other information as standard with the manufacturer, date of manufacture, electrical characteristics, and other applicable data, such as flow rate, temperature, pressure, capacity, and material of construction. Securely fasten separate equipment identification plates with the contract number marked thereon, to the surface of each piece of equipment.
1.5.5  **Underwriters Laboratories Standards**

Provide electrically operated equipment in accordance with applicable UL standards UL 489 and UL 763. Provide a UL label on the equipment as evidence of meeting the requirements, including a UL listing mark per UL Elec Equip Dir or a certified test report from a nationally recognized independent testing laboratory indicating that the specific food service equipment has been tested and conforms to the applicable UL standards or equivalent OSHA Nationally Recognized Testing Laboratory (NRTL) standard.

1.5.6  **Pre-Installation Conference**

Thirty [_____] days prior to the commencement of work, notify the Contracting Officer that the following items are prepared and ready for review:

a.  **Preconstruction Submittals:**
   
   (1) Contractor's Field Verification Data
   
   (2) **Manufacturer's Qualifications**

b.  **Shop Drawings, product data and installation instructions**
   
   (1) **Detail Drawings**

   (2) **Food Service Equipment Schedule**
   
   Submit in the same format as the equipment schedule on the drawings. Include Energy Star labeled model list.

   (3) Food service equipment **utilities**

   (4) **Custom fabricated equipment**

   (5) **Installation Instructions and Diagrams**

c.  **Product Data:**

   food preparation equipment

d.  **Samples**

   (1) **Exterior panel finish material**

   (2) **Interior panel finish material**

   (3) **Sample Warranty**

e.  **Design Data**

   (1) **Manufacturer's descriptive and technical literature**

   (2) **Manufacturer's Test Data**

f.  **Manufacturer's Instructions**

   **Manufacturer's Instructions** for shipping, handling, storage, installation, and start-up.
1.6 DELIVERY, STORAGE, AND HANDLING

Unless otherwise directed, the following procedures apply:

1.6.1 Delivery

a. Deliver field assembled fixed equipment integrated into structure to jobsite when required.

b. Deliver fixed equipment not integrated into structure to the jobsite after completion of finished ceilings, lighting, and acidizing of the finished floor and wall systems, including painting.

c. Deliver major movable equipment to inventory in a secured area for interim jobsite storage, or if secured area is not available, when fixed equipment installation/clean-up has been completed.

d. Deliver minor appliances and loose items to the jobsite when the Contracting Officer is prepared to receive and inventory such items.

1.6.2 Storage of Equipment and Accessories

Store delivered items with protection from weather, humidity, and temperature variation, dirt and dust, or other contaminants. Clearly label and identify all components with respective number as enumerated in approved Food Service Equipment Schedule.

1.6.3 Protection of Fixed/Fabricated Manufactured Equipment

Follow equipment manufacturer's recommendations to protect materials and equipment and prevent damage. Use tape fiberboard or plywood to surfaces as required by equipment shape and installation access requirements. Do not use tape which may possibly damage finished surface.

1.6.4 Prohibited Use of Equipment

Do not use food service equipment as tool or material storage, work bench, scaffold, or stacking area.

1.6.5 Damaged Equipment

Immediately submit documentation to the Contracting Officer with a recommendation of action for repair or replacement and the impact on project schedule.

PART 2 PRODUCTS

2.1 MATERIALS

Floor areas adjacent to food preparation equipment point of operation, and working surfaces must conform to 29 CFR 1910-SUBPART D

Comply with EPA sustainable acquisition (SA) requirements in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING; regarding
insulation materials for all equipment designated within this section. Other materials must conform to the following:

2.1.1 Stainless Steel, Sheets and Formed, Nonmagnetic

ASTM A480/A480M or ASTM A240/A240M: 18-8, 300 Series, austenitic, polished to [No. 3 or ]No.4 finish on exposed surfaces.

2.1.2 Stainless Steel Pipe, Tubing and Bars

ASTM A269/A269M, ASTM A270/A270M, ASTM A666. Provide seamless or welded pipe and tubing, of the gauge specified, of true roundness, and of material as specified for stainless steel. Seamless tubing must be thoroughly annealed, pickled, and ground smooth. Welded tubing must be thoroughly heat-treated, quenched to eliminate carbide precipitation and then drawn true to size and roundness, and ground. Provide No. 3 or 4 finish tubing when exposed to view.

Provide bars conforming to ASTM A276/A276M, ASTM A666, Type 302 or Type 304 or Type 316.

2.1.3 Galvanizing Repair Compound

ASTM D520, Type I pigment.

2.1.4 Brazing and Braze Welding Material

AWS A5.8/A5.8M, class as applicable.

2.1.5 Steel Structural Shapes for Framing

ASTM A36/A36M. Provide uniform structural shapes, ductile in quality, and of hard spots, runs, checks, cracks and other surface defects. Galvanize sections by the hot-dip process, conforming to ASTM A123/A123M.

2.1.6 Coatings

Provide durable, nontoxic, nondusting, nonflaking, and mildew-resistant type coatings, suitable for use with food service equipment and in conformance with NSF/ANSI 2. Application must be in accordance with the recommendations of the manufacturer.

2.1.6.1 Exterior Parts

Exterior, galvanized parts, exposed members of framework, and wrought steel pipe, where specified to be painted, must be cleaned, and free of foreign matter before applying a rust inhibiting prime and two coats of epoxy-based paint in accordance with Section 09 90 00 PAINTS AND COATINGS, unless otherwise specified. Color will be selected by the Contracting Officer from manufacturer's standard colors.

2.1.6.2 Chromium Plating

Apply chromium plating over nickel plating.
2.1.7 Zinc-Coated Steel

2.1.7.1 Sheets and Shapes

Provide zinc coated sheets conforming to ASTM A653/A653M, coating Class Z275 G90. Provide zinc coated shapes conforming to ASTM A36/A36M, in accord with ASTM A123/A123M.

2.1.8 Brass Piping and Fittings

Pipe must conform to ASTM B43. Fittings must conform to ASME B16.15.

2.1.9 Copper Tubing and Fittings

Provide copper tubing conforming to ASTM B88M ASTM B88, Type K, annealed, for buried or embedded in concrete installation and Type L, hard drawn, for above grade installation. Fittings must conform to ASME B16.18, above grade, ASME B16.22 or ASME B16.26, above or below grade.

2.1.10 Solder Material

ASTM B32, Sn96.

2.1.10.1 Lead-Free Solder

ASTM B32, 95.5 tin-antimony solder or other "lead-free" solder. Use for all potable water copper tubing and fitting connections, and for solder joints in contact with food.

2.1.10.2 Tin-Lead Solder

ASTM B32, alloy grade 50B for temperatures up to 65 degrees C 150 degrees F and alloy grade 95TA for temperatures over 65 degrees C 150 degrees F.

2.1.10.3 Silver Solder

AWS A5.8/A5.8M, 15 percent silver base brazing alloy, melting point not less than 540 degrees C 1000 degrees F.

2.1.11 Laminated Plastics

ANSI/NEMA LD 3 and NSF/ANSI 35.

2.1.12 Sealants

Sealants must conform to the requirements of ASTM C1330, ASTM C920.

2.2 CONSTRUCTION OF FABRICATED EQUIPMENT

2.2.1 Grinding, Polishing, and Finishing

Grind smooth all exposed welded joints and finish to match the adjoining material. Wherever materials have been depressed or sunken by welding operation, hammer and peen such depressions flush with the adjoining surface, and again grind to eliminate high spots. Polish and buff ground surfaces to match adjoining surfaces. Exercise care in the grinding operations to avoid excessive heating of the metal and metal discoloration. Abrasives, wheels, and belts used in grinding must be free of iron and not previously used on carbon steel. In all cases, the grain
of rough grinding must be removed by several successively finer polishing operations. Final polishing operation must be uniform, smooth, and consistent. Make the grain direction of horizontal stainless steel surface longitudinal, including the splash back. Provide a mitered appearance when polishing at right angle corners. Provide close fit butt and contact joints not requiring solder as a filler. Wherever brake bends occur, the bends must be free of open texture or orange peel appearance. Where brake work does mar the uniform appearance of the material, remove such marks by grinding, polishing, and finishing. Make sheared edges free of burrs, projections, and fins. Where miters or bullnosed corners occur, finish such miters and corners with the underedge of the material and grind to a uniform condition. Overlapping of material is not acceptable. Provide [No. 3][ or][ 4][XL][XL Buff] finish for all exposed stainless steel surfaces. Finishes of materials, other than stainless steel, must be comparable in appearance to commercial mill finish. Exposed surfaces include:

a. Exterior surfaces exposed to view.

b. Interior surfaces exposed to view in doorless cabinets.

c. Undersides of shelves with a ground finish of No. 90 grit or finer.

2.2.2 Fastening Devices

Provide fastening devices of the same material as the metal being joined when joint pieces are of similar metal. Fastening devices must be stainless steel, ASTM A666 when stainless steel is joined to dissimilar metal. Provide minimum M6 1/4-20 stainless steel stud bolts with length necessary to accept washers, and required nuts, and weld 225 mm 9 inches on center maximum. Exposed surfaces of equipment must be free of bolts, screws, and rivet heads. Use stainless steel stud bolts to fasten tops of counters or tables to angle framing and trim to other surfaces. Such bolts must be the concealed type. Cap threads of stud bolts which are on the inside of fixtures and are either visible or might come in contact with a wiping cloth, with chrome plated washers, lock washers, and chromium-plated brass cap nuts. Wherever bolts are welded to the underside of trim or tops, uniformly finish the reverse side of the welds with the adjoining surface of the trim or the top. Dimples at these points are not be acceptable.

2.2.3 Welding

2.2.3.1 Welds

Use tungsten inert gas process. Use filler metal compatible with the material being welded. Do not use carbon arc welding on tops of counters, tables, drainboards, exposed shelving, or sinks. Make welds ductile and of same color as adjoining surfaces.

2.2.3.2 Welding Rods

Perform all welding with welding rods of the same composition as the sheets or parts welded. Factory weld long section components to the greatest lengths possible to minimize field welded joints.

2.2.3.3 Weld Quality

Weld quality must conform to the requirements of AWS A5.8/A5.8M,
AWS D1.1/D1.1M, AWS D10.4 and AWS D9.1/D9.1M. Factory weld long section components to the greatest lengths possible to minimize field welded joint.

2.2.4 Built-in Equipment Lighting

Built-in lighting must conform to UL 1598.

2.2.5 Sound Deadening of Counters and Sinks

Provide sound deadening for counter tops and sinks with 13 mm 1/2 inch wide rope sealant positioned continuously between all contact surfaces of the frame-members and the underside of counter top, overselves and undershelves. Tighten stud bolts for maximum compression and trim any excess sealant.

2.2.6 Heat Lamp/Display Wiring

Conceal heat lamp/display wiring in corner post(s).

2.2.6.1 Heat Lamps

Provide heat lamp units with consolidated chassis of longest possible length for multiple sections. Include integral incandescent display light with warm white lamps and wire to a recess mounted infinitely adjustable heat control with pilot light for each separate section. Tightly secure heat lamps to the underside of the serving shelf and provide a "USDA" approved heat protector between the heat lamps and the shelf. Maximum allowable temperature at the top of a serving shelf must not exceed 49 degrees C 120 degrees F.

2.2.6.2 Display Light Modules

Provide Energy Star Labeled under-cabinet, shelf-mounted fixtures (not included with heat lamps) in 450 mm 18 inch and 900 mm 36 inch increments. Wire fixtures to a single recess mounted master switch per serving shelf.

PART 3 EXECUTION

3.1 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

Prior to commencement of installation, perform a complete walk down of the facility with the Contracting Officer to verify readiness for installation.

Provide adequate protection of all finished surfaces, fixtures, furnishings and other equipment to prevent any damage during the installation work.

Conduct installation procedures conforming to applicable NSF, OSHA and UL standards specified, and the manufacturer's instructions.

[Set floor mounted equipment on 150 mm 6 inches thick concrete housekeeping pads, complete with anchor bolts and grouting. Finish housekeeping pads with two coats of oil-resistant epoxy polyamide coating. Set all equipment plumb and level. Except for mobile and adjustable-leg equipment, securely anchor and attach items and accessories to walls, floors, or bases with stainless steel bolts.]
Flash food service cabinets located in wall openings to the walls with 0.9 mm thick 20 gage stainless steel. Seal around equipment flashing and flanges, at walls, floor, and ceiling in accord with Section 07 92 00 JOINT SEALANTS. Fillers must be continuous, without opening.

No drilling, cutting, burning, or welding of structural parts of building is permitted. Provide access panels for concealed valves, vent controls, and control devices and items requiring periodic operation, inspection, or maintenance.

3.1.1 Equipment Connections

Complete equipment connections for all utilities. Unless otherwise specified, provide [chromium-plated copper alloy] [stainless steel] exposed piping. Provide access panels of sufficient size and so located that concealed items may be serviced and maintained or removed and replaced.

3.1.2 Backflow Preventers

**************************************************************************
** NOTE: Clearly indicate on the drawings all locations where backflow preventers are required. **
**************************************************************************

Furnish and install backflow preventers as specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE. The Contractor is responsible to install backflow preventers as shown on the contract drawings and at all other locations necessary to preclude a cross-connect or interconnect between a potable water supply and any source of nonpotable water, or other contaminant. Install backflow preventers at all locations where the potable water outlet is below the flood level of the equipment, or will be located below the level of the contaminant. Provide backflow preventers of sufficient size to allow unrestricted flow of water to the equipment, and preclude the backflow of waste or other contamination into the potable water system.

3.1.3 Gas Equipment

Installation of gas operated equipment must conform to NFPA 54. Fasten a heavy duty steel cable, 75 to 150 mm 3 to 6 inch shorter than the equipment connector, to the equipment and the walls.

3.1.4 Electrical Work

Electrical systems, components and accessories must be certified to be in accordance with NFPA 70 and the following:

3.1.4.1 Installed Equipment Load

If the electrical load of the approved equipment differs from that specified or shown on the drawings, provide and install electrical service compatible with the approved equipment.

3.1.4.2 Electrical Equipment and Components

Food service equipment furnished under this section must have loads, voltages, and phases compatible with building system, and conform to manufacturer standards.
3.1.4.3 Cords and Caps

Coordinate all food service equipment cord/caps with related receptacles. All 120/208/240 volt "plug-in" equipment must have Type SO or SJ0 cord and a plug with ground, fastened to frame/body of item. Provide mobile equipment with a strain-relief assembly at the cord connection of the appliance. Mobile electrical support equipment and counter appliances mounted on mobile stands must have cord/cap assembly with cord-hanger as provided by the manufacturer.

3.1.4.4 Switches and Controls

Equip each motor-driven appliance or electrically-heated unit with control switch and overload protection per UL 197 and UL 471. Switches, controls, control transformers, starters, equipment protection and enclosures must be Industry Standards for the related equipment environment.

3.1.4.5 Motors

Provide motors at 120, 240, 208/240 and 460/480 volts with starter, overload protection, and short circuit motor protection per manufacturer standards.

3.1.4.6 Heating Elements

Provide thermostatic controls for all electrically heated equipment. Equip water heating equipment with a positive low-water shut-off.

3.1.4.7 Receptacles and Switches

Install receptacles which are located in vertical panels of closed base bodies in 300 by 215 by 75 mm 12 by 8-1/2 by 3 inch deep recessed mounting panel sloped on a 60-degree angle and turned up to the top of the opening. Prewire receptacles which are located in closed base fixtures to a junction box located within 150 mm 6 inch from the bottom of the utility compartment. Horizontally mount receptacles which are installed in/on fabricated equipment in a metal box with a stainless steel cover plate.

3.1.4.8 Light Fixtures

Prewire light fixtures with lamps which are installed in/on fabricated or field-assembled equipment to a junction box for final connection ( fixtures must be continuous run when indicated). Install fluorescent display light the full-length of the display stand and serving shelf with stud bolts or as indicated, and prewire through a support post to a recess-mounted switch. Install heat lamps to underside of serving shelf assemblies as specified. Heat lamp length for chassis must be sized per manufacturer or as indicated on the drawings. Electrically connect cold storage light fixtures through the hub fitting located on the top of the fixture. Horizontal conduit must be above the ceiling panels. Install plastic sleeves through ceiling panels for electrical conduit and seal all penetrations airtight at both sides of panel.

3.1.4.9 Final Electrical Connection Provisions

Tag final electrical connection points of equipment with item number, name (as indicated on FOOD SERVICE EQUIPMENT SCHEDULE) of devices on the circuit, total electrical load, voltage, and phase. Fabricated equipment
containing electrically-operated components or fittings, indicated on utility connections drawings to be direct-connected, must have each component, fitting, or group thereof prewired to a junction box for final connection. Refer to the drawings for circuit loading.

Field-assembled equipment (example, prefabricated cold storage assemblies, conveyor systems, exhaust hoods) must have electrical components completely interconnected by this section for final connection as indicated on utility connection drawing. Prewire the following groups of cold storage assembly electrical devices to a top-mounted junction box for final connection per compartment grouping, unless otherwise indicated.

a. Light fixtures, switches, and heated pressure-relief vent.
b. Door/jamb heater and temperature monitors/alarms.
c. Evaporator fans, defrost elements, freezer fan door switch, and drain line heaters.

3.1.4.10 Lamps

Provide food service equipment containing light fixtures with standard appliance type bulbs or energy efficient appliance type bulbs as indicated on the drawings. Exposed fluorescent lamps above or within a food zone must have plastic coated T-8 energy efficient lamps or standard lamps, sleeved in plastic coated tube with end caps.

3.1.5 Plumbing Work

Tag all plumbing final connection points of equipment, indicating item number, name of devices or components, and type of utility (water, gas, steam, drain). Provide extensions of indirect waste fitting to open-sight hub drain, floor sink or floor drains from food service equipment.

3.1.5.1 Steam Connection Provisions

Provide all steam-injected equipment with a steam inlet globe control valve with cold handle, relief valve, strainer, condensate gate valve, bucket steam trap, and swing check valve. Compartment steam cookers must have piping manifolded from all compartment exhaust valves to a floor drain, floor sink, or drain trench. Provide steam generators specified within this section with automatic boiler blowdown and a cold water condenser. Separate equipment, devices or components indicated to be connected to a steam-generator, provided under this section, must be provided with all unions, ells, gate valves, nipples, brackets, clamps, etc., required for the complete operating system for final connection.

Steam supply piping must be insulated with **25 mm 1 inch** fiberglass insulation (48 kg/cubic meter3 pounds/cubic foot density) and have factory-applied fire retardant. Install a full-length **1.6 mm 16 gauge** stainless steel pipe enclosure with sloping top, jacket, and vapor barrier over steam lines.

3.2 MANUFACTURER'S FIELD SERVICES

Furnish manufacturer's representatives who are directly employed by the equipment manufacturers and trained to perform the services specified. The manufacturers representatives must provide advice and services on the following matters:
Starting equipment and training Government personnel as to its proper care, operation, maintenance and safety procedures.

3.3 LOCATIONS AND CLEARANCES

Locate equipment to provide working space for necessary servicing such as shaft removal, disassembling, replacing or adjusting drives, motors, or shaft seals, access to water heads and valves of shell and tube equipment, tube cleaning or replacement, access to automatic controls, lubrication, oil draining and working clearance.

3.4 IDENTIFICATION TAGS AND PLATES

Provide equipment with tags numbered and stamped for their use as indicated on the Food Service Equipment Schedule. Provide brass or non-ferrous plates and tags. Minimum letter and numeral sizes are 3.18 mm 1/8 inch high.

3.5 OPERATION AND MAINTENANCE MANUALS

Submit six copies of operating instructions outlining the step-by-step procedures required for equipment start-up, operation and shutdown. Include the manufacturer's name, model number, service manual, parts list, and a brief description of equipment and basic operating features.

Submit [6][_____] copies of maintenance manuals listing routine maintenance procedures, possible breakdowns and repairs, troubleshooting guides, and containing the following:

a. Front and rear protective covers with labeled project name.

b. Index indicating item number, quantity, description, manufacturer's name, and model number.

c. Maintenance instructions for stainless steel and plastic laminate.

d. Manufacturer's catalog specification sheets and manufacturer's detail and control drawings.

e. Manufacturer's operation manual outlining the step-by-step procedures for equipment installation, startup, basic operation features, and operation shutdown.

f. Manufacturer's maintenance manual listing routine maintenance procedures, possible breakdowns, repairs, and troubleshooting guides. Include simplified diagrams for the equipment as installed.

g. Manufacturer's list of parts and supplies with current unit price and address of manufacturer's parts supply warehouse.

Include simplified wiring diagrams in the instructions. Framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, must be posted where directed. Prepare in typed form, condensed operating instructions explaining preventative maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system, framed as specified above for the wiring and control diagrams, and posted beside the diagrams. Submit proposed
diagrams, instructions, and other sheets, prior to posting. Post the framed instructions, including wiring and control diagrams, before acceptance testing of the systems.

3.6 INSTRUCTIONS TO GOVERNMENT PERSONNEL

Prepare and conduct a training course for the operating staff as designated by the Contracting Officer. The training must consist of a total [_____] hours of normal working time and start after the system is functionally completed but prior to final acceptance tests. Cover in the field instructions the items contained in the operating and maintenance instructions, as well as demonstrations of routine maintenance operations. Notify the Contracting Officer at least [14][_____] days prior to date of proposed conduction of the training course.

Submit a list of authorized local service and repair entities to the Contracting Officer 14 days prior to conducting the training course.

3.7 TESTS

Perform the tests including everything required. Notify the Contracting Officer, in writing, [10][_____] days before performing tests. Perform tests in the presence of [a manufacturer's representative][and Contracting Officer].

3.7.1 Initial Start-Up and Operational Test

Provide all lubricants and accessories before initial start-up. Start and operate all equipment. Follow the manufacturer's procedures and place the systems under all modes of operation. Supplement initial charges of lubricating oil to assure maximum operating capacity. Adjust all safety and automatic control instruments. Record manufacturer's recommended readings hourly. Operational tests must cover a period of not less than [3][5][_____] days.

3.7.2 Test Reports

Submit the final field test reports for each system tested, describing test apparatus, instrumentation calculations, and equipment data based on industry standard forms or reasonable facsimiles thereof. Data must include: compressor suction and discharge pressure; refrigerant charge pump, compressor and air moving device ampere readings; power supply characteristics, including phase imbalance, with 1/2 percent accuracy; thermostatic expansion valve superheat-value as determined by field test; subcooling; high and low refrigerant temperature switch set-points; low oil pressure switch set-point; [defrost system timer and thermostat set-points; ] moisture content; ambient, condensing and coolant temperatures; capacity control set-points; field data and adjustments which affect unit performance and energy consumption. Where final adjustments and settings cannot be permanently marked or drilled and pinned as an integral part of device, include adjustment and setting data in test report.

3.7.3 Cleaning and Adjusting

Test and adjust equipment for proper operation. Test rotating components and motors for proper rotation. Lubricate moving parts if suggested by manufacturer's literature. Prior to acceptance of project, clean and sanitize equipment both inside and outside.
3.8 MANUFACTURER'S WARRANTY

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.9 CONTRACTOR'S WARRANTY for INSTALLATION

Submit contractor's warranty for installation to the Contracting Officer prior to final commissioning and acceptance.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for foodservice equipment schedules.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification is to be used in conjunction with the following sections; subject to project scope requirements:

Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT

Section 11 41 11 REFRIGERATED AND FROZEN FOOD STORAGE EQUIPMENT

Section 11 42 00 FOOD PREPARATION EQUIPMENT

Section 11 44 00 FOOD COOKING EQUIPMENT

Section 11 46 00 FOOD DISPENSING EQUIPMENT

Section 11 47 00 ICE MACHINES
PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NSF INTERNATIONAL (NSF)
NSF Food Equipment (2005) NSF Product Listings of Food Equipment and Related Products, Components and Materials

NSF/ANSI 2 (2022) Food Equipment

NSF/ANSI 169 (2023) Special Purpose Food Equipment and Devices

U.S. DEPARTMENT OF DEFENSE (DOD)

U.S. DEPARTMENT OF ENERGY (DOE)

U.S. ENVIRONMENTAL PROTECTION AGENCY (EPA)
1.2 DEFINITIONS

Terms used in paragraph FOOD SERVICE EQUIPMENT SCHEDULE are defined as follows:

a. Sheet Pan: Standard 450 by 650 by 25 mm 18 by 26 by 1 inch deep pan, unless otherwise noted.

b. Pan: Standard 300 by 500 by 150 mm 12 by 20 by 6 inch deep pan.

c. Serving Tray: Cafeteria tray 350 by 450 mm 14 by 18 inch, unless otherwise noted.

d. 115-60-1: 115-volt, 60-hertz, 1-phase electric service and connection.

e. 208-60-1: 208-volt, 60-hertz, 1-phase electric service and connection.

f. 208-60-3: 208-volt, 60-hertz, 3-phase electric service and connection.

1.2.1 Abbreviations

Abbreviations used in paragraph FOOD SERVICE EQUIPMENT SCHEDULE are defined as follows:

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMPS:</td>
<td>Amperes</td>
</tr>
<tr>
<td>J:BTU:</td>
<td>Joules British Thermal Units</td>
</tr>
<tr>
<td>CRS:</td>
<td>Corrosion Resistant Steel</td>
</tr>
<tr>
<td>CW:</td>
<td>Cold water</td>
</tr>
<tr>
<td>DIA:</td>
<td>Diameter</td>
</tr>
<tr>
<td>DR:</td>
<td>Drain</td>
</tr>
<tr>
<td>FED:</td>
<td>Federal Specification</td>
</tr>
<tr>
<td>G:</td>
<td>Gas</td>
</tr>
<tr>
<td>L:GAL:</td>
<td>Liters Gallon</td>
</tr>
<tr>
<td>W:HP:</td>
<td>Watts Horsepower</td>
</tr>
</tbody>
</table>
1.2.2 Dimensions

Dimensions used in paragraph FOOD SERVICE EQUIPMENT SCHEDULE are in millimeters inches, unless otherwise noted. Dimensions are listed in order of length, width, and height, unless otherwise noted. Terms are defined as follows:

a. Length: Distance across front of equipment

b. Width: Distance from front edge to back edge

c. Height: Distance from bottom edge to top of equipment

d. Depth: Distance from rim to bottom at drain, as in a sink.
1.2.3 Measurements

Metric measurements in this section are based on mathematical conversion of English unit measurement, and not on metric measurement commonly agreed to by the manufacturers or other parties. The English and metric units for the measurements shown are as follows:

<table>
<thead>
<tr>
<th>Products</th>
<th>Metric Units</th>
<th>English Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stainless steel legs</td>
<td>100 mm</td>
<td>4 inches</td>
</tr>
<tr>
<td>Stainless Steel</td>
<td>2.5 mm</td>
<td>12 gage</td>
</tr>
<tr>
<td></td>
<td>1.8 mm</td>
<td>14 gage</td>
</tr>
<tr>
<td></td>
<td>1.5 mm</td>
<td>16 gage</td>
</tr>
<tr>
<td></td>
<td>1.2 mm</td>
<td>18 gage</td>
</tr>
<tr>
<td>Channels</td>
<td>25 mm x 25 mm</td>
<td>one x one inch</td>
</tr>
<tr>
<td></td>
<td>2.5 mm</td>
<td>12 gage</td>
</tr>
<tr>
<td>Angles</td>
<td>38 mm x 38 mm x 3 mm</td>
<td>1 1/2 x 1 1/2 x 1/8 inch</td>
</tr>
</tbody>
</table>

1.2.4 Logistical Classification

******************************************************************************
NOTE: The Logistical Classifications listed in the schedule assume Class A (funded with building project funds and provided by the Contractor) for all building equipment and Class C (funded with other than building project funds and provided by the Government) for all collateral equipment. (The latter are listed because they are connected to building services or otherwise need the Contractor's attention). If equipment is to be procured with any other funding or procurement method, revise the "Log Class" symbol as appropriate. Government-furnished equipment must also be addressed in Section 01 11 00 SUMMARY OF WORK.
******************************************************************************

Method of Procurement listed in paragraph FOOD SERVICE EQUIPMENT SCHEDULE is defined as follows:

a. Class A: Contractor-furnished and Contractor-installed.

[ b. Class B: Government-furnished and Contractor-installed.

[ d. Class D: Government-furnished as leased equipment and Government-installed.

][e. Class E1: Government-furnished and Government-installed.
Class E2: Government-furnished and Contractor-installed.

Equipment designated Logistical Class ["C"] ["D"] ["E1"] will be Government-provided. Equipment which is Government-provided will be furnished and installed by the Government in space made available by the Contractor and with rough-in made by the Contractor in accord with the information made available or referenced herein or indicated.

1.3 GENERAL REQUIREMENTS

**************************************************************************

NOTE: Indicate the configuration and layout for all food service equipment and accessory items on the floor plans, with interior elevations and equipment identified by number. Show "Food Service Equipment Schedule" on the drawings using the same identification numbers[ as indicated on the current US Army Quartermaster Center and School equipment schedule]. Ensure that all Contractor built-to-order items, per Food Service Equipment Schedule", are shown and coordinated with the specifications.

Designer must coordinate with other sections for final connection of equipment.

NOTE: Details of particular equipment and installations are provided on Naval Food Service Division drawings. Use these NAVFSD drawings as a basis for the project details. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

**************************************************************************

Submit detailed Food Service Equipment Schedule conforming to DOD 4000.25-1-M. Electrically powered equipment specified within this section must conform to EPA Energy Star requirements and labeling. Food Service Equipment must conform to NSF/ANSI 2 and NSF Food Equipment standards. Special purpose equipment must conform to NSF/ANSI 169. Submit in the same format as the equipment schedule on the drawings. Include Energy Star Labeled models and EPA WaterSense Fixtures.

1.3.1 Design Requirements

**************************************************************************

NOTE: On the drawings, show:

1. A 1:50 1/4 inch scale floor plan with layout of all food service equipment and Naval Equipment Symbols.

2. Food Service Equipment Schedule laid out in accord with NAVSUP41, current US Army Quartermaster Center and School equipment schedule specified design requirements, including Energy Star Labeled model list.

3. Floor, wall, and ceiling penetrations.
4. Raised bases, retainer curbs, or depressions.

5. Recessed, grated floor drains required for equipment.

6. Insulated floors, including under-floor perforated drains and vent pipes.

7. Disconnect switches.

8. Electrical chases and raceways and plumbing chases.

9. Remote compressors and refrigeration systems.

10. Utility connections to building water, sanitary, electrical, and other utility systems. Convenience outlets at point of use for plug-in equipment.

11. All Contractor built-to-order items, per Food Service Equipment Schedule, shown and coordinated with the specifications.

Submit detail drawings for all food service equipment and accessory items. Drawings must be 1:50 1/4 inch scale minimum.

Submit a complete list of equipment, material data, and drawings as specified.

1.4 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.
The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Food Service Equipment Schedule; G[, [_____]]

PART 2 PRODUCTS

2.1 LIST OF EQUIPMENT

NOTE: Edit the master "Food Service Equipment Schedule" carefully; retain items of equipment used for the project. The Equipment List is intended to be edited and included in the project Specification. List the information contained herein on the Equipment List on the Contract Drawings.

2.1.1 Format

Provide the equipment listed except as otherwise specified as a result of the Logistical Class listed. Entries in paragraph FOOD SERVICE EQUIPMENT SCHEDULE include the following information, when applicable:

NOTE: The Navy equipment symbols must be used on the drawings in a table keyed to plan location by a secondary designation. The Navy equipment symbols are intended to be used as shown, without renumbering for deleted items or because of added items. Contact NAVSUP41 for equipment table format.

b. Logistical Classification.

c. Generic description of equipment.

d. Referenced applicable document or statement that equipment is Custom Fabricated or of Commercial design.
2.1.2 Food Service Equipment Schedule

NOTE: Submit the proposed equipment list to the Naval Food Service System Office, who will furnish Naval Equipment Symbols and Descriptions. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

NOTE: The Logistical Classification of the equipment listed at this Technical Note will depend on the Classification selected for associated work listed elsewhere. Coordination is required.

NOTE: When equipment is added to this schedule, add the applicable Standard to the paragraph REFERENCES.

NOTE: Per Energy Star (http://www.energystar.gov), the following items have Energy Star labeled products:
- Commercial Hot Food Holding Cabinets
- Commercial Griddles
- Commercial Ovens
- Commercial Steam Cookers
- Commercial Refrigerators and Freezers
- Commercial Fryers
- Commercial Ice Makers
- Commercial Dishwashers
Edit the schedule below to include Energy Star products.

NOTE: Per EPA WaterSense (http://www.epa.gov/watersense), the following item is a Watersense labeled product:
- Pre -Rinse Spray Valves
Edit the schedule below to include Watersense products.

3.1 LABELING AND IDENTIFICATION

Clearly label and identify all components with respective number as enumerated in approved Food Service Equipment Schedule. Provide equipment with tags numbered and stamped for their use as indicated on the Food Service Equipment Schedule. Provide brass or non-ferrous plates and tags. Minimum letter and numeral sizes are 3.18 mm 1/8 inch high.

NOTE: This guide specification covers the requirements for charging equipment to support electric automobiles and light trucks.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

INSTITUTE OF ELECTRICAL AND ELECTRONICS ENGINEERS (IEEE)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2023; ERTA 4 2023; ERTA 5 2023; ERTA 6 2023) National Electrical Code

UNDERWRITERS LABORATORIES (UL)

UL 2594 (2016) UL Standard for Safety Electric Vehicle Supply Equipment

1.2 DEFINITIONS

1.2.1 ELECTRIC VEHICLE SUPPLY EQUIPMENT

Electric Vehicle Supply Equipment (EVSE), also referred to as "charging stations," encompasses the conductors, including the ungrounded, grounded,
and equipment grounding conductors and the electric vehicle connectors, attachment plugs, and all other fittings, devices, power outlets, or apparatus installed specifically for the purpose of delivering energy from the premises wiring to the electric vehicle (EV). There are three types of EVSE:

a. Level 1 - Refers to a freestanding or wall mounted charging device that delivers a 110/120V charge, replenishing an EV battery at a rate of 4 to 6 miles of range per hour of charging time. Charging an EV at Level 1 typically takes between 7 and 20 hours depending on the size of the vehicle's battery.

b. Level 2 - Refers to a freestanding or wall mounted charging device capable of being networked that delivers a 208/240V charge, replenishing an EV battery at a rate of 10 to 20 miles of range per hour of charging time. Charging an EV at Level 1 typically takes between 2 and 5 hours depending on the size of the vehicle's battery.

c. Direct Current (DC) Fast Charging, a freestanding or wall mounted device capable of being networked that is designed to charge vehicles more quickly than Level 1 or Level 2 with an electrical output ranging between 40 kW - 120 kW delivering a charge of up to 480V. DC Fast Charging can typically replenish an EV battery at a rate of 50 to 90 miles of range per 30 minutes of charging time.

1.2.2 Certified Installers

Installers must be certified by EVSE manufacturer or a recognized certified training agency.

1.3 RELATED REQUIREMENTS

**************************************************************************
NOTE: Include Section 26 08 00 APPARATUS INSPECTION AND TESTING on all projects involving specialized power distribution equipment.
**************************************************************************

Materials not considered to be Electric Vehicle Supply Equipment or accessories are specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION, Section 32 17 23 PAVEMENT MARKINGS and Section 26 08 00 APPARATUS INSPECTION AND TESTING applies to this section with the additions and modifications specified herein.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or
complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

In addition, submit in accordance with paragraph COORDINATED SUBMITTAL REVIEWS herein.

**************************************************************************

NOTE: Bracketed submittal items correspond to bracketed paragraphs within the text. Use these submittal items when the bracketed paragraph is used.

[ Record Documentation

][1.5 MAINTENANCE MATERIAL SUBMITTALS

Provide a list of manufacturer recommended maintenance items required for
EVSE Operation.

1.5.1 Operation and Maintenance Manuals

**************************************************************************
NOTE: Provide number of copies based on Base needs.
**************************************************************************

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Submit [two] [_____] manuals and electronic file at least 2 weeks prior to field training.

[1.5.2 Spare Parts

**************************************************************************
NOTE: Do not include for Navy projects.
**************************************************************************

Provide one spare cord and connector assembly for every three stations installed.

1.6 QUALITY CONTROL

1.6.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" or "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

1.6.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship and:

a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under comparable circumstances and of similar size.

b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.

c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

1.6.2.1 Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.
1.6.2.2 Material and Equipment Manufacturing Date

Provide products manufactured within 2 years prior to date of delivery to site. As a minimum, meet requirements of UL, where UL standards are established for those items, and requirements of NFPA 70 for all materials, equipment, and devices.

1.6.2.3 EVSE Installers

Submit documentation certifying that pertinent personnel are qualified for EVSE installation. The documentation must include installation experience on two projects of comparable size and scope of work.

1.7 WARRANTY

**************************************************************************

NOTE: Include first bracketed option for CONUS,
second bracketed option for OCONUS or fill in the
third bracket for special circumstances.

NOTE: Delete first paragraph on Navy Projects.
**************************************************************************

[ Provide equipment items supported by service organizations that are convenient to the equipment installation in order to render satisfactory service to the equipment within [24] [48] [_____] hours of notification during the warranty period of the contract. ]

Provide warranty for Materials and Workmanship of EVSE: Two years.

PART 2 PRODUCTS

2.1 PRODUCT COORDINATION

Provide products and materials not considered to be ELECTRIC VEHICLE SUPPLY EQUIPMENT and related accessories for power requirements as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM,][ and][ Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION][ and ][ Section 32 17 23 PAVEMENT MARKINGS].

2.2 ELECTRIC VEHICLE SUPPLY EQUIPMENT

2.2.1 System Description

**************************************************************************

NOTE: Number and type of supply stations selection must be based on users requirements, after interviewing User to determine number and frequency of EVs to be charged.
**************************************************************************

Electric Vehicle Supply Equipment capable of charging [one] [multiple] vehicles at [Level 1] [Level 2] [Direct Current (DC) Fast Charging].

2.2.2 Level 1 EVSE

**************************************************************************

NOTE: Power levels for Electrical Supply Equipment should be based on User's Projected Electric Vehicle

**************************************************************************
usage. Verify power requirements for available chargers.

**************************************************************************

2.2.2.1  Level 1 Wall Mounted EVSE

UL 2202, UL 2251, UL 2231-1, UL 2231-2, UL 2594. Type 1, SAE J1772 connector, 120 volt, [input 15 amps, output 12 amps, 2 kW] [input [_____] amps, output [_____] amps, [_____] kW].

2.2.2.2  Level 1 Pedestal Mounted EVSE

UL 2202, UL 2251, UL 2231-1, UL 2231-2, UL 2594. Type 1, SAE J1772 connector, 120 volt, [input 15 amps, output 12 amps, 2 kW] [input [_____] amps, output [_____] amps, [_____] kW].

][2.2.3  Level 2 EVSE

**************************************************************************

NOTE: Power levels for Electrical Supply Equipment should be based on User's Projected Electric Vehicle usage. Verify power requirements for available chargers.

**************************************************************************

2.2.3.1  Level 2 Wall Mounted EVSE

UL 2202, UL 2251, UL 2231-1, UL 2231-2, UL 2594. Type 2, SAE J1772 connector, 208 volt, [input 30 amps, output 30 amps, 7.2 kW] [input [_____] amps, output [_____] amps, [_____] kW].

2.2.3.2  Level 2 Pedestal Mounted EVSE

UL 2202, UL 2251, UL 2231-1, UL 2231-2, UL 2594. Type 2, SAE J1772 connector, 208 volt, [input 30 amps, output 30 amps, 7.2 kW] [input [_____] amps, output [_____] amps, [_____] kW].

][2.2.4  DC Fast Charger EVSE

**************************************************************************

NOTE: Power levels for Electrical Supply Equipment should be based on User's Projected EV usage. Verify power requirements for available chargers.

**************************************************************************

2.2.4.1  DC Fast Charger Wall Mounted EVSE

UL 2202, UL 2251, UL 2231-1, UL 2231-2, UL 2594. [CHAdeMO] [CCS SAE J1772 DC combo charging] [CHAdeMO and CCS Combination] connector[s], 480 volt, [input 32 amps, output 62 amps, 24 kW] [input [_____] amps, output [_____] amps, [_____] kW].

2.2.4.2  DC Fast Charger Pedestal Mounted EVSE

UL 2202, UL 2251, UL 2231-1, UL 2231-2, UL 2594. [CHAdeMO] [CCS SAE J1772 DC combo charging] [CHAdeMO and CCS Combination] connector[s], 480 volt, [input 32 amps, output 62 amps, 24 kW] [input [_____] amps, output [_____] amps, [_____] kW].
2.2.5 Cords

UL 62.

**************************************************************************
NOTE: Provide length of cord for installation.
**************************************************************************

a. [4.25 meters 14 feet], minimum, UL rated charging cords with integral retractable cord management mechanism or separate cord management.

2.3 CONNECTOR HOLSTER DOCK

Provide connector holster dock to store charger plugs when not in use. Holster construction consist of high strength injection molded plastic with temperature ratings of minus 30 deg C to 50 deg C. Provide holster to match EV plug.

2.4 PEDESTAL CONSTRUCTION

**************************************************************************
NOTE: Select NEMA rating based on location conditions.
**************************************************************************

Provide corrosion resistant construction for outdoor use and continuous exposure to a marine environment. Pedestal shall be NEMA 4x [NEMA 3] Construction.

[2.5 ACCESSORIES

**************************************************************************
NOTE: Provide accessories listed below as determined by user requirements.
**************************************************************************

[ a. Back-lit touch button interface keypad with audio feedback. LCD must display READY TO CHARGE, CHARGING, CHARGE COMPLETE, PAUSE-WAITING TO CHARGE AND FAULT.

][b. Daylight readable 64x480 active matrix LCD with auto brightness control.

][c. Activation of EVSE upon identification utilizing [magnetic swipe],[RFID][ or barcode cards].

][e. Real-time energy measurement controls.

][f. Fifteen minute energy measurement interval recording.

][g. Time-of-day pricing capability.

][h. Nuisance tripping avoidance and auto-re-closure features.

][i. Cold Load Pickup (Randomized auto restart following power outage).

][j. Provide minimum four keycards/barcodes/RFID keys for each charger to activate the charger and its data network.
EVSE must include automatic web-based tracking / metering and control connection via a cell phone service provider compatible with Electric Vehicle Management system.

The web-based application shall generate per vehicle kW usage and charging times based on user input intervals.

EVSE Electronic Data Interface shall capture and be capable of push and pull file transfer of the parameters listed below. Web-based control capability shall enable remote charger station administration and access control by the Government. Data must be User ID and Password protected.

(1) Kilowatt (kW) data report must be compatible Microsoft Excel (Version 2007 or higher).

(2) Must have option to limit usage to designated users with bar code/key card type system (locked or open access).

(3) Manufacture control of EVSE is not allowed without prior written Government approval.

2.6 CAST-IN-PLACE CONCRETE

**************************************************************************
NOTE: Coordinate the requirement for concrete pads with user requirements.
**************************************************************************

**************************************************************************
NOTE: Use the first bracketed paragraph when project includes a concrete section in Division 3; otherwise, the second bracketed paragraph may be used. Coordinate requirements with Section 03 30 00 CAST-IN-PLACE CONCRETE.
**************************************************************************

Concrete associated with electrical work for other than encasement of underground ducts shall be 30 MPa 4000 psi minimum 28-day compressive strength unless specified otherwise. All concrete shall conform to the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE.

**************************************************************************
NOTE: If concrete requirements are detailed and no cast-in-place concrete section is to be included in the project specification, refer to Section 03 30 00 CAST-IN-PLACE CONCRETE, and select such portions as needed to provide complete requirements in addition to the requirements below.
**************************************************************************

Shall be composed of fine aggregate, coarse aggregate, portland cement, and water so proportioned and mixed as to produce a plastic, workable mixture. Fine aggregate shall be of hard, dense, durable, clean, and uncoated sand. The coarse aggregate shall be reasonably well graded from 4.75 mm to 25 mm 3/16 inch to one inch. The fine and coarse aggregates shall be free from injurious amounts of dirt, vegetable matter, soft fragments or other deleterious substances. Water shall be fresh, clean, and free from salts, alkali, organic matter, and other impurities. Concrete associated with
electrical work for other than encasement of underground ducts shall be 30 MPa 4000 psi minimum 28-day compressive strength unless specified otherwise. Slump shall not exceed 100 mm 4 inches. Retempering of concrete will not be permitted. Exposed, unformed concrete surfaces shall be given a smooth, wood float finish. Concrete shall be cured for a period of not less than 7 days, and concrete made with high early strength portland cement shall be repaired by patching honeycombed or otherwise defective areas with cement mortar as directed by the Contracting Officer. Air entrain concrete exposed to weather using an air-entraining admixture conforming to ASTM C260/C260M. Air content shall be between 4 and 6 percent.

2.7 MANUFACTURER'S NAMEPLATES

Each item of equipment shall have a nameplate bearing, as a minimum, the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable. Include additional information as applicable to fully identify the equipment. Nameplates shall be made of noncorrosive metal.

2.8 PAVEMENT MARKINGS

**************************************************************************
NOTE: Verify base requirement and coordinate pavement markings. Coordinate with Section 32 17 23 PAVEMENT MARKINGS.
**************************************************************************

Provide pavement markings for the vehicle charging parking spots to indicate the restrictions for electrical vehicle parking.

2.9 ELECTRIC VEHICLE SUPPLY EQUIPMENT (EVSE) SIGNAGE

**************************************************************************
NOTE: Coordinate signage requirements with base requirements and Manual on Uniform Traffic Control Devices (MUTCD).
**************************************************************************

Provide signage Electric Vehicle Supply Equipment per MUTCD and Base standards.

**************************************************************************
NOTE: Provide wheel stops or bollard where existing curbing isn't present for protection of EVSE.
**************************************************************************

2.10 WHEEL STOPS AND BOLLARDS

Provide wheel stops or bollards in Electrical Vehicle parking spaces to provide protection for Electric Vehicle Supply Equipment.

PART 3 EXECUTION

3.1 INSTALLATION

Electrical installations shall conform to IEEE C2, NFPA 70, and to the requirements specified herein.
a. The EVSE installer must be certified by the manufacturer or a recognized training facility to perform the installation.

b. Provide chargers per manufacturer instructions and recommendations. EVSE must be programmed and configured by a certified installer.

3.2 GROUNDING

NFPA 70 and IEEE C2, except provide grounding systems with a resistance to solid earth ground not exceeding 25 ohms.

3.2.1 Grounding Electrodes

Provide driven ground rods as specified in Section 33 71 02 UNDERGROUND ELECTRICAL DISTRIBUTION. Connect ground conductors to the upper end of ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors.

3.3 FIELD APPLIED PAINTING

Where field applied painting of enclosures is required to correct damage to the manufacturer's factory applied coatings, provide manufacturer's recommended coatings and apply in accordance with manufacturer's instructions.

3.4 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

3.5 FOUNDATION FOR EQUIPMENT AND ASSEMBLIES

**************************************************************************
NOTE: Mounting slab connections may have to be given in detail depending on the requirements for the seismic zone in which the equipment is located. Include construction requirements for concrete slab only if slab is not detailed in drawings.
**************************************************************************

3.5.1 Exterior Location

Mount on concrete slab, unless otherwise indicated. The slab shall be at least 200 mm 8 inches thick, reinforced with a 152 by 152 - MW19 by MW19 6 by 6 - W2.9 by W2.9 mesh placed uniformly 100 mm 4 inches from the top of the slab. Slab shall be placed on a 150 mm 6 inch thick, well-compact gravel base. Top of concrete slab shall be approximately 100 mm 4 inches above the finished grade. Edges above grade shall have 15 mm 1/2 inch chamfer. The slab shall be of adequate size to project at least 200 mm 8 inches beyond the equipment. Provide conduit turnups and cable entrance space required by the equipment to be mounted. Seal voids around conduit openings in slab with water- and oil-resistant caulk or sealant. Seals shall be of sufficient strength and durability to protect all energized live parts of the equipment from rodents, insects, or other foreign matter. Cut off and bush conduits 75 mm 3 inches above slab surface.
3.6  OPERATION AND MAINTENANCE

3.6.1  Operation and Maintenance Training

Conduct a training course for the members of the operating staff as designated by the Contracting Officer. Make the training period consist of a total of [4],[_____] hours for Level 1 or level 2 and [8],[_____] hours for DC Fast Charge of normal working time and start it after all work specified herein is functionally completed and the Performance Tests have been approved. Conduct field instruction that covers all of the items contained in the Operation and Maintenance Manuals as well as demonstrations of routine maintenance operations. Submit the proposed On-site Training Materials and schedule concurrently with the Operation and Maintenance Manuals and at least 30 days prior to conducting the training course.

[3.7  RECORD DOCUMENTATION

**************************************************************************
NOTE: Delete Record Documentation for Navy projects.
**************************************************************************

Provide drawings indicating construction provided for this project. Provide electronic files and hard copies on 279 mm by 432 mm 11 inch by 17 inch paper.

3.8  FIELD QUALITY CONTROL

3.8.1  Testing of Electric Vehicle Supply Equipment

Provide testing of Electric Vehicle Supply Equipment with test equipment per current standards and manufacturers recommendations. Provide data submittal indicating time of charge and kW level used.

3.8.2  Performance of Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests. Submit reports, including acceptance criteria.

3.8.2.1  EVSE

a.  Visual and mechanical inspection.

   (1) Compare equipment nameplate data with specifications and approved shop drawings.

   (2) Inspect physical and mechanical condition. Check for damage.

   (3) Inspect anchorage, alignment, and grounding.

   (4) Perform specific inspections and mechanical tests as recommended by manufacturer.

b.  Electrical Tests

   (1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter.
(2) Verify voltage levels.

(3) Check ground fault circuit interrupt.

(4) Check pilot signal detection and verification.

(5) Verify current limit.

(6) Verify operation of alarms.

(7) Verify EVSE Electronic Data Interface.

Values of test shall be within limits of manufacturer's recommendations.

-- End of Section Table of Contents --
NOTE: This guide specification covers requirements for dock bumpers, truck-trailer restraining devices, and industrial, mechanical and electro-hydraulic dock levelers of the fixed hinged type.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Use dock levelers (ramps) to span and compensate for space and height differentials between loading docks and freight carriers in order to facilitate safe and efficient freight transfer. The ramps are recessed into preformed pits in the loading docks.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide.
specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN WELDING SOCIETY (AWS)

AWS C2.18 (1993; Errata 1993; R 2001) Guide for the Protection of Steel with Thermal Sprayed Coatings of Aluminum and Zinc and Their Alloys and Composites

ASTM INTERNATIONAL (ASTM)

MATERIAL HANDLING INDUSTRY OF AMERICA (MHI)

1.2 DEFINITIONS

1.2.1 Industrial Dock Leveler

A manufactured structure designed to span and compensate space and height differentials between a loading dock and freight carrier to facilitate safe, efficient, freight transfer.

1.2.2 Adjustable Loading Ramp

Synonym for Fixed Type Industrial Dock Leveler.

1.2.3 Fixed Type Industrial Dock Leveler

A dock leveler that is permanently affixed to the dock structure, and usually incorporating [an electro-hydraulic] [a mechanical] [recessed into dock face further than 380 mm 15 inch] system to position the dock leveler with respect to the freight carrier at the lip end while being fixed at the opposite hinged end.

1.2.4 Velocity Fuse

A valve or similar device that goes into the hydraulic line. If the dock leveler becomes inadvertently or accidentally unsupported, this fuse will freeze the movement of dock leveler within 100 mm 4 inches of the dock leveler original position.

1.2.5 Carrier

A wheeled, enclosed trailer or container that, when attached to a heavy-duty truck or van, is used to carry bulk freight over long distances.
1.3 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY CONTROL

1.4.1 Manufacturer's Representative

Furnish services of Fixed Type Industrial Dock Leveler technicians, experienced in installation and operation of the type of system being provided, to supervise installation, testing, adjustment of system, and instruction to Government personnel.

1.5 STANDARD PRODUCTS

Submit data including a complete list of equipment and materials, manufacturer's descriptive and technical literature, performance charts and curves, catalog cuts, and installation instructions. Provide materials and equipment, which are the standard products of a manufacturer regularly engaged in the manufacture of the products, and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment must be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this Section, with the additions and modifications specified herein.

1.6 DELIVERY, STORAGE, AND HANDLING

Matchmark and tag parts which are disassembled for shipment with metal tags. Provide waterproofed tags and markings. Protect the delivered equipment in storage from the weather, humidity and temperature variation, dirt and dust, or other contaminants.

1.7 EXTRA MATERIALS

After approval of the detail drawings, and no later than [_____] months before the Government takes possession, provide spare parts data for each different item of material and equipment specified. Furnish a complete list of parts and supplies, with current unit prices and source of supply and a list of the parts recommended by the manufacturer to be replaced after [1] [3] [_____] year(s) of service.
PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Design Requirements

2.1.1.1 Detail Drawings

Submit drawings depicting dimensions, tolerances, surface finishes, hardmesses, flush edge angles, method of mounting and anchoring, and control schematics and diagram. Show complete wiring, schematic diagrams, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show proposed layout and anchorage of equipment and appurtenances. Show the concrete pit details including flush edge angles, dock bumpers including fastening materials in compliance with ASTM A123/A123M and ASTM D2000, and sloped pit bottom; method of mounting and anchoring; and location of control stations and disconnect switches. For vertical, edge-of-dock, and free-standing board dock levelers, show details of required pit or foundation construction and dock bumpers and structural shapes installation, in lieu of concrete pit details. Show all proposed dock bumper locations on drawings.

2.2 MATERIALS

2.2.1 Exposed Surfaces

Exposed metal surfaces and fastening materials must comply with ASTM A123/A123M, ASTM A143/A143M, and ASTM A153/A153M.

2.2.2 Nameplate

Attach corrosion-resistant metal plate securely and legibly on the exterior surface of the dock leveler. Include the following information indented or embossed on the plate:

   a. Description of the equipment: Describe procedures for operating and services equipment, and warnings or cautions of hazardous procedures.

   b. Name of the manufacturer.

   c. Serial and model number.

   d. Rated capacity in kg pounds.

   e. Date of manufacture (month and year).

2.2.3 Toe Guards or Skirts

Provide sides or edges, except front and rear edges, of the ramps which rise above the surrounding loading dock with sheet carbon steel skirts or toe guards of minimum 1.8 mm 14 U.S.S. gage nominal thickness. Furnish smooth faced toe guards or skirts and mount flush with the edges of the ramp surface. Ensure sufficient depth of toe guards or skirts to protect the full operating range of dock travel. Ensure the construction capable of resisting a minimum lateral force of 4.5 kg 10 pounds with a maximum deflection of 13 mm 1/2 inch.
2.3  LOADING DOCK LEVELERS

**************************************************************************
NOTE: Electro-hydraulic type loading dock levelers, supplied with electrical power from a building system, must be equipped with overload protection as provided by preset main system relief valve in the manufacturer's power unit, which will prevent operation of the elevating device when elevating device is loaded to 125 percent or more of the rated capacity. Determine total leveler gross dynamic loads by fork truck weight plus the maximum rated fork lift carrying capacity plus attachment handling device weight.

On small jobs, e.g. replacement of one dock leveler, not all submitted requirements are necessary and must be edited to fit each job.

**************************************************************************

Provide permanent loading dock levelers in accordance with MHI MH30.1 with minimum performance characteristics based on the following:

a. Service Period:
   (1) Number of shift operations: [1] [2] [3].
   (2) Maximum number of trucks per shift opening: [_____].
   (3) Maximum number of days per week: [_____].

b. Fork Lift Loads:
   (2) Design levelers to handle [_____] gross dynamic load.
   (3) Base load leveler design on number of cycles per loading/unloading operation per truck and of [_____].

Provide loading dock leveler with [electro-hydraulic type with electric motor and hydraulic pump operating a hydraulic cylinder that adjusts dock leveler board position] [mechanical type which is manually released at dock leveler and raises by spring action and is lowered by walk-on of dock operator] [air powered type with an industrial fan motor operating a polyvinylchloride air bag that adjusts dock leveler board position]. Coordinate a truck restraint system with the dock leveler via an interconnect function such that the restraint and dock leveler will engage with a single push-button, if a powered trailer restraint is selected to lock truck or trailer into position during loading and for overnight security. Incorporate a visual signal to inform dock operator and driver of locked or unlocked status. Make provision for maintenance access to understructure and lifting mechanism. Provide steel tread plate lip and platform, hinged and supported from beneath by steel framework that contains lifting, positioning, and lowering assembly. Ensure that platform surface is flush with surrounding floor surface of loading dock when not in service. Provide integral positive restraint when leveler is in maintenance position.

2.3.1  Design Requirements

Design, fabricate, and finish loading ramp to permit washing with water and detergents, and operating in an ambient temperature from minus 17 to plus 43 degrees C 0 to plus 110 degrees F.
2.3.2 Dock Leveler Height Adjustment

**************************************************************************
NOTE: Maximum vertical adjustment could be 900 mm 36 inches, if needed.
**************************************************************************

Provide a ramp whose incline can be adjusted to suit the height of the freight carrier. Allow the loading ramp a minimum of [0] [610] mm [0] [24] inches of vertical adjustment. Divide height adjustments [0] [305] mm [0] [12] inches above and [0] [305] mm [0] [12] inches below the dock level to provide coverage between [760] [685] [_____] mm [30] [27] [_____] inches and [1370] [1295] [_____] mm [54] [51] [_____] inches above grade.

2.3.3 Dock Leveler Extension and Retraction

Extend non-fixed end of the dock leveler from a retracted position behind the line of the loading dock platform bumpers to at least 300 mm 12 inches beyond the forward edge of the dock platform bumpers so as to rest on the bed of the freight carrier. The difference in length of the platform from its fully retracted position to its fully extended position must be constant throughout the ramp, including the ramp extension.

2.3.4 Loading Ramp Compensation

Provide automatic compensation with ramp platform loaded or unloaded for:

2.3.4.1 Freight Carrier Out of Level

Out of level freight carrier bed condition (difference in elevation from side to side at the rear of the carrier bed): Allow a minimum correction of 25 mm one inch for each 450 mm 18 inches and maximum 100 mm 4 inch correction of ramp width over the width of the ramp. Ensure the rear edge of the ramp parallel with the rear of the frame in order to prevent tripping or be a pinching hazard.

2.3.4.2 Loading and Unloading of the Freight Carrier

Provide mechanical type dock levelers with manual load compensation for truck beds lowered below dock height. Provide [semi automatic] [manual] air powered dock levelers for trailer movement. When the lip is extended so as to rest on the bed of motor truck or trailer, provide compensation of 100 mm 4 inches for carrier spring deflection so that contact will be maintained between lip and carrier bed.

2.3.5 Safety Devices

2.3.5.1 Electro-Hydraulic System

Provide velocity fuse, ballcheck valve, or other device to automatically prevent a drop of more than 100 mm 4 inches of the lip, should the freight carrier move away from the dock leaving the lip unsupported. Activate this device with a static, dynamic, or impact load exceeding 10 percent of the rated load on the lip and ramp.

2.3.5.2 Mechanical System

Include a three-position safety system to limit platform fall to dock level
and 100 and 200 mm 4 and 8 inches below dock level by means of double structural steel safety legs. Do not deactivate safety legs by dock leveler. This ensures that safety legs are independent of dock leveler motion and retractable from the top of the platform for below dock level control.

2.3.5.3 Air Powered System

When in use, and the dock leveler is above the dock, provide an automatic safety device to prevent a drop of more than 50 mm 2 inches at the outer end of the board, should a truck or trailer be moved away leaving the board unsupported. When in use, and the dock leveler is below dock, the dock leveler will drop to the below dock stops, at the outer end of the board, should a truck or trailer be moved away leaving the board unsupported.

2.3.5.4 Dock Bumpers

Provide ramp and load dock face with laminated rubber, tire-fabric, or equivalent dock bumpers recommended by the dock leveler manufacturer. Submit one fully assembled Loading Dock Bumper with supporting rods, end angles, bolts, and nuts. (This may be the smallest size bumper required.) One section of 203 mm 8 inches wide by full depth and height of bumper including one end angle with the opposite end exposed for inspection. [Solid Rubber pieces conforming to ASTM D2000, Grade 4AA612A13B13F17 may be used instead of rubberized fabric.]

2.3.6 Rated Capacity

Minimum 9070 kg 20,000 pounds roll over capacity.

2.3.7 Ramp Load Carrying Surface

**************************************************************************

NOTE: Board width should be up to maximum leveler width of 2130 mm 7 feet nominal. Board length must be sized based on the maximum operating slopes of the loading equipment used. Manufacturer’s literature must be checked to verify that desired length of boards are available. Pallet, skid, and electric fork trucks should not be required to negotiate greater than 10 percent grade. Gasoline fork trucks should not be required to negotiate greater than 15 percent grade. EXAMPLE:

Given:

Height differential (dock to truck bed): 300 mm 12 inch
Dock leveler nominal overall length: 2400 mm 96 inch

Required:

Check for use of electric fork truck.

Grade Calculation:

Percent grade equals height differential divided by overall leveler length times 100 which equals 300 mm 12 inch divided by 2400 mm 96 inch times 100 which
equals 12.5 percent.

Conclusion:

Grade exceeds 10 percent; therefore, length of dock leveler should be increased until grade is 10 percent or less. Use 3000 mm 120 inch; that way grade equals 300 mm 12 inch divided by 3000 mm 120 inch times 100 which equals 10 percent.

If dimensions for width and length of dock leveler ramp platform surface vary from that specified, so indicate.

The live load carrying surface of the ramp must be [1825] [_____] mm [6] [_____] feet plus or minus 75 mm 3 inch wide and [3050] [_____] mm [10] [_____] feet plus or minus 225 mm 9 inch long with the dock leveler lip retracted.

2.4 OPERATION

2.4.1 Mechanical Control

Manual chain activated system for raising and lowering platform, operated by counterbalance and extension spring. Once the freight carrier has departed, manually return the platform to the stored, level position. Ensure the ramp, in its stored position, is capable of being lowered below dock level platform level without extending the lip of the ramp.

2.4.2 Electro-Hydraulic Control

Provide each dock leveler with a pushbutton station to activate motor, pump, and valves.

2.4.2.1 Pushbutton

Heavy-duty dust tight and oil tight type rated in accordance with NEMA ICS 2, Part 5, Pushbuttons, Selector Switches, Indicating Lights, and Pushbutton Stations. To prevent accidental operation and damage, ensure each button to be recessed in its station or be protected by a peripheral collar (ring) or shroud. Identify each pushbutton by means of cast or etched letters on the station. Provide emergency "STOP" button of momentary type with manual reset or continuous pressing (constant pressure) type. This stop button must stop all dock leveler movement, regardless of the position of the ramp or lip at the time the "STOP" button is depressed.

2.4.2.2 Hinged Lip Ramp Movement

Apply continuous pressure on the "UP" button to raise the loading ramp, descend the lip onto the bed of the freight carrier. Once the freight carrier has departed, the lip must automatically fall or retract to its down position, and the ramp must return to its stored dock level position. The ramp, in its stored position, must have the capability of being lowered below dock level without extending the lip of the ramp to service truck end loads which may be lower than loading dock surface position. Allow 4 to 6 seconds to fully extend or retract the lip.
2.5 CONSTRUCTION AND MATERIALS

Construct load carrying parts of forged or welded steel. Construct entire live load carrying surface of the ramp and rear attachment must be within minimum 6 mm 1/4 inch thick, 350 MPa 55 ksi minimum yield strength, low alloy, nonskid steel tread plate. Provide minimum 16 mm 5/8 inch vertical projections on the live load carrying surface. Bevel the lip or ramp extension. Design load carrying surfaces to permit free movement of powered hand or platform trucks, low lift pallet trucks, and fork lift trucks. Fabricate lip hinge of not less than 6 mm 1/4 inch wall seamless steel tubing.

2.6 ELECTRO-HYDRAULIC SYSTEM

Provide a separate and complete system for each dock leveler. Include an electric motor, motor drive, hydraulic pump, hydraulic ram, pressure relief valve, fluid reservoir, strainer, filter, hydraulic control-valve cylinders, hose, piping, fittings, and hydraulic fluid. Incorporate a means for filling and draining hydraulic fluid. Design cylinders, pump, and control valves to withstand not less than 150 percent of the design operating pressure. Provide hydraulic hose, fittings, pipe, and tubing with working pressures based upon a minimum 4 to 1 safety factor of bursting pressure.

2.7 ELECTRICAL REQUIREMENTS

**************************************************************************

NOTE: Standard available ratings for 3 phase motors are 230 or 460 volts. If motors are used with 208 volt distribution systems, a booster transformer must be provided.

**************************************************************************

NFPA 70, NEMA ICS 2, NEMA ICS 6 and NEMA MG 1. Provide [230][460] volt electrical characteristics, three phase, 60 Hz alternating current power supply. Provide all electrical equipment on the loading ramp. Provide interconnecting wiring for components of packaged equipment as an integral part of the equipment. Include motor, switches, junction box, conduit, wiring cables, panel enclosed control station, motor controller, heater coils, timer, transformer, terminal blocks, and fuses. Provide NEMA ICS 6, Type 4, electrical enclosures. Color code all wiring.

2.7.1 Motor

**************************************************************************

NOTE: Only electrohydraulic and air powered loading dock levelers are equipped with electric motor which activate the power system to raise and operate leveler.

Totally enclosed, non-vented motor (TENV) is the preferred motor for loading dock applications since the motor is not run continuously and only for short periods to raise the dock and extend the lip.

**************************************************************************

Conform to NEMA MG 1 and continuous duty or 60-minute time rated, industrial type, single speed rated for operating conditions. Provide electrical insulation systems conforming to NEMA MG 1, Class B. Provide
permanently lubricated antifriction ball or roller bearings. Equip each electrohydraulic loading dock leveler with a [totally enclosed fan cooled (TEFC)] [totally enclosed non-ventilated (TENV)] squirrel cage induction electric motor. Equip each air powered loading dock leveler with a 115v, single phase, 60 Hz, self cleaning, two stage, UL approved industrial fan motor, which will not exceed its rated capacity under full load conditions of the loading dock leveler.

2.7.2 Controls

**************************************************************************
NOTE: Controls are required for electrohydraulic ramps. If dual controls are provided, the designer will indicate the location on the drawings.
**************************************************************************

NEMA ICS 2, size 0 controller for heavy industrial service. Provide an electrically operated, full magnetic, non-reversing type controller for the motor. Equip all control enclosures with locks and keys.

2.7.3 Transformer

Totally enclosed, self-cooled, dry type. Feed the transformer from the load side of the main disconnecting device. Incorporate circuit breakers with ground fault interrupting protection conforming to UL 943.

2.8 ACCESSORIES

2.8.1 Restraining Device

Provide self-aligning restraining device in accordance with MHI MH30.3. Mount this device as recommended by the manufacturer to engage the ICC bar of the truck/trailer with a positive restraining force of not less than 8150 kg 18,000 pounds. This device must be able to service all trucks or trailers having ICC bars located between 300 and 750 mm 12 and 30 inch above ground level (when truck or trailer is unloaded) and recessed up to 225 mm 9 inch from the rear of truck or trailer. Provide a means to protect the device from disabling damage in the event that more than 8150 kg 18,000 pounds of force is exerted by the restrained truck or trailer. Manually control activation and deactivation from inside the building. Submit data packages in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA for restraining device and loading dock levelers.

2.8.2 Dock Bumpers

Provide bumpers in accordance with ASTM D2632 and ASTM D624, and capable of sustaining repeated impacts from trucks or trailers without damage to the dock, dock levelers, or bumpers.

2.9 TESTS, INSPECTIONS, AND VERIFICATIONS

Indicate to Contracting Officer at time of bid, which field tests specified in FIELD TESTS article are not permitted by manufacturer. Provide equivalent factory test certificates for specified field tests not conducted.
PART 3  EXECUTION

3.1  EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2  INSTALLATION

**************************************************************************
NOTE: As a minimum, the following are required on drawings:

a. 2.5 to 3 meters 8 to 10 feet wide loading dock space behind ramp for vehicle maneuvering.

b. Ramp located in the middle of one truck space.

c. Location of control station for power operated ramps.

d. Location of disconnect switch with provisions for padlocking in the open position which should be just inside the nearest building door.

e. Ramp pits which should have steel angles anchored to concrete on top three sides and dock wall edge in bottom front of dock leveler pit.

**************************************************************************

Install and adjust in accordance with NFPA 70, manufacturer's approved detail drawings, and as-built system assembly drawings. Install controls so operator can see dock leveler while manipulating controls. Do not pour the pit for the adjustable loading ramp until the design and detail drawings have been approved. If the pit size is limited by construction conditions involved, alter the dock leveler equipment to fit the pit. Clearly indicate these alterations or modifications on the drawings. Check and verify the appropriate measurements at the building. Do not exceed 50 mm 2 inch clearances between the ramp and pit.

3.3  CLEANING, TREATMENT AND PAINTING

Shop clean, treat and paint ferrous surfaces including platform, lip, frame, [springs,] [motor,] [pump,] cylinders, [valves,] and any other non-cadmium plated or non-galvanized surface in accordance with manufacturer's published instructions and recommendations. Do not paint bearings, gear contact surfaces, parts protected by lubrication, or other surfaces not usually painted or coated. Clean ferrous surfaces[, shot pen, and protect the base metal with an application of 99.9 percent pure zinc coating with a thickness of 0.010 to 0.012 in accordance with AWS C2.18] [and protect the base metal with an application of a paint manufactured with rust inhibiting chemical additives to a thickness of 0.062 to 0.075 mm 2.5 to 3 mils followed by a final coat of standard primer with a thickness of 0.062 to 0.075 mm 2.5 to 3 mils]. Protect nonferrous parts against corrosion.
3.3.1 Workmanship

Conduct field touch-up work as to avoid damaging other surfaces and public property in the area. Do not apply field applied paint during foggy, damp, rainy weather, or in ambient temperatures below 7 degrees C 45 degrees F and above 35 degrees C 95 degrees F.

3.3.2 Dissimilar Metals Protection

Insulate control surfaces with electrolytically inactive materials.

3.3.3 Finish Coat Color

Paint 75 mm 3 inch wide brilliant black and yellow diagonal stripes on all vertical surfaces of pit, skirts, and platform edges exposed above adjacent surfaces at any ramp position. Paint similar stripes on top of ramp surfaces in 150 mm 6 inch wide band around outside edges (except for fixed edge).

3.4 FIELD TESTS

************************************************************************************
NOTE: Determine local vendor policy with regard to conducting field tests on installed equipment and its effect on local vendor and manufacturer warranty if conducted. Consider requiring factory test certificates in lieu of field tests. See TESTS, INSPECTIONS, AND VERIFICATIONS article in Part 2.
************************************************************************************

Provide personnel, instruments, materials, and equipment, including test vehicles, for the administration and direction of the tests. Correct defects and repeat tests under the cognizance of the Contracting Officer and the dock leveler manufacturer. The Contracting Officer is responsible for certifying the test load.

3.4.1 Roll-Over Load Tests

Move roll-over load of 9070 kg 20,000 pounds over the dock leveler between the bed of a freight carrier and the building loading dock surface for 10 cycles. With the ramp extension retracted and the ramp platform leveled with the building loading dock surface, run a 9070 kg 20,000 pound roll-over load over the ramp in various directions for 20 cycles. Do not allow permanent deformation [or hydraulic system leakage] to occur subsequent to examination after these roll-over tests.

3.4.2 Acceptance Tests

Perform an acceptance test in the presence of the dock leveler manufacturer and the Contracting Officer subsequent to roll-over load tests and drop tests. Conduct operation of the equipment through all of its motions and specified checks as follows:

a. Extend lip to rest on a variety of freight carriers with beds up 300 mm 12 inch above and below dock level;
b. Test 100 mm 4 inch drop limitation with minimum 3175 kg 7000 pound load on ramp, evenly distributed;
c. Test level compensation with the ramp, loaded with minimum 3175 kg 7000 pounds;
d. Test proper compensation (float) for various compression of countersprings, with ramp loaded and unloaded.

3.5 INSTRUCTION TO GOVERNMENT PERSONNEL

******************************************************************************

NOTE: The brackets have been provided because replacement of one dock leveler at an existing facility may not require training. Check with facility before deciding whether this training is required since existing personnel may be knowledgeable of dock leveler operations and maintenance.

******************************************************************************

[Upon completion of the work and at a time designated by the Contracting Officer, provide the services of a competent Technician regularly employed or authorized by the manufacturer of the dock leveler to instruct Government personnel in the proper operation, maintenance, safety, and emergency procedures of the dock leveler. A minimum of one and no more than two eight-hour working days of instruction is required. Conduct the training at the job site or at another location mutually satisfactory to the Government and the Contractor.]

3.6 CLOSEOUT ACTIVITIES

3.6.1 Record Drawings

Record dimensions, tolerances, surface finishes, hardnesses, flush edge angles, method of mounting and anchoring, and control schematics and diagram, including mechanical and electrical components, testing and acceptance for each industrial dock leveler, in as-built drawings.

3.7 OPERATING MANUALS

Provide operating manuals that detail system startup, operation, and shutdown procedures. Include manufacturer's name, model number, parts list, and brief description of equipment and operating features. List routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides in the maintenance manuals. Include piping and equipment layout and simplified wiring and control diagrams of the system as installed.

  3.2.2 Adjustments
NOTE: This guide specification covers the requirements for radiographic darkroom equipment.

Adhere to [UFC 1-300-02](UFC_1-300-02) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: On the drawings, show equipment covered by this section and the relationship to adjacent work.

NOTE: To avoid repetition, general requirements common to other medical and dental equipment sections are in Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT.
publications cited in the text of the guide specification. The publications are referred to in
the text by basic designation only and listed in this paragraph by organization, designation, date,
and title.

Use the Reference Wizard's Check Reference feature
when you add a Reference Identifier (RID) outside of
the Section's Reference Article to automatically
place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature
to update the issue dates.

References not used in the text will automatically
be deleted from this section of the project
specification when you choose to reconcile
references in the publish print process.

The publications listed below form a part of this specification to the
extent referenced. The publications are referred to within the text by the
basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM A480/A480M (2023b) Standard Specification for General
Requirements for Flat-Rolled Stainless and
Heat-Resisting Steel Plate, Sheet, and
Strip

ASTM A568/A568M (2019a) Standard Specification for Steel,
Sheet, Carbon, Structural, and
High-Strength, Low-Alloy, Hot-Rolled and
Cold-Rolled, General Requirements for

and Aluminum-Alloy Extruded Bars, Rods,
Wire, Profiles, and Tubes

and Aluminum-Alloy Extruded Bars, Rods,
Wire, Profiles, and Tubes (Metric)

Poly(Vinyl Chloride) (PVC) Plastic Drain,
Waste, and Vent Pipe and Fittings

1.2 RELATED REQUIREMENTS

Conform to Section[s] 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL
EQUIPMENT[,] [.]" [23 03 00.00 20 BASIC MECHANICAL MATERIALS AND
METHODS][,][.]" [and] [26 20 00 INTERIOR DISTRIBUTION SYSTEM.] Provide
final utility connections and utility service to equipment.

1.3 SUBMITTALS

******************************************************************************

NOTE: Review Submittal Description (SD) definitions
in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Aluminum Alloy

ASTM B221M ASTM B221, equivalent in ultimate tensile, yield, and shear strengths to Alloy 6063-T5 or 6063-T6.

2.1.2 Carbon Steel

ASTM A568/A568M, cold-rolled sheets, commercial bright finish. Stretcher level sheets 1.5 mm thick 16 gage and lighter.

2.1.3 Stainless Steel

ASTM A480/A480M, Class 301, 302, or 304.

2.2 ITEMS

2.2.1 Film-Loading Bin

Cabinet suitable for storing and sorting open, unexposed boxes of medical radiographic film; approximately 525 mm wide, 450 mm deep and 875 mm high 21 inches wide, 18 inches deep and 34 1/2 inches high. Include:

a. Base cabinet fabricated of carbon steel with finished sides, with solid-face, recessed base, suitable for application of resilient base material.

b. Swing-out bin: flush mounted, with front panel marked "FILMS - DO NOT OPEN IN LIGHT." Counterbalance unit mount with continuous plano-type hinge along lower edge.

c. Built-in spacers, dividing bin into five equal compartments each approximately 395 mm wide by 57 mm front to back by 500 mm deep 15 1/2 inches wide by 2 1/4 inches front to back by 20 inches deep.

d. At least four removable inserts, suitable for adapting divided spaces to accept film boxes in sizes of 100 by 125 mm 4 by 5 inches, 125 by 175 mm 5 by 7 inches, 165 by 215 mm 6 1/2 by 8 1/2 inches, 200 by 250 mm 8 by 10 inches, 175 by 430 mm 7 by 17 inches, 240 by 240 mm 9 1/2 by 9 1/2 inches, 250 by 300 mm 10 by 12 inches, 275 by 350 mm 11 by 14 inches and 350 by 430 mm 14 by 17 inches, all with box tops flush with top of bin.

e. Limit switch: 115 volts, 60 hertz (Hz), located in cabinet back, ready for connecting in series with darkroom white light so lights are automatically extinguished when bin is opened.

2.2.2 Cassette Transfer Box Cabinet

Four-door, automatic interlock, lead-lined, double compartment unit, suitable for through-the-wall transfer of radiographic film cassettes,
approximately 550 mm wide by 475 mm deep by 550 mm high 22 inches wide by 19 inches deep by 22 inches high. Include:

a. Automatic interlock doors, preventing both doors of a common compartment from being opened at same time.

b. Label doors "EXPOSED" and "UNEXPOSED".

c. Automatic signal device, activated when one or more standard, 125 by 175 mm 5 by 7 inch or larger cassettes are in compartments, consisting of:

(1) Light system, mounted over doors of transfer cabinet, with white light on side of transfer cabinet opposite darkroom; lighted when compartment designated as "UNEXPOSED" is occupied and colored light on darkroom side of box; lighted when compartment designated as "EXPOSED" is occupied.

(2) Colored light, safe for up to 2 minutes for unprotected high-speed medical radiographic films when they are exposed at distance of 600 mm 24 inches from light source.

d. Voice passage, light, and radiation baffle.

e. Installation accessories, including rough-in frame, brackets, and trim.

f. Lead lining, 2 mm 1/16 inch minimum thickness, providing protection of complete assembly, equal to or greater than protection of wall within which it is located.

g. Power source of [120] [208] [220] [_____] volts, [50] [60] Hz, single-phase, operating from primary electric power.

2.2.3 Illuminator, Radiographic Film, Recess Mounted

Explosion-proof fluorescent fixture, with each viewing panel independently switched. Include:

a. Electrical characteristics: [120] [220] [_____] volts, [50] [60] Hz, single-phase.

b. Illumination: Maximum panel brightness not less than 1540 candelas per square meter 450 foot lamberts located within a 150 mm 6 inch square at center of viewing panel. Minimum panel brightness not less than 65 percent of maximum panel brightness. Do not include areas of viewing panel within 38 mm 1 1/2 inches of edges in brightness measurements.

c. Trim for recessed installation.

d. Film-holding device: Continuous-ball or strip-spring type extending across top of each viewing panel. All parts corrosion-resistant steel or plastic.

2.2.3.1 Illuminator, 1 Panel Recessed

Single unit approximately 500 mm high by 375 mm long by 125 mm deep 20 inches high by 15 inches long by 5 inches deep.
2.2.3.2 **Illuminator, 2 Panel Recessed**

Double unit approximately 500 mm high by 750 mm long by 125 mm deep 20 inches high by 30 inches long by 5 inches deep.

2.2.3.3 **Illuminator, 8 Panel Recessed**

Eight-panel, (four in tandem, double deck), four over four, approximately 1000 mm high by 1500 mm wide by 125 mm deep 40 inches high by 60 inches wide by 5 inches deep.

2.2.3.4 **Illuminator, 4 Panel Recessed**

Four-panel, approximately 700 mm high by 1750 mm wide by 150 mm deep 28 inches high by 69 inches wide by 6 inches deep.

2.2.3.5 **Illuminator, 4 Panel Explosion Proof**

Four-unit, approximately 500 mm high by 1500 mm wide by 125 mm deep 20 inches high by 60 inches wide by 5 inches deep.

2.2.4 **Illuminator, 1 Panel Surface**

Explosion-proof, single-panel, fluorescent fixture, each viewing panel independently switched. Approximate dimensions: 500 mm high by 430 mm wide by 125 mm deep 20 inches high by 17 inches wide by 5 inches deep. Include:

a. Electrical characteristics: [120] [220] [_____] volts, [50] [60] Hz, single-phase.

b. Illumination: Maximum panel brightness not less than 1540 cd/sq m 450 foot lamberts located within 150 mm 6 inch square at center of viewing panel. Minimum panel brightness not less than 65 percent of maximum. Do not include areas of viewing panel within 38 mm 1 1/2 inches of edges in brightness measurements.

c. Enameled steel frame.

d. Line cord, 3-wire, 2125 mm 7 feet long with hospital-grade plug.

e. Film-holding device: Continuous-ball or strip-spring type extending across top of each viewing panel. Corrosion-resistant steel.

f. Mounting hardware.

2.2.5 **Illuminator, 2 Panel Surface**

Double unit, continuous-surface viewing with dual switches, heli-grip film support. Approximate dimensions: 450 mm high by 120 mm wide by 775 mm long 17 7/8 inches high by 4 3/4 inches wide by 31 inches long. Include:

a. Electrical characteristics: [110] [220] [_____] volts, [50] [60] Hz, single-phase.

b. Illumination: Maximum brightness not less than 1540 cd/sq m 450 foot lamberts located within 150 mm 6 inch square at center of viewing panel. Minimum panel brightness not less than 65 percent of maximum. Do not include areas of viewing panel within 38 mm 1 1/2 inches of...
edges in brightness measurements.

c. Stainless steel frame.

d. Line cord, 3-wire, **2125 mm 7 feet** long with hospital grade plug.

e. Film holding device: Continuous-ball or strip-spring extending across
top of each viewing panel. Corrosion-resistant steel.

f. Mounting hardware.

2.2.6 **Illuminator, 8 Panel With Desk**

Four over four format mounted in high density particleboard frame with
walnut grain melamine, high-pressure laminated end panel. Mount lower bank
of illuminators at a 30- or 45-degree angle. Illuminator unit approximately
1475 mm long by 525 mm deep by 1350 mm high 59 inches long by 21 inches
deep by 54 inches high. Desk, of same construction as illuminator frame,
shall be approximately 1500 mm long by 450 mm deep by 200 mm high 60 inches
long by 18 inches deep by 8 inches high. Include:

a. Electrical characteristics: [115] [230] [_____] volts, [50] [60] Hz,
single-phase.

b. Two remote control switches for individual light panel control.

c. High intensity spot-viewer device, manual type.

2.2.7 **Processor, X-Ray Film, 90 Seconds**

Unit shall automatically develop, fix, wash, and dry 350 mixed-sized
medical radiographic films per hour at 90 seconds per film. Provide
cabinetized unit, roller-transport type, for locating in lighted room and
fed from darkroom through opening in wall. Include the following:

a. Cabinet: chemical-resistant finish with removable panels to facilitate
servicing.

b. Controls: automatic, accessible from feed side of unit; include power
switch and replenisher status indicators.

c. Standby mode: to reduce power and water consumption when films are not
being processed.

******************************************************************************

NOTE: Heat and corrosive fumes are normally
exhausted from darkroom face of this unit. The
exhaust hose connects collar on unit to duct stub in
the darkroom. Other specification sections must
provide duct stub and exhaust fan, fabricated of
corrosion-resistant materials.

******************************************************************************

d. Exhaust hose: flexible, acid fume-resistant tubing, [3000 mm] [10 feet]
[_____] long.

******************************************************************************

NOTE: Select size and type. Location of
replenisher tanks should be enclosed by raised curb,
and enclosed area should include an acid-resistant drain to facilitate emptying tanks without lifting them.

**************************************************************************

e. Replenisher tanks: two, 53 liter 14 gallon capacity, suitable for locating inside processor cabinet.

[e. Item Chemical Automatic Mixer to automatically mix replenisher solutions: on rollers with flexible hose connector. Electrical characteristic: 120-volts, 60 Hz, single phase.]

**************************************************************************

NOTE: When chemical tanks are remotely located, chemical supply lines (each approximately 25 mm one inch in diameter) should be concealed in construction.

**************************************************************************

f. Chemical supply tubing, plastic: resistant to harm from chemicals, to run from chemical tank spout to processor fitting.

**************************************************************************

NOTE: The wall where this unit is to be located may be provided with an opening larger than necessary, and millwork can provide a lightproofing rough-in frame fabricated from 20 mm 3/4 inch plywood with compressible foam lightlock strip.

**************************************************************************

g. Lightproof stripping: compressible foam for application to either perimeter of rough opening or edge of unit's face.

**************************************************************************

NOTE: Minimum drainpipe diameter shall be 88 mm 3 1/2 inches. It shall include a strainer and incorporate a bucket or funnel design that deters splashing during discharge. Both drain and waste lines from this drain must be both acid- and corrosion-resistant.

**************************************************************************

h. Pipe and fittings: ASTM D2665, polyvinyl chloride (PVC). Assemble as L-shaped line connected to face of processor at waste opening, allowing waste flushed from processor to discharge directly over floor drain; provide 25 mm one inch minimum air gap between discharge end of pipe and drain.

**************************************************************************

NOTE: Provide breaker in vicinity of processor to facilitate safe removal and servicing.

**************************************************************************

i. Service characteristics:

Electrical: [120/208] [120/240] [_____] volts; [50] [60] Hz; [3] [4] [5]-wire; [single-][three-] phase.

SECTION 11 27 13 Page 11
2.2.8 Developing Tank, X-Ray

Refrigerated type tank assembly, refrigerated type, splashproof, single compartment unit, for manually developing, fixing, and washing medical radiographic films; approximate overall dimensions of 950 mm high by 500 mm wide by 525 mm deep 38 inches high by 20 inches wide by 21 inches deep. Include:

a. Cabinet: Type 316 stainless steel, heliarc welded and chemically passivated, with insulated tank, assembly reinforced, and corrosion-resistant legs with adjustable leveling feet.

b. Refrigeration unit: Integrally located, mounted on isolators, including thermostatic control, watercooled condenser, and cooled water storage tank; capable of delivering 95 liters per hour (LPH) [20] degree Centigrade (C) 25 gallons per hour (GPH) [68] [_____] degree Fahrenheit (F) water when incoming water is [29] [_____] degrees C [85] [_____] degrees F.

c. Waste piping: Preinstalled, acid resistant, including overflow drain, drain valve, couplings, and fittings.

d. Inserts: Two solution tanks, each with 19 liter 5 gallon capacity.

**************************************************************************
NOTE: Select applicable paragraph(s) from following:
**************************************************************************
[e. Insert tank covers: One for each insert, Type 316 stainless steel.]
[e. Tank covers: For covering full tank opening and all inserts, Type 316 stainless steel.]

f. Valve: Thermostatic, for wall surface mounting, 3.8 liters per minute (LPM) through 19 lpm at 412 kilopascals one gallon per minute (GPM) through 5 gpm at 45 pounds per square inch (psi), with integral dial thermometer, diverter valve, and spray hose unit for cleaning tank and components.

PART 3 EXECUTION

3.1 INSTALLATION

Install at locations indicated. Conform to installation requirements of Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT.

3.2 FIELD QUALITY CONTROL

3.2.1 Inspections

Examine each item for visual defects and conformance to specifications.

3.2.2 Adjustments

Adjust each item to ensure that equipment is operational and conforms to specification requirements.

PART 2 PRODUCTS

2.1 KITCHEN EQUIPMENT

2.1.1 Materials

**************************************************************************
NOTE: In drawings, include information on quantities, physical dimensions, colors, and electrical characteristics of kitchen equipment.
**************************************************************************

Except as modified herein, provide manufacturer's standard materials for kitchen equipment. Provide quantities, physical dimensions, colors, and electrical characteristics as indicated.

2.1.2 Cooking Top

[UL 197][UL 858], spill catching, seamless, with [cast-iron] [or] [tubular plug-in] surface elements. Provide indicating "on" lights.

2.1.3 Freezer

UL 250, minimum [0.28] [____] cubic meter [10] [____] cubic feet, [chest
model with manual defrost,] [moisture-proof upright model with [left] [right] [reversible] swing door,] foam or fiberglass insulation, adjustable temperature control to maintain minus 18 degrees C zero degrees storage conditions, [[sliding] removable storage basket, and vertical dividers] [minimum three package door shelves, minimum five full width removable interior shelves, and sliding bottom basket for odd shaped and bulky items, and adjustable leg levelers]. Provide safety indicating light for power failure or temperature fluctuation, magnetic door gasket, and lock with pop-out key. For freezer capacity larger than 0.42 cubic meters 15 cubic feet, provide interior light. Provide freezer that is Energy Star labeled. Provide data identifying Energy Star label for freezer.

2.1.4 Refrigerator

UL 250, refrigerator with frostproof [top] [side by side] freezer, minimum [0.41] [_____] cubic meter [14.6] [_____] cubic feet, automatic defrosting, two vegetable bottom baskets, four adjustable shelves, two door shelves and minimum 12 egg container in the door, separate interior shelves, multiple door shelves, and two ice trays. Provide refrigerator that is Energy Star labeled. Provide data identifying Energy Star label for refrigerator. [For refrigerator with top freezer, provide reversible (left swing and right swing interchangeable) doors.] Provide four fixed rollers or adjustable leg levelers.

2.1.5 Ice Maker

2.1.6 Hot Plate

2.1.7 Microwave Oven

UL 923, [built-in], with black glass window door, minimum 28 liter one cubic foot capacity, automatic oven light, browning element, 10 power levels, automatic temperature controllers, minimum two automatic memory levels, digital time controllers, and electronic touch-control panel.

2.1.8 Oven

UL 858, self-cleaning, [[built-in] [and] [under counter]] [countertop]. Equip oven with black glass window door, safety door lock during self-cleaning cycle, broiler pan, self-locking oven racks, digital clock with one-hour timer, automatic oven light, oven "on" light, oven cycling light and tempered glass control panel.
2.1.9 Trash Compactor

UL 1086, under counter model with storage compartment and [76 liter] [20 gallon] [_____] trash disposable bag, reversible front panel, odor control, minimum 900 kilograms 2,000 pounds ram force delivering constant and balancing pressure, and safety start lock with removable key knob guard.

2.1.10 Tray and Silver Dispenser

NSF/ANSI 2, factory assembled, under counter model with welded steel channel frame, polished stainless steel enclosure, removable access panel on three sides, and minimum 100 mm 4 inch diameter chrome plated and rubber tired swivel casters. Provide manufacturer's standard dispenser mechanism to maintain the dispensing height at a constant level with stainless steel carriers. Provide storage capacity for [350] [_____] trays, and [10] [_____] cylinders with [35 to 40] [_____] to [_____] pieces of silverware per cylinder.

2.1.11 Food Cabinet Cart

NSF/ANSI 2, factory assembled, aluminum construction under counter model with 270 degree swing door, door latch, minimum 100 mm 4 inch swivel casters, and angle ledge pan supports. Provide storage capacity for [seven 450 by 660 mm 18 by 26 inch] [_____] pans.

2.1.12 Kitchen Exhaust Hood

NFPA 96 and NSF/ANSI 2, factory fabricated, [island] [wall-mounted] model of minimum 1.2 mm thick 18 gage stainless steel construction, with replaceable grease filters.

2.1.12.1 Hood Construction

Welded joints and seams, grounded and polished to match adjacent exterior surfaces. Provide stainless steel duct collars and risers.

2.1.12.2 Grease Gutter

1.2 mm thick 18 gage stainless steel gutter down center of hood and directly below filter frame sloping to drain outlet.

2.1.12.3 Accessories

Provide filter frame, minimum [405 by 510 by 50 mm] [16 by 20 by 2 inches] [_____] stainless steel grease extractor, hanger rods, vaporproof light fixtures, and wiring in conduit between light fixtures.

2.1.12.4 Exhaust Fan

UL 710; centrifugal fan with maximum kitchen sound pressure level 45 dB. [Provide factory fabricated [adjustable] roof curbs.]

2.1.13 Range Hood

UL 858, [vented] [nonvented], with two-speed fan, permanent washable filter, [top] [or] [rear] exhaust, and eye level controls.
2.1.14 Kitchen Unit

NSF/ANSI 2, UL 250, and UL 858 consisting of refrigerator, range [and oven], wall cabinets, and sink and countertop.

2.1.14.1 Compact [or Undercounter] Refrigerator

**************************************************************************
NOTE: Automatic defrost feature is available for refrigerators as small as 0.14 cubic meter 5 cubic feet net capacity. Recommend a minimum net capacity of 0.14 cubic meter 5 cubic feet.
**************************************************************************

Refrigerator assembly with freezer, corrosion-resistant inner lining, and minimum net capacity of [______]. Provide minimum one ice cube tray, removable shelves, automatic interior light, adjustable cold controls, and [automatic] [manual (pushbutton)] defrost.

2.1.14.2 Range [and Oven]

[Three] [or] [four] [cast-iron] [or] [tubular plug-in] surface elements of minimum 4,500 total watts at [208] [230] volts, infinite control switches, and range indicating "on" lights. [Equip oven with one minimum 2,000-watt tubular broil element and one minimum 700-watt tubular bake element, oven indicating light, automatic oven-heat control, and utensil drawer.]

2.1.14.3 Sink and Countertop

One-piece, seamless, minimum 0.9 mm thick 20 gage stainless steel sink and countertop. Provide drainboard, swing spout faucet with aerator, 90 mm 3 1/2 inch drain, and continuous feed garbage disposer with minimum 1.2 liter 1 1/4 quart capacity conforming to paragraph HOUSEHOLD GARBAGE DISPOSAL in this section. Provide storage cabinet with cutlery tray or drawer.

2.1.14.4 Wall Cabinets

Double wall minimum 0.8 mm thick 22 gage [stainless steel] [or] [cold rolled] cabinets with chrome plated handles, self-aligning friction hatches, and concealed hinges for 180 degree opening. Furnish wall bracket hangers for flush to wall mounting. Provide manufacturer's standard heat deflector[ and range hood].

2.1.15 Free-Standing Double-Oven Range

UL 858, a combination of cooking top range, microwave oven, and oven. Comply with paragraphs COOKING TOP, MICROWAVE OVEN, and OVEN in this section.

2.1.16 Dishwasher

[UL 921][UL 749], with detergent dispenser. Provide dishwasher that is Energy Star labeled. Provide data identifying Energy Star label for dishwasher. Provide automatic control to cycle machine through wash, rinse, dry or heat, and stop phases. Include manual setting to repeat or skip phases of cycle. Equip machine with safety switch which automatically stops spraying action when door is open. [For heavy duty dishwasher, provide stainless-steel commercial grade with approximately [300] [_____]-dish capacity per hour and [540] [_____]-glasses per hour.
ratings.] [For medium duty dishwasher, provide household grade, with minimum 500-watt input for drying dishes.]

2.1.17 Instantaneous Booster Water Heater

UL listed and self-contained. Provide integral automatic thermostat set for 82 degrees C 180 degrees F.

2.1.18 Household Garbage Disposal

UL 430, stainless steel [continuous feed model, [245] [375] watt [1/3] [1/2] hp motor, and stainless steel grinding element with two 360 degree stainless steel swivel impellers.] [batch feed model, lock cover, minimum 1.9 liter 2 quart capacity, 375 watt 1/2 hp motor, and automatic switch.] Provide polyethylene or polyester drain flow chamber. Equip motor with manual reset, thermal overload protection, and sound insulation.

PART 3 EXECUTION

3.1 INSTALLATION

Do not install items that show visual evidence of biological growth.

NFPA 70, Section 22 00 00 PLUMBING, GENERAL PURPOSE and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Install kitchen equipment in accordance with manufacturers' instructions.

3.2 FIELD QUALITY CONTROL

Conduct inspection and testing in the presence of the Contracting Officer.

3.2.1 Field Inspection

Before and after installation, inspect each piece of kitchen equipment for compliance with specified requirements.

3.2.2 Operation Tests

Upon completion, but before final acceptance, perform operation tests on each piece of equipment to determine that components, including controls, safety devices, and attachments, operate properly and in accordance with specified requirements.

3.3 MANUFACTURER'S WARRANTY

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.4 CONTRACTOR'S WARRANTY FOR INSTALLATION

Submit contractor's warranty for installation to the Contracting Officer prior to final commissioning and acceptance.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for refrigerated and frozen food and drink storage cases, walk-in coolers, and walk-in freezers.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Coordinate this section and use in conjunction with the following:

Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT and Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide
specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF HEATING, REFRIGERATING AND AIR-CONDITIONING ENGINEERS (ASHRAE)

ASTM INTERNATIONAL (ASTM)

NSF INTERNATIONAL (NSF)

NSF Food Equipment (2005) NSF Product Listings of Food Equipment and Related Products, Components and Materials

NSF/ANSI 2 (2022) Food Equipment

NSF/ANSI 6 (2023) Dispensing Freezers

NSF/ANSI 7 (2023) Commercial Refrigerators and Freezers

UNDERWRITERS LABORATORIES (UL)

UL 207 (2022) UL Standard for Safety Refrigerant-Containing Components and Accessories, Nonelectrical
1.2 GENERAL REQUIREMENTS

**************************************************************************

NOTE: Indicate the configuration and layout for all refrigerated and frozen food and drink storage cases, walk-in coolers, and walk-in freezers on the floor plans, with interior elevations and equipment identified by number. Show a Food Service Equipment Schedule on the drawings using the same identification numbers[ as indicated on the current US Army Quartermaster Center and School equipment schedule]. Ensure that all Contractor built-to-order items on the Food Service Equipment Schedule", are shown and coordinated with the specifications.

Designer must coordinate with other Sections, including 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT and 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE for general requirements and final connection of equipment.

NOTE: Details of particular equipment and installations are provided on Naval Food Service Division drawings. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

**************************************************************************

Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for general requirements. Refer to Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE for detailed requirements.

1.3 DESCRIPTION OF WORK

The work includes [furnishing] [and installing] [and modifying existing] [refrigerated] [and frozen] food service equipment and all related work necessary to provide a complete installation. Verify existing dimensions, site conditions, and required utility connections prior to commencement of work. Coordinate delivery of components with finished openings and other vertical handling limitations within the building. Advise the Contracting Officer of discrepancies prior to [procurement and] installation of equipment. Submit Contractor's Field Verification Data prior to the preconstruction meeting.

Provide rough-in and utility connections to equipment in accord with requirements specified in other sections of this specification. Coordinate physical dimensions, capacities, manufacturer's instructions, and other requirements of the equipment furnished.
1.3.1 Design Requirements

**************************************************************************
NOTE: On the drawings, show:

1. A 1:50 1/4 inch scale floor plan with layout of all food service equipment and Naval Equipment Symbols.

2. A Food Service Equipment Schedule laid out in accordance with current CNIC's Galleys Department or US Army Quartermaster Center and School equipment schedules, and specified design requirements.

3. Floor, wall, and ceiling penetrations.

4. Raised bases, retainer curbs, or depressions.

5. Recessed, grated floor drains required for equipment.

6. Insulated floors where applicable, including under floor perforated drains and vent pipes.

7. Disconnect switches.

8. Electrical chases and raceways and plumbing chases.

9. Remote compressors and refrigeration systems.

10. Utility connections to building water, sanitary, electrical, and other utility systems. Convenience outlets at point of use for plug-in equipment.

11. All Contractor built-to-order items, in accordance with the Food Service Equipment Schedule, shown and coordinated with the specifications.

**************************************************************************

Submit detail drawings as stated in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for[ refrigerated ][ and frozen][ food][ and drink][ storage cases][.][, walk-in coolers][ walk-in freezers]. Provide drawings at a minimum 1:50 1/4 inch scale.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's
Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Contractor's Field Verification Data; G[, [______]]

SD-02 Shop Drawings

Manufacturer's Detail Drawings; G[, [______]]

Custom Fabricated Equipment; G[, [______]]

Installation Instructions and Diagrams; G[, [______]]

SD-03 Product Data

[ Frozen Food and Drink Storage Cases; G[, [______]]
][ Refrigerated Food and Drink Storage Cases; G[, [______]]
][ Walk-in Refrigerators; G[, [______]]
][ Walk-in Freezers; G[, [______]]
]

SD-05 Design Data

Manufacturer's Descriptive and Technical Literature; G[, [______]]
1.5 SHOP DRAWINGS

Submit manufacturer's detail drawings and custom fabricated equipment drawings for each refrigerated enclosure. Include insulation details, utility connections, and installation instructions and diagrams. Base shop drawings on verified field measurements and include contractor's field verification data.

1.6 QUALITY ASSURANCE

Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT.

1.6.1 Pre-Installation Conference

Thirty [_____] days prior to commencement of work, notify the Contracting Officer that the following items are prepared and ready for review:

a. Shop Drawings, product data and installation instructions
   (1) Manufacturer's detail drawings
   (2) Custom fabricated equipment drawings and data
       (a) Submit after approval of food service equipment drawings.
   (3) Installation instructions and diagrams

b. Product Data
   (1) Frozen food and drink storage cases
   (2) Refrigerated food and drink storage cases
   (3) Walk-in refrigerators
(4) Walk-in freezers

c. Design Data

(1) Manufacturer's descriptive and technical literature

(2) Manufacturer's Test Data

d. Manufacturer's Instructions

For shipping, handling, storage, installation, and start-up.

1.6.2 Factory Tests and Certifications

Submit Manufacturer's Test Data and certifications, including NSF Certification and UL Certification.

PART 2 PRODUCTS

**************************************************************************
NOTE: Choose one of the three bracketed options depending on whether all refrigerated components (including insulated floors) are metal faced; have automatic sprinklers within the units themselves or in the portion of the building(s) where they are located; or are non-metal faced components such as fiberglass.
**************************************************************************

2.1 MATERIALS

2.1.1 Insulation

Provide insulation materials for all equipment as follows:

[a. Insulated components must have a complete surface enclosure of not less than 0.8 mm 0.032 inches of aluminum or corrosion resistant steel having a base metal thickness of not less than 0.4 mm 0.0160 inches at any point.

[b. Insulated components must be protected by an automatic sprinkler system located within the refrigerated unit(s) themselves as well as in the portions(s) of the building(s) in which they are located.

]c. Insulation must comply with flame spread index limits of not more than 75 and smoke developed index of not more than 450 when tested, in the maximum thickness intended for use, in accordance with ASTM E84 or UL 723.

2.1.2 Other materials

Provide in accordance with Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT.

2.2 LIST OF EQUIPMENT

**************************************************************************
NOTE: Carefully edit the master Foodservice Equipment Schedule in Section 11 06 40.13
**************************************************************************
FOODSERVICE EQUIPMENT SCHEDULE; retain items used for the project. Edit the Equipment List and include in the project Specification. List the information contained on the Equipment List on the Contract Drawings.

**************************************************************************

Submit detailed Food Service Equipment List as specified in Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE.

2.3 CONSTRUCTION OF FABRICATED EQUIPMENT

Construct and finish fabricated equipment in accordance with Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT.

2.4 PREFABRICATED WALK-IN REFRIGERATORS AND FREEZERS

**************************************************************************

NOTE: Provide floor panel walk-in refrigerators and freezers, or floorless walk-in refrigerators and freezers installed over insulated floors, as directed. For floorless units, provide insulated floors under each walk-in refrigerator and freezer as if each unit were a freezer. Material for floors and surrounding areas should be quarry tile or other suitable material.

NOTE: Use floorless design where possible. When refrigerators are provided in existing buildings or over crawl spaces, floors must be prefabricated insulated floor panels. Note on the drawings that the exterior panel surfaces of prefabricated assemblies in contact with concrete must be treated to prevent deterioration caused by corrosion or chemical reaction of dissimilar materials. Indicate type and size of units on drawings and schedule.

NOTE: All insulated components, including insulated floor panels, must comply with IBC Chapter 26 Plastics in that assemblies must either: limit flame spread index to not more than 75 and smoke developed index to not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E84 or UL 723; or have a complete surface covering of not less than 0.8 mm 0.032 inches of aluminum or corrosion-resistant steel having a base metal thickness not less than 0.4 mm 0.0160 inches at any point; or the refrigerated unit(s) themselves, and the part(s) of the building(s) in which they are located, must be protected by automatic sprinklers. See Chapter 26 for provisions for non-sprinklered buildings.

**************************************************************************

Provide walk-in units manufactured for food service use in accordance with NSF/ANSI 7 UL 207, and UL 471. Provide [floorless assemblies with insulated floor screeds, installed over insulated floors.][floor panel walk-in refrigerators and freezers with appropriate insulated floor assemblies and [polished aluminum][galvanized][_____] finish floor.]
Provide prefabricated dispensing freezers in accordance with the requirements of NSF/ANSI 6.

2.4.1 Panel Construction

Interchangeable, 1200 mm 4 feet maximum width, 100 mm 4 inch thick, filled with insulation. Provide preformed corner panels extending not less than 300 mm 12 inches in each direction. Panels to have tongue and groove edges or flush joints with double seal serrated neoprene rubber gaskets to assure air and vapor tight joints. Provide panels for separating sections.

a. Insulation: 100 mm 4 inch minimum foamed-in-place polyurethane with manufacturer's rated "K" factor of not more than 0.15, free rise density of not less than 27 kilograms (kg) per cubic (cu) meter 1.7 pounds per cubic foot, or in-place density of not less than 32 kg per cu meter 2 pounds per cubic foot. Provide floor screeds with minimum of 63 mm 2 1/2 inches of foamed insulation.

b. Closures: Close the exposed exterior of the walk-in unit adjacent to walls and ceiling with panels of same material as used for exterior of walk-in unit panels.

c. I-Beam Supports: Wherever compartment dimension exceeds the clear-span ability of ceiling panels, provide I-beam supports on the exterior of the ceiling or supported by spline-hangers. Install 13 mm 1/2 inch diameter steel rods through beam/hangers and secure to the structure above. Beams or posts within compartments are not be acceptable.

d. Finish:

(1) Exterior:[ Stainless steel on all exposed surfaces and doors, aluminum on unexposed surfaces.][ Aluminum with two coats of white, baked-on enamel paint.][ High impact reinforced fiberglass panels, must comply with flame spread and smoke index limits when tested in accordance with ASTM E84 or UL 723 or protected by an automatic sprinkler system within the refrigeration unit and the location of the building in which the unit occurs. Color of panels as selected by Contracting Officer from manufacturer's complete range of choices.]

(2) Interior:[ Stainless steel][ Aluminum with two coats of white, baked-on enamel paint][ High impact reinforced fiberglass panels must comply with flame spread and smoke index limits when tested in accordance with ASTM E84 or UL 723 or protected by an automatic sprinkler system within the refrigeration unit and the location of the building in which the unit occurs. Color of panels as selected by Contracting Officer from manufacturer's complete range of choices].

2.4.2 Prefabricated Floor Panels

Provide prefabricated floor panels of the same construction as wall/ceiling except with 1.9 mm 14 gauge galvanized skin, sealed watertight. Field apply one hard alloy aluminum tread plate, 5 mm 3/16 inch thick, with all joints caulked. Provide nonskid floor strips 100 by 900 mm 4 by 36 inch and field apply at 300 mm 12 inch spacing in all aisles. Provide prefabricated floor panels [laid on] [recessed], with sloping interior floor ramps at exterior entrance doors [panels flush with surrounding
building floor]. Furnish two sets of erection tools, compatible with fasteners, with each unit.

2.4.3 Floorless Refrigerator Floors

**************************************************************************
NOTE: Designer must determine appropriate insulation thickness, subfloor thickness subject to existing geographical and soil conditions.
**************************************************************************

Make floorless refrigerator floors flush with the surrounding building floor. Provide built-in floor with [two][three][four][_____] layers of [50 mm2 inch][____ mm____ inch] thick polyurethane board insulation with staggered joints set in mastic or other thickness of insulation as recommended in writing by the floor manufacturer and appropriate for the specific geographic, climate and soil conditions. Provide a watertight seal formed by [0.152 mm6 mil][____ mm____ mil] polyethylene sheets with all joints lapped 150 mm 6 inch and sealed, on the surface of the subfloor that will support the insulation and the refrigerator floor. Assembly must comply with flame spread and smoke index limits when tested in accordance with ASTM E84 or UL 723 or when protected throughout by an automatic sprinkler system within the refrigeration unit(s) and the location(s) of the building in which the unit(s) occur(s). Provide a 6.8 kg 15 pound felt slip sheet over insulation with 150 mm 6 inch lapped joints flashed up the height of finished floor base. The subfloor and [walk-in refrigerator][walk-in freezer] floor to each be a minimum 100 mm 4 inch thick reinforced concrete with insulation sandwiched between. Provide drain holes in subfloor to drain water seepage. Make insulation continuous by extending insulation at refrigerator walls and partitions, down to the insulation sandwiched between the subfloor and the refrigerator floor. Insulate the area beneath the door as recommended by the floor manufacturer. Support the subfloor on a fill of 50 mm 2 inch clean rock aggregate having a minimum depth of 375 mm 15 inch. Embed the perimeter within the gravel fill to allow for air circulation.

2.4.4 Doors

**************************************************************************
NOTE: Designer should configure refrigerator and freezer to allow access to freezer directly from refrigerator unit where possible for energy conservation measures.
**************************************************************************

Provide [one] [two] per [unit] [section], with 100 mm 4 inch thickness, filled with insulation. Provide each door panel with an outside pilot light, a light switch and a remote bulb sensor with exterior flush-mounted, waterproof thermometer for registering temperature inside box. Provide anti-condensing strip heaters around the perimeter of door panel jambs. Provide top and each side of door with a resilient, non-magnetic, or thermoplastic with magnetic steel core gasket. On bottom edge of door, provide a replaceable, adjustable rubber or vinyl wiper gasket.

a. Hardware [Polished Stainless Steel][____]: Provide two self-closing, spring-loaded hinges for each door. Include plated steel pin and cam-lift type bearing. Provide door latch with cylinder lock and with provisions for padlock. Include safety-release handle to permit opening from inside when locked.
b. Door Stops: Provide door stops where necessary, to prevent walk-in refrigerator and freezer doors from striking adjacent walls, plumbing fixtures or food service equipment when door is open.

c. Protective Bumpers: Equip the exterior sides of refrigerator that are not installed against each other or against a wall with protective bumpers. [Fabricate bumpers from either 1.5 mm 0.059 inch thick galvanized steel or stainless steel channel or from solid rubber or rubber-like materials having a durometer hardness of 75plus 5.]

d. Gasket: Provide either natural or synthetic rubber gaskets and in accordance with NSF/ANSI 2. Where frames are used, the panels must fit together with gaskets that are designed for 50 percent compression.

2.4.5 Air flow Inhibiting Strip Curtains

Provide transparent flexible vinyl reinforced strip curtains anchored at top and able to be replaced individually. Provide strips a minimum of 200 mm 8 inch wide and 2 mm 0.08 inch thick.

2.4.6 Lights

Provide high efficiency rated two-tube fluorescent lamps in vaporproof fixtures with safety shields. Provide lighting in accordance with UL 1598. Provide diffuser and ballast capable of operating in minus 23 degrees C 10 degrees F temperature. Run lights the full length of walk-in units starting 600 mm 2 feet from front panel and extending within 600 mm 2 feet of back panel. [Run between shelf rows].

2.4.7 Identification Signs

Mount engraved phenolic plastic compartment identification signs 300 by 50 mm 12 by 2 inch high in selected color with 25 mm one inch high letters on door above view window.

2.4.8 Pressure Relief Port

Provide electrically heated, insulated pressure relief port [in each section].

2.5 REFRIGERATION UNIT SYSTEMS

NOTE: Refrigeration units may be located inside or outside, but if units are located outside in a cold climate they should have winter controls, heaters, and enclosed compressor housings.

NOTE: Indicate, on the drawings, the location and heights of the refrigerator coil and condensate drain lines. Locate all coils and drain lines so as not to restrict the full utilization of the food storage racks. Indicate on drawings and in specifications that the condensate drain lines are must be insulated. Locate on the drawings the funnel floor drain for the condensate drain. Floor
drains and drain lines must not protrude into the walking surface or produce a tripping hazard.

Locate thermometer on the drawings, mounted outside the refrigerator, in a location that will preclude vibration, not interfere with the operation of the door, provide protection from damage, and allow easy reading. Locate the sensor to measure the air temperature in the warmest part of the refrigerator. Do not locate thermometer on the door panel.

Provide in accordance with ANSI/ASHRAE 15 & 34 and ASHRAE 189.1. Provide preassembled remote condensing unit assembly with all necessary components factory installed and wired including electrical box, time clock, drier, sight glass, [winter control and crankcase heater] [enclosed compressor housing,] and compressor rack. [Set meat chiller to operate at minus one degree C 30 degrees F and other refrigerators to operate at one degree C 33 degrees F. Set freezers to operate at minus 18 degrees C 0 degrees F.] Mercury is prohibited for use in thermometers. Chlorofluorocarbon (CFC) based refrigerants are prohibited.

Provide refrigerant compressors, packaged compressors and condenser units, and refrigerant condensers as specified in Division 23 of these specifications.

NOTE: Select the first statement for NAVFAC projects, or the second statement for USACE.

2.5.1 Monitoring Alarm System

Provide an electronic monitoring and alarm system for each section of each unit. Alarm is to warn of abnormally low and high temperatures.

a. System components: Detecting thermostat, master control panel, interconnecting wiring, [remote, labeled, and audible alarm,] and defrost compensator. Provide dials showing temperatures and pilot lights, warning lights, switches, transformer, and buzzer, all as a part of the master control panel. Provide master control panel [and remote audible alarm]. Provide power fuse to protect system components.

b. System operation: Set alarms at 5 degrees C 10 degrees F above and below specified operating temperatures.

2.5.2 Personnel Alarm

For each unit, provide separate audible alarm system operable from inside unit, for use of personnel unable to exit unit. Locate remote audible alarm where indicated.
PART 3   EXECUTION

3.1   INSTALLATION

Do not install items that show visual evidence of biological growth.

Prior to commencement of installation, perform a complete walk through of the facility with the Contracting Officer to verify readiness for installation.

Provide adequate protection of all finished surfaces, fixtures, [furnishings] and other equipment to prevent any damage during the installation work.

Conduct installation procedures in accordance with ANSI/ASHRAE 15 & 34, ASHRAE 189.1, NSF Food Equipment and UL standards stated herein, and with the manufacturer's instructions. [Set floor mounted equipment on 150 mm 6 inch thick concrete housekeeping pads, complete with anchor bolts and grouting. Finish housekeeping pads with two coats of oil-resistant epoxy polyamide coating.]

3.1.1   Equipment Connections

Complete equipment connections for all utilities. Unless otherwise specified, provide [chromium-plated copper alloy] [stainless steel] exposed piping.

3.1.2   Plumbing Work

Tag all plumbing final connection points of equipment, indicating item number, name of devices or components, and type of utility (water, gas, steam, drain). Provide extensions of indirect waste fitting to open-sight hub drain, floor sink, or floor drains from food service equipment.

3.2   TESTS

Perform the tests as specified. Notify the Contracting Officer in writing, [10][_____] days prior to performing tests. Perform tests in the presence of the manufacturer's representative][and the Contracting Officer].

3.2.1   Initial Start-Up and Operational Test

Provide all lubricants and accessories before initial start-up. Start and operate all equipment. Follow the manufacturer's procedures and place the systems in all modes of operation. Supplement initial charges of lubricating oil to ensure maximum operating capacity. Adjust all safety and automatic control instruments. Record manufacturer’s recommended readings hourly. Operational tests must cover a period of not less than [3][5][_____] days. Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for detailed Operation and Maintenance Manuals requirements.

Upon completion of start-up and operational tests submit a list of authorized local service and repair entities.

3.2.2   Test Reports

Submit final field test reports for each system tested, describing test apparatus, instrumentation calculations, and equipment data based on
industry standard forms or reasonable facsimiles thereof. Include in

data: compressor suction and discharge pressure; refrigerant charge pump,
compressor and air moving device ampere readings; power supply
characteristics, including phase imbalance, with 1/2 percent accuracy;
thermostatic expansion valve superheat-value as determined by field test;
subcooling; high and low refrigerant temperature switch set points; low oil
pressure switch set point; [defrost system timer and thermostat set
points;] moisture content; ambient, condensing and coolant temperatures;
capacity control set points; field data and adjustments which affect unit
performance and energy consumption. Where final adjustments and settings
cannot be permanently marked as an integral part of device, include
adjustment and setting data in test report.

3.3 MANUFACTURER'S WARRANTY

Submit all manufacturers' signed warranties to Contracting Officer prior to
final commissioning and acceptance.

3.4 CONTRACTOR'S WARRANTY for INSTALLATION

Submit contractor's warranty for installation to the Contracting Officer
prior to final commissioning and acceptance.

NOTE: This guide specification covers the requirements for non-heated, non-refrigerated equipment used for food preparation other than cooking and baking, such as prep tables and units, carts, racks, shelving, blenders, coffee makers, grinders, juicers, mixers, peelers, and slicers.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Coordinate this section and use in conjunction with the following:

Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT and Section 11 06 40.13 FOOD SERVICE EQUIPMENT SCHEDULE.
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

29 CFR 1910.145 Specifications for Accident Prevention Signs and Tags

29 CFR 1910.306 Specific Purpose Equipment and Installations
1.2 GENERAL REQUIREMENTS

**************************************************************************

NOTE: Indicate the configuration and layout for all food preparation equipment, with interior elevations and equipment identified by number. Show a "Food Service Equipment Schedule" on the drawings using the same identification numbers[ as indicated on the current US Army Quartermaster Center and School equipment schedule]. Ensure that all Contractor built-to-order items on the Food Service Equipment Schedule are shown and coordinated with the specifications.

Designer must coordinate with other Sections, including 10 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT and 10 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE for general requirements and final connection of equipment.

NOTE: Details of particular equipment and installations are provided on Naval Food Service Division drawings. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

**************************************************************************

Refer to Section 10 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for general requirements. Provide detailed schedule as specified in Section 10 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE.

1.3 DESCRIPTION OF WORK

The work includes [furnishing][providing][, and modifying existing,] food service preparation equipment and all related work necessary to provide a complete installation. Verify existing dimensions, site conditions, and required utility connections prior to commencement of work. Coordinate delivery of components with finished openings and other vertical handling limitations within the building. Advise the Contracting Officer of discrepancies prior to [procurement and] installation of equipment. Submit Contractor's Field Verification Data prior to the preconstruction meeting.

Provide rough-in and utility connections to equipment in accordance with requirements specified in other sections of this specification. Coordinate physical dimensions, capacities, manufacturer's instructions, and other requirements of the equipment[ furnished].

1.3.1 Design Requirements

**************************************************************************

NOTE: On the drawings, show:

a. A 1:50 1/4 inch scale floor plan with layout of all food service equipment and Naval Equipment Symbols.

b. A Food Service Equipment Schedule laid out in accordance with current CNIC's Galley's Department or US Army Quartermaster Center and School equipment
schedules, and specified design requirements.

c. Floor, wall, and ceiling penetrations.

d. Raised bases, retainer curbs, or depressions.

e. Recessed, grated floor drains required for equipment.

f. Disconnect switches.

g. Electrical chases and raceways and plumbing chases.

h. Utility connections to building water, sanitary, electrical, and other utility systems. Convenience outlets at point of use for plug-in equipment.

i. All Contractor built-to-order items, in accordance with Food Service Equipment Schedule, shown and coordinated with the specifications.

**************************************************************************
Submit detail drawings as stated in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for food preparation equipment and related food processing equipment. Provide drawings at a minimum 1:50 1/4 inch scale.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL
PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Contractor's Field Verification Data; G[, [_____]]

SD-02 Shop Drawings

Manufacturer's Detail Drawings; G[, [_____]]
Custom Fabricated Equipment; G[, [_____]]
Installation Instructions and Diagrams; G[, [_____]]

SD-03 Product Data

Food Preparation Equipment; G[, [_____]]

SD-05 Design Data

Manufacturer's Descriptive and Technical Literature; G[, [_____]]

SD-06 Test Reports

Manufacturer's Test Data; G[, [_____]]
Field Test Reports; G[, [_____]]

SD-07 Certificates

NSF Certification
UL Certification

SD-08 Manufacturer's Instructions

Manufacturer's Instructions for Shipping, Handling, Storage, Installation, and Start-Up.; G[, [_____]]

SD-11 Closeout Submittals

Manufacturer's Warranty

1.5 SHOP DRAWINGS

Submit manufacturer's detail drawings for all custom fabricated equipment. Include any utility connections, and installation instructions and diagrams.
Base shop drawings on verified field measurements and include contractor's field verification data.

1.6 QUALITY ASSURANCE

Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT.

1.6.1 Pre-Installation Conference

Thirty [_____] days prior to the commencement of work, notify the Contracting Officer that the following items are prepared and ready for review:

a. Shop Drawings, product data and installation instructions:
   (1) Manufacturer's detail drawings
   [ (2) Custom fabricated equipment drawings and data
       (a) Submit custom fabricated equipment drawings after approval of food service equipment drawings.
   ] (3) Installation instructions and diagrams

b. Product Data:
   Food preparation equipment

c. Design Data:
   (1) Manufacturer's descriptive and technical literature
   (2) Manufacturer's Test Data

d. Manufacturer's Instructions:
   Manufacturer's Instructions for shipping, handling, storage, installation, and start-up.

PART 2 PRODUCTS

2.1 MATERIALS

Floor areas adjacent to food preparation equipment point of operation, and working surfaces must conform to 29 CFR 1910-SUBPART D.

2.2 LIST OF EQUIPMENT

*****************************************************************************************************************************************
NOTE: Carefully edit the master "Food Service Equipment Schedule" in Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE; retain items of

SECTION 11 42 00 Page 7
equipment used for the project. The Equipment List is intended to be edited and included in the project specification. List the information contained on the Equipment List on the drawings.

**************************************************************************
Submit a detailed Food Service Equipment List as specified in Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE. Include NSF Certification, and UL Certification for individual food preparation equipment components.

2.3 CONSTRUCTION OF FABRICATED EQUIPMENT

Provide construction and finishing of fabricated equipment in accordance with Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT.

2.4 HAND SINKS

**************************************************************************
NOTE: Handwashing sinks must be provided behind each serving line and in each food preparation area. Each handwashing sink must be provided with soap dispensers and either towel dispensers or electric hand dryers specified in Section 10 28 13 TOILET ACCESSORIES.

**************************************************************************

2.4.1 Sink Body

Provide sizes and mountings indicated and in accordance with requirements of NSF/ANSI 2 and ASME A112.19.3/CSA B45.4. Provide sinks in 1.8 mm thick 14 gage stainless steel with round vertical and horizontal corners radii used at not less than 19 mm 0.75 inch.

2.4.2 Mounting

[2.4.2.1 Leg Mounting

Provide sink legs as specified for counters except weld closed gussets to support channels.

][2.4.2.2 Wall Mounting

Provide stainless steel mounting brackets.

][2.4.2.3 Counter Mounting

Provide sink body [set in counter] [integral with counter].

]2.4.3 Faucets and Drain

Provide [backsplash] [countertop] [and] [ledge]. Provide gooseneck faucet spout, aerator, with two valves. Provide nozzle with anti-splash device without hose thread. Provide cleanout at location indicated on the drawings.
PART 3   EXECUTION

3.1   INSTALLATION

Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for detailed installation procedures, operation and maintenance manual requirements, and training and project closeout procedures. Include all food service preparation Field Test Reports.

3.2   MANUFACTURER'S WARRANTY

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

NOTE: This guide specification covers the requirements for commercial cooking equipment.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: This guide specification includes baking ovens, broilers, cooking ovens, exhaust hoods (and related fire suppression and grease extraction equipment, fryers, griddles, grills, holding ovens, kettles, microwave ovens, ranges, rotisseries, steamers, steam kettles, etc.

On the drawings, show:

1. A 1:50 (1/4 inch) scale floor plan with layout of all food service equipment and Naval Equipment Symbols.
2. Food Service Equipment Schedule laid out in accordance with NAVSUP41, or current US Army Quartermaster Center and School equipment schedule specified design requirements.

3. Floor, wall, and ceiling penetrations.

4. Raised bases, retainer curbs, or depressions.

5. Recessed, grated floor drains required for equipment.

6. Exhaust fan curbs, supply fan curbs, exhaust duct, supply duct, and ductwork material.

7. Fire system CO2 tanks, actuating stations.

8. Hoods, plumbing enclosure housing and control panel of automatic washdown system.

9. Disconnect switches.

10. Electrical chases and raceways and plumbing chases.

11. Utility connections to building water, sanitary, electrical, and other utility systems. Convenience outlets at point of use for plug-in equipment.

12. All Contractor built-to-order items, per Food Service Equipment Schedule, shown and coordinated with the specifications.

13. Utility connections to building water, sanitary, gas, electrical, sprinkler, fire alarm, oil, compressed air, steam, and other utility systems. Convenience outlets at point of use for plug-in equipment.

1.1 SUMMARY

The work includes [furnishing and] [installing] [and modifying existing] food service cooking equipment and related work. Verify all existing dimensions, contract drawings, product data and all related conditions prior to commencing rough-in work.

1.2 GENERAL RELATED SECTIONS AND STANDARDS

NOTE: Designate plumbing fixtures as "P" items on plumbing drawings with specific requirements added to Section 22 00 00 PLUMBING, GENERAL PURPOSE.

a. Refer to section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for general requirements. Provide detailed Food Service Equipment Schedule as specified in Section 11 06 40.13 FOOD SERVICE EQUIPMENT

SECTION 11 44 00 Page 4
SCHEDULE.

b. Provide detailed Food Service Equipment Schedule conforming to DOD 4000.25-1-M.

c. Gas-burning equipment must be designed for operation with the type of gas specified and be approved by CSA, conforming to CSA C22.2 No. 109 and CSA Directory.

d. All electrical work must conform to NFPA 70.

e. Provide wet chemical fire extinguishing systems in accordance with Section 21 21 03.00 10 WET CHEMICAL FIRE EXTINGUISHING SYSTEM.

e. Provide connections as part of building sprinkler system, Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION.

f. Grease extracting type hoods that have an internal hood fire protection system do not require wet chemical fire extinguishing protection for those components of the exhaust system, and for cooking equipment protected by a UL listed internal hood fire protection system complying to NFPA 96.

PART 2 PRODUCTS
2.1 EQUIPMENT AND SYSTEM STAGING

**************************************************************************
NOTE: Indicate the configuration and layout for all food preparation equipment, with interior elevations and equipment identified by number. Show "Food Service Equipment Schedule" on the drawings using the same identification numbers and as indicated on the current US Army Quartermaster Center and School equipment schedule. Ensure that all Contractor
built-to-order items, per Food Service Equipment Schedule", are shown and coordinated with the specifications.

Designer must coordinate with other sections for final connection of equipment.

Details of particular equipment and installations are provided on Naval Food Service Division drawings. Use these NAVFSD drawings as a basis for the project details. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

Indicate on drawings the location of each manual activation station.

**************************************************************************

a. Submit detail drawings, as specified, including insulation and utility requirements for all food cooking equipment, custom fabricated equipment, along with equipment schedule. Drawings scale 1:50 1/4 inch minimum. Schedule in the same format as the equipment schedule on the drawings.

b. Include coordination of delivery through existing finished opening and vertical handling limitations within the building. Advise the Contracting Officer of all discrepancies prior to ordering equipment. Submit Contractor's Field Verification Data prior to the preconstruction meeting.

c. Provide rough-in and connect utilities to equipment in accordance with requirements specified in other sections of this specification and in accordance with the physical dimensions, capacities, manufacturer's instructions, and other requirements of the equipment furnished. Submit all installation instructions and diagrams.

2.2 EXHAUST HOODS OVER COOKING EQUIPMENT

**************************************************************************

NOTE: Seismic restraints for kitchen hoods must conform to Guidelines for Seismic Restraints of Kitchen Equipment (SMACNA Los Angeles Chapter). See Appendix 1 of SMACNA Fabrication Guidelines.

Include requirement in seismic zones 3 and 4.

Hood design will be in accordance with NFPA 96, ASHRAE, and the ACGIH Industrial Ventilation Handbook. Designer will indicate type, size, shape, make-up air, and detail of hoods and the required standard cubic meters per second cubic feet per minute, meters per second feet per minute (velocity), static pressure, and duct collar size for exhaust/make-up air on the drawings. Grease extracting automatic washdown hoods will be specified for new construction. Filter type hoods may be used in existing facilities where conditions prevent the use of grease extractor hoods.

**************************************************************************

Conform to NFPA 96 and UL 710. Conform to SMACNA 1966. [Provide seismic
restraints in accordance with SMACNA 1767.) The hood must not vary from
design listing of air requirements or static pressure by more than five
percent. Fabricate from 1.2 mm 18 gage thick stainless steel. Run
electrical wiring in conduit or raceways. When total hood length is more
than 3600 mm 12 feet long, provide hoods individually complete in all
respects, of approximately equal length less than 3600 mm 12 feet long, and
mounted end to end.

2.2.1 Centrifugal Grease-Extracting Hoods

Fabricate in factory. Provide high-velocity type with average throat inlet
air velocity of [5] [_____] mps [1,000] [_____] fpm and duct velocity of
[9] [_____] mps [1,800] [_____] fpm. Provide air inlet above and parallel
to equipment for full length of hood. Provide hood which will remove 95
percent of extraneous matter in air with non-removable grease-extracting
baffles located in plenum chamber. The use of filters, cartridges,
rotating parts, removable parts, or constantly running water is not
acceptable.

2.2.1.1 Types of Hoods

**************************************************************************
NOTE: Delete types not indicated for the project.
If a type is not used, state "not used" at the subparagraph, to avoid renumbering.
**************************************************************************

Provide the following hood types as indicated:

2.2.1.1.1 Serve-Over Shelf; Type 1

Provide over [charbroilers,] [fryers,] [_____], [and] [griddles] on serving
lines. Mount hood 1370 to 1450 mm 54 to 57 inches above finished floor.

2.2.1.1.2 Island; Type 2

Provide over [steam-jacketed kettles,] [fry pans,] [ovens,] [broilers,]
[_____], [and] [steamers] located remote from walls. Mount at height
indicated.

2.2.1.1.3 Wall-Mounted, Free-Standing; Type 3

Provide over [ranges,] [_____], [broilers,] [doughnut fryers,] [griddles,]
[ovens,] [steam-jacketed kettles,] [and] [fryers] located along wall. Mount
at height indicated.

2.2.1.1.4 Low Ceiling; Type 4

Provide over [_____] [and] [_____] where low ceiling restricts installation
of Type 1, 2, or 3.

2.2.1.2 Features

Provide the following:

a. Automatic washdown system.

b. Fan control.
NOTE: Delete references to fire dampers in air inlet if fire dampers are included in exhaust ductwork connecting to hood.

c. Damper controls.
d. Fan control station and plumbing enclosure.
e. Fire protection system, for hoods over [tilting frying pans,] [charbroilers,] [fryers,] [griddles,] [doughnut fryers,] [____,] [deep-fat fryers,] [and] [broilers].
f. Vapor-proof lights.

2.2.1.3 Automatic Washdown System

Provide system that automatically washes internal portions of hood for an adjustable period of between 0 and 15 minutes. Provide for activation by time clock or upon operation of fire damper.

2.2.1.3.1 Features of Operation

a. Shut off supply and exhaust fans, if running, at beginning of cleaning cycle.
b. Subject accumulated contaminates on internal surfaces with water at 60 [82] degrees C [140] [180] degrees F and a water pressure of 0.275 MPa 40 psi. Provide pressure reducing valve.
c. [Pump] [Inject] detergent into hot water supply line to create wash-water.
d. Provide scrubbing action by directing wash-water through manifolds and then through spray nozzles placed so that all internal surfaces are reached with streams of wash-water.
e. Collect wash-water and grease within hood and pipe to outside of hood to point indicated for indirect connection to building plumbing system.
f. End wash cycle by timer.

2.2.1.3.2 Plumbing Components

Provide brass or stainless steel spray heads or nozzles and stainless steel distribution manifold in each hood. Provide the following in fan control station and plumbing enclosure:

<table>
<thead>
<tr>
<th>Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water solenoid valve</td>
</tr>
<tr>
<td>Shut-off valve</td>
</tr>
<tr>
<td>Shock absorber</td>
</tr>
<tr>
<td>Pressure gage</td>
</tr>
</tbody>
</table>
2.2.1.4 Fan Control

Locate in fan control station and plumbing enclosure. Provide delay-time starter on starter leg of exhaust fan so supply fan starts first and run 5 seconds before exhaust fan starts, to insure the required balance in exhausted and make-up air flow. Provide the following operations:

a. Interconnection with washdown system to effect shutoff.

**************************************************************************
NOTE: Delete references to fire dampers in air inlet if fire dampers are included in exhaust ductwork connecting to hood.
**************************************************************************

b. Interconnection with fire dampers to effect shutoff of fans.

c. Operation by time clock.

d. Operation by manual push buttons labeled "start" and "stop".

2.2.1.5 Fire Damper

**************************************************************************
NOTE: Delete references to damper if fire dampers are included in exhaust ductwork connecting to hood.
**************************************************************************

Provide mechanically driven damper and damper control. Activate by heat-sensing thermostat set to react to temperature of 176 degrees C 350 degrees F in exhaust duct at hood. Activation of damper must cause the following additional actions:

a. Shut off exhaust and supply fans of hood.

b. Shut off fuel source and electric power to equipment under hood.

c. Initiate automatic washdown system.
2.2.1.6 Fan Control Station and Plumbing Enclosure

NOTE: Do not locate control cabinet for hoods on serving line tray slide support walls or on drop wall above serving line tray slide.

Provide flush-mounted enclosure. Wire and plumb in factory. Include the following:

a. Plumbing components of washdown system.

b. Components required for fan control, including manual push buttons and interlocks with other systems.

c. Components required to operate fire protection system.

d. Time clock capable of being programmed by the week to operate fan system and automatic washdown system and of maintaining time cycle after being overridden by manual push buttons.

e. Labeled light indicating when exhaust fan and supply fan are operating.

f. Labeled light indicating when automatic washdown system is operating.

2.2.1.7 Fire Protection Systems

NOTE: Select fire protection system based on cost and local regulations. If kitchen cannot tolerate time lost for clean-up in event of dry chemical release, or if kitchen return air is tied into building system return air, do not use that system. Ensure that actuating systems are indicated on drawings.

Provide a pre-engineered [[dry] [wet] chemical system in accordance with Division 21, Section 21 23 00.00 20 DRY CHEMICAL FIRE EXTINGUISHING FOR KITCHEN CABINET] [[liquid foam system] [water spray system] in accordance with NFPA 96]. Include water spray in plenum of hood. Include micro-switch for electric power and fuel shut off to equipment under hood and a fuel shut-off and reset button. Exposed piping under hood and surface nozzles to be stainless steel or chrome plated. Paint exposed piping running to hood with rust-inhibiting aluminum paint. Provide electrical wiring, contactors, shunt breakers, electrical control for gas valves, and other electrical components required to install fire systems in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

2.2.1.7.1 Actuating Stations

Provide manual actuating station and remote manual actuating station as indicated. Clearly label actuating station as "Hood Fire Protection" and specific device protected.

2.2.1.7.2 Water Spray Fire System In Grease-Extracting Type Hood
NOTE: If water spray system is specified, make sure it is compatible with building sprinkler system.

Include wall-mounted control panel with pilot lights for indicating when system is operational, not operational, and on fire alert. Provide audible fire alarm, unions, hand valve, valve switch, and pressure switch. Include duct nozzles and plenum nozzles. Provide water pipe to control panel and from control panel to hood. Provide connections as part of building sprinkler system, Section 21 13 13 WET PIPE SPRINKLER SYSTEMS, FIRE PROTECTION.

2.2.1.7.3 Alarm Connection

NOTE: If exhaust hood fire system is to be connected to building alarm system, the work must be included in other sections and coordinated.

Provide capability to signal operational readiness and to generate electronic signal when hood fire system is activated. Provide connection point for building alarm system. Provide system to connection point and connect in accordance with Section [_____] [Section 28 31 60 INTERIOR FIRE ALARM SYSTEM, NON-ADDRESSABLE] [Section 28 31 66 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, NON-ADDRESSABLE] [Section 28 31 70 INTERIOR FIRE ALARM SYSTEM, ADDRESSABLE] [Section 28 31 76 INTERIOR FIRE ALARM AND MASS NOTIFICATION SYSTEM, ADDRESSABLE].

2.2.1.8 Vapor proof Lights

Provide, [at Type 2 and Type 3 hoods,] incandescent or fluorescent lights in accordance with UL 1598 or UL 1598. Locate switches for operating hood lights on face of hood in lower [right] [_____] corner.

2.2.2 Protection

Protect each exhaust hood system that serves cooking equipment, associated exhaust hood system ducts, and all cooking equipment served by the exhaust hood system with a wet chemical fire extinguishing system.

2.3 COMMERCIAL FOOD COOKING EQUIPMENT

NOTE: The following commercial food cooking equipment must meet FEMP/ Energy Star energy efficiency requirements:
- Beverage Vending Machines (Often Vendor supplied and installed)
- Fryers
- Griddles
- Hot Food Holding Cabinets
- Ice-Machines Air-Cooled
- Ice-Machines Water Cooled
- Ovens
- Refrigerators
- Freezers
- Steam Cookers
The following item must meet EPA Watersense
requirements
Pre-Rinse Spray Valves (WaterSense)
Cooking equipment selected will have as a minimum the efficiency rating determined in under "Energy-Efficient Products" at . Indicate the equipment operating characteristics, including rated energy efficiency, on the drawings.

**************************************************************************
All commercial cooking equipment must conform to 29 CFR 1910, CSA, NSF, UL and other related standards as stated herein and in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT. All equipment must bear NSF Certification and UL Certification labels.

a. Supply all gas fueled appliances with installed automatic shut-off device(s), as well as manual shut-offs device conforming to NFPA 96. In accordance with NFPA 54, equip gas burners and pilots located in enclosed compartments with automatic shut off of gas supply if burners fail to ignite, or pilot is extinguished.

b. Provide electrical cooking appliances conforming to UL 197, UL 489, UL 763, and UL Electrical Appliance.

c. Provide specialty cooking equipment conforming to the requirements of NSF/ANSI 169, NSF/ANSI 2, NSF/ANSI 4, and NSF/ANSI 51. Floor areas adjacent to cooking areas must conform to NSF/ANSI 52 and 29 CFR 1910-SUBPART D.]

2.3.1 Ice Machines

[____]. Provide ice machine that is Energy Star labeled. Provide data identifying Energy Star label for ice machine.

2.3.2 Refrigerated Beverage Vending Machines

**************************************************************************
NOTE: Vending Machines are often Vendor furnished and installed. Keep the bracketed text below if vending machines are part of the project requirements.

**************************************************************************

[____]. Provide refrigerated beverage vending machine that is Energy Star labeled. Provide data identifying Energy Star label for refrigerated beverage vending machine.]

2.3.3 Refrigerators

[____]. Provide refrigerator that is Energy Star labeled. Provide data identifying Energy Star label for refrigerator.

2.3.4 Freezers

[____]. Provide freezer that is Energy Star labeled. Provide data identifying Energy Star label for freezer.

2.3.5 Pre-Rinse Spray Valve

[____]. Provide pre-rinse spray valve that is WaterSense labeled.

SECTION 11 44 00 Page 16
Provide data identifying EPA WaterSense label for pre-rinse spray valve.

2.3.6 Baking Oven

[____]. Provide baking oven that is Energy Star labeled. Provide data identifying Energy Star label for baking oven.

2.3.7 Broiler

[____]

2.3.8 Deep Fryers

[____]. Provide deep fryer that is Energy Star labeled. Provide data identifying Energy Star label for deep fryer.

2.3.9 Griddle

[____]. Provide griddle that is Energy Star labeled. Provide data identifying Energy Star label for griddle.

2.3.10 Steam Cookers

2.3.11 Hot Food Holding Cabinets

[____]. Provide hot food holding cabinet that is Energy Star labeled. Provide data identifying Energy Star label for hot food holding cabinet.

2.4 PORTABLE FIRE EXTINGUISHER

Provide [wall mount for] portable fire extinguisher conforming to NFPA 10, within [_____] feet of cooking area.

PART 3 EXECUTION

3.1 INSTALLATION

Do not install items that show visual evidence of biological growth.

Perform installation in accordance with the manufacturer's printed instructions. Refer to section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for detailed installation, project closeout, and warranty requirements. Lay out work in advance to prevent damage to building, piping, wiring, or equipment as a result of cutting for installation.

3.1.1 Setting and Connecting

Install equipment plumb and level. Except for mobile and adjustable-leg equipment, securely anchor and attach items and accessories to walls, floors, or bases with stainless steel bolts. Flash food service cabinets located in wall openings to the walls with 0.9 mm 20 gage thick stainless steel. Seal around equipment flashing and flanges, at walls, floor, and ceiling in accordance with Section 07 92 00 JOINT SEALANTS. Provide continuous fillers without opening.
3.1.2 Welding Field Joints

Weld stainless steel by the electric fusion method. Provide where required by and in accordance with AWS A5.8/A5.8M, AWS D1.1/D1.1M, AWS D10.4, AND AWS D9.1/D9.1M. Accomplish brazing with silver solder for joining copper tubing to brass and bronze connection fitting and for no other purpose.

3.1.3 Cleaning and Adjusting

Test and adjust equipment for proper operation. Test rotating components and motors for proper rotation. Lubricate moving parts if suggested by manufacturer's literature. Prior to acceptance of project, clean and sanitize equipment both inside and outside.

3.1.4 Installation of Hoods

Install hoods in accordance with NFPA 96 to remain free from vibration under all conditions of operation.

3.2 FIELD INSPECTIONS AND TESTS

Inspect equipment, fixtures, and material after installation for compliance with the applicable standards. Upon completion of inspection perform operational tests on each piece of equipment to determine that equipment and components, including controls, safety devices, and attachments, operate as specified and are properly installed and adjusted. Test all water, drain, gas, steam, oil, refrigerant, and liquid carrying components for leaks. Notify the Contracting Officer 14 calendar days prior to testing. Submit Field Test Reports and [_____] copies of the Exhaust Hood Air-Balance Report to the Contracting Officer.

3.3 MANUFACTURER'S WARRANTY

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.4 CONTRACTOR'S WARRANTY FOR INSTALLATION

Submit contractor's warranty for installation to the Contracting Officer prior to final commissioning and acceptance.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for food dispensing equipment.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification includes, but is not limited to, bar equipment, coffee urns and warmers, salad bars, desert tables, food warmers, soup kettles, tureens and heat lamps; pre-packaged food dispensers, dish, tableware; ice, ice cream, beverage, juice and water dispensers.

On the drawings, show:

1. A 1:50 1/4 inch scale floor plan with layout of all food service equipment and Naval Equipment Symbols.
2. Food Service Equipment Schedule laid out in accordance with NAVFSS current US Army Quartermaster Center and School equipment schedule specified design requirements, including Energy Star qualified model list.

3. Floor, wall, and ceiling penetrations.

4. Raised bases, retainer curbs, or depressions.

5. Recessed, grated floor drains required for equipment.

6. Disconnect switches.

7. Electrical chases and raceways and plumbing chases.

8. Utility connections to building water, sanitary, electrical, and other utility systems. Convenience outlets at point of use for plug-in equipment.

9. All Contractor built-to-order items, per Food Service Equipment Schedule, shown and coordinated with the specifications.

**************************************************************************

1.1 GENERAL RELATED SECTIONS AND STANDARDS

**************************************************************************

NOTE: Edit the master "Food Service Equipment Schedule" in section 11 06 40.13 carefully; retain items of equipment used for the project. The Equipment List is intended to be edited and included in the project Specification. List the information contained on the Equipment List on the Contract Drawings.

**************************************************************************

Refer to section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for general requirements, and Section 11 06 40.13 FOOD SERVICE EQUIPMENT SCHEDULE when preparing the Food Service Equipment List.

Provide floor areas adjacent to food dispensing equipment point of operation, and working surfaces conforming to 29 CFR 1910-SUBPART D

**************************************************************************

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of
the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SUMMARY

**************************************************************************

NOTE: Indicate the configuration and layout for all food dispensing equipment, with elevations and equipment identified by number. Show "Food Service Equipment Schedule" on the drawings using the same identification numbers[ as indicated on the current US Army Quartermaster Center and School equipment schedule]. Ensure that all Contractor built-to-order items, per Food Service Equipment Schedule", are shown and coordinated with the specifications.

Designer must coordinate with other sections for final connection of equipment.

NOTE: Details of particular equipment and installations are provided on Naval Food Service Division drawings. Use these NAVFSD drawings as a basis for the project details. Contact NAVFSD at commercial telephone (717) 790-7580 or DSN 430-7580.

**************************************************************************

The work includes [furnishing and] [installing] [and modifying existing] food service dispensing equipment and related work. Verify all existing dimensions, contract drawings, product data and all related conditions prior to commencing rough-in work. Include coordination of delivery through existing finished opening and vertical handling limitations within the building. Advise the Contracting Officer of all discrepancies prior to ordering equipment. Submit Contractor's Field Verification Data prior to the preconstruction meeting.

Provide rough-in and connect utilities to equipment in accordance with...
requirements specified in other sections of this specification and in accordance with the physical dimensions, capacities, manufacturer's instructions, and other requirements of the equipment furnished.

1.4 PREINSTALLATION MEETING

[Thirty] [_____] days prior to the commencement of work, notify the Contracting Officer that the following items are prepared and ready for review at the Pre-Installation Meetings listed here as shown in the Submittals paragraph.

1.4.1 Detail Drawings

Submit Detail Drawings for food dispensing and related food processing equipment, as specified, including insulation and utility requirements, product data and installation instructions. Submit Custom fabricated equipment drawings after approval of food service equipment drawings. Submit Installation Instructions and Diagrams and food dispensing equipment. Provide Drawings at 1:50 1/4 inch scale minimum.

1.4.2 Design Data

Submit detailed Food Service Equipment List reflecting requirements in Section 11 06 40.13 FOOD SERVICE EQUIPMENT SCHEDULE. Submit Design Data consisting of Manufacturer's literature, Manufacturer's Test Data, and Energy Star Qualified for individual food dispensing components

1.4.3 Manufacturer's Instructions

Submit Manufacturer's Instructions for shipping, handling, storage, installation, and start-up

1.4.4 Certifications

Submit [_____] copies of all Manufacturer's Test Data and certifications, including NSF Certification; UL Certification, and Energy Star Qualified data to the Contracting Officer prior to the commencement of any installation work.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

   Contractor's Field Verification Data; G[, [_____]]

SD-02 Shop Drawings

   Detail Drawings; G[, [_____]]
   Custom Fabricated Equipment; G[, [_____]]
   Installation Instructions and Diagrams; G[, [_____]]

SD-03 Product Data

SD-05 Design Data

   Manufacturer's Literature; G[, [_____]]

SD-06 Test Reports

   Manufacturer's Test Data; G[, [_____]]
   Field Test Reports; G[, [_____]]

SD-07 Certificates

   NSF Certification; G[, [_____]]
   UL Certification; G[, [_____]]
PART 2 PRODUCTS

2.1 EQUIPMENT

2.2 WATER FILTER

**************************************************************************
NOTE: Water filters will be used only where water taste and quality are poor. Delete if adequate water treatment is provided for the entire facility.

Designer will indicate the location of the water filters on the drawings. Water filters will be located in an accessible location. Water filters may be piped in parallel to obtain greater capacity.
**************************************************************************

Provide a cartridge-type water filter on water supply lines to equipment as shown.

2.2.1 Cartridge Filter

Provide filter, conforming to NSF/ANSI 42, NSF/ANSI 51, and NSF 53A, capable of removing dirt and off-taste items, such as chlorine and other medicinal items, and also reduce lime-scale problems when required by water conditions. Provide filter consisting of a stainless steel pressure vessel, which includes shell top, bracket check valve, fittings and accessories, and plastic disposable cartridge. Provide precoat filtration type cartridge in which a coating of particles is applied on a suitable fabric support. The filter must contain not less than 90 percent activated carbon and 10 percent inert binders, and remove particles 2 microns and larger. Install the filter with [an inlet valve] [a three-position valve header], activation faucet, and by-pass valve which will be normally closed. In addition, provide an indication gauge which indicates when cartridge requires replacement.

2.2.2 Working Pressure and Flow Rate

**************************************************************************
NOTE: Designer will select filter size with flow rate to accommodate equipment being filtered.**************************************************************************

Install the filter as recommended by the manufacturer. Provide filter
suitable for 860 kPa 125 psig maximum working pressure at 38 degrees C 100 degrees F water inlet temperature. Each filter must have a nominal flow rate of [11.34] [5.67] [3.78] L/minute [180] [90] [60] gph. Provide [1] [2] [_____] additional replacement cartridge[s] for each filter.

2.3 HAND SINKS

**************************************************************************
NOTE: Handwashing sinks must be provided behind each serving line. Each handwashing sink must be provided with soap dispensers and either towel dispensers or electric hand dryers specified in Section 10 28 13 TOILET ACCESSORIES.
**************************************************************************

2.3.1 Sink Body

Provide sizes and mountings as indicated; provide in accordance with requirements of NSF/ANSI 2. Provide in accordance with ASME A12.19.3/CSA B45.4. Fabricate of 1.8 mm thick 14 gage stainless steel. Round vertical and horizontal corners with a radius of not less than 19 mm 0.75 inch.

2.3.2 Mounting

2.3.2.1 Leg Mounting

Sink legs to be as specified for counters, except weld closed gussets to support channels.

2.3.2.2 Wall Mounting

Provide stainless steel mounting brackets.

2.3.2.3 Counter Mounting

Provide sink body [set in counter] [integral with counter].

2.3.3 Faucets and Drain

Provide [splashback] [counter top] [and] [ledge] mounted [as indicated]. Provide gooseneck faucet spout, aerator, with two valves. Provide nozzle with anti-splash device without hose thread. Provide cleanout at location indicated on drawings.

PART 3 EXECUTION

3.1 INSTALLATION

Refer to section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT for detailed installation procedures, operation and maintenance manual requirements, training and project closeout procedures. Include all food service dispensing equipment in the Field Test Reports.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This section does not address the manufacturing of block ice.

On the drawings, show:

1. A 1:50 1/4 inch scale floor plan with layout of all food service equipment and Naval Equipment Symbols.

2. Food Service Equipment Schedule laid out in accordance with NAVSUP41, current US Army Quartermaster Center and School equipment schedule, and specified design requirements.
3. Floor, wall, and ceiling penetrations.

4. Raised bases, retainer curbs, or depressions.

5. Recessed, grated floor drains required for equipment.

6. Disconnect switches.

7. Electrical chases and raceways and plumbing chases.

8. Utility connections to building water, sanitary, electrical, and other utility systems. Convenience outlets at point of use for plug-in equipment.

9. All Contractor built-to-order items, per Food Service Equipment Schedule, shown and coordinated with the specifications.

NSF/ANSI 14 (2022) Plastics Piping System Components and Related Materials

NSF/ANSI 169 (2023) Special Purpose Food Equipment and Devices
1.2 SUMMARY

**************************************************************************

NOTE: Indicate the configuration and layout for all ice making equipment, with elevations and equipment identified by number. Show "Food Service Equipment Schedule" on the drawings using the same identification numbers as indicated on the current US Army Quartermaster Center and School equipment schedule. Ensure that all Contractor built-to-order items, per Food Service Equipment Schedule", are shown and coordinated with the specifications.

Designer must coordinate with other sections for final connection of equipment.

Details of particular equipment and installations are provided on Naval Food Service Division drawings. Use these NAVFSD drawings as a basis for the project details. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

**************************************************************************

The work includes [furnishing and] [installing] [and modifying existing] ice making equipment, including dispensing, production, storage [, and autocleaning] equipment and related work. Include coordination of delivery through existing finished opening and vertical handling limitations within the building.

a. Provide rough-in and connect utilities to equipment in accordance with requirements specified in other sections of this specification and in conformance with the physical dimensions, capacities, manufacturer's instructions, and other requirements of the equipment furnished.

b. Equipment specified must also conform to the applicable requirements of the following reference standards: NSF/ANSI 12, NSF/ANSI 14, NSF/ANSI 169, and Energy Star for powered equipment.

c. Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Contractor's Field Verification Data; G[, ____]

SD-02 Shop Drawings

Detail Drawings; G[, ____]

Custom Fabricated Equipment; G[, ____]
Installation Instructions and Diagrams; G[], [____]

SD-03 Product Data
- Ice Making Equipment
- Ice Machine Autocleaning Equipment
- Energy Star label for ice machine; S

SD-05 Design Data
- Manufacturer's Applicable Literature; G[], [____]

SD-06 Test Reports
- Manufacturer's Test Data; G[], [____]
- Field Test Reports; G[], [____]

SD-07 Certificates
- NSF Certification
- UL Certification

SD-08 Manufacturer's Instructions
- Manufacturer's Instructions; G[], [____]

SD-10 Operation and Maintenance Data
- Ice Making equipment, Data Package 2; G[], [____]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals
- Manufacturer's Warranty
- Contractor's Warranty for Installation

1.4 ADMINISTRATIVE REQUIREMENTS

1.4.1 Pre-Installation Meeting

Thirty [____] days prior to the commencement of work, notify the Contracting Officer that the following items are prepared and ready for review:

1.4.1.1 Shop Drawings

Detail drawings, as specified, including insulation and utility requirements, product data, installation instructions and diagrams. Submit custom fabricated equipment drawings after approval of ice machine equipment drawings. Drawings must be 1:50 1/4 inch scale minimum.
1.4.1.2 Product Data

Submit the product data for the following equipment, as well as the associated manufacturer's data:

a. ice making equipment
b. ice machine autocleaning equipment
c. Manufacturer's applicable literature
d. Manufacturer's Test Data
e. Energy Star Labeled
f. Manufacturer's Instructions for shipping, handling, storage, installation, and start-up.

1.4.2 LIST OF EQUIPMENT

**************************************************************************
NOTE: Edit the master "Food Service Equipment Schedule" in Section 11 06 40.13 carefully; retain items of equipment used for the project. The Equipment List is intended to be edited and included in the project Specification. List the information contained on the Equipment List on the Contract Drawings.
**************************************************************************

Submit detailed Food Service Equipment List. Include submittal of NSF Certification, Energy Star Labeled and UL Certification for ice making equipment[ and autocleaning equipment].

PART 2 PRODUCTS

2.1 MATERIALS

Provide ice machine that is Energy Star labeled. Provide data identifying Energy Star label for ice machine.

2.2 CONSTRUCTION OF FABRICATED EQUIPMENT

Construction and finish of fabricated equipment must conform to the requirements of Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT.

2.3 FACTORY TESTS AND CERTIFICATIONS

Submit [_____] copies of all Manufacturer's Test Data and certifications, including NSF Certification; UL Certification, and Energy Star Labeled data
to the Contracting Officer prior to the commencement of any installation work.

[2.4 AUTOMATIC CLEANING SYSTEM

******************************************************************************
NOTE: Use automatic cleaning systems for ice machines, and schedule and perform routine ice machine cleaning automatically, reducing the need for a service technician to perform manual cleaning. Cleaning cycles are normally scheduled for 2, 4 or 12 week cycles or less frequently.
******************************************************************************

Provide ice making equipment with [internal] [external] automatic cleaning system with cleaning and sanitizing capability. Provide [115/60/1] [208-230/50/60/1], 0.3 total amps, with 15 amp maximum fuse electrical system. Include one month supply of cleaning and sanitizing fluid plus initial start-up and testing supply.

]PART 3 EXECUTION

3.1 EXAMINATION

Do not install items that show visual evidence of biological growth.

After becoming familiar with all details of the work, verify all existing dimensions, contract drawings, product data and all related conditions prior to commencing rough-in work. Advise the Contracting Officer of any discrepancies prior to ordering equipment. Submit Contractor's Field Verification Data prior to the pre-installation meeting.

3.2 INSTALLATION

Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT for detailed installation procedures, operation and maintenance manual requirements, training and project closeout procedures. Include all ice making [and autocleaning ]equipment Field Test Reports.[ Coordinate ice machine equipment installation with water filter system as specified in section 11 46 00.]

3.3 MANUFACTURER'S WARRANTY

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.4 CONTRACTOR'S WARRANTY FOR INSTALLATION

Submit contractor's warranty for installation to the Contracting Officer prior to final commissioning and acceptance.

NOTE: This guide specification covers the requirements for equipment used to clean food service tableware, utensils, pots, pans, spray units, booster heaters, steam exhaust hoods, waste containers and disposers.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Coordinate this section and use in conjunction with the following sections:

11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT
11 06 40.13 FOOD SERVICE EQUIPMENT SCHEDULE

PART 1 GENERAL

1.2 GENERAL REQUIREMENTS

**************************************************************************

NOTE: Indicate the configuration and layout for all food preparation equipment, with interior elevations and equipment identified by number. Show "Food Service Equipment Schedule" on the drawings using the same identification numbers as indicated on the current US Army Quartermaster Center and School equipment schedule. Ensure that all Contractor built-to-order items, per Food Service Equipment Schedule, are shown and coordinated with the specifications.

Designer must coordinate with other sections, including Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT and Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE for general requirements and final connection of equipment.

NOTE: Details of particular equipment and installations are provided on Naval Food Service Division drawings. Use these NAVFSD drawings as a basis for the project details. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

**************************************************************************

Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for general requirements. Also refer to Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE.

1.3 DESCRIPTION OF WORK

The work includes [furnishing and] [installing] [and modifying existing] food service cleaning and disposal equipment, related accessories, and work. Verify all existing dimensions, contract drawings, product data and all related conditions prior to commencing rough-in work. Include coordination of delivery through existing finished opening and vertical handling limitations within the building. Advise the Contracting Officer...
of all discrepancies prior to ordering equipment. Submit Contractor's Field Verification Data prior to the preconstruction meeting.

Provide rough-in and connect utilities to equipment in accord with requirements specified in other sections of this specification and in accord with the physical dimensions, capacities, manufacturer's instructions, and other requirements of the equipment furnished.

1.3.1 Design Requirements

**************************************************************************
NOTE: On the drawings, show:

1. A 1:50 1/4 inch scale floor plan with layout of all food service equipment and Naval Equipment Symbols.

2. Food Service Equipment Schedule laid out in accord with NAVFSSO, current US Army Quartermaster Center and School equipment schedule specified design requirements, including Energy Star labeled model list.

3. Floor, wall, and ceiling penetrations.

4. Raised bases, retainer curbs, or depressions.

5. Recessed, grated floor drains required for equipment.

6. Disconnect switches.

7. Electrical chases and raceways and plumbing chases.

8. Utility connections to building water, sanitary, electrical, and other utility systems. Convenience outlets at point of use for plug-in equipment.

9. All Contractor built-to-order items, per Food Service Equipment Schedule, shown and coordinated with the specifications.
**************************************************************************
Submit detail drawings as stated in Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT for food service cleaning and disposal equipment and related accessory equipment. Drawings must be 1:50 1/4 inch scale minimum.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity
or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Contractor's Field Verification Data; G[, [_____]]

SD-02 Shop Drawings

Detail Drawings; G[, [_____]]

[ Custom Fabricated Equipment; G[, [_____]]

] Installation Instructions and Diagrams; G[, [_____]]

Detail drawings, as specified, including insulation and utility requirements.

SD-03 Product Data

Food Service Cleaning and Disposal Equipment; G[, [_____]]

Manufacturer's Instructions; G[, [____]] for shipping, handling, storage, installation, and start-up.

SD-10 Operation and Maintenance Data

Food Service Cleaning and Disposal Equipment, Data Package 2; G[, [____]]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

SD-11 Closeout Submittals

Manufacturer's Warranty

Contractor's Warranty for Installation

1.5 QUALITY ASSURANCE

Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT.

1.5.1 Pre-Installation Conference

Thirty [_____] days prior to the commencement of work, notify the Contracting Officer that the following items are prepared and ready for review:

a. Shop Drawings, product data and installation instructions

   (1) Detail Drawings

   (2) Custom fabricated equipment

   Submit custom fabricated equipment drawings after approval of food service equipment drawings.

   (3) Installation Instructions and Diagrams

b. Product Data:

   Food service cleaning and disposal equipment
c. Design Data

(1) Manufacturer's descriptive and technical literature
(2) Manufacturer's Test Data

d. Manufacturer's Instructions

Manufacturer's Instructions for shipping, handling, storage, installation, and start-up.

PART 2 PRODUCTS

2.1 MATERIALS

Food service cleaning and disposal equipment must conform to the following;

OSHA standards:

29 CFR 1910.144
29 CFR 1910.145
29 CFR 1910.212
29 CFR 1910.306

NSF standards:

NSF/ANSI 13
NSF/ANSI 2
NSF/ANSI 21
NSF/ANSI 222
NSF/ANSI 3
NSF/ANSI 59
NSF Food Equipment

and other related standards as specified in Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT.

Floor areas adjacent to food preparation equipment point of operation, and working surfaces must conform to 29 CFR 1910-SUBPART D.

Preparation equipment materials must conform to the requirements as stated in Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT.

2.2 LIST OF EQUIPMENT

-----------------------------------------------------------------------------------
NOTE: Edit the master "Food Service Equipment Schedule" in Section 11 06 40.13 carefully; retain items of equipment used for the project. The Equipment List is intended to be edited and included in the project Specification. List the information contained on the Equipment List on the Contract Drawings.
-----------------------------------------------------------------------------------

Submit detailed Food Service Equipment List as specified in Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE. Include submittal of NSF Certification and UL Certification for individual food preparation equipment components.

SECTION 11 48 00 Page 11
2.3 CONSTRUCTION OF FABRICATED EQUIPMENT

Construction and finish of fabricated equipment must conform to the specifications as stated in Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT.

2.4 CUSTOM-FABRICATED WORKCOUNTERS, DISHWASHER COUNTERS, AND SINKS

2.5 COUNTER TOPS

Fabricate of 1.8 mm 14 gauge stainless steel, with all shop seams and corners welded, ground smooth, and polished.

2.5.1 Counter Edges

Miter and weld corners, grind smooth, and polish.

2.5.2 Work, Landing, and Dump Tables

Roll down counter edges on work, landing, and dump tables 45 mm 1.75 inches at 180 degrees, with corners rounded and bullnosed.

2.5.3 Side and Back Splashes

Turn up counter edges to form side or backsplashes at 90 degrees on a 15 mm 0.625 inch radius with top edge turned back 50 mm 2 inches at 90 degrees with ends closed. Turn up 150 mm 6 inches unless 250 mm 10 inches is required.

2.5.3.1 Soiled Dish Tables, Vegetable, and Pot Sinks

**************************************************************************
NOTE: Designer will indicate dimension and details of the sinks on the drawings. Remove text regarding overflow where not applicable.
**************************************************************************

Turn up counter edges on dishtables and vegetable and pot sinks 75 mm 3 inches at 90 degrees on a 15 mm 0.625 inch radius with top edge rolled 45 mm 1.75 inch at 180 degrees to form a rolled rim. Turn up back edge 250 mm 10 inches at 90 degrees on a 15 mm 0.625 inch radius with top edge turned back 55 mm 2.2 inches at 45 degrees with ends closed.

2.5.3.2 Drain Plug and Overflow Fittings

Provide drain consisting of a 38 mm 1-1/2 inch quick opening brass body valve with side outlet overflow connection with a stainless steel twist lever handle. Provide a removable perforated stainless steel strainer plate of not less than 75 mm 3 inch in diameter. Provide 31 mm 1-1/4 inch diameter chrome-plated brass tubing overflow fittings of not less than 0.91 mm 0.036 inch thickness connected to an overflow head in the back of the sink compartment. Provide overflow head with a removable perforated chrome-plated brass or stainless steel strainer plate of not less than 38 mm 1-1/2 inch diameter. Install overflow head in die-stamped opening 25 mm one inch below counter top.

2.5.3.3 Final Rinse Compartment

Equip the final rinse compartment of the pot washing sink with a booster...
heater for sanitizing.

2.5.3.4 Temperature Gauge

Provide temperature gauge with a 75 mm 3 inch diameter face with stainless steel flange.

2.5.3.5 Mounting Valves, Temperature Gauge, and Controls

Mount valves, temperature gauge, and controls in a stainless steel recessed panel, ready for final connections. Provide a perforated stainless steel casing over the temperature bulb.

2.5.3.6 False Bottom

Provide false bottom constructed of 1.9 mm 14 gauge stainless steel, 13 mm 1/2 inch deep pan formed with a perforated top (13 mm 1/2 inch holes punched 38 mm 1 1/2 inches on center), with welded corners and finger rings. Fit false bottom with 50 mm 2 inch high by 31 mm 1-1/4 inch outside diameter tubular stainless steel feet with closed ends.

2.5.4 Cutlery and Excess Liquid Sinks

Provide cutlery and excess liquid sinks with a removable standpipe overflow, in lieu of an overflow in the back of the sink. Install the overflow in the corner of the sink compartment. Provide compartments with snug-fitting removable basket strainers. Arrange drain plug with quick-opening valve for operation from the work side of the counter.

2.5.5 Glass Washing Sinks

**************************************************************************
NOTE: Glass-washing sinks are not required in enlisted personnel dining facilities.
**************************************************************************

Construct and provide backsplashes suitable for mounting the glass washing machine. Reinforce back to eliminate vibration and noise.

2.5.6 Counter Top Support

Provide supports under all edges of counter tops and tables, and at cross members. Stud-weld counter top to supports. Provide either of following types.

2.5.6.1 Channels

25 by 25 mm by 1 inch, 2.5 mm thick 12 gage galvanized steel channel. Space cross members 600 mm 30 inches on-center.

2.5.6.2 Angles

38 by 38 by 3 mm 1.5 by 1.5 by 0.125 inch galvanized steel angles. Space cross members at 600 mm 2 feet on-center.

2.6 PASS-THROUGH WINDOWS

Except for sill of soiled dish counter, fabricate a mitered window frame of 1.8 mm thick 14 gage stainless steel channel forming a 85 mm 3.5 inch
casing on each side of wall. Return flange 13 mm 0.5 inch, to wall. Weld joints; join only at corners of opening. Seal in accord with Section 07 92 00 JOINT SEALANTS.

2.6.1 Windows for Endless Belt Conveyors

Locate and size opening to allow 13 mm 0.5 inch clearance at each side and below conveyor and 300 mm 12 inch space above conveyor.

2.6.2 Windows for Soiled Dish Counter

Fabricate sill as integral extension of counter. At face of wall opposite counter, turn sill 13 mm 0.5 inch up, then down to form 100 mm 4 inch wide mitered casing.

2.7 CLEANING, DISHWASHING, AND DISPOSAL EQUIPMENT

******************************************************************************
NOTE: Show soiled dishware return service layout and related details on the drawings.

Ozone generators are sometimes required specific zoning or health regulatory agencies for the suppression/elimination of odors generated by food service waste facilities. Delete the statement if not required by project.
******************************************************************************

Commercial warewashing equipment must conform to NSF/ANSI 3. Thermoplastic refuse containers must conform to NSF/ANSI 21. Ozone generators, used to eliminate odors, must conform to NSF/ANSI 222.

Provide commercial dishwasher equipment that is Energy Star labeled. Provide data identifying Energy Star label for commercial dishwasher.

2.7.1 Dish Counters

Construct dish counters and sound deaden as specified for in Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT. Fit and flange the dish counters into the dishwashing machine with a water-tight joint.

2.7.2 Dish Counter Support Channels

Provide 25 by 100 by 25 mm 1 by 4 by 1 inch, 2.7 mm 12 gauge stainless steel dish counter support channels. Provide channels under dish counter top between each pair of legs and close ends. Provide cross members, on the centerline, between legs. Stud bolt channels to counter top at 150 mm 6 inch on center, maximum.

2.7.3 Dish Counter Components

2.7.3.1 Scupper Drain

Provide scupper drain the full width of dish counter with all corners coved, 150 mm 6 inch wide by 50 mm 2 inch deep, and integrally welded to the soiled/clean dish counter top at the entrance/exit of a rack-type dishwashing machine. Score and slope bottom of the scupper drain to 38 mm 1-1/2 inch brass drain with tailpiece. Provide removable drainer 1.6 mm 16 gauge stainless steel, flush-mounted, pan-formed, perforated top, with 13 mm
1/2 inch holes punched 38 mm 1-1/2 inches on center, and install in the scupper opening on 13 mm 1/2 inch diameter stainless steel legs with closed ends.

2.7.3.2 Prewash Sink

Weld integral 520 by 520 mm 20-1/2 by 20-1/2 inch prewash sink to the dish counter top with the corners rounded on 13 mm 1/2 inch radius. Pitch the sink bottom to 1.6 mm 16 gauge stainless steel[ disposer throat flange] [38 mm 1-1/2 inch brass drain]. Provide a 520 mm 20-1/2 inch square 1.6 mm 16 gauge removable rack support/slide assembly, framed with two cross members. Weld two 25 by 3 mm 1 by 1/8 inch stainless steel angle rack guides on top of the frame at 500 mm 20 inch apart with ends flared at 45 degrees.

2.7.3.3 Pre-Rinse Spray Valve

Mount a prerinse spray assembly on the backsplash of the dish counter with vertical tubing, wall bracket, flexible gooseneck hose, and self closing squeeze-type valve and spray.

Provide pre-rinse spray valve that is WaterSense labeled. Provide data identifying EPA WaterSense label for pre-rinse spray valve.

2.7.3.4 Backsplash-Mounted Faucets

**************************************************************************
NOTE: Designer will detail location and type of faucets. Stainless steel will be specified for hospital faucets.
**************************************************************************

Provide combination fitting-type backsplash mounted faucets with concealed supply connections at the back of the sink. Provide fitting with a swinging spout of approximately 200 mm 8 inches in length and inlets with 19 mm 3/4 inch pipe thread. Faucets must have adjustable flanges. Provide valves with indexed metal lever handles and replaceable seats.

2.7.3.5 Hose Bib Faucet

Mount a hose bib faucet on a 2.7 mm 12 gauge stainless steel flange or inverted gusset below top of counter, ground and polished to match counter top.

2.7.3.6 Undershelves

Provide solid type undershelves, constructed as specified for open base shelves.

2.7.3.7 Scraping Trough

Provide a 1.9 mm 14 gauge stainless steel scraping trough in the soiled dish counter with all corners 19 mm 3/4 inch coved, and integrally welded to the dish counter. Provide trough 200 mm 8 inch wide minimum and sloped one percent 1/8 inch per foot or from 100 mm 4 inch depth to integral disposer or prewash sink. Form long sides of trough on a 60 degree angle with a 13 by 13 mm 1/2 by 1/2 inch recessed shoulder at juncture of the dish counter. Provide with removable stainless steel trough covers 197 by 500 mm 7-7/8 by 20 inch, 1.6 mm 16 gauge, pan formed, with perforated top.
Make perforations 13 mm 1/2 inch diameter holes punched 38 mm 1-1/2 inch on center. Provide one trough cover for each 900 mm 36 inch of trough.

Provide and install one inlet fitting at the shallow end of the scraping trough, and intermediate inlet fittings at 1200 mm 48 inch on center. Pipe inlet fittings to a blending valve, vacuum breaker, solenoid valve, and provide a globe valve at each intermediate inlet.

Integral disposer sink must be 450 by 450 by 188 mm 18 by 18 by 7-1/2 inch deep, 1.9 mm 14 gauge stainless steel with all corners coved, welded to dish counter/scraping trough and fitted with a removable silverware-trap. Provide with removable stainless steel flush cover 1.6 mm 16 gauge, 13 mm 1/2 inch pan-formed, and perforated 13 mm 1/2 inch holes punched at 38 mm 1-1/2 inch on center with welded corners. Provide a finger ring for the removal of the cover. Provide 6 mm 1/4 inch diameter stainless steel rod support clips, 50 mm 2 inch long, formed at 45 degree angle with two 19 mm 3/4 inch leg ends and 6 mm 1/4 inch long threaded ends.

Insert rod-clips through tight clearance holes in sink corners, seal watertight, and secure with stainless steel acorn-nuts or tack-welded at exterior of sink wall. Set support clips for a flush cover position (approximately 13 mm 1/2 inch below top). Interconnect a solenoid valve with the disposer delay-relay control to initiate the blended water flow when the disposer is activated. All inlet fittings must 13 mm 1/2 inch [copper] [stainless steel] tubing from blending valve to inlet fittings.

Chrome plate all exposed fittings.

2.7.4 Glass/Cup Rack Overshelf

Provide 1.9 mm 14 gauge stainless steel glass/cup rack overshelf with a 38 mm 1-1/2 inch deep "Vee" trough at free long sides with a 25 mm one inch tight hem at inside of trough. Provide a 13 mm 1/2 inch marine edge at free ends and a 100 mm 4 inch high splash at the wall.

a. Suspend shelf with bottom edge at 450 mm 18 inch above counter top.

b. Provide drain tubes at each end of trough through the backsplash to 19 mm 3/4 inch above top of table.

c. Provide a horizontal rack rest of 41 mm 1-5/8 inch outside diameter stainless steel tubing the full length of the shelf, supported 250 mm 10 inch above the shelf on 31 mm 1-1/4 inch outside diameter stainless steel tubing spaced at 1500 mm 60 inch on center.

2.7.5 Dish/Tray Return Shelf

Provide dish/tray return shelf as indicated on the drawings. Extend shelf through opening in wall to be flush with the wall at the deposit side. Turn down of shelf must be 25 mm one inch at 90 degrees at the front with 19 mm 3/4 inch return at bottom. Turn down rear long side 25 mm one inch at 90 degrees, and integrate with [conveyor slider pan] [dish counter] whenever adjacent.

2.7.5.1 Dish/Tray Return Opening Frame

Provide 1.3 mm 18 gauge stainless steel window shelf with the perimeter flange channel-formed, 25 by 19 mm 1 by 3/4 inch at both sides of the wall. Weld corners of the frame. Install frame with concealed attachments. Aligned/abut jamb of frame with the end splash of [conveyor
slider pan] [dish counter], whenever adjacent.

2.7.5.2 Overhead Rolling Door

**************************************************************************
NOTE: Designer will delete this paragraph if not used.
**************************************************************************

Provide and install an overhead rolling door into the dish/tray return. Coordinate enclosure and track installation with the splash/jambs, and partition bucks.

2.8 CONVEYOR

**************************************************************************
NOTE: Indicate arrangement dimensions and details including enclosures, if required, of the conveyors on the drawings. Select either an electrically or gravity powered conveyor.
**************************************************************************

2.8.1 Conveyor, Electrical

Provide endless belt type conveyor, electrically operated, straight, soiled dish type. Conveyor must be U.L. listed and NSF approved.

2.8.1.1 Trough (Slider Bed)

Provide a one-piece seamless pan constructed conveyor of 1.9 mm 14 gauge stainless steel with integral tracking trough. Pitch integral belt track longitudinally for drainage and equip with a timed/automatic detergent wash. Reinforce horizontal and vertical corners with 2.7 mm 12 gauge stainless steel closed end channels.

Turn up conveyor pan edges 75 mm 3 inch with 19 mm 3/4 inch at 90 degrees to form rolled rim. Pan must be sized to transport standard 356 by 457 mm 14 by 18 inch cafeteria trays. Mount slider pan on "U" shaped supports of 2.7 mm 12 gauge stainless steel, at 1500 mm 60 inch on center. Provide legs as specified for gussets, legs, and feet.

Conveyor drive housing frame must be constructed of 1.9 mm 14 gauge stainless steel. Provide enclosure with a 1.6 mm 16 gauge stainless steel, double insulated pan-formed access door with safety interlock, and set on stainless steel adjustable legs. Provide stainless steel monorail return system with slide rails.

2.8.1.2 Motor

Provide conveyor driven by a totally enclosed gearhead reduction motor of the size scheduled with overload and low voltage protection, with infinitely variable speed from 0.1 to 0.25 meters/second 20 to 50 fpm using solid state controls. The drive must be controlled manually through a water-tight control panel mounted[ where indicated][ as shown by the manufacturer]. Motor components must be factory prewired in accordance with NFPA 70 using waterproof conduit and NEMA ICS 6 and NEMA 250, Type 4 stainless steel waterproof enclosures. Provide motor with devices to automatically stop the conveyor belt without coasting.
2.8.1.3 Control Panel/Controls

Provide control panel controls with an exposed disconnect switch and overload protection with reset key control for AC motors and replaceable fuse for DC motors. Locate and prewire all components to a terminal strip, such as overload and low voltage protection, motor controller, and control relay, within the control panel. External controls must be 24 volt. Provide a remote on-off switch at each scrap station to manually control the conveyor operation. Also provide an automatic limit switch at the take off end. Provide a conveyor belt with an automatic shutoff jam switch.

2.8.1.4 Belt Washer

Provide belt washer with a stainless steel wash tank with a removable scrap basket, and waste extension. Provide a spray assembly to wash the belt on both sides, factory plumbed through a pump-type detergent injector. The wash assembly must be provided with a mixing valve, water pressure regulator, gauge, vacuum breaker, solenoid valve, and in-line strainers. Provide a timer to regulate the duration of the belt-wash system. The beltwasher must not be operable when the conveyor is stopped. Provide easily accessible stainless steel detergent dispenser cabinet with tank and low level indicator, conforming to NSF/ANSI 29.

2.8.1.5 Drip Pan

Provide a 1.3 mm 18 gauge stainless steel drip pan the full length of the conveyor. Turn up the drip pan on each side, creased for center drainage, and pitch or direct by a conveyor belt to an integral sump and removable strainer at the drain locations.

2.8.1.6 Conveyor Belt

The slat conveyor belt must be overlapping and of nonstaining plastic material. Belt slats must be 250 mm 10 inch wide and snap onto a stainless steel chain without the use of tools. The chain is the driving force. Belts must ride on high density plastic slide rails. Provide stainless steel sprocket hubs and shafts with [ultra-high density plastic] [stainless steel] teeth. Hinge 1.3 mm 18 gauge stainless steel enclosure panels to the slider pan, and the conveyor under-bracing assembly by means of concealed hinges at the top and screw fasteners or magnetic catch at the bottom.

2.8.1.7 Curve Guide

Where the conveyor negotiates a curve, equip with an antifriction device to reduce friction and wear. Apply lubrication, if necessary, to the curve by means of a remote electrical pump.

2.8.2 Conveyor, Gravity Flow Type

Provide conveyor with [ultra high density plastic] [stainless steel] roller, gravity operated, soiled dish type, to transport standard 356 by 457 mm 14 by 18 inch cafeteria trays, constructed in accordance with NSF/ANSI 2, size and configuration as indicated on drawings.

2.8.2.1 Conveyor Trough (Pan)

Provide one-piece conveyor trough, seamless, constructed of 1.9 mm 14 gauge stainless steel with integral soiled landing table, with depressed trough.
to accept roller sections, and pan pitched to soiled dishtable where indicated.

2.8.3 Gussets

Provide stainless steel gussets, fully enclosed, a minimum of 75 mm 3 inch in diameter at the top, reinforced with a bushing, continuously welded to channel or angle.

2.8.4 Legs

Provide 1.6 mm 16 gauge, 41 mm 1-5/8 inch outside diameter stainless steel tubing legs, continuously welded to gussets, channel, or angle as specified.

2.8.5 Feet

Provide sanitary, die-stamped stainless steel bullet-shaped, fully enclosed feet which provide for a 25 mm one inch adjustment without threads being exposed. Finish off the bottom of the legs with the stem overlapped to provide a sanitary closed fitting. Feet for free-standing fixtures requiring utility connections must be as above except with a flanged plate at the bottom which is anchored to the floor with noncorrosive bolts.

2.9 ROLLER ASSEMBLIES

Provide[ PVC plastic][ stainless steel] tubing style roller sections, with stainless steel ball bearings. Mount rollers to stainless steel hex shafts, set in 2.7 mm 12 gauge stainless steel side rails formed to maintain trays in proper alignment. Fit each section end of frame with stainless steel plate notched for easy removal. Mount roller section in trough to allow for free movement of trays without drag. Provide curved sections with 1.9 mm 14 gauge side rails with two rollers per shaft to negotiate corner turn.

2.10 CONDENSATE HOODS AND EXHAUSTS

**************************************************************************
NOTE: Not all commercial warewashing equipment require condensate exhaust hoods, (i.e."Flight Type" dish machines). Coordinate this item with the project design requirements and the Contracting Officer.
**************************************************************************
**************************************************************************
NOTE: Indicate type, size, shape, and detail of hoods/ducts, and the required standard cubic meters per second (cubic feet per minute), meters per second (feet per minute) (velocity), static pressure, and duct collar size for exhaust/make-up air on the drawings.
**************************************************************************
**************************************************************************
NOTE: Size exhaust and supply fans and exhaust and supply ducts in accord with hood manufacturer's recommendations, to ensure proper balancing for a satisfactory exhaust system. Provide a separate and self-supporting system for each hood. Air changes
in the utensil washroom must be 5 changes per hour for general room exhaust and 30 changes per hour when all systems are operating.

**************************************************************************

NOTE: Delete types not used in project.

**************************************************************************

Provide hood and duct work systems conforming to ACGIH-2097, ACGIH-2106, SMACNA 1966, and NFPA 96. Unless otherwise specified, secure ducts and hoods to building so as to be level and free from vibrations under all conditions of operation. Supply and install exhaust fans for food service equipment and exhaust hoods as specified in Section [______].

[2.10.1 Hood Over Utensil-Washing Sink, Type 5]

**************************************************************************

NOTE: If Type 5 hood is not used, insert salient requirements regarding shape, mounting, and duct connection.

**************************************************************************

Provide a 1980 by 1065 by 450 mm 78 by 42 by 18 inch high hood. Provide condensate collecting gutter and drain to sink drainboard or floor drain. Slope top of hood 150 mm 6 inches down toward front of hood starting 300 mm 12 inches in from back edge. Mount to wall with anchors provided by manufacturer and hang from ceiling with 16 mm 0.625 inch stainless steel rods. Provide an opening in top of hood for exhaust duct. Center opening in top of hood from left to right and front to back. Provide a 50 mm 2 inch high stainless steel duct collar, welded to hood top. Mount at height indicated. Provide controls for fans.

[2.10.2 Hood Over Utensil-Washing Machine, Type 6]

**************************************************************************

NOTE: If Type 6 hood is not used, insert salient requirements regarding shape, mounting, and duct connection.

**************************************************************************

Provide hood of same length and width as utensil washing machine. Provide condensate collecting gutter and drain to [floor drain] [_____]. Slope top, mount, and provide duct opening and collar as specified for Type 5 hoods. Mount at height which avoids interference with machine operation. Provide controls for fans.

[2.10.3 Exhaust Over Dishwashing Machines, Type 7]

Provide two rectangular duct chambers, with connections at each end of dishwashing machine, not less than 150 mm 6 inches deep and extending width of dishwashing machine unless otherwise recommended by dishwashing machine manufacturer. Chambers must converge over dishwashing machine at a 45 degree angle to form a single outlet to exhaust duct. Provide controls for fans.

[2.10.4 Gutter and Drain]

Provide inside bottom perimeter with a 75 mm 3 inch face with a 25 mm one
inch high flange turned up at a 45 degree angle, to form gutter. Provide a 25 mm one inch stainless steel drain in back corner, extending to specified discharge.

2.10.5 Fan Controls

Provide, for each condensate hood, controls for operating fans. Include manual push buttons labeled "start" and "stop" and labeled light indicating when fans are operating.

2.10.5.1 Hood Exhaust and Supply Fans

**************************************************************************
NOTE: Exhaust fans for kitchen equipment should be centrifugal type with top discharge, adjustable pulleys, and disconnect switches. Protect motor against vapor-laden air stream.
**************************************************************************

Provide in accord with Section 23 30 00 HVAC AIR DISTRIBUTION.

2.10.5.2 Hood Exhaust and Supply Duct

**************************************************************************
NOTE: Duct work to kitchen hoods and for dishwashing machines should be carefully incorporated into Section 23 30 00 HVAC AIR DISTRIBUTION and onto the drawings to assure coordination with kitchen equipment design. The following are necessary:

1. Curbs must conform to NFPA 96.

2. Hood exhaust and supply duct: Minimum 1.2 mm thick 18 gage stainless steel, welded water tight. (Unexposed duct can be galvanized steel). Conform to SMACNA HVAC Duct Const Stds.
**************************************************************************

Provide in accord with Division 23, Section 23 30 00 HVAC AIR DISTRIBUTION.

2.10.6 Condensate Exhaust Hood Connection Provisions

2.10.6.1 Exhaust Duct for Canopy or Noncanopy Condensate Hoods

Construct ducts with 1.3 mm 18 gauge stainless steel. Weld all external seams liquid-tight to hood duct collar as required by NFPA 96. Duct size is based on a minimum air velocity of 4.06 meter/second 800 fpm. Continuously weld duct, liquid tight, to hood duct collar as required by NFPA 96.

2.10.6.2 Hood Support

Support wall mounted or island type hoods from the ceiling structure with stainless steel mounting brackets provided with the hoods. Hanger rods must be 13 mm 1/2 inch diameter stainless steel, thread at the bottom and designed at the top to fit into inserts in building slats above or hanger attachments fastened to structural steel members. Space hanger rods 1200 mm 48 inch on center, maximum.
2.10.6.3 Make-Up Air Tempered and Untempered

Replace the air volume which is exhausted from a kitchen as required by NFPA 96. Air supplied upstream of the hood suction opening does not qualify as make-up air. The exhaust air flow rate of ventilation of dishwashing equipment must be drawn through the open area between the dishwashing machine and the perimeter entrance of the hood. Provide make-up air diffusers the full length of the front panels, at both sides of the hood producing a low velocity discharge. Provide a supply air plenum with 25 mm one inch thick foil-faced fiberglass insulation at interior of plenum. The temperature differential between make-up air and the air in the conditioned space must not exceed 12 degrees C 10 degrees F, except air that is part of the air conditioning system or air that does not decrease comfort conditions of the occupied space.

2.10.6.4 Vapor Proof Hood Lights and Wiring

Provide U.L. listed, recess mounted, gasketed vapor-proof fluorescent light fixtures conforming to UL 1598, [the full length of the hood][ as shown on the drawings]. Provide, at Type 2 and Type 3 hoods, incandescent or fluorescent lights in accord with UL 1598. Prewire the light fixtures to junction box at a rear free corner. Use Cool white T-8 energy efficient lamps.

2.10.6.5 Closure Panels

Provide vertical corner mullions at removable closure panels, 50 by 50 mm 2 by 2 inch wide, 1.6 mm 16 gauge stainless steel, and weld integrally to furring and head channel. Provide exhaust hood closure panels 13 mm 1/2 inch pan-formed 1.3 mm 18 gauge stainless steel. Retain the upper edge of the panel in a 25 by 50 mm 1 by 2 inch continuous 1.6 mm 16 gauge stainless steel head channel secured to the hood superstructure. Mount the lower edge of the panels on perimeter furring cap, and turn back 25 mm one inch for "zee" clip retention.

2.10.7 Ducts at Dishwashing Machines

Provide ducts at dishwashing machines consisting of two vertical ducts, one at each end of the dishwasher. Construct exposed, seamless, ducts of not less than 1.3 mm 18 gauge stainless steel and size to accommodate the machine exhaust vent. The intake of each duct must be at the top edge of the dishwasher and extend to 150 mm 6 inch above the finished ceiling for final connection. Trim the duct at the ceiling with a 1.6 mm 16 gauge stainless steel angle flange with corners welded. Connect the exhaust outlet to the exhaust system.

2.10.8 Duct Openings

Provide duct openings with collars of quantity/size as indicated, with a stainless steel louvered grille at the openings. Trim and seal all penetrations of the dishwashing machine duct risers through the hood body.

[2.10.8.1 Ceiling Recessed Exhaust Hood at Dishwashing Machines

**************************************************************************
NOTE: Use this paragraph for projects where ceiling height limitations require a recessed hood.
**************************************************************************
Provide hood over dishwashing machines constructed of 1.6 mm 16 gauge stainless steel with all seams welded, ground, and polished. Slope both long sides up to 450 mm 18 inch interior height from 150 mm 6 inches above bottom edge. Body must have a 50 mm 2 inch wide perimeter flange turned-up 19 mm 3/4 inch at 90 degrees (increase to 250 mm 10 inch width at supply air diffusers). Provide make up air diffusers at vertical [interior] [exterior] length of hood. Provide duct openings with collars of quantity/size as indicated, with a stainless steel louvered grille at the openings. Trim and seal all penetrations of the dishwashing machine duct risers through the hood body.

2.11 GARBAGE DISPOSAL MACHINES

**************************************************************************
NOTE: When scrap trough is located on front of soiled dish table with a disposer in center and scrapping being done on each side, provide the disposer with an off-set head so disposer does not extend beyond dishtable.
**************************************************************************

Provide floor-mounted type disposer conforming to ASSE 1009, with cast alloy body supported on adjustable tubular legs. Attach waste chamber lid with quick-release clamps. Connect hopper to disposal with a flexible sleeve of molded neoprene, held in place with stainless steel clamps.

2.11.1 Disposal Cone

Fabricate with approximate diameters of 450 mm 18 inches inside unit and 200 mm 8 inches at throat. Provide neoprene silver trap at throat and water swirl inlet in cone to create counterclockwise rotation. Secure cone to disposer with flexible connector sleeve and stainless steel clamps.

2.11.2 Motor

Mount motor with 75 mm 3 inch minimum clearance above floor. Provide with magnetic starter with overload and under-voltage protection timer for 0 to 5 minutes, panel cover interlock, fused disconnect, prewired solenoid, vacuum breaker, two water flow controls, and automatic reversing action. Provide cast alloy rotor carrying rigid impact bars and fixed directly onto motor shaft. Provide motors of the following minimum sizes on disposals at locations listed:

a. Pot and pan sink: 3.75 kw 5 horsepower
b. Soiled dishtable: 5.60 kw 7.5 horsepower.

2.11.3 Disposal Control Center

Include time delay relay, start and stop buttons, panel cover interlock with fused safety disconnect switch and circuit breaker, door locking feature that prevents opening door with power on, full voltage magnetic starter with both overload and under-voltage protection, and solenoid valve. Control center must be waterproof and fabricated using stainless steel and in accord with NEMA ICS 6. Provide controls conforming to NEMA ICS 2.
2.12 DRAINS

Provide cleanout for all drains. Locate drains so that drain lines from equipment are not located in any portion of a walking surface or produce a tripping or burn hazard.

2.13 DRAIN TRENCH LINER/GRATING

*****************************************
NOTE: Indicate on the drawings, required dimensions, details, and coordinate with floor plan layout. Drain trench liner/grating system must be provided with a complete drainage system. Trench must be capable of being readily cleaned out without the removal of bolts or screws to gain access.
*****************************************

Provide 1.9 mm 14 gauge stainless steel drain trench liner/grating in sizes as indicated with a 25 mm one inch wide perimeter shoulder at the top, turned up flush and level with finished floor, tight-hemmed back down to the shoulder level and flanged out 50 mm 2 inch for attachment to the slab.

2.13.1 Interior of the Liner

Interior of the liner must be 150 mm 6 inch deep with corners coved on 19 mm 3/4 inch radius; sloped and scored 25 mm one inch to an integrally welded box pattern drain (drain housing only). Provide drains at 1200 mm 48 inch on center maximum and fit with 150 mm 6 inch long welded tailpiece. Connect a safety chain to the basket strainer assembly and the top of the liner wall. Underside of sloping portion of liner must have 50 mm 2 inch long "zee" clips.

2.13.2 Aluminum Grating

Provide aluminum grating, removable without the use of tools, with 38 by 5 mm 1-1/2 by 3/16-inch bearing bars and a perimeter frame. Close bearing bars must have a 33 by 100 mm 1-5/16 by 4 inch centerline to centerline grid. Provide section quantities and sizes as indicated on the drawings with a maximum of 600 mm 24 inch long sections.

PART 3 EXECUTION

3.1 INSTALLATION

Do not install items that show visual evidence of biological growth.

3.1.1 General

Install in accord with the manufacturer's printed instructions.

3.1.2 Cutting and Patching of Construction

Lay out work in advance to prevent damage to building, piping, wiring, or equipment as a result of cutting for installation.

3.1.3 Setting and Connecting

Install equipment plumb and level. Except for mobile and adjustable-leg equipment, securely anchor and attach items and accessories to walls,
floors, or bases with stainless steel bolts. Flash food service cabinets located in wall openings to the walls with 0.9 mm thick 20 gage stainless steel. Seal around equipment flashing and flanges, at walls, floor, and ceiling in accord with Section 07 92 00 JOINT SEALANTS. Fillers must be continuous, without opening.

3.1.4 Plumbing Work

Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT.

3.1.5 Electrical Work

Electrical systems, components and accessories must be certified to be in accordance with NFPA 70 and the following:

3.1.5.1 Installed Equipment Load

If the electrical load of the approved equipment differs from that specified or shown on the drawings, provide and install electrical service compatible with the approved equipment.

3.1.5.2 Electrical Equipment and Components

Food service equipment furnished under this section must have loads, voltages, and phases compatible with building system, and conform to manufacturer standards.

3.1.5.3 Cords and Caps

Coordinate all food service equipment cord/caps with related receptacles. All 120/208/240 volt "plug-in" equipment must have Type SO or SJO cord and a plug with ground, fastened to frame/body of item. Provide mobile equipment with a strain-relief assembly at the cord connection of the appliance. Mobile electrical support equipment (heated cabinets, dish carts, etc.) and counter appliances mounted on mobile stands (mixers, food cutter, toaster, coffee makers, microwave ovens, etc.) must have cord/cap assembly with cord-hanger as provided by the manufacturer.

3.1.5.4 Switches and Controls

Equip each motor-driven appliance or electrically-heated unit with control switch and overload protection per UL 197 and UL 471. Switches, controls, control transformers, starters, equipment protection and enclosures must be Industry Standards for the related equipment environment.

3.1.5.5 Motors

Provide motors at 120, 240, 208/240 and 460/480 volts with starter, overload protection, and short circuit motor protection per manufacturer standards.

3.1.5.6 Heating Elements

Provide thermostatic controls for all electrically heated equipment. Equip water heating equipment with a positive low-water shut-off.

3.1.5.7 Receptacles and Switches

Install receptacles which are located in vertical panels of closed base.
bodies in 300 by 215 by 75 mm 12 by 8-1/2 by 3 inch deep recessed mounting panel sloped on a 60-degree angle and turned up to the top of the opening. Prewire receptacles which are located in closed base fixtures to a junction box located within 150 mm 6 inch from the bottom of the utility compartment. Horizontally mount receptacles which are installed in/on fabricated equipment in a metal box with a stainless steel cover plate.

3.1.5.8 Light Fixtures

Prewire light fixtures with lamps which are installed in/on fabricated or field-assembled equipment to a junction box for final connection (fixtures must be continuous run when indicated). Install fluorescent display light the full-length of the display stand and serving shelf with stud bolts or as indicated, and prewire through a support post to a recess-mounted switch. Install heat lamps to underside of serving shelf assemblies as specified. Heat lamp length for chassis must be sized per manufacturer or as indicated on the drawings. Electrically connect cold storage light fixtures through the hub fitting located on the top of the fixture. Horizontal conduit must be above the ceiling panels. Install plastic sleeves through ceiling panels for electrical conduit and seal all penetrations airtight at both sides of panel.

3.1.5.9 Final Electrical Connection Provisions

Tag final electrical connection points of equipment with item number, name (as indicated on FOOD SERVICE EQUIPMENT SCHEDULE) of devices on the circuit, total electrical load, voltage, and phase. Fabricated equipment containing electrically-operated components or fittings, indicated on utility connections drawings to be direct-connected, must have each component, fitting, or group thereof prewired to a junction box for final connection. Refer to the drawings for circuit loading.

Field-assembled equipment (example, prefabricated cold storage assemblies, conveyor systems, exhaust hoods) must have electrical components completely interconnected by this section for final connection as indicated on utility connection drawing. Prewire the following groups of cold storage assembly electrical devices to a top-mounted junction box for final connection per compartment grouping, unless otherwise indicated.

a. Light fixtures, switches, and heated pressure-relief vent.

b. Door/jamb heater and temperature monitors/alarms.

c. Evaporator fans, defrost elements, freezer fan door switch, and drain line heaters.

3.1.5.10 Lamps

Provide food service equipment containing light fixtures with standard appliance type bulbs or energy efficient appliance type bulbs as indicated on the drawings. Exposed fluorescent lamps above or within a food zone must have plastic coated T-8 energy efficient lamps or standard lamps, sleeved in plastic tube with end caps.

3.1.6 Cleaning and Adjusting

Test and adjust equipment for proper operation. Test rotating components and motors for proper rotation. Lubricate moving parts if suggested by manufacturer's literature. Prior to acceptance of project, clean and
sanitize equipment both inside and outside.

a. Light fixtures, switches, and heated pressure-relief vent.
b. Door/jamb heater and temperature monitors/alarms.
c. Evaporator fans, defrost elements, freezer fan door switch, and drain line heaters.

3.1.7 Installation of Hoods

Install in accord with NFPA 96. Install hoods to remain free from vibration under all conditions of operation.

3.1.8 Floor Screeds

Anchor, install, and seal in accord with the recommendations of the manufacturer of the walk-in unit.

3.2 FIELD INSPECTIONS AND TESTS

3.2.1 Inspections

Inspect equipment, fixtures, and material after installation for compliance with the applicable standards and as specified in Section 11 05 40 COMMON WORK RESULTS FOR FOOD SERVICE EQUIPMENT.

3.2.2 Field Test Reports

Upon completion of inspection perform operational tests on each piece of equipment to determine that equipment and components, including controls, safety devices, and attachments, operate as specified and are properly installed and adjusted. Test all water, drain, gas, steam, oil, refrigerant, and liquid carrying components for leaks. Notify the Contracting Officer 14 calendar days prior to testing.

3.3 MANUFACTURER'S WARRANTY

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.4 CONTRACTOR'S WARRANTY FOR INSTALLATION

Submit contractor's warranty for installation to the Contracting Officer prior to final commissioning and acceptance.

SECTION 11 53 00
LABORATORY EQUIPMENT AND FUMEHOODS
05/11, CHG 1: 11/17

NOTE: This guide specification covers the requirements for laboratory equipment and fume hoods.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Types of equipment normally specified in this section include fumehoods, furniture not specified in casework section, and related laboratory products. Laboratory fumehoods included by the guide specification are not to be utilized for perchloric acid handling operations. Perchloric acid is extremely dangerous because it is a very strong oxidizer. When this acid reacts with organic material, an explosive product may form.

NOTE: On the drawings, show:

1. Location of equipment, utility connections and relation to other work.
2. Remotely located blower and ductwork, to create negative pressure at hood. Require weatherproof caution labels attached to outlet end of exhaust systems where warning of dangerous chemical fumes will be necessary.

3. Fans and ductwork needed to create negative pressure. Laboratory fume hoods are ventilated enclosures designed to provide safe working area for laboratory activities involving hazardous materials, generated fumes, aerosols, gases, and particulate matter. To operate satisfactorily, air is removed from enclosure at optimum face velocity. Require velocities measurable at maximum face area of hood, with maximum allowances for hood, filter, and appurtenance static pressure losses within specified limits.

**************************************************************************

PART 1 GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN CONFERENCE OF GOVERNMENTAL INDUSTRIAL HYGIENISTS (ACGIH)

ASTM INTERNATIONAL (ASTM)

ASTM A1008/A1008M (2023) Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability,
1.2 RELATED WORK SPECIFIED IN OTHER SECTIONS

Conform to provisions of Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT and Section 12 35 70 HEALTHCARE CASEWORK. Provide final utility connections and utility service to equipment including waste, under Sections 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS; 22 00 00 PLUMBING SYSTEMS; 22 60 70 GAS AND VACUUM SYSTEMS FOR HEALTHCARE FACILITIES; and 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

1.3 SUBMITTALS

**************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets
following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Laboratory equipment and fume hood layout; G[, [_____]]
   Laboratory equipment and hood schedules

SD-03 Product Data
   Fumehood assembly; G[, [_____]]
   Radio isotope fumehood; G[, [_____]]
   Biological safety cabinet; G[, [_____]]
   Include descriptive literature, technical data sheets, and diagrams.

SD-04 Samples
   Exterior hood paint; G[, [_____]]

SD-06 Test Reports
   Fumehood test; G[, [_____]]
   Base cabinet test; G[, [_____]]

SD-08 Manufacturer's Instructions
   Fumehood assembly
Radio isotope fumehood

Biological safety cabinet

SD-10 Operation and Maintenance Data

Fumehood assembly, Data Package 2; G[, [_____]]
Radio isotope fumehood, Data Package 2; G[, [_____]]
Biological safety cabinet, Data Package 2; G[, [_____]]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.4 SUBMITTAL REQUIREMENTS

1.4.1 Hood Paint

Submit color chips of exterior hood paint. Submit [at least five] colors which are standard with the manufacturer.

1.4.2 Drawing Requirements

Show pertinent installation layout. Indicate details of construction and rough-in requirements.

1.4.3 Schedule

Include each type of equipment and hood and submit in accordance with Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT.

1.4.4 Tests

Submit fumehood test [and] cabinet test reports required by ACGIH-2097.

PART 2 PRODUCTS

2.1 MATERIALS, COMPONENTS, AND SPECIAL DESIGN REQUIREMENTS

**************************************************************************
NOTE: Use of certain chemicals such as hydrochloric and hydrofluoric acids may react with specified materials. Epoxy, mineral, or synthetic materials for hood interior working area, acid wastes, and drains may be required depending on chemicals to be used. If other materials are required, add text.
**************************************************************************

2.1.1 Aluminum Alloy

ASTM B221M ASTM B221 equivalent in ultimate tensile, yield, and shear strengths to Alloy 6063-T5 or 6063-T6.

2.1.2 Carbon Steel

ASTM A1008/A1008M, cold rolled sheets, commercial bright finish.
2.1.3  **Stainless Steel**

No 4 satin finish including welds and fabricated surfaces. Provide Type 302, 304, or 316 alloy unless otherwise specified. Provide minimum thickness of 1.5 mm U.S. Standard 16 gage, except 1.8 mm thick 14 gage for working surface.

2.1.4  **Safety Glass**

2.1.5  **Casework Components**

Conform with Section 12 35 70 HEALTHCARE CASEWORK for base cabinets, counter tops, service fittings and finishes.

2.1.6  **High Efficiency Particulate Air (HEPA) Filter**

Meet requirements of **UL 586**.

2.1.7  **Fumehood Design**

Design, calculate face velocities, and test fume hoods in accordance with ACGIH-2097, Laboratory fume hoods, auxiliary systems, and associated equipment shall meet the requirements of **NFPA 70** and **NFPA 45**.

2.1.8  **Hood Static Pressure Loss**

**********************************************************************************************************************************************
NOTE: For determining the system total static pressure loss for sizing blowers, use the hood maximum static pressure loss when operating at 46 mpm 150 fpm face velocity; allow 50 mm 2 inch water gage loss for dirty HEPA filter and 25 mm one inch water gage additional loss for a downstream charcoal filter or a prefilter (or the filter manufacturer's recommended resistance at the rated cfm of exhaust air).
**********************************************************************************************************************************************

With the sash in full-open position the static pressure loss through the fumehood shall not exceed 13 mm 1/2 inch water gage when operating at 23 mpm 75 feet per minute (fpm), 22 mm 7/8 inch water gage at 30 mpm 100 fpm, 29 mm 1.125 inch water gage at 38 mpm 125 fpm. For hoods equipped with bypass, the static pressure loss and exhaust volume shall remain relatively constant (within 5 percent) regardless of sash position.

2.1.9  **Electrical Devices**

Prewired at the factory to a common, integral junction box to provide easy exterior connection and disconnection.

2.2  **UNITS**

2.2.1  Unit [_____], [_____]

2.2.1.1  **Base Cabinet Portion of Assembly**

[____].
2.2.1.2 Hood Interior

[____].

2.2.1.3 Sash

[____].

2.2.2 Fumehood Assembly, Constant Volume

**************************************************************************
NOTE: Provide packaged heater assembly for tempering cold outside air when auxiliary air type hoods are specified.
**************************************************************************

Constant volume, [auxiliary air] [bypass/airfoil] configuration, enclosed unit mounted on base cabinet; exterior dimensions maximum 1245 mm wide (across face) by 750 mm deep (front to back) by 2400 mm high; interior working area at least 900 mm wide by 600 mm deep by 1195 mm high.

2.2.2.1 Base Cabinet Portion of Assembly

Carbon steel, modified to have recessed apron to contain electrical convenience outlets.

2.2.2.2 Hood Interior, Including Working Surface

Type 304 stainless steel, with interior vertical joints and intersections of vertical surface with working surface having an approximate 20 mm 3/4 inch radius. Provide working surface with a raised rim around all sides to prevent spillage from running out face of hood.

2.2.2.3 Sash

Safety glass, 5.6 mm 7/32 inch minimum thickness, counterbalanced, vertical sliding type, Type 304 stainless steel frame.

2.2.2.4 Baffle

Adjustable, with moving parts resistant to corrosion, removable for cleaning.

2.2.2.5 Lighting Fixtures

[Explosion proof] [Vapor proof], fluorescent, with cool white lamps and switch, providing 800 lux 75 foot candles on working area. Locate switch for fixture on exterior of hood frame, or in recess of base cabinet. Provide sealed safety glass window barrier between interior working and fixture spaces, and access for tube replacement exterior to hood interior working area.

2.2.2.6 Service Fixtures

Provide remote controls for piped services and locate on hood exterior frame. Provide serrated supply ends with nozzles arranged close to sash,
precluding the need of reaching to interior back of hood to make connections to outlets. Base metal of fixtures shall be brass. Protect metal fixtures inside hood with chemical resistant coating of [clear plastic over polished chrome plate] [or] [______].

a. Cold water: Remote controlled valve, with vacuum breaker; hood wall mounted gooseneck faucet with serrated nozzle. Arrange faucet parallel to hood wall and over cup sink.

b. Gas, air and vacuum: Provide fixtures for each service, each fitting with remote controlled valve and supply end (inside hood) consisting of a serrated hose nozzle and escutcheon trim. Provide natural gas, air at 685 kPa 85 psig, and vacuum at 750 mm 30 inches of HG.

c. Acid waste: Recessed cup sink, 75 by 150 mm 3 by 6 inches or 75 by 225 mm 3 by 9 inches, fabricated of Type 316 stainless steel, 2 liter capacity. Furnish with acid waste p-trap and locate under water faucet, integral with countertop. Provide acid vent.

d. Electrical convenience outlets: Two duplex, grounded, three-wire, 125 volt, 60 Hz, single phase [and one 240 volt single phase], 20 ampere. Locate in recessed area of base cabinet or on side posts of hood. Provide stainless steel or chrome-plated cover plate. [Provide 15 ampere circuit breaker protection.]

2.2.2.7 Blower Switch

**************************************************************************
NOTE: Coordinate switch requirements with specifications for the blowers for fume hoods. Fans requiring switches not discussed in the paragraph cited above (e.g., greater than one horsepower or 208-volt) shall have a single pole switch with an indicator light.
**************************************************************************

[Single-pole, 115-volt] [Double-pole, 208-volt], 60-Hz, with pilot light. Locate switch in hood frame or in recess of base cabinet.

2.2.2.8 Duct Stub

**************************************************************************
NOTE: Verify that ductwork to hoods is discussed in the appropriate documents and that blowers for the hoods are located at exhaust end. Avoid positive pressure in ducts.
**************************************************************************

Collar size suitable for ductwork indicated. Finish of areas that may come in direct contact with fumes shall be same material and finish as hood interior.

2.2.3 Radio Isotope Fumehood With Vent

Enclosed, isotope-type hood mounted on base cabinet of [auxiliary air] [bypass/airfoil] configuration. Maximum exterior dimensions: 900 mm wide (across face) by 750 mm deep (front to back) by 2400 mm high (including base) 36 inches wide (across face) by 30 inches deep (front to back) by 96 inches high (including base). Minimum interior working area: 750 by 600
2.2.3.1 Base Cabinet Portion of Assembly

Carbon steel comparable to a sink cupboard section, modified to have recessed apron to contain electrical convenience outlets.

2.2.3.2 Hood Interior, Including Working Surface

Type 304 stainless steel, with interior vertical joints and intersections of vertical surface with working surface having an approximate 20 mm 3/4 inch radius. Working surface shall have a raised rim all around to prevent spillage from running out face of hood.

2.2.3.3 Sash

**************************************************************************
NOTE: Several materials are available for sash.
Clear safety glass is acceptable where minimum storage of materials allows use of lead bricks as a front barrier. Leaded safety glass provides excellent protection but scratches easily.
Bulletproof glass and various plastics have good resistance to certain levels of radiation.
**************************************************************************

[Safety glass] [Leaded (equivalent to [_____] mm inch lead protection) safety glass] [____], vertical sliding type, counterbalanced.

2.2.3.4 Lead Lining

Concealed, [_____] mm inch[es] thick. Provide with lapped seams, protecting areas adjacent to the three enclosed vertical sides of the hood [and the area below working surface of hood]. Lap sash area and intersections with adjacent surfaces at least 10 mm 3/8 inch.

2.2.3.5 Baffle

Adjustable with moving parts resistant to corrosion, removable for cleaning.

2.2.3.6 Lighting Fixture

Vapor proof, fluorescent, with cool white lamps and switch, providing 800 lux 75 foot candles on working area. Locate switch for fixture on exterior front of hood, or in recess of base cabinet.

2.2.3.7 Mirror

**************************************************************************
NOTE: Mirror is for view behind lead brick barrier. Clear safety glass is acceptable where minimum storage of materials allows use of lead bricks as a front barrier. Leaded safety glass provides excellent protection but scratches easily.
Bulletproof glass and various plastics have good resistance to certain levels of radiation. It may be desirable for any sash finish. Delete if special equipment must be attached to back interior.
**************************************************************************
Fully framed, fully adjustable, and suitably backed to prevent fume damage to silvering.

2.2.3.8 Service Fixtures

Locate remote controls for piped services on hood exterior and provide serrated supply ends with nozzles arranged close to sash, precluding the need of reaching to interior back of hood to make connections to outlets. Base metal of fixtures shall be brass. Protect metal fittings inside hood with chemical resistant coating of [clear plastic over polished chrome plate] [or] [______].

b. Natural gas and vacuum: Provide fixtures for each service, each fitting with remote controlled valve. Supply end (inside hood) consisting of a serrated hose nozzle and escutcheon trim. Provide natural gas and vacuum 750 mm HG 30 inches HG.

c. Acid waste: Recessed cup sink, 750 by 150 or 75 by 225 mm 3 by 6 or 3 by 9 inches, fabricated of Type 316 stainless steel, 2 liter capacity. Furnish with acid waste p-trap and locate under water faucet, integral with countertop. Provide acid vent.

d. Electrical convenience outlet: Two polarized duplex, grounded, three-wire, 125 volt, 60 Hz, single phase [and one 240 volt single phase], 20 ampere. Locate in recessed area of base cabinet or on side posts of hood. Provide stainless steel or chrome-plated cover plate. [Provide 15 ampere circuit breaker protection.]

2.2.3.9 Blower Switch

**************************************************************************
NOTE: Coordinate switch requirements with specifications for the blowers for fume hoods. Fans requiring switches not discussed in the paragraphs cited above (e.g., greater than one horsepower or 208-volt) shall have a single pole switch with an indicator light.
**************************************************************************

[Single-pole, 115-volt] [Double-pole, 208-volt], 60-Hz, with pilot light. Locate switch in hood frame or in recess of base cabinet.

2.2.3.10 Duct Stub

**************************************************************************
NOTE: Verify that ductwork to hoods is discussed in the appropriate documents and that blowers for the hoods are located at exhaust end. Avoid positive pressure in ducts.
**************************************************************************

Collar size suitable for ductwork indicated. Material of collar same as hood interior or metal coated with epoxy having corrosion resistance comparable to finish on fittings in hood.
2.2.3.11 Replaceable Filter

[HEPA, efficiency [_____] percent] [and] [prefilter] [activated charcoal filter]; with stainless steel filter housing. HEPA filter static pressure loss shall not exceed 249 pascals one inch water gage when clean and operated at the rated airflow capacity.

2.2.3.12 Warning System

Ensure detection and alarm for insufficient air velocities caused by failure of supply or exhaust system or by dirty filter. [Provide static pressure sensing switch in exhaust duct to shut off auxiliary air blower when failure occurs].

2.2.4 Biological Safety Cabinet

Suitable for biological work and protecting the user from airborne infectious agents and similar hazardous particulate matter by providing an inward flow of air while preventing hazardous discharge into ambient atmosphere. Hood must meet the requirements for CDC 21-1112, and have overall approximate dimensions of 1800 mm wide (across front) by 790 mm deep (front to back) by 2160 high 72 inches wide (across front) by 31 inches deep (front to back) by 85 inches high.

2.2.4.1 Glove Panel

Removable, with two pairs of combination gloves, hand sections of surgical rubber, detachable from neoprene sleeves. Provide with built-in tubes connectable to air supply and appropriate "O" rings and clamps. Glove assembly removable, providing access into hood for bare-hand work. Hood shall meet the requirements for general purpose fume hoods of ACGIH-2097, when operated with glove panel removed.

2.2.4.2 Light Fixture[s]

Fluorescent, prewired, with cool white bulbs, with switch hood-mounted exterior to working area. [Ultraviolet, germicidal, prewired, single tube, with separate switch hood-mounted exterior to working area].

2.2.4.3 Service Fittings

Locate remote controls for piped services on hood exterior; provide serrated supply end. Base metal of fixtures shall be brass. Protect metal fixtures inside hood with [chemical resistant coating of clear plastic over polished chrome plate] [or] [____].

a. Natural gas, air at 685 kPa 85 psig minimum, and vacuum at 750 mm 30 inches HG.

b. Cold water: Remote controlled valve with vacuum breaker; hood-wall mounted gooseneck faucet with serrated nozzle. Arrange faucet parallel to hood wall.

c. Sink and drain: 300 mm long by 150 mm wide by 50 mm deep 12 inches long by 6 inches wide by 2 inches deep; minimum of 1.25 mm 0.050 inch thick stainless steel, welded into surface of cabinet, corners coved to not less than 6 mm 1/4 inch radius. Provide with stainless steel strainer; drain plug; and 38 mm 1 1/2 inch borosilicate glass non-syphon P-Trap,
with compression joints and bottom clean-out fitting.

d. Electrical convenience outlets: Two polarized duplex, grounded, three-wire, 125 volt, 60-Hz., single phase [and one 240 volt single phase], 20 ampere. Locate on exterior of hood front or on hood side walls near hood front. Include stainless steel or chrome-plated cover plate. [Provide 15 ampere circuit breaker.]

2.2.4.4 Viewing Panel

Safety glass, 5.56 mm 7/32 inch minimum thickness.

2.2.4.5 Blower Switch

**************************************************************************

NOTE: Coordinate switch requirements with specifications for the blowers for fume hoods. Fans requiring switches not discussed in the paragraphs cited above (e.g., greater than 750 watt one horsepower or 208 volt) shall have a single pole switch with an indicator light.

**************************************************************************

[Single-pole, 115 volt] [Double-pole, 208 volt], 60 Hz, with pilot light. Include galvanized switch box and chrome-plated metal switch cover plate. Locate switch on hood exterior.

2.2.4.6 Duct Stub

**************************************************************************

NOTE: Verify that ductwork to hoods is discussed in the appropriate documents and that blowers for the hoods are located at exhaust end. Avoid positive pressure in ducts.

**************************************************************************

Collar size suitable for ductwork indicated. Finish of areas that may come in direct contact with fumes to be same as to hood interior.

2.2.4.7 Intake and Exhaust Filters

Replaceable HEPA filters having a minimum efficiency rating of 99.97 percent, including stainless steel housing. HEPA filter static pressure loss shall not exceed one inch water gage when clean and operated at the rated airflow capacity.

2.2.4.8 Warning System

Ensure detection and alarm for insufficient air velocities caused by failure of exhaust system or by dirty filters.

PART 3 EXECUTION

3.1 INSTALLATION

Install units at locations indicated. Conform to installation provisions of Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT [and utility installation provisions of] [Section 23 11 20 FACILITY GAS PIPING;] [Section 33 51 15 NATURAL-GAS / LIQUID PETROLEUM GAS DISTRIBUTION]
3.2 POSTED OPERATING INSTRUCTIONS

Provide in accordance with the requirements in Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS.

3.3 FIELD QUALITY CONTROL

3.3.1 Inspection

Examine each unit for visual defects, operation and conformance to specifications.

3.3.2 Tests

Test each unit to ensure that the equipment is operational and conforms to specification requirements. Field tests for fume hood operation and performance shall meet the requirements of ACGIH-2097.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing and installing manufactured playground equipment in children's outdoor play areas.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: Designer should require materials, products and innovative construction methods, and techniques which are environmentally sensitive, take advantage of recycling and conserve natural resources.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in
this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

FSC STD 01 001  (2015) Principles and Criteria for Forest Stewardship
1.2 DEFINITIONS

1.2.1 Age-Appropriate

A term that describes equipment scale to include platform height, fall height and maximum equipment height, that allows safe and successful use by children of a specific chronological age; mental and physical ability; and anthropometric measurement. Maximum equipment height and complexity will not exceed a child's ability in that age group.

1.2.2 Composite Structure

Also "Composite Play Structure; Linked Structure". Two or more play events attached, directly adjacent or functionally linked, to create one integral unit that provides more than one play activity.

1.2.3 Designated Play Surface

Any elevated surface for standing, walking, sitting, or climbing; or a flat surface a minimum 50 mm 2 inches wide having up to a maximum 30 degree angle from horizontal. In some play events the platform surface will be the same as the designated play surface. However, the terms should not be interchanged as they do not define the same point of measurement in accordance with ASTM F1487.

1.2.4 Guardrail

A device around an elevated surface that prevents inadvertent falls from the elevated surface.

1.2.5 Maximum Equipment Height

The highest point on the equipment (i.e., roof ridge, top of support pole).

1.2.6 Play Event

A piece of manufactured playground equipment that supports one or more play activities.

1.2.7 Protective Barrier

An enclosing device around an elevated surface that prevents both inadvertent and deliberate attempts to pass through the device.

1.2.8 Protective Surfacing

Material to be used within the use zone that meets the fall attenuation requirements of Section 32 18 16.13 PLAYGROUND PROTECTIVE SURFACING.
1.2.9 Suspended Hazard

Cable, wire, rope or similar devices suspended up to a maximum 2100 mm 7 feet high between play events; or installed up to a maximum 45 degree angle from the ground to the play event.

1.2.10 Tot

A child under 4 years of age in the pre-toddler and toddler age group.

1.2.11 Use Zone

The area beneath and immediately adjacent to a play structure or equipment that is designated for unrestricted circulation around equipment, and on whose surface it is predicted that a user would land when falling from or exiting the equipment.

1.3 SYSTEM DESCRIPTION

**************************************************************************

NOTE: Drawings will indicate the perimeters of the play event use zone defining fall height, platform height and maximum equipment height; spot elevations and details as required to install protective surfacing to meet child safety requirements.

Accessibility: Drawings will indicate spot elevations; dimensions; ramp slope and rise; transfer platform height and transfer space; transfer step and height; and maneuvering space as required to install play events to meet child accessibility requirements.

**************************************************************************

1.3.1 Child Safety

**************************************************************************

NOTE: Specify playground equipment in accordance with ASTM F1487.

Playground Areas Other Than Child Development Centers (CDC): Inactive UFC 3-210-04, Children's Outdoor Play Areas, provides guidance for the age groups defined in paragraph AGE GROUPS concerning design of outdoor play areas for children. Exercise caution when using this UFC as some of the code information may be outdated. Coordinate safety aspects with CPSC Pub No 325. UFC 3-210-04 describes the differences between unsupervised play areas such as family housing areas and supervised play areas such as child development centers. Site selection and analysis; user needs analysis; play area committee; age group criteria; play activities; play area relationships; child safety requirements; playground equipment; protective surfacing; and exterior plant materials are discussed in terms for designing a playground layout.

**************************************************************************
Child Development Centers (CDC): The CDC outdoor play area requirements are defined in the DA Standard Design Package for Child Development Centers and TI 800-01 Design Criteria, Appendix G, Child Development Centers. The CDC accommodate the age groups as defined in paragraph AGE GROUPS. UFC 4-740-14 discusses inspection frequency and preventative maintenance requirements to assist with selection of playground equipment.

Use Zones (Clear Area or Fall Zones): Play event use zone perimeters are measured in accordance with the requirements of paragraph CHILD SAFETY AND ACCESSIBILITY STANDARDS and paragraph FALL HEIGHT. Provide play events that meet the child safety performance requirements described in CPSC Pub No 325 and ASTM F1487. The requirements include the following: Head and neck entrapment; sharp points, edges, and protrusions; entanglement; pinch, crush, and shear points; suspended hazards; play event access and egress points; play event use zone perimeter; and design criteria. Since ASTM F1487 criteria is defined for the minimum user through the maximum user (2 through 12 years of age), the requirements for the infant or pre-toddler age group are not prescribed. This specification and Section 32 18 16.13 PLAYGROUND PROTECTIVE SURFACING establish the requirements for the infant and pre-toddler age groups.

1.3.2 Child Accessibility

NOTE: Facilities will be accessible in accordance with TI 800-01 and 36 CFR 1191, Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities. Ensure that elevated play events will reasonably accommodate a user with mobility impairments. One access and egress point for a furnished play event must meet accessibility. Some play events will need to be installed higher to accommodate the transfer system. The maximum equipment height should be reduced to lower the cost of the transfer system. Ensure all children are accommodated on the playground in a 'play for all' socialization skill development environment. When children with disabilities are allowed to choose play events, they are more eager to learn the skills necessary to participate.

The accessibility requirement in accordance with ASTM F1487 includes the following: When the play event use zone consists of a protective surfacing rated as inaccessible, provide at least one accessible route from the use zone perimeter to the play event. When there is more than one of the same play activity provided, only one must meet accessibility requirements (i.e., one swing seat or one spring rocking play event). When the access and egress points are not the same for a play event, provide an accessible route to both. The accessible route must access all accessible play events and elements. The protective surfacing performance requirements must be in accordance with Section 32 18 16.13 PLAYGROUND PROTECTIVE SURFACING.
1.3.3 Age Groups

Play areas are designed to provide challenging play activities by age group. Design playground equipment to be age appropriate for the age group designated to use it. There is no anthropometric or fall attenuation significance to the discrepancy for the school-age age group between paragraph CHILD DEVELOPMENT CENTERS (CDC) and paragraph PLAYGROUND AREAS OTHER THAN CDC as described below. The Army age groups are defined as follows:

1.3.3.1 Child Development Centers (CDC)

The age groups accommodated by the CDC program range from 6 weeks through 8 years of age defined as the following: infant age group (6 weeks through 12 months); pre-toddler age group (12 through 24 months); toddler age group (2 through 3 years of age); pre-school age group (3 through 5 years of age); and school-age age group (5 through 8 years of age).

1.3.3.2 Playground Areas Other Than CDC

The age groups accommodated at these areas range from less than 12 months through 12 years of age defined as the following: infant age group (less than 12 months); pre-toddler age group (12 through 24 months); composite toddler/pre-school age group (2 through 5 years of age); school-age age group (5 through 9 years of age); and pre-teen age group (9 through 12 years of age). A multi-age playground consists of the following age groups: infant, pre-toddler, and composite toddler/pre-school age groups.

1.3.4 Equipment Identification

Identify playground equipment with attached and durable label stating the age-group that the equipment is designed to accommodate. Provide permanent WARNING labels and manufacturer's identification labels, ASTM F1487. Submit a list to include part numbers of furnished play event and equipment materials and components.

1.4 SUBMITTALS

*****************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the
District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

[1.5 CERTIFICATIONS

**************************************************************************

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective.
Sustainably Harvested Wood is a product which comes from a third-party Forestry Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration (e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.

Designer must verify suitability, availability

SECTION 11 68 13 Page 12
within the region, cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications - if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certifications other than FSC; for all other projects allow the entire list of third party certifications.

1.5.1 Certified Sustainably Harvested Wood

Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SFI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.

1.6 QUALITY ASSURANCE

1.6.1 Manufacturer Qualification

Play events and equipment similar to those furnished must have been installed in a minimum 10 sites and been in successful service for a minimum 5 year calendar period. The manufacturer must provide a Certificate of Insurance AA rated for a minimum one million dollars covering both product and general liability. Submit name of the owner or user; service or preventive maintenance provider; date of the installation; point of contact and telephone number; and address for 10 sites.

1.6.2 Installer Qualification

The installer must be certified by the manufacturer for training and experience installing the play events and equipment. Submit the installer's company name and address, and training and experience certification.

1.6.3 Manufacturer's Representative

The manufacturer's certified playground safety inspector or the manufacturer's designated certified playground safety representative must supervise the installation and adjustment of the play events and equipment to verify the installation meets the requirements of the manufacturer, this specification, and paragraph CHILD SAFETY AND ACCESSIBILITY STANDARDS. Submit the individual's name, company name and address, and playground safety training certificate.

1.6.4 Technical Representative

1.6.4.1 Child Development Centers (CDC)

The technical representative for outdoor play areas at CDC is the installation Child Development Services (CDS) Coordinator. Base the design of the CDC outdoor play area on the developmental play program for the age groups accommodated at the CDC. The play area is designed to support the
CDC program and to provide a stage set for creative play. Developmental activities are selected which promote the intellectual, social, emotional and physical growth of the children. The developmental play program is developed by the MACOM CDS Director, installation CDS Coordinator and CDC Director. They are responsible for the developmental play program and the selection of play events to meet that program.

1.6.4.2 Playground Areas Other Than CDC

The technical representative for outdoor play areas on sites other than CDCs must be the Director of Public Works or designated representative. Base the design of these outdoor play areas on the play program and the age groups to be accommodated as determined by the play area committee.

1.6.5 Prohibited Equipment

Equipment that does not meet the Army's developmental play program requirements and are prohibited on outdoor play areas include the following: chain balance beams; rotating equipment, such as merry-go-rounds, log rolls, whirls and may poles; fulcrum seesaws (teeter totters); spring rocking equipment intended for standing; animal figure swings; rope swings; multiple occupancy swings; swinging exercise and trapeze bars; swinging platforms; tire climbers; swinging dual exercise rings; roller slides; trampolines; swinging gates or doors; and new or used vehicle tires. Also play houses or enclosures made of horizontal posts or bars with space between them; wood components treated with creosote, pentachlorophenol, and tributyl tin oxide; and wood components coated with a finish containing pesticide.

1.6.6 Shop Drawings

When the use zone perimeter and play event configuration conflict with the requirements and paragraph CHILD SAFETY AND ACCESSIBILITY STANDARDS, submit scale drawings defining the revised use zone perimeters and play event layout and corrective measures to include the following: Adjustment to the play event with the use zone perimeter; use zone perimeter overlaps; hard surface area and pathway widths; structures; exterior plant material and planters; walls and fences; and bare or painted metal platform and slide bed orientation to the direct sun.

1.7 DELIVERY, STORAGE, AND HANDLING

Submit a delivery schedule and manufacturer's name at least 10 calendar days prior to the first day of delivery. Inspect playground equipment, upon arrival at the job site, for meeting age-appropriate requirements for the age-group that the equipment is designated to accommodate, and specified quality in accordance with paragraphs MATERIALS and CONFIGURATION. Equipment must be delivered, handled, and stored in accordance with the manufacturer's recommendations. Remove from the job site prohibited or unacceptable equipment. The storage area must be as designated. Store the materials in a dry, covered area until installed.

1.8 WARRANTY

Furnished play events and equipment must have a minimum 1 year calendar period warranty.
1.9 MAINTENANCE

Submit [two] [_____] bound copies of the manufacturer's operation and maintenance manuals containing the Maintenance Instructions and describing the recommended preventive maintenance, inspection frequency and techniques, periodic adjustments, lubricants, and cleaning requirements. Furnish play event and equipment spare parts provided by the manufacturer.

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials which are the standard products of a manufacturer regularly engaged in the manufacture of play event products. Submit results of assembled play event structural integrity tests; vertical load tests; and the maximum number of users that can be on the play event. Prior to the delivery of materials, submit certificates of compliance attesting that materials meet the specified requirements. Certified copies of the material certificates must include composition and tests to which the material has been subjected.

2.1.1 Metal

Metal components must have factory-drilled holes and be corrosion resistant. The components must be free of excess weld and spatter. Metallic materials must conform to Section 08 31 00 ACCESS DOORS AND PANELS. Components with extra holes not filled by hardware or covered by components must be rejected.

2.1.1.1 Steel

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Designer must verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Research shows the product is available among US national manufacturers above the minimum recycled content stated.
**************************************************************************

Steel components must comply with ASTM A135/A135M, ASTM A500/A500M, or ASTM A513/A513M. Minimum tensile strength must be 310 Mpa 45,000 psi. Minimum yield point must be 225 Mpa 33,000 psi. Provide steel components with pre-consumer recycled content of 40 percent minimum. [Provide data identifying percentage of recycled content for steel components.] Provide stainless steel components with recycled content of 60 percent minimum. Provide data identifying percentage of recycled content for stainless steel components.
2.1.1.2 Aluminum

********************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Designer must verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Research shows the product is available among US national manufacturers above the minimum recycled content stated.

********************************************************************************

Extruded aluminum components must be type 6061-T6, 6062-T6, or 6063-T6, and must conform to ASTM B221M, ASTM B221. Minimum tensile strength of extruded aluminum components must be 270 Mpa 39,000 psi, and the minimum yield must be 250 Mpa 36,500 psi. Cast aluminum alloy must conform to ASTM B179, ASTM B26/B26M, and ASTM B108/B108M. Provide aluminum components with recycled content of 40 percent minimum. Provide data identifying percentage of recycled content for aluminum components.

2.1.1.3 Chain

Chain must be a minimum size 4/0 and must be corrosion resistant zinc plated. Polyvinyl chloride coating must be as specified.

2.1.1.4 Rope Cable

Rope cable must be composed of strands of steel cable with a polypropylene or Dacron synthetic covering that is UV stabilized. Cable ends must be capped to prevent fraying.

2.1.1.5 Hardware

Hardware must be corrosion resistant and consist of the following: aluminum, stainless steel, brass, zinc plated steel, zinc-chromate plated steel, or galvanized steel, ASTM A153/A153M. When secured, the hardware must require a tool to prevent unauthorized loosening and removal.

2.1.1.6 Rails, Loops, and Hand bars

Rails, loops, and hand bars must consist of corrosion resistant aluminum, powder-coated steel or galvanized steel. Polyvinyl chloride coating, if provided, must be as specified.

2.1.1.7 Anchors

Anchors must be in accordance with manufacturer's recommendations.
2.1.2 Wood

----------------------------------------------------------------------------------------------------------------------------------------
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Designer must verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.
----------------------------------------------------------------------------------------------------------------------------------------

Wood components must be exterior premium grade and free of knots. Wood components must have factory-drilled holes. Components with extra holes not filled by hardware or covered by other components will be rejected. [Provide certified sustainably harvested wood components.]

2.1.2.1 Wood Treatment

Treat wood components that are not naturally rot and insect resistant, by using standard treatment procedures. Any wood placed up to a maximum 150 mm 6 inches above, or any portion below the top elevation of the protective surfacing, must be treated after fabrication. Creosote, pentachlorophenol, and tributyl tin oxide are prohibited according to ASTM F1487. Submit wood treatment chemical content, toxicity level, and life-cycle durability. Submit certifications of wood treatment materials and processes.

2.1.2.2 Plywood

Provide plywood that is a minimum 19 mm 3/4 inch thick exterior premium grade, and adhered with a waterproof glue that will not separate under conditions of prolonged freezing temperatures, extreme heat, or excessive moisture. Face layers must be smooth, fine and tightly grained, free of knots, patches, or surface irregularities. Exposed surface must consist of a material with high paint adhesion and retention characteristics. Edges must be sanded smooth and eased to a minimum 3 mm 1/8 inch radius. Fill voids at edges with epoxy prior to sanding.

2.1.3 Plastic Components

2.1.3.1 Panels

Plastic panels must be molded of ultraviolet (UV) and color stabilized polyethylene or nylon with a minimum 5 mm 3/16 inch thickness, ASTM F1487. Edges must be a minimum 5 mm 3/16 inch radius.

2.1.3.2 Window

Plastic windows must be flat or molded into a bubble shape, consisting of clear polycarbonate plastic a minimum 5 mm 3/16 inch thick before forming in accordance with ASTM D1248. Material must be shatterproof and resistant to crazing, cracking, or fogging.

2.1.4 Plastic Components

Construct or manufacture material with a maximum 6 mm 1/4 inch deflection or creep in any member, ASTM D6112. Submit results of individual component and assembled unit structural integrity test; creep tolerance; deflection tolerance; and vertical load test results.
2.1.4.1 High Density Polyethylene

**************************************************************************
NOTE: Ensure manufacturers supply quality plastic products made from post-consumer recycled high
density polyethylene that is equal to the performance of metal or wood by providing tight performance standards. High density polyethylene can be manufactured using post-consumer recycled plastic resins from products such as milk containers. Recommend products using high density polyethylene.
**************************************************************************

Mold components of ultraviolet (UV) and color stabilized polyethylene consisting of a minimum 75 percent plastic profile of high-density polyethylene, low-density polyethylene, and polypropylene raw material. The material must be non-toxic, have no discernible contaminates such as paper, foil, or wood, and contain a maximum 3 percent air voids. The material must be free of splinters, chips, peels, buckling, and cracks and be resistant to deformation from solar heat gain. Material must have factory-drilled holes. Components with extra holes not filled by hardware or covered by other components will be rejected. The material must not be painted.

2.1.4.2 Panel

Panels must be a minimum 6 mm 1/4 inch thick; exposed edges must be smoothed, rounded, and free of burrs and points; and the material must be shatterproof and resistant to fading, cracking, or fogging.

2.1.4.3 Structural Component

Recycled plastic materials will not be used as load bearing structural members: framing, beams, columns or posts.

2.1.4.4 Recycled Plastic Molded As Deck Material

**************************************************************************
NOTE: Recycled plastic molded as lumber and wood-polymer lumber are susceptible to both creep and deflection; therefore, it cannot be used for a load bearing structural members (framing, beams, columns or posts) of playground equipment. To overcome creep and deflection, the deck product is increased in volume of material and dimension.
**************************************************************************

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Designer must verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at
http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Research shows the product is available among US national manufacturers above the minimum recycled content stated.

**************************************************************************

For deck or platform construction, the span of the structural support members must be a maximum 300 mm (12 inches) on center and recycled plastic decking must connect to a minimum three joists. Material used for decking must have a non-slip texture surface. The assembly must deflect a maximum 1/360 of the span of the frame when exposed to a uniform live load of 585 N/m (40 lbs/ft). The product must meet the structural integrity test requirements, ASTM F1487 and ASTM D6112. Recycled plastic deck material must contain a minimum 95 percent of recycled content. Provide data identifying percentage of recycled content for plastic molded as deck material.

2.1.4.5 Recycled Plastic Molded as Rails

**************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Designer must verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Research shows the product is available among US national manufacturers above the minimum recycled content stated.

**************************************************************************

Recycled plastic rails must contain a minimum 95 percent of recycled content. Provide data identifying percentage of recycled content for plastic molded as rails.

2.1.4.6 Recycled Plastic Molded as Roof Planks or Pickets

**************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Designer must verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Research shows the product is available among US national manufacturers above the minimum recycled content stated.

**************************************************************************
content are also acceptable when meeting all requirements of this specification.

Research shows the product is available among US national manufacturers above the minimum recycled content stated.

**************************************************************************

Recycled plastic must contain a minimum 95 percent of recycled content. Provide data identifying percentage of recycled content for plastic molded as roof planks or pickets.

2.1.5 Coatings

**************************************************************************

NOTE: Regional climatic conditions must be considered when selecting playground equipment. Regions that are extremely hot have considerations for equipment selection that are different from regions with freezing conditions. Contact burn injury or contact skin freezing are serious safety concerns. The coatings of the play equipment become extremely important to avoiding these conditions.

**************************************************************************

2.1.5.1 Galvanized

Metal components must be hot-dipped in zinc after fabrication according to ASTM A123/A123M. Remove tailings and sharp protrusions formed as a result of the hot-dip process; edges must be burnished.

2.1.5.2 Polyester Powder

Powder-coated surfaces must receive electrostatic zinc coating prior to painting. Powder coating must be electrostatically applied and must be oven cured. Polyester powder must be in accordance with the following: ASTM D3359 for adhesion; ASTM D173/D173M for flexibility; ASTM D3363 for hardness; ASTM D2794 for impact; ASTM D2454 for overbake resistance; ASTM B117 for salt spray resistance; and ASTM D822 for weatherability.

2.1.5.3 Polyvinyl Chloride (PVC)

Prime PVC coating with a clear acrylic thermosetting solution. The primed parts must be preheated prior to dipping. The liquid polyvinyl chloride must be UV stabilized and mold-resistant. The coated parts must be cured. The coating must be a minimum 2 mm 0.08 inch thick within a plus or minus 0.5 mm 0.020 inch tolerance. The coating must have an 85 durometer hardness, ASTM D3363. The finish must be slip-resistant.

2.1.5.4 Concrete

Provide concrete conforming to [____].

2.1.5.5 Precast Concrete

Provide precast concrete material conforming to Section 03 45 00 PRECAST ARCHITECTURAL CONCRETE.
2.1.5.6 Cast-In Place Concrete

Provide cast-in-place concrete material in conformance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.1.6 Wood Sealants

Exposed wood surfaces must have factory applied prime coat with a minimum [2] [_____] spray coats of two-component polyurethane or approved preservative that meets paragraph WOOD TREATMENT.

2.1.6.1 Paint

Paint must be factory applied to a minimum of 2 coats. Paint must comply with Section 09 90 00 PAINTS AND COATINGS. Paint must be weather resistant, and resist cracking, peeling and fading.

2.1.6.2 Sealants

Seal all applied surfaces from air; sealants containing pesticide are prohibited.

2.1.7 Color

Color must be provided [as indicated] [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [____]. Submit [2] [_____] color charts displaying the colors and finishes.

2.2 EQUIPMENT

**************************************************************************

NOTE: Ensure the play events selected are age-appropriate for the age group designated to use them.

Playground Areas Other Than Child Development Centers (CDC): CPSC Pub No 325 and ASTM F1487 both describe the requirements for children from the toddler through pre-teen age group (2 through 12 years of age). Consult Inactive UFC 3-210-04, Children’s Outdoor Play Areas, and ASTM F2373 for guidance concerning children in the infant through pre-toddler age groups (less than 12 months through 2 years of age). Exercise caution when using the UFC as some of the code information may be outdated. Coordinate safety aspects with CPSC Pub No 325.

Child Development Centers (CDC): The CDC program accommodates children from 6 weeks through 8 years of age. The CDC outdoor play area requirements for these age groups are defined in the DA Standard Design Package for Child Development Centers and TI 800-01 Design Criteria, Appendix G, Child Development Centers. UFC 4-740-14 Child Development Centers, discusses inspection frequency and preventative maintenance requirements may assist with the selection of playground equipment.

**************************************************************************
Submit manufacturer's descriptive data; catalog cuts; references; and the latest edition of ASTM F1487, ASTM F2373 and CPSC Pub No 325. Manufacturer's specifications, handling and storage requirements, installation procedures, and safety data sheets to include the following: bare or painted metal platform and slide bed orientation from the direct sun; warnings; and child safety performance standards.

2.2.1 Configuration

Provide play event configuration, platform height, fall height, and maximum equipment height [as indicated] [____]. When the configuration varies from the play event shown, submit scale drawings defining the revised configuration to include the following: equipment layout with the use zone perimeter; designated play surface spot elevations; maximum equipment height spot elevations; platform spot elevations; protective barriers; guardrails; bare or painted metal platform and slide bed orientation; and play events in relationship to the playground layout.

2.2.2 Substitution

Substitutions will not be allowed and play events will not be selected without written approval from the technical representative. Evaluate manufacturer substitutions which increase the play event platform height or maximum equipment height. The increased height requires additional protective surfacing in accordance with paragraph FALL HEIGHT. Submit technical representative's written approval.

2.2.3 Platform Height

Platform height is used to define the age group for age appropriate play events and composite structures. To be age appropriate, the platform height must meet the finished elevations of the age groups in the following paragraphs. For some play events, platform height and paragraph FALL HEIGHT are the same.

2.2.3.1 Pre-Toddler Age Group

Platforms designed for children 12 through 24 months of age must have a finished elevation a maximum 900 mm 36 inches above the finished elevation of the protective surfacing.

2.2.3.2 Toddler Age Group

Platforms designed for children 2 through 3 years of age must have a finished elevation a maximum 1200 mm 48 inches above the finished elevation of the protective surfacing.

2.2.3.3 Pre-School Age Group

Platforms designed for children 3 through 5 years of age must have a finished elevation a maximum 1200 mm 48 inches above the finished elevation of the protective surfacing.

2.2.3.4 School-Age Age Group

Platforms designed for children 5 through 8 years of age must have a finished elevation a maximum 1800 mm 72 inches above the finished elevation of the protective surfacing.
2.2.3.5 Pre-Teen Age Group

Platforms designed for children 8 through 12 years of age must have a finished elevation a maximum 1800 mm 72 inches above the finished elevation of the protective surfacing.

2.2.4 Protective Barrier and Guardrail

Provide protective barriers and guardrails in accordance with paragraph CHILD SAFETY AND ACCESSIBILITY STANDARDS. This specification establishes the protective barrier and guardrail requirements for the infant and pre-toddler age group.

2.2.4.1 Protective Barrier

The protective barrier for pre-toddler, toddler, and pre-school age groups must be provided on elevated surfaces a minimum 760 mm 30 inches above the protective surfacing. The protective barrier for school-age and pre-teen age groups must be provided on elevated surfaces a minimum 1200 mm 48 inches above the protective surfacing. The protective barrier must completely surround the elevated surface except for the access or egress route. As infants are not to be placed on an elevated surface, the protective barrier for the infant age group must be the same as the crawl wall defined in paragraph MEASURING FALL HEIGHT.

2.2.4.2 Guardrail

The guardrail for pre-toddler, toddler, and pre-school age groups must be provided on elevated surfaces a minimum 510 mm 20 inches above the protective surfacing. The guardrail for school-age and pre-teen age groups must be provided on elevated surfaces a minimum 760 mm 30 inches above the protective surfacing. The guardrail must completely surround the elevated surface except for the access or egress route. As infants are not to be placed on an elevated surface, the guardrail for the infant age group must be the same as the crawl wall defined in paragraph MEASURING FALL HEIGHT.

2.2.5 Sand Table

******************************************************************************
NOTE: Ensure sand tables are located where play activity will not restrict or conflict with circulation.
******************************************************************************

The sand table with a cover must be as shown. The cover must not be attached to the table. The sand sieve size must be provided as defined in Section 32 18 16.13 PLAYGROUND PROTECTIVE SURFACING.

2.2.6 Multiple-Axis (Rotating) Swing

The swivel mechanism must contain a durable long life bearing to reduce friction and wear. A tire manufactured specifically for a multiple-axis swing must be provided and must weigh a maximum 15.8 kg 35 lb. The tire must be composed of rotationally molded, low density elastomer, and internally reinforced with a steel ring. The tire must have no openings for insects or water. The multiple-axis swing must not be confused with the multiple occupancy swing as they are not the same.
2.2.7 Single-Axis (To-Fro) Swing

2.2.7.1 General Requirements

The swing seat must be molded of high quality rubber or polyurethane with an encapsulated steel reinforcement. The swing seat must be designed to accommodate one user.

2.2.7.2 Full Bucket Swing Seat

A full bucket swing seat is designed to accommodate children up to a maximum 4 years of age; the seat is used by a child with adult assistance. The swing seat must be constructed of rubber with a tempered steel insert molded inside, must be double-sided, must be enclosed by rubber both front and back, and must include a 360 degree waist enclosure and leg enclosures. Leg enclosures must be sized to avoid head or neck entrapment. Finish must be smooth and edges must be rounded. These swing seats must not be mixed with other swing seats within a bay.

2.2.8 Spring Rocking Equipment

Spring mechanisms must conform to the requirements for pinch, crush, and shear points for a maximum 54 kg 120 lb weight limit in accordance with ASTM F1487. Seats must be designed to accommodate only the intended number of users.

2.2.9 Roofs

Roofs must contain no designated play surface.

2.2.10 Sliding Poles

Sliding poles must be a maximum 48 mm 1.9 inch diameter and a continuous surface with no protruding welds or joints along the sliding area.

2.2.11 Plastic Slide

**************************************************************************
NOTE: Plastic is the preferred slide material, and must be installed to face in any direction but north.
**************************************************************************

The slide must be molded of UV stabilized polyethylene or nylon with minimum of 5 mm 3/16 inch wall thickness. The edge must be a minimum 5 mm 3/16 inch radius, ASTM D1248, Type II, Class A, Grade G4.

2.2.12 Play House or Enclosures

Provide the play house with a shelf at the window. The play house and enclosures will be designed to provide other than direct outside visibility from a minimum 1.5 m 5 feet to all inside corners.

PART 3 EXECUTION

3.1 SITE PREPARATION

3.1.1 Finished Grade and Underground Utilities

Submit finished grade, underground utilities, storm-drainage system and
irrigation system status; and location of underground utilities and facilities. Verify that finished grades are as indicated; the smooth grading has been completed in accordance with Section 31 00 00 EARTHWORK; installation of the underground utilities through the area has been completed in accordance with Section 31 00 00 EARTHWORK; installation of the storm-drainage system through the area has been completed in accordance with Section 33 40 00 STORMWATER UTILITIES; and the installation of underground sprinklers through the area has been completed in accordance with Section 32 84 24 UNDERGROUND SPRINKLER SYSTEMS. The location of underground utilities and facilities in the area of the operation must be verified. Damage to underground utilities and facilities must be repaired at the Contractor’s expense.

3.1.2 Layout

3.1.2.1 General

The layout of the entire outdoor play area must be staked before excavation begins to include the following: all play event configuration access and egress points; use zone perimeters; hard surface areas and pathway widths; exterior plant material and planters; walls and fences; and structures. Provide sufficient space between all adjacent play events and individual play events for play activities and circulation. Moving and rotating play events must be located away from circulation to prevent collisions.

3.1.2.2 Use Zone

The use zone is associated with the following terms; "Clear Area," and "Fall Zone". The use zone must be free of hard surfaces, objects or obstacles that a child could run into or fall on top of and be injured. The use zone must consist of protective surfacing in accordance with the requirements of Section 32 18 16.13 PLAYGROUND PROTECTIVE SURFACING. Use zone perimeters must not overlap hard surfaces. The use zone perimeter must meet or exceed the requirements of paragraph CHILD SAFETY AND ACCESSIBILITY STANDARDS. Use zone perimeters must not overlap except for certain play events as defined in ASTM F1487.

3.1.3 Orientation

Bare or painted metal platforms and slide beds must be oriented from the direct sun; or shaded to reduce contact burn risk. Play events that require orientation to adjacent play events or to meet visibility requirements must be properly oriented.

3.1.4 Obstructions Below Ground

When obstructions below ground affect the work, submit shop drawings showing proposed adjustments for approval.

3.2 INSTALLATION

Play events must be installed according to the manufacturer's recommendations and as shown to meet the requirements of paragraph CHILD SAFETY AND ACCESSIBILITY STANDARDS.

3.2.1 Play Event Modification

Site modifications of play events affect the coverage provided in paragraph WARRANTY; therefore, play events and equipment must not be modified without
the written approval of the manufacturer. Submit manufacturer's written approval.

3.2.2 Wood Finishes

Field applied or touch up of wood finishes must meet the same specifications as finishes applied at the factory. Submit wood finish chemical content and toxicity level.

3.2.3 Plastic Play Events

Plastic and recycled plastic components must be connected by stainless steel hardware. The hardware must be countersunk. Recycled plastic molded as lumber or wood-polymer lumber must be installed in accordance with the manufacturer's recommendations.

3.2.4 Footings

The top elevation of play event footings will be installed at the subbase of the protective surfacing.

3.2.5 Multiple-Axis (Rotating) Swing

The multiple-axis (rotating) swing must be located away from other play events and circulation. It must not be attached to a composite structure.

3.2.6 Single-Axis (To-Fro) Swing

The single-axis (to-fro) swing must be located on the perimeter of the outdoor play area. It must not be attached to a composite structure.

3.2.7 Slide

The required exit region clear area must be provided in accordance with ASTM F1487.

3.2.8 Chain or Rope Ladder, Climber or Net Climber

A chain or rope ladder; climber; net climber; and similar components must be installed in the vertical position. Angled or arch positions are not accepted.

3.2.9 Composite Structure

The composite structure use zone perimeter must be composed of the use zone perimeters of the play events that, when joined together, comprise the composite structure.

3.2.10 Fall Height

**************************************************************************
NOTE: To assist manufacturers in providing the required depth of protective surfacing, the fall height and the maximum equipment height dimensions and spot elevations for each play event must be shown on the drawings.
**************************************************************************
3.2.10.1 General

The fall height is defined as the vertical distance between the finished elevation of the designated play surface and the finished elevation of the protective surfacing beneath it. For some play events the fall height and paragraph PLATFORM HEIGHT are the same. For some play events the fall height and maximum equipment height are the same. When the furnished play event fall height varies from the play event shown, submit scale drawings defining the revised depth or type of protective surfacing to meet or exceed the requirements of Section 32 18 16.13 PLAYGROUND PROTECTIVE SURFACING must be provided.

3.2.10.2 Measuring Fall Height

<table>
<thead>
<tr>
<th>EQUIPMENT</th>
<th>MEASURING FALL HEIGHT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Composite Structure</td>
<td>For a platform surrounded by protective barriers, measure from the platform finished elevation.</td>
</tr>
<tr>
<td></td>
<td>For a platform surrounded by guardrails, measure from the guardrail top elevation.</td>
</tr>
<tr>
<td>Infant Crawl Area</td>
<td>A maximum 600 mm 24 inch height, measured from the crawl wall or barrier finished elevation.</td>
</tr>
<tr>
<td>Playhouse, Nonclimbable</td>
<td>Measure from the designated play surface finished elevation.</td>
</tr>
<tr>
<td>Spring Rocking Equipment</td>
<td>Measure from the seat top elevation.</td>
</tr>
<tr>
<td>Stationary Equipment, Climbable</td>
<td>Measure from the maximum equipment height finished elevation.</td>
</tr>
<tr>
<td>Stationary Equipment, Nonclimbable</td>
<td>Measure from the designated play surface finished elevation.</td>
</tr>
<tr>
<td>Swing</td>
<td>Measure from the bottom of the pivot point.</td>
</tr>
</tbody>
</table>

3.2.11 Signage

For playground areas other than CDC, durable permanent signage must be provided to identify the age group the equipment is designed to accommodate. Signage must be in accordance with Section 10 14 00.10 EXTERIOR SIGNAGE.

3.3 RESTORATION AND CLEAN UP

When the operation has been completed, clean up and protect the site. Existing areas that have been damaged from the operation must be restored to original condition at the Contractor's expense.

3.3.1 Clean Up

The site and play events must be cleaned of all materials associated with
the operation. Play events and surfaces must be cleaned of dirt, stains, filings, and other blemishes occurring from shipment and installation. Cleaning methods and agents must be as recommended by the manufacturer. Required labeling must be undamaged and visible in accordance with paragraph EQUIPMENT IDENTIFICATION.

3.3.2 Protection

The area must be protected as required or directed by providing barricades and signage. Signage must be in accordance with Section 10 14 00.10 EXTERIOR SIGNAGE.

3.3.3 Disposal of Materials

Excess and waste material must be removed and disposed off Government property.

3.4 CHILD SAFETY AND ACCESSIBILITY EVALUATION

a. When the protective surfacing is installed the play events and protective surfacing must be thoroughly inspected and measured to verify the playground meets manufacturer's recommendations, paragraph CHILD SAFETY AND ACCESSIBILITY STANDARDS, and paragraph FALL HEIGHT.

b. The play events must be age appropriate for the age group using them in accordance with paragraph PLATFORM HEIGHT. Determine 1) secure anchoring; 2) all hardware and connectors are tight; 3) all hardware and connectors require tools to loosen; 4) all hooks are closed; 5) head and neck entrapment; 6) sharp points, edges, and protrusions; 7) entanglement; 8) pinch, crush, and shear points; 9) suspended hazards; 10) all component holes are filled; and 11) recycled plastic components used as load bearing structural members.

c. Use zone distances must be measured to determine the area is free of hard surfaces, objects or obstacles. Determine exceptions to use zone overlaps occur in accordance with paragraph USE ZONE. Play event fall height must be measured and compared to critical height value for thickness of installed protective surfacing. The slide exit region must have the required clear zone. Play events and surfaces must be properly oriented. Chain, rope, net climbers or similar components must be installed in a vertical position. Swing seat clearances must be measured while occupied by a maximum user for the age group using the equipment. Warning labels and manufacturer identification labels must be visible in accordance with paragraph EQUIPMENT IDENTIFICATION.

d. Play events that do not comply must be reinstalled. Fasteners, anchors, hardware and labels that do not comply must be replaced. Ensure positive drainage for the area and the lowest elevation of protective surfacing subgrade has been provided. A written report describing the results of the evaluation must be provided.

e. Submit records of measurements and findings by the certified playground safety inspector. Submit verification stating that the installed play events and equipment meet manufacturer's recommendations and paragraph CHILD SAFETY AND ACCESSIBILITY STANDARDS.

3.5 RE-INSTALLATION

When re-installation is required, accomplish the following: Re-install the
product as specified. Provide new replacement materials supplied by the manufacturer. Material acquisition of replacement parts is the responsibility of the Contractor. Damage caused by the failed installation must be repaired at the Contractor's expense.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for general requirements for medical and dental equipment and similar related specialties specified in Sections 11 71 00 STERILIZERS AND ASSOCIATED EQUIPMENT; 11 72 13 MEDICAL EQUIPMENT, MISCELLANEOUS; 11 74 00 DENTAL EQUIPMENT; 13 17 43 HYDROTHERAPY EQUIPMENT; and 13 21 48 PREFABRICATED AUDIOMETRIC ROOMS.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Specific product requirements are included in the technical Sections listed herein that make reference to this Section.

NOTE: On the drawings show:

1. Location of equipment
2. Installation layout, details, and space requirements.
**************************************************************************
PART 1   GENERAL
1.1 RELATED REQUIREMENTS

This Section covers general requirements for medical and dental equipment specified in Sections [11 71 00 STERILIZERS AND ASSOCIATED EQUIPMENT;] [11 72 13 MEDICAL EQUIPMENT, MISCELLANEOUS;] [11 74 00 DENTAL EQUIPMENT;] [and] [13 17 43 HYDROTHERAPY EQUIPMENT;] [13 21 48 PREFABRICATED AUDIOMETRIC ROOMS;] [.

[ See Section 01 20 00 PRICE AND PAYMENT PROCEDURES for Government's procurement policy for all Category A medical and dental equipment.]

1.2 REFERENCES
**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************
The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION (NEMA)
NEMA MG 1     (2021) Motors and Generators

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

SHEET METAL AND AIR CONDITIONING CONTRACTORS' NATIONAL ASSOCIATION (SMACNA)
1.3 LOGISTICAL CLASSIFICATION

**************************************************************************
NOTE: The logistical classification listed in this guide specification follows MIL-STD-1691, "Military Standard Construction and Material for Military Medical and Dental Equipment."
**************************************************************************

Methods of procurement are defined as follows:

a. Category A: Contractor furnished and Contractor installed.

b. Category B: Government furnished and Contractor installed.

Equipment designated Logistical Category ["B"] ["C"] will be Government provided. For equipment installed by the Government, the Contractor is required to make preparations for installation, as indicated. (See Section 01 11 00 SUMMARY OF WORK[, and drawings,] for list of Government provided equipment.)

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Submittals are specified in Sections [11 71 00 STERILIZERS AND ASSOCIATED EQUIPMENT;] [11 72 13 MEDICAL EQUIPMENT, MISCELLANEOUS;] [11 74 00 DENTAL EQUIPMENT;] [and] [13 17 43 HYDROTHERAPY EQUIPMENT;] [13 21 48 PREFABRICATED AUDIOMETRIC ROOMS;] [.]

1.5 QUALITY ASSURANCE

1.5.1 Materials and Equipment

Provide standard products of a manufacturer regularly engaged in the manufacture of products which are of a similar material, design, and workmanship and are offered for sale on the commercial market through advertisements, manufacturer's catalogs, or sales brochures, and are in commercial or industrial use under similar circumstances and of similar size for 2 years prior to the bid opening.

1.5.2 Alternative Service Record

Products having less than a 2-year field service record will be acceptable if a certified record of the manufacturer's factory or laboratory tests demonstrating performance compliance is provided to the Contracting Officer.

1.5.3 Service Support

Provide equipment items supported by service organizations located near the equipment installation, and able to service the equipment on a regular basis and respond immediately on emergency calls throughout the warranty period.

1.5.4 Manufacturer's Nameplate

Provide each piece of equipment with the manufacturer's name, address, model number, and serial number utility ranges or capacities, including voltage and amperage rating if electrically powered on the nameplate, securely affixed in a conspicuous place. The name of only the distributing
agent on the plate is not acceptable.

1.5.5 Design Parameters

Provide equipment meeting each of the following parameters specified in the cited Sections under RELATED REQUIREMENTS.

a. Size of equipment
b. Function of equipment
c. Standard and listed accessories
d. Equipment controls and performance of equipment
e. Construction of equipment.

[1.5.6 Contractor's Equipment Planner]

Engage a full-time Equipment Planner. The Equipment Planner will be responsible to evaluate equipment specifications and requirements and to provide guidance on the proper installation and testing of equipment. The Equipment Planner must be present at the medical equipment Pre-Installation/Preparatory Conference with contractors, vendors, and installers and is responsible to provide written sign-off of medical equipment installations. The Equipment Planner must have a minimum of 5-years of experience with medical equipment planning and management.

[1.5.7 Biomedical Equipment Technician]

[Engage a full-time Biomedical Equipment Technician.][ The Government will provide a Biomedical Equipment Technician.] The Biomedical Equipment Technician must be present at the medical equipment Pre-Installation/Preparatory Conference with contractors, vendors, and installers and is responsible to provide written sign-off of medical equipment installations after thorough inspection.[ The Biomedical Equipment Technician must have a minimum of 5-years of experience in Biomedical Equipment management.]

[1.5.8 Buy American Act]

Provide "domestic end products" under the Buy America Act (i.e. end-product equipment is manufactured in the United States and, more than 50 percent of the cost of all the components of the equipment are manufactured in the United States).

1.6 STANDARDS COMPLIANCE

Submit the following, as applicable, as evidence of proof of conformance for materials or equipment specified to conform to the standards of organizations such as the American National Standards Institute (ANSI), American Society for Testing and Materials (ASTM), National Electrical Manufacturers Association (NEMA), ASME INTERNATIONAL (ASME), American Gas Association (AGA), Air Conditioning and Refrigeration Institute (ARI), and Underwriters Laboratories (UL).

a. If an organization uses a label or listing to indicate compliance with a particular standard, the label or listing will be acceptable evidence, unless otherwise specified in the individual sections.
b. In lieu of the label or listing, submit a certificate from an independent testing organization which is competent to perform acceptable testing and is approved by the Contracting Officer. The certificate includes statement that the item has been tested in accordance with the specified organization's test methods and that the item conforms to the specified organization's standard.

c. For materials and equipment whose compliance with organizational standards or specifications is not regulated by an organization using its own listing or label as proof of compliance, submit a certificate of compliance from the manufacturer for approval, identifying the manufacturer, product, and referenced standard and certification stating that the product conforms to the requirements of the project specification and the referenced standards listed.

1.7 STANDARDS DEVIATIONS

Submit for approval a record of deviations from the following standards established for the specified product, before ordering equipment.

a. Size of equipment
b. Function of equipment
c. Standard and listed accessories
d. Equipment controls and performance of equipment
e. Construction of equipment.

1.8 SUBSTITUTIONS

Submit before ordering equipment.

a. Size: Layouts are based on the unit specified. If the size of a substituted unit differs from the item specified and is accepted, submit to the Contracting Officer for approval a revised layout, design calculations, drawings, and specifications for changes in the building to accommodate the substituted equipment.

b. Function: Additional functions and accessories of substituted equipment will not be considered as an improvement over the unit specified. If such functions are standard equipment of a substituted item but the function is not desired by the Government, then it is the Government's discretion to either have the Contractor completely remove that function from the unit, if the unit is otherwise acceptable, or allow the Contractor to retain that function on the unit under the following conditions:

(1) The additional function is fully operational and its performance complies with the terms and conditions of this specification, including product quality and warranty;

(2) The additional function does not eliminate or modify those functions required by the Government on the specified unit. Refinement in control or accessibility of the substituted unit will be considered an improvement over the specified unit.
c. Appearance: Only the following aesthetic qualities of design will be considered an improvement:

(1) Uniformity of finish
(2) Variety of finish selections
(3) Compatibility with substituted item.

1.9 PACKAGING, STORAGE AND PROTECTION

1.9.1 Packaging

Package each piece of equipment to ensure protection from damage during shipment and delivery. Legibly indicate on the exterior of each container or crate, the shipping address and a brief description of its contents. Outside of the container, fasten a waterproof envelope containing a packing list and complete instructions for uncrating and setting the equipment in place.

1.9.2 Storage and Protection

During storage and until completion and acceptance by the Contracting Officer, protect materials and equipment from damage. Before acceptance by the Contracting Officer, remove all protective coverings, thoroughly clean the inner and outer surfaces, and ensure that the equipment is free from defects.

1.10 WARRANTY

Equipment manufacturer agrees to repair or replace equipment or components that fail in materials or workmanship within specified warranty period.

a. Warranty Period: [One] [_____] year[s] from date of final acceptance of the work.

b. Other Warranty Periods: As specified in Section[s] [11 71 00 STERILIZERS AND ASSOCIATED EQUIPMENT;] [11 72 13 MEDICAL EQUIPMENT, MISCELLANEOUS;] [11 74 00 DENTAL EQUIPMENT;] [and] [13 17 43 HYDROTHERAPY EQUIPMENT;] [13 21 48 PREFABRICATED AUDIOMETRIC ROOMS;] [.]

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials of the same quality used for the intended purpose in commercial practice, unless otherwise specified or indicated on drawings. Provide new equipment and materials incorporated in the work.

2.2 EQUIPMENT

2.2.1 Safety

Provide medical and dental equipment meeting the requirements of OSHA 21 CFR 701, NFPA 101, and UL 60601-1. In lieu of UL approval, consideration will be given to certified test reports from an approved laboratory meeting UL 60601-1 requirements.
2.2.2 Electrical Motors

**************************************************************************
NOTE: Conform to UL 674 if motors and generators are used in hazardous locations.
**************************************************************************

Provide motors of sufficient size for the duty to be performed and not exceeding the nameplate rating when driven equipment is operating at specified capacity under the most severe conditions. Provide fractional horsepower motors conforming to [NEMA MG 1] [UL 674].

2.3 COMPONENTS

2.3.1 Plumbing

Provide components, such as piping, valves, and controls, conforming to the requirements specified in Section [22 00 00 PLUMBING GENERAL PURPOSE.] [22 00 70 PLUMBING, HEALTHCARE FACILITIES.]

2.3.2 Electrical

Provide components of equipment and systems, such as motors, starters, and controls as specified for complete operable systems. Extended voltage-range motors are prohibited. Provide interconnecting wiring for components of packaged equipment as an integral part of the equipment. Provide interconnecting power wiring and conduit for field-erected equipment and control wiring and conduit as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide motor control equipment forming part of the motor control centers or switchgear assemblies, and the necessary conduit and wiring connecting such assemblies, centers, or other power sources to the equipment as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

PART 3 EXECUTION

3.1 EXAMINATION

Before laying out the equipment, inspect the site of work. Report to the Contracting Officer damage to the building, including piping and wiring systems related to and affecting the installation of the equipment.

3.2 INSTALLATION

Set and connect the equipment plumb and level in accordance with the manufacturer's written instructions. Attach items and accessories as indicated and as required. Make connections between equipment and other work in a neat manner, and install the equipment so as not to damage other work.

3.2.1 Mounting

Provide equipment supports as required to suit conditions in accordance with equipment manufacturer's written instructions.[ Mount the equipment according to SMACNA 1981 seismic restraints guidelines. See also requirements specified in Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT.]
3.2.2 Utility Connections

Provide final utility connections and service to equipment, including waste, under Section[s] [23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS[.][;]] [22 00 00 PLUMBING, GENERAL PURPOSE[.][;]] [22 00 70 PLUMBING, HEALTHCARE FACILITIES[.][;]] [22 60 70 GAS AND VACUUM SYSTEMS FOR HEALTHCARE FACILITIES[.][;]] [and] [26 20 00 INTERIOR DISTRIBUTION SYSTEM.]

3.2.3 Dissimilar Metals Protection

Make provisions to prevent electrolysis where dissimilar metal parts are welded or otherwise fastened together.

3.3 FIELD INSPECTIONS

Notify the Contracting Officer [and Contractor's Equipment Planner] [and] [the Contractor's Biomedical Equipment Technician,] [and] [the Government's Biomedical Equipment Technician,] 5 days before the scheduled inspection. Perform acceptance inspection of the finished work with the Contracting Officer to examine each item to ensure that the equipment is operational.

3.4 CLEANING AND ADJUSTING

Clean and adjust equipment. Lubricate moving parts, as required, and test the equipment in accordance with the manufacturer's written instructions. Clean the medical equipment, both inside and outside. Ensure that equipment is free from construction related defects.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for warming cabinets, sterilizers, and associated equipment.

This Section refers to Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for general requirements; always include Section 11 70 00 when this Section is used.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable items(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Schedule equipment on the drawings and list required salient features on the schedule. These features include size of sterilizer, capacity of stills and storage tanks, manual, automatic or automatic microprocessor controls, sterilizer material handling accessories, and any optional exceptions to standards specified. Also include operating power requirements for each unit.

Identify equipment on the schedule and in the
drawings by Joint Schedule Numbers (JSN) from MIL-STD-1691, Construction and Material Schedule for Military Medical and Dental Facilities.

On the project drawings show exhaust ventilation (to keep gas away from person opening sterilizer door).

**************************************************************************

1.1 RELATED REQUIREMENTS

The requirements of Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT apply to this Section.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B16.18 (2021) Cast Copper Alloy Solder Joint Pressure Fittings

ASME B16.22 (2021) Wrought Copper and Copper Alloy Solder Joint Pressure Fittings

ASME BPVC SEC VIII D1 (2019) BPVC Section VIII-Rules for Construction of Pressure Vessels Division 1

ASTM INTERNATIONAL (ASTM)

SECTION 11 71 00  Page 5

ASTM A240/A240M (2023a) Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications

ASTM B127 (2019) Standard Specification for Nickel-Copper Alloy (UNS N04400) Plate,
Sheet, and Strip

INTERNATIONAL CODE COUNCIL (ICC)

ICC IPC (2024) International Plumbing Code

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up
to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SECTION 11 71 00  Page 16
Submit Data Package 3, including training requirements, for each item of equipment listed above in accordance with requirements of Section 01 78 23 OPERATION AND MAINTENANCE DATA. [In addition, provide hard copies consisting of two Operator's Manuals and two Service Manuals.]

1.4 WARRANTY

[Provide warranties as specified in this Section.] Refer to Article WARRANTY in Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for [additional] requirements.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Carbon Steel

2.1.2 Nickel

ASTM B39. Nickel-copper alloy or stainless steel or white metal.

2.1.3 Nickel and Nickel-Alloy Clad Steel

ASTM A265. Nickel or nickel-copper alloy and steel for pressure vessels, mill-rolled under heat and pressure until integrally bonded over entire interface.

2.1.4 Nickel-Copper Alloy (Monel Metal)

2.1.5 Stainless Steel

ASTM A167, Type 301 or 316L; Class 304L for welded construction and Class 302 or 304 for construction formed without welding. Exposed surfaces of stainless steel to have satin finish.

2.1.6 Stainless Steel Bars and Rods

ASTM B166.

2.1.7 Stainless Steel for Pressure Vessels

ASTM A240/A240M.

2.1.8 Stainless Steel Clad

ASTM A264 for pressure vessels.

2.1.9 Tin

ASTM B339.
2.1.10 Titanium

For construction of products used in contact with distilled water, ASTM B348/B348M, Grade 2.

2.2 PIPING AND TUBING

Seamless, annealed, and ground smooth. Welded tubing to be thoroughly heat treated and properly quenched to eliminate carbide precipitation, drawn true to size and roundness. Provide piping and tubing conforming to the following:

2.2.1 Steam Supply and Return Condensate Lines

Copper pipe must conform to ASTM B42; brass pipe must conform to ASTM B43; brass tube must conform to ASTM B135/B135M, Alloy 230. Include strainer, shut-off valve and pressure gage suitable for steam pressure up to 552 kPa 80 psig. In return line include steam trap, check valve, and hand shut-off valves.

2.2.2 Gaseous Sterilant Lines

Brass pipe must conform to ASTM B43, Alloy 230; stainless steel tube must conform to ASTM A269/A269M, ASTM A312/A312M, or ASTM B167 as applicable.

2.2.3 Water and Waste Lines

Copper tube must conform to ASTM B88M, ASTM B88 Type K, hard-drawn or annealed for bending; brass tube must conform to ASTM B135/B135M, Alloy 230 or C23000.

2.2.4 Pipe Fittings

Wrought copper or wrought bronze, brazing or solder joint type in accordance with ASME B16.18 and ASME B16.22. Use ASTM B32, Alloy Sb5 tin-antimony solder to make joints for copper tubing.

2.2.5 Pressure Vessels

Design, construction, materials, and testing of each pressure vessel, including doors, must comply with applicable provisions of ASME BPVC SEC VIII D1. Submit a signed copy of ASME Form U-1 or U-1A, as shown in ASME BPVC SEC VIII D1 Appendix W, with each sterilizer, as applicable.

2.2.6 Welding Materials

Welding Materials must comply with ASME BPVC SEC II-C. Welding equipment, electrodes, welding wire, and fluxes must be capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

2.2.7 Connections to Equipment

**************************************************************************
NOTE: Specifications, covering supply to units specified herein, must provide cutoff of supply in vicinity of equipment so that unit may be removed

SECTION 11 71 00 Page 18
for servicing. Make provisions for allowing steam lines to be blown down, prior to equipment connection, to prevent preservations and cleansers in piping and boiler from being blown into chamber.

**************************************************************************

Prewire and prepipe each unit of equipment complete with trim and fittings. Equipment includes fittings to prevent backflow of polluted water or waste into water supply system or equipment in accordance with ICC IPC. Provide reduced pressure or atmospheric type backflow preventer.

2.3 ELECTRICAL WORK

Provide electric motor-driven equipment complete with motors, motor starters, and controls. Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Electrical characteristics are as specified herein or as indicated. Provide motor starters complete with thermal overload protection and other components necessary for the motor control specified. Provide each motor of sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Provide manual or automatic control, protective or signal devices required for the operation specified, and any control wiring required for controls and devices specified.

**************************************************************************

NOTE: Select project-specific equipment items from the list below and delete equipment items not used. Additional equipment items may be added as required to suit project-specific conditions.

**************************************************************************

2.4 EQUIPMENT

[2.4.1 Item S0105, Sterilizer, STM, GV, 1DO, CAB, 16x16x26 Chamber

Provide gravity steam sterilizer with freestanding enclosed cabinet, single power vertical sliding door, and a minimum chamber size of 406 mm by 406 mm by 660 mm 16 inches by 16 inches by 26 inches. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, utilizing facility steam, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 121 degrees C to 135 degrees C to 250 degrees F to 275 degrees F.

Approximate Size: 686 mm by 965 mm by 1905 mm 27 inches wide by 38 inches deep by 75 inches high.

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm1 inch NPT, 276 - 552 kPa40 - 80 PSI.

Drain: 50 mm2 inch ODT drain terminal.

][2.4.2 Item S0107, Sterilizer, Elec, GV, 1DO, CAB, Small Chamber

Provide gravity electric sterilizer with freestanding enclosed cabinet, single power vertical sliding door, and a minimum chamber size of 406 mm
406 mm16 inches by 16 inches 660 mm26 inches. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, integral steam generator, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 121 to 135 degrees C250 to 275 degrees F.

Provide vacuum steam sterilizer with chamber size of 406 mm16 inches by 406 mm16 inches by 660 mm26 inches, single power vertical door, and freestanding cabinet. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, utilizing facility steam, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 121 to 135 degrees C250 to 275 degrees F. [See drawings for door swing direction.]

Approximate Size: 686 mm27 inches wide by 965 mm38 inches deep by 1905 mm75 inches high.

Electrical Characteristics: 110V 50/60 Hz.

Drain: 51 mm2 inch ODT drain terminal.

][2.4.3 Item S0125, Sterilizer, Stm, VAC, 1DO, CAB, 16x16x26 Chamber

Provide vacuum steam sterilizer with chamber size of 406 mm16 inches by 406 mm16 inches by 660 mm26 inches, single power vertical door, and freestanding cabinet. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, utilizing facility steam, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 121 to 135 degrees C250 to 275 degrees F. [See drawings for door swing direction.]

Approximate Size: 1016 mm40 inches wide by 1499 mm59 inches deep by 1905 mm75 inches high.

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm1 inch NPT, 207 - 552 kPa30 - 80 PSI.

Drain: 51 mm2 inch ODT drain terminal.

][2.4.4 Item S0127, Sterilizer, Elec, VAC, 1DO, CAB, 16x16x26 Chamber

Provide vacuum electric sterilizer with chamber size of 406 mm16 inches by 406 mm16 inches by 660 mm26 inches, single power vertical door, and freestanding cabinet. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, integral steam generator, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 121 to 135 degrees C250 to 275 degrees F. [See drawings for door swing direction.]

Approximate Size: 711 mm28 inches wide by 965 mm38 inches deep by 1905 mm75 inches high.

Electrical Characteristics: 110V 50/60 Hz.

Drain: 51 mm2 inch ODT drain terminal.
2.4.5 Item S0137, Sterilizer, Stm, VAC, 2DO, RCSD, 1WLL, 16x16x26 Chamber

Provide vacuum steam sterilizer with chamber size of 406 mm16 inches by 406 mm16 inches by 660 mm26 inches and double power vertical sliding doors, utilizing a remote electric steam generator. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, integrated steam generator (boiler), temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 121 to 135 degrees C250 to 275 degrees F.

Approximate Size: 711 mm28 inches wide by 991 mm39 inches deep by 1905 mm75 inches high.

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm1 inch NPT, 207 - 552 kPa30 - 80 PSI.

Drain: 51 mm2 inch ODT drain terminal.

2.4.6 Item S0145, Sterilizer, Stm, LAB, 1DO, CAB, 16x16x26 Chamber

Provide steam sterilizer with chamber size of 406 mm16 inches by 406 mm16 inches by 660 mm26 inches, single power vertical door, and freestanding cabinet. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, utilizing facility steam, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 110 to 135 degrees C230 to 275 degrees F. Recessed through one wall.

Approximate Size: 1016 mm40 inches wide by 1499 mm59 inches deep by 1905 mm75 inches high.

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm1 inch NPT, 207 - 552 kPa30 - 80 PSI.

Drain: 51 mm2 inch ODT drain terminal.

2.4.7 Item S0190, Rack, 2SH, 16x16x26 Chamber

Provide rack with two removable shelves for use with sterilizer having minimum chamber size of 406 mm16 inches by 406 mm16 inches by 660 mm26 inches. Construct rack of Type 304 stainless steel.

2.4.8 Item S0210, Sterilizer, Stm, GV, 1DO, RCSD, 1WLL, 20x20x38 Chamber

Provide gravity steam sterilizer with single power vertical sliding door, and a minimum chamber size of 508 mm20 inches by 508 mm20 inches by 965 mm38 inches. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, utilizing facility steam, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure
Provide gravity steam sterilizer with chamber size of 508 mm by 508 mm (20 inches by 20 inches) and double power vertical sliding doors, utilizing facility steam. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Control unit by microcomputer technology, with vacuum pump, utilizing facility steam, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 100 to 121 degrees C (212 to 250 degrees F). Recessed through one wall.

Approximate Size: 864 mm (34 inches) wide by 1245 mm (49 inches) deep by 1905 mm (75 inches) high.

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm (1 inch) NPT, 207 - 552 kPa (30 - 80 PSI).

Drain: 51 mm (2 inch) ODT drain terminal.

Provide vacuum steam sterilizer with chamber size of 508 mm by 508 mm (20 inches by 20 inches) and 20x20x38 Chamber

Approximate Size: 762 mm (30 inches) wide by 1219 mm (48 inches) deep by 1905 mm (75 inches) high.

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm (1 inch) NPT, 207 - 552 kPa (30 - 80 PSI).

Drain: 51 mm (2 inch) ODT drain terminal.
mm20 inches by 965 mm38 inches, and double power vertical sliding doors, utilizing facility steam. Construct unit of heavy-duty stainless steel Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, utilizing facility steam, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 100 to 121 degrees C 212 to 250 degrees F. Recessed through one wall.

Approximate Size: 762 mm30 inches wide by 1270 mm50 inches deep by 1930 mm 76 inches high.

Electrical Characteristics:  110V 50/60 Hz.

Steam Supply:  25 mm1 inch NPT, 207 – 552 kPa30 – 80 PSI.

Drain:  51 mm2 inch ODT drain terminal.

[2.4.12 Item S0235, Sterilizer, Stm, VAC, 2DO, RCSD 1WLL, Medium Chamber

Provide vacuum steam sterilizer with chamber size of 508 mm20 inches by 508 mm20 inches by 965 mm38 inches, and double power vertical sliding doors, utilizing facility steam. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, utilizing facility steam, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 100 to 121 degrees C 212 to 250 degrees F. Recessed through two walls.

Approximate Size: 762 mm30 inches wide by 1219 mm48 inches deep by 1905 mm 75 inches high.

Electrical Characteristics:  110V 50/60 Hz.

Steam Supply:  25 mm1 inch NPT, 207 – 552 kPa30 – 80 PSI.

Drain:  51 mm2 inch ODT drain terminal.

[2.4.13 Item S0237, Sterilizer, ELEC, VAC,2DO,RCSD 1WLL, 20x20x38 Cham

Provide vacuum electric sterilizer with chamber size of 508 mm20 inches by 508 mm20 inches by 965 mm38 inches, and double power vertical sliding doors. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, integral steam generator, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 100 to 121 degrees C 212 to 250 degrees F. Recessed through one wall.

Approximate Size: 864 mm34 inches wide by 1168 mm46 inches deep by 1930 mm 76 inches high.

Electrical Characteristics:  110V 50/60 Hz.
Steam Supply: 25 mm 1 inch NPT, 207 - 552 kPa 30 - 80 PSI.

Drain: 51 mm 2 inch ODT drain terminal.

[2.4.14] Item S0290, Rack, 2SH, 20x20x38 CHMBR

Provide rack with two removable shelves for use with sterilizer having minimum chamber size of 508 mm 20 inches by 508 mm 20 inches by 965 mm 38 inches. Construct rack of stainless steel.

[2.4.15] Item S0295, Loading Car & Transfer Carriage, 20x20x38 Chamber

Provide loading car and transfer carriage unit that is compatible with sterilizer having minimum chamber size of 508 mm 20 inches by 508 mm 20 inches by 965 mm 38 inches.

Construct loading car frame of Type 304 stainless steel. Provide loading car with one fixed and two adjustable shelves to allow maximum flexibility of load sizes, and with full length removable side rails.

Approximate Size: 1092 to 1219 mm 43 to 48 inches long by 508 mm 20 inches wide by 1092 mm 43 inches high.

Shelf Load Capacity: 45.4 kg 100 lbs.

Construct transfer carriage of stainless steel, height-adjustable, with four swivel casters. Provide transfer carriage with locking mechanism to secure loading car, and a hand operated latching mechanism to secure the carriage to the sterilizer.

Approximate Size: 508 mm 20 inches wide by 381 mm 15 inches high.

[2.4.16] Item S0332, Sterilizer, Stm, VAC,1DO,RCSD 1WLL,24x36x36 Chamber

Provide vacuum steam sterilizer with chamber size of 610 mm 23 inches by 914 mm 36 inches by 914 mm 36 inches, and single automatic hinged door, utilizing facility steam. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, utilizing remote electric steam generator, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 100 to 121 degrees C 212 to 250 degrees F.

[See drawings for door swing direction.] Recessed through one wall.

Approximate Size: 1499 mm 59 inches wide by 1854 mm 73 inches deep by 1930 mm 76 inches high.

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm 1 inch NPT, 207 - 552 kPa 30 - 80 PSI.

Drain: 51 mm 2 inch ODT drain terminal.

[2.4.17] Item S0395, Loading Car & Transfer Carriage, Large Chamber

Provide loading car and transfer carriage unit that is compatible with sterilizer having minimum chamber size of 610 mm 24 inches by 914 mm 36 inches.

SECTION 11 71 00 Page 24
Construct loading car frame of Type 304 stainless steel. Provide loading car with one fixed and two adjustable shelves to allow maximum flexibility of load sizes, and with full length removable side rails.

Approximate Size: 1168 mm 46 inches long by 559 mm 22 inches wide by 965 mm 38 inches high.

Shelf Load Capacity: 45.4 kg 100 lbs.

Construct transfer carriage of stainless steel, height-adjustable, with four swivel casters. Provide transfer carriage with locking mechanism to secure loading car, and with a hand operated latching mechanism to secure the carriage to the sterilizer.

Approximate Size: 559 mm 22 inches wide by 457 mm 18 inches high.

[2.4.18  Item S0405, Sterilizer, STM, GV, 1DO, CAB, 24x36x48 Chamber

Provide gravity steam sterilizer with freestanding enclosed cabinet, single automatic hinged door, and a minimum chamber size of 610 mm 24 inches by 914 mm 36 inches by 1219 mm 48 inches, used for steam sterilization of hospital instruments and supplies. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 100 to 121 degrees C 250 to 275 degrees F. [See drawings for door swing direction.]

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm 1 inch NPT, 275 - 552 kPa 40 - 80 PSI.

Drain: 51 mm 2 inch ODT drain terminal.

[2.4.19  Item S0432, Sterilizer, Stm,VAC,1DO,RCSD 1WLL,24x36x48 Chamber

Provide gravity steam sterilizer with chamber size of 610 mm 24 inches by 914 mm 36 inches by 1219 mm 48 inches, single automatic hinged door, recessed; used for steam sterilization of hospital instruments and supplies. Provide unit that accommodates 12 standard sterilization trays. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, integrated steam generator (boiler), temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 100 to 121 degrees C 250 to 275 degrees F. [See drawings for door swing direction.]

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm 1 inch NPT, 207 - 552 kPa 30 - 80 PSI.

Drain: 2 inch ODT drain terminal.
Provide large load capacity vacuum steam sterilizer with chamber size of 610 mm by 914 mm by 1219 mm, and automatic hinged double doors; used for steam sterilization of hospital instruments and supplies. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, integrated steam generator (boiler), temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 110 to 135 degrees C to 230 to 275 degrees F. Recessed through two walls. [See drawings for door swing direction.]

Electrical Characteristics: 110V 50/60 Hz.

Steam Supply: 25 mm 1 inch NPT, 30 - 80 PSI.

Drain: 51 mm 2 inch ODT drain terminal.

Provide steam sterilizer unit with single door, recessed mounted and with minimum chamber size of 610 mm by 914 mm by 1219 mm. Provide unit that accommodates 12 standard sterilization trays. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, with vacuum pump, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 104 to 135 degrees C to 219 to 275 degrees F. [See drawings for door swing direction.] Recessed through one wall.

Electrical Characteristics: 120V, 50/60 Hz.

Steam Supply: 25 mm 1 inch NPT, 207 - 552 kPa 30 - 80 PSI.

Drain: 51 mm 2 inch ODT drain terminal.

Provide loading car and transfer carriage unit that is compatible with sterilizer having minimum chamber size of 610 mm by 914 mm by 1219 mm. Construct loading car frame of Type 304 stainless steel. Provide loading car with one fixed and two adjustable shelves to allow maximum flexibility of load sizes, and with full length removable side rails.

Approximate Size: 1219 mm long by 610 mm wide by 826 mm high.

Shelf Load Capacity: 54.4 kg 120 lbs.

Car Load Capacity: 163.3 kg 360 lbs.

Construct transfer carriage of stainless steel, height-adjustable, with two swivel and two fixed casters. Provide transfer carriage with locking
mechanism to secure loading car, and with a hand operated latching mechanism to secure the carriage to the sterilizer.

Approximate Size: 610 mm 24 inches wide by 508 mm 20 inches high.

2.4.23 Item S0505, Sterilizer, STM, GV, 1DO, CAB, 24x36x60 Chamber

Provide steam sterilizer unit with freestanding cabinet, a minimum chamber size of 610 mm 24 inches by 914 mm 36 inches by 1524 mm 60 inches, and one single horizontal sliding door; utilize facility steam. Construct of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) Standards.

Provide unit controlled by microcomputer technology, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 104 to 135 degrees C 219 to 275 degrees F.

Electrical Characteristics: 120V, 50/60 Hz.

Steam Supply: 25 mm 1 inch NPT, 207 - 552 kPa 30 - 80 PSI.

Drain: 51 mm 2 inch ODT drain terminal.

2.4.24 Item S0530, Sterilizer, Stm,VAC,1DO,RCSD 1WLL,24x36x60 Chamber

Provide vacuum steam sterilizer with chamber size of 610 mm 24 inches by 914 mm 36 inches by 1524 mm 60 inches. Provide recessed unit with one single horizontal sliding door; utilize facility steam. Provide unit that accommodates 20 standard sterilization trays. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) Standards.

Provide unit controlled by microcomputer technology, vacuum pump, temperature control and display panel showing temperature and pressure, thermal printer. Provide unit with exposure temperature range of 219 to 275 degrees F. Recessed through one wall.

Electrical Characteristics: 120V, 50/60 Hz.

Steam Supply: 25 mm 1 inch NPT, 207 - 552 kPa 30 - 80 PSI.

Drain: 51 mm 2 inch ODT drain terminal.

2.4.25 Item S0535, Sterilizer,Stm,VAC,2DO,RCSD 1WLL, 24x36x60 Chamber

Provide vacuum steam sterilizer with chamber size of 610 mm 24 inches by 914 mm 36 inches by 1524 mm 60 inches. Provide recessed unit with two horizontal sliding doors; utilize facility steam. Provide unit that accommodates 20 standard sterilization trays. Construct unit of heavy-duty stainless steel, Type 316L, meeting Underwriters Laboratory (UL) standards.

Provide unit controlled by microcomputer technology, vacuum pump, temperature control and display panel showing temperature and pressure, and thermal printer. Provide unit with exposure temperature range of 104 to 135 degrees C 219 to 275 degrees F. Recessed through two walls.

Electrical Characteristics: 120V, 50/60 Hz.

Steam Supply: 25 mm 1 inch NPT, 207 - 552 kPa 30 - 80 PSI.
Drain: 51 mm 2 inch ODT drain terminal.

[2.4.26 Item S0595, Loading Car & Transfer Carriage, 24x36x60 Chamber

Provide loading car and transfer carriage unit for use with sterilizer having a minimum chamber size of 610 mm 24 inches by 914 mm 36 inches by 1524 mm 60 inches.

Construct loading car frame of stainless steel. Provide loading car with one fixed and two adjustable shelves to allow maximum flexibility of load sizes, and with full length removable side rails.

Approximate Size: 1524 mm 60 inches long by 610 mm 24 inches wide by 813 mm 32 inches high.

Shelf Load Capacity: 68 kg 150 lbs.

Car Load Capacity: 204 kg 450 lbs.

Construct transfer carriage of stainless steel, height-adjustable, with two swivel and two fixed casters. Provide transfer carriage with locking mechanism to secure loading car, and a hand operated latching mechanism to secure the carriage to the sterilizer.

Approximate Size: 1524 mm 60 inches long by 610 mm 24 inches wide by 508 mm 20 inches high.

[2.4.27 Item S0905 Washer, Multi-Chamber (5), Automated

Provide automated multi-chamber washer with sloped horizontal fixed surfaces and equipped with five preprogrammed cycles (pre-wash, sonic wash, rinse, drying) controlled by computer based system with a remote printer to record cycle information. Construct chambers of 1.59 mm 16-gauge stainless steel. Provide unit with automatic basket/rack accessory index tables on the load and unload end of unit. Unit must meet Underwriters Laboratory (UL) 61010-1.

Approximate Size: 4064 mm 160 inches long by 1067 mm 42 inches wide by 2134 mm 84 inches high.

Minimum Ceiling Height Requirement: 2210 mm 87 inches.

Electrical Characteristics: 200 V, Three-phase, 60 Hz.

[2.4.28 Item S0910, Washer, Multi-Chamber (4), Automated

Provide automated multi-chamber washer with sloped horizontal fixed surfaces and equipped with four preprogrammed cycles (pre-wash, wash, rinse, drying) controlled by computer based system with a remote printer to record cycle information. Construct chambers of 1.59 mm 16-gauge stainless steel. Provide unit with automatic basket/rack accessory index tables on the load and unload end of unit. Unit must meet Underwriters Laboratory (UL) standards.

Approximate Size: 4064 mm 160 inches long by 1067 mm 42 inches wide by 2134 mm 84 inches high.

Minimum Ceiling Height Requirement: 2210 mm 87 inches.
Electrical Characteristics: 200 V, Three-phase, 60 Hz.

2.4.29 **Item S0915**, Washer/Disinfector, STM, 2DO, RCSD1WLL, 23X19X24 Chamber

Provide steam washer disinfector with a chamber size of 584 mm by 483 mm by 610 mm and controlled by microprocessor, with printer to record cycle phase performance. Provide unit with steam and electric heating with cycles pre-programmed to pre-wash, clean, rinse, disinfect and dry. Provide unit with two powered vertical sliding doors with tempered glass windows; utilize facility steam. Construct unit of stainless steel. Recessed through one wall. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics: 208 V, 3-phase, 60 Hz.

Steam Supply: 207 - 621 kPa to 90 PSIG.

Drain: 51 mm 2 inch diameter.

Hot Water Temperature Range: 43 to 90 degrees C to 110 degrees F.

Approximate Size: 1067 mm wide by 813 mm long by 2032 mm high.

2.4.30 **Item S0920**, Washer/Disinfector, STM, 1DO, CAB, 26X24X24 Chamber

Provide steam washer disinfector with a chamber size of 584 mm by 610 mm by 610 mm and controlled by microprocessor with printer to record cycle phase performance. Provide unit with steam and electric heating with cycles pre-programmed to pre-wash, clean, rinse, disinfect and dry. Provide unit with one vertical sliding door with a tempered glass window; utilize facility steam. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics: 208 V, 3-phase, 60 Hz.

Steam Supply: 207 - 621 kPa to 90 PSIG.

Drain: 51 mm 2 inch diameter.

Hot Water Temperature Range: 43 to 90 degrees C to 194 degrees F.

Minimum Ceiling Height Requirement: 2388 mm.

Approximate Size: 16077 mm wide by 813 mm deep by 2032 mm high.

2.4.31 **Item S0925**, Washer/Disinfector, STM, 1DO, CAB, 23X19X24 Chamber

Provide steam washer disinfector with approximate chamber size of 584 mm by 483 mm by 610 mm and controlled by microprocessor with printer to record cycle phase performance. Provide unit with steam and electric heating with cycles pre-programmed to pre-wash, clean, rinse, disinfect and dry. Provide unit with one vertical sliding door with a tempered glass window; utilize facility steam. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) standards.
(UL) standards.

Electrical Characteristics: 208 V, 3-phase, 60 Hz.

Steam Supply: 207 - 621 kPa 30 to 90 PSIG.

Drain: 51 mm diameter.

Hot Water Temperature Range: 43 to 90 degrees C 110 degrees to 194 degrees.

Minimum Ceiling Height Requirement: 2388 mm 94 inches.

Approximate Size: 1067 mm 42 inches wide by 813 mm 32 inches deep by 2032 mm 80 inches high.

][2.4.32 Item S0930, Washer/Disinfector, STM, 1DO, RCSD 1WLL, 23X19X24 Cham

Provide steam washer disinfector with approximate chamber size of 584 mm 23 inches by 483 mm 19 inches by 610 mm 24 inches and controlled by microprocessor with printer to record cycle phase performance. Provide unit with steam and electric heating with cycles pre-programmed to pre-wash, clean, rinse, disinfect and dry. Provide unit with one vertical sliding door with a tempered glass window; utilize facility steam. Recessed through one wall. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics: 208 V, 3-phase, 60 Hz.

Steam Supply: 207 - 621 kPa 30 to 90 PSIG.

Drain: 51 mm diameter.

Hot Water Temperature Range: 43 to 90 degrees C 110 degrees to 194 degrees.

Minimum Ceiling Height Requirement: 2388 mm 94 inches.

Approximate Size: 813 mm 32 inches wide by 711 mm 28 inches deep by 1930 mm 76 inches high.

][2.4.33 Item S0940, Washer/Disinfector, STM, 1DO, RCSD 1WLL, 26X24X24 Cham

Provide steam washer disinfector with approximate chamber size of 660 mm 26 inches by 610 mm 24 inches by 610 mm 24 inches and controlled by microprocessor, with printer to record cycle phase performance. Provide unit with steam and electric heating with cycles pre-programmed to pre-wash, clean, rinse, disinfect and dry. Provide unit with one vertical sliding door with a tempered glass window; utilize facility steam. Recessed through one wall. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics: 208 V, 3-phase, 60 Hz.

Steam Supply: 207 - 621 kPa 30 to 90 PSIG.

Drain: 51 mm diameter.

Hot Water Temperature Range: 43 to 90 degrees C 110 degrees to 194 degrees.

Minimum Ceiling Height Requirement: 2388 mm 94 inches.
Approximate Size: 1143 mm 45 inches wide by 940 mm 37 inches deep by 2057 mm 81 inches high.

[2.4.34 Item S0955, Washer/Disinfector, STM, 2DO, RCSD 1 WLL, LDG/UNLDG STA

Provide steam washer disinfector with approximate chamber size of 660 mm 26 inches by 610 mm 24 inches 610 mm 24 inches and controlled by microprocessor with printer to record cycle phase performance. Provide unit with steam and electric heating with cycles pre-programmed to pre-wash, clean, rinse, disinfect and dry. Provide unit with two vertical sliding doors with a tempered glass windows; utilize facility steam. Recessed through one wall. Construct unit of stainless steel. Unit must be Underwriters Laboratory (UL) standards.

Electrical Characteristics: 208 V, 3-phase, 60 Hz.

Steam Supply: 207 - 621 kPa 30 to 90 PSIG.

Drain: 51 mm 2 inch diameter.

Hot Water Temperature Range: 43 to 90 degrees C 110 degrees to 194 degrees.

Minimum Ceiling Height Requirement: 2388 mm 94 inches.

Approximate Size: 1067 mm 42 inches wide by 813 mm 32 inches deep by 2032 mm 80 inches high.

][2.4.35 Item S0960, Washer/Disinfector,STM,2DO,RCSD1WLL,26X24X24 Chamber

Provide steam washer disinfector with chamber size of 660 mm 26 inches by 610 mm 24 inches by 610 mm 24 inches and controlled by microprocessor with printer to record cycle phase performance. Provide unit with steam and electric heating with cycles pre-programmed to pre-wash, clean, rinse, disinfect and dry. Provide Unit with two powered vertical sliding doors with tempered glass windows; utilize facility steam. Recessed through one wall. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics: 208 V, 3-phase, 60 Hz.

Steam Supply: 207 - 621 kPa 30 to 90 PSIG.

Drain: 51 mm 2 inch diameter.

Hot Water Temperature Range: 43 to 90 degrees C 110 degrees to 140 degrees.

Minimum Ceiling Height Requirement: 2388 mm 94 inches.

Approximate Size: 1067 mm 42 inches wide by 813 mm 32 inches long by 2032 mm 80 inches high.

][2.4.36 Item S0965, Washer/Disinfector, Dental

Provide dental washer/disinfector unit to wash, disinfect and rinse. Provide unit with one door hinged at the bottom and with LED display and printer for documenting washing phases. Water temperature must be between 10 to 93 degrees C 50 degrees and 200 degrees.
Electrical Characteristics:  208 V, 60 Hz.

Approximate Size:  610 mm 24 inches wide by 610 mm 24 inches deep by 914 mm 36 inches high.

][2.4.37  Item S1815, Generator, Steam, Electric, 30 kW

Provide 30 kW electric steam generator/boiler with low water cut-off/level control, water feed system, automatic balance control, water level sight glass, main on/off switch, pilot light, blowdown valve, steam pressure gauge, and safety valve. The unit must provide high pressure steam up to 100 PSIG. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics:  208 V, 3 phase.

Approximate Size:  584 mm 23 inches wide by 838 mm 33 inches deep by 1118 mm 44 inches high.

][2.4.38  Item S1830, Generator, Steam, Electric, 75 kW

Provide 75 kW electric steam generator/boiler with low water cut-off/level control, water feed system, automatic balance control, water level sight glass, main on/off switch, pilot light, blowdown/drain valve, steam pressure gauge, and safety valve. The unit must provide high pressure steam up to 689 kPa 100 PSIG. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics:  208 V, 3 phase, 60 Hz.

Approximate Size:  584 mm 23 inches wide by 838 mm 33 inches deep by 1118 mm 44 inches high.

][2.4.39  Item S1900, Rack, Pass-Through, Window & Door Assembly

Provide pass-through window and door assembly with vertical sliding window and tempered safety glass. Construct unit of 1.59 mm 16 gauge Type 304 stainless steel with fixed top panel. Provide with clear opening of approximately 813 mm 32 inches wide by 406 mm 16 inches high.

Construct rack return doors of 1.59 mm 16 gauge Type 304 stainless steel mounted with self-closing spring loaded hinges. Approximately 864 mm 34 inches wide by 940 mm 37 inches high.

Provide cantilevered counter with wall supports;  approximately 965 mm 38 inches wide by 800 mm 31-1/2 inches deep. Construct of 1.59 mm 16 gauge Type 304 stainless steel.

Approximate Overall Size:  2134 mm 84 inches high by 914 mm 36 inches wide by 914 mm 36 inches deep.

][2.4.40  Item S1905, Window, Sliding Service

Provide pass-through window assembly with vertical sliding window and tempered safety glass. Construct unit of 1.59 mm 16 gauge Type 304 stainless steel with fixed top panel. Provide with clear opening is approximately 711 mm 28 inches wide by 584 mm 23 inches high.

Cantilever counter with wall supports on both sides of window.

SECTION 11 71 00  Page 32
Approximately 914 mm\text{36 inches} wide by 864 mm\text{34 inches} deep. Provide unit with clean side of approximately 457 mm\text{18 inches} deep and decon side of be approximately 305 mm\text{12 inches} deep. Construct of 1.59 mm\text{16 gauge} Type 304 stainless steel.

Approximate Overall Size: 1321 mm\text{52 inches} high by 813 mm\text{32 inches} wide by 102 mm\text{4 inches} deep.

][2.4.41  \textbf{Item S2635} Cleaner, Ultrasonic, SNGL Chamber, CAB, F/S

Provide floor mounted single tank ultrasonic cleaner. Construct unit of stainless steel with automatic lid, powered load tray elevator, automated hands-free controls, automatic fill, automatic detergent dosing, automatic timer and cycle start/stop, and locking castor wheels. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics: 208 V, 3 Phase, 60 Hz.

Drain: 40 mm\text{1-1/2 inch}.

Approximate Chamber Size: 457 mm\text{18 inches} wide by 368 mm\text{14-1/2 inches} deep by 635 mm\text{25 inches} high.

Approximate Overall Size: 686 mm\text{27 inches} wide by 826 mm\text{33 inches} deep by 1041 mm\text{41 inches} high.

][2.4.42  \textbf{Item S2640}, Cleaner, Ultrasonic, Console, DBL CHMBR, CAB, F/S

Provide free-standing self-contained ultrasonic cleaner. Construct unit of stainless steel with two chambers, one for rinse, and one for drying. Provide unit with automatic lid, powered load tray elevator, automated hands-free controls, automatic fill, automatic detergent dosing, automatic timer and cycle start/stop, automatic drying timer and temperature control, and locking castor wheels. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics: 208 V, 3 Phase, 60 Hz.

Drain: 40 mm\text{1-1/2 inch}.

Approximate Wash Chamber Size: 610 mm\text{24 inches} wide by 381 mm\text{15 inches} long by 330 mm\text{13 inches} deep.

Approximate Overall Size: 1524 mm\text{60 inches} long by 1016 mm\text{40 inches} deep by 1067 mm\text{42 inches} high.

][2.4.43  \textbf{Item S3185}, Washer, Cart & Utensil, 2 DO, PIT MNTD, RCSD 2 WLL

Provide pit mounted cart and utensil washer unit controlled by microcomputer, electrically heated, with digital control panel, and cycles to pre-wash, wash, rinse, and dry. Provide pit mounted unit with two doors for pass-through. Unit must meet Underwriters Laboratory (UL) standards.

Electrical Characteristics: 208 V, 3 Phase, 60 Hz.

Approximate Chamber Size: 991 mm\text{39 inches} wide by 1346 mm\text{53 inches} deep by 2007 mm\text{79 inches} high.

Approximate Unit Size: 2946 mm\text{116 inches} wide by 2489 mm\text{98 inches} deep by
Provide wall mounted steam gun with 3048 mm 10 foot hose rated for high pressure steam, 3048 mm 10 foot detergent hose, two nylon brushes, and one stainless steel brush; utilize facility steam. Provide unit with cool touch operator protection.

Approximate Overall Length: 1397 mm 55 inches.

Approximate Weight of Steam Gun with Hoses: 4.5 kg 10 lbs.

Detergent Contained Capacity: 9.46 liters 2-1/2 gallons.

Provide self contained [wall mounted], [floor mounted] flusher/disinfector. Provide unit with nine fixed and two rotating nozzles, stainless steel chamber without welded joints, and the following: read out display with three programmable options, auto lock during processing, and lockable space incorporated for detergent containers and integral steam generator. Unit must meet Under Writers Laboratory (UL) standards.

Cold Water: 15 mm 1/2 inch, pressure 10 - 116 psi 70-800 kPa, flow minimum 0.3 l/second.

Hot Water: 15 mm 1/2 inch, pressure 10 - 116 psi 70-800 kPa, flow minimum 0.3 l/second.

Freestanding and Wall Hung Approximate Sizes: 457 mm 18 inches wide by 533 mm 21 inches deep by 1422 mm 56 inches high.

Electrical Characteristics: 208 V, 3-phase, 60 Hz.

Provide large chamber gravity steam sterilizer recessed unit with one door and hydraulic cart lift located at the door. Provide unit that is microcomputer controlled with printer to record cycle phase performance. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) standards. Provide unit with temperature range of 110 to 135 degrees C 230 degrees to 275 degrees and from 104 to 135 degrees C 219 degrees to 275 degrees for liquid cycles. Utilize facility steam.

Electrical Characteristics: 208 V, 3 Phase, 60 Hz.

Drain: 51 mm 2 inch diameter.

Approximate Chamber Size: 660 mm 26 inches wide, 1397 mm 55 inches deep 1219 mm 48 inches high.

Approximate Overall Size: 1905 mm 75 inches wide by 1905 mm 75 inches deep by 2007 mm 79 inches high.

Provide vacuum steam sterilizer unit that is pit mounted, recessed, with
single door; utilize facility steam. Provide unit that is microcomputer controlled with printer and capable of recording cycle phase performance. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) standards. Provide unit with temperature range of 110 to 135 degrees C, 230 degrees to 275 degrees and from 104 to 135 degrees C, 219 degrees to 275 degrees for liquid cycles.

Electrical Characteristics: 208 V, 3 Phase, 60 Hz.

Drain: 51 mm 2 inch diameter.

Approximate Chamber Size: 660 mm 26 inches wide by 1676 mm 66 inches deep by 1575 mm 62 inches high.

Approximate Overall Size: 1880 mm 74 inches wide by 2184 mm 86 inches deep by 1981 mm 78 inches high.

[2.4.48 Item S9815, Sterilizer, Stm, VAC, 2DO, RCSD2WLL, F/M, 26x62x42 Chamber

Provide vacuum steam sterilizer unit that is pit mounted, recessed, with two doors; utilize facility steam. Provide unit that is microcomputer controlled with printer, and capable of recording cycle phase performance. Construct unit of stainless steel. Unit must meet Underwriters Laboratory (UL) 61010-1, ASME (Section VIII, Division 1) Code for Pressure Vessels. Provide unit with temperature range of 110 to 135 degrees C, 230 degrees to 275 degrees and from 104 to 135 degrees C, 219 degrees to 275 degrees for liquid cycles. Provide unit with chamber capacity of 15 trays, maximum 7.7 kg 17 lbs each.

Electrical Characteristics: 208 V, 3 Phase, 60 Hz.

Drain: 51 mm 2 inch diameter.

Approximate Chamber Size: 660 mm 26 inches wide by 1702 mm 67 inches deep by 1219 mm 48 inches high.

Approximate Overall Size: 1905 mm 75 inches wide by 2210 mm 87 inches deep by 2007 mm 79 inches high.

[PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Install equipment at locations indicated in accordance with manufacturer’s printed installation instructions, Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT, and approved detail drawings. Submit detail drawings specifically prepared to illustrate required work for each item of equipment that interfaces with other items of equipment or construction, including, but not limited to, installation layout, coordination of equipment services, [drain piping connections,] [complete electrical wiring and control diagrams,] and details of construction and rough-in requirements. Furnish and install necessary items such as framing, mounting hardware and trim as required for the type of equipment.
3.3 ADJUSTING

Following installation, adjust flows, timers, levelers, and similar components and operation devices as appropriate. After testing, and before acceptance, examine equipment to ensure that adjustments are correct and that any additional adjustments deemed necessary during product testing have been incorporated.

3.4 UTILITIES

3.4.1 Service Runs

Connect service runs from equipment to building services as indicated.

3.4.2 Dissimilar Metal Connectors

Provide connections between ferrous and nonferrous metallic pipe with dielectric waterways and flanges. Provide dielectric waterways with temperature and pressure rating equal to or greater than that specified for the connecting piping. Provide waterways with metal connections on both ends suited to match connecting piping. Internally line dielectric waterways with an insulator specifically designed to prevent current flow between dissimilar metals. Dielectric flanges must meet the performance requirements described herein for dielectric waterways.

3.5 MANUFACTURER'S FIELD SERVICES

Provide the services of a manufacturer's representative[, in conjunction with] [, in addition to] [the Contractor's Equipment Planner,] [and] [the Contractor's Biomedical Equipment Technician,] [the Government's Biomedical Equipment Technician,] who is experienced in the installation, adjustment, and operation of the equipment specified, and responsible for supervising the installation, adjustment, and testing of the equipment.

3.6 FIELD TESTS AND INSPECTIONS

3.6.1 Before Testing

Clean pipes, equipment and components of grease, dirt, stains, and other foreign materials.

3.6.2 Testing

Perform testing in accordance with manufacturer's written instructions. Unless otherwise approved by the Contracting Officer, test all items of equipment to ensure that they are operational and installation conforms to specification requirements. Hydrostatically test piping system at pressure of 1.5 times system operating pressure with water at temperature not exceeding 38 degrees C/100 degrees F. Before test, remove or isolate gage traps and apparatus that may be damaged by that pressure. Install calibrated test gage in system to observe any loss of pressure. Close off system and maintain test pressure for not less than one hour. Inspect joints and equipment connections for leaks. Retest and make repair until no further leaks are observed. Each test report must indicate compliance with specified performance criteria and the final position of controls.
3.6.3 Inspection

Examine each item for visual defects and conformance to specifications.

3.7 CLEANING

3.7.1 For Final Acceptance

Remove labels, fingerprints, and clean all surfaces both inside and out. Tightly cover and protect fixtures and equipment against rust, dirt, water, and chemical or mechanical injury.

3.7.2 Marred Surfaces Exposed-to-View

Refinish marred exposed surfaces that affect appearance, such as both interior and exterior cabinet finishes, to match the adjacent finishes, like new; replace components that cannot be refinished in this manner.

3.7.3 Concealed Marred Surfaces

Refinish marred surfaces exposed to atmosphere, where such surfaces do not affect product's appearance but do affect resistance to elements, such as galvanized pipes and insulation, to equal resistance performance as the unmarred surfaces.

3.8 TRAINING

3.8.1 Training Course

Conduct training course for operation staff as designated by the Contracting Officer. Start the training period, for a total of [_____] hours of normal working time, after systems are functionally complete but prior to final acceptance. The field instructions must include all of the items contained in the approved operations and maintenance data, as well as demonstrations of routine maintenance operations. Notify Contracting Officer at least 14 days prior to date of the training course.

[3.8.1.1 Government's Biomedical Equipment Technician Training

Include operator's training for one Biomedical Equipment Technician (BMET) for each procured equipment item.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for miscellaneous medical equipment.

This Section refers to Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for general requirements; always include Section 11 70 00 when this Section is used.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: On the drawings, show:

1. Location of equipment.

2. Height of turntable unit and control switch box above finish floor.
PART 1   GENERAL

1.1 RELATED REQUIREMENTS

The requirements of Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT apply to this Section.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM A1008/A1008M (2023) Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable

INTERNATIONAL ELECTROTECHNICAL COMMISSION (IEC)

IEC 60601-1 (2012) Medical Electrical Equipment
1.3 SUBMITTALS

******************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

[ Item A1100, Prefabricated Service ICU Column; G[, [_____]]]

Submit Data Package 3, including training requirements, for each item of equipment listed above in accordance with requirements of Section 01 78 23 OPERATION AND MAINTENANCE DATA. In addition, provide hard copies consisting of two Operator's Manuals and two Service Manuals.

1.4 WARRANTY

[Provide warranties as specified in this Section. ]Refer to Article WARRANTY in Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for [additional] requirements.

PART 2 PRODUCTS

2.1 MATERIALS

Items not specified otherwise must conform to the following requirements:
a. Aluminum alloy: Equivalent in ultimate tensile, yield, and shear strengths to Alloy 6063-T5 or 6063-T6; conforming to ASTM B221M, ASTM B221.

b. Carbon steel: ASTM A1008/A1008M.

c. Laminated plastic: ANSI/NEMA LD 3; colors and patterns as selected by the Contracting Officer from the manufacturer's standard colors and patterns.

d. Stainless steel: Type 301, 302, or 304. Provide satin finish or a minimum No. 3 polished finish for exposed surfaces.

2.2 EQUIPMENT

**************************************************************************
NOTE: Select project-specific equipment items from the list below and delete equipment items not used. Additional equipment items may be added as required to suit project-specific conditions
**************************************************************************

[2.2.1 Item A1100, Prefabricated Service ICU column]

Provide floor to ceiling prefabricated service column for equipment placement and support. Provide gas, electrical, and communications outlets mounted to any or all four sides. Provide vertical and horizontal accessory rails as shown in drawings. Approximate size 229 mm by 229 mm 9 inches by 9 inches minimum.

Additional Equipment and Devices (coordinate with drawings)

a. Electrical Receptacles: 20 amp, 125 volt, U.L. listed, "Hospital Grade". Quantity and type as indicated on drawings. Factory pre-wired by the Headwall module manufacturer. Coordinate requirements with applicable Division 26 Sections. Ensure compatibility of plug on equipment to used with these devices. Duplex: NEMA style 5-20R, "Red" color for critical branch power circuits.

b. Ground Receptacles: Integral with unit; 2.93 mm 10 AWG stranded copper wire conductor.

c. Medical Gas/Vacuum Manifold: Pre-assembled gas manifold with oxygen, air, vacuum connections and risers for all other gases.

d. Gas Outlets: Type to match existing in hospital, compatible with existing equipment. Refer to plumbing drawings for quantity of each specific gas outlet.

e. Telephone Provision: Provide telephone and data outlets. Coordinate installation requirements with applicable Division 26 and 27 Sections. Refer to communication drawings for quantity of each outlet.

f. Flat screen monitor holder/bracket.
2.2.2 Item A1105, Headwall, Prefabricated, ICU, With Equipment

2.2.2.1 Headwall System

Provide a U.L. listed headwall consisting of a horizontal raceways that are surface mounted to the headwall behind the patient bed at specified levels. Electrical (normal or emergency power) services to raceway devices are supplied from a junction box in the wall or from optional vertical chase.

2.2.2.2 Raceways

Must provide for supporting movable ancillary equipment and cabinets. The center raceway provides track for mounting horizontally movable gas blocks. The raceway is low profile of 70 mm 2-3/4 inches deep. Each raceway contains barriers to accommodate any mix of emergency power or communication service desired. Single gang device outlets are spaced at 152 mm 6 inch intervals.

2.2.2.3 Medical Gas Distribution

Must be through a pre-assembled gas manifold located centrally below the (middle) gas raceway. Service to movable secondary gas outlets is through indexed hose assemblies connected to DISS check valves on the pre-assembled gas manifold. Supply to the pre-assembled gas manifold is through copper service drops. Copper drops are located in the wall or a cavity behind the surface mounted service chase. Access to the pre-assembled gas manifold may be accomplished by tilting or removing quick release HPL coved panels installed between the gas (middle) and bumper (bottom) raceways. Panel must cover indexed hose to keep out of view and protect patient from entanglement.

2.2.2.4 Materials

a. Service chase is 114 mm 4-1/2 inches deep by 330 mm 13 inches wide constructed of 1.52 and 0.9 mm 16 and 20 gauge steel box covered with FRL/steel front panels.

b. Horizontal raceway extruded aluminum and FRL covered with 0.91 mm 20 gauge steel.

c. Hose panels high density particle board and coved with FRL - 19 mm 3/4 inch thick.

d. Manifold Type K copper tubing (15.9 mm5/8 inch O.D. oxygen/air - 22.2 mm 7/8 inch O.D. vacuum).

e. Device faceplates - formed 0.51 mm 24 gauge anodized aluminum.

f. Wiring is 2.06 mm 12 gauge for receptacles and 2.06 and 2.59 mm 12 and 10 gauge for grounding.

2.2.2.5 Additional Headwall Equipment and Devices

a. Vacuum bottle Slide: 102 mm 4 inch, one piece extruded aluminum device, clear anodized with stop at the bottom. Slide must accept a 44 mm 1 3/4 inch wide by 3 mm 1/8 inch thick vacuum bottle bracket. Slides extend 381 mm 15 inches from the lower surface of the Headwall Module for use on either side of the bed. Slides swivel upward for storage.
b. Electrical Receptacles: 20 amp, 125 volt, 2 pole, grounding, U.L. listed, "Hospital Grade" duplex receptacles. Quantity as indicated on drawings. Factory pre-wired by the headwall module manufacturer. Coordinate requirements with applicable Division 26 Sections. Ensure compatibility of plug on equipment to used with these devices. Each receptacle cover plate is engraved to indicate the panel board and circuit from which it is served, refer to the electrical drawings for the engraving schedule. Fill-in the engraved portion with black paint.

1) Duplex: NEMA style 5-20R, "Ivory" color on normal power circuits; "Red" color for critical branch power circuits.

2) Single: NEMA style 5-20R, "Ivory" color on normal power circuits; "Red" color for critical branch power circuits.

c. Switches and switching arrangements: "Specification" grade 120/277 volt, 20 amp decora framed rocker switches, quiet action. Switch type SP-ST or 3-way as shown on drawings. Proved factory pre-installed and factory pre-wired switches to junction box for external lights. "Ivory" color on normal power circuits; "Red" color for critical branch power circuits. Provide compatible momentary contact switches for activation of the low voltage lighting controller where indicated on the drawings. "Ivory" color on normal power circuits; "Red" color for critical branch power circuits.

d. Telephone/Data Provision: Provide single gang faceplate factory-punched for six 8 position modular, category 5e rated jacks, provide blank inserts for 4 of the openings.

e. Code Blue Station Provision: Coordinate work with Section 27 52 24 NURSE CALL SYSTEM. Headwall module must allow adequate space and make provisions for the nurse call device.

f. Medical Gas/ Vacuum Outlets: Provide and extend the medical gas/vacuum outlets complete with valves and faceplates in locations shown on approved shop drawings. Medical gas/vacuum outlets are quick connect or diameter indexing safety system (DISS) type and of the outlet manufacturer's console model as defined on the approved shop drawing. Copper tubing for extending and manifolding is type K conforming to ASTM B819. Provide all copper tubing free of oil and foreign material. Nitrogen gas must flow through tubing during brazing to prevent carbon deposits. All brazing of joints must be with silver brazing alloy (melting point 538 degree C 1000 degree F minimum). Complete manifolded or extended system must be pressure tested to 1034 kPa 150 psi to ensure gas tight seal. Single gas outlets: 15 mm 1/2 inch nominal I.D. (16 mm5/8 inch O.D.) tubing. Each multiple oxygen and compressed air outlet is manifolded to a tube of 15 mm 1/2 inch nominal I.D. (16 mm5/8 inch O.D.) and multiple vacuum outlets are manifolded to a tube of 16 mm 5/8 inch nominal I.D. (19 mm3/4 inch O.D.). All manifolds and extensions extend into center raceway and are labeled and capped to prevent incorrect hook-up and contamination. Protect all copper tubing from contact with dissimilar metals to prevent galvanic corrosion by plastic bushings. Provide all primary connections to the extended gas outlets. Perform and certify all pressure tests as required by NFPA 99 and contractual documents.

g. Nurse Call Patient Station: Coordinate work with Section 27 52 24 NURSE CALL SYSTEM. Headwall module must allow adequate space and make
provisions for the nurse call device.

h. Blank Opening with Faceplates: For future expansion of services, provide blank opening locations as indicated on drawings. Provide one or two gang size openings as noted on drawings. Provide blank faceplates (unpunched of formed aluminum) by headwall module manufacturer.

i. Bed Interface Receptacle: The bed interface receptacle must enable nurse call, television controls and lighting functions to be operated at the patient bed side rail controls. Mount the receptacle in the patient headwall rail system as indicated on the drawings. The receptacle includes 3 cables assembled to a 37 pin receptacle; two of the cables must be long enough to be connected to the nurse call patient station and the third cable must be connected to the low voltage lighting controller.

j. Provide a "Dummy Plug" which is inserted into the receptacle whenever the bed is disconnected. Attach the dummy plug to the face plate with a stainless steel ball chain. Provide a simulator which can be inserted into the interface receptacle and can duplicate the functions of the bedside controls for testing purposes.

k. Color/Wood Trim:[ As specified in Section 09 06 00 SCHEDULES FOR FINISHES.][ As indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.]

l. Bed Locator: Provide one set per headwall.

][2.2.3 Item A1107, Rail System, Utility, Gas and Electric

2.2.3.1 Rail System

Provide a U.L. listed headwall consisting of a vertical service chase used in conjunction with a series of 2 horizontal raceways that are surface mounted to the headwall behind the patient bed at specified levels. Provide chase with 3 barrier compartments. Electrical (normal or emergency power) services to raceway devices are supplied from the chase by pre-wired plug connectors. Final electrical connections are made below finished ceiling junction boxes in chase. Low voltage (for example, nurse call, code blue, and monitor). Provide barrier compartment for field routing of cables through service chase to location in raceway via pull strings.

2.2.3.2 Raceways

Must provide for supporting movable ancillary equipment and cabinets. The center raceway provides track for mounting horizontally movable gas blocks. The raceway is low profile of 70 mm 2-3/4 inches deep. Each raceway contains barriers to accommodate any mix of emergency power or communication service desired. Single gang device outlets are spaced at 152 mm 6 inch intervals.

2.2.3.3 Medical Gas Distribution

Must be through a pre-assembled gas manifold located centrally below the (middle) gas raceway. Service to movable secondary gas outlets is through indexed hose assemblies connected to DISS check valves on the pre-assembled gas manifold. Supply to the pre-assembled gas manifold is through copper service drops. Copper drops are located in a cavity behind the surface
mounted service chase. Access to the pre-assembled gas manifold may be accomplished by tilting or removing quick release HPL coved panels installed between the gas (middle) and bumper (bottom) raceways. Panel must cover indexed hose to keep out of view and protect patient from entanglement.

### 2.2.3.4 Materials

a. Service chase is **114 mm 4-1/2 inches** deep by **330 mm 13 inches** wide constructed of **1.52 and 0.91 mm 16 and 20 gauge** steel box covered with FRL/steel front panels.

b. Horizontal raceway is extruded aluminum and FRL covered with **0.91 mm 20 gauge** steel.

c. Hose panels are high density particle board and coved with FRL - **19 mm 3/4 inch** thick.

d. Manifold Type K copper tubing is (**15.9 mm 5/8 inch** O.D. oxygen/air - **22.2 mm 7/8 inch** O.D. vacuum).

e. Device faceplates are formed of **0.51 mm 24 gauge** anodized aluminum.

f. Wiring is **2.06 mm 12 gauge** for receptacles and **2.06 and 2.59 mm 12 and 10 gauge** for grounding.

### 2.2.3.5 Additional Headwall Equipment and Devices

a. Vacuum bottle Slide: **102 mm 4 inch**, one piece extruded aluminum device, clear anodized with stop at the bottom. Slide must accept a **44 mm 13/4 inch** wide by **3 mm 1/8 inch** thick vacuum bottle bracket. Slides extend **381 mm 15 inches** from the lower surface of the headwall module for use on either side of the bed. Slides must swivel upward for storage.

b. Electrical Receptacles: 20 amp, 125 volt, 2 pole, grounding, U.L. listed, "Hospital Grade" duplex receptacles. Quantity as indicated on drawings. Factory pre-wired by the headwall module manufacturer. Coordinate requirements with applicable Division 26 Sections. Ensure compatibility of plug on equipment to used with these devices. Each receptacle cover plate is engraved to indicate the panel board and circuit from which it is served; refer to the electrical drawings for the engraving schedule. Fill in the engraved portion with black paint.

   (1) Duplex: NEMA style 5-20R, "Ivory" color on normal power circuits; "Red" color for critical branch power circuits.

   (2) Single: NEMA style 5-20R, "Ivory" color on normal power circuits; "Red" color for critical branch power circuits.

c. Switches and switching arrangements: "Specification" grade 120/277 volt, 20 amp decora framed rocker switches, quiet action. Switch type SP-ST or 3-way as shown on drawings. Proved factory pre-installed and factory pre-wired switches to junction box for external lights. "Ivory" color on normal power circuits; "Red" color for critical branch power circuits. Provide compatible momentary contact switches for activation of the low voltage lighting controller where indicated on the drawings.

d. Telephone/Data Provision: Provide single gang faceplate factory-punched
for six 8 position modular, category 5e rated jacks, provide blank inserts for 4 of the openings.

e. Code Blue Station Provision: Coordinate work with Section 27 52 24 NURSE CALL SYSTEM. Headwall module must allow adequate space and make provisions for the nurse call device.

f. Medical Gas/ Vacuum Outlets: Provide and extend the medical gas/vacuum outlets complete with valves and faceplates in locations shown on approved shop drawings. Medical gas/vacuum outlet is quick connect or diameter indexing safety system (DISS) type and of the outlet manufacturer's console model as defined on the approved shop drawing. Copper tubing for extending and manifolding is type K conforming to ASTM B819. Provide all copper tubing free of oil and foreign material. Nitrogen gas must flow through tubing during brazing to prevent carbon deposits. All brazing of joints must be with silver brazing alloy (melting point 538 degree C 1000 degree F minimum). Complete manifolded or extended system must be pressure tested to 150 psi to ensure gas tight seal. Single gas outlets: 15 mm 1/2 inch nominal I.D. (16 mm5/8 inch O.D.) tubing. Each multiple oxygen and compressed air outlet is manifolded to a tube of 15 mm 1/2 inch nominal I.D. (16 mm5/8 inch O.D.) and multiple vacuum outlets are manifolded to a tube of 16 mm 5/8 inch nominal I.D. (19 mm3/4 inch O.D.). All manifolds and extensions extend into center raceway and are labeled and capped to prevent incorrect hook-up and contamination. Protect all copper tubing from contact with dissimilar metals to prevent galvanic corrosion by plastic bushings. Provide all primary connections to the extended gas outlets. Perform and certify all pressure tests as required by NFPA 99 and as indicated.

g. Nurse Call Patient Station: Coordinate work with Section 27 52 24 NURSE CALL SYSTEM. Headwall module must allow adequate space and make provisions for the nurse call device.

h. Blank Opening with Faceplates: For future expansion of services, provide blank opening locations as indicated on drawings. Provide one or two gang size openings as noted on drawings. Blank faceplates (unpunched of formed aluminum) are provided by headwall module manufacturer.

i. Bed Interface Receptacle: The bed interface receptacle must enable nurse call, television controls and lighting functions to be operated at the patient bed side rail controls. Mount the receptacle in the patient headwall rail system as indicated on the drawings. The receptacle includes 3 cables assembled to a 37 pin receptacle, two of the cables must be long enough to be connected to the nurse call patient station and the third cable must be connected to the low voltage lighting controller.

j. Provide a "Dummy Plug" for the receptacle which is inserted into the receptacle whenever the bed is disconnected. The dummy plug is attached to the face plate with a stainless steel ball chain. Provide a simulator which can be inserted into the interface receptacle and duplicate the functions of the bedside controls for testing purposes.

k. Color/Wood Trim:

   As specified in Section 09 06 00 SCHEDULES FOR FINISHES.] As indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.]
1. Bed Locator: Provide one set per headwall.

2.2.4 Item A110, Headwall, Prefabricated, General, 1-2 Bed

2.2.4.1 Head Wall System

Provide a U.L. listed headwall consisting of a horizontal raceways that are surface mounted to the headwall behind the patient bed at specified levels. Electrical (normal or emergency power) services to raceway devices are supplied from a junction box in the wall or from optional vertical chase.

2.2.4.2 Raceways

Must provide for supporting movable ancillary equipment and cabinets. The center raceway provides track for mounting horizontally movable gas blocks. The raceway is low profile of 70 mm 2-3/4 inches deep. Each raceway contains barriers to accommodate any mix of emergency power or communication service desired. Single gang device outlets are spaced at 152 mm 6 inch intervals.

2.2.4.3 Medical Gas Distribution

Must be through a pre-assembled gas manifold located centrally below the (middle) gas raceway. Service to movable secondary gas outlets is through indexed hose assemblies connected to DISS check valves on the pre-assembled gas manifold. Supply to the pre-assembled gas manifold is through copper service drops. Copper drops are located in the wall or a cavity behind the surface mounted service chase. Access to the pre-assembled gas manifold may be accomplished by tilting or removing quick release HPL coved panels installed between the gas (middle) and bumper (bottom) raceways. Panel must cover indexed hose to keep out of view and protect patient from entanglement.

2.2.4.4 Materials

a. Service chase is 114 mm 4-1/2 inches deep by 330 mm 13 inches wide constructed of 1.52 and 0.91 mm 16 and 20 gauge steel box covered with FRL/steel front panels.

b. Horizontal raceway is extruded aluminum and FRL covered with 0.91 mm 20 gauge steel.

c. Hose panels are high density particle board and coved with FRL - 19 mm 3/4 inch thick.

d. Manifold is Type K copper tubing (15 mm5/8 inch O.D. oxygen/air - 22 mm 7/8 inch O.D. vacuum).

e. Device faceplates are formed of 0.51 mm 24 gauge anodized aluminum.

f. Wiring is 2.06 mm 12 gauge for receptacles and 2.32 and 2.93 mm 12 and 10 gauge for grounding.

2.2.4.5 Additional Headwall Equipment and Devices: Coordinate with Drawings

a. Vacuum bottle Slide: 102 mm 4 inch, one piece extruded aluminum device, clear anodized with stop at the bottom. Slide must accept a 44 m 1-3/4 inch wide by 3 mm 1/8 inch thick vacuum bottle bracket. Slides extend...
381 mm 15 inches from the lower surface of the Headwall Module for use on either side of the bed. Slides swivel upward for storage.

b. Electrical Receptacles: 20 amp, 125 volt, 2 pole, grounding, U.L. listed, "Hospital Grade" duplex receptacles. Quantity as indicated on drawings. Factory pre-wired by the headwall module manufacturer. Coordinate requirements with applicable Division 26 Sections. Ensure compatibility of plug on equipment to used with these devices. Each receptacle cover plate is engraved to indicate the panel board and circuit from which it is served, refer to the electrical drawings for the engraving schedule. Fill in the engraved portion with black paint.

(1) Duplex: NEMA style 5-20R, "Ivory" color on normal power circuits; "Red" color for critical branch power circuits.

(2) Single: NEMA style 5-20R, "Ivory" color on normal power circuits; "Red" color for critical branch power circuits.

c. Switches and switching arrangements: "Specification" grade 120/277 volt, 20 amp decora framed rocker switches, quiet action. Switch type SP-ST or 3-way as shown on drawings. Proved factory pre-installed and factory pre-wired switches to junction box for external lights. "Ivory" color on normal power circuits; "Red" color for critical branch power circuits. Provide compatible momentary contact switches for activation of the low voltage lighting controller where indicated on the drawings.

d. Telephone/Data Provision: Provide single gang faceplate factory-punched for six 8 position modular, category 5e rated jacks, provide blank inserts for 4 of the openings.

e. Code Blue Station Provision: Coordinate work with Section 27 52 24 NURSE CALL SYSTEM. Headwall module must allow adequate space and make provisions for the nurse call device.

f. Medical Gas/ Vacuum Outlets: Provide and extend the medical gas/vacuum outlets complete with valves and faceplates in locations shown on approved shop drawings. Medical gas/vacuum outlet is quick connect or diameter indexing safety system (DISS) type and of the outlet manufacturer's console model as defined on the approved shop drawing. Copper tubing for extending and manifolding is type K conforming to ASTM B819. Provide all copper tubing free of oil and foreign material. Nitrogen gas must flow through tubing during brazing to prevent carbon deposits. All brazing of joints must be with silver brazing alloy (melting point 538 degree C 1000 degree F minimum). Complete manifolded or extended system must be pressure tested to 1034 kPa 150 psi to ensure gas tight seal. Single gas outlets are 13 mm 1/2 inch nominal I.D. (16 mm5/8 inch O.D.) tubing. Each multiple oxygen and compressed air outlet is manifolded to a tube of 13 mm 1/2 inch nominal I.D. (16 mm5/8 inch O.D.) and multiple vacuum outlets are manifolded to a tube of 16 mm 5/8 inch nominal I.D. (19 m3/4 inch O.D.). All manifolds and extensions extend into center raceway and are labeled and capped to prevent incorrect hook-up and contamination. Protect all copper tubing from contract with dissimilar metals to prevent galvanic corrosion by plastic bushings. Provide all primary connections to the extended gas outlets. Perform and certify all pressure tests as required by NFPA 99 and as indicated.

g. Nurse Call Patient Station: Coordinate work with Section 27 52 24 NURSE
CALL SYSTEM. Headwall module must allow adequate space and make provisions for the nurse call device.

h. Blank Opening with Faceplates: For future expansion of services, provide blank opening locations as indicated on drawings. Provide one or two gang size as noted on drawings. Blank faceplates (unpunched or formed aluminum) are provided by headwall module manufacturer.

i. Bed Interface Receptacle: The bed interface receptacle must enable nurse call, television controls and lighting functions to be operated at the patient bed side rail controls. Mount the receptacle in the patient headwall rail system as indicated on the drawings. The receptacle includes 3 cables assembled to a 37 pin receptacle; two of the cables must be long enough to be connected to the nurse call patient station and the third cable must be connected to the low voltage lighting controller.

j. Provide a "Dummy Plug" which is inserted into the receptacle whenever the bed is disconnected. Attach the dummy plug to the face plate with a stainless steel ball chain. Provide a simulator which can be inserted into the interface receptacle and can duplicate the functions of the bedside controls for testing purposes.

k. Color/Wood Trim: [As specified in Section 09 06 00 SCHEDULES FOR FINISHES.][As indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.]

l. Bed Locator: Provide one set per headwall.

][2.2.5 Item Al112, Column, Service, Overhead, Horizontal, Laboratory

Ceiling mounted horizontal laboratory service column. Must provide housing for gas, electrical, communications outlets, lighting and ventilation. Must be a U.L. listed, pre-wired and pre-plumbed.

Construct of steel with powder finish.

Approximate Size: 914 mm to 2438 mm 36 inches to 96 inches long by 610 mm 24 inches wide by 457 mm to 1372 mm 18 to 54 inches high. Must be configurable to join sections together for continuous runs.

][2.2.6 Item Al115, Console, Service, Infant, Prefabricated

2.2.6.1 Rail System

Provide a U.L. listed headwall consisting of a vertical service chase used in conjunction with a series of horizontal raceways that are surface mounted to the headwall behind the infant bed at specified levels. Chase must have 3 barrier compartments. Electrical (normal or emergency power), services to raceway devices are supplied from the chase by pre-wired plug connectors. Final electrical connections are made below finished ceiling junction boxes in chase. Low voltage (for example, nurse call, code blue, and monitor). Provide barrier compartment for field routing of cables through service chase to location in raceway via pull strings.

2.2.6.2 Raceways

Must provide for supporting movable ancillary equipment and cabinets. The center raceway provides track for mounting gas blocks. The raceway is low
profile of 70 mm 2-3/4 inches deep. Each raceway contains barriers to accommodate any mix of emergency power or communication service desired.

2.2.6.3 Medical Gas Distribution

Must be through a pre-assembled gas manifold located centrally below the (middle) gas raceway. Service to movable secondary gas outlets is through indexed hose assemblies connected to DISS check valves on the pre-assembled gas manifold. Supply to the gas manifold is through copper service drops. Copper drops are located in a cavity behind the service mounted service chase. Access to the pre-assembled gas manifold may be accomplished by tilting or removing quick release HPL coved panels installed between the gas (middle) and bumper (bottom) raceways. Panel must cover indexed hose to keep out of view and protect patient from entanglement.

2.2.6.4 Console/counter

Approximate Size Range: 1118 mm 44 inches wide by 610 mm 24 inches deep by 991 mm 39 inches high. Refer to drawings for exact size and configuration.

2.2.6.5 Materials

a. Service chase is approximately 114 mm 4-1/2 inches deep by 356 mm 14 inches wide constructed of 1.52 and 0.91 mm 16 and 20 gauge steel box covered with HPL/steel front panels.

b. Horizontal raceway is extruded aluminum and HPL covered with 0.91 mm 20 gauge steel.

c. Hose panels are high density particle board and covered with HPL - 19 mm 3/4 inch thick.

d. Manifold is type K copper tubing 16 mm 5/8 inch O.D. oxygen/air 22 mm 7/8 inch O.D. vacuum).

e. Device faceplates are formed 0.51 mm 24 gauge anodized aluminum.

f. Wiring is 2.06 mm 12 gauge for receptacles and 2.06 and 2.59 mm 12 and 10 gauge for grounding.

g. Approximate Size: 1118 mm 44 inches wide by 610 mm 24 inches deep.

2.2.6.6 Rail System

Provide with devices and equipment as indicated on the drawings.

2.2.6.7 Additional Headwall Equipment and Devices

a. Electrical Receptacles: 20 amp, 125 volt, U.L. listed, "Hospital Grade." Quantity and type as indicated on drawings. Factory pre-wired by the headwall module manufacturer. Coordinate requirements with applicable Division 26 Sections. Ensure compatibility of plug in equipment to be used with these devices. Each receptacle cover plate is engraved to indicate the panel board and circuit from which it is served, refer to electrical drawings for the engraving schedule. Fill in the engraved portion with black paint.

(1) Duplex: NEMA style 5-20R, "Ivory" color on normal power circuits: "Red" color for critical branch power circuits.
(2) Single: NEMA style 5-20R, "Ivory" color on normal power circuits: "Red" color for critical branch power circuits.

b. Ground Receptacles: Integral with unit; 10 AWG stranded copper wire conductor.

c. Telephone/Data Provision: Provide a single gang faceplate factory-punched for six 8 position modular, category 5e rated jacks, provide blank inserts for 4 of the openings.

d. Code Blue Emergency Call Button: Switch button and plate. Coordinate work with nurse call requirements. Allow adequate space and provide raceway to accommodate code blue wire pulls to nurse call back box headwall module.

e. Nurse Call Station: Provide nurse call equipment. Coordinate work with Section 27 52 24 NURSE CALL SYSTEM. Headwall module must allow adequate space and make provisions for nurse call. Include backbox and conduit to accommodate all nurse call wiring and nurse call remote jack for servicing access area of module.

f. Blank Opening with Faceplates: For future expansion of services, provide blank opening locations as indicated on drawings. Provide one or two gang size as are noted on drawings. Blank faceplates (unpunched of formed aluminum) provided by headwall module manufacturer.

h. Switches and switching arrangements: "Specification" grade 120 volt, 20 amp decora framed rocker switches, quiet action. Switch type SP-ST or 3-way as shown on drawings. Factory pre-installed and factory pre-wired switches to lights.

i. Vacuum slides as indicated on the drawings.

][2.2.7  Item A1119, Pedestal, Medical Gas Service, Floor-Mounted

Floor mounted prefabricated service pedestal. Must be UL listed and provide housing for gas and electrical outlets. Construct of Type 304 stainless steel with No. 4 satin finish. Provide with removable top for access. Gas outlets can be mounted on sides of pedestal.

Approximate Sizes: 254 mm 10 inches by 508 mm 20 inches by 305 mm to 457 mm 12 to 18 inches high.

][2.2.8  Item A1120, Column, Service, Prefab, Surgical, Ceiling Mounted

Ceiling mounted surgical prefabricated service column. Must provide housing for gas, electrical, and communications outlets, with positive pneumatic braking system locks at each joint, friction brakes. Motorized retractable column. Construct upper and lower sections of shroud of 1.59 mm 16 gauge Type 304 stainless steel with a No. 4 satin finish, including a removable access panel, stainless steel ceiling collar, a steel mounting plate equipped with console gas outlets above the ceiling line. Gas outlets can be mounted on both sides or bottom of column. Provide
provisions for up 10 gas outlets. Electrical outlets can be added to any or all four sides of the column. Fully retracted length from ceiling is 914 mm 36 inches.

2.2.8.1 Additional Equipment and Devices

a. Electrical Receptacles: 20 amp, 125 volt, U.L. listed, "Hospital Grade". Quantity and type as indicated on drawings. Factory pre-wired by the Headwall module manufacturer. Coordinate requirements with applicable Division 26 Sections. Ensure compatibility of plug on equipment to used with these devices. Duplex: NEMA style 5-20R, "Red" color for critical branch power circuits.

b. Ground Receptacles: Integral with unit; 2.59 mm 10 AWG stranded copper wire conductor.

c. Medical Gas/Vacuum Manifold: Pre-assembled gas manifold with oxygen, air, vacuum connections and risers for all other gases.

d. Gas Outlets: Type to match existing in hospital, compatible with existing equipment. Refer to plumbing drawings for quantity of each specific gas outlet.

e. Telephone Provision: Provide telephone and data outlets. Coordinate installation with requirements of applicable Division 26 and 27 Sections. Refer to communication drawings for quantity of each outlet.

2.2.9 Item A1122, Column, Equipment Arm, Ceiling Mounted, Surgery

Ceiling mounted prefabricated equipment articulating service column. Must provide for equipment placement and support. Provide gas, electrical, and communications outlets mounted to any or all four sides. Must accommodate a minimum of 12 gas outlets and 18 electrical duplex outlets. Provide three shelves and vertical accessory rails. Pneumatic moving and braking system. Provide range of motion up to 330 degrees with each arm.

Approximate Size: 584 mm to 940 mm 23 to 37 inches tall.

2.2.9.1 Additional Equipment and Devices

a. Electrical Receptacles: 20 amp, 125 volt, U.L. listed, "Hospital Grade". Quantity and type as indicated on drawings. Factory pre-wired by the Headwall module manufacturer. Coordinate requirements with applicable Division 26 Sections. Ensure compatibility of plug on equipment to used with these devices. Duplex: NEMA style 5-20R, "Red" color for critical branch power circuits.

b. Ground Receptacles: Integral with unit; 2.59 mm 10 AWG stranded copper wire conductor.

c. Medical Gas/Vacuum Manifold: Pre-assembled gas manifold with oxygen, air, vacuum connections and risers for all other gases.

d. Gas Outlets: Type to match existing in hospital, compatible with existing equipment. Refer to plumbing drawings for quantity of each specific gas outlet.

e. Telephone Provision: Provide telephone and data outlets. Coordinate installation with requirements of applicable Division 26 and 27 Sections.
Sections. Refer to communication drawings for quantity of each outlet.

f. Flat screen monitor holder/bracket.

g. Optional second arm.

][2.2.10 Item A1180, Scale, Roll On, Built In, 2000 Pound Capacity

Provide recessed, flush mounted roll on scale, 1219 48 inches wide by 1219 mm 48 inches deep by 76 mm 3 inches high. Scale must have 907 kg 2,000 pound capacity. Standard powder coating. Provide unit with wall mounted digital weight indicator; weighing and counting indicator must have 4 button keypad, dual weighing units, green LED display. 115 VAC, single phase with Battery backup.

][2.2.11 Item A1200, Lift System, Overhead, Patient Rooms

Provide ceiling mounted patient bedroom lift consisting of a motor driven lift unit that traverses on an "H" ceiling mounted track system.

a. Ceiling mounted track system: High strength extruded aluminum in manufacture's standard profile and thickness to support lifting capacity indicated for lift unit. Provide track shapes and accessories as required to provide a complete system in layout indicated on drawings.

b. Lift unit: Construct unit of a steel frame system (1000 kg 2205 pounds tested) driven by a gear reduced high torque motor. Unit must be in compliance with IEC 60601-1 Standard (or comparable UL).

(1) Lifting capacity: 249 kg 550 pounds minimum.

(2) Maximum lift range: 2438 mm 96 inches.

(3) Safety features:

(a) Emergency stopping device.

(b) Current limiter for circuit protection in case of overload

(c) Safety device that stops the motor to lift when batteries are low.

(d) Emergency lowering device, mechanical and electrical

(e) Control of lift strap

(f) Cut off angle: 45 degrees along the rail; 10 degrees across the rail.

(g) Hand held remote control

(h) Quick release trolley

(i) Entire external system (e.g. track, motor, strap, hanger) must be able to be cleaned according to infection control standards without the loss of strength and integrity of the system.

(j) Control unit: Dual control - hand control and on the motor.
(k) Continuous charging option.

(I) IQ technology

c. Spreader bar

(1) 6 point with spring loaded locking clips to secure sling loops

(2) Spreader bar must work for all lift and transfer tasks. 272 kg 600 pound

d. Batteries

(1) The batteries must be of deep discharge construction and must be non-proprietary.

(2) System must be capable of using batteries of same voltage and amp rating by different manufacturers without voiding the warranty.

e. Charger

(1) Charger input: 100-240 Vac 60 Hz

(2) Charger output: 27 Vdc, 1A max

(3) Continuous charge charging system.

f. Other system requirements:

(1) The system must operate in a smooth, consistent manner without and fast, slow or jerky starts and stops.

(2) Emergency lowering shall not require any special tools.

(3) Capable of adding scale to system. Capable of integrated scale.

g. Installation:

(1) Install ceiling mounted patient lift system as in accordance with manufacturer's instructions and under supervision of manufacturer's qualified representative.

(2) Contractor must provide all labor, materials, equipment, shipping and ancillary costs required for installation.

h. Test:

(1) Conduct a performance test on each lift system to show that the patient lift system equipment and control devices operate properly an in accordance with the design and specification requirements.

(2) Contractor must provide certifications for each lift system with the room number and building including a date and time and load test.

(3) Equipment certified after install. Certification must include weight test of maximum lift capacity plus 25 percent at the attachment point, otherwise 100 percent SWL. If the system fails,
Contractor must make all necessary adjustments and re-test within 7 business days.

i. Warranty:

(1) Provide motor with a two year warranty from date of final acceptance of the work. The warranty includes all travel and shipping costs associated with any warranty repair. Refer to Article WARRANTY in Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for additional requirements.

2.2.12 Item A1203, Lift System, Overhead, Bariatric

Ceiling mounted patient bedroom lift consisting of a motor driven lift unit that traverses on an "H" ceiling mounted track system.

a. Ceiling mounted track system: High strength extruded aluminum in manufacture's standard profile and thickness to support lifting capacity indicated for lift unit. Provide track shapes and accessories as required to provide a complete system in layout indicated on drawings.

b. Lift Unit: Construct unit of a steel frame system (1000 kg 2205 pounds tested) driven by a gear reduced high torque motor. Unit must be in compliance with IEC 60601-1 Standard (or comparable UL).

(1) Lifting capacity: 454 kg 1000 pounds minimum.

(2) Maximum lift range: 2438 mm 96 inches

(3) Safety features:

(a) Emergency stopping device.

(b) Current limiter for circuit protection in case of overload

(c) Safety device that stops the motor to lift when batteries are low.

(d) Emergency lowering device, mechanical and electrical

(e) Control of lift strap

(f) Cut off angle: 45 degrees along the rail; 10 degrees across the rail.

(g) Hand held remote control

(h) Quick release trolley

(i) Entire external system (e.g. track, motor, strap, hanger) must be able to be cleaned according to infection control standards without the loss of strength and integrity of the system.

(j) Control unit: Dual control - hand control and on the motor.

(k) Continuous charging option.

(l) IQ technology
c. **Spreader bar**
   
   (1) 6 point with spring loaded locking clips to secure sling loops
   
   (2) Spreader bar must work for all lift and transfer tasks. **272 kg** or **600 pound**

d. **Batteries**
   
   (1) The batteries must be of deep discharge construction and must be non-proprietary.
   
   (2) System must be capable of using batteries of same voltage and amp rating by different manufacturers without voiding the warranty.

e. **Charger**
   
   (1) Charger input: 100-240 Vac 60 Hz
   
   (2) Charger output: 27 Vdc, 1A max
   
   (3) Continuous charge charging system.

f. **Other system requirements:**
   
   (1) The system shall operate in a smooth, consistent manner without and fast, slow or jerky starts and stops.
   
   (2) Emergency lowering shall not require any special tools.
   
   (3) Capable of adding scale to system. Capable of integrated scale.

g. **Installation:**
   
   (1) Install ceiling mounted patient lift system as per manufacturer's instructions and under supervision of manufacturer's qualified representative.
   
   (2) Contractor must provide all labor, materials, equipment, shipping and ancillary costs required for installation.

h. **Test:**
   
   (1) Conduct a performance test on each lift system to show that the patient lift system equipment and control devices operate properly an in accordance with the design and specification requirements.
   
   (2) Contractor must provide certifications for each lift system with the room number and building including a date and time and load test.
   
   (3) Equipment certified after install. Certification must include weight test of maximum lift capacity plus 25 percent at the attachment point, otherwise 100 percent SWL. If the system fails, Contractor must make all necessary adjustments and re-test within 7 business days.

i. **Warranty:**
(1) Provide motor with a two year warranty from date of final acceptance of the work. The warranty includes all travel and shipping costs associated with any warranty repair. Refer to Article WARRANTY in Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for additional requirements.

][2.2.13  Item A1205, Lift System, Overhead, Patient Room with bath

Provide ceiling mounted patient bedroom lift consisting of a motor driven lift unit that traverses on an "H" ceiling mounted track system.

a. Ceiling mounted patient toilet lift consisting of an "I" ceiling mounted track system

b. Ceiling mounted track system: High strength extruded aluminum in manufacturer's standard profile and thickness to support lifting capacity indicated for lift unit. Provide track shapes and accessories as required to provide a complete system in layout indicated on drawings.

c. Lift unit: Construct unit of a steel frame system (1000 kg 2205 pounds tested) driven by a gear reduced high torque motor. Must be in compliance with IEC 60601-1 Standard (or comparable UL).

(1) Lifting capacity: 249 kg 550 pounds minimum.

(2) Maximum lift range: 2438 mm 96 inches

(3) Safety features:

(a) Emergency stopping device.

(b) Current limiter for circuit protection in case of overload

(c) Safety device that stops the motor to lift when batteries are low.

(d) Emergency lowering device, mechanical and electrical

(e) Control of lift strap

(f) Cut off angle: 45 degrees along the rail; 10 degrees across the rail.

(g) Hand held remote control

(h) Quick release trolley

(i) Entire external system (e.g. track, motor, strap, hanger) must be able to be cleaned according to infection control standards without the loss of strength and integrity of the system.

(j) Control unit: Dual control - hand control and on the motor.

(k) Continuous charging option.

(l) IQ technology
d. Spreader bar
   (1) 6 point with spring loaded locking clips to secure sling loops
   (2) Spreader bar must work for all lift and transfer tasks. (272 kg 600 pound)

e. Batteries
   (1) The batteries must be of deep discharge construction and must be non-proprietary.
   (2) System must be capable of using batteries of same voltage and amp rating by different manufacturers without voiding the warranty.

f. Charger
   (1) Charger input: 100-240 Vac, 60 Hz
   (2) Charger output: 27 Vdc, 1A max
   (3) Continuous charge charging system.

g. Other system requirements:
   (1) The system must operate in a smooth, consistent manner without and fast, slow or jerky starts and stops.
   (2) Emergency lowering shall not require any special tools.
   (3) Capable of adding scale to system. Capable of integrated scale.

h. Installation:
   (1) Install ceiling mounted patient lift system in accordance with manufacturer's instructions and under supervision of manufacturer's qualified representative.
   (2) Contractor must provide all labor, materials, tools, equipment, shipping and ancillary costs required for installation.

i. Test:
   (1) Conduct a performance test on each lift system to show that the patient lift system equipment and control devices operate properly in accordance with the design and specification requirements.
   (2) Contractor must provide certifications for each lift system with the room number and building including a date and time and load test.
   (3) Equipment certified after install. Certification must include weight test of maximum lift capacity plus 25 percent at the attachment point, otherwise 100 percent SWL. If the system fails, contractor will make all necessary adjustments and re-test within 7 business days.

j. Warranty:
(1) Provide motor with a two year warranty from date of final acceptance of the work. The warranty includes all travel and shipping costs associated with any warranty repair. Refer to Article WARRANTY in Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for additional requirements.

]2.2.14 Item A4015, Clock, Elapsed Time, Electric

Clock/Timer must be combination four digit time of day clock, elapsed time indicator or date display. 12 or 24-hour format. Electrical requirements: 120 volt, 60 Hz, single phase. Digits must be 13 mm 1/2 inch, vacuum fluorescent blue/green in color on black background, with readability beyond 6.1 m 20 feet and a viewing angle greater than 60 degree either side of normal viewing place. External line voltage power loss of less than 60 seconds must not effect time-of-day, elapsed time or day settings to permit transfer between standard line voltage power source and critical branch line voltage power source. Clock/timer internal power source must not be replaceable battery type and must maintain time accuracy during external loss. Remote control for all functions except Self-Test and Code Blue. Approximate size: 114 mm 4-1/2 inches high by 229 mm 9 inches wide by 64 mm 2-1/2 inches deep.

]2.2.15 Item A6010, Bumper, Wall, Bed Locator

Bed locator wall bumper. Construct of rigid vinyl over heavy gauge aluminum. Approximate size: 1270 mm 50 inches long by 610 mm 24 inches high. Depth: 64 mm to 127 mm 2-1/2 inches to 5 inches.

]2.2.16 Item L9711, Table, Autopsy, Stationary-Fixed-Height

Provide stationary autopsy table on pedestal. Construct the stationary service center of Type 304 welded and polished No. 4 stainless steel. Equip pedestal with mounting flanges. Provide unit with integrated sink, waste disposer, grid plates and perimeter downdraft. Factory install plumbing and electrical with single point connections. Provide GFCI duplex receptacle with waterproof cover. Provide backflow protection. Provide heavy duty 1/2 horsepower with switch. Sink size approximately: 356 mm by 305 mm by 203 mm 14 inches by 12 inches by 8 inches deep with spray hose assembly with cold water control valve, nozzle and 3.05 m 10 foot of flexible house. Mixing faucet with gooseneck spout and wrist blades. Provide with integral downdraft ventilation. Provide four grid plates constructed of 1.27 mm 18-gauge, Type 304 stainless steel with No. 4 finish, perforated and removable. Overall approximate size: 813 mm 32 inches wide by 2642 mm 104 inches long by 889 mm 35 inches high.

]2.2.17 Item L9712, Table, Autopsy, Stationary-Elevating

Provide height adjustable autopsy table on pedestal. Construct the height adjustable service center of Type 304 welded and polished No. 4 stainless steel. Equip pedestal with mounting flanges. Height must be adjustable by a hydraulic mechanism, capable of lifting maximum of 227 kg 500 pounds approximately 203 mm 8 inches. Provide unit with integrated sink, waste disposer, grid plates and perimeter downdraft. Factory install plumbing and electrical with single point connections. Provide GFCI duplex receptacle with waterproof cover. Provide backflow protection. Provide heavy duty 1/2 horsepower waste disposer with switch. Sink size approximately: 356 mm by 305 mm by 203 mm 14 inches by 12 inches by 8 inches deep with spray hose assembly with cold water control valve, nozzle and 3.05 m 10 foot of flexible house. Mixing faucet with gooseneck spout and
wrist blades. Provide with integral downdraft ventilation. Provide four grid plates constructed of 1.27 mm 18-gauge, Type 304 stainless steel with No. 4 finish, perforated and removable. Overall approximate size: 813 mm 32 inches wide by 2462 mm 104 inches long by 889 mm 35 inches high.

2.2.18 Item L9715, Table, Autopsy, Mbl, w/Stationary Service Center

Provide mobile autopsy table with stationary service center. Construct the mobile autopsy table of Type 304 welded and polished stainless steel. Provide with a hand crank to adjust pitch position, a lower rollout tray. Legs are 38 mm 1-1/2 inch square stainless steel, and all swivel casters are 203 mm 8 inches with locks and wheel brakes. Approximate size: 610 mm 24 inches wide by 2438 mm 96 inches long. Height adjustable up to 953 mm 37-1/2 inches high.

The stationary service center is equipped with operator work facilities. Construct of Type 304 welded and polished stainless steel. Provide unit with the legs, feet, sink basin, drainboards and back splash, including water powered vacuum generator with built in vacuum breaker, water service control, mixing faucet, sink faucet, table flushing system, dissecting trays, water proof electrical outlet, switches and lighting. Approximate size: 2438 mm wide by 711 mm deep by 864 mm 96 inches wide by 28 inches deep by 34 inches high.

2.2.19 Item L9720, Station, Pathology, Gross

Provide pathology gross station. Unit size: 1219 mm 48 inches wide by 711 mm 28 inches deep by 232 mm 80 inches high. Provide unit with height adjustable stand with extruded aluminum frame and stainless steel shelf and back panel.

Power Requirements: 115 volt, 60 Hz. Two hospital grade duplex ground fault circuit interrupter receptacles.

Duct adaptor for connection to facility exhaust. Fume removal must be quiet, measuring less than 65 decibels.

Sink is 406 mm 16 inches wide by 305 mm 12 inches deep by 203 mm 8 inches high with rapid positive drain. Vacuum breaker protected cold water faucet with hands free infrared signal with manual override capability. Provide hand spray unit with stainless steel head. Dissection board must slope into sink, and faucet must include wrist blades. Provide paper towel holder above sink.

Microprocessor must be included for clock time and filter replacement alarm.

Provide three removable perforated grid plates on the flat stainless steel work surface.

Provide unit with magnetic tool bar, integral centimeter rulers, tea strainer, paper towel dispenser, side mounted magnifier lamp, and splash shield.

2.2.19.1 Exhaust System

Hood must be rated to provide 30.48 m/minute 100 feet per minute face velocity across hood with an quantity of 11.3 cm/m 400 CFM. Maximum air static pressure loss must not exceed 0.37 kPa 1.15 inches H20 W.G. Provide electronic airflow status monitoring system mounted to front of hood.
Provide monitoring system with an electronic analog gage indicating actual face velocity, pilot lights indicating (green) normal operating status, and (red) alarm; low exhaust flow status. Furnish with 20 amp dry type contacts; one set for normal status, and one set for alarm status for use by laboratory airflow control system. Furnish with normal and alarm pilot lights, 65 db chime alarm and push to silence button.

][2.2.20  **Item M5015**, Desk, Refraction, w/Sink, 33 by 92 by 25

Provide ophthalmic refraction desk with control systems and sink cabinet. Provide unit with three rechargeable instrument wells, two accessory switches, five switch control panel for interior room lights with separate on/off dimmer control for room lights, trial lens drawer with full suspension, in-direct ophthalmoscope control with hanger and overhead lamp. Sink cabinet must include stainless steel sink, gooseneck faucet with wrist blades. Approximate size: **2235 mm 88 inches** wide by **508 mm 20 inches** deep / **813 mm 32 inches** deep by **813 mm 32 inches** high. Electrical: 120 Volts, 15 amp, 60 HZ. Cabinet must not be constructed separately by millwork manufacturer.

][2.2.21  **Item M5016**, Desk, Refraction w/console, w/o Sink

Provide ophthalmic refraction desk with control systems. Provide unit with three rechargeable instrument wells, two accessory switches, separate on/off dimmer control for room lights, trial lens drawer, in-direct ophthalmoscope control with hanger and overhead lamp. Approximate size: **1473 mm 58 inches** wide by **508 mm 20 inches** deep / **813 mm 32 inches** deep by **813 mm 32 inches** high. Electrical: 120 Volts, 15 amp, 60 HZ. Cabinet must not be constructed separately by millwork manufacturer.

][2.2.22  **Item M8075**, Lift, Patient, Physical Therapy

Provide physical therapy patient lift. Construct of passivated stainless steel, bolted to the floor with heavy duty base. Unit to provide **181 kg 400 pound** minimum lifting capacity. Provide adjusted padded headrest, seat with lumbar support, polyethylene swing out footrest with non-slip surface, flip up outer arm, and adjustable height control valve.

][2.2.23  **Item M8930** Suspension Unit, Utility, Ceiling, Microsurgery

Provide microsurgery ceiling suspension arm consisting of a ceiling mounted column with a power supply unit and a hydraulic control/pumping system. The unit to have a track or ceiling plate providing free movement with hand or foot switch. Provide power supply and hydraulic control system as required in drawings.

][2.2.24  **Item M9085** Table, Operating, Floor mounted

Provide floor mounted operating table. Construct table top, side rails and base column of stainless steel. Table top is divided symmetrically divided and can be adjusted using plug in modules. Electromechanical controls, controlled gentle start up, hand controller to return to last patient position, controller to store up to 10 patient positions, support plates to be removed without tools, dual arm support section and hybrid cushioning with electrical discharging capacity. Electro-powered drive provides longitudinal shift with back plate up or down and leg plates up or down. Approximate size: **2057 mm 81 inches** long by **584 mm 23 inches** wide.
][2.2.25  **Item R8000**, Refrigerator, Morgue, 4 Cadaver, 76 by 73 by 96

Provide four cadaver mortuary refrigerators. The exterior front must be 0.032 Type 304 stainless steel with a No. 4 finish. Construct top, sides and back shall be 0.4 mm 26 gauge stucco embossed aluminum.

Approximate Size: 1829 mm 72 inches wide by 2438 mm 96 inches deep by 2007 mm 79 inches high.

Insulation: 102 mm 4 inch foamed in place urethane (UL listed, Class 1).

Doors: Four 686 mm 27 inches by 559 mm 22 inches, flush style with magnetic gasket.

Lighting: Four door controlled light switch and one vaporproof light.

Refrigeration: Condensing unit, 0.56 kw 3/4 hp air cooled with R404 refrigerant. Cooling unit - automatic off-cycle. Operating temperature 3.3 degrees C 38 degrees F.

Electrical: 208/230 volts, 50/60 Hz, single phase.

][2.2.26  **Item R8200**, Refrigerated Room, Mortuary, 3 Cart

Provide walk-in 3 cart mortuary refrigerated room. The exterior front must be 0.032 Type 304 stainless steel with a No. 4 finish. Construct top, sides and back 0.4 mm 26 gauge stucco embossed aluminum. Operating temperature of: 3.9 degrees C 39 degrees F.

Approximate Size: 2946 mm 116 inches wide (front) by 2692 mm 106 inches deep (side) by 2616 mm 103 inches high.

Doors: 1219 mm 48 inches wide by 1981 mm 78 inches high swing out type. Magnetic gasket must be provided on both sides and top of door. Hinges must be polished chrome, strap type with cam-left hinges. Door latch must be polished chrome with provisions for locking and a safety release to prevent entrapment of personnel within the box. View window: approximately 356 mm by 356 mm 14 inch by 14 inch.

Insulation: 102 mm 4 inch foamed in place Class 1 foam.

Exterior Ramp: Heavy usage roll-in traffic ramp. It must provide flush entrance, have non-skid strips and fasten to front of the walk-in floor. Ramp must be as wide as the door and 660 mm 26 inches deep minimum.

Lighting: One pre-installed vapor proof light must be provided.

Provide for 3 cart capacity. Provide a one manual cadaver lift, three carriers and three stainless steel trays.

Refrigeration: Air cooled condensing unit, welded hermetic compressor. Condensing unit must be UL listed. Refrigeration system must be factory assembled and pre-charged. Provide unit with evaporator mounting kit, sight glass, expansion valve, liquid line filter drier and control. R404 Refrigerant.

Electrical: 208 volts, 60 Hz, single phase
Item R8205, Refrigerated Room, Mortuary, 4 Cart

Provide walk-in 4 cart mortuary refrigerated room. The exterior front must be 0.032 type 304 stainless steel with a No. 4 finish. Top, sides and back must be 0.4 mm 26 gauge stucco embossed aluminum. Operating temperature: 3.9 degrees C 39 degrees F.

Approximate Size: 2896 mm 114 inches wide (front) by 4877 mm 192 inches deep (side) by 2616 mm 103 inches high.

Doors: 1219 mm 48 inches wide by 1981 mm 78 inches high swing out type. Magnetic gasket must be provided on both sides and top of door. Hinges must be polished chrome, strap type with cam-left hinges. Door latch must be polished chrome with provisions for locking and a safety release to prevent entrapment of personnel within the box. View window: approximately 356 mm by 356 mm 14 inch by 14 inch.

Insulation: 102 mm 4 inch foamed in place Class 1 foam.

Exterior Ramp: Heavy usage roll-in traffic ramp. It shall provide flush entrance, have non-skid strips and fasten to front of the walk-in floor. Ramp shall be as wide as the door and 660 mm 26 inches deep minimum.

Lighting: One pre-installed vapor proof light shall be provided.

Provide for 4 cart capacity.

Provide a one manual cadaver lift, two, two tier carriers and four stainless steel trays.

Refrigeration: Air cooled condensing unit, welded hermetic compressor. Condensing unit must be UL listed. Refrigeration system must be factory assembled and pre-charged. Provide unit with evaporator mounting kit, sight glass, expansion valve, liquid line filter drier and control. R404 refrigerant.

Electrical: 208 volts, 60 Hz, single phase.

Item R8210, Refrigerated Room, Mortuary, 5 Cart

Provide walk-in 5 cart mortuary refrigerated room. The exterior front shall be 0.032 type 304 stainless steel with a No. 4 finish. Top, sides and back shall be 0.4 mm 26 gauge stucco embossed aluminum. Operating temperature: 3.9 degrees C 39 degrees F.

Approximate size: 2896 mm 114 inches wide (front) by 4877 mm 192 inches deep (side) by 2616 mm 103 inches high. Doors: 1219 mm 48 inches wide by 1981 mm 78 inches high swing out type. Magnetic gasket shall be provided on both sides and top of door. Hinges shall be polished chrome, strap type with cam-left hinges. Door latch shall be polished chrome with provisions for locking and a safety release to prevent entrapment of personnel within the box. View window: approximately 356 mm by 356 mm 14 inch by 14 inch.

Insulation: 102 mm 4 inch foamed in place Class 1 foam.

Exterior Ramp: Heavy usage roll-in traffic ramp. It must provide flush entrance, have non-skid strips and fasten to front of the walk-in floor. Ramp must be as wide as the door and 660 mm 26 inches deep minimum.
Lighting: One pre-installed vapor proof light must be provided. Provide for 5 cart capacity. Provide a one manual cadaver lift, three two tier carriers and five stainless steel trays.

Refrigeration: Air cooled condensing unit, welded hermetic compressor. Condensing unit must be UL listed. Refrigeration system must be factory assembled and pre-charged. Provide unit with evaporator mounting kit, sight glass, expansion valve, liquid line filter drier and control. R404 refrigerant.

Electrical: 208 volts, 60 Hz, single phase.

[2.2.29 Item R8215, Refrigerated Room, Mortuary, 6 Cart]

Provide walk-in 6 cart mortuary refrigerated room. The exterior front must be 0.032 Type 304 stainless steel with a No. 4 finish. Top, sides and back must be 0.4 mm 26 gauge stucco embossed aluminum. Operating temperature: 4 degrees C 39 degrees F.

Approximate Size: 4115 mm 162 inches wide (front) by 4877 mm 192 inches deep (side) by 2616 mm 103 inches high.

Doors: 1219 mm 48 inches wide by 1981 mm 78 inches high swing out type. Magnetic gasket must be provided on both sides and top of door. Hinges must be polished chrome, strap type with cam-left hinges. Door latch must be polished chrome with provisions for locking and a safety release to prevent entrapment of personnel within the box. View window: approximately 356 mm by 356 mm 14 inch by 14 inch.

Insulation: 102 mm 4 inch foamed in place Class 1 foam.

Exterior Ramp: Heavy usage roll-in traffic ramp. It must provide flush entrance, have non-skid strips and fasten to front of the walk-in floor. Ramp must be as wide as the door and 660 mm 26 inches deep minimum.

Lighting: One pre-installed vapor proof light must be provided. Provide for 6 cart capacity. Provide a one manual cadaver lift, three two tier carriers and six stainless steel trays.

Refrigeration: Air cooled condensing unit, welded hermetic compressor. Condensing unit must be UL listed. Refrigeration system must be factory assembled and pre-charged. Provide unit with evaporator mounting kit, sight glass, expansion valve, liquid line filter drier and control. R404 refrigerant.

Electrical: 208 volts, 60 Hz, single phase.

]PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.
3.2 INSTALLATION

Install equipment at locations indicated in accordance with manufacturer's printed installation instructions, Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT, and approved detail drawings. Submit detail drawings specifically prepared to illustrate required work for each item of equipment that interfaces with other items of equipment or construction, including, but not limited to, installation layout, coordination of equipment services, [drain piping connections,] [complete electrical wiring and control diagrams,] and details of construction and rough-in requirements. Furnish and install necessary items such as framing, mounting hardware and trim shall be furnished and installed as required for the type of equipment furnished.

3.3 ADJUSTING

Following installation, adjust flows, timers, levelers, and similar components and operation devices as appropriate. After testing, and before acceptance, examine equipment to ensure that adjustments are correct and that any additional adjustments deemed necessary during product testing, have been incorporated.

3.3.1 Ceiling Mounted Patient-Life Systems

Install tracks level and plumb, according to manufacturer's written instructions.

a. Support track directly from overhead supplementary framing using manufacturer's standard supports, anchors, and fasteners at intervals required by lifting capacity indicated, but not less than 914 mm 36 inches o.c.

b. Brace direct-to-structure track supports where distance between suspended ceiling and anchors is more than 457 mm 18 inches.

c. Provide supports at each track end, splice, and tangent point of each corner.

d. Install track accessories, splices, end caps, connectors, coupling and joining devices, and other accessories as required for a secure and operational installation.

3.4 UTILITIES

3.4.1 Service Runs

Connect service runs from equipment to building services as indicated.

3.4.2 Dissimilar Metal Connectors

Provide connections between ferrous and nonferrous metallic pipe with dielectric waterways and flanges. Provide dielectric waterways with temperature and pressure rating equal to or greater than that specified for the connecting piping. Provide waterways with metal connections on both ends suited to match connecting piping. Internally line dielectric waterways with an insulator specifically designed to prevent current flow between dissimilar metals. Dielectric flanges meet the performance requirements described herein for dielectric waterways.
3.5 MANUFACTURER'S FIELD SERVICES

Provide the services of a manufacturer's representative [, in conjunction with] [, in addition to] [the Contractor's Equipment Planner,][and] [the Contractor's Biomedical Equipment Technician,] [the Government's Biomedical Equipment Technician,] who is experienced in the installation, adjustment, and operation of the equipment specified, and responsible for supervising the installation, adjustment, and testing of the equipment.

3.6 FIELD TESTS AND INSPECTIONS

3.6.1 Before Testing

Clean pipes, equipment and components of grease, dirt, stains, and other foreign materials.

3.6.2 Testing

Perform testing in accordance with manufacturer's written instructions. Unless otherwise approved by the Contracting Officer, test all items of equipment to ensure that they are operational and installation conforms to specification requirements. Hydrostatically test piping system at pressure of 1.5 times system operating pressure with water at temperature not exceeding \(38 \text{ degrees C} \rightarrow 100 \text{ degrees F}\). Before test, remove or isolate gage traps and apparatus that may be damaged by that pressure. Install calibrated test gage in system to observe any loss of pressure. Close off system and maintain test pressure for not less than one hour. Inspect joints and equipment connections for leaks. Retest and make repair until no further leaks are observed. Each test report must indicate compliance with specified performance criteria and the final position of controls.

3.6.3 Inspection

Examine each item for visual defects and conformance to specifications.

3.7 CLEANING

3.7.1 For Final Acceptance

Remove labels, fingerprints, and clean all surfaces both inside and out. Tightly cover and protect fixtures and equipment against rust, dirt, water, and chemical or mechanical injury.

3.7.2 Marred Surfaces Exposed-to-View

Refinish marred exposed surfaces that affect appearance, such as both interior and exterior cabinet finishes, to match the adjacent finishes, like new; replace components that cannot be refinished in this manner.

3.7.3 Concealed Marred Surfaces

Refinish marred surfaces exposed to atmosphere, where such surfaces do not affect product's appearance but do affect resistance to elements, such as galvanized pipes and insulation, to equal resistance performance as the unmarred surfaces.
3.8 TRAINING

3.8.1 Training Course

Conduct training course for operation staff as designated by the Contracting Officer. Start the training period, for a total of [_____] hours of normal working time, after systems are functionally complete but prior to final acceptance. The field instructions must include all of the items contained in the approved operations and maintenance data, as well as demonstrations of routine maintenance operations. Notify Contracting Officer at least 14 days prior to date of the training course.

[3.8.1.1 Government's Biomedical Equipment Technician Training

Include operator's training for one Biomedical Equipment Technician (BMET) for each procured equipment item.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for dental equipment including dental operating lights and similar related dental equipment.

This Section refers to Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for general requirements; always include Section 11 70 00 when this Section is used.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 RELATED REQUIREMENTS

The requirements of Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT apply to this Section.
1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.
**************************************************************************
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Submit Data Package 3, including training requirements, for each item of equipment listed above in accordance with requirements of Section 01 78 23 OPERATION AND MAINTENANCE DATA. In addition, provide hard copies consisting of two Operator's Manuals and two Service Manuals.

1.4 WARRANTY

[Provide warranties as specified in this Section. ]Refer to Article WARRANTY in Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT for [additional] requirements.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Stainless Steel

Class 301, 302, or 304. Provide exposed surfaces with a No. 4 finish.

2.1.2 Aluminum Alloy

ASTM B221M ASTM B221; provide alloy equivalent in ultimate tensile, yield, and shear strengths to Alloy 6063-T5 or 6063-T6, as applicable.
2.1.3 Carbon Steel

ASTM A568/A568M; cold-rolled, stretcher level sheets 1.5 mm thick 16 gage and lighter with a commercial bright finish.

NOTE: Select project-specific equipment items from the list below and delete equipment items not used. Additional equipment items may be added as required to suit project-specific conditions.
**************************************************************************

2.2 EQUIPMENT

[2.2.1 Item D0750, Tank Assembly, Boilout
Cabinet mounted, drop-in boilout tank assembly. Single Stainless steel tank. Approximate size: 254 mm 10 inches wide by 356 mm 14 inches deep by 305 mm 12 inches high. Installed in steel cabinet. Includes cover, gas burner, rectifier, and adjustable thermostat. Electrical requirements: [110 volts 50/60 Hz].
]

[2.2.2 Item D0753, Tank Assembly, Curing
Cabinet mounted, drop-in curing tank. Single Stainless steel tank. Approximate size: 254 mm 10 inches wide by 356 mm 14 inches deep by 305 mm 12 inches high. Installed in steel cabinet. Includes cover, gas burner, rectifier, and adjustable thermostat. Electrical requirements: [110 volts 50/60 Hz].
]

[2.2.3 Item D0755, Assembly, Boilout/Curing, Double
Double tank boilout/curing unit. Two 18 gauge stainless steel tanks: 254 mm 10 inches by 356 mm 14 inches by 305 mm 12 inches deep and 254 mm 10 inches by 356 mm 14 inches by 254 mm 10 inches deep with inside handles. Electrical requirements: 208 volts 50/60 Hz. Steel cabinet and stainless steel countertop included. Includes a backshelf and fifth spout. This should be provided together as one product. Cabinet must not be constructed separately by millwork manufacturer. Approximate Cabinet size 914 mm 36 inches wide by 787 mm 31 inches deep 940 mm 37 inches high.
]

[2.2.4 Item D0760, Guard, Casting Machine
Casting machine guard and rim. Provide the well of the guard minimum 330 mm 13 inches deep and 483 mm 19 inches in diameter. Construct the well of heavy duty rust resistant steel with a rim to align the guard to the casting cabinet working surface. Construct base of steel and fiberboard for attachment to workbench.
]

[2.2.5 Item D0880, Blast Gate, Vacuum System
Vacuum Blast gate. Compatible with bench or central vacuum system. Includes sliding open-close panel in a frame. Mount the gate in the vertical face of a laboratory bench service ledge. Includes front and back flanges adaptable to 76 mm 3 inch hoses in the vacuum system. Provide baked enamel finish.
2.2.6 Item D0900, Workstation, Dental Lab, Receiving

Modular lab receiving workstation. Floor mounted stand consists of a 610 mm 24 inch wide base cabinet unit with four equal drawers, a 610 mm 24 inch wide single or double door base cabinet unit with an adjustable shelf and a 1880 mm 74 inch wide laminate counter supported by the two base cabinets. Provide an under counter 610 mm 24 inch wide single drawer unit between the two cabinets. Provide countertop 610 mm 24 inches deep, high pressure laminate.

2.2.7 Item D0904, Workstation, Tech, Dental, Lab, Single Station

Single, self-contained, modular technician workstation with utility connections for air, gas, and electric. Approximate size: 1219 mm 48 inches wide by 610 mm 24 inches deep by 864 mm 34 inches high without light structure.

a. Load bearing steel frame on adjustable legs with end panels and supports.

b. Overhead color corrected task lighting.

d. Dust extraction unit with support frame for waste drawer, filter drawer with Motor, Suction Hood.

e. Bench top includes one storage cabinet with four drawers and instrument inserts, one stainless steel debris drawer and a cast cement / fiberglass countertop; case pan shelf system with shelf and supports.

f. Gas pipeline connection with stop valves; compressed air connection with stop valves; and pressure reducing valve.

g. Electrical requirements: [110 volts 50/60 Hz].

2.2.8 Item D0905, Workstation, Dental Lab, Four Station

Four station, self-contained, modular technician workstation with utility connections for air, gas, and electric. Approximate size of each station: 1219 mm 48 inches wide by 610 mm 24 inches deep by 864 mm 34 inches high without light structure. Overall approximate size: 2438 mm 96 inches wide by 1219 mm 48 inches deep by 864 mm 34 inches high without light structure. Each station should include:

a. Load bearing steel frame on adjustable legs with end panels and supports.

b. Overhead color corrected task lighting.

d. Dust extraction unit with support frame for waste drawer, filter drawer with Motor, Suction Hood.

e. Bench top includes one storage cabinet with four drawers and instrument inserts, one stainless steel debris drawer and a cast cement /
fiberglass countertop; case pan shelf system with shelf and supports.

f. Gas pipeline connection with stop valves; compressed air connection with stop valves; and pressure reducing valve.

g. Electrical requirements: [110 volts 50/60 Hz].

}[2.2.9 Item D0910, Workstation, Dental Lab, Metal Grinding

Modular metal grinding dental lab workstation. Includes a full-length load-bearing steel frame, adjustable legs, end panels and supports, a 3-drawer storage cabinet, a 4-drawer storage cabinet with instrument inserts, a cast cement/fiberglass countertop, overhead task lighting (3000 Lux, natural daylight), and an air gun and a dust extraction unit. Approximate dimensions: 1219 mm 48 inches wide by 610 mm 24 inches deep by 813 mm 32 inches high. Electrical requirements: [110 volts 50/60 Hz].

}[2.2.10 Item D0915, Workstation, Dental Lab, Ceramic, Modular

Modular ceramic dental lab workstation. Includes a full-length load-bearing steel frame, adjustable legs, end panels and supports, a 610 mm 24 inch wide extension table, a 4-drawer storage cabinet with instrument inserts, a 4-drawer storage cabinet with inserts, a cast cement/fiberglass countertop, overhead task lighting (3000 Lux, natural daylight), an air gun and a micro-filter (ceramic) extraction unit debris drawer. Approximate overall dimensions: 2134 mm 84 inches wide by 610 mm 24 inches deep by 813 mm 32 inches high. Electrical requirements: [110 volts 50/60 Hz].

}[2.2.11 Item D0920, Workstation, Dental Lab, Floor Standing

Floor standing ceramic workstation. Includes two floor standing cabinets with adjustable shelves, a floor standing cabinet with four equal drawers and inserts, and a stainless steel sink with faucet and a 610 mm 24 inch deep stainless steel or plastic laminate counter top. Approximate sink size: 406 mm 16 inches long by 406 mm 16 inches wide by 406 mm 16 inches deep. Approximate dimensions: 1067 mm 42 inches wide by 762 mm 30 inches deep by 813 mm 32 inches high.

}[2.2.12 Item D0925, Hood, Fume, Dental Acrylic, Floor Standing

Floor-standing dental acrylic fume hood. Construct of PVC plastic/fiberglass liner. Includes built-in lighting, an extraction fan with blower vented to atmosphere, water channel, polypropylene 76 mm 3 inch by 152 mm 6 inch cup sink, 110 electrical duplex receptacle and counter-balanced tempered glass vertically sliding front protective window. Fume hood approximate dimensions: 1194 mm 47 inches wide by 635 mm 25 inches deep by 1346 mm 53 inches high. Include cabinet base with work surface. Base cabinet approximate dimensions: 1219 mm 48 inches wide by 610 mm 24 inches deep by 914 mm 36 inches high (or 787 mm 31 inches for ADA). Cabinet supports up to 363 lbs 800 pounds. Construct of epoxy coated steel. Includes two manual closing doors and filler panel to increase cabinet depth to 762 mm 30 inches. Provide work surface with plumbing access openings.

}[2.2.13 Item D0930, Workstation, Dental Lab, Casting

Floor standing casting dental lab workstation. Approximate dimensions: 1854 mm 73 inches wide by 660 mm 26 inches deep by 864 mm 34 inches high. Includes:
a. Full Length load bearing steel support frame on adjustable legs with end panels and supports.

b. Stainless steel wall shelf with brackets. 1219 mm 48 inches wide by 406 mm 16 inches deep.

c. Built in soldering unit.

d. Gas pipeline connection.

e. Compressed air connection.

f. Pull out casting ring cooling drawer with steel grid.

g. Soap Stone counter top.

h. Exhaust to atmosphere extraction Hood. 1829 mm 72 inches wide by 610 mm 24 inches deep. Provide stainless steel hood. Includes start delay and timer.

][2.2.14  Item D0935, Workstation, Dental Lab, Investment

Floor standing Investment dental lab workstation. Includes storage cabinet with door, sink base cabinet with door, storage cabinet with three drawers. Drawers: one 51 mm 2 inches and two equal sized. Waste disposal cabinet, with knife scrapper. Stainless steel counter top, 610 mm 24 inches deep. Stainless steel sink, 406 mm 16 inch wide by 406 mm 16 inch long by 191 mm 7-1/2 inch deep with plaster trap. Front panel with air nozzle. Approximate dimensions: 2464 mm 97 inches wide by 610 mm 24 inches deep.

][2.2.15  Item D0940, Workstation, Dental Lab, Equipment Bench

Modular investment equipment workstation. Includes two floor-mounted single or one double door storage cabinet with two adjustable shelves and a cast cement/fiberglass counter top. Approximate dimensions: 1219 mm 48 inches wide by 610 mm 24 inches deep by 914 mm 36 inches high (787 mm 34 inches high for ADA).

][2.2.16  Item D0942, Workstation, Dental Lab, Microblasting

Microblasting Dental Lab Workstation with dust collector. Includes:

a. Load bearing steel support frame with end panels and supports.

b. Interior space: 0.062 cubic meter 2.2 cubic feet, 610 mm 24 inches wide by 254 mm 10 inches high by 356 mm 14 inches deep.

c. Window: tempered glass opening (hinged) 584 mm 23 inches by 279 mm 11 inches.

d. Lighting: 40 watt cool white fluorescent lamp.

e. Approximate dimensions: 762 mm 30 inches wide by 864 mm 34 inches deep by 1168 mm 46 inches high.

][2.2.17  Item D0945, Workstation, Dental Lab, Surveying / Milling

Floor standing surveying and milling dental laboratory workstation.
Includes three 610 mm 24 inch wide single floor cabinets with one adjustable shelf each, a 610 mm 24 inch wide floor cabinet with four equal drawers, two 610 mm 24 inch wide undercounter single drawer units, end panels and a 610 mm 24 inch deep plastic laminate countertop.

Approximate dimensions: 3658 mm 144 inches long by 610 mm 24 inches deep by 864 mm 34 inches high.

][2.2.18  Item D0950, Workstation, Dental Lab, Acrylic Processing

Modular acrylic processing dental lab workstation. Includes one 610 mm 24 inch wide double door base cabinet with one adjustable shelf, one 610 mm 24 inch wide base cabinet with five drawers, one 610 mm 24 inch wide base cabinet with three equal drawers and a 610 mm 24 inch deep plastic laminate countertop.

Approximate dimensions: 2438 mm 96 inches long by 610 mm 24 inches deep by 864 mm 34 inches high.

][2.2.19  Item D0960, Workstation, Dental Lab, Plaster

Dental lab plaster workstation, 3658 mm 144 inches wide by 610 mm 24 inches deep by 940 mm 37 inches high. Includes:

a. Stainless steel counter top.

b. Stainless steel sink.

c. Counter mounted plaster waste disposal with knife scraper.

d. Trimmer console for rinser bath.

e. Two mixing faucets for cold and warm water.

f. Two plaster traps, one at each sink; plaster trap is 483 mm 19 inches in diameter by 521 mm 20-1/2 inches tall.

g. Panel with air gun module.

h. Pressure reducing valve.

i. Connection kits for sink and rinsing bath.

j. Two 457 mm 18 inches wide floor mounted base cabinets with four drawers.

k. One 1219 mm 48 inch wide floor mounted sink base cabinet, half of cabinet has one single 610 mm 24 inch wide door and the other half has two 610 mm 24 inch wide stacked drawers for housing the rinsing bath.

l. One 610 mm 24 inch wide floor mounted sink base cabinet with door, for housing the sink.

m. Two 457 mm 18 inch single doors base cabinet with one adjustable shelf each.

n. One floor mounted waste disposal base cabinet with waste container.

o. Four ground fault receptacles, 15 amp.
2.2.20 Item D0970, Workstation, Dental Lab, Polishing, 2 Station

Modular two station polishing workstation. Includes:

b. Two polishing hoods with Polishing Motor: No 26 Red wing, two speed lathe.

c. Suction Capacity: 170 cubic meter/min 600 CFM.

d. Filter Area: 5.8 square meters 62 Square feet, 24 shakable cloth filter bags.

e. Cleaning: External foot shaker, internal cabinet dust tray, self contained dust collector with lathe.

f. Approximate unit dimensions: 1422 mm 56 inches high by 813 mm 32 inches to 1219 mm 48 inches wide by 457 mm 18 inches to 610 mm 24 inches deep. Stainless steel work surface with rolled edges approximately 1016 mm 40 inches to table top, adjustable table frame.

g. Over top lighting.

h. Finish: baked coating.

i. Electrical requirements: [110 Volts 50/60 Hz].

2.2.21 Item D0975, Workstation, Dental Lab, Die Trimming

Modular die trimming dental lab workstation. Includes full-length load bearing steel frame, adjustable legs with end panels and supports, overhead task lighting (3000 Lux, natural daylight), two storage cabinets with four drawers and inserts, an adjustable air pressure and air gun, a dust extraction unit with particle filter, a collection hood and stainless steel debris drawer and a cast cement/fiberglass countertop. Approximate dimensions: 1067 mm 42 inches wide by 762 mm 30 inches deep by 813 mm 32 inches high. Electrical requirements: [110 volts 50/60 Hz].

2.2.22 Item D6155, Light, Dental, Operating, Ceiling, Column

Ceiling mounted LED dental operating light used to illuminate the field of work for the dentist.

Provide 76 mm 3 inch by 152 mm 6 inch light pattern with uniform intensity. Long depth of field generated within 457 mm 18 inch to 914 mm 36 inchrange. Vibration and shock resistant. Third axis rotation. Provide flex arm capable of movement travel up to 40 degrees above and below horizontal and up to 27 degrees vertically. 5000 degree and 4200 degree Kelvin selections with high/medium/low intensity settings. Electrical requirements: [110 Volts 50/60 Hz].

2.2.23 Item D7090, Utility Center, Dental, Floor Mounted

Surface mounted dental utility center floor box by the same manufacturer as
the Government provided dental chair that it interfaces with. Coordinate with the Government prior to purchasing. Contractor required to coordinate all final connections to dental operating system. Provide air shut off valve, electrical receptacle box, oral evacuation and stub ups for communication cables. Refer to plumbing, electrical, and communication drawings for location and specific connections.

Provide cover box approximately 432 mm 17 inches long by 356 mm 14 inches wide by 127 mm 5 inches high. Unit includes a contoured floor box frame and a contoured floor box cover.

[2.2.24 Item D8650, Chute, Waste, Plaster, Counter Mounted

Counter mounted plaster waste chute. Construct of stainless steel and shaped round or square. Includes a scraper bar. Approximate size: 152 mm 6 inch diameter by 102 mm 4 inches deep.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 INSTALLATION

Install equipment at locations indicated in accordance with manufacturer's printed installation instructions, Section 11 70 00 GENERAL REQUIREMENTS FOR MEDICAL AND DENTAL EQUIPMENT, and approved detail drawings. Submit detail drawings specifically prepared to illustrate required work for each item of equipment that interfaces with other items of equipment or construction, including, but not limited to, installation layout, coordination of equipment services, [drain piping connections,] [complete electrical wiring and control diagrams,] and details of construction and rough-in requirements. Furnish and install necessary items such as framing, mounting hardware and trim as required for the type of equipment furnished.

3.3 ADJUSTING

Following installation, adjust flows, timers, levelers, and similar components and operation devices as appropriate. After testing, and before acceptance, examine equipment to ensure that adjustments are correct and that any additional adjustments deemed necessary during product testing have been incorporated.

3.4 UTILITIES

3.4.1 Service Runs

Connect service runs from equipment to building services as indicated.

3.4.2 Dissimilar Metal Connectors

Provide connections between ferrous and nonferrous metallic pipe with dielectric waterways and flanges. Provide dielectric waterways with temperature and pressure rating equal to or greater than that specified for the connecting piping. Provide waterways with metal connections on both
ends suited to match connecting piping. Internally line dielectric waterways with an insulator specifically designed to prevent current flow between dissimilar metals. Dielectric flanges must meet the performance requirements described herein for dielectric waterways.

3.5 MANUFACTURER'S FIELD SERVICES

Provide the services of a manufacturer's representative [, in conjunction with] [, in addition to ][the Contractor's Equipment Planner,] [and] [the Contractor's Biomedical Equipment Technician,] [the Government's Biomedical Equipment Technician,] who is experienced in the installation, adjustment, and operation of the equipment specified, and responsible for supervising the installation, adjustment, and testing of the equipment.

3.6 FIELD TESTS AND INSPECTIONS

3.6.1 Before Testing

Clean pipes, equipment and components of grease, dirt, stains, and other foreign materials.

3.6.2 Testing

Perform testing in accordance with manufacturer's written instructions. Unless otherwise approved by the Contracting Officer, test all items of equipment to ensure that they are operational and installation conforms to specification requirements. Hydrostatically test piping system at pressure of 1.5 times system operating pressure with water at temperature not exceeding 38 degrees C 100 degrees F. Before test, remove or isolate gage traps and apparatus that may be damaged by that pressure. Install calibrated test gage in system to observe any loss of pressure. Close off system and maintain test pressure for not less than one hour. Inspect joints and equipment connections for leaks. Retest and make repair until no further leaks are observed. Each test report must indicate compliance with the specified performance criteria and the final position of controls.

3.6.3 Inspection

Examine each item for visual defects and conformance to specifications.

3.7 CLEANING

3.7.1 For Final Acceptance

Remove labels, fingerprints, and clean all surfaces both inside and out. Tightly cover and protect fixtures and equipment against rust, dirt, water, and chemical or mechanical injury.

3.7.2 Marred Surfaces Exposed-to-View

Refinish marred exposed surfaces that affect appearance, such as interior and exterior cabinet finishes, to match the adjacent finishes, like new; replace components that cannot be refinished in this manner.

3.7.3 Concealed Marred Surfaces

Refinish marred surfaces exposed to atmosphere, where such surfaces do not affect product's appearance but do affect resistance to elements, such as galvanized pipes and insulation, to equal resistance performance as the
unmarred surfaces.

3.8 TRAINING

3.8.1 Training Course

Conduct training course for operation staff as designated by the Contracting Officer. Start the training period, for a total of [_____] hours of normal working time, after systems are functionally complete but prior to final acceptance. The field instructions must include all of the items contained in the approved operations and maintenance data, as well as demonstrations of routine maintenance operations. Notify Contracting Officer at least 14 days prior to date of the training course.

[3.8.1.1 Government's Biomedical Equipment Technician Training

Include operator's training for one Biomedical Equipment Technician (BMET) for each procured equipment item.

NOTE: This guide specification covers the requirements for packaged, and modular field-erected; starved, and excess air incinerators.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: The packaged incinerator specified herein is intended to burn waste materials for residential and nonresidential structures in batch burning applications. Waste includes combustible material, rubbish, garbage, and classified materials.

This section addresses incinerators having a capacity ranging from 1.05 MW 3.58 MBtuh or 378 kg/hr 833 pounds/hr, 9 metric tons/day 10 TPD up to 7.91 MW (27 MBtuh), or approximately 2.7 metric tons/hr 3 tons per hour, 68 metric tons/day 75 TPD of Type 2 waste 10 MJ/kg 4300 Btu per pound, or the Joule Btu
equivalent amount of Types 0, 1, or 3.

Excess air incinerators covered by this guide specification are expected to operate in a "controlled air" mode, similar to starved air incinerators, but constructed as a single chamber rather than two separate chambers. These units may have either an integral, or a separate heat recovery boiler. Auxiliary burners are fired with gas, oil, or a combination thereof and sized to supply the input required to ensure complete combustion of the refuse in the primary and secondary combustion zones.

1.2 DEFINITIONS

1.2.1 Waste Type 0, Trash

A mixture of highly combustible waste such as paper, cardboard cartons, wood boxes, and floor sweepings from commercial and industrial activities. The mixture consists of up to 10 percent by weight plastic bags, coated paper, laminated paper, treated corrugated cardboard, oily rags, and plastic or rubber scraps. This type of waste contains up to 10 percent moisture and not more than 5 percent non-combustible solids, and has a heating value of 19,805 kJ/kg 8,500 BTU per pound as fired.

1.2.2 Waste Type 1, Rubbish

A mixture of combustible waste such as paper, cardboard cartons, wood scraps, foliage, and floor sweepings from domestic, commercial, and industrial activities. The mixture consists of up to 20 percent by weight restaurant waste, but contains little or no treated paper, plastic, or rubber wastes. This type of waste contains up to 25 percent moisture and not more than 10 percent incombustible solids, and has a heating value of 15,145 kJ/kg 6,500 BTU per pound as fired.

1.2.3 Waste Type 2, Refuse

An approximately even mixture of rubbish and garbage by weight. This type of waste, common to apartment and residential occupancy, consists of up to 50 percent moisture and not more than 7 percent incombustible solids, and has a heating value of 10,019 kJ/kg 4,300 BTU per pound as fired.

1.2.4 Waste Type 3, Garbage

Garbage such as animal and vegetable wastes from restaurants, hotels, hospitals, markets, and similar installations. This type of waste contains up to 70 percent moisture and up to not more than 5 percent incombustible solids, and has a heating value of 5825 kJ/kg 2,500 BTU per pound as fired.

1.2.5 Waste Type 4, Pathological

Human and animal remains, such as organs, animal carcasses, and solid organic wastes from hospitals, laboratories, slaughterhouses, animal pounds, and similar sources. This type of waste contains up to 85 percent moisture and not more than 5 percent incombustible solids, and has a heating value as low as 2330 kJ/kg 1,000 BTU per pound as fired.

1.2.6 Waste Type 5, Classified

A mixture of highly combustible waste such as paper, plastics, or other items that have been used for intelligence purposes, or deemed sensitive to completing a sensitive mission on behalf of our National security. This mixture consists of up to 10 per cent by weight plastic bags, coated paper, laminated paper, and plastic products. This type waste has approximately zero percent moisture content and non-combustible solids, and has a heating value of 16,310 to 23,300 kJ/kg 7,000 to 10,000 BTU per pound as fired.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions

SECTION 11 82 19 Page 11
in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Pollution Control

**************************************************************************
NOTE: Research air pollution emission requirements by State and local agencies early in the project, including any anticipated changes that the project has to comply with, including particulates, carbon monoxide, HCL, sulfur oxides, heavy metals in the ash, and dioxins and furans. Hydrogen sulfide, hydrocarbons, and carbonyl emissions are normally not of concern in the design and operation of an incinerator at a military facility unless the State or local environmental regulatory agency requires them, in which case compliance needs to be indicated.
**************************************************************************

Provide incinerators meeting all applicable Federal, State, and local environmental requirements.

1.4.1.1 Gaseous Emissions

**************************************************************************
NOTE: In states with stringent air pollution control requirements, a baghouse and scrubber may be needed and should be specified in a separate specification section. Section 44 10 00 AIR POLLUTION CONTROL may not be adequate for this application, but may form a basis for writing this section.
**************************************************************************

[Limits for carbon monoxide emissions are [____] ppm [to be corrected to [____]].] [Limits for acid gases in the form of hydrogen chloride are restricted [to 30 ppm] [to 50 ppm] [by 90 percent removal] [____] through the use of pollution control equipment specified in Section [____].]
Exposure limitations for dioxins and furans of the flue gases are restricted to temperatures of [982 degrees C 1800 degrees F] for [2] seconds. If the incinerator equipment furnished cannot meet the above emission limits, it is the responsibility of the Contractor to provide additional emission control equipment to meet the emission standards.

1.4.1.2 Particle Size and Particulate Limits

NOTE: If requirements are more stringent, specify them in the blanks. Unless proven otherwise as a result of actual testing of the completed unit, the two-chambered, controlled-air incinerator is inherently nonpolluting and does not require the provision of supplemental special scrubbers, precipitators, or other air pollution control devices in most states, unless acid gas requirements have been established. In the event that actual testing of a unit indicates that pollutants are in excess of Federal, State, or local requirements, provide proper control devices as integral elements of the basic installation. Local air pollution control authorities must be contacted during the initial stages of design to determine what their requirements are and whether any changes are anticipated with which the Army will have to comply.

The emission of particles larger than 60 micrometers microns during normal operation is not allowed. At maximum designed charging rate, emission can not exceed [229] [0.1] mg per standard cubic meter [0.08] grains per standard cubic foot of dry flue gas adjusted to 12 percent carbon dioxide without the contribution of carbon dioxide from auxiliary fuel. Emission minus water vapor, corrected to standard conditions containing 6 percent oxygen by volume, and as if no auxiliary fuel had been used, cannot contain particulate matter in excess of a concentration of [29] [0.1] mg per dry cubic meter [0.08] grains per dry cubic foot of exhaust gas. Measure visible emissions in accordance with and not exceeding zero on the Ringelmann scale. Emissions may be as high as 1 on the Ringelmann scale, but not for more than 3 cumulative minutes.

1.4.2 Noise Level

NOTE: Select the noise level required by the location of the equipment. Equipment in remote areas can be allowed to produce noise at a level slightly higher than the normal 85 dBA. OSHA regulations and Corps of Engineers safety regulations should be consulted for the most current 8-hour exposure limits.

Noise level at 305 mm 1 foot from any operating equipment cannot exceed [85] dBA.
[1.4.3  Electromagnetic Interference Control

**************************************************************************
NOTE: This paragraph should be used only for projects located in electromagnetic sensitive areas.
**************************************************************************
Provide equipment conforming to Class IIIC electromagnetic interference control and test limit requirements specified in MIL-STD-461.

]1.4.4  Welding

**************************************************************************
NOTE: Where pipeline, structural, or other welding is required on the same project, tests will be required accordingly. Testing may be by the coupon method as prescribed in the welding code or by special radiographic methods.
**************************************************************************
Perform all welding in accordance with qualified procedures using performance qualified welders and welding operators. Qualify procedures and welders in accordance with AWS B2.1/B2.1M. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests and perform the tests at the work site if practical. Furnish the Contracting Officer with a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators. Apply each welder's or welding operator's assigned symbol near each weld made as a permanent record. Weld structural members in accordance with AWS D1.1/D1.1M. Perform welding and nondestructive testing of piping systems in accordance with ASME B31.1.

1.4.5  Prohibition of Asbestos

Asbestos and asbestos-containing products are prohibited.

1.4.6  Permits

**************************************************************************
NOTE: Preliminary applications required before awarding of contract will be filed by the District. The Contractor cannot be held liable for changes in environmental requirements after award of contract. USAEHA must be contacted well in advance (approximately six months minimum.) in order to determine if they can do the testing. If they cannot do the testing, delete references to USAEHA.
**************************************************************************
Submit an operating and environmental test plan containing detailed, step-by-step actions and explain the expected result to demonstrate compliance with the requirements of this specification. Written approval by the Government of the test plan is one of the prerequisites for beginning the specified testing. Incinerator system must comply with the requirements of all applicable municipal, State and Federal emission regulations. Obtain all permits to construct and test the units, and conduct all tests required by regulatory authorities in order for the owner to obtain a final permit to operate the facility. Perform environmental
1.4.7 Quality Control

********************************************************************************

NOTE: A QA/QC paragraph should be inserted using the District’s most current QA/QC policy and plans.
********************************************************************************

Inspection will be continued during installation, after installation, and during tests. Ensure the Contracting Officer is present for tests. Furnish bound reports certifying instrument readings indicated are actual, computations required for testing are accurate, acceptable methods were used, and units satisfactory performed in accordance with requirements as specified.

1.4.8 Detailed Installation Drawings

Submit detailed installation drawings consisting of a complete list of equipment and materials, including illustrations, schedules, manufacturer's descriptive and technical literature, performance charts, catalog cuts, and installation instructions. Include complete wiring and piping diagrams and schematics, and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show proposed layout and anchorage of equipment and appurtenances, and the equipment's relationship to other parts of the work including clearances for installation, maintenance, and operation.

1.5 DELIVERY, STORAGE, AND HANDLING

Protect all equipment delivered and placed in storage from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

1.6 EXTRA MATERIALS

Submit spare parts data for each different item of material and equipment specified, after approval of drawings and not later than [_____] days prior to the date of beneficial occupancy. Include in the data a list of parts and supplies, with current unit prices and source of supply, and the recommended number to be maintained in inventory for [_____] months of facility operation.

PART 2 PRODUCTS

2.1 SYSTEM REQUIREMENTS

********************************************************************************

NOTE: An incinerator is normally supplied with a boiler for heat recovery in the form of steam or hot water. However, in some cases, it is possible that heat recovery is not included in the project. An example would be where a boiler already exists in an adjacent boiler plant. There may also be cases where an insufficient thermal demand exists relative to the amount of available waste, but high disposal costs by other methods dictate the use of incineration. In those cases, references to the boiler, steam system, and thermal efficiency must be deleted. A thorough economic analysis must be done.
to determine the economic impact of having or not having heat energy recovery. When part of the project, the boiler is normally supplied by the incinerator manufacturer and is compatible with his equipment.

Delete the bracketed sentences regarding multiple units if only one system is to be provided.

Provide a complete and properly operating waste incineration facility [designed to operate with a steam boiler], consisting of [_____] [a] complete modular type waste incineration system[s] (unit systems) [each] with the capability of fully independent[ or simultaneous] operation.[

Ordinary mode of operation is for any [two] [_____] of the [three] [_____] unit systems to be operated simultaneously with the [third] [_____] system on stand-by. Provide each unit system with identical features to create redundancy and capability for maintaining continuous operation of the facility at full rated capacity.] [Each system] [System] must include:

a. An automatic or semi-automatic, hydraulically operated loader to inject waste into the incinerator.

b. A primary combustion chamber or zone consisting of the grate area within the furnace, or a separate chamber with internal rams.

c. A secondary combustion chamber or zone which consisting of an area above the grate within the furnace, or a separate chamber. Include auxiliary burners to maintain adequate combustion temperatures in either arrangement.

d. An ash removal system including a water quench system adequate to extinguish any combustion still occurring in the ash.

e. All auxiliary fans, burners, controls, and any additional air pollution control equipment required.

2.1.1 Waste Reduction

NOTE: Indicate the effectiveness and burnout capability of the incinerator to be provided. The combustible (carbon) content of the ash cannot exceed 10 percent with a minimum volume reduction of 90 percent of the combustible portion of the waste. Allowable weight reduction is only 45 percent measured on a dry basis. If the waste has a high amount of noncombustibles, either the 90 percent volume reduction is to be decreased, or only the combustible content of the ash can be specified. Indicate which criteria is to be used based upon ease of measurement and other project specific considerations.

[Provide incinerator which reduces waste to an ash not to exceed [45.0 percent (dry basis) by weight] [10 percent by volume] of the total combustible portion of the charge as specified.] [Combustible content of the ash cannot exceed [10] [_____] percent.]
2.1.2 Heat Recovery Boiler

**************************************************************************
NOTE: HHV is usually used in the United States while the LHV value is usually used in Europe. LHV is being advocated for use in the United States for thermal efficiency calculations. Indicate which value to use.
**************************************************************************

When equipped with a heat recovery boiler, the thermal efficiency of the total unit cannot be less than [_____] percent including all auxiliary fuel consumption while producing [_____] kg/hour pounds/hour of steam at a pressure of [_____] kPa psig and a temperature of [_____] degrees C degrees F. Provide soot-blowers for fire-tube and water-tube boilers to maintain thermal efficiency. Thermal efficiency is determined by the input-output method in accordance with ASME PTC 4.

2.1.3 Stack Design

**************************************************************************
NOTE: Indicate wind force the stack design will have to withstand. Structural design will include seismic resistance, see next paragraph.
**************************************************************************

Provide stack support in accordance with NFPA 82 and NFPA 211, as applicable. Design vertical and lateral supports for exterior chimneys to withstand wind forces of [129] [_____] km/hour [80] [_____] mph.

2.1.4 Structural Supports

**************************************************************************
NOTE: Provide seismic requirements for stack and equipment supports, if a Government designer is the Engineer of Record, and show on the drawings. Delete the inappropriate bracketed phrase. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC must be included in the contract documents. Designer should investigate bearing requirements of several manufacturers and design footings accordingly.
**************************************************************************

Design structural steel equipment supports shown in accordance Section 05 12 00 STRUCTURAL STEEL. Design support steel to resist all applicable dead loads, live loads, and seismic loads as [specified in UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC] [indicated]. Show a complete loading and support diagram on the detail drawings. Equipment supports shown on the contract drawings are for a general equipment layout and may not conform to the system furnished. Piers and footings may be relocated to suit equipment furnished provided they do not interfere with other footings. Fabricate support steel in accordance with the provisions of AWS D1.1/D1.1M or field bolt using ASTM A325M ASTM A325 high strength bolts.
2.1.5 Special Tools

Furnish, as standard accessories, any special tools required for assembly, adjustment, setting, or maintenance of equipment specified under this section.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Standard Products

******************************************************************************
NOTE: In lieu of the label or listing, the Contractor may submit a written certificate from any nationally recognized testing organization adequately equipped and competent to perform such services, stating that the items have been tested and that the units conform to the requirements, including methods of testing, of the specified agency.
******************************************************************************

Provide materials, incinerator system equipment, and controls which are the standard products of a manufacturer regularly engaged in the manufacture of the incinerator systems and essentially duplicate equipment that has been in satisfactory use for at least [2] [3] [_____] years prior to bid opening.

a. Where materials or equipment are specified to conform to the requirements of, or listed in rating publications of, agencies such as the Underwriter's Laboratories (UL), American Gas Association (AGA), American National Standards Institute (ANSI), the Hydronics Institute (formerly SBI and IBR) and American Boiler Manufacturers Association (ABMA), submit proof of such conformance. Label or listing of the specified agency is acceptable evidence. Where equipment is specified to conform to the requirements of the ASME Boiler and Pressure Vessel Code, also ensure code conformance of the design, fabrication, testing, and installation.

b. Submit certificates attesting that the incinerator equipment to be furnished is of a type that has been used on at least [three][_____] jobs of similar design and capacity as that specified for this project, accompanied with documentation that in a commercially operating industrial plant, the incineration system[ and the steam generating system] [has][have] operated continuously and without interruption for a period of not less than [100] [_____] consecutive hours. Certify this documentation by an independent organization, such as an environmental testing firm or design consultant, who witnessed such operation, the actual plant owner if other than the incinerator manufacturer, or the energy customer.

c. Submit evidence that the incinerator[s] proposed to be furnished [meets] [meet] the applicable air pollution requirements and the emission requirements specified for pollution control. Test data must be for the model proposed to be furnished and for Incinerator Institute of America (IIA) Type.

d. Identify an equipment supporting service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the plant site. Controls that have been shown to have operated satisfactorily for the period may have modifications, provided it can be clearly shown...
that the modifications will not increase maintenance and operating costs and will not decrease the life of the equipment.

e. Submit framed instructions of proposed diagrams, instructions procedures, and other required sheets for review and approval by the Contracting Officer.

2.2.2 Nameplates

Furnish all field items with a permanent metal tag suitable for tag number or service identification; back-of-panel items are included in this category. Identify front-of-panel items by panel nameplates affixed to the item or panel surface, consistent in appearance from panel to panel and including the service function of the item involved. Color code or otherwise identify all wiring and piping within the panel. Install wires and cables without joints or splices except at terminal points. Label wires at each end. Identification of equipment must conform to MIL-DTL-15024. Each nameplate is to contain the following:

a. The manufacturer's name and address.
b. Equipment catalog or model number.
c. Equipment serial number.
d. Maximum refuse fuel feed rate of incinerator in kg/hour lbs/hour.
e. Incinerator volume in cubic meters cubic feet.

2.2.3 Equipment Guards and Access

**************************************************************************
NOTE: Catwalk, ladder, and guardrail, if required, will be indicated on drawings.
**************************************************************************

Provide enclosures and/or guards for all belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts so located to protect any person coming in close proximity thereto. Guard or cover high-temperature equipment and piping so located as to endanger personnel or create a fire hazard with insulation of the type specified for service. Provide items such as [catwalk,][ stair,][ ladder,][ and guardrail] where shown in accordance with paragraph Catwalks and Access Platforms.

2.3 ELECTRICAL WORK

**************************************************************************
NOTE: Indicate on the drawings the type and class of motor enclosure depending on the environment in which the motor is to be used.
**************************************************************************

Provide electric-motor driven equipment specified herein complete with motor, motor starter and controls, conforming to NEMA MG 1, with enclosures as indicated. For motors smaller than 746 W fractional horsepower motors provide Type I, Class 1B or Class 2A or 2B, Continuous Duty. For motors larger than 746 watts integral horsepower motors provide Type I or II, Class 2 Continuous Duty, Design L or M. Provide motor starters of one manufacturer and install in a motor control center located in the control room. Provide electrical equipment and power supply wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide motor starters complete with properly sized thermal-overload protection and other appurtenances necessary for the motor control specified. Select motors of
sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Provide manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices, but not shown on the electrical plans, under this section.

2.4 INCINERATOR

**************************************************************************
NOTE: House the equipment in a pre-engineered, industrialized metal building which is specified using Section 13 34 19 PREENGINEERED METAL BUILDINGS. Include a sprinkler system in the building.
**************************************************************************

Provide incinerators suitable for indoor installation and consisting of a primary combustion chamber or furnace zone (grate area) for partial burning of and conversion of combustible material to a gas, and a secondary combustion chamber or furnace zone that consumes combustible gases and entrained particles. Select an incinerator of the starved air (pyrolytic) [or controlled air grate] type designed for continuous duty, with a gas tight constructed shell. Equip both combustion chambers or zones with combination natural gas/No. 2 oil burners, each designed to use [No. 2 fuel oil] [gas] as a supplementary fuel. Equip burners with an electronic ignition. Minimize supplementary fuel consumption for normal operations, not to exceed [326] [_____] MJ/metric ton [281,000] [_____] Btu per ton of waste fuel. Furnish a complete unit including combustion air and burner controls, interconnected ducts, breaching and piping, facilities for charging of the unit, a means of heat dissipation, [heat recovery unit], stack and air pollution control devices.

2.4.1 Type of Unit and Unit Capacity

**************************************************************************
NOTE: The incinerators should be capable of burning Types 0, 1, 2, 3, and 5 wastes. The approximate general characteristics of each type are indicated in the following table:

<table>
<thead>
<tr>
<th>Type</th>
<th>Plastics, Rubber, Treated Paper (Max. Percent)</th>
<th>Noncombustible Solids (Max. Percent by Weight)</th>
<th>Moisture Content (Max. Percent)</th>

Rubbish is a maximum 20 percent by weight of restaurant waste. The waste stream at each installation must be carefully quantified and analyzed. The information should be utilized for the final design to ensure that each incinerator is correctly sized. Wastes may contain polyurethane foam which may result in the release of cyanide or cyanide products in the exhaust. Include specific instructions regarding the hazardous materials that may be incinerated and excluded by the particular installation. Indicate capacity and operating schedule. Complete design sizing.

******************************************************************************

Provide incinerator with a continuous capacity not less than [_____] kg/hour pounds/hour when provided with the waste fuel specified below. This rate is a continuous burning rate and is not to be considered a charging rate, with no manual stoking required to accomplish the destruction of this waste. Design for each incinerator to normally be in operation [_____] days per week for [one] [two] [three] 8-hour shifts daily, with a primary fuel of unsorted and unprocessed municipal solid waste (MSW) as specified and delivered to the incinerator site including non-homogeneous combustible materials, cans, bottles, metal banding, and other non-combustible materials and significant concentrated quantities of combustible high energy Btu cellulose materials. Provide incinerator[s] [each] capable of burning municipal waste [of IIA Type [______]] [with the following proximate analysis:

<table>
<thead>
<tr>
<th>Waste Component</th>
<th>Range</th>
<th>Typical</th>

</tr>
</tbody>
</table>

During normal, steady-state operations, use the self-sustained incineration process when burning waste as characterized above. Do not exceed auxiliary
fuel limits given above except during start-up or burn-down, or when charging waste with an excessive moisture content. [When fired at the rate of [_____] metric tons/24-hour day tons/24-hour day with municipal solid waste, IIA Type [_____]], each system must be capable of producing a minimum of [_____] kg/hour 1lb/hr of dry saturated steam at a pressure of [_____] kPa psig when furnished with entering water at [_____] degrees C degrees F]

Incorporate accessibility for maintenance and service into equipment design and accessory installations.

2.4.2 Unit

**************************************************************************
NOTE: Indicate the type of incinerator to be provided by optional wording.
**************************************************************************

Equip unit for mechanical charging and operation, and to operate under negative pressure. Equip each unit system with automatic, continuous flow ash removal and ash conveyor equipment to remove all ash and residue as generated. Provide each incinerator as a complete [package-type unit,] [factory fabricated and field assembled,] self-contained, [free standing, mounted on a heavy steel frame,] [and erected at the project site], ready for immediate mounting on a foundation and for attachment of water supply, fuel, electrical, and vent connections, including lifting eye rings for adjusting and setting.

2.4.2.1 Supports

Support each incinerator upon the foundations with structural steel, independent of all refractory, conforming to ASTM A36/A36M. Design the incinerator supports to allow for free expansion and contraction of each portion of the incinerator without placing undue stress on any part of the incinerator or setting.

2.4.2.2 Access Doors

Provide gastight doors in sufficient numbers, adequately sized and properly located, to allow for cleaning, inspection and repair of all areas in the unit. Line interior surfaces exposed to direct radiation and high temperatures with an approved refractory material to prevent excessive heat losses and warping of doors. Hinge doors that are too large or bulky for hand removal or that weigh more than 11 kg 25 pounds.

2.4.3 Minimum Requirements

**************************************************************************
NOTE: During design phase, contact manufacturers of the type and size of equipment to be used and obtain typical values. If this information is difficult to obtain or varies widely between manufacturers, delete the indicated optional sentences. Check with local regulatory authorities concerning residence time at elevated temperatures if dioxin and furan control are required.
**************************************************************************

Provide incinerator with total furnace volume in which the heat released per cubic meter cubic foot of furnace volume will not exceed [_____] W Btu/hr, and the gas velocity does not exceed [_____] m/second feet/second through
the primary combustion zone and [_____] m/second feet/second through the secondary combustion zone and flue. Minimum secondary combustion zone volume is at least [_____] cubic m/kg cubic feet/pound of gas produced per second including excess air required for cooling purposes, and primary combustion zone operating temperature is sufficient for near complete carbon burn-out. After warm-up, maintain a minimum primary combustion zone temperature of at least 704 to 871 degrees C 1300 to 1600 degrees F, but do not exceed 982 degrees C 1800 degrees F at any time. Combustion time in the secondary combustion zone is to be at least [_____] seconds total time with temperatures maintained at 927 to 982 degrees C 1700 to 1800 degrees F with momentary and infrequent peaks not to exceed 1149 degrees C 2100 degrees F.

2.5 FURNACE CONSTRUCTION

2.5.1 General

Provide incinerator[s] meeting the requirements of NFPA 82, for IIA Types 1 and 2 waste, and Class III incinerators. When exposed to the internal environment of the incinerator, provide materials that are compatible with the temperature and atmospheric conditions which they will encounter. Ensure connections between dissimilar materials are electrically isolated from each other with dielectric unions or flanges. Provide galvanizing, where specified, in accordance with ASTM A123/A123M or ASTM A153/A153M.

2.5.2 Lubrication

Provide all sliding, moving, or rotating parts normally requiring lubrication, except those provided with "sealed-for-life" lubrication, with suitable means for such lubrication. Design equipment to operate efficiently and satisfactorily when lubricated using standard military lubricants.

2.5.2.1 Lubrication Fittings

Locate lubrication fittings in accessible protected positions, with a bright red circle painted around each point. Provide carbon steel balls, bodies and tips of fittings threaded with a 1/4-28 taper, straight or 1/8 pipe threads. Incorporate into fittings a surface ball-check valve located at the surface of the inlet tip. Cadmium plate carbon steel fittings in accordance with ASTM B766, Type I, Class 5, or zinc coat in accordance with ASTM B633, Type I, Class 1, except that the salt spray test period for red rust corrosion is a minimum of 50 hours.

2.5.2.2 Lubrication Equipment, 6.9 MPa 1,000 psi and Higher

When the use of high-pressure lubrication equipment, 6.9 MPa 1,000 psi and higher, could possibly damage grease seals or other parts, affix a suitable warning or caution plate to the equipment in a conspicuous location.

2.5.3 Lifting Attachments

Equip each unit with lifting attachments designed and installed to enable the equipment to be lifted in its normal position without undue stress on the units.

2.5.4 Accessibility

Make all parts subject to wear, breakage, or distortion, and all parts
which require periodic maintenance, readily accessible for adjustment or replacement.

2.5.5 Interchangeability

Provide only parts manufactured to standards that permit replacement without modification to parts or equipment.

2.5.6 Fastening Devices

Use suitable bolts and nuts conforming to ASME B18.2.1 and ASME B18.2.2 respectively, and screw threads conforming to the requirements of ASME B1.1. Install all screws, pins, bolts, hydraulic fittings, and similar parts with means for preventing loss of tightness. Do not swag, peen, stake, or otherwise permanently deform parts subject to removal or adjustment.

2.5.7 Electrical

Factory wire equipment complete with all necessary accessory devices, with all wiring brought to a single location, requiring only a source of power at [_____] volts, [_____] phase, 60 hertz, to make the equipment operable.

2.5.8 Castings and Forgings

Use gray iron conforming to ASTM A48/A48M; cast iron conforming to ASTM A319; and heat-resistant alloy conforming to ASTM A297/A297M Grade HF. Provide castings and forgings free from defects such as scale, mismatching, blowholes, or any other defect that will affect the life, or function of the part.

2.5.9 Welding, Brazing, Soldering, Riveting, or Wiring

Employ welding, brazing, soldering, riveting, or wiring only where these operations are required in the original design.

2.5.10 Incinerator Furnace Lining

Line furnace and flue connection with high-heat-duty firebrick conforming to ASTM C27 and ASTM C155 laid in high-heat-duty mortar conforming to ASTM F1097, suitable for use up to 1427 degrees C 2600 degrees F. At the Contractor's option, plastic or castable refractory containing high-duty or super-duty fireclay may be used, except that firebrick must be used in floors and hearths. Attach plastic refractory with anchors. Provide regular castable refractory conforming to ASTM C401, High Strength, Class C, except that the minimum modulus of rupture for transverse strength cannot be less than 4.14 MPa 600 psi after being heat soaked for 5 hours or more at a temperature in excess of 1371 degrees C 2500 degrees F.

a. Provide insulating castable refractory conforming to ASTM C401, Class R, with hydraulic setting of a type especially suitable for incinerators required to burn wet material. Install plastic refractory in accordance with the manufacturer's recommendations and by workmen skilled in its application.

b. Make joints for firebrick as thin as practicable, not exceeding 3.2 mm 1/8 inch in thickness buildup as a buttered joint. Cover the entire surface of the adjoining faces with mortar. Construct arches and circular linings with the necessary radial or wedge brick, straight brick, and special shapes for skewbacks, so as [to conform to the
radius shown and] to produce approximately the same joint thickness at the inner and outer curves. Use 228.6 mm 9 inch series firebrick in the main arches of the furnace and flue connection, laid on end with joints interlocking one-half the width of the brick. Except in the ash pit, lay firebrick on edge with interlocking joints in the hearths and floors.

c. Provide a casing construction not thinner than 3.213 mm 10 gauge steel sheet conforming to ASTM A1011/A1011M for the incinerator roof, with steel sheets and strips conforming to ASTM A568/A568M for incinerator casings, housings, and components. Provide other uncoated black sheet steel of composition and finish best suited to the end use. Use galvanized steel sheets conforming to ASTM A653/A653M and ASTM A924/A924M for incinerator casings, housing, and components. Gauge numbers specified are United States Standard gauge.

d. Use special rounded shapes for the exposed edges of the openings for the charging, firing, and stoking doors. Make the thickness of the refractory furnace lining as necessary to comply with the outer surface temperature requirements specified. Attach refractory walls to the casing with alloy steel or refractory anchors to form a monolithic structure which will resist heat and support the walls with a Safety Factor of 4. Prevent bulging and destruction of refractory due to heat stress by reinforcing, expansion joints, ties, and anchors. Provide manholes and other inspection and access openings, identification plates, and stamps with insulation finished neatly against a metal ring provided for this purpose.

2.5.11 Castable Refractory

Use castable refractory in [guillotine doors, and door sills,] dampers and lids for charging throats. Thoroughly dry-mix material from each original container to ensure uniform distribution of constituents and particle sizes and then mix with water to the consistency of a stiff concrete. Place the mixture in the molds or frames in such manner as to exclude air bubbles and keep moist for 24 hours. Castings may be premolded or molded in place and conform to the details shown. Firmly set premolded castings in place and, where required, bond to the firebrick masonry with firebrick mortar.

2.5.12 Refractory Wall Construction

**************************************************************************
NOTE: Values for minimum thickness of refractory:

<table>
<thead>
<tr>
<th>REFRACTORY THICKNESS VS. CAPACITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capacity (grams per second) (pounds per hour)</td>

</tr>
</tbody>
</table>
Suspended wall construction with a spring arch type roof may be utilized. Install structural steel columns around the perimeter of the furnace, designed to support a succession of low sections of refractory wall, and framed to carry the heavy refractory walls by suspension while allowing gaps to remain in the walls for expansion of the chamber.

2.5.13 Insulation

Where specified or indicated, provide insulating block insulation conforming to ASTM C612, containing no asbestos material, and designed to prevent damage to foundation and incinerator exterior due to excessive heat. Unless otherwise specified, comply with the requirements of Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

a. Provide Class 5 mineral fiber block, laid in approved mortar specially manufactured for this purpose or recommended by the insulating material manufacturer. Provide insulating cement conforming to ASTM C195 or ASTM C196.

b. Provide firebrick conforming to ASTM C27 or ASTM C155 for insulating firebrick, laid up in air-setting mortar. Interpret firebrick to include straight brick, radial brick, wedge brick, skew-type brick, cupola blocks, and other similar shapes. Dip each brick in mortar, rub, shove into place, and then tap with a wooden mallet until it touches the adjacent bricks. Mortar thick enough to lay with a trowel is not permitted, maximum mortar joint thickness cannot exceed 3.2 mm 1/8 inch, and average joint thickness cannot exceed 1.6 mm 1/16 inch.
Insulate main arches of the furnace and flue connection above the firebrick and, where exposed to the weather, protect with a suitable sheath. Insulate firebrick floors from any supporting floors with insulating brick except full bearing supporting floors on earth, on which a 75 mm 3 inch layer of contained dry sand may be used in lieu of insulating brick. Provide walls with a minimum thickness to limit the temperature of the outer incinerator surface to 49 degrees C 120 degrees F in an ambient temperature of 21 degrees C 70 degrees F when the unit is operating at full rated capacity.

2.5.14 Expansion Joints

Provide joints in the firebrick masonry [at approximately the locations as shown] [at spacings of approximately 2.4 m 8 feet], 13 mm 1/2 inch wide, as completely separated sections without any interlocking of the bricks. Locations may be changed from those indicated by as much as 300 mm 12 inches in either direction to suit convenience of construction. Change as necessary, by offset or otherwise, to avoid weakening the arch over an opening. Allow no expansion joint to be closer than 300 mm 12 inches to the vertical side of an arched opening or to the top of the brick forming the arch over the opening. When joints are offset, do not allow bonding of the horizontal faces between the two courses of brick along the offset. In addition, to allow for expansion of the inner face, construct a series of 3.2 mm 1/8 inch wide vertical openings spaced 1.8 m 6 feet apart on the furnace side of the wall. Make proper provision for expansion and contraction between incinerator foundation and floor.

2.5.15 Exterior Walls of the Furnace

Provide a plate steel shell wall at least 6.4 mm 1/4 inch thick separated from the firebrick by suitable insulation, with exterior walls of the flue connection of plate steel shell at least 4.8 mm [3/16] inch thick separated from the firebrick by insulation. Structurally reinforce shells as necessary to support burners, combustion air blowers, stack, refractories, and other components.

2.5.16 Primary Chamber

Construct the primary chamber for dual chamber systems of a steel casing supported by a steel frame and provide with insulation and refractory as necessary to comply with the specified outer surface temperature requirements specified. Make the casing not less than 2.657 mm 12 gauge sheet steel reinforced to withstand internal pressures without deflection or damage to refractory or other components of the incinerator. Construct frame and all reinforcing members of structural steel, free standing, and capable of supporting the weight of all components of the incinerator, including doors, burners, breaching, stack connections, and appurtenant assemblies without binding or warping. Provide frame and casing consisting of all-welded construction, complete and erect prior to installation of the refractory and insulation. Build all access doors and parts with seals to prevent emission of smoke or admission of significant amounts of air during incinerator operation. Primary chamber with openings permitting leakage of waste fluids is not acceptable.

2.5.17 Secondary Chamber

a. Construct the secondary chamber of dual chamber systems with minimum 4.8 mm 3/16 inch thick hot-rolled steel lined with mineral wool insulation and high strength refractory, rated at not less than 1427
degrees C 2600 degrees F, as necessary to comply with the specified outer surface temperature requirements. [A make-up air preheater of the manufacturer's standard design may be installed for this chamber.]

b. Provide secondary chamber burner capable of firing with [No. 2 fuel oil] [gas] with an electric ignition system, having a net output rating capable of reducing the emission of combustible gases and particulate material to meet the current local, State and Federal air pollution emission standards. Equip burners with an FM approved flame sensor and direct spark ignition. Design combustion air supply for the secondary chamber to ensure complete combustion of all volatiles in the flue gas. Equip combustion air supply fans with control dampers to vary the air supply as required to provide complete air pollution control. Control temperature in the secondary chamber through the use of a temperature controller to vary the firing rate of the burner and combustion air supply.

[2.5.18 Primary and Secondary Cowling

**************************************************************************
NOTE: Check with manufacturers of the type and size of equipment expected to be used to determine the availability of this option. If available, preheating the combustion air will improve thermal efficiency and enhance the completeness of the combustion process.
**************************************************************************

The primary and secondary chambers of dual chamber systems may be provided with cowling in such a way as to preheat incinerator combustion air.

][2.5.19 Grates

When so equipped, construct grates of cast iron of size and configuration to support the rated capacity of the type of waste specified. Provide flat type grates, step type grates, or a combination of the two, as standard with the manufacturer of the incinerator, with a minimum weight of 195 kg/square meter 40 psf. Design grates to rest on supporting cast iron channels, I-beams, angles, or similar cast-iron shapes. Make stoker grates of heat-resistant alloy castings with holes or slots in metal surfaces through which combustion air enters. Size these openings to minimize plugging by ash or slag. Design grates to resist distortion, growth, cracking, and oxidation. Actuate grates or internal ram by mechanical or hydraulic means so as to move the refuse through the furnace, agitate the refuse to promote complete combustion, and remove the ash and residue from the furnace. Provide a [traveling,] [reciprocating,] [reverse reciprocating,] [rocking,] [or vibrating] stoker grate.

[2.5.19.1 Stoker Design

Design the stoker or internal ram (when so equipped) with a hydraulically or mechanically operated, self-contained mechanism located inside the furnace comprising a means of moving, shearing, or tumbling the waste material while burning to ash, admitting waste at one end while causing ash to fall off the other end continuously. Design stoker and feed equipment for thin layer distribution of the incoming waste, and slow and thorough agitation of the bed length to ensure ample aeration and complete burnout prior to discharge into the residue quench area. In the drying and ignition zone, retain the refuse long enough for the volatile combustible
gases, water vapor, and smoke to be driven off from the refuse and flow into the secondary combustion zone where they are mixed with air and retained for a sufficient length of time to ensure complete combustion.

2.5.19.2 Stoker or Ram Operation

Devise a means of activation for hydraulic cylinders of adequate size with a minimum stroke of [_____] mm inches to ensure progressive movement of the refuse. Mount cylinders under the [stoker] [ram] carriages or side girders on specially designed mounting brackets and beams arranged so that all thrusts and stresses are contained within the [stoker] [ram] structure without transmission into the furnace structure.

2.5.20 Furnace Doors

Provide doors as necessary for inspection, stoking, cleanout, and charging areas, with door frames securely attached to the frame of the incinerator, having minimum edge thickness of 16 mm 5/8 inch increasing to 19 mm 3/4 inch around the door, to provide a seal for the door. Construct doors and frames of cast iron or steel, with a minimum door thickness of 10 mm 3/8 inch, gastight and when exposed to flame or direct heat of combustion gases and lined with the same type and thickness of refractory and insulation used in the combustion chamber to prevent excessive heat losses and warping. Secure refractory to the doors to prevent sagging. Design refractory with tapered edges to clear door frames during the movement of swinging doors. Weld alloysteel hooked bars to the door cover to anchor the refractory, with doors safely operable by one person. Temperature of door handles must permit operation of doors without gloves or other protective devices. Interlock charging doors with primary burners and air supply so that burner ignition shuts off and under-fire air dampers close when doors open. Gasket door closure with nonasbestos packing suitable for the service.[ Provide guillotine-type doors that lift completely off the seals to effect opening.] Provide doors with hasps or brackets to permit locking. Also make provision to lock the doors in an open position during maintenance to prevent accidental closure while someone is inside the incinerator.

2.5.20.1 Mechanical Charging Doors

Provide guillotine type doors, with a charging door that opens with operation of the charger. Interlock charging and feed hopper doors to prevent simultaneous opening during operation of incinerator. Insulate combustion chamber doors, including guillotine doors as specified above for furnace doors. Provide doors with means for manual operation, which are raised and lowered by flexible steel cables operating over a system of smoothly operated sheaves or hydraulic or pneumatic cylinders attached to a steel frame. Construct doors which, in closed position, rest tightly against the frames.

2.5.20.2 Stoking and Cleanout Doors

Provide access doors for cleanout, stoking mechanism and visual inspection of the entire interior of the incinerator without permitting leakage of waste fluids.

2.5.21 Observation Ports

**************************************************************************

NOTE: Requirements for observation ports and test

SECTION 11 82 19 Page 30
holes depend upon the specific project, including competence and availability of operating and maintenance personnel, and type of material to be burned. Conform the number and location of the test holes to the requirements of the regulatory authority, and provide test holes for monitoring operating efficiency as needed.

Provide [one] [two] observation port[s] 75 mm 3 inches in diameter on the access door for viewing the primary combustion chamber or zone during operation. Make ports no less than 2.7 mm 12 gauge black steel or cast iron tube or duct with a heat-resistant glass cover or an angular steel frame and closure plate with handle for operation without gloves or other protective devices. Extend the tube or duct from the exterior of the casing to not less than one-half the thickness of the refractory opening and make gastight. Make provision for air purging of the port to avoid ash buildup.

2.5.22 Test Holes

Provide incinerators with test holes as indicated and fit with standard weight, 50 mm 2 inch diameter, black steel pipe. Extend sleeve from the exterior of the casing to not less than one-half the thickness of the refractory lining. Form the refractory opening from the end of the pipe sleeve to the interior wall surface to shield the end of the sleeve from reflected heat. Fit the sleeve with a brass screw cap, and each test pipe with two or more sturdy lugs welded approximately in the middle of its length to prevent the pipe from turning when the cap is being removed.

2.5.23 Safety Devices

Provide incinerators with safety devices to provide safe operation, including automatic overheat shutdown and manual shutoff for each burner and main fuel supply, and equipment meeting the requirements of the Occupational Safety and Health Administration (OSHA).

2.5.24 Freeze Protection

Equip low points of all piping and tubing with drains for freeze protection.

2.5.25 Incinerator Cooling System

Provide the manufacturer's standard cooling system for the incinerator furnished, including all necessary equipment, piping, valves and control devices.

2.6 INCINERATOR AUXILIARY EQUIPMENT

2.6.1 Charging Method

**************************************************************************

NOTE: It is not expected that cranes will be used in most military incinerator plants. The referenced standards may not be sufficient for the severe service conditions the crane would encounter. A separate section based upon Division 41, may be required to adequately deal with the crane.

**************************************************************************
a. Mechanically charge incinerator and operate the combustion chamber at negative air pressure when the loading door is open, to prevent injury to the operator and the escape of smoke and gases. Provide a mechanical charger, including an inner door and an outer door, or other form of isolation from the combustion chamber, to discharge the contents of the loading and holding chamber into the combustion chamber. Flange loader directly to the feed opening of the incinerator.

b. Provide charger with a manual control and an adjustable timer to permit semi-automatic charging, with the manual box next to the ram loader opening as indicated. Provide an indication light to show when the incinerator can be charged and when the incinerator cannot be loaded due to insufficient temperature. Mount the light on the control box, visible to the operator when the box is closed. Include an interlock to prevent operation of the charger when a predetermined safe operating temperature is exceeded.

c. Locate the charger on the end of the incinerator. [Provide cranes to load the charger as specified in Section 41 22 13.14 BRIDGE CRANES, OVERHEAD ELECTRIC, TOP RUNNING] [ Section 41 22 13.14 BRIDGE CRANES, OVERHEAD, TOP RUNNING] [ Section 41 22 13.15 BRIDGE CRANES, OVERHEAD ELECTRIC, UNDER RUNNING] to load the charger.) Design charging chambers with a minimum capacity of not less than [0.5] [1.0] [_____] cubic meter [0.5] [1.0] [_____] cubic yard, with an installed digital counter to count the number of loads delivered by the automatic ram loader into the combustion chamber.

2.6.1.1 Feed Hopper

Provide a hopper-type chamber for top loading chargers, constructed of heavy-duty welded steel plate and structural shapes throughout, fabricated of 6 mm 1/4 inch minimum thickness hot-rolled steel, with steel plates and shapes conforming to ASTM A36/A36M. Orient hoppers loaded directly from the tipping floor to be loaded from the side of their longest dimension whenever physically possible, with the opening flush with the tipping floor.

2.6.1.2 Charging Ram

Provide a hydraulically operated ram, self-contained type with directional control, which injects small loads of refuse at frequent intervals, to ensure relatively uniform burning rates, and limits the amount of air entering the primary chamber with each charge through the use of double gates or similar device. Provide a ram which continuously pushes the burning waste toward the cleanout area, constructed to minimize the possibility of refuse becoming trapped in areas that would interfere with the operation of the ram and its seals. Provide sufficient cooling by either air or water to preclude warpage or excessive thermal expansion of the ram. Parts of the ram that come in direct contact with or ride upon the combustion zone refractory or grating are not acceptable.

2.6.2 Auxiliary Burners

**************************************************************************
NOTE: Indicate if auxiliary fuel system is to be gas and/or oil by deleting the inappropriate subparagraphs.
**************************************************************************
Provide [gas] [oil] [combination gas and oil] [LPG] burners for the primary and secondary combustion zones, meeting the requirements set forth in UL 296, UL 726, UL 795, and NFPA 85. Provide each burner as a complete assembly, including fuel and control systems, and accessories. Locate primary chamber burners so that the burner flame impinges directly on the waste materials when present during start-up, but does not impinge directly on the refractory when waste is not present during warm-up.

a. Provide primary burners with a capacity of not less than [_____] W Btu/hr and capable of maintaining a minimum continuous temperature of 760 degrees C 1400 degrees F and a maximum of 871 degrees C 1600 degrees F in that chamber or zone.

b. Provide secondary burners with a minimum capacity of [_____] J Btu and capable of maintaining a minimum continuous temperature in the secondary chamber of [982] [_____] degrees C [1800] [_____] degrees F. [Maintain a minimum continuous temperature of 760 degrees C 1400 degrees F at the roof near the exit of the primary chamber.]

c. Provide burners that are electrically spark-ignited and regulated by a variable set point indicator-controller adjustable from 427 degrees C 800 degrees F to 1316 degrees C 2400 degrees F to operate within the temperature limits recommended by the manufacturer. Include an on/off firing burner in the primary chamber. Provide a modulating burner with continuous burning capability for the secondary chamber, which modulates from high-to low-fire to off, based on the temperature of the secondary chamber. Provide secondary burner that cycles automatically as a function of the chamber temperature in order to minimize the consumption of auxiliary fuel and to minimize temperature peaks.

d. Actuate controllers by a thermocouple or shielded bimetallic sensor located in the upper 1/3 of the combustion chamber. Provide Type K thermocouples in the primary and secondary chambers, suitable for a maximum temperature of 1538 degrees C 2800 degrees F. Incorporate FM-IRI components in burner controls and meet NFPA current standards for gas- and oil-fired boilers, including ultraviolet flame scanners as specified in paragraph Flame Sensor, or flame rods for flame failure safety shutoff for burner and pilot and pre-ignition and postcombustion purging control. Mounting, flame shape, and characteristics of each burner must be suitable for the incinerator chamber in which the burner is installed, with burners that are easily moved out of firing position for inspection, cleaning, adjustment, and maintenance. On mechanically charged incinerators, include an interlock to prevent operation of the charger until secondary chamber or zone temperature has reached 871 degrees C 1600 degrees F.

2.6.2.1 Oil Burners

Provide air-atomizing or mechanical-pressure-atomizing type oil burners (when required), capable of burning unheated Grade No. 2 fuel oil. Provide only oil-burning equipment which meets the requirements of UL FLAMMABLE & COMBUSTIBLE and is installed in accordance with NFPA 30 and NFPA 31.

2.6.2.2 Mechanical Pressure Atomizer

When so equipped, provide mechanical pressure atomizers which operate solely by the use of oil pressure and have no moving parts within the atomizer, and are capable of completely atomizing the oil through a minimum
capacity range of 4 to 1 without changing nozzles or sprayer plates when furnished with oil at the manufacturer's required pressure. Design to supply a constant volume of oil to the atomizer, with variable capacity obtained by adjusting a control valve on the return line. Mount a diffuser to stabilize the flame near the furnace end of the atomizer but in such a position that oil will not strike it.

][2.6.2.3 Air Jet Atomizer

When so required, provide inside mix type air jet atomizers utilizing air mixing with the oil inside the nozzle, with no moving parts required within the atomizer assembly. Furnish the air compressor with the burner, from the burner manufacturer and capable of completely atomizing the oil through a minimum capacity range of 6 to 1 without changing nozzles or sprayer plates, when supplied with air at a maximum pressure of 689 kPa 100 psi gauge, and varying unit capacity by adjusting air pressure supplied to the unit. Furnish unit with a blow-out valve so that air may be blown through the oil passages to clear them of any accumulation. Mount a diffuser to stabilize the flame near the furnace end of the atomizer but in such a position that oil will not strike it.

][2.6.2.4 Air Register

Provide the most suitable type air registers for the atomizer furnished and arrange for connection to the forced-draft fan duct, with adjustable air-volume louvers with all louvers operated by a single, easily accessible lever. Register is to support atomizer and closely related components, and fastened directly to the front of the incinerator. Properly size the throat ring to match the atomizer. Mount a diffuser to stabilize the flame near the furnace end of the atomizer but in such a position that oil will not strike it. Design the register and diffuser to ensure complete mixing of air and fuel with a minimum of excess air.

2.6.2.5 Throat Openings

Construct burner throat openings of superduty plastic refractory or matched sections of refractory tile. Make the throat concentric with the burner, of proper contour to ensure complete mixing of the air and oil, and designed to assist in complete combustion by radiating heat to the fuel. Position the burner so that the flame parallels the contour of the throat but avoids striking the refractory.

2.6.2.6 Electric Ignition System

Provide an ignition system suitable for operation with [No. 2 fuel oil] [gas]. Furnish igniter assembly complete for each burner, with a suitable ignition transformer and electrode rated for not less than 5,000 volts on the secondary side, as a unit readily removable from the incinerator setting for repair. Make provisions in the igniter assembly for manual operation and for inspection of the pilot flame. Provide components in conformance with NFPA 85 requirements, as applicable.

[2.6.3 Fuel Oil System

**************************************************************************
NOTE: Delete these paragraphs and their subparagraphs if oil is not used.
**************************************************************************
Install fuel oil system (when applicable) in strict accordance with NFPA 31 and Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS, unless otherwise indicated. Equip oil supply line to each burner with an automatically operated valve designed to shut off the oil supply in case of fire in the immediate vicinity of the burner. Provide a thermoelectrically or thermomechanically actuated type valve and locate immediately downstream of the manual shutoff valve or other building shutoff devices where oil supply line enters the building. Locate a thermoelectrical or thermomechanical detection device over the oil burner to activate the valve. A fire shutoff valve may be combined with other automatic shutoff devices if listed in UL FLAMMABLE & COMBUSTIBLE.

2.6.4 Fuel-Oil Piping

Furnish piping required between the oil storage tank, burners, and pumps complete with valves, strainers, traps, insulation, and accessories, conforming to Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

2.6.5 Fuel-Oil Storage Tank

Provide storage tanks constructed of steel or fiberglass, suitable for underground installation, constructed and labeled in accordance with NFPA 30, NFPA 31 and Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS.

][2.6.6 Gas Meter

Furnish and install gas meters where indicated, having the full capacity indicated when receiving gas at [100] [_____] kPa [15] [_____] psig. Maximum differential pressure across any meter at full capacity is 3 kPa 0.5 psi. Provide meter housing of pressed steel, cast aluminum or cast iron, suitable for natural gas at [172] [_____] kPa [25] [_____] psig. Provide meters with a 3-valve bypass, with valves and bypass the same size as the gas line in which they are installed. Equip meter with an accessory instrument that indicates a corrected volume reading and an uncorrected volume reading of the gas passed, where the corrected volume reading is in standard cubic meters/second and cubic feet/minute cubic feet/minute. Install the meter in strict accordance with the manufacturer's recommendation. Provide positive displacement type meter of either rotary or diaphragm type. Provide gas piping, fittings, valves, regulators, test, cleaning and adjustments in accordance with Section 23 11 20 FACILITY GAS PIPING. Comply with requirements of ANSI Z21.13/CSA 4.9 as applicable unless otherwise specified herein and appropriate certification is submitted.

]2.6.7 Stack

**************************************************************************

NOTE: Depending on requirements at location and personnel involved, temperature of the casing can be 66 to 93 degrees C 150 to 200 degrees F. The casing temperature is limited to 49 degrees C 120 degrees F maximum when personnel safety is involved. Provide spark arrester if there are no pollution control devices between the incinerator and the stack. References to heat recovery and boilers may have to be deleted if that feature has been excluded from the project.

**************************************************************************
a. Provide sectional, energy recovery and heat dump stacks set on a concrete foundation or otherwise adequately supported. [Make provisions in the ducting to bypass the flue gas around the heat recovery boiler to the normal stack, or direct it to a separate dump stack in the event of a boiler failure.] Provide the size, and number of sections in accordance with the requirements of the stack and refractory manufacturer to adequately support the refractory lining, permit expansion, and prevent cracking of the refractory.

b. Line the entire height of the chimney with refractory as specified for the furnace, and provide with a cleanout door frame and a protective cap. Where the chimney is in the open, furnish a metal side-rail-and-rung ladder, with a [ladder cage or ]fall protection device, designed for a live load of 890 N 200 pounds with a safety factor of at least 2 based on the yield strength of ductile metals, or a safety factor of 4 based on the ultimate strength of cast metals.

c. Provide a stack conforming to NFPA 82 and NFPA 211. Secure refractory to the casing by steel anchors. [Attach a corrosion-resistant steel spark arrester fabricated of 18 gauge, 13 mm 1/2 inch mesh wire screen to the top of the stack.] Provide a corrosion-resistant steel weather cap. The temperature of the casing of any stack must not exceed [_____] degrees C [_____] degrees F in an ambient temperature of 21 degrees C 70 degrees F while passing [_____] actual cubic meters/second ACFM of flue gas at[232] [_____] degrees C [450] [_____] degrees F. Provide fire stops, thimbles, and support assemblies conforming to NFPA 211. Extend stacks at least 1 m 3 feet above the highest point where they pass through the roof of the building and at least 600 mm 2 feet higher than any portion of the roof or building located within 3 m 10 feet horizontally of such chimney. Design and construct each stack to withstand winds up to[210] [_____] km/hour [130] [_____] mph. Provide adequate support, without placing any of the load on the refractory walls of the incinerator, for any stack installed on top of the incinerator.

d. Provide [freestanding stacks with painter's ring and trolley.][required aircraft markings.] Weld stack sampling ports into each stack, consisting of two collars, at least 100 mm 4 inches in diameter.[ Use one hundred fifty mm six inch collars if particle-size sampling is required.] Locate and set collars at a right angle to each other at least ten stack diameters downstream from a fan or change of direction for stack sampling. Provide ports with suitable, removable, replaceable caps.

2.6.8 Breaching

Construct breaching of not lighter than 3.416 mm 0.1345 inch thick, black-steel sheets conforming to ASTM A568/A568M. Reinforce and brace breaching with structural steel angles not smaller than 50.8 by 50.8 by 6.4 mm 2 by 2 by 1/4 inch and weld all joints and seams in the sheets and angles. Construct flexible type expansion joints requiring no packing and install where required. Provide breaching with angle flanges for connection to boilers or other equipment with breaching full size of opening. Supply breaching in bolted or welded sections for ease of handling or erection. Connectors must be in accordance with NFPA 211. Line breaching with a minimum of 75 mm 3 inch thick refractory, and seal tightly all around with a nonasbestos type rope and cement to form an airtight joint where required. Provide cleanout openings of suitable size, with tight fitting hinged doors and frames, at approved locations for
access to all sections of the breaching. [Locate one 406 by 406 mm 16 by 16 inch inspection door in the side of the breaching just preceding the boiler unit.] [Locate a similar inspection door in the side of the breaching just following the boiler unit.]

2.6.9 Draft Equipment

Supply combustion air in the primary and secondary zones by a motor-driven blower as specified for draft fans. Design control circuits to shut down incinerator in case of a power failure, and to purge the chamber prior to ignition of the burners. Provide an air compressor for soot blowing or oil atomization. Also provide equipment to supply the correct amount of air to permit complete, controlled combustion, including forced draft fans, draft gauges, dampers, damper actuators, linkage, and appurtenances necessary to maintain a negative draft in the primary chamber, in order to provide optimum incinerator performance at all operating rates.

2.6.9.1 Combustion Air Damper

Regulate secondary, under-fire, and over-fire air with controller actuated dampers, constructed of black-sheet steel, not less than 1.519 mm 16 gauge, which operate without noise or flutter. Provide electric motor actuators at 110 [220] [440] volt ac, hydraulic, or pneumatic operated.

2.6.9.2 Flue Gas Damper

**************************************************************************

NOTE: Optional wording applicable to guillotine-type dampers.
**************************************************************************

[Install a [guillotine-type] [butterfly] [shutter] damper [of the thickness indicated] [at least 63 mm 2 1/2 inches thick] and consisting of a steel frame enclosing refractory material at the entrance of the waste heat recovery boiler for the purpose of isolation from the incinerator during emergency boiler repairs.] Also install a damper in the dump stack which opens upon occurrence of [excess boiler steam pressure,] induced draft fan failure [, and boiler shutoff]. [Provide a boiler damper operated by a controller actuated motor based on the [boiler steam pressure] [boiler water temperature.] When the boiler damper is open, the stack damper will close. Furnish [a chain hoist for raising and lowering][a manual lever for][an electrical control for] the boiler damper of correct size and design to ensure freedom of movement by the damper. [Secure the hoist cable to the damper frame by means of shackles and bolts, and a damper slot with a steel plate cover 6 mm 1/4 inch thick and of the length and width indicated or required. Provide the cover with a slot to permit the passage of the cable for raising and lowering the damper, and for easy removal of the cover. Provide a spur-gear hoist which is a product of a manufacturer regularly engaged in the manufacture of hoists. Design unit for high-speed lifting, with high mechanical efficiency, an automatic load brake and a built-in load limit.] Maximum effort to operate the unit must not exceed 311 N 70 pounds, with the capacity to move the required load freely and maintain the damper in the desired position within the limits of the flue opening].

2.6.9.3 Blowers

Provide auxiliary fuel burner blowers capable of delivering the necessary amount of air at an atmospheric temperature of [16] [_____] degrees C [60]
[_____] degrees F and a barometric pressure of 101 kPa absolute 14.7 psia to allow the burners to achieve rated capacity. Provide single-inlet, single-width, non-overloading blowers designed for quiet operation with as little vibration as practicable, with grease lubricated bearings, ball or roller type, to accommodate all radial and end thrust. Construct housing of 1.897 mm 14 gauge sheet steel with a smooth interior that will eliminate unnecessary turbulence.

2.6.9.4 Draft Fans

Furnish centrifugal, forced-draft fans conforming to CID A-A-59222 as an integral part of incinerator design, conforming to AMCA 801, Type [I] [II] and AMCA 99, applicable to centrifugal furnace fans and rated for flow rate, pressure, power, speed of rotation, and efficiency in accordance with AMCA 210 and ASME PTC 10, with [backward curved blades] [forward curved blades]. Size each fan for operation at an elevation of [_____] m feet, with an output volume and static pressure rating sufficient for pressure losses, excess air requirements at the secondary zone exit, leakages, temperatures and elevation corrections for worst ambient conditions. Include in the design conditions, at full combustion, net rated output at normal firing condition capacity plus additional capacity sufficient to provide a 15 percent excess volume against a 32 percent static overpressure, and air temperature 14 degrees C 25 degrees F above operating temperature. Provide fan that is driven by a totally enclosed, fan-cooled electric motor. Connect fan directly or indirectly to the driving motor. If the fan is indirectly connected, provide a V-belt drive designed for 50 percent overload capacity, with the motor mounted on the base in a manner that permits tightening of the belt. Noise levels for fans exceeding 85 decibels at 914 mm 3 foot station are not permitted. Provide air-cooled fan bearings, of the backward curved fan blade type with bearings not requiring water cooling of the self-aligning antifriction type. [Provide scroll sheets and rotor blades with liners.] Factory paint fans with the manufacturer's standard finish. Design control circuits to shut down incinerator in case of power failure and to purge the chamber prior to ignition of the burners.

2.6.9.5 Control Equipment

Furnish each motor with a manually operated starter, of the enclosed, across-the-line type with manually reset thermal-overload protection. Provide a separate pole for each ungrounded conductor.

2.6.9.6 Air Ducts

Supply over-fire and under-fire air from the blowers through ducts conforming to SMACNA 1403. Introduce combustion air to the primary chamber below the waste material by means of under-fire air lines or ducts. Regulate over-fire air by controlled air ports located in the wall of the incinerator for completing combustion of combustible materials in the gases. Size ducts to minimize pressure drops and construct of sheet steel with all seams and connections air tight. Construct duct work of galvanized sheet metal, with galvanizing conforming to ASTM A123/A123M and ASTM A153/A153M. Provide access and inspection doors as required. Provide duct wall thickness as follows:
### Heat Recovery System

Boilers for the heat recovery system are as indicated in Section 23 52 30.00 10 HEAT RECOVERY BOILERS.

#### Ash Removal

Provide a unit with provisions for mechanical removal of the ash or residue, which is to discharge from the combustion of the refuse from the far end of the incinerator, opposite the location where waste is introduced. Provide an ash plow or other device, automatically interlocked with the doors for the removal operation, combined with a water quench, spray, or bath which will extinguish live embers and control airborne dust. Also make provisions for manual removal of ash for maintenance purposes upon completion of the cool-down cycle, through the access door. Treat waste liquids (ash water) as necessary to be compatible with, and discharged to, the sewage collection system. Remove ash and residue from the area by mechanical conveyors, constructed of corrosion resistant material, and portable containers. Equip each unit system with an independent ash removal and ash conveyor system designed to conform to the equipment arrangement shown.

**2.6.11.1 Ash Pits**

Provide funnel shaped ash pits, containing receiving hoppers constructed of 6 mm 1/4 inch steel plate, minimum, covered with a heavy grating with openings approximately 50 mm 2 inches square for personnel protection. Discharge ashes and clinkers from the incinerator into the ash hopper located directly below the ash discharge opening. Arrange a combination drag chain conveyor for horizontal conveying and an elevator conveyor for vertical conveying of ashes as indicated to take ashes from the bottom of the ash hopper for discharge into the ash container. Provide conveyors with a capacity of not less than [_____] kg/hour pounds/hour when handling ashes weighing approximately [_____] kg/cubic meter pcf at a maximum speed.
of [0.5] [_____] m/second [100] [_____] fpm. Provide doors for access to all parts as required. Provide totally enclosed, [nonventilated type][fan-cooled type][fan-cooled type suitable for installation in a Class II, Division 1, Group F hazardous location in accordance with NFPA 70] electric motors, with [manual] [magnetic] [across-the-line] [reduced voltage start] type motor starter and [general-purpose] [weather-resistant] [watertight] [dust-tight] [explosion-proof] enclosure.

[2.6.11.2 Drag Chain Conveyor]

Provide a drag chain conveyor consisting of a [single] [double] strand of wide, malleable iron, drag chain with a [_____] mm inch overall width, and [_____] N pounds working strength. The upper strand of the chain must convey the ash in a trough constructed of 10 mm 3/8 inch cast iron, or other suitable material, extending from [_____] mm inches in front of the foot shaft to [_____] mm inches behind the head shaft and set flush with the floor. Carry the return strand of chain in angle runways set flush with the trench floor, without passing through the falling ash.

[2.6.11.3 Elevator Conveyor]

Provide a double strand elevator conveyor, chain type with head and takeup and an extended foot shaft to provide a drive for the drag conveyor. Construct casing of 2.657 mm 12 gauge black steel, minimum, with 4.8 mm 3/16 inch thick boot plates. Include with head-end drive a gear motor and steel roller chain complete with drive brackets, guards, and backstop. Equip elevator with head-end platform and ladder. Factory prime all exposed metal surfaces for field painting.

[2.6.12 Steam Piping]

Steam piping system consists of those piping sections actually conducting steam, condensate return piping, and vent piping. Provide steam piping conforming to the provisions of Section 33 63 23 ABOVEGROUND HEAT DISTRIBUTION SYSTEM, unless otherwise specified, designed for [_____] kPa psi steam.

[2.7 COMBUSTION CONTROL EQUIPMENT]

2.7.1 General

Provide and install all locally indicating instrumentation and local controls complete, as required to suit equipment furnished and as shown. Also provide and install all remote instrumentation, controls, and their connection points as indicated, or as specified, as well as an automatic combustion-control system for each incinerator in accordance with the incinerator manufacturer's recommendations. If controls are manufactured by a manufacturer other than the incinerator manufacturer, install the controls in accordance with the control manufacturer's instructions. Locate automatic controllers on the control room panel as specified. Provide pneumatically, electrically, or electronically operated equipment. If pneumatic controls are provided in lieu of electric, provide duplex air compressors, with a drier between the compressors and tank. Size air
compressor unit to run not more than 60 percent of the time when all controls are in service. Install air filter regulator sets at each control valve and transmitter in the system. Provide dual type master air filter regulator set on the control panel such that one side can be cleaned and repaired while the other is in operation. Provide each system with a selector switch or other means to permit manual control of the firing rate when required. Provide two-wire 120 volts nominal or less, 60 Hz with grounded neutral power supply to the electrical circuit. Wire all operating and limit controls to interrupt the ungrounded circuit conductor.

2.7.2 Equipment

Include in control equipment and instruments burner and fan controls, time clocks, relays, operating switches, indicating lights, gauges, motor starters, fuses, alarms, and circuit elements of the control system, and other controls and instruments necessary for unit operation, in accordance with FM APP GUIDE. Provide proportioning control of the overfire and underfire air supply and of the air supply and fuel supply to the burners. Ensure a visual indication for safe loading of the incinerator and excessive high temperature conditions which may require control or adjustment by the operator are provided within temperature indicator controllers or other indicators. Provide indicating and recording instruments for pressure, flow of air and liquids, as well as for alarm circuitry. Interlock automatic control circuit systems and manual switches to prevent hazardous conditions or the discharge of excessive amounts of air pollutants.

2.7.3 Combustion Control

Control of the products of combustion is based on maintaining a pre-set temperature, not to exceed limits as specified for minimum design requirements under paragraph INCINERATOR. Design the system to minimize auxiliary fuel usage by controlling the quantity of air and waste fuel introduced into the primary chamber or zone in accordance with the temperature. Provide over-fire protection by controlling the upper chamber or zone combustion air as a function of the chamber or zone temperature, with a fully automated and integrated control system, which operates at near the design conditions, and at near constant temperature output.

2.7.4 Incinerator System Operation Sequence

2.7.4.1 Starting

Provide a "START" button which causes the secondary (pollution control) chamber or zone burner to ignite to preheat that area prior to charging the system, using auxiliary fuel only as a heat source during the preheat period. The secondary burner, after ignition, must be under the control of a modulating thermal controller which controls the air/fuel ratio in the secondary chamber or zone. Burner for the primary chamber or zone may be either automatically or manually activated. Interlock the burner control circuit with a timer or temperature sensor which functions to shut off and lock out the burner after a predetermined and preset time or temperature has been achieved.

2.7.4.2 Loading

After a predetermined warm-up period, the system must be ready for loading. Feeder controls allow for two modes of operation, automatic cycle and manual. Control automatic system by a timer or speed control,
interlocked with limit switches and temperature sensors. Initiate automatic feed cycle by a single push button when the operator is ready for that unit to begin the cycle. After cycle initiation, the vertical charging door (when present) must open and the ram or other stoking device must start moving forward to discharge the refuse into the primary chamber or zone. After the ram or other stoking device has reached the end of its stroke, it withdraws back into the hopper to a position where the charging door (when present) is allowed to close, and the ram returns to its original start position.

2.7.4.3 Overrriding

Equip feeder with a charging ram water spray system. Equip loader control with a manual override system which enables the operator to override the automatic sequence if necessary to correct a malfunction of the loader. In the event of a malfunction, provide a flashing light and an audible alarm to signal the operator that a problem has occurred. In the manual mode of operation, provide selector switches to individually control the motions of the charge door, hopper door and ram.

2.7.5 Controllers

Mount controllers on the instrument panel to indicate and control measurement in the areas shown. Provide proportional type controllers with reset, and automatic/manual operation. Provide a set point with a manual adjustment on the front of the instrument. Install controllers complete with wiring or piping between the controller, transmitter, and the final control device. Provide proportional type combustion control equipment capable of maintaining optimum combustion conditions. Set point controllers may be used for on/off functions only. Maintain combustion efficiency without appreciable manual adjustment.

2.7.5.1 Automatic Controller

Provide each automatic controller with a manual-to-automatic station and indicator on the control panel that offers selecting either automatic control or manual control and also allows manual operation. Arrange manual controls to allow any one or more of the functions of the control system to be controlled manually while the other functions remain on automatic control. Provide manual control station complete with all necessary indicators to facilitate changing from automatic control to manual control and vice versa.

2.7.5.2 Fuel-Flow, Air-Flow Type

Provide proportional, reset type combination fuel-flow, air-flow type combustion control equipment for the auxiliary burners, which positions the feed or air flow and then adjusts one to the other by a ratio controller operating from airflow and feed. Include in controls fuel-flow measuring elements and airflow measuring elements which are field-mounted and separate from panel devices. Panel mount separate fuel feed and air-flow controllers along with a fuel-to-air ratio controller. Airflow index may be set by a measuring element in the air stream or in the gas stream exiting the incinerator. Systems controlling fuel and air by line shafting and mechanical connections are not acceptable.

2.7.6 Damper Control

Size power units for the damper movement to operate the device to be
positioned, and mounted to allow for a rigid mechanical connection to the device being operated. Provide automatic draft control by controlling the main damper or uptake damper. Main damper or uptake damper must open to allow air purging of the incinerator and control draft to suit burner operation, and automatically close units in event of failure of the operating medium except for any dump stack damper which fails to open. Provide manual operation of the controller without disconnecting the linkages during power failure or other emergency. Include position switches on fuel and air-drive units for interlock with safety systems. Place retransmitting devices on all power units for remote indication on the control panel of the position of the operator at any time. If electric operators are utilized, provide oil-immersed gear trains on the units.

2.7.7 Fuel Feed Controls

Control automatic feed cycle by an adjustable timer for rams and a speed control for feed grates. Provide an interlock to interrupt the automatic cycle in the event of an emergency such as an extreme overtemperature condition in the primary chamber or zone.

2.7.8 Burner Controls and Safety System

Burner control and safety system must provide for the start, purge, ignition, main flame supervision, safe shutdown and alarm of the incinerator fuel burning equipment, such that a burner malfunction at any time prevents the burners from operating by tripping a burner relay. Integrate control of the burner and incinerator system to ensure overall safety. Provide safety shutoff valves and fuel trains for main burners as required by FM APP GUIDE and NFPA 85. Automatically control sequence of burner operation by programming relays to start a mandatory pre-purge cycle with full protection against flame failure during both electric spark ignition and normal burner operation. Normal cycling of burners that require system pre-purge is prohibited. Govern operation of the programming relays by a [steam pressure limit switch,] approved draft switch, low fuel pressure switch, [low drum level cut-off switch] and an electronic flame failure protection device. A flame failure condition will cause the burner to shut down on safety and require a manual reset before the burner can be restarted. Control normal cycling by means of temperature switch as described earlier.

2.7.8.1 Incinerator Burners

**************************************************************************
NOTE: Insert appropriate fuel oil or gas specification section(s) associated with this project. Only allow direct electric spark ignition for burners up to 732,500 watt 2,500,000 BTU/hour. Values of minimum burner input capacity:

NOTE: Insert appropriate Section number and title in blank below using format per UFC 1-300-02.

Provide [gas] [oil] [combination gas and oil] burners for the primary and secondary combustion chambers. Design burners for [natural type gas] [or] [No. 2 fuel oil conforming to ASTM D396]. [Fuel oil] [Gas] piping is covered in [______]. Design incinerator burners for fully automatic nonrecycling operation, with a combustion-safety control system conforming to FM APP GUIDE or NFPA 85, as appropriate. Certify that the installed control system conforms to FM APP GUIDE or NFPA 85. Provide UL listed and
FM approved system components, designed for use with industrial grade burners. Include the following with all accessories for a complete system.

2.7.8.2 Combustion-Safety Controls System

Provide a combustion-safety control system which includes a flame safeguard relay or control unit that has solid state electronic circuitry and continuous self-check feature. Provide relay or control unit consisting of amplifiers, transformers, power supply, relays, indicating lights, and terminal strips factory prewired and assembled in a NEMA ICS 6, Type 12 steel cabinet with door. Provide a cabinet made of steel, 1.897 mm 14 gauge minimum thickness, with gray enamel finish throughout or any other color selected by the Contracting Officer. Provide cabinet door with piano hinges and latch, with components and supporting chassis which is easily removed for replacement and repair. Provide plug-in or similar units. Provide a flame safeguard relay or control unit which checks itself and the detector circuit for flame simulating component failure at start-up and at intervals not to exceed manufacturer's recommendation or the specified flame failure response time throughout the burner operation. Loss of combustion airflow, flame failure and flame simulating component failure must cause the flame safeguard relay or control unit to de-energize all fuel levels for the burner and initiate a non-recycling burner shutdown and alarm. Provide flame safeguard relay or control unit to program the burner operation to conform to FM APP GUIDE or NFPA 85.

2.7.8.3 Purge Timer

Provide a purge timer to prevent the operation of the flame safeguard relay or control unit until the minimum purges, as required in NFPA 85 or FM APP GUIDE, have been completed. Volume to be purged includes the volume of the combustion chamber, boiler passes and breachings. Interlock the purge timer with the airflow differential pressure switch and igniter and main firing valves to ensure that all fuel lines are closed. Provide a green indicating light as specified above to indicate purge completion.

2.7.8.4 Safety Shutdown Interlocks

Provide safety shutdown interlocks in the flame safeguard relay or control unit for the conditions specified by FM APP GUIDE or NFPA 85. Provide low and high fuel pressure interlock switches, interlocked with the flame safeguard relay or control unit to prevent burner operation if low or high fuel pressure is detected.

2.7.9 Combustion Temperature Control

Provide a separate temperature control for each combustion chamber which controls the firing rate within that chamber. Provide Type "K" thermocouple temperature sensors in a ceramic protection tube, suitable for operation up to 1538 degrees C 2800 degrees F. Temperature is to be transmitted to the controller mounted in the control panel. Provide the type of controllers that can be operated in the automatic or manual mode. Control the temperature within plus or minus 5 percent of the set point over the full operating range required by the manufacturer of the incinerator.

2.7.9.1 Primary Combustion Chamber or Zone Controller

This controller varies the combustion rate through control of the primary air supply and auxiliary burners, and also prevent overfeeding the primary
chamber or zone by locking out the feed system during extreme over or under temperature situations.

2.7.9.2 Secondary Combustion Chamber or Zone Controller

The temperature controller in the secondary chamber maintains the required temperature for complete combustion of the gases and reduction of particulates. This controller varies the firing rate of the burner and the flow of combustion air to the secondary chamber or zone.

2.7.10 Draft Fan Control

Provide forced-draft centrifugal fans with inlet vane controls [and variable speed control where indicated]. [Provide axial propeller fans with variable propeller pitch control.] Provide inlet vanes suitable for use with combustion control equipment. Provide a means for operating the draft fans for 15 minutes after last charge in the incinerator has burned down.

2.7.11 Draft Fan Drives

Provide a draft fan driven by [an electric motor] [or] [a steam turbine]. [Electric motor must be [drip-proof] [totally enclosed nonventilated] [totally enclosed fan-cooled] suitable for installation in a Class I, Division 1, Group F, hazardous location [NFPA 70].] [Motor starter must be magnetic [across-the-line] [reduced voltage start] type with [general-purpose] [weather resistant] [watertight] [dust-tight] [explosion-proof] enclosure and furnished with four auxiliary interlock contacts.] [Provide a steam turbine with horizontally-split, centerline supported casings, water-cooled bearing housings with ring-oiled, babbitt-lined, bronze packing sleeve bearings, and equipped with a mechanical shaft speed governor and valve, and independent emergency over-speed governor and trip valve, reed tachometer, constant pressure type governor, insulation with removable metal jacket, oil-sight glasses with guards, removable stainless steel steam strainer [without disconnecting piping], any special wrenches and tools required for servicing turbine, and a sentinel warning on the exhaust casings. Provide turbines conforming to NEMA SM 23.]

2.7.12 Ash System Control

Provide controls for the ash discharge system which allow for two modes of operation, automatic and manual. Manually initiate and control automatic cycle by cycle programmers or automatically initiated by the charging system programmer. Install lights, controls and interlocks as described earlier for automatic ash removal control in and on the main cabinet with manual controls installed near the ash removal equipment of each incinerator.

2.7.13 Soot Blower

Mount all controls, lights, switches, and indicator provided for operation of soot blower on the control cabinet.

2.7.14 Incinerator Shutdown

When the primary chamber or zone temperature exceeds a control limit of 982 degrees C 1800 degrees F, lock out feed system and suspend waste feeding until manually reset. Shutdown the entire incinerator at 1538 degrees C.
2800 degrees F in the furnace, 400 degrees C 750 degrees F at the induced draft fan, or 260 degrees C 500 degrees F at the combustion air fan. In the event of a complete shutdown, reset the system manually and go through a normal start-up procedure including purging, prior to starting the burners.

2.7.15 Control Panel

Provide wall mounted cabinets conforming to UL 50 and free standing cabinets or panels conforming to NEMA ICS 6, Type 6 or Type 4. Provide prewired, steel, and weathertight panel. Unless enclosed in a booth or separate room, construct the panel to protect the instruments and controls from dust. Instrumentation fabricator must wire all instrument connectors and cable termination connectors in the factory. Flush mount all controls, instruments, and other equipment at the factory and assembly-test prior to shipment. Furnish a lock and two keys. Identify all controls and instruments with nameplates. [Provide a heater to prevent condensation.]

2.7.15.1 Panel Details

a. Size panels to contain all controls, instruments, gauge, and meters. Provide free standing panels with faceplate of not less than 6.4 mm 1/4 inch reinforced steel plate, coated with an approved laminated plastic suitable for the duty and finished with the manufacturer's standard finish coating. Flush mount controls and instrumentation on the panel as far as practicable.

b. Enclose back of panel with sheet metal, with adequate access panels for maintenance and removal of any component without interfering with other components. Provide door-latching equipment and hardware.

c. Identify each recorder, indicator, and control unit with engraved metal or laminated plastic nameplates secured to the panel. Provide panel with a continuous rapid-start fluorescent light fixtures mounted with reflectors providing suitable shielding to illuminate all controls, instruments, gauges, and meters.

d. Terminate field piping connections for each panel in one bulkhead-mounted manifold located to conform with the installation requirements of the system. Terminate field electrical connections in a mounted color-coded terminal strip located to conform with the installation requirements of the system.

e. If a pneumatic control system is provided, mount the panel air supply filter and regulator set on the rear of the panel with properly identified pneumatic terminal blocks. No high pressure lines are allowed to enter the panel. If packaged-type burner units with integral controls are furnished, the control equipment may be mounted on a separate panel for each incinerator. Panel mount and test controller and indicators specified or required at the factory, complete with relays, transformers, switches, wiring, valves, and piping.

f. Completely isolate thermocouple and low energy signal conductors from power and alarm conductors, subject to approval by the Contracting Officer. Provide visual and audible alarms to protect personnel and equipment. Mount annunciator system on each control panel. Provide visual signals consisting of backlighted nameplates for each point. Provide a common audible alarm signal and a common acknowledge
pushbutton for each control panel. Indicate malfunctions on the
annunciator panel as specified [in Section 23 52 30.00 10 HEAT RECOVERY
BOILERS] plus the following as a minimum:

(1) Loader
(2) Burner (each)
(3) Ash Discharge System
(4) Ash Transfer Rams (if used)
(5) Ash Conveyor

Also include in the panel visual indication of the various modes of the
main system components such as loading and charging system, burners,
ash discharge system, ash conveyor, damper positions, [induced draft
fans]. Additionally, include in the incinerator/[boiler] panel [as
specified in Section 23 52 30.00 10 HEAT RECOVERY BOILERS plus] the
following:

(1) Temperature Recorder (lower chamber, upper chamber)
(2) Clock with minimum 200 mm 8 inch diameter face (one panel only)

2.7.15.2 System Diagram

Mount laminated, color-coded system diagram on the control panel indicating
all system components and location of all sensors and alarm points.

2.7.16 Indicating Lights

Mount lights on the door of the control cabinet. Integrate components
through appropriate electromechanical devices with push-to-test type
indicating lights. Install indicators complete with all necessary wiring
and conduit between the indicator and the transmitter in the equipment
room. Operating ranges for each indicator as indicated. Provide industrial
oiltight construction in the following colors for the indication functions:

2.7.17 Selector Switches

As a minimum, provide the following hand-auto-off selector switches:
2.7.18 Clock

Recess mount a single synchronous 120-volt ac, motor-driven, with shatterproof, crystal-covered white dial clock, a minimum of 200 mm 8 inches in diameter with black Arabic numerals, black hour and minute hands, red sweep hand, and anodized brushed aluminum bezel. Totally enclose clock motor and mechanism in a heavy plastic cover.

2.7.19 Recorders

Mount recorders on the instrument panel to record and indicate measurement in the areas shown. Make the record in ink on a [24-hour] [31-day], [100 mm 4 inch linear] [circular] [strip] chart driven by an electric-clock mechanism. Make each recorder point with a different colored ink. Install recorders complete with all necessary wiring or pipe between the recorder and the transmitter. Provide the unit with sufficient blank charts and ink for 1 year's operation.

2.7.20 Water Meters

Provide meters conforming to AWWA C700 of the disk type with reinforced disk for hot water above 66 degrees C 150 degrees F, and a rubber or carbon disk for cold water. Construct meters of bronze composition and cast iron protected by noncorrosive coating, with easily replaceable moving parts.

2.7.21 Annunciator

******************************************************************************
NOTE: Edit to indicate the number of points desired and specific items in the list.
******************************************************************************

Provide an engraved, back-lit window annunciator complete with pushbuttons and alarm horn to indicate abnormal operating conditions of the incinerator. Include a common alarm silencing relay in the alarm circuit to permit the incinerator operator to silence the audible horn while retaining visual indication until the malfunction or abnormal condition has been cleared. Furnish one [_____]-point annunciator for each incinerator and install in the annunciator and pump control panel. Provide alarm module nameplates, nominal 70 mm 2-3/4 inches high by 75 mm 3 inches wide in translucent white acrylic plexiglass. Engrave all nomenclature on front surface in black lettering. Mount and prewire flasher module with silence and test pushbuttons. Provide alarm points and window engraving as [specified in Section 23 52 30.00 10 HEAT RECOVERY BOILERS plus the additional points] shown below. Provide an annunciator from the same manufacture and type as furnished by the supplier of other control panels, with interchangeable spare parts between annunciators.

2.7.22 Flame Sensor

Provide an ultraviolet flame-sensing device for each burner and install in accordance with the manufacturer's recommendations. The flame-sensing device must not respond to ignition spark, hot refractory, reflection of flame on atomizing media or oil spray. Sight flame safeguard sensor to detect only the burner flame for which it is designed. Perform a pilot turndown test, spark response test for ultraviolet detector, and manufacturer's approved test for rectification detectors to verify reliable sensor installation. Weld or fix sensor mount to prevent altering orientation to flame being proven.

2.7.23 Temperature Indicators

Provide temperature gauges to match pressure gauges in appearance and match requirements of the transmitters supplied. Use any of the following temperature sensors unless otherwise specified. Include the following:

a. Outdoor air
b. Incinerator room
c. Primary chamber or zone
d. Secondary chamber or zone
e. Flue gas leaving incinerator

2.7.23.1 Thermometers

Provide thermometers conforming to ASME PTC 19.3 TW, Type 1, Class 3, with wells and separable corrosion-resistant steel sockets and temperature range suitable for the use encountered. Provide dial type thermometers 90 mm 3-1/2 inch diameter chromium-plated case, remote-type bulb or direct-type bulb as required, with plus or minus 1 degree C 1 degree F accuracy and white face with black digits graduated in 2-degree increments. Do not use mercury in thermometers, and install as indicated, to be easily read from the operating floor.

2.7.23.2 Thermocouples

Provide thermocouples conforming to ASTM E230/E230M, Type K, indicating gas passage temperatures. Thermocouples must control burner operation, be suitable for continuous operation up to 1538 degrees C 2800 degrees F, and
accurate to 0.75 percent of the operating and indicating temperature range. Provide thermocouples in the combustion chamber or as otherwise directed, long enough to be inserted 150 mm 6 inches into the furnace. Provide thermocouple with an adjustable flange and a high-temperature, metal alloy, closed-end protection tube suitable for inserting into the furnace without support of the projecting end. Supply thirty meters one hundred feet of 1.519 mm 16 gauge compensating lead wire with a weatherproof braid for connecting the thermocouple to the instrument. Transmit temperature to the instrument in the control panel as shown.

2.7.23.3 Pyrometers

Provide indicating [recording] pyrometers at the locations indicated or directed, with a temperature range from minus 18 to 1316 degrees C 0 to 2400 degrees, and accurate to within plus or minus 0.25 percent of the range. Indicate temperature on a large scale with prominent black letters on a white background [and record with a continuous ink line on a circular chart at least 300 mm 12 inches in diameter, with 24-hour revolution]. Provide instrument with automatic cold-junction compensation. Provide a simple means of pyrometer standardization, which will not be affected by vibration, dust, or air currents when the door of the instrument is open. Operate instrument on 110 volts ac.

2.7.24 Pressure and Vacuum Gauges

Provide gauges conforming to ASME B40.100, Type I, Class 1 or 2, as applicable, style as required; heavy-duty industrial type, suitable for pressure or vacuum specified, with minimum 150 mm 6 inch diameter dial, except as otherwise specified. Gauge piping must be copper tubing conforming to ASTM B68/B68M, Type K or L.

2.7.25 Draft Indicator and Control

Provide Draft Gauges conforming to ASME B40.100, Style I, with approved operating ranges, and with a diaphragm or bellows actuating system and a circular scale. Provide gauges with a zero adjustment screw and a connection to atmosphere and with suitable shutoff cocks. Gauges must be remote-reading to the control panel. Install gauges complete with all necessary piping between them and the points at which the drafts are measured. Provide an indicator which continuously indicates pressure in primary chamber. Also provide a separate draft controlling instrument maintaining a constant 0.10 to 0.15 inch negative pressure in the primary chamber.

2.7.26 Opacity Alarm

**************************************************************************
NOTE: This paragraph may be simplified based upon the monitoring requirements of the state in which the incinerator is to be located. Not all states may require continuous monitoring and recording. However, an opacity alarm should always be included to alert the operator to operational problems.
**************************************************************************

a. Provide a stack gas opacity alarm indicator and recorder system consisting of a stack unit, control or transmitter unit, chart recorder, red alarm, manufacturer's standard color Power On signal lights, and alarm bell on the instrument panel for each incinerator.
Provide self compensating system, and provide continuous measurement, indication, and recording of smoke opacity from the incinerator. Include in stack units a light source, a light detecting or receiving unit mounted in the stack or main breaching as recommended by the manufacturer, and fixed access to the units.

b. Provide the control or transmitter unit with electronic solid-state circuitry and meter or digital indicator, indicating smoke density by 0 to 100 percent opacity. In addition, furnish the control unit or transmitter with calibration and alarm adjustments, in a dust-tight metal enclosure. Provide a purging air system to clean light source lens and light detector lens. Make the control unit adjustable for various smoke densities at which alarm bell will sound and at which warning lights will operate. Warning bell must sound in conjunction with the red light.

c. Provide an electrical or electronic type recorder with a 250 mm 10 inch minimum diameter recorder chart having 24-hour rotation scale, graduated in 0 to 100 percent smoke density. Provide the smoke alarm indicator and recorder system with provisions to field-check 0 and 100 percent smoke density calibration points without shutdown of incinerator or removal of stack units, indicator, and recorder. Provide equipment suitable for ambient temperatures not more than [_____] degrees C degrees F and up to 100 percent humidity. Provide smoke alarm indicator and recorder, including air purging system, which operates on 115-volt, single-phase, 60 Hz electric power. Provide four hundred blank charts and a 1-year ink supply.

2.8 TOOLS

Provide uncommon tools necessary for the operation, cleanout and maintenance of the incinerator, [boilers,] burners, pumps, fans, valves, traps, strainers, [other steam piping equipment,] and other auxiliary equipment. Also provide any special wrenches as required for opening [boiler manholes], handholes, and cleanouts. Provide a smoke pipe cleaner to clean the breaching and smoke connections, with a jointed handle of sufficient length to clean breaching and smoke connections without dismantling.

2.9 PAINTING AND FINISHING

2.9.1 Treatment

Clean all surfaces of castings, forgings, molded parts, stampings, welded parts, inner surfaces of the outer casing of the incinerator, the exterior surfaces of the outer casing, the control panel, and piping, except corrosion-resistant steel, to base metal for removal of oil, rust, sand, dirt, fins, spurs, scale, slag, flux and other extraneous materials before primer is applied at the factory. Make external surfaces smooth and all edges rounded or beveled, unless sharpness is required to perform a necessary function.

2.9.2 Incinerator Coating

Paint incinerator in accordance with the manufacturer's standard practice with a minimum of one primer coat and two finish coats. Paint metal subject to heat with heat resistant (up to 648 degrees C1200 degrees F) silicone aluminum paint. Apply paint directly to clean bare metal surfaces and attain a minimum dry film thickness of 1 mil per coat. Do not apply
paint when the temperature is 10 degrees C 50 degrees F or below or above 32 degrees C 90 degrees F.

2.9.3 Equipment Coating

Factory finish equipment and component items, when fabricated from ferrous metal, with the manufacturer's standard finish if located within buildings. Provide items to be located outside with weather-resistant finishes that will withstand 500 hours of exposure to the salt spray test specified in ASTM B117, using a 20-percent sodium chloride solution. This test may be performed on test specimens coated and finished in the same manner as the actual equipment. Immediately after completion of the test, the specimens must show no sign of blistering, wrinkling, cracking, or loss of adhesion and no sign of rust creepage beyond 3 mm 1/8 inch on either side of the scratch mark. Paint all exposed pipe covering as specified in Section 09 90 00 PAINTS AND COATINGS. Do not paint aluminum sheath over insulation.

2.10 FACTORY TESTS

Conduct initial capacity and performance tests of factory assembled incinerator components at the manufacturer's plant. Correct or replace any material and equipment rejected before installation.

PART 3 EXECUTION

3.1 EXAMINATION

**************************************************************************
NOTE: Equipment dimensions vary widely between different manufacturers. Although the general arrangement of the building will remain the same, some structural dimensions may have to be changed after award of the contract to accommodate the specific equipment being proposed.
**************************************************************************

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancies before performing the work. Because of the small scale of the drawings, it is not possible to detail all runs and indicate all offsets, fittings, and accessories which may be required. Investigate structural and finish conditions affecting all work, arranged accordingly, and furnish such fittings and accessories as may be required to meet such conditions. Plans are generally diagrammatic. Harmonize the work of the different trades so interference between conduit, piping, equipment, architectural, and structural work is avoided. Submit building design modifications required for the specific equipment being supplied prior to start of construction.

3.2 MANUFACTURER'S FIELD SERVICES

Obtain the services of the manufacturer's representative experienced in, and to supervise the installation, adjustment, operation, and testing of the equipment specified. Ensure that sufficient lead time is given to prevent late delivery of equipment and materials and installation delay problems.
3.3 INCINERATOR INSTALLATION

**************************************************************************
NOTE: Delete inapplicable NFPA and FM Standards not to be employed.
**************************************************************************

Install equipment and material as indicated and in accordance with the manufacturer's written instructions, industry standards, and NFPA 82. Provide combustion air supply and ventilation in accordance with NFPA 31 or NFPA 54.

3.3.1 Gas Systems

**************************************************************************
NOTE: Specify the utilities to which connections will be made by the Contractor. Show utilities on the drawings. Delete inapplicable paragraphs.
**************************************************************************

Provide gas service as specified in Section 23 11 20 FACILITY GAS PIPING.

3.3.2 Fuel Oil System

Install fuel oil system in accordance with NFPA 31 and Section 33 56 10 FACTORY-FABRICATED FUEL STORAGE TANKS, unless otherwise indicated.

3.3.3 Foundation

Construct foundations for the incinerator and for other heating equipment specified, when required, as indicated and recommended by the manufacturer. Construct incinerator foundation of [3000] psi concrete as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Set anchor bolts accurately and of adequate length to install the incinerator. When embedded in concrete, install anchor bolts with plates welded on the head and protect them against damage until the equipment is installed.

3.3.4 Steel Ladders

Provide a steel ladder where the depth of manhole exceeds 3.6 m 12 feet, not less than 406 mm 16 inches in width, with 19 mm 3/4 inch diameter rungs spaced 300 mm 12 inches apart, with two stringers a minimum 10 mm 3/8 inch thick and 50 mm 2 inches wide. Rigidly affix the ladder to the tank bottom with pipe guides or slip bars, secured with slip bars at the top, and spaced not more than 1.8 m 6 feet apart vertically, to accommodate expansion of the stringers. Install stringers to provide at least 150 mm 6 inches of space between the wall and the rungs. Galvanize ladders and inserts after fabrication in conformance with ASTM A123/A123M. The wall along the line of the ladder must be vertical for its entire length.

3.3.5 Equipment Structural Support

3.3.5.1 Column Base Plates

3.3.5.2 Anchor Bolts

Provide ASTM A307 anchor bolts. Show anchor bolt sizes and locations on the detail drawings.

3.3.6 Insulation

Provide shop and field applied insulation as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS unless otherwise specified. Insulate breaching [and dust collectors] with magnesia, mineral wool, calcium silicate, or approved mineral insulation. Insulation may be either block or blanket type. Fill joints in the insulation with magnesia, mineral wool, or other equally suitable cement.

3.3.7 Catwalks and Access Platforms

Catwalks, access platform stairs, ladders, and handrails shown, depict a general scheme of ingress and egress. Furnish and install all necessary platforms and stairs for safe and efficient operation and maintenance of the equipment. They may be relocated from the wall openings and passageways shown in order to suit the incineration equipment provided. Provide all railings with 100 mm 4 inch wide toe-board located not more than 6 mm 1/4 inch above the floor level. Conform construction, as close as practical, to similar items as indicated.

3.3.8 Control System Installation

Install equipment in accordance with the manufacturer's approved instructions. Provide all control conduit, wiring and/or tubing under this section of the specifications, except as specified elsewhere. Copper, stainless steel, or non-metallic tubing may be used as appropriate. Provide copper consisting of ASTM B88M ASTM B88, Type K with flare type, cast brass, or wrought copper fittings. Provide pneumatic tubing consisting of 6 mm 1/4 inch OD with a minimum wall thickness of 0.762 mm 0.030 inch unless otherwise indicated. Where 10 mm 3/8 inch or 13 mm 1/2 inch O D tubing is used, provide a minimum wall thickness of 1.245 mm 0.049 inch. Extent, general location, and arrangement of the system will be as indicated on the drawings. Locate control panels as indicated relative to the incinerator, loader [and heat recovery system] and placed so that operating personnel may effectively monitor incinerator operations, but will not be in a position that would interfere with those operations. Fit equipment, instruments, piping, wiring and tubing into the space allotted allowing adequate clearances for entry, servicing, and maintenance. Install locally mounted instruments in such a manner as to prevent interference with mechanical installations and to ensure readability from the front aisles or operating area of the various items of equipment. Provide and install all materials and equipment indicated, specified, and/or required to provide a complete and operable system, including material and items required to arrange the system to compensate for the actual field conditions, whether or not the items required are specifically specified or shown. Carefully coordinate installation of the instrumentation with the work of other trades.

3.3.9 Field Tubing

Provide compression type tube fittings compatible with tubing material, of materials suited to the tubing (brass for copper tubing, stainless steel for stainless steel tubing, and nonmetallic for nonmetallic). Check each tubing connection for proper tightness and installation. All piping
between primary connections and instruments must be a minimum of 10 mm 3/8 inch OD tubing. Provide all copper instrument connecting lines that require only a single line with brass, ASTM B61, 21 MPa 3000 psi rating, forged body screw or tube ends.

3.3.9.1 Tubing Supports

Use PVC coated expansion metal troughs or epoxy coated vertical unistrut racks as tubing supports. Do not use any elbows, tees, or crosses. Where the trough changes direction or branches, a suitable gap for the transition is acceptable; use unsupported tubing over the gap.

3.3.9.2 Air Supply

Instrument air supply headers are as shown. Instrument air is to be distributed through the area at nominally 620 kPa 90 psig. Pressure is to be reduced to that required at the instrument by installation of a local regulator. Furnish and install an air set unit for each instrument that has a pneumatic output signal, such as transmitter, transducer, controllers, positioner and relay. Provide air set units with a filter regulator with integral drip-well and drain cock and output gauge.

3.3.10 Electrical

Provide instrumentation and power-interconnecting wiring as [shown] [recommended by the manufacturer] and as specified in NFPA 70. Terminate all external wiring to the control panels on terminal boards or on devices in the panels. Carry all cable wire and cable runs in conduit or wireways. Run all signal-wiring used for alarm or measurement of control circuits in conduit separate from power circuits. Direct current signals used for electronic transmission may be run in multi-conductor cables. Wiring for control, shutdown, or interlock circuits may be run in the same conduit with power wiring as shown. Do not feed instruments from lighting branch circuits. Make termination of all wires on instrument binding screws with solderless type insulated shoulder ring-tongue lugs of the proper size for the wire and binding screw use. Crimp lugs properly and securely to the wire using the tool recommended by the lug manufacturer. Cut off any termination which is improperly made and install a new lug. Strip all wire with an approved stripping tool or in such a manner as not to damage the conductor.

3.3.10.1 Cable-Conductor Identification

Permanently attach identification to each wire terminating on a terminal board or binding screw to facilitate maintenance. Provide identification by means of plastic sleeving with printed markings, permanently attached stamped foil markers, or by other approved means. Provide wire numbers corresponding to wire numbers shown.

3.3.10.2 Relays

Provide industrial type relays for interlocking circuits, with contacts and coils accessible for cleaning and replacement.

3.3.11 Field Painting

Painting required for surfaces not otherwise specified, and finish painting of items only primed at the factory, are as specified in Section 09 90 00 PAINTS AND COATINGS.
3.4 **FRAMED INSTRUCTIONS**

Post framed instructions under glass or in laminated plastic, including wiring and control diagrams showing the complete layout of the entire system, equipment, piping, valves, and control sequence, where directed. Prepare in typed form, condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system, framed as specified above for the wiring and control diagrams, and posted beside the diagrams. Post framed instructions before acceptance testing of the systems.

3.5 **TESTING**

3.5.1 **General**

Prior to requesting commencement of the performance and acceptance test, conduct final checking of system installation in accordance with the manufacturer's recommendations and the requirements of the other sections of the project specifications. Include in final checking: preliminary operation testing and adjustments of facilities as necessary to ensure completeness of installation and satisfactory operation of all systems. Schedule all tests in advance, conduct at times approved, and perform in the presence of the Contracting Officer.

3.5.1.1 **Schedule for Testing**

Notify the Contracting Officer in writing at least [20] days in advance of his intent to test the incinerator, and submit a testing schedule. The Contracting Officer will notify the appropriate authorities.

3.5.1.2 **Visual Inspection**

Examine each incinerator for defects outlined below:

a. Parts of components missing  
b. Improper assembly  
c. Parts or components not functioning properly  
d. Workmanship not as specified  
e. Exposed edges of metal not smooth  
f. Materials not as specified

3.5.1.3 **Repairs**

Replace defective parts and make all repairs disclosed to be necessary by capacity and operating tests to those items furnished and installed by the Contractor.

3.5.2 **Instrumentation**

Test all after completing the following activities:

a. Inspect complete work and make any non-operating checks required to ensure operability in the manner required for the process application.  
b. Check instrument air lines and wiring for proper hook-up.  
c. Test air lines for tightness according to the requirement of ISA 7.0.01.
d. Commissioning of instruments, controls, interlocks, alarms, and related items including operating checks, provision and installation of seals as required, checking and adjusting settings, standardizing and calibration and proof tests.

e. Installation of relief valves and filter regulator sets.

f. Insulation and winterizing of instruments. If such cannot be completed before startup, advise the Contract Officer in writing 2 weeks before testing.

3.5.3 Dielectric Tests

Test electrical system for dielectric strength. Subject electrical system, excluding control and recording instruments, to a voltage of twice its rated voltage, plus [500] [_____] volts, for a period of not less than [1] [_____] minute[s]. Prior to testing, disconnect all instruments and operators that could be damaged. After this test, the circuit must still register a resistance value of not less than 1 megohm at [600] [_____] volts, dc. Apply this test between all insulated circuits and external metal parts.

3.5.4 Fuel Systems Test

Hydrostatically test auxiliary fuel piping at a pressure of 1.5 times the working pressure. Remove gauges and other apparatus that may be damaged by the test pressure from the system prior to on-site testing. Maintain required test pressure for not less than 2 hours to provide sufficient time for inspection of joints and connections in all piping systems. Correct all defects that develop during testing and retest until no defects or leaks are found.

3.5.5 Fuel Burning Equipment Test

Perform test of fuel burning equipment to demonstrate that the equipment installed meets the requirements of the specifications.

3.5.6 Controls Test

Test incinerator under actual firing conditions. Verify with test that all controls function within the maximum and minimum limits for temperature or timing. Simulate unsafe conditions, such as high temperatures and flame failure, by reducing the settings for the activation of limit and safety controls. Test the stoking mechanism to demonstrate control and operational conformance with the requirements of the specification under varying load conditions.

3.5.7 Performance Testing

Upon completion of all related work and prior to acceptance, test the incinerator [heat recovery], associated equipment, and instrumentation to demonstrate indicated performance. Perform stack sampling for compliance with applicable emission limits by [the AEHA or] an approved independent qualified testing laboratory. Adjust all equipment and controls before the scheduled operating test. Test in accordance with the test procedures indicated below and in accordance with the requirements of ASME PTC 19.10. Take all pressure measurements in accordance with ASME PTC 19.2, and all temperature measurements in accordance with ASME PTC 19.3 TW. Furnish all
instruments, equipment, and personnel required for the tests. The Government will supply fuel, water, electric power, and waste materials. Make two instruction manuals available at all times during the tests.

3.5.7.1 Procedure

**************************************************************************
NOTE: Indicate performance requirements.
**************************************************************************

Preheat incinerators for \([4\) \([_____]\) hours to reach the firing temperature of \([982\) \([_____]\) degrees C \([1800\) \([_____]\) degrees F. Charge incinerator with waste at the rated burning capacity in pounds per hour for a minimum of 72 hours and operate in accordance with the manufacturer's written instructions. Include in performance testing the operation of the mechanical charging facilities, the incinerator, [the heat recovery boiler,] the air pollution control equipment, the ash handling equipment, and the operation monitoring facilities. Test full-scale, for three 24-hour runs accomplished within five days. Monitor performance to verify compliance with the contract requirements. If serious inconsistencies in the observed data are noted during any test run, or in later computational analysis, that run is to be rejected completely.[ Heat recovery unit is to supply the rated amount of steam at the temperature, pressure,[ and at the thermal efficiency specified] when the unit is charged with waste at the rated burning capacity. Entire unit must be able to maintain this efficiency during the entire test period.] Reduce waste to a fine ash residue. Follow normal burnout procedure. After the residue has cooled, analyze samples taken during testing.[ The residue must not exceed \([45.0\) \((dry basis)\)\[10\] percent of the total combustible portion of the charge when tested by [weight][volume] as specified.][ The combustible content of the ash must not exceed \([_____]\) percent.] After cleanout, inspect the incinerator for deterioration such as slugged or spalling refractory, warping of parts, and discolored exterior paint.

3.5.7.2 Efficiency and Operating Tests Procedures

Run an efficiency and capacity test, on one incinerator, conducted in accordance with \(ASME PTC 4\) utilizing the input-output method, except for use of alternate measuring or metering devices properly calibrated before the test, for the purpose of [metering the water used and] weighing the amount of fuel burned as approved by the Contracting Officer.[ Use water meter in the test suitable for hot water. Efficiency less than specified in paragraph Heat Recovery Boiler is not acceptable. Provide maximum moisture content of saturated steam leaving the boiler as specified in Section \(23 52 30.00 10\) HEAT RECOVERY BOILERS.] Conduct efficiency and general performance tests on the incinerators[ and boilers] using a qualified test engineer. Furnish calibration curves or test results furnished by an independent testing laboratory of each instrument, meter, gauge, and thermometer to be used in efficiency and capacity tests before the test. Read all indicating instruments at half-hour intervals unless otherwise directed.

3.5.7.3 Alternate Efficiency Testing Procedures

If equipped with a full-size, backup burner of its own, test the heat recovery boiler for thermal efficiency independent of the incinerator using hot gases supplied by that burner. Analyze ash from the incinerator, which is to show no more than \([_____]\) percent carbon by weight. The entire system is required to produce the rated amount of steam while burning the
rated amount of waste for the durations specified for testing procedures and comply with all other test requirements. This alternate method of testing is intended for use where the additional burner capacity exists, in order to avoid determining the actual heat content of the waste used for the tests.

3.5.7.4 Shell Temperature

Operate incinerator under normal load conditions for not less than [4] [_____] hours. After [4] [_____] hours, temperature instrument readings of the outer shell, taken at not less than five random locations, must not exceed the temperature limitation specified.

3.5.7.5 Test Reports

Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion of construction and testing of the installed system. Indicate in each test report the final position of controls, including logs [thermal efficiency calculations,] and tabulated results together with conclusions. Include the following in the reports:

a. Time, date, and duration of test.
b. Incinerator make, model, rated capacity, grate area.
c. Proximate analysis of waste used during tests.
d. Flue-gas temperature at [boiler] [incinerator] outlet.
e. Percent O2 in flue gas.
f. Quantity of waste consumed.
g. Heat content of waste.
h. Any other data required by ASME PTC 4.

3.5.8 Emission Test

**************************************************************************
NOTE: Local regulatory authorities should be contacted at an early stage of the project design to determine if they consider the methods cited to be adequate, and if they have any additional requirements.
**************************************************************************

Test one incinerator for excessive emissions in accordance with 40 CFR 60, methods 1, 2, 3, and 5 for incinerators or as required by local authorities. Do not exceed the specified emissions limits. Stack emissions sampling is required for a minimum period of [_____] continuous hour[s] of incinerator operation and done concurrently with the efficiency tests. Perform emissions tests by [the USAEHA, or] an independent laboratory recognized by the appropriate authorities. If it is determined during the tests specified above, that the incinerators fail to comply with the applicable air pollution regulations, the incinerator manufacturer is responsible for correcting the problem by modifying the equipment or by adding air pollution control equipment and also be responsible for any additional testing required to prove compliance.

3.6 TRAINING

Conduct a training course for the operating, maintenance, and supervising staff as designated by the Contracting Officer. Start the training period,
a total of [_____] hours of normal working time, after the system is functionally complete but prior to final acceptance tests.

3.6.1 Content

During field instructions cover all of the items contained in the Operating and Maintenance Instructions, and include recommendations for total staffing and job descriptions.

3.6.2 Operating Instructions

Submit [six] [_____] complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation, and emergency procedures, prior to the start of the training course. Include the manufacturer's name, model number, service manual, parts list, and a brief description of all equipment and their basic operating features.

3.6.3 Maintenance Instructions

Submit [six] [_____] complete copies of maintenance instructions listing routine maintenance procedures, possible breakdowns repairs, and trouble shooting guide, prior to the start of the training course. Include simplified wiring, piping, and control diagrams for the system as installed and other information necessary for the equipment maintenance.

SECTION 12 00 01.00 20 Page 2
NOTE: This guide specification covers the requirements for the design, procurement and installation of furniture, fixtures and equipment (FF&E) for new construction and building renovation projects for Navy and Marine Corps (USMC) projects. This specification is not typically used for Army or Air Force projects, but if Naval Facilities Engineering Systems Command (NAVFAC) is administering a project for the Army or Air Force this specification can be used. The use of this specification for Army or Air Force must be coordinated through the Army or Air Force representatives and Army or Air Force Interior Designers for Army or Air Force specific requirements. Use this specification only when it has been determined by the Government that the Contractor will be responsible for the purchase and installation of the FF&E. The following are exceptions: Do not use this specification for Navy projects in which Naval Supply Systems Command (NAVSUP) will be purchasing and installing the FF&E, or for USMC projects in which Asset Management Branch (AMD) or Supply Management Division (SMD) will be purchasing and installing the FF&E.

FF&E is not purchased with building construction funds. Operations & Maintenance (O&M) funding is typically used; coordinate funding source with Government. Since other than building construction funding is used, a separate FF&E Option Item for the FF&E purchase and installation is required on the project Contract Price Schedule to track different funding sources. Coordinate funding sources with the NAVFAC Project Manager. Coordinate the FF&E Option Item requirements with the NAVFAC Contracting Officer, NAVFAC Project Manager, NAVFAC Interior Designer, and when applicable, the Interior Designer of Record (IDOR).
Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)]().

**************************************************************************
**************************************************************************

**NOTE:** There are three Interior Design Services processes for FF&E design and specification for Design Bid Build (DBB) projects.

**DBB PROCESS 1:**
The Architectural/Engineering's (A/E's) Interior Designer (ID) or NAVFAC ID (for in-house projects) develops the FF&E Package from design start to the Concept Design submittal, at approximately 35 percent, during the overall building Design Phases. After the Construction Contract Award, the Contractor must hire a different ID to validate the schematic or Concept package requirements with the Activity and make any necessary revisions, develop specifications, perform the Best Value Determination (BVD) and prepare the Pre-Final and Final FF&E submittals during the Construction Phase. The Construction Contractor may not hire the ID who prepared the Concept Design submittal. All required effort by the Construction Contractor's ID described above, from validation to preparation of the Final FF&E submittal, must be included in the Base Bid Item and is separate and excluded from the FF&E Option Item to procure and install the FF&E.

**DBB Process 2:**
The contracted A/E's Interior Designer or NAVFAC Interior Designer (for in-house projects) develops the FF&E package from design start to Concept Design submittal, through BVD and to the Pre-Final and Final FF&E submittals during the overall building Design Phases and prior to Construction Contract Solicitation. The awarded Contractor must hire an Interior Designer to validate the FF&E package pricing and product availability during the Construction Phase and submit any required changes to the Government for approval prior to award of the FF&E Option Item. The Contractor may not hire the A/E's Interior Designer. The pricing validation
effort of the FF&E design package must be included in the Construction Base Bid Item and is separate and excluded from the FF&E Option Item.

DBB Process 3:
The contracted A/E’s Interior Designer or NAVFAC Interior Designer (for in-house projects) develops the FF&E package from design start to Concept Design submittal, through BVD and to the Pre-Final and Final FF&E submittals during the overall building Design Phases and prior to Construction Contract Solicitation. The same Interior Designer validates the FF&E package pricing and product availability during the Construction Phase and submits any required changes to the Government for approval. Additional tasks such as coordinating FF&E mock-ups and performing punch lists may also be required. The updated and approved Final FF&E Package is provided to the Contractor prior to award of the FF&E Option Item. Unlike DBB Processes 1 and 2 above, the Contractor is not required to hire an Interior Designer to develop or validate the FF&E Package.

**************************************************************************
PART 1   GENERAL

1.1 CONTRACTOR’S FURNITURE, FIXTURES AND EQUIPMENT (FF&E) HANDLING AND ADMINISTRATION RATE (HAR)

The HAR accounts for all administrative costs, overhead, FF&E subcontractor bonding fees deemed necessary by the Contractor, administration of subcontracts, profit, and any other costs associated with, and related to, the coordination and processing of the procurement and installation of FF&E. Offerors must propose a HAR for the FF&E not to exceed 5 percent. Do not include costs associated with INTERIOR DESIGN SERVICES in the HAR. The proposed HAR percentage is a fixed rate and will be incorporated into the contract award. The HAR will not be adjusted regardless of fluctuations from the estimate amount for the FF&E.

**************************************************************************
NOTE: The following paragraph contains tailoring options for PROCESS 1 and PROCESS 2 and PROCESS 3.

The Government will indicate the FF&E estimate in the FF&E Option Item in the Price Schedule based on the Concept Final FF&E Design. The Government estimated price is to provide Offerors with the projected magnitude of effort and includes the actual estimated cost of the FF&E including freight, installation, and other applicable vendor charges. The Government estimated price is only an estimated amount and must not be altered by the Contractor during the solicitation process.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in
the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. DEPARTMENT OF DEFENSE (DOD)

FC 1-300-09N (2014; with Change 6, 2021) Navy and Marine Corps Design

UFC 3-120-10 (2018; with Change 2, 2021) Interior Design

1.3 DEFINITIONS - FF&E TURNKEY EFFORT

The Furnishings, Fixtures, and Equipment Package may include, but is not limited to; systems and modular furniture, workstations, desks, seating, storage, filing, visual display items, accessories, artwork, command graphics, training and conference furniture, soft window treatments (draperies, valances, and cornices), shop equipment, fitness equipment, Child Development Center furniture, appliances, portable weapons cabinets, dorm and quarters furnishings and other miscellaneous items to support facility functions.[ For NAVFAC PACIFIC projects, the term Collateral Equipment (CEQ) Package may be used interchangeably with the term FF&E Package.]

The project may also include Specialty CEQ Package for which the Activity may assist in specifying items, which may include, but not limited to: Audio Visual (AV) equipment, commercial kitchen equipment, medical equipment and wharf equipment. For the purposes of this specification, if a Specialty CEQ Package is required, the same requirements identified for the FF&E Package apply to the Specialty CEQ Package or as outlined by project-specific UFC or requiring Agency.

1.3.1 FF&E Option Item

As an option, provide procurement and installation coordination of the approved complete and usable Final FF&E Package.

[ a. [The Specialty CEQ Package will be identified as a separate Option Item, priced separately from the FF&E and funded as a separate Option.] [The Specialty CEQ Package will be funded as part of the FF&E Package as one Option.]
b. The Government is not obligated to award the FF&E Option Item. Should the Government choose to award the FF&E Option, the Item(s) will be awarded as a negotiated option to the contract or task order. The Contractor's proposed HAR will be applied to all vendor and supplier costs for the FF&E.

c. The Government will provide separate funding for procurement and installation coordination of the FF&E Package. Construction funds will not be used. Upon receipt of required funding, the Contracting Officer will authorize the Contractor, as an option to the construction contract, to provide the Government-approved Final FF&E Package exactly as specified and complying with priorities found in the Federal Acquisition Regulation (FAR) 8.404 Use of Federal Supply Schedules. The amount of the option will be the actual cost of these items from the Federal Government price schedules and, when necessary, Open Market sources. The option amount will also include shipping, freight, handling, installation, vendor design fees, project management fees, applicable sales tax, Contractor's FF&E Handling and Administration Rate percentage as applied to the Final FF&E or Specialty CEQ total cost(s) and the NAVFAC required bond fee.

**************************************************************************
NOTE: The following item contains tailoring options for PROCESS 1 and PROCESS 2.
**************************************************************************

d. If awarded, the FF&E Option Item will be awarded at least 6 months prior to the contract completion date. A minimum of 6 months is required for the Contractor to purchase, deliver and install the product without impacting the overall completion date of the project. The Contractor's schedule must assume the award of the FF&E as an option. Government Fiscal Year funding availability must be considered and incorporated into the FF&E Schedule. No schedule extensions will be granted if the option item is awarded at least 6 months prior to the contract completion date. If the Government decides to negotiate and award the option item with less than 6 months prior to the contract completion date, the Contractor may be entitled to a contract extension and extended field overhead. A contract extension and extended field overhead will only be granted in those cases where the Contractor demonstrates that the accepted Final FF&E Package was submitted within the approved schedule deadlines, sufficient lead time is not available, and the Government's award of the FF&E Option Item is within the last 6 months of the contract.

e. The FF&E Option Item (and any Specialty Equipment and Audio Visual (A/V) Option Item(s)) are exempt from NAVFAC Procedures, Guidance and Instruction (NPGI) 17.202(a)(ii) option restriction to award within 365 days of contract award. Per NPGI 17.202(a)(ii), Note 2, "Options for Collateral Equipment (CEQ) to include Furniture, Fixtures and Equipment (FF&E) and Audio-Visual (A/V) are not limited to the 365 day time period from date of award. Written approval for a longer period to exercise options for FF&E and A/V is not required."

1.3.2 Authorization for Use of Government Supply Sources

The Contracting Officer will authorize the Contractor to purchase the required products through the specified sources and will provide a letter of authorization to the Contractor in accordance with FAR 51.102 Authorization to use Government supply sources (e)(1) through (5) citing
the name of the furniture dealer(s) and other information to use when accessing the Federal Government supply sources. The Contractor must procure and coordinate the installation of the approved Final FF&E Package exactly as specified.

1.3.3 Buy American Act (BAA) and Trade Agreement Act (TAA)

All products under the FF&E Option Item are subject to the rules and regulations governing the acquisition of foreign supplies, e.g., Buy American Act (BAA) (FAR 25.1 Buy American-Supplies). This also includes all supplies procured through Government Supply Sources. Solicitations are required to meet the Trade Agreement Act (TAA) Designated Countries (FAR 25.4 Trade Agreements), as part of the BAA. In addition to the applicable BAA clauses and provisions for construction materials, the Contracting Officer must also insert the appropriate BAA or TAA clauses and provisions for supplies. The Contractor is responsible for ensuring the FF&E is compliant with the BAA or TAA.

1.3.4 Prohibition on Procurement of Certain Items Containing Perfluorooctane Sulfonate (PFOS) or Perfluorooctanoic Acid (PFOA)

Effective April 1, 2023, in accordance with section 333 of the William M. (Mac) Thornberry National Defense Authorization Act for Fiscal Year 2021, the Department of Defense must not procure any covered items that contain PFOS or PFOA. The Contractor must not provide any covered items containing PFOS or PFOA in performance of this contract, task order, delivery order, or blanket purchase agreement order. A covered item means the following:

a. Nonstick cookware or cooking utensils for use in galleys or dining facilities.

b. Upholstered furniture, carpets, and rugs that have been treated with stain-resistant coatings.

1.3.5 Procurement and Installation

The Contractor must coordinate the building completion date with the installation dealer(s) specified in the FF&E Package. It is recommended that the Contractor order the products once the option is awarded to avoid incurring additional costs. Production and delivery dates should be requested of manufacturers or dealers at the time of order placement to coincide with the Beneficial Occupancy Date (BOD). The Contractor must anticipate possible manufacturer price increases if order placement is delayed. Any costs incurred due to manufacturer price increases as a result of order placement delays will be the burden of the Contractor.

1.3.6 Deposits

The Contractor must anticipate providing a deposit of between 30 percent and 50 percent of the product costs when placing the orders with the manufacturer's dealerships. The Government will not fund deposits.

1.3.7 Construction Wage Rate Requirements Statute

****************************************************************************************
NOTE: The following paragraph contains tailoring options for PROCESS 1, PROCESS 2, and PROCESS 3.
****************************************************************************************
Prior to the Interior Designer sending out the Best Value Determination (BVD) Request for Quote (RFQ) Package[s] to vendors, the NAVFAC Contracting Officer, Contract Specialist, Project Manager, Design Manager, NAVFAC Interior Designer and Collateral Equipment Manager must make made made a determination as to whether the FF&E [and Specialty CEQ ]installation is covered by the Construction Wage Rate Requirements statute. The BVD RFQ Package must identify identified any items with installation that is subject to the Construction Wage Rate Requirements statute.

1.3.7.1 Construction Wage Rate Requirements Statute is Not Applicable

The Construction Wage Rate Requirements Statute is Not Applicable if the FF&E assembly and installation work is:

a. Segregable from the construction of the facility (i.e., procured in a separate FF&E Option (Item)); and

b. The assembly and installation work is performed by the FF&E vendor or dealer or subcontractor(s); and

c. The onsite FF&E work does not include a substantial amount of construction work; and

d. The workforce for the FF&E installation and delivery is separate and distinct from the labor workforce performing the construction effort by the Contractor.

If the above a. through d. are true, the Construction Wage Rate Requirements Statute is not applicable to FF&E installed by General Services Administration (GSA), other Government Supply Sources or Open Market.

1.3.7.2 Construction Wage Rate Requirements Statute is Applicable

The Construction Wage Rate Requirements Statute is Applicable if the FF&E assembly and installation work is:

a. Performed by the Contractor; and

b. Is not physically or functionally separate from the other construction work required by the contract; and

c. Is not capable of being performed on a segregated basis from the other construction work required by the contract.

-OR-

d. The assembly and installation work is performed by the FF&E vendor or dealer or subcontractor(s); and

e. The onsite FF&E work does include a substantial amount of construction work.

If the above a. through c. are true or d. through e. are true, the Construction Wage Rate Requirements statute would be applicable to the installation of all FF&E that is installed and attached to the facility.
1.3.8 Taxes

1.3.8.1 Exemptions

Exemptions for certain state or local taxes may be available to the Contractor and its subcontractors. The Contractor must take maximum advantage of all exemptions, including obtaining a resale permit from state and local taxation authorities whether available directly to the Contractor or based on an exemption afforded the Government. The responsibility for paying applicable taxes rests with the Contractor. Applicable state and local taxes to the FF&E Package must be included with the subcontractor's quote, if required by the state or locality.

1.3.8.2 Construction Contract Requirements

As prescribed in FAR 29.401-3 Federal, State, and local taxes, the Contracting Officer must insert FAR clause 52.229-3, Federal, State and Local Taxes, in the construction contract. In accordance with this clause:

a. The contract price includes all applicable Federal, State, and local taxes and duties; and

b. The Government must, without liability, furnish evidence appropriate to establish exemption from any Federal, State, or local tax when the Contractor requests such evidence and a reasonable basis exists to sustain the exemption.

1.3.9 Performance and Payment Bonds

1.3.9.1 No Bond Requirement for FF&E at Time of Construction Contract Award

FAR 28.102-1(a) requires that performance and payment bonds be included in all construction contracts exceeding the Simplified Acquisition Threshold (SAT), except under the conditions listed. Since the FF&E Option Item is not part of the original contract award, the Contractor is not required to secure bond for the FF&E at the time the basic construction contract is awarded.

1.3.9.2 Additional Bond at FF&E Option Item Award

FAR 28.102-2(d) requires the Government to secure additional bond from the Contractor for any contract price increases. An increase to the original contract bond is required at the time of the FF&E Option Item award to protect the Government against the Contractor not providing FF&E ordered and to ensure that the FF&E vendor(s) receive payment if the Contractor goes out of business. The increased cost of the Government required bond must come from the FF&E funding source and is not a part of the Contractor's HAR.

1.3.9.3 Bonds Required by the Contractor

If the Contractor requires bonding from the FF&E subcontractor(s), the cost must be covered in the Contractor's HAR.

1.3.10 Item Unique Identification (IUID) and Valuation

Item Unique Identification (IUID) and valuation is a system of marking and valuing items delivered to Department of Defense (DoD) that enhances logistics, contracting, and financial business transactions. Utilize the
IUID policy for all DoD contracts that require the delivery of items. An item is a single article or a single unit formed by a grouping of subassemblies, components or constituent parts. In accordance with DFARS 211.274-2 Policy for item unique identification, IUID is required for all delivered items for which the Government's unit acquisition cost is $5,000 or more. Items identified by the requiring activity to be serially managed, mission essential, controlled inventory or for other reasons requiring permanent identification, must be marked with a unique item identifier.

1.3.10.1 IUID

The two main steps involved in IUID requirements are:

a. Item marking, and

b. Delivery of data about items as a part of the acceptance and delivery process.

1.3.10.2 Data Matrix Requirements

Item marking requires that qualifying items contain a data matrix either directly inscribed on the individual item or on a permanent label or data plate attached to the item. Delivery of data is executed by submitting to the IUID Registry information such as: description of the item, its value, and the date of acceptance by the government. The IUID Registry is the repository established to capture and store all IUID data.

1.3.10.3 Government's Unit Acquisition Cost

In accordance with DFARS 211.274-3 Policy for valuation, Contractors must be required to identify the Government's unit acquisition cost for all items delivered even if none of the criteria for placing a unique item identification mark applies.

1.4 ADMINISTRATIVE REQUIREMENTS

1.4.1 FF&E Pre-Installation Walk-Through

The Contractor must coordinate and participate in a walk-through to ensure that the building interior is substantially complete in all areas scheduled to receive FF&E to include floor, wall and ceiling finishes and building systems located on or in the ceilings. Attendees must include the FF&E vendor(s) in-person (if geographically feasible) or virtually and the NAVFAC Construction Manager. Approval by the NAVFAC Construction Manager to proceed with the FF&E installation is required. The walk-through date must occur prior to the commencement of the FF&E installation and accommodate sufficient time in the construction schedule for transportation of FF&E to the job site upon approval by the NAVFAC Construction Manager.

1.4.2 Sequencing

The Contractor must coordinate the building completion, occupancy, and furniture installation dates with the installation dealer(s) specified in the FF&E Package. Any costs associated with or delaying furniture shipments to accommodate the construction schedule is the responsibility of the Contractor.
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

The NAVFAC Interior Designer is required to receive a copy of all submittals with a "G" Classification.

1.6 QUALITY CONTROL

1.6.1 Installation Qualifications

**************************************************************************
NOTE: The following paragraph contains tailoring options for PROCESS 1 and PROCESS 2.
**************************************************************************

All FF&E must be installed by the manufacturer's dealer of record and not by the Contractor. In addition, installation dealer(s) must be located within a [100] [_____] mile radius of the project site unless approved by the NAVFAC Interior Designer.

1.7 DELIVERY, STORAGE, AND HANDLING

FF&E must be shipped to and stored at the vendor or dealer's conditioned warehouse, until all items are received unless dealer has coordinated just-in-time delivery with the Contractor. Vendor or dealer is responsible for any orders arriving before or after the agreed upon delivery and installation date with the Contractor, including storage of items.

PART 2 PRODUCTS

Not Used
PART 3 EXECUTION

3.1 INTERIOR DESIGN SERVICES

3.1.1 SYSTEM DESCRIPTION: CONTRACTOR'S INTERIOR DESIGN SERVICES

**************************************************************************
NOTE: The following paragraphs contain tailoring options for PROCESS 1, PROCESS 2, and PROCESS 3.
**************************************************************************

The Final FF&E or CEQ Concept Design Package submittal (approximately 35 percent), as prepared by the [A/E's] [NAVFAC] Interior Designer, was sufficiently developed to fully integrate with the building systems (e.g., electrical, mechanical) to include product sizes and communications, data, and electrical requirements. The Contractor must hire a different Interior Designer to validate the pricing and availability of the Final FF&E Concept Design Package requirements with the Activity or End User and NAVFAC Interior Designer and make any necessary revisions. The Contractor is not required to hire an Interior Designer to develop or validate the Final FF&E Package.

Provide and comply with Interior Design Procedures: Furniture Fixtures and Equipment (FF&E) CHAPTER(s) 1 through 4 and specific Design, Meeting and Submittal deliverables identified below and as defined for the Contractor's Interior Designer in CHAPTER 5 ID SERVICES - DESIGN BID BUILD (DBB) - PROCESS 123. The Contractor may not hire the A/E's Interior Designer who prepared the Concept Final FF&E Design Package submittal. All required effort by the Contractor's Interior Designer described above must be included in the Construction Base Price and is separate and excluded from the FF&E Option Item.

3.1.1.1 Contractor's Interior Designer's Qualifications

**************************************************************************
NOTE: These paragraph are tailored for PROCESS 1 and PROCESS 2.
**************************************************************************

Provide the services of an Interior Designer. Qualification of Interior Designer is based on education, experience and examination. The Contractor's Interior Designer must have completed a program accredited by the Council for Interior Design Accreditation (CIDA) or equal accreditation program of academic training in Interior Design. For all Interior Design Services, the Interior Designer must have attained National Council for Interior Design Qualification (NCIDQ) certification and state licensure, certification or registration. In addition, the Contractor's Interior Designer must have experience as the primary Interior Designer on projects, to include NAVFAC projects, of similar type, size, scope and complexity to this contract project. Experience using GSA contracts is required. Writing non-proprietary, technical performance criteria and the evaluation
of vendor proposals for competitive furniture and specialty equipment. Best Value Determinations (BVDs) is required and must be clearly indicated in the resume. The Contractor must obtain the services of equipment specialists to provide design product availability and pricing validation services and assist the Interior Designer with the development of non-proprietary performance criteria for any specialty equipment. The Contractor may not hire the A/E's Interior Designer or A/E's equipment specialist(s).

The Contractor, the Contractor's Interior Designer, Design Firm owners, and any Equipment Specialists must NOT have any affiliation or partnership with any furniture, fixture, and equipment products, manufacturers, furniture or equipment vendor or dealerships used on this project in order to avoid any organizational conflict of interest. For the Contractor's Interior Designer's Qualifications submittal, provide a detailed resume, client references and documentation of the Contractor's Interior Designer's qualifications and significant interior design experience to the NAVFAC Contracting Officer and Interior Designer for approval PRIOR to the Pre-Construction Conference (PRECON). The Government will approve or disapprove the Contractor's Interior Designer based on the provided documentation and past performance.

3.1.1.2 Concept Final FF&E Package

**************************************************************************
NOTE: The following paragraph contain tailoring options for PROCESS 1, PROCESS 2 and PROCESS 3.
**************************************************************************

The Final FF&E or CEQ Concept Package indicating the salient characteristics for with all required FF&E items and Computer Aided Design and Drafting (CADD)/BIM drawings, will be provided by the NAVFAC Contracting Officer upon request. The Contractor must request to receive the package prior to the PRECON.

3.1.1.3 FF&E Schedule and Schedule Updates Submittal

For all projects, including fast track projects and renovations, the Contractor is responsible for sufficiently scheduling all FF&E meetings and deliverables early enough to:

a. Obtain the required government approvals,

b. Meet all FF&E funding, award, ordering and installation lead times and deadlines, and

c. Complete the FF&E installation by the Beneficial Occupancy Date (BOD).

**************************************************************************
NOTE: The following paragraph contains tailoring options for PROCESS 1 and PROCESS 2, and PROCESS 3.
**************************************************************************

All submittal due dates for the FF&E and any Specialty CEQ must be noted in the FF&E Schedule and Schedule Updates Submittal and reflected in the Contractor's construction schedule. Provide a FF&E Schedule and Schedule Updates Submittal for all FF&E and Specialty CEQ services and deliverables to the NAVFAC Construction Manager, Interior Designer and Contracting Officer 7 business days after the Interior Design Orientation Meeting PRECON.
Submit FF&E Schedule and Schedule Updates Submittal to the NAVFAC Interior Designer within 7 days of any construction schedule revisions.

All submittal due dates for the FF&E [and specialty equipment] must be reflected in the Contractor's construction schedule. Submit proposed changes to the NAVFAC Interior Designer for review. The Contracting Officer must approve all revisions or deviations.

3.1.1.4 Services

**************************************************************************
NOTE: The following paragraphs are tailored for PROCESS 1 and PROCESS 2.
**************************************************************************

The Contractor's Interior Designer and any Equipment Specialists are responsible for developing Final FF&E and Specialty CEQ Packages required in the project.

3.1.1.4.1 Validation of Requirements

The Contractor's Interior Designer and Equipment Specialist(s) must meet with the Activity at the PRECON to discuss the function of each area, validate all FF&E or CEQ requirements pricing and product availability, make any necessary changes and additions to the Concept Final FF&E Package and recommend any adjustments or revisions to the interior building finishes and building infrastructure.

3.1.1.4.2 Building Infrastructure and Systems

**************************************************************************
NOTE: The following paragraphs contain tailoring options for PROCESS 1, PROCESS 2, and PROCESS 3.
**************************************************************************

The Contractor's Interior Designer is responsible for ordering samples of all interior building finishes if required for coordination. The FF&E and CEQ Package(s) must be fully integrated with the design, construction, and schedule of all building finishes and all building infrastructure and systems (such as heating, ventilation and air conditioning (HVAC), plumbing, fire protection, communications, electrical, data, architecture). All electrical, data and communications outlets, switches, fire extinguishers, thermostats, sprinkler heads and Architectural Barriers Act (ABA) clearances must be accommodated for and be fully accessible once equipment is installed. The Contractor's [A/E's] [NAVFAC] Interior Designer and Equipment Specialist(s) must work with the Contractor and the electrical, telecommunication, and mechanical subcontractors to coordinate all infrastructure with the recommended vendors to include connection of power, data, communications, waterlines and gas lines, and calibration, testing and training prior to facility turnover and operation.

Provide coordination with the building infrastructure and provide revisions to the building infrastructure if required to support the FF&E Package and Specialty CEQ Package. Provide dimensioned locations on plans and elevations for multi-user telecommunications outlet assemblies (MUTOAs), junction boxes, wall outlets and floor boxes based on sizes, layouts and configurations of the equipment items in the FF&E Package and any Specialty CEQ Package.
3.1.1.4.3 Government-Furnished, Government Installed Equipment (GFGI) and Government-Furnished, Contractor-Installed Equipment (GFCI)

The FF&E and CEQ plans included in each submittal must take into consideration the Final FF&E Package identify all FF&E or CEQ to include specialty CEQ, existing and future Government-Furnished, Government Installed (GFGI) Equipment and Government-Furnished, Contractor-Installed Equipment (GFCI). These items may include, but are not limited to, multi-function devices, printers, shredders, safes and vending machines.

3.1.1.4.4 Inventory of Existing FF&E or CEQ

The Contractor's Interior Designer is responsible for creating an inventory of existing FF&E or CEQ to be relocated to the new or renovated facility and incorporating both new and existing FF&E or CEQ into the FF&E plans. The Activity will supply the Contractor's Interior Designer with a complete list of all existing FF&E or CEQ, to include e.g., sizes, utility requirements and weight, to be relocated or used in the new or renovated facility. If revisions to the Final FF&E Package are required, the Contractor's Interior Designer is responsible for incorporating this equipment into the FF&E plan.

3.1.2 FF&E MEETINGS, PRESENTATIONS AND SUBMITTALS FOR THE INTERIOR DESIGN SERVICES

The Contractor's Interior Designer must attend all design meetings, site visits, walk-throughs, coordinate required mock-ups with the [A/E's and NAVFAC Interior Designer], obtain Activity and NAVFAC approvals and provide a complete and functional FF&E Package. All meetings must be coordinated with advance notice to the FF&E vendor(s), and [A/E's and ]NAVFAC Interior Designer, so that schedule and travel can be coordinated. Each submittal must demonstrate thorough interaction with the Activity's functional requirements and complete coordination with the facility design and the Structural Interior Design (SID).

These are minimum requirements and the Contractor must be prepared to provide all additional meetings and submittals that may be necessary to support the Interior Design effort and FF&E coordination. Submit any revisions or deviations caused by discontinued items or NAVFAC required changes to the NAVFAC Interior Designer for review. The Contracting Officer must approve all revisions and deviations.
3.1.2.1 Interior Design Orientation Meeting

**********************************************************************
NOTE: The following paragraph is tailored for PROCESS 1.
**********************************************************************

The Interior Design Orientation Meeting must occur [at the PRECON.] at NAVFAC, located in [_____] [virtually] [_____] [This meeting must occur within 7 days of PRECON meeting] [This meeting must include a validation of FF&E requirements with the Activity and a walk-through of the Activity's existing facility(s) or similar facility.] Submit minutes of this meeting to the NAVFAC Interior Designer within 7 business days of this meeting and include the preliminary schedule for the FF&E Meetings and Submittals.

3.1.2.2 Interior Design Orientation Meeting

**********************************************************************
NOTE: The following paragraph is tailored for PROCESS 2.
**********************************************************************

The Interior Design Orientation Meeting must occur [at the PRECON.] at NAVFAC, located in [_____] [virtually] [_____] [This meeting must occur within 7 days of PRECON meeting] [This meeting must include a validation of FF&E requirements with the Activity and a walk-through of the Activity's existing facility(s) or similar facility.] Submit minutes of this meeting to the NAVFAC Interior Designer within 7 business days of this meeting and include the preliminary schedule for the FF&E Meetings and Submittals.

3.1.2.3 "Over the Shoulder" Review Meeting of the FF&E Basis of Design Package Submittal

**********************************************************************
NOTE: The following paragraphs are tailored for PROCESS 1.
**********************************************************************

3.1.2.3.1 "Over the Shoulder" Review Meeting

The "Over the Shoulder" Review Meeting will be held [at NAVFAC] [_____] located in [_____] [virtually] [If the meeting is held virtually, submit one hard copy and one digital copy of the presentation to the NAVFAC Interior Designer prior to the meeting.]

The Contractor's Interior Designer must present the FF&E Basis of Design Package Submittal to the NAVFAC Interior Designer prior to presenting to the Activity. The submittal may be presented in a "loose" format or binder for NAVFAC approval prior to the Activity presentation. No presentation boards are required.

3.1.2.3.2 FF&E Basis of Design Package Submittal

Provide FF&E Basis of Design Package Submittal in accordance with Interior Design Procedures: Furniture, Fixtures and Equipment (FF&E).

3.1.2.4 FF&E Basis of Design Package Submittal Presentation to the Activity

This FF&E Basis of Design Presentation will be held [at the Activity's location in _____] [virtually] [______]. After implementing all feedback
from the NAVFAC Interior Designer, the Contractor's Interior Designer must present the FF&E Basis of Design Package Submittal to the Activity for feedback and approval. [This meeting must include a walk-through of the Activity's existing facility(s) or similar facility.] Minutes of this meeting with photos of the approved FF&E product must be submitted to the NAVFAC Interior Designer within 7 business days.

During this meeting, a detailed, functional review of the entire project must occur, with the FF&E presentation to follow, to ensure that all current FF&E requirements have been validated and captured. The submittal may be presented to the Activity in a "loose" format or binder. No presentation boards are required.

3.1.2.5 "Over the Shoulder" Review Meeting of the BVD Request for Quotation (RFQ) Package Submittal

Meet with the NAVFAC ID for an "over-the-shoulder" review meeting. Hold meeting[ at NAVFAC, located in [_____]] [virtually] [_____].

3.1.2.6 FF&E BVD Request for Quotation (RFQ) Package Submittal

Provide FF&E BVD Request for Quotation (RFQ) Package Submittal in accordance with Interior Design Procedures: Furniture, Fixtures and Equipment (FF&E).

3.1.2.7 BVD FF&E Mock-Up Submittal Requirements

**************************************************************************
NOTE: BVD Mock-Up(s) may be required for FF&E items used repetitively throughout a facility such as chairs, workstations and Bachelor Enlisted Quarters (BEQ) Berthing Room furniture. Mock-up(s) may be required for evaluation during the Best Value process.
**************************************************************************

The Contractor's Interior Designer must coordinate a mock-up for best value review of [Identify REQUIRED FURNITURE TYPICAL(s)]. Mock-ups must be provided by [all vendors] [the top three vendors]. The reviewers must include the NAVFAC Interior Designer, the Contracting Officer,[ Asset Management Branch (AMD) or Supply Management Division (SMD) (USMC projects),] and the Activity.[Provide [3] [_____] weeks notice to NAVFAC prior to scheduling the mock-up to allow time for travel arrangements.] The mock-up must be completed prior to the BVD Vendor(s) Recommendation.

All vendors must have a technical representative on site to demonstrate the functional aspects of their product and review the following:

[a. Interface of furniture system from wall, column, floor, or power pole.

[b. Distribution of all data, communications and power through the systems furniture panels, including segregated paths for Secure Internet Protocol Router Network (SIPRnet) and Non-classified Internet Protocol Router Network (NIPRnet), other networks, and faceplate locations and types, as required to support a group of [four] [six] [eight] [_____] workstations.

[c. Wire management solutions for all cords and cables, both internal and external to the furniture panels.
3.1.2.8 BVD Package Submittal and "Over the Shoulder" Review Meeting

The Contractor's Interior Designer must schedule an "Over the Shoulder" virtual meeting to review the results of the responses to each FF&E BVD RFQ Package and discuss the best value vendor recommendation(s). If clarifications, updates or revisions are required, documentation must be revised and resubmitted. The Contractor's Interior Designer must submit [one hard copy in a 3-ring binder and] one book-marked PDF copy of this submittal to the NAVFAC Interior Designer. Book-marked PDF copies must also be sent to the NAVFAC Construction Manager[ , Asset Management Branch (AMD) or Supply Management Division (SMD) (USMC projects), ] and the NAVFAC Contracting Officer.

3.1.2.9 Vendor Recommendation Letter and De-Briefs

Following the approval of the vendor recommendation, the Contractor's Interior Designer must send out notification to the vendors that submitted pricing proposals. A template for the notification letter will be provided by the NAVFAC Interior Designer. If a de-brief is requested by a vendor, the Contractor's Interior Designer must not reveal any pricing or proprietary information from other vendors in the de-brief.

3.1.2.10 Final FF&E Mock-Up Submittal

**************************************************************************
NOTE: The following paragraph contains tailoring options for PROCESS 1 and PROCESS 2.
**************************************************************************

The Contractor and their [A/E's] [NAVFAC] Interior Designer must coordinate [a] [an on-site] Final FF&E Mock-Up Submittal and review of [IDENTIFY REQUIRED FURNITURE TYPICAL(s)] with the recommended, best-valued vendor(s). Complete mock-up exercise prior to the submittal of the Final FF&E Package Price Validation and award of the FF&E Option Item.[ Building finishes and fixtures must be installed in the affected area(s) to the greatest extent practicable in order to assess building systems and fixture coordination.] The reviewers must include the [A/E's Interior Designer,] NAVFAC Interior Designer and Construction Manager, the Contractor, the Contractor's Interior Designer,[ Asset Management Branch (AMD) or Supply Management Division (SMD) (USMC projects), ] and the Activity.[ The vendor(s) technical representative must be available on-site to respond to questions, must identify specifically what is included in their proposal and what must be provided by the Contractor.] The technical representative must be prepared to demonstrate the functional aspects of their product and review the following:

[ a. Interface of furniture system from wall, column, floor, or power pole.

][b. Distribution of all data, communications and power through the systems furniture panels, including segregated paths for SIPRnet and NIPRnet,
other networks, and faceplate locations and types, as required to support a group of [six] [eight] [_____] workstations.

][c. Wire management solutions for all cords and cables, both internal and external to the furniture panels.
][d. Comfort and expected durability
][e. Representative finish offerings based on RFQ Package
][f. Seating
][g. [____]

3.1.2.10.1 Coordination of all Trades

The Contractor must have all coordinating trades available at the mock-up to discuss items such as size of wiring and fiber bundles, MUTOAs, junction box locations, wall plates, and cover plates in furniture. Provide [3] [____] weeks notice to NAVFAC prior to scheduling the mock-up to allow time for travel arrangements. Complete the Final FF&E Mock-up prior to the submittal of the Pre-Final and Final FF&E submittals.

3.1.2.11 Pre-Final FF&E Package "Over the Shoulder" Submittal Review Meeting

**************************************************************************
NOTE: The following paragraphs are tailored for PROCESS 1.
**************************************************************************

The meeting is to occur[ at the Activity, located [at [_____]][ at NAVFAC, located in [_____]][ virtually]. The Contractor's Interior Designer must present the Pre-Final FF&E Package "Over the Shoulder" Submittal for NAVFAC and Activity approval. The submittal may be presented in a "loose" format or binder. No presentation boards required.

3.1.2.12 Pre-Final FF&E Package Submittal

**************************************************************************
NOTE: The number of binder and electronic copies is dependent on whether the project is NAVY or USMC.
**************************************************************************

Provide the following number of Pre-Final FF&E Package Submittals; [Two binder copies and four electronic copies total, as follows:

a. One binder copy and one electronic copy for the NAVFAC Interior Designer
b. One binder copy and one electronic copy for the Activity
c. One electronic copy for the Facilities Engineering and Acquisition Division (FEAD) or Resident Officer in Charge of Construction (ROICC)
d. One electronic copy for the NAVFAC Project Manager
][Three binder copies and five electronic copies total, as follows:

a. One binder copy and one electronic copy for the NAVFAC Interior Designer
b. One binder copy and one electronic copy for the Activity

c. One binder copy and one electronic copy for Asset Management Branch (AMD) or Supply Management Division (SMD) (USMC projects)

d. One electronic copy for the Facilities Engineering and Acquisition Division (FEAD) or Resident Officer in Charge of Construction (ROICC)

e. One electronic copy for the NAVFAC Project Manager

][In addition, include:

[ a. 406 mm x 508 mm 16-inch x 20-inch color boards of furniture and finishes specified for Activity presentation to indicate overall design intent. One physical copy required for Activity. One electronic copy required for the NAVFAC Interior Designer.

][b. 203 mm x 254 mm 8-inch x 10-inch color photographs of the color boards. One electronic copy required for the NAVFAC Project Manager.

]]3.1.2.13 Final FF&E Package Submittal

**************************************************************************
NOTE: The following paragraphs are tailored for PROCESS 1. The number of binder and electronic copies is dependent on whether the project is NAVY or USMC.
**************************************************************************

Provide the Final FF&E Package Submittal [9][10][11][12][_____] months prior to BOD, following the receipt of review comments on the Pre-Final FF&E Package Submittal and as determined by the approved FF&E schedule developed and incorporated into the Contractor's Schedule.

Submit the Final FF&E Submittal in a 3-ring binder for review and approval. Provide the following number of Final FF&E submittals; [Three binder copies and four electronic copies, as follows:

a. One binder copy and one electronic copy for the NAVFAC Interior Designer

b. One binder copy and one electronic copy for the Facilities Engineering and Acquisition Division (FEAD) or Resident Officer in Charge of Construction (ROICC)

c. One binder copy and one electronic copy for the Activity

d. One electronic copy for the NAVFAC Project Manager

][Four binder copies and five electronic copies total, as follows:

a. One binder copy and one electronic copy for the NAVFAC Interior Designer

b. One binder copy and one electronic copy for the Activity

c. One binder copy and one electronic copy for Asset Management Branch (AMD) or Supply Management Division (SMD) (USMC projects)

d. One binder copy and one electronic copy for the Facilities Engineering
and Acquisition Division (FEAD) or Resident Officer in Charge of Construction (ROICC)

e. One electronic copy for the NAVFAC Project Manager

3.1.2.14 Final FF&E Package Price Validation Submittal

******************************************************************************
NOTE: The following paragraphs are tailored for PROCESS 2. The number of binder and electronic copies is dependent on whether the project is NAVY or USMC.
******************************************************************************

Provide the Final FF&E Package Price Validation Submittal [9][10][11][12][_____] months prior to BOD, following the receipt of review comments on the Pre-Final FF&E Package Submittal as determined by the approved FF&E schedule developed and incorporated into the Contractor's Schedule.

Submit the Final FF&E Submittal in a 3-ring binder for review and approval. Provide the following number of Final FF&E submittals; [Three binder copies and four electronic copies, as follows:

a. One binder copy and one electronic copy for the NAVFAC Interior Designer

b. One binder copy and one electronic copy for the Facilities Engineering and Acquisition Division (FEAD) or Resident Officer in Charge of Construction (ROICC)

c. One binder copy and one electronic copy for the Activity

d. One electronic copy for the NAVFAC Project Manager

][Four binder copies and five electronic copies total, as follows:

a. One binder copy and one electronic copy for the NAVFAC Interior Designer

b. One binder copy and one electronic copy for the Activity

c. One binder copy and one electronic copy for Asset Management Branch (AMD) or Supply Management Division (SMD) (USMC projects)

d. One binder copy and one electronic copy for the Facilities Engineering and Acquisition Division (FEAD) or Resident Officer in Charge of Construction (ROICC)

e. One electronic copy for the NAVFAC Project Manager

3.1.2.15 Interior Finish Construction Submittals

Some building interior finishes (Structural Interior Design) may need to be revised to coordinate with the Final FF&E Package. Submit any revisions or deviations to the building interior finishes to the NAVFAC Interior Designer for review. The Contracting Officer must approve any changes to the building interior finishes.
3.2 POST-AWARD FF&E OPTION ITEM CHANGES

3.2.1 Requests for Price Changes

**************************************************************************
NOTE: The following paragraph contains tailoring options for PROCESS 2.
**************************************************************************

The FF&E Option has been priced, negotiated, and awarded based on specific line items as detailed in the approved Final FF&E Package Price Validation Submittal. These items have been approved considering color, specific type and quality of material, price, and usable life. The Government will expect and require the Contractor to provide exactly those items. Any requests to change FF&E items that will cause a price change must be submitted in writing for approval by the NAVFAC Contracting Officer and Interior Designer before purchase and installation.

3.2.2 Requests for Item Changes

**************************************************************************
NOTE: The following paragraphs are tailored for PROCESS 1 and PROCESS 2.
**************************************************************************

Should changes become necessary, careful consideration is required to ensure that equivalent quality, price and other aspects of the items are maintained. Any adjustments must be negotiated. Provide BVD documentation for each substituted item if the extended cost for the item exceeds the micro-purchase threshold (MPT). If multiple items from the same SIN must be substituted, include in the same BVD. Unexpired vendor quotes from the original FF&E RFQ may be used in the new BVD, provided that they are the same SIN and all quotes are from the same procurement category, i.e., GSA or Open Market. The Contractor must coordinate with the NAVFAC Interior Designer and Collateral Equipment Manager, in consultation with the Activity, for any changes to the FF&E. The Contracting Officer must approve any changes.

3.2.3 Post Option Award FF&E Finish Submittals

FF&E finishes may need to be revised due to discontinued product finishes. Submit any revisions or deviations to the FF&E finishes to the NAVFAC Interior Designer for review. The Contracting Officer must approve any changes to the FF&E finishes.

3.2.4 Validation of Pricing

The Contractor must validate pricing with the FF&E vendor(s) prior to FF&E Option award. Cost increases due to authorized GSA schedule price increases must be allowed prior to the FF&E Option award to purchase the FF&E. Reimbursement for price increases after FF&E Option award will not be considered.

3.2.5 Post Option Award Price Increases

**************************************************************************
NOTE: The following paragraph is tailored for PROCESS 3.
**************************************************************************
Reimbursement for price increases after FF&E Option award will not be considered.

3.2.6 Progress Payments

Per FAR 52.232-5 Payments under Fixed-Price Construction Contracts, the Contracting Officer may authorize a progress payment on the FF&E ordered as material delivered to the Contractor, at locations other than the site if:

a. Consideration is specifically authorized by this contract; and

b. The Contractor furnishes satisfactory evidence, including a copy of the order acknowledgment and proof of payment, that it has acquired title to such material, the material is stored in a secure, climate controlled location, and that the material will be used to perform this contract.

3.3 INSTALLATION

**************************************************************************
NOTE: The following paragraph contains tailoring options for PROCESS 2.
**************************************************************************

The FF&E Package includes the installation of all furniture and furnishings as specified in the Final FF&E Package Price Validation. The FF&E installation dealer(s) specified in the FF&E Package must receive, store as required, transport to the project site, off load, inside deliver, unpack, assemble, install, clean, and dispose of all the trash for all FF&E. It is the Contractor's responsibility to coordinate the building completion, occupancy, and furniture installation dates with the installation dealer(s) specified in the FF&E Package. Any costs associated with or delaying furniture shipments to accommodate the construction schedule is the responsibility of the Contractor.

3.3.1 FF&E Pre-Installation Walk-Through

The Contractor must coordinate and participate in a walk-through to ensure that the building interior is substantially complete in all areas scheduled to receive FF&E to include floor, wall and ceiling finishes and building systems located on or in the ceilings. Attendees must include the NAVFAC Construction Manager and the FF&E vendor(s) in-person (if geographically feasible) or virtually. Approval by the NAVFAC Construction Manager to proceed with the FF&E installation is required. The walk-through date must occur prior to the commencement of the FF&E installation and accommodate sufficient time in the construction schedule for transportation of FF&E to the job site upon approval by the NAVFAC Construction Manager.

3.3.2 Walk Through(s) and Punch List(s) Submittal

**************************************************************************
NOTE: The following paragraph contains tailoring options for PROCESS 1 and PROCESS 2.
**************************************************************************

The Contractor, Contractor's Interior Designer,[ A/E's Interior Designer,] NAVFAC Interior Designer, FF&E vendor(s) or dealer(s) representative and installation superintendent, other specialty consultants (if applicable),
The Contractor must repair, to the Government's satisfaction, all damage to any facility finish that is a result of the furniture installation and correct all punch list items for the FF&E. Any damage or loss of FF&E after installation will be the responsibility of the Contractor and not the FF&E vendor or installer. Daily installation walk-throughs by the Contractor and the FF&E installation dealer are encouraged to document any damage and identify the responsible party(s).

3.4 INSTALLATION WARRANTY

Install all movable furnishings in accordance with the manufacturer's instructions and warranty requirements. All movable furnishings must be level and aligned. All doors, drawers and accessories must be level and aligned to open, close and otherwise operate smoothly and securely.

All FF&E and Specialty CEQ must be installed by the manufacturer's dealer of record and not by the Contractor.

3.5 CLOSEOUT SUBMITTALS

3.5.1 Warranty And Maintenance Information

Provide to the Contracting Officer at the final FF&E walk-thru one electronic copy and one binder copy of all ordering documentation, including but not limited to, quotes, purchase orders, factory order numbers (FO), IUID, and warranty and maintenance information for all products.

[3.5.2 Interior Photography Submittal

Upon completion of the FF&E installation, provide professional Interior Photography of the completed interior. The photographer must be in the business of specializing in architectural and interior photography. The submittal must be a minimum of six photos. "Before" and "After" photos are required for all renovation projects. Permission for publishing and using the photos by NAVFAC is required. Images must be submitted electronically as a Joint Photographic Experts Group (JPEG) or Portable Document Format (PDF) with a resolution of no less than 300 Dots Per Inch (dpi) as well as 200 mm x 250 mm 8-inch x 10-inch matte photographs. The photographs must be taken prior to occupancy and staged with accessories as needed. Additional lighting may be needed to ensure quality images.

All costs associated with the Interior Photography Submittal must be included in the Construction Base Price and must not be included in the FF&E Option item.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for window blinds and hardware.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**PART 1 GENERAL**

NOTE: Use Section 12 22 00 for CURTAINS AND DRAPES. Use Section 12 24 13 for ROLLER WINDOW SHADES.

**1.1 SUMMARY**

Provide window treatment, conforming to NFPA 701, complete with necessary brackets, fittings, and hardware. Provide each window treatment type as a complete unit in accordance with paragraph WINDOW TREATMENT PLACEMENT SCHEDULE. Mount and operate equipment in accordance with manufacturer's instructions. Completely cover windows to receive a treatment.

**1.2 REFERENCES**
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

CALIFORNIA DEPARTMENT OF PUBLIC HEALTH (CDPH)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 701 (2023; ERTA 1 2023) Standard Methods of Fire Tests for Flame Propagation of Textiles and Films

SCIENTIFIC CERTIFICATION SYSTEMS (SCS)

SCS SCS Global Services (SCS) Indoor Advantage

UNDERWRITERS LABORATORIES (UL)

UL 2818 (2022) GREENGUARD Certification Program For Chemical Emissions For Building Materials, Finishes And Furnishings

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's
Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES.

[Indoor Air Quality for window blinds; S]

**SD-08 Manufacturer's Instructions**

SECTION 12 21 00 Page 5
1.4 CERTIFICATIONS

1.4.1 Window Blinds

Provide products certified to meet indoor air quality requirements by UL 2818 Greenguard [Gold], SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver components to the jobsite in the manufacturer's original packaging with the brand or company name, item identification, and project reference clearly marked. Store components in a dry location that is adequately ventilated and free from dust, water, or other contaminants and has easy access for inspection and handling. Store materials flat in a clean dry area with temperature maintained above 10 degrees C 50 degrees F. Do not open containers until needed for installation unless verification inspection is required.

1.6 WARRANTY

Provide manufacturer's standard performance guarantees or warranties that extend beyond a 1 year period.

PART 2 PRODUCTS

**************************************************************************
NOTE: Coordinate with the drapery hardware specified for the project.
**************************************************************************

2.1 WINDOW BLINDS

Provide each blind, including hardware, accessory items, mounting brackets and fastenings, as a complete unit produced by one manufacturer. Unless otherwise indicated, all parts will be the same color and will match the color of the blind slat. Treat steel features for corrosion resistance. Submit product data and samples of each type and color of window treatment. Provide [slat][louver] samples 150 mm 6 inch in length for each color.[ Window blinds must meet emissions requirements of CDPH SECTION 01350 (use the office or classroom requirement, regardless of space type). Provide certification or validation of indoor air quality for window blinds.]

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of
bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content of the first bracket. Some manufacturers and regions have higher percentages. If desired, insert higher percentages into the second set of brackets.

**************************************************************************
[Provide Aluminum Components with a minimum of [24][_____] percent recycled content. Provide data identifying percentage of recycled content for aluminum components.]
**************************************************************************

NOTE: Include bracketed sentence below requiring products with indoor air quality certifications when it is verified there is a product available that is certified by a third-party organization such as Greenguard or SCS Global Services. Also, verify that the certified product is both cost effective and appropriate for the project.

**************************************************************************
[Provide certification of indoor air quality for window blinds.]
**************************************************************************

2.1.1 Horizontal Blinds

**************************************************************************
NOTE: Typically horizontal blinds are fabricated to fill the openings from head-to-sill and jamb-to-jamb with inside mounted brackets. A clearance of 6 mm 1/4 inch should be allowed at each jamb. This typical mounting procedure may not be appropriate under certain conditions for 25 mm 1 inch slats and for windows in special frames, sliding glass doors, or windows in doors. Check specifications of glass manufacturer for recommended clearances when detailing the mounting.
**************************************************************************

Provide horizontal blinds with[ 50 mm 2 inch][ 25 mm 1 inch] slats. Blind units must be capable of nominally 180 degree partial tilting operation and full-height raising. Blinds must be [inside][outside] mount. Provide tapes for 50 mm 2 inch slats with longitudinal reinforced vinyl plastic in 1-piece turn ladder construction. Tapes for 25 mm 1 inch slats must be braided polyester or nylon.

2.1.1.1 Head Channel and Slats

**************************************************************************
NOTE: For clarification purposes, 0.006 inch refers to 0.006 gauge and 0.008 refers to 0.008 gauge. For 25 mm 1 inch venetian blinds, aluminum slats should be specified, unless justification exists for using steel. Steel slats have a tendency to cut the
thin-line tape used with 25 mm 1 inch slats.

Do not use steel materials in humid locations or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid project locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations. Provide window blinds of prefinished aluminum with a minimum thickness of 0.032 inch (0.813 mm) for recommended spans.

Provide head channel made of[ steel or] aluminum with corrosion-resistant finish nominal[ 0.46 mm 0.018 inch for 50 mm 2 inch] [ 0.61 mm 0.024 inch for 25 mm 1 inch] slats. Provide slats of aluminum, not less than [0.203][0.152][0.813] mm [0.008][0.006][0.032] inch thick, and of sufficient strength to prevent sag or bow in the finished blind. Provide a sufficient amount of slats to assure proper control, uniform spacing, and adequate overlap. Enclose all hardware in the headrail.

2.1.1.2 Controls

A transparent tilting wand will be provided to tilt the slats, it will hang vertically by its own weight, and will swivel for easy operation. Provide a tilter control of enclosed construction. Provide moving parts and mechanical drive made of compatible materials which do not require lubrication during normal expected life. The tilter will tilt the slats to any desired angle and hold them at that angle so that any vibration or movement of ladders and slats will not drive the tilter and change the angle of slats. Include a mechanism to prevent over tightening. Provide a wand of sufficient length to reach to within 1500 mm 5 feet of the floor. [Provide cordless blinds or blinds with cords that are out of reach of children and strangulation proof.]

2.1.1.3 Intermediate Brackets

Provide intermediate brackets for installation, as recommended by the manufacturer, of blinds over [1200][1500][2100] mm [48][60][84] inch wide.

2.1.1.4 Bottom Rail

Provide bottom rail made of corrosion-resistant steel with factory applied finish. Provide closed oval shaped bottom rail with double-lock seam for maximum strength. Bottom rail and end caps to match slats in color.

2.1.1.5 Braided Ladders

Provide braided ladders of 100 percent polyester yarn, color to match the slat color. Space ladders 15.2 slats per 300 mm/foot of drop in order to provide a uniform overlap of the slats in a closed position.
2.1.1.6 Hold-Down Brackets

**************************************************************************
NOTE: Holddown brackets should not be specified for windows except where air movement may cause the blinds to sway excessively.
**************************************************************************

Provide universal type hold-down brackets for sill or jamb mount where indicated on placement list.

2.1.2 Light Control and Privacy Blinds

**************************************************************************
NOTE: Light control and privacy blinds are special purpose blinds to be used only when more than average blocking of light and privacy is required. Refer to UFGS SECTION 12 24 13 ROLLER WINDOW SHADES for black out shades.
**************************************************************************

In addition to requirements for horizontal blinds, provide each unit with a feature that offers hidden slat holes for maximum light control and privacy.

2.1.3 Vertical Blinds

**************************************************************************
NOTE: Typically, vertical blinds will be wall mounted with outside brackets, sill length. Certain instances will call for different installation methods. When selecting a ceiling mount with inside brackets, the designer should verify that the window recess will accommodate this type installation.
**************************************************************************

Provide vertical blind units capable of nominal 180 degree partial tilting operation and full stackback. Provide blinds that are listed by the manufacturer as designed for heavy duty strength applications including heavy duty hardware. Provide [ceiling][wall] mounted vertical blinds with [outside][inside] brackets. Provide blinds that are [sill][floor] length. Outside mount type installation must provide adequate overlap to control light and privacy.

2.1.3.1 Louvers

**************************************************************************
NOTE: Fabric louvers are freehanging and different from groover louvers. Groovers are vinyl louvers with fabric inserts included. Edit accordingly and do not use groovers and fabric louvers together.
**************************************************************************

Generally, 90 mm 3-1/2 inch blinds will be specified because they are more economical. In some cases, 50 mm 2 inch blinds will be more aesthetically pleasing because of the window size.

**************************************************************************
Provide louvers [which are fire resistant solid vinyl, UV stable, and impact resistant.][which are flame retardant fabric having straight, flat,
unfrayed edges and flat, without noticeable twists. Provide a weight at
the bottom of the louver without the insert discoloring the fabric.]
[which are groover extruded from solid vinyl with clear non-yellowing
channel lips to accept fabric inserts. Provide fabric inserts that are
flame retardant and colorfast.] Louvers that are [90 mm 3-1/2 inch must
overlap not less than 10 mm 3/8 inch] [50 mm 2 inch must overlap not less
than 1 mm 1/4 inch] and be dimensionally stable.

2.1.3.2 Carriers

Provide carriers to support each louver made of molded plastic to
transverse on self-fabricated wheels for smooth, easy operation. The hook
of the carrier must have an automatic latch to permit easy installation and
removal of the louver, and to securely lock the louver for tilting and
traversing.

2.1.3.3 Headrail System

Provide headrail system not less than 1.19 mm 0.047 inch thick and made of
anodized aluminum alloy or 0.635 mm 0.027 inch thick phosphate treated
steel with a baked on ivory gloss enamel paint finish. Provide a headrail
that extends the full width of the blind and can be closed with an end cap
at each end. One cap will contain the traversing and tilting controls.
The opposite cap will house the pulley for the traversing cord.

2.1.3.4 Valance

Attach the manufacturer's standard valance to the headrail by metal or
plastic holders which grip the top and bottom edge of the valance and
accept an insert of the same material as the slats. Provide sufficient
clearance behind the valance to permit the louvers to tilt without
interference. Extend the headrail cover the full width of the blind.[
Provide returns].

2.1.3.5 Controls

**************************************************************************
NOTE: Typically, a tilting control baton is used
because it is unobtrusive. Control mechanisms
generally are on the right side, but window
placement may require the controls to be placed on
the left side for ease of operation.

Select which direction the vertical blind will
traverse in the Placement Schedule, considering
there must be adequate space for the width of the
stack without concealing any electrical or
mechanical components.
**************************************************************************

Provide tilting and traversing controls that hang compactly at the side of
the blinds and reach within 1500 mm 5 feet of the floor. Provide
[tilt/traverse control][bead chain tilting control] that tilts all vanes
simultaneously to any desired angle and hold them at that angle. Provide
louvers that traverse [one way to the right] [one way to the left] [two-way
split].[ The traversing control cord will be minimum 1.78 mm 0.070 inch in
diameter with a minimum breaking strength of 556 N 125 pounds. Anchor the
cord to a lead carrier linked to all adjacent carriers.] Provide louvers
that traverse along the headrail by pulling one side of the looped cord.
Connectors and Spacers

The connector must be flexible, smooth and flat to slide unhindered when carriers move independently of each other, and to nest compactly when carriers are stacking. Relate the length of the links to the louver width in order to equally space the traversing louvers, to maintain uniform and adequate overlap of louvers, and to fully cover the width of the opening.

Intermediate Brackets

Provide intermediate installation brackets for blinds over 1575 mm 62 inches wide.

COLOR

NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawings are used when the project is designed by an Architect or Interior designer. Color must be selected from manufacturer's standard colors or identified as a manufacturer's color in this specification only when the project has minimal finishes.

When the government directs that color be located in the drawings, a note will be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

When more than one type, pattern or color is specified, identify location.

When a manufacturer's name, stock number, pattern, and color is specified for color, be certain that the product conforms to the specification, as edited.

Provide color, pattern and texture [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES][as indicated][selected from manufacturer's standard colors][[_____. Color listed is not intended to limit the selection of equal colors from other manufacturers.]}

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with details of the work, verify all dimensions in
the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2 WINDOW TREATMENT PLACEMENT SCHEDULE

**************************************************************************
NOTE: The Window Treatment Placement Schedule will be provided at the designer's option to clarify placement of the treatments. When all exterior windows are to receive a window treatment, a note can be made to this effect instead of filling out the schedule. The location of the window treatment should be clearly defined within this specification.
**************************************************************************

[All exterior windows include [_____].] [Provide window covering as follows:

<table>
<thead>
<tr>
<th>Room Number/Name</th>
<th>Window Covering Type</th>
<th>Vertical Blind Draw Direction</th>
<th>Window Type</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>
]

3.3 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

Submit drawings showing fabrication and installation details. Show layout and locations of track, direction of draw, mounting heights, and details. Provide Manufacturer's Instructions and Operation and Maintenance Data. Perform installation of window blinds in accordance with the approved detail drawings and manufacturer's installation instructions. Install units level, plumb, secure, and at proper height and location relative to window units. Provide and install supplementary or miscellaneous items in total, including clips, brackets, or anchorages incidental to or necessary for a sound, secure, and complete installation. Do not start installation until completion of room painting and finishing operations.

3.4 CLEAN-UP

Upon completion of the installation, inspect window treatments for soiling, damage or blemishes; and adjust them for form and appearance and proper operating condition. Repair or replace damaged units as directed by the Contracting Officer. Isolate metal parts from direct contact with concrete, mortar, or dissimilar metals. Ensure blinds installed in recessed pockets can be removable without disturbing the pocket. The entire blind, when retracted, must be contained behind the pocket. For blinds installed outside the jambs and mullions, overlap each jamb and mullion 20 mm 0.75 inch or more when the jamb and mullion sizes permit. Include all hardware, brackets, anchors, fasteners, and accessories necessary for a complete, finished installation.

NOTE: This guide specification covers the requirements for draperies, drapery hardware, and installation.

Note: Use Section 12 21 00 for WINDOW BLINDS

Note: Use Section 12 24 13 for ROLLER WINDOW SHADES

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

This guide specification includes tailoring options for Motorized Drapery Rods. Selection or deselection of a tailoring option (select view-tailoring options) will include or exclude that option in the section. Specific project editing is still required for the resulting section.

Motorized drapery systems must be coordinated with electrical and HVAC systems (energy conservation measures), as well as the drapery manufacturer to verify weight and related carrying hardware.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
NOTE: On the drawings, show:

1. Windows and other locations requiring drapery. Indicate whether drapery extends to ceiling or to specific height above windows.

2. Location of each different drapery fabric when more than one type, pattern or color is to be provided.

3. Width of window and width of drapery extension if bay window.

4. Location of sample window installation, if appropriate.

5. Indicate draw direction when one-way draw traverse rods or tracks are to be provided.

6. Indicate motor location and any integrated components or accessories.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

** SD-02 Shop Drawings  
  Drawings; G[, [_____]]

** SD-03 Product Data  
  Drapery System

** SD-04 Samples  
  Drapery Fabric; G[, [_____]]
  Submit a range of three samples, 900 by 900 mm 36 by 36 inches or larger, to match the fabric quality, weight, pattern, and color shown or specified. Once selected, label approved samples to identify locations for their use in the project. Maintain identification and approval markings until final acceptance of the work.

  Motor and Controller; G[, [_____]]

** NOTE: Coordinate with the drapery hardware specified for the project. Should the designer choose to indicate the location for the sample window installation, clearly indicate the location on the project drawings and edit the paragraph accordingly.

** Finished Drapery  
  Provide one full size window sample installation including hardware. Install the finished drapery on a [stationary] [traverse] [rod] [or] [track] [at the location indicated].

** SD-06 Test Reports  
  Flame Resistance

** SD-07 Certificates  
  Indoor Air Quality for Fabrics; S

** SD-08 Manufacturer's Instructions  
  Drapery Hardware
  Motor and Controller
Special Fabrication

Before fabrication, submit the manufacturer's printed instructions for fabrics requiring special fabrication methods.

SD-10 Operation and Maintenance Data

Drapery System, Data Package 1; G[, [_____]]

Motor and Controller

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

**************************************************************************
NOTE: The Government's preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, it must be verified there is a certified product available that is both cost effective and appropriate for the project. Retain the bracketed sentences when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness. In addition, when these sentences are retained requiring Greenguard or SCS products, also include the Indoor Air Quality Certificates in SD-07 submittals of this section.
**************************************************************************

[1.3 CERTIFICATIONS]

1.3.1 Indoor Air Quality Certifications

1.3.1.1 Fabrics

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

]1.4 DRAWINGS

Submit drawings indicating the following:

Windows and other locations requiring drapery extent of drapery, to ceiling or to specific height above windows; location of each different drapery fabric when more than one type, pattern or color is to be provided; width of window and width of drapery extension if bay window. Motor and Controller location and any integrated components or accessories.

1.5 SYSTEM REQUIREMENTS

Submit data for completed drapery system in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Include laundering and dry cleaning
instructions for fabrics requiring special care. Furnish separate instruction sheet for each material (one for fiberglass, one for Verel). For fabrics which are not permanently or inherently flame resistant, furnish instruction to include frequency and process required for retreat ing the fabric to renew the effectiveness of the flame resistant treatment. Head each sheet with name and number of room or rooms in which each material is hung. In lieu of instruction sheets, provide instructions on small, permanent labels (either iron-on type or sewn-on) affixed to back of the heading of each panel.

1.6 DELIVERY, STORAGE, AND HANDLING

Deliver draperies and hardware to the site in sealed containers clearly labeled with manufacturer's name and contents. Store in a safe, dry, clean, and well ventilated area. Do not open containers until needed for installation, unless verification inspection is required.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Fabrics

Provide fabrics meeting the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification or validation of indoor air quality for fabrics.

2.1.1.1 Drapery Fabric

**************************************************************************

NOTE: Generic descriptions are preferred in order to promote competition. However, due to variety of fabrics available, manufacturer's names and designations may be the more practical method of describing desired fabrics. When a manufacturer's name and designation are used, add the following note to text: "Manufacturer's name and fabric designation are provided to identify the fabric weight, pattern, weave, texture, and color desired. Other manufacturers' products meeting the requirements specified and having similar fabric weight, pattern, weave, texture, and color will be acceptable."

When project requires matching a standard sample, include last sentence. Make fabric sample available at location stated for inspection by prospective bidders when special fabrics are required.

If more than one fabric is required, repeat the listing as necessary.

**************************************************************************

ASTM D3691/D3691M. Provide fabric manufactured from [man-made] [or] [natural] fibers. Fabric physical characteristics must be as [indicated.]
[follows:]

a. Finished fabric weight: [_____] to [_____] kilograms per square meter
b. Pattern: [Printed] [Woven] [_____]

c. Weave: [Open (25.1 to 50 percent)] [Semi-open (7.1 to 25 percent)]
[Closed (0 to 7 percent)]

d. Texture: [Burlap] [Smooth] [Twill] [_____]

e. Color: [_____]

f. Shading coefficient (single glass with drapery): [_____]

[ A sample of each drapery fabric to be matched is on display at [____].]

2.1.1.2 Drapery Lining

**************************************************************************
NOTE: Delete this paragraph if unlined draperies are specified. Other lining fabrics may be specified in the blank space provided. Specify lining color.
**************************************************************************

[Insulated], [soft blackout,] [_____], color [_____] [as indicated].

2.1.1.3 Flame Resistance

**************************************************************************
NOTE: NFPA 701 includes small and large scale test procedures. The large scale test is more severe than the small scale test. NFPA 701 provides for optional use at the discretion of the authority having jurisdiction. National Fire Protection Association 101, "Code for Safety to Life from Fire in Buildings and Structures", requires both tests for fabrics used in assembly, educational, health care, detention and correctional, and residential occupancies.

For other occupancies, the large scale test should be specified only when stringent flame resistance requirements are necessary, or when the nature of the fabric specified is such that excessive melting or shrinkage will render the small scale test ineffective. Otherwise, the small scale test requirements are adequate in most cases.

A variety of flame-retardant treatments are available. Generally, they fall into two broad categories: (1) permanent type, and (2) the less expensive, renewable type. Permanent treatments retain their effectiveness through a number of cleanings without reapplication. Renewable treatments, however, must be reapplied periodically, frequently after each cleaning, which imposes a continuing maintenance burden. Permanent treatments can be successfully applied to most fabrics. Only a few fibers or fabrics are limited to renewable
**treatments. Specify permanent treatment except where the fiber type or other fabric characteristics prohibit use of this type.**

NFPA 701. Drapery fabric and lining must pass the [small] [and] [large] scale test. Treatment to enhance flame resistance must be [permanent] [renewable] type. If treated, fabric must pass the [small] [and] [large] scale test after being subjected to the accelerated dry cleaning or laundering cycles specified in NFPA 701.

2.1.2 Sewing Thread

Pre-shrunk mercerized cotton (50/3) or monofilament in equivalent size, except do not use monofilament in the heading.

2.1.3 Heading

2.1.3.1 Heading Hooks

Slip-in-type, [bright zinc-plated] [chromium-plated], [nickel-plated steel], and of a size adequate to hold the heading upright. Provide one hook for each pleat. Provide 10 percent [_____] surplus hooks for possible lost or damaged hooks.

2.1.3.2 Snap-Tape System (Ripplefold)

Heavy vinyl or nylon tape with locking fasteners attached to tape to form desired pleat spaces and fullness. Cut tapes to size and sew to drapery fabric to form the heading.

2.1.4 Drapery Hardware

**NOTE:** Unless both stationary and traverse rods or tracks are required, delete the type not to be used.

When traverse, indicate whether two or one-way draw; when one-way, select whether left-to-right or right-to-left.

**NOTE:** Permit Contractor's option of steel or aluminum rods and tracks unless the desired finish cannot be provided with both materials or the installation dictates the use of one particular material.

[Stationary] [and] [traverse] [wall-mounted rods] [and] [ceiling mounted tracks] of heavy-duty type. [manually operated] [motorized], [center close two-way] [one-way draw] [left-to-right] [right-to-left]. Rods and tracks must be cold-rolled, commercial quality steel minimum 0.75 mm 0.030 inch thick or extruded aluminum minimum 1.27 mm 0.050 inch thick. Rod and track cross section width and depth must be sufficient to carry the drapery without sagging. Track configuration (number of channels) must be such so as to permit drapery operation as specified or indicated. Finish steel components with a [white] [_____] baked enamel, vinyl, or epoxy coating as standard with the manufacturer.
Finish aluminum components with [an anodic [clear (natural)] [bronze] [_____] coating] [a baked enamel, vinyl, or epoxy coating] as standard with the manufacturer. Provide smooth and non-sticking sliding surfaces. Provide one-piece rod and track up to 4875 mm 16 feet long. Provide steel brackets and intermediate supports. Provide one manufacturer's design throughout.

2.1.4.1 Track Sets

Include ceiling track, sliding or rolling carriers, and caps for stationary draperies; ceiling track, sliding or rolling carriers, master sliding or rolling carriers, ball bearing end pulleys, and traverse cord with cord [tassels] [tension pulleys] for traverse draperies.

2.1.4.2 Rod Sets

Include wall-hung rod, sliding or rolling carriers, brackets, and intermediate supports with 65 to 90 mm 2-1/2 to 3-1/2 inch projection for stationary draperies; wall-hung rod, sliding or rolling carriers, master sliding or rolling carriers, ball bearing end pulleys, brackets, intermediate supports with 65 to 90 mm 2-1/2 to 3-1/2 inch projection, and traverse cord with cord [tassels] [tension pulleys] for traverse draperies.

2.1.4.3 Traverse Cord

**************************************************************************
NOTE: When traverse draperies are required, select cord tassels or tension pulleys.
**************************************************************************

Size No. 4 with fiberglass center. Provide cord [tassel with lead weight center and plastic coating] [tension pulley, metal tube type, with mounting bracket, helical spring, and ball bearing pulley wheel]. Finish color, white or off-white.

2.1.4.4 Hand Traverse Cordless Track System

Extra heavy duty track assembly with baton on roomside of draperies where it is readily visible and easily used. [Ceiling mounted] [side-wall mounted] in extruded aluminum track anodized in [clear (natural)] [bronze] [_____] finish.

2.1.4.5 Motor and Controller

Provide motor[s] for [single][double] track system, complete with remote controller and manufacturer's instructions for installation and operation. Verify motor size is adequate for drapery system to be installed. Coordinate with [existing][new] electrical system for power supply and location of motor mounting.[ Coordinate thermostatic setting instructions for automated systems.]

2.1.4.6 Snap-Tape System Track

Dovetail slots in clear folding linkage. Provide one-piece molded plastic snap tab type carriers with snap-on components sewn to drapery heading.

2.1.5 Fasteners

Provide [zinc][cadmium][_____] plated.
2.2 FABRICATION

Prior to cutting and fabrication, field measure each drapery location paying particular attention to field conditions affecting the work.

2.2.1 Drapery Fabrication

2.2.1.1 Panels

***********************************************************************************************************************************************
NOTE: Select fullness required, enter percentage and edit fullness definition to suit (i.e. 200 percent fullness is defined as 2 times the rod width plus overlaps and returns.) Select appropriate length.
***********************************************************************************************************************************************

Make from full or half widths of fabric to give a minimum of [200] [250] [300] [_____] percent fullness. [_____] percent fullness is defined as [2] [2 1/2] [3] [_____] times the rod width plus overlaps and returns. Provide [conventional french pleats] [ripplefold]. Draperies must be [floor] [sill] [apron] length. [Floor length draperies must hang 25 mm 1 inch above finish floors.] [Sill length draperies must hang 13 mm 1/2 inch above window sills and heating-air conditioning units.] [Apron length draperies must hang 25 mm 1 inch below bottom of window aprons.] Provide table-sized drapery panels with a plus or minus tolerance of 6 mm 1/4 inch accurately laid-out before cutting. Cut fabric to allow for pleats and for outside ends to return to the walls. For traverse draperies, allow for a minimum overlap of 75 mm 3 inches at the center. Accurately match patterned fabrics to provide identical designs horizontally and vertically on each window within each room. Where variations in length or placement of windows occur in a room, match patterns horizontally. When fabricating panels from fabrics which require special methods or instructions, conform to the workroom instructions provided by the fabric manufacturer. Sew seams and hems using a firm interlocking stitch at a stitch rate per millimeter inch appropriate to fabric being sewn. Sew with enough slack present so that thread shrinkage due to laundering and dry cleaning will not pucker seams and hems. Do not expose seam and hem raw edges.

2.2.1.2 Headings

***********************************************************************************************************************************************
NOTE: This specification covers conventional triple french pleat and ripplefold construction and heavy-duty rodding. Special "architectural" type patented pleating systems are not included. Where special heading treatment is required, appropriate requirements should be incorporated into the project specification.
***********************************************************************************************************************************************

Pleat evenly to required widths. Make headings 100 mm 4 inches high with triple french pleats, and double fold. Include permanent finish stiffener of buckram, crinoline, or pellon across entire heading. Paper stiffening is not acceptable. Machine stitch pleats for a depth of at least 95 millimeters 3-3/4 inches. Do not use horizontal stitching across the width of the heading.
2.2.1.3 Seams

Join widths by serging, overlock, and safety stitch. Retain selvage when practical.

2.2.1.4 Hems

**************************************************************************
NOTE: When sheer fabrics are used, suitable cotton covered beaded tape should be specified in lieu of standard covered weights for better appearance.
**************************************************************************

Double fold hems (top and bottom) and blind stitch so as not to show on the panel face. Make side seams 38 mm 1-1/2 inches wide and bottom seams 100 mm 4 inches deep with weights sewn 13 mm 1/2 inch above hem bottom. Provide weights at corners and each vertical seam. When lining is attached to the drapery fabric, single fold heading is acceptable, however, double fold the bottom hem.

[2.2.2 Lining Fabrication

**************************************************************************
NOTE: Delete this paragraph if unlined draperies are specified.
**************************************************************************

Lock stitch lining to the back of the fabric panel. Hem fabric panel and lining panel separately at the bottom.

][2.2.3 Tie-Backs

**************************************************************************
NOTE: Delete this paragraph if drapery tie-backs are not required. Specify tie-back materials, if other than same as draperies. Specify tie-back width and length, if other than specified.
**************************************************************************

Make from [same material as draperies] [____], [75] [____] millimeters wide by [750] [____] millimeters [3] [____] inches wide by [30] [____] inches long. Fabricate from a double thickness of fabric, press flat to provide specified width, and locate seam at the bottom fold so as to permit the tie-back to be reversible. Provide bone or plastic ring end fastenings to loop over tie-back hooks.

][2.2.4 Valances

**************************************************************************
NOTE: Delete paragraph if valances not required.
**************************************************************************

[Rod-hung, fabricated in the same manner as draperies and of [same material] [____].] [Box-type, with sides and top constructed of 25 mm 1 inch thick [softwood pine] [____], and 10 mm 3/8 inch thick plywood front. Cover front, sides and bottom edges of valance with batting, stretch fabric [and trim] evenly and neatly over valance exterior, and fasten to the inside. Provide [same fabric as draperies] [____]. Paint interior of valance. Shape valance bottom front edge [straight] [____].]
Make valance of required width to span the window, and [_____] millimeters or inches high. Make depth of valance adequate to ensure proper appearance and to permit proper operation of traverse draperies.

PART 3  EXECUTION

3.1  EXAMINATION

Ensure that work of other trades and cleaning operations are completed. Test completed installation to ensure smooth and continuous operation of all draperies, hardware and accessories.

3.2  INSTALLATION

Install draperies in rooms and areas [indicated] [as scheduled herein]. Include all material indicated, specified, or necessary for a complete finished drapery installation. Contractor is responsible for the required quantities of draperies and hardware.

Do not install building construction materials that show visual evidence of biological growth.

3.2.1  Hardware

Install in accordance with the manufacturer's printed instructions and as specified herein. Install ceiling tracks parallel to walls and windows, fasten at each end, at 400 mm 16 inches from each end and with additional intermediate fasteners spaced not more than 1200 mm 48 inches apart. Install wall rods with end brackets and provide intermediate support brackets 600 mm 24 inches from each end with additional intermediate support brackets spaced not more than 1200 mm 48 inches apart. Provide fasteners for installation as follows:

<table>
<thead>
<tr>
<th>Fastener</th>
<th>Structural Material</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wood or sheet metal screw</td>
<td>Wood</td>
</tr>
<tr>
<td>Self tapping screw</td>
<td>Metal</td>
</tr>
<tr>
<td>Case hardened, self-tapping sheet metal screw</td>
<td>Sheet metal</td>
</tr>
<tr>
<td>Screw or bolt in expansion shield</td>
<td>Solid masonry</td>
</tr>
<tr>
<td>Toggle or molly bolt</td>
<td>Hollow masonry, wallboard, plaster</td>
</tr>
</tbody>
</table>

3.2.2  Draperies

Install with a minimum clearance of 6 mm 1/4 inch between the ceiling and top of drapery heading. Floor length draperies must hang 25 mm 1 inch above finished floors; sill length, 13 mm 1/2 inch above window sills and heating-air conditioning units; and apron length, 25 mm 1 inch below bottom of window aprons. Insert heading hooks at rear of each pleat, placed to obtain the clearance specified. Press well before hanging, except fiberglass. Dress-down and adjust hung draperies to provide best form and appearance. Traverse draperies must operate smoothly and easily over the full range of travel. Remove incorrectly sized drapery and remake to correct size. Remove damaged, spotted, or otherwise defective fabric and repair to original state or replace with new material.
3.2.3 **Valances**

Install with top edge parallel to ceiling.

3.3 **DRAPERY SCHEDULE**

NOTE: Some projects require several drapery treatments. Where such variations exist, a drapery schedule made a part of this section or should be included in the drawings. The schedule and any necessary detailed drawings should be cross-referenced. Schedule and drawing data should include all necessary information, such as: areas and rooms to receive draperies; size and placement of each; type and location of rods or tracks, (ceiling-hung, stationary, center close two-way, etc.); drapery length, (floor, sill, or apron); whether lined or unlined; fabric type, color, and pattern unless covered in paragraph FABRICS.

[ All exterior windows include [____].

][Provide window covering as follows:

<table>
<thead>
<tr>
<th>Room Number/Name</th>
<th>Window Covering Type</th>
<th>Drapery Draw Type/Direction</th>
<th>Window Type</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>[____]</td>
<td>[____]</td>
<td>[____]</td>
<td>[____]</td>
<td>[____]</td>
</tr>
</tbody>
</table>

]3.3.1 **IDENTIFICATION**

NOTE: Projects requiring large quantities of window treatments or a variety of window treatment types may need a numbering plan.

In accordance with the numbering plan, mark each opening and the corresponding window treatment with identical numbers. For multiple windows separated by mullions, the space required by each blind must be numbered separately. Use brass, aluminum, plastic, durable paper plates, or stamp to place corresponding numbers on unexposed surfaces of openings and inside or on top of the headrail track.

NOTE: This guide specification covers the requirements for roller window shades and hardware.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Use Section 12 21 00 for WINDOW BLINDS. Use Section 12 22 00 for CURTAINS AND DRAPES

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's
Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard’s Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by basic designation only.

1.2 SUBMITTALS

 **************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification
technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES

SD-02 Shop Drawings

Window Shades, Data Package 1; G[, [_____]]

SD-11 Closeout Submittals

Submit Data Package 1 for roller window shades, and Data Package 2 for electrical operators, in accordance with Section 01 78 23 OPERATIONS AND MAINTENANCE DATA.

1.3 CERTIFICATES

1.3.1 Indoor Air Quality Certifications

1.3.1.1 Roller Window Shades

**************************************************************************
NOTE: The Government's preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, verify there is a certified product available that is both cost effective and appropriate for the project.
**************************************************************************

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) [Gold], SCS Global Services Indoor Advantage Gold or provide validation by other third-party program that products meet the requirements of this paragraph. Provide current product certification documentation from certification body.

1.4 QUALITY ASSURANCE

1.4.1 Qualifications

1.4.1.1 Installer's Qualifications

Installer trained and certified by the manufacturer with a minimum of ten years of experience in installing products comparable to those specified in this section.

1.4.2 Flammability Requirements

Passes in accordance with NFPA 701 small and large-scale vertical burn. Materials tested are identical to products proposed for use.

1.4.3 Electrical Requirements

NFPA Article 100 listed and labeled in accordance with UL 325 or other testing agency acceptable to authorities having jurisdiction, marked for intended use, and tested as a system. Individual testing of components is not acceptable in lieu of system testing.
1.4.4 Anti-Microbial Requirements

'No Growth' per ASTM G21 results for fungi ATCC9642, ATCC 9644, ATCC9645.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver components to the jobsite in the manufacturer's original packaging with the brand or company name, item identification, and project reference clearly marked. Store components in a dry location that is adequately ventilated and free from dust, water, or other contaminants and has easy access for inspection and handling. Store materials flat in a clean dry area with temperature maintained above 10 degrees C 50 degrees F. Do not open containers until needed for installation unless verification inspection is required. Handle and store shades in accordance with manufacturer's recommendations.

1.6 WARRANTY

Provide manufacturer's warranty to repair or replace defective materials and workmanship for a period of [10] [_____] years from date of final acceptance of the work.

PART 2 PRODUCTS

**************************************************************************
NOTE: Coordinate with the drapery hardware specified for the project.
**************************************************************************

2.1 WINDOW SHADES

**************************************************************************
NOTE: Window shade options will include manual single or dual shade and motor-operated single or dual shade. Light filtering shade cloth is translucent in varying shades of opacity. Room darkening shades are opaque and block out light completely.

The designer should specify a complete room darkening system only if total light block is necessary, as in an audio visual application. A room darkening shade is typically made of a vinyl coated fiberglass cloth. Do not specify cotton cambric fabric for room darkening shades since it cannot provide total light block. Coordinate maximum unit sizes available with the window sizes.

Attachment of fabric to roller tube with double sided adhesive is not recommended.

Recycled content is affected by openness factor. Projects need to balance the desired openness factor with all other requirements including recycled content, aesthetics, color and energy efficiency.
**************************************************************************

Submit drawings showing plans, elevations, sections, product details, installation details, operational clearances, wiring diagrams and
relationship to work. Submit a location schedule showing location, size and quantity of shades. Include the use of same room designations as indicated on the drawings.

Provide product data composed of catalog cuts, brochures, and operating and maintenance instructions on each product to be used. Include styles, profiles and features.

Furnish samples of each type and color of roller shade fabric and roller shade channel. Provide shade material minimum 150 by 150 mm 6 by 6 inches in size. Mark face of material to indicate interior faces.

Mock up: Install shade in area designated by Contracting Officer. Do not proceed with remaining work until the Contracting Officer approves workmanship and operation. Rework mock up as required to produce acceptable work. The approved shade can be used in the installation.

Submit fire resistance data, flame spread and smoke contribution data.

Provide roller tube that operates smoothly and of sufficient diameter and thickness to prevent excessive deflection. Provide brackets that are appropriate for [inside][outside][ceiling] mount. Provide shade cloth meeting the performance described in NFPA 701, small scale test. Treat steel features for corrosion resistance.

Provide Various Fiber Components with a minimum of 60 percent recycled content. Provide data identifying percentage of recycled content for various fiber components.

**************************************************************************

NOTE: Included bracketed sentence below requiring products with indoor air quality certifications when product will be located in offices or classrooms.

**************************************************************************

[Provide certification of indoor air quality for roller window shades.]

2.1.1 Manufacturer's Qualifications

Obtain motor-controlled roller shades through one source from a single manufacturer with a minimum of twenty years of experience and minimum of three projects of similar scope and size in manufacturing products comparable to those specified in this section. Furnish manual and motorized shades produced by the same manufacturer to provide matching appearance.

2.1.2 Manually Operated Shades with Single Rollers

2.1.2.1 Chain-and-Clutch Operating Mechanisms

Provide continuous-loop bead chain and clutch that stops shade movement when bead chain is released; shade to be permanently adjusted and lubricated.

2.1.2.2 Bead Chains

Provide bead chain from #10 stainless steel rated to 400N 90 lb. minimum breaking strength with pull chain tensioning device complying with ANSI/WCMA A100.1
a. Loop Length: [Full length of roller shade][As indicated].

b. Limit Stops: Allows shade to stop when chain is released. Provide limit stops to prevent shade from being raised or lowered too far.

c. Chain-Retainer Type: [Clip, jamb mount][Chain tensioner, jamb mounted][Chain tensioner, sill mounted].

[2.1.2.3 Crank-and-Gear Operating Mechanisms

Sealed gearbox drive system controlled by crank handle, [detachable][permanently mounted].

a. Crank-Handle Length: [Manufacturer's standard for height of shade][As indicated on drawings].

b. Coupling system: Provide system to operate shades from single crank by coupling shade rollers together. System to consist of endcaps, plus couplings to connect rollers.

[2.1.2.4 Rollers

Provide corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shade bands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shade cloth for service.

a. Roller Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated].

b. Direction of Shade cloth Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].

c. Shade cloth-to-Roller Attachment: [Manufacturer's standard method][Removable spline fitting into integral channel in tube]. Adhesive attachment is not acceptable.

2.1.2.5 Mounting Hardware

Provide corrosion resistant brackets or endcaps compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated. Provide hardware that allows for field adjustment or removal of shade roller tube and other operable hardware component without removal of brackets and end or center supports.

2.1.2.6 Shade Cloth

a. Shade Material: [Light-filtering fabric: Openness [1 percent][3 percent][5 percent][_____]][Light-blocking fabric].

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade band material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

2.1.2.7 Installation Accessories

a. Front Fascia: L-shaped aluminum extrusion to conceal shade roller
and hardware that snaps onto end caps without requiring exposed
fasteners of any kind. Fascia can be mounted continuously across
two or more shade bands. Provide manufacturers standard height
fascia as required to conceal roller and shade band assembly when
shade is fully open.

[ b. Exposed Headbox: Rectangular, extruded-aluminum enclosure
including front fascia, top and back covers, endcaps, and
removable bottom closure. Provide manufacturers standard height
fascia as required to conceal roller and shade band assembly when
shade is fully open.

c. Endcaps: Extruded aluminum with universal design suitable for
mounting to window mullions. Provide size compatible with roller
size. Provide end cap covers matching fascia/headbox finish.

d. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure
designed for recessed ceiling installation; with front, top, and
back formed as one piece, end plates, and removable bottom closure
panel. Provide manufacturers standard height fascia as required
to conceal roller and shade band assembly when shade is fully
open. Provide pocket with lip at lower edge to support acoustical
ceiling panel.

][ e. Closure Panel and Wall Clip: Removable aluminum panel designed for
installation at bottom of site-constructed ceiling recess or
pocket and for snap-in attachment to wall clip without fasteners.

][2.1.2.8 Room Darkening Shades

Provide room darkening (black-out) window shades designed to eliminate all
visible light gaps when shades are fully closed and conform with the
following:

a. Provide roller tube made of aluminum. Provide shop fabricated light
traps consisting of a head box to house the roller shade, and U-shaped
channels to serve as guides for the shade along the sides and to
receive the bottom edge of the shade along the sill.

b. Provide light trap made of sheet steel having a minimum thickness of
0.64 mm 22 gauge or anodized, extruded, aluminum. Provide legs of the
channels not less than 44 mm 1-3/4 inches long and separated by the
minimum distance that permits free operation of the shade. Edges of
light trap coming into contact with the shade cloth are smooth pile
light seal. The exposed face of the head box is hinged or removable
for access to the shade roller. The interior or unexposed surfaces of
the light trap have a finish coat of flat black enamel. The exposed
portions of the light trap have a factory-applied priming coat of gray
paint.

c. Provide type of cloth for blackout purposes. Provide shade from a
single piece of [PVC polyester][PVC fiberglass][PVC free
material][______].

d. Fit the bottom edge of the shade with a steel operating bar. Shades to
engage positively with bottom rail through operating bar or chain
pull. Paint bars with flat black enamel. Make pull cords of No. 4
braided nylon or beaded chain having not less than 778 N 175 pounds
breaking strength.
2.1.3 Manually Operated Shades with Dual Rollers

2.1.3.1 Chain-and-Clutch Operating Mechanisms

Provide continuous-loop bead chain and clutch that stops shade movement when bead chain is released; shade to be permanently adjusted and lubricated.

2.1.3.2 Bead Chains

Provide bead chain from #10 stainless steel rated to 400 N 90 lb. minimum breaking strength with pull chain tensioning device complying with ANSI/WCMA A100.1. Provide positive mechanical engagement of drive mechanism to shade roller tube. Center bead chain placement for right or left-hand operation.

a. Loop Length: [Full length of roller shade][As indicated].

b. Limit Stops: Allows shade to stop when chain is released. Provide limit stops to prevent shade from being raised or lowered too far.

c. Chain-Retainer Type: [Clip, jamb mount][Chain tensioner, jamb mounted][Chain tensioner, sill mounted].

2.1.3.3 Crank-and-Gear Operating Mechanisms

Sealed gearbox drive system controlled by crank handle, [detachable][permanently mounted].

a. Crank-Handle Length: [Manufacturer's standard for height of shade][As indicated].

[ b. Coupling system: Provide system to operate shades from single crank by coupling shade rollers together. System to consist of endcaps, plus couplings to connect rollers.

2.1.3.4 Rollers

Provide corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shade bands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shade bands for service.

a. Dual Shade-Roller Mounting Configuration: [Side by Side][Offset][______].

b. Inside Roller: Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated on drawings]. Direction of Shade cloth Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].

c. Outside Roller: Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated]. Direction of Shade cloth Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].

d. Shade cloth-to-Roller Attachment: [Manufacturer's standard
method][Removable spline fitting into integral channel in tube].
Adhesive attachment is not acceptable.

2.1.3.5 Mounting Hardware

Provide corrosion resistant brackets or endcaps compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated. Provide hardware that allows for field adjustment or removal of shade roller tube and other operable hardware component without removal of brackets and end or center supports.

2.1.3.6 Inside Shade Cloth

a. Shade Material: [Light-filtering fabric: Openness [1 percent][3 percent][5 percent][_____]][Light-blocking fabric].

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

2.1.3.7 Outside Shade Cloth

a. Shade Material: [Light-filtering fabric: Openness [1 percent][3 percent][5 percent][_____]][Light-blocking fabric].

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

2.1.3.8 Installation Accessories

a. Front Fascia: L-shaped aluminum extrusion to conceal shade roller and hardware that snaps onto end caps without requiring exposed fasteners of any kind. Fascia can be mounted continuously across two or more shade bands. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

b. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

c. Endcaps: Extruded aluminum with universal design suitable for mounting to window mullions. Provide size compatible with roller size. Provide end cap covers matching fascia/headbox finish.

d. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open. Provide pocket with lip at lower edge to support acoustical ceiling panel.

[e. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.
2.1.3.9 Room Darkening Shades

Provide room darkening (black-out) window shades designed to eliminate all visible light gaps when shades are fully closed, and conform with the following:

a. Provide roller tube made of aluminum. Provide shop fabricated light traps, consisting of a head box to house the shade roller, and U-shaped channels to serve as guides for the shade along the sides and to receive the bottom edge of the shade along the sill.

b. Provide light trap made of sheet steel having a minimum thickness of 0.64 mm 22 gauge or anodized, extruded, aluminum. Provide legs of the channels not less than 44 mm 1-3/4 inches long and separated by the minimum distance that permits free operation of the shade. Edges of light trap coming into contact with the shade cloth are smooth pile light seal. The exposed face of the head box is hinged or removable for access to the shade roller. The interior or unexposed surfaces of the light trap have a finish coat of flat black enamel. The exposed portions of the light trap have a factory-applied priming coat of gray paint.

c. Provide type of cloth for blackout purposes. Provide shade from a single piece of [PVC polyester][PVC fiberglass][PVC free material][____].

d. Fit the bottom edge of the shade with a steel operating bar. Shades to engage positively with bottom rail through operating bar or chain pull. Paint bars with flat black enamel. Make pull cords of No. 4 braided nylon or beaded chain having not less than 778 N 175 pounds breaking strength.

2.1.4 Motor-Operated Shades with Single Rollers

Provide factory-assembled, shade-operator system of size and capacity and with features, characteristics, and accessories suitable for conditions indicated, complete with electric motor and factory-prewired motor controls, power disconnect switch, enclosures protecting controls and operating parts, and accessories required for reliable operation without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.

2.1.4.1 Motors

Provide motors that are [hardwired, wired into the building electrical system and][plug-in to standard AC electrical outlets and] concealed from interior view. The position of the motor and electrical connection is [left][right] side of roller, based on the hand of the user facing the shade from inside, unless otherwise indicated [on drawing][in the ROLLER WINDOW SHADE PLACEMENT SCHEDULE]. Provide motors capable of operating at or below 44 dBA measured 914 mm 3 feet from the center of the shade depending on the electronic drive unit selected; no audible clicks when motor starts and stop. Motors are [120V, 60 Hz][low voltage with Class 2 power supply].

2.1.4.2 Controls

Provide electric controls with NEMA ICS 6 Type 1 enclosure for
mounting. Controls are able to electronically set and reconfigure shade open and close limits, shade preset positions, system groups and system subgroups at the control without rewiring and without access to the Electronic Drive Unit. Provide wall control engraved with button, group, or scene description as indicated on the drawings.

- **Key Pad:** Three-position, switch-operated control station with open, close, and off functions. Provide two keys per station. Battery operated key pads are not allowed.

- **Switches:** Wall-switch-operated control station with open, close, and center off functions. Switch Positions: [Three][Five]. Switch Style: [Toggle][Rocker].

- **Group Control Station:** Three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for single-switch group control.

- **Individual/Group Control Station:** Three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for individual and group control.

- **Sun Sensor Control:** Provide solar adaptive shading software that automatically adjusts motorized shades throughout the day in response to the changing position and intensity of the sun. Customized shade schedules are developed combining information about building location and facade orientation. Wireless mullion sensors to be provided for cloudy-day override.

- **Low Voltage Controls:** Provide a digital system that includes a low-voltage interface to communicate with both wired and wireless inputs. Wireless controls to utilize radio frequency in FCC governed frequency spectrum for periodic operation; continuous transmission spectrum is not permitted.

- **Provide a whole building shade control system that can be preprogrammed and reprogrammed to accomplish different operations for management flexibility.**

### 2.1.4.3 Timer Controls

Clock timer, [24-hour][seven-day][_____] programmable for regular events.

- Provide switches that are adjustable and interlocked with motor controls and set to automatically stop the shade at fully raised and fully lowered positions. (Low voltage switching is required.)

- Operating Function: [Stop and hold shade at any position][Stop and hold shade at open, midpoint, and closed positions][Stop and hold shade at 3 pre-determined positions including open, closed and user-programmed position][Stop and hold shade at 5 pre-determined position including open, closed, and 3 user-programmed positions][______].

- Provide the following options: [Low voltage system][Group switching with integrating switch control][Capability of interface with [audiovisual][multi-room][_____] control system][Capability of accepting input from building automation control system][Override switch][Power failure memory for the life of the systems which protects]
2.1.4.4 Rollers

Provide corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shade bands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shade cloth for service.

a. Roller Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated on drawings].

b. Direction of Shade Cloth Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].

c. Shade Cloth-to-Roller Attachment: [Manufacturer's standard method][Removable spline fitting into integral channel in tube]. Adhesive attachment is not acceptable.

2.1.4.5 Mounting Hardware

Provide corrosion resistant brackets or endcaps compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated. Provide hardware that allows for field adjustment or removal of shade roller tube and other operable hardware component without removal of brackets and end or center supports.

2.1.4.6 Shade Cloth

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

2.1.4.7 Installation Accessories

a. Front Fascia: L-shaped aluminum extrusion to conceal shade roller and hardware that snaps onto end caps without requiring exposed fasteners of any kind. Fascia can be mounted continuously across two or more shade bands. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

b. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

c. Endcaps: Extruded aluminum with universal design suitable for mounting to window mullions. Provide size compatible with roller size. Provide end cap covers matching fascia/headbox finish.

d. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel. Provide manufacturers standard height fascia as required to conceal
roller and shade band assembly when shade is fully open. Provide pocket with lip at lower edge to support acoustical ceiling panel.

][e. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.

][2.1.4.8 Room Darkening Shades

Provide room darkening (black-out) window shades designed to eliminate all visible light gaps when shades are fully closed, and conform with the following:

a. Provide roller tube made of aluminum. Provide shop fabricated light traps consisting of a head box to house the roller shade, and U-shaped channels to serve as guides for the shade along the sides and to receive the bottom edge of the shade along the sill.

b. Provide light trap made of sheet steel having a minimum thickness of 0.64 mm 22 gauge or anodized, extruded, aluminum. Provide legs of the channels not less than 44 mm 1-3/4 inches long and separated by the minimum distance that permits free operation of the shade. Edges of light trap coming into contact with the shade cloth are smooth pile light seal. The exposed face of the head box is hinged or removable for access to the shade roller. The interior or unexposed surfaces of the light trap have a finish coat of flat black enamel. The exposed portions of the light trap have a factory-applied priming coat of gray paint.

c. Provide type of cloth for blackout purposes. Provide shade from a single piece of [PVC polyester][PVC fiberglass][PVC free material][______].

d. Fit the bottom edge of the shade with a steel operating bar. Shades to engage positively with bottom rail through operating bar or chain pull. Paint bars with flat black enamel. Make pull cords of No. 4 braided nylon or beaded chain having not less than 778 N 175 pounds breaking strength.

][2.1.5 Motor-Operated, with Dual Rollers

Provide factory-assembled, shade-operator system of size and capacity and with features, characteristics, and accessories suitable for conditions indicated, complete with electric motor and factory-prewired motor controls, power disconnect switch, enclosures protecting controls and operating parts, and accessories required for reliable operation without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.

2.1.5.1 Motors

Provide motors that are [hardwired, wired into the building electrical system and][plug-in to standard AC electrical outlets and] concealed from interior view. The position of the motor and electrical connection is [left][right] side of roller, based on the hand of the user facing the shade from inside, unless otherwise indicated [on drawing][in the ROLLER WINDOW SHADE PLACEMENT SCHEDULE]. Provide motors capable of operating at or below 44 dBA measured 914 mm 3 feet from the center of the shade.
depending on the electronic drive unit selected; no audible clicks when motor starts and stops. Motors are [120V, 60 Hz] [low voltage with Class 2 power supply].

2.1.5.2 Controls

Provide electric controls with NEMA ICS 6, Type 1 enclosure for [surface][recessed or flush] mounting. Controls are able to electronically set and reconfigure shade open and close limits, shade preset positions, system groups and system subgroups at the control without rewiring and without access to the Electronic Drive Unit. Provide wall control engraved with button, group, or scene description as indicated on the drawings.

[ a. Key Pad: Three-position, switch-operated control station with open, close, and off functions. Provide two keys per station. Battery operated key pads are not allowed.

][b. Switches: Wall-switch-operated control station with open, close, and center off functions. Switch Positions: [Three][Five]. Switch Style: [Toggle][Rocker].

][c. Group Control Station: Three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for single-switch group control.

][d. Individual/Group Control Station: Three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for individual and group control.

][e. Sun Sensor Control: Provide solar adaptive shading software that automatically adjusts motorized shades throughout the day in response to the changing position and intensity of the sun. Customized shade schedules are developed combining information about building location and facade orientation. Wireless mullion sensors to be provided for cloudy-day override.

][f. Low Voltage Controls: Provide a digital system that includes a low-voltage interface to communicate with both wired and wireless inputs. Wireless controls to utilize radio frequency in FCC governed frequency spectrum for periodic operation; continuous transmission spectrum is not permitted.

][g. Provide a whole building shade control system that can be preprogrammed and reprogrammed to accomplish different operations for management flexibility.

2.1.5.3 Timer Controls

Clock timer, [24-hour][seven-day][_____] programmable for regular events.

[ a. Provide switches that are adjustable and interlocked with motor controls and set to automatically stop the shade at fully raised and fully lowered positions.[ Low voltage switching is required.]

][b. Operating Function: [Stop and hold shade at any position][Stop and hold shade at open, midpoint, and closed positions][Stop and hold shade at 3 pre-determined positions including open, closed and user-programmed position][Stop and hold shade at 5 pre-determined position including open, closed, and 3 user-programmed
c. Provide the following options: [Low voltage system][Group switching with integrating switch control][Capable of interface with [audiovisual][multi-room][_____] control system][Capable of accepting input from building automation control system][Override switch][Power failure memory for the life of the systems which protects presets][_____]  

2.1.5.4 Rollers

Provide corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shade bands indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shade cloth for service.

a. Dual Shade Mounting Configuration: [Side by Side][Offset][_____]  

b. Inside Roller: Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated on drawings]. Direction of Shade Cloth Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].  

c. Outside Roller: Drive-End Location: [Right side of interior face of shade][Left side of interior face of shade][As indicated on drawings]. Direction of Shade Band Roll: [Regular, from back (exterior face) of roller][Reverse, from front (interior face) of roller].  

d. Shade Cloth-to-Roller Attachment: [Manufacturer's standard method][Removable spline fitting into integral channel in tube]. Adhesive attachment is not acceptable.

2.1.5.5 Sub Title

Provide corrosion resistant brackets or endcaps compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated. Provide hardware that allows for field adjustment or removal of shade roller tube and other operable hardware component without removal of brackets and end or center supports.

2.1.5.6 Inside Shade Cloth

a. Shade Material: [Light-filtering fabric: Openness [1 percent][3 percent][5 percent][_____]][Light-blocking fabric].  

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom where it meets the sill].

2.1.5.7 Outside Shade Cloth

a. Shade Material: [Light-filtering fabric: Openness [1 percent][3 percent][5 percent][_____]][Light-blocking fabric].  

b. Shade Cloth Bottom (Hem) Bar: Steel or extruded aluminum. Provide shade bar [enclosed in sealed pocket of shade cloth material][exposed with endcaps][exposed with endcaps and integral light seal at bottom
where it meets the sill].

2.1.5.8 Installation Accessories

a. Front Fascia: L-shaped aluminum extrusion to conceal shade roller and hardware that snaps onto end caps without requiring exposed fasteners of any kind. Fascia can be mounted continuously across two or more shade bands. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

b. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open.

c. Endcaps: Extruded aluminum with universal design suitable for mounting to window mullions. Provide size compatible with roller size. Provide end cap covers matching fascia/headbox finish.

d. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel. Provide manufacturers standard height fascia as required to conceal roller and shade band assembly when shade is fully open. Provide pocket with lip at lower edge to support acoustical ceiling panel.

[e. Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.

2.1.5.9 Room Darkening Shades

Provide room darkening (black-out) window shades designed to eliminate all visible light gaps when shades are fully closed, and conform with the following:

a. Provide roller tube made of aluminum. Provide shop fabricated light traps consisting of a head box to house the roller shade, and U-shaped channels to serve as guides for the shade along the sides and to receive the bottom edge of the shade along the sill.

b. Provide light trap made of sheet steel having a minimum thickness of 0.64 mm 22 gauge or anodized, extruded, aluminum. Provide legs of the channels not less than 44 mm 1-3/4 inches long and separated by the minimum distance that permits free operation of the shade. Edges of light trap coming into contact with the shade cloth are smooth pile light seal. The exposed face of the head box is hinged or removable for access to the shade roller. The interior or unexposed surfaces of the light trap have a finish coat of flat black enamel. The exposed portions of the light trap have a factory-applied priming coat of gray paint.

c. Provide type of cloth for blackout purposes. Provide shade from a single piece of [PVC polyester][PVC fiberglass][PVC free material][______].

d. Fit the bottom edge of the shade with a steel operating bar. Shades to engage positively with bottom rail through operating bar or chain pull. Paint bars with flat black enamel. Make pull cords of No. 4
braided nylon or beaded chain having not less than 778 N 175 pounds breaking strength.

]2.2  COLOR

**************************************************************************
NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally, Section 09 06 00 SCHEDULES FOR FINISHES or drawings are used to indicate color references. Color must be selected from manufacturer's standard colors or identified as a manufacturer's color in this specification only when the project has minimal finishes.

When the government directs that color be located in the drawings, a note must be added to the drawings that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Considerations of fabric selection include: glare control, view maintenance, privacy and heat build-up. Identify if solar reflective property is required on the backside of the fabric and specify a dual-sided fabric if applicable.

When more than one type, pattern or color is specified identify location.

When a manufacturer's name, stock number, pattern, and color is specified for color, verify that the product conforms to the specification, as edited and is not a proprietary product.

**************************************************************************
Provide color, pattern and texture for metal trim and shade fabric [as specified in Section 09 06 00 SCHEDULES FOR FINISHES.] [as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.]

PART 3  EXECUTION

3.1  FIELD MEASUREMENTS

After becoming familiar with details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.2  ROLLER WINDOW SHADE PLACEMENT SCHEDULE

**************************************************************************
NOTE: The Roller Window Shade Placement Schedule will be provided at the designer’s option when it will clarify placement of the window treatments.

SECTION 12 24 13  Page 20
When all exterior windows are to receive a window treatment, a note can be added to this effect instead of filling out the schedule completely. The location of window treatment placement should be clearly defined within this specification. The Placement Schedule will be completely filled out with the room number/name, window covering type, window type and quantity.

**************************************************************************

[All exterior windows include [_____.] [Provide window covering as follows:

<table>
<thead>
<tr>
<th>Room Number/Name</th>
<th>Roller Window Shade Covering Type</th>
<th>Window Type/Size</th>
<th>Window Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

3.3 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

Provide roller window shades, complete with necessary brackets, fittings, and hardware [in accordance with paragraph ROLLER WINDOW SHADE PLACEMENT SCHEDULE] [as indicated].

Perform installation in accordance with the approved detailed drawings and manufacturer's installation instructions. Install units level, plumb, secure, and at proper height and location relative to window units. Provide and install supplementary or miscellaneous items in total, including clips, brackets, or anchorages incidental to or necessary for a sound, secure, and complete installation. Do not start installation until completion of room painting and finishing operations.

3.4 CLEAN-UP

Upon completion of the installation, clean window treatments and exposed components as recommended by manufacturer. Adjust window treatment for form and appearance and proper operating condition. Repair or replace damaged units as directed by the Contracting Officer. Isolate metal parts from direct contact with concrete, mortar, or dissimilar metals. Ensure shades installed in recessed pockets can be removed without disturbing the pocket. The entire shade, when retracted, is contained inside the pocket. For shades installed outside the jambs and mullions, overlap each jamb and mullion 19 mm 0.75 inch or more when the jamb and mullion sizes permit. Include all hardware, brackets, anchors, fasteners, and accessories necessary for a complete, finished installation.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for vanities for Bachelor Enlisted Quarters (BEQ).

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Lavatories and wall base, if desired, must be specified in other sections. If the project requires custom wood millwork such as required in locations like the Marine Corps Air Station, Cherry Point and Marine Corps Base, Camp Lejeune, North Carolina, do not use this section. Custom wood vanities require the designer to show elevations, sections, and details which clarify materials, thicknesses, size, finishes, and support framing on the contract drawings and use Section 06 20 00 FINISH CARPENTRY to specify the product.
PART 1  GENERAL

1.1  REFERENCES

******************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

******************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

APA - THE ENGINEERED WOOD ASSOCIATION (APA)

APA L870 (2010) Voluntary Product Standard, PS 1-09, Structural Plywood

SOCIETY OF AUTOMOTIVE ENGINEERS INTERNATIONAL (SAE)

U.S. GENERAL SERVICES ADMINISTRATION (GSA)

CID A-A-50565 (Basic; CANC Notice 1) Cabinet, Storage; Wardrobe, Three Drawer

1.2  SUBMITTALS

******************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

  Vanities; G[, [_____]]

  Show configuration, materials, thicknesses, hardware, finishes, and colors of vanities for the project.

1.3 DELIVERY, STORAGE, AND HANDLING

Deliver vanities undamaged and store in a safe, dry, and clean location. Handle so as to prevent damage.

PART 2 PRODUCTS

2.1 VANITIES

**************************************************************************

NOTE: Insert type and size required. Sizes listed should be used unless otherwise approved by the Engineering Field Division Code 04 in writing. If other sizes are required, determine whether modification of door/intermediate panel configuration is required to maintain proper door size and structural support.

**************************************************************************

Provide, [single lavatory type with double doors, Size ([750 mm30 inches wide]) ([900 mm36 inches wide]) ([1050 mm42 inches wide]) ([1200 mm48 inches wide])]
wide)] [double lavatory type with two sets of double doors, Size (1500 mm 60 inches wide)] [The type and size shall be [as indicated] [[_____] mm inches wide]], and except as specified herein. Wood construction shall be used. Particleboard shall not be used. Countertop, doors, and all wood panels shall be 20 mm 3/4 inch plywood, APA L870, Exterior Type, Grade A-A. Chromium-plated brass pulls or aluminum pulls and chromium-plated, spring-loaded, self-closing, adjustable, European type hinges may be used in lieu of pulls, hinges, and magnetic catches.

2.1.1 Quantity
[_____] [As indicated].

2.2 FINISHES

**************************************************************************
NOTE: Since a wood or steel constructed vanity is the Contractor’s option, specify finish, pattern, and color for laminated plastic for both and a paint color for steel.
**************************************************************************

Five-digit designations refer to SAE AMS-STD-595A.

2.2.1 Exposed Surfaces

Exterior of doors and exposed surfaces of cabinet body shall be decorative laminated plastic of color and pattern [indicated] [specified].

2.2.2 Concealed Surfaces

Interior of doors and cabinet body, and concealed exterior surfaces of cabinet body, shall be nondecorative laminated plastic.

2.3 END CURBS

**************************************************************************
NOTE: Delete this paragraph if end curbs are not required.
**************************************************************************

Provide end curbs to match back splash where end of countertop abuts a wall.

2.4 DRAWERS

**************************************************************************
NOTE: Delete this paragraph if drawers are not required.
**************************************************************************

Where drawers are indicated in vanities, comply with CID A-A-50565 for drawers, drawer slides, and slide supports.
PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Final Assembly

Distribute vanities to rooms [as indicated] [as directed]. Uncrate, assemble, adjust as necessary, and place as specified or indicated, complete with accessories and hardware. Position vanities [as indicated] [as directed].

3.1.2 Fastening

**************************************************************************
NOTE: Ensure that work referred to is actually specified in the referenced sections.
**************************************************************************

Fasten wood vanities as indicated on the drawings and as specified. Fasten steel vanities through the holes in vanity back flanges. Fasteners shall be appropriate for use with the wall construction. Seal joint between back splash and wall and between end curb and wall as specified in Section 07 92 00 JOINT SEALANTS.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**NSF INTERNATIONAL (NSF)**

NSF/ANSI 2  (2022) Food Equipment

NSF/ANSI 35  (2020) High Pressure Decorative Laminates for Surfacing Food Service Equipment

**U.S. DEPARTMENT OF DEFENSE (DOD)**

### 1.2 DEFINITIONS

Refer to Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE.

### 1.3 SUMMARY

**NOTE:** Indicate the configuration and layout for all casework, countertops, slide rails, sneeze guards, and other accessories, with casework and counter details, and each equipment item identified by number. Show "FoodService Equipment Schedule" on the drawings using the same identification numbers as indicated in Section 11 06 40.13 FOODSERVICE EQUIPMENT SCHEDULE[, as indicated on the current US Army Quartermaster Center and School equipment schedule]. Ensure that all Contractor built-to-order items, per equipment schedule, are shown and coordinated with the specifications.

Coordinate with other sections for final connection of equipment.

Details of particular equipment and installations are provided on Naval Food Service Division
General requirements, including all mechanical, electrical, health and safety, are specified in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT. Provide detailed equipment Schedule conforming to DOD 4000.25-1-M.

1.3.1 General Requirements

The work includes [furnishing] [and] [installing] [and modifying existing] [casework] [countertops] [slide rails] ______ for foodservice and related work. Verify all existing dimensions, contract drawings, product data and all related conditions prior to commencing rough-in work. Include coordination of delivery through existing finished opening and vertical handling limitations within the building. Advise the Contracting Officer of all discrepancies prior to ordering equipment. Submit Field Verification Data prior to the preconstruction meeting. Provide rough-in and connect utilities to equipment in accordance with requirements specified in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT and with the physical dimensions, capacities and other requirements of the equipment furnished. Submit Detail Drawings for foodservice casework, countertops, and rails in the same format as the equipment schedule on the drawings.

1.3.2 Foodservice Configuration

NOTE: Details of particular equipment and installations are provided on Naval Food Service Division drawings. Use these NAVFSD drawings as a basis for the project details. Contact Supported Command to assist with identification of kitchen equipment necessary to meet mission requirements.

<table>
<thead>
<tr>
<th>Equipment Item</th>
<th>NAVFSSO Dwg. File</th>

On the drawings, show:

1. A 1:50 1/4 inch scale floor plan with layout of all foodservice equipment, casework, counters and rails using Naval Equipment Symbols.

2. A food Service Equipment Schedule laid out in accordance with current CNIC's Galley Department or US Army Quartermaster Center and School equipment
schedules, and specified design requirements.

3. Wall and ceiling penetrations.

4. Raised bases, retainer curbs, or depressions.

5. Recessed, grated floor drains required for equipment.

6. Utility connections to building water, sanitary, electrical, and other utility systems coordinated with all casework. Convenience outlets at point of use for plug-in equipment.

7. All Contractor built-to-order items, per equipment schedule, shown and coordinated with the specifications.

8. Electrical chases and raceways and plumbing chases.

**************************************************************************
Submit coordinated detail drawings for [casework] [countertops] [slide rails] [_____]_. On layout drawing, use Naval Equipment Symbols designated herein. Refer to Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT for complete detail drawing requirements. Follow all the applicable NSF International standards for equipment. Submit within [60] [_____] days of award of contract. Drawings scale: 1:50 (1/4 inch) minimum.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required
as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Field Verification Data; G[, [____]]

SD-02 Shop Drawings

Foodservice Configuration; G[, [____]]

Food Service Equipment Schedule; G[, [____]]

SD-03 Product Data

Recycled Content for steel components; S

SD-04 Samples

Closure Panels; G[, [____]]

1.5 PRE-INSTALLATION MEETINGS

Thirty [____] days prior to the commencement of work, notify the Contracting Officer that the submittal items listed above are prepared and ready for review.

1.6 DELIVERY, STORAGE AND HANDLING

Submit and comply with manufacturer's instructions for shipping, handling, storage, installation and start-up.

PART 2 PRODUCTS

2.1 STEEL COMPONENTS

Provide Steel Components with a minimum of 60 percent recycled content. Provide data identifying percentage of recycled content for steel components.
2.2 CAFETERIA; BUFFET; HOT AND COLD COUNTERS

2.2.1 Counter Edges and Backsplashes

2.2.1.1 Counter Edges

Provide counter edges, as required by design, of the following types:

2.2.1.1.1 Turned Down

50 mm 2 inch at 90 degrees with 19 mm 3/4 inch tight hem at bottom. Round free corners with 19 mm 3/4 inch radius.

2.2.1.1.2 Marine Edge

Turned up 13 mm 1/2 inch [and] 38 mm 1-1/2 inch at 45-degree angle and turned down 50 mm 2 inch at 135 degree angle with 19 mm 3/4 inch tight hem at bottom.

2.2.1.1.3 Rolled Rim

Coved up 75 mm 3 inch with 38 mm 1-1/2 inch wide rim rolled 180 degrees and turned down to table top; hem edges, and bullnose corners.

2.2.1.2 Counter Backsplash

Provide counter backsplash of the following types:

2.2.1.2.1 Coved Up

Coved up [250] mm [10] inch and sloped back 38 mm 1-1/2 inch at the top on a 45-degree angle; 63 mm 2-1/2 inch slope where piping occurs. Turned down 25 mm 1 inch at 135 degrees at the rear of the splash with the ends closed to the bottom of the top turn down. Secure splash turn down to wall with 100 mm 4 inch long, 1.9 mm 14 gauge stainless steel "zee" clips anchored to wall, 900 mm 36 inches on center.

2.2.1.2.2 Turned Up

Turned up [150] mm [6] inch at 90 degrees on a 16 mm 5/8 inch radius with edge turned back 25 mm 1 inch [50 mm 2 inch] at 90-degree angle with 25 mm 1 inch turn down at 90 degrees at rear of splash with the ends closed to the bottom of the top turn down. Secure splash turn down to wall with 100 mm 4 inch long, 1.9 mm 14 gauge stainless steel "zee" clips anchored to wall, 900 mm 36 inch on center.

2.2.2 Counter Bases

******************************************************************************

NOTE: Indicate the type desired for the individual pieces of equipment or specify which is to be used. Alternatively, both types may be specified as a Contractor's option.
******************************************************************************

2.2.2.1 Closed Counter Bases

Fabricate with 38 by 38 by 3 mm 1.5 by 1.5 by 0.125 inch galvanized steel angles with all corners mitered, welded and ground smooth. Provide
horizontal and vertical angles at 600 mm 2 feet on-center. Fabricate closure panels of 1.2 mm 18 gage thick stainless steel or 1.2 mm 18 gage thick galvanized steel with laminated plastic material in accordance with NSF/ANSI 35. Fabricate joint trim of 50 mm 2 inch wide, 1.8 mm 14 gage thick stainless steel; attach with concealed bolts or screws. For enclosed bases provide double-wall at ends and partitions. Weld support legs to body support angles. [Use closed-type bases on [____].]

2.2.2.2 Open Counter Bases

Fabricate and crossbrace with 40 mm 1.625 inch outside diameter, 1.5 mm 16 gage thick stainless steel tubing. Weld crossbraces to legs to reinforce each leg. Weld legs to gussets. Make gussets of stainless steel, fully enclosed, a minimum of 75 mm 3 inches in diameter at top, reinforced with bushing, and continuously welded to support channels located under the counter top. [Use open-type bases on [____].]

2.2.3 Legs

Fabricate of 1.5 mm 16 gage thick, 40 mm 1.625 inch outside diameter stainless steel tubing. Continuously weld to angles on closed bases and gussets on open bases. Finish bottom of legs smoothly. Overlap stem of feet to provide a sanitary fitting.

2.2.4 Pedestal Bases

Fabricate of 2.5 mm 12 gage thick stainless steel for serving line counters. Make pedestal 200 mm high, 250 mm wide, and 600 mm long 8 inches high, 10 inches wide, and 24 inches long with top and bottom edges flanged 38 mm 1.5 inch to the inside at 90 degrees. Provide holes in both flanges for 13 mm 0.5 inch lag screws. Locate utility stub-ups inside pedestal and run to designated equipment.

2.2.5 Feet

Die-stamped stainless steel, bullet shaped, fully enclosed, with slightly rounded bottom. Fit top of feet with male threaded stem to mate with end of legs and provide for a 25 mm 1 inch adjustment without threads being exposed.

2.2.6 Casters

Provide heavy-duty, ball bearing disc wheel, with replaceable grease-proof rubber or neoprene tires and brakes. Provide tires with minimum 125 mm 5 inch diameter and minimum 25 mm one inch width of tread and 90 kilograms 200 pounds capacity per caster. Provide pressure-type grease fittings, threaded guards, and plated finish.

2.2.7 Open Base Shelves

Fabricate of 1.5 mm 16 gage thick stainless steel with all edges turned down 50 mm 2 inches at 90 degrees on a 6 mm 0.25 inch radius with bottom edges turned back 13 mm 0.5 inch at 45 degrees. Notch corners 90 degrees, and intersections 180 degrees. Weld to legs at corners and intersections. Locate legs maximum 1200 mm 48 inches apart. Shelving to be removable without use of tools.
2.2.8 Closed Base Interior Shelves

Fabricate of 1.5 mm 16 gage thick stainless steel. Turn back and side edges up 50 mm 2 inches at 90 degrees on a 6 mm 0.25 inch radius. Turn front edge down 50 mm 2 inches at 90 degrees on a 6 mm 0.25 inch radius and back 6 mm 0.25 inch at 45 degrees. Reinforce shelves longer than 750 mm 30 inches with 38 by 38 by 3 mm 1.5 by 1.5 by 0.125 inch galvanized steel angles under front edge and horizontal center of the shelf. Shelving to be removable without use of tools.

2.2.9 Shelf Pan Slides

Provide 1.8 mm 14 gage thick stainless steel 38 by 38 by 3 mm 1.5 by 1.5 by 0.125 inch angles, with front and back corners rounded and finished smooth. Set angles at 50 mm 2 inches on-center for 450 by 660 mm 18 by 26 inch bun pans and 300 by 500 mm 12 by 20 inch serving pans.

2.2.10 Drawers

Provide die-stamped 1.2 mm 18 gage thick stainless steel, 500 by 500 by 125 mm 20 by 20 by 5 inch deep. Ensure drawer body can be easily removed for cleaning with top edges flanged out 13 mm 0.5 inch. Round interior horizontal corners on a 25 mm one inch radius and interior vertical corners on a 50 mm 2 inch radius. Fabricate supporting frame of 1.8 mm 14 gage thick stainless steel channel. Weld drawer face to frame. Die-stamp drawer face with raised border for rigidity. Die-form an integral open sanitary handle into face. Mount drawer slides with ball bearing nylon or stainless steel rollers on channel frame. Provide with slides and frame which allow for full opening of drawer, and are reinforced to support a weight of 22.5 kg 50 pounds when fully extended. Provide stops for each drawer at fully open position. Enclose drawers on open-base tables in 1.2 mm 18 gage thick stainless steel housing.

2.2.11 Doors

Provide stainless steel double-cased doors, 1.2 mm 18 gage thick outer pan with corners welded, ground smooth and polished; 0.9 mm 20 gage thick inner pan fitted tightly into outer pan with core of sound deadening material. Tack-weld outer and inner pans together with solder-filled seam. Provide doors approximately 20 mm 0.75 inch thick and fitted with flush-recessed, stainless steel door pulls. Mount doors on stainless steel piano or concealed hinges.

2.3 TRAY SLIDE

**************************************************************************
NOTE: Install tray slides for Enlisted General Messes as an integral fabrication of serving line counterfront; NAVFSSO drawing 11103-857 and as specified in the applicable Standard for other equipment.
**************************************************************************

[Solid] [Tube] type, 300 mm 12 inch wide; mounted 865 mm 34 inches above floor. Extend to full length of supporting counter.

[2.3.1 Solid Type]

Provide solid type constructed with 1.8 mm 14 gage thick stainless steel
with front and back edges rolled 45 mm 1.75 inch at 180 degrees. Ensure top edge of roll is 10 mm 0.375 inch above flat surface of slide. Provide three inverted "V" forms, approximately 10 mm 0.375 inch high, in flat surface of slide as running surface for trays. Close ends of slide.

2.3.2 Tube Type

Provide four 25 mm one inch diameter 1.5 mm 16 gage thick stainless steel tubes with supporting hardware. Close both ends of each tube.

2.3.3 Support Brackets

Stainless steel or chromium plated. Secure to counter with stainless steel bolts. Space 1200 mm 4 feet on-center. Provide [stationary] [fold-down] type extending under full width of tray slide.

2.3.4 Protector Shelf

Install and locate protector shelf as indicated on the drawings. Fabricate top of 1.8 mm 14 gage thick stainless steel with all edges rolled down 180 degrees for 38 mm 1.5 inches with bullnosed corners. Shelf to be minimum 250 mm 10 inches wide.

2.3.5 Shelf Frame

Provide 25 by 25 mm one by one inch, 1.5 mm 16 gage thick stainless steel square tubing under all edges of shelf at 750 mm 30 inches on center.

2.3.6 Shelf Frame Support

Form front uprights of 30 by 30 mm 1.25 by 1.25 inch, 1.5 mm 16 gage thick stainless steel tubing. Form back uprights of 25 by 25 mm one by one inch, 1.5 mm 16 gage thick stainless steel square tubing. Provide a horizontal brace, 25 mm one inch above bottom of front uprights. Space front uprights 750 mm 30 inches apart or less, fit with die-formed flanges to be attached to counter top from underside with bolts, and slope 10 degrees to rear.

2.4 PROTECTOR GLASS

6 mm 0.25 inch thick, transparent [clear tempered plate glass] [heat and mar resistant clear acrylic]. Frame edges with 13 mm 0.5 inch, 0.09 mm 20 gage thick stainless steel channel. [Glass] [Acrylic] to be easily replaced in the event of [breakage] [damage]. Provide matching [glass] [acrylic] end panels. Round all free corner on 19 mm 3/4 inch radius.

2.5 FOOD SHIELD

Provide self-serve food shield conforming to NSF/ANSI 2 constructed of 1.6 mm (16 gauge) 16 gauge stainless steel, with a minimum width of at least 300 mm 12 inch with a full 25 mm 1 inch skirt with 19 mm 3/4 inch tight hem on all sides. Support on stainless steel uprights [at front] [as indicated on drawings]. Round all free corners with 19 mm 3/4 inch radius.

a. Provide adjustable louver brackets below the top fitted with 6 mm 1/4 inch polished, [tempered plate glass][heat and mar-resistant clear acrylic] framed in an all welded stainless steel channel and installed with a 175 mm 7 inch clearance above counter top.

b. Install fluorescent light fixtures the full length of the non-heated
undershelf displays, with translucent protection guard. Conceal display light wiring in a corner post. Prewire fixtures to a single recess-mounted master switch per serving shelf.

2.6 DRIP GUTTER

Provide drip gutter as integral part of counter tops, where indicated. Provide a 25 mm one inch brass drain tube centered in bottom of gutter with bottom pitched to drain. Make drip gutter 100 mm wide, 25 mm deep 4 inches wide, one inch deep, and length indicated. Provide removable, stainless steel, die-stamped, anti-splash strainer with finger hole.

[2.7 COLORS

[Refer to Section 09 06 00 - SCHEDULES FOR FINISHES.][ As indicated on drawings.]

]PART 3 EXECUTION

3.1 INSTALLATION,

Install as specified in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT.

3.2 MANUFACTURER'S FIELD SERVICES

As specified in Section 11 05 40 COMMON WORK RESULTS FOR FOODSERVICE EQUIPMENT.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for metal and wood casework for medical and dental facilities.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: This specification covers metal and wood casework, normally preassembled, for installation as fixed or built-in elements in medical and dental facilities. The "casework" includes: Cabinets, singularly or in assemblies; treatment room units wardrobes; deck units; reagent racks; countertops and sink; plus their components; hardware and service fixture trim. All casework must be shown on the drawings.

A schedule of casework, shown in alpha-numerical order, will be included on the drawings. Schedules will include the Joint Schedule Number (JSN) designator, and dimensions. The schedule or
elevations should indicate the number of shelves required. Joint Schedule Numbers (JSN) or the National Stock Numbers are specified in MIL-STD-1691. Any additional specially required casework items which are not covered by MIL-STD-1691 should be described herein and identified on the drawings and schedule.

On the drawings, show:

1. Sizes and spacing of casework units, plumbing fixtures and utility outlets.

2. Schedule of casework including all component parts and accessories.

3. Details of connections and anchorage where special conditions exist. Size and spacing of anchors.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN FOREST FOUNDATION (AFF)

ASTM INTERNATIONAL (ASTM)

CARB 93120 (2007) Airborne Toxic Control Measure (ATCM) to Reduce Formaldehyde Emissions from Composite Wood Products

CSA Z809-08 (R2013) Sustainable Forest Management

FSC STD 01 001 (2015) Principles and Criteria for Forest Stewardship

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office.

U.S. DEPARTMENT OF DEFENSE (DOD)

MIL-STD-1691 (1994; Rev F) Construction and Material Schedule for Military Medical and Dental Facilities

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

40 CFR 770 Formaldehyde Standards for Composite Wood Products
(Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3  CERTIFICATIONS

1.3.1  Certified Sustainably Harvested Wood

**************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Sustainably Harvested Wood is a product which comes from a third-party Forestry Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration (e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.

Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications – if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certifications other than FSC; for all other projects pursuing third-party certification allow the entire list of third party certifications.

**************************************************************************

Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SPI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.
1.3.2 Indoor Air Quality Certification

NOTE: Include this subparagraph when composite wood or agrifiber products are included in project.

For purposes of this specification, composite wood and agrifiber products include particleboard, medium density fiberboard (MDF), wheatboard, strawboard, panel substrates, and door cores. Provide products certified to meet requirements of both 40 CFR 770 and CARB 93120. Provide current product certification documentation from certification body.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver casework to the jobsite in the original individual containers, complete with screws, keys, and instructions. Mark each container with the manufacturer's name and catalog number. Store casework in an adequately ventilated, dry location that is free of dust, water, or other contaminates and in a manner to permit access for inspection and handling. Handle casework carefully to prevent damage to the surfaces. Replace damaged items that cannot be restored to like-new condition.

PART 2 PRODUCTS

2.1 CASEWORK

NOTE: Joint schedule numbers used in MIL-STD-1691 provide the Military Medical Services a uniform basis for identifying casework items in medical and dental facilities. Any items required which are not covered by MIL-STD-1691 should be described appropriately and identified on the drawings with a new assigned number.

Tempered or high-density hardboard is suitable for drawer bottoms. In plastic laminate covered cabinets, back doors with plastic-laminate backing sheets.

Require non-ferrous metal fasteners, fittings, and hardware wherever possible, especially in high humidity areas of facilities.

Submit for approval Drawings showing layout of casework at 1:20 3/4 inch equals one foot scale. Indicate details of construction and rough-in requirements. Indicate whether cabinets are metal or wood, whether countertop is corrosion-resisting steel or plastic laminate, and whether sink is coated with [modified epoxy resin] [polypropylene] [polyethylene] or corrosion-resisting steel. All wood products must be formaldehyde free. Verify job condition affecting the work and obtain accurate field measurements for incorporation into drawings. Locate structural members, required utilities and services provided by other sections of this specification. Submit details and information necessary for fabrication and installation, manufacturer's printed data, catalog cuts, and instructions for installation and cleaning. Provide casework as scheduled.
on the detail drawings. Factory fabricate of manufacturer's standard sizes and finishes and conform to MIL-STD-1691, and the requirements specified below. Supplementary ordering data are as follows: [_____]. Casework items are identified on drawings with numbers preceded by the letters "C" and "D". These numbers are Joint Schedule Numbers in MIL-STD-1691.[Provide material finish and color [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [_____].]

2.1.1 Medical Casework

**************************************************************************
NOTE: Plastic laminated casework may be used in non corrosive areas such as hospital rooms and nursing stations. Corrosion resisting steel should be specified for areas, such as laboratories, where highly corrosive chemicals are handled. Enameled carbon steel casework should be utilized to the maximum practicable extent in lieu of corrosion-resistant steel.
**************************************************************************

Provide medical casework of [baked enamel carbon steel] [corrosion resisting steel] [wood core or carbon steel covered with laminated plastic sheets]. Color of finish [_____] [in accordance with color schedule as indicated] [selected by the Contracting Officer from the manufacturer's standard colors].

2.1.1.1 Recycled Content

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.
**************************************************************************

[Baked enamel carbon steel must contain a minimum of [40][_____] percent recycled content. Provide data identifying percentage of recycled content for baked enamel carbon steel medical casework.] [Corrosion resisting steel must contain a minimum of [40][_____] percent recycled content. Provide data identifying percentage of recycled content for corrosion resisting steel medical casework.] [Wood core must contain a minimum of [50][_____] percent recycled content. Provide data identifying percentage of recycled content for wood core medical casework.] [Carbon steel covered with laminated plastic sheets must contain a minimum of [40][_____] recycled content. Provide data identifying percentage of recycled content for carbon steel medical casework.]
2.1.1.2 Sustainably Harvested Wood

**********************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.
**********************

Wood materials must contain a minimum of [50][_____] percent wood that is certified sustainably harvested. Provide documentation that certified sustainably harvested wood for medical casework is used and identify percentage.

2.1.2 Dental Casework

**********************
NOTE: When selection is to be made from manufacturer's standard samples, specify whether solids or woodgrains are required.
**********************

Provide dental operator casework of [wood core] [carbon steel] covered with laminated plastic sheets. Pattern, color and finish of decorative laminated plastic for exteriors of casework [_____] [in accordance with color schedule as indicated] [selected by the Contracting Officer from the manufacturer's standard [color] [woodgrain] samples].

**********************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.
**********************

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.

**********************
Wood core covered laminated plastic sheets must contain a minimum of [50][_____] percent recycled wood content. Provide data identifying percentage of recycled content for wood core dental casework. [Carbon steel covered laminated plastic sheets must contain a minimum of [40][_____] percent recycled steel content. Provide data identifying percentage of recycled content for carbon steel dental casework.]
**********************

2.1.3 Dental Prosthetics Casework

Provide dental prosthetics casework of [baked enamel carbon steel] [corrosion resisting steel]. Color of finish [_____] [in accordance with color schedule as indicated] [selected by the Contracting Officer from the manufacturer's standard colors].
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide) before specifying product recycled content requirements.

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.

Baked enamel carbon steel must contain a minimum of [40] percent recycled steel content. Provide data identifying percentage of recycled content for baked enamel carbon steel dental prosthetics casework. (Corrosion resisting steel must contain a minimum of [40] percent recycled steel content. Provide data identifying percentage of recycled content for corrosion resisting steel dental prosthetics casework.)

2.1.4 Countertops

NOTE: Do not specify countertops constructed of particle board for high humidity locations or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. See UFC 1-200-01 for determination of ESC for project locations.

Provide countertops of [corrosion-resisting steel] [plastic laminate covered plywood] [plastic laminate covered particleboard] [modified epoxy resin] [or] [resin coated laminated pressed wood fiber]. In lieu of individual samples, complete minimum size casework may be submitted as samples. Mock-up units are not acceptable. Provide samples of sufficient size to show color, pattern, and method of assembly. Some requirements are:

<table>
<thead>
<tr>
<th>Countertop and backsplash</th>
<th>One section, containing both</th>
</tr>
</thead>
<tbody>
<tr>
<td>Door and drawer front</td>
<td>One of each, with hardware mounted</td>
</tr>
<tr>
<td>Melamine plastic color samples</td>
<td>approx 50 X 75 mm 2 X 3 inch size</td>
</tr>
<tr>
<td>Stain/color samples</td>
<td>approx 50 by 75 mm 2 by 3 inch size</td>
</tr>
</tbody>
</table>

[2.1.4.1 Recycled Content]

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide)
specification) before specifying product recycled content requirements.

Research shows the product is commonly available above the minimum recycled content percentages shown below. However, higher percentages may be available. Based on research, insert desired minimum percentages into the empty set of brackets.

**************************************************************************

[Corrosion-resisting steel must have a minimum of [40][_____] percent recycled steel content. Provide data identifying percentage of recycled content for corrosion resisting steel countertops.] [Plastic Laminate (plywood or particleboard) must have a minimum of [50][_____] percent recycled wood content. Provide data identifying percentage of recycled wood content for plastic laminate countertops.]

2.1.4.2 Sustainably Harvested Wood

Wood materials must contain a minimum of [50][_____] percent wood that is certified sustainably harvested. Provide documentation that certified sustainably harvested wood for countertops is used and identify percentage.

2.1.4.3 Indoor Air Quality Requirements

Provide certification of indoor air quality for composite wood and agrifiber products used in countertops.

2.2 PLUMBING FIXTURES

Provide faucet, trap and drain fittings, gas, air and vacuum cocks as required. Provide connection conforming to the requirements specified in Section 22 00 70 PLUMBING, HEALTHCARE FACILITIES.

PART 3 EXECUTION

3.1 INSTALLATION

Install casework in a manner that does not damage the work of other trades. Secure the casework in place in true alignment, level, and plumb. Secure units with screws through backs to cleats that have been anchored to building structure with toggle or expansion bolts.

Do not install building construction materials that show visual evidence of biological growth.

3.1.1 Wall Hung Cabinets

Install wall-hung cabinets to support the weight of the cabinets plus the normally expected weight of the contents of the cabinets. Space fasteners 300 mm 12 inch on center using at least three bolts in each 900 or 1200 mm 3 or 4 foot unit width. Join adjacent cabinets in an assembly together at top and bottom with inconspicuous bolts or clips. Seal joints between the casework and wall surfaces which are not larger than the joints between casework sections with sealant conforming to ASTM C920, Type M, Grade NS, Class 25, Use NT. Close larger joints with filler strips of the same material and finish as adjacent casework. Cut filler strips to the contour of the wall surface and secure to the casework with concealed nails or screws. Use filler strips no wider than 150 mm 6 inch.
3.1.2 **Floor Mounted Cabinets**

Set floor-mounted metal cabinets on a common metal base or integral base, in assemblies up to 1800 mm (6 feet) in length in rooms having concrete or resilient flooring. Bolt cabinets to bases at cabinet corners. Face metal bases with resilient material to match wall base in space where the cabinets are located. Fasten together adjoining cabinets at top and bottom of front and back with bolts placed inconspicuously inside cabinets. Set metal cabinets in rooms having terrazzo or ceramic-tile floors on concrete or masonry bases with exposed faces finished the same as other bases in the room. Seal flush openings between cabinet and wall surfaces, due to irregularity of surfaces, with Type S or M, Grade NS, Class 12.5, use NT, conforming to **ASTM C920**. Close exposed-to-view openings larger than joints in tile work with filler or scribing strip of the same material and finish as adjacent casework. Cut filler to contour of wall surface and secure to casework with concealed sheet-metal screws. Use minimum width and number of fillers consistent with need and do not use filler exceeding 150 mm (6 inch) in width.

3.1.3 **Countertops**

Height of counter tops as indicated. Where required, provide toe space at front of cabinets by installing front face of cabinets 75 mm (3 inch) in front of face of base. Where toe space is not required, face of base and cabinets must be flush. Bases must have a height of approximately 100 mm (4 inch). Install all items as required for proper operation in accordance with the manufacturer's directions.

3.2 **INSPECTION AND CLEANING**

Inspect placed items for proper location, fastening, connection to utilities, operation, and for damage which may have occurred during installation. Put each item into service to prove proper operation. Correct defects disclosed during inspection. Clean cabinets and countertops in accordance with manufacturer's instructions.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of
the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

36 CFR 1191 Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Architectural Barriers Act (ABA) Accessibility Guidelines

1.2 SUSTAINABILITY REPORTING

Materials in this technical specification may increase contract compliance with sustainability requirements.

**************************************************************************

NOTE: The bracketed items are representative of LEED material documentation and requirements that may apply to this project. These items should be edited to reflect the project requirements.

**************************************************************************

1.2.1 EPA Comprehensive Procurement Guidelines

See Section 01 33 29 SUSTAINABILITY REPORTING for requirements associated with EPA-designated products.

1.2.2 USDA Biobased

See Section 01 33 29 SUSTAINABILITY REPORTING for requirements associated with USDA Biobased products.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Installation Drawings; G[, [____]]

Detail Drawings; G[, [____]]

Custom Graphics Drawings; G[, [____]]
1.4 QUALITY CONTROL

Comply with 36 CFR 1191 Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Architectural Barriers Act (ABA) Accessibility Guidelines for installed entrance floor mats and frames. Ensure that entrance floor mats and frames are slip-resistant in accordance with ASTM D2047, with a minimum 0.60 coefficient of friction, for accessible routes and are structurally capable of withstanding a [uniform floor load of 14 kPa 300 lb/sq ft][wheel load of 160 kg/wheel 350 lb/wheel]. Ensure that flammability is in accordance with ASTM E648, Class 1, Critical Radiant Flux, minimum 0.45 watts/square centimeter.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the project site in their original packages or containers bearing labels clearly identifying the manufacturer, brand name, and quality or grade.

Store materials in their original unbroken packages or containers in the area in which they will be installed. Unwrap, inspect, and place mats at indicated locations. Remove all excess packing materials.

PART 2 PRODUCTS

2.1 MANUFACTURED UNITS

2.1.1 Entrance Floor Mats and Frames

Submit the manufacturer's catalog data. Submit samples of assembled sections of floor mats showing corners, intersections, and other details of construction. Submit samples of custom graphics, exposed floor mats, frame
finishes and accessories.

2.1.1.1 Resilient-Link Mats

Provide [rubber][vinyl][rubber-tire] resilient-link mats, [9.5][11] mm [3/8][7/16] inch thick with [galvanized-spring][stainless] steel wire link rods. Ensure that nosing is vulcanized and [beveled for surface installation extending approximately 50 mm 2 inches around the perimeter][square for recess or mats butted one to another]. Provide mats with steel-reinforced end trim that is [close-weave with link openings of 1.6 mm by 12 mm 1/16 inch by 1/2 inch][open-weave with link openings of 38 mm by 12 mm 1 1/2 inches by 1/2 inch].

2.1.1.2 [Rubber][Vinyl] Mats

Provide mats [6.4][9.6][1.6][_____] mm [1/4][3/8][1/16][_____] inches thick with [square edges for recessed installations][beveled edges for surface applications]. Provide mats with [solid sheet (no perforations) style][perforated style, 6 mm 1/4-inch diameter on standard spacing] [perforated style, 5 mm by 19 mm 3/16 inch by 3/4 inch on standard spacing][standard pyramid design with knob back][standard wide-wale corrugated][hi-rib, narrow-wale corrugated] top profile and [low-rib, narrow-wale corrugated][standard knob-base][flat-base] bottom surface. Ensure that mats are made of a nonslip prime-quality compound free of calendaring and curing defects, and resistant to weather aging and ozone in normal concentrations.

2.1.1.3 Coco Mats

********************************************************************************
NOTE: Coco (also spelled cocoa) matting makes ideal scraper mats, which effectively remove dirt, debris and moisture from shoes.
********************************************************************************

Provide coco brush mats made of high-quality coir yarn from coconut husk fibers. Secure mats with a heavy-duty vinyl backing, woven tightly together and securely bound around the perimeter with matching coir yarn rope. Overall thickness is [16][19][25][32] mm [5/8 inch][3/4 inch][1 inch][1 1/4 inches].

2.1.1.4 Recycled Rubber Tire [Tiles][Mats]

Provide recycled rubber tire [tiles] [mats] that are made from recycled truck, bus and aircraft tires, with sidewall cords and are buffed to a chenille finish. Ensure that the [tiles] [mats] are bonded to a woven flexible backing to form 9.5 to 11.1 mm 3/8- to 7/16-inch-thick [300 mm 12-inch-wide tiles][300 mm 12-inch-wide rolls up to 7.5 m 25 feet long].

2.1.1.5 Carpet-Type Mats

Provide a [nylon][polypropylene][olefin][polyester][_____] carpet bonded to a 3 mm to 6 mm 1/8-inch to 1/4-inch-thick, flexible vinyl backing to form mats that are [9.5][11] mm [3/8][7/16] inch thick with nonraveling edges.

2.1.1.6 Loop Filament Mats

Provide loop filament vinyl material [9.5][13] mm [3/8][1/2] inch thick, with [solid vinyl sheet] [foam sheet] backing. Ensure that chemical agents
are built into the backing to reduce fungus and mildew.

2.1.1.7 Roll-Up Mats

Provide roll-up mats with [mill finish] [[clear][bronze]] [black] [anodized] [_____] aluminum tread rails spaced a maximum 51 mm 2 inches on center and running counter to the traffic flow. Ensure that the mats must allow debris to fall to subfloor. Ensure that tread rails are connected by [aluminum] [vinyl] hinges and include [an aluminum] [a vinyl] edge around the perimeter and a continuous vinyl cushion.

Provide [recessed] [surface] mats mounted with [carpet consisting of nylon or polypropylene carpet fibers fusion-bonded to a rigid two-ply backing to prevent fraying and supplied in continuous splice-free lengths. Carpet has antistatic and antistain treatments] [carpet/bristle filament mix] [abrasive tape] [poured abrasive] [recycled rubber] [serrated aluminum] [_____] inserts.

2.1.1.8 Floor Grids

Provide a floor grid consisting of a series of [aluminum][bronze] tread rails spaced [38] [_____] mm [1 1/2] [_____] inches on center and running counter to the traffic flow. Ensure that floor grids allow debris to fall to the subfloor. Provide a [drain pan] [trench drain] [_____] deep. Rest grid assemblies on a continuous vinyl cushion mounted to each continuous foot at [_____] on center. [Ensure that pits are [_____] deep and rest on a continuous vinyl cushion with additional support members [_____] on center, including adjustable support legs.] [Provide a drain pan to include a drain and a stainless-steel strainer.] For a [stainless-steel grid, provide satin-finished stainless-steel rails [_____] apart, electronically welded joints, and a stainless-steel frame [_____] deep.] Provide all anchors, fasteners, accessories, and other parts required for a complete installation.

2.1.1.9 Frames

[Provide surface-mounted frames that have a tapered flexible vinyl edge at least [50][38] mm [2][1 1/2] inches wide, with welded corners and attached to the mat at all four edges.] [Ensure that surface-mounted frames are tapered, at least [2][1 1/2] inches wide, screwed into an opening in the floor to create an opening for the mat to sit in.] [Provide recessed frames in extruded aluminum Alloy 6061-T6 or Alloy 6063-T5 ASTM B221M ASTM B221. Ensure that the frame depth accommodates the mat and system specified.] Frame color is [mill finish] [clear] [black] [[light] [medium] [dark] bronze] [____]. Ensure that edge-frame members are fabricated in single lengths or with the fewest pieces possible, with hairline joints equally spaced and pieces spliced together by straight connecting pins. Ensure that any concealed surfaces of aluminum frames that contact cementous material are coated with the manufacturer's standard protective coating. Ensure that frames include accessories and devices required for a complete installation.

2.1.1.10 Tread Insert Options

**************************************************************************
NOTE: Tread inserts are to be specified with floor grid systems or frames provided in two previous paragraphs.
**************************************************************************
Provide tread inserts consisting of [carpet composed of solution-dyed nylon or polypropylene carpet fibers fusion-bonded to a rigid two-ply backing to prevent fraying and supplied in continuous splice-free lengths; carpet has antistatic and antistain treatments. Ensure that pile weight is a minimum 30 ounces per square yard] [carpet/bristle filament mix] [vinyl] [abrasive tape] [poured abrasive] [recycled rubber] [serrated aluminum] [_____].

2.1.2 Adhesives and Concrete Primers

Provide adhesives and concrete primers, where required, according to the manufacturer's recommendations.

2.1.3 Graphics

Clearly illustrate details in drawing of custom graphic [emblem] [logo][design].

2.1.4 Color and Size

Ensure that color is in accordance with [Section 09 06 00 SCHEDULES FOR FINISHES][the drawings][____]. Ensure that the size of mat is [____][as indicated].

PART 3 EXECUTION

3.1 EXAMINATION

Comply with the manufacturer's requirements for substrates and floor conditions affecting installation of floor mats and frames. Ensure that all unsatisfactory conditions have been corrected before installation.

3.2 INSTALLATION

Submit detail drawings, and custom graphics drawings as required. Provide installation drawings. Provide the manufacturer's protection, maintenance, and repair information.

Install floor mats and frames according to manufacturer's instructions. Set mat tops at the height recommended by the manufacturer for the most effective cleaning action. Provide clearance between bottoms of doors and tops of mats. [Coordinate recess frame installation with concrete construction to ensure that frame anchorage is correct and that the base is level and flat. Install grout and fill around frames and, if required to set mat tops at proper elevations, in recesses under mats. Finish grout and fill smooth and level.]

Furniture, Fixtures and Equipment (FF&E) Package

-- End of Section Table of Contents --
NOTE: Use this specification for new construction and building renovation projects for Army and Air Force projects. This specification is not typically used for Navy projects, but if the Army is administering a project for the Navy this specification can be used but must be coordinated through the Navy representatives and Navy Interior Designers for Navy specific requirements. Use this specification only when it has been determined by the Government that the Contractor will be responsible for the purchase and installation of the furniture. This specification can also be used for furniture purchases that are not associated with building construction. Following are exceptions:

- Do not use this specification for Army projects in which the U.S. Army Corps of Engineers Huntsville Engineering and Support Center (HNC) will be purchasing and installing the furniture.

Furniture is not purchased with building construction funds. O&M funding is typically used; coordinate funding source with Government. Since other than building construction funding is used, a separate line item for the FF&E purchase and installation is required on the project Contract Line Item Number (CLIN) Bidding Schedule in the specifications to track different funding sources. Coordinate funding sources with the Government Project Manager. Coordinate the CLIN Schedule requirements with the Contracting Officer, Government Project Manager and Project Specification Editor. If a project also includes System Furniture, Section 12 59 00, include it as part of the FF&E line item on the CLIN Bidding Schedule.

NOTE: This Guide Specification covers the requirements for furniture and furniture installation.
NOTE: Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

**************************************************************************

PART 1   GENERAL

**************************************************************************

NOTE: The FF&E Package must be attached and be designed in accordance with the Government Scope of Services document. The FF&E Package must comply with the Federal Acquisition Requirements (FAR), Buy American Act (BAA), User Requirements and Government Contracting Office's procurement methodology. Coordination is required with the Government Contracting Office to insure that the FF&E Package is procurable.

The FF&E Package furnishings order form contains ordering information, such as but not limited to description, size, finish and fabric information (see Government Scope of Services for more information). The description must include and identify minimum product requirements, be non-proprietary and contain project specific salient characteristics. This information must be sufficient so the Contractor understands the design and furniture intent and furniture minimum requirements. Dependent on the project Scope of Services this form may have different names, for example: data sheet, furniture data sheet, specification sheet or procurement information.

Do not include a cost estimate or furniture item costs in the FF&E Package included in the construction contract documents. Provide copies of the cost estimate for the project design reviews as required by the Government.

For coordination purposes with the other design disciplines (architectural, electrical, mechanical, etc.) include the furniture drawings in the building construction contract drawing set. Also include the furniture drawings in the FF&E binder for the project design review submittals as required by the
Government.

Provide information on existing furniture to be reused and not reused in the FF&E if required for project. See paragraph titled EXISTING FURNITURE in Part 1 of this specification for more information.

Various provisions of this guide specification may be irrelevant to or in conflict with the requirements of any given project. This spec should be carefully edited to fit the needs of each specific application. Portions must be deleted, if not applicable, and additional material inserted where necessary to adequately delineate requirements. Brackets and blanks identify provisions which involve alternates; the editor must select and/or insert the appropriate requirements.

Purchase and install furniture as identified within this specification. This specification section includes a Furniture, Fixtures and Equipment (FF&E) Package attachment.[

The requirements of this specification also apply to systems furniture unless otherwise specified in Section 12 59 00 Systems Furniture.]

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor’s Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for
Codes following the "G" typically are not used for Navy and Air Force projects.
