Clean and prime exposed aluminum surfaces. Provide a [baked enamel finish in accordance with AAMA 2603 with total dry film thickness not less than 0.02 mm 0.8 mil] [superior performance finish in accordance with AAMA 2605 with total dry film thickness of not less than 0.03 mm 1.2 mils].

2.6 SOURCE QUALITY CONTROL

2.6.1 Window Assembly Structural Test

2.6.1.1 Test Sample Number

At least two sample window assemblies for each type of window provided must be tested, under an increasing uniform static load. Number of samples, beyond two, is left up to the vendor. However, it is noted that the acceptance criteria encourages a larger number of test samples.

2.6.1.2 Test Procedure

NOTE: To assure receiving the desired blast resistance protection, window assemblies provided by Contractor must be exactly as specified. If deviations from the specified requirements are sought by the Contractor, the Contractor must perform acceptance testing for the provided blast resistant window assemblies.

Test windows (glass panes and support frame) must be identical in type, size, sealant, gasket or bead and construction to those furnished by the window manufacturer. The frame assembly in the test setup must be secured by boundary conditions that simulate the adjoining walls of the structure for intended installation. The simulation securing boundary conditions must be verified and attested by an attending Professional Engineer. Using either a vacuum or a liquid-filled bladder, an increasing uniform load must be applied to the entire window assembly (glass and frame) until failure occurs in either the glass or frame. Failure must be defined as either breaking of glass or loss of frame resistance. The failure load, rf, must be recorded to three significant figures. The load should be applied at a rate of 0.5 ru per minute where ru is the static design resistance:

<table>
<thead>
<tr>
<th>Glass Size</th>
<th>Static Design Resistance</th>
</tr>
</thead>
<tbody>
<tr>
<td>[<em><strong>] by [</strong></em>] mm [<em><strong>] by [</strong></em>] inch</td>
<td>[<em><strong>] kPa [</strong></em>] psi</td>
</tr>
</tbody>
</table>
2.6.1.3 Acceptance Criteria

The static load capacity (rs) of a glass pane for the specified acceptance test procedure is:

\[ rs = 0.876 \text{ ru} \]  

(1)

The window assembly (frame and glass) is considered acceptable when the arithmetic mean of all the samples tested, r-, such that:

\[ r- \Rightarrow rs + sA \]  

(2)

where: \( rs \) = static load capacity of the glass pane for certification testing  
\( s \) = sample standard deviation  
\( A \) = acceptance coefficient (Table 1)

a. Arithmetic mean/standard deviation: For n test samples, r- is defined as:

\[ r- = \frac{\text{sum from } i = 1 \text{ thru } n \text{ for } rfi}{n} \]  

(3)

where rfi is the recorded failure load of the ith test sample.

The sample standard deviation, s, is defined as:

\[ s = \sqrt{\frac{\text{sum from } i = 1 \text{ thru } n \text{ for } (rfi - r-2)}{n - 1}} \]  

(4)

The minimum value of the sample standard deviation, s, permitted to be employed in Equation (2) is:

\[ s = 0.145 \text{ } rs \]  

(5)

This assures a sample standard deviation no better than observed for the general population of tempered glass.

b. Additional sampled determination: The following equation can be used by tester to determine if additional test samples are justified. If:

\[ r- \leq rs + sB \]  

(6)

then with 90 percent confidence, the design will not prove to be adequate with additional tests. Obtain rejection coefficient, B, from Table 1.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Method of Installation

Install in accordance with the window manufacturer's printed instructions and details. Set windows at proper elevation, location, and reveal. Brace properly to prevent distortion and misalignment. Bed screws or bolts in sill members, joints at mullions, contacts of windows with sills, built-in fins, and subframes in mastic sealant of a type recommended by the window manufacturer. Install windows in a manner that will prevent entrance of water. Fasten hardware to windows.

3.1.2 Glass Setting

Items to be glazed must be either shop or field glazed using glass of the quality and thickness specified or indicated. Preparation and glazing, unless otherwise approved, must conform to applicable recommendations in the GANA Glazing Manual. Windows may be glazed in conformance with one of the glazing methods described in the standards under which they are produced, except that face puttying with no bedding will not be permitted. Handle and install glazing materials in accordance with manufacturer's instructions. Use beads or stops furnished with items to be glazed, to secure glass in place.

3.1.3 Dissimilar Materials

Where aluminum surfaces are in contact with, or fastened to, masonry, wood, or dissimilar metals, except stainless steel or zinc, the aluminum surface must be protected from dissimilar materials as recommended in the Appendix to AAMA/WDMA/CSA 101/I.S.2/A440. Do not coat surfaces on which sealants are to adhere.

3.1.4 Anchors and Fastenings

Make provision for securing units to each other and to adjoining construction.

3.1.5 Adjustments After Installation

After installation of windows and completion of glazing and field painting, adjust ventilators and hardware to operate smoothly and to provide weathertight sealing when ventilators are closed and locked. Lubricate hardware and operating parts as recommended by the manufacturer.
3.2 CLEANING

Clean interior and exterior surfaces of window units of mortar, plaster, paint spattering spots, and other foreign matter to present a neat appearance, to prevent fouling of weathering surfaces and weatherstripping, and to prevent interference with the operation of hardware. Remove stained, discolored, or abraded windows that cannot be restored to their original condition, and replace with new windows.

3.3 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of English unit measurements, and not on metric measurements commonly agreed to by the manufacturers or other parties. The English and metric units for the measurements shown are as follows:

NOTE: This guide specification covers the requirements for detention steel cell windows.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The following information shall be shown on the project drawings:

1. Jamb, head and sill sections.
2. Method of anchoring and spacing; type of anchor.
3. Window elevations and dimensions.
4. Type of glazing.
5. Elevations above finished floor.
6. Details of non-structural mullions and mullion covers.
PART 1   GENERAL

1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASTM INTERNATIONAL (ASTM)

ASTM A239  (2021) Standard Practice for Locating the Thinnest Spot in a Zinc (Galvanized) Coating on Iron or Steel Articles

Tool-Resisting Steel Bars, Flats, and Shapes for Detention and Correctional Facilities

ASTM A653/A653M (2023) Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

STEEL WINDOW INSTITUTE (SWI)

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Window Units

Indicate the elevations of windows, half-size sections, thicknesses and gages of metal, fastenings, proposed method of anchoring, the size and spacing of anchors, details of construction, method of glazing, mullion details, casings, sills, trim, other related items, and installation details.

SD-03 Product Data

Fasteners

Accessories

Include finishes.

SD-06 Test Reports

Air Infiltration

Water infiltration

Mullion and Transom Bar Wind Load

1.3 QUALITY ASSURANCE

The requirements specified in this section govern where there is a difference between this section and the referenced industry specifications.
1.3.1 Test Reports

1.3.1.1 Air and Water Infiltration Tests

ASTM E283 and ASTM E331. Air infiltration shall not exceed 0.8 L/s per meter one-half cubic foot per minute per foot of crack length when subjected to a static pressure of 75 Pa 1.56 pounds per square foot (equivalent to a wind velocity of 40 km/hr 25 miles per hour). The amount of water infiltration shall be "zero" when tested in accordance with ASTM E331.

1.3.1.2 Mullion and Transom Bar Wind Load Tests

**********************************************************************************************************************************************
NOTE: Specify wind loading requirements in areas subject to high wind velocities in excess of 110 km/hr 70 MPH; otherwise delete. The wind loading of 960 Pa 20 psf is based on a 145 km/hr 90 mph wind velocity at 61 m 200 feet above grade.
**********************************************************************************************************************************************
**********************************************************************************************************************************************
NOTE: Delete when not applicable.
**********************************************************************************************************************************************

ASTM E330/E330M. Members shall withstand a uniform wind load of 960 Pa 20 pounds per square foot of window area without deflecting more than 1/175 of the span.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver windows to project site in an undamaged condition. Store windows and components at the site on edge, out of contact with the ground, and under a weathertight covering.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Steel Bars

SWI AGSW.

2.1.2 Sheet Steel

ASTM A1011/A1011M.

2.1.3 Zinc-Coated Sheet Steel

ASTM A653/A653M.

2.1.4 Zinc-Coated Steel

ASTM A90/A90M, ASTM A123/A123M or ASTM A153/A153M.

2.1.5 Corrosion Resisting Sheet Steel

ASTM A167.
2.1.6 Screws and Bolts

ASTM B766 or ASME B18.6.3, as applicable.

2.2 WINDOW UNITS

Units shall conform to the SWI AGSW, except as modified herein.

2.3 FABRICATION

Form permanent joints by welding or by mechanically fastening as specified [for each type window]. Use joints of strength required to maintain the structural value of members connected. Weld joints solid, remove excess metal, and dress smooth on exposed and contact surfaces. Closely fit joints formed with mechanical fastenings and make permanently watertight. Assemble frames at the plant, and ship as a unit with hardware unattached.

2.3.1 Window Sections

Where fixed window sections adjoin, provide a fixed sash, fabricated from similar frame members and of the manufacturer's standard type suitable for the purpose. [Roll weathering surfaces integrally to provide two-point, parallel-surface contact with an overlap at both inside and outside points of closure.]

2.3.2 Drainage Holes

Provide drips and weep holes, as required, to return water to outside, minimum of two per window.

2.3.3 Fasteners

Use flat or oval head spanner, twist-off or safety head screws and bolts with standard threads on windows, trim and accessories. Self tapping sheet-metal screws are not acceptable.

2.3.4 Fastener Finish

Fabricate windows with hot-dipped galvanized finish, using stainless steel or hot-spun galvanized steel fasteners. Use heavily cadmium plated steel fasteners for windows with painted finish or electrogalvanized in accordance with ASTM A239. Finish exposed heads of fasteners to match finish of windows.

2.3.5 Frames

Form frames from low carbon steel not less than 12 U.S. gage. Frames shall be one piece, channel shaped sections, at each jamb and between jamb at head and sill. Cope or miter and weld frame members at corners full depth of the frame for maximum strength and weathertightness; dress exposed welds smooth. Provide frame members with dimensions and profiles indicated. Provide 20 by 57 mm 3/8 by 2 1/4 inch, tool resistant steel flats conforming to ASTM A627, penetrated by 22 mm 7/8 inch tool-resistant steel rounds conforming to ASTM A627 in frame members.

2.4 PROVISIONS FOR GLAZING

Design for outside single glazing and for securing glass with metal beads and glazing compound. Glazing specified in Section 08 88 53 DETENTION AND
SECURITY GLAZING.

2.5 SCREENS

Provide manufacturer's standard screens for window units with movable sash, galvanized frame.

2.6 ACCESSORIES

Provide windows complete with necessary hardware, fastenings, clips, fins, anchors, glazing beads, and other appurtenances necessary for complete installation of windows.

2.7 ANCHORS

Use hot-dip, zinc-coated steel anchors of the type indicated or specified. Use cadmium or zinc-coated nuts, bolts, and other fasteners for ferrous material.

2.8 SHOP PRIMED FINISH

After fabrication, clean surfaces of windows, fins, mullions, cover plates [and screen frames], provide a hot-dip galvanized, phosphate-treated and shop primed finish. The methods of cleaning, chemical treating, galvanizing, and painting shall conform to SWI AGSW. Windows shall receive finish paint coats as specified in Section 09 90 00 PAINTS AND COATINGS.

PART 3 EXECUTION

3.1 INSTALLATION

Install windows in accordance with the manufacturer's printed instructions and details, except as specified otherwise in this section. Build in windows as the work progresses. Set windows at indicated elevation, location, and reveal. Set plumb, square, level, and in alignment. Brace, strut, and stay to prevent distortion and misalignment.

3.2 ANCHORS AND FASTENINGS

Place anchorage as wall construction progresses. Build in anchors or bolt anchors and fastenings to the jambs of openings and weld securely to the windows or frames and to the adjoining construction. Space anchors not more than 400 mm 16 inches apart on jambs, and install a minimum of four anchors on each side of each opening. Anchors and fastenings shall have sufficient strength to hold the member firmly in position.

3.3 SEALANTS

Section 07 92 00 JOINT SEALANTS.

3.4 CLEANING

Clean metal surfaces of windows, inside and outside, of mortar, plaster,
paint, and other foreign matter to present a neat appearance and to prevent fouling of weathering surfaces. Clean and touch-up abraded surfaces of steel windows. Replace stained, discolored, or abraded windows that cannot be restored to their original condition with new windows.

NOTE: This guide specification covers the requirements for skylights and translucent panels manufactured from glass-fiber or thermoplastic polycarbonate.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 SUMMARY

Provide commercially available [roof windows] [unit skylights [flat glass] [domed] [pyramidal] [vaulted]] [metal or wood framed skylights] which satisfy all requirements contained in this section and have been verified by load testing and independent design analyses (if required) to meet specified design requirements. Provide UV-stabilized, shatterproof and energy efficient skylight systems. Provide light transmitting plastics in the manufacturing of skylights for daylighting applications. Systems must meet requirements of UFC 4-010-01.

1.2 REFERENCES
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ALUMINUM ASSOCIATION (AA)

AA DAF45 (2003; Reaffirmed 2009) Designation System for Aluminum Finishes

AMERICAN ARCHITECTURAL MANUFACTURERS ASSOCIATION (AAMA)

AAMA 611 (2014) Voluntary Specification for Anodized Architectural Aluminum

ASTM INTERNATIONAL (ASTM)

ASTM C297/C297M (2016) Flatwise Tensile Strength of Sandwich Constructions

ASTM D1002 (2010; R 2019) Apparent Shear Strength of Single-Lap-Joint Adhesively Bonded Metal Specimens by Tension Loading (Metal-to-Metal)

ASTM D1003 (2013) Haze and Luminous Transmittance of Transparent Plastics

ASTM E72 (2022) Conducting Strength Tests of Panels for Building Construction

ASTM E661 (2022) Standard Test Method for Performance of Wood and Wood-Based Floor and Roof Sheathing Under Concentrated Static and Impact Loads
1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Systems

Qualifications

1.4 QUALITY ASSURANCE

a. Provide documentation of Qualifications for the following: The manufacturer is a company specializing in the manufacture of the specified products with a minimum of [5] [10] years documented experience. The installer has documented experience of [5] [_____] years minimum performing the work specified.

b. Before fabrication, provide a full service mock-up of [each type of
skylight] [one skylight unit] [_____] complete with glass and AAMA certification label for structural purposes and NFRC temporary and Permanent Label for certification of thermal performance rating for review of skylight construction and quality of hardware operation. Glass and glaze in conformance with the applicable requirements of Section 08 81 00 GLAZING.

1.5 DELIVERY, STORAGE, AND HANDLING

Provide factory assembled system modules to the greatest extent possible. Ship panels to the jobsite in rugged shipping units, ready for erection. Affix conspicuous decals on all skylights warning individuals against sitting or stepping on the units. Store skylight panels on the long edge, several mm inches above the ground, blocked and under cover to prevent warping. Deliver unit skylights in manufacturer's original containers, dry, undamaged, with seals and labels intact. Delivered, store and protect all products in accordance with manufacturer's recommendations.

1.6 WARRANTY

Provide the manufacturer's complete warranty for materials, workmanship, and installation. The warranty is for [5] [_____] years from the time of project completion and with no proration. The warranty must guarantee, but not be limited to, the following:

a. [No change in light transmission and color of the panels after exposure to heat of 149 degrees C 300 degrees F for 25 minutes. ][In accordance with ASTM D2244, panels do not darken more than 3.0 Delta E units after 5 years of outdoor weathering in South Florida at 45 degrees facing south. Document compliance with this requirement in submitted Test Reports.]

b. There is no delamination of the panel affecting appearance, performance, weatherability or structural integrity of the panels or the completed system.

c. There is no fiberbloom on the panel face.

d. Change in light transmission of no more than 6 percent in accordance with ASTM D1003, and in color (yellowing index) no more than 10 points in comparison to the original specified value over a 10 year period.

e. Provide a single source warranty for the glazing panels and the framing system. Third party warranty for the glazing panels will not be accepted.

PART 2 PRODUCTS

2.1 [SKYLIGHTS][ AND ][TRANSLUCENT PANELS]

**************************************************************************

NOTE: A polyvinyl fluoride film coating may be specified for the exterior surface of skylight panels when longer wearability is considered necessary. For fire rated construction, panels with fire ratings consistent with the overall construction of the building should be specified. Retain appropriate bracketed statements and corresponding paragraphs below and delete the others.
The designer must consider the differences and performance characteristics of the two materials: glass-fiber reinforced polyester and extruded cellular thermoplastic polycarbonate before making the selection to meet specific project requirements.

When editing this section and developing details for skylight systems, Designer must ensure systems meet requirements of UFC 4-010-01.

Fabricate skylight panels of [glass-fiber reinforced polyester] [or] [extruded cellular thermoplastic polycarbonate] panels conforming to the specified requirements and other appropriate lab test specified criteria, weighing not less than 2.4 kg/square meter 8 ounces/square foot. Submit certified Test Reports from independent testing laboratory for each type and class of panel system. Reports must verify that the material meets specified performance requirements. Previously completed test reports will be acceptable if they are current and indicative of products used on this project. Where a Class A, B or C roof is part of the project, provide a listing certificate for roof covering systems category certifying that the product complies with the safety standards of ASTM E108 and ICC IBC. Size and color of skylight panels as indicated.

2.2 GLASS-FIBER PANELS

 Provide glass-fiber reinforced polyester panels conforming to ASTM D3841, Class [_____] and to the requirements of AAMA/WDMA/CSA 101/I.S.2/A440.

2.2.1 Weatherability

Provide the exposed faces of fiberglass sandwich type panels with a permanent glass veil erosion barrier embedded integrally to provide maximum long term resistance to reinforcing fiber exposure. The exterior face sheet must be uniform in strength and resistant to penetration by pencil point.

2.2.2 Non Combustible Grid Core

Use 6063-T6 aluminum I-beams with provisions for mechanical interlocking of muntin-mullion and perimeter to prevent high and low intersections which do not allow full bonding surface to contact with face material. I-beam width no less than 11 mm 7/16 inch. Machine I-beam grid to tolerances of not greater than plus or minus 0.05 mm 0.002 inch for flat panels. Panels must withstand 650 degrees C 1200 degrees F fire for a minimum of one hour without collapse or exterior flaming.

2.2.3 Adhesive

Use heat and pressure resin-type laminate adhesive engineered for structural sandwich panel use; which passes testing requirements specified by the International Conference of Building Officials' "Acceptance Criteria for Sandwich Panel Adhesive". Provide with the following minimum strength:

a. Tensile Strength of 5.2 MPa 750 psi in accordance with ASTM C297/C297M after two exposures to six cycles each of the aging conditions prescribed in ASTM D1037.
b. Shear Strength, after exposure to five separate aging conditions in accordance with ASTM D1002:

(1) 3.7 MPa 540 psi at 50 percent relative humidity and 23 degrees C 73 degrees F.

(2) 5.5 MPa 800 psi under accelerated aging in accordance with ASTM D1037 at room temperature.

(3) 1.7 MPa 250 psi under accelerated aging in accordance with ASTM D1037 at 83 degrees C 182 degrees F.

(4) 9.7 MPa 1400 psi after 500 hour Oxygen Bomb in accordance with ASTM D572.

(5) 690 kPa 100 psi at 83 degrees C 182 degrees F.

2.2.4 Panel Construction

**************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements. Where it is confirmed panels are readily available with aluminum containing recycled content, include the last bracketed sentences.

**************************************************************************

Provide panels consisting of fiberglass faces laminated to an aluminum I-beam grid core and deflecting no more than 48 mm 1.9 inches at 147 kg per square meter in 3 m 30 psf in 10 feet in accordance with ASTM E72, without a supporting frame. Include manufacturing facilities, sandwich panel components and production sandwich panels in the quality control inspections and required testing, conducted at least once each year, for conformance with ICC-ES AC04 or equivalent. [Provide aluminum framing materials with a minimum recycled content of 20 percent. Provide data identifying percentage of recycled content for aluminum framing materials.]

2.3 THERMOPLASTIC POLYCARBONATE PANELS

Manufacture systems from translucent polycarbonate panels designed for architectural applications. Provide panels consisting of a polycarbonate resin with a permanent, co-extruded, ultra-violet protective layer; co-extruded by the manufacturer during the original extrusion of the panel a permanent part of the exterior and interior layers. Pot-applied coatings or films of dissimilar materials are unacceptable. Provide panel width not to exceed 600 mm 2 feet to ensure best performance for wind uplift, vibration, oil canning and visual appearance. Meet the following manufacturing requirements:

a. Extruded in one single formable length. Transverse sections are unacceptable. Manufacture the panels with upstands which are integral to the unit, and with the upstands 90 degrees to the panel face (standing seam dry glazed concept). Welding or gluing of upstands or standing seam is unacceptable.

b. Provide dry glazed profiles mullions, using no sealant, welding,
adhesives or gaskets; thermally break mullions continuous for panel length.

c. For structural performance, the use of adhesives, plastic or sonic welding or sealant is not allowed.

d. For longevity, the minimum ratio of panel weight to thickness must be [2.44 kg/m$^2$ for 10 mm 0.5 psf for 0.4 inch] [3.3 kg/m$^2$ for 16 mm 0.68 psf for 0.63 inch] [4.4 kg/m$^2$ for 55, 75 and 100 mm double glazed 0.91 psf for 2.2, 3, and 4 inch double glazed] thick panel.

e. Extruded panel includes integral extruded multi-cells, and truss-like structural core for resistance to buckling. Interconnect the panel's exterior skins and space apart by supporting ribs, perpendicular to the skins, at a spacing not to exceed 4 mm 0.16 inches (truss-like construction). In addition, divide the space between the two exterior skins in a cross section by multiple parallel intermediate surfaces, at a spacing not to exceed 4 mm 0.16 inches.

f. Interior flame spread classification is Class [I] [II] in accordance with ASTM E84.

g. Smoke density no greater than 70 in accordance with ASTM D2843.

h. The exterior and interior faces must be an approved light transmitting panel with a CC1 fire rating classification in accordance with ASTM D635.

i. Self-ignition greater than 570 degrees C 1058 degrees F in accordance with ASTM D1929.

j. Fire rated roof assembly translucent panels must be successfully evaluated for fire from exterior exposure in accordance with [ASTM E108 ] [_____] to meet Class [A] [B] [C] rating. Provide panel listed by an independent recognized listing laboratory.

2.4 COMMON PANEL REQUIREMENTS

2.4.1 Appearance

Provide face sheets uniform in color to prevent splotchy appearance and completely free of ridges and wrinkles which prevent proper surface contact. Clusters of air bubbles/pinholes which collect moisture and dirt are not acceptable.

2.4.2 Panel Fabrication

Panel construction must meet the following requirements:

a. Light transmission [_____] percent; color [_____].

b. Assembled panel thickness [_____] mm inches.

c. Grid size [_____] [as indicated].

2.4.3 Thermal Performance

**************************************************************************
NOTE: Skylight properties are critical to energy performance and comfort. Specify low U value rate

SECTION 08 60 45 Page 11
of heat transfer) to reduce winter heat loss and low solar heat gain coefficient to reduce summer solar heat gain.

Energy Star labeling is applicable to residential units only. For nonresidential applications, refer to UFC 1-200-02, High Performance and Sustainable Building Requirements, for minimum requirements for energy efficiency and meet minimum building envelope requirements of UFC 3-101-01 including fenestrations and glazing.

Select the performance requirements for non-residential skylights and the residential skylights.

**************************************************************************

Provide non-residential skylights (including frames and glass) certified by the National Fenestration Rating Council with a whole-unit Solar Heat Gain Coefficient (SHGC) maximum of [_____] determined according to NFRC 200 procedures and a U-factor maximum of [_____] W/m2-KBtu/hr-ft2-F in accordance with NFRC 100.

Provide residential skylights (including frames and glass) that are Energy Star labeled products for the [Northern] [North-Central] [South-Central] [Southern] climate zone, or have the following performance characteristics:

Southern climate zone, thermal properties of windows must not exceed a U-factor of 0.60 determined according to NFRC 100, and a solar heat gain coefficient (SHGC) not exceeding 0.28 determined according to NFRC 200.

South-Central climate zone, thermal properties of windows must not exceed a U-factor of 0.53 determined according to NFRC 100, and a solar heat gain coefficient (SHGC) not exceeding 0.28 determined according to NFRC 200.

North-Central climate zone, thermal properties of windows must not exceed a U-factor of 0.53 determined according to NFRC 100, and a solar heat gain coefficient (SHGC) not exceeding 0.35 determined according to NFRC 200.

Northern climate zone, thermal properties of windows must not exceed a U-factor of 0.50 determined according to NFRC 100.

Provide proof of Energy Star label for residential skylights.

2.4.4 Condensation Index Rating

**************************************************************************

NOTE: Determination of the resistance of the skylight unit to the formation of condensation in any form, referred to as the Condensation Index, should be accomplished using the NFRC approved software tool THERM. Refer to paragraph Condensation Index Rating in Section 08 52 00 WOOD WINDOWS for examples and guidance. In addition, the design must meet the requirements of UFC 1-200-02, High Performance and Sustainable Building Requirements, "Moisture Control" and meet minimum building envelope requirements of UFC 3-101-01 "Architecture" including fenestrations and glazing.

**************************************************************************

The condensation index rating must be [_____] as determined using National Fenestration Rating Council approved software THERM.

SECTION 08 60 45 Page 12
2.5 [SKYLIGHT] [AND] [TRANSLUCENT PANEL] SYSTEMS

**************************************************************************

NOTE: A wide variety of skylight configurations, features, fastening systems, and accessories is commercially available. Unique details of the roof system, which could affect the skylight installation, will be shown on the Contract drawings. It is not possible to indicate all possible combinations and selections which may be utilized in adapting this guide specification to a particular project; therefore, careful editing is necessary to assure that the project is properly and adequately specified.

Since the skylight becomes an integral element of the roofing system after installation, it must meet or exceed the roof requirements for fire protection, insulation value, energy efficiency rating, thermal performance, air infiltration, and water penetration. Design must meet the requirements of UFC 1-200-02, High Performance And Sustainable Building Requirements and meet minimum building envelope requirements of UFC 3-101-01 "Architecture" including fenestrations and glazing.

**************************************************************************

Submit manufacturer's certificate that the systems meet or exceed specified requirements. Provide systems evaluated and listed (the whole [skylight][and ][translucent panel] as a unit, not just a glazing material in the unit) by the recognized building code authorities: ICC and SBCCI-Public Safety Testing and Evaluation Services Inc. Product ratings determined using NFRC 100 and NFRC 200 must be authorized for certification and properly labeled by the manufacturer. Provide [skylight][and ][translucent panel] systems meeting the following requirements:

a. Integral perimeter framing system assembly by the manufacturer.

b. Exterior panel faces [crystal] [clear matte] [white] [_____] in color.  Interior panel faces [crystal] [clear matte] [white] [_____] in color.

c. Air infiltration at 75 Pa 1.57 psf less than [0.2] [_____] L/s/m² [0.04] [_____] cfm/ft² and at 300 Pa 6.24 psf less than [0.36][0.5] [_____] L/s/m² [0.07][0.1] [_____] cfm/ft² in accordance with ASTM E283.

d. Water penetration at test pressure of 718 Pa 15 psf equals zero in accordance with ASTM E331.

e. Manufacturer is responsible for maximum system deflection, in accordance with the applicable building code, and without damage to system performance. Calculate deflection in accordance with engineering principles.

f. Incorporate weepage elements within the perimeter framework of the glazing system for drainage of any condensation or water penetration.

g. System must accommodate movement within the system; movement between the system and perimeter framing components; dynamic loading and
release of loads; and deflection of supporting members. Achieve this
without damage to system or components, deterioration of weather seals
and fenestration properties specified.

h. The exterior panel face must repel an impact of [68 N-m 50 foot-pounds
without fracture or tear when impacted by a 83 mm diameter, 2.3 kg 3.25
inch diameter, 5 pound free falling ball dropped from a vertical
distance of 3 m 10 feet] [271 N-m 200 foot-pounds without fracture or
tear when impacted by a 83 mm diameter, 2.3 kg 3.25 inch diameter, 5
pound free falling ball dropped from a vertical distance of 12 m 40 feet]
when tested in accordance with UL 972.

i. Provide system meeting the fall through requirements of 29 CFR 1910.23
as demonstrated by testing in accordance with ASTM E661 or ASTM E695,
thereby not requiring supplemental screens or railings.

**************************************************************************

NOTE: The selection of anodic or organic coating is
based primarily on the desired appearance: anodized
finishes provide a metallic appearance and organic
finishes provide a painted or metal-like finish
(organic finishes are available in a variety of
colors). Only allow both types as a Contractor
option when the Designer confirms that the desired
appearance is available in both types of finishes.

For organic coatings, to provide enhanced resistant
to corrosion, weathering, ozone, and UV radiation
utilize superior performance powder coat finishes
conforming to AAMA 2605 in humid locations and
project locations with an ESC of C3 thru C5; baked
enamel finishes conforming to AAMA 2603 may be
utilized for non-humid locations and ESC C1 or C2
project locations. Humid locations are those in
ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C
(as identified in ASHRAE 90.1). Refer to UFC
1-200-01 for determination of ESC for a specific
project location.

For anodic coatings, specify Architectural Class I
for harsh atmospheres where dust, gases, salts, and
other destructive elements will attack metal
finish. Also specify Class I for humid locations or
project locations with Environmental Severity
Classifications (ESC) of C3 thru C5. Humid
locations are those in ASHRAE climate zones 0A, 1A,
2A, 3A, 3C, 4C and 5C (as identified in ASHRAE
90.1). Specify Architectural Class II for all
atmospheric conditions not requiring Class I.

**************************************************************************

j. Exposed aluminum color must be [a [_____] shade] selected from the
manufacturer's standard range. Provide corrosion resistant [baked-on
enamel coating in accordance with AAMA 2603 with a total dry film
thickness not less than 20 µm 0.8 mil] [superior-performance organic
finish in accordance with AAMA 2605] [with total dry film thickness of
not less than 30 µm 1.2 mils] [anodized finish complying with AA DAF45
and AAMA 611 must be [Architectural Class II (10 µm to 18 µm0.4 mil to
0.7 mil), designation AA-M10-C22-[A31, clear (natural)] [A32, integral
color] [A34, electrolytically deposited color]] [Architectural Class I (}
18 \text{µm} 0.7 \text{mil or thicker}, designation AA-M10-C22-[A41, clear (natural)] [A42, integral color] [A44, electrolytically deposited color] anodized.]

k. Provide a system requiring no scheduled recoating to maintain its performance or for UV resistance.

l. Design criteria:

(1) Wind Load [_____] ; snow load [______].

(2) Frame Blast Loads: Design framing to resist 2.4 kPa 50 pounds per square foot blast load at L/160 deflection.

(3) Anchor Blast Loads: Design anchors to resist 4.8 kPa 100 pounds per square foot blast load.

m. Use 6063-T6 and 6063-T5 extruded aluminum; all fasteners of stainless steel or plated steel.

2.5.1 Glass Glazed Skylights and Roof Windows

Provide roof windows to withstand dead and live loads caused by pressure and uplift of wind acting normal to the plane of roof and tested by an ICC listed, independent testing and quality control inspection agency to an allowable downward pressure of [0.57-8.71] [_____] MPa [12-182] [_____] psf and an uplift pressure of [1.05-5.03] [_____] MPa [22-105] [_____] psf measured in accordance with ASTM E330/E330M, as recommended by the manufacturer for the type of window tested.

2.5.1.1 Fixed Skylight

Fixed skylight featuring a select wood frame, mortise and tenon joints, gaskets to drain any condensation to the outside, a choice of tempered clear, laminated, insulated daylight area. Provide [aluminum] [copper] protective exterior cladding for protection and low profile appearance. The skylight must have a [ventilation flap that opens to allow air circulation and contains a filter within the flap to keep dust and insects out] [ventilating panel and insect screen with an operator hook that allows easy opening and closing, with control rods, for out-of-reach installations or smooth-turning handle for within-reach installation].

2.5.1.2 Emergency Escape and Rescue Roof Window

Emergency escape and rescue roof window which opens [45] [_____] degrees to satisfy egress requirements for emergency escape. When the unit is closed, a ventilation flap can be opened to allow in fresh air. For easy cleaning from inside the room, the sash rotates completely inward. Insect screen and sunscreen accessories are available.

2.5.1.3 Balcony Roof Window Featuring Dual-Sash Operation

The top sash opens for maximum ventilation and also pivots completely inward for easy cleaning from inside the room; the bottom sash opens outward to create a roof balcony. When the window is closed, a ventilation flap allows fresh air circulation. Insect screen and sunscreen accessories are available.
2.5.2 [Plastic Glazed Unit Skylight] [and] [Translucent Panels]

2.5.2.1 Dome

Provide factory assembled dome skylight units each consisting of a single dome or sealed double domes with a 1.5 mm 0.06 inch extruded aluminum frame and 1.5 mm 0.06 inch [sealed double or triple domes with 1.5 mm 0.06 inch extruded aluminum frame with a polyurethane thermal break to prevent condensation on the interior portion of the frame and 1.75 mm 0.07 inch extruded aluminum retainer cap. Submit Manufacturer's descriptive data, catalog cuts and certificate stating that products meet or exceed specified requirements. Provide the skylight with an integral condensation gutter with weep hole slots to provide sufficient drainage to the outside; and [clear] [white] [bronze] [_____] dome. Use the manufacturer's standard for self-flashing domes, the curbs, treated wood nailing, and insulation. Uniform design load capacity of composite dome and frame must meet or exceed [1.9] [1.4] [_____] MPa [40] [30] [_____] psf snow load. Insulated curbs with PVC thermal barriers connecting the top and bottom of the inner and outer walls are available.

2.5.2.2 Pyramid

Pyramid skylights are, for all practical purposes, just a configuration alternative to the dome skylights; the requirements specified above for the domes also apply to the pyramids. Pyramid skylight units are available from 1.2 to 6 m 4 to 20 foot square and can be used for both self-flashing or curb mount installations; 22 and 40 degrees are standard. The maximum horizontal thrust load on the pyramid curb is [0.4 to 1.5 kN 90 to 330 lbs (1 panel per side)] [1.8 to 3.2 kN 410 to 730 lbs (2 panels per side)] [3.8 to 5.8 kN 850 to 1300 lbs (4 panels per side)] depending on size. Pyramids are available in grid and tandem models.

2.5.2.3 Vault

Provide [single] [double] glazed vault skylights; barrel vault height, for low rise vaults, at 10 percent of the vault width, and 50 percent of the vault width for half round vaults; provide outside curbs in accordance with the manufacturer's details. Vaults must support a 1.4 or 1.9 MPa 30 or 40 psf roof snow or live load, and a negative 1.2 MPa 25 psf wind load plus dead load; rafter spacing is determined by load requirements but must not exceed 900 mm 36 inches on center for 1.9 MPa 40 psf and 1200 mm 48 inches on center for 1.4 MPa 30 psf. Provide sill members that are factory slotted at anchors for thermal movement, and weep water infiltration and condensation. Use EPDM gaskets. Ship all units over 2.2 m 87 inches unassembled for access to anchors from roof level.

2.5.3 [Framed Skylights] [and] [Translucent Panels]

Framed skylights must [be designed to [_____] size] [span up to [3.4] [_____] m [12] [_____] feet in a single pitch] and up to [6] [_____] m [20] [_____] feet in a double pitch configuration]; determine rafter and purlin spacing by loading requirements. Skylights manufactured in prefabricated sections easy to install are available in a wide range of standardized pitches. Provide [tubular] [I-beam] framing members; deflection of rafters not to exceed [L/175] [L/180] [_____] of the rafter span. A registered professional engineer must size all framing members and design all structural connections; submit a copy of the calculations. Framing includes a primary gutter system with secondary gutters to control water infiltration and condensation runoff from the underside of the glazing.
material and channel it to the exterior. Design skylight structural members for a live load of [_____] MPa psf and wind load of [_____] MPa psf; do not induce objectionable distortion or stress in fastenings and joinery due to expansion and contraction when subjected to a 55 degree C 100 degree F temperature change.

2.6 FLEXIBLE SEALING TAPE

Provide manufacturer's standard pre-applied sealing tape to closure system at the factory under controlled conditions.

PART 3 EXECUTION

3.1 EXAMINATION

Field verify all submitted opening sizes, dimensions and tolerances; preparation of openings includes isolating dissimilar materials from aluminum system to avoid damage by electrolysis. The installer must examine area of installation to verify readiness of site conditions and to notify the Contractor about any defects requiring correction. Verify when structural support is ready to receive all specified work and to convene a pre-installation conference, if approved by the Contracting Officer, including the Contractor, skylight installer and all parties directly affecting and affected by the specified work. Do not install any materials that show visual evidence of biological growth due to the presence of moisture. Do not commence work until conditions are satisfactory.

3.2 ERECTION

Erect translucent skylight system in accordance with the approved shop drawings supplied by the manufacturer. Submit drawings showing fabrication details, materials, dimensions, installation methods, anchors, and relationship to adjacent construction. Fasten and seal in accordance with the manufacturer's shop drawings. Remove all panel, after other trades have completed work on adjacent materials. Carefully inspect and adjust panel installation as necessary to ensure proper installation and weather-tight conditions. Provide all staging, lifts and hoists required for the complete installation and field measuring. Install system clean of dirt, debris or staining and thoroughly examined for removal of all protective material prior to final inspection of the designated work area. Do not use snow rakes on roof windows or skylights.

NOTE: This guide specification covers the requirements for finish hardware for permanent structures. All items of finish hardware necessary for completion of the project and not specified in other sections should be included in this section.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: On the drawings, show:

1. Location, class, and hourly rating of fire doors;

2. Location and installation details for blocking behind door stops (wall bumpers) mounted on wallboard partitions; and

3. Either hardware set numbers (e.g. HW-2) in the door schedule, or list doors by number in each hardware set.
PART 1   GENERAL

NFPA 80 (2022) Standard for Fire Doors and Other Opening Protectives
1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

NOTE: If sustainable door hardware is available, choose bracketed option.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Manufacturer's Detail Drawings; G[, [_____]]

Verification of Existing Conditions; G[, [_____]]

Hardware Schedule; G[, [_____]]

Keying System; G[, [_____]]

SD-03 Product Data

Hardware Items; G[, [_____]]

**************************************************************************

NOTE: For special hardware items requiring shop drawings, add submittal requirement for SD-04, Drawings. Do not require shop drawings for standard commercial hardware.

**************************************************************************

SD-08 Manufacturer's Instructions

Installation

SD-10 Operation and Maintenance Data

Hardware Schedule Items, Data Package 1; G[, [_____]]

SD-11 Closeout Submittals

Key Bitting

1.3 SHOP DRAWINGS

Submit manufacturer's detail drawings indicating all hardware assembly components and interface with adjacent construction.[ Indicate power components and wiring coordination for electrified hardware.] Base shop drawings on verified field measurements and include verification of existing conditions.
1.4  PRODUCT DATA

Indicate fire-ratings at applicable components. Provide documentation of ABA/ADA accessibility compliance of applicable components, as required by 36 CFR 1191 Appendix D - Technical.

1.5  HARDWARE SCHEDULE

Provide Hardware Item List and Hardware Schedule containing the following information, and additional information as needed to identify the complete make up of each hardware set and its application to each opening:

1.5.1  Hardware Item List:

a. Hardware Type
b. Item Number
c. Quantity
d. Size(s)
e. Reference Publication / Type Number
f. Manufacturer's Name / Catalog Number
g. Key Control Symbols
h. UL Mark (If fire rated and listed)
i. BHMA Finish(es)
j. Remarks

1.5.2  Hardware Schedule

a. Hardware Set Number
b. Opening Number(s)
c. Opening Description (single/double leaf, hand, size, door/frame material)
d. Fire Rating
e. Sound Rating
f. Hardware Items
g. Quantity
h. Size
i. BHMA Finish
j. Remarks

In addition, submit hardware schedule data package 1 in accordance with
Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.6 KEY BITTING CHART REQUIREMENTS

1.6.1 Requirements
Submit key bitting charts to the Contracting Officer prior to completion of the work. Include:

a. Complete listing of all keys (e.g. AA1 and AA2).

b. Complete listing of all key cuts (AA1-123456, AA2-123458).

c. Tabulation showing which key fits which door.

d. Copy of floor plan showing doors and door numbers.

e. Listing of 20 percent more key cuts than are presently required in each master system.

1.7 QUALITY ASSURANCE

1.7.1 Hardware Manufacturers and Modifications

Provide, as far as feasible, locks, hinges, [pivots,] and closers of one lock, hinge, [pivot,] or closer manufacturer's make. Modify hardware as necessary to provide features indicated or specified.

1.7.2 Key Shop Drawings Coordination Meeting

Prior to the submission of the key shop drawing, the Contracting Officer, Contractor, Door Hardware Subcontractor, using Activity and Base Locksmith must meet to discuss and coordinate key requirements for the facility.

1.8 DELIVERY, STORAGE, AND HANDLING

**************************************************************************
NOTE: Whenever construction master keying is required, permanent keys (and removable cores) should be sent directly to the Contracting Officer.
**************************************************************************

Deliver hardware in original individual containers, complete with necessary appurtenances including fasteners and instructions. Mark each individual container with item number as shown on hardware schedule.[ Deliver permanent keys [and removable cores] to the Contracting Officer, either directly or by certified mail. Deliver construction master keys with the locks.]

PART 2 PRODUCTS

2.1 TEMPLATE HARDWARE

Hardware applied to metal [or to prefinished] doors must be manufactured using a template. Provide templates to door and frame manufacturers in accordance with ANSI/BHMA A156.7 for template hinges. Coordinate hardware items to prevent interference with other hardware.
2.2 HARDWARE FOR FIRE DOORS AND EXIT DOORS

Provide all hardware necessary to meet the requirements of NFPA 72 for door alarms, NFPA 80 for fire doors, NFPA 101 for exit doors, NFPA 252 for fire tests of door assemblies, ABA/ADA accessibility requirements, and all other requirements indicated, even if such hardware is not specifically mentioned in paragraph HARDWARE SCHEDULE.[ Provide swinging hardware for tin-clad fire doors in accordance with UL 14C.] Provide Underwriters Laboratories, Inc. labels for such hardware in accordance with UL Bld Mat Dir or equivalent labels in accordance with another testing laboratory approved in writing by the Contracting Officer.

2.3 HARDWARE ITEMS

**************************************************************************
NOTE: It is essential for the specifier to have current editions of the ANSI/BHMA A156 series standards, available online at http://www.buildershardware.com from Builders Hardware Manufacturers Association, 355 Lexington Avenue, 15th Floor, New York, New York, 10017. For Department of Defense (DoD) employees, these standards are available through the Whole Building Design Guide (WBDG) / IHS. The specifier should also have publications of the ANSI/BHMA A156 series Standards, for guidance in selecting and scheduling finish hardware.

Levels of quality are standardized for particular hardware items in the ANSI/BHMA A156 Standards. These product grades (grade 1, 2, or 3 - with grade 1 being the highest) are defined by progressive levels of performance benchmarks in each applicable ANSI/BHMA standard. The grade of any particular architectural hardware item can also be ascertained by looking at its BHMA product number. This standardized BHMA numbering system also delineates other important classification information, such as the predominant material used, product category, and function of a specific hardware item.

**************************************************************************

NOTE: For projects at Camp Lejeune and New River:

1. Specify Series 4000, Grade 1, locks and latches with 70 mm 2-3/4 inch backset.

2. Specify interchangeable cores with seven pin tumblers.

3. Specify "All locks must have interchangeable cores of Grade 1 products from one manufacturer. Verify manufacturer compliance with existing Base hardware systems."

4. For offices, entrances, classrooms, and maintenance shops, specify lock function F81, unless F82 or F84 is more appropriate.
5. For mechanical rooms and pipe chases, specify lock function F86 (storeroom lock, outside knob always rigid).

6. For sleeping room doors, specify one deadbolt, E2151, with concealed mounting screws, and one latch set, F75.

7. For Bachelor Enlisted Quarters (BEQs), require a separate master keying system for each floor of each building.

**************************************************************************

Clearly and permanently mark with the manufacturer's name or trademark, hinges, pivots, locks, latches, exit devices, bolts and closers where the identifying mark is visible after the item is installed. For closers with covers, the name or trademark may be beneath the cover. Coordinate electrified door hardware components with corresponding components specified in Division 28 ELECTRONIC SECURITY SYSTEMS (ESS).

2.3.1  Hinges

Provide in accordance with ANSI/BHMA A156.1. Provide hinges that are 114 by 114 mm 4-1/2 by 4-1/2 inch unless otherwise indicated. Construct loose pin hinges for interior doors and reverse-bevel exterior doors so that pins are non-removable when door is closed. Other anti-friction bearing hinges may be provided in lieu of ball bearing hinges.

**************************************************************************

NOTE: Use full-mortise (butt) hinges except where special types are required. Use swing-clear hinges where necessary to keep door opening completely clear when door is opened 90 to 95 degrees. Use wide-throw hinges where necessary to keep door leaf clear of wall, casings, jambs, or reveals. Use antifriction-bearing hinges on high-frequency or extra-heavy doors, and on doors equipped with closers. Use plain-bearing hinges on low-frequency doors up to 900 mm 3 feet wide and without closers. Use hospital tips in neuropsychiatric areas of medical facilities. In general, full-mortise hinges for interior doors should be steel with BHMA 600 finish (primed for painting). Hinges on natural wood or plastic surfaced interior doors should be steel with BHMA 652 finish (satin chromium plated) or BHMA 639 finish (satin bronze plated) to match finish of other door hardware. Hinges for exterior doors should be stainless steel with BHMA 630 finish or solid brass or bronze with BHMA 626 finish. Use stainless steel with BHMA 630 finish on all exterior hinges in humid conditions or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations. Provide interior hinges at project locations with ESC classifications of C3 thru C5 of cast or forged.
bronze or stainless steel, Type 302 or 304. Fire rated doors must have base metal of steel or stainless steel. Plated steel hinges may rust if used on exterior doors. Use two hinges for doors 1500 mm 60 inch or less in height and one additional hinge for each additional 750 mm 30 inches (or fraction thereof) of door height.

1. Select and size hinges for lead lined, unusually heavy, and high-frequency doors on an individual basis.

2. The 114 by 114 mm 4-1/2 by 4-1/2 inch listed is for 44 mm 1-3/4 inch doors up to 915 mm 3 feet wide and with up to 20 mm 3/4 inch trim projection, and covers the majority of openings. For other doors, determine hinge width in accordance with:

Twice the door thickness plus trim projection, minus 13 mm 1/2 inch, or 2(t plus p) minus 1/2. If answer falls between regular hinge sizes, use nearest larger size. Formula is for hinges set back 6 mm 1/4 inch from edge of door.

---

**2.3.1.1 Protection Devices**

---

NOTE: In accordance with UFC 4-740-14 Design: Child Development Centers provide finger guards to protect children's fingers from being crushed or injured in the hinge space of a door or gate.

---

Provide full height hand and finger protection device at the hinge-side area opening of doors and gates. Provide hinge-side protection devices on both sides of doors and gates, covering hinges and space between door and frame when doors are in the open position. The installed device must push hand and fingers out of the opening and away from a crushing hazard.

---

**2.3.2 Continuous Hinges**

---

NOTE: For heavy duty doors, where required. See ANSI/BHMA A156.26 and manufacturers' literature for types available. Coordinate with security door specifications.

---

Where continuous hinges are required, provide in accordance with ANSI/BHMA A156.26.

---

**2.3.3 Pivots**

---

NOTE: For extra heavy doors, pivots are sometimes preferable to hinges, particularly on entrance doors and lead-lined doors. See ANSI/BHMA A156.4 and manufacturers' literature for types available.

---

Provide in accordance with ANSI/BHMA A156.17.
2.3.4  Spring Hinges

**************************************************************************
NOTE:  Use spring hinges only where closers are not practicable and for gates at counters. Ensure that specified spring hinges are large enough and strong enough to serve their purpose adequately. See ANSI/BHMA A156.17 for types available. See manufacturers catalogs for recommendations on sizes, quantities, and styles of spring hinges.
**************************************************************************

Provide in accordance with ANSI/BHMA A156.17.

2.3.5  Locks and Latches

**************************************************************************
NOTE:  Specify Series 1000, in paragraph MORTISE LOCKS AND LATCHES, for hollow metal doors where security is a major factor. See ANSI/BHMA A156.13, Appendix A, Users' Guide, for guidance on Security Grades.

For Unaccompanied Housing UH/BEQ sleeping room doors, specify electronic key card locks used in current industry standards. For Navy and Marine Corps UH spec writer should also confirm this locking requirement with FC 4-721-10N to ensure the sleeping room locking requirement has not changed. Check with activity housing managers to determine preference.

For doors between sleeping room and shared bath, use a privacy lock, F76, Grade 1, and a deadlock, E0151 (key by thumb turn) keyed like the sleeping room entrance door and with the key on the bathroom side.
**************************************************************************

**************************************************************************
NOTE: Choose the applicable paragraph(s) from the following.
**************************************************************************

**************************************************************************
NOTE: Insert this paragraph into all locks and locksets in humid conditions or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.
**************************************************************************

[ a. At exterior locations provide locksets of full stainless steel type 302 or 304 construction including fronts, strike, escutcheons, knobs, bolts and all interior working parts. Marine Grade I, fully non-ferrous.

b. In non-air-conditioned interior environments or humid interior environments, provide interior locksets on the same Marine Grade I,
fully non-ferrous as exterior locksets.

2.3.5.1 Mortise Locks and Latches

Provide in accordance with ANSI/BHMA A156.13, Series 1000, Operational Grade 1, Security Grade 2.[ Provide mortise locks with escutcheons not less than 178 by 57 mm 7 by 2-1/4 inch with a bushing at least 6 mm 1/4 inch long. Cut escutcheons to fit cylinders and provide trim items with straight, beveled, or smoothly rounded sides, corners, and edges.] Provide knobs and roses of mortise locks with screwless shanks and no exposed screws.

2.3.5.2 Bored Locks and Latches

Provide in accordance with ANSI/BHMA A156.2, Series 4000, Grade 1.

2.3.5.3 Residential Bored Locks and Latches

**************************************************************************
NOTE: For temporary buildings and family housing only. Delete if not applicable. See ANSI/BHMA A156.2 for types available.
**************************************************************************

Provide in accordance with ANSI/BHMA A156.2, Series 4000, Grade 2. Install locks for exterior doors with threaded roses or concealed machine screws.

2.3.5.4 Interconnected Locks and Latches

**************************************************************************
NOTE: For exterior doors in family housing units only. See BHMA A156.12 and manufacturers' literature for types available.
**************************************************************************

Provide in accordance with ANSI/BHMA A156.12. Provide F96 or F97, unless otherwise specified.

2.3.5.5 Hospital Latches

Push-pull latch set similar and equal to Glynn-Johnson HL6, 13 mm 1/2 inch throw, [70 mm2-3/4 inch] [127 mm5 inch] backset, to fit 161 cutout. Cover approximately 64 by 140 mm 2-1/2 by 5-1/2 inch, handle approximately 38 by 114 mm 1-1/2 by 4-1/2 inch, projection approximately 64 mm 2-1/2 inch, covers and handles of stainless steel, BHMA 630 finish, engraved "PUSH" and "PULL" on handles, push handle pointing up, pull handle pointing down.

2.3.5.6 Auxiliary Locks

**************************************************************************
NOTE: Delete if not applicable. See ANSI/BHMA A156.36 for types available.
**************************************************************************

Provide in accordance with ANSI/BHMA A156.36, Grade 1.
2.3.5.7 Combination Locks

**************************************************************************
NOTE: For medical projects only, include the first bracketed option.
**************************************************************************

[Key pharmacy door locks separately from building master key system.]
Heavy-duty, mechanical combination lockset with five push buttons, standard sized knobs, 20 mm 3/4 inch deadlocking latch, 70 mm 2-3/4 inch backset. Locks to operate by pressing two or more of the buttons in unison or individually in the proper sequence. Inside knob operates the latch. Provide a keyed cylinder on the interior to permit setting the combination.[ Provide a keyed [removable core] cylinder on the exterior to permit bypassing the combination.][ Provide a thumb turn on the interior to activate passage set function so that outside knob operates latch without using the combination.]

2.3.6 Exit Devices

**************************************************************************
NOTE: Due to the difficulty in securing exit devices against unauthorized use, they should only be specified where required by NFPA 101. Use single exit doors with locksets in preference to pairs of doors. When pairs are required, specify removable Mullions and rim type devices. Vertical rod devices require use of an overlapping astragal and door coordinator for security and fire protection. They should be used only where mullions are not feasible.
**************************************************************************

**************************************************************************
NOTE: Insert the last bracketed paragraph for all exit devices in humid conditions or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.
**************************************************************************

Provide in accordance with ANSI/BHMA A156.3, Grade 1. Provide adjustable strikes for rim type and vertical rod devices. Provide open back strikes for pairs of doors with mortise and vertical rod devices. Provide [touch bars in lieu of conventional crossbars and arms.][ Provide escutcheons not less than 178 by 57 mm 7 by 2-1/4 inch.]

[ Use stainless steel or bronze base metal with plated finishes. Also include stainless steel fasteners and screws.]

2.3.7 Exit Locks With Alarm

Provide in accordance with ANSI/BHMA A156.3 and ANSI/BHMA A156.29, Type E0431 (with full width horizontal actuating bar) for single doors; Type E0431 (with actuating bar) or E0471 (with actuating bar and top and bottom bolts, both leaves active) for pairs of doors, unless otherwise specified.[ Provide terminals for connection to remote indicating
2.3.8 Cylinders and Cores

**************************************************************************
NOTE: When an extension of an existing system is required, the manufacturer's name and type of locks should be indicated. Confirm existing hardware requirements with Contracting Officer's Representative (COR). Requirements may include but are not limited to interchangeable cores, product level of quality, compatibility, if any, with other manufacturers' hardware components.

Specify the system which will best meet the activity's needs without restricting competition.

For projects at Lajes Field, Azores, delete first paragraph; use second paragraph.
**************************************************************************

Provide cylinders and cores for new locks, including locks provided under other sections of this specification. Provide cylinders and cores with [six] [seven] pin tumblers. Provide cylinders from the products of one manufacturer, and provide cores from the products of one manufacturer. Rim cylinders, mortise cylinders, and knobs of bored locksets have interchangeable cores which are removable by special control keys. Stamp each interchangeable core with a key control symbol in a concealed place on the core.

Provide cylinders for new locks, including locks provided under other sections of this specification. Provide fully compatible cylinders of Grade 1 products from products of one manufacturer with interchangeable cores that are removable by a special control key. Factory set the cores with [six] [seven] pin tumblers using the A4 system and F keyway. Submit a core code sheet with the cores. Provide master keyed cores in one system for this project. Provide construction interchangeable cores.

For medical projects, key pharmacy door locks separately from building master key system.

2.3.8.1 High Security Cylinders

Provide in accordance with ANSI/BHMA A156.30, security level [A][B][C] for all high security cylinder components.

2.3.9 Push Button Mechanisms

Provide in accordance with ANSI/BHMA A156.5, Grade 1.

2.3.10 Electrified Hardware

**************************************************************************
NOTE: Coordinate electrified hardware operation and specific backup power requirements with site safety personnel, site fire authority, and applicable life safety codes. Determine whether signal switches are required for the particular site application.
Comply with the requirements of NFPA 70 for wiring of electrified hardware.

2.3.10.1 Electric Strikes and Frame Mounted Actuators

NOTE: Specify electric strikes and lock functionality when power fails. Choose one of three bracketed choices (release automatically, remain secure or remain maintained).

Provide in accordance with ANSI/BHMA A156.31, Grade 1. Provide electric strikes and actuators as required to meet operational requirements. Provide electric strikes that [release automatically] [remain secure] [remain maintained] during power failure. Provide a separate power supply for electric strikes, other locking devices and ancillary parts. Provide battery backup for continued operation during power failure. Provide strikes and actuators with a minimum opening force of 101 kilonewtons (kN) 2300 pounds.

Provide facility interface devices that use direct current (dc) power to energize the solenoids. Provide electric strikes and actuators that incorporate end-of-line resistors to facilitate line supervision by the system. If not incorporated into the electric strike or local controller, provide metal oxide resistors (MOVs) to protect the controller from reverse current surges.

2.3.10.1.1 Solenoid

Provide actuating solenoid for strikes and actuators that are rated for continuous duty, cannot dissipate more than 12 Watts and must operate on 12 or 24 Volts dc. Inrush current cannot exceed 1 ampere and the holding current cannot be greater than 500 milliamperes. Actuating solenoid must move from fully secure to fully open positions in less than 500 milliseconds.

2.3.10.1.2 Signal Switches

Provide strikes and actuators with signal switches to indicate to the system when the bolt is not engaged or the strike mechanism is unlocked. Signal switches must report a forced entry to the system.

2.3.10.1.3 Tamper Resistance

[ Provide strike guards that prevent tampering with the latch bolt of the locking hardware or the latch bolt keeper of the electric strike. Strike guards to bolt through the door using tamper resistant screws. Provide strike guards made of 3 mm 1/8 inch thick brass and that are 286 mm 11-1/14 inch high by 41 mm 1-5/8 inch wide, with a minimum 4 mm 5/32 inch wide offset.

]2.3.10.1.4 Coordination

Provide electric strikes and actuators of a size, weight and profile compatible with each specified door frame. Field verify installation clearances prior to procurement.
2.3.10.1.5 Mounting Method

Provide electric strikes and actuators suitable for use with single and double doors, with mortise or rim type hardware specified, and for right or left hand mounting as specified. In double door installations, locate the lock in the active leaf and monitor the fixed leaf.

2.3.10.2 Electrified Mortise Locks

******************************************************************************

NOTE: Electrified mortise locks provide an excellent solution for stairwell doors that require positive latching when unlocked. A power transfer hinge or raceway is required to get power and signal wire from the door to the doorframe for a secure and fully enclosed connection to the access control system. Specify power transfer hinges for doors with electrified hardware.

******************************************************************************

Provide in accordance with ANSI/BHMA A156.25, Grade 1. Provide electrified mortise locks that [release automatically] [remain secure] [remain maintained] during power failure. Provide facility interface devices that use dc power to energize solenoids. Provide solenoids, resisters, and signal switches in accordance with paragraph ELECTRIC STRIKES AND FRAME MOUNTED ACTUATORS.

2.3.10.2.1 Power Transfer Hinges

Provide power transfer hinges with each electrified lock that route power and monitoring signals from the lockset to the door frame. Coordinate power transfer hinges with door frames.

2.3.10.3 Card Readers and Keypad Access Control Hardware

******************************************************************************

NOTE: Verify card readers are compatible with card type. Coordinate this section with Division 28 ELECTRONIC SECURITY SYSTEMS (ESS) requirements.

******************************************************************************

Provide in accordance with ANSI/BHMA A156.5 and ANSI/BHMA A156.25, Grade 1 components. Provide devices that are tamper alarmed, tamper and vandal resistant, solid state, and do not contain electronics which could compromise the access control subsystem should the subsystem be attacked. Provide surface, semi-flush, pedestal, or weatherproof mountable devices as specified for each individual location. Each device to contain a visual display, either mounted on the face, or on an integral part of the device, to indicate access or exit request processing, request approval, and request denial. Provide [proximity] [insertion] [swipe through] type card readers capable of reading [magnetic stripe] [high coercivity magnetic stripe] [Wiegand] [Hollerith] [proximity] [Transmissive Infrared] [Keypad] [_____]/Keypad [Smart Card] [Biometric] [_____] type access control cards. Provide keypads that contain an integral 12-digit tactile keyboard with digits [arranged in numerical order]. Provide keypads that are [a standalone device] [or] [integrated into the card reader]. Coordinate access control hardware with corresponding devices and systems specified in Division 28 ELECTRONIC SECURITY SYSTEMS (ESS).
2.3.10.4 Power Operated Pedestrian Door Hardware

Provide in accordance with ANSI/BHMA A156.10, Grade 1.

2.3.10.5 Release Devices

In accordance with ANSI/BHMA A156.15, Grade 1.

2.3.10.5.1 Closer Holders

Provide [floor] [door] [header] mounted closer holder devices connected by [separate releasing] [integral releasing] to [fire] [smoke] detecting devices.

2.3.10.5.2 Release Devices

Provide [wall] [floor] [door] mounted [Electromagnetic] [electromechanical] [free swinging] release devices connected to [fire] [smoke] detecting devices.

2.3.10.6 Power Assist and Low Energy Power Operated Doors

Provide in accordance with ANSI/BHMA A156.19, Grade 1.

2.3.10.7 Electromagnetic Locks

Provide in accordance with ANSI/BHMA A156.23, Grade 1. Provide electromagnetic locks that do not contain any moving parts and depend solely upon electromagnetism to secure a portal by generating at least 5.3 kN 1200 pounds of holding force. The lock must interface with the local processors without external, internal or functional alteration of the local processor. The electromagnetic lock must incorporate an end of line resistor to facilitate line supervision by the system. Provide metal-oxide resistors (MOVs) to protect controllers from reverse current surges, if not incorporated into the electromagnetic lock or local controller.

2.3.10.7.1 Armature

Provide electromagnetic locks with internal circuitry to eliminate residual magnetism and inductive kickback. Provide actuating armature that operates on 12 or 24 Volts dc and cannot dissipate more than 12 Watts. Holding current must be less than 500 milliamperes. Actuating armature must take less than 300 milliseconds to change the status of the lock from fully secure to fully open or fully open to fully secure.

2.3.10.7.2 Tamper Resistance

Provide lock mechanism encased in hardened guard barriers to deter forced entry.

2.3.10.7.3 Mounting Method

Provide electromagnetic lock suitable for use with single and double door with mortise or rim type hardware and compatible with right or left hand mounting.

2.3.10.8 Delayed Egress Locking System

Provide in accordance with ANSI/BHMA A156.24, Grade 1.
2.3.10.9  Power and Manual Operated Revolving Pedestrian Doors

Provide in accordance with ANSI/BHMA A156.27, Grade 1.

2.3.11  Keying System

**************************************************************************
NOTE: Do not require higher levels of master keying than necessary because each level decreases the security of the locks. Specify a construction system where necessary to ensure security after construction is complete.
**************************************************************************

Provide[ a [great][grand] master keying system][ an extension of the existing keying system. Existing locks were manufactured by [_____] and [do not] have interchangeable cores.][ Provide[ a construction master keying system][ construction interchangeable cores].][ Provide key cabinet as specified.]

**************************************************************************
NOTE: Add the following for Naval Submarine Base, Kings Bay, Georgia. Coordinate with the lead paragraph.
**************************************************************************

[The Government will provide permanent cylinders with cores and keys for mortise locksets, auxiliary locks, and exit devices. ][Provide cylinders of Grade 1 products from one manufacturer. Notify the Contracting Officer 90 days prior to the required delivery of the cylinders. Provide temporary cores and keys for the Contractor's use during construction, and for testing of locksets.]

2.3.12  Lock Trim

**************************************************************************
NOTE: For facilities that have not been certified as accessible only to able-bodied personnel, specify lever handles for doors that will be accessible to disabled persons and knurled or abrasive coated knobs and lever handles for doors that are accessible to the visually impaired and that lead to dangerous areas. When only lever handles will be required, delete the paragraph KNOBS AND ROSES and the first bracket statement in the paragraph LEVER HANDLES.
**************************************************************************

Provide cast, forged, or heavy wrought construction and commercial plain design for lock trim.

2.3.12.1  Knobs and Roses

Provide in accordance with ANSI/BHMA A156.2 and ANSI/BHMA A156.13 for knobs, roses, and escutcheons. For unreinforced knobs, roses, and escutcheons, provide a 1.25 mm 0.050 inch thickness. For reinforced knobs, roses, and escutcheons, provide an outer shell thickness of 0.89 mm 0.035 inch and a combined total thickness of 1.78 mm 0.070 inch, except at knob
shanks. Provide knob shanks 1.52 mm 0.060 inch thick.

2.3.12.2 Lever Handles

Provide lever handles [where indicated in the Hardware Schedule]. Provide in accordance with ANSI/BHMA A156.3 for mortise locks of lever handles for exit devices. Provide lever handle locks with a breakaway feature (such as a weakened spindle or a shear key) to prevent irreparable damage to the lock when force in excess of that specified in ANSI/BHMA A156.13 is applied to the lever handle. Provide lever handles return to within 13 mm 1/2 inch of the door face.

2.3.13 Keys

******************************************************************************
NOTE: For projects at Lejes Field, Azores, delete first paragraph; use second paragraph.******************************************************************************

[Furnish][Provide] one file key, one duplicate key, and one working key for each key change [and for each master [and grand master] keying system]. [Furnish][Provide] one additional working key for each lock of each keyed-alike group. [Furnish][Provide] two additional keys for each sleeping room.] [Furnish][Provide] [_____] great grand master keys,] [_____] construction master keys,] [and [_____] control keys for removable cores].] [Furnish][Provide] a quantity of key blanks equal to 20 percent of the total number of file keys.] Stamp each key with appropriate key control symbol and "U.S. property - do not duplicate." Do not place room number on keys.

[Furnish][Provide] seven change keys for each interchangeable core, furnish][provide] two control keys, six maters keys, and six construction master keys.[[Furnish][Provide] a quantity of key blanks equal to 20 percent of the total number of change keys.] Stamp each key with appropriate key control symbol and "U.S. property - do not duplicate." Do not place room numbers on keys.

2.3.14 Door Bolts

******************************************************************************
NOTE: Use chain and foot bolts for exceptionally high doors and where use of flush bolts is impracticable.******************************************************************************

Provide in accordance with ANSI/BHMA A156.16. Provide dustproof strikes for bottom bolts, except at doors having metal thresholds. Provide automatic latching flush bolts in accordance with ANSI/BHMA A156.3, Type 25.

2.3.15 Closers

******************************************************************************
NOTE: Use closers Type C02011 with o.f. PT 4C for surface applications, except use parallel arm closers, C02021, on outswinging exterior doors. Specify holder arms, C02051 and C02061, where doors must be held open from 90 degrees to 135 degrees, or to 180 degrees where desired. Do not use holder arms for fire-rated doors. Use overhead concealed
closers on main entrance doors of monumental buildings, double-acting doors, and for other openings where concealment is necessary. Avoid overhead concealed closers with wood doors. Where they cannot be avoided, modify section on wood doors to require a 125 mm 5 inch head rail. Avoid use of floor-concealed closers, but where required, ascertain that floor slab design will not interfere with closer case.

**************************************************************************
NOTE: Insert the bracketed paragraph for all doors in humid conditions or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.
**************************************************************************
Provide in accordance with ANSI/BHMA A156.4, Series C02000, Grade 1, with PT 4C. Provide with brackets, arms, mounting devices, fasteners, [full size covers, except at storefront mounting,] [pivots,] [cement cases,] and other features necessary for the particular application. Size closers in accordance with manufacturer's printed recommendations, or provide multi-size closers, Sizes 1 through 6, and list sizes in the Hardware Schedule. Provide manufacturer's 10 year warranty.

[ Use stainless steel inside bracketed or door mounted closers on exterior doors. Non-ferrous closers, such as aluminum or cast bronze, are permissible where door utilization is minimal. On interior doors use closers of 302 or 304 stainless steel or non-ferrous materials. On surface-mounted closers use or apply rust inhibiting finish on all ferrous parts. Also apply this finish on concealed closers.

]2.3.15.1 Identification Marking

Engrave each closer with manufacturer's name or trademark, date of manufacture, and manufacturer's size designation in locations that will be visible after installation.

2.3.16 Overhead Holders

**************************************************************************
NOTE: Use overhead holders for doors which will not swing 180 degrees and where there is no adjacent wall to accommodate wall type holder and stop. If holder must be on outside of doors, specify bronze (C12511) with satin chrome finish (626). Overhead holders can be specified as "Stop Only" where the hold open feature is not desirable.
**************************************************************************
Provide in accordance with ANSI/BHMA A156.8.

2.3.17 Door Protection Plates
NOTE: Use pulls attached to plates. Use 200 by 400 mm 8 by 16 inch push plates where door design permits. Use push bars or push and pull bars on all-glass doors. Use kick plates for push sides of doors equipped with closers. Use door plates in high traffic areas and where damage from rolling carts, shoe scuffs, and other potential damage to the bottom of doors is likely. Use door plates for hospital and clinic environments. Use armor plates on heavy-duty doors where hand trucks or other heavy objects regularly passing through the door could cause damage.

Provide in accordance with ANSI/BHMA A156.6.

2.3.17.1 Sizes of [Armor] [Mop] [and] Kick Plates

NOTE: NFPA 80 requires that door plates be not more than 400 mm 16 inch high. Where wheelchair traffic is anticipated, kick plates should be 400 mm 16 inch high.

50 mm 2 inch less than door width for single doors; 25 mm 1 inch less than door width for pairs of doors. Provide [200] [1200] mm [8] [10] inch kick plates for flush doors] [and] [125 mm 1 inch less than height of bottom rail for panel doors]. Provide a minimum [900] [1200] [_____] mm [36] [48] [_____] inch armor plates for flush doors [and] completely cover lower panels of panel doors, except 400 mm 16 inch high armor plates on fire doors. Provide [100] [150] mm [4] [6] inch mop plates.

2.3.17.2 Edge Guards

NOTE: Edge guards should be detailed on drawings; stipulate items such as material, gauge, and dimensions. Use edge guards in addition to armor plates on heavy-duty doors where hand trucks or other heavy objects passing through could damage doors. They are not required at hinge stiles on doors equipped with "swing clear" hinges.

Stainless steel, of same height as armor plates. Apply to [hinge stile] [lock stile] [meeting stiles].

2.3.18 Door Stops and Silencers

NOTE: Specify wall bumpers Type L02251 wherever practical, except where they would be mounted on stud walls or partitions. Use floor stops only where necessary to prevent doors from hitting towel bars or similar items, as they create stumbling hazards and interfere with floor cleaning equipment.
Provide in accordance with ANSI/BHMA A156.16. Silencers Type L03011. Provide three silencers for each single door, two for each pair.

2.3.19 Padlocks

**************************************************************************
NOTE: See referenced specification for types, grades and options available.
**************************************************************************
Provide in accordance with ASTM F883.

2.3.20 Thresholds

**************************************************************************
NOTE: Where vertical rod exit devices are used, and for other outswinging exterior doors, ANSI/BHMA A156.21, type J35100, is recommended.
**************************************************************************
Provide in accordance with ANSI/BHMA A156.21. Use J35100, with vinyl or silicone rubber insert in face of stop, for exterior doors opening out, unless specified otherwise.

2.3.21 Weatherstripping Gasketing

**************************************************************************
NOTE: Weatherstripping is also specified in Section 08 11 13 STEEL DOORS AND FRAMES Section 08 11 16 ALUMINUM DOORS AND FRAMES and Section 08 14 00 WOOD DOORS. Coordinate requirements to avoid conflict and duplication. Do not use interlocking type or spring tension type on metal doors and frames.
**************************************************************************

**************************************************************************
NOTE: Maximum air leakage rates are 2.19 by 10^-5 cms per sq m 0.5 cfm per sq. ft. of door area for residential swinging doors and 5.48 by 10^-5 cms per sq m 1.25 cfm per sq. ft. of door area for non-residential swinging doors.
**************************************************************************
Provide in accordance with ANSI/BHMA A156.22. Provide the type and function designation where specified in paragraph HARDWARE SCHEDULE. Provide a set to include head and jamb seals[, sweep strips,[ and, for pairs of doors, astragals]. Air leakage of weatherstripped doors not to exceed [2.19 by 10^-5] [5.48 by 10^-5] cms [0.5] [1.25] cubic feet per minute of air per square meter foot of door area when tested in accordance with ASTM E283. Provide weatherstripping with one of the following:

**************************************************************************
NOTE: At exterior doors, retainers at sills are necessary for air leakage and for weather and vermin protection.
**************************************************************************
2.3.21.1 Extruded Aluminum Retainers

Extruded aluminum retainers not less than 1.25 mm 0.050 inch wall thickness with vinyl, neoprene, silicone rubber, or polyurethane inserts. Provide [clear (natural)] [bronze] anodized aluminum.

2.3.21.2 Interlocking Type

Zinc or bronze not less than 0.45 mm 0.018 inch thick.

2.3.21.3 Spring Tension Type

Spring bronze or stainless steel not less than 0.20 mm 0.008 inch thick.

2.3.22 [Lightproofing] [and] [Soundproofing] Gasketing

Provide in accordance with ANSI/BHMA A156.22. Provide adjustable doorstops at heads, jambs and automatic door bottoms in accordance with the hardware set, of extruded aluminum, [clear (natural)] [bronze] anodized, surface applied, with vinyl fin seals between plunger and housing. Provide doorstops with solid neoprene tube, silicone rubber, or closed cell sponge gasket. Provide door bottoms with adjustable operating rod and silicone rubber or closed cell sponge neoprene gasket. Provide doorstops that are mitered at corners. Provide type and function designation where specified in paragraph HARDWARE SETS.

**************************************************************************
NOTE: At exterior doors that are not protected by a horizontal projection such as an awning, roof, or eave, specify rain drips that overlap each side of each door at the head of such exposed doors by choosing the bracketed item below.
**************************************************************************

2.3.23 Rain Drips

Provide in accordance with ANSI/BHMA A156.22. Provide extruded aluminum rain drips, not less than 2.03 mm 0.08 inch thick, [clear anodized] [bronze anodized] [factory painted] [factory primed] finish. Provide the manufacturer's full range of color choices to the Contracting Officer for color selection. Provide rain drips with a 102 mm 4 inch overlap on each side of each exterior door that is not protected by an awning, roof, eave or other horizontal projection. Set drips in sealant and fasten with stainless steel screws.

2.3.23.1 Door Rain Drips

Approximately 38 mm high by 16 mm 1-1/2 inch high by 5/8 inch projection. Align bottom with bottom edge of door.

2.3.23.2 Overhead Rain Drips

Approximately 38 mm high by 64 mm 1-1/2 inch high by 2-1/2 inch projection. Align bottom with door frame rabbet.

2.3.24 Auxiliary Hardware (Other than locks)

Provide in accordance with ANSI/BHMA A156.16, Grade 1.
2.3.25 Sliding and Folding Door Hardware

Provide in accordance with ANSI/BHMA A156.14, Grade 1. Finishes to match other hardware specified herein.

2.3.26 Special Tools

Provide special tools, such as spanner and socket wrenches and dogging keys, as required to service and adjust hardware items.

2.4 FASTENERS

Provide fasteners of type, quality, size, and quantity appropriate to the specific application. Fastener finish to match hardware. Provide stainless steel or nonferrous metal fasteners in locations exposed to weather. Verify metals in contact with one another are compatible and will avoid galvanic corrosion when exposed to weather.

2.5 FINISHES

**************************************************************************
NOTE: Choose one of the following options. Choose the first option for new buildings. Choose the second option only where necessary to match the finish on existing hardware.
**************************************************************************

**************************************************************************
NOTE: Use stainless steel in bathroom and toilet locations and in project locations with Environmental Severity Classifications (ESC) of C3 through C5. See UFC 1-200-01 for determination of ESC for project locations.
**************************************************************************

[ Provide in accordance with ANSI/BHMA A156.18. Provide hardware in BHMA 630 finish (satin stainless steel), unless specified otherwise. Provide items not manufactured in stainless steel in BHMA 626 finish (satin chromium plated) over brass or bronze, except [aluminum paint] [prime coat] finish for surface door closers, and except [BHMA 652 finish (satin chromium plated)] [BHMA 600 finish (primed for painting)] for steel hinges. Provide hinges for exterior doors in stainless steel with BHMA 630 finish[ or chromium plated brass or bronze with BHMA 626 finish]. Furnish exit devices in BHMA 626 finish in lieu of BHMA 630 finish [except where BHMA 630 is specified under paragraph HARDWARE SETS]. Match exposed parts of concealed closers to lock and door trim. Match hardware finish for aluminum doors to the doors.

][Provide in accordance with ANSI/BHMA A156.18. Provide hardware in BHMA 612 finish (satin bronze), unless specified otherwise. Finish surface door closers [bronze paint] [prime coat] finish. Provide steel hinges in [BHMA 639 finish (satin bronze plated)] [BHMA 600 finish (primed for painting)]. Provide exposed parts of concealed closers finish to match lock and door trim. Match hardware finish for aluminum doors to match the doors. Provide hardware showing on interior of [bathrooms] [shower rooms] [toilet rooms] [washrooms] [laundry rooms] [and kitchens] in BHMA 629 finish (bright stainless steel) or BHMA 625 finish (bright chromium plated).]
2.6 KEY CABINET AND CONTROL SYSTEM

NOTE: Key cabinets hold keys on panels. Systems include materials and devices for recording and cross-referencing data on use and location of locks and keys. See ANSI/BHMA A156.5 for description of cabinets and control systems.

Provide in accordance with ANSI/BHMA A156.5, [Type [E8331 (25 hooks)] [E8341 (125 hooks)] [E8351 (150 hooks)] [E8311 (600 hooks)] [E8321 (700 hooks)].] [Type required to yield a capacity (number of hooks) 50 percent greater than the number of key changes used for door locks.]

PART 3 EXECUTION

3.1 INSTALLATION

Provide hardware in accordance with manufacturers' printed installation instructions. Fasten hardware to wood surfaces with full-threaded wood screws or sheet metal screws. Provide machine screws set in expansion shields for fastening hardware to solid concrete and masonry surfaces. Provide toggle bolts where required for fastening to hollow core construction. Provide through bolts where necessary for satisfactory installation.

3.1.1 Weatherstripping Installation

Provide full contact, weathertight seals that allow operation of doors without binding the weatherstripping.

3.1.1.1 Stop Applied Weatherstripping

Fasten in place with color matched sheet metal screws not more than 225 mm 9 inch on center after doors and frames have been finish painted.

3.1.1.2 Interlocking Type Weatherstripping

Provide interlocking, self adjusting type on heads and jambs and flexible hook type at sills. Nail weatherstripping to door 25 mm 1 inch on center and to heads and jambs at 100 mm 4 inch on center.

3.1.1.3 Spring Tension Type Weatherstripping

Provide spring tension type on heads and jambs. Provide bronze nails with bronze. Provide stainless steel nails with stainless steel. Space nails not more than 38 mm 1-1/2 inch on center.

3.1.2 [Lightproofing] [and] [Soundproofing] Installation

Provide as specified for stop applied weatherstripping.

3.1.3 Threshold Installation

Extend thresholds the full width of the opening and notch end for jamb stops. Set thresholds in a full bed of sealant and anchor to floor with cadmium-plated, countersunk, steel screws [in expansion sleeves]. For aluminum thresholds placed on top of concrete surfaces, coat the underside...
surfaces that are in contact with the concrete with fluid applied waterproofing as a separation measure prior to placement.

3.2 FIRE DOORS AND EXIT DOORS

Provide hardware in accordance with NFPA 72 for door alarms, NFPA 80 for fire doors, NFPA 101 for exit doors, and NFPA 252 for fire tests of door assemblies. [Provide tin-clad fire doors in accordance with UL 14C].

3.3 HARDWARE LOCATIONS

Provide in accordance with SDI/DOOR A250.8, unless indicated or specified otherwise.

b. Mop Plates: Bottom flush with bottom of door.

3.4 KEY CABINET AND CONTROL SYSTEM

Locate where [directed][indicated]. Tag one set of file keys and one set of duplicate keys. Place other keys in appropriately marked envelopes, or tag each key. Provide complete instructions for setup and use of key control system. On tags and envelopes, indicate door and room numbers or master or grand master key.

3.5 FIELD QUALITY CONTROL

After installation, protect hardware from paint, stains, blemishes, and other damage until acceptance of work. Submit notice of testing 15 days before scheduled, so that testing can be witnessed by the Contracting Officer. Adjust hinges, locks, latches, bolts, holders, closers, and other items to operate properly. Demonstrate that permanent keys operate respective locks, and give keys to the Contracting Officer. Correct, repair, and finish, errors in cutting and fitting and damage to adjoining work.

3.6 HARDWARE SETS

**************************************************************************
NOTE: Coordinate this section with Section 08 11 16 ALUMINUM DOORS AND FRAMES.

Either list hardware set numbers on the drawings or list doors by number in each hardware set. List hardware sets in the following format:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for detention hardware for use in brigs and detention facilities.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The following information shall be shown on the project drawings:

1. Security hardware set numbers in door schedule.
2. Elevations and details of food pass.
3. Elevations of lock pocket locations in security doors and frames.
4. Elevations and details of security locks installed gates.
PART 1 GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

BUILDERS HARDWARE MANUFACTURERS ASSOCIATION (BHMA)

ANSI/BHMA A156.1 (2021) Butts and Hinges
ANSI/BHMA A156.4 (2013) Door Controls - Closers
ANSI/BHMA A156.5 (2020) Cylinder and Input Devices for Locks
ANSI/BHMA A156.6 (2021) Architectural Door Trim
ANSI/BHMA A156.7 (2016) Template Hinge Dimensions
ANSI/BHMA A156.8 (2021) Door Controls - Overhead Stops and Holders
ANSI/BHMA A156.16 (2023) Auxiliary Hardware
ANSI/BHMA A156.18 (2020) Materials and Finishes

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 70 (2023; ERTA 4 2023; ERTA 5 2023; ERTA 6 2023) National Electrical Code

UNDERWRITERS LABORATORIES (UL)

UL 10B (2008; Reprint May 2020) Fire Tests of Door Assemblies
1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in
accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Detention hardware schedule

SD-02 Shop Drawings

Type 1 lock
Type 3 lock
Door position switches
Detention hinges

Submit complete system wiring diagrams for locks and controls, following approval of the detention hardware schedule. Indicate electrical requirements for locks and controls.

SD-03 Product Data

Keys and cylinders
Detention hinges
Detention locks
Door trim
Door position switches
Security door accessories

Submit details of construction and methods of installation, finishes, sizes, shape, alloy and thickness of materials. Include wiring details and electrical specifications.

SD-10 Operation and Maintenance Data

Detention locks, Data Package 5; G[, [_____]]
DOOR CLOSERS, Data Package 5; G[, [_____]]
Door position switches, Data Package 5; G[, [_____]]

Submit in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.3 QUALITY ASSURANCE

1.3.1 Qualifications of Installer

The work shall be installed by a detention equipment installer approved by the detention hardware manufacturer.

1.3.2 Regulatory Requirements

a. Electrically controlled, monitored, and operated detention hardware and
related components shall meet applicable requirements of NFPA 70.

b. Detention hardware for labeled fire doors shall meet applicable requirements of UL 10B and be listed (labeled).

c. Detention hardware for doors that are considered "Means of Egress" shall meet applicable requirements of NFPA 101.

d. Electrically operated detention locks shall meet applicable requirements of UL 1034 and be listed (labeled).

1.3.3 Schedule Requirements

Submit detention hardware schedule at the same time hardware samples are submitted. Schedule shall include quantities, manufacturer's catalog numbers, descriptive information, location, sizes, finish, key control symbols including keying systems for each piece. Use the same door marks as shown on the schedule in the contract documents.

1.4 DELIVERY, STORAGE, AND HANDLING

1.4.1 Keys

Send to the Contracting Officer directly from the manufacturer via registered mail.

1.4.2 Detention Hardware

Deliver in a timely manner and store in accordance with the manufacturer's recommendations. Deliver in manufacturer's original container and protect from damage by weather.

1.5 HARDWARE COORDINATION CONFERENCE

Conduct a hardware coordination conference for hardware and hollow metal work prior to submittals for the purpose of coordinating the interface of materials that are furnished by the participants listed. Require that a representative of the entity responsible for each of the following functions attend the conference. Notify participants a minimum of 5 working days before the conference.

a. Contractor

b. Hollow metal supplier and installer

c. Detention hollow metal supplier and installer

d. Hardware supplier

e. Hardware installer

f. Detention hardware supplier

g. Detention hardware installer

h. Locking control system supplier and installer

i. Electrical contractor
j. Contracting Officer

1.6 MAINTENANCE TOOLS

Furnish six tool holders and bits for each different size and type of screw and fastener.

1.7 TEMPLATES

Furnish templates for door and frame preparation.

PART 2 PRODUCTS

2.1 FINISH

Finish surfaces, painted surfaces and painted items shall be in accordance with ANSI/BHMA A156.18 and as follows:

2.1.1 Painted Surfaces

600.

2.1.2 Finish Surfaces

626 or 630.

2.1.3 Painted Items

689.

2.2 KEYS AND CYLINDERS

ANSI/BHMA A156.5.

2.2.1 Mogul Keys

Keys for pin tumbler locks shall be not less than 73 mm 2 7/8 inches in length, blade shall be 14 mm 9/16 inch wide by 3.2 mm 1/8 inch thick. Handle shall be 25 mm one inch in diameter. Stamp each key with number or letter per code.

2.2.2 Mogul Cylinder

Provide a special "Mogul" cylinder approximately twice the diameter of a commercial mortise lock cylinder with internal parts proportionately larger. Special "Mogul" keys and restricted keying are required. The sale of cut keys and blanks shall be factory regulated to control usage and reproduction. The design shall be wear and pick resistant and shall include a minimum of five stainless steel 4 mm 5/32 inch diameter pin tumblers, stainless steel springs, and stainless steel ball bearings which intermesh with the key and pin tumblers. Cylinder shall conform to UL 437.

2.2.3 Builders Cylinder

Type E09211A. Keys shall be for restricted use. Cylinder shall conform to UL 437.
2.3 KEYING SYSTEM

Keying system shall consist of dissimilar combinations [for each building] with external doors keyed alike; internal corridor doors keyed alike; utility spaces, [wickets, and food passes] keyed alike; each group of cells [or dormitory group] keyed alike but different from other groups. Establish two separate detention key systems; one system shall be for the security Mogul type hardware, and one for the paracentric key system.

2.4 DETENTION HINGES

Provide hinges in accordance with ANSI/BHMA A156.1 and ANSI/BHMA A156.7. Type A8191 HT with stainless steel maximum security pin. Type A8192 HT with stainless steel maximum security pin. The 225 mm 9 inches denotes 4 wire continuous conduction. Screws shall be twist-off or spanner head. Sizing shall be in accordance with standard. Hinges shall be drilled and counter-sunk for proper size machine screws. Use zinc coated hinges on exterior doors with a prime coat. Furnish junction box and mortar shield. Electric hinges shall meet the requirements of UL 634 and be labeled.

2.5 DETENTION LOCKS

2.5.1 Type 1 Lock

Electro-mechanical solenoid operation lock; jamb mounted for use with security hollow metal doors with the following features:

a. Solenoid operated 115 V ac continuous duty.
b. Cylinder operated one or two sides using mogul or builders cylinders.
c. Lock case 10 gage minimum galvanized cold-rolled steel.
d. Latch Bolt 20 mm 3/4 inch throw stainless steel.
e. Bronze or stainless steel face plate.
f. Signal switch for latch bolt and deadlocking bolt.
g. Strike and mounting screws.
h. Push button in frame if on a cell door.

2.5.2 Type 2 Lock

Mechanical deadlock; lever tumbler deadlock for use with security hollow metal doors with the following features:

a. Paracentric key operated one or two sides.
b. Six lever tumblers with spring temper brass/bronze springs.
c. Steel or stainless steel deadbolt with saw resistant insets.
d. Bolt 20 by 50 mm 3/4 by 2 inches with 20 mm 3/4 inch throw.
e. Lock case primed for paint or galvanized.
f. Lock mount plate including escutcheon, mounting screws, and strike.
2.5.3  **Type 3 Lock**

Electro-mechanical deadlocking latchlock meeting requirements of UL 10B; jamb mounted in 50 mm 2 inch face security hollow metal frame with the following features:

a. Solenoid operated 24 V dc continuous duty.

b. Cylinder operated one or two side using builders cylinder.

c. Structural and working parts stainless steel.

d. Deadlatch 20 mm 3/4 inch throw stainless steel with saw resistant insets.

e. Stainless steel deadlocking bolt, base plate, and strike.

f. Signal switch for lock status.

g. Plug connectors for conductors.

2.5.4  **Type 4 Lock**

Mortise lock for security hollow metal swinging doors with the following features:

a. Mogul cylinder key operated one or two sides.

b. Cast brass, bronze, or stainless steel bolts. 25 mm One inch throw with saw resistant inserts. Knob operated deadbolt.

c. Armored front adjustable 3 in 50 mm 1/8 in 2 inches.

2.5.5  **Type 5 Lock**

Mechanical deadlocking latch lock for security hollow metal swinging doors with the following features:

a. Mogul key operated one or two sides.

b. Five lever tumbler with spring temper brass/bronze springs.

c. Steel or stainless steel latchbolt.

d. Lock case primed for paint or galvanized.

e. Lock mounting plate including escutcheon mounting screws and strike.

2.5.6  **Type 6 Lock**

Mechanical deadlock for use on security hollow metal doors with the following features.

a. Mogul key operated one or two sides.
b. Five lever tumblers with spring tempered brass/bronze screws.
c. Malleable iron case and cover.
d. Bronze deadbolt 20 by 38 by 16 mm 3/4 by 1 1/2 by 5/8 inch throw.
e. Lock case and cover primed for paint.
f. Lock mounting plate including escutcheon, mounting screws and strike.

2.5.7 Type 7 Lock

Mechanical spring lock for use on chase and access doors with the following features.

a. Mogul key operated one side only.
b. Five lever tumblers with spring temper brass/bronze springs.
c. Malleable iron case and cover.
d. Bolt retracted by key 25 by 12.7 mm with 11 mm one by 1/2 inch with 7/16 inch throw.
e. Lock case and cover primed for paint.
f. Mounting screws and strike.

2.6 DOOR CLOSERS

2.6.1 Type 1 Door Closers

Surface mounted door closer shall conform to test requirements of ANSI/BHMA A156.4, PT 1, Grade 1.

a. C02011: Regular Arm Type

b. C02021: Parallel Arm Type

Closers installed on labeled fire doors shall meet UL 228. Closers shall be non-handed and installed with hex nut and bolts assembly. Exposed screws shall be security type.

2.6.2 Type 2 Door Closer

Concealed overhead closer meeting test as required by ANSI/BHMA A156.4 PT6 Grade 2.

C05032: Concealed Arm and Track - Butt hinge hung

Closers shall be installed in a 100 mm 4 inch head section.

2.7 STRIKES

Mortised strikes shall be compatible with the lock which it serves. Provide dust box and switch to monitor lock bolt where indicated in set numbers.
2.8 DOOR TRIM

2.8.1 Loop Type Pulls

Manganese bronze or stainless steel 200 mm 8 inches center-to-center surface mounted with spanner type screws. Pulls shall be in accordance with ANSI/BHMA A156.6 J401.

2.8.2 Flush Type Pulls

Manganese bronze or stainless steel set for one side or back to back mounting with spanner type screws. Pulls shall be in accordance with ANSI/BHMA A156.6 J403.

2.8.3 Door Stops and Holders

2.8.3.1 Type PH1

In accordance with ANSI/BHMA A156.8 -C01511; overhead concealed slide type. Exposed screws shall be spanner head.

2.8.3.2 Type PH2

In accordance with ANSI/BHMA A156.8 -C02511; overhead surface mounted slide type; attached with hex nut and bolt assemblies. Exposed screws shall be spanner head.

2.8.3.3 Type OH3

In accordance with ANSI/BHMA A156.8 -C08511, overhead surface mounted rod type, attached with hex nut and bolt assemblies. Exposed screws shall be spanner head.

2.8.3.4 Type FS1

In accordance with ANSI/BHMA A156.16 -L02131. Bronze.

2.8.3.5 Type FS2

In accordance with ANSI/BHMA A156.16 -L01371. Bronze.

2.8.3.6 Type FS3

In accordance with ANSI/BHMA A156.16 -L02141-L02161. Bronze. Exposed screw shall be spanner head.

2.9 DEADBOLTS (HEAD AND FOOT BOLT)

Surface mounted and 25 mm one inch diameter with 20 mm 3/4 inch throw. Bolt shall be operated by spanner key case, be malleable iron, or steel with cover. Attachment shall be with spanner head screws.

2.10 DOOR POSITION SWITCHES

2.10.1 Type 1 Door Position Switch

Mechanically mortised door position switch with the following features:

a. Components concealed when door is in closed position.
b. Switch mechanism housing mortises into door frame headers.
c. Galvanized steel actuator arm.
d. Actuator arm track mortises into the top rail of the door.
e. Allows door opening 180 degrees.
f. Switch monitors door position within \(20 \text{ mm } 3/4 \text{ inch}\) from the leading edge of the door to the door stop.
g. Unit constructed of brass and plated steel. The exposed face plate galvanized steel.
h. Switch single pole, double throw type with a rating of 5 amps at 125/250 V ac.
i. Color coded wires with a pair of cable connectors.

2.10.2 Type 2 Door Position Switch

A magnetic door position switch for meeting requirements for UL 634 for mounting in head of door to indicate closed door position. Provide the following features:

a. Mortised into door frame header.
b. Potted components.
c. Life expectancy per manufacturer - over 1 million operations.
d. Maximum contact rating:
   (1) Current, resistive load - 1 amp.
   (2) Power, resistive load - 24 V ac.
e. Maximum current at 24 V ac, resistive load - 1 amp.

2.11 SECURITY DOOR ACCESSORIES

2.11.1 Wall Bumpers

In accordance with ANSI/BHMA A156.16 Type L02101.

2.11.2 Thresholds

Aluminum extrusion minimum thickness 4.4 by 125 mm 0.172 by 5 inches wide by 12 mm 1/2 inch rise with panic stop and vinyl or neoprene insert.

2.11.3 Drip Strip

Extruded galvanized steel strip 64 mm 2 1/2 inches wide with 16 mm 5/8 inch back strip. Attach to shower doors with a continuous weld.

2.11.4 Weatherstrip

Apply for head and jambs, pressure sensitive adhesive silicone rubber seal.
2.12 SCREWS AND FASTENERS

**************************************************************************
NOTE: There are several types of "tamper-resistant"
fasteners and screws which provide different levels
of security. Specify fasteners which will provide
the level of security required. Consult detention
hardware manufacturers.
**************************************************************************

Comply with detention manufacturer's standard fastening hardware and
recommendations for size, type, and material.

2.12.1 Fabrication

Finish exposed fasteners to match hardware fastened. Fabricate fasteners
of the same metal as hardware fastened, except use plated brass or
stainless steel for fastening aluminum.

2.12.2 Location

Provide spanner head screws and fasteners for exposed hardware.

2.13 TEMPLATE HARDWARE

Hardware to be applied to frames and to doors shall be made to template.

PART 3 EXECUTION

3.1 EXAMINATION

Examine doors, frames, and hardware for damage, defects, and suitability
for intended use. Inspect components and adjacent areas of construction
for conditions that could be detrimental to the proper operation or
performance of the detention hardware.

3.2 INSTALLATION

Sequence and procedures for installation shall be in accordance with
detention hardware manufacturer's instructions.

3.3 ADJUSTMENT AND CLEANING

Examine hardware for complete and proper installation. Lubricate bearing
surfaces of moving parts. Adjust hinges, locks, and keepers to function
properly. Test keys for smooth operation and for conformance to approved
keying system. Hardware shall operate freely without binding and be
properly aligned. Protect hardware from paint, stains, weather, and other
damage until acceptance of the work.

3.4 FIELD QUALITY CONTROL

After hardware has been installed and placed in operating order, conduct
performance tests which shall demonstrate to the Contracting Officer that
the hardware operates as specified. Remove items that fail to conform to
the requirements specified and replace with new.
3.5 TRAINING

Upon completion of the work and at a time designated by the Contracting Officer, a manufacturer's technical service representative or manufacturer's authorized representative for the locking control system, shall instruct Government personnel in the proper operation, troubleshooting, maintenance, safety, and emergency procedures of the system. The period of instruction shall be four 8-hour sessions. Conduct training at the job site. The Government shall have the option to video tape training sessions. Notify the Contracting Officer at least two weeks in advance.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for locking control systems which control all electrically controlled hardware and motorized gates and doors, including but not limited to solenoid locks.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The system monitors and annunciates the status condition of electrically equipped hardware, doors, gates, control conditions, security conditions, call-in signals, and other functions as specified herein.

NOTE: Show the following information on the project drawings:

1. Location of locking control panels.
2. Electrified door hardware.

3. Homerun indications from electrified door hardware to appropriate locking control panel.
a. Locking control panels: Provide mounting for various control switches, audible annunciators, and visual annunciators which provide control and annunciation interface between the staff and the locking control system.

b. Logic units: Provide logic transactions necessary to implement the functional operation of the locking control system.

c. Relay terminal equipment: Provide relay terminal equipment, with terminal facilities for field wiring and relay equipment for the conversion of low energy system control to high energy control signals, as necessary to control and operate devices as specified in this section.

1.2.2 General Control and Annunciation

The following paragraphs describe the operation for various devices controlled and annunciated at locking control panels.

1.2.2.1 Hardware

**************************************************************************
NOTE: Coordinate with door schedule shown in the architectural drawing.
**************************************************************************

Provide operational and annunciation provisions for each electrically controlled and monitored hardware set as specified herein. Refer to architectural door schedule for door hardware information. Provide hardware type in accordance with Section 08 71 63 DETENTION HARDWARE.

a. Annunciation: Annunciate each door and gate equipped to be monitored and controlled in the following manner. Single red indicator on the locking control panel illuminates on nonsecure condition at the door or gate. On swing doors and gates, the annunciation occurs on the first movement of the locking mechanism. Door and gate position switches causes the annunciation on nonsecured position. Monitor secured status of controlled doors and gates by either two or more position switches which include but are not limited to door on gate position, lockbar position, roller bolt position, latch-bolt position, and motor limit switches. Annunciate nonsecure condition by any one nonsecure switch on a given hardware set.

b. Cell and shower door solenoid: Where cell doors are equipped with solenoid locks, the following operation applies. Pressing the "unlock" switch of an "unlock - lock" pair of membrane switches on a locking control panel causes the hardware to unlock and remain unlocked until the "lock" switch is pressed. When the "lock" action is taken, the lock bolt extends, regardless of whether the door has been opened or not, except on deadbolt locks. Group unlock provisions must allow hardware to be held unlocked.

c. Corridor and miscellaneous solenoid: Where corridor and other doors are equipped with solenoid locks, and the specific door operation is not given elsewhere in this section, the following operation applies. Pressing the "unlock" switch of an "unlock/lock" pair of membrane switches on a locking control panel causes the hardware to unlock and remain unlocked until the "lock" switch is pressed. When the "lock" action is taken, the lock bolt extends, regardless of the door having been opened or not, except on deadbolt locks.
d. Key relock doors solenoid: Where fire egress doors are equipped with hardware which, when electrically unlocked, requires a key action at the door to relock, the following operation applies: Unlocking the door requires the simultaneous pressing of two unlock membrane switches. Releasing the switches on the locking control panel causes the operating power to return to the locked state.

e. Deadbolt solenoid locks: Where doors are equipped with electrically operated deadbolt locks, the operation is as specified for solenoid locks on noncell doors, except the bolt must not extend until the controls are in the "lock" condition and the door is closed.

f. Motorized overhead gates: Where motor operated gates are installed, the following operation applies. Pressing the "open" momentary action switch causes the gate to travel to the locked open position unless the "stop" momentary action switch is pressed, which will stop the travel of the gate. Pressing the "close" momentary action switch causes the gate to travel to the locked closed position unless the "stop" switch is pressed. Pressing the "open" or "close" switch while the gate is traveling in the opposite direction must have no effect.

1.2.2.2 Hardware Related Functions

**************************************************************************
NOTE: Architectural door schedule should indicate those doors that require interlocking.
**************************************************************************

**************************************************************************
NOTE: Specify night secure function for housing unit locking control panels that control prisoner cells and shower doors.
**************************************************************************

a. Group control: For pretrial and female locking control panels requiring group operation of hardware, the following operation applies: Pressing the "open" or "unlock" membrane switch causes hardware in the associated group to unlock and cause the group control red LED to illuminate. Pressing the "off" switch causes the hardware to react to the condition required by the individual hardware controls, and the group annunciator extinguishes. On group unlock, solenoid locks unlocks in half second intervals.

b. Interlocks: Where two or more doors with electric hardware form a Sallyport or where interlocks between hardware sets occur, the operation of the individual hardware sets are as specified in this section with the following modifications. The controls must allow only one of the hardware sets to be in the nonsecured condition at any given time unless the interlock bypass function is activated. Upon simultaneously pressing the two interlock bypass switches, the red interlock bypass LED flashes on panels which control hardware in the same interlock scheme and allow the operator to control hardware with no interlock restrictions. By pressing the interlock bypass switch the second time, the interlock scheme reactivates. Provide locking control panels controlling interlocked doors with the interlock bypass switch and annunciator provisions. An amber "interlock active" LED illuminates on panels controlling hardware in a given interlock scheme when one or more of the interlocked doors are nonsecured. A separate
annunciator for each interlock scheme on each controlling panel
annunciates the "interlock active" condition. Once an interlock scheme
has become active, activation of other unlock controls for hardware in
the same scheme must have no effect and where the controls are
specified as maintained contact devices and more than one has been
placed in the unlock condition while the interlocks are active, upon
resecuring of the original hardware one and only one of the additional
doors will open in response to the multiple unlock switch position.
Upon simultaneous operation of central devices in an interlock scheme,
one and only one will cause a hardware set to become nonsecure.

c. Monitored doors and gates: Doors which are equipped with hardware
which monitors the secure status and are not electrically operated, is
monitored in the following manner: The door or gate red LED functions
as specified for annunciation above, except as described in this
paragraph. Control panels monitoring monitored-only doors and gates
provides night secure provisions. The night secure provisions secures
all doors and gates unless specific groups are required. Once the
doors or gates are secured, this function alerts the control officer of
unsecured conditions. Pressing the night secure switch on membrane
switch panels causes the secure mode to become active and the secure
green LED to illuminate. Upon activation, hardware in the nonsecure
condition or hardware which becomes nonsecure causes an audible alarm
to sound and the status LED for the nonsecure hardware to latch
illuminated until reset. Pressing the silence switch silences the
audible alarm. The secure function annunciates subsequent alarms
audibly and visually in the manner specified above. Pressing the
secure reset switch releases latched indicators, extinguish the secure
green LED, and return the panel to normal operation.

d. Shower and cell call-in: For the shower and cell doors in the pretrial
and female areas, the following operation applies: Pressing the
momentary action pushbutton in the cell or shower causes an amber LED
associated with the cell or shower on the locking control panel to
flash and an audible signal sounds. Pressing the control panel
momentary action silence switch on the control panel silences the
audible signal and cause the LED to illuminate constantly. Pressing
the control panel momentary action call-in reset switch extinguishes
the LED. Once an individual cell or shower has been received at the
control panel and has been silenced, additional activations of the same
cell or shower call-in switch must have no effect. Silencing one
call-in will not inhibit other calls from being received.

e. Control panel enable/disable keyswitch: Equip the locking control
panel located at the reception counter with a keyswitch mounted on the
front that enables and disables the locking panel control functions.

1.2.3 Battery Power

Provide batteries, complete with charging system as back-up power, in the
event of a utility and emergency power failure. Provide adequate capacity
to supply locking control system electrical load for a period of four
hours. On restoration of utility or emergency power, the batteries must
automatically be recharged. Battery backup provides power to support input
status and LED annunciations, output controls, and memory retention.
Battery backup power is not required for power source which actually
operates the locking door or gate hardware.
1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
- Locking Control Systems
- Security Equipment Cabinets
- Graphic Locking Control Panels
- Linear Locking Control Panels
SD-03 Product Data
- Control Devices

SECTION 08 71 63.10 Page 8
Light Emitting Diodes
Audible Signal Devices
Control Power Transformer
Batteries
Auxiliary Relays
DC Power Supply
Wiring Materials
Submit specifications and data sheets.

SD-07 Certificates

Locking Control System Components
Submit manufacturer's certificates attesting that materials meet specified requirements.

SD-08 Manufacturer's Instructions

Graphic Locking Control Panels
Linear Locking Control Panels
Security Equipment Cabinets
Submit construction specifications.

SD-10 Operation and Maintenance Data

Locking Control Systems, Data Package 2; G[, [____]]
Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Include as-built wiring diagrams complete with conductor color codes, conductor number, and termination identification. General system descriptions included in manufacturer's catalogs or advertising media will not be acceptable in meeting the operation and maintenance manual requirement.

1.4 QUALITY ASSURANCE

Programmable controller must be the product of a manufacturer engaged in the production of controllers for industrial applications.

1.4.1 Drawing Requirements

Submit installation drawings and wiring diagram for the overall system and for each of the following major components. Show how each item of equipment will function in the system and include an overall system schematic indicating relationship of components. Prior to preparation of drawings, review the electrical and operational characteristics of each electrically controlled and monitored hardware. Include a layout of
devices to be installed in non-graphic locking control panel. Include cabinet dimensions, full dimensional drawings, and layout of equipment to be installed within security equipment cabinets. Include full dimensional drawings of graphic panels and non-graphic panels. Include layout of each display panel at a minimum of one-half full scale illustrating graphic layout orientation for area and position of devices required in console, as well as dimensional drawing of housing.

1.5 EXTRA PARTS

1.5.1 Programmable Controller

At final inspection, furnish one spare controller composed of one fully equipped processor, 1 percent space I/O interface boards (minimum of one), and 1 percent spare I/O modules (minimum of one of each type used).

1.5.2 Erasable Program Read-Only Memory (EPROM)

Provide one spare EPROM loaded with the proper software for each programmable controller and located with the controller in a protective enclosure. Mark the enclosure "SPARE EPROM" and physically identify the EPROM for use in the specific controller.

PART 2 PRODUCTS

2.1 LOCKING CONTROL PANEL COMPONENTS

2.1.1 Switches

Provide unembossed, nontactile, momentary contact membrane-type switches for control devices installed in the graphic and linear panels. Provide operating force of membrane-type switches of 2.22 N 8 ounces. Supply membrane switches with silver contacts and proper circuitry to perform functions as specified in this section. Supply membrane switches in modules with no more than four individual switches in each.

2.1.2 Light Emitting Diodes (LED)

Provide T 1 3/4 light emitting diodes (LED) visual indicators with resistors and protective diodes as required for operation at 24 volts dc. Provide indicators rated at a minimum of 4 million hours of operation at 20 milliamps dc and produce a minimum of 147 and 570 lumens/watt for red and yellow devices, respectively. Size resistors according to the manufacturer's instructions and adjusted to produce uniform brightness among LEDs. Mount resistors and protective diodes on standoff terminal blocks mounted adjacent to the LED served on the underside of the panel. Mounting hardware must not be visible from the face of the panel. Resistors and protective diodes may be an integral part of the LED. Include a red LED in the panels for each electrically controlled and monitored door.

2.1.3 Press to Test

Each locking control panel must contain a "press to test" pushbutton which tests visual and audible signal devices.

2.2 GRAPHIC LOCKING CONTROL PANELS

**************************************************************************
SECTION 08 71 63.10 Page 10
NOTE: Provide graphic type locking control panels for housing unit control panels that control prisoner cell, shower, or for locking control panels that control remote doors such as exterior doors. Specify linear type for all others.

2.2.1 Metal Control Cabinets

Provide graphic panel for locking system controls for installation in metal control cabinets as specified in this section. Custom build each graphic panel for the specific area to be controlled.

2.2.2 Construction

Construct graphic panel of 14 gage sheet steel with 38 mm 1 1/2 inch flange on all sides and cover for mounting devices hinged to frame at top. Provide continuous piano-type hinge. Secure panel to metal control cabinet with flathead, No. 8, 38 mm 1 1/2 inch flathead wood screw steel bolts on centers not exceeding 200 mm 8 inches. Overall general dimensions indicated are maximum dimensions. Coordinate mounting dimensions and support requirements with metal control cabinet installation.

2.2.3 Finish

Prime finish surfaces of the graphic panel, except that portion containing the graphic display, with rust inhibiting paint and two coats of hammertone finish gray enamel. Attach a reverse silkscreen polyester plastic film or lexan panel with nomenclature set forth in this specification to the graphic panel.

2.2.4 Graphic Display - Floor Plan Area

Provide graphic display of building floor plan area containing locking devices to be controlled. Display must graphically illustrate each electric-operated locking device to be controlled and also include legends of 5 mm 3/16 inch high letters in contrasting color. Provide graphic display in accordance with typical graphic display panel indicated, modified as required for the specific area and orientation of the building to be controlled. Scale of the graphic display may not be less than 3 mm per 300 mm 1/8 inch per foot. Make display with not more than eight colors.

2.2.5 Wiring

Group wiring on underside of graphic display and lace with nylon tie straps, support on intervals a maximum of 200 mm 8 inches and terminate on identified terminal blocks at top of panel adjacent to hinged side. Strand wiring spanning hinge on conductors. Terminate conductors with crimp-type lugs of both sets of terminal blocks. Leave 150 mm 6 inches of slack in conductors.

2.2.6 Graphic Display - Central Control Room

Provide a facility site plan graphic display of central control room main graphic locking panel. Control or monitor exterior doors from this panel.
2.3  LINEAR LOCKING CONTROL PANELS

2.3.1  Linear Panels

Provide linear panels as indicated and as specified to control groups of designated electric-operated locking devices. Manufacture and install linear locking control panels with same type materials and process as graphic locking control panels and identical except that graphic floor plan display is not required.

2.4  WIRING REQUIREMENTS

2.4.1  Power Wiring

Provide No. 14 THWN or XHHW conductors for solenoid-operated lock sets operating at 120 volts. Connect solenoid-operated lock sets operating at 24 V ac or dc with No. 16 MTW conductors.

2.4.2  Control Wiring

Provide class one signaling circuits as defined by Article 725 NFPA 70 for status indicator wiring. Install No. 16 MTW conductors in common conduit and equipment enclosures with other conductors for locking devices within limitations defined by Article 725-15 NFPA 70.

2.4.3  Wiring Materials

Use solid copper conductors for wiring systems. Stranded conductors will be acceptable only where all terminations can be made to screw type lug. Where stranded conductors are used, make all terminations with crimp type lug, size correctly for termination, and apply to conductor with crimping tool intended for use with lug used.

2.4.4  Color Coding

Color-code wiring systems, providing each conductor for individual lock sets and operating mechanisms with a distinctive color. Use white only for neutral conductors, and use green only for grounding conductors.

2.5  DISCRETE ELECTRONIC LOCKING CONTROL SYSTEM

2.5.1  Logic Units

Discrete electronic locking control system consisting of logic units in the form of printed circuit boards, relay terminal equipment, and associated hardware and wiring. Control system must accept input control information from and send output status information to graphic and linear type locking control panels.

2.5.2  Printed Circuit Boards

Logic units provided with circuitry necessary to perform the functions as specified. Mount circuit boards in a card cage frame, arranged to allow front and back access. Provide wiring connections to printed circuit boards capable of being connected to allow field replacement of printed circuit board with no disconnection or desoldering of wiring. Rack mount card cage frame in security equipment cabinets.
2.5.3 Relay Terminal Equipment

Consisting of electronic relays that switch the power wiring for locking and control devices. Control relays must be optically isolated, solid state type devices, rated for at least 50 percent more than connected load, capable of handling all connected load voltages, and provide a minimum of 2500 volts root mean square (RMS) isolation. Group and lace wiring with nylon tie straps, supported in intervals not to exceed 200 mm 8 inches and terminated on identified terminal blocks. Rack mount relay terminal equipment in security equipment cabinets.

2.6 PROGRAMMABLE CONTROLLERS

Programmable controllers may be provided in lieu of discrete electronic locking control for locking control, door monitoring, annunciation and other specified functions. Provide all necessary logic functions, timing functions, input points, output points, memory, communication capabilities and software for the operating features specified in this section. Individual input/output, (I/O), interface boards and I/O modules are considered part of the controller even if physically separated. Controller must be general purpose in nature, not custom designed and built for an isolated application, and not location specific in its construction. Controller may be made location specific and operationally customized by installing EPROM with applicable software and making the I/O interface boards system specific by setting the proper address via DIP switches or plug-in headers, and installing the proper I/O modules.

2.6.1 Logic Functions

Include, but do not limit to logical AND, OR, and INVERT functions implemented in sufficient levels to provide specified operating features. Arrange logic in such a manner as to prevent unsecure conditions from arising as a result of power failure to part or all of the control power system.

2.6.2 Timing Functions

Include, but do not limit to on-delay, off-delay, pulsing and stepping functions with programmable timing in sufficient variations and quantities to provide specified operating features.

2.6.3 Input/Output

Plug-in mounted on the I/O interface boards and held securely by screw type fasteners. Provide I/O modules as solid state devices providing a minimum of 2500 volts RMS (root means square) isolation. Provide output point modules rated for both voltage and load of device controlled including constant duty and inrush currents. In the event of power failure, output points controlling electrical locks and gates must fail in the secure condition, except shower points. Provide input point modules compatible with input device and voltage connected.

2.6.4 Software

Provide system and operating software and fixed data base contained in erasable program read only memory. Provide operating data base contained in random access memory backed up with a minimum of 48 hours of rechargeable batteries. Charge must be maintained by the controller. Develop operating software for each controller on an individual basis.
2.6.5 Processor

Controller processor communicates to and from the I/O interface boards via a multipair, bidirectional communication bus incorporating digital multiplexing techniques. Communications facilities must allow the processor to communicate with remotely located I/O interface boards at a distance of up to 305 meters 1000 feet. Where operational features require two or more controllers to interact, hard wire the interaction, point for point. Optionally, data communication may be provided for controller to controller interaction provided operational considerations remain unchanged.

2.6.6 Interface

Standard printed circuit boards containing the necessary coding/decoding solid state circuits for communicating with the processor, method of setting board address as required in this section, LED indicators which display the status of each point and plug-in input/output modules.

2.6.7 Voltage

Provide controller that operates on 105 to 130 V ac, 60 Hz and contains an integral circuit breaker for overload protection. Controller must operate properly in environmental conditions of zero to 60 degrees C in up to 95 percent humidity (noncondensing). Controller must conform to electrical noise standards of IEEE C37.90.1 and NEMA ICS 1.

2.6.8 Speed

Provide controller speed such that no delay is noticed between the initiation of a control function such as operating a switch or opening a monitored door, and the resulting control action.

2.7 CONTROL POWER TRANSFORMER

Provide control power transformers to supply low voltage, 24 V ac power for locking control or signaling devices. Provide transformer with secondary, 24 V ac output with circuit breaker type overload interruption. Provide transformer rated for not less than 20 percent of load imposed on transformer of most severe loading condition. Provide power source for control power transformer from building emergency power system.

2.8 DC POWER SUPPLY

2.8.1 Low Voltage Power Supply Units

Provide low voltage dc power supply units to provide 24-volt regulated, filtered dc power for locking controls, dc locks and signal devices. Provide 24 V dc output power with ampere rating not less than 150 percent of load imposed on power supply under most severe conditions of load. The dc output must be fused. Regulate output voltage within plus or minus 5 percent from no load to full load. Power supply unit must be U.L. listed. Provide power source for dc power supply unit from panelboards that are fed from emergency generator.

2.8.2 Multiple Power Supplies

Where low voltage dc requirements for control devices operated at maximum load exceed output of a single power supply, provide multiple power
supplies and subdivide loads to prevent overloading the power supply unit.

2.9 SECURITY EQUIPMENT CABINETS

2.9.1 Location

Provide cabinets where indicated to house auxiliary control system components such as power supplies, control power transformers, auxiliary relays, and amplifiers.

2.9.2 Construction

Provide surface mounted cabinets, constructed of code-gage steel, and finished on all surfaces with rust inhibiting prime coat and two coats of flat medium gray enamel paint. Provide hinged door and flush mounted lock and latch.

2.10 METAL CONTROL CABINETS

Provide cabinet to house locking control equipment. Furnish multiple cabinets assembled to form a single unit with space to accommodate equipment required to be installed therein.

2.10.1 Construction

Provide louvered cabinet sides, 16 gage sheet steel attached to 14 gage, 12.7 mm 1/2 inches wide angle frames from the inside with bolts. Provide cabinet front with hinged, lockable louvered doors, keyed alike. Provide cabinet rear panel of solid sheet steel unless the cabinet is mounted against a solid wall, in which case, a back is not required. Prime and paint trim, braces, angles, and exterior sides. Visual parts outside the cabinet will be beige. Provide cabinet with 305 mm 12 inch writing surface the same width as the cabinet mounted approximately 760 mm 30 inches above the floor.

2.10.2 Sloped Turrets

Provide the top part of the cabinets with sloped fonts. The approximate slope of the turret off the horizontal axis should be 0.523 rad 30 degrees. Provide cabinets 635 mm 25 inches front to back unless indicated otherwise, and a maximum overall height of 1065 mm 42 inches.

2.10.3 Cooling Fan

Provide a cooling fan located on the interior of the panel side with a capacity of 9.63 cubic meter 340 cubic feet per minute equipped with an integral charcoal filter. Position the fan intake as low as possible in the cabinet. The fan must be fused, operate at 120 volts, and operate continuously.

2.10.4 Groupings

Group conductors by systems and tie with nylon tie straps. Shape wire bundles for support from top and sides of structure. Do not attach support devices to removable panels.

2.10.5 Protection

Where groups of conductors or single conductor pass through metal framing
or panels, protect conductors with rubber or plastic grommets.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Locking Control Panels

Install graphic locking control panels and linear locking control panels in metal control cabinets as specified. Coordinate installation of locking control panels in metal control cabinets with respect to dimensions, mounting and accessibility.

3.1.2 Security Equipment Cabinets

Install security equipment cabinets for locking control systems in the security equipment or electrical room closest to the associated locking control panel.

3.1.3 Junction Boxes

Provide junction boxes required for locking systems wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Do not install junction boxes and pull boxes in areas accessible to prisoners.

3.1.4 Conduit Systems

Provide conduit systems required for locking systems wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

3.1.5 Wiring Systems

3.1.5.1 Wiring Specification

The work under this section includes the installation of wiring for the electrically operated locks, gates, and doors. The actual connections to individual locks, doors, and gates and the actual connections in the control panels and consoles is also included under this section. Coordinate this portion of the work with the detention hardware manufacturer.

3.1.5.2 Grouping

Group conductors within junction boxes, pull boxes, and equipment enclosures and lace with nylon tie straps with identification tabs, in individual sets servicing individual lock sets or operating mechanisms. Identify conductor groups on the strap with respect to room or operator served.

3.1.5.3 Continuous Runs

Do not splice locking system conductors. Conductors must be continuous between locksets and termination point for control panel.

3.1.5.4 Surge Protection

Protect communication and data equipment against surges induced on control, sensor, and data cables. Provide cables and conductors which serve as control, sensor or data conductors with surge protection circuits installed.
at each end that meets the IEEE C37.90.1 surge withstand capability test. Do not use fuses for surge protection.

3.1.5.5 Grounding

Provide grounding of wiring for locking control system in accordance with NFPA 70.

3.1.5.6 Wiring

Install wiring for locking control system in accordance with NFPA 70 and the approved locking control system wiring diagram.

3.2 PROTECTION OF EQUIPMENT

Due to the sensitivity of the locking control equipment to dust, dirt, condensing humidity, and other products normally found on construction sites, take precautions to ensure that the equipment is kept clean.

3.3 FIELD QUALITY CONTROL

Upon 7-days notice to the Contracting Officer, conduct the following tests in the presence of the Contracting Officer.

3.3.1 Locking Control System Test

Perform an operational system test to verify conformance of locking control system to this specification. Tests include the activation of all individual and group locking controls keep verification of operation, and verification of status annunciation of controlled devices.

3.3.2 Retesting

Rectify deficiencies indicated by test and completely retest work affected by such deficiencies.

3.4 TRAINING

Upon completion of the work and at a time designated by the Contracting Officer, furnish a competent technician regularly employed or authorized by the manufacturer of the locking control system to instruct Government personnel in the proper operation, troubleshooting, maintenance, safety, and emergency procedures of the locking control system. Provide a period of instruction of four eight-hour working days. Conduct the training at the job site. The Government has the option to record the training session.

3.5 EQUIPMENT SCHEDULES

The equipment schedules for locking control panels contained in this section of the specifications represent the type of control functions and status indication devices required in each locking control panel. Switches and LEDs must conform to the requirements for control devices and visual indicators as specified.

**************************************************************************

NOTE: Panel schedule is a sample to be used as a guide by the writer for developing locking panel. Information on the schedules should be as follows: the name of locking control panel, type (graphic or...
linear), mounting (metal control cabinet), and location. Also list the function (e.g., press to test switch, silence switch, interlock bypass, interlock active, etc.) and quantity. These functions are individually described in this section. Under "REMARKS" include a brief description of the function. Finally, list the quantity and type of all security and builders hardware controlled or monitored by the locking control panel. Refer to architectural door schedule for type of door hardware.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for normal glazing. For specifying pre-assembled window units used in residential buildings, utilize the following Sections: 08 51 13 ALUMINUM WINDOWS, 08 52 00 WOOD WINDOWS, or 08 53 00 PLASTIC WINDOWS.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: If special glazing such as leaded glass, laminated transparent mirrors, or plastic glazing for unprotected openings is required, add appropriate paragraphs.

NOTE: On the drawings, show:

1. Locations of each type of glass, using same terminology as in specification.

2. Thickness of glass, unless glass of each type is same thickness.

3. Frame and rabbet details, indicating method of glazing.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ARCHITECTURAL MANUFACTURERS ASSOCIATION (AAMA)

AAMA 800 (2016) Voluntary Specifications and Test Methods for Sealants

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air
Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

NOTE: Regarding the use of SD-03 Product Data and SD-07 Certificates, only use one of these on complicated and large products. It is preferred to use SD-03 Product Data. If control tower glazing data is only available by certificates, use SD-07 Certificates.

SD-03 Product Data
- Insulating Glass
- Plastic Glazing
- Glazing Accessories
- Sealants
- Joint Backer

SD-04 Samples
- Insulating Glass
- Plastic Sheet
- Glazing Compound
- Glazing Tape
- Sealing Tapes

[ SD-07 Certificates
- Insulating Glass
- Plastic Glazing

] SD-08 Manufacturer's Instructions

SECTION 08 81 00 Page 8
Warranty for Insulated Glass Units

Warranty for Polycarbonate Sheet

Warranty for Monolithic Reflective Glass

Warranty for Monolithic Opacified Spandrel

**************************************************************************

NOTE: The Energy Star designation below is for residential windows only.
**************************************************************************

Energy Efficient Equipment for Residential Windows; S

[1.3] SYSTEM DESCRIPTION

Fabricate and install watertight and airtight glazing systems to withstand thermal movement and wind loading without glass breakage, gasket failure, deterioration of glazing accessories, or defects in the work. Glazed panels must comply with the safety standards, in accordance with ANSI Z97.1, and comply with indicated wind/snow loading in accordance with ASTM E1300. Sloped glazing must comply with AAMA GDSG-1 and AAMA TIR A7, and IGMA TB-3001.

[1.3.1] Glazing for Passive Solar and Dynamic Control Fenestration

**************************************************************************

NOTE: Use the following paragraph if design is utilizing Passive Solar Heating Systems or Chromogenic Fenestration.
**************************************************************************

Identify glazing for Passive Solar and Dynamic Control Fenestration noted as part of a passive solar heating system and/or chromogenic fenestration and evaluate separately from other fenestration. Glazing for use in Passive Solar systems are exempt from SHGC requirements. Area-weighted averaging of chromogenic fenestration with other non-chromogenic fenestration is not permitted. For chromogenic fenestration systems, the lower-rated labeled SHGC must be used with automatic controls to modulate the amount of heat flow into the space in multiple steps in response to daylight levels or solar intensity.

[1.4] QUALITY CONTROL

Submit two 203 by 254 mm 8 by 10 inch samples of each of the following: tinted glass, patterned glass, heat-absorbing glass, [_____] and insulating glass units.

Submit three samples of each other material. Samples of plastic sheets must be minimum 125 by 175 mm 5 by 7 inches.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver products to the site in unopened containers, labeled plainly with manufacturers' names and brands. Store glass and setting materials in safe, enclosed dry locations and do not unpack until needed for installation. Handle and install materials in a manner that will protect them from damage.
1.6 ENVIRONMENTAL REQUIREMENTS

Do not start glazing work until the outdoor temperature is above 4 degrees C (40 degrees F) and rising, unless procedures recommended by the glass manufacturer and approved by the Contracting Officer are made to warm the glass and rabbet surfaces. Provide ventilation to prevent condensation of moisture on glazing work during installation. Do not perform glazing work during damp or rainy weather.

1.7 WARRANTY

**************************************************************************
NOTE: The warranty clauses in this guide specification have been approved by a Level I Contracting Officer, and may be used without further approval or request for waiver.
**************************************************************************

**************************************************************************
NOTE: Delete inapplicable paragraph[s].
**************************************************************************

1.7.1 Warranty for Insulated Glass Units

Warranty insulating glass units against development of material obstruction to vision (such as dust, fogging, or film formation on the inner glass surfaces) caused by failure of the hermetic seal, other than through glass breakage, for a 10-year period following acceptance of the work. Provide new units for any units failing to comply with terms of this warranty within 45 working days after receipt of notice from the Government.

1.7.2 Warranty for Polycarbonate Sheet

For a 5-year period following acceptance of the work:

a. Warranty Type I, Class A (UV stabilized) sheets against breakage;

b. Warranty Type III (coated, mar-resistant) sheets against breakage and against coating delamination;

c. Warranty Type IV (coated sheet) against breakage and against yellowing;

d. Warranty extruded polycarbonate profile sheet against breakage.

For a 10-year period following acceptance of the work, warranty Type IV against yellowing and loss of light transmission.

1.7.3 Monolithic Reflective Glass

Manufacturer must warrant the monolithic reflective glass to be free of peeling or deteriorating of coating for a period of 10 years after Date of Substantial Completion. Warranty must be signed by manufacturer.

1.7.4 Monolithic Opacified Spandrel

Manufacturer must warrant the opacifier film on the spandrel to be free of peeling for a period of five years after Date of Substantial Completion. Warranty must be signed by manufacturer.
NOTE: Specifically identify any openings that are intended to facilitate solar heat gain for space heating using "passive solar" design strategies. Note that such fenestration is exempt from the Solar Heat Gain Coefficient (SHGC) requirements below. Likewise, passive solar and chromogenic fenestration must be specified and evaluated separately from other fenestration. Area-weighted averaging of chromogenic fenestration with other non-chromogenic fenestration is not permitted.

2.1 PRODUCT SUSTAINABILITY CRITERIA

[2.1.1 Energy Efficient Equipment for Residential Windows

Provide Energy Star residential windows in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING paragraph ENERGY EFFICIENT PRODUCTS.

2.2 GLASS

Design must meet the requirements of UFC 1-200-02, "High Performance and Sustainable Building Requirements" which invokes the requirements within UFC 3-101-01, "Architecture". UFC 1-200-02 and UFC 3-101-01 make references throughout to various ASHRAE documents governing energy efficiency and requirements for the components of building envelope design including fenestrations and glazing.

ASTM C1036, unless specified otherwise. In doors and sidelights, provide safety glazing material conforming to 16 CFR 1201.

2.2.1 Clear Glass

NOTE: Glass areas and thicknesses are based on 1.20 kilopascals 25 pounds per square foot (psf) design wind load and vertical glazing with annealed glass. For other glass and for wind loads greater than 1.20 kPa 25 psf, thickness will depend upon aspect ratio (length divided by width), area, and design wind load. The thickness and area limitations for each type of glass must be indicated or specified. Do
not specify glass less than 3.0 mm 1/8 inch.

Method of Determination for Minimum Glass Thickness:

Refer to UFC 4-010-01 "DoD Minimum Antiterrorism Standards for Buildings", ASTM E1300, ASTM F1642/F1642M and ASTM F2248.

2. Determine aspect ratio, area, and type of glass for each opening to be glazed.

3. Select thickness required from glass manufacturer's chart for each type of glass.

**************************************************************************
**************************************************************************

NOTE: Use the following data on Army projects

a. Category I Products: Doors and glazed panels that contain single piece of glazing material no greater than 0.84 m² 9 ft² in area. The product must be capable of withstanding 203 Nm 150 foot pound impact load test.

b. Category II Products: Doors and glazed panels that contain any single piece of glazing material greater than 0.84 m² 9 ft² in area. The product must be capable of withstanding a 542 Nm 400-foot-pound impact load test. Category II products may be used in both Category I and Category II situations.

c. Doors: 16 CFR 1201 applies to all types of interior doors and exterior doors, including storm doors and combination doors. FIRE/SAFETY RATED GLASS: Is not required for openings in doors through which a 76 mm 3 inch diameter sphere is unable to pass. Glazing for fire doors must be in accordance with NFPA 80, even though this may be at variance with requirements of 16 CFR 1201.

d. Glazed Panels: 16 CFR 1201 no longer applies to exterior and interior glazed panels. FIRE/SAFETY RATED GLASS: Glazed panels must conform to ANSI Z97.1, SAFETY PERFORMANCE SPECIFICATION AND METHODS OF TEST FOR SAFETY GLAZING MATERIALS USED IN BUILDINGS. Since glazed panels may be hazardous, safety glazing should be generally provided as described below:

FIRE/SAFETY RATED GLASS

(1) Glazed panels of any size located adjacent to a
doorway, with the nearest vertical edge of panel within 1219 mm (48 inches) of doorway, and with bottom edge of panel below top of door. Safety glazing is not required for panels separated from the doorway by an intervening interior permanent wall.

(2) Glazed panels with a surface area greater than 0.84 m² (9 ft²) where there is a walking surface on either side of panel, and the walking surface is within 914 mm (36 inches) of the panel. Safety glazing is not required if the lowest edge of the glazing material is 457 mm (18 inches) or more above both walking surfaces, or if the panels have a horizontal member, such as a mullion or permanent railing not less than 38 mm (1-1/2 inches) in width, capable of withstanding a horizontal load of 75 kg/m (50 plf), on the accessible sides of the glazing and located between 609 mm and 914 mm (24 and 36 inches) above the walking surface.

(3) Where insulating glass units are used in locations requiring safety glazing, both panes must be safety glass.

(4) For exterior applications, safety glazing must also meet the wind and snow load requirements in accordance with ASTM E1300.

(5) In general, any glazed area subject to human impact should be provided with safety glazing or other acceptable protective devices such as handrails or horizontal mullions.

ASTM C1036 covers the quality requirements for clear annealed glass, transparent tinted glass, patterned and wired glass with a series of classification designations such as Types, Classes, Qualities, Forms, Finishes, mesh and pattern, as defined below:

1. Type designations are: Type I - Transparent Flat Glass; Class 1 - Clear, or Class 2 - Tinted; Type II - Patterned and Wired Flat Glass, Class 1 - Clear or Class 2 - Tinted.

2. Type I, Class 1 and 2 Quality and Uses: Quality: Q1, for the production of high quality mirrors; Q2, for the production of general use mirrors and other applications; Q3, production of architectural glass products, including coated, heat treated, laminated, and other select glass products; Q4, general glazing applications.

3. Type II, Class 1 and 2 Quality and Uses: Q5, applications in which design and aesthetic characteristics are major considerations; Q6, applications in which functional characteristics are a consideration and blemishes are not a major concern.
4. Form designations are: Form 1 - Wired polished both sides; Form 2 - Patterned and wired, Form 3 - Patterned.

5. Finish Designations are: F1, patterned one side; F2, patterned both sides.

6. Mesh Designations: M1, Diamond; M2, Square; M3, Parallel Strand; M4, Special.

7. Pattern Designation: P1, Linear; P2, Geometric; P3, Random; P4, Special.

**************************************************************************
NOTE: It is critical that skylights be maintainable. Designer must include skylight access devices as a part of the design package where skylights are large or at great heights above floor.
**************************************************************************

**************************************************************************
NOTE: Use the following bracketed statement for Army projects only.
**************************************************************************

[ For interior glazing (i.e., pass and observation windows), 6 mm 1/4 inch thick glass should be used.
 ] Type I, Class 1 (clear), Quality [q4 (A)] [q5 (B)]. Provide for glazing openings not indicated or specified otherwise. Use double-strength sheet glass or 3 mm 1/8 inch float glass for openings up to and including 1.39 square meters 15 square feet, 4.5 mm 3/16 inch for glazing openings over 1.39 square meters 15 square feet but not over 2.79 square meters 30 square feet, and 6 mm 1/4 inch for glazing openings over 2.79 square meters 30 square feet but not over 4.18 square meters 45 square feet.

2.2.2 Annealed Glass

**************************************************************************
NOTE: Annealed glass is used for general glazing where clear or tinted glass is required. Glass thickness must be shown on drawings. Under some heavy thermal conditions, tinted glass may require heat strengthening for thermal endurance.
**************************************************************************

Annealed glass must be Type I transparent flat type, [Class 1 - clear, ] Quality q3 - glazing select, [_____] percent light transmittance, [_____] percent shading coefficient, conforming to ASTM C1036.

2.2.3 Heat-Absorbing Glass

**************************************************************************
NOTE: For Use On Army Projects Only: Heat-absorbing and light-absorbing glass may be used in accordance with TI 800-01, DESIGN CRITERIA.
Tinted (light-reducing) glass may be used where glare is a problem and a reduction of visible light transmission is desired. Visible light transmittance will vary from 15 to 85 percent, depending on color density and thickness. Color density is a function of thickness and increases as the thickness increases; visible light transmittance will decrease as thickness increases. ASTM C1036 separates Heat-Absorbing and Tinted (light-reducing) glasses into categories, Higher light transmittance, and Lower light transmittance, which is based on the maximum solar energy transmittance by glass thickness.

Refer to ASTM C1036 for evaluation quality requirements and glass manufacturer's data for color selection, light transmittance and shading coefficient. When specifying performance and color, the available ranges of performance and colors should be specified for glazing units to allow several manufacturers to bid. When matching existing glass, provide existing manufacturer's name, color and acceptable range for shading factor, light transmittance, indoor and outdoor reflectance.

Heat-absorbing and light-reducing glass is affected by thermal stresses which can result in breakage. Care should be taken to make sure that the glass units will not be thermally overburdened. Glass that will be thermally overburdened should be Heat-Strengthened or, if safety glazing is required, Fully Tempered to resist thermal breakage. Refer to ASTM C1048 for quality evaluation and refer to manufacturer's data for performance and color selection.

Factors which increase the risk of breakage include building orientation, unusual shapes of lites, large lites, indoor shading devices, heating registers, and outdoor shading by trees, structure or exterior shading devices.

**************************************************************************
**************************************************************************
NOTE: For Navy Projects, consult manufacturer's literature for colors, thicknesses, and transmittance values available. Coordinate with safety glazing requirements and paragraph TEMPERED GLASS.
**************************************************************************
**************************************************************************

Type I, Class 2 (tinted), Quality [q3 (select)] [q4 (A)], [_____] mm inch thick, [blue][green] in color, [_____] percent light transmittance, [_____] percent shading coefficient, conforming to ASTM C1036.

2.2.4 Reflective Coating Vision Glass

ASTM C1376
2.2.5 Wired Glass

**********

NOTE: Wired glass is no longer produced in the United States. On 17 March 1992 (effective for a five year period) OSD determined that the Buy America Act does not apply to the procurement of wired glass and added the product to the list of excepted materials under 48 CFR 25.108(d)(1) Excepted Articles, Materials, and Supplies. Accordingly, wired glass furnished in compliance with Section 08 81 00 GLAZING does not violate the Buy America Act.

Types of wired glass available are polished, patterned, and tinted/heat-absorbing wired glass. Wired glass cannot be tempered. Wired Glass does not meet the requirements of 16 CFR 1201 and cannot be used as safety glazing materials in situations governed by that regulation.

Typically 6 mm 1/4 inch thick wired glass is used for fire-rated windows and doors where required by building codes and other fire-protection criteria.

Only wired glass in Mesh 1 - Diamond and Mesh 2 - Square are acceptable for fire rated door and window openings. Mesh 3 - Parallel is not acceptable for fire rated openings.

Wired glass, because of the wire mesh and edge damage from cutting, is very susceptible to thermal breakage. Heat absorbing wired glass increases the tendency for breakage. Wired glass is also susceptible to edge breakage from water penetrating the capillary in which the wires reside. The glazing system should insure that the edges are kept dry by sealing the edges with silicone.

**********

Provide UL listed glass for fire-rated windows rated for [45] [20] minutes when tested in accordance with ASTM E2226. Wired glass must be Type II flat type, Class [1 - translucent] [2 - tinted, heat-absorbing] [3 - tinted, light-reducing], Quality [q7 - decorative] [q8 - glazing], Form [1 - wired and polished both sides] [2 - patterned and wired], [_____] percent light transmittance, [_____] percent shading coefficient, conforming to ASTM C1036. Wire mesh must be polished stainless steel Mesh [1 - diamond] [2 - square] [3 - parallel]. Wired glass for fire-rated windows must bear an identifying UL label or the label of a nationally recognized testing agency, and be rated for [20] [45] minutes when tested in accordance with NFPA 257. Wired glass for fire-rated doors must be tested as part of a door assembly in accordance with NFPA 252.

2.2.6 Patterned Glass

**********

NOTE: Patterned glass is normally provided for windows of toilet rooms, vertical sliding sash in post offices borrowed light sash at entrances, etc.
Patterned glass is available in various thicknesses, with a pattern embossed on one or both sides. This glass is frequently called "figured", "obscure", or "decorative" glass. The degree of diffusion achieved is a function of the pattern and whether the pattern is on one or both sides. Some patterned glass cannot be heat-strengthened or tempered because of the pattern depth. Pattern glass does not offer complete obscurity and must be used with caution in very private areas such as toilets. The appropriate pattern designation should be selected from ASTM C1036. If a more specific pattern designation is desired, a manufacturer's name and pattern may be specified. When specific manufacturer's names and patterns are specified, the designer should add the following note to the spec: "Manufacturer's name and patterns indicated are for identification purposes only; the listing is not intended to limit selection of similar patterns from other manufacturers." Refer to GANA GLAZING MANUAL, and glass manufacturer's performance tables for proper evaluation of patterned glass thickness and size of opening to be glazed. Patterned glass 3 mm 1/8 inch thick should not be larger than 2.15 square meters 6 square feet.

**************************************************************************
Type II, Class 1 (translucent), Form 3 (patterned), Quality q5 or q6 (decorative), Finish [F1 (patterned one side)] [F2 (patterned two sides)], Pattern [P1 (linear)] [P2 (geometric)] [P3 (random)] [P4 (special)], [_____] percent light transmittance, [_____] percent shading coefficient.

2.2.7 Laminated Glass

**************************************************************************
NOTE: For Antiterrorism (AT) criteria, refer to UFC 4-010-01 "DoD Minimum Antiterrorism Standards for Buildings." Laminated annealed flat glass must be provided at exterior window and door glazing. When force protection minimum measures are required, use the first bracketed option below. Use the second bracketed option when greater than minimum measures are required. This section must be completed for an established DBT and LOP by an engineer experienced in Blast-Resistant Design.

**************************************************************************
[ASTM C1172, Laminated glass fabricated from two nominal [3] [_____] mm [1/8] [_____] inch pieces of Type I, Class 1, [Class ____], Quality Q3, flat annealed [ultraclear]; [clear] [_____] glass conforming to ASTM C1036.]
[ASTM C1172, Laminated glass fabricated from two nominal [3] [_____] mm [1/8] [_____] inch pieces of Type I, Kind [HS] [FT], Condition [A] [B] [C], Class 1, Class [____], Quality Q3, flat [heat strengthened] [fully tempered] [clear] [_____] glass conforming to ASTM C1048.] Flat glass to be laminated together with a minimum of 0.75 mm 0.030 inch [_____] mm inch thick, clear [polyvinyl butyral] [ionoplast] [cast-in-place liquid resin] laminate, conforming to requirements of 16 CFR 1201 and ASTM C1172. The total thickness of nominally 6 [_____] mm 1/4 [_____] inches. Color to be
The total thickness of nominally [_____] mm inch.

Design window glazing using a dynamic analysis[ testing from airblast loading in accordance with ASTM F1642/F1642M by an independent testing agency regularly engaged in blast testing] to prove the glazing will provide performance equivalent to or better than a [low] [very low] [_____] hazard rating in accordance with ASTM F2912 for the peak positive pressure of [_____] kilopascals (kPa) [_____] pounds per square inch (psi) and peak positive phase impulse of [_____] kilopascal-millisecond (kPa-msec) pounds per square inch - millisecond (psi-msec).

2.2.8 Bullet-Resisting Glass

**************************************************************************
NOTE: Bullet-resisting glazing material is available in ten rating levels to resist shots from the following Arms:

UL 752 Level 1: Provides protection against three shots of a 124-grain 9mm full metal copper jacket with lead core at an fps between 1175 and 1293

UL 752 Level 2: Provides protection against three shots of a 158-grain .357 magnum jacketed lead soft point at an fps between 1250 and 1375

UL 752 Level 3: Provides protection against three shots of a 240-grain 44 Magnum Lead Semi-Wadcutter Gas Checked at an fps between 1350 and 1485

UL 752 Level 4: Provides protection against one shot of a 180-grain .30 caliber rifle lead core soft point at an fps between 2540 and 2794

UL 752 Level 5: Provides protection against one shot of a 150-grain 7.62mm rifle lead core full metal copper jacket military ball (.308 caliber) at an fps between 2750 and 3025

UL 752 Level 6: Provides protection against five shots of a 124-grain 9mm full metal copper jacket with lead core at an fps between 1400 and 1540

UL 752 Level 7: Provides protection against five shots of a 55-grain 5.56mm rifle full metal copper jacket with lead core (.223 caliber) at an fps between 3080 and 3383

UL 752 Level 8: Provides protection against five shots of a 150-grain 7.62mm rifle lead core full metal copper jacket military ball (.308 caliber) at an fps between 2750 and 3025

Shotgun: Provides protection against three shots of a 12-gauge rifled lead slug at an fps between 1585 and 1744 and three shots of a 12-gauge 00 buckshot (12 pellets) at an fps between 1200 and 1320

**************************************************************************
Fabricated from Type I, Class 1, Quality q3 glass with polyvinyl butyral plastic interlayers between the layers of glass and listed by UL MEAPD as bullet resistant, with a rating Level of [Level 1] [Level 2] [Level 3] [Level 4] [Level 5] [_____] in accordance with UL 752. Provide [_____] [where indicated].

2.2.9 Mirrors

**************************************************************************

NOTE: For Army projects only. Navy projects will specify mirrors in Division 10, Specialties. Select the frames (J-Mold channels) or clips to secure mirror to wall. Mastic is required with each type of installation. Mirror sizes will be shown on the drawings. Coordinate with Section 05 50 13 MISCELLANEOUS METAL FABRICATIONS, Section 05 51 00 METAL STAIRS or Section 05 51 33 METAL LADDERS and Section 10 28 13 TOILET ACCESSORIES to ensure that frames are specified for these mirrors.

One-way vision glass should be used for psychiatric and security observation windows. Where safety glazing is required, specify either laminated glass or tempered glass.

**************************************************************************

2.2.9.1 Glass Mirrors

Glass for mirrors must be Type I transparent flat type, Class 1-clear, Glazing Quality q1 6 mm 1/4 inch thick conforming to ASTM C1036. Glass must be coated on one surface with silver coating, copper protective coating, and mirror backing paint. Silver coating must be highly adhesive pure silver coating of a thickness which must provide reflectivity of 83 percent or more of incident light when viewed through 6 mm 1/4 inch thick glass, and must be free of pinholes or other defects. Copper protective coating must be pure bright reflective copper, homogeneous without sludge, pinholes or other defects, and must be of proper thickness to prevent "adhesion pull" by mirror backing paint. Mirror backing paint must consist of two coats of special scratch and abrasion-resistant paint, and must be baked in uniform thickness to provide a protection for silver and copper coatings which will permit normal cutting and edge fabrication.

2.2.10 One-Way Vision Glass (Transparent Mirrors)

Type I, Class 1, Quality q1, 6 mm 1/4 inch thick, coated on one face with a hard, adherent film of chromium or other approved coating of equal durability. Glass must transmit not less than 5 percent or more than 11 percent of total incident visible light and must reflect from the front surface of the coating not less than 45 percent of the total incident visible light.[ Provide [_____].]

2.2.11 Tempered Glass

**************************************************************************

NOTE: Tempered glass is the preferred material for areas requiring safety glazing materials. Laminated glass, organic-coated glass, wire glass, and plastic sheet are permitted if they conform to the
requirements of the CPSC 16 CFR Part 1201.

**************************************************************************

ASTM C1048, Kind FT (fully tempered), Condition A (uncoated), Type I, Class [1 (transparent)] [2 (tinted heat absorbing)], Quality q3, [_____] mm inch thick, [_____] percent light transmittance, [_____] percent shading coefficient conforming to ASTM C1048 and GANA Standards Manual. Color must be [[clear] [bronze] [gray] [_____]]. [Provide [_____] [and wherever safety glazing material is indicated or specified].

2.2.12 Heat-Strengthened Glass

ASTM C1048, Kind HS (heat strengthened), Condition A (uncoated), Type I, Class [1 (clear)] [2 (tinted heat absorbing)], Quality q3, [_____] mm inch thick. [Provide [_____]].

2.2.13 Spandrel Glass

2.2.13.1 Ceramic-Opacified Spandrel Glass

Ceramic-opacified spandrel glass must be Kind HS heat-strengthened transparent flat type, Condition B, coated with a colored ceramic material on No. 2 surface, Quality q3 - glazing select, [_____] mm [_____] inch thick, conforming to ASTM C1048. Glass performance must be K-Value/Winter Nighttime [_____], R-Value/Winter Nighttime [_____], shading coefficient [_____]. Color must be [_____].

2.2.13.2 Film-Opacified Spandrel Glass

Film-opacified spandrel glass must be Kind HS heat-strengthened transparent flat type, Quality q3 - glazing select, Condition C glass with a polyester or polyethylene film 0.025 mm to 0.127 mm 2 mils to 5 mils thick attached to No. 2 surface of a sputtered solar-reflective film, conforming to ASTM C1048. Film opacification must be compatible to and specifically developed for application to solar reflective films. Glass performance must be K-Value/Winter Nighttime [_____], R-Value/Winter Nighttime [_____], shading coefficient [_____]. Color must be [_____].

2.2.13.3 Spandrel Glass With Adhered Backing

**************************************************************************

NOTE: Spandrel glass with adhered backing is required wherever glass spandrels are located above sidewalks, pedestrian or vehicular ramps, paved plazas, entrances not covered by a protective canopy, and other locations where glass could fall onto an area used by the public.

**************************************************************************

NOTE: Refer to NFPA 101 Life Safety Code for fire rated requirements of assemblies which have glazing components. Coordinate with adjacent framing and
hardware assemblies to achieve required rating.
**************************************************************************

[2.2.14.1 Fire Protection Rated Glass

Clear tempered and meet 16 CFR 1201 Category I (under 0.836 sqm) (under 9 square feet) or II (over 0.836 sqm) (over 9 square feet) impact safety standard. Glass to make [20] [45] minute rating when tested in accordance with NFPA 257 and NFPA 252. Glass to be permanently labeled with appropriate markings.

[2.2.14.2 Fire Resistive Rated Glazing

Fire resistive glass must be laminated, with intumescent interlayer, Type I transparent flat type, Class 1-clear and meet 16 CFR 1201 Category I (under 0.836 sqm) (under 9 square feet) or II (over 0.836 sqm) (over 9 square feet). Glass must have a [60] [90] [120] minute rating when tested in accordance with ASTM E119 and NFPA 251. Glass must be permanently labeled with appropriate markings.

][2.3 INSULATING GLASS UNITS

**************************************************************************

NOTE: Where safety glazing is required, both lights of insulating units must be safety glass, and each light must have a permanent label.
**************************************************************************

**************************************************************************

NOTE: When antiterrorism/force protection requirements apply, specify laminated annealed flat glass for interior light. Use the bracketed option regarding ASTM C1172 in the paragraph below.

NOTE: Where safety glazing is required, both lights of insulating units must be safety glass, and each light must have a permanent label.

NOTE: Design must meet the requirements of UFC 1-200-02, "High Performance and Sustainable Building Requirements" which invokes the requirements within UFC 3-101-01, "Architecture". UFC 1-200-02 and UFC 3-101-01 make references throughout to various ASHRAE documents governing energy efficiency and requirements for the components of building envelope design including fenestrations and glazing.

NOTE: U value (rate of heat transfer) and SHGC (how much heat the building gains from the sun) are determined on a whole-opening basis (glazing and frame). Specify U value and SHGC in the appropriate exterior opening (window, door, curtain wall) sections and coordinate insulated glass description with energy performance requirements specified in those sections. Include bracketed U value and SHGC requirements here only if not specified elsewhere as a whole-opening rating for frame and glass. Determine appropriate values by consulting ASHRAE 90.1 - SI ASHRAE 90.1 - IP.
Window properties are critical to energy performance and visual satisfaction. Low SHGC is achieved with selective glass, tinted glass, or reflective coating. Specify selective glass for clear appearance or when high visible transmittance is required for daylighting goals. In the Northern Hemisphere, south side glass may be protected from summer sun by an overhang and have a high SHGC if winter heat is useful. Specify a low SHGC for south-side glass if the building is dominated by internal heat gain and solar heat is unwelcome even in winter. North side receives very little sun and requires no special treatment.

Consider glazing with aerogel insulation between two panels of glass, producing the highest visual transmittance with the highest insulation values currently available. Verify availability and cost before specifying aerogel.

Installing energy efficient windows contributes to achieving sustainability requirements as outlined in UFC 1-200-02.

For specifying pre-assembled window units used in residential buildings, utilize the following Sections: 08 51 13 ALUMINUM WINDOWS, 08 52 00 WOOD WINDOWS, or 08 53 00 PLASTIC WINDOWS.

Designer must verify availability and adequate competition for products energy performance requirements before specifying and edit as needed.

NOTE: STC levels higher than 35 may require costly design modifications and special glazing. STC addresses construction subject to interior sound frequencies and does not include all typical outdoor frequencies; Outside-Inside Transmission Class (OITC) was developed to evaluate an expanded sound-frequency range generally considered to be more reflective of exterior noise conditions imposed on the building envelope such as road, rail, and airplane traffic.

**************************************************************************

[Two][Three] panes of glass separated by a dehydrated airspace[, filled with argon gas][, filled with krypton gas][, filled with aerogel] and hermetically sealed, conforming to ASTM E2190. Submit performance and compliance documentation for each type of insulating glass.

[ Insulated glass units must have a Solar Heat Gain Coefficient (SHGC) maximum of [_____] determined according to NFRC 200 and a U-factor maximum of [_____] W per square m by K Btu per square foot by hr by degree F in accordance with NFRC 100.

] [See section[s][_____] for energy performance requirements for glazed systems (glazing and frames).] [Glazed panels must be rated for not less than [26] [30] [35] [_____] Sound Transmission Class (STC) when tested for
laboratory sound transmission loss according to ASTM E90 and determined by ASTM E413."

Dimensional tolerances must be as specified in IGMA TB-1200. Spacer must be black, roll-formed, [thin-gauge, C-section steel] [steel-reinforced butyl rubber] [thermally broken aluminum] [polyurethane and silicon foams], with bent or tightly welded or keyed and sealed joints to completely seal the spacer periphery and eliminate moisture and hydrocarbon vapor transmission into airspace through the corners. Primary seal must be compressed polyisobutylene and the secondary seal must be a specially formulated silicone.

**************************************************************************
NOTE: Delete intermediate light if triple glazing is not required.
**************************************************************************

The inner light must be [ASTM C1172, clear annealed flat glass Type I, Class I, Quality q3] [ASTM C1036, Type I, Class I, Quality q4, [_____ mm inch thick] [ASTM C1048, Grade B (fully tempered), Style I (uncoated), Type I, Class 1 (transparent), Quality q4, [_____ mm inch thick]. The intermediate light must be [ASTM C1172, clear annealed flat glass Type I, Class I, Quality q3] [ASTM C1036, Type I, Class I, Quality q4, [_____ mm inch thick] [ASTM C1048, Grade B (fully tempered), Style I (uncoated), Type I, Class 1 (transparent), Quality q4, [_____ mm inch thick]. The outer light must be [ASTM C1036, Type I, Class [1 (transparent)] [2 (tinted heat absorbing)], [2 (solar-reflective)], Quality q4, [_____ mm inch thick] [ASTM C1048, Grade B (fully tempered), Style I (uncoated), Type I, Class [1 (clear)] [2 (tinted heat absorbing)][solar-reflective], Quality q4, [_____ mm inch thick].

2.3.1 Low Emissivity Coatings

**************************************************************************
NOTE: Low emissivity coating should be on the air space surface of the inner pane of glass (the number 3 surface) in heating-dominated buildings, and on the number 2 surface (inside surface of the exterior pane) in cooling-dominated buildings.

NOTE: Design must meet the requirements of UFC 1-200-02, "High Performance and Sustainable Building Requirements" which invokes the requirements within UFC 3-101-01, "Architecture". UFC 1-200-02 and UFC 3-101-01 make references throughout to various ASHRAE documents governing energy efficiency and requirements for the components of building envelope design including fenestrations and glazing.

**************************************************************************

Interior and exterior glass panes for Low-E insulating units must be Type I annealed flat glass, Class [1-clear] [2-tinted] with anti-reflective low-emissivity coating or heat-strengthened or fully tempered glass complying with ASTM C1048, Condition C on [No. 2 surface (inside surface of exterior pane)] [No. 3 surface (inside surface of interior pane)], Quality q3 - glazing select, conforming to ASTM C1036. Glass performance must be U value maximum of [_____] [W/m2-K] [Btu/hr-ft2-F], Solar Heat Gain Coefficient (SHGC) maximum of [_____. Color must be [green] [gray] [bronze] [blue] [_____.}
2.4 PLASTIC GLAZING

**************************************************************************
NOTE: Plastic glazing may be used in some areas where high resistance to breakage is required, but combustibility must be considered in the design. See manufacturers' literature for many types available. Do not specify plastic for glazing unprotected openings, for roof panels, or for skylights without consulting UFC 3-600-01, "Fire Protection Engineering for Facilities" and NAVFACENGCOM Code 04F.
**************************************************************************

**************************************************************************
NOTE: Polycarbonate is more expensive than acrylic and should only be selected for locations which are highly vulnerable to vandalism or other types of abuse. Avoid polycarbonate if possible due to potentially hazardous constituent chemicals (including Bisphenol A). Where only one material is used in the project, the other one should be deleted.

Where translucent plastic sheets are required, locations will be shown on the contract drawings. The following will be added at the end of the paragraph:

"Translucent sheets, where shown, must be white having light transmission of [_____] percent for sheets [_____] mm inches thick, or clear with matte finish."

The light transmission required for a particular sheet thickness will be selected from plastic sheet manufacturer's catalogs.

Acrylic-plastic is a combustible material and must not be used in areas where exposure to fire would create a hazard condition.

Consider glazing with aerogel insulation between two panels of plastic, producing the highest visual transmittance with the highest insulation values currently available. Plastic glazing must have a U-factor maximum of the specified U-factor for insulating glass units. Verify availability and cost before specifying aerogel.

**************************************************************************
Plastic glazing must have a U-factor maximum of [_____] W per square m by K Btu per square foot by hr by degree F.[ Plastic glazing must include a [16] [32] [_____] mm [0.63] [1.26] [_____] inch layer of aerogel between panels.]

Certificates stating that the plastic glazing meets the specified requirements. Labels or manufacturers marking affixed to the glass will be accepted in lieu of certificates.
2.4.1 Acrylic Sheet

ASTM D4802, [Type I, regular] [Type II, heat resistant,] [clear and smooth on both sides] [translucent, textured on both sides,] [gray tint,] [bronze tint,] ultraviolet stabilized, [scratch resistant,] [_____] [6] [_____] mm [0.236] [_____] in. thick.

2.4.2 Polycarbonate Sheet

ANSI Z97.1, [Clear and smooth both sides] [Translucent, textured both sides] [Gray tint] [Bronze tint] [mar-resistant] [high abrasion resistant], ultraviolet stabilized, [_____] mm inch thick and listed in UL MEAPD as burglar resisting.

2.4.3 Extruded Polycarbonate Profiled Sheet

Provide [double] [triple] walled, surface treated for improved UV resistance, offering thermal efficiency and impact strength.

2.4.4 Bullet-Resistant Plastic Sheet

**************************************************************************
NOTE: Bullet-resisting glazing material is available in four power ratings to resist scattered shots from (1) medium-power small arms (MSA); (2) high-power small arms (HSA); (3) super-power small arms (SSA); and (4) high-power rifles (HR). Bullet-resisting acrylic sheet is listed by UL for MSA rating only and is 25.4 mm one inch thick. Bullet-resisting polycarbonate sheet is listed for MSA 25.4 mm one inch and for HSA and SSA ratings 31.8 mm 1 1/4 inch. Consult manufacturers for exact thicknesses and availability.
**************************************************************************

Cast acrylic sheet or mar-resistant polycarbonate sheet laminated with a special interlayer, and listed in UL 752 as bullet resisting, Class [I] [II] [III], [clear] [_____] in color. [ Provide [______].]

2.5 SETTING AND SEALING MATERIALS

Provide as specified in the GANA Glazing Manual, IGMA TM-3000, IGMA TB-3001, and manufacturer's recommendations, unless specified otherwise herein. Do not use metal sash putty, nonskinning compounds, nonresilient preformed sealers, or impregnated preformed gaskets. Materials exposed to view and unpainted must be gray or neutral color. Sealant testing must be performed by a testing agency qualified according to ASTM C1021.

Submit glass manufacturer's recommendations for setting and sealing materials and for installation of each type of glazing material specified. [ Include cleaning instructions for plastic sheets.]

2.5.1 Putty and Glazing Compound

Provide glazing compound as recommended by manufacturer for face-glazing metal sash. Putty must be linseed oil type. Do not use putty and glazing compounds with insulating glass or laminated glass.
2.5.2 Glazing Compound

Use for face glazing metal sash. Do not use with insulating glass units or laminated glass.

2.5.3 Sealants

Provide elastomeric [and structural] sealants.

2.5.3.1 Elastomeric Sealant

ASTM C920, Type S, Grade NS, Class 12.5, Use G. Use for channel or stop glazing [wood] [and] [metal] sash. Sealants must be chemically compatible with setting blocks, edge blocks, and sealing tapes[, with sealants used in manufacture of insulating glass units] [, and with plastic sheet]. Color of sealant must be white.

2.5.3.2 Structural Sealant

ASTM C1184, Type S.

2.5.4 Joint Backer

Joint backer must have a diameter size at least 25 percent larger than joint width; type and material as recommended in writing by glass and sealant manufacturer.

2.5.5 Glazing Tapes

2.5.5.1 Back-Bedding Mastic Glazing Tapes

Preformed, butyl-based, 100 percent solids elastomeric tape; nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod as recommended in writing by tape and glass manufacturers for application indicated; and complying with ASTM C1281 and AAMA 800 for products indicated below:

a. AAMA 804.3 tape, where indicated.

b. AAMA 806.3 tape, for glazing applications in which tape is subject to continuous pressure.

c. AAMA 807.3 tape, for glazing applications in which tape is not subject to continuous pressure.

2.5.5.2 Expanded Cellular Glazing Tapes

Closed-cell, PVC foam tapes; factory coated with adhesive on both surfaces; and complying with AAMA 800 for the following types:

a. AAMA 810.1, Type 1, for glazing applications in which tape acts as the primary sealant.

b. AAMA 810.1, Type 2, for glazing applications in which tape is used in combination with a full bead of liquid sealant.

2.5.6 Sealing Tapes

Preformed, semisolid, PVC-based material of proper size and compressibility
for the particular condition, complying with ASTM D2287. Use only where glazing rabbet is designed for tape and tape is recommended by the glass or sealant manufacturer. Provide spacer shims for use with compressible tapes. Tapes must be chemically compatible with the product being set.

2.5.7 Setting Blocks and Edge Blocks

Closed-cell neoprene setting blocks must be dense extruded type conforming to ASTM C509 and ASTM D395, Method B, Shore A durometer between 70 and 90. Edge blocking must be Shore A durometer of 50 (plus or minus 5). Provide silicone setting blocks when blocks are in contact with silicone sealant. Profiles, lengths and locations must be as required and recommended in writing by glass manufacturer. Block color must be [black][____].

2.5.8 Glazing Gaskets

Glazing gaskets must be extruded with continuous integral locking projection designed to engage into metal glass holding members to provide a watertight seal during dynamic loading, building movements and thermal movements. Glazing gaskets for a single glazed opening must be continuous one-piece units with factory-fabricated injection-molded corners free of flashing and burrs. Glazing gaskets must be in lengths or units recommended by manufacturer to ensure against pull-back at corners. Provide glazing gasket profiles as recommended by the manufacturer for the intended application.

2.5.8.1 Fixed Glazing Gaskets

Fixed glazing gaskets must be closed-cell (sponge) smooth extruded compression gaskets of cured elastomeric virgin neoprene compounds conforming to ASTM C509, Type 2, Option 1.

2.5.8.2 Wedge Glazing Gaskets

Wedge glazing gaskets must be high-quality extrusions of cured elastomeric virgin neoprene compounds, ozone resistant, conforming to ASTM C864, Option 1, Shore A durometer between 65 and 75.

2.5.8.3 Aluminum Framing Glazing Gaskets

Glazing gaskets for aluminum framing must be permanent, elastic, non-shrinking, non-migrating, watertight and weathertight.

2.5.9 Accessories

Provide as required for a complete installation, including glazing points, clips, shims, angles, beads, and spacer strips. Provide noncorroding metal accessories. Provide primer-sealers and cleaners as recommended by the glass and sealant manufacturers. Use ASTM C1087 to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of glazing sealants to surface.

[2.6 MIRROR ACCESSORIES

**************************************************************************
NOTE: Use for Army projects only. Navy projects will specify Mirrors and Accessories in Division 10, Specialties.
**************************************************************************
2.6.1 Mastic

Mastic for setting mirrors must be a [polymer] [_____] type mirror mastic resistant to water, shock, cracking, vibration and thermal expansion. Provide mastic compatible with mirror backing paint, and as approved by mirror manufacturer.

2.6.2 Mirror Frames

Provide mirrors with mirror frames (J-mold channels) fabricated of one-piece roll-formed Type 304 stainless steel with No. 4 brushed satin finish and concealed fasteners which will keep mirrors snug to wall. Frames must be 32 by 6 by 6 mm 1-1/4 by 1/4 by 1/4 inch continuous at top and bottom of mirrors. Concealed fasteners of type to suit wall construction material must be provided with mirror frames.

2.6.3 Mirror Clips

Provide clips with concealed fasteners of type to suit wall construction material.

PART 3 EXECUTION

Any materials that show visual evidence of biological growth due to the presence of moisture must not be installed on the building project.

3.1 PREPARATION

Preparation, unless otherwise specified or approved, must conform to applicable recommendations in the GANA Glazing Manual, GANA Sealant Manual, IGMA TB-3001, IGMA TM-3000, and manufacturer's recommendations. Determine the sizes to provide the required edge clearances by measuring the actual opening to receive the glass. Grind smooth in the shop glass edges that will be exposed in finish work. Leave labels in place until the installation is approved, except remove applied labels on heat-absorbing glass and on insulating glass units as soon as glass is installed. Securely fix movable items or keep in a closed and locked position until glazing compound has thoroughly set.

3.2 GLASS SETTING

Shop glaze or field glaze items to be glazed using glass of the quality and thickness specified or indicated. Glazing, unless otherwise specified or approved, must conform to applicable recommendations in the GANA Glazing Manual, GANA Sealant Manual, IGMA TB-3001, IGMA TM-3000, and manufacturer's recommendations. Aluminum windows, wood doors, and wood windows may be glazed in conformance with one of the glazing methods described in the standards under which they are produced, except that face puttying with no bedding will not be permitted. Handle and install glazing materials in accordance with manufacturer's instructions. Use beads or stops which are furnished with items to be glazed to secure the glass in place. Verify products are properly installed, connected, and adjusted.

3.2.1 Sheet Glass

Cut and set with the visible lines or waves horizontal.
3.2.2 Patterned Glass

Set glass with one patterned surface with smooth surface on the weather side. When used for interior partitions, place the patterned surface in same direction in all openings.

3.2.3 Insulating Glass Units

Do not grind, nip, or cut edges or corners of units after the units have left the factory. Springing, forcing, or twisting of units during setting will not be permitted. Handle units so as not to strike frames or other objects. Installation must conform to applicable recommendations of IGMA TB-3001 and IGMA TM-3000.

3.2.4 Installation of Wire Glass

Install glass for fire doors in accordance with installation requirements of NFPA 80.

3.2.5 Installation of Heat-Absorbing Glass

Provide glass with clean-cut, factory-fabricated edges. Field cutting will not be permitted.

3.2.6 Installation of Laminated Glass

Sashes which are to receive laminated glass must be weeped to the outside to allow water drainage into the channel.

3.2.7 Plastic Sheet

Conform to manufacturer's recommendations for edge clearance, type of sealant and tape, and method of installation.

3.3 CLEANING

Clean glass surfaces and remove labels, paint spots, putty, and other defacement as required to prevent staining. Glass must be clean at the time the work is accepted. Clean plastic sheet in accordance with manufacturer's instructions.

3.4 PROTECTION

Protect glass work immediately after installation. Identify glazed openings with suitable warning tapes, cloth or paper flags, attached with non-staining adhesives. Protect reflective glass with a protective material to eliminate any contamination of the reflective coating. Place protective material far enough away from the coated glass to allow air to circulate to reduce heat buildup and moisture accumulation on the glass. Upon removal, separate protective materials for reuse or recycling. Remove and replace glass units which are broken, chipped, cracked, abraded, or otherwise damaged during construction activities with new units.

3.5 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurement commonly agreed to by the manufacturers or other parties. The inch-pound and metric measurements are as follows:
<table>
<thead>
<tr>
<th>PRODUCTS</th>
<th>INCH-POUND</th>
<th>METRIC</th>
</tr>
</thead>
<tbody>
<tr>

NOTE: This guide specification covers the requirements for transparent film at least 0.10 mm 0.004 inch thick (4 mil) applied to the interior side of glass to reduce spalling and fragment dispersal.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN NATIONAL STANDARDS INSTITUTE (ANSI)

ASTM INTERNATIONAL (ASTM)

ASTM D882 (2012) Tensile Properties of Thin Plastic Sheeting

GLASS ASSOCIATION OF NORTH AMERICA (GANA)

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

16 CFR 1201 Safety Standard for Architectural Glazing Materials

1.2 SYSTEM DESCRIPTION

NOTE: This specification should be used when glass may be subjected to the effects of explosives or
projectiles and when protection of personnel from the resulting glass spalling is required. The film is most effective when installed on the interior surface of the glass. Under low blast pressures or projectile loads, the film may not prevent the glass from breaking but it holds the glass fragments together and reduces the destructive capability of flying glass fragments. Note that testing has shown that fragment retention film will not necessarily hold glass fragments together when subjected to very high blast pressures, and the designer may therefore want to consider alternate methods for protection of personnel. The application of film to glass generally allows projectiles, fragments, or bullets to pass through; however, the film does reduce spalling of the glass associated with a projectile passing through the film.

The application of film to glass provides some resistance against impacts from hammers, rocks, clubs, or thrown objects. An impact on the film reinforced glass creates a hole approximately the size of the impacting object. Therefore, several impacts are needed to make a hole large enough for entry. The use of greater film thickness and/or factory laminated films provides more resistance against these impacts.

Tints and reflective films can improve the thermal energy performance of a building. However, darkly tinted and reflective films can cause internal heat buildup and internal stresses in the glass resulting in a weakened glazing system. If reflective films are used to reduce visibility into a facility, also provide curtains or shades for night use because films are not reflective when the light level on the exterior side of the film is less than that on the interior side.

**************************************************************************

1.2.1 General Requirements

Apply clean fragment retention film free of peeling, splitting, scratches, creases, wrinkles, discoloration, and foreign particles. The film application must be free of air bubbles after 30 days. Do not show signs of waviness and distortion at the time the work is accepted. Make this determination by the unaided eye (except for corrective prescription glasses), when the film is viewed from a distance of 3 m 10 feet from the interior room side at angles up to 45 degrees when looking at a clear or uniformly overcast sky. Remove unacceptable fragment retention film applications in accordance with manufacturer's instructions and new film applied.

1.2.2 Other Submittals Requirements

Submit the following for fragment retention film:

a. Manufacturer's data consisting of catalog cuts, brochures, circulars, and a list of glazing compounds and/or gaskets known to be
incompatible with the fragment retention film.

b. Manufacturer's application and cleaning instructions for fragment retention film.

c. A statement that the fragment retention film supplied was manufactured using the same materials and process as the material tested. A statement that the adhesive contains ultraviolet inhibitors which limit ultraviolet transmission to not more than 8 percent of the radiation between 300 and 380 nanometers. A statement that the film manufacturer or manufacturer's representative trained the personnel who will apply the film.

d. A sample consisting of a minimum 200 by 275 mm 8 by 11 inch section of fragment retention film including the adhesive layer.

e. Certified test reports including analysis and interpretation of test results. Identify the manufacturer, the specific product name, the film thickness, the adhesive type and thickness, and the glass type and thickness. Identify the methods used and include the results recorded.

f. On applications where the film will contact the glazing beads or gaskets, a certificate from the Contractor stating that the glazing compounds and gaskets are compatible with the fragment retention film and adhesive.

1.3 SUBMITTALS

******************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL
PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
  Fragment Retention Film
  Cleaning
SD-04 Samples
  Fragment Retention Film; G[, [_____]}
SD-06 Test Reports
  Fragment Retention Film
SD-07 Certificates
  Fragment Retention Film

1.4 QUALITY ASSURANCE

The personnel applying the fragment retention film must be trained by the film manufacturer or manufacturer's representative.

1.5 DELIVERY, STORAGE, AND HANDLING

The Contractor is responsible for delivery of the fragment retention film to the appropriate location for application. Deliver, store, and handle fragment retention film in accordance with the manufacturer's recommendations. Store glass, including glass in windows or doors with factory applied film, in a dry location free of dust, water, and other contaminants. Deliver, store, and handle glass with factory applied film so that the film is not damaged, scratched, or abraded and store in a manner which permits easy access for inspection and handling. Provide each roll of film with a tamperproof label containing full details of the roll, the batch number, and sufficient information to enable the Contracting Officer to ensure that the correct film is supplied.

1.6 WARRANTY

Furnish a 5 year warranty for fragment retention film material, providing for replacement of film if cracking, crazing, peeling, or inadequate adhesion occurs.
PART 2 PRODUCTS

2.1 STANDARD PRODUCTS

Provide fragment retention film which is the standard product of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening.

2.2 FRAGMENT RETENTION FILM

**************************************************************************

NOTE: Indicate windows and doors requiring film on the window and door schedules or window and door elevations of the drawings.

The film is available in 0.05 mm 0.002 in., 0.10 mm 0.004 in., 0.18 mm 0.007 in., 0.20 mm 0.008 in., 0.25 mm 0.010 in., and 0.30 mm 0.012 inch thicknesses. A minimum thickness of 0.10 mm 0.004 inch film is acceptable for fragment retention. The use of greater than 0.10 mm 0.004 inch film thickness and/or factory laminated films of 0.10 mm 0.004 inch or greater may provide more protection for occupants from flying fragments of glass but may not be warranted for low blast pressure. The designer must investigate window frames and building components adjacent to the glazed opening for transfer of the blast load when using 0.18 mm 0.007 inch and thicker films.

The properties of fragment retention film and/or the adhesive may change over time, effecting the film's capacity to retain fragments. Testing has shown the film retains fragments up to 7 years of use.

**************************************************************************

Provide fragment retention film consisting of polyester, polyethylene terephthalate, or a composite, optically clear and free of waves, distortions, impurities, and adhesive lines. The film may be a single layer or laminated. Laminate film at the factory of the fragment retention film manufacturer. Include an abrasion resistant coating on the surface that does not receive the film adhesive. Provide [clear] [tinted] [reflective] fragment retention film with a minimum thickness of [0.10] [0.18] [0.25] mm [0.004] [0.007] [0.010] inch. Supply with an optically clear weatherable pressure sensitive adhesive. The adhesive must contain ultraviolet inhibitors to protect the film for its required life and must limit ultraviolet transmission to not more than 8 percent of the radiation between 300 and 380 nanometers. The adhesive must not be water activated. A water soluble detackifier and/or release liner may be incorporated over the adhesive to facilitate film application. The adhesive must be 90 percent cured within 30 days of installation. Provide adhesives that are a minimum of 0.02 mm 0.0008 inch thick on film thicknesses of 0.25 mm 0.010 inch and greater. Perform the following tests to indicate compliance with specified requirements by an independent testing laboratory, and have a responsible official of the laboratory sign the laboratory reports.
2.2.1 Impact Performance

NOTE: Retain sentences about splices when the film will be applied to sheets of glass with a dimension exceeding **1475 mm 58 inches** in both directions.

Paragraph 5.1.3 (2) of ANSI Z97.1 and paragraph 1204.4 (e) (1) (ii) of 16 CFR 1201 will not be an accepted form of testing glazing failure after the impact test because these paragraphs allow complete disintegration if fragment particles are small enough. Complete disintegration of the glazing is unacceptable under blast loading because the particles would be propelled into the building and could seriously injure or kill the occupants. Designers specifying fragment retention film for use in other countries may substitute impact test reports in accordance with British Standard (BS) BS 6206 Class B and German Standard DIN 5237, which use similar testing methods to the impact tests specified. The designer should accept but not specify films tested and receiving an A1 impact resistance under DIN 52290 or film which has tested positively in accordance with BS 5544. Do not specify the film to be tested in accordance with DIN 52290 or BS 5544 because relatively few films can pass these more stringent impact tests.

Test fragment retention film for impact in accordance with ANSI Z97.1 or 16 CFR 1201. Conduct tests on fragment retention film applied to 3.1 to 6.4 mm 1/8 to 1/4 inch-thick annealed flat glass which conforms to the requirements of ASTM C1036, Type I, Class 1, Quality q3. Apply the tested film to the glass with a splice located at the midpoint of the specimen. Include sketches showing location and configuration of splice in submitted certified test reports. After the impact portion of the test is conducted, determine satisfactory performance of the test specimens using ANSI Z97.1, paragraph 5.1.3 or 16 CFR 1201, paragraph 1201.4 (e)--INTERPRETATION OF RESULTS. To be qualified for use under this specification, provide a report that the fragment retention film satisfactorily performed in accordance with ANSI Z97.1, paragraph 5.1.3 (1), (3), or (4) or with 16 CFR 1201, paragraph 1204.4 (e) (1) (i), (iv), or (v). ANSI Z97.1, paragraph 5.1.3 (2) or 16 CFR 1201, paragraph 1204.4 (e) (1) (ii) does not constitute passing criteria.

2.2.2 Tensile Strength

The fragment retention film samples tested must exhibit a minimum tensile strength at break of **172.4 MPa 25,000 psi** when tested in accordance with ASTM D882. Use Method A, Static Weighing, Constant Rate of Grip Separation Test, to conduct this test. Rate of grip separation exceeding **0.2 mm/s 1/2 inch per minute** is not permitted.

2.2.3 Peel Strength

Conduct testing following 1,200 hours accelerated weathering exposure. The fragment retention film must exhibit a minimum peel strength of **930 N/m 5.3 pounds/inch** for **0.10 mm 0.004 inch** thick film and **790 N/m 4.5 pounds/inch**
for 0.18 mm 0.007 inch thick and thicker film when tested in accordance with ASTM D3330/D3330M. Use Method A to conduct the tests. Use a glass substrate and a maximum dwell time of 45 days is permitted.

2.2.4 Surface Abrasion

Exhibit a change in haze not to exceed 3.2 percent following 100 turns, using 500-gram weights on a CS 10F abrasive wheel when tested in accordance with ASTM D1044.

2.2.5 Flame Spread and Smoke Density

**************************************************************************

Note: The designer may delete the requirement for flame spread and smoke density index if not required by the project.

**************************************************************************

Exhibit a flame spread index not exceeding 25 and a smoke density index not exceeding 100 when tested in accordance with ASTM E84. For the test, mount the specimen to 6.4 mm 1/4 inch thick tempered glass which conforms to the requirements of ASTM C1048, Kind FT, Type I, Class 1, Quality q3.

PART 3 EXECUTION

3.1 SURFACE PREPARATION

Clean the glass surface, to which the fragment retention film is to be applied, of paint, foreign compounds, smears, and spatters. After the initial cleaning, further clean the surface to receive the film in accordance with the film manufacturer's instructions.

3.2 APPLICATION

**************************************************************************

NOTE: Greater protection for occupants from flying glass caused by blast loads is achieved by applying film such that it extends edge to edge of the sheet and into the bite of the frame. Some gaskets and compounds can dissolve the film surface, the adhesive, or the metallic coating interlayer of reflective or tinted films. For insulated glass units, apply film to the interior (room) side only. Other applications have not been tested. Tests show that film applications to insulated glass units offer more protection for occupants than applications on single sheets of glass. When more than one type of film application is used for a project, indicate the application to be used on the door and window schedules or elevations.

**************************************************************************

Provide fragment retention film on window and door glass where indicated. After surface preparation, apply the fragment retention film in accordance with the manufacturer's recommendations and instructions. Apply film to the interior (room) side of the glass for both single and double glazed sheets, unless otherwise indicated. Multiple applications of film to achieve specified thicknesses is not allowed. Do not apply film if there are visible dust particles in the air, if there is frost on the glazing, or
if any room condition such as temperature and humidity do not meet the manufacturer's instructions. After film application, maintain room conditions as required by the manufacturer's instructions to allow for proper curing of the adhesive.

3.2.1 Application to New Glass Before Glazing

**************************************************************************
NOTE: Retain this paragraph when film will be applied to the glass before glazing. This may occur at the window or door manufacturer's shop or in the field. Designer will insert a coordinating note into Section 08 81 00 GLAZING, indicating that fragment retention film application is a requirement.
**************************************************************************

Apply fragment retention film so that it extends edge to edge of the glass sheet. Then set the film reinforced glass into the frame with glazing compounds or gaskets as specified in Section 08 81 00 GLAZING. Ensure compatibility when contact between the glazing compounds and/or gaskets and the film occurs. Coordinate fragment retention film application and curing with the glass supplier and window or door manufacturer prior to glazing installation.

3.2.2 Application to Existing Glass Involving Dismantlement

**************************************************************************
NOTE: Retain this paragraph when film is to be applied to existing glazing where the stops, compounds, and/or gaskets must be removed to apply the film edge to edge of the glass sheet. Dismantlement is recommended for glazed openings with removable stops and removable reusable gaskets. Removable gaskets include vinyl and rubber channels or beads and extruded aluminum beads. Dismantlement may be too expensive for openings glazed with compounds. This expense is due to the increased labor, increased risk of breakage, and increased cost of replacing compounds because most compounds are not reusable. Compounds include wet applied or semi-soft compounds such as sealant, putty, butyl, hypalon, silicone, acrylic, polyurethane, polysulfide, and preformed semi-solid tapes. Although existing gaskets are readily identifiable, determining the composition of existing compounds to check compatibility with the film is more difficult and could add expense to the project.
**************************************************************************

Remove the existing glazing compound, gaskets, and/or stops as required to expose the existing glass pane. If necessary, remove the glass so that the film can be applied extending edge to edge of the glass sheet. Install existing gaskets and/or stops and replace any removed glazing compounds with new glazing compounds. Scrap removed glazing compounds and do not reuse. Provide glazing compounds in accordance with GANA Sealant Manual. Perform glazing in accordance with GANA Glazing Manual. Ensure compatibility when contact between the glazing compounds and/or gaskets and the film occurs. Replace damaged or broken glazing and gaskets and
reinstall in kind.

3.2.3 Application to Existing Glass Without Dismantlement

*********************************************************************************************
NOTE: Retain this paragraph for application where dismantlement is not possible or is too expensive. When exposed to the effects of explosives, films that stop close to the frame but do not extend into the bite tend to break along the weak edge and disengage completely from the frame. Because the disengaged film reinforced glass is held together as a unit, protection is provided for building occupants. This application is simplest and the least costly. Also, coordination and compatibility of the film with the compounds and gaskets is not necessary because they do not contact. If the edges of the existing glazing compounds are particularly irregular, the designer may specify the film application to be within a maximum of 5 mm 3/16 inch, although the 3 mm 1/8 inch maximum is recommended.
*********************************************************************************************

Apply fragment retention film so that it extends to within 1.6 mm 1/16 inch, with a maximum of 3 mm 1/8 inch of the edge of the visible glass area.

3.2.4 Application to Existing Glass and Frame Without Dismantlement

*********************************************************************************************
NOTE: Retain this paragraph for application where dismantlement is not possible or is too expensive. Although this application has not been tested under blast loads, several manufacturers recommend it. In this application, the film is likely to contact the existing gaskets and compounds. Trim or a batten may be indicated on the drawings and/or added to this paragraph to hide the film edge.
*********************************************************************************************

Apply fragment retention film past the edge of the visible glass and extend onto the frame. Provide amount of film overlap, edge connection to the frame, and adhesive for adhering film to frame as recommended by the film manufacturer. Ensure compatibility when contact between the glazing compounds and/or gaskets and the film occurs.

3.2.5 Splicing

*********************************************************************************************
NOTE: Overlaps of 0.25 mm 0.010 inch thick and thicker film are highly visible and are not recommended. If no glazing has a dimension exceeding 1475 mm 58 inches in both directions, specify that the film may not be spliced.
*********************************************************************************************

[Splices or seams in fragment retention film are not permitted.] [Splices or seams in fragment retention film are permitted only when a sheet of glass has a dimension exceeding 1.475 m 58 inches in both directions.]
Apply all seams with a minimum overlap of 6 mm 1/4 inch unless submitted test reports indicate impact performance is not diminished when seam is applied with a different overlap or a gap.

3.3 CLEANING

Clean the fragment retention film in accordance with the manufacturer's instructions.

### 1.2 SUBMITTALS

**NOTE:** Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's
Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Glazing materials

Include glass manufacturer's printed literature for setting and sealing materials and for cleaning of each type of glazing material specified.

SD-04 Samples

Glazing materials

Submit samples, 250 mm 10 inches square, factory labeled, for each type of glazing specified.

SD-08 Manufacturer's Instructions

Glass setting

1.3 DELIVERY, STORAGE, AND HANDLING

Deliver products to the site in their original unopened containers, plainly labeled with manufacturers' names and brands. Store all glass and setting materials in safe, dry locations and do not unpack until needed for installation. Handle and install materials in a manner that protects them...
1.4 ENVIRONMENTAL CONDITIONS

Do not start glazing work until the outdoor temperature is above 4 degrees C (40 degrees F) and rising unless approved provisions are made to warm the glass and rabbet surfaces. Provide sufficient ventilation to prevent condensation of moisture on glazing work during installation. Do not perform glazing work during wet weather.

1.5 WARRANTY

**************************************************************************

NOTE: The warranty clause in this guide specification has been approved by NAVFACENGCOMHQ in accordance with the requirements of Naval Facilities Acquisition Supplement (NFAS). NFAS can be found at the following link: https://portal.navfac.navy.mil/portal/page/portal/navfac/navfac_forbusinesses

The paragraph in this specification may be used without any HQ approval or request for waiver.

**************************************************************************

Warranty glass units against development of material obstruction to vision as a result of delamination, other than through glass breakage for at least a 5 year period from the date of acceptance of the work. Provide new units for units failing to comply with terms of this warranty no later than 45 working days following receipt of notice from the Government.

PART 2 PRODUCTS

2.1 DETENTION GLAZING ASSEMBLIES

2.1.1 Glass-Clad Polycarbonate

Two glass outer layers (plies), bonded to a core of one or more plastic layers (plies).

2.1.2 Plastic Laminated (Bonded) Construction

Two or more layers (plies) of plastic sheet bonded together with polyurethane.

2.1.3 Glass Laminated (Bonded) Construction

Two or more layers (plies) of chemically-strengthened float glass bonded together with polyvinyl butyral (PVB).

2.2 DETENTION GLAZING MATERIALS

2.2.1 Glass, Chemically Strengthened

ASTM C158, transparent prestressed.

2.2.2 Glass, Annealed, Wire

ASTM C1036, Type II, Class 1, form 1, Quality q8, 6 mm 1/4 inch thick, with diamond or square mesh.
2.2.3 Polycarbonate, Transparent, Rigid Sheet Plastic

**************************************************************************
NOTE: The type, class, and thickness of polycarbonate glazing material to be used in detention glazing assemblies is specified in paragraph entitled "Detention Glazing Types" by Type. Note that mar-resistant coating is to be provided in Glazing Types 3, 5, and 5W only.
**************************************************************************

CID A-A-59502, [Type I Grade A] [Type III Grade A] [clear] [transparent], thickness as specified.

2.3 DETENTION GLAZING TYPES

**************************************************************************
NOTE: Glazing types should be indicated on project drawings.
**************************************************************************

a. Type 1: Tempered Glass; Conform to Section 08 81 00 GLAZING.

b. Type 2: 11 mm 7/16 inch nominal glass-clad polycarbonate: 3 mm 1/8 inch clear chemically-strengthened glass, 1.3 mm 0.050 inch polyurethane interlayer, 3 mm 1/8 inch polycarbonate sheet, 1.3 mm 0.050 inch polyurethane interlayer, 3 mm 1/8 inch clear chemically-strengthened glass.

c. Type 3: 10 mm 3/8 inch nominal laminated plastic: 4.8 mm 3/16 inch mar-resistant (hard coat) polycarbonate (threat side), 0.9 mm 0.034 inch polyurethane interlayer, 4.8 mm 3/16 inch polycarbonate sheet.

d. Type 4: 11 mm 7/16 inch nominal laminated glass: 3 mm 1/8 inch clear chemically-strengthened glass, 2.3 mm 0.090 inch polyvinyl butyral interlayer, 3 mm 1/8 inch clear chemically-strengthened glass.

e. Type 4W: Add a separate (not laminated) 6 mm 1/4 inch annealed wire glass on staff side to Type 4.

f. Type 5: 14.3 mm 9/16 inch nominal glass-clad polycarbonate: 3 mm 1/8 inch clear chemically-strengthened glass (threat side), 1.3 mm 0.050 inch polyurethane interlayer, 6 mm 1/4 inch polycarbonate sheet, 1.3 mm 0.050 inch polyurethane interlayer, 3 mm 1/8 inch clear chemically-strengthened glass.

g. Type 5W: Add a separate (not laminated) 6 mm 1/4 inch annealed wire glass on staff side to Type 5.

h. Type 6: 8 mm 5/16 inch nominal laminated glass: 3 mm 1/8 inch clear chemically-strengthened glass, 2.3 mm 0.090 inch polyvinyl butyral interlayer, 3 mm 1/8 inch clear chemically-strengthened glass.

2.4 SETTING MATERIALS

Provide types required for the applicable setting method specified in GANA Glazing Manual and GANA Sealant Manual, except as modified in this
section. Do not use metal sash putty, nonskinning compounds, nonresilient preformed sealers, or impregnated preformed gaskets. Materials exposed to view shall be gray or neutral color.

2.4.1 Glazing Compound

Use for face glazing metal sash. Verify compatibility with materials in glazing assembly.

2.4.2 Elastomeric Sealant

**ASTM C920**, Type S, Grade NS, Class 12.5, use NT. Use for channel or stop glazing metal sash. Sealant shall be chemically compatible with setting blocks, edge blocks, and sealing tapes [, and with plastic sheet]. Color of sealant shall be white.

2.4.3 Preformed Channels

Neoprene, **AAMA MCWM-1**, as recommended by the glass manufacturer for the particular condition. Channels shall be chemically compatible with plastic sheet.

2.4.4 Sealing Tapes

Preformed, semisolid, polymeric-based material of proper size and compressibility for the particular condition. Use only where glazing rabbet is designed for tape and tape is recommended by the glass or sealant manufacturer. Provide spacer shims for use with compressible tapes. [Tapes shall be chemically compatible with plastic sheet.]

2.4.5 Setting Blocks and Edge Blocks

**ASTM C864** neoprene of 70 to 90 Shore "A" durometer hardness, chemically compatible with sealants used, and of sizes recommended by the glass manufacturer.

2.4.6 Accessories

As required to provide a complete installation, including glazing points, clips, shims, angles, beads, and spacer strips. Provide noncorroding metal accessories. Provide primer-sealers and cleaners as recommended by the glass and sealant manufacturers.

PART 3 EXECUTION

3.1 GLAZING TYPES

**************************************************************************
**NOTE: Glazing types should be indicated on project drawings.**
**************************************************************************

Locations and types of glass for use in glazed openings as indicated.

3.2 PREPARATION

Determine the sizes to provide the required edge clearances by measuring the actual opening to receive the glass. Leave labels in place until the installation is approved. Securely attach movable items or keep in a
closed and locked position until glazing compound has thoroughly set.

3.3 GLASS SETTING

Items to be glazed shall be either shop or field glazed using glass of the quality and thickness specified. Preparation and glazing shall conform to applicable recommendations in the GANA Glazing Manual and GANA Sealant Manual. Handle and install glazing materials in accordance with manufacturer's instructions. Use beads or stops furnished with items to be glazed to secure glass in place.

3.3.1 Wire Glass

Install glass for fire doors in accordance with installation requirements of NFPA 80.

3.3.2 Plastic Sheet

Conform to manufacturer's recommendations for edge clearance, type of sealant and tape, and method of installation.

3.4 CLEANING

Clean glass surfaces and remove labels, paint spots, putty, and other defacement. Glass shall be clean at the time the work is accepted. [Clean plastic sheet in accordance with manufacturer's instructions.]

3.5 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurement commonly agreed to by the manufacturers or other parties. The inch-pound and metric measurements are as follows:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for engineered outward sloping low-iron clear annealed tower cab glass for use in military air traffic control towers.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The Designer of Record's (DOR) selection of tower cab glass performance and related systems must comply with the UFC including, at a minimum, UFC 1-200-01, General Building Requirements, UFC 3-301-01, Structural Engineering and UFC 4-133-01N, Navy Air Traffic Control Facilities; if seismic design is required UFC 3-301-01, Structural Engineering; and if antiterrorism protection is required UFC 4-010-01, DoD Minimum Antiterrorism Standards for Buildings.

Coordinate tower cab glass with supporting glazing framing system and design performance requirements applicable to the location of the air traffic
control tower cab. Selection of framing system and glass units are integral to the performance as a whole and how glazing system is anchored to the structure. Coordinate with glass and framing systems manufacturer's anticipated design thicknesses and the connection between the glass the frame, the "bite", which is how far the glass is imbedded into the frame.

**************************************************************************

NOTE: On the drawings, show:
1. Locations of each type of tower cab glass unit, using the same terminology as in the specification.
2. Outward slope angle of tower cab glass.
3. Dimension and shape of tower cab glass units.
4. Frame and edge details indicating method of glazing, glass-edge bite requirements, and system anchorage.
5. Wind pressure on tower cab glass.
6. Whether tower cab glass is 'basic' or 'enhanced' per ASTM E1886 or ASTM E1996, as applicable.

In the specifications, show blast pressure and design method: standard air blast, dynamic, or computational, when antiterrorism protection is applicable.

**************************************************************************

PART 1   GENERAL

1.1 SUMMARY

This specification covers engineered tower cab glass for use in military air traffic control towers. Engineering of the tower cab glass is delegated to an approved Glass Engineer. The tower cab glass is used where air traffic is visually controlled and having tower cab glass free of optical distortions or other obstructions that can block or distort vision is critical to air traffic control operations.

1.2 DEFINITIONS

1.2.1 ATCT

Air Traffic Control Tower

1.2.2 Authority Having Jurisdiction (AHJ)

The party that regulates the design and construction process for the project on behalf of the Government.

1.2.3 Deterioration of Coated Glass

Defects developed from normal use and weather conditions that are attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning coated glass contrary to fabricator's directions. Defects include peeling, cracking, and other indications of deterioration in metallic coating.
1.2.4 Deterioration of Glass

Defects developed from normal use and weather conditions that are attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning glass contrary to fabricator's directions. Defects include glass found to be out of compliance with ASTM C1036.

1.2.5 Deterioration of Insulating Glass

Failure includes, but is not limited to, failure of the hermetic seal under normal use and weather conditions due to causes other than glass breakage and improper practices for maintaining and cleaning insulating glass. Evidence of failure is the obstruction of vision by dust, moisture, film, or minerals on the surfaces of insulated glass facing the interspace or optical distortions (ghosting or double-images) not due to improper practices for maintaining and cleaning glass not in compliance with the manufacturer's or fabricator's directions.

1.2.6 Deterioration of Laminated Glass

Defects developed from normal use and weather conditions that are attributed to the manufacturing process and not to glass breakage and practices for maintaining and cleaning laminated glass contrary to manufacturer's or fabricator's directions. Defects include edge separation, delamination, materially obstructing vision through glass, and blemishes exceeding those allowed by referenced laminated glass standard.

1.2.7 Designer of Record (DOR)

Architect or Engineer planning and designing the building and site and preparing the contract documents on behalf of the Government.

1.2.8 Fabricator

Where used in this Section to refer to a firm that fabricates glass units as defined in the referenced glazing standards.

1.2.9 Glass Thickness

Nominal glass thickness indicated by thickness designation per glass ply according to ASTM C1036.

1.2.10 Interspace

Air- or inert gas-filled space between lites of an insulating-glass unit.

1.2.11 Manufacturer

Where used in this Section to refer to a firm that produces primary glass or fabricated glass as defined in the referenced glazing standard.

1.2.12 Tower Cab Glass

Air traffic control tower cab glass as indicated on the Drawings.

1.3 REFERENCES

**************************************************************************

SECTION 08 88 58  Page 5
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

NOTE: Ensure that the dates of the references are compatible with the version of the building code used for the design of this project.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN NATIONAL STANDARDS INSTITUTE (ANSI)

ASTM INTERNATIONAL (ASTM)

ASTM D2287 (2019) Nonrigid Vinyl Chloride Polymer and Copolymer Molding and Extrusion Compounds

GLASS ASSOCIATION OF NORTH AMERICA (GANA)

INSULATING GLASS MANUFACTURERS ALLIANCE (IGMA)

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Tower Cab Glass; G[, [_____]}

Submittals which graphically show complete details of the proposed setting methods, mullion details, edge blocking, dimension of glass, dimension of openings, frame details and materials, and types of thickness of glass, coatings, coating position,
laminates, and other aspects of the work.

SD-03 Product Data

******************************************************************************

NOTE: "Product Data for IEQ credit" Subparagraph below applies to LEED-NC and LEED-CS; coordinate with requirements for glazing sealants.
******************************************************************************

[ Laminated Annealed Glass; G[, [_____]]
][ Low-E Coated Laminated Annealed Glass; G[, [_____]]
][ Insulated Laminated Annealed Glass Units; G[, [_____]]
][ Low-E Coated Insulated Laminated Annealed Glass Units; G[, [_____]]
]

Setting and Sealing Materials; G[, [_____]]

Glazing Accessories; G[, [_____]]

Submit manufacturer of the glass lites and the fabricator of the insulating units. Submit descriptive product data, handling and storage recommendations, installation instructions, and cleaning instructions from both the manufacturer of the glass lites and the fabricator of the insulating and laminated units.

[ Product Data for IEQ credit: For field-applied glazing sealants - documentation including declaration of VOC content.
]

    - Warranty for Laminated Glass Products
    - Warranty for Coated-Glass Products

1.5 SYSTEM PERFORMANCE REQUIREMENTS

Provide glazing systems that are engineered, produced, fabricated, and installed to withstand normal thermal movement, wind loading[, and] impact loading] without failure including loss of glass or glass breakage attributable to the following: defective manufacture, fabrication, and installation, failure of sealants or gaskets to remain watertight and airtight, deterioration of glazing materials, visual distortion, blockage of vision, and other defects impacting use or performance.[ Provide
glazing systems that conform to antiterrorism protection blast pressure and design method or air blast test indicated.

Normal thermal movement results from the following maximum change (range) in ambient and surface temperatures acting on glass-framing members and glazing components. Base engineering calculation on materials' actual surface temperatures due to both solar heat gain and nighttime sky heat loss expected for the service life of the tower.

**************************************************************************
NOTE: Verify temperature range at project site with range shown. Provide new data if site specific range is greater than default.
**************************************************************************

Temperature Change (Range): [67 degrees C 120 degrees F][_____] ambient; [100 degrees C 180 degrees F][_____] material surfaces.

Design, engineering, fabrication, and installation must comply with all applicable requirements.

1.6 QUALITY ASSURANCE

**************************************************************************
NOTE: Determine qualifications required for the Glass Engineer. In the U.S., a registered professional engineer is required; outside the U.S., consider specifying alternate licensing requirements (second set of brackets) where the services of a U.S. registered professional engineer may not be feasible. Alternate requirements must be coordinated with the Contracting Officer. Select requirements and delete items not required.
**************************************************************************

1.6.1 Glass Engineer Qualifications

Glass Engineer must be a registered professional engineer in [a U.S. state or territory][_____] experienced in the design of glass who has successfully completed a minimum of [five][_____] air traffic control tower cab glass projects and possesses no less than [5][_____] years of experience with similar projects in nature, size, and extent to this air traffic control tower; being familiar with special requirements indicated; and having complied with requirements of the AHJ.

1.6.2 Fabricator Qualifications

Provide qualifications for fabricators for glass units who have successfully completed a minimum of five air traffic control tower cab glass projects similar in nature, size, and extent to this air traffic control tower including successful in-service performance[ and is a qualified insulating glass fabricator who is approved and certified by the [coated ]glass manufacturer].

1.6.3 Insulating Glass Certification Program

Provide insulating glass units permanently marked either on spacers or at least one component lite of units with appropriate certification label of inspecting and testing agency:
a. Insulating Glass Certification Council (IGCC).

b. Associated Laboratories, Inc. (ALI).

1.6.4 Installer Qualifications

Engage an experienced installer who has installed similar glazing assemblies in material, design, and extent to the indicated for this Project with a record of successful in-service performance. Installer must be certified under the National Glass Association's certified glass installer program as level Y2 (Senior Glaziers) or level Y3 (Master Glazier). Equivalent or better certification may be considered if acceptable to the Contracting Officer.

1.6.5 Single-Source Responsibility

Obtain all tower cab glass from one source. Obtain glazing accessories from one source for each product and installation method indicated.

1.6.6 Product Certificates

Signed by glazing materials manufacturers certifying that their products comply with specified requirements. Submit certificates to indicate that materials meet specified requirements. Permanent marking safety glass approval on glass lower corner exposed to view is required unless that requirement is waived by the AHJ.

1.6.7 Glazing Accessories

Submit certificates from the manufacturers attesting that the accessories meet the project requirements including requirements set by the glass engineer designing the glass and supports.

Provide compatibility and adhesion test reports from manufacturer of insulating glass edge sealant indicating that glass edge sealants were tested for compatibility with other glazing materials including sealants, glazing tape, gaskets, setting blocks, and edge blocks.

1.6.8 Setting and Sealing Materials

ASTM C1087. Submit data from the manufacturer attesting that the sealant used in glazing is compatible with the laminated glass interlayer or primary and secondary sealants in insulated units where applicable. Provide compatibility and adhesion test reports from sealant manufacturer; indicating that glazing materials were tested for compatibility and adhesion with glazing sealant. Include sealant manufacturer's test results relative to sealant performance and recommendations for primers and substrate preparation required for adhesion.

1.7 DELIVERY, STORAGE, AND HANDLING

Deliver products to the site in unopened containers labeled plainly with manufacturers' names and brands.

Tower cab glass must be boxed, crated, and shipped to the site in a vertical position or as directed by the fabricator. The tower cab glass
must be stored in a vertical position against a sturdy support at an angle of approximately 7 degrees from vertical or as directed by the fabricator.

For insulating glass units that will be exposed to substantial altitude changes between location of fabrication and project site or in transit to project site, comply with insulating-glass manufacturer’s written recommendations for preventing hermetic seal ruptures at any point or bowing inward or outward of glazing lites when installed due to pressure differentials between interspace air or gas pressure and ambient air pressure at project location.

Tower cab glass and setting materials must be stored in a safe, dry location with adequate ventilation free from heavy dust and must permit easy access for inspection and handling. Unpack glass at time of installation, or as directed by Contracting Officer.

Unpack glass from the front of the case or container and avoid sliding the glass against itself or any un-cushioned materials. Stack individual lites on edge using clean, cushioned pads placed at the quarter points of the bottom edge. Protect all edges from impact and use a clean dry separating materials.

1.8 ENVIRONMENTAL REQUIREMENTS

Do not proceed with glazing when ambient and substrate temperature conditions are outside limits permitted by the glazing material manufacturers and when glazing channel substrates are wet from rain, frost, condensation, or other causes.

Do not install liquid glazing sealants when ambient and substrate temperature conditions are outside limits permitted by glazing sealant manufacturer or below 5 degrees C 40 degrees F.

1.9 SUSTAINABLE DESIGN REQUIREMENTS

[1.9.1 Local/Regional Materials]

**************************************************************************
NOTE: Include "Regional Materials" paragraph below for LEED-NC, or LEED-CS, MR credit; before retaining, verify availability of materials that comply. Coordinate with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING. Use second option if Contractor is choosing local products in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING. First option must not be used for USACE projects. Army projects must include second option only if pursuing this LEED credit.
**************************************************************************

[Regional Materials: Materials must be manufactured within 800 kilometers 500 miles of Project site from materials that have been extracted, harvested, or recovered, as well as fabricated, within 800 kilometers 500 miles of Project site, if available from a minimum of [three][_____] sources.][ See Section 01 33 29 SUSTAINABILITY REQUIREMENTS AND REPORTING for cumulative total local material requirements. Glazing materials may be locally available.]
1.9.2 Sealants VOC Content

Field-applied sealants must have a VOC content of not more than 250 g/L or lower as required to meet LEED IAQ limits.

1.9.3 Environmental Data

NOTE: ASTM E2129 provides for detailed documentation of the sustainability aspects of products used in the project. This level of detail may be useful to the Contractor, Government, building occupants, or the public in assessing the sustainability of these products.

Submit Table 1 of ASTM E2129 for sealants.

1.10 WARRANTY

Provide 10-year manufacturer's or, where applicable, fabricator's warranty for tower cab glass.

NOTE: Include 10-year warranty for all projects. Select appropriate paragraphs for inclusion based on products specified.

1.10.1 Warranty for Insulating-Glass Products

Provide warranty signed by the [manufacturer][ or ][fabricator] of insulating-glass units agreeing to replace insulating-glass units that deteriorate as defined in "Definitions" article for Deterioration of Insulating Glass, FOB point of manufacture, freight allowed project site, within 10-years after date of Final Acceptance. Warranty covers only deterioration due to normal conditions of use as defined and not due to handling and installing.

1.10.2 Warranty for Laminated-Glass Products

Provide warranty signed by glass the [manufacturer][ or ][fabricator] of laminated-glass agreeing to replace laminated-glass units that deteriorate as defined in "Definitions" article for Deterioration of Laminated Glass, FOB point of manufacture, freight allowed project site, within 10-years after date of Final Acceptance. Warranty covers only deterioration due to normal conditions of use as defined and not due to handling and installing.

1.10.3 Warranty for Coated-Glass Products

NOTE: Verify whether glass manufacturer or glass fabricator applies coating to glass.
Provide warranty signed by coated-glass units the [manufacturer][ or ][fabricator] agreeing to replace coated-glass units that deteriorate as defined in definitions article for Deterioration of Coated Glass, FOB point of manufacture, freight allowed project site, within 10-years after date of Final Acceptance. Warranty covers only deterioration due to normal conditions of use as defined and not due to handling and installing.

PART 2   PRODUCTS

2.1   SYSTEM DESIGN REQUIREMENTS

******************************************************************************

NOTE: The design of glass should be delegated to the contractor. The contractor is required to assume responsibility for glass engineering and final design and coordination.

******************************************************************************

2.1.1   Cab Glazing Design Analysis

Engage a qualified Glass Engineer to design glazing system as a delegated design. Installed glazing system must withstand normal thermal movement and wind[ and] impact[ and air blast] loads without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, or installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction. [ Delegated design must include antiterrorism protection requirements.]

2.1.2   Structural Performance

Submit signed and sealed glass wind load calculations by the Glass Engineer for all glass installations certifying compliance with wind load[ and impact load] requirements below, and as indicated on the drawings[ as well as antiterrorism protection blast loads and design methods specified]. The thickness of glass and support requirements must be determined using the most stringent requirements of both ASTM E1300 and ASTM E2461.

[ For insulating glass units that will be exposed to substantial altitude changes after fabrication, engineer insulated glass unit lites to maintain parallel alignment to avoid optical distortions (ghosting /double images) when viewing through glass. ]

******************************************************************************

NOTE: The Designer of Record (DOR) is responsible for determining the design wind speed and the resulting design wind pressure on the tower cab glass. The glass manufacturer/fabricator is responsible for determining that glass engineering and fabrication meet the design wind pressure requirements.

The UFC cited International Building Code (IBC) requires that design wind speed and resulting pressure used for design of exterior components and cladding be determined by the DOR and be indicated on the construction drawings.
Verify the current standard for determining wind pressure and antiterrorism protection requirements with UFC 1-200-01. Wind (and impact, hurricane, and tornado) design guidance is found in UFC 3-301-01. If anti-terrorism protection is a factor, coordinate with UFC 4-010-01 and referenced requirements.

The DOR is responsible for determining the antiterrorism protection requirements and for indicating loads, durations, and method of design in the specifications.

a. Design Wind Pressure: As indicated on the Drawings.

b. Maximum Lateral Deflection: Tower cab glass is supported on all four edges, limit center-of-glass deflection at design wind pressure to not more than \([1/50](____)\) times the short-side length or 25 mm 1 inch, whichever is less.

2.1.3 Thermal Performance
Glazing must be designed in response to full calendar year project site climatic conditions and sun angles in coordination with tower cab mechanical systems assuring that maximum visibility is afforded while thermal effects that could overwhelm mechanical systems or cause condensation on interior or exterior surfaces of the glass are prevented.

[2.1.4 Antiterrorism Performance

Minimum Antiterrorism Performance - Glazing must meet the minimum antiterrorism performance criteria specified in the paragraphs below. Conformance to the performance requirements must be validated by[ one of] the following method[s].

NOTE: The blank in the following paragraph
(Computational Design Analysis Method) should be the value of the equivalent 3-second duration design loading obtained from Figure 1 of ASTM F2248 for the explosive weight and standoff distance combination that is being designed for in this project.

[ a. Computational Design Analysis Method - Cab glazing must be designed to the criteria listed herein. Computational design analysis must include calculations verifying the structural performance of each glazing unit proposed for use, under the given static equivalent loads. Glazing resistance must be greater than equivalent 3-second duration loading of [_____] Pascal [_____] pounds per square foot (psf). The glazing frame bite for the cab frames must be in accordance with ASTM F2248.]

NOTE: The blanks in the following paragraph (Dynamic Design Analysis Method) should be the value of the peak positive pressure and impulse for the explosive weight and standoff distance combination that is being designed for in this project. Choose the first bracketed items, low hazard rating/very low level of protection for inhabited building occupancy as defined in UFC 4-010-01. Choose the second bracketed items, very low hazard rating/low level of protection for primary gathering building occupancy as defined in UFC 4-010-01. The values for input into the blanks in the following paragraph related to 'ductility ratio' and 'maximum support rotation' can be found in Engineering Technical Report (PDC TR-10-02) titled Blast Resistant Design Methodology for Window Systems Designed Statically and Dynamically at USACE Protective Design Center: https://pdc.usace.army.mil/library/tr/10-02]

[ b. Dynamic Design Analysis Method - Cab glazing must be designed using a dynamic analysis to prove the glazing will provide performance equivalent to or better than a [low][very low] hazard rating in accordance with ASTM F2912 associated with the applicable [very low] [low level] of protection for the peak positive pressure of [_____] kilopascals (kPa) [_____] pounds per square foot (psf) and positive phase impulse of [_____] kilopascal-millisecond (kPa-msec) [_____] pounds per square inch - millisecond (psi-msec). The allowable response limits of aluminum frame elements for low level of protection requirements are as follows: Maximum ductility ratio of [_____] and maximum support rotation of [_____] degrees.]

NOTE: The blanks in the following paragraph (Standard Airblast Test Method) should be the value of the peak positive pressure and impulse for the explosive weight and standoff distance combination that is being designed for in this project. Choose the first bracketed items, low hazard rating/very low level of protection for inhabited building occupancy as defined in UFC 4-010-01. Choose the second bracketed items, very low hazard rating/low level of protection for primary gathering building occupancy as defined in UFC 4-010-01.
occupancy as defined in UFC 4-010-01.

[ c. **Standard Airblast Test** Method - As an alternative to 'Dynamic Design Analysis Method' indicated above, glazing may be tested for evaluation of hazards generated from airblast loading in accordance with ASTM F1642/F1642M by an independent testing agency regularly engaged in blast testing. For proposed glazing systems that are of the same type as the tested system but of different size, the test results may be accepted provided the proposed glazing size is within the range from 25 percent smaller to 10 percent larger in area and aspect ratio of the original qualified tested glazing systems. Proposed glazing of a size outside this range must require testing to evaluate their hazard rating or are certified by the 'Dynamic Design Analysis Method' indicated above. Testing may be by shock tube or arena test. The test must be performed on the entire proposed glazing system, which must include, but not be limited to, the glazing, its framing/support system, operating devices, and all anchorage devices. Anchorage of the glazing support system must replicate the method of installation to be used for the project. The minimum airblast loading parameters for the test must be as follows: peak positive pressure of [_____] kilopascal (kPa) [_____] pounds per square inch (psi) and positive phase impulse of [_____] kilopascal-millisecond (kPa-msec) [_____] pounds per square inch - millisecond (psi-msec). The hazard rating for the proposed glazing systems, as determined by the rating criteria of ASTM F1642/F1642M, to provide performance equivalent to or better than a [low][very low] hazard rating (i.e. the "No Break", "No Hazard", "Minimal Hazard" and "Very Low Hazard" ratings are acceptable. "Low Hazard" and "High Hazard" ratings are unacceptable) associated with the applicable [very low][low level] of protection. Results of glazing systems previously tested by test protocols other than ASTM F2912 may be accepted provided the required loading, hazard level rating, and size limitations stated herein are met.

][2.1.5 **Windborne-Debris-Impact Performance**

******************************************************************************************

NOTE: Retain "Windborne-Debris-Impact Resistance" Paragraph if required by Project. The UFC cited IBC defines windborne debris regions. Enhanced protection applies to essential facilities. Verify site specific requirements with the AHJ. Delete items not required.

******************************************************************************************

Exterior glazing must comply with indicated basic or enhanced protection testing requirements in ASTM E1996 for [Wind Zone 1] [Wind Zone 2] [Wind Zone 3] [Wind Zone 4] when tested according to ASTM E1886. Test specimens must be no smaller in width and length than glazing indicated for use on Project and must be installed in same manner as glazing indicated for use on Project.

a. Refer to drawings for classification of tower cab requiring basic or enhanced protection.

[ b. **Large-Missile Test**: For glazing located within 9.1 m 30 feet of grade.

][c. **Small-Missile Test**: For glazing located more than 9.1 m 30 feet above grade.
2.1.6 Tower Cab Glass Location and Sizes

Refer to Drawings for location, size intent, and geometry of tower cab glass units.

2.1.7 Tower Cab Glass Slope

Provide outward slope indicated on the drawings for tower cab glass.

2.2 GLASS MATERIALS

******************************************************************************

NOTE: Insulated glass systems should be used where required for thermal insulation or condensation control. Use air- or inert gas-filled interspace for insulated glass only.
******************************************************************************

Tower cab glass thicknesses shown on the Drawings or specified herein are minimums. Manufacturer must certify that glass can withstand all forces specified.

a. The thickness of the tower cab glass must be determined by the Glass Engineer complying with ASTM E2461 for a probability of breakage of 1 lite per 1000.

******************************************************************************

NOTE: "Probability of Breakage for Sloped Glazing" subparagraph below is more conservative than ASTM E1300 and the IBC, which are based on a probability of breakage of 8 lite per 1000.
******************************************************************************

b. No on-site grinding or buffing of the glass is allowed. Glass edges must be clean cut, undamaged, and flat ground.

c. Probability of Breakage for Sloped Glazing: For glass surfaces sloped from vertical, the thickness of the tower cab glass must be determined by ASTM E2461 for a probability of breakage not greater than 1 lite per 1000 at the first occurrence of the design wind loading.

d. Glass subject to accidental human impact must be glazed with laminated safety glass in accordance with 16 CFR 1201 and ANSI Z97.1.

2.2.1 Annealed Glass

******************************************************************************

NOTE: Tower cab glazing recommended for air traffic control towers is low-iron clear float glass. Standard clear glass is not recommended because of lower visible light transmission compared to low-iron glass. However, where new glass is to match existing adjacent glass that is not low-iron the Contracting Officer may elect to approve standard glass. Tinted glass is not allowed for cab glazing.

Heat strengthened, tempered, and chemically...
strengthened glass is not allowed for cab glazing because of optical distortions created by the strengthening process. Glass clad polycarbonate is also not allowed.

Coordinate with user and mechanical engineer if a Low-E coating is to be applied to glass to improve the glass unit’s thermal properties. The Low-E coating has some affect on the visible light transmission, though this is considered an acceptable trade-off because of the increased comfort levels for the controllers in the tower cab.

Select one of the float glass products below as the tower cab glass. Retain or modify following sub-paragraphs as required.

Low-iron annealed float glass must be ASTM C1036, Type I, Class I (Clear), quality q3; and with visible light transmission of not less than 91 percent and solar heat gain coefficient of not less than 0.90 for 6 mm 1/4 inch thickness with the following quantities:

a. Allowable scratches: None.

NOTE: Select one of the following paragraphs below based on consultation with glass manufacturer on recommended glazing for tower cab. Wind design criteria developed by structural engineer, size of glass units, and cab glass framing system will dictate required assembly of cab glass.

[2.2.2 Insulated Glass]

Insulating-glass components must be as required to factory-assemble glass units with hermetically sealed dehydrated interspace, qualified according to ASTM E2190.

NOTE: Base selection of sealing system of insulated glass units on compatibility with other glazing materials. For example, glazing systems installed with silicone glazing sealants generally require the same material for secondary sealing of insulating-glass units.

Insulating glass units inner and outer lites may not remain parallel if fabricated at one elevation level and transported or installed at higher elevations. Provide grade elevation of ATCT above sea level either on drawings or in specifications.

a. Sealing System: Units must be double sealed. Primary seal must be polyisobutylene; secondary seal must be silicone.
NOTE: Spacer must be stainless steel for the following reasons, stronger and keeping hermetic seals intact during installation, and better thermal performance than other spacer materials.

b. Spacer: Stainless steel.

c. Desiccant: Molecular sieve or silica gel, or a blend of both.

NOTE: Breather tubes must not be allowed for insulated glass units. Coordinate with manufacturer the need for capillary tubes only if use is approved by the Contracting Officer and only if use does not limit warranty coverage.

Capillary Tube - Typically 0.25 to 0.50 mm 0.01 to 0.02 inch inside diameter stainless steel tubes, approximately 305 mm 12 inch long, and are left open after installation. Capillary tubes are used in low humidity mountainous areas of the country to equalize pressure. The 305 mm 12 inch long tube minimizes moisture entering unit, but in small glass units, this can still be significant amount of moisture.

Breather Tube - Typically 3 mm 1/8 inch inside diameter aluminum tubes, 75 to 150 mm 3 to 6 inches long that are sealed after installation. Breather tubes are used to allow for pressure differentials during shipping. Concern is will humidity enter dehydrated interspace during manufacturing and shipping. Some manufacturers will not honor warranty if glass unit has breather tube.

NOTE: Antiterrorism performance rated glass, windborne debris region rated glass, and safety glass are required to be laminated glass. One or all of these requirements may apply to the tower cab glass design.

[2.2.3 Laminated Glass Interlayers

Laminated glass must comply with the GANA Laminate Manual and interlayer must comply with ASTM C1172. Use materials that have a proven record of no tendency to bubble, discolor, or lose physical and mechanical properties after fabrication and installation.

a. Interlayer Material: [Polyvinyl butyral (PVB) interlayer] [Ionomeric polymer interlayer][ or ][Cast-in-place and cured-transparent-resin interlayer] used in compliance with the interlayer manufacturer's written instructions.

b. Interlayer Thickness: Provide thickness not less than that indicated and as needed to comply with engineered requirements.
c. Interlayer Color: Clear.

][2.2.4 Interspace

The inner and outer lites of insulated glass units must be separated by a 12.7 mm 1/2-inch minimum hermetically sealed interspace. The entrapped air or gas must be dehydrated by a drying agent. Tower cab glass must be fabricated for use at the installation’s elevation above mean sea level (AMSL). Units must be free of any optical distortion at the time of installation.

2.3 TOWER CAB GLASS ASSEMBLIES

**********************************************************************************************************************************************
NOTE: Requirements for control tower cab glazing are for the sizes and details on the current standard control tower drawings. Any modification from standard will be made only with the approval of the Contracting Officer.

If spare units are required for a particular project an "Extra Materials" paragraph must be developed for PART 1 which identifies the items, states quantities, and indicates to whom, when and where to be delivered.

For overseas work the following subparagraph will also be added: When units from other than a United States manufacturer are proposed for use, the manufacturer must prove successful use of the insulating glazing units in aircraft control tower cabs to the Contracting Officer.

**********************************************************************************************************************************************

Tolerances and clearances for units must be designed to prevent the transfer of stress in metal frames to the glass under all design conditions. Resilient setting blocks, spacer strips, clips, bolts, washers, angles, glazing sealants, and resilient channels must be of the type recommended in the glass manufacturer's approved written instructions.

**********************************************************************************************************************************************

NOTE: For better thermal performance, a Low-Emissivity (Low-E) coating on glass is recommended for most locations. Low-E coating selection must have minimal impact on the visible light transmittance, as the importance of visible transmittance of light is critical to the cab operation. Coordinate with glass manufacturer, Contracting Officer, and mechanical engineer regarding selection of Low-E coating.

For insulated glass units, Low-E coating should be on one of the glass surfaces facing the interspace; on the interior-side surface in heating-dominated buildings and on the exterior-side surface (inside surface of the exterior pane) in cooling-dominated buildings. The number one surface of the glass is always the exterior face of the glass assembly; surfaces are counted on each ply of glass with the
highest numbered surface facing the interior of the building.

When selecting glass and a coating, verify with manufacturer/fabricator if Low-E coating is either pyrolytic or vacuum applied to glass. Be aware that currently applying Low-E coating to glass thicker than 6 mm 1/4 inch is problematic. If required on glass thicker than 6 mm 1/4 inch consider using laminated glass. Coordinate with glass manufacturer/fabricator.

Pyrolytic coatings (hard coat) are applied by glass manufacturer during the manufacturing process and are integral to the glass. Pyrolytic coatings are more durable than vacuum deposit. Easier to ship, handle, and install. This Low-E coating is used on single panes of glass where Low-E coating is exposed. (Verify if selecting laminated glass, if low-E is required to be pyrolitically applied.)

Vacuum deposit (Sputter) coatings (soft coat) can be applied by either manufacturer, or fabricator of glass. Vacuum deposit coatings require special handling and storage to protect the coating. Typically only used in insulated glass units, as coating requires protection. Vacuum deposit offers more coating options and improved solar, thermal, and light-to-solar gain options than the pyrolitic process.

Coordinate with glass manufacturer’s and fabricator’s thermal performance of glass assembly.

**************************************************************************
**************************************************************************

NOTE: The use of Low-E coating on the glass is recommended for most climates, however caution should be used. It is problematic to apply to glass thicker than 6 mm 1/4 inch. If the glass layup is required to be thicker, then it is possible to use multiple layers of laminated glass (i.e., 6 mm 1/4 inch glass plus 1.52 mm 0.060 inch interlayer plus 12.7 mm 1/2 inch glass plus 1.52 mm 0.060-inch interlayer plus 12.7 mm 1/2 inch glass) with the Low-E on the 6 mm 1/4 inch lite when required.

Use greater interlayer thicknesses for improved impact and blast resistance as determined by the glass engineer. It is not recommended to use thickness less than 1.52 mm 0.060 inch.

**************************************************************************
**************************************************************************

NOTE: The assembly of laminated glass can be done a number of different ways. It can be with or without a Low-E coating. It can be assembled in two, three, or more plies of varying glass ply thicknesses or the same thicknesses. Modify following paragraphs
as necessary for selection of this cab glazing.

**************************************************************************

[2.3.1] Laminated Annealed Glass Units

Glass Type: Low-iron clear laminated glass with no less than two plies of low-iron annealed float glass.

**************************************************************************

NOTE: Provide overall unit thickness minimum based on concept design and including total glass thickness and interlayer thickness. These will be minimums as delegated glass engineering may increases unit thicknesses.

**************************************************************************

a. Overall Unit Thickness: [_____] mm [_____] inch minimum.

b. Minimum Thickness of Each Glass Ply: 3 mm 1/8 inch.

c. Interlayer Thickness: 1.52 mm 0.060 inch minimum each.

**************************************************************************

[2.3.2] Low-E Coated Laminated Annealed Glass Units

Glass Type: Low-iron clear Low-E laminated glass with [two] [_____] plies of low-iron annealed float glass.

**************************************************************************

a. Overall Unit Thickness: [_____] [_____] mm [_____] inch minimum.

b. Minimum Thickness of Each Glass Ply: 3 mm 1/8 inch.

c. Interlayer Thickness: 1.52 mm 0.060 inch minimum each.

**************************************************************************

NOTE: Where low-e coating is required at laminated uninsulated glass, provide pyrolytic hard coat at external surface when approved by the Contracting Officer or on surface approved or provide approved low-e film between two plies of interlayers.

**************************************************************************

d. Low-E Performance: [Pyrolytic hard coat on first surface (out of four surfaces total)] [Pyrolytic hard coat on fourth surface (out of four surfaces total)] [Low-E film between two plies of interlayer].

e. Winter Nighttime U-Factor: [_____] maximum.

f. Summer Daytime U-Factor: [_____] maximum.

g. Visible Light Transmittance: [_____] percent minimum.

h. Solar Heat Gain Coefficient: [_____] maximum.

**************************************************************************

[2.3.3] Insulated Laminated Annealed Glass Units

Glass Type: Insulating laminated low-iron clear annealed float glass.

**************************************************************************

a. Overall Unit Thickness: [_____] mm [_____] inch minimum.
b. Outdoor Lite: Low-iron clear laminated glass with two plies of low-iron annealed float glass.
   (1) Minimum Thickness of Each Glass Ply: 3 mm 1/8 inch.
   (2) Interlayer Thickness: 1.52 mm 0.060 inch minimum each.

   Interspace Content: [Air][Argon].

d. Indoor Lite: Low-iron clear laminated glass with two plies of low-iron annealed float glass
   (1) Minimum Thickness of Each Glass Ply: 3 mm 1/8 inch.
   (2) Interlayer Thickness: 1.52 mm 0.060 inch minimum each.

e. Winter Nighttime U-Factor: [_____] maximum.

f. Summer Daytime U-Factor: [_____] maximum.

g. Visible Light Transmittance: [_____] percent minimum.

h. Solar Heat Gain Coefficient: [_____] maximum.

)[2.3.4  Low-E Coated Insulated Laminated Annealed Glass Units

   Glass Type: Insulating laminated Low-E coated low-iron clear annealed float glass.
   a. Overall Unit Thickness: [_____] mm [_____] inch minimum.

   b. Outdoor Lite: Low-iron clear laminated glass with two plies of low-iron annealed float glass.
      (1) Minimum Thickness of Each Glass Ply: 3 mm 1/8 inch.
      (2) Interlayer Thickness: 1.52 mm 0.060 inch minimum each.

   c. Interspace Content: [Air][Argon].

   d. Low-E Coating: [Pyrolytic on fourth] [Pyrolytic on fifth] [Sputtered on fourth] [Sputtered on fifth] surface (out of eight surfaces total).

   e. Indoor Lite: Low-iron clear laminated glass with two plies of low-iron annealed float glass
      (1) Minimum Thickness of Each Glass Ply: 3 mm 1/8 inch.
      (2) Interlayer Thickness: 1.52 mm 0.060 inch minimum each.

   f. Winter Nighttime U-Factor: [_____] maximum.

   g. Summer Daytime U-Factor: [_____] maximum.

   h. Visible Light Transmittance: [_____] percent minimum.

   i. Solar Heat Gain Coefficient: [_____] maximum.
2.4 SETTING AND SEALING MATERIALS

Provide as specified in the GANA Glazing Manual, IGMA TM-3000, IGMA TB-3001, and manufacturer's recommendations, unless specified otherwise herein. Do not use metal sash putty, nonskinning compounds, nonresilient preformed sealers, or impregnated preformed gaskets. Materials exposed to view and unpainted must be a dark color to match mullions.

2.4.1 Elastomeric Sealant

ASTM C920, Type S, Grade NS, Class 12.5, Use G. Use for channel or stop glazing sash. Sealant must be chemically compatible with setting blocks, edge blocks, and sealing tapes, with sealants used in manufacture of insulating glass units. For laminated glass the sealant must be compatible with interlayer. Sealant color must be as selected from manufacturer's samples.

2.4.2 Preformed Channels

Neoprene, vinyl, or rubber, as recommended by the glass manufacturer for the project specific conditions.

2.4.3 Sealing Tapes

Preformed, semisolid, PVC-based material of proper size and compressibility for the particular condition, complying with ASTM D2287. Use sealing tape only where glazing rabbet is designed for tape and tape is recommended by the glass or sealant manufacturer. Provide spacer shims for use with compressible tapes. Tapes must be chemically compatible with the product being set.

2.4.4 Setting Blocks and Edge Blocks

Closed-cell neoprene setting blocks must be dense extruded type conforming to ASTM C509 and ASTM D395, Method B, Shore A durometer of 90. Profiles, lengths and locations must be as required and recommended in writing by glass manufacturer. Block color must be black.

2.4.5 Aluminum Framing Glazing Gaskets

Glazing gaskets for aluminum framing must be permanent, elastic, non-shrinking, non-migrating, water tight, and weather tight.

2.4.6 Glazing Accessories

Provide as required for a complete installation, including glazing points, clips, shims, angles, beads, and spacer strips. Provide anticorrosion metal accessories. Provide primer-sealers and cleaners as recommended by the glass and sealant manufacturers.

2.5 FABRICATION

Provide glazing units required to fit glazing opening sizes and shapes and outward slope indicated on the construction documents and as verified in the field with edge and face clearances, edge and surface conditions, and bite complying with written instructions manufacturer, fabricator and referenced glazing publications, to comply with system performance requirements.
PART 3   EXECUTION

3.1   GLAZING, GENERAL

Comply with combined recommendations of manufacturers of glass, sealants, gaskets, and other glazing materials, except where more stringent requirements are indicated, including those in referenced glazing publications.

Install tower cab glass at outward slope indicated on the drawings.

Glazing channel dimensions as indicated on Drawings provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances. Adjust as required by Project conditions during installation.

Protect glass from edge damage during handling and installation as follows:

a. Use a rolling block in rotating glass units to prevent damage to glass corners. Do not impact glass with metal framing. Use suction cups to shift glass units within openings; do not raise or drift glass with a pry bar. Rotate glass lites with flares or bevels on bottom horizontal edges so edges are located at top of opening, unless otherwise indicated by manufacturer's label.

b. Remove damaged glass from Project site and legally dispose of off site. Damaged glass is glass with edge damage or other imperfections that, when installed, weaken glass and impair performance and appearance.

Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction sealant-substrate testing.

Install elastomeric setting blocks in sill rabbets, sized and located to comply with referenced glazing standard, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.

Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.

Provide spacers for glass as follows:

a. Locate spacers inside, outside, and directly opposite each other. Install correct size and spacing to preserve required face clearances, except where gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and comply with system performance requirements.

b. Provide manufacturer's recommended minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.

Provide edge blocking to comply with requirements of referenced glazing publications, unless otherwise required by glass manufacturer. Prevent shifting of glass units within the mullion rabbets which could cause loss of required bite.
3.2 PREPARATION

Preparation, unless otherwise specified or approved, must conform to applicable recommendations in the GANA Glazing Manual, GANA Sealant Manual, IGMA TB-3001, IGMA TM-3000, and manufacturer's recommendations. Determine the sizes to provide the required edge clearances by measuring the actual opening to receive the glass. Grind smooth in the shop glass edges that will be exposed in finish work. Leave labels in place until the installation is approved, except remove applied labels on insulating glass units as soon as glass is installed. Securely fix movable items or keep in a closed and locked position until glazing compound has thoroughly set.

**************************************************************************

NOTE: Retain following paragraph if the speed of construction of the air traffic control tower is not of the essence. The cab glazing and structural framing system dimensions can sometimes be distorted by weight of cab roof assembly or temperature/solar heat gain where radiant energy of the sun causes some opening sizes to vary during installation process.

**************************************************************************

[ Where tower cab glass mullions also structurally support the tower cab roof and penthouse, the full dead load of the tower cab roof, not including the tower cab ceiling grid and panels, must be applied before taking final measurements of the tower cab glazing openings. The tower cab glass must then be fabricated to fit those actual dimensions.

] Inspect glazing units to locate exterior and interior surfaces. Temporarily label or mark units as needed so that exterior and interior surfaces are readily identifiable. Do not use materials that leave visible marks in the completed Work.

Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings not specified as permanently bonded to substrates.

Ensure that glazing framing weep system must not be obstructed during installation of glazing. Coordinate installation with glazing frame manufacturer's instructions, and requirements.

3.3 GLASS SETTING

Shop glaze or field glaze items to be glazed using glass of the quality and thickness specified or indicated. Glazing, unless otherwise specified or approved, must conform to applicable recommendations in the GANA Glazing Manual, GANA Sealant Manual, IGMA TB-3001, IGMA TM-3000, and manufacturer's recommendations. Handle and install glazing materials in accordance with manufacturer's instructions. Use beads or stops which are furnished with items to be glazed to secure the glass in place. Verify products are properly installed, connected, and adjusted.

3.3.1 Manufacturer's Instructions

Comply with the manufacturer's warranty and written instructions. Confirm that additional specified requirements are accepted by the manufacturer in writing. Secure glass in place with bolts and spring clips. The minimum clearance between bolts and edge of glass unit must be 5 mm 3/16 inch. The
glass must be edged, top and bottom, with 5 mm 3/16 inch thick continuous neoprene, vinyl, or other approved material. Trim edging after installation. The channel shapes or strips must be firmly held against the glass by the spring action of the extruded metal moldings or metal bars. Resilient setting blocks, spacer strips, clips, bolts, washers, angles, applicable glazing compound, and resilient channels or cemented-on materials must be as recommended in the written instructions of the glass manufacturer which must be submitted and approved prior to shipping the tower cab glass.

3.3.2 Tolerances and Clearances of Units

Design to prevent the transfer of stress in the setting frames to the glass. Springing, twisting, or forcing of units during setting is not permitted.

3.3.3 Insulating Glass Units

**************************************************************************
NOTE: Delete following paragraph if cab glass units are not insulated glass units.
**************************************************************************

Springing, forcing, or twisting of units during setting is not permitted. Handle units so as not to strike frames or other objects. Installation must conform to applicable recommendations of IGMA TB-3001 and IGMA TM-3000.

3.3.4 Seismic Installation

**************************************************************************
NOTE: Delete following paragraph if cab glass units are not being installed in high seismic area.
**************************************************************************

Comply with the following requirements for seismic installation.

a. Glass Corner and Edge Cushioning: Padding consisting of 50-70 shore durometer hardness material should be placed in the glazing channel or on the glass edges/corners to avoid any glass to frame contact.

b. Gasket Performance: Gasket should have a positive lock-in method so that gasket will not disengage from metal framing system during up and down and side-to-side movement.

c. Setting Blocks and Supports: Permanently mount setting block and supports to frame using a compatible sealant. Use anti-walk blocks.

3.3.5 Laminated Glass Units

**************************************************************************
NOTE: Delete following paragraph if cab glass units are not laminated glass.
**************************************************************************

Frames which are to receive laminated glass must be weeped to the outside to prevent water collection in channels or rabbets.
3.4 CLEANING

Follow recommendations of GANA Glazing Manual and the glass manufacturer. Clean glass and metal frequently during construction. Clean glass surfaces and remove labels, paint spots, and other defacement as required to prevent staining. Glass must be cleaned with a soft, clean, grit-free cloth, mild soap, detergent, or slightly acidic cleaning solution. Rinse immediately after cleaning with water and promptly remove excess rinse water with a clean squeegee. Razor blades or other sharp objects must not be used to clean glass surfaces. Glass must be clean at the time the Work is accepted.

3.4.1 Cleaning Prior to Final Inspection

Clean glass at least one day prior to final inspection. Final inspection will be performed during the day and at night. Inspection at night is required verifying that the glass does not have optical distortions that causes ghosting/double images. No additional work will be performed in tower cab by the contractor after final inspection without permission of contracting officer.

3.5 PROTECTION

Glass work must be protected immediately after installation. Glazed openings must be identified with suitable warning tapes, cloth or paper flags, attached with non-staining adhesives. Protective material must be placed far enough away from the coated glass to allow air to circulate to reduce heat buildup and moisture accumulation on the glass. Glass units which are broken, chipped, cracked, abraded, or otherwise damaged during construction activities must be removed and replaced with new units.

Follow recommendations of GANA Glazing Manual and the glass manufacturer. Protect the glass from weld splatter by using plywood or heavy tarpaulins. Do not place insulation over the glass for protection or keep shading material on the glass because excess thermal buildup could result in glass breakage. Do not allow materials to be stored or placed in contact with the glass.

3.6 WASTE MANAGEMENT

**************************************************************************
NOTE: Float glass cannot be recycled with beverage-container glass. Diverting waste from the landfill contributes to the required LEED MR credit. Coordinate with Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL. Designer must verify that items are able to be disposed of as specified.
**************************************************************************

Disposal and recycling of waste materials, including corrugated cardboard recycling, must be in accordance with the Waste Management Plan. Close and seal tightly all partly used sealant containers and store protected in well-ventilated, fire-safe area at moderate temperature.

3.7 MAINTENANCE MANUALS

Provide product manufacturer's published and written instructions for both the maintenance and cleaning of the tower cab glass assemblies as installed in the format compliant with the project requirements and as approved by
the Contracting Officer.

   3.2.3 Metal
   3.2.4 Wood

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for average metal wall louvers, metal louvers in wood doors, screens and frames, and accessories.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: For very large or special louvers and louvers subject to snow or seismic loads, insert additional paragraphs as required.

NOTE: On the drawings, show:

1. Locations, sizes, and types of louvers.

2. Details of louver construction and installation, including subframes, sills, and flashing.

3. Locations and arrangement of mullions.
4. Colors of factory-finished louvers, unless color is specified.

PART 1  GENERAL

1.1  REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AIR MOVEMENT AND CONTROL ASSOCIATION INTERNATIONAL, INC. (AMCA)

AMCA 500-L (2015) Laboratory Methods of Testing Louvers for Rating

AMCA 511 (2010; R 2016) Certified Ratings Program for Air Control Devices

ALUMINUM ASSOCIATION (AA)

AA DAF45 (2003; Reaffirmed 2009) Designation System for Aluminum Finishes

AMERICAN ARCHITECTURAL MANUFACTURERS ASSOCIATION (AAMA)

AAMA 611 (2014) Voluntary Specification for Anodized Architectural Aluminum

Coatings on Aluminum Extrusions and Panels

ASTM INTERNATIONAL (ASTM)

ASTM A653/A653M (2023) Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

ASTM A1008/A1008M (2023) Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable

1.2 SUBMITTALS

**************************************************************************

NOTE:  Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**
- Wall Louvers

**SD-03 Product Data**
- Metal Wall Louvers
- Door Louvers

**SD-04 Samples**
- Wall Louver Samples; G[, [____]]
- Door Louver Samples; G[, [____]]

1.3 DELIVERY, STORAGE, AND PROTECTION

Deliver materials to the site in an undamaged condition. Carefully store materials off the ground to provide proper ventilation, drainage, and protection against dampness. Louvers must be free from nicks, scratches, and blemishes. Replace defective or damaged materials with new.

1.4 DETAIL DRAWINGS

Show all information necessary for fabrication and installation of wall louver s. Indicate materials, sizes, thicknesses, fastenings, and profiles.

1.5 COLOR SAMPLES

Colors of finishes for wall louver samples and door louver samples must closely approximate colors indicated. Where color is not indicated, submit the manufacturer's standard colors to the Contracting Officer for selection.
PART 2   PRODUCTS

2.1   MATERIALS

2.1.1  Galvanized Steel Sheet

ASTM A653/A653M, coating designation Z275 G90.

2.1.2  Aluminum Sheet

ASTM B209M ASTM B209, alloy 3003 or 5005 with temper as required for forming.

2.1.3  Extruded Aluminum

ASTM B221M ASTM B221, alloy 6063-T5 or -T52.

2.1.4  Stainless Steel

Type 302 or 304, with 2B finish.

2.1.5  Cold Rolled Steel Sheet

ASTM A1008/A1008M, Class 1, with matte finish. Use for interior louvers only.

2.2   METAL WALL LOUVERS

**********************************************************************************************
NOTE: Louver free areas vary from 25 to 65 percent, depending on blade design. When a certain free area is required, indicate blade type as well as louver size. CAUTION: Even "weather-resistant" louvers will allow water penetration. Quantity and velocity specified are for wall louvers in mechanical rooms and similar locations. Where water penetration would be a problem, specify acceptable quantity of water penetration at air velocity required, or provide operable louvers or operable dampers to exclude wind-driven rain.
**********************************************************************************************

[Weather][Wind driven rain] resistant type, with bird screens and made to withstand a wind load of not less than [1.44] [_____] kilopascals [30] [_____] pounds per square foot. Wall louvers must bear the AMCA certified ratings program seal for air performance and water penetration in accordance with AMCA 500-L and AMCA 511. The rating must show a water penetration of 0.06 kilograms or less per square meter 0.20 or less ounce per square foot of free area at a free velocity of 244 meters 800 feet per minute.

**********************************************************************************************
NOTE: Use only Aluminum or Stainless Steel louvers in humid locations or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.

**********************************************************************************************
2.2.1 Extruded Aluminum Louvers

Fabricated of extruded 6063-T5 or -T52 aluminum with a wall thickness of not less than 2 mm 0.081 inch.

2.2.2 Formed Metal Louvers

Formed of [zinc-coated] [stainless] steel sheet not thinner than 16 U.S. gage, or aluminum sheet not less than 2 mm 0.08 inch thick.

2.2.3 Mullions and Mullion Covers

NOTE: Large louvers may require bracing for given wind loads and with a maximum deflection of L/180.

Same material and finish as louvers. Provide Mullions [where indicated] [for all louvers more than 1500 mm 5 feet in width at not more than 1500 mm 5 feet on centers]. Provide mullion covers on both faces of joints between louvers.

2.2.4 Screens and Frames

For aluminum louvers, provide 12.5 mm 1/2 inch square mesh, 1.8 or 1.5 mm 14 or 16 gage aluminum or 6 mm 1/4 inch square mesh, 1.5 mm 16 gage aluminum bird screening. For steel louvers, provide 12.5 mm 1/2 inch square mesh, 2.5 or 1.5 mm 12 or 16 gage zinc-coated steel; 12.5 mm 1/2 inch square mesh, 1.5 mm 16 gage copper; or 6 mm 1/4 inch square mesh, 1.5 mm thick 16 gage zinc-coated steel or copper bird screening. Mount screens in removable, rewirable frames of same material and finish as the louvers.

2.3 Door Louvers

NOTE: Avoid louvered doors on exterior locations in humid locations or project locations with Environmental Severity Classifications (ESC) of C3 thru C5 as they are very susceptible to weather deterioration. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations. Consider other means of providing the venting functions.

Ensure that louvers in doors are drainable, weatherproof and factory primed. Doors with factory-installed louvers are also recommended.

NOTE: Avoid louvered doors on exterior locations in buildings subject to the antiterrorism requirements of UFC 4-010-01.

Inverted "Y"[ or ][Inverted "V"] sightproof type not less than 25 mm one inch thick with matching metal trim. Louvers for exterior doors must be
weather resistant type.

2.3.1 Extruded Aluminum Door Louvers

Fabricate of 6063-T5 or -T52 aluminum alloy with a wall thickness of not less than 1.25 mm 0.050 inch thick. Frames and trim must be clamp-in "L" type.

2.3.2 Formed Metal Door Louvers

Fabricate of [0.9 mm thick 20 U.S. gage steel sheet][ or ][sheet aluminum not less than 1.25 mm 0.050 inch thick]. Trim must be beveled "Z" molding both sides.

2.3.3 Screens and Frames

For exterior doors, provide aluminum insect screens, 18 by 16 or 18 by 14 mesh. Mount screens in removable, rewirable frames of same material and finish as the louvers.

2.4 FASTENERS AND ACCESSORIES

Provide stainless steel screws and fasteners for aluminum louvers and zinc-coated or stainless steel screws and fasteners for steel louvers. Provide other accessories as required for complete and proper installation.

2.5 FINISHES

**************************************************************************
NOTE: Specify anodic and organic coatings meeting the selection requirements in the Notes below as Contractor's option when these finishes are determined to be available in similar colors an economically competitive in the project area, unless the project requires use of one or the other to match an existing condition.
**************************************************************************

**************************************************************************
NOTE: The selection of anodic or organic coating is based primarily on the desired appearance: anodized finishes provide a metallic appearance and organic finishes provide a painted or metal-like finish (organic finishes are available in a variety of colors). Only allow both types as a Contractor option when the Designer confirms that the desired appearance is available in both types of finishes.
**************************************************************************

2.5.1 Aluminum

Exposed aluminum surfaces must be factory finished with an [anodic coating][ or ][organic coating].[ Color must be [_____] as indicated]. Louvers [for each building] must have the same finish.

2.5.1.1 Anodic Coating

**************************************************************************
NOTE: Specify Architectural Class I for harsh
**************************************************************************
atmospheres where dust, gases, salts, and other destructive elements will attack metal finish. Also specify Class I for humid locations or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). Specify Architectural Class II for all atmospheric conditions not requiring Class I. See UFC 1-200-01 for determination of ESC for project locations.

Clean exposed aluminum surfaces and provide an anodized finish conforming to AA DAF45 and AAMA 611. Finish must be:

[a. Architectural Class II (0.01 to 0.0175 mm 0.4 mil to 0.7 mil), designation AA-M10-C22-[A31, clear (natural)] [A32, integral color] [A34, electrolytically deposited color] anodized.

[b. Architectural Class I (0.0175 mm 0.7 mil or thicker), designation AA-M10-C22-[A41, clear (natural)] [A42, integral color] [A44, electrolytically deposited color] anodized.

2.5.1.2 Organic Coating

NOTE: For organic coatings, to provide enhanced resistant to corrosion, weathering, ozone, and UV radiation utilize superior performance powder coat finishes conforming to AAMA 2605 in humid locations and project locations with an ESC of C3 thru C5; baked enamel finishes conforming to AAMA 2603 may be utilized for non-humid locations and ESC C1 or C2 project locations. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). Refer to UFC 1-200-01 for determination of ESC for a specific project location.

Clean and prime exposed aluminum surfaces. Provide a [baked enamel finish conforming to AAMA 2603, with total dry film thickness not less than 0.02 mm 0.8 mil] [superior performance finish in accordance with AAMA 2605 with total dry film thickness of not less than 0.03 mm 1.2 mil], color [______].

2.5.2 Steel

NOTE: Include the bracketed item below for projects that include louvers on both the exterior and interior conditioned spaces of the building.

Surfaces specified must have a zinc coating, a phosphate treatment, and a shop prime coat of rust-inhibitive paint. The galvanized coating must conform to ASTM A653/A653M, coating designation Z275 (G90)[, except that louvers located in conditioned spaces on interior of the building may be Z180 (G60)]. The weight of zinc coatings must be as designated in Table I
of ASTM A123/A123M for the thickness of base metal to be coated. The prime coat must be a type especially developed for materials treated by phosphates and adapted to application by dipping or spraying. Repair damaged zinc-coated surfaces by the materials and methods conforming to ASTM A780/A780M and spot prime. At the option of the Contractor, a two-part system including bonderizing, baked-on epoxy primer, and baked-on enamel top coat may be applied before forming, in lieu of prime coat specified.

PART 3  EXECUTION

3.1  INSTALLATION

3.1.1  Wall Louvers

Install using stops or moldings, flanges, strap anchors, or jamb fasteners as appropriate for the wall construction and in accordance with manufacturer's recommendations.

3.1.2  Door Louvers

Install louvers in wood doors by using metal "Z" or "L" moldings. Fasten moldings to door with screws.

3.1.3  Screens and Frames

Attach frames to louvers with screws or bolts.

3.2  PROTECTION FROM CONTACT OF DISSIMILAR MATERIALS

3.2.1  Copper or Copper-Bearing Alloys

Paint copper or copper-bearing alloys in contact with dissimilar metal with heavy-bodied bituminous paint or separate with inert membrane.

3.2.2  Aluminum

Where aluminum contacts metal other than zinc, paint the dissimilar metal with a primer and two coats of aluminum paint.

3.2.3  Metal

Paint metal in contact with mortar, concrete, or other masonry materials with alkali-resistant coatings such as heavy-bodied bituminous paint.

3.2.4  Wood

Paint wood or other absorptive materials that may become repeatedly wet and in contact with metal with two coats of aluminum paint or a coat of heavy-bodied bituminous paint.

SSPC SP 2 (2018) Hand Tool Cleaning

SSPC SP 3 (2018) Power Tool Cleaning

SSPC SP 5/NACE No. 1 (2007) White Metal Blast Cleaning

SSPC SP 6/NACE No.3 (2007) Commercial Blast Cleaning

SSPC SP 10/NACE No. 2 (2015) Near-White Blast Cleaning

1.2 SUMMARY

**************************************************************************

NOTE: The Federal Clean Air Act requires each state
to meet the National Ambient Air Quality Standards. In addition, each state or local government may impose more restrictive requirements. States with areas identified as exceeding EPA standards for ozone must adopt limits on the volatile organic compound (VOC) content of paint removers, wood preservatives, solvents and other chemical preparation materials. Therefore, the designer should determine the local restrictions and eliminate prohibited materials. It may be necessary to specify locally available commercial products which have been developed to meet local restrictions.

The requirements for Contractor test report responsibilities should be modified regarding exempt materials.

**************************************************************************

The procedures proposed for the accomplishment of the work must provide for safe conduct of the work, careful removal and disposition of materials specified to be salvaged, protection of property which is to remain undisturbed, and coordination with other work in progress. Submit the names, quantity represented, and intended use for proprietary brands of materials proposed to be substituted for the specified materials when the required quantity of a particular batch is 200 liters 50 gallons or less. Submit manufacturer's current printed product description, safety data sheets (SDS) and technical data sheets for each product. Provide detailed mixing, thinning and application instructions, minimum and maximum application temperature, and curing and drying times for each product submitted. Include in the work plan a Safety and Health plan describing procedures for handling monitoring, and disposition of VOCs and other hazardous and toxic materials. Submit [one copy] [_____] copies of the Work Plan and a certificate stating that products proposed for use meet the VOC regulations of the local Air Pollution Control Districts having jurisdiction over the geographical area in which the project is located. Include a detailed description of the methods and equipment to be used for each operation, and the sequence of operations. Test the materials designated by the Contracting Officer.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the
Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Work Plan; G[, [_____]]

Materials

Qualifications

SD-07 Certificates

Work Plan

1.4 QUALITY ASSURANCE

Perform work in compliance with the ACCIDENT PREVENTION PLAN, including the Activity Hazard Analysis as specified in the CONTRACT CLAUSES. Include analyses of the potential impact of surface preparation operations on personnel and on others involved in and adjacent to the work zone in the Activity Hazard Analysis.

1.4.1 Worker Exposures

Do not expose workers to chemical substances exceeding limits as established by ACGIH 0100.

1.4.2 Training

Inform workers, having access to an affected work area, of the contents of the applicable SDS and of potential health and safety hazard and protective controls associated with materials used on the project. An affected work area is one which may receive dust, mists, and odors from the surface preparation operations. Workers involved in surface preparation and clean-up must be trained in the safe handling and application, and the
exposure limit, for each material which the worker will use in the project. Instruct personnel having a need to use respirators and masks in the use and maintenance of such equipment.

1.4.3 Coordination

Coordinate work to minimize exposure of building occupants, other Contractor personnel, and visitors to mists and odors from surface preparation and cleaning operations.

1.4.4 Qualifications

Provide qualified workers trained and experienced in the preparation for painting of wood and metal surfaces in historic structures, submit documentation of 5 consecutive years of work of this type and a statement certified by the Contractor attesting that the experience and qualifications of the workers (journeymen) comply with the specifications. Provide a list of similar jobs identifying when, where, and for whom the work was done and a current point-of-contact for identified references.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver paint removers, solvents, and other chemicals, used for surface preparation, in sealed containers that legibly show the designated name, formula or specification number, quantity, date of manufacture, manufacturer's formulation number, manufacturer's directions including any warnings and special precautions, and name of manufacturer. Furnish such materials in containers not larger than 20 L 5 gallons; store them in accordance with the manufacturer's written directions; and, as a minimum, store them off the ground, under cover, with sufficient ventilation to prevent the buildup of flammable vapors and at temperatures between 4 and 35 degrees C 40 and 95 degrees F.

1.6 ENVIRONMENTAL REQUIREMENTS

Unless otherwise recommended by the product manufacturer, provide an ambient temperature between 7 and 35 degrees C 45 and 95 degrees F when applying paint removers, solvents, or other preparation materials.

PART 2 PRODUCTS

**************************************************************************
NOTE: When the required quantity of a particular material is 200 liters 50 gallons or less, the factors of time, value of material versus cost of testing, and the end use of material may justify acceptance on the basis of manufacturer's data.
**************************************************************************

2.1 PAINT REMOVERS

Provide chemical paint removers that are a commercial item specifically manufactured for the type of paint to be removed.
2.2 EPOXY CONSOLIDANTS

2.2.1 Liquid Consolidant

Provide liquid wood consolidant consisting of a 2-part, low-viscosity liquid epoxy that meets the criteria of Table 1.

2.2.2 Epoxy Paste

Provide epoxy paste consisting of a 2-part, thixotropic paste that meets the criteria of Table 1.

PART 3 EXECUTION

3.1 GENERAL REQUIREMENTS

Use methods for preparation of historic wood and metal surfaces for painting which are the gentlest possible to achieve the desired results. Do not damage or marr substrate materials in the process of surface preparations. Collect and analyze samples of the existing paint finishes for the purpose of documentation or matching, if [so directed by the Contracting Officer] [required by the contract documents.] Material and application requirements for paints are covered in Section 09 90 00 PAINTS AND COATINGS.
3.2 VENTILATION

Ventilate interior work zones, having a volume of 280 cubic meters 10,000 cubic feet or less, at a minimum of 2 air exchanges per hour. Maintain ventilation in larger work zones by means of mechanical exhaust. Exhaust solvent vapors outdoors, away from air intakes and workers. Temporarily seal return air inlets in the work zone before start of work until the prepared surfaces have dried. Operators and personnel in the vicinity of paint removal processes involving chemicals or mechanical action (sanding or blasting) must wear respirators.

3.3 PROTECTION OF AREAS NOT TO BE PAINTED

Remove or protect items not to be painted, which are in contact with or adjacent to painted surfaces, prior to surface preparation and painting operations. Replace items removed prior to painting when painting is completed. Following completion of painting, reinstall removed items. Restore surfaces contaminated by preparation materials to original condition.

3.4 CLEANING OF SURFACES

Provide surfaces that are clean and free of grease, dirt, dust and other foreign matter before application of paint or surface treatments. After cleaning, exhibit a surface disfigurement rating of 7 or greater when evaluated in accordance with ASTM D3274. Clean dirt and surface contaminants by brush with solutions of water and detergent or trisodium phosphate, then rinsed clean with water and let dry. Clean surfaces on which mildew or other microbiological growth is present with a detergent solution containing household bleach. Remove oil and grease with clean cloths and cleaning solvents prior to mechanical cleaning. Provide low toxicity cleaning solvents with a flashpoint in excess of 38 degrees C 100 degrees F. Program cleaning so that dust and other contaminants will not fall on newly prepared or newly painted surfaces.

3.5 EXISTING PAINT

Test existing paint for adhesion to substrate in accordance with ASTM D3359, Test Method A and obtain a rating of 4 or better in order to be considered sound. Existing paint meeting this requirement may be considered a satisfactory base for repainting.

3.6 PAINT REMOVAL

Remove flaking, cracking, blistering, peeling or otherwise deteriorated paint by scraping with hand scrapers. After scraping, remove large areas of paint or paint on architectural details using sanders, heat guns or heat plates, or chemical paint removers. Remove paint to bare substrate or first sound paint layer. Do not use open flame heat devices. Mechanical paint removal must not damage or mar the substrate material.

3.6.1 Chemical Paint Removers

Use chemical paint removers in accordance with manufacturer's recommendations. If chemical strippers are used, neutralizesubstrate to a pH of 5 to 8.5 after stripping.
3.6.2 Lead Paint

In preparation of lead-based painted surfaces for repainting, follow the procedures described in Section 02 83 00 LEAD REMEDIATION.

3.7 SURFACE PREPARATION

After cleaning and removal of deteriorated paint, feather and sand edges of remaining chipped paint. Repair damaged areas such as, but not limited to, nail holes, cracks, chips, and spalls with suitable material to match adjacent undamaged areas. Roughen slick surfaces. Clean rusty metal surfaces in accordance with [SSPC SP 1] [SSPC SP 2] [SSPC SP 3] [SSPC SP 5/NACE No. 1] [SSPC SP 6/NACE No.3] [SSPC 7/NACE No.4] [SSPC SP 10/NACE No. 2]. Remove chalk so that when tested in accordance with ASTM D4214, the chalk resistance rating is no less than 8. Provide new, proposed coatings that are compatible with existing coatings. If existing surfaces are glossy, reduce the gloss.

3.8 WOOD SURFACES

Clean wood surfaces of foreign matter. Prime or touch up surfaces adjacent to surfaces to receive water-thinned paints before applying water-thinned paints. Scrape and clean small, dry seasoned knots, and give a thin coat of commercial knot sealer before application of the priming coat. Scrape off pitch on large, open, unseasoned knots and all other beads or streaks of pitch, or, if it is still soft, remove with mineral spirits or turpentine, and thinly coat the resinous area with knot sealer.

3.8.1 Interior Wood Surfaces

Sand interior wood surfaces to receive stain. Give oak and other open-grain wood to receive stain a coat of wood filler recommended by the finish manufacturer not less than 8 hours before the application of stain; remove excess filler and sand the surface smooth. Sanding of wood floors is specified in Section 09 64 29 WOOD STRIP AND PLANK FLOORING. Moisture content of the wood must not exceed 12 percent as measured by a moisture meter, unless otherwise authorized.

3.8.2 Wood Repair

Remove and repair badly decayed areas. Replace areas and pieces decayed beyond repair with new pieces that match originals in all respects. Patch moderately decayed areas, weathered, or gouged wood with approved patching compounds, and sand smooth. Identify and correct the source or cause of wood decay prior to application of patching materials. Completely dry wet wood to a moisture content not exceeding 12 percent, as measured by a moisture meter, to its full depth before patching, unless otherwise authorized. Wood that is to be patched must be clean of dust, grease, and loose paint.

3.8.2.1 Epoxy Wood Repair

Apply epoxy wood repair materials in accordance with manufacturer's written instructions. Follow health and safety instructions in accordance with the manufacturer's instructions. Use clean mixing equipment to avoid contamination. Provide mix and proportions as directed by the manufacturer. Provide batches large enough to complete the specific job intended. Completely cure batching materials before painting or reinstallation of patched pieces.
3.8.2.2 Epoxy Consolidant and Epoxy Paste

Use epoxy liquid wood consolidant: 1) to penetrate and impregnate deteriorated wood sections in order to reinforce wood fibers that have become softened or absorbent. 2) as a primer for areas that are to receive epoxy paste filler. Use epoxy paste to fill areas where portions of wood are missing such as holes, cracks, gaps, gouges, and other voids.

3.8.3 Exposed Ferrous Metals

Spot-prime exposed ferrous metals such as nail heads on or in contact with wood surfaces to be painted with water-thinned paints, with a suitable corrosion-inhibitive primer capable of preventing flash rusting and compatible with the coating specified for the adjacent areas.

3.8.4 Finishing Nails

Set finishing nails, and prime all holes and surface imperfections. After priming, fill holes and imperfections in finish surfaces with putty or plastic wood filler, colored to match the finish coat if natural finish is required, allowed to dry, and sanded smooth. Putty or wood filler must be compatible with subsequent coatings.

3.8.5 Wood Preservative

Treat areas of bare wood in exterior locations prone to excessive moisture or standing water with a commercial, fungicide, paintable water repellent/preservative. Do not use water repellant/preservatives on interior surfaces.

3.9 METAL SURFACES

Clean metal surfaces of foreign matter. Prepare metal in accordance with SSPC PA Guide 5. Remove grease, oil, and other soluble contaminants by solvent cleaning in accordance with SSPC SP 1. Surfaces must be free from soils and corrosion; e.g. grease, oil, solder flux, welding flux, weld spatter, sand, rust, scale, and other contaminants that might interfere with the application of the new finish. Gently clean to achieve the desired result. Do not abrasively clean metals which are soft, thin, or exhibit fine detail. Evidence of corrosion or contamination on a previously cleaned surface must be cause for recleaning prior to painting.

3.9.1 Ferrous Surfaces

Mechanically clean surfaces that contain loose rust, loose mill scale, and other foreign substances with hand tools according to SSPC SP 2, power tools according to SSPC SP 3 or by blast cleaning according to [SSPC SP 5/NACE No. 1], [SSPC SP 6/NACE No.3], [SSPC 7/NACE No.4], [SSPC SP 10/NACE No. 2]. Protect shop-coated ferrous surfaces from corrosion by treating and touching up corroded areas immediately upon detection.

3.9.2 Nonferrous Metallic Surfaces

Solvent-clean galvanized, aluminum and aluminum-alloy, lead, copper, and other nonferrous metal surfaces in accordance with SSPC SP 1.
3.9.2.1 Aluminum

Treat aluminum surfaces in accordance with ASTM D173/D173M or ASTM D173/D173M. Do not use steel wool, steel brushes and uninhibited caustic etching solutions, such as sodium hydroxide, on aluminum.

3.9.2.2 Zinc

Clean zinc surfaces including zinc-coated substrates prior to painting as follows: degrease, soak in a mild and inhibited alkaline cleaner, rinse with clean overflowing water, clean anodically in an acid (e.g. 0.25 to 0.75 percent sulfuric acid), and rinse with clean overflowing water.

3.10 TIMING

Give surfaces that have been cleaned, pretreated, and otherwise prepared for painting a coat of the specified first coat as soon as practical after such pretreatment has been completed, but prior to any deterioration of the prepared surface. Unless otherwise directed, apply the first coat primer within 48 hours of surface preparation.

3.11 SURFACES TO BE PREPARED FOR PAINTING

Prepare surfaces as specified and as shown in the painting schedule [in Section 09 90 00 PAINTS AND COATINGS] [on the drawings].

3.12 CLEANING

Place cloths, cotton waste and other debris, that might constitute a fire hazard, in closed metal containers for removal at the end of each day. Remove containers from the site or destroy in an approved manner. Remove preparation materials and other deposits on adjacent surfaces and leave the entire job clean and ready for painting.

2.4.7.6 Operable Partitions
2.4.7.7 Accordion Partitions
2.4.7.8 Acoustical Wall Panels
2.4.7.9 Corner Guards
2.4.7.10 Protective Wall Covering/Panel
2.4.7.11 Chair Rail
2.4.7.12 Signage Message Color
2.4.7.13 Signage Background Color
2.4.7.14 Building Directory
2.4.7.15 Bulletin Board
2.4.7.16 Markerboard
2.4.7.17 Closet Shelving
2.4.7.18 Lockers
2.4.7.19 Benches
2.4.7.20 Wall Switch Handles and Standard Receptacle Bodies
2.4.7.21 Electrical Device Cover Plates
2.4.7.22 Electrical Panels
2.4.7.23 Fin Tubes
2.4.7.24 Shower [Curtain][Doors]
2.4.7.25 Shower Wall Kits, Trim and Shower Pan

2.5 PLACEMENT SCHEDULE

PART 3 EXECUTION

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for color of exterior and interior materials and products.

Per 2017 NDAA-Section 888, the use of brand names or brand-name or equivalent descriptions, or proprietary specifications or standards is prohibited in Department of Defense solicitations unless a justification for such specification is provided and approved in accordance with section 2304(f) of title 10, United States Code. Use this guide specification when providing a Justification and Approval (J&A), OR when using color reference systems such as Pantone, RAL, AMS-STD-595 (Federal Standard 595C) and NCS to define finish colors.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
PART 1   GENERAL

1.1 SUMMARY

This section covers only the color of exterior and interior materials and products that are exposed to view in the finished construction. The word "color", as used herein, includes surface color and pattern. Requirements for quality, product specifications, and method of installation are covered in other appropriate sections of the specifications. Specific locations where the various materials are required are shown on the drawings if not identified in this specification. Items not designated for color in this section may be specified in other sections. When color is not designated for items, propose a color for approval.

1.2 SUBMITTALS

**************************************************************************

NOTE:  Fill in the empty brackets following the "G" classification with a designation identifying the DOR (Designer of Record).

**************************************************************************

SD-04 Samples

Contractor Color Boards; G[, [_____]]

1.3 COLOR REFERENCE SYSTEMS

Colors for project finishes are identified in the Color Schedule and based on the [Pantone [Home & Interiors Color Guide][     ]][RAL [Design Color Guide] [     ]][AMS-STD-595 (Federal Standard 595C)][NCS [1950 Index][     ]] color reference system.

PART 2   PRODUCTS

2.1 CONTRACTOR COLOR BOARDS

**************************************************************************

NOTE: If a Justification and Approval (J&A) is not obtained for a project, the following requirement can be included for the contractor to submit construction color boards.

**************************************************************************

Contractor to submit actual color boards to include all finish color samples specified on the project, prior to the submittal and approval of individual finish submittals. The DOR must review and approve the color boards to verify overall building finish coordination and aesthetic. Color boards must be prepared by professional interior designers or architects with significant interior design experience. Qualification of designers is based on education, experience and examination. Interior designers or architects must have completed a program accredited by the Council for Interior Design Accreditation (CIDA) or equal accreditation program of academic training in interior design. In addition, the interior designer or architect must also have attained National Council for Interior Design Qualification (NCIDQ) certification or state licensure, certification or registration and must not be affiliated with a furniture dealership, vendor or manufacturer.
2.2 COLOR SCHEDULE

**************************************************************************
NOTE: All interior and exterior finish colors are to be included in this specification or in the Finish Color Legend in the drawings. Add finishes not included in the specification per the project requirements, and delete finishes that are not required for the project. Include applicable mechanical, fire protection, structural, architectural, site and electrical items that have an impact on the aesthetics of a facility. Coordinate the color for these items with the appropriate design discipline.

When this specification is utilized, include reference in the applicable guide specifications "color will be as specified in Section 09 06 00 SCHEDULES FOR FINISHES." If this text is not currently included in the applicable guide specification, the designer should add it.

The Color Schedule may contain a reference to another specification section where the color is designated (example: Signage: See Section 10 14 00.10 EXTERIOR SIGNAGE for color).

When multiple colors of the same material are specified, add finish color codes and notes within the color listing to identify location of different material colors. For example, CPT-1 (Offices), CPT-2 (Conference Rooms) etc.

Coordinate finish terminology and finish color codes between the specifications and drawings, including drawing details such as floor and wall patterns, finish plans, and the Room Finish Schedule.

Do not duplicate information that is specified in the individual specifications or in the drawings.

EDITING TIPS:
1. An easy way to capture finish material text (example:

   <SPT =2.2.1.1><TTL>2.2.1.1   Brick</TTL>

   </SPT =2.2.1.1>) is to place your cursor in the title, double click and continue to double click until it is highlighted from beginning tag (<SPT =2.2.1.1>) to end tag (/<SPT =2.2.1.1>). Once this has been done the highlighted portion can be deleted if not applicable or copied for further editing if text for a new finish material is required.

2. Add information inside ITEM tags (<ITM></ITM>) to prevent text wrapping problems (example:
2.3.1.2 Carpet Tile (CPT)

<ITM>CPT-1 - XYZ Co., Pattern ABC, Color #12354 Blue</ITM>
<ITM>CPT-2 - LPQ Co., Pattern JKL, Color #78911</ITM>.

The color information provided in the following paragraphs lists the colors, patterns and textures for exterior and interior finishes, including both factory applied and field applied colors. In the case of difference between the drawings and specifications, colors identified in this specification govern.

2.3 EXTERIOR FINISHES

******************************************************************************

NOTE: Exterior color information (exterior walls, exterior trim and exterior roof) can be included in this specification or on the exterior elevation drawings. If provided on the drawings include a color legend. When this information is added to the drawings delete the applicable paragraphs in this specification (paragraphs EXTERIOR WALLS, EXTERIOR TRIM and EXTERIOR ROOF).

******************************************************************************

[Reference drawings for color information.]

2.3.1 Exterior Walls

Exterior wall colors apply to exterior wall surfaces including recesses at entrances and projecting vestibules. When applicable, paint conduit to closely match the adjacent surface color. Provide wall colors to match the colors listed below.

2.3.1.1 Brick

[____]  

2.3.1.2 Mortar

[____]  

2.3.1.3 Concrete Masonry Units ([Integrally Colored][Rock/Split-Faced][Ribbed][Burnished][____])

[____]  

2.3.1.4 Metal Wall Panels, Hardware, and Associated Trim

[____]  

2.3.1.5 Insulation and Finish System

[____]
2.3.1.6 Precast Concrete
[____]

2.3.1.7 Precast Stone
[____]

2.3.1.8 Glass and Glazing
[____]

2.3.1.9 Paint
[____]

2.3.1.10 Cement Board Siding and Trim
[____]

2.3.1.11 Cultured Stone
[____]

2.3.1.12 Screen Wall
[____]

2.3.2 Exterior Trim

Provide exterior trim to match the colors listed below.

2.3.2.1 Steel Doors and Door Frames
[____]

2.3.2.2 Steel Windows (mullion, muntin, sash, trim, and sill)
[____]

2.3.2.3 Aluminum Doors and Door Frames
[____]

2.3.2.4 Aluminum Windows (mullion, muntin, sash, trim, and sill)
[____]

2.3.2.5 Wood Clad Windows (mullion, muntin, sash, trim, and sill)
[____]

2.3.2.6 Window Screens
[____]

2.3.2.7 Wood Stain
[____]
2.3.2.8  Fascia
[____]

2.3.2.9  Soffits and Ceilings
[____]

2.3.2.10  Overhangs
[____]

2.3.2.11  Downspouts and Gutters
[____]

2.3.2.12  Scuppers
[____]

2.3.2.13  Louvers
[Match adjacent material in color.][____]

2.3.2.14  Flashings
[Match adjacent material in color.][____]

2.3.2.15  Coping
[____]

2.3.2.16  Precast Concrete [[Caps][, ]][____][ and ][Sills]
[____]

2.3.2.17  Precast Stone [[Caps][ ,]][____][ and ][Sills]
[____]

2.3.2.18  Handrails
[____]

2.3.2.19  Guardrails
[____]

2.3.2.20  Caulking and Sealants
[Match adjacent material in color.][____]

2.3.2.21  Stringers and Stair Framing
[____]
2.3.2.22  Bollards  
[_____]  

2.3.2.23  Signage  
[_____]  

2.3.2.24  Sun Shades  
[_____]  

2.3.2.25  Control Joints  
[Match adjacent material in color.][_____]  

2.3.2.26  Expansion Joint and/or Covers  
[Match adjacent material in color.][_____]  

2.3.3  Exterior Roof  

Apply roof color to exterior roof surfaces including sheet metal flashings and copings, snow guards, mechanical units, mechanical penthouses, roof trim, pipes, conduits, electrical appurtenances, and similar items. Provide roof color to match the colors listed below.  

2.3.3.1  Metal  
[_____]  

2.3.3.2  Shingles  
[_____]  

2.3.3.3  EPDM  
[_____]  

2.3.3.4  TPO  
[_____]  

2.3.3.5  Penetrations  
[Match roof in color.][_____]  

2.4  INTERIOR FINISHES  

2.4.1  Interior Floor Finishes  

Provide flooring materials to match the colors listed below.  

2.4.1.1  Carpet (Broadloom)  
[_____]
2.4.1.2 Carpet Tile
[______]
2.4.1.3 Static-Control Carpet
[______]
2.4.1.4 Vinyl Composition Tile
[______]
2.4.1.5 Linoleum
[______]
2.4.1.6 Luxury Vinyl Tile
[______]
2.4.1.7 Cork
[______]
2.4.1.8 Sheet Vinyl
[______]
2.4.1.9 Rubber Tile
[______]
2.4.1.10 Static-Control Resilient Flooring ([Conductive Vinyl Tile][Conductive Rubber Tile][Conductive Rubber SheetFlooring][Static-Dissipative Vinyl Tile][Static-Dissipative Rubber Tile])
[______]
2.4.1.11 Stair Flooring
[______]
2.4.1.12 Stair Landings
[______]
2.4.1.13 Porcelain Tile
[______]
2.4.1.14 Quarry Tile
[______]
2.4.1.15 Ceramic Tile
[______]
2.4.1.16 Grout
[____]

2.4.1.17 [Aluminum][Marble][Solid Surface][____] Transition
[____]

2.4.1.18 Entrance Mat
[____]

2.4.1.19 Plastic Laminate
[____]

2.4.1.20 Wood
[____]

2.4.1.21 Concrete ([Paint][Stain][Integrally Colored][____])
[____]

2.4.1.22 Industrial Floor Coating
[____]

2.4.2 Interior Base Finishes

Provide base materials to match the colors listed below.

2.4.2.1 Resilient Base and Moldings
[____]

2.4.2.2 Porcelain Tile
[____]

2.4.2.3 Quarry Tile
[____]

2.4.2.4 Ceramic Tile
[____]

2.4.2.5 Grout
[____]

2.4.2.6 Integral Cove Base
[____]

2.4.2.7 Brick
[____]

SECTION 09 06 00 Page 13
2.4.2.8 Mortar

[______]

2.4.2.9 Paint

[______]

2.4.2.10 Wood

[______]

2.4.3 Interior Wall Finishes

Apply interior wall color to the entire wall surface, including reveals, vertical furred spaces and columns, grilles, diffusers, electrical and access panels, and piping and conduit adjacent to wall surfaces unless otherwise specified. Paint items not specified in other paragraphs to match adjacent wall surface. Provide wall materials to match the colors listed below.

2.4.3.1 Paint

[______]

2.4.3.2 Vinyl Wall Covering

[______]

2.4.3.3 Fabric Wall Covering

[______]

2.4.3.4 Acoustical Wall Covering

[______]

2.4.3.5 Porcelain Tile

[______]

2.4.3.6 Ceramic Tile

[______]

2.4.3.7 Grout

[______]

2.4.3.8 Brick

[______]

2.4.3.9 Mortar

[______]
2.4.3.10 Metal Liner Panels

[_____

2.4.3.11 Exposed Structural Columns

[_____

2.4.4 Interior Ceiling Finishes

Apply ceiling colors to ceiling surfaces including soffits, furred down areas, grilles, diffusers, registers, and access panels. In addition, apply ceiling color to joists, underside of roof deck, and conduit and piping where joists and deck are exposed and required to be painted. Provide ceiling materials to match the colors listed below.

2.4.4.1 Acoustical Tile and Grid

[Manufacturers Standard Color][____

2.4.4.2 Paint (Ceilings)

[____

2.4.4.3 Paint (Soffits)

[____

2.4.4.4 Metal Deck

[____

2.4.4.5 Structural Framing

[____

2.4.5 Interior Trim

Provide interior trim to match the colors listed below.

2.4.5.1 Steel Doors

[____

2.4.5.2 Steel Door Frames

[____

2.4.5.3 Steel Windows (mullion, muntin, sash, trim, and stool)

[____

2.4.5.4 Aluminum Doors and Door Frames

[____

2.4.5.5 Aluminum Windows (mullion, muntin, sash, trim, and stool)

[____]
2.4.5.6  Wood Doors
[_____]

2.4.5.7  Wood Stain
[_____]

2.4.5.8  Fire Extinguisher Cabinets
[_____]

2.4.5.9  Handrails
[_____]

2.4.5.10 Guardrails
[_____]

2.4.5.11 Ladders
[_____]

2.4.5.12 Metal Stairs[; includes [risers][and underside of stairs] only]
[_____]

2.4.5.13 Exposed Ductwork
[_____]

2.4.5.14 Bollards
[_____]

2.4.6  Interior Window Treatment

Provide window treatments to match the colors listed below.

2.4.6.1  Horizontal Blinds
[_____]

2.4.6.2  Vertical Blinds
[_____]

2.4.6.3  Window Shades
[_____]

2.4.6.4  Drapery Hardware
[_____]
2.4.7 Interior Miscellaneous

Provide miscellaneous items to match the colors listed below.

2.4.7.1 Toilet Partitions and Urinal Screens

[_____

2.4.7.2 Casework

**************************************************************************
NOTE: Add project requirements for items such as cabinetry, countertops, backsplashes and toilet room access panels, etc. and list the finish materials for these items such as plastic laminate, wood finish, solid surface materials, engineered quartz, etc.
**************************************************************************

[_____

2.4.7.3 Plastic Laminate

**************************************************************************
NOTE: Delete this paragraph if all applicable materials are listed under paragraph "Casework" above.
**************************************************************************

[_____

2.4.7.4 Solid Surfacing Material

**************************************************************************
NOTE: Delete this paragraph if all applicable materials are listed under paragraph "Casework" above.
**************************************************************************

[_____

2.4.7.5 Window Sills ([Solid Surface][Plastic Laminate][_____])

[_____

2.4.7.6 Operable Partitions

[_____

2.4.7.7 Accordion Partitions

[_____

2.4.7.8 Acoustical Wall Panels

[_____]
2.4.7.9 Corner Guards
[______]
2.4.7.10 Protective Wall Covering/Panel
[______]
2.4.7.11 Chair Rail
[______]
2.4.7.12 Signage Message Color
[______]
2.4.7.13 Signage Background Color
[______]
2.4.7.14 Building Directory
[______]
2.4.7.15 Bulletin Board
[______]
2.4.7.16 Markerboard
[______]
2.4.7.17 Closet Shelving
[______]
2.4.7.18 Lockers
[______]
2.4.7.19 Benches
[______]
2.4.7.20 Wall Switch Handles and Standard Receptacle Bodies
[______]
2.4.7.21 Electrical Device Cover Plates
[______]
2.4.7.22 Electrical Panels
[______]
2.4.7.23 Fin Tubes
[______]
2.4.7.24  Shower [Curtain][Doors]

[_____]  

2.4.7.25  Shower Wall Kits, Trim and Shower Pan

[_____]  

[2.5]  PLACEMENT SCHEDULE

**************************************************************************
NOTE: Delete this paragraph if there is a Room Finish Schedule in the drawings.

If this schedule is required, use the same codes as in the above Color Schedule or create finish color codes to populate the columns.

**************************************************************************

Placement of color to be in accordance with the following schedule:

<table>
<thead>
<tr>
<th>ROOM # AND NAME</th>
<th>FLOOR</th>
<th>BASE</th>
<th>NORTH WALL</th>
<th>SOUTH WALL</th>
<th>EAST WALL</th>
<th>WEST WALL</th>
<th>CEILING</th>

3.2 ERECTION TOLERANCES

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for non-load bearing cold-formed metal framing, furring, and ceiling suspension systems for the attachment of lath, plaster, stucco, and wallboard.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Load bearing cold-formed steel framing is included in Section 05 40 00 COLD-FORMED METAL FRAMING. Metal suspension systems for acoustical ceilings are included in Section 09 51 00 ACOUSTICAL CEILINGS.

NOTE: On the drawings, show:

1. Locations of each type of metal framing, furring, or suspension system.

2. Spacing and gage of members if other than those
3. Seismic restraint for projects located in seismic zone 2, 3, or 4, in accordance with AISC 341 and UFC 3-301-01, "Structural Engineering".
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will
review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

**************************************************************************
NOTE: Require drawings only for projects where complexity or quantity make it feasible.
**************************************************************************

Metal Support Systems; G[, [_____]]

Submit for the erection of metal[ framing,][ furring,][ and][ ceiling suspension systems]. Indicate materials, sizes, thicknesses, and fastenings.

**SD-03 Product Data**

Metal Support Systems

Recycled Content for Metal Support Systems; S

1.3 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the job site and store in ventilated dry locations permitting easy access for inspection and handling. If materials are stored outdoors, stack materials off the ground, supported on a level platform, and fully protected from the weather. Handle materials carefully to prevent damage. Remove damaged items and provide new items.

PART 2 PRODUCTS

2.1 MATERIALS

Provide steel materials for metal support systems with galvanized coating ASTM A653/A653M, Z180 G-60; aluminum coating ASTM A463/A463M, T1-75 T1-25; or a 55-percent aluminum-zinc coating.[ Provide support systems and attachments per [AISC 341][_____] [UFC 3-301-01, "Structural Engineering"] in seismic zones.]

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.
**************************************************************************

Provide metal support systems containing a minimum of 20 percent recycled content. Provide data identifying percentage of recycled content for metal support systems.

2.1.1 Materials for Attachment of Lath

2.1.1.1 Suspended and Furred Ceiling Systems and Wall Furring

ASTM C841, and ASTM C847.
2.1.1.2 Non-load Bearing Wall Framing

NAAMM EMLA 920.

2.1.2 Materials for Attachment of Gypsum Wallboard

2.1.2.1 Suspended and Furred Ceiling Systems

ASTM C645.

2.1.2.2 Non-load Bearing Wall Framing and Furring

**************************************************************************
NOTE: Minimum thickness of 0.45 mm 0.0179 inch (25 gage) is standard for interior non-load bearing studs without supporting attached loads. Choose the second option of 0.85 mm 0.0329 inch (20 gage) thickness for medical, dental or other building types requiring large quantities of wall supported cabinet work and equipment throughout the facility.
**************************************************************************

ASTM C645, but not thinner than 0.45 mm 0.0179 inch thickness, with 0.85 mm 0.0329 inch minimum thickness supporting wall hung items such as cabinetwork, equipment and fixtures[0.85 mm 0.0329 inch thickness regardless of the ASTM certified third party testing statement for equivalent thicknesses].

2.1.2.3 Furring Structural Steel Columns

ASTM C645. Steel (furring) clips and support angles listed in UL Fire Resistance may be provided in lieu of steel studs for erection of gypsum wallboard around structural steel columns.

2.1.2.4 Z-Furring Channels with Wall Insulation

**************************************************************************
NOTE: The depth specified for Z-furring channels should be coordinated with the R-value specified for wall insulation thickness.
**************************************************************************

Not lighter than 0.5 mm thick 26 gage galvanized steel, Z-shaped, with 32 mm and 19 mm 1-1/4 inch and 3/4 inch flanges and [25] [38] [50] [75] mm [1] [1 1/2] [2] [3] inch furring depth) [depth as required by the insulation thickness provided].

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Systems for Attachment of Lath

3.1.1.1 Suspended and Furred Ceiling Systems and Wall Furring

ASTM C841, except as indicated otherwise.
3.1.1.2 Non-load Bearing Wall Framing

NAAMM EMLA 920, except provide framing members 400 mm 16 inches o.c. unless indicated otherwise.

3.1.2 Systems for Attachment of Gypsum Wallboard

3.1.2.1 Suspended and Furred Ceiling Systems

ASTM C754, except provide framing members 400 mm 16 inches o.c. unless indicated otherwise.

3.1.2.2 Non-load Bearing Wall Framing and Furring

ASTM C754, except as indicated otherwise.

3.1.2.3 Furring Structural Steel Columns

Install studs or galvanized steel clips and support angles for erection of gypsum wallboard around structural steel columns in accordance with the UL Fire Resistance, design number(s) [indicated] [of the fire resistance rating indicated].

3.1.2.4 Z-Furring Channels with Wall Insulation

Install Z-furring channels vertically spaced not more than 600 mm 24 inches o.c. Locate Z-furring channels at interior and exterior corners in accordance with manufacturer's printed erection instructions. Fasten furring channels to[ masonry][ and][ concrete] walls with powder-driven fasteners or hardened concrete steel nails through narrow flange of channel. Space fasteners not more than 600 mm 24 inches o.c.

3.2 ERECTION TOLERANCES

Provide framing members which will be covered by finish materials such as wallboard, plaster, or ceramic tile set in a mortar setting bed, within the following limits:

a. Layout of walls and partitions: 6 mm 1/4 inch from intended position;

b. Plates and runners: 5 mm in 1.9 meters 1/4 inch in 8 feet from a straight line;

c. Studs: 5 mm in 1.9 meters 1/4 inch in 8 feet out of plumb, not cumulative; and

d. Face of framing members: 5 mm in 1.9 meters 1/4 inch in 8 feet from a true plane.

Provide framing members which will be covered by ceramic tile set in dry-set mortar, latex-portland cement mortar, or organic adhesive within the following limits:

a. Layout of walls and partitions: 6 mm 1/4 inch from intended position;

b. Plates and runners: 5 mm in 3.8 meters 1/8 inch in 8 feet from a straight line;
c. Studs: 5 mm in 3.8 meters 1/8 inch in 8 feet out of plumb, not cumulative; and

d. Face of framing members: 5 mm in 3.8 meters 1/8 inch in 8 feet from a true plane.

3.3 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for lathing for gypsum and portland cement-based plaster work.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Metal framing, furring and ceiling suspension systems for lathing are specified in Section 05 40 00 COLD-FORMED METAL FRAMING and Section 09 22 00 SUPPORTS FOR PLASTER AND GYPSUM BOARD.

NOTE: If discoloration of exterior plaster work along the lines of the framing system used to support the lath (metal framing in particular and wood framing to a lesser extent) occurs or is anticipated, design the exterior wall with a thermal break between the metal lath and the framing members. One suggested solution is to install 12.7 mm 1/2 inch thick gypsum sheathing board, conforming to ASTM C79, "Gypsum Sheathing Board," on the framing members before attaching the metal lath.
NOTE: On the drawings, show:

1. Location and extent of plastering
2. Type(s) and spacing of supports
3. Type(s) of plaster and location
4. Control joint locations
5. Fire resistance rating(s), where applicable
6. Sound transmission class (STC) rating(s), where applicable
7. Location and size of access panels and fabrication details for access panels larger than 600 by 900 mm 24 by 36 inches.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving section number.
authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Lath

Recycled Content for Metal Lath; S

Accessories

Access Panels

1.3 DELIVERY AND STORAGE

Deliver materials in the manufacturer's original unbroken packages or containers that are labeled plainly with the manufacturer's names and brands. Store materials in dry locations with adequate ventilation, free from water, and in such a manner to permit easy access for inspection and handling. [Stack gypsum lath flat to avoid sagging or damage to edges, ends, or surfaces, and protect from exposure to direct sunlight.]

PART 2 PRODUCTS

**************************************************************************

NOTE: This guide specification presents nonproprietary materials. When the guide specification is edited or supplemented to suit project requirements, ensure project specification section which contains no proprietary materials.

**************************************************************************

2.1 LATH
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Provide metal lath containing a minimum of 20 percent recycled content. Provide data identifying percentage of recycled content for metal lath.

2.1.1 Metal Plastering Base (Lath)

Provide the type(s) and weight(s) required for the type and spacing of supports shown for the kind of plaster indicated and specified. Do not use rib lath for ceramic tile scratch coat.

2.1.1.1 For Portland Cement-Based Plaster (Stucco)

ASTM C1063,[ diamond mesh][ self-furring diamond mesh][ flat rib][ 10 mm 3/8 inch rib][ 20 mm 3/4 inch rib][ sheet][ welded wire][ woven wire] metal lath weighing not less than [_____] kilograms per square meter pounds per square yard.

2.1.1.2 For Gypsum Plaster

**************************************************************************

NOTE: Consult Table 2 in ASTM C1063 and Table 1 in ASTM C841 to determine the type and weight of the metal lath based on the type and spacing of the support system shown on the project drawings.

**************************************************************************

ASTM C841,[ diamond mesh][ self-furring diamond mesh][ flat rib][ 10 mm 3/8 inch rib][ 20 mm 3/4 inch rib][ sheet][ welded wire][ woven wire] metal lath weighing not less than [_____] kilograms per square meter pounds per square yard.

2.1.1.3 Paper Backing (Waterproofed Kraft Building Paper)

**************************************************************************

NOTE: Specify "Moderate water-vapor Resistant" where moisture protection or use of vapor barrier is required. Specify "Water-vapor permeable" to maintain hollow partitions plaster free, to prevent plaster from bonding to substrate, to prevent over spray where plaster is sprayed on, to provide uniform plaster thickness and to improve bonding (keying). Edit paragraph as required.

**************************************************************************

Provide metal plastering base with paper backing,[ "Moderate water-vapor Resistant" for room(s) [_____]][ "Water-vapor permeable" for room(s) [_____]][ and][ for exterior plastering work].

2.1.1.4 Galvanized Metal Plastering Base

**************************************************************************

NOTE: Specify galvanized metal plastering base for all exterior plastering and for plastering interior
areas subject to high moisture conditions such as natatoriums and shower and laundry rooms.

Provide[ for exterior plastering work][ and][ for plastering room(s) [_____]][ in all locations].

2.1.2 Gypsum Lath

**************************************************************************

NOTE: Specify only for interior gypsum plastering work in relatively large, flat areas. Do not use for curved areas or areas subject to high moisture conditions.

**************************************************************************

2.1.3 Accessories

**************************************************************************

NOTE: Referenced ASTM standards permit accessories fabricated from:

1.  ASTM C1063:
   - zinc coated (galvanized) steel
   - zinc alloy
   - rigid poly (vinyl chloride) (PVC) plastic

2.  ASTM C841:
   - zinc coated (galvanized) steel
   - paint coated steel
   - rigid poly (vinyl chloride) (PVC) plastic
   - clear plastic coated aluminum

If no exceptions are specified, these materials become Contractor options. Include the last sentence, appropriately edited, to exclude any undesirable options.

**************************************************************************

NOTE: Use PVC or plastic coated aluminum in lieu of galvanized metal for areas of high humidity or project locations with Environmental Severity Classifications (ESC) of C3 thru C5. Humid project locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.

**************************************************************************

[ASTM C1063. ][ASTM C841. ] [ Provide only][ galvanized steel][ zinc alloy][ rigid poly (vinyl chloride) (PVC) plastic][ clear plastic coated aluminum] accessories.]
2.2 ACCESS PANELS

******************************************************************************
NOTE: Detail fabrication of access panels larger than 600 by 900 mm 24 by 36 inches on project drawings.
******************************************************************************

Prefabricated steel units, size(s) [as indicated] [_____] by [_____] mm inches. Fabricate frame of preformed angle or channel with welded joints. Perforate wide leg or flange of frame section or extend frame section into expanded metal wings to provide a key for the plaster. Provide a hinged or snap-on type cover with turn-latch or spring catch. [Provide access panels for room(s) [_____] with a means for locking.] Fabricate access panels not larger than 600 by 900 mm 24 by 36 inches from 1.8 mm thick 14 gage steel with frames not lighter than 1.5 mm thick 16 gage. Fabricate access panels larger than 600 by 900 mm 24 by 36 inches as indicated. Factory-prime panels with rust-inhibitive paint.

2.3 HANGERS

******************************************************************************
NOTE: Indicate and provide a detail drawing showing splayed and countersplayed suspension system hanger wires.
******************************************************************************

In high humidity areas or project locations with Environmental Severity Classifications (ESC) of C3 thru C5, use corrosion resistant materials (stainless steel or copper-bearing alloys) for suspension components. Humid project locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.

******************************************************************************
Provide hangers and attachment capable of supporting a minimum 1330 N 300 pound ultimate vertical load without failure of supporting material or attachment.
******************************************************************************

2.3.1 Wires

******************************************************************************
NOTE: Select stainless steel or nickel copper alloy wire for facilities where high humidity can be expected such as large kitchens, dishwashing areas, and indoor swimming pools. Select zinc-coated steel wire for other locations.

When spacing of hanger wires exceeds 1200 mm 4 feet or when heavy loads are supported, specify 3.4 or 4.1 mm 8 or 10 gage wire.
******************************************************************************

Conform wires to [ASTM A641/A641M, Class 1, [2.0] [_____] mm [0.08 inch (12 gage)] [_____] inch in diameter.] [ASTM A580/A580M, composition 302 or 304, condition annealed stainless steel, [2.0] [_____] mm [0.08 inch (12 gage)] [_____] inch in diameter.]
NOTE: Normally wire hangers should be used, as specified above. If the project is in an area subject to violent storms, specify steel strap or rod hangers as included in the following sub-paragraphs.

[2.3.2] Straps

Provide straps of 25 by 5 mm 1 by 3/16 inch galvanized steel conforming to ASTM A653/A653M, with a light commercial zinc coating or ASTM A1008/A1008M with an electrodeposited zinc coating conforming to ASTM B633, Type RS.

[2.3.3] Rods

Provide 5 mm 3/16 inch diameter threaded steel rods, zinc or cadmium coated.

[2.3.4] Eyebolts

Provide eyebolts of weldless, forged-carbon-steel, with a straight-shank in accordance with ASTM A489. Eyebolt size must be a minimum [_____] [7] mm [1/4] inch, [zinc coated][cadmium plated].

2.3.5 Masonry Anchorage Devices

Comply with [ASTM C636/C636M][_____] for anchorage devices for [eyebolts] [machine screws] [wood screws].

PART 3 EXECUTION

3.1 INSPECTION

Verify that framing, furring and accessories are securely attached and of proper sizes and spacing necessary to provide a suitable substrate to receive lath. Do not proceed with work until framing, furring and accessories are acceptable to the Contracting Officer for application of lath.

3.2 INSTALLATION

3.2.1 Lathing Materials and Accessories

Install in accordance with[ ASTM C1063 for portland cement-based plaster work][ and][ ASTM C841 for gypsum plaster work], except where indicated or specified otherwise herein.

3.2.1.1 Metal Plastering Base

Install[ where indicated][ on wood or metal studding, furring, joists, rafters, and similar framing members for plastered walls, partitions, ceilings, and soffits][ to receive scratch coat for ceramic tile or terrazzo work][ on[ concrete][ and][ masonry] surfaces to receive plaster].

3.2.1.2 Metal Plaster Base with Paper Backing

Where used, lap joints to provide backing on backing and metal-on-metal. Lap backing not less than 25 mm one inch. Lap backing so that water will flow to the exterior.
3.2.1.3 Gypsum Lath

Install[ where indicated] on wood or metal studding, furring, joists, rafters and similar framing members for plastered walls, partitions, ceilings, and soffits.

3.2.1.4 Control (Expansion and Contraction) Joints

a. For portland cement-based plaster (ceilings and walls), install to create panels no larger than 9.3 square meters 100 square feet with no dimension exceeding 3.0 m 10 feet.

b. For unrestrained gypsum plaster ceilings install to create panels no larger than 232 square meters 2,500 square feet with no dimension exceeding 15.2 m 50 feet. For gypsum plaster walls, partitions and ceilings without perimeter relief install not more than 9.1 m 30 feet on centers in either direction.

c. Install[ where indicated,] where expansion joints occur in the structural walls and ceilings and where ceiling framing or furring changes direction. Terminate lath at each side of joint and fasten joints securely to lath.

3.2.1.5 Unrestrained Ceilings

Ensure furred or suspended ceilings constructed with[ gypsum plaster and larger than 232 square meters 2,500 square feet in area or with any dimension exceeding 15.2 m 50 feet][ or][ portland cement-based plaster] are unrestrained. Isolate ceiling lath and plaster from ceiling intersecting vertical surfaces with casing beads, control joints, or similar devices designed to keep the ceiling isolated from the adjacent vertical surfaces (walls, partitions, beams, and columns). Do not use corner reinforcement at the internal angle between the ceiling and the vertical surfaces.

3.2.1.6 Plastering Beads

Install edge trim (casing bead)[ at the edges of plaster which abuts or adjoins an unplastered surface,[ on each surface at the internal angle formed by load bearing and non-load bearing walls and partitions abutting structural walls, columns, or floor-ceiling slabs,[ between concrete or terrazzo bases and the plaster above them,[ on each side of the joint between walls or partitions constructed of dissimilar materials which require plastering,[ and between plasters of a different composition]. Fill voids formed in corners with sealant. Install corner beads at all vertical external corners of plaster walls.

3.2.2 Fire-Resistant Assemblies

******************************************************************************
NOTE: Coordinate with the preparer of the project drawings to ensure that UL Design Number(s) or GA File Number(s) are indicated on the drawings for fire resistant construction.
******************************************************************************

Wherever fire-resistant construction is indicated, provide all materials and application methods, including types and spacing of fasteners, in
accordance with the specifications contained in the [UL Fire Resistance for the Design Number(s) indicated] or [GA 600 for the File Number(s) indicated].

3.2.3 Access Panels

**************************************************************************
NOTE: Ensure project drawings include the exact number and location of access panels coordinate with mechanical and electrical work to ensure adequate access to mechanical and electrical systems. Do not install access panels in fire rated walls or ceilings unless approved by the Government's Fire Protection Engineer.
**************************************************************************

**************************************************************************
NOTE: Insert appropriate Section number and title in blank below using format per UFC 1-300-02, "Unified Facilities Guide Specifications (UFGS) Format Standard".
**************************************************************************

Install in suspended ceilings and plastered walls at locations indicated and specified in [______].

3.3 SCHEDULE

Some metric measurements in this section are based on mathematical conversion of inch-pound measurements, and not on metric measurement commonly agreed to by the manufacturers or other parties. The inch-pound and metric measurements are as follows:

<table>
<thead>
<tr>
<th>PRODUCTS</th>
<th>INCH-POUND</th>
<th>METRIC</th>

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for interior and exterior plaster work.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Gypsum plaster refers to interior work. Stucco refers to cement plaster used on the building exterior. Indicate on the project drawings the extent and location of the work to be accomplished, and the type of plaster required.

NOTE: Specification requirements of a one-coat system are Portland cement plaster with a sand float finish applied to concrete masonry units and concrete surfaces.

NOTE: This specification is for unrestrained stucco and plaster systems. Design and detail the
cold-formed metal framing (Section 05 40 00 - COLD-FORMED METAL FRAMING), lathing (Section 09 22 36 - LATH), and (Section 09 22 00 - SUPPORTS FOR PLASTER AND GYPSUM BOARD) to provide an unrestrained system. Also design and detail sleeve and caulking for fire sprinkler, electrical, and mechanical penetrations to avoid transferring structural or vibrational loads from these systems to the plaster panels.

******************************************************************************

******************************************************************************

PART 1   GENERAL

1.1   REFERENCES

******************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

******************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM C35 (2001; R 2019) Inorganic Aggregates for Use in Gypsum Plaster

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL.
PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

NOTE: Request for samples as noted below only where walls are textured.

SD-03 Product Data

Gypsum Base Coat Plaster

Gypsum Finish Coat Plaster

SD-04 Samples

Sample Panel; G[, [_____]]

Submit four 900 mm 36 inch square panels of varying texture for the Contracting Officer's approval.

Gypsum Plaster Full Size Sample; G[, [_____]]

SD-08 Manufacturer's Instructions

Ready-Mix Gypsum Plaster

[ Acoustical Plaster Finish

Submit manufacturer's printed mixing instructions for ready-mix plaster[ and acoustical plaster finish].

1.3 QUALITY ASSURANCE

1.3.1 Sample Panels

Erect sample panel at the building site, or as otherwise directed. Finished gypsum plaster work must match the approved sample panel.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver manufactured materials in the manufacturers' original unbroken packages or containers which are labeled plainly with the manufacturers' names and brands. Keep cementitious materials dry and stored off the ground, under cover, and away from sweating walls and other damp surfaces until ready for use. Keep materials wrapped and separate from off-gassing materials, such as paints and adhesives. Do not use materials that have visible moisture or biological growth.
1.5 GYPSUM PLASTER FULL SIZE SAMPLE

After selection of an acceptable texture, construct a sample [panel] [wall] separate from the building, minimum size of [2400] [_____] mm [8] [_____] ft in height, by [2400] [_____] mm [8] [_____] ft in length, using 150 mm6 inch metal studs, and gypsum board, metal lath and gypsum plaster. The sample wall must show all aspects of gypsum plaster work, including but not limited to, expansion joints, control joints, corner extrusions, [electrical][ mechanical][ and][ fire sprinkler] penetration[s] and casing beads. A sample of a control joint and extrusion butt joint must also be incorporated into the sample wall. Finish work must match the approved sample panel.[ Divide the panel into four equal quadrants with the expansion and control joints to show each phase of work, lath, scratch coat, brown coat, and finish coats.] Provide and protect the sample wall from damage during the length of the contract.

1.6 SCHEDULING AND ENVIRONMENTAL REQUIREMENTS

Commence application only after the area scheduled for gypsum plastering work is completely weathertight. The heating, ventilating, and air-conditioning systems must be complete and in operation prior to application of the plaster. If the mechanical system cannot be activated before veneer plastering is begun, the plastering may proceed in accordance with an approved plan to maintain the environmental requirements specified below. Apply plaster prior to the installation of finish flooring and acoustic ceiling.

1.6.1 Environmental Requirements

**************************************************************************
NOTE: Gypsum plaster is a very thin coating that will be adversely affected by extreme of non-uniform drying conditions and by rapid changes in temperature. It should not be used in spaces where adequate environmental control cannot be obtained.
**************************************************************************

Do not expose the gypsum base to excessive sunlight prior to plaster application, as bond failure of the plaster may result. Maintain a continuous uniform temperature of not less than 10 degrees C 50 degrees F and not more than 27 degrees C 80 degrees F for at least one week prior to the application of veneer plaster, while the plastering is being done, and for at least one week after the plaster is set. Shield air supply and distribution devices to prevent any uneven flow of air across the plastered surfaces. Provide ventilation to exhaust moist air to the outside during plaster application, set, and until plaster is dry. In glazed areas, keep windows open top and bottom or side to side 75 to 100 mm 3 to 4 inches. Openings can be reduced in cold weather. For enclosed areas lacking natural ventilation, provide temporary mechanical means for ventilation. In unglazed areas subjected to hot, dry winds or temperature differentials from day to night of 10 degrees C 20 degrees F or more, screen openings with cheesecloth or similar materials. Avoid rapid drying. During periods of low indoor humidity, provide minimum air circulation following plastering and until plaster is dry.

[1.7 FIRE RESISTIVE COATINGS

**************************************************************************
NOTE: For fire-resistive assemblies, drawing details must follow the tested and approved designs. The addition of gypsum plaster to an approved gypsum wallboard design will improve the fire-resistive properties of the partitions. Tested and approved designs are published by gypsum wallboard manufacturers, Underwriters Laboratory, and Factory Mutual, and are included in the Gypsum Association Fire Resistance Design Manual.

Comply with specified fire-rated assemblies for design numbers indicated per UL Fire Resistance or FM APP GUIDE.

PART 2 PRODUCTS

2.1 MATERIALS

Conform to the specifications, standards, and requirements specified herein. Provide asbestos-free materials.

2.2 GYPSUM BASE COAT PLASTER

[2.2.1 Gypsum Neat Plaster Base Coat

ASTM C28/C28M.
]

[2.2.2 Gypsum Ready-Mixed Plaster Base Coat

ASTM C28/C28M.
]

[2.2.3 Gypsum Wood-Fibered Plaster Base Coat

ASTM C28/C28M.
]

[2.2.4 High Strength Gypsum Plaster Base Coat

ASTM C28/C28M, gypsum neat plaster, except plaster must have a compressive strength of not less than 17.25 MPa 2,500 psi, when tested dry in accordance with ASTM C472.
]

2.3 GYPSUM FINISH COAT PLASTER

[2.3.1 Gypsum Gauging Plaster Finish Coat

ASTM C28/C28M.
]

[2.3.2 High Strength Gypsum Gauging Plaster Finish Coat

**************************************************************************

NOTE: High strength gauging plaster, when blended with finish lime-putty, produces a finish plaster with controlled set, early hardness and strength, and resistance to shrinkage cracks.

**************************************************************************

ASTM C28/C28M, gypsum gauging plaster, except plaster must have a compressive strength of not less than 31 MPa 4,500 psi when tested dry in accordance with ASTM C472.
2.3.3 Gypsum Molding Plaster for Ornamental Plaster
ASTM C59/C59M.

2.3.4 Keene's Cement Finish Coat
ASTM C61/C61M.

2.3.5 Acoustical Plaster Finish Coat

**************************************************************************
NOTE: Selected type and grade of plaster to provide the required acoustical characteristics. Acoustical plaster is not recommended for use in places where heavy abrasion and rough usage is expected.

A Portland cement - lime mix is corrosive to metal lath in high humidity/ salt intensive areas. For high humidity areas or project locations with Environmental Severity Classifications (ESC) of C3 thru C5, to reduce plaster and stucco cracking, delete the lime and substitute a liquid plasticizing agent with a resin compound as the principal ingredient. The result produces a material with greater resistance to most climatic effects and minimizes structure related cracking. Humid project locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.

If surface is to be painted, do not use coral aggregate in the plaster system. If no option is available, use sodium silicate system for stabilization.
**************************************************************************

ASTM E1042 Type [I,] [II,] Class A, noncombustible.

2.4 HYDRATED LIME
ASTM C206, Type S.

2.5 AGGREGATES
2.5.1 Sand for Gypsum Base Coats
ASTM C35.

Sand Gradation: Percentage retained by weight (plus or minus 2 percent) on each sieve.

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Maximum</th>
<th>Minimum</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. 4</td>
<td>[4760 microns]</td>
<td>0</td>
</tr>
</tbody>
</table>

SECTION 09 23 00 Page 9
Sieve Size | Maximum | Minimum
---|---|---
No. 8 [2380 microns] | 5 | 0
No. 16 [1190 microns] | 30 | 5
No. 30 [590 microns] | 65 | 30
No. 50 [300 microns] | 95 | 65
No. 100 [150 microns] | 100 | 90

2.5.2 Sand for Gypsum Sand Float Finish

*******************************
NOTE: Aggregates for finish-coat plaster should be less than No. 16 sieve size. Larger sizes may be added for finish appearance purposes. Select sieve number that will provide the desired texture. Float texture is governed by maximum sieve sizes of sand. Sieve sizes of 20 to 30 provide a fine float finish and 16 to 20 provide a coarse finish.
 *******************************

ASTM C842.

Sand Gradation: Percentage retained by weight (plus or minus 2 percent) on each sieve.

Sieve Size | Maximum | Minimum
---|---|---
No. 20 [850 microns] | 0 | 0
No. 30 [590 microns] | 0.5 | 0.5
No. 100 [150 microns] | 100 | 40
No. 200 [75 microns] | 100 | 70

2.5.3 Lightweight Aggregates, Perlite or Vermiculite for Gypsum Base Coat

ASTM C35.

2.5.4 Silica Sand or Perlite Fines

For use in lime-putty gypsum-gauged finish, aggregated white coat, must have the following gradation: 10 percent maximum retained on a No. 30 sieve (590 microns), 4 percent minimum and 70 percent maximum retained on a No. 100 sieve (150 microns), and 70 percent minimum and 100 percent maximum retained on No. 200 sieve (75 microns).

2.6 WATER

Use only potable water, free of mineral and organic substances that affect the hardening and durability of the plaster or stucco.
2.7 PROPORTIONING

Unless specified otherwise, materials are specified on a volume basis and must be measured in approved containers, to ensure that the specified proportions will be controlled and accurately maintained during the progress of the work. Measuring materials with shovels (shovel count) is not be permitted. Prepare ready-mix gypsum plaster for use by the addition of water only.

2.7.1 Gypsum Base Coat Plaster

**************************************************************************
NOTE: List all conditions where sand or lightweight aggregate should not be used.
**************************************************************************

Use of sand or lightweight aggregate is optional in gypsum plaster basecoats, except provide (1) sand for Keene's cement and high strength gypsum-gauged finish coats; (2) lightweight aggregate when necessary for a required fire resistance rating [; and (3) [______]].

2.7.1.1 Sand and Gypsum Plaster Base Coat

Mix scratch coat in the proportion of 45 kg 100 lb of gypsum neat plaster to not more than 56 liter 2 cu ft of damp loose sand; mix brown coat in the proportion of 45 kg 100 lb of gypsum neat plaster to not more than 85 liter 3 cu ft of damp loose sand; or scratch and brown coats may both be mixed in the proportion of 45 kg 100 lb of gypsum neat plaster to not more than 70 liter 2-1/2 cubic feet of damp loose sand. Mix the basecoats for double-up work in the proportion of 45 kg 100 lb of gypsum neat plaster to[ not more than 70 liter 2-1/2 cu ft of damp loose sand on gypsum lath][ and][ not more than 85 liter 3 cu ft of damp loose sand on masonry].

2.7.1.2 Lightweight Aggregate and Gypsum Plaster Base Coat

Mix scratch coat in the proportion of 45 kg 100 lb of gypsum neat plaster to[ not more than 70 liter 2-1/2 cu ft of lightweight aggregate on gypsum lath,][ and][ not more than 85 liter 3 cu ft of lightweight aggregate on masonry]. Mix brown coat in the proportion of 45 kg 100 lb of gypsum neat plaster to[ not more than 70 liter 2-1/2 cu ft of lightweight aggregate on gypsum lath][ and][ not more than 85 liter 3 cu ft of lightweight aggregate on masonry]. Where plaster thickness exceeds 25 mm one inch, the aggregate proportion may be increased to 85 liter 3 cu ft. Mix the basecoats in two-coat double-up work in the proportion of 45 kg 100 lb of gypsum neat plaster to[ not more than 70 liter 2-1/2 cu ft of lightweight aggregate on gypsum lath][ and][ not more than 85 liter 3 cu ft of lightweight aggregate on masonry]. Gypsum ready-mixed plaster with perlite aggregate may be provided in lieu of field-mixed lightweight aggregate and gypsum plaster, provided the specified proportion of aggregate to plaster does not exceed the proportion specified for field-mixed plaster.

2.7.1.3 Sand and Wood Fibered Gypsum Plaster Base Coat

**************************************************************************
NOTE: Because of its higher cost, specify wood-fibered gypsum plaster only when needed; e.g., for fireproofing.
**************************************************************************

SECTION 09 23 00 Page 11
Mix basecoats in the proportion of 45 kg 100 lb of wood-fibered gypsum plaster to not more than 28 liter one cu ft of damp loose sand.

2.7.1.4 Sand and High-Strength Gypsum Plaster Base Coat

**************************************************************************
NOTE: Specify high strength gypsum plaster base coat only where needed to withstand heavy abuse; e.g., hospital corridors, handball courts, etc.
**************************************************************************
Mix scratch coat in the proportion of 45 kg 100 lb of high strength gypsum base coat plaster to not more than 56 liter 2 cu ft of damp loose sand.
Mix brown coat in the proportion of 45 kg 100 lb of high strength gypsum basecoat plaster to not more than 85 liter 3 cu ft of damp loose sand.

2.7.2 Gypsum Plaster Finish Coat

**************************************************************************
NOTE: Do not use gypsum plaster in areas where the ceiling and walls will be subjected to frequent moisture or wetting.
**************************************************************************
2.7.2.1 Lime-Putty

Prepare lime-putty in accordance with the printed directions of the manufacturer. Use putty following preparation or following a soaking period as recommended by the manufacturer.

2.7.2.2 Lime-Putty Gypsum-Gauged (White Coat)

Use over[ sand and gypsum plaster][ sand and wood-fibered gypsum plaster]. Mix finish coat in the proportions of one part of gypsum gauging plaster to a volume of hydrated lime or lime putty.
This mix is approximately equivalent to one 45 kg 100 lb bag of gypsum gauging plaster to:

a. Not more than four 22.5 kg 50 lb bags of hydrated lime, or
b. Not more than 127 liter 4-1/2 cu ft of lime putty, or
c. Not more than 132 liter 35 gal of lime putty.

2.7.2.3 Aggregated Finish Coat

**************************************************************************
NOTE: Specify aggregated white coat where a smooth trowel finish is required over perlite or vermiculite base coats. Do not use smooth trowel finish over lightweight aggregate base coat or metal lath.
**************************************************************************
Finish coat must consist of the lime-putty, gypsum-gauged finish specified herein with the addition of fine pulverized silica sand or perlite fines in the following proportions:
a. 14 liter per 45 kg  1/2 cu ft per 100 lb bag of gypsum gauging plaster used in finish, or

b. 3.5 liter per 22.5 kg  1/8 cu ft per 50 lb bag of hydrated lime, or

c. 3.8 liter per 7.5 liter  one gal per cu ft of lime-putty.

2.7.2.4 Gypsum Sand Float Finish[ for [______]]:

**************************************************************************

NOTE: Do not use this type finish in bathrooms, kitchens, and other similar places requiring a constant cleaning cycle.
**************************************************************************

Mix finish in the proportion of one part neat unfibered gypsum plaster to not more than two parts of sand, by weight.

2.7.2.5 Keene's Cement Lime-Putty Finish[ for [______]]

**************************************************************************

NOTE: Do not use Keene’s cement as finish coat over a portland cement plaster base coat, or on monolithic concrete, due to the probability of unsatisfactory bond between the materials. Not recommended over lightweight aggregate base coats.
**************************************************************************

Mix finish in the proportion of not more than 45 kg 100 lb of lime putty to 45 kg 100 lb of Keene’s cement.

2.7.2.6 High Strength Gypsum-Gauged Plaster Finish[ for [______]]

**************************************************************************

NOTE: Specify high-strength gypsum-gauged finish plaster where surface hardness and resistance to abrasion are required. Not recommended over lightweight aggregate base coats.
**************************************************************************

Mix finish in the proportion of 90 kg 200 lb of high strength gauging to 45 kg 100 lb of hydrated lime.

2.7.2.7 Acoustical Plaster Finish[ for [______]]

Mix finish in accordance with manufacturer's printed instructions.

2.8 MIXING

2.8.1 Job-Mixed Materials

Mix materials in mechanical mixers except finish coats containing lime may be hand mixed. Mechanical mixers must be an approved type that accurately and uniformly controls the quantity of water. When mixing by hand, mix dry plaster aggregate to a uniform color in the mixing box, add water, and hoe the plaster immediately into the water and mix thoroughly to a proper consistency.
2.8.1.1 Water

Water used for rinsing and cleaning containers and tools must not be used in mixing the materials.

2.8.1.2 Sand

Sand proportions must be damp and in loose condition. A volume of damp loose sand must contain a minimum of 36 kg 80 lb of dry sand in 0.0283 cu m one cu ft.

2.8.1.3 Mixing (Do's)

Mix the material while the mixer is in continuous operation in the following sequence:

a. Add maximum close to 90 percent of estimated quantity of water.

b. Add approximately one-half of the sand. If vermiculite or perlite is used, add all the aggregate.

c. Add cement and approved admixtures. [Add lime prior to cement.]

d. Add remainder of sand.

e. Mix with remainder of water as required. Mix until the mixture is uniform in color and consistency.

2.8.1.4 Mixing (Don'ts)

Avoid excessive mixing and agitation. Discard gypsum plaster which has begun to set before it is used; do not permit retempering. Do not use frozen, caked, or lumped materials. Empty mixers and mixing boxes after each batch is mixed, and keep free of old plaster.

2.8.2 Ready-Mixed Packaged Materials

Mix ready-mixed packaged gypsum plaster in accordance with manufacturer's printed instructions.

2.9 BONDING AGENT

******************************************************************************
NOTE: Bonding agents may be surface applied or integrally mixed with the plaster. Use Integral bonding agents only after review of the manufacturer's documentation of testing and past performance. Check compatibility of the bonding agent with the plaster mixtures. Bonding admixtures increase the potential for shrinkage of the plaster.
******************************************************************************

ASTM C631, interior application.

PART 3 EXECUTION

3.1 SURFACE PREPARATION

Clean surfaces before application of gypsum plaster of projections, dust,
loose particles, grease, bond breakers, and foreign matter. Do not apply plaster directly to surfaces (1) of masonry or concrete that have been coated with bituminous compound or other waterproofing agents, or (2) that have been painted or previously plastered. Before plaster work is started, wet masonry and concrete surfaces thoroughly with a fine fog spray of clean water to produce a uniformly moist condition. Check metal grounds, corner beads, screeds, and other accessories carefully for alignment before starting work. Do not apply gypsum plaster to surfaces containing frost.

3.2 WORKMANSHIP

3.2.1 Slump Tests

Apply Plaster by hand or machine. When a plastering machine is used, control the fluidity of gypsum plaster to have a slump of not more than 75 mm 3 inch when tested using a 50 by 100 by 150 mm 2 by 4 by 6 inch high slump cone. Subsequent to determining water content to meet the specified slump, do not add additional water to the mix. Conduct the slump test according to the following procedure:

a. Place cone on level, dry, non-absorptive base plate.

b. While holding cone firmly against base plate, fill cone with plaster taken directly from the hose or nozzle of the plastering machine, tamping with metal rod during filling to release air bubbles.

c. Screed off plaster level with top of cone. Remove cone by lifting it straight up with a slow and smooth motion.

d. Place cone in a vertical position adjacent to freed plaster sample, using care not to shake or move base plate.

e. Lay a straightedge across top of cone, being careful not to shake or move cone. Measure slump in mm inch from the bottom edge of the straightedge to the top of the slumped plaster sample.

3.2.2 Application

Apply gypsum plaster in three coats, except as follows:

Gypsum plaster applied to [masonry] [and] [gypsum lath] using the two-coat double-up method.

Apply base coats with sufficient pressure and ensure plaster is sufficiently plastic to provide a strong bond to bases. Work base coats into screeds at intervals from 1500 to 2400 mm 5 to 8 ft. Plaster must not be continuous across expansion and control joints occurring in walls, partitions, and ceilings. Finish work level, plumb, square, and true, within a tolerance of 3 mm in 2400 mm 1/8 inch in 8 ft, without waves, cracks, blisters, pits, crazing, discoloration, projections, or other imperfections. Form plaster work carefully around angles and contours, and well-up to screeds. Take special care to prevent sagging and consequent dropping of applications. There must be no visible junction marks in finish coat where one day's work adjoins another. Plastered surfaces to receive rubber or vinyl base coves[ wood base boards] must extend to wood ground indicated as backing for base. Plaster not required behind built-in cabinets and equipment[, and [______]] unless part of a fire-rated assembly.
3.2.3 Control And Expansion Joints

[Install control joints at locations indicated before applying gypsum plaster. Vertical joints must be continuous and butt horizontal joints against the vertical joints. ]Check expansion, control joints and accessories to ensure unrestrained movement, metal lath not continuous behind the joints, and area between joints do not exceed 14 sq m 150 sq ft.

3.2.4 Curing

3.2.4.1 Gypsum Plaster

Before the plaster has set, provide environmental controls to prevent the plaster from drying too fast. After the plaster has set, provide for rapid drying to develop high strength.

3.3 GYPSUM PLASTER WORK

ASTM C842.

******************************************************************************

NOTE: Gypsum basecoat plaster may be by one of two methods for a three-coat or two-coat (double back) systems. The three-coat plaster system will require a basecoat of a scratch coat, cross raked, partial drying, and a brown coat. The two-coat plaster system requires a scratch coat and a brown coat that is applied (double back) within a few minutes to the unset (moist) scratch coat. The cross raking of the scratch coat is omitted in the double back system.

******************************************************************************

3.3.1 Gypsum Plaster Thickness Requirements

Plaster thicknesses are from face of metal lath plaster base (scratch coat) or solid base surfaces.

a. Vertical Surfaces

<table>
<thead>
<tr>
<th>Base Types</th>
<th>Base Coat</th>
<th>Finish Coat</th>
<th>Total Thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metal Lath</td>
<td>13 mm 1/2 inch</td>
<td>3 mm 1/8 inch</td>
<td>16 mm 5/8 inch</td>
</tr>
<tr>
<td>Masonry</td>
<td>13 mm 1/2 inch</td>
<td>3 mm 1/8 inch</td>
<td>16 mm 5/8 inch</td>
</tr>
<tr>
<td>Concrete</td>
<td>13 mm 1/2 inch</td>
<td>3 mm 1/8 inch</td>
<td>16 mm 5/8 inch</td>
</tr>
<tr>
<td>Other Bases</td>
<td>10 mm 3/8 inch</td>
<td>3 mm 1/8 inch</td>
<td>13 mm 1/2 inch</td>
</tr>
</tbody>
</table>

b. Horizontal Surfaces. Total plaster thickness for metal lath plaster, masonry and concrete bases is 16 mm 5/8 inch. Total thickness of plaster for horizontal concrete surfaces is 3 to 10 mm 1/8 to 3/8 inch.

c. Where vertical and horizontal concrete surfaces require more than 16 mm 5/8 inch and 10 mm 3/8 inch, to produce required lines or surfaces, [attach metal plaster base for plaster application] [as indicated].
3.3.2 Gypsum Plaster Basecoat Work

3.3.2.1 Gypsum Two-Coat System

Apply the first coat to cover the base with sufficient material and pressure to form a good bond on the wall or ceiling base. Before the first coat has set and without scratching or cracking the surface, apply a second coat (double back) of the same material proportion as the base coat to the screeds. Straighten to a true surface without application of water, and cross rake or scratch to receive the finish coat.

3.3.2.2 Gypsum Three-Coat System

Apply scratch coat 5 to 6 mm 3/16 to 1/4 inch thick to cover the base with sufficient material and pressure to form a good bond on the wall or ceiling base. Rake or scratch the surface and allow to set firm and hard. Apply the brown coat to bring the base coat out to the screeds, compact and straighten to a true surface without the application of water, and cross rake or scratch to receive the finish coat.

3.3.3 Gypsum Plaster Finish Coats

**************************************************************************
NOTE: Do not specify rough textured finishes
bathrooms, kitchens, and other similar type places,
which require a constant cleaning cycle.
**************************************************************************

**************************************************************************
NOTE: There are six gypsum finish coat plasters,
each with a specific function:

Smooth Finishes: Gypsum-lime putty trowel finish
Keene's cement-lime putty trowel finish Prepared gypsum trowel finish

Float Finishes: Keene's cement-lime sand float finish Gypsum-sand float finish

Acoustical Plaster Finishes
**************************************************************************

Moderately moisten or fog spray base coat of plaster that has become dry before finish coat is applied. Accelerate plaster, if necessary, to provide a setting time of not more than 4 hours from the time the plaster is mixed.

3.3.3.1 Lime-Putty and Gypsum-Gauged Finish Coats

Apply lime-putty gypsum-gauged finish white coat or aggregated white coat [and high strength gypsum gauged finish] over the base coat, scratch in thoroughly, lay on well, double back, and fill out to a true, even surface. Allow the finish to dry a few minutes, then trowel well with water. Apply maximum pressure in order to compact the finish coat and provide a smooth finish free from blemishes and irregularities. Apply trowel finish coats of gypsum-gauged lime-putty over properly prepared base coats as thin as possible and 2 to 3 mm 1/16 to 1/8 inch thick for conventional plaster system, except as necessary in spots to level out hollows in base coat.
3.3.3.2 Keene's Cement Lime-Putty Finish Coat

******************************
NOTE: Do not use Keene’s cement as finish coat over
a portland cement plaster basecoat, or on monolithic
concrete, due to the probability of unsatisfactory
bond between gypsum and portland cement materials.
******************************

Apply finish over gypsum-sand base coat only, scratch in thoroughly, lay on
well, double back, and fill out to a true, even surface. Allow the finish
to dry a few minutes, then trowel it well with water. Apply maximum
pressure in order to compact the finish coat and provide a smooth finish
free of blemishes and irregularities. Continue troweling until the finish
sets.

3.3.3.3 Gypsum Sand Float Finish Coat

******************************
NOTE: Specify type of float required to produce the
texture desired.
******************************

Apply finish over the base coat, scratch in thoroughly, lay on with a
trowel to an even surface, and then float with [_____] floats to a true,
even surface, free of slick spots or other blemishes. Apply sand float
finishes to a maximum thickness of 3 mm 1/8 inch except as necessary to
level out hollow spots.

3.3.3.4 Acoustical Plaster Finish Coat

Apply finish in accordance with manufacturer's printed instructions and in
the thickness necessary to provide the sound absorption coefficient
specified, but not be less than 13 mm 1/2 inch thick.

3.4 ORNAMENTAL PLASTER WORK

Complete ornamental work before the finish coat of plaster is applied to
adjoining areas. Plaster for ornamental work must consist of a mixture
that will produce satisfactory results for the respective conditions, be
reinforced properly with fiber or zinc-coated steel wire netting as
necessary to provide permanent construction, and be rigidly secured in
place. Run plain moldings in place to templates and guides, with true
radial lines for curved work; where it is not practicable to run such
moldings, cast or run them on a bench and then secure in place firmly.
Cornices and moldings must be straight or curved, true to line, and corners
neat.

3.5 PATCHING AND POINTING

Cut out and patch loose, cracked, damaged, or defective gypsum plaster.
Patch must match existing work in texture, color and finish flush with
previously applied gypsum plaster surfaces. Point work abutting or
adjoining finish work in a neat manner. Remove droppings or spatterings from surfaces. Leave clean and in a condition to receive paint or other finish. Remove protective covering from floors and other surfaces, and rubbish and debris from [the interior and exterior of] the building.

NOTE: This guide specification covers the requirements for fire protection applications of specified plaster bases.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Associated work found in other sections includes metal framing, furring systems, and metal lath, and standard gypsum plastering applications. Show areas and location of application and installation details on drawings.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in
this paragraph by organization, designation, date, and title.

Use the Reference Wizard’s Check Reference feature when you add a Reference Identifier (RID) outside of the Section’s Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard’s Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM E605 (1993; R 2011) Thickness and Density of Sprayed Fire-Resistive Material (SFRM) Applied to Structural Members

INTERNATIONAL CODE COUNCIL (ICC)

1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Pre-Installation Meetings

Within [30] [____] days of Contract Award, the Contracting Officer will schedule [a] Pre-Installation meeting[s]. Submit the following for review and approval at the Pre-Installation meeting:

a. Installation Drawings

b. Manufacturer's Catalog Data
c. Fireproofing Plaster Sample

d. Certificates of Conformance

[ e. Special Provisions

}1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Installation Drawings[; G[, [____]]]

SD-03 Product Data

Manufacturer's Catalog Data[; G[, [____]]]
SD-04 Samples

Fireproofing Plaster Sample; G[, [___]]
Mockups; G[, [___]]

SD-07 Certificates

Certificates of Conformance; G[, [___]]

SD-08 Manufacturer's Instructions

Manufacturer's Instructions; G[, [___]]
Special Provisions; G[, [___]]

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials in original unopened packages bearing the name of the product, manufacturer's name, and the Underwriters Laboratories, Inc. label. Store materials off the ground, under cover, and away from damp surfaces and keep dry until ready to use. Discard all materials that have been exposed to water before use.

1.5 QUALITY CONTROL

1.5.1 Catalog Data

Submit manufacturer's catalog data for fireproof plaster showing applicable flame spread classification, fuel contribution, and smoke developed.

1.5.2 Plaster Sample

Submit no less than 0.2 kilogram 1/2 pound of Fireproofing Plaster Sample for review and approval.

1.5.3 Drawing Requirements

Submit installation drawings indicating the fireproof plaster, framing and furring as indicated and specified. Ensure components of the installation drawings meet the requirements of indicated and specified fireproofing.

**************************************************************************
NOTE: Coordinate with drawings for the appropriate hour rating assembly.
**************************************************************************

1.5.4 Four Hour Fire Rated Construction

Prior to the commencement of work, submit certificates of conformance for fireproof plaster showing conformance with the ICC IBC, "International Building Code", "Requirements for Four-Hour Construction". Submit manufacturer's instructions for Fireproof Plaster[ including special provisions required to install equipment components and system packages]. Indicate all detail impedances, hazards and safety precautions on drawings.
[1.5.5  **Mockups**

Build mockups to demonstrate aesthetic effects and to set quality standards for materials and execution.

]PART 2  PRODUCTS

2.1  MATERIALS

2.1.1  Fireproof Plaster

Provide gypsum-vermiculite fireproof plaster mix, consisting of one part gypsum to two parts vermiculite, conforming to ICC IBC, "Requirements for 4-Hour Construction".

Ensure cohesion of the dry set material is such that the fireproofing coat will not crack or delaminate when the structural element is subjected to a downward deflection of 1/120 of the span, and the minimum compressive strength requirement in accordance with ASTM E761/E761M is not less than 485 kilopascal 70 pounds per square inch.

Provide set and dried material, which when tested in accordance with ASTM E84, yields the following characteristics:

a. Flame spread 10
b. Fuel contributed 5
c. Smoke developed 0

2.1.2  Water

Use only potable water for mixing.

PART 3  EXECUTION

3.1  INSTALLATION

Apply fireproofing plaster as specified to those areas indicated on drawings. Install per details as indicated on drawings.

3.1.1  Application

Provide pneumatic or trowelled application of fireproofing plaster in accordance with material manufacturer's written recommendations and ASTM E736. Provide thickness of application as indicated and in compliance with ASTM E605 and the applicable fire and local codes to provide rated fireproofing when tested in accordance with ASTM E119.

Provide framing and furring that meets the requirements of [09 22 00][09 22 36], and as recommended by manufacturer for the installation of the fireproofing plaster thickness required as indicated in the drawings.

3.2  ADJUSTING AND CLEANING

After completion of fireproofing work, remove all application equipment. Clean all areas of ceilings, walls, and floors, adjacent or exposed to the operations of application of the fireproofing material, and other surfaces and finishes that may have been soiled by fireproofing materials.
Remove any damaged or unacceptable portions of the fireproofing plaster and replace with new work at no additional cost to the Government.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
  Lath

SD-03 Product Data
  Proportions and Mixing
  [Recycled percentage of fly ash in Portland cement; S]
  [Recycled Content for steel framing; S]
  [Recycled Content for metal lath; S]

SD-04 Samples
  Colored Stucco Finish Coat
  Sample Panel; G[, [_____]]

1.3 QUALITY ASSURANCE

Submit a SAMPLE PANEL as follows: [One 300 mm 12 inch square stucco panel showing finish texture and color and exposed reinforcement at the edges, one 300 mm 12 inch square of reinforcement, and a 300 mm 12 inch length of each accessory proposed, prior to proceeding with stucco work.] [A sample panel of stucco, constructed at the jobsite, and located as directed, to demonstrate installation procedures, texture and color, prior to proceeding with any stucco work; panel size must be a minimum of 1200 mm wide x 2400 mm 4 feet wide x 8 feet high; containing each type accessory proposed for use and constructed in the vertical position. Sample panel must have exposed reinforcement at the edges. Each phase of installation such as framing, scratch coat, brown coat, finish coat and curing procedures must be demonstrated in the construction of the panel. Submit one 300 mm 12 inch square of reinforcement and one 300 mm 12 inch length of each accessory proposed for use, prior to constructing the sample panel.]

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver packaged materials to the site in the original packages and containers with labels intact and seals unbroken. Keep cementitious materials dry and stored off the ground, under cover and away from damp surfaces until ready to be used. Aggregate must be covered to prevent the absorption or loss of moisture.
1.5 ENVIRONMENTAL REQUIREMENTS

Do not apply stucco when the ambient temperature is 4 degrees C 40 degrees F or lower, or when a drop in temperature below 4 degrees C 40 degrees F is expected within 48 hours after application.

PART 2 PRODUCTS

2.1 PORTLAND CEMENT

**************************************************************************
NOTE: Where colored or white stucco finish is required, the gray Portland cement will be omitted. Select type of cement to provide the required characteristics. Type I cement should normally be specified when stucco requires no special characteristics. Type II cement should be specified when stucco will be exposed to moderate sulphate (alkali) action. Type III cement should be specified when high early strength is needed.

Use materials with recycled content where appropriate for use. Verify sustainability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Consider specifying fly ash as recycled materials; however, where white stucco finish is required, the requirement for fly ash will be omitted. In no case should the installation contractor use more than 40% fly ash as strength will be compromised. Research shows fly ash is commonly available from recycling operations. The designer of record needs to confirm local/regional availability and cost effectiveness.

Research shows there are other recycled materials that may be considered in lieu of, or in addition to, fly ash. According to ASTM C 595, ground granulated blast furnace slag (GGBF slag) may replace up to 50 percent of the cementitious material on a dry weight basis. Cenospheres may replace up to 10 percent of the cementitious material by volume. And silica fume may replace up to 10 percent of the cementitious material on a dry weight basis.

A Portland cement-lime mix is corrosive to metal lath in high humidity/salt intensive areas. For high humidity areas or project locations with Environmental Severity Classifications (ESC) of C3 thru C5, to reduce plaster and stucco cracking, delete the lime base and substitute a liquid plasticizing agent with a resin compound as the principal ingredient. The result produces a material with greater resistance to most climatic effects and minimizes structure related cracking. Humid project locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified
If surface is to be painted, do not use coral aggregate in the plaster system. If no option is available, use sodium silicate system for stabilization.

Portland cement must conform to ASTM C150/C150M, [gray Portland cement Type [I] [II] [III].] [white Portland cement, Type [I] [II] [III].] [Provide system that has a minimum of 15% and maximum 40% fly ash. Provide data from installation contractor identifying recycled percentage of fly ash in Portland cement.]

2.2 COLORED STUCCO FINISH COAT

Colored stucco finish coat must be a mill mixed product using white Portland cement and requiring only the addition of and mixing with water for application. Color must be [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [______]. Submit samples including both a fabricated portion of unit of work and color samples.

2.3 LIME

Lime must conform to ASTM C206, Type S.

2.4 SAND

Sand aggregate for job-mixed base coat and job-mixed finish coat stucco must conform to ASTM C897.

2.5 ACCESSORIES

NOTE: Custom aluminum radiuses, and custom miters and intersections with welded corners or taped backs are available. Aluminum shapes with clear anodized, color anodized, or baked enamel finishes may be used where required for aesthetic purposes. Aluminum shapes are more costly than standard steel or PVC shapes.

In areas of high humidity or project locations with Environmental Severity Classifications (ESC) of C3 thru C5, use PVC or vinyl as galvanized metal will rust over time. Humid project locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.

Accessories must be [roll formed galvanized steel,][ or] [rigid polyvinyl chloride (PVC)] [______], except that cornerite and striplath must be formed from steel sheets with manufacturer’s standard galvanized coating. Vinyl members must be in accordance with ASTM D1784. Welded wire corner reinforcements must be zinc coated, galvanized 1.4 mm 17 gauge steel wire conforming to ASTM A1064/A1064M. Furring must include hangers, bolts, inserts, clips, fastenings, and attachments of number, size, and design to
develop the full strength of the members.

2.6 STEEL FRAMING

**************************************************************************
NOTE: Stud sizes and framing dimensions and details will be indicated on the drawings. Framing will be designed for a maximum deflection of L/240 studs only assembly or a maximum deflection of L/360 for completed assembly, based on wind load design requirements in UFC 3-301-01.
**************************************************************************

Steel framing must be as shown and must be manufacturer's standard products with shop applied protective coating. Refer to Section 09 22 00 SUPPORTS FOR PLASTER AND GYPSUM BOARD.

Provide steel framing containing a minimum of 20 percent recycled content, as calculated by the sum of the percentage of post-consumer and \( \frac{1}{2} \) the percentage of pre-consumer recycled steel content. Provide data identifying percentage of recycled content for steel framing.

2.7 METAL LATH

Metal lath must conform to ASTM C847, types and weights in accordance with the various spacing shown in ASTM C841. Lath for vertical application on steel and wood framing supports must be expanded metal or welded or woven wire and must have paper backing with a minimum vapor permeance of 287.2 ng per Pa per second per square meter 5 perms. Woven wire lath must be a maximum 38 x 38 mm 1-1/2 x 1-1/2 inch mesh wire of not less than 1.37 mm 0.0540 inch nominal diameter and must conform to ASTM C1032. Welded wire lath must conform to ASTM C933, with openings not to exceed 50 x 50 mm 2 x 2 inches. Expanded metal or wire lath must be fabricated in a manner to provide not less than 6 mm 1/4 inch keying between wire and paper backing and keying must be obtained by a uniform series of slots in a perforated face paper woven between the wires.

Provide Metal Lath containing a minimum of 20 percent recycled content, as calculated by the sum of the percentage of post-consumer and \( \frac{1}{2} \) the percentage of pre-consumer recycled steel content. Provide data identifying percentage of recycled content for metal lath.

2.8 WATER

Provide clean, fresh, potable water, free from amounts of oils, acids, alkalis and organic matter that would be injurious to the stucco.

2.9 HANGERS

**************************************************************************
NOTE: Construction drawings should include a detail drawing showing splayed and countersplayed suspension system hanger wires.
**************************************************************************

In high humidity areas or project locations with Environmental Severity Classifications (ESC) of C3 thru C5, use corrosion resistant materials (stainless steel or copper-bearing alloys) for suspension components. Humid project locations are
those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.

Provide hangers and attachment capable of supporting a minimum 1330 N 300 pound ultimate vertical load without failure of supporting material or attachment.

2.9.1 Wires

NOTE: Select stainless steel or nickel copper alloy wire for facilities where high humidity can be expected such as large kitchens, dishwashing areas, and indoor swimming pools. Select zinc-coated steel wire for other locations.

When spacing of hanger wires exceeds 1200 mm 4 feet or when heavy loads are supported, specify 3.4 or 4.1 mm 8 or 10 gage wire.

Use stainless steel wires in areas of high humidity.

Conform wires to [ ASTM A641/A641M, Class 1, [2.0] [_____] mm [0.08 inch (12 gauge)] [[_____] inch] in diameter.][ ASTM A580/A580M, composition 302 or 304, condition annealed stainless steel, [2.0] [_____] mm [0.08 inch (12 gauge)] [[_____] inch] in diameter.]

NOTE: Normally wire hangers should be used, as specified above. If the project is in an area subject to violent storms, specify steel strap or rod hangers as included in the following sub-paragraphs.

2.9.2 Straps

Provide straps of 25 by 5 mm 1 by 3/16 inch galvanized steel conforming to ASTM A653/A653M, with a light commercial zinc coating or ASTM A1008/A1008M with an electrodeposited zinc coating conforming to ASTM B633, Type RS.

2.9.3 Rods

Provide 5 mm 3/16 inch diameter threaded steel rods, zinc or cadmium coated.

2.9.4 Eyebolts

Provide eyebolts of weldless, forged-carbon-steel, with a straight-shank in accordance with ASTM A489. Eyebolt size must be a minimum [_____] [7] mm [1/4] inch, [zinc coated][cadmium plated].

2.9.5 Masonry Anchorage Devices

Comply with [ ASTM C636/C636M][_____] for anchorage devices for [eyebolts] [machine screws][wood screws].
3.1 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

3.2 FRAMING

Framing must be installed as indicated.

3.3 CONTROL JOINTS

**************************************************************************
NOTE: Control joints will be shown on the drawings, dividing the stucco into areas of not more than 13 square meters 144 square feet with no dimension between control joints greater than 5.4 meters 18 feet. The length to width ratio of the area bounded by the control joints will not exceed 25 to 65 mm 1 to 2-1/2 inches.
**************************************************************************
Locate control joints [as indicated on the drawings] so that unbroken areas of stucco do not exceed 13 square meters 144 square feet with no dimension between control joints greater than 5.4 m 18 ft.] Install prefabricated control joint members prior to the application of the stucco. Clear control joints of all stucco within the control area after stucco application and prior to final stucco set.

3.4 LATH

**************************************************************************
NOTE: Drawings will clearly indicate where metal lath is required. Metal lath will be used over metal supports and wood supports. Metal reinforcement with water-resistant paper is recommended in all steel frame construction and suspended ceilings. The use of metal reinforcement over concrete and masonry will be in accordance with local practice based upon satisfactory experience. Paper backed lath may be applied to interior concrete and masonry when adequate and uniform bond cannot be obtained otherwise, and when the lath will be protected from moisture.
**************************************************************************
Install lath in accordance with ASTM C841 or ASTM C1063 except as otherwise specified. Metal and wire lath must be applied straight, without buckles and with joints staggered. End laps of metal lath must be not less than 25 mm 1 inch. When paper-backed lath is used, the paper must be split from the lath at all lap areas to provide a paper to paper and lath to lath lap. Horizontal joints must be shiplapped. Lath must be interrupted at all control joints. Submit drawings showing details of construction for reinforcement, furring, and grounds; including manufacturer's installation instructions for stucco materials, and locations where each mix and coating thickness will be used.
3.4.1 Steel and Wood Supports

Apply metal lath over vertical open or solid wood and steel backing frame construction only after sheathing and air barrier has been applied to the area to receive the stucco. Fasten lath every 200 mm 8 inches vertically and every 400 mm 16 inches horizontally; and where sheets of lath are lapped. Drive fasteners to hold both lapped edges securely in place.

3.4.2 On Concrete and Masonry

Fasten lath every 200 mm 8 inches vertically and every 400 mm 16 inches horizontally. Where wood supports adjoin masonry or concrete in the same direction, provide casing bead, control joints, or reinforcement as indicated.

3.4.3 Over Metal Lintels and Flashings

Lath over metal lintels must be extended vertically over the angles to a height of not less than 150 mm 6 inches and horizontally across the underside of the lintels and must be secured in an approved manner. Lath over metal flashings must lap the flashings not less than 50 mm 2 inches and must be extended vertically for a height of not less than 150 mm 6 inches.

3.4.4 Special Shapes, Profiles, and Contours

Special shapes, profiles, and contours must be formed with wood, metal or aluminum furring and reinforcing.

3.5 Furring

Furring must be installed to true lines and surfaces and must be rigidly supported and secured in place.

3.6 Preparation of Surfaces

Preparation of surfaces for application of stucco to solid bases such as stone, masonry or concrete must conform to the applicable requirements of ASTM C926.

3.7 Proportions and Mixing

Proportions and mixing for job-mixed base coat and finish coat must conform to the applicable requirements of ASTM C926. Mixing of mill-mixed finish coat must be in accordance with the manufacturer's directions. Submit detailed description of the proposed job-mix proportions for base and finish coats; including identification of thickness of coats.

3.8 Stucco Application

Stucco must be applied in three coats to a thickness of not less than 25 mm 1 inch as measured from the back plane of metal reinforcement, exclusive of ribs or dimples or from the face of solid backing or support, with or without metal reinforcement, to the finished stucco surface, including moderate texture variations. Stucco application must conform to the applicable requirements of ASTM C926 and the following:
3.8.1 Workmanship

Items or features of the work in connection with or adjoining the stucco must be in place, plumb, straight, and true prior to beginning the stucco work. Metal and wire lath, where required, must be in place and positioned to provide a good key at back of lath. Where lath is applied over copper, the copper must be given a heavy coat of bituminous paint. Masonry surfaces to receive stucco must be evenly dampened immediately prior to application of stucco. Each stucco coat must be applied continuously in one general direction, without allowing mortar to dry at edges. Where it is impossible to work the full dimension of a wall surface in a continuous operation, jointing must be made at a break, opening, or other natural division of the surface. Edges to be joined must be dampened slightly to produce a smooth confluence. Exterior corners of stucco must be slightly rounded. Stucco on soffit surfaces must be pitched forward to form a drip.

3.8.2 Scratch Coat

Apply scratch coat not less than 10 mm 3/8 inch thick under sufficient pressure to form good keys and to completely embed the reinforcement. Before the scratch coat has set, it must be lightly scratched in one direction and vertical surfaces must be scratched in the horizontal direction only. The scratch coat must be fog cured for a minimum of 72 hours.

3.8.3 Brown Coat

Evenly dampen the scratch coat to obtain uniform suction before the brown coat is applied. There must be no visible water on the surface when the brown coat is applied. The brown coat must be applied to the scratch coat with sufficient pressure to force the stucco into the scratches and must be brought to a plumb, true, even plane with rod or straightedge. When set sufficiently, the brown coat must be uniformly floated with a dry float to promote densification of the coat and to provide a surface receptive to bonding of the finish coat. Brown coat must be fog cured for a minimum of 72 hours.

3.8.4 Finish Coat

Dampen surfaces of the brown coat not more than 1 hour before the finish coat is to be applied to a uniform wetness with no free-standing water on the surface. The finish coat must have a [smooth trowel] [float] [trowel-textured] [rough-textured] [spray-textured] [exposed aggregate] finish and must conform to the approved sample. Fog cure the finish coat for a minimum of 48 hours. Take care to prevent staining.

3.8.5 Surface Tolerance

When a 3 m 10 foot straightedge is placed at any location on the finished surface of the stucco, excluding rough-textured finish, the surface must not vary more than 3 mm 1/8 inch from the straightedge.

3.9 CURING AND PROTECTION

Perform fog curing by applying a fine mist of water to the stucco. Exercise care during fog curing to avoid erosion damage of the stucco surfaces. Do not use a solid stream of water. Fog not less than three times daily. Protect the stucco from the direct rays of the sun during severe drying conditions using canvas, cloth or other approved sheet
material.

3.10 PATCHING AND POINTING

Replace or patch loose, cracked, damaged or defective work as directed. Patching must match existing work in texture and color and must be finished flush.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for veneer plaster systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Veneer plaster consists of a 2 to 3 mm 1/16 to 1/8 inch thick plaster coating applied in one or more coats to a special gypsum lath base over metal or wood framing. Veneer plaster provides a hard, dense finish for areas such as corridors and conference rooms of major facilities where walls are subjected to frequent impact and where appearance is important. It should not be used in shower rooms or excessively humid areas.

NOTE: On the drawings, indicate location and extent of each type of veneer plaster and control joints.
PART 1   GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM C587 (2004; R 2014) Gypsum Veneer Plaster

ASTM C631 (2009; R 2020) Bonding Compounds for Interior Gypsum Plastering

ASTM C645 (2014; E 2015) Nonstructural Steel Framing Members

Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs from 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness

**1.2 GENERAL REQUIREMENTS**

**NOTE:** Select either the one or two-coat system. The one-coat is slightly lower in cost, requires less installation time, and requires only one plastering material on the job. The two-coat system has greater crack resistance and is more resistant to damage. The one-coat system should be used where appearance is the sole consideration. The two-coat system should be used where physical abuse is a consideration.

Except where otherwise indicated or specified, conform to ASTM C754, ASTM C843, and ASTM C844. Apply the gypsum veneer plaster as a [one coat] [two coat] system over a special gypsum base. The veneer plaster, gypsum base, and joint reinforcement must be products of the same manufacturer. The extent and location of veneer plaster must be as shown on the drawings. Metal framing is specified herein.[ Wood framing specified in Section 06 10 00 ROUGH CARPENTRY may be used as an option to the steel framing.]

**1.3 SUBMITTALS**

**NOTE:** Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit.
the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

<table>

1.4 DELIVERY AND STORAGE

Deliver and store plaster materials in the manufacturer's original unopened containers. Store materials off the ground within a completely enclosed structure or enclosed within a weathertight covering. Store gypsum base and gypsum backing board flat to prevent warping and protect from excessive exposure to sunlight. Keep materials wrapped and separate from off-gassing materials, such as paint and adhesives. Do not use materials that have
visible moisture or biological growth.

1.5 SCHEDULING

Commence application only after the area scheduled for veneer plaster work is completely weathertight. The heating, ventilating, and air-conditioning systems must be complete and in operation prior to application of the plaster. If the mechanical system cannot be activated before veneer plastering is begun, the plastering may proceed in accordance with an approved plan to maintain the environmental conditions specified below. Apply plaster prior to the installation of finish flooring and acoustic ceiling.

1.6 ENVIRONMENTAL REQUIREMENTS

**************************************************************************

NOTE: Veneer plaster is a very thin coating that will be adversely affected by extreme or non-uniform drying conditions and by rapid changes in temperature. It should not be used in spaces where adequate environmental control cannot be obtained.
**************************************************************************

Do not expose the gypsum base to excessive sunlight prior to plaster application, as bond failure of the plaster may result. Maintain a continuous uniform temperature of not less than 10 degrees C 50 degrees F and not more than 27 degrees C 80 degrees F for at least one week prior to the application of veneer plaster, while the plastering is being done, and for at least one week after the plaster is set. Shield air supply and distribution devices to prevent any uneven flow of air across the plastered surfaces. Provide ventilation to exhaust moist air to the outside during plaster application, set, and until plaster is dry. In glazed areas, keep windows open top and bottom or side to side 75 to 100 mm 3 to 4 inches. Openings can be reduced in cold weather. For enclosed areas lacking natural ventilation, provide temporary mechanical means for ventilation. In unglazed areas subjected to hot, dry winds or temperature differentials from day to night of 10 degrees C 20 degrees F or more, screen openings with cheesecloth or similar materials. Avoid rapid drying. During periods of low indoor humidity, provide minimum air circulation following plastering and until plaster is dry.

[1.7 FIRE RESISTIVE CONSTRUCTION

**************************************************************************

NOTE: For fire-resistant assemblies, drawing details must follow the tested and approved designs. The addition of veneer plaster to an approved gypsum wallboard design will improve the fire-resistive properties of the partitions. Tested and approved designs are published by gypsum wallboard manufacturers, Underwriters Laboratory, and Factory Mutual, and are included in the Gypsum Association Fire Resistance Design Manual.
**************************************************************************

Comply with specified fire-rated assemblies for design numbers indicated per UL Fire Resistance or FM APP GUIDE.
PART 2   PRODUCTS

2.1   MATERIALS

**************************************************************************
NOTE: The designer must assure that the drawings show the required thickness for gypsum base and gypsum backing board for all application.
**************************************************************************

Conform to the requirements specified below. Miscellaneous items not otherwise specified must be as recommended by the veneer plaster system manufacturer and approved prior to use. Powder driven fasteners may be used only when approved in writing.

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.
Research shows the product is available from US national manufacturers above the minimum recycled content shown.
**************************************************************************

2.1.1 Steel Framing, Furring, and Related Items

ASTM C645. [Provide steel framing, furring, and related items that contain a minimum of 25 percent recycled content. Provide data identifying percentage of recycled content for steel framing or furring.]

2.1.2 Vapor Retarder

Foil-backed gypsum base or gypsum backing board, or 4-mil polyethylene.

2.1.3 Gypsum Backing Board

ASTM C1396/C1396M, [Regular] [Foil-backed] [Water-Resistant] [Type X]. Provide boards with square edges as the first ply in two-ply application. Provide 1200 mm 48 inches wide boards, thickness as shown except that board used for liner panels and core plies of shaftwall construction must be the size and thickness recommended by the system manufacturer.

2.1.4 Gypsum Base

ASTM C1396/C1396M, [Regular] [Foil-backed] [Type X], 1200 mm 48 inches wide, thickness as shown. Provide square edges, rounded, or tapered as recommended by the veneer plaster manufacturer.

2.1.5 Gypsum Veneer Plaster

ASTM C587. Minimum compressive strength of finish coat plaster must be 17 MPa 2500 psi.

2.1.6 Joint Reinforcement

ASTM C475/C475M, Mesh reinforcing strip or paper tape as recommended by the
veneer plaster manufacturer.

2.1.7 Joint Compound

ASTM C475/C475M.

2.1.8 Screws

ASTM C1002 or ASTM C954, type appropriate to use.

2.1.9 Nails

ASTM C514, with corrosion-resistant treatment.

2.1.10 Corner Bead, Casing Bead, and Control Joints

ASTM C1047 [or] ASTM D3678, Corrosion protective-coated steel[, vinyl or clear anodized aluminum] as recommended by the veneer plaster manufacturer. Provide flanges free of any material that would adversely affect bonding of the plaster.

PART 3 EXECUTION

3.1 STEEL FRAMING

******************************************************************************
NOTE: Since the veneer plaster is a thin, hard coating, it may be damaged by excessive deflection or racking of the partition. Partitions should be isolated from the structural building frame so that movement of the frame does not distort the partitions. Where heavy loads such as wall hung cabinets, counters or hospital TV sets are indicated, the partitions must be strengthened to support the applied loads.
******************************************************************************

ASTM C754. Space framing at 400mm 16 inches on center maximum. Partitions must support applied loads such as cabinets and counters without exceeding the permitted deflection.

3.1.1 Partition Framing System

Metal non-load bearing framing and furring system must be capable of carrying a transverse load of 24 ksm 5 psf without exceeding either the allowable stress or a deflection of L/240. Provide studs of 0.45 mm 0.0179 inch minimum thickness for partitions having the same material and the same material thickness on both sides. For partitions using 0.45 mm 0.0179 inch thick studs, the surfacing material must cover the full height of the partition on both sides, or the stud flange must be otherwise supported to insure rigidity. Provide studs of 0.84 mm 0.0329 inch minimum thickness for partitions having different materials or different material thickness on the two sides. At partition ends, corners, and intersections, and at jambs of openings, fasten studs to runners with screws.

3.1.2 Special Framing

Build framing for beams, columns, soffits, and other special items to the sizes, shapes, or forms indicated. Secure rigidly at each intersection.
with screws.

3.1.3 Shaftwall Framing System

Shaftwalls must be standard, tested designs. Metal framing must be in accordance with the shaftwall manufacturer's printed instructions.

3.1.4 Ceiling Openings

Provide support members at ceiling openings such as required for access panels, recessed light fixtures, and for air supply or exhaust. Locate support members of not less than 38 mm 1 1/2 inch main runner channels and suspension wires or straps to provide at least the minimum support specified herein for furring and wallboard attachment. Provide intermediate structural members for attachment or suspension of support members.

3.1.5 Wall Openings

At wall openings the framing system must provide for the installation and anchorage of the required subframes or finish frames. Attach steel frames securely through built-in anchors to the nearest stud on each side of the opening with wallboard screws. Provide 0.84 mm 0.329 inch minimum thickness double studs at both jambs of all doors openings. For doors over 1200 mm 4 feet wide, double doors, and for extra-heavy doors (such as x-ray doors), provide doubled studs [_____] millimeters inches minimum thickness. Spot grout door frames at the jamb anchor locations with joint compound applied just prior to application of gypsum base.

3.1.6 Blocking

Provide blocking when mounting equipment. Cut [metal][or][wood] blocking to fit in between the framing members. Rigidly anchor blocking to the framing members. Under no circumstances will accessories or other wall mounted equipment be anchored directly to the veneer plaster system.

3.2 APPLICATION OF GYPSUM BASE

Apply gypsum base and gypsum backing board to framing and furring members in accordance with ASTM C844 and the requirements specified herein. Gypsum wallboard may be used for the base ply in two-ply construction. Provide gypsum base and backing board of maximum practical length, using full length boards for vertical application. Install separate boards in moderate contact without forcing in place. Install boards tight against the framing so as to eliminate any offset in the face plane between adjoining boards. Stagger end joints of adjoining boards. Fit abutting end and edge joints. Cut boards as required to make close joints around openings. Gypsum base may be adhered to gypsum backing board with an adhesive, except where prohibited by fire rating. In multi-layer construction, offset joints between layers. Offset joints on opposite faces of the partition.

3.2.1 Curved Surfaces

Use bending radii in accordance with ASTM C844, TABLE 5. Bend gypsum base into place without damaging the face paper. If the base is dampened to facilitate bending, dry thoroughly, and apply a bonding agent (ASTM C631) before plastering.
3.2.2 Cavity Shaftwall System

Install gypsum backing boards, core boards, and gypsum base in accordance with the shaftwall system manufacturer's printed recommendations to achieve the fire rating required.

3.2.3 Control Joints

**************************************************************************

NOTE: Control joint locations should be shown on the drawings. Control joint spacing in walls or wall furring must not exceed 9000 mm 30 feet. Control joint spacing must not exceed 9000 mm 30 feet in either direction in restrained ceilings, and 15000 mm 50 feet in either direction in ceilings with perimeter relief. Joints should be provided at the wings of L, U, and T shaped ceiling areas.

**************************************************************************

Control joints in ceilings and walls must be one piece manufactured products designed for use with a veneer plaster system.

3.2.4 Vapor Retarder

Install foil-backed gypsum base or gypsum backing board with the reflective surface against the framing members. Install polyethylene vapor retarder with joints over framing members, and with joints lapped the full width of the framing members.

3.3 JOINT REINFORCEMENT

Reinforce all interior angles and flat joints prior to application of the veneer plaster. Do not use self-adhering fiberglass mesh tape. Reinforcement must be a special mesh reinforcing strip embedded in veneer plaster, or paper gypsum wallboard tape embedded in joint compound.

3.3.1 Mesh Reinforcing

Embed the mesh reinforcing strip in veneer plaster, so that embedment material is both under and covering the reinforcement. Allow areas of reinforcement to preset, and leave rough enough for proper bonding of the plaster coat. Reinforcement must be set but not dry, before the application of veneer plaster.

3.3.2 Paper Tape Reinforcing

Press the paper tape into a bedding coat of setting type joint compound, and immediately cover with a skim coat of the same compound. After the bedding and skim coats are set, apply a fill coat of joint compound. Set the reinforcement and dry thoroughly before application of veneer plaster.

3.4 APPLICATION OF GYPSUM VENEER PLASTER

**************************************************************************

NOTE: Veneer plaster may be applied to masonry or concrete surfaces as well as to gypsum base. Special conditioning and treatment are required for masonry or concrete surfaces to receive veneer plaster. Review ASTM C843 and manufacturer's
Apply gypsum veneer plaster in accordance with ASTM C843, and with the manufacturer's approved installation instructions where such instructions are additional to or more restrictive than the requirements of ASTM C843. Apply plaster as a [one-component] [two-component] system. Minimum plaster thickness must be as recommended by the manufacturer, but must in no case be less than [1.6 mm/16 inch for one-component system.] [1.6 mm/16 inch for base coat and 0.8 mm/1/32 inch for finish coat of a two-component system.]

3.4.1 Mixing

Clean mixer between batches to avoid accelerating the setting time. Do not add other plaster materials to modify the properties of the veneer plaster. When extreme conditions so demand, small quantities of commercial retarder or accelerator may be added to the mixing water to adjust setting time. When used, the retarder or accelerator must conform to the veneer plaster manufacturer's recommendations.

3.4.2 Application

Trowel plaster on by hand. Apply with sufficient material and pressure to develop bond and to provide the specified component thickness.

3.4.2.1 Base Coat

NOTE: Delete base coat requirements when one-component system is desired.

Scratch in the base coat tightly, then immediately double back using material from the same batch. Fill all voids and imperfections and level the plaster to a true surface without the application of water. For good bond or adhesion, roughen the final surface for bond by brushing or cross-raking with a fine wire rake. For application of finish coat, set the base coat and partially dry. If the base coat is totally dry, dampen before finish coat application.

3.4.2.2 Finish Coat

NOTE: A smooth-troweled finish will normally be specified. If a textured finish is desired, it may be added to the specification. The texture pattern should be specified, i.e., swirl, skip trowel, etc. Some texture finishes may require a greater coating thickness.

Scratch in the finish coat tightly, then immediately double back using material from the same batch. After the plaster has been allowed to set up slightly, lightly trowel the surface without the addition of water, filling all voids and imperfections and eliminating surface irregularities. When
the plaster has become firm and prior to set, smooth-trowel the surface using water sparingly. Avoid over troweling.

3.5 CLEANUP AND PATCHING

Remove plaster splashes from adjacent surfaces. Repair defects in the veneer plaster. Plaster surfaces must be smooth, clean, and in condition to receive the finishing materials that will be applied.

          2.1.2.2   Foil-Backed
          2.1.2.3   Type X (Special Fire-Resistant)
  2.1.3   Regular Water-Resistant Gypsum Backing Board
          2.1.3.1   Regular
          2.1.3.2   Type X (Special Fire-Resistant)
  2.1.4   Glass Mat Water-Resistant Gypsum Tile Backing Board
          2.1.4.1   Regular
2.1.4.2 Type X (Special Fire-Resistant)
2.1.5 Glass Mat Covered or Reinforced Gypsum Sheathing
   2.1.5.1 Glass Mat Covered or Reinforced Gypsum Sheathing Sealant
2.1.6 Abuse Resistant Gypsum Board
   2.1.6.1 Soft Body Impact Test
   2.1.6.2 Hard Body Impact Test
   2.1.6.3 Surface Abrasion Test
   2.1.6.4 Indentation Test
2.1.7 Factory-Laminated Gypsum Board
   2.1.7.1 ASTM E90 Factory Test Report
2.1.8 Predecorated Gypsum Board
2.1.9 Cementitious Backer Units
2.1.10 Joint Treatment Materials
   2.1.10.1 Embedding Compound
   2.1.10.2 Finishing or Topping Compound
   2.1.10.3 All-Purpose Compound
   2.1.10.4 Setting or Hardening Type Compound
   2.1.10.5 Joint Tape
2.1.11 Fasteners
   2.1.11.1 Nails
   2.1.11.2 Screws
   2.1.11.3 Staples
2.1.12 Adhesives
   2.1.12.1 Adhesive for Fastening Gypsum Board to Metal Framing
   2.1.12.2 Adhesive for Fastening Gypsum Board to Wood Framing
   2.1.12.3 Adhesive for Laminating
2.1.13 Gypsum Studs
2.1.14 Shaftwall Liner Panel
2.1.15 Accessories
2.1.16 Asphalt Impregnated Building Felt
2.1.17 Water

PART 3 EXECUTION

3.1 EXAMINATION
   3.1.1 Framing and Furring
   3.1.2 [Gypsum Board] [and] [Framing]
   3.1.3 [Masonry] [and] [Concrete] Walls
   3.1.4 Building Construction Materials
3.2 APPLICATION OF GYPSUM BOARD
   3.2.1 Application of Single-Ply Gypsum Board to Wood Framing
   3.2.2 Application of Two-Ply Gypsum Board to Wood Framing
   3.2.3 Adhesive Nail-On Application to Wood Framing
   3.2.4 Semi-Solid Gypsum Board Partitions
   3.2.5 Solid Gypsum Board Partitions
   3.2.6 Adhesive Application to Interior Masonry or Concrete Walls
   3.2.7 Application of Gypsum Board to Steel Framing and Furring
   3.2.8 Arches and Bending Radii
   3.2.9 Gypsum Board for Wall Tile or Tile Base Applied with Adhesive
   3.2.10 Exterior Application
   3.2.11 Glass Mat Covered or Fiber Reinforced Gypsum Sheathing
   3.2.12 Floating Interior Angles
   3.2.13 Control Joints
   3.2.14 Application of Foil-Backed Gypsum Board
   3.2.15 Application of Predecorated Gypsum Board
   3.2.16 Application of Abuse Resistant Gypsum Board
   3.2.17 Application of Factory-Laminated Gypsum Board
3.3 APPLICATION OF CEMENTITIOUS BACKER UNITS
   3.3.1 Application
3.3.2 Joint Treatment
3.4 FINISHING OF GYPSUM BOARD
   3.4.1 Uniform Surface
   3.4.2 Metal Trim for Predecorated Gypsum Board
3.5 SEALING
   3.5.1 Sealing for Glass Mat or Reinforced Gypsum Board Sheathing
3.6 FIRE-RESISTANT ASSEMBLIES
3.7 SOUND RATED ASSEMBLIES
3.8 PATCHING
3.9 SHAFTWALL FRAMING
3.10 SOUND RATED ASSEMBLY FIELD TESTING

-- End of Section Table of Contents --
NOTE: This guide specification includes the requirements for gypsum board, cementitious backer units, and accessories intended for use in drywall construction.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

Reference Section 05 40 00 COLD-FORMED METAL FRAMING for load bearing studwork. Reference Section 09 22 00 SUPPORTS FOR PLASTER AND GYPSUM BOARD for non-loadbearing studs, furring and ceiling suspension systems.

NOTE: On the drawings, show:

1. Locations of each type of gypsum board, backing board and cementitious backer units, using same terminology as in the specification.

2. Locations and UL or GA design numbers for fire rated gypsum board and cementitious backer unit assemblies.
3. Locations of asphalt impregnated building felt if gypsum sheathing is used or if cementitious backer units are used in wet areas.

PART 1  GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN NATIONAL STANDARDS INSTITUTE (ANSI)

ANSI A108.11 (1992; Reaffirmed 2005) Specifications for Interior Installation of Cementitious Backer Units

ASTM INTERNATIONAL (ASTM)

Panel Products or Metal Plaster Bases to Steel Studs from 0.033 in. (0.84 mm) to 0.112 in. (2.84 mm) in Thickness

ASTM C1002 (2022) Standard Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood STUDS or Steel Studs

CALIFORNIA DEPARTMENT OF PUBLIC HEALTH (CDPH)

FM GLOBAL (FM)

GREEN SEAL (GS)

GS-36 (2013) Adhesives for Commercial Use

GYPSUM ASSOCIATION (GA)

GA 214 (2010) Recommended Levels of Gypsum Board Finish

GA 224 (2008) Installation of Predecorated Gypsum Board

SCIENTIFIC CERTIFICATION SYSTEMS (SCS)

SCS Global Services (SCS) Indoor Advantage
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
Cementitious Backer Units

Glass Mat Water-Resistant Gypsum Tile Backing Board

Water-Resistant Gypsum Backing Board

[ Glass Mat Covered or Reinforced Gypsum Sheathing ]

[ Glass Mat Covered or Reinforced Gypsum Sheathing Sealant ]

[ Abuse Resistant Gypsum Board ]

Accessories

Submit for each type of gypsum board and for cementitious backer units.

Gypsum Board

[ Recycled Content for Gypsum Board; S ]

[ Recycled Content for Paper Facing and Gypsum Cores; S ]

VOC Content of Joint Compound; S

SD-04 Samples

Predecorated Gypsum Board; G[, [_____]]

Submit for each color and pattern of predecorated gypsum board. Where colors are not indicated, submit color selection samples of not less than eight of the manufacturer's standard colors.

SD-06 Test Reports

[ ASTM E90 Factory Test Report; G[, [_____]] ]

[ ASTM E336 Field Test Report; G[, [_____]] ]

SD-07 Certificates

Asbestos Free Materials; G[, [_____]]

Certify that gypsum board types, gypsum backing board types, cementitious backer units, and joint treating materials do not contain asbestos.

Indoor Air Quality for Gypsum Board; S

Indoor Air Quality for Non-aerosol Adhesives; S

Indoor Air Quality for Aerosol Adhesives; S

Safety Data Sheets

SD-10 Operation and Maintenance Data
1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality Certifications

Submit required indoor air quality certifications in one submittal package.

**************************************************************************
NOTE: The Government’s preference is for use of products that have been certified for indoor air quality by a third-party organization such as Greenguard or SCS Global Services. However, it must be verified there is a certified product available that is both cost effective and appropriate for the project. Retain the following section when the designer of record confirms local/regional availability of Greenguard or SCS products that does not impact cost effectiveness.
**************************************************************************

1.3.1.1 Ceiling and Wall Systems

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.3.1.2 Adhesives and Sealants

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.4 DELIVERY, STORAGE, AND HANDLING

1.4.1 Delivery

Deliver materials in the original packages, containers, or bundles with each bearing the brand name, applicable standard designation, and name of manufacturer, or supplier.

1.4.2 Storage

**************************************************************************
NOTE: Gypsum board provides a sink for adsorbing high short-term emissions of VOCs, formaldehyde, particulates, or other air-borne compounds. Materials with high short-term emissions include, but are not limited to: adhesives, sealants and glazing compounds (specifically those with
petrochemical vehicles or carriers); paint, wood preservatives, and finishes; control and/or expansion joint fillers; hard finishes requiring adhesive installation; gypsum board (with associated finish processes and products); and composite or engineered wood products with formaldehyde binders.

Keep materials dry by storing inside a sheltered building. Where necessary to store gypsum board and cementitious backer units outside, store off the ground, properly supported on a level platform, and protected from direct exposure to rain, snow, sunlight, and other extreme weather conditions. Provide adequate ventilation to prevent condensation. Store per manufacturer's recommendations for allowable temperature and humidity range.

Do not store gypsum wallboard with materials which have high emissions of volatile organic compounds (VOCs) or other contaminants, including [____]. Do not store panels near materials that may offgas or emit harmful fumes, such as kerosene heaters, fresh paint, or adhesives. Do not use materials that have visible moisture or biological growth.

1.4.3 Handling

Neatly stack gypsum board and cementitious backer units flat to prevent sagging or damage to the edges, ends, and surfaces.

1.5 QUALIFICATIONS

Furnish type of gypsum board work specialized by the installer with a minimum of [3] [____] years of documented successful experience.

1.6 SCHEDULING

NOTE: Use one or both of the following procedures to minimize the exposure of gypsum wallboard to materials or finishes which have high short-term emissions of VOCs, formaldehyde, particulates, or other air-borne compounds.

[The gypsum wallboard must be taped, finished and primed before the installation of the highly-emitting materials, including [____].] [The gypsum wallboard must be installed after the installation and ventilation period of the highly-emitting materials, including [____].]

Commence application only after the area scheduled for gypsum board work is completely weathertight. The heating, ventilating, and air-conditioning systems must be complete and in operation prior to application of the gypsum board. If the mechanical system cannot be activated before gypsum board is begun, the gypsum board work may proceed in accordance with an approved plan to maintain the environmental conditions specified below. Apply gypsum board prior to the installation of finish flooring and acoustic ceiling.

1.7 ENVIRONMENTAL REQUIREMENTS

NOTE: Gypsum board is a thin sheathing that will be adversely affected by extreme or non-uniform drying
conditions and by rapid changes in temperature. It should not be used in spaces where adequate environmental control cannot be obtained.

Do not expose the gypsum board to excessive sunlight prior to gypsum board application. Maintain a continuous uniform temperature of not less than 10 degrees C 50 degrees F and not more than 27 degrees C 80 degrees F for at least one week prior to the application of gypsum board work, while the gypsum board application is being done, and for at least one week after the gypsum board is set. Shield air supply and distribution devices to prevent any uneven flow of air across the plastered surfaces. Provide ventilation to exhaust moist air to the outside during gypsum board application, set, and until gypsum board jointing is dry. In glazed areas, keep windows open top and bottom or side to side 75 to 100 mm 3 to 4 inches. Reduce openings in cold weather to prevent freezing of joint compound when applied. For enclosed areas lacking natural ventilation, provide temporary mechanical means for ventilation. In unglazed areas subjected to hot, dry winds or temperature differentials from day to night of 10 degrees C 20 degrees F or more, screen openings with cheesecloth or similar materials. Avoid rapid drying. During periods of low indoor humidity, provide minimum air circulation following gypsum boarding and until gypsum board jointing complete and is dry.

[1.8 FIRE RESISTIVE CONSTRUCTION

NOTE: For fire-resistive assemblies, drawing details must follow the tested and approved designs. Tested and approved designs are published by gypsum wallboard manufacturers, Underwriters Laboratory, and Factory Mutual, and are included in the Gypsum Association Fire Resistance Design Manual.

Comply with specified fire-rated assemblies for design numbers indicated per UL Fire Resistance or FM APP GUIDE.

PART 2 PRODUCTS

2.1 MATERIALS

NOTE: Check ASTM C840, GA 216 and ANSI A108.11 for details of materials, fasteners, and application.

Conform to specifications, standards and requirements specified. Provide gypsum board types, gypsum backing board types, cementitious backing units, and joint treating materials manufactured from asbestos free materials only. Submit Safety Data Sheets and manufacturer maintenance instructions for gypsum materials including adhesives.

2.1.1 Gypsum Board

Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness.
and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Section allows establishing recycled content requirements based on either the gypsum board product in its entirety, or on the paper facing and gypsum core separately. Include the first bracketed sentence if specifying a recycled product in its entirety; include the second bracketed sentence if specifying a recycled product based on its separate components. Research shows the product is available from US national manufacturers above the minimum recycled content of the first bracket. Some manufacturers and regions have higher percentages (for components that have a threshold less than 100 percent). Based on research, insert desired minimum percentages into the empty set of brackets.

**************************************************************************

ASTM C1396/C1396M. [ Gypsum board must contain a minimum of [5][10][_____] percent post-consumer recycled content, or a minimum of [20][40][_____] percent post-industrial recycled content. Provide data identifying percentage of recycled content for gypsum board.] [ Paper facings must contain a minimum of 100 percent recycled paper content. Gypsum cores must contain a minimum of [95][_____] percent post-industrial recycled gypsum content. Provide data identifying percentage of recycled content for paper facing and gypsum cores.] Provide gypsum wall board and panels meeting the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide certification or validation of indoor air quality for gypsum board.

2.1.1.1 Regular

**************************************************************************

NOTE: Use tapered and featured edge gypsum board with embedding and finishing compounds when a very flat surface is required, such as long walls with lighting at the end of the wall and down or up lighted walls.

**************************************************************************

1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, [tapered] [, tapered and featured] edges. [Provide tapered and featured edge gypsum board [in Rooms [_____] ] [as indicated].]

2.1.1.2 Foil-Backed

1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, [tapered] [tapered and featured] edges.
2.1.1.3 Type X (Special Fire-Resistant)
1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, [tapered] [tapered and featured] edges.

2.1.1.4 Mold Resistant / Anti-Microbial Gypsum

2.1.2 Gypsum Backing Board

**************************************************************************
NOTE: When thicker board is needed, replace the term "backing board" with "coreboard", and change dimension to 19.05 to 25.4 mm 3/4 to 1 inch, depending on system used.
**************************************************************************

ASTM C1396/C1396M, gypsum backing board must be used as a base in a multilayer system.

2.1.2.1 Regular
1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, square edges.

2.1.2.2 Foil-Backed
1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, square edges.

2.1.2.3 Type X (Special Fire-Resistant)
1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, square edges.

2.1.3 Regular Water-Resistant Gypsum Backing Board

**************************************************************************
NOTE: For adhesive applied ceramic tile in wet areas (tubs, shower enclosures, saunas, steam rooms, gang shower rooms, etc.), use cementitious backer units (Tile Council of America (TCA) Handbook) as a substrate. Specify ASTM C1396/C1396M or ASTM C1178/C1178M for all other tiled areas including areas where only ceramic or quarry tile base is to be installed, and for ceilings in humid areas. When using water-resistant gypsum backing board at tile applications, the metal studs should not be spaced more than 406 mm 16 inches o.c. Specify moisture resistant gypsum board ASTM C1396/C1396M for humid areas that are not exposed to direct moisture.

When using moisture resistant board on ceilings, spacing of supports should be no more than 305 mm 12 inch on center.
**************************************************************************

**************************************************************************
NOTE: Additives used to produce water-resistant gypsum board ("green board") may include VOCs.
Water-resistant types may be difficult to recycle.

**************************************************************************

ASTM C1396/C1396M

2.1.3.1 Regular

1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, tapered edges.

2.1.3.2 Type X (Special Fire-Resistant)

1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, tapered edges.

2.1.4 Glass Mat Water-Resistant Gypsum Tile Backing Board

ASTM C1178/C1178M

2.1.4.1 Regular

1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, square edges.

2.1.4.2 Type X (Special Fire-Resistant)

1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, square edges.

2.1.5 Glass Mat Covered or Reinforced Gypsum Sheathing

**************************************************************************

NOTE: This section should be used where exterior gypsum sheathing with water resistance is required (i.e. cavity sheathing over metal studs with brick veneer or as substrate for EIFS systems). Always use asphalt impregnated felt paper for sheathing protection. For additional protection or if recommended by the manufacturer, choose the paragraph for sheathing sealant.

**************************************************************************

NOTE: Glass-fiber reinforced types may be difficult to recycle.

**************************************************************************

Exceeds physical properties of ASTM C1396/C1396M and ASTM C1177/C1177M. Provide [12.7] [15.9,] mm [1/2][5/8] inch, gypsum sheathing. Provide gypsum board of with a noncombustible water-resistant core, with glass mat surfaces embedded to the gypsum core or reinforcing embedded throughout the gypsum core. Warrant gypsum sheathing board for at least twelve months against delamination due to direct weather exposure. Provide continuous, asphalt impregnated, building felt to cover exterior face of sheathing. [Seal all joints, seams, and penetrations with compatible sealant.]

2.1.5.1 Glass Mat Covered or Reinforced Gypsum Sheathing Sealant

Provide sealant compatible with glass mat covered or reinforced gypsum sheathing, rubber washers for masonry veneer anchors, and other associated cavity wall components such as anchors and through wall flashing. Provide
sealants for glass mat covered or reinforced gypsum sheathing board edge seams and veneer anchor penetrations recommended by the glass mat covered or reinforced gypsum sheathing manufacturer and have the following performance requirements:

a. **ASTM D412**: Tensile Strength, 551 kilopascals 80 psi
b. **ASTM D412**: Ultimate Tensile Strength (maximum elongation), 1172 kilopascals 170 psi
c. **ASTM D624**: Tear Strength, dieB, 4.7 kN/m 27 ppi
d. **ASTM D1149**: Joint Movement Capability after 14 Days cure, plus or minus 50 percent.

\][2.1.6 Abuse Resistant Gypsum Board

**************************************************************************

Note: Abuse Resistant Gypsum Board Should Be Used When Abuse Or Vandalism Of Walls Is Anticipated And Gypsum Board Is The Only Wall Material Alternative Feasible. Consult Manufacture For Use Restrictions Of Abuse Resistant Gypsum Board On Exterior Walls. This Product Requires A Minimum Of 20 Gauge Metal Framing As Support, Coordinate with Section 09 22 00 SUPPORTS FOR PLASTER AND GYPSUM BOARD.

Some products rely on lexan backing for penetration resistance. The impervious layer will act as a vapor barrier which may not be desirable in certain wall systems and climates.

None of the paper faced gypsum products have high resistance to abrasion. Consider high strength veneer plaster on wall systems using abuse resistant gypsum wallboard, coordinate with Section 09 26 00 VENEER PLASTER.

**************************************************************************

1200 mm 48 inch wide, 15.9 mm 5/8 inch thick, tapered edges. Reinforced gypsum panel with imbedded fiber mesh or lexan backing tested in accordance with the following tests. Hard body impact test must attain a Level 2 performance in accordance with **ASTM C1629/C1629M**. Provide fasteners that meet manufacturer requirements and specifications stated within this section. Abuse resistant gypsum board, when tested in accordance with **ASTM E84**, have [a flame spread rating of 25 or less and a smoke developed rating of 50 or less for [_____] [and] [a flame spread rating of 75 or less and a smoke developed rating of 100 or less for [_____]].

2.1.6.1 Soft Body Impact Test

**ASTM E695** or **ASTM D2394** for impact penetration and deformation. **ASTM E695** using a 27.2 kg 60 lb leather bag filled with steel pellets, resisting no less than 407 N-m 300 ft. lb. cumulative impact energy before failure or **ASTM D2394** using 139.7 mm 5.5 inch hemispherical projectile resisting no less than 357 N-m 264 ft. lb. before failure. Provide test specimen stud spacing a minimum 406 mm 16 inch on center.

2.1.6.2 Hard Body Impact Test

Comply with hard body impact test in accordance with **ASTM C1629/C1629M**
2.1.6.3 Surface Abrasion Test

Comply with test surface abrasion test in accordance with ASTM C1629/C1629M.

2.1.6.4 Indentation Test

ASTM D5420 or ASTM D1037 for indentation resistance. ASTM D5420 using a .907 kg 32 oz weight with a 16 mm 5/8 inch hemispherical impacting head dropped once 915 mm 3 feet creating not more than 3.5 mm 0.137 inch indentation or ASTM D1037 using no less than 213 kg 470 lb weight applied to the 11.13 mm 0.438 inch diameter ball to create not more than a 0.5 mm 0.0197 inch indentation depth.

2.1.7 Factory-Laminated Gypsum Board

**************************************************************************
NOTE: Specify Factory-laminated gypsum panels when using wall or ceiling assemblies to comply with high performance acoustical separation assemblies (laboratory tested assemblies STC 45 and above) noted in applicable DoD Unified Facilities Criteria (UFC). Such rooms and spaces can include conference rooms, partitions between living units, medical rooms and offices, rooms containing noise-generating equipment such as mechanical rooms, and secure spaces that are required to meet IC Tech Spec - for ICD/ICS 705, Technical Specifications for Construction and Management of Sensitive Compartmented Information Facilities. Coordinate on drawings location(s), laboratory testing number, sound rating performance and composition of each sound rated assembly.
**************************************************************************

[ ASTM C1766, [regular] [Type X], 1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, sound dampening gypsum panel products composed of [two [or more]] factory-laminated gypsum panel laminated into a composite panel.

][2.1.7.1 ASTM E90 Factory Test Report

**************************************************************************
NOTE: Include the following when using wall or ceiling assemblies intended to comply with acoustical separation assemblies noted in applicable DoD Unified Facilities Criteria (UFC) or perimeter of secure spaces that are required to meet IC Tech Spec - for ICD/ICS 705.
**************************************************************************

Submit Factory Test Report for proposed STC Rated wall assembly. Test reports must be prepared by an independent acoustical laboratory qualified under the National Voluntary Laboratory Accreditation Program (NVLAP) by the National Institute for Science and Technology (NIST). Test reports must indicate that the sound transmission classification (STC) of the proposed wall [and ceiling] assembly, based on tests at 16 third-octave band frequencies from 125 to 4,000 hertz, is no less than STC 50 for STC 45
assemblies and no less than STC 55 for STC 50 assemblies when tested in accordance with ASTM E90.

2.1.8 Predecorated Gypsum Board

NOTE: Predecorated gypsum board is available only in 1200 mm 48 inch wide panels. Interior finish materials for exits, hospitals, individual rooms with capacity for 5 or more persons must have a flame spread rating of 25 or less and smoked developed rating of 50 or less. Interior finish materials for other locations must have flame spread rating of 75 or less and smoke developed rating of 100 or less. Flame spread rating greater than 75 and smoke developed rating greater than 100 are not permitted. Refer to UFC 3-600-01, "Fire Protection Engineering for Facilities," for further guidance on specifying flame spread and smoke developed ratings.

NOTE: If the optional phrase "as selected" is not used to designate a color (and pattern), insert a manufacturer’s name and color (and pattern) designation in the blank and add the following to the end of this paragraph "The manufacturer’s name and catalog designation are provided in order to describe the color (and pattern) desired. Other manufacturer’s products having a similar color (and pattern) will be acceptable."

NOTE: Insert designations of rooms or areas in which different flame spread and smoke developed ratings are required.

ASTM C1396/C1396M, [regular] [Type X] gypsum board, 1200 mm 48 inch wide, [12.7] [15.9] mm [1/2] [5/8] inch thick, with a decorative wall covering (Class I) [or coating (Class II)] applied in-plant by the gypsum board manufacturer. The color [and pattern] of wall covering must be [_____] [as selected]. Provide [_____] color [and pattern] wall covering selected. [Furnish gypsum board with square edges, and a slight bevel to produce a shallow vee joint. Wrap all coverings around edges.] Furnish a predecorated gypsum board with [a flame spread rating of 25 or less and a smoke developed rating of 50 or less for [_____] [and] [a flame spread rating of 75 or less and a smoke developed rating of 100 or less for [_____]].

2.1.9 Cementitious Backer Units

NOTE: For adhesive applied ceramic tile in wet areas (tubs, shower enclosures, saunas, steam rooms, gang shower rooms), specify only cementitious backer units.
In accordance with the Tile Council of America (TCA) Handbook.

2.1.10 Joint Treatment Materials

**ASTM C475/C475M.** Product must be low emitting VOC types with VOC limits not exceeding 50 g/L. Provide data identifying **VOC content of joint compound.** [Use all purpose joint and texturing compound containing inert fillers and natural binders, including lime compound. Pre-mixed compounds must be free of antifreeze, vinyl adhesives, preservatives, biocides and other slow releasing compounds.]

2.1.10.1 Embedding Compound

Specifically formulated and manufactured for use in embedding tape at gypsum board joints and compatible with tape, substrate and fasteners.

2.1.10.2 Finishing or Topping Compound

Specifically formulated and manufactured for use as a finishing compound.

2.1.10.3 All-Purpose Compound

Specifically formulated and manufactured to serve as both a taping and a finishing compound and compatible with tape, substrate and fasteners.

2.1.10.4 Setting or Hardening Type Compound

Specifically formulated and manufactured for use with fiber glass mesh tape.

2.1.10.5 Joint Tape

Use cross-laminated, tapered edge, reinforced paper, or fiber glass mesh tape recommended by the manufacturer.

2.1.11 Fasteners

2.1.11.1 Nails

**ASTM C514.** [For predecorated gypsum board provide special nails with factory coated heads of color to match wall covering materials as recommended by the predecorated gypsum board manufacturer.]

2.1.11.2 Screws

**ASTM C1002, Type "G", Type "S" or Type "W" steel drill screws for fastening gypsum board to gypsum board, wood framing members and steel framing members less than 0.84 mm 0.033 inch thick. ASTM C954 steel drill screws for fastening gypsum board to steel framing members 0.84 to 2.84 mm 0.033 to 0.112 inch thick. Provide cementitious backer unit screws with a polymer coating.]

2.1.11.3 Staples

1.5 mm thick No. 16 USS gage flattened galvanized wire staples with 11.1 mm 7/16 inch wide crown outside measurement and divergent point for base ply of two-ply gypsum board application. Use as follows:
2.1.12  Adhesives

Provide non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of GS-36. Provide certification or validation of indoor air quality for non-aerosol adhesives applied on the interior of the building (inside of the weatherproofing system). Provide certification or validation of indoor air quality for aerosol adhesives used on the interior of the building (inside of the weatherproofing system).

2.1.12.1  Adhesive for Fastening Gypsum Board to Metal Framing

**************************************************************************
**NOTE: Use adhesive only where screw type fastener attachment to metal framing is not possible to avoid difficulty with future gypsum recycling.**
**************************************************************************

[Not permitted.][Type recommended by gypsum board manufacturer.]

2.1.12.2  Adhesive for Fastening Gypsum Board to Wood Framing

**************************************************************************
**NOTE: Use adhesive only where screw type fastener attachment to wood framing is not possible to avoid difficulty with future gypsum recycling.**
**************************************************************************

[Not permitted.][ASTM C557.]

2.1.12.3  Adhesive for Laminating

**************************************************************************
**NOTE: Use adhesive only where screw type fastener attachment is not possible to avoid difficulty with future gypsum recycling.**
**************************************************************************

[Not permitted.][ Adhesive attachment is not permitted for multi-layer gypsum boards. For laminating gypsum studs to face panels, provide adhesive recommended by gypsum board manufacturer.]

2.1.13  Gypsum Studs

Provide 25 mm one inch minimum thickness and 150 mm 6 inch minimum width. Studs may be of 25 mm one inch thick gypsum board or multilayers fastened

<table>
<thead>
<tr>
<th>Length of Legs</th>
<th>Thickness of Gypsum Board</th>
</tr>
</thead>
<tbody>
<tr>
<td>28.6 mm 1-1/8 inches</td>

<td>15.9 mm 5/8 inch</td>
</tr>
</tbody>
</table>
to required thickness. Conform to ASTM C1396/C1396M for material and GA 216 for installation.

2.1.14 Shaftwall Liner Panel

**************************************************************************
NOTE: Shaftwall panels are typically used for elevators, stairwells and mechanical chases that penetrate rated floor systems. When using shaftwall system, edit Section 09 22 00 SUPPORTS FOR PLASTER AND GYPSUM BOARD to include shaftwall liner panel metal studs.
**************************************************************************

ASTM C1396/C1396M. Conform to the UL Fire Resistance for the Design Numbers(s) indicated for shaftwall liner panels. Manufacture liner panel for cavity shaftwall system, with water-resistant paper faces, bevel edges, single lengths to fit required conditions, [25.4 mm] [19.05 mm] [1 inch] [3/4 inch] thick, by 610 mm 24 inch wide.

2.1.15 Accessories

**************************************************************************
NOTE: In areas of high humidity or project locations with Environmental Severity Classifications (ESC) of C3 thru C5, use PVC or plastic trim and accessories. Galvanized metal will rust over time. Humid project locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations.
**************************************************************************

ASTM C1047. Fabricate from [corrosion protected steel][ or ][plastic] designed for intended use. Accessories manufactured with paper flanges are not acceptable. Flanges must be free of dirt, grease, and other materials that may adversely affect bond of joint treatment. Provide prefinished or job decorated materials. [For predecorated gypsum board provide prefinished metal or plastic trim to match predecorated gypsum board.]

2.1.16 Asphalt Impregnated Building Felt

Provide a 6.7 kg 15 lb asphalt moisture barrier over glass mat covered or reinforced gypsum sheathing. Conforming to ASTM D226/D226M Type 1 (No. 15) for asphalt impregnated building felt.

2.1.17 Water

Provide clean, fresh, and potable water.

PART 3 EXECUTION

3.1 EXAMINATION

3.1.1 Framing and Furring

Verify that framing and furring are securely attached and of sizes and spacing to provide a suitable substrate to receive gypsum board and cementitious backer units. Verify that all blocking, headers and supports
are in place to support plumbing fixtures and to receive soap dishes, grab bars, towel racks, and similar items. Do not proceed with work until framing and furring are acceptable for application of gypsum board and cementitious backer units.

3.1.2 [Gypsum Board] [and] [Framing]
Verify that surfaces of [gypsum board] [and] [framing] to be bonded with an adhesive are free of dust, dirt, grease, and any other foreign matter. Do not proceed with work until surfaces are acceptable for application of gypsum board with adhesive.

3.1.3 [Masonry] [and] [Concrete] Walls
Verify that surfaces of [masonry] [and] [concrete] walls to receive gypsum board applied with adhesive are dry, free of dust, oil, form release agents, protrusions and voids, and any other foreign matter. Do not proceed with work until surfaces are acceptable for application of gypsum board with adhesive.

3.1.4 Building Construction Materials
Do not install building construction materials that show visual evidence of biological growth.

3.2 APPLICATION OF GYPSUM BOARD

**************************************************************************
NOTE: Coordinate with the drawings to ensure that all types of gypsum board specified are indicated. Terminology on the drawings should be identical to that in the specifications.
**************************************************************************

**************************************************************************
NOTE: Allow adhesive bonding of gypsum board and substrate members only when required for proper installation.
**************************************************************************

**************************************************************************
NOTE: Use of special clips designed to provide support at wall corners and wall-ceiling intersections in lieu of backup studs or blocking minimizes framing, and is approved except where not permitted in fire rated assemblies. Include gypsum or ceiling board over framing sentence when appropriate with design and meets industry guidance and requirements for fire rated assemblies. Ceilings insulated with heavy or compressed insulation (such as cellulose, mineral wool, or compressed fiberglass batts) may require 16 mm 5/8 inch gypsum board.
**************************************************************************

Apply gypsum board to framing and furring members in accordance with ASTM C840 or GA 216 and the requirements specified. Apply gypsum board with separate panels in moderate contact; do not force in place. Stagger end joints of adjoining panels. Neatly fit abutting end and edge joints.
Use gypsum board of maximum practical length; select panel sizes to minimize waste. Cut out gypsum board to make neat, close, and tight joints around openings. In vertical application of gypsum board, provide panels in lengths required to reach full height of vertical surfaces in one continuous piece. Lay out panels to minimize waste; reuse cutoffs whenever feasible. Surfaces of gypsum board and substrate members may [not] be bonded together with an adhesive[, except where prohibited by fire rating(s)]. Treat edges of cutouts for plumbing pipes, screwheads, and joints with water-resistant compound as recommended by the gypsum board manufacturer. Minimize framing by floating corners with single studs and drywall clips. Install [16 mm/5/8 inch] [_____] gypsum or [13 mm/1/2 inch] [_____] ceiling board over framing at [610 mm/24 inch] [_____] on center. Provide type of gypsum board for use in each system specified herein as indicated.

3.2.1 Application of Single-Ply Gypsum Board to Wood Framing

Apply in accordance with ASTM C840, System I or GA 216.

3.2.2 Application of Two-Ply Gypsum Board to Wood Framing

Apply in accordance with ASTM C840, System II or GA 216.

3.2.3 Adhesive Nail-On Application to Wood Framing

Apply in accordance with ASTM C840, System III or GA 216. This method may be used in lieu of ASTM C840, System I at the option of the Contractor.

3.2.4 Semi-Solid Gypsum Board Partitions

Provide in accordance with ASTM C840, System IV or GA 216.

3.2.5 Solid Gypsum Board Partitions

Provide in accordance with ASTM C840, System V or GA 216.

3.2.6 Adhesive Application to Interior Masonry or Concrete Walls

Apply in accordance with ASTM C840, System VI or GA 216.

3.2.7 Application of Gypsum Board to Steel Framing and Furring

Apply in accordance with ASTM C840, System VIII or GA 216.

3.2.8 Arches and Bending Radii

Apply gypsum board in accordance with ASTM C840, System IX or GA 216.

3.2.9 Gypsum Board for Wall Tile or Tile Base Applied with Adhesive

**************************************************************************

NOTE: For adhesive applied ceramic tile in wet areas (tubs, shower enclosures, saunas, steam rooms, gang shower rooms), specify cementitious backer board (in accordance with the Tile Council of America Handbook) as the substrate; specify ASTM C1178/C1178M glass mat water-resistant backing board or ASTM C1396/C1396M water-resistant gypsum backing board for other tiled areas including areas where
In dry areas (areas other than tubs, shower enclosures, saunas, steam rooms, gang shower rooms), apply glass mat water-resistant gypsum tile backing board [or water-resistant gypsum backing board] in accordance with ASTM C840, System X or GA 216.

3.2.10 Exterior Application

Apply exterior gypsum board (such as at soffits) in accordance with ASTM C840, System XI or GA 216.

3.2.11 Glass Mat Covered or Fiber Reinforced Gypsum Sheathing

NOTE: Choose the bracketed option below if sealant will be applied to sheathing joints and penetrations in addition to the asphalt impregnated building felt.

Apply glass mat covered or fiber reinforced gypsum sheathing in accordance to gypsum association publications GA 253. Follow gypsum sheathing manufacturer's requirements of design details for joints and fasteners and be properly installed to protect the substrate from moisture intrusion. Do not leave exposed surfaces of the glass mat covered or fiber reinforced gypsum sheathing beyond the manufacturer's recommendation without a weather barrier cladding. Provide continuous asphalt impregnated building felt over sheathing surface in shingle fashion with edges and ends lapped a minimum of 150 mm 6 inch. Properly flash the openings. [Seal all joints, seams, and penetrations with a compatible silicone sealant.]

3.2.12 Floating Interior Angles

NOTE: Use of special clips designed to provide support at wall corners and wall-ceiling intersections in lieu of backup studs or blocking minimizes framing, and is approved except where not permitted in fire rated assemblies. Include gypsum or ceiling board over framing sentence when appropriate for design and meets industry guidance and requirements for fire rated assemblies.

Minimize framing by floating corners with single studs and drywall clips. Locate the attachment fasteners adjacent to ceiling and wall intersections in accordance with ASTM C840, System XII or GA 216, for [single-ply] [and] [two-ply] applications of gypsum board to wood framing.

3.2.13 Control Joints

Install expansion and contraction joints in ceilings and walls in accordance with ASTM C840, System XIII or GA 216. Fill control joints between studs in fire-rated construction with firesafing insulation to match the fire-rating of construction.
3.2.14 Application of Foil-Backed Gypsum Board

Apply foil-backed gypsum board in accordance with ASTM C840, System XIV or GA 216.

3.2.15 Application of Predecorated Gypsum Board

Apply predecorated gypsum board in accordance with GA 224. Attach predecorated gypsum board with adhesive and fasteners as recommended by the manufacturer. Conceal fasteners in the finished work.

3.2.16 Application of Abuse Resistant Gypsum Board

Apply in accordance with applicable system of ASTM C840 as specified or GA 216. Follow manufacturers written instructions on how to cut, drill and attach board.

3.2.17 Application of Factory-Laminated Gypsum Board

Apply in accordance with manufacturer instructions for testing sound assembly. Face of laminated surface must not be on finished side of assembly.

3.3 APPLICATION OF CEMENTITIOUS BACKER UNITS

3.3.1 Application

In wet areas (tubs, shower enclosures, saunas, steam rooms, gang shower rooms), apply cementitious backer units in accordance with ANSI A108.11. Place a 7.6 kg 15 lb asphalt impregnated, continuous felt paper membrane behind cementitious backer units, between backer units and studs or base layer of gypsum board. Place membrane with a minimum 150 mm 6 inch overlap of sheets laid shingle style.

3.3.2 Joint Treatment

ANSI A108.11.

3.4 FINISHING OF GYPSUM BOARD

Tape and finish gypsum board in accordance with ASTM C840, GA 214 and GA 216. Finish plenum areas above ceilings to Level 1 in accordance with GA 214. Finish water resistant gypsum backing board, ASTM C1396/C1396M, to receive ceramic tile to Level 2 in accordance with GA 214. Finish walls and ceilings to receive a heavy-grade wall covering or heavy textured finish before painting to Level 3 in accordance with GA 214. Finish walls and ceilings without critical lighting to receive flat paints, light textures, or wall coverings to Level 4 in accordance with GA 214. Unless otherwise specified, finish all gypsum board walls, partitions and ceilings to Level 5 in accordance with GA 214. Provide joint, fastener depression, and corner treatment. Tool joints as smoothly as possible to minimize sanding and dust. Do not use self-adhering fiber glass mesh tape with conventional drying type joint compounds; use setting or hardening type compounds only. Provide treatment for water-resistant gypsum board as recommended by the gypsum board manufacturer. Protect workers, building occupants, and HVAC systems from gypsum dust.
3.4.1 Uniform Surface

Wherever gypsum board is to receive eggshell, semigloss or gloss paint finish, or where severe, up or down lighting conditions occur, finish gypsum wall surface in accordance to GA 214 Level 5. In accordance with GA 214 Level 5, apply a thin skim coat of joint compound to the entire gypsum board surface, after the two-coat joint and fastener treatment is complete and dry.

[3.4.2 Metal Trim for Predecorated Gypsum Board]

Finish edges, ends, and joints of predecorated gypsum board, except prefinished vee joints and monolithic type joints, with metal or plastic trim selected to match the gypsum board finish.

3.5 SEALING

Seal openings around pipes, fixtures, and other items projecting through gypsum board and cementitious backer units as specified in Section 07 92 00 JOINT SEALANTS. Apply material with exposed surface flush with gypsum board or cementitious backer units.

[3.5.1 Sealing for Glass Mat or Reinforced Gypsum Board Sheathing]

Apply silicone sealant in a 9.5 mm 3/8 inch bead to all joints and trowel flat. Apply enough of the same sealant to all fasteners penetrating through the glass mat gypsum board surface to completely cover the penetration when troweled flat. [Do not place construction and materials behind sheathing until a visual inspection of sealed joints during daylight hours has been completed by Contracting Officer.]

3.6 FIRE-RESISTANT ASSEMBLIES

**************************************************************************
NOTE: Coordinate with the drawings to ensure that UL or GA design numbers are indicated for fire-resistant assemblies. If review of building code requires pressurized enclosures, include the following:

Pressurized fire-rated gypsum board enclosures must allow the mechanical and electrical life-safety systems to operate in accordance with the design intent. Air pressure within elevator shaft must be 360 Pa. 7.5 psf. Air pressure within stair shaft must be 240 Pa. 5.0 psf. Maximum mid-span deflection must be L/360.
**************************************************************************

Wherever fire-rated construction is indicated, provide materials and application methods, including types and spacing of fasteners, wall framing in accordance with the specifications contained in UL Fire Resistance for the Design Number(s) indicated, or GA 600 for the File Number(s) indicated. Joints of fire-rated gypsum board enclosures must be closed and sealed in accordance with UL test requirements or GA requirements. Seal penetrations through rated partitions and ceilings tight in accordance with tested systems.
3.7 SOUND RATED ASSEMBLIES

NOTE: Construction practices have an influence on final STC ratings of assemblies. Flanking sound patterns, the integrity of the assembly, and construction methods factor into the STC rating of the completed assembly. Include the following section when using wall or ceiling assemblies intended to meet the acoustical separation assembly requirements in applicable DoD Unified Facilities Criteria (UFC). Such rooms and spaces can include conference rooms, partitions between living units, medical patient rooms and offices, rooms containing noise-generating equipment such as mechanical rooms, and secure spaces that are required to meet IC Tech Spec - for ICD/ICS 705, Technical Specifications for Construction and Management of Sensitive Compartmented Information Facilities. Coordinate on drawings location(s), laboratory testing number, sound rating performance and composition of each sound rated assembly.

When sound rated assemblies are required, provide materials and application methods, including panels, insulation, types and spacing of fasteners, wall and ceiling framing in accordance with the contract document and the description of the assembly in the ASTM E90 Factory Test Report. Seal partitions continuously with acoustical foam or sealant (both sides) and finished to match wall wherever it abuts another element such as the floor, ceiling, wall, column, mullion, or another system or assembly.

3.8 PATCHING

Patch surface defects in gypsum board to a smooth, uniform appearance, ready to receive finishes. [Remove predecorated gypsum board which cannot be restored to like-new condition. Provide new predecorated gypsum board.]

3.9 SHAFTWALL FRAMING

Install the shaftwall system in accordance with the system manufacturer's published instructions. Coordinate bucks, anchors, blocking and other items placed in or behind shaftwall framing with electrical and mechanical work. Patch or replace fireproofing materials which are damaged or removed during shaftwall construction.

3.10 SOUND RATED ASSEMBLY FIELD TESTING

NOTE: Include the following when field-testing is required for wall or ceiling assemblies intended to comply with acoustical separation assemblies noted in applicable DoD Unified Facilities Criteria (UFC) or perimeter of secure spaces that are required to meet IC Tech Spec - for ICD/ICS 705. For secure spaces that are to comply with IC Tech Spec - for ICD/ICS 705, this may be documented in the Construction Security Plan.
Provide third party testing of sound rated assemblies tested in accordance with ASTM E336. Provide the ASTM E336 Field Test Report verifying that the installed assemblies perform no less than five ASTC rating points below the ASTM E90 Factory Test Report. Examine, modify adjust, and retest any installation not meeting the STC Rating until compliance is obtained.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for a variety of types of ceramic tile for walls and floors.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Tile grouted with epoxy or furan resin is included in this specification, but quarry tile subject to severe chemical exposures is specified in Section 09 35 16 CHEMICAL-RESISTANT QUARRY TILING.

Ensure drawings indicate location, dimensions, elevations, schedules, content, details and such other information as required to indicate the extent of the work.

Base product selections on aesthetic values, function, type of facility, and cost as related to project needs.
1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality Certifications

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party programs that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited in this Section.

1.3.2 Water Absorption Rates Certification

*****************************************************************************************************************************************
NOTE: The four water absorption (wa) classifications indicated below are from ANSI A137.1. Lower water absorption (wa) indicates a denser product.
1. Impervious tile has water absorption (wa) of less than 0.5 percent. Porcelain tile is typically impervious tile.

2. Vitreous tile has water absorption (wa) of 0.5 to 3.0 percent. Mosaic tile and quarry tile can be vitreous tile.

3. Semi-Vitreous tile has water absorption (wa) of 3.0 to 7.0 percent. Quarry tile can be semi-vitreous tile, but with a maximum of 5 percent water absorption.

4. Non-Vitreous tile has water absorption (wa) of 7.0 percent or more. Ceramic wall tile, glazed and unglazed, is typically non-vitreous tile suitable for interior wall use.

The designer must select the water absorption (wa) rate for each type of tile needed on a project-specific basis, and must verify the tile manufacturers' actual water absorption (wa) rates for each tile product specified.

**************************************************************************
Provide certification for each tile type indicating compliance with the following water absorption (wa) rates per ANSI A137.1 criteria as tested per ASTM C373 requirements.

[ a. [Porcelain][ and ][Mosaic] Tile (Impervious): Provide water absorption (wa) of 0.5 percent or less.

][b. [Mosaic][_____] Tile (Vitreous): Provide water absorption (wa) of more than 0.5 percent, but not more than 3.0 percent.

][c. [Mosaic][_____] Tile (Semi-Vitreous): Provide water absorption (wa) of more than 3.0 percent, but not more than 7.0 percent.

][d. [Ceramic Wall][_____] Tile (Non-Vitreous): Provide maximum water absorption (wa) of [7.0][____] percent.

]1.4 QUALITY ASSURANCE

Provide installers having a minimum of two years of experience with a company specializing in performing the type of work described. Each type and color of tile to be provided from a single source. Each type and color of mortar, adhesive, and grout to be provided from the same source.

1.5 DELIVERY, STORAGE, AND HANDLING

Ship tiles in sealed packages and clearly marked with the grade, type of tile, producer identification, and country of origin. Deliver materials to the project site in manufacturer's original unopened containers with seals unbroken and labels and hallmarks intact. Protect materials from weather, and store them under cover in accordance with manufacturer's printed instructions. Store and handle tiles per manufacturer's instructions for gauged porcelain tile and gauged porcelain tile panels/slabs.
1.6 ENVIRONMENTAL REQUIREMENTS

Do not perform ceramic tile work unless the substrate and ambient temperature is at least 10 degrees C (50 degrees F) and rising. Maintain temperature above 10 degrees C (50 degrees F) while the work is being performed and for at least 7 days after completion of the work. When temporary heaters are used, ventilate the area to the outside to avoid carbon dioxide damage to new tilework.

1.7 WARRANTY

Provide manufacturer's warranty to repair or replace defective tiling materials and workmanship[, including tile, mortar and grout products and installation as a system,] for a period of [one year][[_____][years]] from date of final acceptance of the work..

1.8 EXTRA MATERIALS

Supply an extra [2][_____] percent of each type tile used in clean and marked cartons.

PART 2 PRODUCTS

2.1 TILE

**************************************************************************
NOTE: Ceramic tile with low absorption rates are easier to maintain because they are more resistant to staining. They do not readily absorb grease, food or beverage spills, or other staining agents.

Not all tiles with a wet dynamic coefficient of friction (DCOF) equal to or greater than 0.42 are appropriate for all types of level interior spaces. Designer to consider application, use, and coordinate requirements with manufacturers to determine the recommended DCOF value. Tiles with a wet DCOF AcuTest of less than 0.42, should only be installed when the surface will be kept dry when walked upon and proper safety procedures will be followed when cleaning the tiles. For level interior spaces expected to be walked on when wet, the threshold minimum wet DCOF AcuTest value is 0.42.

Gauged porcelain tile and gauged porcelain tile panel/slabs are defined by the American National Standard Specification: "Gauged" means manufactured to a thickness that is specified and largely associated with installation and use. Tile panel/slabs are those that are on one square meter in facial area or larger.

Gauged porcelain tile and gauged porcelain tile panels/slabs are not suitable for some project types. Verify application with manufacturer of this tile type. Tiles with a 3 mm 1/8 inch thickness are suitable for wall application only. Tiles with a 6 mm 1/4 inch thickness are suitable for floors, walls and counter tops.
Per TCNA Hdbk breaking strength is measured in "lbf". This specification uses "pounds" since this is how most manufacturers list the method of measurement.

Take into account expected foot traffic, building and site conditions and maintenance during selection of tile. In accordance with ANSI 137.1 the visible abrasion classifications for floors are as follows:

Class 0 - Generally used on walls. Not recommended for use on floors. This type of tile should not be exposed to wear, traffic or aggressive maintenance.

Class I - Light Residential. Tile may withstand soft-soled foot traffic as long as dirt and/or other abrasives are not present. Tile should not be used in areas with direct access to the outside or in areas with large amounts of foot traffic.

Class II - Residential. Tile may withstand soft-soled and some normal traffic with limited quantities of dirt and/or other abrasives. Tile is not recommended in areas with direct access to the outside or in areas with large amounts of foot traffic.

Class III - Heavy Residential or Light Commercial. Tile may withstand normal footwear and regular traffic with some dirt and/or other abrasives in limited quantities. Tile may be used in light commercial facilities with limited foot traffic and no direct access to the outside. Examples: residential kitchens and hallways with limited outside traffic.

Class IV - Commercial. Tile may withstand heavier amounts of traffic with more dirt and abrasives. Examples: commercial kitchens and spaces with regular outside traffic.

Class V - Heavy Commercial. Tiles may withstand constant foot traffic with larger amounts of dirt and/or other abrasives. Examples: airports, malls, and other commercial walkways subject to high volumes of foot traffic and constant traffic from the outside.

Manufacturers use the aesthetic classification to identify the variation of color, texture, and appearance within a particular line of tile. Delete this requirement if not necessary to express design intent.

The surface datum will be established for the top of the tile floors to indicate to other trades the required elevation for the top of subfloor.
Check availability of tile colors in the sizes specified before specifying color. Also, check availability of tile thickness before specifying.

Trim pieces are rarely made in the same factory as the tile and could be fabricated from other materials. Trim pieces are "coordinating trim pieces".

Per TCNA Hdbk Base/Cove Alternate installation details include square, flush and thin-lip. Provide direction for installation type.

**************************************************************************

Provide tiles that comply with ANSI A137.1 and are standard grade tiles[, the exception is glass tile. Furnish glass tiles that comply with ANSI A137.2[, the exception is gauged [porcelain tile][porcelain tile panels/slabs]. Furnish gauged [porcelain tile][porcelain tile panels/slabs] that comply with ANSI A137.3/A108.19. Provide a minimum breaking strength of 57 kg 125 lbs. for wall tile and 113 kg 250 lbs. for floor tile in accordance with ASTM C648. Provide exterior building tile for cold climate projects that is approved by the manufacturer for exterior use when tested in accordance with ASTM C1026. Provide floor tiles with a minimum wet dynamic coefficient of friction (DCOF) value of [0.42][_____] when tested in accordance with ANSI A137.1 requirements. Provide glazed floor tile with a Class [III-Heavy Residential or Light Commercial][IV-Commercial][V-Heavy Commercial][_____] classification as rated by the manufacturer when tested in accordance with ASTM C1027 for visible abrasion resistance as related to foot traffic. For materials like tile, accessories, and transition strips submit samples of sufficient size to show color range, pattern, type and joints.

Submit manufacturers' descriptive product data for [each type of] ceramic, quarry and glass tiling indicated. Include manufacturers' literature, finishes, profiles and thicknesses of materials.

Submit manufacturers' operations and maintenance data for [each type of] ceramic, quarry and glass tiling indicated in accordance with Section 01 78 23 OPERATIONS AND MAINTENANCE DATA.

2.1.1 Porcelain Tile

Provide [unglazed[ through body (surface color and pattern go all the way through the tile body)][ or ][glazed[ color body (body of tile is stained to match the glaze color)][, rectified] porcelain tile[ and [cove][bullnose] base and trim pieces]. Provide tile with a [V0][V1][V2][V3][V4] aesthetic classification. Blend tiles in factory and in a packages to have same color range and continuous blend for installation.) Provide nominal tile size(s) of [150 by 150][300 by 300][450 by 450][300 by 600] [_____] mm and [8][10][_____] mm [6 by 6][12 by 12][18 by 18][12 by 24][_____] inch and [3/8][5/16][_____] inch thick.

Provide porcelain tiling materials that contain a minimum of 10 percent recycled content. Provide data identifying percentage of recycled content for porcelain tile.

2.1.2 Gauged [Porcelain Tile][ and ][Porcelain Tile Panels/Slabs]

Provide [unglazed [through body (surface color and pattern go all the way through the tile body)]][ or ][glazed[ color body (body of tile is stained to match the glaze color)][, rectified] porcelain tile[ and [cove][bullnose] base and trim pieces]. Provide tile with a [V0][V1][V2][V3][V4] aesthetic classification. Blend tiles in factory and in a packages to have same color range and continuous blend for installation.) Provide nominal tile size(s) of [150 by 150][300 by 300][450 by 450][300 by 600] [_____] mm and [8][10][_____] mm [6 by 6][12 by 12][18 by 18][12 by 24][_____] inch and [3/8][5/16][_____] inch thick.

Provide porcelain tiling materials that contain a minimum of 10 percent recycled content. Provide data identifying percentage of recycled content for porcelain tile.
through the tile body)) [or] [glazed [color body (body of tile is stained to match the glaze color)], [rectified] gauged [porcelain tile] [porcelain tile panels/slabs] [and [cove] [bullnose] base and trim pieces]. [Provide tile with a [V0][V1][V2][V3][V4] aesthetic classification.] Blend tiles in factory and in packages to have same color range and continuous blend for installation. Provide nominal tile size(s) of [750 by 375][750 by 750][1500 by 750][1500 by 1500][3000 by 1500][_____]mm [30 by 15][30 by 30][60 by 30][60 by 60][120 by 60] [_____] inch and [3][6][_____] mm [1/8][1/4][_____] inch thick.

Provide gauged [porcelain tile] and [porcelain tile panels/slabs] materials that contain a minimum of 10 percent recycled content. Provide data identifying percentage of recycled content for gauged [porcelain tile] and [porcelain tile panels/slabs].

[2.1.3 Quarry Tile

**************************************************************************
NOTE: Specify abrasive surface quarry tile for vestibules, kitchens, walk-in refrigerators, and work spaces behind serving lanes. Consider abrasive surface quarry tile for other areas which may become slippery due to grease or soapy water spillage or for other reasons. Red quarry tile is the most economical color. If other colors are desired, they should be limited to the darker shades.
**************************************************************************

Furnish an unglazed quarry tile, [cove][bullnose] base and trim pieces. Provide tile with [smooth][abrasive] surface. Provide nominal tile size(s) of [150 by 150][_____] mm and 13 mm [6 by 6][_____] inch and 1/2 inch thick.

Provide quarry tiling materials that contain a minimum of 10 percent recycled content. Provide data identifying percentage of recycled content for quarry tile.

]2.1.4 Mosaic Tile

**************************************************************************
NOTE: Glazed porcelain and ceramic mosaic tiles are recommended for walls only.

Typically glass, stone, and metal mosaic tiles are recommended for walls only, but can be installed on the floor. Verify application with manufacturer.

Verify that glass tiles specified are made in the USA. Many of these products are made in countries that do not comply with the Buy American Act.
**************************************************************************

Furnish [unglazed][glazed], mosaic tile[, [cove][bullnose] base] and trim composed of [ceramic][porcelain][glass][stone][metal]. [Provide tile with a [V0][V1][V2][V3][V4] aesthetic classification. Blend tiles in factory and in a packages to have same color range and continuous blend for installation.] Provide [nominal tile size(s) of [25 by 25][25 by 50][50 by 50][_____] mm [1 by 1][1 by 2][2 by 2][_____] inch][a mixture of standard sizes in a stock pattern].
Provide mosaic tiling materials that contain a minimum of 3 percent recycled content. Provide data identifying percentage of recycled content for mosaic tile.

2.1.5 Large Format Glass Tile

NOTE: Verify that glass tiles specified are made in the USA. Many of these products are made in countries that do not comply with the Buy American Act.

Typically glass tiles are recommended for walls only.

Provide tile with a [V0][V1][V2][V3][V4] aesthetic classification.

Provide nominal tile size(s) of [75 by 75] [_____] mm [3 by 3] [_____] inches or greater.

NOTE: Research shows glass tile is available among US national manufacturers above the minimum recycled content shown.

Provide glass tiling materials that contain a minimum of [10][_____] percent recycled content. Provide data identifying percentage of recycled content for glass tile.

2.1.6 Glazed Ceramic Wall Tile

NOTE: Glazed wall tiles are recommended for walls only.

Provide glazed[, rectified] ceramic wall tile that has [cushioned edges][square edges] and trim with lead-free [bright][matte] finish.

Provide nominal tile size(s) of [106 by 106][106 by 150][150 by 150] mm [4-1/4 by 4-1/4][4-1/4 by 6][6 by 6] inch.

Provide glazed ceramic wall tile materials that contain a minimum of 3 percent recycled content. Provide data identifying percentage of recycled content for glazed ceramic wall tile.

2.1.7 Accessories

NOTE: Where glazed accessories are required, add the color, style, and number to the accessories table in this paragraph, unless otherwise noted.

For Navy projects add a sentence stating that color is as indicated since they provide color information in the drawings. Provide mounting heights for accessories in the drawings. Coordinate this paragraph with Section 10 28 13 TOILET ACCESSORIES.

Provide built-in type accessories of the same materials and finish as the
wall tile. Provide accessories as follows:

<table>
<thead>
<tr>
<th></th>
<th>Quantity</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recessed soap holders</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Tumbler holders</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Combination tumbler and toothbrush holders</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Towel bars, [stainless steel][ceramic] [600] [750] mm [24] [30] inch long, two towel posts</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Robe hooks</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>Roll paper holder</td>
<td>[_____]</td>
<td>[_____]</td>

<tr>
<td>Premade niche and shelf</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

2.2  **SETTING-BED**

Submit manufacturer's catalog data. Compose the setting-bed of the following materials:

2.2.1  **Aggregate for Concrete Fill**

Conform to ASTM C33/C33M for aggregate fill. Do not exceed one-half the thickness of concrete fill for maximum size of coarse aggregate.

2.2.2  **Portland Cement**

Conform to ASTM C150/C150M for cement, Type I, white for wall mortar and gray for other uses.

2.2.3  **Sand**

Conform to ASTM C144 for sand.

2.2.4  **Hydrated Lime**

Conform to ASTM C206 for hydrated lime, Type S or ASTM C207, Type S.

2.2.5  **Metal Lath**

Conform to ASTM C847 for flat expanded type metal lath, and weighing a minimum 1.4 kg/square meter 2.5 pound/square yard.
2.2.6 Reinforcing Wire Fabric

Conform to ASTM A1064/A1064M for wire fabric. Provide [50 by 50 mm2 by 2 inch mesh, 16/16 wire] [or] [38 by 50 mm1-1/2 by 2 inch mesh, 16/13 wire].

2.3 WATER

Provide potable water.

2.4 MORTAR, GROUT, AND ADHESIVE

**************************************************************************

NOTE: For projects where these products are located on the interior of the building (defined as inside of the weatherproofing system), include the bracketed sentences below requiring products with indoor air quality certifications as defined in Part 1 of this specification.

Glass Tile Installation: Designer of record to verify with the glass manufacturer the thin-set mortar color best suited for glass tile installations.

Organic Adhesive: Not all tiles are suitable for the use of organic adhesive, verify with tile manufacturer.

**************************************************************************

[Provide non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide aerosol adhesives used on the interior of the building meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of GS-36. For products located on the interior of the building (inside of the weatherproofing system, provide certification or validation of indoor air quality for adhesives.) Provide bond coat, mortar, and grout supplied from the same manufacturer.

2.4.1 Dry-Set Portland Cement Mortar

TCNA Hdbk.

2.4.2 Furan Mortar

TCNA Hdbk.

2.4.3 Latex-Portland Cement Mortar

TCNA Hdbk.

2.4.4 Ceramic Tile Grout

TCNA Hdbk; petroleum-free and plastic-free [sand-portland cement grout] [standard unsanded cement grout (dry-set grout)] [high-performance cement grout (latex-portland cement grout)] [standard cement commercial portland cement grout].
2.4.5 Organic Adhesive

TCNA Hdbk, Type I. Water-resistant. Comply with ANSI A108/A118/A136.1.

2.4.6 Epoxy Resin Grout

**************************************************************************
NOTE: Use resin grout where chemical resistance is required.
**************************************************************************

TCNA Hdbk. Water cleanable epoxy conforming to ANSI A108/A118/A136.1; provide manufacturer proportioned and packaged kit having hardener, resin and colored filler and horizontal and vertical grade products as applicable. Provide antimicrobial additive designed for prevention of mold and mildew.

2.4.7 Furan Resin Grout

TCNA Hdbk; chemical resistant furan conforming to ANSI A108/A118/A136.1; and consist of an intimate mixture of furfuryl-alcohol resin with carbon filler and catalyst. Prohibited unless specifically indicated otherwise.

2.4.8 Urethane Grout

TCNA Hdbk; premixed, urethane, water-based grout with color consistency and antimicrobial protection; no color fading, streaking or shading, chemical and stain resistant; and UV stable.

2.4.9 Sealants

Comply with applicable regulations regarding toxic and hazardous materials and as specified. Provide sealant that does not change the color or alter the appearance of the grout. Refer to Section 07 92 00 JOINT SEALANTS.

**************************************************************************
NOTE: For projects where these products are located on the interior of the building (defined as inside of the weatherproofing system), include the bracketed sentences below requiring products with indoor air quality certifications as defined in Part 1 of this specification.
**************************************************************************

[Provide sealants used on the interior of the building (defined as inside of the weatherproofing system) meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. For products located on the interior of the building (inside of the weatherproofing system), provide certification or validation of indoor air quality for sealants.]

2.5 SUBSTRATES

[Refer to Section 09 29 00 GYPSUM BOARD][ for cementitious backer units][ and ][glass-mat water-resistant backing board].
[2.5.1 Cementitious Backer Units]

Provide cementitious backer unit, for use as tile substrate as indicated, in accordance with TCNA Hdbk. Furnish [13][16] mm [1/2][5/8] inch thick cementitious backer units.

[2.5.2 Glass-Mat Gypsum Water-Resistant Backing Board]

Provide glass-mat water-resistant backing board, for use as tile substrate as indicated, in accordance with ASTM C1178/C1178M. Provide [13][16] mm [1/2][5/8] inch thick glass-mat water-resistant backing board.

[2.6 MISCELLANEOUS TRIMS]

NOTE: Provide transition strips where the top of tile floors will occur at a different elevation from the top of finished floors in adjoining spaces and to transition between different flooring materials.

Metal and vinyl cove-shaped trim profiles can be used for floor and wall transitions in lieu of cove tile base. Metal edge protection trims and other tile transition trim profiles are available to protect and conceal tile edges.

[2.6.1 Transition Strips]

Provide [[clear][_____] anodized aluminum transitions between tile and carpet or resilient flooring. Provide types as recommended by flooring manufacturer for both edges and transitions of flooring materials specified][marble transitions appropriate for conditions]. Categorize marble Group A as classified by MIA Design Manual. Provide a fine sand-rubbed finish marble, [white][pink][gray][beige] in color. Provide [minimum 12.0 marble abrasion when tested in accordance with ASTM C241/C241M][solid surfacing material transitions appropriate for conditions. Refer to Section 06 61 16 SOLID SURFACING FABRICATIONS.] Provide transition strips that comply with 36 CFR 1191 requirements.

[2.6.2 Metal Strips]

Provide [Cove][,][Angle][,][and][L-shape][,] [_____] trim shapes, height to match tile and setting thickness, designed specifically for flooring, and wall applications. [Provide [extruded, [clear] [_____] anodized aluminum][stainless steel][rigid-vinyl] cove strip where floor tile abuts wall tile for sanitary transition and elimination of cove tile base.] [Provide extruded [radiusied][square][_____,] [[clear][_____] anodized aluminum][stainless steel] edging at tile surfaces with exposed outside [and inside] corners.] [Provide profiles appropriate for finished floor and wall materials as indicated.]
2.7  WATERPROOF MEMBRANE

2.7.1  General

Manufacturer's standard product that complies with ANSI A108/A118/A136.1 and is recommended by the manufacturer for the application indicated. Include reinforcement and accessories recommended by manufacturer.

2.7.2  Chlorinated-Polyethylene Shower Waterproof Membrane

Nonplasticized, chlorinated polyethylene faced on both sides with nonwoven polyester fabric; [1][_____] mm [0.040][_____] inch nominal thickness.

2.8  CRACK ISOLATION MEMBRANE

2.8.1  General

Manufacturer's standard product that complies with ANSI A108/A118/A136.1 and is recommended by the manufacturer for the application indicated. Include reinforcement and accessories recommended by manufacturer.

2.8.2  Chlorinated-Polyethylene Crack Isolation Membrane

Nonplasticized, chlorinated polyethylene faced on both sides with nonwoven polyester fabric; [0.75][_____] mm [0.030][_____] inch nominal thickness.

2.9  COLOR, TEXTURE, AND PATTERN

**************************************************************************
NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an Architect or Interior designer. Color should be selected from manufacturer's standard colors or identified in this specification only when the project has minimal finishes.

When the government directs that color be located in the drawings add a note that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

When more than one type, pattern or color is specified identify location and extent of work for each.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

NOTE: Drawings are required for projects with floor patterns.
**************************************************************************
Provide color, pattern and texture [as specified in Section 09 06 00 SCHEDULES FOR FINISHES.][as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers.].

PART 3 EXECUTION

3.1 PREPARATORY WORK AND WORKMANSHIP

**************************************************************************

NOTE: When using the dry-set method to install tile on concrete or masonry surfaces, coordinate Section 03 30 00 CAST-IN-PLACE CONCRETE and Section 04 20 00 UNIT MASONRY, as applicable, to require (1) steel trowel and fine broom-finished concrete floors free of curing compounds and waxes, (2) masonry surfaces that are level and plumb with struck joints and square openings.

**************************************************************************

Inspect surface to receive tile in conformance to the requirements of TCNA Hdbk for surface conditions for the type setting bed specified and for workmanship. Provide variations of tiled surfaces that fall within maximum values shown below:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>WALLS</th>

</table>

3.2 GENERAL INSTALLATION REQUIREMENTS

Do not start tile work until roughing in for mechanical and electrical work has been completed and tested, and built-in items requiring membrane waterproofing have been installed and tested. Close space, in which tile is being set, to traffic and other work. Keep closed until tile is firmly set. Do not start floor tile installation in spaces requiring wall tile until after wall tile has been installed. Apply tile in colors and patterns indicated in the area shown on the drawings. Install tile with the respective surfaces in true even planes to the elevations and grades shown. Provide special shapes as required for sills, jambs, recesses, offsets, external corners, and other conditions to provide a complete and neatly finished installation. Solidly back tile bases and coves with mortar. Do not walk or work on newly tiled floors without using kneeling boards or equivalent protection of the tiled surface. Keep traffic off horizontal portland cement mortar installations for at least 72 hours. Keep all traffic off epoxy installed floors for at least 40 hours after grouting, and heavy traffic off for at least 7 days, unless otherwise specifically authorized by manufacturer. Dimension and draw detail drawings at a minimum scale of 1:50 1/4 inch = 1 foot. Include drawings of pattern at inside corners, outside corners, termination points and location of all equipment items such as thermostats, switch plates, mirrors and toilet...
accessories mounted on surface. Submit drawings showing ceramic tile pattern [elevations] and [floor plans]. Submit manufacturer's preprinted installation instructions.

Do not install building construction materials that show visual evidence of biological growth.

3.3 INSTALLATION OF SUBSTRATES

3.3.1 [Cementitious Backer Units] [and] [Glass-Mat Water-Resistant Backing Board]

Install [as specified in Section 09 29 00 GYPSUM BOARD.][in accordance with manufacturer's written instructions.]

3.4 INSTALLATION OF WALL TILE

**************************************************************************
NOTE: See current TCNA Hdbk for detailed guidance. Specify project-specific TCNA Hdbk numbers for each type of wall tile installation method. Edit text accordingly.

General guidance for wall tile installation methods as follows:

Specify TCNA Hdbk B-series methods for interior wet areas, including shower stalls, over wood or metal studs with glass-mat water-resistant backing board substrate or with cementitious backer unit substrate.

Specify TCNA Hdbk EJ-series methods for movement (i.e. construction, contraction, expansion, isolation or perimeter) joints.

Specify TCNA Hdbk W-series methods for interior and exterior walls, including masonry or concrete substrates, and wood or metal studs with glass-mat water-resistant backing board substrate.

Specify TCNA Hdbk TR-series methods for renovation applications over existing substrates.
**************************************************************************

Install wall tile in accordance with the TCNA Hdbk, method [_____] and with grout joints [[as recommended by the manufacturer for the type of tile][of [_____] mm][of [_____] inch]. [Install thinner wall tile flush with thicker wall tile applied on same wall and provide installation materials as recommended by the tile and setting materials manufacturer's to achieve flush installation.]]

3.4.1 Installation of Gauged [Porcelain Tile][Porcelain Tile Panels/Slabs]

Install gauged [porcelain tile][porcelain tile panels/slabs] in accordance with TCNA Hdbk method [_____] and ANSI A137.3/A108.19 for thin-bed method bonded with modified dry-set cement mortar over improved modified dry-set cement mortar.
3.4.2 Workable or Cured Mortar Bed

Install tile over workable mortar bed or a cured mortar bed at the option of the Contractor. Install a 0.102 mm 4 mil polyethylene membrane, metal lath, and scratch coat. Conform to TCNA Hdbk method [_____] for workable mortar bed, materials, and installation of tile. Conform to TCNA Hdbk method [_____] for cured mortar bed and materials.

3.4.3 Dry-Set Mortar and Latex-Portland Cement Mortar

Use [dry-set] [or] [latex-portland cement] to install tile in accordance with TCNA Hdbk method [_____]. Use latex-portland cement when installing porcelain ceramic tile.

3.4.4 Organic Adhesive

Comply with the requirements of TCNA Hdbk method [_____] for organic adhesive installation of ceramic tile.

3.4.5 Furan Mortar and Grout

Comply with the requirements of TCNA Hdbk method [_____] for furan mortar and grout installation.

3.4.6 Ceramic Tile Grout

Prepare and install ceramic tile grout in accordance with TCNA Hdbk method [_____]. [Provide and apply manufacturer's standard [_____] product for sealing grout joints in accordance with manufacturer's recommendations.]

3.4.7 Epoxy Resin Grout

Prepare and install epoxy resin grout in accordance with TCNA Hdbk method [_____].

3.4.8 Urethane Grout

Prepare and install urethane grout in accordance with TCNA Hdbk method [_____].

3.5 INSTALLATION OF FLOOR TILE

**************************************************************************

NOTE: See current TCNA Hdbk for detailed guidance.

Specify project-specific TCNA Hdbk numbers for each type of floor tile installation method. Edit text accordingly.

General guidance for floor tile installation methods as follows:

Specify TCNA Hdbk B-series methods for interior shower receptors.

Specify TCNA Hdbk EJ-series methods for movement (i.e. construction, contraction, expansion, isolation or perimeter) joints.

Specify TCNA Hdbk F-series methods for interior and
exterior floors, including concrete substrates (above-ground and on-ground), and interior floors over wood substrates.

Specify TCNA Hdbk TR-series methods for renovation applications over existing substrates.
******
Install floor tile in accordance with TCNA Hdbk method [specified herein] [_____] and with grout joints [as recommended by the manufacturer for the type of tile] [of [_____] mm] [of [_____] inch]. Install shower receptors in accordance with TCNA Hdbk method [B414] [B415] [_____].

3.5.1 Installation of Gauged [Porcelain Tile][Porcelain Tile Panels/Slabs]
Install gauged [porcelain tile][porcelain tile panels/slabs] in accordance with TCNA Hdbk method [_____] and ANSI A137.3/A108.19 for thin-bed method bonded with modified dry-set cement mortar over improved modified dry-set cement mortar.

3.5.2 Workable or Cured Mortar Bed
Install floor tile over a workable mortar bed or a cured mortar bed at the option of the Contractor. Conform to TCNA Hdbk method [_____] for workable mortar bed materials and installation. Conform to TCNA Hdbk method [_____] for cured mortar bed materials and installation. Provide minimum 6 mm 1/4 inch to maximum 10 mm 3/8 inch joints in uniformed width.

3.5.3 Dry-Set and Latex-Portland Cement
Use [dry-set] [or] [latex-portland cement] mortar to install tile directly over properly cured, plane, clean concrete slabs in accordance with TCNA Hdbk method [_____]. Use latex-portland cement when installing porcelain ceramic tile.

3.5.4 Resinous Grout
NOTE: Use resin grout where chemical resistance is required. For quarry tile subject to severe chemical exposure conditions, use Section 09 35 16 CHEMICAL-RESISTANT QUARRY TILING.

Ensure the areas to receive resin grout are clearly indicated on the drawings or defined in the specifications. Due to the higher cost of this grout, its use will generally be limited to areas such as:

a. Within the areas bounded by a line 610 mm 2 feet outside of the trough areas for ranges, kettles, and ovens.

b. Within the areas of pot washing and dish washing. In small kitchens where it may be impracticable to subdivide areas for grouting, resin grout method F114 or F133 may be used throughout.

For severe chemical exposure such as meat packing
plants and photo labs, resin grout method F134 will be used throughout and a resin setting-bed will be required. Wherever resin setting-bed is used, the concrete slab will be steel-troweled finished to the final slope of the finished floor. Set tile in a 3 mm 1/8 inch thick layer of epoxy-or furan-resin mortar. When using furan resins, the concrete slab will be neutralized or painted in accordance with the resin manufacturer's directions.

When resinous grout is indicated, grout quarry tile with either furan grout conforming to ANSI A108/A118/A136.1 or epoxy resin grout conforming to ANSI A108/A118/A136.1. Rake and clean joints to the full depth of the tile and neutralize when recommended by the resin manufacturer. Install epoxy resin grout in conformance with TCNA Hdbk method [____]. Install resin grout in accordance with manufacturer's printed installation instructions. Provide a coating of wax applied from the manufacturer on all tile installed with furan resin. Follow manufacturer's printed installation instructions of installed resin grout for proportioning, mixing, installing, and curing. Maintain the recommended temperature in the area and on the surface to be grouted. Protect finished grout of grout stain.

3.5.5 Ceramic Tile Grout

Prepare and install ceramic tile grout in accordance with TCNA Hdbk method [____]. Provide and apply manufacturer's standard [____] product for sealing grout joints in accordance with manufacturer's recommendations.

3.5.6 Waterproof and Crack Isolation Membranes

Install as indicated in accordance with manufacturer's written instructions.

3.5.7 Concrete Fill

NOTE: Select the first sentence in areas to receive conductive ceramic tile.

Provide a 24.1 MPa 3500 psi concrete fill mix to dry as consistency as practicable. [Compose concrete fill by volume of 1 part Portland cement to 3 parts fine aggregate to 4 parts coarse aggregate, and mix with water to as dry a consistency as practicable.] Spread, tamp, and screed concrete fill to a true plane, and pitch to drains or levels as shown. Thoroughly damp concrete fill before applying setting-bed material. Reinforce concrete fill with one layer of reinforcement, with the uncut edges lapped the width of one mesh and the cut ends and edges lapped a minimum 51 mm 2 inch. Tie laps together with 1.02 mm 18 gauge wire every 254 mm 10 inch along the finished edges and every 152 mm 6 inch along the cut ends and edges. Provide reinforcement with support and secure in the centers of concrete fills. Provide a continuous mesh; except where expansion joints occur, cut mesh and discontinue across such joints. Provide reinforced concrete fill under the setting-bed where the distance between the under-floor surface and the finished tiles floor surface is a minimum of 51 mm 2 inches, and of the same thickness that the mortar setting-bed over the concrete fill with the thickness required in the specified TCNA Hdbk method [____].
3.6 INSTALLATION OF MISCELLANEOUS TRIMS

**************************************************************************
NOTE: Where the top of tile floors will occur at a
different elevation from the top of finished floors
in adjoining spaces, provision for marble, or other
hard surface thresholds or saddles will be edited
appropriately.
**************************************************************************

3.6.1 Transition Strips

Install transition strips where indicated, in a manner similar to that of
the ceramic tile floor and as recommended by the manufacturer. Provide
thresholds full width of the opening. Install head joints at ends not
exceeding 6 mm 1/4 inch in width and grouted full.

3.6.2 Metal Trims

Install trim where indicated. Embed anchoring leg in setting mortar in
accordance with manufacturer's instructions. During grouting of tile
joints, immediately wipe grout from finish surface.

3.7 EXPANSION JOINTS

**************************************************************************
Note: Indicate expansion-joint details on the
drawings. Location of expansion joints should,
insofar as practical, be located outside the areas
of tile finishes.
**************************************************************************

Form and seal joints as specified in Section 07 92 00 JOINT SEALANTS.

3.7.1 Walls

Provide expansion joints at control joints in backing material. Wherever
backing material changes, install an expansion joint to separate the
different materials.

3.7.2 Floors

Provide expansion joints over construction joints, control joints, and
expansion joints in concrete slabs in accordance with TCNA Hdbk method
[_____] EJ171 type to suit conditions. Provide expansion joints where tile
abuts restraining surfaces such as perimeter walls, curbs and columns and
at intervals of 6.1 to 7.6 m 20 to 25 feet each way in large interior floor
areas[.] and 2.4 to 3.7 m 8 to 12 feet each way in large exterior areas or
areas exposed to direct sunlight or moisture.] Extend expansion joints
through setting-beds and fill.

3.8 CLEANING AND PROTECTING

Upon completion, thoroughly clean tile surfaces in accordance with
manufacturer's approved cleaning instructions. Do not use acid for
cleaning glazed tile. Clean floor tile with resinous grout or with factory
mixed grout in accordance with printed instructions of the grout
manufacturer. After the grout has set, provide a protective coat of a
noncorrosive soap or other approved method of protection for tile wall
surfaces. Cover tiled floor areas with building paper before foot traffic is permitted over the finished tile floors. Provide board walkways on tiled floors that are to be continuously used as passageways by workmen. Replace damaged or defective tiles.

3.4   PROTECTION
NOTE: This guide specification covers the requirements for quarry tile with chemical resistant grout and setting bed for use in medium to large dining facilities and other areas subject to spillage of acids or other chemicals.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

**PART 1 GENERAL**

**NOTE:** On the drawings, show:

1. Rooms, areas, or spaces to have chemical-resistant quarry tile floors including under ranges, kettles, and ovens and areas 600 mm 2 feet beyond such items, as well as 600 mm 2 feet outside trough areas; within dish-and pot-washing areas, food-preparation areas, serving areas, and garbage rooms. If quarry tile with conventional mortar and grout is also included in the project, areas for each type must be clearly indicated.
2. Depressed concrete slabs, 16 mm for 13 mm 5/8 inch for 1/2 inch tile and 22 mm for 19 mm 7/8 inch for 3/4 inch tile so that tile surfaces will align with adjacent finish materials. See detail F 131-15 or F 133-15 in Tile Council of America Inc. Handbook for Ceramic Tile Installation for recommended details.

3. Slope of floors to drain.

4. Treatment at expansion joints in tiled floors.

5. Thresholds at doorways.

6. Details at floor sinks, floor drains, intersections with walls, equipment bases, and trough areas.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Quarry Tile; G[, [_____]]
Recycled Content for Chemical-Resistant Quarry Tile; S
Grout; G[, [_____]]
Indoor Air Quality for Mortar and Grout; S

SD-04 Samples

Quarry Tile; G[, [_____]]
Grout; G[, [_____]]

SD-06 Test Reports

Grout; G[, [_____]]

SD-08 Manufacturer's Instructions

Quarry Tile
Grout; G[, [_____]]

1.3 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the site in manufacturers' original unbroken packages or containers plainly labeled with manufacturers' names and brands. Grade mark tile containers. Store materials in dry locations. Handle materials in a manner that will prevent inclusion of foreign materials and damage by water, dampness, or temperature extremes. Store materials in area in which they will be used at temperatures not lower than 16 degrees C 60 degrees F at least 24 hours before use.

1.4 ENVIRONMENTAL REQUIREMENTS

Do not start tile work unless ambient temperature of work area is at least 16 degrees C 60 degrees F and rising, and slab temperature is not less than 16 degrees C 60 degrees F. Maintain room and slab at these minimum temperatures without interruption while work is in progress and for at least 3 days after completion of work.

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials conforming to the standards, specifications, and other requirements listed below:
2.1.1 Quarry Tile

NOTE: Check availability of tile colors in the sizes specified before specifying color. Also, check availability of tile thickness before specifying.

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is available from US national manufacturers above the minimum recycled content percentages shown below. Some manufacturers and regions have higher percentages. Based on research, insert desired minimum percentages into the empty set of brackets.

TCNA Hdbk, standard grade, [_____] by [_____] [150 by 150 mm] [6 by 6 inches] by [minimum 13 mm 1/2 inch] [_____] thick, color [indicated] [selected by the Contracting Officer from the manufacturer's standard color samples.] [Minimum thickness in Garbage Room must be 30 by 200 by 200 mm 1-1/4 by 8 by 8 inches.] Quarry tile must have flat or serrated back. Chemical-Resistant Quarry Tiling Materials must contain a minimum of [3][10][_____] percent recycled content. Provide data identifying percentage of recycled content for chemical-resistant quarry tile.

2.1.1.1 Slip-Resistant Quarry Tile

NOTE: Slip-resistant quarry tile should be specified for areas where food and water spillage cause the floors to be slippery and hazardous (e.g., dishwashing areas, sculleries, food-preparation areas).

Provide quarry tile for floors [of [_____] that contain an abrasive aggregate uniformly embedded into face surface of tile. Abrasive aggregate must be fused aluminum oxide or other rustproof aggregate of comparable hardness having a grain size smaller than 1.18 mm 16 mesh and larger than 150 micrometers 100 mesh (US Standard Sieve Sizes). Tile provided must contain grains in the surface between 50 percent and 150 percent, on the average by count, and as much aggregate as the approved samples.

2.1.1.2 Quarry Tile Trim Units

TCNA Hdbk standard grade. Provide cove base around perimeter of floors and at vertical projections through floors. Provide bullnose trim around depressions in floors. Provide rounded internal and external corners with 13 mm 1/2 inch minimum radius using appropriate matching corner units.
2.1.2 Chemical-Resistant Mortar and Grout

**************************************************************************
NOTE: Insert other items or areas subject to heat beyond 54 degrees C 130 degrees F.

If a project design includes use of mortar and grout products on the building interior (inside the weatherproofing system), include the bracketed paragraph requiring products with low emissions or VOC content properties.
**************************************************************************

Provide chemical-resistant grout for quarry tile floors [in [____]]. Provide a compatible system of setting bed and joint material from a single source. In addition to the chemical resistance and physical properties specified, conform mortar and grout to the following:

[Provide mortar and grout products used on the interior of the building (defined as inside of the weatherproofing system) meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for mortar and grout from certification body.]

2.1.2.1 Furan Mortar

ASTM C395. Either two-component or three-component is acceptable.

2.1.2.2 Furan Grout

ASTM C658.

2.1.2.3 Epoxy

ASTM C395 for setting tile grouted with furan.

2.1.2.4 Epoxy Mortar and Grout

TCNA Hdbk.

2.2 FACTORY TESTS

2.2.1 Chemical Resistance

**************************************************************************
NOTE: The chemicals and strengths are those considered necessary for use in food preparation and serving areas of medium to large dining facilities. For other types of projects modify the list of chemicals to reflect the exposure likely to be encountered.
**************************************************************************

Test mortar and grout in accordance with ASTM C267 except as modified herein. Immerse test specimens in the test solutions for 28 days, and maintain solutions continuously at 79 degrees C 175 degrees F for furan and 60 degrees C 140 degrees F for epoxy. The test specimens must not change.
in weight more than 5 percent after immersion, or exhibit a compressive strength of less than 90 percent of the compressive strength of specimens that have aged in air at 21 to 26 degrees C 70 to 80 degrees F during conditioning period. Test for chemical resistance to the following solutions:

a. Acetic acid, 5 percent
b. Citric acid, 5 percent
c. Lactic acid, 5 percent
d. Sodium hypochlorite, 5 percent
e. Trisodium phosphate, 5 percent
f. Household ammonia (test at room temperature)
g. Sugar, saturated solution
h. Vegetable oil

2.2.2 Physical Properties

After curing for 7 days at 21 to 26 degrees C 70 to 80 degrees F, the mortar must:

a. have a water absorption of not more than 0.5 percent when tested in accordance with ASTM C413;
b. have a hardness of not less than 90 percent of its initial hardness immediately before exposure, when tested after being exposed for 6 hours at 54 degrees C 130 degrees F for epoxy resin mortar and 93 degrees C 200 degrees F for furan resin mortar. Conduct hardness tests on 10 by 19 mm 3/8 by 3/4 inch samples with a Barcol Hardness Tester, within 30 seconds after the samples are removed from the oven.

PART 3 EXECUTION

3.1 PREPARATION

Do not start tile work until rough-in for plumbing, heating, ventilating, air conditioning, and electrical work has been completed and tested [and membrane waterproofing has been installed and tested]. Protect the work of other trades in area where tile work is to be done.

3.1.1 Preparation of Tile

**************************************************************************

NOTE: According to manufacturers, the prefinished wax surface is no longer available. Factory-coated units should be specified, if available, when experience indicates that application of wax in the field is unsatisfactory. Used as a protector for epoxy or furan grout – verify with the tile manufacturer if this is available. Once grouting is complete, wax should be steamed off and removed.

When factory coated units are not selected, add
language to require the application of a sealer and grout release agent per manufacturer's recommendations.

[Factory coat] [Coat] with hot paraffin wax to produce a thin continuous film on the face surfaces only of quarry tile units to be installed and grouted with furan. Apply wax in such manner that it will not get on edges or backs of tile. Handle tile in a manner that will prevent waxed surfaces of units from touching the backs or edges of other units. Remove from the job tile with wax on edges or backs. Verify that wax used is acceptable to grout manufacturer. With flatback or serrated back tile use 6 mm 1/4 inch square notched trowel with notches on 13 mm 1/2 inch centers.

3.1.2 Preparation of Concrete Floors for Setting Beds

NOTE: Where tile is to be installed, concrete slabs should not have air entrainment or other additives in the mix, nor sealers or curing compounds applied without specific approval of mortar and grout manufacturer. Slabs should have steel trowel and fine broom finish and be free of laitance. In case of any question on condition of slab, it should be tested for bondability with a Dillon Dynamometer and show a tensile bond of not less than 2068 kPa 300 psi. These requirements should be incorporated in Section 03 30 00 CAST-IN-PLACE CONCRETE.

Before tile is applied, test structural floor for levelness or uniformity of slope by water. Fill, level, and retest areas as required to meet tolerances specified in TCNA Hdbk and retest. When specified levelness or uniformity of slope is obtained, prepare floors for setting bed in accordance with TCNA Hdbk. Free floors of sealers, coatings, oil, dirt, and dust. Prepare floors before application of resin mortar in accordance with printed instructions and recommendations of the mortar manufacturer.

3.2 INSTALLATION

Except where specified otherwise herein, apply materials in accordance with manufacturer's printed instructions, including recommended safety requirements.

3.2.1 Setting Bed

Using a plain (not serrated) trowel, apply a continuous setting bed of chemical-resistant mortar, not less than 3 mm 1/8 inch thick. Apply only over a floor area that can be tiled during "open time" of mortar. Place tile into setting bed and tap lightly to a true plane. Level tile as it is placed. Maintain uniform tile joints of 6 mm 1/4 inch minimum and 10 mm 3/8 inch maximum width. Allow the setting bed to cure sufficiently to anchor tile in place, but not less than 24 hours, at a floor temperature of not less than 16 degrees C 60 degrees F. When furan setting bed is used, first install a glass reinforced asphalt membrane. With flatback or serrated back tile use trowel with 6 mm 1/4 inch square notches on 13 mm 1/2 inch centers.
3.2.2  Tile Joints

After the setting bed has cured, fill tile joints with chemical-resistant grout. Spread grout on surface of tile and work it into the open joints with a trowel. Fill joints flush with top surfaces of tile. Remove excess grout with one pass of a trowel or squeegee pulled diagonally across joints in order to prevent imperfect filling and low joints. Immediately fill voids, pinholes, and depressions with additional grout. Protect completed joints from dampness. Permit grout to harden for not less than 72 hours. Flush cure joints with tile edges; contour depression must not exceed $1.2 \text{ mm for 6 mm 3/64 inch for 1/4 inch wide joints or 2 mm for 10 mm 1/16 inch for 3/8 inch wide joints}$. Sealants for expansion joints provided by the grout manufacturer must be compatible with grout and setting mortars. Completely fill joints with no back up foam or rope. Install joints maximum $6000 \text{ mm 20 feet}$ on center above slab around room peripheries and columns but not at drains.

3.2.3  Tile Installation

Install and grout tile with water cleanable tile setting and grouting epoxy in accordance with TCNA Hdbk.

3.3  CLEANING

After grout has hardened, scrub and wash tile surfaces with steam or hot water to melt wax coating and remove excess grout. Remove remnants of grout with wide-bladed paint scraper or other tool that will not damage tile. Rinse tile with clean warm water applied with a flat sponge. Remove excess water from floor, and leave floor dry when work is completed. Remove tile from which surface grout cannot be removed without damage to tile. Remove damaged tile and provide new tile.

3.4  PROTECTION

Cover finished tile floors with clean building paper before permitting foot traffic on them. Place board walkways on floors that are to be continuously used as passageways by workmen.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for conventional and impact/abrasion resistant acoustical ceiling tile and panels, unit acoustical absorbers, hangers, and suspension system grid for installation in commercial-type work.

Adhere to UFC_1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
a. Location of acoustical systems. Arrangement of acoustical units, panels, light fixtures, and diffusers, other penetrations and exposed suspension grids.

b. Location of systems required to have ceiling attenuation class (CAC).

c. Location of continuous or common acoustical ceilings that span or cover more than one room, so adequate detailing can be addressed on the drawings to coordinate requirements between CAC and STC ratings.

d. Location and details of system required to have a fire resistive rating.

e. Location and details and material of fire stops above suspended ceilings.

f. Location and details of access panels and maximum spacing of suspension members for concealed grid suspension systems.

g. Location of each different color and pattern when more than one type acoustical unit is specified for a project. Details of special or patterned panels if necessary to describe adequately. If more than one system is used, key to locations by using symbols.

h. Where acoustical ceilings are provided in conjunction with thermal insulation beneath vented attic spaces, careful attention should be given to furnishing the appropriate type ceiling tile, adequate details on the contract drawings, and to including appropriate sections in the specifications. Details on the drawings will cover such features as support of insulation at flush-mounted light fixtures, conduit, acoustical units, suspension system components, heating and air-conditioning units, and other utilities. Installation of insulation over the suspension systems, light fixtures, and other ceiling penetrations will be coordinated with Sections 06 10 00 ROUGH CARPENTRY and 07 21 13 BOARD AND BLOCK INSULATION, and manufacturer’s literature.

SCAQMD Rule 1168 (2017) Adhesive and Sealant Applications
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality Certifications

1.3.1.1 Ceiling Tiles

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party programs that products meet the requirements of this section. Provide current product certification documentation from certification body.

1.3.1.2 Adhesives and Sealants

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party programs that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited in this Section.

1.4 DELIVERY, STORAGE. AND HANDLING

Deliver materials to the site in the manufacturer's original unopened containers with brand name and type clearly marked. Carefully handle and store materials in dry, watertight enclosures. Immediately before installation, store acoustical units for not less than 24 hours at the same temperature and relative humidity as the space where they will be installed in order to assure proper temperature and moisture acclimation.

1.5 ENVIRONMENTAL REQUIREMENTS

Maintain a uniform temperature of not less than 16 degrees C 60 degrees F nor more than 29 degrees C 85 degrees F and a relative humidity of not more than 70 percent for 24 hours before, during, and 24 hours after installation of acoustical units.

1.6 SCHEDULING

Complete and dry interior finish work such as plastering, concrete and terrazzo work before ceiling installation. Complete mechanical, electrical, and other work above the ceiling line; install and start operating heating, ventilating, and air conditioning systems in order to maintain temperature and humidity requirements.

1.7 WARRANTY

Provide manufacturer's warranty to repair or replace defective materials and workmanship including but not limited to, sagging and warping of panels and rusting and of grid systems, for a period of [ten years][_____] [years] from date of final acceptance of the work.

1.8 EXTRA MATERIALS

*************************************************************************
NOTE: In order to assure matching acoustical units that may become damaged and require spot replacement, a supply of extra ten percent of units
*************************************************************************
in the original pattern is recommended in order to prevent later replacement of the ceiling in an entire room because of mismatched units. However, the Government facility should be consulted to ensure that adequate warehousing and protection is available for these extra units.

Furnish spare tiles, from the same lot as those installed, of each color at the rate of [_____] [5] tiles for each 1000 tiles installed.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

NOTE: When reflected ceiling plans showing ceiling penetrations are included in the project drawings, it may not be necessary for the Contractor to re-draw and submit as a shop drawing; in such cases, delete the requirement from SD-02. Details not applicable to the project should also be deleted. On simple projects where manufacturer's standard printed data are sufficient, omit this submittal category from SD-03.

Where many different ceiling systems are used, it may be more convenient to schedule acoustical performance ratings, fire ratings, panel and suspension types on the drawings, keyed to finish schedules, rather than to include this data in the specification.

Provide sound controlling units mechanically mounted on a ceiling suspension system for acoustical treatment. Provide the unit size, texture, finish, and color as specified. [The Contractor has the option to substitute inch-pound (I-P) Recessed Light Fixtures (RLF) for metric RLF. If the Contractor opts to provide I-P RLF, then provide I-P products for other ceiling elements like acoustical ceiling tiles, air diffusers, air registers and grills.] Coordinate the entire ceiling system with other details, like the location of access panels and ceiling penetrations, for instance, shown on the drawings. Submit drawings showing the location, extent and details of acoustical treatment including suspension system, method of anchoring and fastening, and reflected ceiling plan. [Coordinate with paragraph RECLAMATION PROCEDURES for reclamation of mineral fiber acoustical ceiling panels to be removed from the job site.]

2.1.1 Fire Resistive Ceilings

NOTE: Certified laboratory test reports for fire resistance rating cannot be obtained for ceiling assemblies which are nonstandard with the manufacturer. Therefore, where a fire resistance rating is necessary, do not specify a nonstandard ceiling assembly. Refer to data in the UL Fire Resistance Directory for details.

For Navy projects, delete this paragraph when fire
separation is not required by UFC 3-600-01, Fire Protection Engineering for Facilities. Where required, rating applies to total floor-ceiling or roof-ceiling assembly, including mechanical-electrical elements, penetrations, structural system, and deck. If system is required to be fire-endurance rated, show details of recessed fixture enclosures and other penetrations on drawings.

**************************************************************************

Rate *acoustical ceiling systems*, indicated as fire resistant, for fire endurance as specified when tested in accordance with ASTM E119. Test suspended ceiling with a specimen [roof][floor] assembly representative of the indicated construction, including mechanical and electrical work within ceiling space openings for light fixtures, and air outlets, and access panels. Provide ceiling assembly rating for [[1][1-1/2][2][3][4] hour [concealed grid system][exposed grid system]][as shown on drawings]. Provide acoustical units with a flame spread of 25 or less and smoke development of 50 or less when tested in accordance with ASTM E84.

Submit manufacturer's catalog showing UL classification of fire-rated ceilings giving materials, construction details, types of floor and roof constructions to be protected, and UL design number and fire protection time rating for each required floor or roof construction and acoustic ceiling assembly.

Submit reports by an independent testing laboratory attesting that acoustical ceiling systems meet specified [fire endurance] [and] [sound transmission] requirements. Data attesting to conformance of the proposed system to Underwriters Laboratories requirements for the fire endurance rating listed in UL Fire Resistance may be submitted in lieu of test reports.

2.1.2 *Acoustical Performance*

2.1.2.1 Ceiling Sound Transmission

**************************************************************************

**NOTE:** In open spaces without partitions and areas where enclosed rooms have partitions that extend full height to the floor or roof above, Ceiling Attenuation Class (CAC) is not applicable and should not be specified unless required by an acoustician. Where enclosed rooms do not have full-height partitions, the sound transmission path through the plenum could prevent acoustical privacy between rooms. Ensure the CAC rating of the acoustical ceiling system, including all building services components, is equivalent to the STC rating of the partitions. It is ineffective for the acoustical ceiling to have a CAC rating that is lower or higher than the STC rating of the partition. Penetrations through the acoustical ceiling for light fixtures, air terminals, etc. can decrease the CAC rating of the ceiling system below that of the ceiling panel by 10 points. Verify that other specification sections and the drawings include appropriate noise
control measures such as light fixture covers, a ducted return air system, return air grille silencers, etc. so the penetrations do not degrade the CAC rating below the STC rating of the partition. Speech privacy between rooms typically requires partitions with STC ratings of 40–50. Limited acoustical ceiling panels can achieve CAC rating above 40 and these panels often do not comply with the specified sound absorption ratings. Lightweight, acoustic, plenum barriers oriented vertically over the partitions can increase the CAC rating of the acoustical ceiling system from CAC 20–35 to CAC 40–50 so that it matches the acoustical performance of the partition. Expected speech privacy levels with specific constructions: STC/CAC 40 minimal; STC/CAC 45 – acceptable; STC/CAC 50 – optimal. Speech privacy should not be expected for construction below STC/CAC 40. Some highly confidential rooms may require full height walls with STC ratings above 50.

**************************************************************************

Provide ceiling systems with the specified Ceiling Attenuation Class (CAC) ratings as determined in accordance with ASTM E1414/E1414M and ASTM E413. Provide sound attenuators over light fixtures, air terminals and other ceiling penetrations, provide acoustical blanket insulation on top of the ceiling or adjacent to partitions to provide lightweight acoustical plenum barriers above partitions as required to achieve the specified CAC ratings. Provide test ceiling continuous at the partition and assembled in the suspension system in the same manner that the ceiling will be installed on the project.

2.1.2.2 Ceiling Sound Absorption

**************************************************************************

NOTE: Ceiling panel sound absorption can be specified using Noise Reduction Coefficient (NRC) or Attenuation Class (AC). NRC is more common and used when the concern is general reverberation, loud occupant noise levels or speech intelligibility inside enclosed rooms. AC is sometimes used instead of NRC when the concern is speech privacy in mostly open areas, particularly open offices. The two metrics are highly correlated.

Ceilings in rooms and areas that are normally occupied by people should have a minimum NRC of 0.70. This level of absorption is appropriate for enclosed rooms with one person and no (or limited) noisy equipment. Ceilings in enclosed rooms with multiple people or with noisy equipment should have a minimum NRC of 0.80. Ceilings in open areas, especially those with high density occupancy should have a minimum NRC of 0.90 (or AC of 180).

**************************************************************************

Determine the Noise Reduction Coefficient (NRC) in accordance with ASTM C423. Determine Articulation Class (AC) in accordance with ASTM E1111/E1111M.
2.1.3 Light Reflectance

Determine light reflectance factor in accordance with ASTM E1477 test method.

2.2 ACOUSTICAL UNITS

******************************************************************************

NOTE: Color, class, pattern, NRC, LR coefficient, CAC, and type of acoustical ceiling units must be shown, as required, on the drawings when more than one type acoustical unit is specified for a project.

Color and pattern must be coordinated with the drawings, and this section when more than one type acoustical unit is specified for a project.

When a specific pattern, as shown in ASTM E1264 is required, specify the applicable one and delete other patterns; otherwise, specify all patterns as Contractor's options. Ascertain that a specific pattern required is commercially available in the type unit specified since some type units are available only in certain patterns. Specialized patterns must be described in detail within the bracketed blank space.

Acoustical units will be limited generally to Types III and IV and Type XX (stone wool, fiberglass). Metal-faced units (Types V, VI, VII, and VIII), and fabric faced overlay (Type XI), because of the higher cost factor, will not normally be considered.

Composition units with paint finish are lowest in cost and available in widest variety of patterns. Types III and IV are available in three forms: Form 1 (nodulated, cast, or molded) is appropriate for high quality areas such as conference rooms, and officers dining facilities. It is more costly than forms 2 (water-felted) and 3 (dry-felted). Type XX is available in a wide price range. All options have smooth, non-fissured surfaces.

Type I - Cellulose composition with standard washable painted finish (not listed as an option in this specification)

Type II - Cellulose composition with plastic membrane-faced overlay (not listed as an option in this specification)

Type III - Mineral composition with standard washable painted finish

Type IV - Mineral composition with plastic membrane-faced overlay

Type V - Steel facings with mineral composition absorbent backing
Type VI - Stainless steel with mineral composition absorbent backing

Type VII - Aluminum with mineral composition absorbent backing

Type VIII - Cellulose composition with scrubbable pigmented or clear finish (not listed as an option in this specification)

Type IX - Mineral composition with scrubbable pigmented or clear finish

Type X - Mineral composition with plastic/aluminum membrane

Type XX - Stone wool or fiberglass composition with membrane-faced overlay and painted finish.

Type XI - Mineral composition with fabric overlay

Type XII - Glass fiber composition with plastic/cloth overlay

Type III or IV units should be used except when any of the following conditions exist, one of the types listed below should be specified:

High Humidity - Aluminum or stainless steel pans with mineral wool pads. Humidity resistant mineral composition units.

Staining or Heavy Soiling - Composition units with plastic film face. Metal pan units. Metal faced composition units.

Impact Abrasion - Metal pan units. Impact resistant composition units. Metal faced composition units.

Metal pan units with pads cannot be used when space above the ceiling is used as an air plenum for heating, ventilating or air conditioning systems.

Pattern -

A. Perforated, regularly spaced large holes
B. Perforated, randomly spaced large holes
C. Perforated, small holes
D. Fissured
E. Lightly textured
F. Heavily textured
G. Smooth
H. Printed
I. Embossed
J. Embossed-in-register
K. Surfaced Scored
L. Random Swirl
M. Other patterns (specify)

Mineral fiber Type III, IV, IX, and XI acoustical ceiling units offer a combination of rated fire resistance, flame spread classification, acoustical performance, and design versatility. Units are available in a variety of configurations ranging from flat panels with simple textured surfaces to panels with detailed edges or carved patterns and motifs. Cost generally increases with the complexity of design and increase of thickness and/or unit weight.

Fiberglass Type XII acoustical ceiling units are available cloth-faced and vinyl-faced. The fiberglass units have high acoustical performance, thermal insulation value, and moisture resistance ratings. The cloth faced units are good for open-office installations and areas such as libraries that require high acoustical absorption. The vinyl-faced fiberglass units, because of their washable vinyl face, are good for use in buildings with supply and return-air ducts in the ceiling.

Light Reflectance – A lower light reflectance may be specified when desired for special architectural or lighting effects. The available LR (light reflection factor) are LR-1 (0.75 minimum), LR-2 (0.70 minimum), LR-3 (0.65 minimum), LR-4 (0.60 minimum).

Edge Detail – Rabbeted edges may be specified to permit face of panels to project below surface of exposed grid system. Strong sidelighting at low angle of incidence in concealed suspension systems will greatly exaggerate surface irregularities; beveled edge tiles are suggested for such locations.

Review manufacturer's literature and edit the following paragraphs.

Submit samples of each type of acoustical unit and each type of suspension grid tee section showing texture, finish, and color. Conform acoustical units to ASTM E1264, Class A, and the following requirements:

2.2.1 Units for Exposed-Grid System [A] [_____]

NOTE: In facilities where several different NRC values are specified, clearly indicate which room or areas should receive lay-in panels of a specific NRC value.

2.2.1.1 Type

NOTE: Use materials with recycled content where appropriate for use. Verify suitability,
availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Where minimums are stated, research shows the product is available among US national manufacturers above the minimum recycled content of the first bracket. Some manufacturers and regions have higher percentages. If desired, insert higher percentages into the second set of brackets.

**************************************************************************

[III (non-asbestos mineral fiber with painted finish). [ Provide Type III Acoustical Ceiling Tiles containing a minimum of 30 percent recycled content. Provide data identifying percentage of recycled content for Type III ceiling tiles. Provide certification of indoor air quality for Type III Ceiling Tiles.]]

[IV (non-asbestos mineral fiber with membrane-faced overlay). [ Provide Type IV Acoustical Ceiling Tiles containing a minimum of 60 percent recycled content. Provide data identifying percentage of recycled content for Type IV ceiling tiles. Provide certification of indoor air quality for Type IV Ceiling Tiles.]]

[IX (mineral fiber with scrubbable finish). [ Provide Type IX Acoustical Ceiling Tiles containing a minimum [50][_____] percent recycled content. Provide data identifying percentage of recycled content for Type IX ceiling tiles. Provide certification of indoor air quality for Type IX Ceiling Tiles.]]

[X (mineral composition with plastic membrane). [ Provide certification of indoor air quality for Type X Ceiling Tiles.]]

[XI (mineral fiber with fabric faced overlay). [ Provide certification of indoor air quality for Type XI Ceiling Tiles.]]

[XII (fiberglass base with membrane-faced overlay). [ Provide Type XII Acoustical Ceiling Tiles containing a minimum of [25][_____] percent recycled content. Provide data identifying percentage of recycled content for Type XII ceiling tiles. Provide certification of indoor air quality for Type XII Ceiling Tiles.]]

2.2.6.8 Joint Detail

Trimmed and butted
2.2.6.9 Finish

Factory-applied standard finish. See paragraph COLORS AND PATTERNS.

2.2.7 Unit Acoustical Absorbers

**************************************************************************

NOTE: Unit acoustical absorbers should be used in high noise areas such as bowling alleys, industrial areas or in other locations when recommended by an acoustical consultant. Quantity and spacing should be shown on the drawings.

**************************************************************************

Provide individually mounted sound absorbing plaques composed of glass fibers or non-asbestos mineral fibers and having a NRC range of not less than 0.60 - 0.70 when tested in accordance with ASTM C423 and reported as a 4 frequency average.

2.3 SUSPENSION SYSTEM

**************************************************************************

NOTE: If more than one type of acoustical unit is required, a separate paragraph for that type unit will be used. Each unit type will be designated with a letter or number symbol, such as A, B, etc. Use the same letters or numbers to key unit types to locations listed or shown on the drawings and in Section 09 06 00 SCHEDULES FOR FINISHES.

Each different type of suspension system must be shown on the drawings.

Generally, lay-in panels supported by exposed grid suspension system provide most economical installation and allow greatest access to space above ceiling. Where lay-in panels are subject to displacement by building occupants or where ceiling must be directly attached to underside of structural system, concealed framing system may be more appropriate. In lobbies, auditoriums, chapels or clubs where a monolithic appearance may be desired, greater expense of concealed suspension system may be justified. Downward access concealed systems should not be specified in areas of high seismic activity.

An intermediate-duty suspension system should be specified when the minimum load-carrying capacity of the main runner is 175 N per m 12 pounds per linear foot on a simple span of 1200 mm 4 feet without the mid-span deflection exceeding 1/360th of the span. Intermediate-duty systems are used primarily for ordinary commercial structures where some ceiling loads, due to light fixtures and air diffusers are anticipated.

A heavy-duty suspension system should be specified when the above described minimum load-carrying
capacity is 230 N per m 16 pounds per linear foot. Heavy-duty systems are used when ceiling loads are greater than ordinary commercial construction. See ASTM C635/C635M for load testing methods for metal suspension systems for acoustical tile and lay-in panel ceilings.

Select classification required to support ceiling load including acoustical units, lights and other items supported by suspension system. Light duty should be specified for residential construction only. Load carrying capacities based on 1200 mm (4 foot) hanger spacing:

<table>
<thead>
<tr>
<th>Classification</th>
<th>kg/meter</th>
<th>lb/Linear Foot of Main Runner</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Direct Hung</td>
<td>Indirect Hung</td>
</tr>
<tr>
<td>Light Duty</td>
<td>7.44</td>
<td>2.98</td>
</tr>
<tr>
<td>Intermediate Duty</td>
<td>17.86</td>
<td>5.21</td>
</tr>
<tr>
<td>Heavy Duty</td>
<td>23.81</td>
<td>11.91</td>
</tr>
</tbody>
</table>

Corner caps are not available in all types of wall moldings and are an extra cost item when available.

Provide seismic details, if a Government designer (either Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the second bracketed phrase, in the last sentence, if no seismic details are provided.

**************************************************************************

Provide [[standard] [fire-resistive] [snap-in metal pan]] [[exposed-grid] [indirect hung concealed H and T or Zee] [direct hung, concealed, downward access] [direct hung, concealed, upward access]] [[standard width flange] [narrow width flange] [narrow width slotted flange]] [as indicated] suspension system conforming to ASTM C635/C635M [for intermediate-duty systems] [for heavy-duty systems]. Provide surfaces exposed to view of [aluminum or steel with a factory-applied [white] [black] [color] baked-enamel finish] [aluminum with a clear anodized finish] [aluminum with colored factory-applied vinyl paint finish]. Provide wall molding having a flange of not less than [24 mm 15/16 inch] [____]. Provide [inside and outside corner caps] [[standard] [overlapped] [mitered] corners]. Provide a suspension system with a maximum deflection of 1/360 of the span length capable of supporting the finished ceiling, light fixtures, air diffusers, and accessories, as shown.[ Conform seismic details [to the guidance in UFC 3-301-01 and ASTM E580/E580M] [as indicated].]

[Provide Suspension System containing a minimum of 15 percent recycled content. Provide data identifying percentage of recycled content for suspension systems.]

2.4  HANGERS

**************************************************************************
NOTE: Construction drawings should include a detail drawing showing splayed and countersplayed suspension system hanger wires.

Provide hangers and attachment capable of supporting a minimum 1334 N 300 pound ultimate vertical load without failure of supporting material or attachment.

2.4.1 Wires

NOTE: Select stainless steel or nickel copper alloy wire for facilities where high humidity can be expected such as large kitchens, dishwashing areas, or indoor swimming pools. Select zinc-coated steel wire for other locations.

When spacing of hanger wires exceeds 1219 mm 4 feet or when heavy loads are supported, 3.25 or 2.59 mm 8 or 10 gauge wire should be specified.

Conform wires to [ASTM A641/A641M, Class 1, [2.0] [_____] mm [0.08 inch (12 gauge)] [[_____] inch] in diameter.] [ASTM A580/A580M, composition 302 or 304, condition annealed stainless steel, [2.0] [_____] mm [0.08 inch (12 gauge)] [[_____] inch] in diameter.]

2.4.2 Straps

NOTE: Normally wire hangers should be used. If the project is in an area subject to violent storms, steel straps or rod hangers should be specified.

Provide straps of 25 by 5 mm 1 by 3/16 inch galvanized steel conforming to ASTM A653/A653M, with a light commercial zinc coating or ASTM A1008/A1008M with an electrodeposited zinc coating conforming to ASTM B633, Type RS.

2.4.3 Rods

NOTE: Normally wire hangers should be used. If the project is in an area subject to violent storms, steel straps or rod hangers should be specified.

Provide 5 mm 3/16 inch diameter threaded steel rods, zinc or cadmium coated.

2.4.4 Eyebolts

2.4.5 Masonry Anchorage Devices

Comply with [ASTM C636/C636M] [_____] for anchorage devices for [eyebolts]
[machine screws] [wood screws].

2.5 ACCESS PANELS

**************************************************************************
NOTE: Include this paragraph only when access panels are specified in paragraph titled SUSPENSION SYSTEM. Delete identification code numbers and systems not applicable to the particular project and add additional numerical codes and system descriptions if necessary. Code numbers and corresponding system descriptions must remain unchanged, i.e., if "sprinkler system" is omitted, the code number "6" will also be omitted from the listing.
**************************************************************************

Provide access panels that match adjacent acoustical units, designed and equipped with suitable framing and fastenings for removal and replacement without damage. Size panel to be not less than 300 by 300 mm 12 by 12 inch or more than 300 by 600 mm 12 by 24 inch.

a. Attach an identification plate of 0.8 mm 0.032 inch thick aluminum, 19 mm 3/4 inch in diameter, stamped with the letters "AP" and finished the same as the unit, near one corner on the face of each access panel.

b. Identify ceiling access panel by a number utilizing white identification plates or plastic buttons with contrasting numerals. Provide plates or buttons of minimum 25 mm 1 inch diameter and securely attached to one corner of each access unit. Provide a typewritten card framed under glass listing the code identification numbers and corresponding system descriptions listed above. Mount the framed card where directed and furnish a duplicate card to the Contracting Officer. Code identification system is as follows:

(1) Fire detection/alarm system
(2) Air conditioning controls
(3) Plumbing system
(4) Heating and steam systems
(5) Air conditioning duct system
(6) Sprinkler system
(7) Intercommunication system
(8) Nurse's call system
(9) Pneumatic tube system
(10) Medical piping system
(11) Program entertainment
(12) Telephone junction boxes
2.6 ADHESIVE

****************************************************************************************
NOTE: Tiles larger than 300 by 600 mm 12 by 24 inch should not be attached by adhesive method.
****************************************************************************************

****************************************************************************************
NOTE: For projects where these products are located on the interior of the building (defined as inside of the weatherproofing system), include the bracketed sentences below requiring products with indoor air quality certifications as defined in Part 1 of this specification.
****************************************************************************************

Use adhesive as recommended by tile manufacturer. [Provide non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) that meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide aerosol adhesives used on the interior of the building that meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of GS-36. For products located on the interior of the building (inside of the weatherproofing system), provide certification or validation of indoor air quality for adhesives.]

2.7 FINISHES

Use manufacturer's standard textures, patterns and finishes as specified for acoustical units and suspension system members. Treat ceiling suspension system components to inhibit corrosion.

2.8 COLORS AND PATTERNS

****************************************************************************************
NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an architect or interior designer. Color must be selected from manufacturers' standard colors or identified as a manufacturer's color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings a note must be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

SECTION 09 51 00 Page 27
Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

Use colors and patterns for acoustical units and suspension system components [as specified in Section 09 06 00 SCHEDULES FOR FINISHES][as indicated; colors listed are not intended to limit the selection of equal colors from other manufacturers].

2.9 ACOUSTICAL SEALANT

Conform acoustical sealant to ASTM C834, nonstaining. [Provide sealants used on the interior of the building (defined as inside of the weatherproofing system)] [in accordance with requirements of Section 07 92 00 JOINT SEALANTS.][ that meet either emissions requirements of CDPH SECTION 01350 (limit the requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. For products located on the interior of the building (inside of the weatherproofing system), provide certification of indoor air quality for Sealants.]

3.1 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

Examine surfaces to receive directly attached acoustical units for unevenness, irregularities, and dampness that would affect quality and execution of the work. Rid areas, where acoustical units will be cemented, of oils, form residue, or other materials that reduce bonding capabilities of the adhesive. Complete and dry interior finish work such as plastering, concrete, and terrazzo work before installation. Complete and approve mechanical, electrical, and other work above the ceiling line prior to the
start of acoustical ceiling installation. Provide acoustical work complete with necessary fastenings, clips, and other accessories required for a complete installation. Do not expose mechanical fastenings in the finished work. Lay out hangers for each individual room or space. Provide hangers to support framing around beams, ducts, columns, grilles, and other penetrations through ceilings. Keep main runners and carrying channels clear of abutting walls and partitions. Provide at least two main runners for each ceiling span. Wherever required to bypass an object with the hanger wires, install a subsuspension system so that all hanger wires will be plumb.

3.1.1 Suspension System

Install suspension system in accordance with ASTM C636/C636M and as specified herein. Do not suspend hanger wires or other loads from underside of steel decking.

3.1.1.1 Plumb Hangers

Install hangers plumb and not pressing against insulation covering ducts and pipes. Where lighting fixtures are supported from the suspended ceiling system, provide hangers at a minimum of four hangers per fixture and located not more than 152 mm 6 inch from each corner of each fixture.

3.1.1.2 Splayed Hangers

**************************************************************************
NOTE: The designer will add a detail to the construction drawings detailing the proper method of splaying and countersplaying hangers when hangers must be splayed (sloped or slanted) around obstructions.
**************************************************************************

Splay (slope or slant) hangers around obstructions, offsetting the resulting horizontal force by bracing, countersplaying, or other acceptable means.

3.1.2 Wall Molding

Provide wall molding where ceilings abut vertical surfaces. Miter corners where wall moldings intersect or install corner caps. Secure wall molding not more than 76 mm 3 inch from ends of each length and not more than 406 mm 16 inch on centers between end fastenings. Provide wall molding springs at each acoustical unit in semi-exposed or concealed systems.

3.1.3 Acoustical Units

**************************************************************************
NOTE: In areas where the ceiling will be subject to impact or where lay-in ceiling units are subject to pressure differentials between the air plenum above the ceiling and the space below, units will be specified to be held in place with manufacturer's standard hold-down clips.
**************************************************************************

If the ceiling has a fire endurance rating or the panels weigh less than 4.9 kilograms per square meter 1.0 pound per square foot, hold down clips are
required. Hold down clips may also be specified where frequent cleaning is required to prevent displacement during cleaning.

Install acoustical units in accordance with the approved installation instructions of the manufacturer. Ensure that edges of acoustical units are in close contact with metal supports, with each other, and in true alignment. Arrange acoustical units so that units less than one-half width are minimized. Hold units in exposed-grid system in place with manufacturer's standard hold-down clips, if units weigh less than 4.9 kg/square meter 1 psf or if required for fire resistance rating.

3.1.4 Acoustical Sealant

**NOTE:** Specify acoustical sealant only when the space above the ceiling will be used as an air plenum, or when required to reduce sound transmission between rooms.

Seal all joints around pipes, ducts or electrical outlets penetrating the ceiling. Apply a continuous ribbon of acoustical sealant on vertical web of wall or edge moldings.

3.1.5 Adhesive Application

**NOTE:** Adhesive method of application should not be used for new construction. It may be used for application to existing ceiling surfaces in remodel work. Tiles larger than 300 by 600 mm 12 by 24 inch should not be attached by the adhesive method.

Wipe back of tile to remove accumulated dust. Daub acoustical units on back side with four equal daubs of adhesive. Apply daubs near corners of tiles. Ensure that contact area of each daub is at least 51 mm 2 inch diameter in final position. Press units into place, aligning joints and abutting units tight and uniform without differences in joint widths.

3.2 CEILING ACCESS PANELS

Locate ceiling access panels directly under the items which require access.

3.3 CLEANING

Following installation, clean dirty or discolored surfaces of acoustical units and leave them free from defects. Remove units that are damaged or improperly installed and provide new units as directed.

[3.4 RECLAMATION PROCEDURES

**NOTE:** If the job requires removal of acoustical ceiling systems, or acoustical units are left over from new construction, the decision to recycle must be weighed against the cost of packaging and
transportation, especially in remote areas. Most mineral fiber and fiberglass ceilings can be recycled. The following ceiling tiles cannot be recycled: 1) Faced materials (vinyl faced, mylar, metal faced). 2) Molded or cast ceiling products and glue up ceiling tiles (either 300 by 300 mm 12 by 12 inch or 300 by 600 mm 12 by 24 inch panels). 3) Fiberglass panels. 4) Ceramic based tiles. 5) Some proprietary products.

**************************************************************************

Neatly stack completely dry ceiling tile, designated for recycling by the Contracting Officer, on 1219 by 1219 mm 4 by 4 foot pallets not higher than 1219 mm 4 foot. Shrink wrap and symmetrically stack pallets on top of each other without falling over.

1.2 SCHEDULING

Schedule static-control flooring work after any other work which would damage the finished surface of the flooring.

1.3 SUBMITTALS

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3.1 Samples

1.3.1.1 Static-Control Resilient Flooring

Submit [three][____] samples of each indicated color and type of flooring, base, moldings, and accessories sized a minimum 60 by 100 mm 2-1/2 by 4 inch.

1.3.1.2 Static-Control Carpet

Submit [three][____] "Production Quality" samples 450 by 450 mm 18 by 18 inches of each carpet proposed for use, showing quality, pattern, and color specified.

1.3.1.3 Moldings

Submit [three][____] pieces of each type at least 300 mm 12 inches long.

1.3.1.4 Special Treatment Materials

Submit [three][____] samples showing system and installation method.

1.3.1.5 Operations and Maintenance Data

a. Submit Data Package 1 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

b. Submit [three][____] copies of manufacturer's maintenance instructions for each type of flooring material describing recommended type of cleaning equipment and materials, spotting and cleaning methods, and cleaning cycles.

1.4 CERTIFICATIONS

1.4.1 Indoor Air Quality Certifications

1.4.1.1 Floor Covering Materials

Provide [Conductive Vinyl Tile][Conductive Rubber Tile][Conductive Rubber Sheet Flooring][Static-Dissipative Vinyl Tile][Static-Dissipative Rubber Tile] and wall base products certified to meet indoor air quality requirements by FLOORSCORE, UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party programs that products meet the requirements of this Section. Provide [Static-Control Carpet] certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold, CRI Green Label Plus or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from
1.4.1.2 Adhesives

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party programs that products meet the requirements of this Section. Provide current product certification documentation from certification body.

1.5 EXTRA MATERIALS

Provide extra material from same dye lot for future maintenance. Provide a minimum of [_____] percent of total square meters square yards of each flooring and base type, pattern, and color.

1.6 QUALITY ASSURANCE

The flooring manufacturer will approve the Qualifications of Applicator and certify that he/she has a minimum of 3 years of experience in the application of the materials to be used.

1.7 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the building site in original unopened containers bearing the manufacturer's name, style name, pattern color name and number, size, production run, project identification, handling instructions and related information. Observe ventilation and safety procedures specified in the Safety Data Sheets (SDS). Do not store flooring near materials that may off-gas or emit harmful fumes, such as kerosene heaters, fresh paint, or adhesives.

1.7.1 Static-Control Resilient Flooring

Store materials in a clean, dry, secure, and well-ventilated area free from strong contaminant sources and residues with ambient air temperature range as recommended by the manufacturer but not less than 20 degrees C 68 degrees F or more than 30 degrees C 85 degrees F. Stack materials according to manufacturer's recommendations. Protect materials from the direct flow of heat from hot-air registers, radiators and other heating fixtures and appliances.

1.7.2 Static-Control Carpet

Remove materials from packaging and store them in a clean, dry, well ventilated area protected from damage, soiling, and moisture, and maintain at a temperature range as recommended by the manufacturer but not less than 16 degrees C 60 degrees F or more than 32 degrees C 90 degrees F for 2 days prior to installation.

1.8 ENVIRONMENTAL CONDITIONS

Provide temporary ventilation during work of this section.

1.8.1 Static-Control Resilient Flooring

Maintain areas in which resilient flooring is to be installed at a temperature range as recommended by the manufacturer but not less than 20 degrees C 68 degrees F or more than 30 degrees C 85 degrees F for 3 days.
before application, during application and 2 days after application, unless otherwise directed by the flooring manufacturer for the flooring being installed. Maintain a minimum temperature range as recommended by the manufacturer but not less than 13 degrees C 55 degrees F thereafter for the duration of the contract. Provide adequate ventilation to remove moisture from area and to comply with regulations limiting concentrations of hazardous vapors.

1.8.2 Static-Control Carpet

Maintain areas in which carpeting is to be installed at a temperature range as recommended by the manufacturer but not less than 16 degrees C 60 degrees F or more than 32 degrees C 90 degrees F for 2 days before installation, during installation, and for 2 days after installation. Maintain a minimum temperature range as recommended by the manufacturer but not less than 13 degrees C 55 degrees F thereafter for the duration of the contract. Do not permit traffic or movement of furniture or equipment in carpeted area for 24 hours after installation.

1.9 WARRANTY

1.9.1 Static-Control Resilient Flooring

Provide manufacturer's standard performance guarantees or warranties including a five year wear warranty and ten year conductivity warranty.

1.9.2 Static-Control Carpet

Provide manufacturer's standard performance guarantees or warranties including a minimum two years for material and workmanship and ten years for wear, static control, tuft bind and delamination.

PART 2 PRODUCTS

2.1 STATIC-CONTROL RESILIENT FLOORING

**************************************************************************

NOTE: Consider the function of the room, User requirements and consult with the project electrical engineer when determining the type of flooring that is appropriate.

Street shoes generate static electricity with all finish flooring types. Dependent on the function of the room and flooring material specified, special footwear may be required. The special footwear and flooring should be tested as a whole system. Verify with the user if and what type of special footwear will be used (such as ESD shoes or conductive heel straps). If the proper special footwear will not be worn on the static-control floor, a type of static-control flooring that provides very low static generation without special footwear should be specified. This type of flooring, such as static-control carpet, may be appropriate for mission critical areas such as 911 centers, call centers and air traffic control areas. Rooms requiring special handling considerations for electronic devices (for handling, repair,
manufacturing and assembly) due to extreme device sensitivity (sometimes called Class 0) may require an alternative static-control flooring and footwear system that is also very low charging; additional research to determine appropriate flooring type is required. In this instance, extreme device sensitivity (or Class 0) is defined as having a HBM (Human Body Model) or CDM (Charged-Device Model) threshold less than 250 volts.

This specification does not address testing of flooring and footwear together. This is testing which is not the responsibility of the Contractor. User is encouraged to test flooring and footwear together in method as referenced in ESD S20.20.

Heat welding adds cost to a project and is often reserved for clean rooms and wet lab type applications. Tile 305 mm x 305 mm 12 inches x 12 inches in size is not normally heat welded, 610 mm x 610 mm 24 inches x 24 inches tile is occasionally heat welded and 915 mm x 915 mm 36 inches x 36 inches tile is more typically used for heat weld applications.

This specification does not address applications requiring static-control during explosives handling. For this application, the designer is encouraged to research DOD 4145.26-M to determine the specific requirement of explosive handling versus static mitigation for electronic parts handling.

2.1.1 Conductive Resilient Flooring

2.1.1.1 Conductive Vinyl Tile

Conductive vinyl tile must be a homogeneous vinyl product and conform to ASTM F1700. Provide electrical resistance from surface to surface and surface to ground between 25,000 ohms (2.5 x 10 to the 4th) and 1,000,000 ohms (1.0 x 10 to the 6th) when tested in accordance with ASTM F150. Tile must be [300][600][900][_____] mm [12][24][36][_____] inches square and 3.2 mm1/8 inch thick. [Tile must be pre-grooved for heat welding of seams. As required, provide welding rods as recommended by the manufacturer.]

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content shown. Some manufacturers and regions have higher percentages.
[Provide Conductive Vinyl Tile containing a minimum of 10 percent recycled content. Provide data identifying percentage of recycled content for Conductive Vinyl Tile.]

**************************************************************************
NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.
**************************************************************************

[Provide certification of indoor air quality for Conductive Vinyl Tile.]

2.1.1.2 Conductive Rubber Tile

**************************************************************************
NOTE: Some rubber flooring is not resistant to oil and grease and can perform poorly against certain reagents and stain spills. Determine project needs, research available product and add verbiage to paragraph if rubber flooring needs to be resistant to oil and grease and perform against certain reagents and stain spills.

Research available sizes and thicknesses since not all manufacturers offer all sizes and thicknesses. The following thicknesses of rubber flooring are recommended for the traffic type shown: 2.0 mm 0.080 inch thickness - low traffic; 2.5 mm 0.100 inch thickness - medium traffic; 3 mm 0.118 inch thickness or greater - heavy traffic.

Ingredients in rubber flooring may include either natural rubber or synthetic materials. Natural rubber is a renewable raw material that is extracted from the sap of the tropical rubber plant without harming the plant.

**************************************************************************
Provide conductive rubber tile conforming to ASTM F1344 Class 1 homogeneous, Type B (through mottled) with a [smooth] or [hammered] surface. Provide electrical resistance from surface to surface and surface to ground between 25,000 ohms (2.5 x 10 to the 4th) and 1,000,000 ohms (1.0 x 10 to the 6th) when tested in accordance with ASTM F150. Provide tile [300][___] mm [24][___] inches square and [2.0][___] mm thick.

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content shown. Some manufacturers and regions have higher percentages.

**************************************************************************
[Provide Conductive Rubber Tile containing a minimum of 10 percent recycled content.]

SECTION 09 62 38 Page 12
content. Provide data identifying percentage of recycled content for Conductive Rubber Tile.

**************************************************************************

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.

**************************************************************************

Provide certification of indoor air quality for Conductive Rubber Tile.

2.1.1.3 Conductive Rubber Sheet Flooring

**************************************************************************

NOTE: Some rubber flooring is not resistant to oil and grease and can perform poorly against certain reagents and stain spills. Determine project needs, research available product and add verbiage to paragraph if rubber flooring needs to be resistant to oil and grease and perform against certain reagents and stain spills.

The following thicknesses of rubber flooring are recommended for the traffic type shown:

- 2.0 mm 0.080 inch thickness - low traffic
- 2.5 mm 0.100 inch thickness - medium traffic
- 3 mm 0.118 inch thickness or greater - heavy traffic.

Research available widths. Manufacturer's widths vary and not all manufacturers offer all sizes.

**************************************************************************

Provide conductive rubber sheet flooring conforming to ASTM F1859 (flooring without backing), Type I homogeneous. Provide electrical resistance from surface to surface and surface to ground between 25,000 ohms (2.5 x 10 to the 4th) and 1,000,000 ohms (1.0 x 10 to the 6th) when tested in accordance with ASTM F150. Provide tile [1200][_____] mm [4][_____] feet wide and [2.0][_____] mm thick.

**************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content shown. Some manufacturers and regions have higher percentages.

**************************************************************************

Provide Conductive Rubber Sheet Flooring containing a minimum of 5 percent recycled content. Provide data identifying percentage of recycled content for Conductive Rubber Sheet Flooring.

**************************************************************************

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.
[Provide certification of indoor air quality for Conductive Rubber Sheet Flooring.]

2.1.2 Static-Dissipative Resilient Flooring

2.1.2.1 Static-Dissipative Vinyl Tile

Static-dissipative vinyl tile must be a homogeneous vinyl product and conform to ASTM F1700. Provide electrical resistance from surface to surface and surface to ground between 1,000,000 ohms (1.0 x 10 to the 6th) and 1,000,000,000 ohms (1.0 x 10 to the 9th) when tested in accordance with ASTM F150. Tile must be [300][600][900][_____] mm [12][24][36][_____] inches square and 3.2 mm 1/8 inch thick. [Tile must be pre-grooved for heat welding of seams. As required, provide welding rods as recommended by the manufacturer.]

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content shown. Some manufacturers and regions have higher percentages.

[Provide Static-Dissipative Vinyl Tile containing a minimum of 10 percent recycled content. Provide data identifying percentage of recycled content for Static-Dissipative Vinyl Tile.]

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.

[Provide certification of indoor air quality for Static-Dissipative Vinyl Tile.]

2.1.2.2 Static-Dissipative Rubber Tile

Static-dissipative rubber tile conforming to ASTM F1344 Class 1 homogeneous, [Type A (solid color)][Type B (through mottled)]. Provide a [smooth][hammered] surface. Provide electrical resistance from surface to surface and surface to ground between 1,000,000 ohms (1.0 x 10 to the 6th) and 1,000,000,000 ohms (1.0 x 10 to the 9th) when tested in accordance with ASTM F150. Provide tile [300][600][900][_____] mm [18][24][36][_____] inches square and [2.0][3.5][_____] mm thick.

[Provide certification of indoor air quality for Static-Dissipative Rubber Tile.]
2.2  STATIC-CONTROL CARPET

******************************************************************************************************************************************

NOTE: Consider the function of the room, User requirements and consult with the project electrical engineer when determining the type of flooring that is appropriate.

Street shoes generate static electricity with all finish flooring types. Dependent on the function of the room and flooring material specified, special footwear may be required. The special footwear and flooring should be tested as a whole system. Verify with the user if and what type of special footwear will be used (such as ESD shoes or conductive heel straps). If the proper special footwear will not be worn on the static-control floor, a type of static-control flooring that provides very low static generation without special footwear should be specified. This type of flooring, such as static-control carpet, may be appropriate for mission critical areas such as 911 centers, call centers and air traffic control areas. Rooms requiring special handling considerations for electronic devices (for handling, repair, manufacturing and assembly) due to extreme device sensitivity (sometimes called Class 0) may require an alternative static-control flooring and footwear system that is also very low charging; additional research to determine appropriate flooring type is required. In this instance, extreme device sensitivity (or Class 0) is defined as having a HBM (Human Body Model) or CDM (Charged-Device Model) threshold less than 250 volts.

This specification does not address testing of flooring and footwear together. This is testing which is not the responsibility of the Contractor. User is encouraged to test flooring and footwear together in method as referenced in ESD S20.20.

If more than one carpet type is required for a project, a separate paragraph will be used for each carpet type. Each carpet type will be designated with a letter or number symbol. Use the same designations to key carpets to locations on the drawings and in Section 09 06 00 SCHEDULES FOR FINISHES.

ADA Requirements: Carpet must be securely attached; have a firm backing; and have a level loop, textured loop, level cut pile, or level cut/uncut pile texture. The maximum thickness should be 13 mm 1/2 inch. Fasten exposed edges of carpet to floor surfaces and have trim along the entire length of the exposed edge.

Nylon fiber is typically abrasion resistant and durable in all pile configurations using filament
fiber, has good stain removal characteristics, and is recommended for commercial installations.

Provide first quality carpet; free of visual blemishes, streaks, poorly dyed areas, fuzzing of pile yarn, spots or stains, and other physical and manufacturing defects. Provide carpet materials and treatments as reasonably non-allergenic and free of other recognized health hazards. Provide a static control construction on all grade carpets which gives adequate durability and performance.

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content shown. Some manufacturers and regions have higher percentages.

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.

[Provide certification of indoor air quality for Static-Control Carpet.]

2.2.1 Physical Characteristics

2.2.1.1 Carpet Construction

Tufted

2.2.1.2 Type

Modular tile [600 by 600][_____] mm square [24 by 24][_____] inch square with 0.15 percent growth/shrink rate in accordance with ISO 2551.

2.2.1.3 Pile Type

[Level-loop][Multilevel loop][____]

2.2.1.4 Pile Fiber

Commercial 100 percent branded (federally registered trademark) nylon continuous filament

2.2.1.5 Conductive Fiber

Provide a continuous conductive fiber as recommended by the manufacturer in...
every tuft.

2.2.1.6 Gauge
Minimum [_____] mm inch in accordance with ASTM D5793.

2.2.1.7 Stitches
Minimum [_____] per square meter square inch

2.2.1.8 Surface Pile Weight
Minimum [_____] kg/square meter ounces per square yard. This does not include weight of backings. Determine weight in accordance with ASTM D5848.

2.2.1.9 Pile Thickness
Minimum [_____] mm inch in accordance with ASTM D6859.

2.2.1.10 Pile Density

******************************************************************************
NOTE: Pile Density = 36 x Pile Weight/Pile Thickness.
******************************************************************************
Minimum [____] 

2.2.1.11 Dye Method
[Solution dyed][____]

2.2.1.12 Backing System
Provide conductive backing system of synthetic material as recommended by the carpet manufacturer.

2.2.2 Static-Control Carpet Performance Requirements

2.2.2.1 Electrical Resistance

******************************************************************************
NOTE: Coordinate acceptable measurement ranges for project with the project Electrical Engineer.
******************************************************************************
Provide electrical resistance from surface to surface and surface to ground between [25,000 ohms (2.5 x 10 to the 4th) and 100,000,000 ohms (1.0 x 10 to the 8th) ohms][_____] when tested in accordance with NFPA 99.

2.2.2.2 Tuft Bind
Provide tuft bind force required to pull a tuft or loop free from carpet backing with a minimum 40 N 10 pound average force for loop pile.

2.2.2.3 Colorfastness to Crocking
Comply dry and wet crocking with AATCC 165 and with a Class 4 minimum rating on the AATCC Color Transference Chart for all colors.
2.2.2.4 Colorfastness to Light

Comply colorfastness to light with AATCC 16, Test Option E "Water-Cooled Xenon-Arc Lamp, Continuous Light" and with a minimum 4 grey scale rating after 40 hours.

2.2.2.5 Colorfastness to Water

******************************************************************************
NOTE: Include the following test when specifying carpet constructed of yarn dyed fibers.
******************************************************************************

Comply colorfastness to water with AATCC 107 and with a minimum 4.0 gray scale rating and a minimum 4.0 transfer scale rating.

2.2.2.6 Delamination Strength

Provide delamination strength for tufted carpet with a secondary back of minimum 440 N/m 2.5 lbs/inch.

2.3 WALL BASE

2.3.1 Resilient Base

******************************************************************************
NOTE: Delete this paragraph if Section 09 65 00 RESILIENT FLOORING is used, it also specifies resilient base.
******************************************************************************

Job formed corners are recommended. The return on preformed corners is not always long enough to hold the piece in place and the corners can be knocked off during vacuuming and other cleaning operations.

Base is available in different lengths ranging from 1220 mm 4 feet pieces to 30,480 mm 100 feet or 36576 mm 120 feet rolls. Availability and roll lengths vary dependent on manufacturer. Identify required length if it impacts design intent. Some manufacturers of Type TS (vulcanized thermoset rubber) base offer only 1220 mm 4 feet lengths and not roll goods.

Resilient base must conform to ASTM F1861, [[Type TS (vulcanized thermoset rubber)]], [Type TP (thermoplastic rubber)] or [Type TV (thermoplastic vinyl)], [Style A (straight - installed with carpet)] and [Style B (coved - installed with resilient flooring)]. Provide 100 [150] mm [4][6] inch high and a minimum 3 mm 1/8 inch thick wall base.

Provide [preformed][job formed] corners in matching height, shape, and color.

2.3.2 Self-Coving

Self-coving must consist of static-control resilient flooring over a cove stick and must have [cove cap][ and metal corner] as recommended by the manufacturer of the flooring. Self-coving base material must be same as
2.4 ADHESIVES

Provide conductive adhesive as recommended by the manufacturer of the static-control flooring [and self-coving base]. Provide conductive adhesive for carpet tile that is also releasable as recommended by the manufacturer. Provide adhesive for wall base as recommended by the wall base manufacturer.

Provide non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) that meet either emissions requirements of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide aerosol adhesives used on the interior of the building that meet either emissions requirements of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type) or VOC content requirements of GS-36. Provide certification or validation of indoor air quality for adhesives.

2.5 MOLDINGS

Provide heavy duty tapered moldings of [[vinyl][or][rubber]][[_____] -colored anodized aluminum][clear anodized aluminum] and types as recommended by flooring manufacturer for both edges and transitions of flooring materials specified. Provide vertical lip on molding of maximum 6 mm 1/4 inch. Provide bevel change in level between 6 and 13 mm 1/4 and 1/2 inch with a slope no greater than 1:2. Provide [_____] color to match [resilient base][____].

2.6 ACCESSORIES

Use accessories recommended by the manufacturer of the flooring.

2.7 ELECTRICAL GROUND CONNECTION

**************************************************************************
NOTE: The static-control resilient flooring is installed in a conductive adhesive. The floor system is grounded to an external ground by a short grounding strip, usually on a room-by-room basis. Designer must provide for connection to an external ground and should coordinate with static-control flooring manufacturers during design stage regarding connections to external ground. Designer will show ground connection to the external ground on the drawings.
**************************************************************************

Provide an electrical ground connection that meets the requirements of ESD S6.1. Connection between the static-control floor system and the external grounding system must be provided. Contact with the static-control floor system must be with conductive grounding strip and must have the greater of the following: a minimum contact area of 5800 square mm 9 square inch or the dimensions recommended by the manufacturer. Provide the grounding conductor recommended by the manufacturer of the flooring. Connect and install the grounding conductor as recommend by the flooring manufacturer.
2.8 MANUFACTURER'S COLOR, PATTERN AND TEXTURE

**************************************************************************
NOTE: Coordinate editing of color reference sentence(s) with the Government. Generally the Section 09 06 00 SCHEDULES FOR FINISHES or drawings are used when the project is designed by an Architect or Interior designer. Select color from manufacturer's standard colors or identified in this specification only when the project has minimal finishes.

When the government directs that color be located in the drawings, a note will be added that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

When more than one type, pattern or color is specified identify location.

When a manufacturer's name, stock number, pattern, and color is specified for color, be certain that the product conforms to the specification, as edited.
**************************************************************************

Provide color, pattern and texture [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES][as indicated][_____] to provide flooring in any one continuous area or replacement of damaged flooring in continuous area from same production run with same shade and pattern.

2.9 FIRE RESISTANCE TESTING REQUIREMENTS

**************************************************************************
NOTE: Choice of critical radiant flux level as it applies to building type and area of application will be made in accordance with the latest edition of UFC 3–600–01 and NFPA 101. Wherever the use of Class II (0.22) watts finish is required, Class I (0.45) watts will be permitted. Critical radiant flux will be a minimum average of 0.45 watts when used in corridors in bachelor enlisted quarters, bachelor officer quarters, hospital, child care centers, temporary lodging facilities, and new construction detention and correctional facilities. Generally the critical radiant flux will be a minimum of 0.22 for corridors of other type facilities. Where an approved automatic sprinkler system is installed, Class II interior floor finish may be used where Class I floor finish is required, and where Class II is required, no critical radiant flux rating is required.
**************************************************************************

Provide a minimum average critical radiant flux of [0.22][0.45] watts per
square centimeter for flooring in corridors and exits when tested in accordance with ASTM E648.

PART 3 EXECUTION

3.1 SURFACE PREPARATION

******************************************************************************
NOTE: Curing and sealing compounds should not be used on concrete surfaces to receive static-control resilient flooring. If a curing compound is required, it must be coordinated for compatibility with the flooring adhesive and approved by the flooring manufacturer.
******************************************************************************

Before any work under this section is begun, defects such as rough or scaling concrete, low spots, high spots, and uneven surfaces must be corrected, and damaged portions of concrete slabs must be repaired in accordance with flooring manufacturer's recommended instructions. Floor must be in a level plane with a maximum variation of 3 mm 1/8 inch every 3 m 10 feet, except where indicated as sloped. Repair cracks and irregularities and prepare the subfloor in accordance with flooring manufacturer's recommended instructions. Curing and sealing compounds should not be used on concrete surfaces to receive flooring unless they have been tested and approved by the flooring manufacturer. In addition, remove paint, varnish, oils, release agents, sealers, waxes, and adhesives, as required by the flooring product in accordance with manufacturer's printed installation instructions. If a curing compound is required, it must be coordinated for compatibility with the flooring adhesive.

3.2 MOISTURE, ALKALINITY AND BOND TESTS

Determine the suitability of the concrete subfloor for receiving the flooring with regard to moisture content and pH level by moisture and alkalinity tests. Conduct moisture testing in accordance with ASTM F1869 or ASTM F2170, unless otherwise recommended by the flooring manufacturer. Conduct alkalinity testing as recommended by the flooring manufacturer. Determine the compatibility of the flooring adhesives to the concrete floors by a bond test in accordance with the flooring manufacturer's recommendations.

3.3 GENERAL INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

3.4 INSTALLATION OF STATIC-CONTROL RESILIENT TILE FLOORING

Install static-control resilient flooring, ground connections[, heat welded joints,] and accessories in accordance with the approved manufacturer's installation instructions. Tile lines and joints must be kept square, symmetrical, tight, and even. Tile at the perimeter of the area to be finished may vary as necessary to maintain full-size tiles in the field, but no perimeter tile may be less than one-half the field tile size, except where irregular shaped rooms make it impossible. Tile must be cut, fitted, and scribed to walls, partitions, and projections after field flooring has been applied. Install grounding strips in accordance with manufacturer's installation instructions. Protect edges of flooring material meeting hard
surface flooring with molding and install in accordance with the molding manufacturer's printed instructions.

3.5 INSTALLATION OF STATIC-CONTROL RESILIENT SHEET FLOORING

Install static-control resilient sheet flooring, ground connections[, heat welded joints] and accessories in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions. Provide square, symmetrical, tight, and even flooring lines and joints. Keep each floor in true, level plane, except where slope is indicated. Cut flooring to fit around all permanent fixtures, built-in furniture and cabinets, pipes, and outlets. Lay out sheets to minimize waste. Cut, fit, and scribe flooring to walls and partitions after field flooring has been applied. Finish joints flush, free from voids, recesses, and raised areas. Install grounding strips in accordance with manufacturer's installation instructions. Protect edges of flooring material meeting hard surface flooring with molding and install in accordance with the molding manufacturer's printed instructions.[ Install flooring with an integral coved base.]

3.6 INSTALLATION OF STATIC-CONTROL CARPET

**************************************************************************
NOTE: When applicable to the project, coordinate method of installation of static-control carpet tile on raised access flooring with access flooring specification.
**************************************************************************

Install static-control carpet, ground connections and accessories in accordance with the approved manufacturer's installation instructions and CRI 104/CRI 105. Protect edges of carpet meeting hard surface flooring with molding and install in accordance with the molding manufacturer's printed instructions. Follow ventilation, personal protection, and other safety precautions recommended by the adhesive manufacturer. Continue ventilation during installation and for at least 72 hours following installation. Install modular tiles with [release][_____] adhesive and join together snugly. Lay tiles in [the same direction] [an alternating pattern] with accessibility to the subfloor where required. Install grounding strips in accordance with manufacturer's installation instructions.

3.7 INSTALLATION OF WALL BASE

3.7.1 Resilient Base

**************************************************************************
NOTE: Delete this paragraph if Section 09 65 00 RESILIENT FLOORING specifies resilient base.
**************************************************************************

Install wall base in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions. Tighten base joints and make even with adjacent resilient flooring. Fill voids along the top edge of base at masonry walls with caulk. Roll entire vertical surface of base with hand roller, and press toe of base with a straight piece of wood to ensure proper alignment. Avoid excess adhesive in corners.
3.7.2 Self-Coving

The static-control resilient flooring must have a self-coving base and must be installed in accordance with the flooring manufacturer's printed installation instructions. Extend the self-cove up the walls, columns and pilasters [100][150] mm [4][6] inches. Terminate the coving with a cove cap. Place a cove stick at the floor-wall junction to support the coving at the bend. Provide self-cove [at room perimeter and at fixed vertical interruptions to the flooring][as indicated]. [Provide protective metal corners at outside and inside corners.]

3.8 CLEANING AND PROTECTION

The flooring must be cleaned in accordance with the manufacturer's recommendations. Flooring must be protected by a covering of heavy-duty building paper before foot traffic is permitted. Lap and secure edges of kraft paper protection to provide a continuous cover. Boardwalks must be placed over flooring in areas where subsequent building operations might damage the floor. Remove and replace flooring that becomes loose, broken, or curled prior to acceptance, or flooring that does not conform to resistance requirements of ASTM F150.

3.9 TESTING

Test the flooring in accordance with and conform to the requirements of ESD S6.1.

NOTE: This guide specification covers the requirements for portable (demountable) wood flooring for use in enclosed multipurpose areas.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: On the drawings, show:

1. Elevation of top of concrete slab on which floor system is to be installed

2. Location of equipment around which flooring is to be installed

3. Locations of, and structural provisions for, anchor-plate assemblies for sports equipment

4. Plan of floor system showing overall dimension of portable panels, sizes and installation pattern of floor panels, and game line markings

5. Storage spaces for floor panels and flat bed,
four-wheel storage trucks.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification.
and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Flooring System

Submit drawings indicating the overall layout, the panel numbers, and the complete details of the floor system. Include all assembly and disassembly instructions.

SD-03 Product Data

Finish Wood Flooring

Floor Finish Material

Coating for Flooring Panels

Indoor Air Quality for Floor Finish Material; S

Indoor Air Quality for Game Line Marking Materials; S

Indoor Air Quality for Coating for Flooring Panels; S

SD-04 Samples

Wood Floor Unit; G[, [_____]]

Accessories

Submit one wood floor unit, consisting of two completely finished, interlocked partial panels measuring 915 by 915 mm 36 by 36 inches.

SD-07 Certificates

[ Certified Sustainably Harvested Wood Flooring; S ]

Finishing
1.3 CERTIFICATIONS

**************************************************************************

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Sustainably Harvested Wood is a product which comes from a third-party Forestry Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration (e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.

Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications – if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certifications other than FSC; for all other projects pursuing third-party certification allow the entire list of third party certifications.

[1.3.1 Certified Sustainably Harvested Wood]

Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA 2809-08, SFI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.

]1.4 DELIVERY AND STORAGE

Deliver floor materials to the building site in original containers, properly assembled and thoroughly protected by providing flat-strapped wire, fiberboard protectors, blocking, and bulkheading, as necessary. Before the initial assembly and erection, store the floor materials under cover in a well-ventilated, enclosed area so that the floor materials are not exposed to extreme changes in temperature and humidity. Do not store the floor materials in an enclosed area under construction until the concrete, masonry, ceramic tile work, terrazzo, and plaster are dry.

1.5 STANDARD PRODUCT

Provide portable (demountable) wood flooring system product of a manufacturer regularly engaged in the production of such wood flooring...
systems. Provide all accessories required for a finished installation.

PART 2   PRODUCTS

2.1   MATERIALS

2.1.1   Wood Framing Members

**************************************************************************

NOTE: Modify the pressure-preservative treatment specified herein in accordance with the recommendations made by the special assistant for entomology and wood preservation assigned by NAVFAC directives.

**************************************************************************

Use kiln-dried, 50 by 75 mm 2 by 3 inch (nominal size), S4S, No. 1 common and better Douglas fir or No. 2 dimension southern pine lumber. The moisture content of the lumber must not exceed 15 percent. Provide pressure-preservative treatment of the lumber in accordance with AWPA C1 and AWPA C2.

2.1.2   Finish Wood Flooring

**************************************************************************

NOTE: Select the appropriate flooring as follows:
First Grade--where fine appearance is desired, e.g., churches, offices, hospitals; Second and Better Grade--stores, schools, factories, and other similar locations; Third and Better Grade--recreation rooms, factories, warehouses, grain storage bins, farm buildings, and other similar locations.

**************************************************************************

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.

**************************************************************************

Provide flooring of hard maple (acer saccharum), graded in accordance with the MFMA GRHM "Grading Rules for Hard Maple." Provide flooring of [26.2 mm 33/32 inch] [19.8 mm 25/32 inch] thickness with a 57 mm 2 1/4 inch face, kiln dried, continuous tongue-and groove, and end-matched. Clearly stamp the flooring: [First Grade] [Second and Better Grade] [Third and Better Grade]. Provide wood products with no added urea-formaldehyde resins. The moisture content of the flooring must not exceed 8 percent at the time of arrival and must not be greater than [8 to 10] [8 to 9] percent when installed. [Provide certified sustainably harvested wood flooring.]

2.1.3   Portable Flooring Subfloor

Provide subfloor of 12.7 mm 1/2 inch thick fir or pine plywood, C-D grade with exterior grade glue, Exposure 1.
2.1.4 Floor Finish Material

The floor finish material must be selected by the flooring manufacturer from the latest MFMA AFSFSCL "Floor Finish List." The finish material must be suitable for the service requirements imposed on the type of portable flooring specified herein. Provide products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for floor finish material.

2.1.5 Kiln Drying

Only flooring which has been kiln dried will be considered to be standard grade.

2.1.6 Edge Grain Flooring

Use edge grain hardwood flooring consisting of pieces with annual rings that range from 30 degrees horizontal to 90 degrees vertical.

2.1.7 Game Line Marking Materials

Use game line marking materials recommended by the wood floor finish manufacturer. Provide products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for game line marking materials.

2.1.8 Nails

Use coated casing nails, screw nails, staples, or nailing cleats recommended by the flooring manufacturer.

2.1.9 Storage Trucks

**************************************************************************

NOTE: If trucks are to be used for storage of floor panels, one truck will be required for each row of floor panels. An 18 by 34 meter 60 by 112 foot floor will have 15 rows of floor panels, will require 15 storage trucks and 48 square meters 480 square feet of floor space for storage with each row approximately 1065 mm 42 inches high.

**************************************************************************

Use manufacturer-recommended flatbed, four-wheel roller-bearing trucks of approximately 1200 by 2400 mm 4 by 8 feet on which to stack the panels.

2.1.10 Coating for Flooring Panels

**************************************************************************

NOTE: Use Group II finish for multipurpose, high-wear areas; use Group III for floors to be utilized solely for sports.

**************************************************************************

The coating must conform to MFMA AFSFSCL "Heavy-Duty and Gymnasium Finishes

SECTION 09 64 00 Page 9
for Maple, Beech, and Birch Floors"; Group [II] [III] finish. Provide products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for coating for flooring panels.

2.1.11 Moisture, Insect, and Fungi Protection

Structural wood members must be treated for moisture and termite protection. Prior to shipment, apply to the underside portion of the floor system, including subflooring, a heavy coating of pigmented, moisture-repellent resin paint with additives to control moisture absorption and to prevent attack by termites and fungi.

2.2 FLOORING SYSTEM

2.2.1 Design

******************************************************************************
NOTE: The overall dimensions specified cover the optimum floor size for an official basketball court as required by the National Collegiate Athletic Association (NCAA).
******************************************************************************

******************************************************************************
NOTE: The section of the project specification pertaining to the subfloor should include the requirement that the subfloor must not vary more than 6 mm 1/4 inch within an area 3 by 3 meters 10 by 10 feet. If the intent is to install the portable floor over an existing floor, specify the 6 mm 1/4 inch tolerance in paragraph INSPECTION OF THE SUBFLOORS.
******************************************************************************

Design and construct the system for use over [a concrete floor slab as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.] [a wood subfloor as specified in Section 06 10 00 ROUGH CARPENTRY.] [an ice rink surface.] [a synthetic floor surface.] Provide flooring system consisting primarily of 1200 by 2400 mm and 1200 by 1200 mm 4 by 8 foot and 4 by 4 foot self-aligning and interlocking panels. Each panel must consist of hardwood strip flooring nailed to subflooring which is nailed to rigid lumber frames.

2.2.2 Assembly and Construction

Provide an assembled floor that is properly aligned, smooth, level and with the overall appearance of being a permanent floor. Bolts, screws or other fastening or locking devices must not be visible on the floor surface. Design and construct the flooring panels in a manner affording simple and recurrent assembling, interlocking, disassembling, and storing without the use of special tools or equipment. Ensure that all like panels are interchangeable and replaceable. The method of panel assembling and locking must preclude inadvertent disassembling under all types of playing conditions. Where they are used, the projecting tongues interlocking the flooring sections must be wood, metal, metal-clad, or another material approved by the Contracting Officer.
2.3  SHOP FABRICATION AND PREASSEMBLY

2.3.1  Framing

Use jigs for each fabrication operation to provide for maximum accuracy. Space the framing members at a maximum of 300 mm 12 inches on center. Fasten the framing members and blocking from the top. The bottom surfaces of the framing and blocking must be free of protrusions or sharp edges that could prevent proper seating of the finished panel or could prevent stacking of the panels for storage or shipment. Provide frames rigid, square, level, and true.

2.3.2  Finished Flooring

Lay the finished flooring over [the subflooring and] the framing members, running the flooring parallel with the long dimensions of the panels. Stagger the adjacent ends of the flooring strips so that there will be at least two strips of flooring between the joints.

2.3.2.1  Fastening the Finished Flooring

Fasten the finished flooring to [the subflooring and] the framing members with coated nails, screw nails, staples, or nailing cleats. Fasten each strip of flooring at each bearing. Provide for any normal expansion, contraction, or aeration in each panel.

2.3.3  Preassembly

Prior to shipment, preassemble the entire floor at the factory with all panels interlocked, and prepare for the sanding and finishing operations specified herein. Maintain proper temperatures and humidity conditions necessary to retain the quality of the flooring. During the preassembling of the flooring, note any inaccuracies, misalignments, or other defects, and make the necessary corrections before shipping the panels. Letter or number each panel on its the ends to indicate its position in the assembling of the floor.

2.4  [SHOP] [FIELD] SANDING, FINISHING, AND MARKING

******************************************************************************
NOTE: If it is preferred to have the sanding, finishing, and marking performed at the jobsite, the specification should be modified accordingly.
******************************************************************************

2.4.1  Sanding

Machine sand the surface of the wood floor and edging using coarse, medium, and fine grades of sandpaper, respectively, to provide for smooth and level surfaces. Following this perform a final disc sanding of the wood floor.

2.4.2  Finishing

Within 24 hours after the final sanding, sweep the floor clean using a tacky rag with a solvent recommended by the manufacturer of the floor finish material. Apply a liberal coat of sealer to the floor, and thoroughly dry and burnish the floor with No. 2 steel wool using an industrial-type power machine. Repeat this procedure with each coat, as specified in MFMA AFPSFSC specifications. [After the final burnishing but
prior to the application of the final two finish coats, lay out and mark the game lines as specified herein. After the game lines are thoroughly dry, apply the final two finish coats."

[2.4.3 Game Line Marking

Striping and patterns must be completed in the manufacturing plant. Lay out the game lines [and the fields, [and the patterns,] as indicated, masking the edges to provide for sharp, clean edges. Provide straight edges and uniform widths. Apply the markings of colors as indicated, providing a minimum dry film thickness of one mil.

PART 3 EXECUTION

3.1 INSPECTION OF THE SUBFLOORS

**************************************************************************
NOTE: The section of the project specification pertaining to the subfloor should include the requirement that the subfloor must not vary more than 6 mm 1/4 inch within an area 3 by 3 meters 10 by 10 feet. If the intent is to install the portable floor over an existing floor, specify the 6 mm 1/4 inch tolerance in paragraph INSPECTION OF THE SUBFLOORS.
**************************************************************************

Do not install portable floor systems on subfloors having defects that could prevent proper installation. Before the initial installation of the floor, correct all defects in the subfloor.

3.2 FIELD ASSEMBLY, INSTALLATION, DISASSEMBLY, AND STORAGE

Do not install the floor in an enclosed area under construction until the concrete, masonry, ceramic tile work, terrazzo, and plaster are dry. Do not install building construction materials that show visual evidence of biological growth.

3.2.1 Assembly and Installation

Assemble and install the entire floor system at the designated location. Unless directed otherwise, leave the floor system in place for a minimum of one week to permit inspection by the Contracting Officer.

3.2.2 Disassembly

After the floor system has been inspected and accepted, disassemble the floor system in the manner prescribed by the floor system manufacturer. Correct all deficiencies prior to the storage of the floor system.

3.2.3 Storage

Following the disassembling of the floor system, store the panels within the enclosed area at the location(s) [indicated] [designated by the Contracting Officer] and in accordance with the floor system manufacturer's
3.3 SCHEDULE

Metric measurements in this section are based on mathematical conversion of English unit measurement, and not on metric measurement commonly agreed to by the manufacturers or other parties. The English and metric units for the measurements shown are as follows:

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for wood parquet flooring systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: On the drawings, show:

1. Location and extent of wood parquet flooring.

2. Where flooring is to be installed on concrete slab, indicate elevation of the top(s) of concrete slab.

3. Locations of equipment, columns, and other permanent obstructions adjoining flooring and around which flooring is to be laid.

4. Floor pattern that differs from conventional checkerboard pattern and is not defined by file sample.
5. Profile of shoe mold.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN FOREST FOUNDATION (AFF)

ASTM INTERNATIONAL (ASTM)

CALIFORNIA DEPARTMENT OF PUBLIC HEALTH (CDPH)

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity
or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATIONS
**************************************************************************
NOTE: Use certified sustainably harvested wood
where suitable for application and cost effective.
Sustainably Harvested Wood is a product which comes
from a third-party Forestry Certification Program
and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and
wildlife habitat, sustainable harvest levels,
protection of water quality, and prompt regeneration
(e.g., replanting and reforestation); 2) Third-party
certification audits performed by accredited
certification bodies; 3) Publicly available
certification audit summaries; 4) Multi-stakeholder
involvement in a standards development process; 5) Complaints and appeals process.
Verify suitability, availability within the region,
cost effectiveness and adequate competition before
specifying these sustainably harvested wood
certifications – if these conditions are verified
for the project locale, include the following
section. For projects pursuing LEED, delete
certifications other than FSC; for all other
projects pursuing third-party certification allow
the entire list of third party certifications.
**************************************************************************

[1.3.1 Certified Sustainably Harvested Wood

Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SFI 2015-2019, or other third party program
certified by PEFC ST 2002:2013]. Provide a letter of Certification of
Sustainably Harvested Wood signed by the wood supplier. Identify
certifying organization and their third party program name and indicate
compliance with chain-of-custody program requirements. Submit sustainable
wood certification data; identify each certified product on a line item
basis. Submit copies of invoices bearing certification numbers.

]1.3.2 Indoor Air Quality Certifications

Submit required indoor air quality certifications in one submittal package.
[1.3.2.1 Floor Covering Materials

Provide hardwood parquet flooring product certified to meet indoor air quality requirements by FLOORSCORE, UL 2818 (GreenGuard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.3.2.2 Paints and Coatings

Provide primer product certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.3.2.3 Adhesives and Sealants

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the building site in original, unopened packages, bundles, or containers. Protect materials against dampness during shipment and after delivery. Store materials under cover in a well ventilated building where materials will not be exposed to extreme changes of temperature and humidity. Do not store materials in buildings under construction until all wet-applied building materials are dry. Do not open packages, bundles, or containers until the flooring is to be installed. Remove rejected material from Government property. Keep materials wrapped and separated from off-gassing materials, such as paints and adhesives. Do not use materials that have visible moisture or biological growth.

1.5 ENVIRONMENTAL REQUIREMENTS

NOTE: Control of temperature and humidity prior to laying flooring is necessary to prevent buckling and cupping. Since climatic conditions vary due to geographical location and the trend is toward natural ventilation for energy conservation, it is
imperative to check with flooring manufacturer and local installers to determine correct temperature and humidity ranges for the project area.

Store the parquet flooring in the building or space where the parquet flooring is to be laid for a minimum of 3 days to allow absorbed moisture to evaporate. Separate the wood parquet so that all pieces are exposed to the air during this 3-day period to allow uniform acclimation. Maintain the temperature of the building or space between [21 and 10] [[_____] and [_____]] degrees C [70 and 50] [[_____] and [_____]] degrees F, and maintain the relative humidity between [30 and 65] [[_____] and [_____]] percent. Maintain the preceding temperatures and humidity conditions throughout the installation period.

1.6 SCHEDULING

Schedule parquet flooring work after completion of any other work which would raise the moisture content of the flooring or damage the finished surface of the flooring. See PART 3 for additional scheduling requirements.

1.7 WARRANTY

Provide manufacturer's standard performance guarantees or warranties that extend beyond a one-year period.

PART 2 PRODUCTS

2.1 FLOORING MATERIALS

NOTE: Select the type of flooring to be used on the appropriate project design requirements, availability, and relative cost. The method of specifying the pattern is optional, but the "file sample" is recommended for projects for which the design is sensitive.

Acrylic impregnated hardwood floors are recommended for commercial type facilities. Prefinished urethane and stain/wax prefinishes are normally for residential or light commercial usage.

Choice of critical radiant flux level as it applies to building type and area of application will be made in accordance with the latest edition of UFC 3-600-01 or NFPA 101. Wherever the use of Class II (0.22 watts) finish is required, Class I (0.45 watts) will be permitted.

Critical radiant flux will be a minimum average of 0.45 watts when used in corridors in bachelor enlisted quarters, bachelor officer quarters, hospital, child care centers, temporary lodging facilities, and new construction detention and correctional facilities. Generally the critical radiant flux will be a minimum of 0.22 for corridors of other type facilities. Where an approved automatic sprinkler system is installed, Class II
interior floor finish may be used where Class I floor finish is required, and where Class II is required, no critical radiant flux rating is required. Omit sentence if not applicable.

Use certified sustainably harvested wood where suitable for application and cost effective. Verify availability within the region, cost effectiveness, and adequate competition before specifying this certification.

Include last bracketed sentences requiring certification for indoor air quality when product will be located in offices or classrooms.

In termite-prone areas, wood should be termite treated. Verify with manufacturers on availability and effect on finishes.

Provide hardwood parquet flooring conforming to NOFMA Grading Rules. [The flooring must match the color and pattern of the sample on file at the office of the Contracting Officer.] [Pattern must be [_____] [as indicated].] Hardwood flooring in corridors and exits must have a minimum average critical radiant flux of [0.22] [0.45] watts per square centimeter when tested in accordance with ASTM E648. Provide wood products with no added urea-formaldehyde resins. Submit manufacturer's descriptive data, documentation stating physical characteristics and flame resistance, installation instructions and [two] [_____] samples of each type of parquet flooring. Provide samples, minimum 300 x 300 mm 12 x 12 inches. Submit statement from the manufacturer attesting that the materials meet the specified requirements. The statement must be dated after the award of the contract, stating the Contractor's name and address, showing the name of the project and location, and listing the specific requirements being certified. Submit Data Package 1 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. [Provide a product treated for resistance to termite damage.] [Provide certified sustainably harvested hardwood parquet flooring.]

Product must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for hardwood parquet flooring.

2.1.1 Laminated Block Flooring

**********************************************************************************************

NOTE: The species are listed in descending order of wear resistance and hardness. Limit the species, based on quality required and compatibility with color desired or selected for the file sample. Size of units will depend on pattern selected and should be stated.

***************************************************************************************

HPVA EF, plain face, factory finished. Fabricate face veneer of each block from [hard maple,] [red oak,] [white oak,] [birch,] [ash,] [beech,] [walnut,] [or] [cherry]. Provide [_____] mm inches by [_____] mm inches flooring units.
2.1.2 Slat Block Flooring

NOTE: The species are listed in descending order of wear resistance and hardness. Limit the species, based on quality required and compatibility with color desired or selected for the file sample. Size of units will depend on pattern selected and should be stated.

APA E30, unfinished, Select and Better Grade, fabricated from [hard maple,] [teak,] [red oak,] [white oak,] [ash,] [walnut,] [or] [cherry]. Provide finishing at the site as specified herein. Provide [_____] mm inches by [_____] mm inches flooring units.

2.1.3 Solid Block Flooring

2.1.3.1 Grading

NOTE: The species are listed in descending order of wear resistance and hardness. Limit the species, based on quality required and compatibility with color desired or selected for the file sample. Size of units will depend on pattern selected and should be stated.

[Red oak] [or] [white oak] fabricated into [prime] [Standard and Better] [or] [hard maple,] [beech,] [or] [birch] fabricated into [First] [Second and Better] Grade blocks, free from defects and discolorations. Grade blocks in accordance with the rules of the association governing the grading of the species used.

2.1.3.2 Construction

NOTE: Quarter-sawn oak and edge-grain maple wear better, but the plain-sawn and flat-grain cuts are adequate and should be allowed for most projects.

Oak must be quarter-sawn [or plain-sawn].] [Maple must be edge-grain [or flat-grain].] Fasten the strips composing each block together tightly in a manner that will maintain the integrity of the block. Each block must have a standard flooring tongue or corresponding matching grooves on each of the four edges, so arranged that the blocks can be laid in the conventional checkerboard pattern with the strips of each block at right angles to the strips of the adjacent blocks. The back of each strip in the block may be flat or channeled. Face edges of blocks must not be beveled.

2.1.3.3 Dimensions

NOTE: When red or white oak is specified, specify tolerances of plus or minus 0.80 mm 1/32 inch in length and plus or minus 0.40 mm 1/64 inch in width. When other species are specified, use first
Blocks must be 228.6 mm 9 inches square [plus or minus 0.40 mm 1/64 inch in length and width] [plus or minus 0.80 mm 1/32 inch in length and plus or minus 0.40 mm 1/64 inch in width] and must be not less than 19 mm 3/4-inch thick. The length of the face diagonals of each block must be within 0.80 mm 1/32 inch to ensure squareness.

2.1.3.4 Moisture Content

Not less than 5 percent or more than 12 percent at time of shipment.

2.1.3.5 Finish

[Apply finish at the factory.] [Ship flooring to the site with a smooth surface without applied finish. Provide finish specified herein at the site.]

2.1.4 Premolded Cork Strips

Cork strips must be the same depth as the flooring and of width recommended by flooring manufacturer.

2.1.5 Accessories and Supporting Materials

Submit manufacturer's safety data sheets for adhesives, finishes, and other materials which may be considered hazardous because of toxicity, flammability, VOC's, or reactivity.

2.1.5.1 Wax Finish

As recommended by flooring manufacturer.

2.1.5.2 Asphalt Saturated Felt

ASTM D226/D226M.

2.1.5.3 Adhesive

Waterproof, suitable for use with [subflooring] [underlayment] used, and as recommended by flooring manufacturer. Provide non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) that are certified to meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide certification or validation of indoor air quality for adhesive.

2.1.5.4 Primer

Provide primer recommended by flooring manufacturer. Provide primer product certified to meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide certification or validation of Indoor Air Quality for Primer.
2.1.5.5 Shoe Molds

[Hard maple,] [red oak,] [white oak,] [ash,] [beech,] [birch,] [walnut,] [or] [cherry]. Shape and size as indicated. Prefinish shoe molds to match flooring.

2.2 FLOORING SYSTEMS

**************************************************************************
NOTE: Select flooring system to be used.
**************************************************************************

2.2.1 Flooring on Concrete Slabs

The system consists of the application of block flooring on concrete slabs by means of adhesive.

2.2.2 Flooring on [Subflooring] [Underlayment]

The system consists of the application of block flooring on [subflooring] [underlayment]. The provision of [subflooring] [underlayment] is specified in Section [______]. The application of block flooring must be by means of [nails] [adhesive].

PART 3 EXECUTION

3.1 PREPARATION OF SURFACES

**************************************************************************
NOTE: If flooring is to be applied on slab-on-ground construction, site grading and drainage should be such that water will not collect under slab. A polyethylene vapor barrier of not less than 0.15 mm 6 mils thick and at least 150 mm 6 inches of porous fill consisting of clean, washed gravel graded from 19 to 38 mm 3/4 inch to 1-1/2 inch sizes should be specified in Division 3. A single-ply, asphalt-saturated felt or 0.15 mm 6 mil polyethylene film set in asphalt may be applied to top of slab if acceptable to flooring manufacturer. Add to this paragraph, if warranted.
**************************************************************************

3.1.1 Concrete Slabs

Do not install flooring on surfaces that are unsuitable for proper installation. Before work is begun, correct defects such as rough or scaling concrete, low spots and high spots, uneven surfaces, and all damaged portions of concrete slabs. If concrete curing compounds or surface sealers have been applied to the concrete slabs, remove the compounds and sealers from the slabs by an approved method. Concrete slabs must be level [within tolerance specified in the Section 03 30 00 CAST-IN-PLACE CONCRETE] [within a tolerance of 2 mm/meter 0.25 inch per 10 feet.]

3.1.2 [Underlayment] [Subflooring]

Repair damaged portions, and replace defective boards with sound boards; renail loose or warped boards, and drive protruding or loose nails flush.
3.1.3 Adhesive-Applied Wood Flooring on Concrete Slab

Clean concrete floor slabs that are to receive flooring. Remove spots of paint, plaster, masonry droppings, grease, dirt, and other foreign matter.

3.1.4 Nailed Wood Flooring on [Subflooring] [Underlayment]

Cover [subflooring] [underlayment] over which nailed wood flooring is to be laid with a layer of asphalt saturated felt. Lap all edges at least 50 mm 2 inches.

3.1.5 Adhesive-Applied Wood Flooring on [Subflooring] [Underlayment]

Prepare [subflooring] [underlayment] in accordance with the printed instructions of the flooring manufacturer.

3.2 INSTALLATION

Do not install flooring until other work that might cause damage to flooring has been completed, until all wet work is completed and has cured for [14] [_____] days, and until exterior openings are closed. Cure new concrete slabs to receive flooring a minimum of 60-days before application of flooring. Perform flooring installation, including sanding and finishing, in conformance with manufacturer's printed instructions. Provide mechanical ventilation of area receiving flooring as required to maintain concentrations of toxic gases and explosive vapors below permissible levels.

Do not install building construction materials that show visual evidence of biological growth.

3.2.1 Flooring on Concrete Slabs

Apply block flooring on concrete slabs in accordance with the flooring manufacturer's printed instructions.

3.2.2 Flooring on [Subflooring] [Underlayment]

**************************************************************************
NOTE: Wood or plywood subflooring or hardboard underlayment should be specified in Section 06 10 00 ROUGH CARPENTRY of the project specifications.
**************************************************************************

[In applying wood blocks with nails, lay blocks with close joints when nailing to [subflooring] [underlayment]. Drive blocks firmly together, and blind-nail each block.] [In applying block flooring with an adhesive, use the materials and follow the methods stipulated in the manufacturer's printed instructions.]

3.2.3 Expansion Spaces

Provide expansion spaces at walls and partitions. Size expansion spaces as recommended by flooring manufacturer. Install premolded cork strips in expansion spaces in accordance with flooring manufacturer's directions.
3.2.4 Shoe Molds

Nail shoe molds to baseboards. [Baseboards are specified in Section [_____] .]

]3.3 SANDING AND FINISHING [SLAT] [SOLID] BLOCK FLOORING

**************************************************************************
NOTE: Coordinate these requirements with Section 09 90 00 PAINTS AND COATINGS of the project specifications.
If prefinished flooring is used, delete this paragraph.
**************************************************************************

3.3.1 Sanding

Sand and buff floors to smooth and level surface, free of sanding marks and in proper condition to receive the finish specified. After final sanding and buffing, vacuum or tack floors in accordance with finish manufacturer's recommendations. Wipe off foot marks.

3.3.2 Finishing

After final sanding and buffing have been completed, apply two coats of finish; use polyurethane coating recommended by flooring manufacturer for type and specie of wood flooring specified. When floors are dry, apply two coats of wax, unless otherwise recommended in writing by manufacturer of flooring. Spread at rate of 0.07 L/10 square meters one gallon per 1,500 square feet. Within 15 to 30 minutes after wax application, polish floors with weighted floor brush or electric polisher.

3.4 PROTECTION

After completion of laying [and the finishing and drying] of floors, cover flooring immediately with nonstaining kraft building paper. Lap and tape edges of paper. At project completion and acceptance, carefully take up and remove the protective paper.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for wood strip and plank flooring for gymnasiums, handball and squash courts, and other special purpose applications.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

1.1  SUMMARY

NOTE: Wood strip flooring is very sensitive to ambient humidity conditions since all wood flooring will expand and contract as relative humidity varies. In order to keep the flooring manufacturer’s warranty valid after installation, the areas in which the wood floors are installed must be adequately ventilated with natural or mechanical air circulation at all times during the life of the flooring.
If prior experience at the site indicates that relative humidity during sustained heating periods will fall below 35 percent, the office in charge of building maintenance should provide equipment to introduce moisture into the floored area when required; conversely, if relative humidity increases to 50 percent or higher at any time, measures should be taken to dry the floored area, including turning on the heat.

At sites with humidity problems, the maintenance of the flooring may require: 1) The design of a localized HVAC system to also react to and automatically control ambient humidity conditions through the life of the flooring; or 2) Continuous monitoring of relative humidity with on the spot corrective actions, as needed, without altering the HVAC system. These alternatives could be very expensive or impractical. The designer, in the absence of local experience, should coordinate with local manufacturers to specify compatible floorings which have performed well locally; that is, the designer should check gymnasiums in the area when building a gymnasium floor; the same for handball courts, etc. Of course, the designer has the option of purchasing commercially available floating or sleeper systems specifically designed to reduce the possibility of buckling and cupping brought on by moisture buildup or specifying other types of flooring when a cost analysis (including all HVAC variations) indicates that wood strip flooring is not economical.

This specification is written to allow the Contractor to build wood strip floorings for gymnasiums, handball and squash courts, and other special purpose applications but does not preclude the installation of competitive, manufacturer standard, integrated systems.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile.
The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a
code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 CERTIFICATIONS

**************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Sustainably Harvested Wood is a product which comes from a third-party Forestry Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration (e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.

Verify suitability, availability within the region,
cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications - if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certifications other than FSC; for all other projects pursuing third-party certification allow the entire list of third party certifications.

[1.4.1 Certified Sustainably Harvested Wood]

Provide wood certified as sustainably harvested by FSC STD 01 001[1, ATFS STANDARDS, CSA 2809-08, SFI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.

[1.4.2 Indoor Air Quality Certifications]

Submit required indoor air quality certifications in one submittal package.

NOTE: Include this subparagraph requiring low VOC content products when product will be located in offices or classrooms.

[1.4.2.1 Floor Covering Materials]

Provide wood strip and plank flooring, bamboo flooring, and resilient pad products certified to meet indoor air quality requirements by FLOORSCORE, UL 2818 (GreenGuard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

[1.5 DELIVERY, STORAGE, AND HANDLING]

Deliver materials to the site in original unopened packages, bundles or containers and with all labels intact. Store flooring in fully covered, well ventilated areas protected from extreme changes in temperature and humidity. Maintain flooring at an average moisture content of 6 to 9 percent. Temperature and humidity in the storage area must closely approximate the temperature and humidity of the rooms in which the flooring is to be installed.

[1.6 ENVIRONMENTAL REQUIREMENTS]

NOTE: The values stated in the guide specification for moisture content of the flooring and for the humidity and temperature of the space where the flooring will be installed are those which are
generally suitable. When local experience has proven that values differing from those included in the guide specification are necessary because of geographical location or seasonal weather conditions, appropriate values will be substituted for the values stated in the guide specification.

Provide permanent heating and air conditioning, installed and working, in rooms where wood flooring is to be installed or adequate arrangements for ventilation and temperature controls. Maintain the temperature at 14 to 27 degrees C (55 to 80 degrees F) and maintain the humidity [at [40] [_____] percent] [as recommended by the manufacturer] starting not less than 3 days prior to beginning the installation of flooring and continuing throughout the remainder of the contract period.

1.7 SCHEDULING

Schedule strip and plank flooring work after any other work which would raise the moisture content of the flooring or damage the finished surface of the flooring.

PART 2 PRODUCTS

2.1 STRIP FLOORING

NOTE: Designer will select appropriate species and will permit maximum competition wherever possible; however, gymnasiums will be limited to hard maple. Flooring of 26 mm (33/32 inch) thickness should be considered when floors will be subjected to hard service and frequent sanding.

2.1.1 General Requirements

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Designer must verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is available from US national manufacturers above the minimum recycled content percentages shown below. Some manufacturers and regions have higher percentages. Based on research, insert desired minimum percentages into the empty set of brackets.
Include last bracketed sentences requiring certification or validation for indoor air quality when product will be located in offices or classrooms.

In termite-prone areas, wood flooring should be termite treated. Verify with manufacturer for availability and effect on finishes.

Strip and plank flooring must be [19] [26] mm [3/4] [33/32] inch thick by 55 mm 2-1/4 inch face width, kiln dried, continuous tongue and groove and of standard lengths. [Provide certified sustainably harvested wood strip and plank flooring.] Beech and birch must be second grade in accordance with NOFMA Grading Rules. Hard maple must be second and better in accordance with MFMA GS. Red and white oak must be select grade in accordance with NOFMA Grading Rules. Provide wood products with no added urea-formaldehyde resins. Strip flooring must be marked with the trademark of the grading agency. Submit two samples of each type of strip and plank flooring. [Wood Strip Flooring must contain a minimum of [90] [_____] percent reclaimed, salvaged, and recycled wood. Provide data identifying percentage of recycled content for wood strip and plank flooring.]

Provide flooring product meeting emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for wood strip and plank flooring.

2.1.2 Bamboo

NOTE: Use of materials, such as bamboo, with bio-based content is required where suitable for application and cost effective. Verify availability within the region, cost effectiveness and adequate competition before specifying product bio-based content requirements. A resource that can be used to identify products with bio-based content is the "Catalog" tab within the USDA's "Biopreferred" website at http://www.biopreferred.gov. The bio-based content percentage listed is the required threshold within the USDA Biopreferred program. Use of other products which meet all requirements of this specification and contain bio-based content is also acceptable.

Include last bracketed sentences requiring certification or validation for indoor air quality when product will be located in offices or classrooms.

In termite-prone areas, bamboo flooring should be termite treated. Verify with manufacturer for availability and effect on finishes.

Bamboo flooring must be laminated, tongue-and-groove plank flooring, [16 to 19 mm 5/8 to 3/4 inch thick, 2- or 3-ply, flat grain with horizontal laminations] [13 mm 1/2 inch thick with vertical laminations]. Provide
bamboo products with minimum 91 percent bio-based content. Submit data identifying percentage of biobased content for bamboo flooring. [Provide a product treated for resistance to termite damage.]

Provide flooring product meeting emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for bamboo flooring.

2.2 NAILS

Provide nails in accordance with strip flooring manufacturer's recommendations.

2.3 RESILIENT PADS

**************************************************************************
NOTE: Include last bracketed sentences requiring certification or validation for indoor air quality when product will be located in offices or classrooms.
**************************************************************************

Resilient pads must be pneumatic rubber, PVC, or polyurethane resilient mounts to fit the selected floor system. [Provide product meeting emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for resilient pads.]

2.4 WALL BASE

Wall base must be wood molding or vented cove with premolded outside corners and mitered inside corners.

2.5 MOISTURE BARRIER

Moisture barrier must be 0.15 mm 6 mil minimum thickness polyethylene.

2.6 CLIPS, ANCHOR CHANNELS AND INSULATION

**************************************************************************
NOTE: Include this paragraph when channel anchorage system is specified. Channel anchorage system will be included as an option to wood nailers for gymnasium floors.
**************************************************************************

Galvanized steel clips for steel channel anchorage systems must be in accordance with steel channel anchorage system manufacturer's recommendations. Clips must be designed to provide holding at least equal to the nailing specified and must function without splitting the assembled boards or otherwise reducing the performance of the floor. Anchor channels must be as recommended by the flooring manufacturer. Anchor channels must be galvanized, complete with all pads, anchors and other components required for channel installation. Underfloor insulation must be asphalt impregnated fiberboard or closed-cell polyethylene foam.

2.7 ASPHALT PRIMER

ASTM D41/D41M. Provide asphalt primer product meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or
classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for asphalt primer.

### 2.8 ASPHALT MASTIC

As recommended by the flooring manufacturer. Provide asphalt mastic products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for asphalt mastic.

### PART 3 EXECUTION

#### 3.1 SURFACE CONDITIONS

Concrete slab must be level, steel troweled to a tolerance of 3 mm 1/8 inch plus or minus in a 3 m 10 foot radius. Slab surface must be clean, dry, and approved prior to start of installation. The slab must be depressed as required by the floor specified.

#### 3.2 INSTALLATION

Install flooring in accordance with the approved installation instructions of the manufacturer. Submit manufacturer's descriptive data and installation instructions. Wood nailers are specified in Section 06 10 00 ROUGH CARPENTRY. Unless otherwise approved, flooring must be laid parallel to the length of the area to be floored. Strips must be laid [with close joints, snugly driven up but providing for absorption of a small amount of expansion] [to allow for intermediate expansion in accordance with humidity conditions expected during the life of the flooring]. End joints must be so alternated that there will be at least two boards between end joints in the same plane and at least 150 mm 6 inches between end joints in adjacent boards. Space for expansion must be left along perimeter walls and around fixed projections through the floor surface. Unless otherwise shown or permitted by the approved installation instructions, expansion space must be 5 mm per meter 1/16 inch per foot of distance between opposite walls, with one half the space provided at each wall and with a minimum space of 25 mm 1 inch at each wall.

Do not install building construction materials that show visual evidence of biological growth.

#### 3.2.1 Gymnasium Floors

##### 3.2.1.1 Wood Sleepers

For wood sleeper supported floors, the slab must be vapor-sealed with a two-ply membrane and hot-poured, steep-slope asphalt to a minimum depth of 6 mm 1/4 inch above bottom of sleepers. Anchored, treated wood sleepers must be spaced at 400 mm 16 inches on center with wood or plywood subfloor or, if required by design considerations, wood sleepers at 300 mm 12 inches on centers without subfloor and with 26 mm 33/32 inch thick flooring. Space between rows of wood sleepers must be left vacant. Expansion joints must be 50 mm 2 inches maximum.

##### 3.2.1.2 Steel Channels

Galvanized steel channel system must be placed on manufacturer's standard
grooved foam or grooved resilient insulation board. Expansion joints must be in accordance with manufacturer's recommendations.

3.2.2 Handball Court Floor and Walls

Strip flooring used for floors and walls in handball courts must be laid out to provide an overall light appearance; contrast from one board to the next must be gradual in order to avoid dark streaks.

3.2.3 Squash and Handball Court Walls

Maximum space for expansion must be 50 mm 2 inches at each wall. Expansion joints over 25 mm 1 inch and expansion joints for steel channel-strip flooring application must be detailed and the drawings, showing the method of covering, submitted for approval.

3.2.3.1 Wood Supports

Anchored wood supports must be used to keep the treated wood sleepers shimmed away from the wall to provide ventilation. Wood sleepers must be spaced at 400 mm 16 inches on center. Exterior grade plywood 15 mm 5/8 inch thick, with two coats of aluminum enamel on the back side in accordance with Section 06 10 00 ROUGH CARPENTRY, must be used for vapor seal and sound deadener.

3.2.3.2 Steel Supports

Anchored, galvanized, steel channel supports must be used with steel channel system; steel channels must be spaced at 300 mm 12 inches on center. The space between the supporting wall and the back of the finished wall must be filled to within 300 mm 12 inches of the ceiling with an approved hot-poured, steep-slope asphalt as the construction of the wall progresses. As an option to the asphalt-backed wall construction when 26 mm 33/32 inch thick flooring is used, the wall must be vapor sealed with a 0.15 mm 6 mil thickness of polyethylene sheeting prior to application to steel channels and the space between the supporting wall and the back of the finished wall must be filled with insulation as used for the floor.

3.3 Sanding

Sand flooring to a smooth, even, uniform finish without burns. Make a minimum of three sanding cuts, each with a finer sandpaper. Use a heavy drum-type sander for floors, except a disc-type sander is permitted for the final cut on strip flooring. Either the first pass or the second pass of the drum-type sander must be at an angle of 45 degrees to the grain; other passes of the drum-type sander must be in the direction of the grain of strip flooring. Finish edges not reached by the sander with an edger or by hand methods. Perform the final sanding at a time and in a manner that will permit application of the first seal coat as specified in Section 09 90 00 PAINTS AND COATINGS to be completed within 8 hours after completion of sanding. Leave the flooring clean and ready to receive the finishing materials.

3.4 Protection

Protect flooring from damage from the time of installation until final acceptance.

PART 3 EXECUTION

3.1 PREPARATION
3.1.1 Condition of Subfloors
3.1.2 Preparation of Concrete Slab
3.1.3 Anchor Plate Assemblies for Portable Sports Equipment
3.1.4 Work of Other Trades
3.1.5 Moisture Content

3.2 INSTALLATION
3.2.1 Vaporproofing For Slabs on Grade
3.2.2 Flooring Clipped to Steel Channels
   3.2.2.1 Channel Placing
   3.2.2.2 Laying of Finished Flooring
3.2.3 Flooring on Wood Sleepers with Rubber Cushions
   3.2.3.1 Installation of Wood Sleepers With Rubber Cushions
   3.2.3.2 Laying of Finished Flooring
3.2.4 Flooring on Board Subflooring, Wood Nailers, and Asphalt Fill
   3.2.4.1 Priming of Concrete Slab
   3.2.4.2 Wood Nailers
   3.2.4.3 Asphalt Fill
   3.2.4.4 Wood Board Subflooring
   3.2.4.5 Felt
   3.2.4.6 Laying of Finished Flooring
3.2.5 Flooring on Plywood Subflooring With Rubber Pads
   3.2.5.1 Installation of Plywood Subflooring With Rubber Pads
   3.2.5.2 Laying of Finished Flooring
3.2.6 Flooring, Continuous Steel-Splined, [on Cork Underlayment]
   3.2.6.1 Vaporproofing for Slabs on Grade
   3.2.6.2 Cork Underlayment
   3.2.6.3 Finished Flooring
3.2.7 Hardwood Base Installation
3.2.8 Molded-Rubber Base Installation
3.2.9 Steel Angle Base Installation

3.3 SANDING, FINISHING, AND MARKING
3.3.1 Sanding
3.3.2 Finishing
3.3.3 Marking

3.4 PROTECTION
3.5 SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for five gymnasium-type hardwood strip flooring systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This specification is intended for use in gymnasiums and for other similar uses and purposes. Guidance for selection of a system can be made based on the recommended applications, local availability or costs as shown in Selection Guidance Table in paragraph entitled "Hardwood Strip Flooring Systems on Concrete Slab." Construction of squash and handball court walls is not within the scope of this specification.

NOTE: On the drawings, show:

1. Elevation of top of concrete slab on which the floor system will be installed.
2. Location of permanent or temporary seats

3. Location of equipment and other permanent obstructions around which flooring is to be laid

4. Structural provisions for anchor-plate assemblies for sport equipment

5. Edge detail, including kind and size of wall base

6. Location, width, and color of game lines.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Hardwood Strip Flooring System

Clearly delineate components of the system. Show layout of [sleepers] [steel channels] [steel spines]; location of anchor plate assemblies, floor outlets, and underfloor conduit or raceway location; flooring system details; and flooring abutting other construction. Accessories shall be approved by the flooring manufacturer.

1.3 CERTIFICATION

1.3.1 Certified Sustainably Harvested Wood

**************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Sustainably Harvested Wood is a product which comes from a third-party Forestry Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration (e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.

Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications - if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certifications other than FSC; for all other projects pursuing third-party certification allow the entire list of third party certifications.
**************************************************************************

Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SPI 2015-2019, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable
wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.

1.3.2 Indoor Air Quality Certification

Submit required indoor air quality certifications in one submittal package.

1.3.2.1 Floor Covering Materials

Provide wood strip flooring and molded rubber base products certified to meet indoor air quality requirements by FLOORSCORE, UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide rubber cushions and pads, and flexible foam underlayment products certified to meet indoor air quality requirements by FLOORSCORE, UL 2818 (GreenGuard) Gold, SCS Global Services Indoor Advantage Gold, CRI GL CUSHION or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

******************************************************************************
NOTE: Include following section when fiberboard underlayment is included in project.
******************************************************************************

[1.3.2.2 Composite Wood, Wood Structural Panel and Agrifiber Products

For purposes of this specification, composite wood and agrifiber products include particleboard, medium density fiberboard (MDF), wheatboard, strawboard, panel substrates, and door cores. Provide products certified to meet requirements of both 40 CFR 770 and CARB 93120. Provide current product certification documentation from certification body.

]1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the building site in original unopened packages, bundles, or containers. Protect materials against dampness during shipment and after delivery. Store material under cover in a well-ventilated building. Prevent exposure to extreme changes of temperature and humidity. Do not store materials in building under construction until wet-applied building materials are dry. Store flooring in accordance with MFMA GRHM, under adequate and controlled ventilation and under approved temperature and humidity conditions at the location where it is to be laid for at least seven days before installation. Handle and store preservative-treated materials in accordance with AWPA M4.

1.5 ENVIRONMENTAL CONDITIONS

******************************************************************************
NOTE: Termite protection must be included. For new work, provide perimeter protection, using Section 31 31 16.13 CHEMICAL TERMITE CONTROL. For existing buildings without perimeter protection, add termite protection to the flooring using AWPA Standard C2 or other method recommended by the manufacturer.
******************************************************************************
For at least one week prior to and during installation, in the location to receive finish flooring and the location where flooring will be stored, maintain a temperature of between 18 and 27 degrees C (65 and 80 degrees F), and a relative humidity of between 40 and 60 percent. When the interior relative humidity exceeds 60 percent during or after installation of flooring, sanding and finishing of flooring shall be delayed for two to three weeks after completion of laying, unless directed otherwise. Provide adequate ventilation during the entire sealing and finishing process to ensure that no unhealthy or hazardous accumulation of vapors occurs. Ensure that environmental conditions are met.

PART 2 PRODUCTS

2.1 HARDWOOD STRIP FLOORING SYSTEMS ON CONCRETE SLAB

**************************************************************************

NOTE: Select the system most suited to the project and as recommended in Selection Guidance Table below.

In areas where termite or other insect attack is likely to occur specify that flooring be treated with wood preservative as recommended by flooring manufacturer.

Designer must indicate on finish schedule, schedule at end of specification or on drawings the location of selected subfloor systems.

</table>
2.1.1 Clipped to Steel Channels on Underlayment

Provide flooring system consisting of hardwood strip flooring clipped to steel channels that rest in premilled grooves in [fiberboard] [flexible foam] underlayment. Anchor steel channels to concrete floor slab.

2.1.2 Wood Sleepers with Rubber Cushions

Provide flooring system consisting of hardwood strip flooring nailed to wood sleepers that are seated on rubber cushions resting on the concrete floor slab.

2.1.3 Wood Board Subflooring, Wood Nailers, and Asphalt Fill

Provide flooring system consisting of hardwood strip flooring nailed to wood board subflooring that is, in turn, nailed to shimmed wood nailers anchored to the concrete floor slab. Provide hot asphalt fill under and between the wood nailers.

2.1.4 Plywood Subflooring with Rubber Pads

Provide flooring system consisting of hardwood strip flooring nailed to two-layer plywood subflooring that is seated on cushioned pads resting on the concrete floor slab.

2.1.5 Steel-Splined, Continuous Unit, [on Cork Underlayment]

Provide flooring system consisting of uniform lengths of hardwood strip flooring interlocked with steel splines and laid in asphalt mastic [on cork underlayment which is laid in asphalt mastic over membrane of felt] on the concrete floor slab.

2.2 MATERIALS

NOTE: Delete materials not included in floor system selected. Samples shall be complemented with manufacturer’s data and standard catalogs to describe the flooring system selected.

2.2.1 Strip Flooring

NOTE: Flooring of 26.2 mm 33/32 inch thickness should be used for floors subjected to hard and frequent service and frequent sanding.

NOTE: Maple flooring should be used for floors subjected to hard and frequent service or major athletics. Use beech and birch for less critical service.

Include last bracketed sentences requiring with indoor air quality certification or
validation products when product will be located in offices or classrooms.

**************************************************************************

Second or better grade [hard maple] [beech or birch] graded in accordance with current MFMA GRHM. Flooring must be [19.8] [26.2] [_____] mm [25/32] [33/32] [_____] inch thick by [57] [38] mm [2 1/4] [1 1/2] inches or narrower on the face, kiln dried, continuous tongue-and-groove, and end-matched. Provide wood products with no added urea-formaldehyde resins. Each bundle of flooring must be clearly grade stamped. Moisture content of strip flooring must not exceed 8 percent at time of arrival on job site and must be allowed to acclimate in accordance with paragraph DELIVERY, STORAGE, AND HANDLING.[ Flooring for steel-splined systems must be edge-grain 26.2 mm 33/32 inch thick by 33 mm 1 5/16 inch on the face, kiln-dried, continuous tongue-and-groove, and end grooved.] Provide certified sustainably harvested wood strip flooring.

[ Products must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for wood strip flooring.]

2.2.2 Hardwood Base

Clear [hard maple] [beech or birch]. Provide shape and size of base as indicated or as recommended by the flooring manufacturer.

2.2.3 Molded-Rubber Base

100 mm 4 inch vertical leg by 75 mm 3 inch, designed to allow ventilation under floor [with premolded outside corners and mitered inside corners], and as recommended by flooring manufacturer. Products must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for molded-rubber base.

2.2.4 Steel Angle Base

Provide 75 by 75 by 5 mm 3 by 3 by 3/16 inch continuous steel angle along perimeter walls, designed to allow ventilation under the floor. Base angle must conform to ASTM A36/A36M.

2.2.5 Steel Channels and Clips

Provide channels and clips not less than 1.5 mm thick 16 gage zinc-coated steel.

2.2.6 Fiberboard Underlayment

ASTM C208, fiberboard insulation board, impregnated with asphalt or coated with asphalt on faces and edges, treated for termite and water resistance. Products must contain no added urea-formaldehyde resins. Provide certification of indoor air quality for fiberboard underlayment.

2.2.7 Rubber Cushions and Pads

Rubber cushions and pads must have a durometer hardness of A50, plus or minus 5, when tested in accordance with ASTM D2240 and must have a minimum tensile strength of 10 MPa 1500 psi, when tested in accordance with ASTM D412. When subjected to an aging period of 70 hours and exposed to a temperature of 70 degrees C 158 degrees F, allowed to cool to room temperature over a period of 4 hours and retested, tested specimen must
have a change in hardness of 10 points maximum, a change in tensile strength of minus 25 percent maximum and a change in ultimate elongation of minus 25 percent maximum in accordance with the applicable test methods referenced above. Test rubber cushions, under a load of 275 kPa 40 psi, in accordance with ASTM D395, Method A. Size of tested specimen must be 57 by 75 by 10 mm 2 1/4 by 3 by 3/8 inch. Length of testing time must be 22 hours; temperature of test must be 70 degrees C 158 degrees F. Test specimen must recover, without set or displacement. Products must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for rubber cushions and pads.

2.2.8 Flexible Foam Underlayment

Multicellular, closed cell flexible polyethylene plastic foam having smooth skin; density 27 to 52 kg/cu m 1.7 to 3.3 pounds per cubic foot when tested by ASTM D1622/D1622M. Foam must be 13 mm 1/2 inch thick by 1200 mm 48 inches wide by manufacturer's standard length, premilled to receive steel channels at 300 mm 12 inch centers. Products must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for flexible foam underlayment.

2.2.9 Polyethylene Vaporproofing Membrane

ASTM D2103 Type 21110. Minimum thickness shall be 0.15 mm 6 mils. Perm rating must not exceed 0.02 when tested in accordance with ASTM E96/E96M.

2.2.10 Asphalt Primer

ASTM D41/D41M. Provide asphalt primer products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for asphalt primer.

2.2.11 Asphalt Mastic

As recommended by the flooring manufacturer. Provide asphalt mastic products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for asphalt mastic.

2.2.12 Asphalt Fill

ASTM D449/D449M, Type I. Provide asphalt fill material products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for asphalt fill.

2.2.13 Felt

2.2.14 Building Paper

Water-vapor permeable, 290 grams per mm 20 lb per inch dry tensile strength.
2.2.15 **Sleepers and Nailers**

NOTE: Preservative treatment specified herein shall be modified as necessary to suit local conditions. When referencing AWPA C1 and C2, water repellent requirements, if any, should be specified.

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.

Surfaced on four sides, 50 by 75 mm 2 by 3 inches nominal size, Standard or No. 2 grade douglas fir, northern or western and west coast hemlock, engleman-spruce or No. 2 dimension southern pine. Moisture content must not exceed 15 percent. Provide preservative treatment in accordance with [AWPA C1] [AWPA C2]. Identify treatment on each piece of material by the quality mark of an agency accredited by the Board of Review of the American Lumber Standard Committee. Brush coat exposed areas that are cut or drilled after treatment with the same preservative in accordance with AWPA M4.[ Provide certified sustainably harvested sleepers and nailers.]

2.2.16 **Wood Board Subflooring**

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.

No. 2 common douglas fir, northern or western hemlock, engleman spruce, or southern pine No. 2 boards, northern red or Norway pine, surfaced on four sides. Nominal sizes must be 25 by 150 mm or 25 by 100 mm 1 by 6 inches or 1 by 4 inches. Moisture content must not exceed 15 percent.[ Provide certified sustainably harvested wood board subflooring.]

2.2.17 **Plywood Subflooring**

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.

Douglas fir, southern pine, or western larch plywood; grade C-D, with exterior glue; 12.7 mm 1/2 inch thick by 4200 by 2400 mm 4 by 8 feet.[ Provide certified sustainably harvested plywood subflooring.]
2.2.18 Sealing and Finishing for Hardwood Strip Flooring

**************************************************************************
NOTE: Use Group II finish for aerobics, dance, and stage applications; use Group III for floors to be utilized for gymnasium and multipurpose applications.
**************************************************************************

**************************************************************************
NOTE: Use Group II finish for multipurpose, high wear areas; use group III for floors to be utilized solely for sports. Group III finish generally requires two sealer coats and two finish coats. Group II finish requires one sealer coat and two finish coats. Regardless of which finish is selected, each coat except the final coat should be burnished with No. 2 steel wool and wiped with a tack rag before application of the next coat.
**************************************************************************

Conform to MFMA AFSFSCL, Group [II] [III] finish. Seal coat and finish coat materials must be compatible with each other. Provide seal coat and finish coat products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for seal coat and finish coat materials.

2.2.19 Game Line Marking Materials

As recommended by wood flooring finish manufacturer. Provide game line marking products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for game line marking materials.

2.2.20 Nails

Shape and size as recommended by flooring manufacturer.

2.2.21 Underlayment

Corkboard or corkroll, 13 mm 1/2 inch thick, conforming to ASTM F36.

2.2.22 Adhesives

Waterproof, suitable for use with molded rubber base, recommended by rubber base manufacturer. Provide adhesive products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for adhesives.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Condition of Subfloors

**************************************************************************
NOTE: The concrete slab on which the floor system is to be installed must be depressed according to the requirements of floor system being used. Ensure that the required depressions are shown on the drawings.

Do not install flooring on surfaces that are not suitable for proper installation. Before beginning work under this section, correct defects such as rough or scaling concrete, low spots, high spots, uneven surfaces, and repair damaged portions of concrete slabs. Concrete slabs must be given a leveling course of latex fill and the surface shall not vary more than 3 mm 1/8 inch when measured with a 3 meter 10 foot straightedge placed in any direction.

3.1.2 Preparation of Concrete Slab

Sweep concrete floor. Ensure that slab is dry and clean. Remove paint spots, plaster, masonry droppings, grease, dirt, and other foreign matter [including chemical curing agents which may affect the bond of adhesive-applied wood flooring systems]. Concrete must be fully cured and dry.

3.1.3 Anchor Plate Assemblies for Portable Sports Equipment

NOTE: Anchor plate assemblies for portable sports equipment should be specified as a part of each individual piece of equipment in Division 11 of the project specifications; however, if no equipment is to be specified and anchor plates are desired for future equipment, they must be detailed in the drawings, and materials and installation must be specified in Part 2 of this section. Do not specify anchors to be supplied by floor manufacturer; they do not normally supply them.

Floor anchor plate assemblies for vertically adjustable portable sports equipment shall be installed where indicated. Flooring must be cut neatly around floor plates.

3.1.4 Work of Other Trades

Do not start work specified under this section until work of trades which could create moisture, has been completed.

3.1.5 Moisture Content

Check flooring, subflooring, sleepers and nailers with an approved meter verifying conformance with the requirements specified hereinbefore.

3.2 INSTALLATION

NOTE: Provisions for expansion and contraction will be governed by local weather conditions and by temperatures and humidities to be maintained within building. Modify specifications accordingly. The
Floor systems included in this specification are intended for installation on or above grade. If installation is below grade, provisions for waterproofing must be made and the requirements specified in Division 7. Select type of flooring to be used and delete other.

In conjunction with vapor-proofing, at least 150 mm 6 inches of porous fill, capillary water barrier, consisting of clean, washed gravel graded from 19 to 38 mm 3/4 to 1 1/2 inch sizes should be provided under slab and specified in Division 2. No sand or crushed coral should be used between top of gravel and bottom of slab. If surrounding drainage conditions indicate probable development of hydrostatic pressure under slab, three-ply membrane waterproofing should be provided under slab. Specify in Division 7.

**************************************************************************

Do not install building construction materials that show visual evidence of biological growth.

3.2.1 Vaporproofing For Slabs on Grade

Cover slab with the polyethylene membrane. Lap joints at least 150 mm 6 inches. Seal joints with a full coverage of the adhesive recommended by the membrane manufacturer.

3.2.2 Flooring Clipped to Steel Channels

3.2.2.1 Channel Placing

Install each channel in premilled grooves spaced 300 mm 12 inches on center in [fiberboard] [flexible foam] parallel to the short side of the room, with butted end-to-end joints staggered at least 600 mm 24 inches. Anchor channels to the slab at 350 mm 14 inches on center with 10 mm 3/8 inch diameter, flat headed anchors that penetrate the slab by at least 32 mm 1-1/4 inches. Set channels level.

3.2.2.2 Laying of Finished Flooring

Lay finished flooring at right angles to the steel channels. Begin installation with double-tongue strips of flooring in center of room. Clip each board down tightly at each channel intersection with zinc-coated flooring clips. Each clip must firmly engage the side edges of the flooring and the steel channels. Ensure that each clip is placed properly. Stagger adjacent end joints of flooring so that there will be at least two boards between joints. Where floor plates occur, install steel channels along edges of flooring board; provide clips for flooring. Drive each flooring strip up sideways and endways as tightly as practicable using steel driving tools that prevent marring of exposed flooring. Scribe boards to permanent obstructions and be securely blocked at wall lines.

3.2.3 Flooring on Wood Sleepers with Rubber Cushions

3.2.3.1 Installation of Wood Sleepers With Rubber Cushions

Install rubber-cushioned wood sleepers, [300 mm 12 inches on center for 26.2

SECTION 09 64 66   Page 20
mm 33/32 inch] [225 mm 9 inches on center for 19.8 mm 25/32 inch] thick flooring, parallel to short side of the room, with butted end-to-end joints, 6 mm 1/4 inch apart at the joints, staggered at least 600 mm 24 inches. Sleepers must have the rubber cushions attached at 300 mm 12 inch centers. Provide a 50 mm 2 inch air space between ends and sides of sleepers at walls and other permanent obstructions. Sleepers must be seated level and firm with rubber cushions bearing completely on the subfloor.[ In areas where fixed or temporary seats are indicated, provide 40 by 48 mm 1-5/8 by 1-7/8 inch wood screeds midway between the cushioned wood sleepers.]

3.2.3.2 Laying of Finished Flooring

Begin installation of flooring in center of space with double-tongue strips of flooring. Lay flooring at right angles to the wood sleepers. Blind nail each strip of flooring to each wood sleeper with 63 by 3 mm 8 penny spiral screw nails. Leave a continuous air space, 50 mm 2 inches wide, between the finished flooring and perimeter walls and other permanent obstructions. Stagger end joints of adjacent strips of flooring so that there will be at least two boards between each joint.

3.2.4 Flooring on Board Subflooring, Wood Nailers, and Asphalt Fill

3.2.4.1 Priming of Concrete Slab

Prime slab with asphalt primer using minimum of 1.6 liter per 10 square meters one gallon per 250 square feet. Allow primer to dry.

3.2.4.2 Wood Nailers

Install continuous 50 by 75 mm 2 by 3 inch nominal size wood nailers 300 mm 12 inches on center, parallel to short side of room, with butted end-to-end staggered joints, 6 mm 1/4 inch apart at the joints. Elevate bottoms of nailers about 5 mm 3/16 inch above concrete slab with fiber shims. Fasten nailers to slab with 6 by 88 mm 1/4 by 3 1/2 inch power driven anchors spaced 750 mm 30 inches on center and staggered in adjacent rows. Provide an additional anchor not more than 150 mm 6 inches from the end of each nailer. Provide a 50 mm 2 inch air space between ends and sides of sleepers at walls and other permanent obstructions. Nailers must be set level and in alignment. Check level of tops of nailers with a surveyor's instrument.

3.2.4.3 Asphalt Fill

**************************************************************************
NOTE: Because of asphalt cushion and fill specified, no additional vapor barrier is recommended.
**************************************************************************

When the wood nailers have been set and leveled, pour the hot asphalt over the entire concrete slab surface; fill the spaces under the wood nailers completely and cover the concrete slab surface between the nailers to a depth of approximately 10 to 13 mm 3/8 to 1/2 inch. Pour asphalt up 6 mm 1/4 inch on the sides of the nailers.

3.2.4.4 Wood Board Subflooring

Apply wood subflooring diagonally over the wood nailers. Cut ends parallel to and over center lines of wood nailers. Nail subflooring securely to
each wood nailer with 57 by 3 mm 7 penny steel spiral screw nails; use two nails for 100 and 150 mm 4 and 6 inch wide boards. Space boards approximately 3 mm 1/8 inch apart. Top of subflooring shall have a true, even plane. Provide 50 mm 2 inches of clearance between subflooring and perimeter walls and other permanent obstructions.

3.2.4.5 Felt

Cover wood subflooring with a layer of the felt. Butt edges tightly. Do not extend felt over air space between ends and sides of finished floor and perimeter walls or other permanent obstructions.

3.2.4.6 Laying of Finished Flooring

Begin installation of flooring in center of space with double-tongue strips of flooring. Lay flooring at right angles to the wood nailers and parallel with the long dimension of the room. Blind nail each strip of flooring through the subflooring and into the sleeper with 63 by 3 mm 8 penny screw type nails, spaced not over 300 mm 12 inches apart over the sleepers. Leave a continuous air space 50 mm 2 inches wide between the finished flooring and perimeter walls and other permanent obstructions. Stagger end joints of adjacent strips of flooring so that there will be at least two boards between each joint.

3.2.5 Flooring on Plywood Subflooring With Rubber Pads

3.2.5.1 Installation of Plywood Subflooring With Rubber Pads

Provide two layers of 12.7 mm 1/2 inch thick plywood sheets, of 1200 by 2400 mm 4 by 8 feet. Each 1200 by 2400 mm 4 by 8 foot sheet in the bottom layer bearing on slab must have 32 rubber pads, 57 by 75 by 10 mm 2-1/4 by 3 by 3/8 inch thick, approximately 300 mm 12 inches on center in each direction, stapled to underside of sheet. Partial sheets must have rubber pads 300 mm 12 inches on center and at perimeters. Lay first layer of plywood on concrete floor slab, parallel to short side of room. Lay second layer at a 45 degree angle to first layer and fasten it to first layer by machine nailing or stapling on 600 mm 24 inch centers using 25 mm one inch nails or staples. Leave a continuous air space 50 mm 2 inches wide between the subflooring and perimeter walls and other permanent obstructions and 6 mm 1/4 inch between panels at sides and ends. Lap panels so that no joint will fall over any joint of the first layer.[ In areas where fixed or temporary seats are indicated, provide fixed hardboard shims, 3 mm 1/8 inch thick, between the cushioned pads.]

3.2.5.2 Laying of Finished Flooring

Begin installation of flooring in center of space with double-tongue strips of flooring. Lay flooring parallel with the long dimension of the room. Flooring must be blind nailed on 250 mm 10 inch centers with 45 mm 1-3/4 inch spiral screw nails. Leave a continuous air space, 50 mm 2 inches wide, between the finished flooring and perimeter walls and other permanent obstructions. Stagger end joints of adjacent strips of flooring so that there will be at least two boards between each joint.[ Roller skating rink flooring shall be 26.2 mm 33/32 inch thick or 19.8 mm 25/32 inch and laid in special octagonal pattern as indicated. Diagonal intersections of flooring shall be joined with barbed steel splines.]
3.2.6 Flooring, Continuous Steel-Splined, [on Cork Underlayment]

3.2.6.1 Vaporproofing for Slabs on Grade

Prime concrete slab with asphalt primer using a minimum of 1.6 liter per 10 square meters one gallon per 250 square feet. Following application and drying of the primer apply a membrane of two layers of felt. Lay each layer of felt in a coating of trowelled asphalt mastic, applied at the rate of at least 11.5 liters per 10 square meters one gallon per 35 square feet. Felts shall be butted at joints. Turn up felt 40 mm 1-1/2 inches at perimeter walls and other permanent obstructions. Roll felt thoroughly, eliminating air pockets and blisters, to provide an overall smooth and level surface. Cover top layer of felt with a coating of trowelled asphalt mastic applied at the rate of at least 11.5 liters per 10 square meters one gallon per 35 square feet.

3.2.6.2 Cork Underlayment

Install underlayment in asphalt mastic. Provide a 2 mm 1/16 inch space at joints of corkboard. After underlayment has been installed, roll entire area with a 68 kilogram 150 pound roller to attain maximum bond and a uniformly even surface. Leave a 40 mm 1-1/2 inch air space between underlayment and perimeter walls and other permanent obstructions.

3.2.6.3 Finished Flooring

Lay 300 mm 12 inch long strips of finished flooring firmly in full bed of asphalt mastic in end-to-end courses, interlocking with saw-tooth steel splines into the slotted ends. Break joints of continuous strip units in succeeding courses. Lay continuous strip units parallel with the width of the room. Lay flooring level and in correct alignment. Leave a continuous air space, 40 mm 1-1/2 inches wide, between the finished flooring and perimeter walls and other permanent obstructions. Lay flooring with hairline joints. Do not drive flooring up tightly.

3.2.7 Hardwood Base Installation

**************************************************************************
NOTE: Select type of base desired and delete the inapplicable types. Bases specified are not a standard product of any manufacturer, and must be detailed on the drawings.
**************************************************************************

Install molded and perforated continuous hardwood base of the type indicated, along perimeter walls. Base shall have 10 mm 3/8 inch diameter vent holes spaced 125 mm 5 inches on center in a straight row. Nail or bolt base to wall. Do not fasten base to flooring.

3.2.8 Molded-Rubber Base Installation

**************************************************************************
NOTE: Select type of base desired and delete the inapplicable types. Bases specified are not a standard product of any manufacturer, and must be detailed on the drawings.
**************************************************************************

Install molded-rubber base firmly on perimeter walls in continuous adhesive
as recommended by the base manufacturer. Provide vertical, circular or semicircular vent holes in base spaced 125 mm 5 inches on center in a straight row. Do not fasten base to flooring.

3.2.9 Steel Angle Base Installation

**************************************************************************
NOTE: Select type of base desired and delete the inapplicable types. Bases specified are not a standard product of any manufacturer, and must be detailed on the drawings.
**************************************************************************

Install 75 by 75 by 5 mm 3 by 3 by 3/16 inch continuous steel angle along perimeter walls. Bottom leg of angle shall have 10 mm 3/8 inch diameter vent holes spaced 125 mm 5 inches on center in a straight row. Fasten angle to wall at intervals of 400 mm 16 inches with countersunk head [expansion] [toggle] bolts. Do not fasten angle to flooring.

3.3 SANDING, FINISHING, AND MARKING

3.3.1 Sanding

Sand wood floor surfaces with a machine using coarse, medium, and fine grades of sandpaper; the edges must be sanded to a smooth edge; the finished surface must be smooth and level, free from scratches. A final disc sanding shall be provided. After final sanding or buffing, vacuum floors until clean. Do not walk on floors thereafter until finish has been applied and is dry.

3.3.2 Finishing

**************************************************************************
NOTE: Use first bracketed sentence if finish is to be specified elsewhere in Division 9 of the project specifications; use second bracketed sentence if finish is specified under this section. Select Group II or Group III finish in the next-to-last sentence of this section.
**************************************************************************

[Finishing must be provided as specified in [____].] [Within one day after the final sanding, buffing, and sweeping have been completed, use a tacky rag to clean flooring with a low VOC solvent recommended by the manufacturer of the floor finish material. Follow cleaning with a coating of sealer; when thoroughly dry, burnish with No. 2 steel wool, using a power machine. After final burnishing and prior to application of final finish coat(s), layout and mark game lines as specified herein; after game lines are thoroughly dry, apply final finish coat.] Floors must be wiped with a tacky rag each burnishing.[ Finish floors in accordance with MFMA SSCLFMGF. Four Coat Specification: Group II finish must consist of one sealer coat and three finish coats. Group III finish must consist of two sealer coats and two finish coats. Allow 5 days for proper curing.]
3.3.3 Marking

Lay out game lines and fields [and patterns] where indicated, masking edges to provide sharp, clean edges. Edge must be straight and width shall be uniform. Apply marking of colors indicated, providing a minimum dry film thickness of one mil.

3.4 PROTECTION

After completion of laying, finishing, and marking of the flooring, do not use the floor for at least 72 hours. Avoid heavy traffic on the floor for at least one week. Upon floor drying, use nonstaining, porous building paper of the type and grade recommended by manufacturer, taped along edges. Remove kraft paper covering after work in this area is completed.

3.5 SCHEDULE

Metric measurements in this section are based on mathematical conversion of English unit measurement, and not on metric measurement commonly agreed to by the manufacturers or other parties. The English and metric units for the measurements shown are as follows:

NOTE: This guide specification covers the requirements for resilient floor coverings, base materials, and accessory items.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: Resilient flooring may be used over wood subfloor provided that the subfloor underside is well ventilated and the installation conforms to the manufacturer's recommendations. Note that not all products are recommended for installation over panel type underlayment.

Flooring such as nonslip tile is not included in this specification; add appropriate wording when it is required.

Show location of resilient flooring, including types, on the drawings.
1.1 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBMITTALS

**********************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor’s Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.
Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 CERTIFICATES

1.3.1 Indoor Air Quality

Submit required indoor air quality certifications and validations in one submittal package.
1.3.1.1 Floor Covering Materials

Provide [Vinyl Composition Tile][Sheet Vinyl Flooring][Rubber Tile][Rubber Sheet Flooring][Luxury Vinyl Tile][Solid Vinyl Tile][Sheet Linoleum][Linoleum Tile][Cork Flooring], and wall base products certified to meet indoor air quality requirements by FLOORSCORE, UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification by other third-party programs. Provide current product certification documentation from certification body.

1.3.1.2 Adhesives, Caulking and Sealants

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party programs that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

**************************************************************************

NOTE: Include the following section when specifying cork flooring. Use certified sustainably harvested wood where suitable for application and cost effective. Sustainably Harvested Wood is a product which comes from a third-party Forest Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest regeneration (such as, replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.

Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications – if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certification other than FSC; for all other projects pursuing third-party certification allow the entire list of third party certifications.

**************************************************************************

1.3.2 Certified Sustainably Harvested Wood

Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SPI 2015-2019 Standards and Rules, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.
1.4 DELIVERY, STORAGE, AND HANDLING

**************************************************************************
NOTE: Materials which are woven, fibrous, or porous in nature have a high capacity to adsorb VOC emissions; for instance, acoustical ceilings, carpet, textiles, and unprimed gypsum wall board. If specifying porous materials include bracketed text and indicate materials to be protected.
**************************************************************************

Deliver materials to the building site in original unopened containers bearing the manufacturer's name, style name, pattern color name and number, production run, project identification, and handling instructions. Store materials in a clean, dry, secure, and well-ventilated area free from strong contaminant sources and residues with ambient air temperature maintained above 20 degrees C (68 degrees F) and below 30 degrees C (85 degrees F), stacked according to manufacturer's recommendations. Remove resilient flooring products from packaging to allow ventilation prior to installation. Protect materials from the direct flow of heat from hot-air registers, radiators and other heating fixtures and appliances. Observe ventilation and safety procedures specified in the MSDS. Do not store rubber surface products with materials that have a high capacity to adsorb volatile organic compound (VOC) emissions, including [_____] near materials that may offgas or emit harmful fumes, such as kerosene heaters, fresh paint, or adhesives.

1.5 ENVIRONMENTAL REQUIREMENTS

Maintain areas to receive resilient flooring at a temperature above 20 degrees C (68 degrees F) and below 30 degrees C (85 degrees F) for 3 days before application, during application and 2 days after application, unless otherwise directed by the flooring manufacturer for the flooring being installed. Maintain a minimum temperature of 13 degrees C (55 degrees F) thereafter. Provide adequate ventilation to remove moisture from area and to comply with regulations limiting concentrations of hazardous vapors.

1.6 SCHEDULING

Schedule resilient flooring application after the completion of other work which would damage the finished surface of the flooring.

1.7 WARRANTY

Provide manufacturer's standard performance guarantees or warranties that extend beyond a one year period.

1.8 EXTRA MATERIALS

**************************************************************************
NOTE: To ensure matching flooring that may become damaged and require spot replacement, a supply of extra flooring of same types, colors and dye lot is recommended. Coordinate requirement for extra stock with customer; warehousing may not be available.
**************************************************************************
Provide extra flooring material of each color and pattern at the rate of 
([_____] [5] tiles for each 1000 tiles) [and] ([_____] [0.5] square m [5] 
square feet for each 92 square m 1000 square feet of sheet flooring) 
installed. Provide extra wall base material composed of 6 m 20 linear feet 
of each type, color and pattern. Package all extra materials in original 
properly marked containers bearing the manufacturer's name, brand name, 
pattern color name and number, production run, and handling instructions. 
Provide extra materials from the same lot as those installed. Leave extra 
stock at the site in location assigned by Contracting Officer.

PART 2  PRODUCTS

**************************************************************************
NOTE: Appropriate flooring material should be determined by:
- Amount and type (such as, foot, cart, wheelchair) of traffic
- Abrasiveness of local soil conditions
- Exposure to water, chemicals, grease, and burns
- Exposure to in-use damage (cuts, tears, gouges)
- Exposure to direct sunlight (fading potential)
- Anticipated type of and frequency of maintenance
- Cost of maintenance
- Appearance expectations
Verify proposed use of flooring with manufacturer's recommendations.

Sheet flooring should be considered for areas such as healthcare facilities due to the reduced amount of seams. Seam welded sheet flooring without backing provides a monolithic floor impervious to moisture penetration.

Specify special adhesive for resilient flooring installed on floors with radiant heating, wet areas and areas with heavy rolling loads.

If more than one type of resilient flooring is required, a separate paragraph for each type will be used. Each type will be designated with a letter or number symbol. Use the same symbols to key flooring to locations on the drawings and in Section 09 06 00 SCHEDULES FOR FINISHES. Delete reference to type symbol if not used.

**************************************************************************
2.1 VINYL COMPOSITION TILE [TYPE [A][____]]

**************************************************************************
NOTE: When vinyl composition tile is used, 3.2 mm 1/8 inch thick should be utilized in high traffic commercial type installations.

Solid color tiles are tiles with uniform color throughout. These are recommended for use as an accent only in small quantities and not as the floor field color. These tiles do not hide soiling well and show scratches easily.
Through pattern tiles are tiles with patterning distributed through the entire thickness.

Conform to ASTM F1066 [Class 1, (solid color tile),] [Class 2, (through pattern tile),] Composition 1, asbestos-free, [300] [_____] mm [12] [_____] inch square and [2.4] [3.2] mm [3/32] [1/8] inch thick. Provide color and pattern uniformly distributed throughout the thickness of the tile.

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available from some US national manufacturers above the minimum recycled content shown. Some manufacturers do not offer recycled content.

[ Provide Vinyl Composition Tile containing a minimum of 10 percent recycled content. Provide data identifying percentage of recycled content for Vinyl Composition Tile.]

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.

[ Provide certification of indoor air quality for Vinyl Composition Tile.]

2.2 SHEET VINYL FLOORING [TYPE [A][_____]]

NOTE: Not all sheet vinyl flooring is available with chemically bonded or heat welded seams. Research available products.

Conform to [ASTM F1303, Type I, Grade 1, [Class A-non-asbestos formulated fibrous backing] [or] [Class B-nonfoamed plastic backing] (minimum wear layer thickness 0.5 mm 0.020 inch and minimum overall thickness 2 mm 0.080 inch) and a minimum [1800 mm 6 feet] [3660 mm 12 feet] wide.] [ ASTM F1303, Type II, Grade 1, without backing (minimum wear layer thickness 2 mm 0.080 inch and minimum overall thickness 2 mm 0.080 inch), and a minimum 1800 mm 6 feet wide. Extend color and pattern through the total thickness of the material.] [ ASTM F1303, Type II, Grade 1, [Class A non-asbestos formulated fibrous backing] [or] [Class B nonfoamed plastic backing] (minimum wear layer thickness 1.27 mm 0.050 inch and minimum overall thickness 2 mm 0.080 inch) and a minimum 1800 mm 6 feet wide. Extend color and pattern throughout the thickness of the wear layer.] [ ASTM F1913, (minimum wear layer thickness 1.9 mm 0.075 inch and minimum overall thickness 1.9 mm 0.075 inch) and a minimum 1800 mm 6 feet wide. Extend color and pattern through the total thickness of the material.] As required, provide welding rods as recommended by the manufacturer for heat welding of joints.

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available from some US national manufacturers above the minimum recycled content shown. Some manufacturers do not offer recycled content.

[ Provide Sheet Vinyl Flooring containing a minimum of 25 percent recycled content. Provide data identifying percentage of recycled content for Sheet Vinyl Flooring.]

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.

[ Provide certification of indoor air quality for Sheet Vinyl Flooring.]

2.3 RUBBER TILE [TYPE [A][_____]]

NOTE: Rubber flooring provides slip resistance not usually found with other type floor tiles. Consider for areas such as stairwell landings and ramps. Rubber flooring has a cushioning quality that reduces leg weariness and fatigue.

Some rubber flooring is not resistant to oil and grease and can perform poorly against certain reagents and stain spills. Determine project needs, research available product and add verbiage to paragraph if rubber flooring needs to be resistant to oil and grease and perform against certain reagents and stain spills.

Research available sizes. Manufacturer's sizes vary and not all manufacturers offer all sizes.

Ingredients in rubber flooring may include either natural rubber or synthetic materials. Natural rubber is a renewable raw material that is extracted from the sap of the tropical rubber plant without harming the plant. Typically, no waxes are required to maintain rubber floors.

Conform to ASTM F1344 [Class 1 homogeneous] [Class 2 layered], [Type A (solid color)] [Type B (through mottled)], [300] [450] [600] [900] [_____] mm [12] [18] [24] [36] [_____] inch square. Provide [smooth] [_____] [raised] [round] [square] [diamond] surface studs with chamfered edges. Provide [high] [low] stud profile. Provide [3.2] [_____] mm [0.125] [_____] inch overall thickness. [With Vulcanize Particulate Rubber, use
recycled tire treads in accordance with ASTM D5603, fine mesh size particulate, [Grade 1, 2, or 3] [Grade 4] [Grade 5] [Grade 6].

**************************************************************************
NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.
**************************************************************************

[ Provide certification of indoor air quality for Rubber Tile.]

2.4 RUBBER SHEET FLOORING [TYPE [A] [_____]]

**************************************************************************
NOTE: Rubber sheet flooring provides slip resistance not usually found with other type floor tiles. Consider for areas such as stairwell landings and ramps. Rubber flooring has a cushioning quality that reduces leg weariness and fatigue.

Some rubber flooring is not resistant to oil and grease and can perform poorly against certain reagents and stain spills. Determine project needs, research available product and add verbiage to paragraph if rubber flooring needs to be resistant to oil and grease and perform against certain reagents and stain spills.

The following thicknesses of rubber flooring are recommended for the traffic type shown: 2.0 mm 0.080 inch thickness - low traffic; 2.5 mm 0.100 inch thickness - medium traffic; 3 mm 0.118 inch thickness or greater - heavy traffic.

Research available widths. Manufacturer's widths vary and not all manufacturers offer all sizes.
**************************************************************************
Conform to [ASTM F1859 (flooring without backing), [Type I homogeneous] [Type II layered)] [or] [ASTM F1860 (flooring with backing), [Type I homogeneous] [Type II layered]], [minimum] [1 m 36 inch] [_____] wide.
Provide [smooth] [embossed] [_____] surface. Provide [2] [2.5] [3] [_____] mm [0.080] [0.100] [0.118] [_____] inch overall thickness.[ With Vulcanize Particulate Rubber, use recycled tire treads in accordance with ASTM D5603, fine mesh size particulate, [Grade 1, 2, or 3] [Grade 4] [Grade 5] [Grade 6].]
**************************************************************************
NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.
**************************************************************************

[ Provide certification of indoor air quality for Rubber Sheet Flooring.]

2.5 LUXURY VINYL TILE [TYPE [A][_____]]

Conform to ASTM F1700 Class III printed film with a minimum wear layer
thickness [ 0.50 mm 0.020 inch (20 mil)][ 0.70 mm 0.030 inch (30 mil)][_____] and minimum overall thickness [[ 2.5 mm 0.098 inch] [or] [ 3 mm 0.118 inch]] [ 5 mm 0.197 inch[ with non slip/skid backing]], Type A (smooth) [B (embossed)]. Provide[ [300 by 600] [_____] mm [12 by 24] [_____] inch][ [300] [400] [450] [600] [900] [_____] mm [12] [16] [18] [24] [36] [_____] inch square][_____] tile.[ Provide tile with a factory protective finish that enhances cleanability and durability.]

**************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available from some US national manufacturers above the minimum recycled content shown. Some manufacturers do not offer recycled content.

**************************************************************************

[ Provide Luxury Vinyl Tile containing a minimum of 35 percent recycled content. Provide data identifying percentage of recycled content for Luxury Vinyl Tile.]

**************************************************************************

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.

**************************************************************************

[ Provide certification of indoor air quality for Luxury Vinyl Tile.]

2.6 SOLID VINYL TILE [TYPE A][_____] 

Conform to ASTM F1700 Class I monolithic (minimum wear layer thickness 3 mm 0.125 inch and minimum overall thickness 3 mm 0.125 inch, Type A (smooth)] [B (embossed)]. Provide [300] [400] [450] [600] [900] [_____] mm [12] [16] [18] [24] [36] [_____] inch square tile.

**************************************************************************

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.

**************************************************************************

[ Provide certification of indoor air quality for Solid Vinyl Tile.]

2.7 SHEET LINOLEUM [TYPE A][_____] 

Conform to ASTM F2034 and consist of a homogeneous layer of a mixture of linoleum cement (binder in linoleum consisting of a mixture of linseed oil, pine rosin, fossil, or other resins or rosin, or an equivalent oxidized oleoresinous binder), cork and/or wood flour, mineral fillers, and pigments bonded to a jute backing. Provide a minimum 1800 mm 6 feet wide and overall thickness not less than [2.0 mm 0.080 inch] [2.5 mm 0.100 inch] [3.2 mm 0.125 inch] for linoleum. As required, provide welding rods as recommended by the manufacturer for heat welding of joints.
Provide Sheet Linoleum containing a minimum of 30 percent recycled content. Provide data identifying percentage of recycled content for Sheet Linoleum.

Provide Sheet Linoleum products with minimum 95 percent bio-based content. Submit data identifying percentage of bio-based content for Sheet Linoleum.

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.

[ Provide certification of indoor air quality for Sheet Linoleum.]

2.8 LINOLEUM TILE [TYPE [A][_____]]

Conform to ASTM F2195 and consist of a homogeneous layer of a mixture of linoleum cement (binder in linoleum consisting of a mixture of linseed oil, pine rosin, fossil, or other resins or rosin, or an equivalent oxidized oleoresinous binder), cork or wood flour, mineral fillers, and pigments bonded to a [polyester] [_____] backing. Provide square tiles a minimum [450 mm 18 inch] [_____] square and overall thickness [2.0 mm 0.08 inch] [_____] minimum for linoleum tile.

Provide Linoleum Tile containing a minimum of 30 percent recycled content. Provide data identifying percentage of recycled content for Linoleum Tile.

Provide Linoleum Tile with minimum 90 percent bio-based content. Submit data identifying percentage of bio-based content for Linoleum Tile.

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms.

[ Provide certification of indoor air quality for Linoleum Tile.]

2.9 CORK FLOORING

NOTE: Cork granules used for cork flooring and linoleum are by-products from bottle-cork manufacturing. Some cork floors use synthetic binders in the manufacturing process and synthetic finishes to provide more durable walking surfaces. Typically available only in tile form, cork usually provides better sound absorption characteristics than most vinyl flooring but is less durable than commercial vinyl and rubber flooring.

Conform to ISO 3813, and be [300] [_____] mm [12] [_____] inches square and [0.05] [_____] m [3/16][_____] inches to [0.08] [_____] m [5/16] [_____] inches thick. [Provide cork-faced MDF tongue-and-groove planks with cork facing.] Do not use products made with urea-formaldehyde binder.

NOTE: Use materials with recycled content where...
appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available from some US national manufacturers above the minimum recycled content shown. Some manufacturers do not offer recycled content.

**************************************************************************
[ Provide Cork Flooring containing a minimum of 95 percent recycled content. Provide data identifying percentage of recycled content for Cork Flooring.]

Provide Cork Flooring with minimum 100 percent bio-based content. Submit data identifying percentage of bio-based content for Cork Flooring.

**************************************************************************

[ Provide certification of indoor air quality for Cork Flooring.]

**************************************************************************

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms. Research shows that the product is available from some US national manufacturers with the following certification.

**************************************************************************

[ Provide certified sustainably harvested Cork Flooring.]

2.10 WALL BASE

**************************************************************************

NOTE: Job formed corners are recommended. The return on preformed corners is not always long enough to hold the piece in place and the corners can be knocked off during vacuuming and other cleaning operations.

Base is available in different lengths ranging from 1.22 m 4 feet pieces to 30.48 m 100 feet or 36.58 m 120 feet rolls. Availability and roll lengths vary dependent on manufacturer. Identify required length if it impacts design intent. Some manufacturers of Type TS (vulcanized thermoset rubber) base offer only 1.22 m 4 feet lengths and not roll goods.

**************************************************************************

Conform to ASTM F1861, [[Type TS (vulcanized thermoset rubber)] [or] [Type TP (thermoplastic rubber)]] [, or] [Type TV (thermoplastic vinyl)], [Style
A (straight - installed with carpet) [,] [and] [Style B (coved - installed with resilient flooring)] [, ] [and] [Style C (butt toe cove installed with 3 mm 1/8 inch thick flooring)]. Provide [100] [150] mm [4] [6] inch high and a minimum 3.175 mm 1/8 inch thick wall base. Provide [preformed] [job formed] corners in matching height, shape, and color. With Vulcanizate Particulate Rubber, use recycled tire treads in accordance with ASTM D5603, fine mesh size particulate, [Grade 1, 2, or 3] [Grade 4] [Grade 5] [Grade 6].

**************************************************************************

NOTE: Include the last bracketed sentence requiring products with indoor air quality certifications when product will be located in offices or classrooms. Research shows that the product is available from some US national manufacturers with the following certification.

**************************************************************************

[ Provide certification of indoor air quality for Wall Base.]

2.11 INTEGRAL COVE BASE

**************************************************************************

NOTE: Integral coves can be used in many situations in which sheet vinyl and linoleum flooring are used to enhance the sanitary capacity inherent in seamless construction.

Consider specifying corner protectors in high traffic areas and areas that may receive some abuse.

Corner protectors are preferred in naval installations.

**************************************************************************

Extend integral coved base for [[sheet vinyl] [and] [sheet linoleum] flooring up the wall [100] [150] mm [4] [6] inch]. Provide a [vinyl] [or] [rubber] [clear anodized aluminum], [square] [round] cap strip and vinyl, rubber, or wood fillet strip with a minimum radius of 19 mm 3/4 inch for integral coved bases [at perimeter and fixed vertical interruptions to flooring] [as shown]. Provide integral cove of the same material as flooring. [Provide inside and outside corner protectors of [______]-colored anodized aluminum] [clear anodized aluminum] [or] [plastic] approved by flooring manufacturer.]

2.12 STAIR TREADS, RISERS AND STRINGERS

Conform to ASTM F2169, [[Type TS (vulcanized thermoset rubber)] [or] [Type TP (thermoplastic rubber)]] [or] [Type TV (thermoplastic vinyl)]. Conform to ASTM F2169 for surface of treads [Class 1 smooth] [[Class 2 raised [round] [square] [diamond] stud] [ribbed] pattern] [and have [Group 1 abrasive non-slip strip] [Group 2 strip for visually impaired of contrasting [______] color of [same] [abrasive] material]]. Provide [square] [or] [round] nosing. Provide either a one piece nosing/tread/riser or a two piece nosing/tread design with a matching coved riser. [ With Vulcanizate Particulate Rubber, use recycled tire treads in accordance with ASTM D5603, fine mesh size particulate, [Grade 1, 2, or 3] [Grade 4] [Grade 5] [Grade 6].]
2.13 MOULDING

Provide tapered mouldings of [vinyl] [or] [rubber] [clear anodized aluminum] and types as recommended by flooring manufacturer for both edges and transitions of flooring materials specified. Provide vertical lip on moulding of maximum 6 mm 1/4 inch. Provide bevel change in level between 6 and 13 mm 1/4 and 1/2 inch with a slope no greater than 1:2.

2.14 ADHESIVES

**************************************************************************
NOTE: Adhesives may be a source of VOCs. Some styles of plastic flooring are available in loose-laid design (puzzle pieces that are tapped together with a rubber mallet) that can be installed without adhesive.
**************************************************************************

Provide adhesives for flooring, base and accessories as recommended by the manufacturer and comply with local indoor air quality standards. Submit manufacturer's descriptive data, documentation stating physical characteristics, and mildew and germicidal characteristics.

Provide non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) that meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide aerosol adhesives used on the interior of the building that meet either emissions requirements of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type) or VOC content requirements of GS-36. Provide certification or validation of indoor air quality for adhesives.

2.15 SURFACE PREPARATION MATERIALS

**************************************************************************
NOTE: Panel type underlayments, such as plywood and hardboard, are specified in Section 06 10 00 ROUGH CARPENTRY. Coordinate underlayments requirements with the ROUGH CARPENTRY specifications.
**************************************************************************

Provide surface preparation materials, such as panel type underlayment, lining felt, and floor crack fillers as recommended by the flooring manufacturer for the subfloor conditions. Comply with ASTM F1482 for panel type underlayment products. Use one of the following substrates:

[ a. Particleboard: As specified in Section 06 10 00 ROUGH CARPENTRY.]
[ b. Fiberboard: As specified in Section 06 10 00 ROUGH CARPENTRY.]
[ c. Cork: As specified in Section 06 10 00 ROUGH CARPENTRY.]
[ d. Cement-fiber board: As specified in Section 09 29 00 GYPSUM BOARD.]
[ e. Plywood: As specified in Section 06 10 00 ROUGH CARPENTRY.]
2.16 POLISH/FINISH

Provide polish finish as recommended by the manufacturer and conform to ASTM D4078 for polish.

2.17 CAULKING AND SEALANTS

Provide caulking and sealants in accordance with Section 07 92 00 JOINT SEALANTS.

2.18 MANUFACTURER'S COLOR, PATTERN AND TEXTURE

**************************************************************************

NOTE: Coordinate color reference sentence(s) with the Government. Generally the Section 09 06 00 SCHEDULES FOR FINISHES or drawings are used when the project is designed by an Architect or Interior designer. Select color from manufacturer's standard colors or identify in this specification.

When the government directs that color be located in the drawings, add a note that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

When more than one type, pattern or color is specified identify location.

When a manufacturer's name, stock number, pattern, and color is specified for color, be certain that the product conforms to the specification, as edited.

NOTE: Drawings are required for projects with floor patterns.
**************************************************************************

Provide color, pattern and texture for resilient flooring and accessories [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [as indicated on the drawings] [selected from manufacturer's standard colors] [[____]]. Color listed is not intended to limit the selection of equal colors from other manufacturers]. [Provide floor patterns as specified on the [drawings Sheet No. [____]] [____].] Provide flooring in any one continuous area or replacement of damaged flooring in continuous area from same production run with same shade and pattern. Submit scaled drawings indicating patterns (including location of patterns and colors) and dimensions. Submit manufacturer's descriptive data and [three] [____] samples of each indicated color and type of flooring, base, mouldings, and accessories sized a minimum 60 by 100 mm 2-1/2 by 4 inch. Submit Data Package 1 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.
2.19 FIRE RESISTANCE TESTING REQUIREMENTS

**************************************************************************
NOTE: Choice of critical radiant flux level as it applies to building type and area of application will be made in accordance with the latest edition of UFC 3-600-01 and NFPA 101. Wherever the use of Class II (0.22) watts finish is required, Class I (0.45) watts will be permitted. Critical radiant flux will be a minimum average of 0.45 watts when used in corridors in bachelor enlisted quarters, bachelor officer quarters, hospital, child care centers, temporary lodging facilities, and new construction of detention and correctional facilities. Generally the critical radiant flux will be a minimum of 0.22 for corridors of other type facilities. Where an approved automatic sprinkler system is installed, Class II interior floor finish may be used where Class I floor finish is required, and where Class II is required, no critical radiant flux rating is required.
**************************************************************************

Provide a minimum average critical radiant flux of [0.22][0.45] watts per square centimeter for flooring in corridors and exits when tested in accordance with ASTM E648.

PART 3 EXECUTION

3.1 EXAMINATION

Examine and verify that site conditions are in agreement with the design package. Report all conditions that will prevent a proper installation. Do not take any corrective action without written permission from the Government. Work will proceed only when conditions have been corrected and accepted by the installer. Submit manufacturer's printed installation instructions for all flooring materials and accessories, including preparation of substrate, seaming techniques, and recommended adhesives.

3.2 SURFACE PREPARATION

Provide a smooth, true, level plane for surface preparation of the flooring, except where indicated as sloped. Floor to be flat to within 4.75 in 3048 mm 3/16 inch in 10 feet. Prepare subfloor in accordance with flooring manufacturer's recommended instructions. Prepare the surfaces of lightweight concrete slabs (as defined by the flooring manufacturer) as recommended by the flooring manufacturer. Comply with ASTM F710 for concrete subfloor preparation. Floor fills or toppings may be required as recommended by the flooring manufacturer. Install underlayments, when required by the flooring manufacturer, in accordance with manufacturer's recommended printed installation instructions. Comply with ASTM F1482 for panel type underlayments. Before any work under this section is begun, correct all defects such as rough or scaling concrete, chalk and dust, cracks, low spots, high spots, and uneven surfaces. Repair all damaged portions of concrete slabs as recommended by the flooring manufacturer. Remove concrete curing and sealer compounds from the slabs, other than the type that does not adversely affect adhesion. Remove paint, varnish, oils, release agents, sealers, waxes, and adhesives, as required by the flooring product in accordance with manufacturer's printed installation instructions.
3.3 MOISTURE, ALKALINITY AND BOND TESTS

Determine the suitability of the concrete subfloor for receiving the resilient flooring with regard to moisture content and pH level by moisture and alkalinity tests. Conduct moisture testing in accordance with ASTM F1869 or ASTM F2170, unless otherwise recommended by the flooring manufacturer. Conduct alkalinity testing as recommended by the flooring manufacturer. Determine the compatibility of the resilient flooring adhesives to the concrete floors by a bond test in accordance with the flooring manufacturer's recommendations. Submit copy of test reports for moisture and alkalinity content of concrete slab, and bond test stating date of test, person conducting the test, and the area tested.

3.4 GENERAL INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

3.5 PLACING VINYL COMPOSITION, LINOLEUM AND SOLID VINYL TILES

Install tile flooring and accessories in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's directions. Keep tile lines and joints square, symmetrical, tight, and even. Keep each floor in true, level plane, except where slope is indicated. Vary edge width as necessary to maintain full-size tiles in the field, no edge tile to be less than one-half the field tile size, except where irregular shaped rooms make it impossible. Cut flooring to fit around all permanent fixtures, built-in furniture and cabinets, pipes, and outlets. Cut, fit, and scribe edge tile to walls and partitions after field flooring has been applied.

3.6 PLACING LUXURY VINYL TILES

**************************************************************************
NOTE: Most LVT flooring is installed using conventional glue down installation. LVT flooring that is 5 mm 0.197 inch thick can be installed loose lay or adhesive dependent on the project requirements. Glue down installation is typically required in areas with high traffic and rolling loads. Coordinate recommended installation methods with flooring manufacturers.
**************************************************************************

[Install luxury vinyl tile flooring using [glue down] [loose lay (room perimeter adhesive only)] installation. ]Install flooring and accessories in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's directions for installation method specified. Keep tile lines and joints square, symmetrical, tight, and even. Keep each floor in true, level plane, except where slope is indicated. Vary edge width as necessary to maintain full-size tiles in the field, no edge tile to be less than one-half the field tile size, except where irregular shaped rooms make it impossible. Cut flooring to fit around all permanent fixtures, built-in furniture and cabinets, pipes, and outlets. Cut, fit, and scribe edge tile to walls and partitions after field flooring has been applied.
3.7 PLACING SHEET VINYL FLOORING

**************************************************************************
NOTE: Determine if welded seams are necessary to meet project requirements.
**************************************************************************

Install sheet vinyl flooring and accessories in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions. Provide square, symmetrical, tight, and even flooring lines and joints. Keep each floor in true, level plane, except where slope is indicated. Cut flooring to fit around all permanent fixtures, built-in furniture and cabinets, pipes, and outlets. Lay out sheets to minimize waste. Cut, fit, and scribe flooring to walls and partitions after field flooring has been applied. Provide [chemically bonded] [or] [heat welded] seams and edges [in rooms [_____] [shown on the drawings] in accordance with the manufacturer's written installation instructions. Finish joints flush, free from voids, recesses, and raised areas. [Install flooring with an integral coved base.]

3.8 PLACING SHEET LINOLEUM FLOORING

**************************************************************************
NOTE: Determine if welded seams are necessary to meet project requirements.
**************************************************************************

Install sheet linoleum flooring and accessories in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions. Provide square, symmetrical, tight, and even flooring lines and joints. Keep each floor in true, level plane, except where slope is indicated. Cut flooring to fit around all permanent fixtures, built-in furniture and cabinets, pipes, and outlets. Lay out sheets to minimize waste. Cut, fit, and scribe flooring to walls and partitions after field flooring has been applied. Cut seams by overlapping or underscribing as recommended by the manufacturer. Provide heat welded seams [in rooms [_____] [as shown on the drawings] in accordance with the manufacturer's written installation instructions.] Finish joints flush, free from voids, recesses, and raised areas. [Install flooring with an integral coved base.]

3.9 PLACING RUBBER TILE

Install rubber tile and accessories in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions. Provide square, symmetrical, tight, and even flooring lines and joints. Keep each floor in true, level plane, except where slope is indicated. Vary width of edge tiles as necessary to maintain full-size tiles, except where irregular-shaped rooms makes it impossible. Cut flooring to fit around all permanent fixtures, built-in furniture and cabinets, pipes, and outlets. Cut, fit, and scribe flooring to walls and partitions after field flooring has been applied.

3.10 PLACING RUBBER SHEET FLOORING

Install rubber sheet flooring and accessories in accordance with manufacturer's printed installation instructions. Prepare and apply
Install cork [tile] [plank flooring] and accessories in accordance with manufacturer's installation instructions. Prepare and apply adhesives in accordance with manufacturer's directions. Provide square, symmetrical, tight, and even flooring lines and joints except where slope is indicated. Keep each floor in true, level plane, except where slope is indicated. [Vary width of edge tiles as necessary to maintain full-size tiles in field, while keeping edge tiles larger than one-half full size, except where irregular-shaped rooms make it impossible.] Cut and fit flooring around all permanent fixtures, built-in furniture and cabinets, pipes, and outlets. Cut, fit, and scribe flooring to walls and partitions after field flooring has been applied.

3.11 PLACING CORK FLOORING

Install feature strips in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions.

3.13 PLACING MOULDING

Provide moulding where flooring termination is higher than the adjacent finished flooring and at transitions between different flooring materials. When required, locate moulding under door centerline. Moulding is not required at doorways where thresholds are provided. Secure moulding with adhesive as recommended by the manufacturer. Prepare and apply adhesives in accordance with manufacturer's printed directions. [Anchor aluminum moulding to floor surfaces as recommended by the manufacturer.] 

3.14 PLACING WALL BASE

Install wall base in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions. Tighten base joints and make even with adjacent resilient flooring. Fill voids along the top edge of base at masonry walls with caulk. Roll entire vertical surface of base with hand roller, and press toe of base with a straight piece of wood to ensure proper alignment. Avoid excess adhesive in corners.

3.15 PLACING STAIR TREADS, RISERS, AND STRINGERS

**************************************************************************
NOTE: Installation of stringers can be labor intensive. Dependent on the project requirements consider other stringer finish alternatives, an example would be a painted stringer.
**************************************************************************

Secure and install stair treads, risers, and stringers in accordance with
manufacturer's printed installation instructions. Cover the surface of treads and risers[ the full width of the stairs][ within 150 mm 6 inch to the stair edges]. Provide equal length pieces butted together to cover the treads and risers for stairs wider than manufacturer's standard lengths. [Provide stringer angles on both the wall and banister sides of the stairs, and landing trim.]

3.16 PLACING INTEGRAL COVED BASE

Install integral cove base in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions. Shape integral coved base by extending the flooring material [100] [150] [_____] mm [4] [6] [_____] inch onto the wall surface. Support cove by a filler. Provide a cap strip at the top of the base. Fill voids along the top edge of base at masonry walls with caulk.

3.17 CLEANING

**************************************************************************
NOTE: Some activities prefer no-wax maintenance; others prefer waxing. Pre-waxed flooring and flooring that does not require wax need not be waxed after installation if properly protected. Coordinate any requirements for application of polish/floor finish with the end user. Modify paragraph accordingly.
**************************************************************************

Immediately upon completion of installation of flooring in a room or an area, dry and clean the flooring and adjacent surfaces to remove all surplus adhesive. Clean flooring as recommended in accordance with manufacturer's printed maintenance instructions and within the recommended time frame. As required by the manufacturer, apply the recommended number of coats and type of polish and finish in accordance with manufacturer's written instructions.

3.18 PROTECTION

From the time of installation until acceptance, protect flooring from damage as recommended by the flooring manufacturer. Remove and replace flooring which becomes damaged, loose, broken, or curled and wall base which is not tight to wall or securely adhered.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for resilient athletic flooring.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Systems specified in this guide specification are recommended for indoor athletic rooms e.g., weight rooms, running tracks, recreational areas, aerobic centers, multi-purpose gym floors, etc. Hardwood flooring is preferable for basketball courts, handball, and racquetball courts. Rubber-base floorings can be used in outdoor installations like wet bars, running tracks, tennis courts, and swimming pool walks.

1.1 REFERENCES

NOTE: This paragraph is used to list the
publications cited in the text of the guide 
specification. The publications are referred to in 
the text by basic designation only and listed in 
this paragraph by organization, designation, date, 
and title.

Use the Reference Wizard's Check Reference feature 
when you add a Reference Identifier (RID) outside of 
the Section's Reference Article to automatically 
place the reference in the Reference Article. Also 
use the Reference Wizard's Check Reference feature 
to update the issue dates.

References not used in the text will automatically 
be deleted from this section of the project 
specification when you choose to reconcile 
references in the publish print process.

The publications listed below form a part of this specification to the 
extent referenced. The publications are referred to within the text by the 
basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
  Approved Detail Drawings; G[, [_____]]

SD-03 Product Data
  Installation
  Indoor Air Quality for Rubber Poured-In-Place Flooring; S
  Indoor Air Quality for Urethane Poured-In-Place Flooring; S
  Indoor Air Quality for Adhesives; S
1.3 QUALITY ASSURANCE

1.3.1 Shop Drawings

Provide approved detail drawings showing, as a minimum, installation details and locations of borders, patterns, and locations of floor seams.

1.3.2 Manufacturer Qualifications

Manufacturer must have at least ten years active experience in the manufacturing and marketing of indoor resilient athletic flooring, and be a certified manufacturer in accordance with ISO 9001 and ISO 14001. Manufacturer must also have an authorized installer training program.

1.3.3 Installer Qualifications

Installer must have at least five years of experience in the installation of resilient athletic flooring, and have experience on at least five projects of similar size, type and complexity as this Project. Installer must also utilize workers for this Project who are competent in techniques required by manufacturer of resilient athletic flooring installation indicated.

1.3.4 Laboratory Test Results

1.3.4.1 Performance Properties

Provide certification documents indicating testing per ASTM F2772 has been
performed and the product being supplied complies with the ASTM category/classification specified for this project. Information from product catalogs or sales literature is not sufficient.

1.3.4.2 Shock Absorption

Shock absorption (force reduction) test results certified by an independent testing laboratory certified to perform such testing.

a. ASTM test must be from certified North American laboratories.
b. EN and DIN test must be from certified European laboratories.

1.3.4.3 Fire Performance

Provide fire performance test results.

1.3.5 Fire Test Characteristics

As determined by testing identical products according to ASTM E648, Class 1, by a qualified testing agency acceptable to authorities having jurisdiction.

1.3.6 Athletic Performance Properties

Comply with ASTM F2772 Performance Level C2 for force reduction and ball rebound.

1.3.7 Adhesive Application

Adhesive applied and poured-in-place flooring must be installed by an experienced floor applicator approved by the manufacturer.

1.3.8 Flooring Material Samples

Submit three samples minimum 225 x 275 mm 9 x 11 inches of each color of flooring material required and manufacturer's certificates stating that the resilient athletic flooring materials conform to the specified requirements. Labels or markings affixed to manufacturer's products attesting that products meet requirements specified herein will be accepted in lieu of certificates.

1.4 CERTIFICATIONS

1.4.1 Indoor Air Quality Certifications

Submit required indoor air quality certifications in one submittal package.

1.4.1.1 Floor Covering Materials

Provide rubber composition tile, sheet rubber composition flooring, sheet vinyl composition flooring, and wall base products certified to meet indoor air quality requirements by FLOORSCORE, UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide resilient mat underlay products certified to meet indoor air quality requirements by FLOORSCORE, UL 2818 (GreenGuard) Gold, SCS Global Services Indoor Advantage Gold, CRI GL CUSHION or provide certification or validation by other third-party program that products meet
the requirements of this Section. Provide indoor-outdoor carpeting products certified to meet indoor air quality requirements by UL 2818 (GreenGuard) Gold, SCS Global Services Indoor Advantage Gold, CRI GLP QM or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver Materials in manufacturer's original unopened containers with labels intact. Do not deliver materials to the installation area or installed before all work that may damage the materials or the finished floor, such as overhead work, is completed. Store materials in a clean, dry area. Maintain materials in storage at temperatures recommended by the manufacturer. Store protection boards flat and off the ground.

a. Store flooring and installation materials in protected dry spaces, with ambient temperatures maintained within range recommended by manufacturer, but less than 13 degrees C 55 degrees F nor more than 29 degrees C 85 degrees F.

b. Store the indoor resilient athletic surfacing rolls in an upright position on a smooth flat surface immediately upon delivery to Project.

1.6 WARRANTY

1.6.1 Manufacturer's Warranty

Manufacturer's standard form in which manufacturer agrees to repair or replace sports flooring that fails within specified warranty period. Material warranty must be direct from the product manufacturer. Material warranties from separate or third party insurance providers are not valid. Material warranties from private label distributors are not valid.

Failures include, but are not limited to, the following:

a. Material manufacturing defects.

b. Surface wear and deterioration to the point of wear-through.

c. Failure due to substrate moisture exposure not exceeding 80 percent relative humidity when tested according to ASTM F2170 or 5 pounds moisture vapor emission rate when tested according to ASTM F1869.

1.6.1.1 Warranty Period

For materials: Minimum of 2 years from date of Substantial Completion. For surface wear: minimum of 15 years from date of Substantial Completion.

1.6.2 Installer's Warranty

Installer's standard form in which installer agrees to repair or replace sports flooring that fails due to poor workmanship or faulty installation within the specified warranty period.
1.7 COORDINATION
Coordinate layout and installation of flooring with other gymnasium equipment.

1.8 EXTRA MATERIALS

1.8.1 Floor Tiles
Furnish spare tiles of each color at the rate of [_____] [5] tiles for each 1000 tiles installed. Tiles must be from the same lot as those installed.

1.8.2 Carpeting
Extra material from same dye lot consisting of full width continuous broadloom must be provided for maintenance. A minimum of [_____] percent of total square meters square yards of each carpet type, pattern, and color must be provided.

PART 2 PRODUCTS

*************************************************************************
NOTE: If more than one type of resilient flooring is required, a separate paragraph for that type floor will be used. Each flooring type will be designated with a letter or number symbol. Use the same symbols to key flooring types to locations listed or shown on the drawings.

Floor types will be specified for a specific use such as, carpet for pool areas, multi-use areas, and pro shops, or rubber tile flooring for weight rooms, etc. Edit specification as required to meet project needs and omit text not applicable.
*************************************************************************

2.1 FLOORING MATERIALS

*************************************************************************
NOTE: If more than one type of resilient flooring is required, a separate paragraph for that type floor will be used. Each flooring type will be designated with a letter or number symbol. Use the same symbols to key flooring types to locations listed or shown on the drawings.

Floor types will be specified for a specific use such as, carpet for pool areas, multi-use areas, and pro shops, or rubber tile flooring for weight rooms, etc. Edit specification as required to meet project needs and omit text not applicable.
*************************************************************************

2.1.1 Indoor-Outdoor Carpeting Type [A] [_____]

*************************************************************************
NOTE: Carpeting must be specially designed for indoor or indoor-outdoor environments as required, e.g., weight rooms, outdoor playground areas,
indoor/outdoor pool areas, and pro shops. Edit as required to meet project requirements.

Carpet-type flooring that is spike proof [[ribbed] [berber] pattern consisting of a top layer of rugged [polypropylene] [or] [nylon] fibers combined with an inorganic cut-resistant [non-skid] [_____] [wet areas artificial turf pattern consisting of a top layer of rugged polypropylene fibers combined with an inorganic cut-resistant [porous rubber knob][foam] [_____] backing. Minimum total thickness must be [10] [_____] mm [0.375] [_____] inches. Finished surface pile yarn weight (face weight) must be minimum [_____] kg/square meter ounces/square yard. Test results for resistance to soil bacteria or fungi must show no sustained growth or discoloration after 21 days when tested in accordance with ASTM G21. Product must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for Indoor-Outdoor Carpeting.

2.1.2 Rubber Composition Tile Type [A] [_____]  
Provide [interlocked] [_____] [600 x 600] [_____] mm [24 x 24] [_____] inches square, of solid first quality rubber, uniformly resilient material rubber tiles, designed to be applied [with] [without] adhesive. Provide tiles that are approximately [13] [_____] mm [1/2] [_____] inch thick, [smooth] [traction] [_____] texture, and [reversible] [non-reversible]. Flooring must be able to withstand [75 percent compression for 22 hours at 70 degrees C 158 degrees F] [_____] without residual deformation when tested in accordance with ASTM D395. Provide flooring with a durometer hardness Shore-A of 50-60 when tested in accordance with ASTM D2240. Product must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for Rubber Composition Tile.

2.1.3 Rubber Poured-In-Place Flooring Type [A] [_____]  
Provide resilient poured-in-place rubber surface composed of chloroprene rubber, chloroprene rubber sponge, aggregate, setting powders, and a top finish composed of acrylic resins. Flooring must be able to withstand 50 percent compression for 72 hours at 22 degrees C 72 degrees F with a residual deformation of less than 10 percent when tested in accordance with ASTM D395. Flooring must have a minimum compression modulus at 10 percent of 690 kPa 100 psi, a minimum elongation of 250 percent and a minimum tensile strength of 3800 kPa 550 psi plus or minus 34 kPa 5 psi when tested in accordance with ASTM D412. Provide flooring with a durometer hardness Shore-A of 55-60 when tested in accordance with ASTM D2240 and a minimum tear resistance of 10.5 kN/m 60 lbf/inch when tested in accordance with ASTM D624. For interior applications (defined as inside of the weatherproofing system) of rubber poured-in-place flooring, provide products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for Rubber Poured-In-Place Flooring.

2.1.4 Sheet Rubber Composition Flooring Type [A] [_____]  
Provide prefabricated, homogeneous, natural and synthetic rubbers sheet rubber flooring, minimum [5] [_____] mm [3/16] [_____] inch thick, and [smooth gymnasium] [textured all-purpose] finish. Provide roll type flooring not less than 1500 [_____] mm 60 [_____] inches wide. Flooring
must have a minimum tensile stress at 100 percent elongation of 1500 kPa 220 psi and a minimum ultimate elongation of 250 percent when tested in accordance with ASTM D412. Flooring must be able to withstand 50 percent compression for 72 hours at 22 degrees C 72 degrees F with a residual deformation of less than 10 percent when tested in accordance with ASTM D395. Flooring must provide a 55 plus or minus 5 percent rebound when tested in accordance with ASTM D1054. Product must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for Sheet Rubber Composition Flooring.

2.1.5 Sheet Vinyl Composition Flooring Type [A] [_____]

Provide sheet vinyl flooring consisting of a solid polyvinyl chloride material that conforms to the chemical resistance requirements of ASTM F1303. Provide flooring not less than 1200 mm 48 inches wide and a minimum thickness of [3] [_____] mm [1/8] [_____] inch. Provide [smooth] [stipple] [track embossed] texture floor surface. Flooring must have a minimum coefficient of friction of 0.75 when tested in accordance with ASTM D1894. Provide flooring with an average thickness loss of 0.2 mm 8.0 mils plus or minus 0.025 mm 1 mil. Rebound resilience of flooring must be greater than 12 percent and less than 30 percent when tested in accordance with ASTM D2632. Product must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for Sheet Vinyl Composition Flooring. [Provide an optional compatible top coating recommended by the sheet vinyl flooring manufacturer.]

2.1.6 Urethane Poured-In-Place Flooring Type [A] [_____]

**************************************************************************
NOTE: Urethane resilient flooring may be installed on a variety of substrates and in a variety of thicknesses from 3 to 25 mm 1/8 to 1 inch. Coordinate with manufacturer's literature. Edit specification as required.
**************************************************************************

The resilient poured-in-place urethane surface is composed of a seamless pigmented monolithic material. Provide minimum [3] [_____] mm [1/8] [_____] inch thick and [smooth gymnasium] [textured all-purpose] [textured track] finish flooring. Flooring must have a durometer hardness Shore-A of 55-60 when tested in accordance with ASTM D2240. Flooring must have a minimum ultimate elongation of 250 percent when tested in accordance with ASTM D412 and must have a density of 1.25.

For interior applications (defined as inside of the weatherproofing system) of urethane poured-in-place flooring, provide products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for Urethane Poured-in-Place Flooring.

2.2 RESILIENT MAT UNDERLAY

**************************************************************************
NOTE: Resilient mat underlay may be used under a two-component polyurethane wear coat system, sheet rubber surfacing system, or a vinyl sheet surfacing system. Deletion or specification and thickness of mat underlay will be determined by the athletic
flooring requirements. Coordinate with manufacturer’s literature.

Provide prefabricated resilient mat underlay consisting of granulated indoor/outdoor rubber mat bound with polyurethane for shock absorption. Mat thickness must be [_____] mm [inches]. Product must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for Resilient Mat Underlay.

2.3 ADHESIVES

Adhesive must be as recommended by the flooring manufacturer and correspond to the specified flooring product and to the substrate. Adhesive products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for adhesives.

2.4 CRACK FILLER/LEVELER FOR CONCRETE SURFACES

Provide crack filler/leveler for concrete floor surfaces as recommended by flooring manufacturer.

2.5 EDGING STRIPS

Provide strips of the same material and design as recommended by flooring manufacturer.

2.6 PRIMER

Concrete primer must be as recommended by flooring manufacturer and correspond to the specified flooring product and to the substrate. For interior applications (defined as inside of the weatherproofing system) of primer, provide products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for primer.

2.7 GAME LINE MATERIAL

Game line material must be as recommended by the flooring manufacturer and correspond to the specified flooring product. For interior applications (defined as inside of the weatherproofing system) of game line marking materials, provide products meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for game line marking materials.

2.8 WALL BASE

******************************************************************************

NOTE: Include last bracketed sentences requiring products with indoor air quality certifications or validations when product will be located in offices or classrooms.

******************************************************************************
Base must be [rubber] [vinyl], Type [straight] [coved] style. Base must be 100 mm 4 inches high and minimum 2 mm 0.080 inch thick.

Product must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for wall base.

2.9 SEALANTS

Provide sealants in accordance with Section 07 92 00 JOINT SEALANTS.

2.10 MANUFACTURERS COLOR

Color must be [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [______].

PART 3 EXECUTION

******************************************************************************

NOTE: Expansion joints under resilient athletic flooring should be avoided to the maximum extent possible by placing the joints at the perimeter of the floor area. For large areas such as gymnasiums, shrinkage compensating concrete may be advisable.

******************************************************************************

3.1 PREPARATION

Concrete surfaces must be completely cured and dry. Do not use curing agents, sealers, or hardeners to aid in the curing of the concrete slab. Surfaces must be free of paint spots, and other foreign materials. Surfaces must be ground down or leveled with an approved leveling compound to a tolerance of plus or minus 3 mm 1/8 inch within a 3 meters 10 foot radius. Cracks, construction joints, or damaged portions of floor must be filled with crack filler for concrete surfaces. Expansion joints must be filled and sealed in accordance with the approved installation instructions of the manufacturer. All sealants must be in accordance with ASTM C920. Expansion joints must not be filled with a material that will make them inoperable.

3.2 MOISTURE TEST

Confirm that the moisture content of concrete subfloors is in the range recommended by the flooring manufacturer before floor installation.

3.3 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

3.3.1 General Requirements

Installation must be in accordance with the approved installation instructions. Tile or sheet flooring must be rolled with a medium-sized roller in both directions to release entrapped air. Submit manufacturer's descriptive data and catalog cuts indicating materials of construction and physical characteristics. Installation, cleaning and maintenance instructions must be included.
3.3.2 Molded Rubber Base

Install base in accordance with the approved installation instructions of the manufacturer of the base.

3.3.3 Indoor-Outdoor Carpeting

Apply flooring as recommended by the manufacturer.

3.3.4 Sheet Vinyl Composition Flooring

Prime the concrete slab in accordance with approved installation instructions. Install flooring as recommended by the manufacturer.

3.3.4.1 Seams

Cut and place end seams as recommended by the manufacturer. Weight seams as required.

3.3.4.2 Hot-Welded Seams

Groove butted sheets to a depth of approximately two thirds of their total thickness using an electrical or hand grooving tool. Thermoweld grooved seams using a hot air welding tool and a PVC welding thread. After seam has cooled to room temperature, trim the excess off to provide a flush joint.

3.3.5 Sheet Rubber Composition Flooring

Sheet flooring must be dry cut and layed out flat a minimum of 24 hours prior to adhering to the substrate. Single cut end seams. Cut edge seams through overlapping sheets, then snap into place to ensure tight seams. Weight seams as required.

3.3.6 Rubber Composition Tile Flooring

**************************************************************************
NOTE: Tile flooring can be installed with adhesive or without adhesive using a mechanical locking technique. Edit to comply with the type flooring specified.
**************************************************************************

3.3.6.1 Application With Adhesive

Lay tiles on adhesive surface in pattern according to approved detail drawings. Joints of tiles must be even and tight. Cut tiles to fit tightly against the wall. Submit drawings showing game lines, location of anchor plate assemblies, floor outlets, and under-floor conduit or raceways.

3.3.6.2 Application Without Adhesive

Join tiles together using interlocking ears or other mechanical locking techniques. Interlock the ears into the adjoining tile 40 mm 1-1/2 inches and provide at least five interlocks for each 600 mm 24 inch edge. Where required, supply a beveled transfer border to interlock with the flooring tiles. The borders must be 150 mm 6 inches wide and 600 mm 24 inches long and the same thickness as the matching tiles.
3.3.7 Rubber Poured-in-Place Flooring

Prime the concrete slab with primer recommended by manufacturer in a thin film covering approximately 10 square meters/L 400 square feet per gallon. Pour chloroprene rubber onto subfloor and trowel to a smooth and uniform layer of the required thickness. Apply a grout chloroprene rubber coat to fill possible voids in surface. After the chloroprene rubber is completely dry, apply a pigmented finish with a spray and roller.

3.3.8 Urethane Poured-in-Place Flooring

Prime the concrete slab with primer recommended by the manufacturer. Rate of application must be in accordance with approved installation instructions and be allowed to dry odor free. Cover concrete construction joints with 50 mm 2 inch wide PVC duct tape. Apply resin in a minimum of 2 lifts. Apply pigmented and textured coatings in accordance with manufacturer's recommendations.

3.3.9 Resilient Mat Underlay

Unroll the resilient mat underlay and allow to relax prior to cutting or fitting. Install the mat in accordance with manufacturers instructions.

3.3.10 Line Marking and Finishing

After installation is complete, clean the floor surface in accordance with installation instructions. Lay out, mask, and paint line marking according to approved detail drawings and approved installation instructions. Finish in accordance with the manufacturer's recommendations.

3.4 PROTECTION

Protect the installed flooring from soiling and damage with heavy reinforced, nonstaining kraft paper, plywood, or hardboard sheets as required. Lap and secure edges of kraft paper protection to provide a continuous cover. Remove protective covering when directed by the Contracting Officer.

SECTION 09 66 13

NOTE: This guide specification covers the requirements for standard terrazzo bonded to concrete subfloor.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: Bonded terrazzo is normally 45 mm 1-3/4 inch total thickness, consisting of 13 mm 1/2 inch thick terrazzo topping over a 32 mm 1-1/4 inch thick underbed.

Where structural movement which may injure the terrazzo is anticipated, installations should be by the sand cushion (floating) method. Where requirement exists for sand-cushion or other-type installation method, bases, precast work, or specialized work such as structural, abrasive, rustic, or venetian terrazzo, or terrazzo over permanent metal forms, the specification should be revised or a separate section should be prepared as
Areas to receive terrazzo will be shown on the drawings. Color should be indicated by showing a selected plate number from the NTMA publication, "Terrazzo Design/Technical Data"

Example: NTMA Terrazzo Color Palette, plate No. S-301-4. Colors selected may be any combination of standard marble granules of domestic origin available in the local market.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM C33/C33M (2023) Standard Specification for Concrete Aggregates

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in
accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Installation; G[, [_____]]

SD-03 Product Data
   Flooring System Materials
   Recycled Content for Portland Cement Terrazzo Flooring System; S
   Indoor Air Quality for Curing Material; S
   Indoor Air Quality for Sealer; S

SD-11 Closeout Submittals
   Warranty

1.3 DELIVERY, STORAGE, AND HANDLING

Deliver materials in the manufacturer's unopened containers marked with the brand name. Deliver, handle, and store materials in accordance with manufacturers instructions in a manner that prevents deterioration and contamination.

1.4 ENVIRONMENTAL REQUIREMENTS

Maintain areas to receive terrazzo at a temperature above 10 degrees C 50 degrees F 24 hours prior to the time mixtures are placed and until completely cured.

1.5 WARRANTY

Provide manufacturer's standard performance guarantees or warranties that extend beyond a one-year period.

PART 2 PRODUCTS

******************************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness
and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is commonly available with the minimum recycled content percentages shown below. Include section below when system with recycled content is desired, and select material option based on research of availability and price effectiveness.

**************************************************************************

[2.1 PORTLAND CEMENT TERRAZZO FLOORING SYSTEM MATERIALS]

Provide system that has a minimum of [40 percent fly ash] [100 percent recycled aggregate] [____]. Provide data identifying percentage of recycled content for portland cement terrazzo flooring system. Do not use coral, dolomite, or limestone aggregates in setting bed.

]2.2 PORTLAND CEMENT

Provide portland cement conforming to ASTM C150/C150M, Type I, of colors required to match NTMA Info Guide color plate indicated [in Section 09 06 00 SCHEDULES FOR FINISHES].

2.3 SAND

Provide sand conforming to ASTM C33/C33M for fine aggregate.

2.4 MARBLE CHIPS

Provide marble chips of domestic origin of sizes and colors required to match NTMA Info Guide color plate indicated [in Section 09 06 00 SCHEDULES FOR FINISHES]. Marble chips must have an abrasive hardness of not less than 10 when tested in accordance with ASTM C241/C241M; contain no deleterious or foreign matter; and less than one percent by weight dust content.

2.5 DIVIDER STRIPS

**************************************************************************

NOTE: Manufacturer's literature should be reviewed when making selections for divider strips. When material and thickness of divider strips and color of plastic strips vary, depending on location in the project, material thickness and color should be shown on the drawings and specified.

**************************************************************************

Provide divider strips in accordance with NTMA Info Guide and 30 mm 1-1/4 inch deep, [_____] mm gauge thick and of [brass] [zinc] [plastic in color as indicated [in Section 09 06 00 SCHEDULES FOR FINISHES]]. Standard type one-piece divider strips must [be not lighter than 1.5 mm No. 16 Brown & Sharpe gage thick] [be of thickness indicated]. Heavy-top strips may be either one- or two-piece strips with a solid top section, [not less than 6 mm 1/4 inch nor more than 10 mm 3/8 inch in depth and not less than [3] [6] mm [1/8] [1/4] inch thick] [of thickness shown]. Submit two 150 mm 6 inch lengths of each type divider.
2.6  **CONTROL JOINT STRIPS**

**************************************************************************

NOTE: Manufacturer's literature should be reviewed when making selections for control joint strips.
**************************************************************************

Provide control joint strips in accordance with NTMA Info Guide and [_____] mm inches deep, [_____] mm gauge thick of [brass] [zinc]. Use neoprene filler [_____] mm inches thick in color as indicated [in Section 09 06 00 SCHEDULES FOR FINISHES]. Submit two 150 mm 6 inch lengths of each type control joint strip.

2.7  **COLORANTS**

Provide alkali-resistant and nonfading colorants. Pigments must be of colors required to match NTMA Info Guide color plate indicated [in Section 09 06 00 SCHEDULES FOR FINISHES].

2.8  **CURING MATERIAL**

Curing material must be either liquid membrane-forming compound, wet sand, polyethylene sheeting, or water. Liquid membrane-forming compound must conform to ASTM C309, Type I. Floor curing material products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for curing material. Polyethylene sheeting must conform to ASTM C171.

2.9  **TERRAZZO CLEANER**

Use biodegradable, phosphate free terrazzo cleaner with a pH factor between 7 and 10 and of a type specially prepared for use on terrazzo. Submit maintenance instructions for bonded terrazzo.

2.10  **SEALER**

**************************************************************************

NOTE: Include bracketed pH factor for NAVFAC SW projects only.
**************************************************************************

Sealer must [have a pH factor between 7 and 10 and] be a penetrating type specially prepared for use on terrazzo. The sealer must not discolor or amber the terrazzo and must produce a slip resistant surface. Flash point of sealer must be in accordance with NTMA Info Guide. Sealer products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for sealer.

2.11  **SHEET MATERIALS**

Sheet materials used for curing the terrazzo must conform to ASTM C171.
PART 3 EXECUTION

3.1 TERRAZZO PROPORTIONS

3.1.1 Underbed

Use underbed composed of one part portland cement to [4] [4.5] parts sand. Add water to provide workability at as low a slump as possible. Spread to a level 13 mm 1/2 inch below the finished floor, to a thickness of approximately 30 mm 1-1/4 inches.

3.1.2 Terrazzo Topping

Topping must be composed of one 43 kg 94 pound bag of portland cement per 91 kg 200 pounds of marble chips and approximately 20 L 5 gallons of water. Add color pigment as needed, but not to exceed 1 kg 2 pounds per bag of cement. Add water in sufficient quantity to provide workability at as low a slump as possible.

3.2 INSTALLATION

Submit drawings indicating the type, size, and layout of divider strips and control joint strips and color of floor areas.

3.2.1 Underbed Placement

Clean and saturate concrete surfaces with water in accordance with NTMA Info Guide. Do not treat concrete substrate to receive bonded terrazzo with curing agent or additives which would preclude bonding. Remove excess water from the subfloor before slushing and brooming with neat cement paste. Place the underbed on the concrete subfloor and screed to an elevation 13 mm 1/2 inch below the finished floor. Install divider strips in the semiplastic underbed. Firmly trowel the underbed along the edges to insure positive anchorage of the divider strips. Install control joint strips over subfloor expansion joints and extend the full depth of the underbed.

3.2.2 Setting Divider Strips

Set in accordance with layout indicated while underbed is still plastic. Set strips to straight lines and to the proper level to ensure that tops of strips will show uniformly after completing grinding and finishing operations. Fit joints and intersections tight. Where divisions in field work are not shown, divide field work into squares or rectangles of uniform size and not more than 1800 mm 6 feet on a side. Divide borders by strips to coincide with the layout of division strips in the field of floors. Place edging strips at doorways between terrazzo and other types of flooring and along the edges of terrazzo borders adjoining other types of floor finishes or floor coverings. Place expansion strips over control joints, construction joints, and expansion joints.

3.2.3 Placing Terrazzo Topping

Slush and broom the underbed in accordance with NTMA Info Guide with neat cement paste of the same color as required for the topping. Place the topping in panels formed by divider strips and trowel level with the top of the strips. Seed the troweled surface with chips in the same color proportions as contained in the terrazzo mix, trowel and roll with heavy rollers until excess water has been extracted. Trowel the terrazzo to a
3.2.4 Curing

Cure the terrazzo until the topping develops sufficient strength to prevent lifting or pulling of terrazzo chips during grinding. Keep the completed terrazzo continuously moist and free of traffic during the curing period. Cure by covering with a liquid membrane-forming compound, sheet materials, wet sand, or sprinkling with water.

3.2.5 Finishing

[Finish in accordance with NTMA Info Guide.] [After curing the grout coat for a minimum of 72 hours, grind the floor using a No. 80 or finer grit stone. In the latter stages of grinding, use grit stones or other abrasive in the grinding machine of a grain or fineness that will give the surface a honed finish. Grind and rub by hand small areas, inaccessible portions, and corners that cannot be reached by the grinding machine. The honed surface of finished terrazzo must show not less than 70 percent of the area as exposed aggregate evenly distributed, and conform in appearance to the approved samples. Finished thickness of terrazzo topping must be a minimum of 13 mm 1/2 inch.]

3.2.5.1 Rough Grinding

After topping has cured, machine gring the terrazzo using the wet method, to a true even surface using No. 24 or finer grit followed by No. 80 grit or finer grit stone. Finish floor surface must not vary by more than 2 mm/meter 1/4 inch in 10 feet.

3.2.5.2 Grouting

After rough grinding, cleanse and rinse the floor with clean water. After removing excess rinse water, grout the floor using identical portland cement, color and pigments as used in the topping taking care to fill voids. After the grout has attained its initial set, cure the surface for a minimum of 72 hours.

3.2.5.3 Fine Grinding

After grout has cured, gring the surface with fine grit stones until all grout is removed from the surface. Upon completion of grinding, the terrazzo flooring must show a minimum of 70 percent of marble chips. Submit two 150 x 150 mm 6 x 6 inch (minimum) samples of each color of terrazzo

3.3 CLEANING AND SEALING

Wash the terrazzo with a neutral cleaner and, where required, clean with a fine abrasive to remove stains or cement smears. Rinse the cleaned surface. When dry, apply a terrazzo sealer in accordance with the manufacturer's directions.

3.4 PROTECTION

cover and protect the terrazzo work from damage until completion of the work of all other trades.

TERRAZZO FLOOR TILE
08/16, CHG 1: 08/18

NOTE: This guide specification covers the requirements for cast marble or granite terrazzo tile of various sizes and thicknesses).

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL
1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature.
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

CALIFORNIA DEPARTMENT OF PUBLIC HEALTH (CDPH)

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (SCAQMD)

SCAQMD Rule 1168 (2017) Adhesive and Sealant Applications

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that

SECTION 09 66 16 Page 3
require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Terrazzo Tile

Recycled Content for Terrazzo Tile; S

Adhesive

Indoor Air Quality for Adhesive; S

Installation

SD-04 Samples

Terrazzo Tile

Terrazzo Base
1.3 QUALITY ASSURANCE

Installer must possess, to the satisfaction of the Contracting Officer, the technical qualifications, experience, trained personnel, and facilities to properly install the specified items.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the jobsite in the manufacturer's original unopened containers marked with the manufacturer's brand name, color, and pattern. Store materials delivered and placed in storage protected from damage, weather, humidity and temperature variation, dirt and dust, or other contaminants. Temperature of storage area must not be lower than 10 degrees C 50 degrees F or higher than 32 degrees C 90 degrees F.

1.5 SITE CONDITIONS

Do not install tiles until other work that could cause damage to the finished flooring has been completed. Maintain a temperature of not less than 21 degrees C 70 degrees F in all areas where tile is to be installed for a period of not less than [48] hours before, during and after laying of tiles. Bring tiles into installation areas and allow to condition at not less than 21 degrees C 70 degrees F for a period of [48] hours prior to installation. After installation of tiles, maintain a minimum temperature of 13 degrees C 55 degrees F.

1.6 WARRANTY

Provide manufacturer's standard performance guarantees or warranties that extend beyond a one year period.

PART 2 PRODUCTS

2.1 STANDARD PRODUCTS

Provide materials which are the standard products of a manufacturer regularly engaged in the manufacture of the material and that essentially duplicate products that have been in satisfactory use at least 2 years prior to bid opening.

2.2 TERRAZZO TILE

**************************************************************************

NOTE: Designer will select the chip requirements and also determine whether flexible or rigid resin is required, or give the Contractor the options. The source of the aggregate will directly impact the look of the tile.
Coordinate with manufacturer's data of terrazzo tile when determining the patterns, styles, sizes and thicknesses of tiles.

**************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is commonly available with the minimum recycled content percentages shown below. Based on research, insert desired minimum percentages into the empty set of brackets.

**************************************************************************

Provide terrazzo tile of the indicated colors and consisting of [marble] [or] [granite] chips embedded in a [flexible] [or] [rigid] thermoset resin matrix. Submit drawings indicating pattern, size, style, and color of tiles and two 150 by 150 mm 6 by 6 inch minimum samples of each color and pattern of terrazzo tile to be used. Tiles must be [5] [_____] mm [3/16] [_____] inch thick and nominal [300 by 300] [_____] mm [12 by 12] [_____] inches. Provide tiles with a [polished] [polished and [honied] [textured]] [honied] [textured] finish with uniform color distribution of chips. [Grade marble chips to [16] [6] mm [5/8] [1/4] inch maximum size.] [Granite chips must be manufacturer's standard gradation.] Provide tile with the following properties:

<table>
<thead>
<tr>
<th>PROPERTY</th>
<th>TEST METHOD</th>
<th>VALUE</th>
</tr>

<td>ASTM E648</td>
<td>Class I</td>
</tr>
</tbody>
</table>

[Provide Terrazzo Tile with [50][100][_____] percent recycled aggregate. Provide data identifying percentage of recycled content for terrazzo tile.]

2.3 ADHESIVE

Adhesive must be flooring manufacturer's standard product or a product recommended by the manufacturer. Submit documentation from manufacturer indicating that the materials conform to the specified requirements and flooring manufacturer's approval of underlayment, adhesive, and cleaners.
Adhesive products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for adhesive.

2.4 TERRAZZO BASE

Provide terrazzo base of colors as indicated, meeting the requirements of paragraph TERRAZZO TILE and being a manufacturer's standard product. Base/strips must be [10] [19] mm thick by [_____] mm wide by [_____] mm long [3/8] [3/4] inch thick by [_____] inch wide by [_____] inch long. Provide base/strips that have [polished] [honed] [textured] finish. Submit two 100 mm 4 inch long samples of each type and color of trim pieces.

2.5 TERRAZZO STRIPS

Provide terrazzo strips of colors as indicated, meeting the requirements of paragraph TERRAZZO TILE and being a manufacturer's standard product. Strips must be [_____] mm high by [_____] mm wide by [_____] mm long [3/8] [3/4] inch high by [_____] inch wide by [_____] inch long. Strips must have [polished] [honed] [textured] finish. Submit two 100 mm 4 inch long samples of each type and color of trim pieces.

2.6 METAL EDGE STRIPS

Metal edge strips must be extruded aluminum, butt type, approximately 40 mm 1-1/2 inches wide with thickness to set top surface flush with top of tile and with bevel at exposed edge. Edge strips must have countersunk holes near each end and spaced not more than 200 mm 8 inches on center for securement. Submit one 150 mm 6 inch long sample of metal edge strip.

2.7 COLOR

Color must be [as indicated] [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [______].

PART 3 EXECUTION

3.1 GENERAL

Install flooring and base on floor surfaces and walls where indicated. Except as required for installation of new tile, keep traffic new tile for at least [24] [_____] hours after installation.

3.2 EXAMINATION

After becoming familiar with details of the work, verify dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

3.3 SUBSTRATE PREPARATION

Fill holes and cracks with mortar. Floors must be free of curing compounds, grease, dirt, loose particles and other foreign matter that would prevent adhesion. Chip and grind smooth projecting irregularities. Fill depressions and level uneven surfaces. Rinse subfloors and allow to dry prior to applying adhesive.
3.4 MOISTURE TEST

After concrete floor surfaces have been cleaned, spread small patches of adhesive in several locations in each room or area to receive tile and allowed to dry overnight. If the adhesive can be peeled easily from the floor surfaces, the surface is not sufficiently dry. Repeat the steps until the adhesive adheres properly. Do not apply tiles until adhesive adheres tightly to the floor.

3.5 INSTALLATION

Submit the manufacturer's printed installation instructions for the conditions indicated.

3.5.1 Tile

Install tile in accordance with the manufacturer's approved installation instructions, except as specified herein. Lay tile symmetrical about center lines of rooms or areas. Joints must be tight, inconspicuous as possible, and in alignment. Cut tile to fit snugly at pipes and other vertical surfaces. Seal joints at pipes with adhesive. Remove spots or smears of adhesive immediately. Entire surface of finished tile floor must be smooth, straight, and free from bleeding adhesive, buckles, waves, or projecting tile edges upon completion. Bleeding of adhesive on finished floors is cause for rejection by the Contracting Officer. Remove and replace damaged or rejected tiles.

3.5.2 Metal Edge Strips

Secure edge strips with No. 10 aluminum alloy, counter-sunk, flathead machine screws with expansion sleeves. Provide exposed edges of tile with one-piece metal edge strips.

3.5.3 Terrazzo Base/Strips

Terrazzo base/strips must be continuous and adhesively applied. Joints must be tight and inconspicuous in same manner as floor tile.

3.6 CLEANING

Upon completion of the installation and after adhesive has cured, thoroughly clean flooring in accordance with the manufacturer's recommendations.

3.7 PROTECTION

Cover and protect the terrazzo tile work from damage until completion of the work of all other trades. Remove and replace defects which develop, such as loose, broken, or curled tiles. Submit [six] [_____] copies of the Manufacturer's Maintenance Instructions.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for resinous terrazzo flooring and conductive resinous terrazzo flooring.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The resinous terrazzo floor systems covered by this guide specification may be used in lieu of portland cement terrazzo where the light weight of the thin set system would be advantageous.

The conductive resinous terrazzo flooring is primarily intended for use in areas where volatile materials are handled, clean-rooms, parachute assembly areas, etc. These systems, which have a wear factor four times better than cementitious terrazzo and five to six times better than vinyl may be used, when economically justified, in hard wear areas where there is a need for a high degree of cleanliness, a decorative effect, and some chemical resistance. These systems will not be used over
lightweight concrete and will not be used in lieu of quarry tile in kitchens.

The selection of a floor system for a location where resistance to specific conditions is important should be based upon the ability of the system to withstand required exposure conditions. For example, polyesters are suitable where resistance to detergents is required but should not be used in laboratory or other areas where spillage of sodium hydroxide or similar strong alkaline solution occurs; epoxies should not be used where resistance to oxidizing acids is required or where resistance to temperatures in excess of 54 degrees C (130 degrees F) is required; latex mastic and resin emulsions should not be used where resistance to strong acids or alkalis is required. Each job should be evaluated on its own merits considering exposure conditions, costs, and local experience with the various systems.

Areas to receive terrazzo will be shown on the drawings. Color should be shown by specifying a selected plate number from the NTMA publication, "Terrazzo Information Guide." Example: NTMA terrazzo catalog, plate No. S-301-4. Colors selected may be any combination of standard marble granules of domestic origin available in the local market, but it is highly desirable that color combinations be designated by NTMA color plates.

**************************************************************************
1.1 SUMMARY
**************************************************************************

NOTE: Conductive floors will be used at operations where explosives having an electrostatic sensitivity of 0.1 joule or less such as primer, detonator, igniter, and incendiary mixtures are exposed. Conductive floors are also required where the following are performed:

a. Loose unpacked ammo with electric primers.
b. Exposed electro-explosive devices.
c. Electrically initiated items with exposed electric circuitry.
d. Hazardous materials that could be ignited by static discharge from humans.

**************************************************************************
Apply resinous terrazzo flooring, in the colors indicated, in the areas shown on the detail drawings. Submit two 150 x 150 mm (6 x 6 inches, minimum) samples of each color of resinous terrazzo and two 150 mm (6 inches) lengths, of each type of strip. Flooring must be [(an epoxy terrazzo system that conforms to the requirements specified in paragraphs 2.01A and B of NTMA Info Guide)] or [(a polyester terrazzo flooring system that conforms to the requirements specified in paragraphs 2.01A and B of NTMA Info Guide)] [(a conductive epoxy terrazzo system that conforms to the requirements specified in paragraphs 2.01A, B, and H of NTMA Info Guide)]
[or] [polyester terrazzo flooring system that conforms to the requirements specified in paragraphs 2.10A, B, and J of NTMA Info Guide].

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D56 (2016a) Standard Test Method for Flash Point by Tag Closed Cup Tester

CALIFORNIA DEPARTMENT OF PUBLIC HEALTH (CDPH)

NATIONAL FIRE PROTECTION ASSOCIATION (NFPA)

NFPA 99 (2024; TIA 23-1; TIA 23-2) Health Care Facilities Code

NATIONAL TERRAZZO AND MOSAIC ASSOCIATION (NTMA)

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (SCAQMD)

SCAQMD Rule 1113 (2016) Architectural Coatings

SCAQMD Rule 1168 (2017) Adhesive and Sealant Applications
1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detail Drawings; G[, [_____]]
Strips; G[, [_____]]

SD-06 Test Reports
Certified Test Reports; G[, [_____]]
SD-07 Certificates
Qualifications of Installer; G[, [_____]]

1.4 QUALITY ASSURANCE

Applicator must be approved by the resin manufacturer and must have a minimum of 3 years experience in the application of the materials to be used and must have completed 8 successful installations within the past 2 years. Furnish a written statement from the manufacturer detailing the Qualifications of Installer.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the project site in manufacturer's original unopened containers. Keep materials in a clean, dry, area with temperatures controlled between 10 and 33 degrees C 50 and 90 degrees F.

1.6 ENVIRONMENTAL REQUIREMENTS

Maintain areas to receive terrazzo at a temperature above 10 degrees C 50 degrees F for 2 days prior to installation and for 7 days following installation.

PART 2 PRODUCTS

2.1 PRIMER

Primer must be a material recommended by the resin manufacturer which will penetrate the pores of the substrate and bond with the topping to form a permanent monolithic bond between the substrate and the topping. Primer products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for primer.
2.2 RESIN

Resin for the specified terrazzo flooring must conform to the requirements shown in NTMA Info Guide. Submit resin manufacturer’s descriptive data, plus mixing, proportioning, and installation instructions. Resin products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for resin.

2.3 FILLERS

Fillers, if required, must be inert mineral or cellulosic material as recommended by the manufacturer and best suited for the resin binder used. Fillers must be furnished in the quantity necessary to impart the required color and physical characteristics.

2.4 MARBLE CHIPS

**************************************************************************
NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Consider specifying marble chips as recycled materials. Research shows marble chips are commonly available from recycling operations. The designer of record needs to confirm local/regional availability that does not impact cost effectiveness.
**************************************************************************

Marble chips must be of domestic origin of sizes and colors to match NTMA Info Guide color plate indicated [on the drawings] [in Section 09 06 00 SCHEDULES FOR FINISHES]. Chips must be a range of sizes up to and including the NTMA Standard No. 0 and Standard No. 1 for 6 mm 1/4 inch thick floors and Standard No. 0 through Standard No. 2 for 10 mm 3/8 inch thick floors.

Provide Marble Chips with 100 percent recycled content. Provide data identifying percentage of recycled content for marble chips.[

2.5 STRIPS

Submit drawings indicating the type, size, and layout of divider strips and control joint strips.

2.5.1 Divider Strips

**************************************************************************
NOTE: Location of strips will be shown on the drawings. Strips should be used at logical stops and expansion joints. Manufacturer's literature should be reviewed when making selections for strips.

Plastic divider strips and control joint strips should be used with conductive type terrazzo.
Divider strips must be as deep as required, [_____] mm gauge and of [brass] [zinc] [plastic in color as indicated [in Section 09 06 00 SCHEDULES FOR FINISHES]].

2.5.2 Control Joint Strips

Control joint strips must be as deep as required, [_____] mm gauge and of [brass] [zinc] [plastic in color as indicated [on the drawings] [in Section 09 06 00 SCHEDULES FOR FINISHES]]. Provide neoprene filler [_____] mm inches thick in color as indicated [in Section 09 06 00 SCHEDULES FOR FINISHES].

2.6 GROUT

Grout must be as recommended by the manufacturer of the resin. Grout products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide validation of indoor air quality for grout.

2.7 SEALER

Sealer must have a pH factor between 7 and 10 and must be a penetrating type specially prepared for use on terrazzo. The sealer must not discolor or amber the terrazzo and must produce a slip resistant surface. Flash point of sealer must be a minimum of 27 degrees C 80 degrees F when tested in accordance with ASTM D56. Sealer products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for sealer.

PART 3 EXECUTION

3.1 PREPARATION OF CONCRETE SUBFLOOR

Do not commence installation of the floor topping until the concrete substrate has cured for at least 28 calendar days. Prepare the concrete surfaces in accordance with the instructions of the resin manufacturer.

3.2 MIXING, PROPORTIONING, AND INSTALLATION

NOTE: Terrazzo topping thickness will be determined by the marble chip size indicated in the selected NTMA-01 color plate referenced in paragraph MARBLE CHIPS. If the cross-section is less than 10 mm 3/8 inch the use of No. 1 and No. 0 size chips will be required. Delete last sentence if resinous terrazzo bases are not required.

Mixing, proportioning, and installing must be in accordance with the approved instructions of the manufacturer. Install strips in locations indicated. Apply the topping to give a finish thickness of [6] [10] mm

3.3 TESTING

Between 30 and 45 days after flooring installation is completed, and prior to its use, test the conductive resinous terrazzo flooring in accordance with paragraph 12-4.1.3.8(b)(7) of NFPA 99. The resistance of the conductive floor at any one location must be more than 5,000 ohms in areas with 110 volts service, more than 10,000 ohms in areas with 220 volt service, and average less than 1,000,000 ohms and more than 25,000 ohms in all areas. Submit certificates indicating conformance with specified requirements. Accompany certificates with certified test reports showing that the conductive resinous terrazzo floor has been tested and meets the requirements specified.

3.4 CLEANING AND SEALING

Wash the terrazzo with a neutral cleaner and where required, clean with a fine abrasive to remove any stains or cement smears. Rinse the cleaned surfaces. When dry, apply a terrazzo sealer in accordance with the manufacturer's directions. Submit maintenance literature for terrazzo cleaning and sealing.

3.5 PROTECTION

cover and protect the terrazzo work from damage until completion of the work of all other trades.

NOTE: This guide specification covers the requirements for thin-set, troweled, heavy-duty, epoxy floor toppings.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1   REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature
to update the issue dates.

References not used in the text are automatically deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**ASTM INTERNATIONAL (ASTM)**

<table>
<thead>
<tr>
<th>Standard</th>
<th>Title</th>
<th>Issue Year</th>
</tr>
</thead>
</table>
1.2 ADMINISTRATIVE REQUIREMENTS

1.2.1 Pre-Installation Meetings

Pre-installation Conference: Conduct conference at Project site.

1.2.2 Product Data

Within [30] [_____] days of contract award, submit manufacturer's catalog data for the following items:

a. Epoxy-Resin Binder/Matrix
b. Cured Epoxy Binder
[ c. Aggregate ]
d. Surface Sealing Coat

1.2.3 Design Mix Data

Within [30] [_____] days of contract award, submit design mix data for the following items, including a complete list of ingredients and admixtures:

a. Epoxy-Resin Binder/Matrix
b. Cured Epoxy Binder
c. Surface Sealing Coat

Ensure applicable test reports verify the mix has been successfully tested and meets design requirements.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification
technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Installation Drawings[; G[, [___]]]

Fabrication Drawings[; G[, [___]]]

SD-03 Product Data

Manufacturer's Catalog Data[; G[, [___]]]

SD-04 Samples

Hardboard Mounted Epoxy Flooring[; G[, [___]]]

Floor Topping[; G[, [___]]]

Mockups[; G[, [___]]]

SD-05 Design Data

Design Mix Data[; G[, [___]]]
1.4 DELIVERY, STORAGE, AND HANDLING

Protect materials from weather, soil, and damage during delivery, storage, and construction. Deliver materials in original packages, containers, or bundles bearing brand name and name of material.

Maintain materials used in the installation of floor topping at a temperature between 18 and 30 degrees C (65 and 85 degrees F).

1.5 QUALITY CONTROL

Prior to commencement of work, submit referenced standards certificates for the following, showing conformance with the referenced standards contained in this section:

a. Epoxy-Resin Binder/Matrix
b. Cured Epoxy Binder
c. Aggregate
d. Surface Sealing Coat

1.5.1 Mockups

Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution. Apply full-thickness mockups on 2.44 meters (96 inch) square floor area selected by Contracting Officer. Simulate finished lighting conditions for the review of mockups.

1.5.2 Qualifications

Submit a listing of product installations for heavy duty epoxy flooring including identification of at least [5] units, similar to those proposed for use, that have been in successful service for a minimum period of [5] years. Identify purchaser, address of installation, service organization, and date of installation.

Ensure floor system applicators are experienced in the application of troweled [walnut-shell] aggregate thin-set floor topping.

1.5.3 Sampling

Submit hardboard mounted epoxy flooring samples not less than 300 millimeter (12 inch) square for each required color.

Provide panels showing nominal thickness of finished toppings, color, and
texture of finished surfaces. Finished floor toppings and the approved samples are to match in color and texture.

1.6 WARRANTY

Submit a [2] [_____] year written warranty for all materials and installation work.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Thin-set, heavy-duty, troweled floor topping is a mixture of a two-component epoxy-resin binder and a blend of several sizes of pregraded aggregate. Clearly designate on drawings areas of application.
**************************************************************************
**************************************************************************
NOTE: Coordinate with plumbing drawings for floor drains, slopes and details.
**************************************************************************
**************************************************************************
NOTE: Delete the second paragraph for projects which are cast completely on site. Include the second paragraph for projects requiring factory assembly prior to site delivery.
**************************************************************************

Submit installation drawings for heavy duty epoxy flooring systems clearly designating the areas of application and the installation plan. Include in the installation plan, methods to control sand and dust if sand blasting is required.

[ Submit fabrication drawings for heavy duty epoxy flooring Systems consisting of fabrication and assembly details to be performed in the factory.

]2.2 MATERIALS

2.2.1 Mixes

2.2.1.1 Epoxy-Resin Binder/Matrix

Provide a clear two-component compatible system epoxy resin binder consisting of: (1) a liquid blend of a biphenyl-based epoxy resin and an aliphatic polyglyceride ether, and (2) a liquid blend of two modified amine curing agents, which individually cures the epoxy resin at room temperature to a glossy smooth film. Ensure the two components and the cured epoxy binder have the following physical properties:

#### 2.2.1.4 Surface Sealing Coat

**NOTE:** Glossy final finishes may cause a slip hazard.
under room conditions when exposed to water or oily lubricants, particularly in various labs or maintenance areas. Specify the type of final finish desired and the material required (grit) to be added to prevent slip hazards.

The slip resistance of floor surfaces is an important consideration for resinous flooring. Static coefficient-of-friction (COF) requirements for walking surfaces are not stipulated in the ADA standards. Previous accessibility guidance for floor surfaces recommended COF values of not less than 0.6 for level surfaces and 0.8 for ramped surfaces, but did not indicate the test required to make the measurement.

Provide nonambering aliphatic or aromatic moisture-curing polyurethane surface sealer into which has been incorporated a flatting agent. Add flatting agent not more than 24 hours prior to actual application of the coating. Ensure cured coating with flatting agent yields 60-degree specular gloss of 10 to 20 when tested in accordance with ASTM D523.

PART 3 EXECUTION

3.1 PREPARATION

NOTE: Select test per manufacturer’s written instructions.

Prior to applying resinous flooring material, inspect substrate and immediately report any unsatisfactory conditions that exist and repair.

Verify that the concrete substrates are dry and the moisture-vapor emissions are within acceptable levels according to the manufacturer’s written instructions.

[ Anhydrous Calcium Chloride Test: ASTM F1869. Proceed with application of resinous flooring only after substrates have a maximum moisture-vapor-emission rate of \( [1.36 \text{ kg of water/92.9 sq. meters}] \) \( [2.04 \text{ kg of water/1000 sq ft.}] \)[Insert emission rate] of slab area in 24 hours.

][ Relative Humidity Test: Use in situ probes, ASTM F2170. Proceed with installation only after substrates have a maximum [75] [Insert number] percent relative humidity level measurement.

][ Alkalinity and Adhesion Testing: Verify that concrete substrates have a pH within an acceptable range. Perform tests recommended by the manufacturer. Proceed with the application only after the substrates pass testing.]

3.1.1 Safety Precautions

Prior to application in confined spaces of toppings and coatings containing flammable or toxic properties, institute safety precautions recommended by the manufacturer of the product.
Erect "NO SMOKING" signs, and prohibit smoking or use of spark- or flame-producing devices within 15 meter 50 feet of any mixing or placing operation involving flammable materials.

Provide the personnel required to handle, mix, or apply toppings containing toxic or flammable properties with such items of personal protective equipment and apparel for eye, skin, and respiratory protection as are recommended by the manufacturer of the product. Ensure all personnel are trained in the appropriate use and wearing of personal protection equipment.

3.1.2 Protection of Adjacent Surfaces

In addition to the protection of adjacent surfaces during installation, provide areas used to store and mix materials with a protective covering under the materials. After application of the sealer coats, protect finished flooring during the remainder of the construction period. In areas of expected minimum or moderate traffic, cover floors with 12300 newton per meter 70 pound kraft paper, with strips taped together and edges secured to prevent roll-up. Place vegetable fiberboard, plywood, or other suitable material that does not mar the flooring over the paper to protect areas used as passages by workmen and areas subject to floor damage because of subsequent building operations. Upon completion of construction, remove the protection, clean flooring and, where necessary, repair, reseal, or both, at no additional cost to the Government.

3.1.3 Concrete Subfloor

3.1.3.1 New Concrete Floors

Do not commence installation of the floor topping until the concrete has cured a minimum of 28 calendar days. Verify that the concrete floor is straight, properly sloped, and has rough broom wooden float type finish. Ensure that the concrete is moist cured with burlap or polyethylene. Before applying the prime coat, clean the concrete surface by an approved method.

3.1.3.2 Existing Concrete Floors

Clean existing concrete floors, with hard troweled or contaminated areas in conformance with ASTM D4259. Ensure the concrete is free of all paint, sealers, curing agents, oil, grease, moisture, dirt or any other contaminants. Remove any loose or corroded segments of existing concrete. Patch with a grouting compound as recommended by the resinous flooring manufacturer. Fill all cracks with an elastomeric jointing compound compatible with the resinous flooring system used.

3.1.4 Steel Subfloor

Clean surfaces of grease, rust, and mill scale by dry sand blasting in accordance with SSPC SP 6/NACE No.3. Prime all surfaces with a primer as recommended by the resinous flooring manufacturer, the same day or before there are any visible signs of oxidation, which ever is sooner. Using other means of surface preparation is optional, as approved by the Contracting Officer, provided the degree of cleanliness and the profile obtained by sand blasting is equivalent. Power brushing is not permitted.
3.1.5 Mixing Of Materials

**************************************************************************
NOTE: Mixtures providing satisfactory density, trowelability, and surface texture are affected by variations in particle shapes, sizes, and size distribution.
**************************************************************************

Select the job mix proportions on the trial batch proportions used to prepare the floor topping samples as submitted and approved.

Use mechanical equipment for mixing of materials in accordance with the manufacturer's instructions.

Use rotating paddle-type masonry mortar mixers for preblending the three sizes and color pigment, if any, of the walnut shell aggregate and addition of the mixed epoxy resin binder. Ensure mixing times are as recommended by the materials supplier(s), provided mixing times result in homogeneous mixtures. Limit quantity of material mixed at one time to that which can be applied and finished within the working life of the mixtures. Verify that the temperature of materials at the time of mixing are between 18 and 30 degrees C.

3.2 APPLICATION

3.2.1 Areas of Application

Anchor plates set with the top surface at or above the finished epoxy floor level do not require coverage with this flooring material. Extend flooring under equipment, except when the equipment base is indicated to be flush against the structural floor. Cover and/or mask surfaces not to receive the epoxy floor topping, such as equipment or cabinets installed prior to surface-preparation efforts and adjacent to the flooring installation.

3.2.2 Application of Prime Coat and Troweling

Combine the epoxy binder components A and B in the proportions specified by the manufacturer to form a clear compatible system immediately on mixing. Cure combined components to a clear film possessing a glossy, non-greasy surface at relative humidities less than 80 percent, having the following properties after curing 24 hours at 25 degrees C, followed by 24 hours at 52 degrees C:

Ensure that the prepared subfloor surface is dry and at a temperature of not less than 16 degrees C when application of the floor topping is initiated. Immediately before application of the prime/scratch coat on the prepared surface, remove dust or other loose particles by blowing with compressed air or vacuum cleaned. Use only an air compressor equipped with an efficient oil-water trap to prevent oil contamination or wetting of surface.

Apply a thin roller coat of the epoxy binder specified to the prepared subfloor as a prime coat. As an aid to placing, compacting, and finishing the floor topping, form a scratch coat by sprinkling a minimum quantity of the walnut shell aggregate on the prime coat surface immediately following the prime coat application. Prior to application of the prime/scratch coat, fill cracks in the concrete per manufacturer's instructions, and make provisions to keep control or expansion joints open.
Place the floor topping prior to final gelling of the prime/scratch coat. Immediately after the materials are mixed as specified, dump the mixture in the placement area and spread to prolong troweling life. Screed or rough trowel placed materials to the specified thickness and then compact by the use of a smooth roller prior to finish troweling to a nominal thickness of 4.76 millimeter plus or minus 1.59 millimeter 3/16 inch plus or minus 1/16 inch. Ensure all finished surfaces are free of ridges, hollows (bird-baths), trowel marks, and smoothness varies no more than 3.18 millimeter 1/8 inch when tested with an 2500 millimeter 8 foot straightedge. Make provisions to maintain the work areas in a relatively dust-free environment during curing of the topping.

3.2.3 Sealer Coat

After the floor topping has set firmly (approximately 6 to 16 hours depending on subfloor temperature) in a relatively dust-free environment, apply two thin coats of the sealer coat, by means of brush, roller, squeegee, or notched trowel to provide a pore-free, easy-to-clean surface. At the time of sealer application, ensure that the surface is dust-free. Depending on relative humidity, allow the applied sealer to cure to a tack-free condition in 2 to 4 hours. Do not apply second coat until after the initial coat has cured to a tack-free, hard film. Maintain topping areas in a relatively dust-free environment during curing of the sealer coats.

[3.2.4 Integral Cove Base]  

**************************************************************************  
NOTE: Use the following paragraph if project requires an integral cove base.  
**************************************************************************

Provide a [10.16] [_____] cm [4] [_____] inch high cove base to all wall surfaces as indicated on the drawings. Install so as to provide a [1.27] [_____] cm [1/2] [_____] inch radius at the juncture of the floor and the wall.

3.3 FIELD QUALITY CONTROL

3.3.1 Repairing

Remove and replace damaged or unacceptable portions of completed work with new work to match adjacent surfaces at no additional cost to the Government.

3.4 ADJUSTING AND CLEANING

Clean surfaces of the new work, and adjacent surfaces soiled as a result of the work. Remove all equipment, surplus materials, and rubbish associated with the work from the site.

-- End of Section Table of Contents --
NOTE: This specification covers the requirements for trowelled-on industrial resinous flooring, conductive resinous flooring, and decorative resinous flooring except resinous terrazzo.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: The floor systems covered by this guide specification are primarily intended for use in biological laboratories, in similar areas which are subject to hard wear or spillage of chemicals and require a high degree of cleanliness, and for explosive and ammunition facilities.

These systems are for use over normal weight concrete and will not be used over lightweight concrete. The selection of a floor system for a location where resistance to specific chemical conditions is important should be based upon the ability of the system to withstand required exposure.
conditions. For example, polyesters are suitable for use where resistance to detergents is required but should not be used in laboratory or other areas where spillage of sodium hydroxide or similar strong alkaline solution occurs; epoxies should not be used where resistance to oxidizing acids is required or where resistance to temperatures in excess of 54 degrees C 130 degrees F is required. Each job should be evaluated on its own merits considering exposure conditions, costs, flammability of materials, and local experience with the various systems. All provisions relating to the systems not selected will be deleted.

Check other sections of the specifications to ensure:

1. No vermiculite or perlite aggregates in concrete substrates.

2. No curing compounds or sealers on concrete substrates.

3. New concrete receives single trowelled finish; and no burnished finishes.

4. Vapor barrier is provided under all concrete slabs-on-grade.

5. Only exterior grade plywood on new plywood substrates. No interior grade or interior grade with exterior glue. Plywood is nailed with annular ring or spiral nails only.

6. No dimension lumber substrate in new construction; when existing lumber substrates are to be covered, overlay with 50 by 50 mm (2 by 2 inch) mesh hardware cloth.

On the drawings, show:

1. Location of resinous flooring. If more than one type is to be used, key each to location on the drawings.

2. Details of special items such as coved bases, expansion joints, control joints, stairs, and floor drains.

3. Details for grounding of conductive floors.

1.2 SUBMITTALS

-------------------------
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.
The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE

1.3.1 Qualifications of Installer

Perform installation by an applicator approved by the manufacturer of the floor surfacing materials. Furnish a written statement from the manufacturer detailing the Qualifications of Installer.

1.3.2 Shop Drawings

Submit drawings indicating the type and layout of the flooring system for approval.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver the materials to the project site in unopened bags and containers clearly labeled with the name of the manufacturer, type of material, batch number, and date of manufacture. Store materials, other than aggregates, away from fire, sparks, or smoking areas. Maintain the storage area between 10 and 32 degrees C (50 and 90 degrees F).

1.5 ENVIRONMENTAL REQUIREMENTS

Maintain the ambient room and floor temperatures at 18 degrees C (65 degrees F), or above, for a period extending from 48 hours before installation until one week after installation. Cure concrete for at least 28 days and keep it free of water for at least 7 days prior to receiving surfacing in accordance with ASTM D4263. Measure and insure moisture content of wood substrates between 8 and 10 percent prior to application.

PART 2 PRODUCTS

2.1 MATERIALS

Provide materials (except aggregate) used in the flooring from a single manufacturer. Furnish and install [trowel applied type epoxy finish of 6 mm (1/4 inch) thickness with properties and chemical resistance conforming to the requirements specified in NTMA Info Guide.] [trowel or spray applied [1.6 mm (1/6 inch) [3.17 mm (1/8 inch) [6.35 mm (1/4 inch)] thick, epoxy, polyester, or other resinous material conforming to ASTM C722 with [Type A surfacings (chemical resistance and moderate to heavy traffic resistance)] [Type B surfacings (mild chemical resistance and severe thermal shock stability)] resin-based flooring. Meet the following material requirements:

2.1.1 Primer

Type recommended by the manufacturer to penetrate into the pores of the substrate and bond with the floor surfacing matrix to form a permanent monolithic bond between substrate and surfacing matrix. Primer products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for primer.

2.1.2 Aggregate
NOTE: Select the desired colors for colored quartz from the following and specify the percentage of each color in the mixture; white, grey, brown, buff, green, and red.

Use first bracketed sentence when industrial resinous and conductive industrial resinous flooring are required (biological laboratories, industrial facilities, clean rooms, laundries, and other areas subject to hard wear or spillage). Use second bracketed sentence when decorative floor is desired and floor is subject to spillage or requires high degree of cleanliness (gang showers, clean rooms, laundries, laboratories, and small kitchens where quarry tile is not economically feasible).

Provide [silica sand, quartz, granite, or other suitable chemical resistant material having a Mohr's hardness of not less than 6.0] [angular, translucent quartz covered with a colored inorganic coating as [indicated] [selected from manufacturer's standard aggregates]] aggregate.

2.1.3 Binder

NOTE: Delete unsuitable matrix or matrices in accordance with the following:

Do not use latex or resin emulsion matrices where maximum resistance to solvents, strong acid or alkaline solutions is required; where high stain resistance is required; where maximum resistance to compressive loads and indentation are required; or where colored quartz decorative aggregate is specified.

Do not use epoxy matrix where resistance to strong oxidizing acid solutions is required; where maximum fire resistance is required; where subject to prolonged temperatures in excess of 54 degrees C 130 degrees F; where frequently exposed to steam or boiling liquids; where white or light colored quartz decorative aggregates are specified or where substrate cannot be thoroughly dried.

Do not use polyester matrix where resistance to strong alkaline solutions is required; where maximum fire resistance is required; where maximum slip resistance is required; where building will be occupied during installation; or where food stuffs will be stored within building during installation.

Provide [synthetic rubber latex or resin emulsion] [thermo-setting epoxy] [or] [medium reactive nonthixotropic modified polyester] binder.

2.1.4 Fillers

If required, provide inert silica, quartz or other hard aggregate material
fillers as recommended by the flooring manufacturer. Furnish fillers in the quantity necessary to impart the required color and physical characteristics. Provide a filler containing sufficient fines to obtain an even-textured, nonslip type of surface on the finished topping.

2.1.5 Top Coating

**************************************************************************
NOTE: Specify clear top coat for decorative aggregate flooring. Top coatings are available in light grey, dark grey, red, blue, tan, brown, dark green, and light green for industrial resinous floors. Conductive resinous floorings are dark grey to black and should be specified with conductive clear top coats only.
**************************************************************************

Furnish [clear] [[_____] color] coating of type recommended by the manufacturer. Floor top coating products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for top coating.

2.2 FLOORING SYSTEMS

Submit cured samples of each floor finish or color combination and Data Package 1 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. The complete systems, after curing, must have the following properties when tested in accordance with the test methods listed for each property.

2.2.1 Latex or Resinous Emulsion Matrix Floor Surfacing

**************************************************************************
NOTE: Resistance to reagents specified in item j. is required to withstand cleaning agents and spillage associated with normal use. Where resistance to specific chemicals associated with laboratories, plating shops, etc., is required, these chemical solutions and concentrations should be added to the lists. Manufacturer’s literature should be checked to assure that the matrix is capable of resistance to these chemicals.
**************************************************************************

2.2.1.1 Compressive Strength

ASTM C579, 31 MPa 4500 psi minimum at 7 days.

2.2.1.2 Tensile Strength

ASTM C307, 4.2 MPa 600 psi minimum at 7 days.

2.2.1.3 Flexural Strength

ASTM C580, 5.6 MPa 800 psi minimum at 7 days.
2.2.1.4 Thermal Coefficient of Expansion

ASTM C531; 5.5 x 10^-4 mm per 100 mm 0.01 mil per inch per degree C or F maximum.

2.2.1.5 Bond Strength

1.4 MPa 200 psi minimum with 100 percent concrete failure.

2.2.1.6 Flame Spread Index

ASTM E162, 4.0 maximum.

2.2.1.7 Smoke Developed

ASTM E162, 0.4 gm maximum.

2.2.1.8 Abrasion Resistance

ASTM D4060; 30 mg weight loss.

2.2.1.9 Moisture Absorption

ASTM C413; 3.5 percent maximum.

Chemical Resistance

ASTM D1308; no effect when exposed to the following reagents for 7 days:

- Acetic Acid: 5 percent solution
- Ammonium Hydroxide: 10 percent solution
- Citric Acid: 5 percent solution
- Coffee
- Cola Syrup
- Isopropyl Alcohol
- Mineral Oil
- Sodium Hydroxide: 5 percent solution
- Tri-Sodium Phosphate: 5 percent solution
- Urea: 6.6 percent solution

2.2.2 Epoxy Matrix Floor Surfacing

**************************************************************************

NOTE: The first set of figures in brackets for items b. and c. represents epoxy and polyester matrix containing more fillers and extenders and are suitable for most installations. The second set of figures in brackets represents high resin content epoxy and polyester matrices and should be specified only when higher strengths or increased chemical resistance is required.

Resistance to reagents specified in item k. is required to withstand cleaning agents and spillage associated with normal use. Where resistance to specific chemicals associated with laboratories, plating shops, etc., is required, these chemical solutions and concentrations should be added to the lists. Manufacturer's literature should be checked.
to assure that the matrix is capable of resistance to these chemicals.

2.2.2.1 Compressive Strength

ASTM C579; 64 MPa 10,000 psi minimum at 7 days.

2.2.2.2 Tensile Strength

ASTM C307; [4.2] [10.3] MPa [600] [1500] psi minimum at 7 days.

2.2.2.3 Flexural Modulus of Elasticity

ASTM C580; [1610] [3215] MPa [250,000] [500,000] psi minimum at 7 days.

2.2.2.4 Thermal Coefficient of Expansion

ASTM C531; 22 by 10-4 mm per 100 mm 0.00004 inches per inch per degree C F maximum.

2.2.2.5 Shrinkage

ASTM C531; 0.5 percent maximum.

2.2.2.6 Bond Strength

1.9 MPa 300 psi minimum with 100 percent concrete failure (16 MPa 2500 psi Compressive Strength Concrete).

2.2.2.7 Flame Spread Index

ASTM E162; 25 maximum.

2.2.2.8 Smoke Deposited

ASTM E162; 4 mg maximum.

2.2.2.9 Abrasion Resistance

ASTM D4060; 15 mg maximum weight loss.

2.2.2.10 Moisture Absorption

ASTM C413; 1.0 percent maximum.

2.2.2.11 Chemical Resistance

ASTM D1308; no effect when exposed to the following reagents for 7 days:

- Acetic acid: 5 percent solution
- Ammonium Hydroxide: 10 percent solution
- Citric Acid: 5 percent solution
- Coffee
- Cola Syrup
- Isopropyl Alcohol
- Mineral Oil
- Sodium Hydroxide: 5 percent solution
- Tri-Sodium Phosphate: 5 percent solution
Urea: 6.6 percent solution

2.2.3 Polyester Matrix Floor Surfacing

**************************************************************************
NOTE: The first set of figures in brackets for items a., b., c., and e. represents epoxy and polyester matrix containing more fillers and extenders and are suitable for most installations. The second set of figures in brackets represents high resin content epoxy and polyester matrices and should be specified only when higher strengths or increased chemical resistance is required.

Resistance to reagents specified in item q. is required to withstand cleaning agents and spillage associated with normal use. Where resistance to specific chemicals associated with laboratories, plating shops, etc., is required, these chemical solutions and concentrations should be added to the lists. Manufacturer's literature should be checked to assure that the matrix is capable of resistance to these chemicals.
**************************************************************************

2.2.3.1 Compressive Strength

ASTM C579; [51] [64] MPa [8000] [10,000] psi minimum at 7 days.

2.2.3.2 Tensile Strength

ASTM C307; [3.8] [10.3] MPa [600] [1500] psi minimum at 7 days.

2.2.3.3 Flexural Modulus of Elasticity

ASTM C580; [3215] [6430] MPa [500,000] [1,000,000] psi minimum at 7 days.

2.2.3.4 Thermal Coefficient of Expansion

ASTM C531; 22 by 10^-4 mm per 100 mm 0.00004 inches per inch per degree C F maximum.

2.2.3.5 Shrinkage

ASTM C531; [0.6] [1.0] percent maximum.

2.2.3.6 Bond Strength

1.9 MPa 300 psi minimum with 100 percent concrete failure.

2.2.3.7 Flame Spread Index

ASTM E162; 25 maximum.

2.2.3.8 Smoke Deposited

ASTM E162; 4 gm maximum.
2.2.3.9 Abrasion Resistance

ASTM D4060; no more than 0.025 mm 1.0 mil loss of thickness.

2.2.3.10 Porosity

ASTM D4060; no more than 8 percent gain in weight and no evidence of cracking, peeling, blistering, or loss of adhesion.

2.2.3.11 Impact Resistance

ASTM D4060; no evidence of cracking, spalling, or loss of adhesion.

2.2.3.12 Fungistatic and Bacteriostatic Resistance

ASTM D4060; no support for growth of fungus or bacteria.

2.2.3.13 Ultraviolet Light Resistance

ASTM D4060; no evidence of chalking, cracking, peeling, blistering, or loss of adhesion.

2.2.3.14 Thermal Shock Resistance

ASTM D4060; no evidence of cracking, peeling, blistering, spalling, or loss of adhesion.

2.2.3.15 Stain Resistance

ASTM D4060; no permanent staining.

2.2.3.16 Adhesion

ASTM D4060; 90 percent failure of concrete substrate.

2.2.3.17 Chemical Resistance

ASTM D1308; no effect when exposed to the following reagents for 7 days.

- Acetic Acid: 5 percent solution
- Ammonium Hydroxide: 10 percent solution
- Citric Acid: 5 percent solution
- Coffee
- Cola Syrup
- Isopropyl Alcohol
- Mineral Oil
- Sodium Hydroxide: 5 percent solution
- Tri-Sodium Phosphate: 5 percent solution
- Urea: 6.6 percent solution

2.3 CONDUCTIVE SPARKPROOF FLOORING

**************************************************************************

NOTE: Conductive floors will be used at operations where explosives having an electrostatic sensitivity of 0.1 joule or less such as primer, detonator, igniter, and incendiary mixtures are exposed. Conductive floors are also required where the following are performed:

SECTION 09 67 23.14 Page 14
a. Loose unpacked ammo with electric primers.
b. Exposed electro-explosive devices.
c. Electrically initiated items with exposed electric circuitry.
d. Hazardous materials that could be ignited by static discharge from humans.

Trowel or spray apply conductive sparkproof industrial resin-based flooring [1.6 mm 1/16 inch] [3 mm 1/8 inch] [6 mm 1/4 inch] thick, epoxy, polyester, or other resinous material conforming to ASTM C722 with [Type A surfacings (chemical resistance and moderate to heavy traffic resistance)] [Type B surfacings (mild chemical resistance and severe thermal shock stability)]. Ground conductive flooring and conform to the requirements for conductive flooring of NFPA 99.

2.4 SEALER AND RESIN

Provide a sealer product recommended by the industrial resin-based flooring manufacturer; when applied to the resin topping and dried, it must be nonslip and resistant to staining and suitable for the type application indicated. Floor resin and sealer products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation for Indoor Air Quality for Sealer and Resin.

2.5 ANTIMICROBIAL

Treat industrial resin-based flooring to be resistant to fungi and bacteria.

2.6 COLOR

Provide color [as indicated] [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [______].

PART 3 EXECUTION

3.1 SURFACE PREPARATION

Resinous floor systems should not be installed over existing resilient tile or sheet flooring. If existing concrete substrates are badly cracked, crumbling, punky, or deeply contaminated with oil or fat, a new concrete topping of proper thickness and strength should be shown and specified. Wood floors that are poorly supported, badly worn, splinter, grease or oil soaked should be renovated prior to application of resinous flooring.
[Completely remove existing resilient flooring and adhesive by scraping.]
[Remove all dirt, dust, debris, and other loose particles by sweeping or vacuum cleaning.] Protect adjacent surfaces not scheduled to receive the flooring by masking, or by other means, to maintain these surfaces free of the flooring material.

[3.1.1 Concrete Surfaces]

**************************************************************************
NOTE: Proper preparation of substrate is essential for satisfactory performance of resinous floor systems. Existing concrete floors should be carefully inspected to determine condition. Based on inspection, select most suitable surface treatment:

<table>
<thead>
<tr>
<th>Surface Condition</th>
<th>Surface Preparation Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Concrete</td>
<td>Acid etching and air drying</td>
</tr>
<tr>
<td>Old Concrete</td>
<td>Neutralize with hot alkaline cleaner, acid etching, and air drying</td>
</tr>
<tr>
<td>Acid contaminated</td>
<td>Mechanical cleaning or steam cleaning</td>
</tr>
<tr>
<td>Oil, fat or wax contaminated</td>
<td>Mechanical cleaning or steam cleaning</td>
</tr>
<tr>
<td>Alkali contaminated</td>
<td>Acid etching and air drying</td>
</tr>
<tr>
<td>Painted</td>
<td>Mechanical cleaning or paint stripping</td>
</tr>
<tr>
<td>Adhesive and asphalt contaminated</td>
<td>Mechanical cleaning</td>
</tr>
<tr>
<td>Dust and dirt contaminated</td>
<td>Mechanical cleaning</td>
</tr>
<tr>
<td>Form oil, sealer or curing compound contaminated</td>
<td>Mechanical cleaning</td>
</tr>
</tbody>
</table>

NOTE: Select the applicable paragraph(s) from the following:
**************************************************************************

[3.1.1.1 Mechanical Cleaning]

Completely remove dirt, wax, paint, laitance, and [_____] by grinding with a terrazzo machine, sanding with coarse open grid sandpaper, sand blasting, chipping, bush hammering, or wire brushing.

[3.1.1.2 Steam Cleaning]

Completely remove all animal fats, grease, oil, wax, and [_____] using a high pressure steam cleaner equipped with a soap injection system. Scrape the surface to remove any build-up of debris. Then thoroughly saturate the surface with hot caustic solution. Allow the solution to remain on the floor for 15 to 20 minutes. Apply steam, with caustic, over the presoaked area until all contamination is removed. Leach the caustic residue from the surface using one or more applications of steam without caustic. Flush the floor with warm water.
3.1.1.3 Paint Stripping

Brush or spray on a paint stripping material that has been demonstrated to effectively remove the paint. Leave the stripping material on the surface until the paint has softened or blistered. Remove paint by scraping, brushing, or wiping. Rinse the surface in accordance with the stripping material manufacturer's recommendations. Avoid strippers containing toxic methylene chloride.

3.1.1.4 Acid Etching

Apply a 10 percent solution of muriatic acid at a rate of one L/square meter or one quart/each 10 square feet of concrete surface. Allow the solution to stand until it stops bubbling but not less than 5 minutes. Remove the acid and wash the surfaces several times, as required, to remove all traces of the acid. Always dilute acid by pouring into water. Use face shield, rubber gloves, and other safety equipment when using acids, alkalis, or solvents.

3.1.1.5 Air Drying

After cleaning, allow concrete surface to air dry thoroughly prior to application of surfacing. Blowers or oil free compressed air may be used. Do not use flame-drying methods. Prior to application of surfacing, test concrete surface for excessive moisture in at least two locations. Place rubber mats at each location with smooth side against concrete and place weight on top of mat to hold in position and ensure contact with concrete. Polyethylene with all edges taped may be used in lieu of mats. After 8 hours remove mat or sheeting and examine floor surface for moisture accumulation. If tests indicate accumulation of moisture at either location, perform additional air drying until additional tests show no moisture accumulation.

3.1.2 Plywood

For new plywood substrates, provide exterior grade plywood with exterior grade glue nailed with annular ring or spiral nails. Sand the plywood to remove all latent contaminants. Sweep or vacuum surfaces to remove all sanding debris. Tape joints with 100 mm wide glass fiber reinforced tape.

3.1.3 Ceramic Tile

Remove all fats, oils, grease, or soap scum using a caustic solution of one kg of caustic soda to 8.3 L of water. Allow the solution to stand on the surface for at least one hour then scrub with steel brushes or steel wool. Mop up the caustic solution, neutralize it with a 10 percent muriatic acid solution, and thoroughly rinse the residue from the surface. Test glazed tile a deglazing agent as recommended by the flooring manufacturer and sanded or acid etched to roughen the surface sufficiently to obtain a good bond. Sweep or vacuum surfaces to remove all sanding debris. Use face shield, rubber gloves, and other safety equipment when using acids, alkalis, or solvents.

3.1.4 Substrate Cracks, Spalls, Joints, and Depressions

Fill all cracks, joints, spalls, and other depressions in the substrate with a latex underlayment, as recommended by the manufacturer compatible
with the floor surfacing material.

3.2 MIXING

Proportion and mix the floor surfacing components in accordance with the manufacturer's instructions. Submit flooring manufacturer's descriptive data, mixing, proportioning, and installation instructions. Include maintenance literature for resinous flooring.

3.3 APPLICATION

Submit complete instructions for application of flooring system including any precautions or special handling instructions required to comply with OSHA 29 CFR 1910-Subpart Z. Apply primer, floor surfacing, and seal coat in accordance with the manufacturer's recommendations and the following requirements.

3.3.1 Primer

Apply primer uniformly over the entire area to receive floor surfacing using clean rubber squeegees or clean steel trowels. Do not allow primer to collect in depressions. Allow primer to dry thoroughly before the next coat is applied. Reprime porous areas or areas where primer has dried.

3.3.2 Floor Surfacing

**************************************************************************

NOTE: Specify desired thickness of resinous flooring. Latex and resinous emulsion matrix flooring should be installed 6, 10 and 13 mm 1/4, 3/8, and 1/2 inch thick for light, medium, and heavy duty traffic. Epoxy and polyester matrix flooring should be installed 3, 5 and 6 mm 1/8, 3/16, and 1/4 inch thick for light, medium, and heavy duty traffic.

Use first bracketed option requiring continuous floor installation only if structural floor control joints have been located out of floor area.

**************************************************************************

Apply mixed surfacing material to provide a finish floor surfacing not less than [_____] mm inch thick. The entire surfacing in any one room or area must be [placed in one continuous operation without use of cold joints or divider strips] [one continuous operation except for placement of divider strips at structural floor control joints or as indicated]. All surfaces must be flush, true to plane and line, and level within 2 mm in one meter 1/4 inch in 10 feet.

3.3.3 Seal Coat

Apply seal coat uniformly covering all surfaces after floor surfacing has cured and as recommended by the supplier.

3.4 TESTING

**************************************************************************

NOTE: For explosive and ammunition facilities and other facilities requiring conductive sparkproof industrial resinous flooring, edit the following
Submit reports of tests for conductive sparkproof flooring, including analysis and interpretation of test results. Properly identify each report. Identify and record the test methods used.

### 3.4.1 Electrical Resistance

Test the flooring between 30 and 45 days after flooring installation is completed, and prior to its use, in accordance with paragraph 12-4.1.3.8(b)(7) of **NFPA 99**. The resistance of the floor at any one location must be more than 5,000 ohms in areas with 110 volts service, more than 10,000 ohms in areas with 220 volt service, and average less than 1,000,000 ohms and more than 25,000 ohms in all areas. Perform tests using a technician experienced in such work.

### 3.4.2 Spark Resistance

Test the floor for spark resistance by stroking the floor vigorously with a 300 mm 12 inch hardened steel file in a 914.4 mm 3 foot arc. Perform the test for each 7.43 square meters 80 square feet of floor area. Perform the tests in a darkened space and only when the relative humidity of the atmosphere within the space does not exceed 50 percent. The floor must not produce a spark when tested under these conditions.

### 3.5 PROTECTION

Allow surfacing to set for a minimum period of 48 hours before traffic is allowed on the floor. Protect finished flooring from traffic by covering with 13.5 kg 30 pound building paper or other equally effective means until final acceptance of the project.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for a three-coat, liquid flooring system with reflective urethane topcoats, slip resistance, and joint work.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification contains tailoring options for Army and Navy projects. Where an Editor’s Note states a paragraph is tailored for a Service or project type, the content of the paragraph, or a portion of the paragraph, is suited specifically to be included only for that Service or project type.

NOTE: The designer must not alter the products or processes specified herein without thorough knowledge of the need for the changes and the implications of those changes. Use of alternate coating systems must be justified by evaluating
lifecycle costs using 50 year life as a baseline.

**************************************************************************

NOTE: The thin film flooring system is appropriate for use in: aircraft maintenance hangars, equipment maintenance shops, and all other industrial floors where resistance to abrasion and fuel is required. Installation costs: $2.00 to $4.50 per 0.1 square meters square foot. Nominal thickness: 0.375 mm 15.0 mils. Can be rejuvenated by replacing urethane topcoats, and non-skid, only. Approximate service life: Urethane top coating with non-skid grit at three or more years. The flooring system is neither conductive nor Electro-Static Dissipative (ESD), however, either formulation is easily designed upon request. This specification is not for use in overcoating existing sound floor coatings.

**************************************************************************

NOTE: Prior to the flooring systems installation, a concrete condition assessment in accordance with the Naval Facilities Engineering Service Center's (NFESC) Users Guide (UG)-2036-SHR is highly recommended. The condition assessment is designed to identify problem floors and eliminate premature flooring failures produced by: 1) coating concrete with low surface strength, 2) coating concrete with high levels of surface contamination (such as oils, fuels, fats, and waxes), and 3) coating concrete with a high rate of Moisture Vapor Emission (MVE). The thin film flooring system is suitable for application to: A) "smooth" concrete surface texture (no greater than ICRI 310.2R CSP 5), B) concrete with a rate of MVE no more than 169.0 micrograms moisture per second, square meter 3.0 pounds moisture per 24 hours, 1000 square feet (ASTM F1869), C) concrete with surface strength greater than 1.34 MPa 200 psi (ASTM D4541), and D) concrete with fuel/oil contamination to a depth no more than 6.25 mm 1/4 inch.

**************************************************************************

NOTE: If a concrete floor has a rate of Moisture Vapor Emission (MVE) more than 197.0 micrograms moisture per second, square meter 3.5 pounds moisture per 24 hours, 1000 square feet (ASTM F1869), apply a layered Moisture Reducing System (MRS) prior to the application of the thin film flooring system. The MRS must be compatible with the submitted flooring system and approved/warranted by the manufacturer of the thin film flooring system. Apply the MRS to shot blasted concrete and reduce the rate of MVE to less than 169.0 micrograms moisture per second, square meter 3.0 pounds moisture per 24 hours, 1000 square feet. MRSs can employ combinations of concrete sealers,
specific epoxies, and moisture insensitive grouts, with or without mesh.

**************************************************************************

NOTE: Include Section 03 01 00 REHABILITATION OF CONCRETE for repair of minor spalls and surface deterioration to depths less than 75 \text{mm} \ 3 \text{inches}.
Specify epoxy mortar for repairs to depths no more than 50 \text{mm} \ 2 \text{inches}. Specify epoxy concrete for repairs to depths from 25 \text{mm} \ 1 \text{inch} to 75 \text{mm} \ 3 \text{inches}.
Contain repairs to depths greater than 25 \text{mm} \ 1 \text{inch} in a rectangular geometry with saw cut edges. Finish repairs to resemble surrounding concrete using a stainless steel trowel.

Include Section 32 01 29.61 PARTIAL DEPTH PATCHING OF RIGID PAVING for repair of large spalls and severe deterioration to depths from 75 \text{mm} \ 3 \text{inches} to 150 \text{mm} \ 6 \text{inches}. Specify Portland Cement Concrete (PCC) with less than 0.45 water-cement ratio, light steel trowel finish, and cure using plastic coated burlap. Provide rectangular geometry for repairs with saw cut edges to a nominal repair depth of 150 \text{mm} \ 6 \text{inches}. Cure PCC repair for approximately 30 days prior to the application of the flooring system. Do not cure repairs using liquid membrane-forming compounds.

For repairs to spalls and severely distressed concrete to depths greater than 150 \text{mm} \ 6 \text{inches}, seek material guidance from Section 03 30 00 CAST-IN-PLACE CONCRETE and procedural guidance from the American Concrete Pavement Association (ACPA) Guideline TB-002.02P "Concrete Paving Technology - Guidelines for Full Depth Repair." Contain within repair base a minimum of 50 \text{mm} \ 2 \text{inches} of clean, non-reactive concrete sand over a suitable vapor retarder (0.25 \text{mm} \ 10 \text{mils} polyethylene sheeting). Finish repairs by light steel trowel and cured using plastic coated burlap. Cure repairs for approximately 30 days, or more, prior to the application of the flooring system. Do not cure repairs using liquid membrane-forming compounds.

Scarify to level any curled or settled slab ends with joint surfaces displaying more than 3.2 \text{mm} \ 1/8 \text{inch} difference in vertical height. Contain within resulting surfaces a height difference no more than 1.5 \text{mm} \ 1/16 \text{inch} and a surface texture equal ICRI 310.2R CSP 4.

**************************************************************************

NOTE: Include Section 03 30 00 CAST-IN-PLACE CONCRETE for new concrete slab construction. Employ measures to control the rate of base, subbase, and subgrade Moisture Vapor Emission (MVE) to total no more than 169.0 micrograms moisture per second,
square meter 3.0 pounds moisture per 24 hours, 1000 square feet when measured on the slab's surface (ASTM F1869). Improper MVE controls have produced numerous premature coating failures. In addition to appropriate subbase drainage, specify a minimum of 25 mm 2 inches of clean, non-reactive concrete sand over no less than 0.25 mm 10 mils of polyethylene sheeting (ASTM F4397) with sealed lap joints. Specify concrete mix to be free of both accelerators containing calcium chloride and other sources of chloride ion contamination. Specify two passes of a light power troweled finish and cure using plastic coated burlap or equal method. Do not cure concrete using liquid membrane-forming compounds. Do not specify surface hardeners or dry shake finish (Section 09 97 23 METALLIC TYPE CONDUCTIVE/SPARK RESISTANT CONCRETE FLOOR FINISH). Approximately 60 days following the concrete pour and prior to the installation of the flooring system, test concrete for the rate of MVE and confirm rate is no more than 169.0 micrograms moisture per second, square meter 3.0 pounds moisture per 24 hours, 1000 square feet (ASTM D1869). Consult ACI 224.3R "Joints in Concrete Construction," ACI 302.1R "Guide for Concrete Floor and Slab Construction," ACI 360R "Design of Slabs on Grade," and other appropriate construction guidance.

**************************************************************************

NOTE: Where tile is to be removed prior to the application of flooring system, test both tile and mastic for the presence of asbestos. If asbestos is detected, include Section 02 82 00 ASBESTOS REMEDIATION for removal and disposal.

**************************************************************************

NOTE: If flooring system is to be applied to warehouse floors with heavy forklift traffic, a semi-flexible joint sealant is required in lieu of the specified flexible sealant. Use a semi-flexible epoxy sealant with approximately 90 percent elongation. Do not use semi-flexible sealants in areas exposed to exterior temperatures.

**************************************************************************

NOTE: Include Section 01 45 00 QUALITY CONTROL, as applicable.

**************************************************************************

NOTE: Include Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. This section defines fugitive dust, generated waste, hazardous materials, hazardous substance, hazardous waste, solid waste, construction and demolition (CD) debris, and liquid waste, and contains documentation for dangerous
waste profile, waste information sheet, waste identification document, waste generation record, landfill disposal form, and hazardous material reporting.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

******************************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE

1.3.1 Qualifications of Certified Protective Coatings Specialist (PCS)

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party PCS. Submit documentation that the specialist is certified by SSPC: The Society for Protective Coatings (SSPC) as a PCS, including certification number and date of certification/recertification. If the PCS is employed by the same coating inspection company to which the coating inspector is employed, this does not violate the independent third-party requirements. The PCS must remain certified during the entire project, and the Contracting Officer must be notified of any change in certification status within 10 days of the change. The PCS must not be the designated coating inspector.
1.3.2 Coating Work Plan

**************************************************************************
NOTE: For maintenance painting, add requirement for pre-work determination of the existing surface condition. If paint removal is specified in another Section include this evaluation such that the paint removal operation does not create excessive profile.
**************************************************************************

b. Provide procedures for reviewing Contract Documents immediately after award to identify errors, omissions, and discrepancies so that any such issues can be resolved prior to project planning and development of detailed procedures.

c. Provide procedures for verification of key processes during Initial Phase to ensure that Contract requirements can be met. Key processes must include surface preparation, coating application and curing, inspection, and documentation, and any other process that might adversely impact orderly progression of work.

d. Provide procedures for all phases of coating operations, including planned work, rework, repair, inspection, and documentation. Address mobilization and setup, surface preparation, coating application, coating initial cure, tracking and correction of non-compliant work, and demobilization. Coordinate work processes with health and safety plans and confined space entry plans. For each process, provide procedures that include appropriate work instructions, material and equipment requirements, personnel qualifications, controls, and process verification procedures. Provide procedures for inspecting work to verify and document compliance with Contract requirements, including inspection forms and checklists, and acceptance and rejection criteria.

e. [Provide procedures for determining the existing surface profile under paint, and procedures for ensuring that the profile is not increased beyond the maximum profile specified herein.][___]

f. Provide procedures for correcting non-compliant work. Detailed procedures are required in advance to avoid delays in meeting overcoat windows as well as to avoid delays in production. Provide procedures for repairing defects in the coating film, such as runs, drips, sags, holidays, overspray, as well as how to correct coating thickness non-compliance, any other areas of repair or rework that might be adversely affected by delays in preparing and approving new procedures.

g. If a procedure is based on a proposed or approved request for deviation, the deviation must be referenced. Changes to procedures must be noted by submittal number and date approved, clearly delineating old requirements and new requirements, so that the records provide a continuous log of requirements and procedures.

1.3.3 Design Data

1.3.3.1 Environmental Control System

Submit design details of the proposed environmental control system to include ventilation, humidity control, and temperature regulation. Provide
calculations for humidity control during separate surface preparation and coating application procedures, ventilation requirements during coating application, and maximum allowable coating application rates to coincide with ventilation. Include basis of design data on local conditions. Provide equipment layout sketches and procedures showing function of each piece of equipment and fail-safe measures. A Certified Industrial Hygienist must approve calculations, work procedures and personal protective equipment.

1.3.4 Test Reports

1.3.4.1 Joint Sealant Test Report
Submit test results that confirm sealant complies with the requirements of Table Ia. Samples must have been tested within the last three years.

1.3.4.2 Daily Inspection Report
Submit one copy of the daily inspection report to the Contracting Officer within 24 hours of the date recorded.

1.3.5 Certificates

1.3.5.1 Qualifications of Certified Industrial Hygienist (CIH)
Submit name, address, telephone number, FAX number, and e-mail address of the independent third party CIH. Submit documentation that hygienist is certified by the American Board of Industrial Hygiene in comprehensive practice, including certification number and date of certification/recertification. Provide evidence of experience with hazards involved in industrial coating application work.

1.3.5.2 Qualifications of Coating Inspection Company
Submit documentation that the coating inspection company performing all coating inspection functions is certified by SSPC to the requirements of SSPC QP 5 prior to Contract award. The coating inspection company submitted and approved must remain and not changed through completion of the Contract. The coating inspection company must remain so certified for the duration of the project. If a coating inspection company's certification expires, the firm will not be allowed to perform any inspection functions, and all surface preparation and coating application work must stop, until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered. Notify the Contracting Officer of any change in coating inspection company certification status. Notify the Contracting Officer of all scheduled and unannounced on-site inspections from SSPC and furnish a copy of all inspection reports.

1.3.5.3 Qualifications of QC Specialist Coating Inspector
Submit documentation that each coating inspector is employed, and qualified to SSPC QP 5, Level II, by the selected coating inspection company. Each inspector must remain employed by the coating inspection company while performing any coating inspection functions. In addition to the handwritten records, the inspector must employ an electronic reporting program with functionality as outlined in Table II. The Administrator must be the designated Government Representative for the project.
1.3.5.4 **Qualifications of Coating Contractors**

NOTE: Solicitations requiring certification for prequalification should point out the existence and location of the certification requirement on the PROJECT INFORMATION FORM. This requirement must be pointed out in the solicitation documents for the "prior to Contract award" requirement to be enforceable. Certification is a special responsibility requirement pursuant to FAR 9.104-2 Special Standards. This is analogous to requiring bidders to have a specified level of experience or expertise and GAO has sustained these types of special requirements.

All Contractors that perform surface preparation or coating application must be certified to **SSPC QP 8** and should also be **SSPC QS 1** certified prior to Contract award and must remain certified while accomplishing any surface preparation or coating application. The painting Contractors must remain so certified for the duration of the project. If a Contractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered. Notify the Contracting Officer of any change in Contractor certification status. Notify the Contracting Officer of all scheduled and unannounced on-site audits from SSPC and furnish a copy of all audit reports.

For OCONUS, non-US territories where documentation is provided that certified **SSPC QP 8** with or without **SSPC QS 1** Contractors did not bid and are not available, all Contractors that perform surface preparation or coating application must be certified to **ISO 9001** prior to Contract award, and must remain certified while accomplishing any surface preparation or coating application. If a Contractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered. Notify the Contracting Officer of any change in Contractor certification status. Notify the Contracting Officer of all scheduled and unannounced on-site inspections from the ISO certifying organization and furnish a copy of all inspection reports.

Minimum requirements for the installation Contractor are as follows: Completed three or more jobs within the past two years applying the specified materials to concrete surfaces in which the total area exceeds 18,587 square meters 200,000 square feet. Submit documentation listing location of work, point of contact at job site, total square footage of applied materials, listing of both materials and equipment used, and validation from coating manufacturer documenting quality of materials purchased per job for work totaling 18,587 square meters 200,000 square feet within the past two years. In addition to the above requirements, be certified by the material manufacturer(s) to install the submitted coatings and sealant. Submit copy of certificates.

1.3.5.5 **Joint Sealant Certificates**

Submit literature documenting the past performance of the sealant's use in
automotive or aircraft maintenance shops. Minimum requirements are two or more maintenance shops with joint work totaling 3,048 linear meters 10,000 linear feet where the sealant has performed for two years with less than 1 percent combined sealant failures and defects. List location of shops, total linear feet of sealant applied per shop, shop point of contact, date sealant was applied, and the name of the installed sealant material.

1.3.5.6 Thin Film Flooring System Certificates

********************************************************
NOTE: Use bracketed option when MPI certified products cannot be obtained.
********************************************************

Provide manufacturer's certification of conformance to Contract requirements.

[ Submit literature documenting the past performance of the coating system's use in aircraft maintenance shops and over floors with high rates of Moisture Vapor Emission (MVE). Minimum requirements are two or more aircraft maintenance shops totaling 3,160 square meters 34,000 square feet where the coating system has performed for two years with less than 0.05 percent combined premature coating failures, material defects and surface discoloration; no more than 0.03 percent discoloration from aviation chemicals, tire plasticizers, and UV exposure. Provide a minimum of two additional case histories where successful installation occurred on floor slabs with no less than 197.0 micrograms moisture per second, square meter 3.5 pounds moisture per 24 hours, 1000 square feet. List location of shops, total coated area per shop, shop point of contact, date coating system was applied, successful installation to concrete with high MVE, and the names of the installed coating materials.

]1.3.6 Product Data

1.3.6.1 Joint Sealant Manufacturer's Instructions

Submit manufacturer's printed instructions to include detailed application procedures, minimum and maximum application temperatures, and curing procedures. In accordance with 29 CFR 1926.59, include Safety Data Sheets (SDS) for the sealant to be used at the job site.

1.3.6.2 Thin Film Flooring System Manufacturer's Instructions

Submit manufacturer's printed instructions to include detailed mixing, minimum and maximum application temperatures, acceptable atmospheric and interior climatic conditions, application procedures, curing procedures, and procedures for maintenance cleaning of flooring system. Provide explicit instructions detailing surface preparation, recoat windows and remedial actions in case recoat windows are missed, and, if applicable, solvent-wiping between coats with acceptable types and grades of solvents. In accordance with 29 CFR 1926.59, include SDSs for the coatings to be used at the job site.

1.3.6.3 Water-Based Alkaline Degreaser

Submit manufacturer's printed instructions to include detailed mixing, rate of dilution, application procedures, and rinsing procedures. In accordance with 29 CFR 1926.59, include SDSs for the water-based alkaline degreaser to be used at this job site.
1.4 DELIVERY, STORAGE, AND HANDLING

Store coatings and sealant in spaces with temperatures from 5 degrees C (40 degrees F) to 24 degrees C (75 degrees F). Inspect materials on site for damage prior to use. Return to manufacturer packaged materials in dented, rusty, or leaking containers. Conduct testing by manufacture of returned materials with an expired shelf life and if compliant, reissue a shelf life extension.

1.5 COATING HAZARDS

******************************************************************************
NOTE: Include either Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS or prepare instructions detailing each element of safety for use with this section.
******************************************************************************

Ensure that employees are trained in all aspects of the safety plan. Follow the coating manufacturer's written safety precautions throughout mixing, application, and curing of coatings. Comply with respiratory protection requirements in 29 CFR 1910.134 and safe levels of airborne contaminants in 29 CFR 1910.1000.

1.6 JOB SITE REFERENCES

Make available to the Contracting Officer at least one copy each of ASTM D4541, ASTM D6237, SSPC-TU 2/NACE 6G197, and ICRI 310.2R, including replica standards ICRI 310.2R CSP 1 through CSP 9, at the job site.

1.7 PATCH TEST DEMONSTRATION

******************************************************************************
NOTE: Patch test demonstration is a very important part of the submittal process. While it is unusual to require a test patch prior to the submitted coating system's approval, this flooring system is unusual in that it is required to provide extended, uninterrupted performance. A demonstration of Contractor claims, especially under conditions to be encountered in the specific project, is considered necessary.

If customer is not satisfied with the level of non-skid grit, adjustments to the specification can be made. Grit coarser than No. 60 aluminum oxide is not recommended. On architectural floors, non-skid grit broadcast rates can range from none to approximately half the specified level.
******************************************************************************

Prior to the submitted flooring system's approval, apply the complete coating system to a 3 meter by 3 meter (10 foot by 10 foot) square section of concrete as prepared in accordance with PART 3 EXECUTION. Within this area, perform three adhesion tests as described in the paragraph ADHESION TESTING. If adhesion testing produces cohesive failures within the concrete, no less than 1 mm (40 mils) concrete removed over 95 percent of each pull-off coupon, or adhesion more than 2.75 MPa (400 psi), patch test...
adhesion is acceptable. If concrete surface preparation was insufficient, apply an additional coating system patch to properly prepared concrete followed by the above adhesion testing. If adhesion results are unacceptable for both the topcoats and the primer, submit a new coating system manufactured by a different coating vendor. Apply a patch of the new coating system and subject patch to the above requirements for adhesion prior to approval. If customer is not satisfied with the non-skid grit application, adjustments to the specifications can be made. Grit coarser than No. 60 aluminum oxide is not recommended.

1.8 WARRANTY

Warranty materials and workmanship for a minimum period of one year following coating and sealant application. The following terms and conditions form a part of the warranty: If the applied coating system develops either blisters (chemical), checks, softening, or lifting within one year following application, rework each area at Contractor's expense. The following conditions are excluded from the warranty: A) concrete cracking, flooring system mirrors cracks in concrete; B) cosmetic imperfections due to scratching and gouging; C) application to metallic concrete finishes; and D) application to concrete with a rate of Moisture Vapor Emission (MVE) greater than 197.0 micrograms moisture per second, square meter 3.5 pounds moisture per 24 hours, 1000 square feet. If the coating system's adhesion is in question, perform one adhesion test per 9.3 square meters 100 square feet as described in the paragraph ADHESION TESTING. To satisfy the warranty, each adhesion test must produce cohesive failures, concrete removal over 95 percent of each pull-off coupon, or adhesion no less than 2.8 MPa 400 psi. Require two additional adhesion tests to confirm results for each area failing to meet adhesion requirements. Within the warranty period, remove to sound material and rework all areas unable to meet adhesion requirements. There must be zero percent sealant failures within one year. Within the warranty period, remove and rework all sealant material with chemically attacked surfaces or lifting from joint walls. Topcoat cracking over sealant is excluded from warranty.

PART 2 PRODUCTS

***************************************************************************
NOTE: The specified materials are not appropriate for use in primary chemical containment, secondary chemical containment, or on floors subjected to spills from concentrated acids, bases, and organic solvents. Consult with the Naval Facilities Engineering and Expeditionary Warfare Center's (NAVFAC EXWC) Paints and Coatings Center of Expertise for alternative coating systems to suit specific Navy needs.
***************************************************************************

2.1 JOINT SEALANT

Formulate the joint sealant to exhibit the properties as listed in Table Ia.

2.2 THIN FILM FLOORING SYSTEM

A three-coat industrial flooring system consisting of primer and two urethane topcoats. Apply the coating system at a Dry Film Thickness (DFT) ranging from 325 to 500 microns 13 to 20 mils and contain a broadcast of
aluminum oxide non-skid grit.

2.2.1 Primer Coat

In addition to the requirements of the thin film flooring system, use MPI 211 primer coat.

2.2.2 Urethane Topcoat

In addition to the requirements of the thin film flooring system, use MPI 212 top coat.

2.3 WHITE ALUMINUM OXIDE NON-SKID GRIT

Size No. 60, dust free (washed and dry), minimum 99 percent pure, having the following sieve analysis when tested using a 1000 gram 2.2 pound sample (ASTM E11):

<table>
<thead>
<tr>
<th>Sieve No.</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>40</td>
<td>100 percent passing</td>
</tr>
<tr>
<td>50</td>
<td>15-30 percent retained</td>
</tr>
<tr>
<td>60</td>
<td>70-85 percent retained</td>
</tr>
<tr>
<td>70</td>
<td>0-15 percent retained</td>
</tr>
</tbody>
</table>

PART 3 EXECUTION

3.1 COATING SAMPLE COLLECTION

The Contracting Officer and QC Manager must witness all material sampling. Notify the Contracting Officer a minimum of three days in advance of sampling. Obtain liquid samples of each component of primer and topcoat by random selection from sealed containers and in accordance with ASTM D3925. Samples may be either individual cans of liquid material or 1.0 liter 1.0 quart quantities of properly mixed, extracted, and sealed liquid material. Identify samples by designated name, specification number, batch number, project Contract number, sample date, intended use, and quantity involved. When the applied coating system has met the requirements defined in the paragraph ADHESION TESTING, return coating to the installation Contractor for proper disposal.

3.2 TILE AND TILE ADHESIVE REMOVAL

**************************************************************************
NOTE: Delete this Article if concrete is not tiled.
**************************************************************************

Remove 100 percent of tile employing one or more of the following techniques: chipping, scraping, sanding, scarification, high-pressure water, and various hand tools. Remove 100 percent of the tile adhesive using solvents and power scrubbing. Remove residual contamination using hot potable water under a minimum of 27.6 MPa 4,000 psi. Resulting surfaces must appear clean and display the gray color of concrete.

3.3 JOINT MATERIAL REMOVAL, RE-SAW CUTTING, CRACK CHASING

**************************************************************************
NOTE: Hairline cracks having no more than 3.2 mm 1/8
cracks greater than 3.2 mm 1/8 inch width can be chased to a minimum depth of 12.5 mm 1/2 inch and sealed using the procedures and materials specified for joints. Cracks more than 18.75 mm 3/4 inch width can be repaired using either epoxy mortar or epoxy concrete. Sealed cracks will assist in protecting the subbase against chemical migration.

Remove 100 percent of the existing material in all joints including material bonded to joint walls and base. Rigid material may require saw cutting equipment to remove. Joints may be widened up to 3.2 mm 1/8 inch when re-saw cutting. Chase concrete cracks identified for repair and open to a minimum depth of 12.5 mm 1/2 inch below crack surface resulting in crack(s) with smooth vertical walls. Cracks greater than 18.75 mm 3/4 inch width can be repaired using either epoxy mortar or epoxy concrete.

3.4 DEGREASING

On both coated and uncoated concrete, degrease entire floor by scrubbing using a solution of hot potable water, 49 degrees C 120 degrees F to 77 degrees C 170 degrees F, and a concentrated water-based alkaline degreaser. Perform two complete degreasing cycles on the entire floor surface. Allow solution to soak into surfaces prior to scrubbing and remove using hot potable water under a minimum of 27.6 MPa 4,000 psi. Rinsing is complete when the rinse water appears clear. If the industrial detergent is not biodegradable, collect all rinse water and dispose as hazardous waste. Squeegees and shop vacuums may be used to collect pooling rinse water. Fans may be used to aid drying of floor surfaces.

3.5 COATING SYSTEM REMOVAL

NOTE: Delete this Article if concrete is uncoated.

Remove 100 percent of the existing coating system employing one or more of the following techniques: shot blasting, chipping, scraping, sanding, scarification, high pressure water blasting, and various hand tools. Impact tools, such as scabblers, may be used to remove unsound epoxy mortar flooring systems. In general, a coating system cannot be completely removed by shot blasting and, to attain 100 percent coating removal, requires a combination of the above techniques.

3.6 SURFACE PREPARATION

Shot blast entire floor to produce a level of coarseness equal to ICRI 310.2R CSP 3. Overlap each pass of shot blasting by 6.25 mm 1/4 inches to 12.5 mm 1/2 inches. Add new shot to shot blasting equipment prior to blasting. Prepare surfaces inaccessible to shot blasting, base of perimeter walls and under secured equipment, using diamond disk grinding or light scarification to produce a level of coarseness equal to ICRI 310.2R CSP 2 or ICRI 310.2R CSP 4, respectively. Resulting surfaces must appear clean and contain the appropriate level of surface coarseness. If the resulting level of cleanliness cannot be determined, place numerous drops of water on surfaces that appear contaminated. If the water drops soak into concrete, the surfaces are free of hydrocarbon contamination (oils, grease, skydrol). If the water drops bead up and do not flatten out,
surfaces require additional degreasing as detailed in the Article DEGREASING. Shot blasting coarse concrete or broom finished concrete can produce a level of coarseness equal to ICRI 310.2R CSP 5: employ a best-effort attempt to minimize over-shot-blasting of coarse concrete. If coarse concrete is encountered, shot blasting to a level of coarseness equal to ICRI 310.2R CSP 5 is acceptable; however, extremely coarse concrete can require resurfacing prior to the flooring system's installation. Sweep, vacuum, and run a high powered magnet over all surfaces to be coated, including joints.

**************************************************************************
NOTE: At this point in the installation sequence, minor spalls and surface deterioration to depths less than 75 mm 3 inches can be repaired. Use epoxy mortar for repairs to depths no more than 50 mm 2 inches. Use epoxy concrete for repairs to depths from 25 mm to 75 mm 1 inch to 3 inches. Finish repairs to depths greater than 25 mm 1 inch with a rectangular geometry with saw cut edges. Repairs must be finished to resemble surrounding concrete using a stainless steel trowel. Include Section 03 01 00 REHABILITATION OF CONCRETE if concrete repairs of this nature are required.
**************************************************************************

3.7 JOINT TREATMENT

Use the "Conventional Sealed Joint" as detailed in Figure 1 of SSPC-TU 2/NACE 6G197 to seal joints. Employ measures to reduce contamination from equipment and foot traffic. Limit floor access to essential Contractor personnel. Confirm joint surfaces are sufficiently clean.

3.7.1 Install Backer Rod

Install a continuous length of round, closed-cell polyethylene backer rod into each joint using a backer rod tool. For 12.5 mm 1/2 inch, 9.4 mm 3/8 inch, and 6.25 mm 1/4 inch wide joints, place backer rod to a depth of 9.4 mm 3/8 inch (depth equals the distance from the concrete's surface to the highest point on the backer rod). For joints greater than or equal to 18.75 mm 3/4 inch width, place backer to a depth of 15.6 mm 5/8 inch below the concrete's surface. Fit backer rod tight between joint walls (30 percent compression). Remove and reinstall all backer rod that is installed using either the incorrect size (loose fit) or at the incorrect depth. Following backer rod installation, apply painter's tape to surfaces adjacent joints to protect from sealant.

3.7.2 Joint Sealant Application

Apply sealant directly into joints using a bulk-caulking gun. At room temperature, the resulting sealant application must exhibit a concave recess between 3.2 mm 1/8 inch to 1.6 mm 1/16 inch below the concrete's surface. Remove and reapply cured sealant remaining either flush or greater. Following sealant application, remove painter's tape and sealant drips on concrete surfaces. Cure sealant a minimum of 24 hours, prior to the application of coatings.
3.8  PRE-APPLICATION TESTING FOR CONTAMINATION

Spot check surfaces for oil/grease contamination using the water break test. At a rate of 5 tests per 95 square meters 1000 square feet, place one to two drops of water onto surfaces and observe for beading. Test all other surfaces that show visible signs of potential contamination. Apply additional degreasing techniques to surfaces displaying water beading in accordance with the Article DEGREASING.

3.9  COATING APPLICATION

**************************************************************************
NOTE: Use epoxy primer the same color, either white or ultra-light gray, as the selected topcoats. Ultra-light gray is preferred to white.
**************************************************************************

Vacuum flooring space one additional time prior to coating application.

3.9.1  Primer Application

Apply MPI 211 epoxy primer to flooring space at 175 microns 7.0 mils to 375 microns 15.0 mils Dry Film Thickness (DFT). If the prepared concrete resembles an ICRI 310.2R CSP 3 surface, apply the primer at a minimum of 175 microns 7.0 mils DFT. If the prepared concrete resembles an ICRI 310.2R CSP 5 surface, apply the primer at a maximum of 375 microns 15.0 mils DFT. The previously applied sealant may be lightly coated.

3.9.2  Non-Skid Grit Broadcast

**************************************************************************
NOTE: Aircraft hangars servicing light aircraft with weight less that 18,140 kg 40,000 pounds may require a higher loading of non-skid grit. The additional grit will assist in towing aircraft under wet conditions; however, the additional grit will decrease coating aesthetics. Up to 450 grams 1 pound per 93 square meters 100 square feet of additional non-skid grit can be required.
On either warehouse or architectural floors, considerably less non-skid grit may be appropriate. Broadcast rates can range from none to less than 450 grams 1.0 pound per 93 square meters 1000 square feet.
**************************************************************************

Broadcast non-skid grit at a rate of 680 grams 1.5 pounds per 9.3 square meters 100 square feet into the second urethane top coat and backroll. Map floor into 55.8 square meter 600 square foot sections where 4080 grams 9.0 pounds of non-skid grit is pre-weighed, placed into clean buckets and used in its entirety per marked 55.8 square meter 600 square foot section.

3.9.3  Application of Topcoats

Apply two coats of MPI 211 epoxy urethane topcoat to the epoxy primer and broadcast white aluminum oxide non-skid grit directly into the second urethane topcoat.
3.9.3.1 First Topcoat

Apply a full coat of the urethane topcoat at a spreading rate from 62.5 to 80 microns 2.5 to 3.2 mils Dry Film Thickness (DFT). Stripe coat perimeter edges and around equipment footings. Monitor and record a minimum of one Wet Film Thickness (WFT) reading per 55.8 square meter 600 square feet of floor surface. Sealant is to be lightly coated.

3.9.3.2 Second Topcoat

Apply a second coat of the urethane topcoat at a spreading rate of 62.5 to 80 microns 2.5 to 3.2 mils DFT. Stripe coat perimeter edges and around equipment footings. Monitor and record a minimum of one WFT reading per 55.8 square meters 600 square feet of floor surface prior to broadcasting non-skid grit. When the correct WFT has been applied per 55.8 square meters 600 square feet of area, immediately and evenly broadcast non-skid grit directly into the second topcoat of urethane and backroll in two directions. Test the adhesion of the thin film flooring system in accordance with the paragraph ADHESION TESTING.

3.9.3.3 Walkway Stripe and Grounding Rod Markings

Place the walkway stripe and grounding rod markings according to Government drawings, if applicable. When the second topcoat is within its recoat window, apply a walkway stripe of the red/orange urethane topcoat at 75 microns 3.0 mils DFT, completely hiding the top coat, in one coat. If insufficient hiding occurs, apply one additional coat of the walkway stripe. Lightly broadcast non-skid grit into the wet walkway stripe. Use solvent-resistant tape to protect the floor coating against stripe coat bleed. A thin clear coat of either epoxy or urethane may be required to prevent stripe coat bleed prior to the full application of the colored stripe coat. Apply grounding rod markings using similar procedures, urethane top coat, and colors and size according to Government drawings.

3.10 CURING

Cure installed materials to display performance equal to manufacturer's product literature. Remove and reapply improperly cured material.

3.11 FIELD QUALITY CONTROL

3.11.1 Coating Inspector

**************************************************************************
NOTE: Insert directly into Section 01 45 00 QUALITY CONTROL, as applicable, requirement for SSPC QP5 Level II Coating Inspector.

A) Modify Section 01 45 00 QUALITY CONTROL to include SSPC QP5 Level II Coating Inspector as follows:

1. In the Submittals Article, add submittal requirement "SD-07 Certificates," add "SSPC QP5 Level II Coating Inspector; G" and add the following paragraph below the addition of "SSPC QP5 Level II Coating Inspector; G."

2. Add the following to the table in the

SECTION 09 67 23.15 Page 21
3. Use SSPC QP5 Level II Coating Inspector on all flooring projects or, as a minimum, on flooring projects with greater than 232.25 square meters (2,500 square feet).

B) Modify Section 01 45 00 QUALITY CONTROL to include SSPC QP5 Level II Coating Inspector as follows:

Add SSPC QP5 Level II Coating Inspector to paragraph CQC PERSONNEL and its associated Experience Matrix. The SSPC QP5 Level II Coating Inspector must be directly employed by the prime Contractor. Use the following for the Qualifications column:

The SSPC QP5 Level II Coating Inspector will act as QC Specialist.

Consider the Coating Inspector as a QC Specialist, who works for the QC Manager, and qualified in accordance with Section 01 45 00 QUALITY CONTROL. The Coating Inspector must be present during all field tests, surface preparation, flooring application, initial cure of the flooring system, and during all flooring repair work. The Coating Inspector must provide all tools/equipment necessary to perform field tests and inspection. The Coating Inspector is responsible for field tests and specified level of inspection.

3.11.2 Inspection

Document weather conditions, job site occurrences, and report conditions and occurrences potentially detrimental to the flooring system. The listed inspection requirements are in addition to the QC inspection and reporting requirements defined in Section 01 45 00 QUALITY CONTROL. The Coating Inspector must prepare a project reference sheet outlining all requirements, tests, test methods, and evaluation criteria, and hold regular meetings with Contractor personnel, including shot blasting operators and applicators, to review requirements/evaluation criteria for upcoming work prior to execution. At the start of coating operations and every hour following until daily work is complete, record air temperature, substrate temperature, and relative humidity. Following the application of each coat, inspect surfaces for improperly cured material, blisters, inadequate or excessive coating thickness, and other defects. Document each inspection, test, non-compliant area, and location of each non-compliant area. List method of evaluation, evaluation criteria, areas requiring rework, and all other pertinent observations.
3.11.2.1 Daily Inspection Report

Submit to the Contracting Officer one copy of the daily inspection report completed each day when performing work under this Section. Use Appendix X1 "Inspection Checklist" of ASTM D6237 to monitor daily activity and to assist in preparing the daily inspection report. Note each non-compliant issue and each issue identified for rework in accordance with the QC documentation procedures of Section 01 45 00 QUALITY CONTROL. Use of forms containing entry blocks for all required data is encouraged. The data must be legible and presented in a professional format. Submit report within 24 hours of the report date.

3.11.2.2 Inspection Logbook

Maintain a continuous record of all activity related to this Section on a daily basis. A computer / software package as outlined in Table II is preferred to record all information provided in the Daily Inspection Reports, as well as other pertinent observations and information including photo documentation where appropriate. The designated Government Representative for the project is assigned the highest level Administrator privileges and only the Administrator must be able to modify reports. In areas where photography is not allowed, the computer must come with verification that the camera / photo capability has been removed.

Alternatively, a continuous record of all activity related to this Section must be maintained in an Inspection Logbook on a daily basis. The logbook must be hard or spiral bound with consecutively numbered pages, and must be used to record all information provided in the Daily Inspection Reports, as well as other pertinent observations and information. Submit the original Inspection Logbook to the Contracting Officer upon completion of the project and prior to final payment.

3.11.2.3 Inspection Equipment

Use equipment in good condition, operational within its design range, and calibrated as required by the specified standard for use with each device.

3.11.3 Adhesion Testing

Perform a minimum of three adhesion tests in accordance with ASTM D4541 to the thin film flooring system. Select three random flooring locations spaced a minimum of 6 meters 20 feet between each location. Prior to attaching pull-off coupons, lightly sand flooring surface and attach pull-off coupons containing a grit-blasted anchor profile. Adhere directly to the center of each sanded surface a 18.75 mm 3/4 inch diameter pull-off coupon. When pull-off coupon adhesive has sufficiently cured, score circumference of each pull-off coupon to concrete substrate. Test adhesion and evaluate results. If testing produces cohesive failures within the concrete, no less than 1 mm 40 mils concrete removed over 95 percent of each pull-off coupon, or adhesion more than 2.75 MPa 400 psi coating system's adhesion is acceptable. If the above requirements are not satisfied, then perform one adhesion test per 9.3 square meters 100 square feet using the above procedures. Perform two additional tests per non-compliant area to confirm results. Remove to sound material and rework all areas unable to meet adhesion requirements. Repair each adhesion test using a combination of primer, sand-filled epoxy mortar (for deep cohesive failures, if applicable), and two urethane topcoats. Make repairs flush with adjacent coatings and display an equivalent appearance.
3.12 FINAL CLEANUP

Following completion of the work, remove debris, equipment, and materials from the site. Remove temporary connections to Government or Contractor furnished water and electrical services. Restore existing facilities in and around the work areas to their original condition.

</tr>
<tr>
<td>All enabled users must view the same active report in real time. There must be no opportunity for multiple versions of the same report to exist.</td>
</tr>
<tr>
<td>Administrators must be able to setup unique approval processes for each project and promote or remove unique people from this process at any time.</td>
</tr>
<tr>
<td>Administrators must be able to associate Contract specific documents and specification limits quickly and easily.</td>
</tr>
<tr>
<td>Administrators must be able to associate PDS, SDS, blueprints, scope of work and Contracts uniquely to each job.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Objectivity Controls:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Entry fields must be by multi-selectable choices, numeric keypads, pickers and skip logic to ensure repeatable data entry in a way that makes running analytics and metrics easy and objective.</td>
</tr>
<tr>
<td>The program / hardware package must be able to communicate with inspection devices that provide (batch) data export capability such as Elcometer and Defelsko gages.</td>
</tr>
<tr>
<td>The program / hardware package must automatically time, date and GPS stamp all reports without input or interference from the inspector.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Real Time Syncing:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Forms must be available for approved associates to view at all times.</td>
</tr>
<tr>
<td>Retrievable storage must be provided for all job related reports and documents for a minimum time of 5 years from completion of the job or project. Archiving of the documents after 5 years will be the responsibility of the Government.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Document Library:</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>All reports must be in searchable and annotatable PDF format.</td>
</tr>
<tr>
<td>The Administrator must be able to upload and annotate job specific reports in real time. Examples include but not limited to Safety Data Sheets, Product Data Sheets and Blueprints.</td>
</tr>
</tbody>
</table>
Annotations and modifications must be locked and associated with the document. Only the Administrator has rights to modify or delete annotations or allow modifications to the document library especially all related inspection reports.

**Customization:**

The program must be capable of being customized to specific jobs, Contracts or specifications.

3.14 FINAL CLEANUP

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for a five-coat, epoxy mortar flooring system with reflective urethane topcoats, slip resistance, and joint work.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification contains tailoring options for Army and Navy projects. Where an Editor's Note states a paragraph is tailored for a Service or project type, the content of the paragraph, or a portion of the paragraph, is suited specifically to be included only for that Service or project type.

NOTE: The designer must not alter the products or processes specified herein without thorough knowledge of the need for the changes and the implications of those changes. Use of alternate coating systems must be justified by evaluating...
lifecycle costs using 50 year life as a baseline.

NOTE: The epoxy mortar flooring system is appropriate for use in: aircraft maintenance hangars, equipment maintenance shops, jet engine test cells, and all other industrial floors where resistance to impact, abrasion, and fuel is required. Benefits: Tolerates high Moisture Vapor Emission (MVE) rates, produces a level surface over coarse concrete, high impact resistance, good chemical resistance, and may provide a suitable topcoat base for more than 10 years service. Can be rejuvenated by replacing urethane topcoats, and non-skid, only. Approximate service life: Urethane topcoating with non-skid grit at three or more years. The flooring system is neither conductive nor Electro-Static Dissipative (ESD), however, either formulation is easily designed upon request. This specification is not for use in overcoating existing sound coating systems.

NOTE: Prior to the flooring systems installation, a concrete condition assessment in accordance with the Naval Facilities Engineering Service Center's (NFESC) Users Guide (UG)-2036-SHR is highly recommended. The condition assessment is designed to identify problem floors and eliminate premature flooring failures produced by: 1) Coating concrete with low surface strength, 2) coating concrete with high surface contamination levels (such as oils, fuels, fats, and waxes), and 3) coating concrete with a high Moisture Vapor Emission (MVE) rate. The thin film flooring system is suitable for application to: A) "Smooth" or "Coarse" concrete surface textures, B) concrete with a MVE rate no more than 254 micrograms moisture per second, square meter 4.5 pounds moisture per 24 hours, 1000 square feet (ASTM F1869), C) concrete with surface strength greater than 1.34 MPa 200 psi (ASTM D4541), and D) concrete with fuel/oil contamination to a depth no more than 6.25 mm 1/4 inch.

NOTE: If a concrete floor has a Moisture Vapor Emission (MVE) rate more than 254 micrograms moisture per second, square meter 4.5 pounds moisture per 24 hours, 1000 square feet (ASTM F1869), apply a layered Moisture Reducing System (MRS) prior to the epoxy mortar flooring system application. Use MRS compatible with the submitted flooring system and approved / warranted by the epoxy mortar flooring system manufacturer. Apply the MRS to shot blasted concrete and reduce the MVE rate to less than 254 micrograms moisture per second.
second, square meter 4.5 pounds moisture per 24 hours, 1000 square feet. MRSs can employ combinations of concrete sealers, specific epoxies, and moisture insensitive grouts, with or without mesh.

**************************************************************************

NOTE: Include Section 03 01 00 REHABILITATION OF CONCRETE for minor spalls and surface deterioration repair to depths less than three inches. Specify epoxy mortar for repairs to depths no more than 50 mm 2 inches. Specify epoxy concrete for repairs to depths from 25 to 75 mm 1 to 3 inches. Saw cut repairs to depths greater than 25 mm 1 inch to a rectangular geometry. Finish repairs to resemble surrounding concrete using a stainless steel trowel.

Include Section 32 01 29.61 PARTIAL DEPTH PATCHING of RIGID PAVING for repair of large spalls and severe deterioration to depths from 75 to 150 mm 3 to 6 inches. Specify Portland Cement Concrete (PCC) with less than 0.45 water-cement ratio, light steel trowel finish, and cure using plastic coated burlap. Use rectangular geometry for repairs with saw cut edges to a nominal repair depth of 150 mm 6 inches. Cure PCC repair for approximately 30 days prior to the application of the flooring system. Do not cure repairs using liquid membrane-forming compounds.

For repairs to spalls and severely distressed concrete to depths greater than 150 mm 6 inches, seek material guidance from Section 03 30 00 CAST-IN-PLACE CONCRETE and procedural guidance from the American Concrete and Pavement Association (ACPA) Guideline TB-002.02P "Concrete Paving Technology - Guidelines for Full Depth Repair." Fill repair base with a minimum of 50 mm 2 inches of clean, non-reactive concrete sand over a suitable vapor retarder (0.25 mm 10 mils polyethylene sheeting). Finish repairs by light steel trowel and cured using plastic coated burlap. Cure repairs for approximately 30 days, or more, prior to the the flooring system application. Do not cure repairs using liquid membrane-forming compounds.

Scarify level any curled or settled slab ends with joint surfaces displaying more than 3.2 mm 1/8 inch difference in vertical height. Resulting surfaces must contain a height difference no more than 1.5 mm 1/16 inch and a surface texture equal to ICRI-310.2R CSP 4.

**************************************************************************

NOTE: Include Section 03 30 00 CAST-IN-PLACE CONCRETE for new concrete slab construction. Employ measures to control the base, subbase, and subgrade
moisture Moisture Vapor Emission (MVE) rates to total no more than 169.0 micrograms moisture per second, square meter 3.0 pounds moisture per 24 hours, 1000 square feet when measured on the slab's surface (ASTM F1869). Improper MVE controls have produced numerous premature coating failures. In addition to appropriate subbase drainage, specify a minimum of 50 mm 2 inches of clean, non-reactive concrete sand over no less than 0.25 mm 10 mils of polyethylene sheeting (ASTM D4397) with sealed lap joints. Specify concrete mix to be free of accelerators containing calcium chloride and other sources of chloride ion contamination. Specify two passes of a light power troweled finish and cure using plastic coated burlap or equal method. Do not cure concrete using liquid membrane-forming compounds. Do not specify surface hardeners or dry shake finish (Section 09 97 23 METALLIC TYPE CONDUCTIVE/SPARK RESISTANT CONCRETE FLOOR FINISH). Approximately 60 days following the concrete pour and prior to the flooring system installation, test concrete for the MVE rate and confirm rate is no more than 254 micrograms moisture per second, square meter 4.5 pounds moisture per 24 hours, 1000 square feet (ASTM F1869). Consult ACI 224.3R "Joints in Concrete Construction," ACI 302.1R "Guide for Concrete Floor and Slab Construction," ACI 360R "Design of Slabs on Grade," and other appropriate construction guidance.

******************************************************************************

NOTE: Where tile is to be removed prior to the flooring system application, test both tile and mastic for the presence of asbestos. If asbestos is detected, include Section 02 82 00 ASBESTOS REMEDIATION for removal and disposal.

******************************************************************************

NOTE: If flooring system is to be applied to warehouse floors with heavy forklift traffic, a semi-flexible joint sealant is required in lieu of the specified flexible sealant. Use a semi-flexible epoxy sealant with approximately 90 percent elongation. Do not use semi-flexible sealants in areas exposed to exterior temperatures.

******************************************************************************

NOTE: Include Section 01 45 00 QUALITY CONTROL, as applicable.

******************************************************************************

NOTE: Include Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS. This section defines fugitive dust, generated waste, hazardous materials, hazardous substance, hazardous waste, solid waste,
construction and demolition (CD) debris, and liquid waste, and contains documentation for dangerous waste profile, waste information sheet, waste identification document, waste generation record, landfill disposal form, and hazardous material reporting.

PART 1   GENERAL

1.1   REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 QUALITY ASSURANCE

1.3.1 Qualifications of Certified Protective Coatings Specialist (PCS)

Submit name, address, telephone number, FAX number, and e-mail address of the independent third-party PCS. Submit documentation that the specialist is certified by SSPC: The Society for Protective Coatings (SSPC) as a PCS, including certification number and date of certification/recertification. If the PCS is employed by the same coating inspection company to which the coating inspector is employed, this does not violate the independent third-party requirements. The PCS must remain certified during the entire project, and the Contracting Officer must be notified of any change in certification status within 10 days of the change. The PCS must not be the designated coating inspector.

1.3.2 Coating Work Plan

********************************************************************
NOTE: For maintenance painting, add requirement for pre-work determination of the existing surface condition. If paint removal is specified in another Section include this evaluation such that the paint removal operation does not create excessive profile.
********************************************************************

a. Include coating Work Plan in Quality Control Plan.

b. Provide procedures for reviewing Contract Documents immediately after award to identify errors, omissions, and discrepancies so that any such issues can be resolved prior to project planning and development of detailed procedures.

c. Provide procedures for verification of key processes during Initial Phase to ensure that Contract requirements can be met. Key processes must include surface preparation, coating application and curing, inspection, and documentation, and any other process that might adversely impact orderly progression of work.

d. Provide procedures for all phases of coating operations, including planned work, rework, repair, inspection, and documentation. Address mobilization and setup, surface preparation, coating application, coating initial cure, tracking and correction of non-compliant work, and demobilization. Coordinate work processes with health and safety plans and confined space entry plans. For each process, provide procedures that include appropriate work instructions, material and equipment requirements, personnel qualifications, controls, and process verification procedures. Provide procedures for inspecting work to verify and document compliance with Contract requirements, including inspection forms and checklists, and acceptance and rejection criteria.

e. [Provide procedures for determining the existing surface profile under paint, and procedures for ensuring that the profile is not increased beyond the maximum profile specified herein.][______]

f. Provide procedures for correcting non-compliant work. Detailed procedures are required in advance to avoid delays in meeting overcoat windows as well as to avoid delays in production. Provide procedures for repairing defects in the coating film, such as runs, drips, sags, holidays, overspray, as well as how to correct coating thickness.
non-compliance, any other areas of repair or rework that might be adversely affected by delays in preparing and approving new procedures.

g. If a procedure is based on a proposed or approved request for deviation, the deviation must be referenced. Changes to procedures must be noted by submittal number and date approved, clearly delineating old requirements and new requirements, so that the records provide a continuous log of requirements and procedures.

1.3.3 Design Data

1.3.3.1 Environmental Control System

Submit design details of the proposed environmental control system to include ventilation, humidity control, and temperature regulation. Provide calculations for humidity control during separate surface preparation and coating application procedures, ventilation requirements during coating application, and maximum allowable coating application rates to coincide with ventilation. Include basis of design data on local conditions. Provide equipment layout sketches and procedures showing function of each piece of equipment and fail-safe measures. A Certified Industrial Hygienist must approve calculations, work procedures and personal protective equipment.

1.3.4 Test Reports

1.3.4.1 Joint Sealant Test Report

Submit test results that confirm sealant complies with Table Ia requirements. Samples must have been tested within the last three years.

1.3.4.2 Daily Inspection Report

Submit one copy of the daily inspection report to the Contracting Officer within 24 hours of the date recorded.

1.3.5 Certificates

1.3.5.1 Qualifications of Certified Industrial Hygienist (CIH)

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party CIH. Submit documentation that hygienist is certified by the American Board of Industrial Hygiene in comprehensive practice, including certification number and date of certification/recertification. Provide evidence of experience with hazards involved in industrial coating application work.

1.3.5.2 Qualifications of Certified Protective Coatings Specialist (PCS)

Submit name, address, telephone number, FAX number, and e-mail address of the independent third-party PCS. Submit documentation that specialist is certified by SSPC: The Society for Protective Coatings (SSPC) as a PCS, including certification number and date of certification/recertification. If the PCS is employed by the same coating inspection company to which the coating inspector is employed, this does not violate the independent third-party requirements. The PCS must remain certified during the entire project, and the Contracting Officer must be notified of any change in certification status within 10 days of the change. The PCS must not be the designated coating inspector.
1.3.5.3 Qualifications of Coating Inspection Company

Submit documentation that the coating inspection company performing all coating inspection functions is certified by SSPC to the requirements of SSPC QP 5 prior to Contract award. The approved coating inspection company must remain and not be changed through completion of the Contract. The coating inspection company must remain so certified for the duration of the project. If a coating inspection company's certification expires, the firm will not be allowed to perform any inspection functions, and all surface preparation and coating application work must stop, until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered. Notify the Contracting Officer of any change in coating inspection company certification status. Notify the Contracting Officer of all scheduled and unannounced on-site inspections from SSPC and furnish a copy of all inspection reports.

1.3.5.4 Qualifications of QC Specialist Coating Inspector

Submit documentation that each coating inspector is employed, and qualified to SSPC QP 5, Level II, by the selected coating inspection company. Each inspector must remain employed by the coating inspection company while performing any coating inspection functions. In addition to the handwritten records, the inspector must employ an electronic reporting program with functionality as outlined in Table II. The Administrator must be the designated Government Representative for the project.

1.3.5.5 Qualifications of Coating Contractors

**************************************************************************
NOTE: Solicitations requiring certification for prequalification should point out the existence and location of the certification requirement on the PROJECT INFORMATION FORM. This requirement must be included in the solicitation documents for the "prior to Contract award" requirement to be enforceable. Certification is a special responsibility requirement pursuant to FAR 9.104-2 Special Standards. This is analogous to requiring bidders to have a specified level of experience or expertise and GAO has sustained these types of special requirements.
**************************************************************************

All Contractors that perform surface preparation or coating application must be certified to SSPC QP 8 and should also be SSPC QS 1 certified prior to Contract award and must remain certified while accomplishing any surface preparation or coating application. The painting Contractors must remain so certified for the duration of the project. If a Contractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered. Notify the Contracting Officer of any change in Contractor certification status. Notify the Contracting Officer of all scheduled and unannounced on-site audits from SSPC and furnish a copy of all audit reports.

[ For OCONUS, non-US territories where documentation is provided that certified SSPC QP 8 with or without SSPC QS 1 Contractors did not bid and... ]

SECTION 09 67 23.16 Page 13
are not available, all Contractors that perform surface preparation or coating application must be certified to ISO 9001 prior to Contract award, andmust remain certified while accomplishing any surface preparation or coating application. If a Contractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered. Notify the Contracting Officer of any change in Contractor certification status. Notify the Contracting Officer of all scheduled and unannounced on-site inspections from the ISO certifying organization and furnish a copy of all inspection reports.

}[Minimum requirements for the installation Contractor are as follows: Completed three or more jobs within the past two years applying the specified materials to concrete surfaces in which the total area exceeds 18,587 square meters 200,000 square feet. Submit documentation listing location of work, point of contact at job site, total square footage of applied materials, listing of both materials and equipment used, and validation from coating manufacturer documenting quality of materials purchased per job for work totaling 18,587 square meters 200,000 square feet within the past two years. In addition to the above requirements, installation Contractor must be certified by the material manufacturer(s) to install the submitted coatings and sealant. Submit copy of certificates.

]1.3.5.6 Joint Sealant Certificates

Submit literature documenting the sealant's past performance in automotive or aircraft maintenance shops. Minimum requirements are two or more maintenance shops with joint work totaling 3048 linear meters 10,000 linear feet whereby the sealant has performed for two years with less than one percent combined sealant failures and defects. Include from sealant manufacturer a list of shop locations, total linear feet of sealant applied per shop, shop point of contact, date sealant was applied, and the name of the installed sealant material.

1.3.5.7 Epoxy Mortar Flooring System Certificates

**************************************************************************
NOTE: Use bracketed option when MPI certified products cannot be obtained.
**************************************************************************

Provide manufacturer's certification of conformance to Contract requirements.

[ Submit literature documenting the coating system's past performance in aircraft maintenance shops and over floors with high Moisture Vapor Emission (MVE) rates. Minimum requirements are two or more aircraft maintenance shops totaling 3160 square meters 34,000 square feet where the coating system has performed for two years with less than 0.05 percent combined premature coating failures, material defects and surface discoloration; no more than 0.03 percent discoloration from aviation chemicals, tire plasticizers, and UV exposure. Provide a minimum of two additional case histories where successful installation occurred on floor slabs with no less than 254 micrograms moisture per second, square meter 4.5 pounds moisture per 24 hours, 1000 square feet. Include from flooring manufacturer a list of shop locations, total coated area per shop, shop point of contact, date coating system was applied, successful installation to concrete with high MVE, and the names of the installed coating materials.
1.3.6  Product Data

1.3.6.1  Joint Sealant Manufacturer's Instructions

Submit manufacturer's printed instructions to include detailed application procedures, minimum and maximum application temperatures, and curing procedures. In accordance with 29 CFR 1926.59, include Safety Data Sheets (SDS) for the sealant to be used at the job site.

1.3.6.2  Epoxy Mortar Flooring System Manufacturer's Instructions

Submit manufacturer's printed instructions to include detailed mixing, minimum and maximum application temperatures, acceptable atmospheric and interior climatic conditions, application procedures, curing procedures, and procedures for flooring system maintenance cleaning. Provide explicit instructions detailing surface preparation, recoat windows and remedial actions in case recoat windows are missed, and, if applicable, solvent-wiping between coats with acceptable types and grades of solvents. In accordance with 29 CFR 1926.59, include SDSs for the coatings to be used at the job site.

1.3.6.3  Water-Based Alkaline Degreaser

Submit manufacturer's printed instructions to include detailed mixing, dilution rate, application procedures, and rinsing procedures. In accordance with 29 CFR 1926.59, include SDSs for the water-based alkaline degreaser to be used at the job site.

1.4  DELIVERY, STORAGE, AND HANDLING

Store coatings and sealant in spaces with temperatures from 5 to 24 degrees C 40 to 75 degrees F. Inspect materials on site for damage prior to use. Return to manufacturer any packaged materials in dented, rusty, or leaking containers. Return to manufacturer materials with an expired shelf life for testing, and if compliant, reissuing of shelf life extension.

1.5  COATING HAZARDS

******************************************************************************
NOTE: Include either Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS or prepare instructions detailing each safety element for use with this section.
******************************************************************************

Ensure that employees are trained in all safety plan aspects. Follow the coating manufacturer's written safety precautions throughout mixing, application, and curing of coatings. Comply with respiratory protection requirements in 29 CFR 1910.134 and safe levels of airborne contaminants in 29 CFR 1910.1000.

1.6  JOB SITE REFERENCES

Make available to the Contracting Officer at least one copy each of ASTM D4541, ASTM D6237, SSPC-TU 2/NACE 6G197, and ICRI 310.2R, including replica standards ICRI 310.2R-CSP 1 through CSP 9, at the job site.
1.7 PATCH TEST DEMONSTRATION

NOTE: Patch test demonstration is a very important part of the submittal process. While it is unusual to require a test patch prior to the submitted materials' approval, this flooring system is unusual in that it is required to perform significant tasks for a long time. Proof of Contractor claims, especially under conditions to be encountered in the specific project, is considered necessary.

If customer is not satisfied with the non-skid grit level, adjustments to the specification can be made. Grit coarser than No. 60 aluminum oxide is not recommended. On architectural floors, non-skid grit broadcast rates can range from none to approximately half the specified level. To confirm grit broadcast is acceptable, walk on cured patch test under both dry and wet conditions. Water can be used to simulate the wet condition.

Prior to the submitted flooring system's approval, apply the complete flooring system to a 3 meter by 3 meter 10 foot by 10 foot square concrete section as prepared in accordance with PART 3 EXECUTION. Within this area, perform three adhesion tests using procedures as detailed in the paragraph ADHESION TESTING. If adhesion testing produces cohesive failures within the concrete, no less than 1 mm 40 mils concrete removed over 95 percent of each pull-off coupon, or adhesion more than 2.75 MPa 400 psi, patch test adhesion is acceptable. If concrete surface preparation was insufficient, apply an additional coating system patch to properly prepared concrete followed by the above adhesion testing. If adhesion results are unacceptable for both the topcoat and the coatings below the grout coat, submit a new coating system manufactured by a different coating vendor. Apply new coating system to a patch and subject this patch to the above requirements for adhesion prior to approval. If customer is not satisfied with the non-skid grit application, adjustments to the specifications can be made. Grit coarser than No. 60 aluminum oxide is not recommended. Immediately following "passing" adhesion results, remove urethane topcoats and grout coat by sanding, repair patch test holes using epoxy mortar, and place a "Key-In Termination" adjacent to patch test perimeter. Perform coarse scarification or pneumatic scabbling as required to remove patch tests failing to meet adhesion requirements.

1.8 WARRANTY

Warranty materials and workmanship for a minimum of one year following completion of flooring and sealant application. The following terms and conditions form a part of the warranty: If the applied coating system develops blisters (chemical), checks, softening, or lifting within one year following application, rework each area at Contractor's expense. The following conditions are excluded from the warranty: A) Concrete cracking, flooring system mirrors cracks in concrete, B) cosmetic imperfections due to scratching and gouging, C) application to metallic concrete finishes (Section 09 97 23 METALLIC TYPE CONDUCTIVE/SPARK RESISTANT CONCRETE FLOOR FINISH), and D) application to concrete with a MVE rate greater than 282 micrograms moisture per second, square meter 5.0 pounds moisture per 24 hours, 1000 square feet. If the coating system's adhesion is in question,
perform one adhesion test per 9.3 square meters 100 square feet as described in the paragraph ADHESION TESTING. To satisfy the warranty, adhesion testing must produce cohesive failures within the concrete, concrete removal over 95 percent of each pull-off coupon, or adhesion no less than 2.8 MPa 400 psi. Each area failing to meet adhesion requirements requires two additional adhesion tests to confirm results. Within the warranty period, remove to sound material and rework all areas unable to meet adhesion requirements. There must be zero percent sealant failures within one year. Within the warranty period, remove and rework all sealant material that has chemically attacked surfaces or lifting from joint walls. Topcoat cracking over sealant is excluded from warranty.

PART 2   PRODUCTS

**************************************************************************
NOTE: The specified materials are not appropriate for use in primary chemical containment, secondary chemical containment, or on floors subjected to spills from concentrated acids, bases, and organic solvents. Consult with the Naval Facilities Engineering and Expeditionary Warfare Center's (NAVFAC EXWC) Paints and Coatings Center of Expertise for alternative coating systems to suit specific Navy needs. The system must be provided by a single manufacturer or have proven compatibility.
**************************************************************************

**************************************************************************
NOTE: Tables Ia and II are presented at the end of PART 3 EXECUTION.
**************************************************************************

2.1 JOINT SEALANT

Formulate the joint sealant to exhibit the properties as listed in Table Ia.

2.2 EPOXY MORTAR FLOORING SYSTEM

A five-coat flooring system consisting of primer, epoxy mortar, grout coat, and two urethane topcoats. Apply the system at a nominal thickness of 6.25 mm 1/4 inch and contain an aluminum oxide non-skid grit broadcast. Additional requirements for primer coat, epoxy mortar, grout coat, and urethane top coat are contained in the following sub-paragraphs.

2.2.1 Primer Coat

In addition to the epoxy mortar flooring system requirements, use MPI 208 primer coat.

2.2.2 Epoxy Mortar Coat

In addition to the epoxy mortar flooring system requirements, use MPI 209 epoxy mortar coat compatible with MPI 208, MPI 210, and MPI 212.

2.2.3 Grout Coat

In addition to the epoxy mortar flooring system requirements, use MPI 210 grout coat compatible with MPI 208, MPI 209, and MPI 212.
2.2.4 Urethane Topcoat

In addition to the epoxy mortar flooring system requirements, use MPI 212 topcoat compatible with MPI 208, MPI 209, and MPI 210.

2.3 WHITE ALUMINUM OXIDE NON-SKID Grit

Size No. 60, dust-free (washed and dry), minimum 99 percent pure, having the following sieve analysis when tested using a 1000 gram 2.2 pound sample (ASTM E11):

<table>
<thead>
<tr>
<th>Sieve No.</th>
<th>Retention Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. 40</td>
<td>100 percent passing</td>
</tr>
<tr>
<td>No. 50</td>
<td>15-30 percent retained</td>
</tr>
<tr>
<td>No. 60</td>
<td>70-85 percent retained</td>
</tr>
<tr>
<td>No. 70</td>
<td>0-15 percent retained</td>
</tr>
</tbody>
</table>

PART 3 EXECUTION

3.1 COATING SAMPLE COLLECTION

The Contracting Officer and QC Manager must witness all material sampling. Notify the Contracting Officer a minimum of three days in advance of sampling. Obtain liquid samples of each component (e.g., primer, intermediate, grout coat, topcoat) by random selection from sealed containers and in accordance with ASTM D3925. Samples may be either individual cans of liquid material or 1.0 liter 1.0 quart quantities of properly mixed, extracted, and sealed liquid material. Label samples by designated name, specification number, batch number, project Contract number, sample date, intended use, and quantity involved. When the applied epoxy mortar system has met the requirements defined in the paragraph ADHESION TESTING, return coating samples to the installation contractor for proper disposal.

3.2 TILE AND TILE ADHESIVE REMOVAL

******************************************************************************

NOTE: Delete this Article if concrete is not tiled.
******************************************************************************

Remove 100 percent of tile employing one or more of the following techniques: chipping, scraping, sanding, scarification, high-pressure water, and various hand tools. Remove 100 percent of the tile adhesive using solvents and power scrubbing. Remove residual contamination using hot potable water under a minimum of 27.6 MPa 4,000 psi. Resulting surfaces must appear clean and display the gray color of concrete.

3.3 JOINT MATERIAL REMOVAL, RE-SAW CUTTING, CRACK CHASING

******************************************************************************

NOTE: Hairline cracks having no more than 3.2 mm 1/8 inch width are typically not repaired. However, cracks greater than 3.2 mm 1/8 inch width can be chased to a minimum depth of 12.5 mm 1/2 inch and sealed using the procedures and materials specified for joints. Cracks more than 18.75 mm 3/4 inch

SECTION 09 67 23.16 Page 18
width can be repaired using either epoxy mortar or epoxy concrete. Sealed cracks will assist in protecting the subbase against chemical migration.

Remove 100 percent of the existing material in all joints including material bonded to joint walls and base. Rigid material may require saw cutting equipment to remove. Joints may be widened up to 3.2 mm 1/8 inch when re-saw cutting. Hairline cracks having no more than 3.2 mm 1/8 inch width are typically not repaired. Cracks greater than 3.2 mm 1/8 inch width can be chased to a minimum depth of 12.5 mm 1/2 inch and sealed using the procedures and materials specified for joints. Cracks more than 18.75 mm 3/4 inch width can be repaired using either epoxy mortar or epoxy concrete. Chase concrete cracks identified for repair and open to a minimum depth of 12.5 mm 1/2 inch below crack surface resulting in crack(s) with smooth vertical walls.

3.4 DEGREASING

On both previously coated and uncoated concrete, degrease entire floor by scrubbing using a hot potable water solution, 49 to 77 degrees C 120 to 170 degrees F, and a concentrated water-based alkaline degreaser. Perform two complete degreasing cycles on the entire floor surface. Allow solution to soak into surfaces prior to scrubbing and remove using hot potable water under a minimum of 27.6 MPa 4,000 psi. Rinsing must be complete when the rinse water appears clear. If the industrial detergent is not biodegradable, collect all rinse water and dispose of as hazardous waste. Squeegees and shop vacuums may be used to collect pooling rinse water. Fans may be used to aid drying of floor surfaces.

[3.5 COATING SYSTEM REMOVAL

NOTE: Delete this Article if concrete is uncoated.

Remove 100 percent of the existing coating system employing one or more of the following techniques: shot blasting, chipping, scraping, sanding, scarification, high pressure water blasting, and various hand tools. Impact tools such as scabblers may be used to remove unsound epoxy mortar flooring systems. In general, a coating system cannot be completely removed by shot blasting and, to attain 100 percent coating removal, requires a combination of the above techniques.

]3.6 SURFACE PREPARATION

Shot blast entire floor to produce a level of coarseness equal to ICRI 310.2R CSP 3. Overlap each shot blasting pass by 6.25 to 12.5 mm 1/4 to 1/2 inch. Add new shot to shot blasting equipment prior to blasting. Prepare concrete surfaces inaccessible to shot blasting, perimeter wall bases and under secured equipment, using a diamond disk grinding or light scarification to produce a level of coarseness equal to ICRI 310.2R CSP 2, ICRI 310.2R CSP 4, respectively. Resulting surfaces must appear clean and contain the appropriate surface coarseness level. If the resulting cleanliness level cannot be determined, place numerous drops of water on surfaces that appear contaminated. If the water drops soak into concrete, the surfaces are hydrocarbon contamination free (oils, grease, skydrol). If the water drops bead up and do not flatten out, surfaces require additional degreasing as detailed in the Article DEGREASING. Shot blasting
coarse concrete or broom finished concrete can produce a coarseness level equal to ICRI 310.2R CSP 5: employ a best-effort attempt to minimize over-shot-blasting of coarse concrete. If coarse concrete is encountered, shot blasting to a level of coarseness equal to ICRI 310.2R CSP 5 is acceptable: however, extremely coarse concrete can require resurfacing prior to the flooring system's installation. Sweep, vacuum, and run a high powered magnet over all surfaces to be coated, including joints.

3.6.1 Concrete Masonry Units (CMU) Surface Preparation

**************************************************************************
NOTE: Delete paragraph if epoxy mortar is not to be applied to the CMU wall bases.
**************************************************************************

Remove 100 percent of coatings 100 mm 4 inches up the base of CMU walls adjacent the flooring space, and prepare surface by power grinding to a resulting level of coarseness equal to ICRI 310.2R CSP 2. If oils/grease are present, degrease in accordance with the Article DEGREASING.

3.7 COVE STRIP INSTALLATION

**************************************************************************
NOTE: Delete paragraph if epoxy mortar is not to be applied to the CMU wall bases.
**************************************************************************

Install a continuous cove strip at a nominal height of 100 mm 4 inches up each CMU perimeter wall base. Install a solvent-resistant cove strip using a solvent-resistant adhesive.

3.8 KEY-IN TERMINATIONS

**************************************************************************
NOTE: If the epoxy mortar flooring system is to be applied up the CMU wall bases, a Key-In termination is not required adjacent these walls.
**************************************************************************

Place the "Key-In" termination as detailed in SSPC-TU 2/NACE 6G197 Figure 8 at transition surfaces, directly below doorways, and adjacent walls, floor drains, drain grates (interior side), and all other obstructions embedded into the floor slab. The Key-In termination must contain one vertical wall at a depth from 9.4 to 15.6 mm 3/8 to 5/8 inch and, leading down to the resulting vertical depth, a sloped surface from 37.5 to 50 mm 1-1/2 to 2 inches. A hand held concrete saw can be used to cut the correct vertical depth followed by power tool grinding to create a sloped surface. Remove concrete dust by vacuuming.

3.9 CRACK REPAIRS

Use the "Elastomeric Underlayer Crack-Bridging Design" as detailed in SSPC-TU 2/NACE 6G197 Figure 7 over the surface of epoxy mortar filled cracks.

3.9.1 Install Bondbreaker

Install bondbreaker, either solvent-resistant bondbreaker tape or a 3.2 to 6.25 mm 1/8 to 1/4 inch No. 20-No. 40 mesh silica sand layer, to the base...
of previously chased cracks identified for repair. For cracks without a rigid base, install suitably sized fiberboard to a depth of 12.5 mm 1/2 inch below floor level and with bondbreaker over exposed fiberboard. Install bondbreaker to cover the crack's horizontal base and continuously span the entire crack length. Bondbreaker application prevents epoxy mortar from penetrating deep into cracks. Use bondbreaker tape no more than 150 microns 6 mils thick. In this application, the use of backer rod is prohibited.

3.9.2 Repair Cracks

Using the specified materials, prime interior crack walls and apply epoxy mortar directly into wet primer. Finish epoxy mortar level with floor and without feathered edges. When cured, remove mortar imperfections by sanding flush with adjacent concrete. Apply solvent-resistant tape parallel to each side of the mortar filled crack(s) at a minimum inner width of 100 mm 4 inches between tape. A 100 mm 4 inch inner tape width is generally suitable for cracks less than 12.5 mm 1/2 inch wide whereas cracks more than 12.5 mm 1/2 inch wide can require an inner tape width of 150 mm 6 inches. Apply 1 mm 1/24 inch of the specified sealant, in one coat, directly over filled crack(s) and spread flush with inner tape edges: a stiff bristled paintbrush can be used to spread the sealant. Use a Wet Film Thickness (WFT) gage to confirm sealant application is between 875 to 1125 microns 35 to 40 mils wet. Remove tape and allow sealant to cure a minimum of 24 hours prior to the epoxy mortar flooring system application. Sealant application above 1250 microns 50 mils dry will require removal and reaplication.

3.10 PRE-APPLICATION TESTING FOR CONTAMINATION

Spot check surfaces for oil/grease contamination using the water break test. At a rate of 5 tests per 95 square meters 1000 square feet place one to two water drops onto surfaces and observe for beading. Test all other surfaces that show visible signs of potential contamination. Perform additional degreasing to surfaces displaying water beading in accordance with Article DEGREASING.

******************************************************************************
NOTE: At this point in the installation sequence, minor spalls and surface deterioration to depths less than 75 mm 3 inches can be repaired. Use epoxy mortar for repairs to depths no more than 50 mm 2 inches. Use epoxy concrete for repairs to depths from 25 to 75 mm 1 to 3 inches. Contain repairs to depths greater than 25 mm 1 inch in a rectangular geometry with saw cut edges. Finish repairs to resemble surrounding concrete using a stainless steel trowel. Include Section 03 01 00 REHABILITATION OF CONCRETE if concrete repairs if this nature are required.
******************************************************************************

3.11 COATING APPLICATION

Prior to the flooring system application, vacuum flooring space and mark all joints.

3.11.1 Isolation (Expansion) and Construction Joint Treatment

Install into each isolation (expansion) and construction joint, a
continuous length of round polyethylene backer rod flush with the floor's surface and under 30 percent compression.

3.11.2 Contraction Joint Treatment

Apply primer and epoxy mortar directly into all contraction joints. This quantity is in addition to the specified 6.25 mm 1/4 inch epoxy mortar thickness. This step may be performed either prior to, or during, the full epoxy mortar application.

3.11.3 Primer Application

Apply MPI 208 epoxy primer to flooring space at a minimum of 250 microns 10.0 mils wet. Do not prime previously installed patch test.

3.11.4 Epoxy Mortar Application

Apply MPI 209 epoxy mortar at 6.25 mm 1/4 inch directly into wet primer using a screed box or equal equipment. Finish open areas using a power trowel with stainless steel blades. Perimeter edges and adjacent equipment footings may require finishing by stainless steel hand trowel. Directly above areas with Key-In terminations and at a distance from 25 to 37.5 mm 1 to 1-1/2 inches away from the mortar's outer edge, slope the mortar down and flush with the concrete's surface. Terminate the resulting angle flush with the Key-In termination vertical cut. Apply epoxy mortar flush with previously installed patch test. Do not apply epoxy mortar onto patch test surface. When sufficiently cured, sand entire mortar surface. Resulting surface must appear level, contain uniform thickness, and be free of surface imperfections including trowel marks.

3.11.5 Primer Application to CMU Walls

**************************************************************************
NOTE: Delete paragraph if epoxy mortar is not to be applied to CMU wall bases.
**************************************************************************

When the epoxy mortar has sufficiently cured, prime approximately 100 mm 4 inches up base of CMU walls to cove strip and 50 mm 2 inches adjacent the wall's base using the specified primer.

3.11.6 Epoxy Mortar Application to CMU Walls

**************************************************************************
NOTE: Delete paragraph if epoxy mortar is not to be applied to CMU wall bases.
**************************************************************************

Apply MPI 209 epoxy mortar directly into wet primer at 4.5 mm to 6.25 mm 3/16 to 1/4 inch. Use a cove trowel to create a rounded transition between floor surfaces and perimeter wall bases. When sufficiently cured, sand the base and 100 mm 4 inches up perimeter walls. Resulting finish must contain a rounded transition of uniform thickness between flooring surfaces and CMU walls. When sufficiently cured, sand mortar surfaces. Resulting surface must be free of surface imperfections including trowel marks.

3.11.7 Grout Coat Application

**************************************************************************

SECTION 09 67 23.16  Page 22
NOTE: Select a grout coat color identical to the selected topcoat color, either white or ultra-light gray. Ultra-light gray is preferred to white.

Sweep and vacuum up residual dust from epoxy mortar sanding. Apply MPI 210 grout coat to epoxy mortar at a minimum of 250 microns 10 mils wet. Apply grout coat to previously install patch test. Where wall bases are used, extend coating up CMU wall. If the cured grout coat feels oily/greasy, an amine blush has occurred which requires removal. Consult the coating manufacturer to recommend an appropriate blush removal procedure. Epoxy amines can blush during cool temperatures with high humidity.

3.11.8 Grout Coat Sanding

Sand grout coat using 100 grit or finer sandpaper to a dull appearance with visible scratches. Resulting surface must appear 100 percent absent of gloss with zero shiny spots. Lightly sand perimeter edges and around equipment footings.

3.11.9 Saw Cutting and Sealing Joints

Use the "Conventional Sealed Joint" as detailed in Figure 1 of SSPC-TU 2/NACE 6G197 to seal each contraction and expansion joint. Take care to reduce contamination from saw cutting equipment and foot traffic. Limit floor access to essential Contractor personnel. When performing joint work, including saw cutting, suggest placing clean rolled cardboard adjacent joint surfaces to reduce coating system contamination.

3.11.9.1 Saw Cut Contraction Joints

Place saw cuts directly in the middle of each contraction joint 6.25 mm 1/4 inch wide, placed to a minimum depth of 31.2 mm 1-1/4 inches, and span the joint's entire length.

3.11.9.2 Saw Cut Isolation (Expansion) and Construction Joints

Place saw cuts to the isolation (expansion) and construction joint's original width and to a minimum depth of 31.2 mm 1-1/4 inches. Completely remove the epoxy mortar across the joint's width and further remove the previously installed backer rod.

3.11.9.3 Install Backer Rod

Install a continuous length of round, closed-cell polyethylene backer rod into each saw cut. For 12.5, 9.4 and 6.25 mm 1/2, 3/8 and 1/4 inch wide saw cuts, place backer rod to a depth of 9.4 mm 3/8 inch below the grout coat's surface the highest point on the backer rod. For expansion joint saw cuts greater than or equal to 18.8 mm 3/4 inch wide, place backer rod to a depth of 15.6 mm 5/8 inch below the grout coat's surface. Fit backer rod tight between joint walls under 30 percent compression and place using a backer rod tool. Remove and reinstall all backer rod that is the incorrect size or at the incorrect depth. Following backer rod installation, apply painter's tape to surfaces adjacent joints to protect from sealant.

3.11.9.4 Joint Sealant Application

Apply sealant directly into joints using a bulk-caulking gun. At room
temperature, the resulting sealant application must exhibit a concave recess between 3.2 to 1.0 mm 1/8 to 1/24 inch below the grout coat’s surface. Remove and reapply cured sealant remaining either flush or greater. Following sealant application, remove painter’s tape and sealant drips on grout coat. Prior to topcoating, cure sealant a minimum of 24 hours.

3.11.10 Application of Topcoats

Apply two coats of MPI 212 urethane topcoat. Broadcast No. 60, white, aluminum oxide non-skid grit into the second urethane topcoat.

3.11.10.1 Non-Skid Grit Broadcast

******************************************************************************
NOTE: Aircraft hangars servicing light aircraft with weight less than 18,140 kg 40,000 pounds may require a higher non-skid grit loading. The additional grit will assist in towing aircraft under wet conditions; however, the additional grit will decrease coating aesthetics. Up to 450 grams 1.0 pounds per 9.3 square meters 100 square feet of additional non-skid grit can be required.

On either warehouse or architectural floors, considerably less non-skid grit may be appropriate. Broadcast rates can range from none to less than 450 grams 1.0 pound per 93 square meters 1000 square feet.

******************************************************************************

Broadcast non-skid grit at a rate of 680 grams 1.0 pound per 9.3 square meters 100 square feet into the second urethane topcoat and backroll. Map floor into 55.8 square meters 600 square foot sections where 4080 grams 9.0 pounds of non-skid grit is pre-weighed, placed into clean buckets and used in its entirety per marked 55.8 square meter 600 square foot section.

3.11.10.2 Grout Coat Cleaning

Inspect floor for shiny grease spots and, if detected, spot degrease using manufacturer approved solvent(s) with clean, lint-free rags. Sweep and vacuum up all residual dirt and dust. Solvent wipe all surfaces using solvent(s) and procedures as recommended by manufacturer of epoxy mortar flooring system.

3.11.10.3 First Topcoat

Apply a full coat of urethane topcoat at a spreading rate from 62.5 to 80 microns 2.5 to 3.2 mils Dry Film Thickness (DFT). Stripe coat perimeter edges and around equipment footings. Monitor and record a minimum of one Wet Film Thickness (WFT) reading per 55.8 square meters 600 square foot section of floor surface. Sealant is to be lightly coated.

3.11.10.4 Second Topcoat

Apply a second coat of urethane topcoat at a spreading rate from 62.5 to 80 microns 2.5 to 3.2 mils DFT. Stripe coat perimeter edges and around equipment footings. Monitor and record a minimum of one WFT reading per 55.8 square meters 600 square foot section of floor surface prior to broadcasting non-skid grit. When the correct WFT has been applied per 55.8...
square meters 600 square feet of area, immediately and evenly broadcast non-skid grit into the second urethane topcoat and backroll in two directions. Test the adhesion of the epoxy mortar flooring system in accordance with the paragraph ADHESION TESTING.

3.11.10.5 Walkway Stripes and Grounding Rod Markings

Place the walkway stripe and grounding rod marker, if applicable, according to Government drawings. When the second topcoat is within its recoat window, apply a walkway stripe of the red/orange urethane topcoat at 75 microns 3.0 mils DFT. Lightly broadcast non-skid grit into the wet walkway stripe. Use solvent-resistant tape to protect the floor coating against stripe coat bleed. A thin clear coat of either epoxy or urethane may be required to prevent stripe coat bleed prior to the full application of the colored stripe coat. Completely hide the topcoat color with the red/orange stripe, in one coat. If insufficient hiding occurs, apply one additional walkway stripe coat. Apply grounding rod markings using similar procedures, urethane topcoat, and colors and size according to Government drawings.

3.12 CURING

Installed materials must cure and display performance equal to manufacturer's product literature. Remove and reapply improperly cured material.

3.13 FIELD QUALITY CONTROL

3.13.1 Coating Inspector

**************************************************************************
NOTE: Insert directly into Section 01 45 00 QUALITY CONTROL, as applicable, requirement for SSPC QP5 Level II Coating Inspector.

A) Modify Section 01 45 00 QUALITY CONTROL to include SSPC QP5 Level II Coating Inspector as follows:

1. In the Submittals Article, add submittal requirement "SD-07 Certificates," add "SSPC QP5 Level II Coating Inspector; G" and add the following paragraph below the addition of "SSPC QP5 Level II Coating Inspector; G."

2. Add the following to the table in the paragraph "QC Specialists Duties and Qualification:" under the heading "Qualification/Experience in Area of Responsibility," add "SSPC QP5 Level II Coating Inspector;" under the heading "Area of Responsibility," add "Surface preparation, flooring system installation, field tests, and field inspection;" and under the heading "Frequency" add "Full-time during surface preparation, flooring system installation, field tests, and field inspection."

3. Use SSPC QP5 Level II Coating Inspector on all flooring projects or, as a minimum, on flooring
projects with greater than 232.25 square meters
2,500 square feet.

B) Modify Section 01 45 00 QUALITY CONTROL to
include SSPC QP5 Level II Coating Inspector as follows:

Add SSPC QP5 Level II Coating Inspector to
paragraph CQC PERSONNEL and its associated
Experience Matrix. The SSPC QP5 Level II Coating
Inspector must be directly employed by the prime
Contractor. Use the following for the Qualifications column:

The SSPC QP5 Level II Coating Inspector will act
as QC Specialist.

**************************************************************************
Consider the Coating Inspector a QC Specialist, working for the QC Manager,
and be qualified in accordance with Section 01 45 00 QUALITY CONTROL. The
Coating Inspector must be present during all field tests, surface
preparation, flooring application, initial cure of the flooring system, and
during all flooring repair work. The Coating Inspector must provide all
tools/equipment necessary to perform field tests and inspection. The
Coating Inspector is responsible for field tests and specified level of
inspection.

3.13.2 Inspection

Document weather conditions, job site occurrences, and report conditions
and occurrences potentially detrimental to the flooring system. The listed
inspection requirements are in addition to the QC inspection and reporting
requirements defined in Section 01 45 00 QUALITY CONTROL. The Coating
Inspector must prepare a project reference sheet outlining all
requirements, tests, test methods, and evaluation criteria, and hold
regular meetings with Contractor personnel, including shot blasting
operators and applicators, to review requirements/evaluation criteria for
upcoming work prior to execution. At the start of coating operations and
every hour following until daily work is complete, record air temperature,
substrate temperature, and relative humidity. Following each coat
application, inspect surfaces for improperly cured material, blisters,
inadequate or excessive coating thickness, and other defects. Document
each inspection, test, non-compliant area, and location of each
non-compliant area. List evaluation method, evaluation criteria, areas
requiring rework, and all other pertinent observations.

3.13.2.1 Daily Inspection Report

Submit to the Contracting Officer one copy of the daily inspection report
completed each day when performing work under this Section. Use Appendix
X1 "Inspection Checklist" of ASTM D6237 to monitor daily activity and to
assist in preparing the daily inspection report. Note each non-compliant
issue and each issue identified for rework in accordance with the QC
documentation procedures in Section 01 45 00 QUALITY CONTROL. Use of forms
containing entry blocks for all required data is encouraged. The data must
be legible and presented in a professional format. Submit report within 24
hours of the report date.
3.13.2.2 Inspection Logbook

Maintain a continuous record of all activity related to this Section on a daily basis. A computer / software package as outlined in Table II is preferred to record all information provided in the Daily Inspection Reports, as well as other pertinent observations and information including photo documentation where appropriate. The designated Government Representative for the project is assigned the highest level Administrator privileges and only the Administrator must be able to modify reports. In areas where photography is not allowed the computer must come with verification that the camera / photo capability has been removed.

Alternatively, a continuous record of all activity related to this Section must be maintained in an Inspection Logbook on a daily basis. The logbook must be hard or spiral bound with consecutively numbered pages, and must be used to record all information provided in the Daily Inspection Reports, as well as other pertinent observations and information. Submit the original Inspection Logbook to the Contracting Officer upon completion of the project and prior to final payment.

3.13.2.3 Inspection Equipment

Use equipment in good condition, operational within its design range, and calibrated as required by the specified standard for each device.

3.13.3 Adhesion Testing

Perform a minimum of three modified adhesion tests (ASTM D4541) on the topcoat no less than forty-eight hours following application. Select three random flooring locations spaced a minimum of 6 meters 20 feet between each location. Vertically core completely through the epoxy mortar flooring system and a minimum of 9.4 mm 3/8 inch into concrete using a suitable drill fitted with a 25 mm 1 inch diameter core bit. Throughout coring, employ a best effort attempt to avoid fracturing and overheating both the mortar system and concrete: improper coring can affect adhesion results. Adhere directly to each cored surface's center a 18.75 mm 3/4 inch diameter pull-off coupon. Lightly sand test area flooring surface prior to attaching pull-off coupons containing a grit-blasted anchor profile. When pull-off coupon adhesive has sufficiently cured, test adhesion and evaluate results. If testing produces cohesive failures within the concrete, no less than 1 mm 40 mils concrete removed over 95 percent of each pull-off coupon, or adhesion more than 2.75 MPa 400 psi mortar system's adhesion is acceptable. If the above requirements are not satisfied, then perform one adhesion test per 9.3 square meters 100 square feet using the above procedures. Two additional tests will confirm results for each non-compliant area. Remove and rework all areas unable to meet adhesion requirements to sound material. Fill core holes using primer, sand-filled epoxy mortar, grout coat, and urethane topcoats. Finish resulting repairs flush with adjacent coatings, displaying an equivalent appearance.

3.14 FINAL CLEANUP

Following work completion, remove debris, equipment, and materials from site. Remove temporary connections to Government or Contractor furnished water and electrical services. Restore existing facilities in and around the work areas to their original condition.

**Administrative Controls:**

Administrators must be able to turn on and off unique access to specific jobs and Contracts.

Administrators must be able to remotely enable and disable access for users.

All enabled users must view the same active report in real time. There must be no opportunity for multiple versions of the same report to exist.

Administrators must be able to setup unique approval processes for each project and promote or remove unique people from this process at any time.

Administrators must be able to associate Contract specific documents and specification limits quickly and easily.

Administrators must be able to associate PDS, SDS, blueprints, scope of work and Contracts uniquely to each job.

**Objectivity Controls:**

Data Entry fields must be by multi-selectable choices, numeric keypads, pickers and skip logic to ensure repeatable data entry in a way that makes running analytics and metrics easy and objective.

The program / hardware package must be able to communicate with inspection devices that provide (batch) data export capability such as Elcometer and Defelsko gages.

The program / hardware package must automatically time, date and GPS stamp all reports without input or interference from the inspector.

**Real Time Syncing:**

Forms must be available for approved associates to view at all times.

Retrievable storage must be provided for all job related reports and documents for a minimum time of 5 years from completion of the job or project. Archiving of the documents after 5 years will be the responsibility of the Government.

**Document Library:**

All reports must be in searchable and annotatable PDF format.

The Administrator must be able to upload and annotate job specific reports in real time. Examples include but not limited to Safety Data Sheets, Product Data Sheets and Blueprints.
<table>

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for broadloom carpet, modular tile carpet, and entrance carpet.

This section is intended for floor coverings only, and should not be used to specify carpeting installed on wall or ceiling surfaces. Where carpeting is to be used on surfaces other than floors, refer to Section 09 72 00 WALLCOVERINGS.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**AMERICAN ASSOCIATION OF TEXTILE CHEMISTS AND COLORISTS (AATCC)**

AATCC 16

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a

1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality Certifications

1.3.1.1 Floor Covering Materials

Provide carpet and cushion products certified to meet indoor air quality requirements by UL 2818 (GreenGuard) Gold, SCS Global Services Indoor Advantage Gold, CRI GLP QM or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to the site in the manufacturer's original wrappings and packages clearly labeled with the manufacturer's name, brand name, size, dye lot number, and related information. Remove materials from packaging and store them in a clean, dry, well ventilated area (100 percent outside air supply, minimum of 1.5 air changes per hour, and no recirculation), protected from damage, soiling, and moisture, and strong contaminant sources and residues, and maintain at a temperature above 16 degrees C 60 degrees F for 2 days prior to installation. Do not store carpet or carpet tiles with materials which have high emissions of volatile organic compounds (VOCs) or other contaminants, including paints and adhesives. Do not store carpet near materials that may off gas or emit harmful fumes, such as kerosene heaters, fresh paint, or adhesives.

1.5 AMBIENT CONDITIONS

Maintain areas in which carpeting is to be installed at a temperature above 16 degrees C 60 degrees F and below 32 degrees C 90 degrees F for 2 days before installation, during installation, and for 2 days after installation. Provide temporary ventilation during work of this section. Maintain a minimum temperature of 13 degrees C 55 degrees F thereafter for the duration of the contract.

1.6 WARRANTY

Provide manufacturer's standard performance guarantees or warranties including minimum ten year wear warranty, two year material and workmanship and ten year tuft bind and delamination.

PART 2 PRODUCTS

2.1 CARPET

**************************************************************************

NOTE: If more than one carpet type is required for a project, use a separate paragraph for each carpet type. Designate each carpet type with a letter or...
number symbol. Use the same designations to key carpets to locations on the drawings and in Section 09 06 00 SCHEDULES FOR FINISHES.

ADA Requirements: Carpet must be securely attached; have a firm cushion, or backing, or no cushion; and have a level loop, textured loop, level cut pile, or level cut/uncut pile texture. The maximum thickness should be 13 mm 1/2 inch. Fasten exposed edges of carpet to floor surfaces and have trim along the entire length of the exposed edge.

Nylon fiber is typically abrasion resistant and durable in all pile configurations using filament fiber, has good stain removal characteristics, and is recommended for commercial installations.

Triexta (PTT) fiber is recommended for residential installations. Some PTT fiber made outside the US can be used in commercial applications, but specification of these products must comply with the Buy America Act when applicable. Triexta is marketed as offering excellent durability, resiliency and crush resistance. Permanent stain resistance, bleach resistance and colorfastness built into the fiber helps to make triexta carpets easy to clean and can extend the life of the carpet. It is important to note that long term performance of triexta fiber has not yet been tested.

Polyethylene terephthalate (PET) recycled polyester fiber has permanent fade resistance, is permanently colorfast, has a permanent stain resistance which is higher than other type fibers, is impervious to harsh chemicals, and has the lowest static buildup. PET type polyester carpet, once crushed under continued high pressure, is less likely than nylon carpet to rebound. PET carpet is not recommended for severe and moderate wear level areas and should be limited to light wear areas.

Wool is a natural fiber, which is inherently flame resistant, forming a char that will neither melt nor drip. Wool is also rapidly renewable and resilient, and due to the scaly character of its fiber it scatters optical light, thus reducing soiling visibility. Wool is highly recommended for shipboard use due to it being inherently flame resistant.

Wool, cotton, jute, hemp and sisal carpets may not meet accepted performance requirements of commercial carpet. Verify suitability, availability and adequate competition before specifying these products.

Flexible and modular components, like carpet tile, reduce the labor and materials costs related to
operations and maintenance, churn, and future renovations.

Continuous dye process uses two to three times less water than batch dyeing during manufacture.

Furnish first quality carpet that is free of visual blemishes, streaks, poorly dyed areas, fuzzing of pile yarn, spots or stains, and other physical and manufacturing defects. Provide carpet materials and treatments as reasonably nonallergenic and free of other recognized health hazards. Provide a static control construction on all grade carpets which gives adequate durability and performance. Submit manufacturer's catalog data and printed documentation stating physical characteristics, durability, resistance to fading, and flame resistance characteristics for each type of carpet material and installation accessory. Submit manufacturer's Product Data for 1) Carpet, 2) Moldings, and 3) Carpet Cushion. Also, submit Samples of the following:

a. Carpet: [Two] [_____] "Production Quality" samples 450 by 450 mm 18 by 18 inches of each carpet proposed for use, showing quality, pattern, and color specified

b. Moldings: [Two] [_____] samples of each type minimum 300 mm 12 inches long

c. Carpet Cushion: [Two] [_____] samples minimum 150 by 150 mm 6 by 6 inches

2.1.1 Recycled Content

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements. A resource that can be used to identify products with recycled content is the "Comprehensive Procurement Guidelines (CPG)" page within the EPA's website at http://www.epa.gov. Other products with recycled content are also acceptable when meeting all requirements of this specification.

Research shows the product is available from US national manufacturers above the minimum recycled content percentages shown below. Some manufacturers and regions have higher percentages. Based on research, insert desired minimum percentages into the empty set of brackets.

Carpeting must contain a minimum of [20][40][_____] percent recycled content. Provide data identifying percentage of recycled content for carpeting.
2.1.2 Indoor Air Quality Requirements

Products must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for carpet.

2.1.3 Physical Characteristics for [Broadloom][Modular Tile][Entrance] Carpet

**************************************************************************

NOTE: Copy this paragraph including subparagraphs if more than one carpet is specified. Designate each carpet type with a letter or number symbol. Use the same designations to key carpets to locations on the drawings or in Section 09 06 00 SCHEDULES FOR FINISHES.

**************************************************************************

2.1.3.1 Carpet Construction

[Tufted] [Woven] [Bonded] [Needlebond] [Needle Felt] [_____]

Minimum [_____] per square meter square inch

2.1.3.7 Surface Pile Weight

Minimum [_____] kg/square meter ounces per square yard. This does not include weight of backings. Determine weight in accordance with ASTM D5848.
2.1.3.8 Pile Thickness

Minimum [_____] mm inch in accordance with ASTM D6859

2.1.3.9 Pile Density

******************************************************************************
NOTE: Pile Density = 36 x Pile Weight/Pile Thickness.
******************************************************************************

Minimum [_____] 

2.1.3.10 Dye Method

[Solution dyed] [Stock dyed] [Yarn (or Skein) dyed] [Piece dyed] [Space dyed] [Continuous dyed]

2.1.3.11 Backing Materials

Provide primary backing materials like [those customarily used and accepted by the trade for each type of carpet] [polypropylene] [synthetic material] [rubber] [jute] [cotton] [_____] . Provide secondary backing to suit project requirements of those customarily used and accepted by the trade for each type of carpet.

2.1.3.12 Attached Cushion

Provide an attached cushion [chemically frothed polyurethane with minimum weight of 0.610 kg/sq. m 18 oz/sq. yard, minimum density of 176 kg/cubic m 11 lb/cubic foot] [mechanically frothed polyurethane with minimum weight of 0.745 kg/sq. m 22 oz/sq. yard, minimum density of 224 kg/cubic m 14 lb/cubic foot, minimum thickness of 2.5 mm 0.100 inch, and maximum compression resistance of 34.5 kPa 5 psi, and compression set of 15 percent in accordance with ASTM D3676] . Do not exceed the maximum ash content of 50 percent when tested in accordance with ASTM D297. Pass the accelerated aging test in accordance with [ASTM D3676] [ASTM D1667] for the cushion.

2.2 PERFORMANCE REQUIREMENTS

2.2.1 Texture Appearance Retention Rating (TARR)

******************************************************************************
NOTE: Use the chart below to identify the recommended minimum use TARR traffic level classification that corresponds to the end-use application. These classifications are based on typical usage. Use a higher classification if traffic exposure is expected to be greater than usual. Provide a TARR traffic level classification for each carpet used on a project.
******************************************************************************

</table>

Provide carpet with a greater than or equal to [3.0 (Heavy)] [3.5 (Severe)] TARR traffic level classification in accordance with ASTM D7330 or CRI Test Method 103.
2.2.2 Static Control

**************************************************************************
NOTE: Specify static control to meet project requirements. Installations for critical areas such as computer rooms will use the 2.0 kV requirements. Static protected carpets for most commercial installations are normally rated at 3.5 kV.
**************************************************************************

Provide static control to permanently regulate static buildup to less than [3.5] [2.0] [_____] kV when tested at 20 percent relative humidity and 21 degrees C 70 degrees F in accordance with AATCC 134.

2.2.3 Flammability and Critical Radiant Flux Requirements

**************************************************************************
NOTE: Choice of critical radiant flux level as it applies to building type and area of application will be made in accordance with the latest edition of NFPA 101. Wherever the use of Class II (0.22) watts finish is required, Class I (0.45) watts will be permitted.
**************************************************************************

Comply with 16 CFR 1630 or ASTM D2859. Provide carpet in corridors and exits with a minimum average critical radiant flux of [0.22] [0.45] watts per square centimeter when tested in accordance with ASTM E648.

2.2.4 Tuft Bind

Comply with ASTM D1335 for tuft bind force required to pull a tuft or loop free from carpet backing with a minimum [40 N 10 pound average force for loop pile broadloom] [18 N 3 pound average force for cut pile broadloom] [36 N 8 pound average force for modular carpet tile].

2.2.5 Colorfastness to Crocking

Comply dry and wet crocking with AATCC 165 and with a Class 4 minimum rating on the AATCC Color Transference Chart for all colors.

2.2.6 Colorfastness to Light

Comply colorfastness to light with AATCC 16, Test Option E "Water-Cooled Xenon-Arc Lamp, Continuous Light" and with a minimum 4 grey scale rating after 40 hours.

2.2.7 Colorfastness to Water

**************************************************************************
NOTE: Include this test when specifying carpet constructed of yarn dyed fibers.
**************************************************************************

Comply colorfastness to water with AATCC 107 and with a minimum 4.0 gray scale rating and a minimum 4.0 transfer scale rating.
2.2.8 Delamination Strength

Provide delamination strength for tufted carpet with a secondary back of minimum 440 N/m 2.5 lbs/inch.

2.2.9 Antimicrobial

**************************************************************************

NOTE: Include when required for a specific use such as child care, dining facilities or hospitals.
**************************************************************************

Nontoxic antimicrobial treatment in accordance with AATCC 174 Part I (qualitative), guaranteed by the carpet manufacturer to last the life of the carpet.

2.3 CARPET CUSHION

**************************************************************************

NOTE: Select the appropriate carpet cushion.
**************************************************************************

[2.3.1 Fiber Cushion

[Rubberized hair, mothproofed and sterilized] [Rubberized jute [with minimum 40 percent recycled content], mothproofed and sterilized] [Synthetic with minimum [___] percent recycled content] [Resinated, recycled textile]. [Provide data identifying percentage of recycled content for fiber cushion.

Products must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for fiber cushion.]

2.3.1.1 Weight

[___] g/sq.m[___] oz./sq. yd.

2.3.1.2 Thickness

[___] mm[___] inches plus 5 percent maximum

2.3.1.3 Density

[___] kg/cu.m[___] lb/cu.ft.

][2.3.2 Rubber Cushion

[Flat][Rippled waffle][Textured flat][Reinforced][, with minimum 60 percent recycled content. Provide data identifying percentage of recycled content for rubber cushion.

Products must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for rubber cushion.]

2.3.2.1 Weight

[___] g/sq.m[___] oz./sq. yd.
2.3.2.2 Thickness

[_____] mm[_____] inches plus 5 percent maximum

2.3.2.3 Compression Resistance

[_____] kg/sq. mm[_____] lb/sq. in. at [25][65] percent in accordance with ASTM D3574.

2.3.2.4 Density

[_____] kg/cu.m[_____] lb/cu.ft.

2.3.3 Polyurethane-Foam Cushion

[Grafted prime] [Densified] [Bonded] [Mechanically frothed] [, with minimum 15 percent recycled content. Provide data identifying percentage of recycled content for polyurethane-foam cushion.

Products must meet emissions requirements of CDPH SECTION 01350. Provide certification or validation of indoor air quality for polyurethane-foam cushion.]

2.3.3.1 Compression Force Deflection at 65 Percent

[_____] mm[_____] lb/sq.in. of polymer density in accordance with ASTM D3574

2.3.3.2 Thickness

[_____] mm[_____] inches plus 5 percent maximum

2.3.3.3 Density

[_____] kg/cu.m[_____] lb/cu.ft.

2.3.4 Performance Requirements - Critical Radiant Flux

Provide carpet cushion in corridors and exits with a minimum average critical radiant flux of [0.22][0.45] watts per square centimeter when tested in accordance with ASTM E648.

2.4 ADHESIVES AND CONCRETE PRIMER

Comply with applicable regulations regarding toxic and hazardous materials. Provide water resistant, mildew resistant, nonflammable, and nonstaining adhesives and concrete primers for carpet installation as required by the carpet manufacturer. Provide release adhesive for modular tile carpet as recommended by the carpet manufacturer. Provide adhesives flashpoint of minimum 60 degrees C 140 degrees F in accordance with ASTM D3278. Non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of GS-36. Provide validation of indoor air quality for aerosol adhesives. Provide validation of indoor air quality for aerosol adhesives.
quality for non-aerosol adhesives. Concrete primer products used on the interior of the building (defined as inside of the weatherproofing system) must meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for concrete primer.

2.5 MOLDINGS

Provide carpet moldings where floor covering material changes or carpet edge does not abut a vertical surface. Provide [a heavy-duty [vinyl] [rubber] molding designed for the type of carpet being installed. Provide floor flange of a minimum [38 mm] [1 1/2 inches] wide. Provide [_____] color to match [resilient base] [_____].] [an aluminum molding, pinless clamp-down type, designed for the type of carpet being installed. Provide [natural color anodized] [prefinished color [_____] finish. Provide a floor flange of a minimum 38 mm 1-1/2 inch wide and face a minimum 16 mm 5/8 inch wide.]

2.6 TAPE

Provide tape for seams as recommended by the carpet manufacturer for the type of seam used in broadloom installation. Seam sealant must have a maximum VOC content of no more than 50 grams/liter. Do not use sealants that contain 1,1,1-trichloroethane or toluene.

2.7 COLOR, TEXTURE, AND PATTERN

**************************************************************************
NOTE: Coordinate editing of color reference sentence(s) with the Government. Generally the Section 09 06 00 SCHEDULES FOR FINISHES or drawings are used when the project is designed by an Architect or Interior designer. Select color from manufacturer's standard colors or identified in this specification only when the project has minimal finishes.

When the government directs that color be located in the drawings, add a note that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

When more than one type, pattern or color is specified identify location.

When a manufacturer's name, stock number, pattern, and color is specified for color, be certain that the product conforms to the specification, as edited.
**************************************************************************

Provide color, texture, and pattern in accordance with [Section 09 06 00 SCHEDULES FOR FINISHES] [the drawings] [____].
PART 3  EXECUTION

3.1  SURFACE PREPARATION

Do not install carpet on surfaces that are unsuitable and will prevent a proper installation. Prepare subfloor in accordance with flooring manufacturer's recommended instructions. Repair holes, cracks, depressions, or rough areas using material recommended by the carpet or adhesive manufacturer. Free floor of any foreign materials and sweep clean. Before beginning work, test subfloor with glue and carpet to determine "open time" and bond. Submit [three] [_____] copies of the manufacturer's printed Installation instructions for the carpet, including Surface Preparation, seaming techniques, and recommended adhesives and tapes.

3.2  MOISTURE AND ALKALINITY TESTS

Test concrete slab for moisture content and excessive alkalinity in accordance with CRI 104/CRI 105. Submit [three] [_____] copies of reports of Moisture and Alkalinity Tests including content of concrete slab stating date of test, person conducting the test, and the area tested.

3.3  PREPARATION OF CONCRETE SUBFLOOR

**************************************************************************
NOTE: Coordinate need for sealing of concrete slab with project requirements such as wet conditions which might occur in hospital care.
**************************************************************************

Do not commence installation of the carpeting until concrete substrate is at least 90 days old. Prepare the concrete surfaces in accordance with the carpet manufacturer's instructions. Match carpet, when required, and adhesives to prevent off-gassing to a type of curing compounds, leveling agents, and concrete sealer.

3.4  INSTALLATION

Isolate area of installation from rest of building. Perform all work by manufacturer's approved installers. Conduct installation in accordance with the manufacturer's printed instructions and CRI 104/CRI 105. Protect edges of carpet meeting hard surface flooring with molding and install in accordance with the molding manufacturer's printed instructions. Use autofoam mothproofing system for wool carpets. Follow ventilation, personal protection, and other safety precautions recommended by the adhesive manufacturer. Continue ventilation during installation and for at least 72 hours following installation. Do not permit traffic or movement of furniture or equipment in carpeted area for 24 hours after installation. Complete other work which would damage the carpet prior to installation of carpet. Submit [three] [_____] copies of Installation Drawings for 1) Carpet, 2) Carpet Cushion, and 3) Moldings indicating areas receiving carpet, carpet types, patterns, direction of pile, location of seams, and locations of edge molding.

Do not install building construction materials that show visual evidence of biological growth.
3.4.1 Broadloom Installation

Install broadloom carpet [direct glue down] [pre-applied adhesive glue down] smooth, uniform, and secure, with a minimum of seams. Apply regular, unnoticeable, and treated seams with a seam adhesive. Run side seams toward the light, where practical, and where such layout does not increase the number of seams. Install breadths parallel, with carpet pile in the same direction. Match patterns accurately. Neatly cut and fit cutouts, at door jambs, columns and ducts securely. Locate seams at doorways parallel to and centered directly under doors. Do not make seams perpendicular to doors or at pivot points. Provide seams at changes in directions of corridors to follow the wall line parallel to the carpet direction. Lay the carpet lengthwise down the corridors with widths less than 1.8 m 6 feet.

3.4.2 Modular Tile Installation

Install modular tiles with [releasable] [manufacturer approved adhesive tab system] [permanent vinyl-compatible] [_____] adhesive and snug joints. Use [monolithic] [1/4 turn] [ashlar] [brick] [herringbone] [random] [_____] installation method. Comply with manufacturer installation instructions for required drying time of releasable adhesive so it sets up properly. Provide accessibility to the subfloor where required. Carpet tile on stairs and sloped surfaces must be installed with a more permanent installation method in accordance with the manufacturer's instructions and with manufacturer recommended adhesives for this application. [See Section [09 69 13 RIGID GRID ACCESS FLOORING][ and ][09 69 19 STRINGERLESS ACCESS FLOORING] for installation method of carpet tile on access flooring.]

3.4.3 Entrance Carpet Installation

[Install tiles with [permanent vinyl-compatible] [releasable] adhesive and snug joints. Use [monolithic] [1/4 turn] [ashlar] [brick] [random] installation method.] [Install roll goods [direct glue down] [pre-applied adhesive glue down] and smooth, uniform, and secure, with a minimum of seams. Prepare regular, unnoticeable, and treated seams with a seam adhesive. Install breadths parallel, with carpet pile in the same direction. Match patterns accurately. Neatly cut and fit, securely, cutouts at door jambs, columns, and ducts. Locate seams at doorways parallel to and centered directly under doors. Do not make seams perpendicular to doors or at pivot points.] [Cut mats to specified size and finish them with a tapered vinyl edge that is glued and sewn on.]

3.4.4 Stretch-in Installation

**************************************************************************
NOTE: Installation with tack strips (stretch in method) over cushion can avoid potential adhesive interaction with carpet backing. It is appropriate for residential and hospitality settings, in which rooms are relatively small and separate cushion is used; but not feasible in large, open spaces.
**************************************************************************

Provide carpet tack strips wherever carpeting abuts vertical surfaces. Install tackless carpet stripping by nailing. Place carpet cushion face-up, as recommended by cushion manufacturer, over entire floor area to be carpeted with joints butted. Do not use adhesives to attach carpet, cushion, or substrate. Comply with carpet manufacturer's instructions for installation. Attach rubber or metal edge strip to substrate with adhesive
for transition when carpet meets other flooring materials or to finish carpet edge when required.

3.5 CLEANING AND PROTECTION

Submit [three] [_____] copies of carpet manufacturer's maintenance instructions describing recommended type of cleaning equipment and material, spotting and cleaning methods, and cleaning cycles.

3.5.1 Cleaning

As specified in Section 01 78 00 CLOSEOUT SUBMITTALS. After installation of the carpet, remove debris, scraps, and other foreign matter. Remove soiled spots and adhesive from the face of the carpet with appropriate spot remover. Cut off and remove protruding face yarn. Vacuum carpet clean with a high-efficiency particulate air (HEPA) filtration vacuum.

3.5.2 Protection

Protect the installed carpet from soiling and damage with heavy, reinforced, nonstaining kraft paper, plywood, or hardboard sheets. Lap and secure edges of kraft paper protection to provide a continuous cover. Restrict traffic for at least 48 hours. Remove protective covering when directed by the Contracting Officer.

3.6 REMNANTS

Manage waste as specified in the Waste Management Plan. [Provide remnants remaining from the installation, consisting of scrap pieces more than 600 mm 2 feet in dimension with more than 0.6 square meters 6 square feet total [to the Government] [to local non-profit such as Habitat for Humanity as directed by the Government]]. [Set aside and return non-retained scraps to manufacturer for recycling into new product] [Remove non-retained scraps from site and recycle appropriately].

3.7 MAINTENANCE

3.7.1 Extra Materials

Provide extra material from same dye lot consisting of [full width
continuous broadloom] [and] [uncut carpet tiles] for future maintenance. Provide a minimum of [three] [_____] percent of total square meters square yards of each carpet type, pattern, and color. [Furnish [three] [_____] percent extra of total adhesive tabs.]

3.7.2 Maintenance Service

**************************************************************************
NOTE: Maintenance agreements are standard practice in the building industry. Under a green lease, when the customer no longer requires the use of the particular product or requires an updated model, the manufacturer is obligated to reclaim it and refurbish it or disassemble it for recycling as appropriate.**************************************************************************

Collect information from the manufacturer about [maintenance agreement] [green lease] options, and submit to Contracting Officer. Service must
reclaim materials for recycling and/or reuse. Service must not landfill or
burn reclaimed materials. When such a service is not available, seek local
recyclers to reclaim the materials. Submit documentation of manufacturer's
[maintenance agreement] [take-back program] [green lease] for carpet.
Include contact information, summary of procedures, and the limitations and
conditions applicable to the project. Indicate manufacturer's commitment
to reclaim materials for recycling and reuse.

-- End of Section Table of Contents --
PART 1 GENERAL

NOTE: This specification does not include the floor upon which the elevated floor is superimposed, except to define the nature and condition of the supporting floor.

Access flooring systems include floor panels, pedestals and items such as stringers, steps, ramps,
closures and trim. Access flooring systems must be
designed to accommodate static, rolling and impact
loadings.

None of the mechanical and electrical services
essential to the operation of equipment are
included. Coordinate with mechanical and electrical
to provide ventilation and cable openings which will
be required.

The designer is responsible for identifying and
defining requirements for the floors. Drawings must
indicate location and limits of the flooring
systems, finish floor elevation, panel size, type,
finish and anti-static provisions, colors, pedestal
mounting and subfloor connection system details.

STRINGERLESS ACCESS FLOORING is covered in SECTION
09 69 19.

Stair and/or ramp information, such as tread width
and riser height for stairs and width, slope and
length of ramps, including railings, are included in
this section.

Ancillary components such as floor diffusers and
grills, fascias and floor opening trims are also
included.

Seismic loadings and any other information required
to indicate the extent of work must be considered in
designing access flooring systems.

There are three fundamental conditions relative to
the design of access flooring installations:

Condition I - Floors are completely surrounded by
building walls. These are the most resistant to
seismic loadings.

Condition II - Floors have part of the edge exposed
and not restrained by other structural elements.
Condition II floors are less resistive to seismic
loadings along the axis of the unconstrained side.
Seismic loadings can be resisted by securing the
perimeter panels of all floors to the supporting
structural framing and fitting the panels tightly
together, or by cross bracing the structural frame
to resist overturning. The designer must select
fascia type and finish for exposed edges.

Condition III - Floors are free standing without
lateral contact with other structural elements.
Type III floors are primarily strengthened with
cross bracing to resist lateral loads.

Buildings not excluded by UFC 3-301-01 or TI 800-01
Design Criteria will be accessible in accordance
with 36 CFR, Part 1191, Americans with Disabilities

On the drawings, show:

1. Extent and shape of access flooring area. Include details of panel-to-panel and panel-to-wall intersections, edge treatment at openings, expansion joints, elevation(s) above structural floor, and other special features of the elevated floor system.

2. Location and design of ramps, steps, and doors to access floor area; railing heights and design.

3. Location and sizes of registers, grilles, perforated panels, and cable openings through access floor panels.

4. Design and type of plenum fire extinguishing systems, if space under access floor is to be used as air plenum.

5. Layout of plenum dividers.

6. Pattern of access floor panels.

7. Location of building electrode. Coordinate structural grounding connections with appropriate building and electrical systems.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**NOTE:** Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 SPARE PARTS

**************************************************************************
NOTE: To assure matching floor panel, which may become damaged and require replacement, supply of extra stock is recommended. Set amount based on conditions of specific project. Do not specify extra stock unless user activity concurs; warehousing may not be available.
**************************************************************************

[Furnish spare floor panels for each finish including bare panels for carpet tile, complete pedestal assemblies, and stringers at the rate of one for each 100 or fraction thereof required.][ Provide [four] [_____] floor panels complete with specified floor covering for future use.][ Provide four spare panels with identical floor covering pedestals and stringers for each 100 square meters 1,000 square feet of access flooring and total of 3 linear meters 10 linear feet of cut-out trim. Store extra stock in same manner and location as project materials.][ Provide extra carpet tile from same dye lot consisting of uncut tiles for future maintenance. Provide a minimum of [three][_____] percent of total square meters square yards of each carpet type, pattern, and color. [Furnish [[five][_____] percent extra of total adhesive tabs][[one][_____] percent extra of total components] required for installing carpet tile.]]

1.4 QUALITY CONTROL

1.4.1 Qualification of Manufacturer

**************************************************************************
NOTE: Specify 5 years manufacturer experience unless directed otherwise by the Government
**************************************************************************

Access flooring manufacturer must have at least 5 years experience in manufacturing access flooring systems. Certify that the manufacturer of
the access flooring system meets requirements specified under paragraph entitled QUALIFICATION OF MANUFACTURER.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery

Deliver materials to site in undamaged condition, in original containers or packages, complete with accessories and instructions. Label packages with manufacturer's name and brand designations. Package materials covered by specific references bearing specification number, type and class as applicable.

1.5.2 Storage

Store all materials in original protective packaging in a safe, dry, and clean location. Store panels at temperatures between 4 and 32 degrees C 40 and 90 degrees F, and between 20 and 70 percent humidity. Replace defective or damaged materials.

1.5.3 Handling

Handle and protect materials in a manner to prevent damage during the entire construction period.

1.6 WARRANTY

**************************************************************************
NOTE: Manufacturers standard warranty is for one year. For government projects, at an additional cost, manufacturers will provide an extended warranty of 5 or more years.
**************************************************************************

Minimum manufacturer warranty must have no dollar limit, cover full system, and must have a minimum duration of [1] [5] [_____] years. Include an agreement to repair or replace floor panels, pedestals or stringers that fail within the warranty period in the standard performance guarantee or warranty. Failures include, but are not limited to, sagging and warping of panels; rusting and manufacturers defects of panels or support system.

- For [high pressure laminate][conductive high pressure laminate][luxury vinyl tile] provide manufacturer's standard performance guarantees or warranties that extend beyond a one-year period for finish materials.
- For [conductive][static-dissipative] vinyl tile provide manufacturer's standard performance guarantees or warranties that extend beyond one year, standard warranty must not be less than a five year wear warranty and ten year conductivity warranty.
- For carpet tile provide manufacturer's standard performance guarantees or warranties including a minimum two years for material and workmanship and ten years for wear, static control, tuft bind and delamination.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Access flooring support systems are available as either a stringer or stringerless system. Refer to Section 09 69 19 STRINGERLESS ACCESS FLOORING for stringerless applications.
**************************************************************************
A stringer is a horizontal framing member that connects the pedestal head, supports the panel edges and adds lateral stability to the floor system. Stringers should be used on all systems with a height that exceeds 300 mm 12 inches.

Specify the stringer system in seismic zones or when the total area is over 278 square meters 3,000 square feet unless the system provides bolted connection between the panel and pedestal. Coordinate with applicable codes and Structural Engineer.

For Air Force facilities, use stringer type floor systems for data processing facilities.

Consideration should be given to loads which will be imposed during operation. Some equipment, such as high speed printers require large quantities of paper to be delivered by carts. When in motion, these heavy loads may exceed capacity of floor system. Check with user activity and floor system manufacturer when heavy rolling loads are expected. Insure that project specific floor loading requirements are fully coordinated with Structural Engineer and applicable codes.

Zinc whiskers can occur on the underside of raised floor systems which are treated with a zinc electroplated anti-corrosion coating. Zinc whiskers are small enough (2 microns in diameter up to several millimeters in length) to render normal dust filters on computer equipment ineffective. The result is possible electrical shorts and damage to circuitry and equipment. Zinc electroplated anti-corrosion coated components must be prohibited in office areas and data centers when the access flooring system is utilized as an air plenum.

**************************************************************************

a. Provide for self-alignment of floor panels, adjustable pedestals and readily removable floor panels covered as specified.

b. Lateral stability of floor support system must be independent of panels. Provide a finished assembly that is rigid and free of vibration, noises, and rocking panels. Provide bolted stringer system with equipotential plane grounding.

c. Submit certificate of compliance attesting that the installed access floor system meets specification requirements, including all special equipment loads and specific electrical and or cable requirements for the complete access flooring system including, but not limited to the following:

(1) Compliance with ICC-ES AC300 and Compliance with ICC IBC Acceptance Criteria for Access Floors.

(2) Load-bearing capabilities of pedestals, floor panels, and pedestal
adhesive resisting force.

(3) Supporting independent laboratory test reports. For panel, stringer and pedestal load test results include concentrated loads at center of panel, panel edge midpoint, ultimate loads and uniform loads.

(4) Floor electrical characteristics.

(5) Material requirements.

(6) An elevated floor system free of defects in materials, fabrication, finish, and installation, that will remain so for a period of not less than [_____] [1] years after completion.

d. Submit manufacturer's product data for access flooring system consisting of descriptive data, catalog cuts, and installation instructions. Include in the data information about any design and production techniques, total system including all accessories and finish coatings of under-floor components, procedures and policies used to conserve energy, reduce material, improve waste management or incorporate green building/recycled products into the manufacturer of their components or products. Include cleaning and maintenance instructions. Systems which contain zinc electroplated anti-corrosion coatings are prohibited.

2.1.1 Design Requirements

**************************************************************************

NOTE: Insert heavier load as required by facility use conditions. The deflection and permanent deformation limits are for panels 610 by 610 mm 24 by 24 inches, and smaller.

Check manufacturer's literature for maximum loadings available. Generally, by ICC IBC, computer rooms are based on live load of 4.8 kPa 100 psf and point load of 900 kg 2000 lbs. Server rooms may require greater floor loading. Coordinate design loads for access floor with project specific floor loading requirements, structural engineer and design of structural slab.

Project design loads will be in accordance with the International Building Code and UFC 1-200-01.

For most office spaces, underfloor systems rated at 6.9 to 8.6 MPa 1000 to 1250 PSI concentrated load are adequate. For heavier traffic loads at loading docks, elevator entrances, and corridors underfloor systems rated at 10.3 MPa 1500 PSI are appropriate. Underfloor systems rated at 17.2 MPa 2500 PSI are available for heavy equipment.

When editing below paragraphs a., b., c., d. and f. insure that each paragraph is matched up with it's matching option. Options in each paragraph are in matching sequential order.

**************************************************************************
Conduct floor panel testing in accordance with CISCA Access Floors. When tested as specified, make all deflection and deformation measurements at the point of load application on the top surface of the panel. Floor panels must be capable of supporting the following loads:

a. **Concentrated load** of [4450] [5560] [6670] [8900] [11120] [_____] N [1000] [1250] [1500] [2000] [2500] [_____] pounds on 645 square mm one square inch, at any point on panel, without a top-surface deflection more than 2.54 mm 0.10 inch, and a permanent set not to exceed 0.25 mm 0.01 inch in any of the specified tests. Testing must be in accordance with CISCA Access Floors, Section 1 Concentrated Loads with test panels being supported by understructure to be used with installed system instead of steel support blocks.

b. **Uniform live load** of [11.97] [14.36] [16.76] [19.15] [23.94] [_____] kPa [250] [300] [350] [400] [500] [_____] psf, without a top-surface deflection more than 1.5 mm 0.06 inch, and a permanent set not to exceed 0.25 mm 0.01 inch in any of the specified tests, when tested in accordance with CISCA Access Floors, Section 7 Uniform Load Test with test panels being supported by understructure to be used with installed system instead of steel support blocks.

c. **A rolling load** of [2670] [3560] [4450] [5340] [7110] [_____] N [600] [800] [1000] [1200] [1600] [_____] pounds applied through hard rubber surfaced wheel 152 mm 6 inch diameter by 51 mm 2 inch wide for 10,000 cycles over the same path. Permanent set at conclusion of test must not exceed 1.0 mm 0.040 inch when tested in accordance with CISCA Access Floors, Section 3 Rolling Loads.

d. **A rolling load** of [3560] [4450] [5560] [6670] [8890] [_____] N [800] [1000] [1250] [1500] [2000] [_____] pounds applied through a 75 mm 3 inch diameter by 30 mm 1-13/16 inch wide caster for 10 cycles over the same path, without developing a local overall surface deformation greater than 1 mm 0.04 inch. In accordance with CISCA Access Floors, Section 3 Rolling Loads, the permanent deformation limit under rolling load must be satisfied in all of the specified tests.

e. **An impact load** of [670] N [150] pounds anywhere on the panel dropped from a height of 914 mm 36 inches onto a 645 square mm 1 square inch area without failure of the system, according to CISCA Access Floors, Section 8 Drop Impact Load Test.

f. **Ultimate Load**. Panels must meet manufactures published Ultimate Load rating of [6230] [8010] [11120] [12450] [13790] [_____] N [1400] [1800] [2500] [2800] [3100] [_____] pounds when tested in accordance with CISCA Access Floors, Section 2 Ultimate Loading.

g. **Safety Factor**. Panels must provide a minimum Safety Factor of 5 times the uniform load specified above in accordance with ICC-ES AC300.

h. **Recycled Content**. Provide Access Flooring System (panels, stringers and pedestals) containing a minimum of [20] [_____] percent recycled content. Provide data identifying percentage of recycled content of access flooring system.
2.1.2 Allowable Tolerances

2.1.2.1 Floor Panel Flatness

Plus or minus 0.89 mm 0.035 inches on diagonal on top of panel or underneath edge.

2.1.2.2 Floor Panel Length

Plus or minus 0.4 mm 0.015 inch.

2.1.2.3 Floor Panel Squareness

Plus or minus 0.5 mm 0.02 inch in panel length.

2.1.3 Stringers

Provide stringers capable of supporting a [_____] N [_____] pound [1110 N 250 pound] [90 kg 200 pounds] [1550 N 350 pound] [2000 N 450 pound] concentrated load at midspan without permanent deformation in excess of 0.25 mm 0.010 inch, when tested in accordance with CISCA Access Floors, Section 4 Stringer Load Testing.

2.1.4 Pedestals

**************************************************************************

NOTE: Pedestals consist of a base plate, post and an adjustable head, and are available in heights from 150 mm 6 inches to 2400 mm 96 inches. Pedestals 610 mm 24 inches high or higher must be securely anchored to the structural floor in addition to being held in place by adhesive.

Pedestals are normally held in place with an adhesive and must be in full contact with the subfloor surface. Pedestal 610 mm 24 inches high or higher will be securely anchored to the structural floor in addition to the adhesive.

For Air Force projects, the minimum pedestal height is 300 mm 12 inches.

**************************************************************************

Pedestals must be capable of supporting a 22.24 kN 5000 pound axial load without permanent deformation, when tested in accordance with CISCA Access Floors, Section 5 Pedestal Axial Load Test.

2.1.5 Bonding Strength of Pedestal Adhesive

**************************************************************************

NOTE: Use 113 Nm 1,000 lbf-in for raised floors with a maximum height of 610 mm 24 inches and 226 Nm 2,000 lbf-in for raised floor heights greater than 610 mm 24 inches up to 1219 mm 48 inches maximum. Raised floor heights greater than 1219 mm 48 inches require specific structurally designed bracing.

**************************************************************************
Adhesive for anchoring pedestal bases must have a bonding strength capable of resisting an overturning moment of \[113 \text{ Nm} \quad 1,000 \text{ lbf-in}\] \[226 \text{ Nm} \quad 2,000 \text{ lbf-in}\] when a force is applied to the top of the pedestal in any direction, when tested in accordance with CISCA Access Floors, Section 6 Pedestal Overturning Moment Test. Pedestal adhesive must meet emissions requirement of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type). Provide validation of indoor air quality for pedestal adhesive.

2.1.6 Bond Strength of Factory Installed Covering

**************************************************************************
NOTE: Coordinate test load weights with those specified for floor panel testing in General System Requirements.
**************************************************************************

Bond strength of floor covering must be sufficient to permit handling of the panels by use of the panel lifting device, and to withstand moving caster loads up to \[3560 \quad 4450 \quad 5560 \quad 6670 \quad 8890 \quad \text{[_____]} \quad 800 \quad 1000 \quad 1250 \quad 1500 \quad 2000 \quad \text{[_____]} \quad \text{pounds}, without separation of the covering from the panel.

2.1.7 Seismic Calculations

2.1.7.1 Navy Project Specific Requirements

**************************************************************************
NOTE: For Navy projects, provide lateral bracing calculations on all installations. Level 1 Contracting Officer's approval was granted for calculations by a registered professional engineer. Occupancy importance factor (I) and seismic zone factor (z) should be deleted in accordance with UFC 1-200-01.

Provide seismic requirements, if a Government designer (Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the second bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT must be included in the contract documents.

**************************************************************************

Submit seismic calculations for lateral bracing, sealed by a Professional Engineer. Document that access flooring system complies with seismic requirements of ICC IBC and ASCE 7-16 for Occupancy Importance Factor (Ip) of \[1.0 \quad 1.5\], and seismic horizontal force (Fp) determined in accordance with UFC 3-301-01 and Section 1615 of the ICC IBC and ASCE 7-16, Minimum Design Loads for buildings and other structures.

2.1.7.2 Army Project Specific Requirements

**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the second
Submit seismic calculations for special bracing to resist the effects of seismic or other forces [in accordance with UFC 3-301-01, ICC IBC and ASCE 7-16] [as shown on the approved detailed installation drawings]. Submit design calculations which demonstrate that the proposed floor system meets requirements for seismic loading. Certified copies of test reports may be submitted in lieu of calculations.

2.2 FLOOR PANELS

2.2.1 Floor System Drawings And Planer Quality

a. Submit Fabrication Drawings for elevated floor systems consisting of fabrication and assembly details to be performed in the factory.

b. Indicate on Location Drawings exact location of pedestals, ventilation openings, cable cutouts, and the panel installation pattern.

c. Provide Detail Drawings showing details of the pedestals, pedestal-floor interlocks, floor panels, panel edging, floor openings, floor opening edging, floor registers, floor grilles, cable cutout treatment, perimeter base, expansion, and peripheral support facilities.

d. Design and workmanship of the floor, as installed, must be completely planar within plus or minus 1.5 mm in 3050 mm 0.060 inch in 10 feet, 2.5 mm 0.100 inch for the entire floor, and 0.7 mm 0.030 inch across panel joints.

e. Floor-panel joint-width tolerances must not exceed 0.43 mm 0.017 inch as measured with a feeler gage at any point in any joint when the panels are installed and as long as the air leakage requirements specified in this section are met.

f. Submit [three][_____] complete samples of floor panels.

2.2.2 Detailed Installation Drawings

Submit Detailed Installation Drawings that as a minimum indicate the following:

a. Location of panels

b. Layout of supports, panels, and cutout locations

c. Stair, handrail, and ramp framing

d. Sizes and details of components

e. Details at floor perimeter and height above structural floor

f. Method of anchorage to structural subfloor

g. Lateral bracing
h. Typical cutout details
i. Gasketing, return air grilles, supply air registers, and perforated panels. Include air transfer capacity of grilles, registers and panels
j. Description of [shop] [factory] coating
k. Floor finishes
l. Location of connection to building grounding electrode

2.2.3 Panel Construction

**************************************************************************

NOTE: There are five basic floor panel types: aluminum, hollow formed steel, cementitious-filled formed steel, metal-clad wood core, and concrete. The most commonly used floor panel is the Cementitious-Filled Formed Steel (Composite Panels). Nonferrous materials should be used in areas where there is potential for damage by rust oxides or paint flakes.

Editing of a Non-Proprietary Specification: Note that there are two primary Buy America FAR compliant access flooring system suppliers to the North American market who respectively manufacture the Cementitious-Filled Formed Steel and Lightweight Concrete Filled Panels. Both panel types should be selected to insure non-proprietary specifications.

The standard panel size of 600 by 600 mm 24 by 24 inch will normally be used. Check with user activity and verify product availability before specifying nonstandard panels of 450, 750 and 900 mm 18, 30, and 36 inch where required to match existing floor systems or to satisfy special requirements.

Use 150 mm 6 inches as minimum practical height for access floor installation and 300 mm 12 inches minimum when there is a plenum. Include the five panel types as options except that wood core panels should not be specified for Air Force projects, SPAWAR projects, or other projects where data processing involves highly strategic data having direct bearing on National Defense effort. Check with user activity before specifying wood core panels. SPAWAR may be involved in Air Force and Army projects, verify with the User.

**************************************************************************

a. Base access floor system on a 600 by 600 mm 24 by 24 inch square module providing minimum of [150] [300] [_____] mm [6] [12] [_____] inch clearance between structural floor and underside of panel and stringer. Fabricate so accurate job cutting and fitting may be done using standard sizes for perimeters and around columns.

b. Do not expose metal on finished top surface of panels. Provide cutouts and cutout closures to accommodate utility systems and equipment
intercabling. Reinforce cutouts to meet design load requirements. Provide extra support pedestals at each corner of cutout for cutout panels that do not meet specified design load requirements.

c. Panel design must provide for convenient panel removal for underfloor servicing and for openings for new equipment. Use panels of uniform dimensions within specified tolerances. Permanently mark panels to indicate load rating and model number.

d. Machine square floor panels to within plus or minus 0.38 mm 0.015 inch with edge straightness plus or minus 0.064 mm 0.0025 inch. If plastic edging is applied to the panel, the tolerances apply to the panel before the plastic edging is applied.

**************************************************************************
NOTE: For security or additional structural stability of the access flooring system, panels can be bolted to pedestals. However this will cause additional maintenance concerns and will need to be coordinated with the desired floor covering.
**************************************************************************

[ e. Provide panels with holes drilled in corners to align precisely with threaded holes in pedestal heads and to accept countersunk corrosion resistant screws with heads that are flush with top of panel.]

[2.2.3.1 Aluminum

**************************************************************************
NOTE: Die-cast aluminum panels are lightweight, have very little variation in dimension from panel to panel, and are acceptable in environments where nonferrous materials are required (e.g., Magnetic Resonance Imagery rooms), but they tend to be more expensive than other types of panels.

Die-cast aluminum panels are normally used as a stringerless system. Stringers, when required, are fastened to the top of the pedestal shaft.
**************************************************************************

Provide aluminum panels of die-cast or extruded construction conforming to ASTM B85/B85M.

] [2.2.3.2 Hollow Formed Steel

**************************************************************************
NOTE: Die-formed hollow steel panels perform best under static loads and should not be used under dynamic (rolling) loads. These panels are more economical than other types of panels and can be provided by most flooring system manufacturers.
**************************************************************************

Steel panels must be of die-formed construction, consisting of a flat steel top sheet welded to one or more formed steel stiffener sheets or components. Panels must be chemically cleaned, bonderized, and painted with the manufacturer’s standard finish.
2.2.3.3 Cementitious-Filled Formed Steel (Composite Panels)

******************************************************************************

NOTE: Cementitious core filled panels are enclosed in steel sheeting and are designed to provide improved resistance to rolling and impact loads. Specific strength and load requirements should be specified wherever it is a critical concern. These panels are quiet due to their mass.

There is some concern that the fill material may deteriorate when subjected to repeated loading cycles, and the cut edges could introduce dust into the underfloor space. Where the underfloor space will be a plenum, or where dust-sensitive computer equipment is to be installed, verify that the composite panel is acceptable to the Using Agency.

Current Air Force criteria does not permit the use of composite panel.

******************************************************************************

a. Provide composite panels of die-formed steel construction totally enclosing the panel, including the top surface. The void spaces between the top sheet and the formed steel bottom sheet must be completely filled with an incombustible cementitious or concrete material. Seal cut edges in accordance with manufacturer's recommendations. Gravity held panels with bolted stringer understructure: Fasten end of each stringer and mid-point of each 1212 mm 4 foot stringer positively to pedestal heads, using manufacturer's standard screws. Provide screws that are removable from top.

b. Grid supported panels must be further tested by supporting them at two opposite edges and applying a 2225 newton 500-pound load at the center of a panel selected; the panel must be similarly tested while supported at the other two edges. Weld failure at any point under this loading is not acceptable. This additional test must be applied to one panel per 46.45 square meter 500 square feet of floor in the system, but in no case less than two panels. When any weld fails, the number of panels designated by the Contracting Officer must be similarly tested; replace those panels that have a weld failure at no cost to the Government.

2.2.3.4 Metal-Clad Wood Core

******************************************************************************

NOTE: Wood core panels consist of a core of particleboard with an overlapping skin of galvanized steel. The wood core is a good sound deadener and insulator and increases resistance to rolling loads. Wood core panels are the most economical option.

Although the core material is combustible, the composite panel with bonded steel for face sheets when tested in accordance with the NFPA 225, revealed the composite panel to be noncombustible with a flame spread index of 0, a smoke developed index of 10, and to have a Class A fire rating.
Wood core panels can be easily cut and trimmed; however, doing so causes loss of fire retardancy and UL rating. The edges of wood core panels must be protected from moisture in order to prevent warping.

Provide wood core panels with cores of wood particleboard conforming to CPA A208.1, Grade 1-M-3, or of plywood conforming to CPA A208.2, APA E30, and APA L870, EXT-DFPA-C-C. The core must be not less than 25 mm 1 inch thick, and be faced on all sides with structurally bonded zinc-coated steel sheets not lighter than 0.70 mm 24 gauge. All edges and corners must be sealed with zinc-coated steel or extruded aluminum. The completed panels must have a flame spread rating of 25 or less when tested in accordance with ASTM E84. Provide zinc-coated steel, extruded aluminum, fire resistant vinyl, or other fire resistant edging to protect shop and field edge cuts and cutouts through the face of panels in a manner to meet specified flame spread, smoke developed and Class A fire rating requirements.

2.2.3.5 Lightweight Concrete Filled Panels (Exposed Concrete)

Provide lightweight concrete of lightweight structural concrete with either structural reinforcing or a die-formed, hot dipped galvanized steel bottom pan. All concrete surfaces, including those resulting from field cuts, must be sealed with the manufacturer's standard sealer before covering the surfaces with other materials. Concrete sealer must meet either emissions requirements of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for concrete sealer.

2.2.4 Floor Covering

Verify with User and manufacturers which finishes are recommended for what type of functional space, type of panel and understructure. Delete finish paragraphs that are not applicable to the project. Clearly indicate in contract documents where different floor covering types are located if more than one type is specified for a project. Verify that finishes being considered are approved for use by the access flooring manufacturer. Some finishes may be considered standard by some manufacturers and non-standard by others which could add cost to the project. The finishes need to be of

SECTION 09 69 13 Page 22
a size that is appropriate for a one-to-one installation to the floor panel with no seams, size needs to be slightly smaller than a standard 610 by 610 mm (24 inch by 24 inch). Coordinate size with access flooring manufacturer. Note that not all manufacturer floor tile products are available in the required size and may require additional cuts, this may add cost to the project and add product waste.

Consider the desired aesthetics, appearance and use of a facility and the following edge detail information to determine the type of floor covering edge detail preferred for a project:

a. Cementitious Filled Formed Steel (Composite) and Lightweight Concrete Filled (Exposed Concrete) Panels with factory applied high pressure laminate or resilient flooring material — The integral finish edge detail is available from more manufacturers than the applied trim piece edge detail. If the applied trim piece detail is acceptable for a project, recommend that both types remain in the specification to open it up to more manufacturers so the specification does not become proprietary with only the applied trim piece. The integral finish detail is more durable than the applied trim piece which can become damaged.

b. Metal-Clad Wood Core Panels with factory applied high pressure laminate material— Edge detail is available both integral to the finish material and as an applied trim piece dependent upon the manufacturer. Recommend that both types remain in the specification to open it up to more manufacturers so the specification does not become proprietary.

c. Metal-Clad Wood Core Panels with factory applied resilient flooring material— Edge detail with applied trim piece is more typical.

d. Steel and Aluminum Panels — Edge detail is available both integral to the finish material and as an applied trim piece dependant upon the manufacturer. Recommend that both types remain in the specification to open it up to more manufacturers so the specification does not become proprietary.

Verify that finish being considered is appropriate for the system specified when raised access floor panels are required to be screwed into place. Panels that are screwed into place and have a factory finish that is bonded into place will have an exposed screwhead in each corner. The screwhead for resilient floor materials will be flush with panel face and not finish face and may require additional maintenance to clean out screwhead locations. If it is determined that a panel with factory applied finish will be screwed into place verify with User if a requirement for finish plugs be added to the specification to provide a more
finished appearance and coordinate availability with the manufacturer. These plugs would be the same material as the panel finish and would be installed to cover the exposed screwhead. Plugs are not permanent, can come out and become lost. Plug should be installed per manufacturer recommendations for easy removal and replacement for User to access underfloor area.

Choice of critical radiant flux level as it applies to building type and area of application will be made in accordance with UFC 3-600-01, UFC 1-200-01 and NFPA 101. Wherever the use of Class II (0.22) watts finish is required, Class I (0.45) watts will be permitted.

Aluminum panels often do not receive an applied finish. If it is determined a finish is required, add edge detail requirement to applicable finish paragraph inside empty brackets.

Verify with manufacturer if embossed texture being specified is acceptable for use with the lifting device.

Surface floor panels with [factory applied finish materials firmly bonded in place with waterproof adhesive][carpet tile installed in the field]. Provide finish flooring materials in corridors and exits with a critical radiant flux of not less than [0.45 watts per square centimeter (Class 1)] [0.22 watts per square centimeter (Class 2)] when tested in accordance with ASTM E648 or NFPA 253. The electrical resistance must remain stable over the life expectancy of the floor covering. Any anti-static agent used in the manufacturing process must be an integral part of the material, not surface applied. Bolt heads or similar attachments must not rise above the traffic surface. Submit [three] [_____] separate samples of each specified floor covering finish and color.

[2.2.4.1 High Pressure Laminate

NOTE: HDM, 2 mm 1/16 inch thick high pressure laminate is typically used. HDH, 3.2 mm 1/8 inch thickness is also available, but is more expensive than the HDM.

Provide factory applied high pressure laminate surfacing conforming to ANSI/NEMA LD 3, High-Wear type, Grade [HDM, 2 mm 1/16 inch thickness][____]. Finish material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][or][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][or][ABS][____]]. The total system electrical resistance from the wearing surface of the floor to the ground connection must be between 1,000,000 (1.0 x 10^6) ohms and 20,000,000,000 ohms (2.0 x 10^{10}).
2.2.4.2 Conductive High Pressure Laminate

Note: HDM, 2 mm 1/16 inch thick high pressure laminate is typically used. HDH, 3.2 mm 1/8 inch thickness is also available, but is more expensive than the HDM.

Provide factory applied high pressure laminate surfacing conforming to ANSI/NEMA LD 3, High-Wear type, Grade [HDM, 2 mm 1/16 inch thickness][______]. Finish material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][______]]. The total system electrical resistance from the wearing surface of the floor to the ground connection must be between 25,000 ohms (2.5 x 10^4) and 1,000,000 ohms (1.0 x 10^6).

2.2.4.3 Solid Vinyl Tile

Provide factory applied conductive vinyl tile that is a homogeneous vinyl product and conforms to ASTM F1700, Class I monolithic (minimum wear layer thickness 3 mm 0.125 inch and minimum overall thickness 3 mm 0.125 inch), Type A smooth surface. Finish material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][______]].

2.2.4.4 Luxury Vinyl Tile

Provide factory applied luxury vinyl tile conforming to Class III printed film minimum wear layer thickness of 0.50 mm 0.020 inch and minimum overall thickness 3 mm 0.125 inch, Type [A (smooth)] [B (embossed)]. Finish material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][______]].

2.2.4.5 Conductive Vinyl Tile

Provide factory applied conductive vinyl tile that is a homogeneous vinyl product and conforms to ASTM F1700, Class I monolithic, Type A smooth surface. Provide electrical resistance from surface to surface and surface to ground between 25,000 ohms (2.5 x 10^4) and 1,000,000 ohms (1.0 x 10^6) when tested in accordance with ASTM F150. Material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][______]].

2.2.4.6 Static-Dissipative Vinyl Tile

Provide factory applied static-dissipative vinyl tile that is a homogeneous vinyl product and conforms to ASTM F1700, Class I monolithic, Type A smooth surface. Provide electrical resistance from surface to surface and surface to ground between 1,000,000 ohms (1.0 x 10^6) and 1,000,000,000 ohms (1.0 x 10^9) when tested in accordance with ASTM F150. Material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][______]].
piece to cover the face of the panel. Provide edge detail that is
[integral to the finish material][ or ].[is an applied trim piece that
finishes the edges of the panel, is flush with floor finish, and is [PVC][
or ].[ABS][____]].

2.2.4.7 Carpet Tile

***********************************************************************
NOTE: Consider the function of the room, User
requirements and consult with the project electrical
engineer when determining the type of carpet that is
appropriate, 09 68 00 CARPETING or 09 62 38
STATIC-CONTROL FLOORING (for static-control carpet
tile).

Be aware that full spread releasable if not
installed in accordance with manufacturer required
drying time can become overly tacky making it
difficult to remove from screwheads and between
panels and to lift carpet tile from panel.

Coordinate carpet tile selection for one to one
alignment with floor panels with the access flooring
manufacturers. Due to the size required (slightly
smaller than 610 by 610 mm 24 inch by 24 inch) the
access flooring manufacturers have a variety of
standard carpets available from different carpet
manufacturers.

Recommend listing at least two manufacturers for one
to one alignment so specification does not become
proprietary.

Installation method for one to one alignment with
floor panels is limited to monolithic and quarter
turn installation patterns.

Do not use the odor-free adhesive tab system or full
spread releasable adhesive to achieve a one to one
alignment with floor panels. This is not
recommended by manufacturers.

***********************************************************************
Reference Section [09 68 00 CARPETING][ and ][09 62 38 STATIC-CONTROL
FLOORING (static-control carpet tile)] for carpet tile specification
requirements including recycled content, volatile organic compound (VOC)
limits, and additional flammability testing requirements for carpet tile.
Carpet tile must be field installed and comply with the following:

a. Installation method on level surfaces must allow carpet tile to be
easily removed and replaced in the field and must be installed in
accordance with manufacturer's recommended installation instructions.

b. Install carpet tile in a [monolithic][1/4
turn][ashlar][brick][random][____] pattern.

[ c. Install carpet tile on secure and level surfaces offset from the access
floor grid with a [manufacturer approved odor-free adhesive tab
system][ or ][with full spread releasable adhesive using manufacturer

SECTION 09 69 13 Page 26
recommended adhesives. Comply with manufacturer installation instructions for required drying time so the adhesive sets up properly].

][d. Install carpet tile on secure and level surfaces with the access flooring manufacturer's recommended installation method and components for a one to one alignment with floor panels (one carpet tile to one floor panel); equal to Tate PosiTile[, _____] or Haworth CarpetLok. This installation method requires the removal of only one carpet tile to access one raised access panel. Carpet tile size for a one-to-one installation must be slightly smaller than a standard 610 by 610 mm 24 inch by 24 inch tile, coordinate required size with the raised access flooring manufacturer. Factory applied carpet tile with perimeter edge strip and field applied one to one carpet tile installation over raised access floor panels with permanent or releasable adhesive are not acceptable installation methods.

][e. Carpet tile on access flooring stairs and sloped surfaces must be installed with a more permanent installation method in accordance with manufacturer's instructions and with manufacturer recommended adhesives for these types of locations.

][2.2.4.8 Lightweight Concrete Filled (Exposed Concrete)

**************************************************************************

NOTE: Bare panels may be specified to achieve a desired visual aesthetic. Finish panels with sealer to prevent dusting and to minimize water absorption. User should be made aware that sealer will need to be reapplied over time.

**************************************************************************

Provide lightweight concrete filled panel with a [MPI 58 concrete stain][ and ][MPI 104 concrete floor sealer][ or ][MPI 99 water based concrete floor sealer]. Apply coatings in accordance with manufacturer's instructions.

]2.2.5 Accessories

**************************************************************************

NOTE: Perforated panels are preferred for use in areas with hard surfaces such as high pressure laminates, and grilles or registers are preferred in areas with carpet

**************************************************************************

Provide the manufacturer's standard registers, grilles, perforated panels, and plenum dividers type where indicated. Provide registers, grilles, and perforated panels designed to support the same static loads as floor panels without structural failure, and capable of delivering the air volumes indicated. Registers and perforated panels must be 25 percent open area and equipped with adjustable dampers. Submit [three][_____] samples and colors of each accessory.

2.2.6 Resilient Base

Conform to ASTM F1861, [[Type TS (vulcanized thermoset rubber)] [or] [Type TP (thermoplastic rubber)] [ or ][Type TV (thermoplastic vinyl)], [Style A (straight - installed with carpet)] [and] [Style B (coved - installed with resilient flooring)]. Provide [100] [150] mm [4] [6] inch high and a
minimum 3.175 mm 1/8 inch thick wall base. Provide [preformed] [job formed] corners in matching height, shape, and color.

2.2.7 Adhesives

Provide adhesives as recommended by the manufacturer. Provide non-aerosol adhesive products that meet either emissions requirements of CDPH SECTION 01350 (use the requirements for either office or classroom, regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide aerosol adhesives that meet either emissions requirements of CDPH SECTION 01350 (use the requirements for office or classroom, regardless of space type) or VOC content requirements of GS-36. Provide validation of indoor air quality for adhesives. Provide conductive adhesive as recommended by the manufacturer of the static-control flooring. [Provide conductive releasable adhesive as recommended by the manufacturer for static-control carpet tile.]

2.2.8 Lifting Device

At turn over provide one floor panel lifting device standard with the floor manufacturer, for each individual floor area (room or corridor). Furnish a minimum of two devices. [For AIR FORCE projects, at turnover, provide a total of two suction-type floor panel lifting devices for each floor area (room or corridor).]

2.3 PANEL SUPPORT SYSTEM

Design support system to allow for 360 degree clearance in laying out cable and cutouts for service to machines and so that panel and stringer together take up maximum of 50 mm 2 inches. Submit one sample of suspension system proposed for use.

2.3.1 Pedestals

Provide pedestals made of steel or aluminum or a combination thereof. Ferrous materials must have a factory-applied corrosion-resistant finish. Provide pedestal base plates with a minimum of 10,300 square mm 16 square inches of bearing surface and a minimum of 3 mm 1/8 inch thickness. Pedestal shafts must be threaded to permit height adjustment within a range of approximately 50 mm 2 inches, to permit overall floor adjustment within plus or minus 2.5 mm 0.10 inch of the required elevation, and to permit leveling of the finished floor surface within 1.56 mm 0.062 inch in 3000 mm 10 feet in all directions. Provide locking devices to positively lock the final pedestal vertical adjustments in place. Pedestal caps must interlock with [panels] [stringers] to preclude tilting or rocking of the panels.

2.3.2 Stringers

**************************************************************************

NOTE: Specify bolted stringer and bolted panel systems. Specify bolted stringer type system and high pressure laminate finish for computer room access flooring in Air Force and Naval Warfare Systems Command (SPAWARS) facilities, except where die-cast interlocking panel to pedestal aluminum system is designated. SPAWARS may be involved in Air Force and Army projects, verify and coordinate requirements with User.
Consideration must be given to equipment planned for installation including type and amount of grounding required. If such equipment has extendable drawers or chassis which require equipment to be firmly anchored to prevent overturning, a rigid grid stringer system of suitable strength and rigidity may be used as anchoring point in lieu of fabricating special subfloor foundations for such equipment, which would restrict 360 degree freedom. The specification may require modification to provide sufficiently rigid grid system to accommodate this condition.

**************************************************************************

Provide stringers of rolled steel or extruded aluminum, to interlock with the pedestal heads to prevent lateral movement. Provide stringers that can be added or removed after floor is in place.

2.3.3 Gaskets

Provide continuous gasketing at contact surfaces between panel and stringers to deaden sound and seal off the underfloor cavity from above for air tightness, and to maintain panel alignment.

2.4 FASCIA

Provide aluminum or steel fascia plates at open ends of floor, at sides of ramps and steps, and elsewhere as required to enclose the free area under the raised floor. Steel plates must have a factory applied baked enamel finish. Finish on aluminum plates must be standard with the floor system manufacturer. Fascia plates must be reinforced on the back, and supported using the manufacturer's standard lateral bracing at maximum 1200 mm 4 feet on center. Provide trim, angles, and fasteners as required. Submit [three][_____] color samples for fascia.

2.5 STEPS AND RAMPS

**************************************************************************

NOTE: Coordinate step and ramp finish with finishes specified in FLOOR COVERINGS and insert selected finish. Resilient flooring is recommended if there will be a lot of cart traffic. Carpet tile should be installed with a permanent adhesive.

**************************************************************************

Securely fasten steps and ramps to the access flooring system and to the structural floor. Include in the construction standard floor system components and custom components as required, and all supports, fasteners, and trim necessary for a finished installation. Step nosings, threshold strips, and floor bevel strips must be cast or extruded aluminum with non-slip traffic surfaces. Submit [three][_____] color samples for exposed step and ramp structure.

2.5.1 Steps

Height of risers must comply with applicable codes. Design steps to support a uniform load of 7.18 kPa 150 psf. Surface treads with the manufacturer's standard non-slip floor finish. Floor covering must be [____].
2.5.2  Ramps

Slope of ramps must comply with applicable codes and 36 CFR 1191 Americans with Disabilities Act (ADA). Design ramps to support the same loads as specified for floor panels. Surface ramps with the manufacturer's standard non-slip floor finish. Floor covering must be [____].

2.6  RAILINGS

**************************************************************************
NOTE: Where open sides of floors are 1200 mm (4 feet or more above adjacent ground or floor level, install "standard railing" in accordance with CFR 1910.23(e). Run post through raised floor and bolt to concrete floor for stability.
**************************************************************************

Provide railings compliant with applicable codes and 36 CFR 1191 Americans with Disabilities Act (ADA). As a minimum railings must be of the double rail and post type, fabricated of at least [25 mm 1 inch] [_____] [round] [square] seamless [aluminum tubing] [_____] with a [satin natural anodized] [_____] finish. At steps and ramps, make the top rail a minimum of 900 mm 36 inches high and parallel to the incline. Make the top rail 1050 mm 42 inches high at open ends of the floor. Guardrails must have intermediate rails or an ornamental pattern such that a sphere 100 m 4 inches in diameter cannot pass through. Space posts maximum of [1200] [1500] [1800] mm [4] [5] [6] feet oc. Provide railings complete with anchorages, floor plates, and end caps.[ Electronically ground hand rails to raised floor system to prevent static build-up.] Submit [three][_____] color samples for railings.

2.7  FACTORY TESTS

Factory test access flooring, using an independent laboratory, at the same position and maximum design elevation and in the same arrangement as shown on the drawings for installation so as to duplicate service conditions as much as possible.

2.7.1  Load Tests

Conduct floor panel, stringer, and pedestal testing in accordance with CISCA Access Floors to determine deformation and permanent set of panels and sytem due to concentrated, Uniform, rolling, impact and ultimate loading when panels are supported by actual understructure.

2.7.2  Bond Strength of Covering

**************************************************************************
NOTE: Coordinate test load weights with those specified for floor panel testing in General System Requirements.
**************************************************************************

Conduct test for bond strength of covering in accordance with CISCA Access Floors for rolling loads, except as specified. Panels must be
tested with specified hard surface flooring and on the pedestals and stringers as specified for the installed floor. Brace the supports as necessary to prevent sideways movement during the test. Impose a test load of 3560 [4450] 5560 [6670] 8890 [_____] N 800 [1000] 1250 [1500] [2000] [_____] pounds on the test assembly through a 75 mm 3 inches in diameter and 25 mm 1 inch wide hard plastic caster. Roll the caster completely across the center of the panel. The panel must withstand 20 passes of the caster with no delamination or separation of the covering.

[2.8 REGISTERS AND GRILLES]

******************************************************************************
NOTE: Size of registers should be stated if applicable. Coordinate with Mechanical Engineer.
******************************************************************************

Registers and grilles must be [_____] mm inches by [_____] mm inches long with a minimum free area of [_____] square mm inches, made from extruded [aluminum] [____], in [mill] [____] finish, to sustain point loads of 1100 newton 250 pounds per vane without failure or permanent deformation. No part of a grille may project more than 3 mm 1/8 inch above the floor. Registers and grills are not permitted in a laminate floor tile system.

[2.9 PERFORATED AIR SUPPLY PANELS]

Provide air supply floor panels that meet the design criteria specified for standard panels, are fabricated of 2 mm 14-gage perforated steel sheet welded to minimum 1.6 mm 16-gage side channels, are covered with high pressure laminate to match standard panels, and have a uniform perforated pattern to allow even air distribution.

[2.10 PERFORATED DIRECTIONAL AIR SUPPLY PANELS]

Provide directional air supply floor panels that meet or exceed the design criteria specified for standard panels, are fabricated of [light weight die cast aluminum with powder coat finish] [welded steel vanes with powder coat finish] [perforated steel sheet welded to a formed steel pan with powder coat finish]. Submit [three][_____] color samples for perforated directional air supply panels.

[2.11 CUT OUTS]

Provide cable cutouts finished with rigid polyvinylchloride or molded polypropylene edging to conform to the appearance level of the floor surface and to cover raw edges of the cutout panel. Extrusion must be of a configuration to permit its effective and convenient use when new cable openings are required. Provide at least 7300 mm 24 feet of additional extrusion for future use. Submit [three][_____] color samples for cut outs.

a. Provide non-metallic adapter for openings less than 100 mm 4 inches wide. Secure adapter adhesively in cutout to preclude removal from panel. Provide at least two adapters per 10 square meter 1000 square feet for future use.

b. Openings larger than 100 mm 4 inches wide must use rigid polyvinylchloride or molded polypropylene edging. Perform cutting of panels, including cutouts, outside of the building.

c. When size of cutout reduces the performance requirement of panel,
provide intermediate stringers adjacent to cutouts.

][2.12 EDGE CLOSURE

Provide 1.5 mm 1/16 inch aluminum closure plate and extruded aluminum nosing at exposed edge of floor. Back up the closure plates with aluminum or steel framing braced diagonally, or anchor at bottom to continuous angle.

]2.13 COLOR

**************************************************************************

NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally UFGS 09 06 00 SCHEDULES FOR FINISHES or as indicated is used when the project is designed by an Architect or Interior designer. Color should be selected from manufacturer’s standard colors or identified as a manufacturer’s color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located as indicated, a note must be added to the drawings that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note that there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is referenced, be certain that the product conforms to this specification, as edited.

**************************************************************************

Color must be [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [as indicated] [______]. Color listed is not intended to limit the selection of equal colors from other manufacturers.

PART 3 EXECUTION

3.1 INSTALLATION

Install access flooring at the location and elevation and in the arrangement shown on the approved detailed installation drawings. The floor system must be of the rigid grid stringer type, complete with all supplemental items, and be the standard product of a manufacturer specializing in access flooring systems.

Install the floor system in accordance with the manufacturer's instructions. Open ends of the floor, where the floor system does not abut wall or other construction, must have positive anchorage and rigid support. Maintain areas to receive access flooring between [16] [4] and 32
degrees C [60] [40] and 90 degrees F, and between 20 and 70 percent humidity for 24 hours prior to and during installation.

3.1.1 Preparation for Installation

******************************************************************************************************************
NOTE: Section 03 30 00 CAST-IN-PLACE CONCRETE should require that concrete floors used as air plenum surfaces beneath raised floors be sealed with approved liquid sealer compound. Sealer should be compatible with pedestal adhesive, if pedestals are anchored with adhesive. If a non-compatible sealer is applied before pedestals are anchored, specify removal of sealer at pedestal locations before adhesive is applied. If an existing subfloor has been painted or otherwise sealed with non-compatible sealer or paint, specify removal of coating before applying adhesive.
******************************************************************************************************************

Clear out all debris in the area in which the floor system is to be installed. Thoroughly clean structural floor surfaces and remove all dust. Install floor coatings, required for dust or vapor control, prior to installation of pedestals, only if the pedestal adhesive will not damage the coating. If the coating and adhesive are not compatible, apply the coating after the pedestals have been installed and the adhesive has cured.

3.1.2 Pedestals

******************************************************************************************************************
NOTE: Seismic calculations must be made by the designer to determine if adhesives or anchors are to be used; pedestal adhesives must be capable of securing pedestals in place with sufficient bonding strength to resist an overturning force of 113 N-m 1000 inch-pounds. If the calculations indicate the overturning force is greater than 113 N-m 1000 inch-pounds steel expansion anchors will be used.
******************************************************************************************************************

Pedestals must be accurately spaced, and set plumb and in true alignment. Set base plates in full and firm contact with the structural floor, and secured to the structural floor with adhesive or steel expansion anchors in accordance with manufacturer's instructions.

3.1.3 Stringers

Interlock stringers with the pedestal caps to preclude lateral movement, spaced uniformly in parallel lines at the indicated elevation.

3.1.4 Auxiliary Framing

Provide auxiliary framing or pedestals around columns and other permanent construction, at sides of ramps, at open ends of the floor, and beneath panels that are substantially cut to accommodate utility systems. Use special framing for additional lateral support as shown on the approved detailed installation drawings. Provide additional pedestals and stringers designed to specific heights and lengths to meet structural irregularities and design loads. Connect auxiliary framing to main framing.
3.1.5 Panels

Interlock panels with supports in a manner that will preclude lateral movement. Fasten perimeter panels, cutout panels, and panels adjoining columns, stairs, and ramps to the supporting components to form a rigid boundary for the interior panels. Level floors within the specified tolerances. Cut edges of [steel and wood-core panels must be [painted] [finished] [_____] as recommended by the panel manufacturer.][Exposed edges of composite panels must be coated with a silicone rubber sealant or with an adhesive recommended by the panel manufacturer.][Secure extruded vinyl edging in place at all cut edges of all panel cut-outs to prevent abrasion of cables.[Where the space below the floor is a plenum, close cutouts for conduit and similar penetrations using self-extinguishing sponge rubber or air sealing grommets.]

3.1.6 Carpet Tile

Reference carpet tile paragraph in FLOOR COVERING for carpet tile installation requirements.

3.1.7 Resilient Base

Provide base at vertical wall intersections as indicated in the [drawings][_____.] Apply the base after the floor system has been completely installed. Install wall base in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions. Tighten base joints and make even with adjacent flooring. Fill voids along the top edge of base at masonry walls with caulk. Roll entire vertical surface of base with hand roller, and press toe of base with a straight piece of wood to ensure proper alignment. Avoid excess adhesive in corners.

3.1.8 Fascia Plates

Cover exposed floor ends and exposed openings of ramps and stairs with [aluminum] [steel closures] [finish material as indicated on the drawings].

3.1.9 Repair of Zinc Coating

Repair zinc coating that has been damaged, and cut edges of zinc-coated components and accessories, by the application of a galvanizing repair paint conforming to ASTM A780/A780M. Areas to be repaired must be thoroughly cleaned prior to application of the paint.

3.2 FIELD TESTS

Submit certified copies of test reports from an approved testing laboratory, attesting that the proposed floor system components meet the performance requirements specified.

3.2.1 Acceptance Tests

Conduct acceptance tests after installation of floor system. Make at least one test for each [40] [100] [_____] square meters [400] [1000] [_____] square feet of floor area. Conduct tests in presence of Contracting Officer and representatives of manufacturer and installer. Submit certified copies of test reports from an approved testing laboratory, attesting that the proposed floor system components meet the performance requirements.
3.2.2 Air Leakage

**************************************************************************
NOTE: Delete the requirements for air leakage when the space under the
finished floor is not used as an air plenum. Concrete floors to be used as air
plenums must be sealed and coated. Coordinate with Mechanical Engineer
for anticipated positive pressure in the plenum.
**************************************************************************

When the space below the finished floor is an air plenum, air leakage
through the joints between panels and around the perimeter of the floor
system must not exceed 0.15 L/s of air per linear meter 0.1 cubic foot of
air per minute per linear foot of joint subjected to 2.5 mm [.05 inches h2o
(Pa)][0.1 inches h2o (Pa)], water gauge, positive pressure in the plenum,
when tested in accordance with CISCA Access Floors, Section 10 Air Leakage
Test. Measure the leakage rate on the finished raised floor system, which
may include carpet.

3.2.3 Grounding

**************************************************************************
NOTE: Access flooring system must be grounded for safety hazard and static
control. The three most common static control requirements are:

1. Computer rooms, electronic offices, data centers and control rooms. The access floor system should
provide resistance from floor wearing surface to building grounding electrode within range of 0.5 to
20,000 megohms.

2. Clean rooms, laboratories, and other environments which are more sensitive to static discharge. The access floor system should provide resistance within range of 0.2 to 2.0 megohms.

3. Hospitals and other facilities described by NFPA 99 and referenced to UL 779. The access floor system should provide resistance within range of 0.025 to 1.0 megohms.

These limits may be changed if other values are required by the Using Agency. Design the grounded floor system to provide positive contact between all metal components. Grounding details must be shown on the project drawings; the option of using manufacturer’s alternate methods of grounding may be included in the project specification.
**************************************************************************

Ground the access flooring system for safety hazard and static suppression. Provide positive contact between components for safe, continuous electrical grounding of entire floor system. Total system resistance from wearing surface of floor to building grounding electrode must be within range of [0.5 to 20,000 megohms] [0.2 to 2.0 megohms] [0.025
3.2.3.1 Metal Grilles

Exposed metal is not allowed at wearing surface of access floor system, except at metal grilles and registers. When grilles and metal registers are provided, insulate as required to provide same grounding resistance as wearing surface.

3.2.3.2 Joint Resistance

**************************************************************************
NOTE: Coordinate with electrical drawings and specifications to assure that connection to building grounding electrode is shown. Do not use sound deadening materials which prevent grounding of system. Select a total system resistance to comply with user requirements.
**************************************************************************

Electrical joint resistance between individual stringer and pedestal junctions must be less than 0.1 milliohms. Electrical resistance between stringers and floor panels, as mounted in normal use, must be less than 3 ohms when tested in accordance with ASTM F150.

3.2.4 Electrical Resistance

Conduct testing of electrical resistance, in the completed installation, in the presence of the Contracting Officer in accordance with NFPA 99, modified by placing one electrode on the center of the panel surface and connecting the other electrode to the metal flooring support. Take measurements at five or more locations. Each measurement must be the average of five readings of 15 seconds duration at each location. During the tests, relative humidity must be 45 to 55 percent and temperature set at 21 to 24 degrees C (69 to 75 degrees F). Select panels used in the testing at random and include two panels most distant from the ground connection. Measure electrical resistance with instruments that are accurate within 2 percent and that have been calibrated within 60 days prior to the performance of the resistance tests. The metal-to-metal resistance from panel to supporting pedestal must not exceed 10 ohms. The resistance between the wearing surface of the floor covering and the ground connection, as measured on the completed installation, must be in accordance with paragraph FLOOR COVERING.

3.2.5 SEISMIC SPECIAL INSPECTION AND TESTING

**************************************************************************
NOTE: Include this paragraph only when special inspection and testing for seismic-resisting systems is required by Appendix 11A of ASCE 7-16.
**************************************************************************

This paragraph will be applicable to both new buildings designed according to UFC 3-301-01 SEISMIC DESIGN FOR BUILDINGS, and to existing building seismic rehabilitation designs.

The designer must indicate on the drawings all locations and all features for which special inspection and testing is required in accordance
with UFC 3-301-01 and Appendix 11A of ASCE 7-16. This includes indicating the locations of all structural components and connections requiring inspection.

Add any additional requirements as necessary.

Perform special inspections and testing for seismic-resisting systems and components in accordance with UFC 3-301-01 and Section 01 45 35 SPECIAL INSPECTIONS.

3.3 CLEANING AND PROTECTION

3.3.1 Cleaning

Keep the space below the completed floor free of all debris. Before any traffic or other work on the completed raised floor is started, clean the completed floor in accordance with the floor covering manufacturer's instructions.[ Do not permit seepage of cleaner between individual panels.][ Cleaning of ferrous surfaces must conform to FS TT-C-490.]

3.3.2 Protection

Protect traffic areas of raised floor systems with a covering of building paper, fiberboard, or other suitable material to prevent damage to the surface. Cover cutouts with material of sufficient strength to support the loads to be encountered. Place plywood or similar material on the floor to serve as runways for installation of heavy equipment not in excess of design load capacity. Maintain protection until the raised floor system is accepted.

3.3.3 Surplus Material Removal

Clean surfaces of the work, and adjacent surfaces soiled as a result of the work. Remove all installation equipment, surplus materials, and rubbish from the work site.

3.4 FIRE SAFETY

Install an automatic detection system below the raised floor meeting the requirements of NFPA 75 paragraph 5-2.1 to sound an audible and visual alarm. Air space below the raised floor must be subdivided into areas not exceeding 929 square meters 10,000 square feet by tight, noncombustible bulkheads. Seal all penetrations for piping and cables to maintain bulkhead properties.

3.5 OPERATION AND MAINTENANCE MANUALS

Submit maintenance instructions for proper care of the floor panel surface. When conductive flooring is specified, also submit maintenance instructions to identify special cleaning and maintenance requirements to maintain "conductivity" properties of the panel finish.

NOTE: This Guide Specification covers the requirements for stringerless access flooring.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in the respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR)

PART 1   GENERAL

NOTE: This specification does not include the floor upon which the elevated floor is superimposed, except to define the nature and condition of the supporting floor.

Access flooring systems include floor panels, pedestals and items such as steps, ramps, closures
Access flooring systems must be designed to accommodate static, rolling and impact loading.

None of the mechanical and electrical services essential to the operation of equipment are included. Coordinate with mechanical and electrical to provide ventilation and cable openings which will be required.

The designer is responsible for identifying and defining requirements for the floors. Drawings must indicate location and limits of the flooring systems, finish floor elevation, panel size, type, finish and anti-static provisions, colors, pedestal mounting and subfloor connection system details.

RIGID GRID ACCESS FLOORING is covered in SECTION 09 69 13.

Stair and/or ramp information, such as tread width and riser height for stairs and width, slope and length of ramps, including railings, are included in this section.

Ancillary components such as floor diffusers and grills, fascias and floor opening trims are also included.

Seismic loadings and any other information required to indicate the extent of work must be considered in designing access flooring systems.

There are three fundamental conditions relative to the design of access flooring installations:

Condition I - Floors are completely surrounded by building walls. These are the most resistant to seismic loadings.

Condition II - Floors have part of the edge exposed and not restrained by other structural elements. Condition II floors are less resistive to seismic loadings along the axis of the unconstrained side. Seismic loadings can be resisted by securing the perimeter panels of all floors to the supporting structural framing and fitting the panels tightly together, or by cross bracing the structural frame to resist overturning. The designer must select fascia type and finish for exposed edges.

Condition III - Floors are free standing without lateral contact with other structural elements. Type III floors are primarily strengthened with cross bracing to resist lateral loads.

Buildings not excluded by UFC 3-301-01 or TI 800-01 Design Criteria will be accessible in accordance with 36 CFR, Part 1191, Americans with Disabilities Act (ADA–ABA) Accessibility Guidelines for Buildings.
On the drawings, show:

1. Extent and shape of access flooring area. Include details of panel-to-panel and panel-to-wall intersections, edge treatment at openings, expansion joints, elevation(s) above structural floor, and other special features of the elevated floor system.

2. Location and design of ramps, steps, and doors to access floor area; railing heights and design.

3. Location and sizes of registers, grilles, perforated panels, and cable openings through access floor panels.

4. Design and type of plenum fire extinguishing systems, if space under access floor is to be used as air plenum.

5. Layout of plenum dividers.

6. Pattern of access floor panels.

7. Location of building electrode. Coordinate structural grounding connections with appropriate building and electrical systems.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.3 SPARE PARTS

**************************************************************************
NOTE: To assure matching floor panel, which may become damaged and require replacement, supply of extra stock is recommended. Set amount based on conditions of specific project. Do not specify extra stock unless user activity concurs; warehousing may not be available.
**************************************************************************

[Furnish spare floor panels for each finish including bare panels for carpet tile, complete pedestal assemblies at the rate of one for each 100 or fraction thereof required.][ Provide [four] [_____] floor panels complete with specified floor covering for future use.][ Provide four spare panels with identical floor covering and pedestals for each 100 square meters 1,000 square feet of access flooring and total of 3 linear meters 10 linear feet of cut-out trim. Store extra stock in same manner and location as project materials.][ Provide extra carpet tile from same dye lot consisting of uncut tiles for future maintenance. Provide a minimum of [three][_____] percent of total square meters square yards of each carpet type, pattern, and color. Furnish [[five][____] percent extra of total adhesive tabs][[one][____] percent extra of total components] required for installing carpet tile.]

1.4 QUALITY CONTROL

1.4.1 Qualification of Manufacturer

**************************************************************************
NOTE: Specify 5 years manufacturer experience unless directed otherwise by the Government
**************************************************************************

Access flooring manufacturer must have at least 5 years experience in manufacturing access flooring systems. Certify that the manufacturer of the access flooring system meets requirements specified under paragraph entitled QUALIFICATION OF MANUFACTURER.
1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 Delivery

Deliver materials to site in undamaged condition, in original containers or packages, complete with accessories and instructions. Label packages with manufacturer's name and brand designations. Package materials covered by specific references bearing specification number, type and class as applicable.

1.5.2 Storage

Store all materials in original protective packaging in a safe, dry, and clean location. Store panels at temperatures between 4 and 32 degrees C 40 and 90 degrees F, and between 20 and 70 percent humidity. Replace defective or damaged materials.

1.5.3 Handling

Handle and protect materials in a manner to prevent damage during the entire construction period.

1.6 WARRANTY

**************************************************************************

NOTE: Manufacturers standard warranty is for one year. For government projects, at an additional cost, manufacturers will provide an extended warranty of 5 or more years.

**************************************************************************

Minimum manufacturer warranty must have no dollar limit, cover full system, and must have a minimum duration of [1] [5] [_____] years. Include an agreement to repair or replace floor panels or pedestals that fail within the warranty period in the standard performance guarantee or warranty. Failures include, but are not limited to, sagging and warping of panels; rusting and manufacturers defects of panels or support system.[ For [high pressure laminate][conductive high pressure laminate][solid vinyl tile][luxury vinyl tile] provide manufacturer's standard performance guarantees or warranties that extend beyond a one-year period for finish materials.][ For [conductive][static-dissipative] vinyl tile provide manufacturer's standard performance guarantees or warranties that extend beyond one year, standard warranty must not be less than a five year wear warranty and ten year conductivity warranty.][ For carpet tile provide manufacturer's standard performance guarantees or warranties including a minimum two years for material and workmanship and ten years for wear, static control, tuft bind and delamination.

PART 2 PRODUCTS
2.1 SYSTEM DESCRIPTION

**************************************************************************

NOTE: Access flooring support systems are available as either a stringer or stringerless system. Refer to Section 09 69 13 RIGID GRID ACCESS FLOORING for applications using stringers.

A stringer is a horizontal framing member that connects the pedestal head, supports the panel edges
and adds lateral stability to the floor system. Stringers should be used on all systems with a height that exceeds 300 mm 12 inches.

Specify the stringer system in seismic zones or when the total area is over 278 square meters 3000 square feet unless the system provides bolted connection between the panel and pedestal. Coordinate with applicable codes and Structural Engineer.

For Air Force facilities, use stringer type floor systems for data processing facilities.

Consideration should be given to loads which will be imposed during operation. Some equipment, such as high speed printers require large quantities of paper to be delivered by carts. When in motion, these heavy loads may exceed capacity of floor system. Check with user activity and floor system manufacturer when heavy rolling loads are expected. Insure that project specific floor loading requirements are fully coordinated with Structural Engineer and applicable codes.

Zinc whiskers can occur on the underside of raised floor systems which are treated with a zinc electroplated anti-corrosion coating. Zinc whiskers are small enough (2 microns in diameter up to several millimeters in length) to render normal dust filters on computer equipment ineffective. The result is possible electrical shorts and damage to circuitry and equipment. Zinc electroplated anti-corrosion coated components must be prohibited in office areas and data centers when the access flooring system is utilized as an air plenum.

**************************************************************************

a.  Provide for self-alignment of floor panels, adjustable pedestals and readily removable floor panels covered as specified.

b.  Make lateral stability of floor support system integral with panels. Finished assembly must be stable and free of vibration, noises, and rocking panels. [Provide stringerless system with equipotential plane grounding.]

c.  Submit certificate of compliance attesting that the installed access floor system meets specification requirements, including all special equipment loads and specific electrical and or cable requirements for the complete access flooring system including, but not limited to the following:

   (1) Compliance with ICC-ES AC300 and Compliance with ICC IBC Acceptance Criteria for Access Floors.

   (2) Load-bearing capabilities of pedestals, floor panels, and pedestal adhesive resisting force.

   (3) Supporting independent laboratory test reports. For panel panel, stringer and pedestal load test results include concentrated loads
(4) Floor electrical characteristics.

(5) Material requirements.

(6) An elevated floor system free of defects in materials, fabrication, finish, and installation, that will remain so for a period of not less than [_____] [1] years after completion.

d. Submit manufacturer's product data for access flooring system consisting of descriptive data, catalog cuts, and installation instructions. Include in the data information about any design and production techniques, total system including all accessories and finish coatings of under-floor components, procedures and policies used to conserve energy, reduce material, improve waste management or incorporate green building/recycled products into the manufacturer of their components or products. Include cleaning and maintenance instructions. Systems which contain zinc electroplated anti-corrosion coatings are prohibited.

2.1.1 Design Requirements

**************************************************************************
NOTE: Insert heavier load as required by facility use conditions. The deflection and permanent deformation limits are for panels 610 by 610 mm (24 by 24 inches, and smaller.

Check manufacturer's literature for maximum loadings available. Generally, by ICC IBC, computer rooms are based on live load of 12 kPa 100 psf and point load of 900 kg 2000 lbs. Server rooms may require greater floor loading. Coordinate design loads for access floor with project specific floor loading requirements, structural engineer and design of structural slab.

Project design loads will be in accordance with the International Building Code and UFC 1-200-01.

For most office spaces, underfloor systems rated at 6.9 to 8.6 MPa 1000 to 1250 PSI concentrated load are adequate. For heavier traffic loads at loading docks, elevator entrances, and corridors underfloor systems rated at 10.3 MPa 1500 PSI are appropriate. Underfloor systems rated at 17.2 MPa 2500 PSI are available for heavy equipment.

When editing below paragraphs a., b., c., d. and f. insure that each paragraph is matched up with it's matching option. Options in each paragraph are in matching sequential order.
**************************************************************************

Conduct floor panel testing in accordance with CISCA Access Floors. When tested as specified, make all deflection and deformation measurements at the point of load application on the top surface of the panel. Floor
panels must be capable of supporting the following loads:

a. **Concentrated load** of \([4450] \ [5560] \ [6670] \ [8900] \ [11120] \ [_____] \text{N}
   [1000] \ [1250] \ [1500] \ [2000] \ [2500] \ [_____] \text{pounds on 645 square mm one square inch}, at any point on panel, without a top-surface deflection more than 2.54 mm 0.10 inch, and a permanent set not to exceed 0.25 mm 0.01 inch in any of the specified tests. Testing must be in accordance with **CISCA Access Floors**, Section 1 Concentrated Loads with test panels being supported by understructure to be used with installed system instead of steel support blocks.

b. **Uniform live load** of \([11.97] \ [14.36] \ [16.76] \ [19.15] \ [23.94] \ [_____] \text{kPa/square meter} \ [250] \ [300] \ [350] \ [400] \ [500] \ [_____] \text{psf}, without a top-surface deflection more than 1.5 mm 0.06 inch, and a permanent set not to exceed 0.25 mm 0.01 inch in any of the specified tests, when tested in accordance with **CISCA Access Floors**, Section 7 Uniform Load Test with test panels being supported by understructure to be used with installed system instead of steel support blocks.

c. **A rolling load** of \([2670] \ [3560] \ [4450] \ [5340] \ [7110] \ [_____] \text{N} \ [600] \ [800] \ [1000] \ [1200] \ [1600] \ [_____] \text{pounds applied through hard rubber surfaced wheel 152 mm 6 inch diameter by 51 mm 2 inch wide for 10,000 cycles over the same path. Permanent set at conclusion of test must not exceed 1.0 mm 0.040 inch} when tested in accordance with **CISCA Access Floors**, Section 3 Rolling Loads.

d. **A rolling load** of \([3560] \ [4450] \ [5560] \ [6670] \ [8890] \ [_____] \text{N} \ [800] \ [1000] \ [1250] \ [1500] \ [2000] \ [_____] \text{pounds applied through a 75 mm 3 inch diameter by 30 mm 1-13/16 inch wide caster for 10 cycles over the same path, without developing a local overall surface deformation greater than 1 mm 0.04 inch. In accordance with **CISCA Access Floors**, Section 3 Rolling Loads, the permanent deformation limit under rolling load must be satisfied in all of the specified tests.}

e. **An impact load** of \([670] \ [150] \text{pounds anywhere on the panel dropped from a height of 914 mm 36 inches onto a 645 square mm 1 square inch area without failure of the system, according to **CISCA Access Floors**, Section 8 Drop Impact Load Test.}

f. **Ultimate Load**. Panels must meet manufactures published Ultimate Load rating of \([6230] \ [8010] \ [11120] \ [12450] \ [13790] \ [_____] \text{N} \ [1400] \ [1800] \ [2500] \ [2800] \ [3100] \ [_____] \text{pounds when tested in accordance with **CISCA Access Floors**, Section 2 Ultimate Loading.}

g. **Safety Factor**. Panels must provide a minimum Safety Factor of 5 times the uniform load specified above in accordance with **ICC-ES AC300**.

h. **Recycled Content**. Provide Access Flooring System (panels, stringers and pedestals) containing a minimum of \([20] \ [_____] \text{percent recycled content. Provide data identifying percentage of recycled content for access flooring system.}

2.1.2 Allowable Tolerances

2.1.2.1 Floor Panel Flatness

Plus or minus 0.89 mm 0.035 inches on diagonal on top of panel or underneath edge.
2.1.2.2 Floor Panel Length

Plus or minus 0.4 mm 0.015 inch.

2.1.2.3 Floor Panel Squareness

Plus or minus 0.5 mm 0.02 inch in panel length.

2.1.3 Pedestals

**************************************************************************

NOTE: Pedestals consist of a base plate, post and an adjustable head, and are available in heights from 150 mm 6 inches to 2400 mm 96 inches. Pedestals 610 mm 24 inches high or higher must be securely anchored to the structural floor in addition to being held in place by adhesive.

Pedestals are normally held in place with an adhesive and must be in full contact with the subfloor surface. Pedestal 610 mm 24 inches high or higher will be securely anchored to the structural floor in addition to the adhesive.

For Air Force projects, the minimum pedestal height is 300 mm 12 inches.

**************************************************************************

Pedestals must be capable of supporting a 22.24 kN 5000 pound axial load without permanent deformation, when tested in accordance with CISCA Access Floors, Section 5 Pedestal Axial Load Test.

2.1.4 Bonding Strength of Pedestal Adhesive

**************************************************************************

NOTE: Use 113 Nm 1,000 lbf-in for raised floors with a maximum height of 610 mm 24 inches and 226 Nm 2,000 lbf-in for raised floor heights greater than 610 mm 24 inches up to 1219 mm 48 inches maximum. Raised floor heights greater than 1219 mm 48 inches require specific structurally designed bracing.

**************************************************************************

Adhesive for anchoring pedestal bases must have a bonding strength capable of resisting an overturning moment of [113 Nm 1,000 lbf-in] [226 Nm 2,000 lbf-in] [_____] when a force is applied to the top of the pedestal in any direction, when tested in accordance with CISCA Access Floors, Section 6 Pedestal Overturning Moment Test. Pedestal adhesive must meet emissions requirement of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type). Provide validation of indoor air quality for pedestal adhesive.

2.1.5 Bond Strength of Factory Installed Covering

**************************************************************************

NOTE: Coordinate test load weights with those specified for floor panel testing in General System
Requirements.
**************************************************************************
Bond strength of floor covering must be sufficient to permit handling of the panels by use of the panel lifting device, and to withstand moving caster loads up to [3560] [4450] [5560] [6670] [8890] [_____] N [800] [1000] [1250] [1500] [2000] [_____] pounds, without separation of the covering from the panel.

2.1.6 Seismic Calculations

2.1.6.1 Navy Project Specific Requirements
**************************************************************************
NOTE: For Navy projects, provide lateral bracing calculations on all installations. Level 1 Contracting Officer’s approval was granted for calculations by a registered professional engineer. Occupancy importance factor (I) and seismic zone factor (z) should be deleted in accordance with UFC 1-200-01.

Provide seismic requirements, if a Government designer (Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the second bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT must be included in the contract documents.
**************************************************************************
Submit seismic calculations for lateral bracing, sealed by a Professional Engineer. Document that access flooring system complies with seismic requirements of ICC IBC and ASCE 7-16 for Occupancy Importance Factor (Ip) of [1.0] [1.5], and seismic horizontal force (Fp) determined in accordance with UFC 3-301-01 and Section 1615 of the ICC IBC and ASCE 7-16, Minimum Design Loads for buildings and other structures.

2.1.6.2 Army Project Specific Requirements
**************************************************************************
NOTE: Provide seismic requirements, if a Government designer (Corps office or A/E) is the Engineer of Record, and show on the drawings. Delete the second bracketed phrase if seismic details are not provided. Pertinent portions of UFC 3-301-01 and Section 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT must be included in the contract documents.
**************************************************************************
Submit seismic calculations for special bracing to resist the effects of seismic or other forces [in accordance with UFC 3-301-01, ICC IBC and ASCE 7-16] [as shown on the approved detailed installation drawings]. Submit design calculations which demonstrate that the proposed floor system meets requirements for seismic loading. Certified copies of test reports may be submitted in lieu of calculations.
2.2 FLOOR PANELS

2.2.1 Floor System Drawings And Planer Quality

a. Submit Fabrication Drawings for elevated floor systems consisting of fabrication and assembly details to be performed in the factory.

b. Indicate on Location Drawings exact location of pedestals, ventilation openings, cable cutouts, and the panel installation pattern.

c. Provide Detail Drawings showing details of the pedestals, pedestal-floor interlocks, floor panels, panel edging, floor openings, floor opening edging, floor registers, floor grilles, cable cutout treatment, perimeter base, expansion, and peripheral support facilities.

d. Design and workmanship of the floor, as installed, must be completely planar within plus or minus 1.5 mm in 3050 mm 0.060 inch in 10 feet, 2.5 mm 0.100 inch for the entire floor, and 0.7 mm 0.030 inch across panel joints.

e. Floor-panel joint-width tolerances must not exceed 0.43 mm 0.017 inch as measured with a feeler gage at any point in any joint when the panels are installed and as long as the air leakage requirements specified in this section are met.

f. Submit [three] complete samples of floor panels.

2.2.2 Detailed Installation Drawings

Submit Detailed Installation Drawings that as a minimum indicate the following:

a. Location of panels

b. Layout of supports, panels, and cutout locations

c. Stair, handrail, and ramp framing

d. Sizes and details of components

e. Details at floor perimeter and height above structural floor

f. Method of anchorage to structural subfloor

g. Lateral bracing

h. Typical cutout details

i. Gasketing, return air grilles, supply air registers, and perforated panels. Include air transfer capacity of grilles, registers and panels

j. Description of [shop] [factory] coating

k. Floor finishes

l. Location of connection to building grounding electrode
2.2.3 Panel Construction

**NOTE:** There are five basic floor panel types: aluminum, hollow formed steel, cementitious-filled formed steel, metal-clad wood core, and concrete. The most commonly used floor panel is the Cementitious-Filled Formed Steel (Composite Panels). Nonferrous materials should be used in areas where there is potential for damage by rust oxides or paint flakes.

Editing of a Non-Proprietary Specification: Note that there are two primary Buy America FAR compliant access flooring system suppliers to the North American market who respectively manufacture the Cementitious-Filled Formed Steel and Lightweight Concrete Filled Panels. Both panel types should be selected to insure non-proprietary specifications.

The standard panel size of 600 by 600 mm 24 by 24 inch will normally be used. Check with user activity and verify product availability before specifying nonstandard panels of 450, 750 and 900 mm 18, 30, and 36 inch where required to match existing floor systems or to satisfy special requirements.

Use 150 mm 6 inches as minimum practical height for access floor installation and 300 mm 12 inches minimum when there is a plenum. Include the five panel types as options except that wood core panels should not be specified for Air Force projects, SPAWARS projects, or other projects where data processing involves highly strategic data having direct bearing on National Defense effort. Check with user activity before specifying wood core panels. SPAWARS may be involved in Air Force and Army projects, verify and coordinate requirements with User.

a. Base access floor system on a 600 by 600 mm 24 by 24 inch square module providing minimum of [150] [300] [_____] mm [6] [12] [_____] inch clearance between structural floor and underside of panel. Fabricate so accurate job cutting and fitting may be done using standard sizes for perimeters and around columns.

b. Do not expose metal on finished top surface of panels. Provide cutouts and cutout closures to accommodate utility systems and equipment intercabling. Reinforce cutouts to meet design load requirements. Provide extra support pedestals at each corner of cutout for cutout panels that do not meet specified design load requirements.

c. Panel design must provide for convenient panel removal for underfloor servicing and for openings for new equipment. Use panels of uniform dimensions within specified tolerances. Permanently mark panels to indicate load rating and model number.

d. Machine square floor panels to within plus or minus 0.38 mm 0.015 inch.
with edge straightness plus or minus 0.064 mm 0.0025 inch. If plastic edging is applied to the panel, the tolerances apply to the panel before the plastic edging is applied.

**************************************************************************
NOTE: For security or additional structural stability of the access flooring system, panels can be bolted to pedestals. However this will cause additional maintenance concerns and will need to be coordinated with the desired floor covering.
**************************************************************************

[ e. Provide panels with holes drilled in corners to align precisely with threaded holes in pedestal heads and to accept countersunk corrosion resistant screws with heads that are flush with top of panel.]

[2.2.3.1 Aluminum

**************************************************************************
NOTE: Die-cast aluminum panels are lightweight, have very little variation in dimension from panel to panel, and are acceptable in environments where nonferrous materials are required (e.g., Magnetic Resonance Imagery rooms), but they tend to be more expensive than other types of panels.

Die-cast aluminum panels are normally used as a stringerless system.
**************************************************************************

Provide aluminum panels of die-cast or extruded construction conforming to ASTM B85/B85M.

][2.2.3.2 Hollow Formed Steel

**************************************************************************
NOTE: Die-formed hollow steel panels perform best under static loads and should not be used under dynamic (rolling) loads. These panels are more economical than other types of panels and can be provided by most flooring system manufacturers.
**************************************************************************

Steel panels must be of die-formed construction, consisting of a flat steel top sheet welded to one or more formed steel stiffener sheets or components. Panels must be chemically cleaned, bonderized, and painted with the manufacturer's standard finish.

][2.2.3.3 Cementitious-Filled Formed Steel (Composite Panels)

**************************************************************************
NOTE: Cementitious core filled panels are enclosed in steel sheeting and are designed to provide improved resistance to rolling and impact loads. Specific strength and load requirements should be specified wherever it is a critical concern. These panels are quiet due to their mass.

There is some concern that the fill material may
deteriorate when subjected to repeated loading cycles, and the cut edges could introduce dust into the underfloor space. Where the underfloor space will be a plenum, or where dust-sensitive computer equipment is to be installed, verify that the composite panel is acceptable to the Using Agency.

Current Air Force criteria does not permit the use of composite panel.

Provide composite panels of die-formed steel construction totally enclosing the panel, including the top surface. The void spaces between the top sheet and the formed steel bottom sheet must be completely filled with an incombustible cementitious or concrete material. Seal cut edges in accordance with manufacturer's recommendations.

][2.2.3.4 Metal-Clad Wood Core

NOTE: Wood core panels consist of a core of particleboard with an overlapping skin of galvanized steel. The wood core is a good sound deadener and insulator and increases resistance to rolling loads. Wood core panels are the most economical option.

Although the core material is combustible, the composite panel with bonded steel for face sheets when tested in accordance with the NFPA 225, revealed the composite panel to be noncombustible with a flame spread index of 0, a smoke developed index of 10, and to have a Class A fire rating.

Wood core panels can be easily cut and trimmed; however, doing so causes loss of fire retardancy and UL rating. The edges of wood core panels must be protected from moisture in order to prevent warping.

Provide wood core panels with cores of wood particleboard conforming to CPA A208.1, Grade 1-M-3, or of plywood conforming to CPA A208.2, APA E30, and APA L870, EXT-DFPA-C-C. The core must be not less than 25 mm 1 inch thick, and be faced on all sides with structurally bonded zinc-coated steel sheets not lighter than 0.70 mm 24 gauge. All edges and corners must be sealed with zinc-coated steel or extruded aluminum. The completed panels must have a flame spread rating of 25 or less when tested in accordance with ASTM E84. Provide zinc-coated steel, extruded aluminum, fire resistant vinyl, or other fire resistant edging to protect shop and field edge cuts and cutouts through the face of panels in a manner to meet specified flame spread, smoke developed and Class A fire rating requirements.

][2.2.3.5 Lightweight Concrete Filled Panels (Exposed Concrete)

NOTE: Lightweight concrete filled panels are either solid or metal clad. They perform well under dynamic loadings with little deformation and their
weight is approximately $195 \, \text{kg/m}^2$ or 10 psf. They are primarily used in office flooring and are similar in cost to cementitious fill panels.

Provide lightweight concrete of lightweight structural concrete with either structural reinforcing or a die-formed, hot dipped galvanized steel bottom pan. All concrete surfaces, including those resulting from field cuts, must be sealed with the manufacturer's standard sealer before covering the surfaces with other materials. Concrete sealer must meet either emissions requirements of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type) or VOC content requirements of SCAQMD Rule 1113. Provide validation of indoor air quality for concrete sealer.

### 2.2.4 Floor Covering

**NOTE:** Verify with User and manufacturers which finishes are recommended for what type of functional space, type of panel and understructure. Delete finish paragraphs that are not applicable to the project.

Clearly indicate in contract documents where different floor covering types are located if more than one type is specified for a project.

Verify that finishes being considered are approved for use by the access flooring manufacturer. Some finishes may be considered standard by some manufacturers and non-standard by others which could add cost to the project. The finishes need to be of a size that is appropriate for a one-to-one installation to the floor panel with no seams, size needs to be slightly smaller than a standard 610 mm (24 inch) by 610 mm (24 inch). Coordinate size with access flooring manufacturer. Note that not all manufacturer floor tile products are available in the required size and may require additional cuts, this may add cost to the project and add product waste.

Consider the desired aesthetics, appearance and use of a facility and the following edge detail information to determine the type of floor covering edge detail preferred for a project:

a. Cementitious Filled Formed Steel (Composite) and Lightweight Concrete Filled (Exposed Concrete) Panels with factory applied high pressure laminate or resilient flooring material - The integral finish edge detail is available from more manufacturers than the applied trim piece edge detail. If the applied trim piece detail is acceptable for a project, recommend that both types remain in the specification to open it up to more manufacturers so the specification does not become proprietary with only the applied trim piece. The integral finish detail is more durable than the applied trim piece.
which can become damaged.

b. Metal-Clad Wood Core Panels with factory applied high pressure laminate material—Edge detail is available both integral to the finish material and as an applied trim piece dependent upon the manufacturer. Recommend that both types remain in the specification to open it up to more manufacturers so the specification does not become proprietary.

c. Metal-Clad Wood Core Panels with factory applied resilient flooring material—Edge detail with applied trim piece is more typical.

d. Steel and Aluminum Panels—Edge detail is available both integral to the finish material and as an applied trim piece dependant upon the manufacturer. Recommend that both types remain in the specification to open it up to more manufacturers so the specification does not become proprietary.

Verify that finish being considered is appropriate for the system specified when raised access floor panels are required to be screwed into place. Panels that are screwed into place and have a factory finish that is bonded into place will have an exposed screwhead in each corner. The screwhead for resilient floor materials will be flush with panel face and not finish face and may require additional maintenance to clean out screwhead locations. If it is determined that a panel with factory applied finish will be screwed into place verify with User if a requirement for finish plugs be added to the specification to provide a more finished appearance and coordinate availability with the manufacturer. These plugs would be the same material as the panel finish and would be installed to cover the exposed screwhead. Plugs are not permanent, can come out and become lost. Plug should be installed per manufacturer recommendations for easy removal and replacement for User to access underfloor area.

Choice of critical radiant flux level as it applies to building type and area of application will be made in accordance with UFC 3-600-01, UFC 1-200-01 and NFPA 101. Wherever the use of Class II (0.22) watts finish is required, Class I (0.45) watts will be permitted.

Aluminum panels often do not receive an applied finish. If it is determined a finish is required, add edge detail requirement to applicable finish paragraph inside empty brackets.

Verify with manufacturer if embossed texture being specified is acceptable for use with the lifting device.

**************************************************************************
Surface floor panels with [factory applied finish materials firmly bonded in place with waterproof adhesive][carpet tile installed in the field]. Provide finish flooring materials in corridors and exits with a critical radiant flux of not less than [0.45 watts per square centimeter (Class 1)] [0.22 watts per square centimeter (Class 2)] when tested in accordance with ASTM E648 or NFPA 253. The electrical resistance must remain stable over the life expectancy of the floor covering. Any anti-static agent used in the manufacturing process must be an integral part of the material, not surface applied. Bolt heads or similar attachments must not rise above the traffic surface. Submit [three] [_____] separate samples of each specified floor covering finish and color.

[2.2.4.1 High Pressure Laminate]

**************************************************************************
NOTE: HDM, 2 mm 1/16 inch thick high pressure laminate is typically used. HDH, 3.2 mm 1/8 inch thickness is also available, but is more expensive than the HDM.
**************************************************************************

Provide factory applied high pressure laminate surfacing conforming to ANSI/NEMA LD 3, High-Wear type, Grade [HDM, 2 mm 1/16 inch thickness][____]. Finish material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][____]]. The total system electrical resistance from the wearing surface of the floor to the ground connection must be between 1,000,000 (1.0 x 10^6) ohms and 20,000,000,000 ohms (2.0 x 10^{10}).

[2.2.4.2 Conductive High Pressure Laminate]

**************************************************************************
NOTE: HDM, 2 mm 1/16 inch thick conductive high pressure laminate is typically used. HDH, 3.2 mm 1/8 inch thickness is also available, but is more expensive than the HDM.
**************************************************************************

Provide factory applied high pressure laminate surfacing conforming to ANSI/NEMA LD 3, High-Wear type, Grade [HDM, 2 mm 1/16 inch thickness][____]. Finish material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][____]]. The total system electrical resistance from the wearing surface of the floor to the ground connection must be between 25,000 ohms (2.5 x 10^4) and 1,000,000 ohms (1.0 x 10^6).

[2.2.4.3 Solid Vinyl Tile]

Provide factory applied conductive vinyl tile that is a homogeneous vinyl product and conforms to ASTM F1700, Class I monolithic (minimum wear layer thickness 3 mm 0.125 inch and minimum overall thickness 3 mm 0.125 inch), Type A smooth surface. Finish material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish
material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][______]].

][2.2.4.4 Luxury Vinyl Tile

Provide factory applied luxury vinyl tile conforming to Class III printed film minimum wear layer thickness of 0.50 mm 0.020 inch and minimum overall thickness 3 mm 0.125 inch, Type [A (smooth)] [B (embossed)]. Finish material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][______]].

][2.2.4.5 Conductive Vinyl Tile

Provide factory applied conductive vinyl tile that is a homogeneous vinyl product and conforms to ASTM F1700, Class I monolithic, Type A smooth surface. Provide electrical resistance from surface to surface and surface to ground between 25,000 ohms (2.5 x 10^4) and 1,000,000 ohms (1.0 x 10^6) when tested in accordance with ASTM F150. Material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][______]].

][2.2.4.6 Static-Dissipative Vinyl Tile

Provide factory applied static-dissipative vinyl tile that is a homogeneous vinyl product and conforms to ASTM F1700, Class I monolithic, Type A smooth surface. Provide electrical resistance from surface to surface and surface to ground between 1,000,000 ohms (1.0 x 10^6) and 1,000,000,000 ohms (1.0 x 10^9) when tested in accordance with ASTM F150. Material must consist of one piece to cover the face of the panel. Provide edge detail that is [integral to the finish material][ or ][is an applied trim piece that finishes the edges of the panel, is flush with floor finish, and is [PVC][ or ][ABS][______]].

][2.2.4.7 Carpet Tile

**************************************************************************
NOTE: Consider the function of the room, User requirements and consult with the project electrical engineer when determining the type of carpet that is appropriate, 09 68 00 CARPETING or 09 62 38 STATIC-CONTROL FLOORING (for static-control carpet tile).

Be aware that full spread releasable if not installed in accordance with manufacturer required drying time can become overly tacky making it difficult to remove from screwheads and between panels and to lift carpet tile from panel.

Coordinate carpet tile selection for one to one alignment with floor panels with the access flooring manufacturers. Due to the size required (slightly smaller than 610 by 610 mm 24 inch by 24 inch) the access flooring manufacturers have a variety of standard carpets available from different carpet
manufacturers.

Recommend listing at least two manufacturers for one to one alignment so specification does not become proprietary.

Installation method for one to one alignment with floor panels is limited to monolithic and quarter turn installation patterns.

Do not use the odor-free adhesive tab system or full spread releasable adhesive to achieve a one to one alignment with floor panels. This is not recommended by manufacturers.

Reference Section [09 68 00 CARPETING][ and ][09 62 38 STATIC-CONTROL FLOORING (static-control carpet tile)] for carpet tile specification requirements including recycled content, volatile organic compound (VOC) limits and additional flammability testing requirements for carpet tile. Carpet tile must be field installed and comply with the following:

a. Installation method on level surfaces must allow carpet tile to be easily removed and replaced in the field and must be installed in accordance with manufacturer's recommended installation instructions.

b. Install carpet tile in a [monolithic][1/4 turn][ashlar][brick][random][____] pattern.

c. Install carpet tile on secure and level surfaces offset from the access floor grid with a [manufacturer approved odor-free adhesive tab system][ or ][with full spread releasable adhesive using manufacturer recommended adhesives. Comply with manufacturer installation instructions for required drying time so the adhesive sets up properly].

d. Install carpet tile on secure and level surfaces with the access flooring manufacturer's recommended installation method and components for a one to one alignment with floor panels (one carpet tile to one floor panel); equal to Tate PosiTite[, ____] or Haworth CarpetLok. This installation method requires the removal of only one carpet tile to access one raised access panel. Carpet tile size for a one-to-one installation must be slightly smaller than a standard 610 by 610 mm 24 inch by 24 inch tile, coordinate required size with the raised access flooring manufacturer. Factory applied carpet tile with perimeter edge strip and field applied one to one carpet tile installation over raised access floor panels with permanent or releasable adhesive are not acceptable installation methods.]

e. Carpet tile on access flooring stairs and sloped surfaces must be installed with a more permanent installation method in accordance with manufacturer's instructions and with manufacturer recommended adhesives for these types of locations.]

2.2.4.8 Lightweight Concrete Filled (Exposed Concrete)

NOTE: Bare panels may be specified to achieve a desired visual aesthetic. Finish panels with sealer
to prevent dusting and to minimize water absorption. User should be made aware that sealer will need to be reapplied over time.

Provide lightweight concrete filled panel with a [MPI 58 concrete stain][ and ]/[MPI 104 concrete floor sealer][ or ]/[MPI 99 water based concrete floor sealer]. Apply coatings in accordance with manufacturer's instructions.

2.2.5 Accessories

Provide the manufacturer's standard registers, grilles, perforated panels, and plenum dividers type where indicated. Provide registers, grilles, and perforated panels designed to support the same static loads as floor panels without structural failure, and capable of delivering the air volumes indicated. Registers and perforated panels must be 25 percent open area and equipped with adjustable dampers. Submit [three][_____] samples and colors of each accessory.

2.2.6 Resilient Base

Conform to ASTM F1861, [[Type TS (vulcanized thermoset rubber)] [or] [Type TP (thermoplastic rubber)] [or] [Type TV (thermoplastic vinyl)]], [Style A (straight - installed with carpet)] [and] [Style B (coved - installed with resilient flooring)]. Provide [100] [150] mm [4] [6] inch high and a minimum 3.175 mm 1/8 inch thick wall base. Provide [preformed] [job formed] corners in matching height, shape, and color.

2.2.7 Adhesives

Provide adhesives as recommended by the manufacturer. Provide non-aerosol adhesive products that meet either emissions requirements of CDPH SECTION 01350 (use the requirements for either office or classroom, regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide aerosol adhesives that meet either emissions requirements of CDPH SECTION 01350 (use the requirements for office or classroom, regardless of space type) or VOC content requirements of GS-36. Provide validation of indoor air quality for adhesives.[ Provide conductive adhesive as recommended by the manufacturer of the static-control flooring.][ Provide conductive releasable adhesive as recommended by the manufacturer for static-control carpet tile.]

2.2.8 Lifting Device

At turnover provide one floor panel lifting device standard with the floor manufacturer, for each individual floor area (room or corridor). Furnish a minimum of two devices.[ For AIR FORCE projects, at turnover, provide a total of two suction-type floor panel lifting devices for each floor area (room or corridor).]
2.3 PANEL SUPPORT SYSTEM

Design panel and pedestal support system to allow for 360 degree clearance in laying out cable and cutouts for service to machines. Submit one sample of suspension system proposed for use.

2.3.1 Pedestals

Provide pedestals made of steel or aluminum or a combination thereof. Ferrous materials must have a factory-applied corrosion-resistant finish. Provide pedestal base plates with a minimum of 10,300 square mm 16 square inches of bearing surface and a minimum of 3 mm 1/8 inch thickness. Pedestal shafts must be threaded to permit height adjustment within a range of approximately 50 mm 2 inches, to permit overall floor adjustment within plus or minus 2.5 mm 0.10 inch of the required elevation, and to permit leveling of the finished floor surface within 1.56 mm 0.062 inch in 3000 mm 10 feet in all directions. Provide locking devices to positively lock the final pedestal vertical adjustments in place. Pedestal caps must interlock with panels to preclude tilting or rocking of the panels.

2.3.2 Gaskets

**************************************************************************
NOTE: For stringerless systems, gasketing is not available for all panel types. Verify availability of gaskets for the panel types specified.
**************************************************************************

Provide continuous gasketing at contact surfaces between panel to deaden sound and seal off the underfloor cavity from above for air tightness, and to maintain panel alignment.

2.4 FASCIA

Provide aluminum or steel fascia plates at open ends of floor, at sides of ramps and steps, and elsewhere as required to enclose the free area under the raised floor. Steel plates must have a factory applied baked enamel finish. Finish on aluminum plates must be standard with the floor system manufacturer. Fascia plates must be reinforced on the back, and supported using the manufacturer's standard lateral bracing at maximum 1200 mm 4 feet on center. Provide trim, angles, and fasteners as required. Submit [three][_____] color samples for fascia.

2.5 STEPS AND RAMPS

**************************************************************************
NOTE: Coordinate step and ramp finish with finishes specified in FLOOR COVERINGS and insert selected finish. Resilient flooring is recommended if there will be a lot of cart traffic. Carpet tile should be installed with a permanent adhesive.
**************************************************************************

Securely fasten steps and ramps to the access flooring system and to the structural floor. Include in the construction standard floor system components and custom components as required, and all supports, fasteners, and trim necessary for a finished installation. Step nosings, threshold strips, and floor bevel strips must be cast or extruded aluminum with non-slip traffic surfaces. Submit [three][_____] color samples for exposed step and ramp structure.
2.5.1  Steps

Height of risers must comply with applicable codes. Design steps to support a uniform load of 7.18 kPa 150 psf. Surface treads with the manufacturer's standard non-slip floor finish. Floor covering must be [____].

2.5.2  Ramps

Slope of ramps must comply with applicable codes and 36 CFR 1191 Americans with Disabilities Act (ADA). Design ramps to support the same loads as specified for floor panels. Surface ramps with the manufacturer's standard non-slip floor finish. Floor covering must be [____].

2.6  RAILINGS

******************************************************************************
NOTE: Where open sides of floors are 1200 mm 4 feet or more adjacent ground or floor level, install "standard railing" in accordance with CFR 1910.23(e). Run post through raised floor and bolt to concrete floor for stability.
******************************************************************************

Provide railings compliant with applicable codes and 36 CFR 1191 Americans with Disabilities Act (ADA). As a minimum railings must be of the double rail and post type, fabricated of at least[ 25 mm 1 inch] [____] [round] [square] seamless [aluminum tubing] [____] with a [satin natural anodized] [_____] finish. At steps and ramps, make the top rail a minimum of 900 mm 36 inches high and parallel to the incline. Make the top rail 1050 mm 42 inches high at open ends of the floor. Guardrails must have intermediate rails or an ornamental pattern such that a sphere 100 m 4 inches in diameter cannot pass through. Space posts maximum of [1200] [1500] [1800] mm [4] [5] [6] feet oc. Provide railings complete with anchorages, floor plates, and end caps.[ Electronically ground hand rails to raised floor system to prevent static build-up.] Submit [three][_____] color samples for railings.

2.7  FACTORY TESTS

Factory test access flooring, using an independent laboratory, at the same position and maximum design elevation and in the same arrangement as shown on the drawings for installation so as to duplicate service conditions as much as possible.

2.7.1  Load Tests

Conduct floor panel and pedestal testing in accordance with CISCA Access Floors to determine deformation and permanent set of panels and sytem due to concentrated, Uniform, rolling, impact and ultimate loading when panels are supported by actual understructure.

2.7.2  Bond Strength of Covering

******************************************************************************
NOTE: Coordinate test load weights with those specified for floor panel testing in General System Requirements.
******************************************************************************
Delete this test when field applied carpet tile is specified.

Conduct test for bond strength of covering in accordance with CISCA Access Floors for rolling loads, except as specified. Panels must be tested with specified hard surface flooring and on the pedestals and stringers as specified for the installed floor. Brace the supports as necessary to prevent sideways movement during the test. Impose a test load of \([3560] [4450] [5560] [6670] [8890] \) N \([800] [1000] [1250] [1500] [2000] \) pounds on the test assembly through a 75 mm 3 inches in diameter and 25 mm 1 inch wide hard plastic caster. Roll the caster completely across the center of the panel. The panel must withstand 20 passes of the caster with no delamination or separation of the covering.

[2.8] REGISTERS AND GRILLES

NOTE: Size of registers should be stated if applicable. Coordinate with Mechanical Engineer.

Registers and grilles must be \([\_\_\_]\) mm inches by \([\_\_\_]\) mm inches long with a minimum free area of \([\_\_\_]\) square mm inches, made from extruded [aluminum] \([\_\_\_]\), in [mill] \([\_\_\_]\) finish, to sustain point loads of 1100 newton 250 pounds per vane without failure or permanent deformation. No part of a grille may project more than 3 mm 1/8 inch above the floor. Registers and grills are not permitted in a laminate floor tile system.

[2.9] PERFORATED AIR SUPPLY PANELS

Provide air supply floor panels that meet the design criteria specified for standard panels, are fabricated of 2 mm 14-gage perforated steel sheet welded to minimum 1.6 mm 16-gage side channels, are covered with high pressure laminate to match standard panels, and have a uniform perforated pattern to allow even air distribution.

[2.10] PERFORATED DIRECTIONAL AIR SUPPLY PANELS

Provide directional air supply floor panels that meet or exceed the design criteria specified for standard panels, are fabricated of [light weight die cast aluminum with powder coat finish] [welded steel vanes with powder coat finish] [perforated steel sheet welded to a formed steel pan with powder coat finish]. Submit [three][\_\_\_] color samples for perforated directional air supply panels.

[2.11] CUT OUTS

Provide cable cutouts finished with rigid polyvinylchloride or molded polypropylene edging to conform to the appearance level of the floor surface and to cover raw edges of the cutout panel. Extrusion must be of a configuration to permit its effective and convenient use when new cable openings are required. Provide at least 7300 mm 24 feet of additional extrusion for future use. Submit [three][\_\_\_] color samples for cut outs.

a. Provide non-metallic adapter for openings less than 100 mm 4 inches wide. Secure adapter adhesively in cutout to preclude removal from panel. Provide at least two adapters per 10 square meter 1000 square feet for future use.
b. Openings larger than 100 mm 4 inches wide must use rigid polyvinylchloride or molded polypropylene edging. Perform cutting of panels, including cutouts, outside of the building.

c. When size of cutout reduces the performance requirement of panel, provide intermediate pedestals adjacent to cutouts.

}[2.12  EDGE CLOSURE

Provide 1.5 mm 1/16 inch aluminum closure plate and extruded aluminum nosing at exposed edge of floor. Back up the closure plates with aluminum or steel framing braced diagonally, or anchor at bottom to continuous angle.

]2.13  COLOR

**************************************************************************

NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally UFGS 09 06 00 SCHEDULES FOR FINISHES or as indicated is used when the project is designed by an Architect or Interior designer. Color should be selected from manufacturer’s standard colors or identified as a manufacturer’s color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located as indicated, a note must be added to the drawings that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note that there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is referenced, be certain that the product conforms to this specification, as edited.

**************************************************************************

Color must be [in accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [as indicated] [______]. Color listed is not intended to limit the selection of equal colors from other manufacturers.

PART 3   EXECUTION

3.1  INSTALLATION

Install access flooring at the location and elevation and in the arrangement shown on the approved detailed installation drawings. The floor system must be of the stringerless type, complete with all supplemental items, and be the standard product of a manufacturer.
specializing in access flooring systems.

Install the floor system in accordance with the manufacturer's instructions. Open ends of the floor, where the floor system does not abut wall or other construction, must have positive anchorage and rigid support. Maintain areas to receive access flooring between [16] [4] and 32 degrees C [60] [40] and 90 degrees F, and between 20 and 70 percent humidity for 24 hours prior to and during installation.

3.1.1 Preparation for Installation

**************************************************************************
NOTE: Section 03 30 00 CAST-IN-PLACE CONCRETE should require that concrete floors used as air plenum surfaces beneath raised floors be sealed with approved liquid sealer compound. Sealer should be compatible with pedestal adhesive, if pedestals are anchored with adhesive. If a non-compatible sealer is applied before pedestals are anchored, specify removal of sealer at pedestal locations before adhesive is applied. If an existing subfloor has been painted or otherwise sealed with non-compatible sealer or paint, specify removal of coating before applying adhesive.
**************************************************************************

Clear out all debris in the area in which the floor system is to be installed. Thoroughly clean structural floor surfaces and remove all dust. Install floor coatings, required for dust or vapor control, prior to installation of pedestals, only if the pedestal adhesive will not damage the coating. If the coating and adhesive are not compatible, apply the coating after the pedestals have been installed and the adhesive has cured.

3.1.2 Pedestals

**************************************************************************
NOTE: Seismic calculations must be made by the designer to determine if adhesives or anchors are to be used; pedestal adhesives must be capable of securing pedestals in place with sufficient bonding strength to resist an overturning force of 113 N-m 1000 inch-pounds. If the calculations indicate the overturning force is greater than 113 N-m 1000 inch-pounds steel expansion anchors will be used.
**************************************************************************

Pedestals must be accurately spaced, and set plumb and in true alignment. Set base plates in full and firm contact with the structural floor, and secured to the structural floor with adhesive or steel expansion anchors in accordance with manufacturer's instructions.

3.1.3 Auxiliary Framing

Provide auxiliary framing or pedestals around columns and other permanent construction, at sides of ramps, at open ends of the floor, and beneath panels that are substantially cut to accommodate utility systems. Use special framing for additional lateral support as shown on the approved detailed installation drawings. Provide additional pedestals designed to specific heights and lengths to meet structural irregularities and design requirements.
loads. Connect auxiliary framing to main framing.

3.1.4 Panels

Interlock panels with supports in a manner that will preclude lateral movement. Fasten perimeter panels, cutout panels, and panels adjoining columns, stairs, and ramps to the supporting components to form a rigid boundary for the interior panels. Level floors within the specified tolerances. Cut edges of [steel and wood-core panels must be [painted] [finished] [_____] as recommended by the panel manufacturer.] [Exposed edges of composite panels must be coated with a silicone rubber sealant or with an adhesive recommended by the panel manufacturer.] Secure extruded vinyl edging in place at all cut edges of all panel cut-outs to prevent abrasion of cables. [Where the space below the floor is a plenum, close cutouts for conduit and similar penetrations using self-extinguishing sponge rubber or air sealing grommets.]

3.1.5 Carpet Tile

Reference carpet tile paragraph in FLOOR COVERING for carpet tile installation requirements.

3.1.6 Resilient Base

Provide base at vertical wall intersections as indicated in the [drawings][____]. Apply the base after the floor system has been completely installed. Install wall base in accordance with manufacturer's printed installation instructions. Prepare and apply adhesives in accordance with manufacturer's printed directions. Tighten base joints and make even with adjacent flooring. Fill voids along the top edge of base at masonry walls with caulk. Roll entire vertical surface of base with hand roller, and press toe of base with a straight piece of wood to ensure proper alignment. Avoid excess adhesive in corners.

3.1.7 Fascia Plates

Cover exposed floor ends and exposed openings of ramps and stairs with [aluminum] [steel closures] [finish material as indicated].

3.1.8 Repair of Zinc Coating

Repair zinc coating that has been damaged, and cut edges of zinc-coated components and accessories, by the application of a galvanizing repair paint conforming to ASTM A780/A780M. Areas to be repaired must be thoroughly cleaned prior to application of the paint.

3.2 FIELD TESTS

Submit certified copies of test reports from an approved testing laboratory, attesting that the proposed floor system components meet the performance requirements specified.

3.2.1 Acceptance Tests

Conduct acceptance tests after installation of floor system. Make at least one test for each [40] [100] [_____] square meters [400] [1000] [_____] square feet of floor area. Conduct tests in presence of Contracting Officer and representatives of manufacturer and installer. Submit certified copies of test reports from an approved testing laboratory,
attesting that the proposed floor system components meet the performance requirements specified.

3.2.2 Air Leakage

**************************************************************************
NOTE: Delete the requirements for air leakage when the space under the finished floor is not used as an air plenum. Concrete floors to be used as air plenums must be sealed and coated. Coordinate with Mechanical Engineer for anticipated positive pressure in the plenum.
**************************************************************************

When the space below the finished floor is an air plenum, air leakage through the joints between panels and around the perimeter of the floor system must not exceed 0.15 L/s of air per linear meter 0.1 cubic foot of air per minute per linear foot of joint subjected to 2.5 mm [.05 inches h2o (Pa)] [0.1 inches h2o (Pa)], water gauge, positive pressure in the plenum, when tested in accordance with CISCA Access Floors, Section 10 Air Leakage Test. Measure the leakage rate on the finished raised floor system, which may include carpet.

3.2.3 Grounding

**************************************************************************
NOTE: Access flooring system must be grounded for safety hazard and static control. The three most common static control requirements are:

1. Computer rooms, electronic offices, data centers and control rooms. The access floor system should provide resistance from floor wearing surface to building grounding electrode within range of 0.5 to 20,000 megohms.

2. Clean rooms, laboratories, and other environments which are more sensitive to static discharge. The access floor system should provide resistance within range of 0.2 to 2.0 megohms.

3. Hospitals and other facilities described by NFPA 99 and referenced to UL 779. The access floor system should provide resistance within range of 0.025 to 1.0 megohms.

These limits may be changed if other values are required by the Using Agency. Design the grounded floor system to provide positive contact between all metal components. Grounding details must be shown on the project drawings; the option of using manufacturer's alternate methods of grounding may be included in the project specification.
**************************************************************************

Ground the access flooring system for safety hazard and static suppression. Provide positive contact between components for safe, continuous electrical grounding of entire floor system. Total system resistance from wearing surface of floor to building grounding electrode
must be within range of [0.5 to 20,000 megohms] [0.2 to 2.0 megohms] [0.025 to 1.0 megohms].

3.2.3.1 Metal Grilles

Exposed metal is not allowed at wearing surface of access floor system, except at metal grilles and registers. When grilles and metal registers are provided, insulate as required to provide same grounding resistance as wearing surface.

3.2.3.2 Joint Resistance

**********************************************************************************************************************************************
NOTE: Coordinate with electrical drawings and specifications to assure that connection to building grounding electrode is shown. Do not use sound deadening materials which prevent grounding of system. Select a total system resistance to comply with user requirements.
**********************************************************************************************************************************************

Electrical joint resistance between individual stringer and pedestal junctions must be less than 0.1 milliohms. Electrical resistance between stringers and floor panels, as mounted in normal use, must be less than 3 ohms when tested in accordance with ASTM F150.

3.2.4 Electrical Resistance

Conduct testing of electrical resistance, in the completed installation, in the presence of the Contracting Officer in accordance with NFPA 99, modified by placing one electrode on the center of the panel surface and connecting the other electrode to the metal flooring support. Take measurements at five or more locations. Each measurement must be the average of five readings of 15 seconds duration at each location. During the tests, relative humidity must be 45 to 55 percent and temperature set at 21 to 24 degrees C 69 to 75 degrees F. Select panels used in the testing at random and include two panels most distant from the ground connection. Measure electrical resistance with instruments that are accurate within 2 percent and that have been calibrated within 60 days prior to the performance of the resistance tests. The metal-to-metal resistance from panel to supporting pedestal must not exceed 10 ohms. The resistance between the wearing surface of the floor covering and the ground connection, as measured on the completed installation, must be in accordance with paragraph FLOOR COVERING.

[3.2.5 SEISMIC SPECIAL INSPECTION AND TESTING

**********************************************************************************************************************************************
NOTE: Include this paragraph only when special inspection and testing for seismic-resisting systems is required by Appendix 11A of ASCE 7-16.
**********************************************************************************************************************************************

This paragraph will be applicable to both new buildings designed according to UFC 3-301-01 SEISMIC DESIGN FOR BUILDINGS, and to existing building seismic rehabilitation designs.

The designer must indicate on the drawings all locations and all features for which special
inspection and testing is required in accordance with UFC 3-301-01 and Appendix 11A of ASCE 7-16. This includes indicating the locations of all structural components and connections requiring inspection.

Add any additional requirements as necessary.

Perform special inspections and testing for seismic-resisting systems and components in accordance with UFC 3-301-01 and Section 01 45 35 SPECIAL INSPECTIONS.

3.3 CLEANING AND PROTECTION

3.3.1 Cleaning

Keep the space below the completed floor free of all debris. Before any traffic or other work on the completed raised floor is started, clean the completed floor in accordance with the floor covering manufacturer's instructions. [Do not permit seepage of cleaner between individual panels.] [Cleaning of ferrous surfaces must conform to FS TT-C-490.]

3.3.2 Protection

Protect traffic areas of raised floor systems with a covering of building paper, fiberboard, or other suitable material to prevent damage to the surface. Cover cutouts with material of sufficient strength to support the loads to be encountered. Place plywood or similar material on the floor to serve as runways for installation of heavy equipment not in excess of design load capacity. Maintain protection until the raised floor system is accepted.

3.3.3 Surplus Material Removal

Clean surfaces of the work, and adjacent surfaces soiled as a result of the work. Remove all installation equipment, surplus materials, and rubbish from the work site.

3.4 FIRE SAFETY

Install an automatic detection system below the raised floor meeting the requirements of NFPA 75 paragraph 5-2.1 to sound an audible and visual alarm. Air space below the raised floor must be subdivided into areas not exceeding 929 square meters 10,000 square feet by tight, noncombustible bulkheads. Seal all penetrations for piping and cables to maintain bulkhead properties.

3.5 OPERATION AND MAINTENANCE MANUALS

Submit maintenance instructions for proper care of the floor panel surface. When conductive flooring is specified, also submit maintenance instructions to identify special cleaning and maintenance requirements to maintain "conductivity" properties of the panel finish.

NOTE: This guide specification covers the requirements for wallcoverings over gypsum wallboard, plaster, concrete, or masonry.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: On the drawings, show:

1. Location and extent of work including dimensions of surfaces to receive wallcovering.

2. Profile of wainscot cap, when required.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in
the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00
SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Wallcoverings and Accessories; G[, [_____]]

Primer and Adhesive [Recycled Content for vinyl wallcovering; S]
[Recycled Content for textile wallcovering; S]

Wallcoverings and Accessories; G[, [_____]]

1.3 CERTIFICATIONS

1.3.1 Indoor Air Quality Certifications

Submit required indoor air quality certifications and validations in one submittal package.

1.3.1.1 Fabrics and Wallcoverings

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product
certification documentation from certification body.

1.3.1.2 Primers and Adhesives

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party programs that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver the material to the site in manufacturer's original wrappings and packages and clearly label with the manufacturer's name, brand name, pattern and color name and number, dye lot number, size, and other related information. Store in a safe, dry, clean, and well-ventilated area at temperatures not less than 10 degrees C 50 degrees F and within a relative humidity range of 30 to 60 percent. Store wallcovering material in a flat position and protected from damage, soiling, and moisture. Do not open containers until needed for installation, unless verification inspection is required.

1.5 ENVIRONMENTAL REQUIREMENTS

Comply with wallcovering manufacturer's printed installation instructions for minimum temperature of area to receive requirements for conditioning adhesive and wallcovering. Provide a minimum 10 degrees C 50 degrees F area temperature, 72 hours prior to installation, during installation, and until the adhesive dries. Observe ventilation and safety procedures.

1.6 WARRANTY

Provide manufacturer's standard performance guarantees or warranties that extend beyond a one-year period.

1.7 EXTRA MATERIALS

*************************************************************************
NOTE: Extra stock of wallcovering may be required.
If not, delete this paragraph. Extra stock should be based on anticipated usage. In the absence of experience data, a minimum of one linear meter for each 100 lineal meters one linear foot for each 100 linear feet installed is suggested.
*************************************************************************

Provide one linear meter foot of full-width wallcovering of each pattern and color for each [100] [_____] linear meters [100] [_____] linear feet of wallcovering installed[, excluding presentation dry erase wallcovering]. Provide the same manufacturer, type, pattern, color, and lot number of extra stock as the installed wallcovering. Provide full rolls, packed for storage and marked with content, manufacturer's name, pattern and color name and number and dye lot number. Leave extra stock at the site at a location as directed by the Contracting Officer.
PART 2   PRODUCTS

2.1 WALLCOVERINGS AND ACCESSORIES

**************************************************************************
NOTE: If more than one wallcovering type is required and specifications vary, a separate paragraph vinyl wallcovering Type, textile wallcovering Type, and/or wall covering Border Type will be used for each wallcovering type. Each wallcovering type will be designated with a letter or number symbol. Use the same symbols to key wallcovering types to locations on the drawings and Section 09 06 00 SCHEDULES FOR FINISHES. Delete reference to type symbol if not used.
**************************************************************************

Comply with NFPA 101 requirements.

Provide wall coverings and accessories material designed specifically for the specified use. Provide vinyl wallcovering and borders with a mercury, cadmium, lead, and chromium free base. Protect wallcoverings with bactericides and mildew inhibitors against microbiological and mildew growth.

2.1.1 Product Data

a. Wallcovering: Submit manufacturer's descriptive data, documenting physical characteristics, flame resistance, mildew and germicidal characteristics for wallcovering.

b. Accessories: Submit manufacturer's descriptive data for corner guard and wainscot cap.

c. Primer and Adhesive: Submit manufacturer's descriptive data, documenting physical characteristics, mildew and germicidal characteristics.

2.1.2 Samples

2.1.2.1 Wallcovering

Submit [three] samples of each indicated type, pattern, and color of wallcovering. Provide minimum 125 by 175 mm 5 by 7 inch samples of wallcovering to show pattern repeat of sufficient size.

2.1.2.2 Accessories

Submit [three] samples of each indicated type corner guard and wainscot cap; provide samples a minimum of 75 mm 3 inch long. Submit [three] samples of each indicated type of frame for presentation dry erase wallcovering; provide samples a minimum of 75 mm 3 inch long.

2.1.2.3 Wallcovering

Provide three samples, 3 meter yards long by the width specified, of each type to be installed in the work, as required to illustrate material weight, color, shade, decorative design, and embossing when required.
After samples are approved, and prior to starting installation, provide a minimum 2430 by 2430 mm 8 by 8 foot wallcovering mock-up for each color and type of [vinyl][, ] [fabric][, and] [presentation dry erase] wallcovering, using the proposed primers and adhesives and actual substrate materials. Once approved, use the mock-up samples as a standard of workmanship for installation within the facility. Written notification to the Contracting Officer at least 48 hours prior to mock-up installation.

2.1.3 Certificates

Submit manufacturer's statement attesting that the product furnished meets or exceeds specification requirements. Date the statement after the award of the contract, state Contractor's name and address, name the project and location, and list the requirements being certified. Include these certificates:

(1) Certified laboratory test reports of the physical properties for vinyl wallcovering, as specified.

(2) Certificates of Compliance for UL fire hazard classification listing, as specified.

(3) Certificates of Compliance for contact adhesive.

2.1.4 Manufacturer's Instructions

Submit preprinted installation instructions for wallcovering and accessories, adhesives and primers. Include substrate preparation and material application in the instructions.

2.1.5 Operations and Maintenance Data

a. Submit Data Package 1 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

b. Submit [three][_____] copies of manufacturer's maintenance instructions for each type of vinyl wallcovering and accessory describing recommended type of cleaning equipment and materials, spotting and cleaning methods, and cleaning cycles. Instructions to also include preventative maintenance, recommended cleaning materials and precautions in the use of cleaning materials that may be detrimental to the wallcovering surface and accessories when improperly applied.

2.2 VINYL WALLCOVERING [TYPE [A] [_____]]

**************************************************************************

NOTE: Select the appropriate vinyl Type designation for each wallcovering specified and delete inapplicable Types. Type selection should be based on abuse conditions and the following recommendations:

Type I (Light Duty) is satisfactory for use on ceilings and light duty walls not subjected to scuffing and abrasion. This type is rarely used.

Type II (Medium Duty) is satisfactory for areas
subject to average traffic wear and scuffing (varies based on facility type and use); can include areas such as vestibules, corridors, lounges, offices. It may be used full height on walls or as a wainscot. Type II should be used for most vinyl wallcovering installations.

Type III (Heavy Duty) is slightly more resistant to scuffing than Type II but is difficult to install and clean, and is not available from most manufacturers. Type III wallcovering is expensive and should be used only where specifically requested; may include areas that are exposed to damage by moving equipment.

Some manufacturer's Type I, Type II and/or Type III wallcovering will overlap or vary slightly from the weights shown in the following paragraphs.

Conversion Table:

<table>
<thead>
<tr>
<th></th>
<th>Type I</th>
<th>Type II</th>
<th>Type III</th>
</tr>
</thead>
<tbody>
<tr>
<td>ozs/sq yd</td>
<td>7 (10)</td>
<td>13</td>
<td>22</td>
</tr>
<tr>
<td>ozs/linear yd (54 inch wide)</td>
<td>10.5 (15)</td>
<td>20</td>
<td>33</td>
</tr>
<tr>
<td>g/sq meter</td>
<td>237 (339)</td>
<td>441</td>
<td></td>
</tr>
<tr>
<td>g/linear meter</td>
<td>325 (465)</td>
<td>620</td>
<td></td>
</tr>
</tbody>
</table>

The Wallcovering Association WA-101 and Chemical Fabrics and Film Association CFFA-W-101-D minimum weight requirements are listed in the ozs/sq yd row in the above table, with the exception of the number shown in parenthesis. The measurements in parenthesis reflect what is currently used in the industry for Type I. The heavier weight provides a more durable product. Note that CFFA-W-101-D has now been replaced by the WA-101, but it is still being used by industry.

The following formulas can be used for English to metric conversions:

a. Ounces per square yard to ounces per linear yard—
   Multiply # ounces per square yard by 1872 for 52 inches wide or 1908 for 53 inches wide or 1944 for 54 inches wide. Divide the total by 1296 to obtain per linear yard.

b. Ounces per square yard to grams per square meter—
   Divide the # ounces per square yard by 144. Multiply total by 4882 to obtain grams per square
meter measurement.

c. Ounces per linear yard to grams per linear meter-
   Multiply # ounces per linear yard by 28.35.
   Multiply total by 1.0936 to obtain grams per linear meter measurement.

Polyvinyl-fluoride (PVF) film is an extra cost. The film is designed to provide additional resistance to staining and soiling from exposure to staining reagents or chemicals, and resistance from abuse. Generally the PVF coated vinyl wallcoverings have a slightly different appearance from the standard noncoated vinyl wallcovering. The film is available in 3 thicknesses with the thin gauge material being much less expensive. Various thicknesses represent moderate (thinnest), heavy, and extreme wear (thicker) in the installation area. Consider PVF film top coating for heavy-use areas and other areas exposed to chemical reagents and staining agents such as dormitories, dining halls, cafeterias, medical facilities, and clubs.

Delete PVF film when not required.

******************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content of the first bracket. Some manufacturers and regions have higher percentages. If desired, insert higher percentages into the second set of brackets.

******************************************************************************

Provide a vinyl coated woven or nonwoven wallcovering fabric. Conform to FS CCC-W-408 for vinyl wallcovering, [Type I (Light Duty) with a minimum total weight of [237] [339] grams/square meter [7] [10] ounces/square yard and [325][465] grams/linear meter [10.5][15] ounces/linear yard][Type II (Medium Duty) with a minimum total weight of 441 grams/square meter 13 ounces/square yard and 620 grams/linear meter 20 ounces/linear yard][Type III (Heavy Duty) with a minimum total weight of 746 grams/square meter 22 ounces/square yard and 1023 grams/linear meter 33 ounces/linear yard]. Provide width of[ 1320/1371 mm 52/54 inch] [____:]. Test vinyl wallcovering in accordance with NFPA 286 or meet the requirements of Class A when tested in accordance with ASTM E84 or UL 723. [Apply a polyvinyl fluoride (PVF) film,[ 0.00889 mm 0.00035 inch] [ 0.0127 mm 0.0005 inch] [ 0.0254 mm 0.0010 inch] thick over the face of the wallcovering. Provide a transparent (clear) film, medium gloss.]

[Provide Vinyl Wallcovering containing a minimum of [10][____] percent
recycled content. Provide data identifying percentage of recycled content for vinyl wallcovering.

Provide certification of indoor air quality for vinyl wallcovering.

2.3 TEXTILE WALLCOVERING [TYPE [A] [_____]]

**************************************************************************

NOTE: These notes apply to both textile and acoustical wallcoverings.

In accordance with NFPA 101, the use of textile materials on walls and ceilings will comply with one of the following conditions:

a. Textile materials meeting the requirements of Class A when tested in accordance with ASTM E84, Standard Test Method for Surface Burning Characteristics of Building Materials, or UL 723, Standard for Test for Surface Burning Characteristics of Building Materials, using the mounting method of ASTM E2404, Standard Practice for Specimen Preparation and Mounting of Textile, Paper or Vinyl Wall or Ceiling Coverings to Assess Surface Burning Characteristics, are permitted on the walls or ceilings of rooms or areas protected by an approved automatic sprinkler system.

b. Textile materials meeting the requirements of Class A when tested in accordance with ASTM E84, Standard Test Method for Surface Burning Characteristics of Building Materials, or UL 723, Standard for Test for Surface Burning Characteristics of Building Materials, using the mounting method of ASTM E2404, Standard Practice for Specimen Preparation and Mounting of Textile, Paper or Vinyl Wall or Ceiling Coverings to Assess Surface Burning Characteristics, are permitted on partitions that do not exceed 3/4 of the floor-to-ceiling height or do not exceed 2440 mm 8 feet in height whichever is less.

c. Textile materials meeting the requirements of Class A when tested in accordance with ASTM E84, Standard Test Method for Surface Burning Characteristics of Building Materials, or UL 723, Standard for Test for Surface Burning Characteristics of Building Materials, using the mounting method of ASTM E2404, Standard Practice for Specimen Preparation and Mounting of Textile, Paper or Vinyl Wall or Ceiling Coverings to Assess Surface Burning Characteristics, are permitted to extend not more than 1200 mm 48 inches above the finished floor on ceiling-height walls and ceiling-height partitions.

d. Textile materials are permitted on walls and partitions where tested in accordance with NFPA 265. (ICC IBC is equivalent to NFPA 265.)
e. Textile materials are permitted on walls, partitions, and ceilings where tested in accordance with NFPA 286.

Add information on natural fibers as applicable to the project.

**************************************************************************
Provide colorfast, stain, and soil resistant textile wallcovering fabricated of woven fabric with paper or acrylic backing. [Test in accordance with NFPA 265 or NFPA 286.][Meet the requirements of Class A when tested in accordance with ASTM E84 or UL 723.] Comply with or exceed the following for textile wallcovering:

<table>
<thead>
<tr>
<th>Face fiber content</th>
<th>[_____]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weave</td>
<td>[Plain] [_____]</td>
</tr>
<tr>
<td>Total Weight</td>
<td>[_____] g/square meter ounces/square yard</td>
</tr>
<tr>
<td>Width</td>
<td>[_____] mm inch</td>
</tr>
</tbody>
</table>

**************************************************************************

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content of the first bracket. Some manufacturers and regions have higher percentages. If desired, insert higher percentages into the second set of brackets.

**************************************************************************

[Provide Textile Wallcovering containing a minimum of [5][_____] percent recycled content. Provide data identifying percentage of recycled content for textile wallcovering.]

Provide certification of indoor air quality for textile wallcovering.

2.4 ACOUSTICAL WALLCOVERING [TYPE [A] [_____]]

**************************************************************************

NOTE: See textile wallcovering notes; these notes also apply to acoustical wallcovering.

**************************************************************************

Provide acoustical wallcovering fabricated of [synthetic material] [vinyl coated fabric with porous surface with fused back] [_____]. [Test in accordance with NFPA 265 or NFPA 286.][Meet the requirements of Class A when tested in accordance with ASTM E84 or UL 723.] Comply with or exceed
the following for textile wallcovering:

<table>
<thead>
<tr>
<th>Total Weight</th>
<th>[_____] g/square meter ounces/square yard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>[_____] mm inch</td>
</tr>
<tr>
<td>NRC rating in accordance with ASTM C423</td>
<td>[_____] mm inch</td>
</tr>
</tbody>
</table>

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content shown.

Provide Acoustical Wallcovering containing a minimum of 10 percent recycled content. Provide data identifying percentage of recycled content for acoustical wallcovering.

Provide certification of indoor air quality for acoustical wallcovering.

2.5 WALLCOVERING BORDER [TYPE [A] [____]]

Provide wallcovering border of nonwoven vinyl cellulose/polyester blend or vinyl coated strippable paper back. Comply with or exceed the following for wallcovering border:

<table>
<thead>
<tr>
<th>Total Weight</th>
<th>[_____] g/linear meter ounces/linear yard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>[_____] mm inch</td>
</tr>
</tbody>
</table>

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows the product is available among US national manufacturers above the minimum recycled content of the first bracket. Some manufacturers and regions have higher percentages. If desired, insert higher percentages into the second set of brackets.

[Provide Wallcovering Border containing a minimum of [10][_____] percent recycled content. Provide data identifying percentage of recycled content]
for wallcovering border.]

Provide certification of indoor air quality for wallcovering border.

2.6 PRESENTATION DRY ERASE WALLCOVERING

**************************************************************************
NOTE: Some products must be installed on glass reinforced cement board to achieve Class A rating.

Research product to determine available features.
Note that surfaces designed to be used as a projection screen are not available with 50 by 50 mm 2 by 2 inch grid pattern.
**************************************************************************

Provide presentation dry erase wallcovering that accepts dry erase markings [and is designed to be used as a projection screen] [and has a 50 by 50 mm 2 by 2 inch grid pattern]. Provide wallcovering with a minimum total weight of [678] [_____] g/square meter [20] [_____] ounces/square yard, a width of [1524 mm 60 inch] [_____] and backing of a woven or nonwoven polyester. Test wallcovering in accordance with NFPA 286 or have a Class A flame spread rating of 0-25 and smoke development rating of 0-450 when tested in accordance with ASTM E84 or UL 723. Provide wallcovering color [selected from manufacturer's standard colors] [white] [_____] . When frame is required provide [aluminum] [oak] [_____] and have a full length tray of the same material. Markings must be removable with a felt eraser or cloth without ghosting. Provide each unit complete with an eraser, four different color compatible dry erase markers, and a 240 ml 8 ounce bottle of liquid surface cleaner recommended by the manufacturer.

Provide certification of indoor air quality for presentation dry erase wallcovering.

2.7 WALL LINER

**************************************************************************
NOTE: Wall lining should be specified where wallcovering will be installed over masonry walls.
**************************************************************************

Provide a non-woven polyester cellulose blend wall liner having a minimum weight of 125 g/square meter 3.7 ounces/square yard and a total minimum thickness of 0.33 mm 0.013 inch. Test wall liner in accordance with NFPA 286 or have a Class A flame spread rating of 0-25 and smoke development rating of 0-450 when tested in accordance with ASTM E84 or UL 723.

Provide certification of indoor air quality for wall liner.

2.8 CORNER GUARDS

**************************************************************************
NOTE: Delete references to corner guards in this specification if they are to be of the type specified in Section 10 26 00 WALL AND DOOR PROTECTION. Some projects may require both types. Coordinate locations when this occurs.
**************************************************************************
Provide 1 mm 0.040 inch thick corner guards and cover 20 mm 3/4 inch [2 mm 0.075 inch thick corner guards and cover 28 mm 1 1/8 inch] [2.2 mm 0.085 inch thick and cover 63 mm 2 1/2 inch] [_____] each side of corner at right angles. Provide [clear] [_____] [polycarbonate] [vinyl] [rubber] corner guards from the same color lot.

Provide certification of indoor air quality for corner guards.

2.9 WAINSCOT CAP

**************************************************************************
NOTE: A metal, vinyl, or wood wainscot cap molding will normally be required for all wainscot installations. The specification should include whether metal, vinyl, or wood molding is required. If metal or vinyl cap moldings are shown on the drawings, provisions in this paragraph should be modified accordingly. Delete inapplicable text if wainscot doesn’t apply.
**************************************************************************

Provide [[satin-finished extruded aluminum] [_____] wainscot cap [19][_____] mm [3/4][_____] inch high, feathered at bottom edge, with 5 mm 3/16 inch exposed face on top edge, and grooved to receive the covering][_____].

2.10 PRIMER AND ADHESIVE

**************************************************************************
NOTE: When mold is a problem in the area consider specifying mold proof primers and adhesives.
**************************************************************************

Provide a type primer and adhesive recommended by the wallcovering manufacturer, containing a non-mercury based mildewcide, and complying with local indoor air quality standards. Primer must permit removal of the wallcovering and protect the wall surface during removal. Do not damage gypsum wallboard facing paper during removal of wallcovering. Provide a strippable type adhesive. When substrate color variations show through vinyl wallcovering, provide a white pigmented primer as recommended by the wallcovering manufacturer used to conceal the variations. Provide a recommended type adhesive to install corner guards and wainscot cap by the manufacturer of the corner guards and wainscot cap.

Provide primers and non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) that meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide aerosol adhesives used on the interior of the building that meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of GS-36. Provide certification or validation of indoor air quality for primer; also, provide certification or validation of indoor air quality for adhesives.

2.11 COLOR, TEXTURE, AND PATTERN

**************************************************************************
NOTE: Avoid selection of a deeply embossed pattern where frequent cleaning of wallcovering is required.

Editing of color reference sentence(s) must be coordinated with the Government. Generally Section 09 06 00 Color Schedule or drawing is used when the project is designed by an Architect or Interior designer. Color should be selected from manufacturer's standard colors or identified in this specification only when the project has minimal finishes.

When the government directs that color be located in the drawings add a note that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

When more than one type, pattern or color is specified identify location and extent of work for each.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

Prior to specifying a custom color finish, research to determine if additional cost is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

Provide color, texture and pattern in accordance with [Section 09 06 00 SCHEDULES FOR FINISHES] [the drawings] [selected from manufacturers standard colors][______]. Color listed is not intended to limit the selection of equal colors from other manufacturers.

PART 3 EXECUTION

3.1 EXAMINATION

Inspect all areas and conditions under which wallcoverings are to be installed. Notify the Contracting Officer, in writing, of any conditions detrimental to the proper and timely completion of the installation. Work will proceed only when conditions have been corrected and accepted by the installer.

3.2 SURFACE PREPARATION

NOTE: When applying wallcovering over concrete or masonry surfaces, Section 03 30 00 CAST-IN-PLACE CONCRETE, will be coordinated to require, as applicable: (1) smooth concrete finish (2) masonry surfaces that are level and plumb with flush joints.
and square openings and (3) no variations in the surfaces exceeding 1 mm in 1000 mm 1/8 inch in 10 feet with no abrupt irregularities.

Coordinate level of gypsum wallboard finish required for presentation dry erase wallcovering with Section 09 29 00 Gypsum Board. Some manufacturers require a Level 4 finish and others Level 5.

When mold is a problem in an existing building that is being renovated, add verbiage to specification to cover removal of mold and appropriate surface preparation necessary to install new wallcovering. In addition, the source of the moisture needs to be located and fixed prior to installation of the wallcovering.

**************************************************************************

Do not apply wallcovering to surfaces that are rough, that contain stains which will bleed through the wallcovering, or that are otherwise unsuitable for proper installation. Fill cracks and holes; sand rough spots smooth. Finish walls to receive presentation dry erase wallcovering to a Level 4 gypsum wallboard finish in accordance with GA 214 unless Level 5 is recommended by the wallcovering manufacturer. Thoroughly dry surfaces at least 30 days prior to installation of vinyl wallcovering. Provide interior surfaces of new and existing gypsum wallboard with a wallcovering primer in accordance with the manufacturer's printed instructions. As required, use white primer when substrate color variations are visible through thin or light color wallcovering. Fill cracks and holes with flush joints. Test moisture content of plaster, concrete, and masonry with an electric moisture meter of a maximum five percent reading. Apply a thin coat of joint compound or cement plaster, as recommended by the wallcovering manufacturer, to the concrete and masonry walls as a substrate preparation. To promote adequate adhesion of wall lining over masonry walls, prime the walls as recommended by the wall lining manufacturer. Prime the surfaces of walls as required by the manufacturer's printed instructions to permit ultimate removal of wallcovering from the wall surfaces. Allow primer to completely dry before adhesive application.

3.3 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

3.3.1 Wallcovering

Install wallcovering in accordance with the manufacturer's printed installation instructions. Remove glue and adhesive spillage from wallcovering face and seams with a remover recommended by the manufacturer.

3.3.1.1 Textile Wallcovering

When textile wallcoverings are specified to comply with NFPA 265, NFPA 286, or ICC IBC (Section 803.5 Textile wall coverings) testing, install the wallcovering in accordance with the manufacturer's printed installation
instructions for compliance with the testing using the same product mounting system, including adhesive. After the installation is complete, vacuum the fabric with a ceiling to floor motion.

3.3.1.2 Acoustical Wallcovering

When acoustical wallcoverings are specified to comply with NFPA 265, NFPA 286, or ICC IBC (Section 803.5 Textile wall coverings) testing, install the wallcovering in accordance with the manufacturer's printed installation instructions for compliance with the testing using the same product mounting system, including adhesive. After the installation is complete, vacuum the fabric with a ceiling to floor motion.

3.3.1.3 Presentation Dry Erase Wallcovering Placement

**************************************************************************
NOTE: Delete frame size column in schedule when wall-to-wall and floor-to-ceiling wallcovering is specified.

Location of wallcovering and mounting height of framed wallcovering must be specified.

Size and type of wallcovering should be specified only once in the contract documents. If more than one type is specified, clearly identify locations.

Installing horizontally eliminates seams at writing height when installed at the proper height.
**************************************************************************

Install presentation dry erase wallcovering [wall-to-wall and floor-to-ceiling] [_____] and horizontally on the wall. Make the first seam at [610 mm 24 inch above finished floor for rooms with 2440 mm 8 foot ceilings] [and ] [760 mm 30 inch above finished floor for rooms with 2740 mm 9 foot ceilings] [_____]. Do not make seams at writing height to provide a continual, seamless writing surface. Provide wallcovering with an [aluminum] [oak] [_____] frame. When frame and tray are required for presentation dry erase wallcovering, install them in accordance with manufacturer's installation instructions. Upon completion of presentation dry erase wallcovering installation, clean the wallcovering surface as recommended by the manufacturer prior to first use. Provide a mounting height of framed wallcovering [as shown on the drawings] [_____] above finished floor to top of the frame.] Wallcovering locations are [as indicated on drawings.] [as scheduled below:

<table>
<thead>
<tr>
<th>Room Name and Number</th>
<th>Wall Location</th>
<th>Frame Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

3.3.2 Wall Liner

**************************************************************************
NOTE: Provide reinforcing at partitions to support presentation dry erase wallcovering frames.
**************************************************************************

Install wall liner over masonry walls that are to receive wallcovering.
Install liner in accordance with the manufacturer's printed installation instructions. Install liner perpendicular to wallcovering to prevent overlapping of seams between liner and wallcovering.

3.3.3 Corner Guards and Wainscot Cap

Install corner guards and wainscot cap [as indicated on sheet [_____]] [on all exposed corners with [wallcovering] [_____]] and in accordance with the manufacturer's printed instructions. Run corner guards from top of base to [wainscot cap] [ceiling] [_____] in a continuous length.

3.4 CLEAN-UP

Upon completion of the work, clean wallcovering free of dirt, soiling, stain, or residual film. Remove and clean surplus materials, rubbish, and debris resulting from the wallcovering installation.

NOTE: This guide specification covers the requirements for fabric covered acoustical wall panel systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

1.1  REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature.
to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF TEXTILE CHEMISTS AND COLORISTS (AATCC)

AATCC 16 (2004; E 2008; E 2010) Colorfastness to Light

1.2 SUBMITTALS

************************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

************************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.] [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in
accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

[1.3 CERTIFICATIONS

1.3.1 Certified Sustainably Harvested Wood

**************************************************************************
NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Sustainably Harvested Wood is a product which comes from a third-party Forestry Certification Program and thus carries certain characteristics: 1) Protection of biodiversity, species at risk and wildlife habitat, sustainable harvest levels, protection of water quality, and prompt regeneration (e.g., replanting and reforestation); 2) Third-party certification audits performed by accredited certification bodies; 3) Publicly available certification audit summaries; 4) Multi-stakeholder involvement in a standards development process; 5) Complaints and appeals process.

Verify suitability, availability within the region, cost effectiveness and adequate competition before specifying these sustainably harvested wood certifications – if these conditions are verified for the project locale, include the following section. For projects pursuing LEED, delete certifications other than FSC; for all other
Provide wood certified as sustainably harvested by FSC STD 01 001[, ATFS STANDARDS, CSA Z809-08, SPI 2015-2019s, or other third party program certified by PEFC ST 2002:2013]. Provide a letter of Certification of Sustainably Harvested Wood signed by the wood supplier. Identify certifying organization and their third party program name and indicate compliance with chain-of-custody program requirements. Submit sustainable wood certification data; identify each certified product on a line item basis. Submit copies of invoices bearing certification numbers.

1.4 DELIVERY, STORAGE, AND HANDLING

Protect materials delivered and placed in storage from the weather, humidity and temperature variations, dirt, dust, or other contaminants.

1.5 WARRANTY

Provide manufacturer's standard performance guarantees or warranties that extend beyond a one year period.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Design

Provide [wood][fabric wrapped mineral / glass-fiber core] acoustical wall panel materials in the manufacturer's standard sizes and finishes of the type, design and configuration indicated.

[2.1.1.1 Wood Recycled Content

**************************************************************************

NOTE: Use materials with recycled content, calculated on the basis of post-industrial and post-consumer percentage content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Research shows wood panels are available from US national manufacturers above the minimum recycled content percentages shown below. Some manufacturers and regions have higher percentages. Based on research, insert desired minimum percentages into the empty set of brackets.

**************************************************************************

Wood Panels must contain a minimum of [50][_____] percent recycled content. Provide data identifying percentage of recycled content for wood panels.
2.1.1.2 Sustainably Harvested Wood

NOTE: Use certified sustainably harvested wood where suitable for application and cost effective. Verify suitability, availability within the region, cost effectiveness, and adequate competition before specifying this certification.

Wood Panels must contain a minimum of [50]% certified sustainably harvested wood. Provide documentation that certified sustainably harvested wood is used and identify percentage.

2.1.1.3 Fabric Recycled Content

NOTE: Use materials with recycled content where appropriate for use. Verify suitability, availability within the region, cost effectiveness and adequate competition (including verification of bracketed percentages included in this guide specification) before specifying product recycled content requirements.

Based on research, recycled content percentages of fabric panels varies among national manufacturers. Designer must research acceptable products and insert minimum percentage in the empty bracket below.

Fabric Panels must contain a minimum of [_____] percent recycled content. Provide data identifying percentage of recycled content for fabric panels.

Composite wood and agrifiber products must contain no added urea-formaldehyde resins. Products containing composite wood and agrifiber components must meet emissions requirements of either CARB 93120 or CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type). Provide validation of indoor air quality for composite wood and agrifiber products.

2.2 FABRIC COVERED ACOUSTICAL WALL PANELS

NOTE: Drawings must show locations and dimensions of acoustical panels, details of joints, base, head, and mounting details.

The same or similar acoustical benefits can possibly be obtained by other means such as wall covering, etc.

Omit the following items that do not meet project requirements.

Provide acoustical wall panels consisting of prefinished, factory assembled, seamless fabric covered, fiber glass or mineral fiber core system as described below manufactured to the dimensions and configurations.
shown on the approved detail drawings; submit drawings showing plan locations, elevations and details of method of anchorage, location of doors and other openings, base detail and shape and thickness of materials. Perimeter edges must be [non-reinforced.] [reinforced by either an aluminum frame or a formulated resin edge hardener.] Acoustical wall panels must comply with the interior finish requirements of NFPA 101. Submit manufacturer's descriptive data and catalog cuts; fabric and vinyl swatches, minimum 450 mm 18 inches wide by 600 mm 24 inches long [3] [_____] samples of each color range specified; and certificates of compliance from an independent laboratory accredited by the National Laboratory Accreditation Program of the National Institute of Standards. A label or listing from the testing laboratory will be acceptable evidence of compliance. Wall panels must conform to the following:

2.2.1 Panel Width

[Widths must be [600] [750] [1200] [1500] mm [24] [30] [48] [60] inches] [End panels may vary in width as necessary to cover wall] [Panel width must be as detailed.]

2.2.2 Panel Height

[Heights must be [2400] [2700] [3000] mm [96] [108] [120] inches.] [[Field measures panels for custom fit to ceiling.] [Tolerance at floor as detailed].] [Panel height must be as detailed.]

2.2.3 Thickness

[Panel thickness as required to meet the indicated NRC range] [____].

2.2.4 Fabric Covering

Seamless [non-woven, embossed texture, needle punched 100 percent polyester, minimum 0.034 kg/linear meter 11 ounces/linear yard. Tear strength a minimum 110 N 25 pounds machine direction and minimum 178 N 40 pounds cross-machine direction. Tensile strength a minimum 220 N 50 pounds machine direction and minimum 330 N 75 pounds cross-machine direction in accordance with ASTM D5034.] [plain woven 2-ply 100 percent polyester, minimum 0.47 kg/linear meter 15 ounces/linear yard. Tear strength a minimum 129 N 29 pounds. Tensile strength 667 N 150 pounds minimum in accordance with ASTM D5034.] [perforated vinyl covering with fabric backing, minimum 0.62 kg/linear meter 20 ounces/linear yard total weight.] Stretch fabric covering free of wrinkles and then bond to the edges and back or bond directly to the panel face, edges, and back of panel a minimum distance standard with the manufacturer. Light fastness (fadeometer) approximately 40 hours in accordance with AATCC 16.

2.2.5 Fire Rating for the Complete Composite System

Class A, 200 or less smoke density and flame spread less than 25, when tested in accordance with ASTM E84.

2.2.6 Substrate

Fiber glass or mineral fiber

2.2.7 Noise Reduction Coefficient (NRC) Range

[0.50-0.60] [0.80-0.90] [____] ASTM C423
2.2.8  Edge Detail

[Half bevel] [Bevel] [Radius] [Square] [Mitered] [_____] edge with fabric wrapped on all four sides.

2.2.9  Core Type

[Standard acoustical] [High impact acoustical] [Acoustical/tackable] [_____] core

2.2.10 Mounting Acoustical Panels

Mount acoustical panels by manufacturer's standard [concealed spline] [mechanical fasteners] [magnetic fasteners] [hook and loop] [adhesive mounting] [_____].

2.3  COLOR

**************************************************************************

NOTE: Editing of color reference sentence(s) must be coordinated with the Government. Generally Section 09 06 00 SCHEDULES FOR FINISHES or drawing is used when the project is designed by an Architect or Interior designer. Select color from manufacturers standard colors or identified as a manufacturers color in this specification only when the project is very simple and has minimal finishes.

When the Government directs that color be located in the drawings add a note that states: "Where color is shown as being specific to one manufacturer, an equivalent color by another manufacturer may be submitted for approval. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. The word "color" as used herein includes surface color and pattern."

Prior to specifying a custom color finish, research to determine if additional cost and lead time is feasible. Note there is often a minimum order requirement; this requirement will also affect future orders.

When a manufacturer's name, stock number, pattern, and color is used, be certain that the product conforms to this specification, as edited.

**************************************************************************

[In accordance with Section 09 06 00 SCHEDULES FOR FINISHES] [As indicated] [Selected from manufacturers standard colors] [_____]. Color listed is not intended to limit the selection of equal colors from other manufacturers.]
PART 3   EXECUTION

3.1    SURFACE CONDITIONS

Must be clean, smooth, oil free and prepared in accordance with panel manufacturer's instructions. Do not begin installation until all wet work, such as, plastering, painting, and concrete are completely dry.

3.2    INSTALLATION

Panel installation must be by personnel familiar with and normally engaged in installation of acoustical wall panels. Apply panels in accordance with the manufacturer's installation instructions. Submit manufacturer's installation instructions and recommended cleaning instructions.

3.3    CLEANING

Following installation, clean dirty or stained panel surfaces in accordance with manufacturer's instructions and leave free from defects. Remove and replace panels that are damaged, discolored, or improperly installed.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for painting of new and existing, interior and exterior substrates, including masonry, concrete, metal, wood, and other miscellaneous materials.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification includes tailoring for ARMY and NAVY projects, and for INTERIOR and EXTERIOR painting. Where an Editor's Note states a paragraph is tailored for a Service or painting type, the content of the paragraph, or a portion of the paragraph, is suited specifically to be included only for that Service or painting type.

NOTE: This Guide Specification is used in the preparation of project specifications for Department of Defense facilities:
1. Buildings;
2. Related mechanical, electrical, and miscellaneous items; and

This guide specification has been prepared to address the requirements of routine maintenance painting when modified to include or utilize maintenance options.

This guide specification DOES NOT address high-performance or specialty coating requirements, or protective coating of industrial structures or facilities, including but not limited to:
1. Towers;
2. Pilings;
3. Pavement markings;
4. Items requiring specialized treatment due to peculiar usage;
5. Petroleum storage facilities;
6. Water storage facilities;
7. Waterfront facilities, except shore-to-ship utility connections; and
8. Hangars

If such items are in the project include in a separate section or modify this section accordingly. The following guide specifications are examples of those available for specific service conditions noted, and may be modified to provide for related service conditions:

1. Section 09 97 23 METALLIC TYPE CONDUCTIVE/SPARK RESISTANT CONCRETE FLOOR FINISH. This specification covers the requirements for metallic type conductive/spark resistant concrete floor finish for ordnance and other similar structures.

2. Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES. This specification covers the painting of hydraulic structures located in fresh water such as locks and dams.

3. Section 09 97 13.27 HIGH PERFORMANCE COATING FOR STEEL STRUCTURES. This specification is usable for any steel structure exposed to weather, and is usable for other purposes as well, such as hangar structures, enclosed swimming pool structures, and most situations requiring high-performance protective coating systems.

4. Section 09 97 13.16 INTERIOR COATING OF WELDED STEEL WATER TANKS. This guide specification covers the requirements for polyamide epoxy coating system for interior of newly constructed Navy and Air Force water tanks, potable and non-potable, where shop applied coatings are not being considered.

This guide specification generally contains only two types of coating systems, solvent based and water
based. If different systems are required regionally, or for special needs, modify the guide accordingly.

PART 1   GENERAL

1.1 RELATED REQUIREMENTS

**************************************************************************
NOTE: Indicate type and extent of work on drawings. Specific quantities should not be cited in the specification. Indicate on the drawings the linear amount of existing putty, glazing compound, sealant or caulking to be replaced with new material and quantify the area of existing coating to be removed by methods specified for each substrate material.
**************************************************************************

1.1.1 Painting Included

Where a space or surface is indicated to be painted, include the following unless indicated otherwise.

a. Surfaces behind portable objects and surface mounted articles readily detachable by removal of fasteners, such as screws and bolts.

b. New factory finished surfaces that require identification or color coding and factory finished surfaces that are damaged during performance of the work.

c. Existing coated surfaces that are damaged during performance of the work.

1.1.1.1 Exterior Painting

**************************************************************************
NOTE: The following subparagraph is tailored for inclusion in projects with exterior painting.
**************************************************************************

Choose bracketed items according to scope of project.

**************************************************************************
Includes new surfaces[, existing coated surfaces,][ and ][existing uncoated surfaces,] of the building[s] and appurtenances. Also included are existing coated surfaces made bare by cleaning operations.
**************************************************************************

1.1.1.2 Interior Painting

**************************************************************************
NOTE: The following subparagraph is tailored for inclusion in projects with interior painting.
**************************************************************************

Choose bracketed items according to scope of project.

**************************************************************************
Includes new surfaces[, existing uncoated surfaces,][ and ][existing coated surfaces] of the building[s] and appurtenances as indicated and existing
coated surfaces made bare by cleaning operations. Where a space or surface is indicated to be painted, include the following items, unless indicated otherwise.

a. Exposed columns, girders, beams, joists, and metal deck; and
b. Other contiguous surfaces.

1.1.2 Painting Excluded

Do not paint the following unless indicated otherwise.

a. Surfaces concealed and made inaccessible by panelboards, fixed ductwork, machinery, and equipment fixed in place.

b. Surfaces in concealed spaces. Concealed spaces are defined as enclosed spaces above suspended ceilings, furred spaces, attic spaces, crawl spaces, elevator shafts and chases.

c. Steel to be embedded in concrete.

d. Copper, stainless steel, aluminum, anodized aluminum, brass, and lead except existing coated surfaces.

e. Hardware, fittings, and other factory finished items.

[f. Do not paint surfaces in the following areas: [_____].

1.1.3 Mechanical and Electrical Painting

**************************************************************************
NOTE: Choose bracketed items in paragraph below according to scope of project.
**************************************************************************

Includes field coating of [interior][ and ][exterior] new[ and existing] surfaces.

a. Where a space or surface is indicated to be painted, include the following items unless indicated otherwise.

(1) Exposed piping, conduit, and ductwork;

(2) Supports, hangers, air grilles, and registers;

(3) Miscellaneous metalwork and insulation coverings.

[b. Do not paint the following, unless indicated otherwise:

[ (1) New zinc-coated, aluminum, and copper surfaces under insulation
][ (2) New aluminum jacket on piping
][ (3) New interior ferrous piping under insulation.

][1.1.3.1 Fire Extinguishing Sprinkler Systems

Clean, pretreat, prime, and paint new fire extinguishing sprinkler systems including valves, piping, conduit, hangers, supports, miscellaneous...
metalwork, and accessories. Apply coatings to clean, dry surfaces, using clean brushes.

1.1.4 Exterior Painting of Site Work Items

**************************************************************************
NOTE: The following paragraph is tailored for inclusion in projects with exterior painting.

Insert list of Site Work Items to be painted in table below, such as hand rails, fire extinguishing systems, doors.
**************************************************************************

Field coat the following items:

<table>
<thead>
<tr>
<th>New Surfaces</th>
<th>Existing Surfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>a.</td>
<td></td>
</tr>
<tr>
<td>b.</td>
<td></td>
</tr>
<tr>
<td>c.</td>
<td></td>
</tr>
</tbody>
</table>

1.1.5 Miscellaneous Painting

1.1.5.1 Lettering [Building ][Room Number(s)]

Provide lettering [as scheduled on the drawings][block][Gothic] type, [black enamel][water-type decalcomania, finished with a protective coating of spar varnish]. Samples must be approved before application.

1.1.5.2 Obstructions To Aviation

**************************************************************************
NOTE: Specify by name structures such as smokestacks, poles, and buildings which have been identified as obstruction to aviation. Verify that the structures so identified are not specified to be painted in the sections specifying the structures so that painting will not be specified twice. Coordinate with FAA for alternate colors and patterns.
**************************************************************************

Paint the following obstructions to aviation in the pattern and color prescribed by FAA AC 70/7460-1: [smokestacks][poles][buildings][_____]
Use the Reference Wizard’s Check Reference feature when you add a Reference Identifier (RID) outside of the Section’s Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard’s Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 DEFINITIONS

1.3.1 Qualification Testing

Qualification testing is the performance of all test requirements listed in the product specification. This testing is accomplished by MPI to qualify each product for the MPI Approved Product List, and may also be accomplished by Contractor's third-party testing lab if an alternative to Batch Quality Conformance Testing by MPI is desired.

1.3.2 Batch Quality Conformance Testing

Batch quality conformance testing determines that the product provided is the same as the product qualified to the appropriate product specification. This testing must be accomplished by an MPI testing lab.

1.3.3 Coating

SSPC Glossary: (1) A liquid, liquefiable, or mastic composition that is converted to a solid protective, decorative, or functional adherent film after application as a thin layer; (2) Generic term for paint, lacquer, enamel.

1.3.4 DFT or dft

Dry film thickness, the film thickness of the fully cured, dry paint or coating.

1.3.5 DSD

Degree of Surface Degradation, the MPI system of defining degree of surface degradation. Five levels are generically defined under the Assessment sections in the MPI MRM, MPI Maintenance Repainting Manual.

1.3.6 EXT

**************************************************************************
NOTE: The following paragraph is tailored for inclusion in projects with exterior painting.
**************************************************************************

MPI short term designation for an exterior coating system.
1.3.7 INT

**************************************************************************
NOTE: The following paragraph is tailored for inclusion in projects with interior painting.
**************************************************************************

MPI short term designation for an interior coating system.

1.3.8 Loose Paint

Paint or coating that can be removed with a dull putty knife.

1.3.9 micron / microns

The metric measurement for 0.001 mm or one one-thousandth of a millimeter.

1.3.10 mil / mils

The English measurement for 0.001 in or one one-thousandth of an inch.

1.3.11 mm

The metric measurement for millimeter, 0.001 meter or one one-thousandth of a meter.

1.3.12 MPI Gloss Levels

MPI system of defining gloss. Seven gloss levels (G1 to G7) are generically defined under the Evaluation sections of the MPI Manuals. Traditionally, Flat refers to G1/G2, Eggshell refers to G3, Semigloss refers to G5, and Gloss refers to G6.

Gloss levels are defined by MPI as follows:

<table>
<thead>
<tr>
<th>Gloss Level</th>
<th>Description</th>
<th>Units at 60 degree angle</th>
<th>Units at 80 degree angle</th>
</tr>
</thead>
<tbody>
<tr>
<td>G1</td>
<td>Matte or Flat</td>
<td>0 to 5</td>
<td>10 max</td>
</tr>
<tr>
<td>G2</td>
<td>Velvet</td>
<td>0 to 10</td>
<td>10 to 35</td>
</tr>
<tr>
<td>G3</td>
<td>Eggshell</td>
<td>10 to 25</td>
<td>10 to 35</td>
</tr>
<tr>
<td>G4</td>
<td>Satin</td>
<td>20 to 35</td>
<td>35 min</td>
</tr>
<tr>
<td>G5</td>
<td>Semi-Gloss</td>
<td>35 to 70</td>
<td></td>
</tr>
<tr>
<td>G6</td>
<td>Gloss</td>
<td>70 to 85</td>
<td></td>
</tr>
<tr>
<td>G7</td>
<td>High Gloss</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Gloss is tested in accordance with ASTM D523. Historically, the Government has used Flat (G1 / G2), Eggshell (G3), Semi-Gloss (G5), and Gloss (G6).

1.3.13 MPI System Number

The MPI coating system number in each MPI Division found in either the MPI Architectural Painting Specification Manual or the Maintenance Repainting
Manual and defined as an exterior (EXT/REX) or interior system (INT/RIN).

1.3.14 Paint

SSPC Glossary; (1) Any pigmented liquid, liquefiable, or mastic composition designed for application to a substrate in a thin layer that is converted to an opaque solid film after application. Used for protection, decoration, identification, or to serve some other functional purposes; (2) Application of a coating material.

1.3.15 REX

**************************************************************************
NOTE: The following paragraph is tailored for inclusion in projects with exterior painting.
**************************************************************************

MPI short term designation for an exterior coating system used in repainting projects or over existing coating systems.

1.3.16 RIN

**************************************************************************
NOTE: The following paragraph is tailored for inclusion in projects with interior painting.
**************************************************************************

MPI short term designation for an interior coating system used in repainting projects or over existing coating systems.

1.4 SCHEDULING

**************************************************************************
NOTE: This Article is tailored for inclusion in NAVY projects only.
**************************************************************************

Materials that adsorb VOCs include carpets, textiles, unprimed gypsum wallboard, and acoustical ceiling panels. Add any of these materials that are included in the project and other adsorbing materials into the empty bracket.

**************************************************************************
Allow paint, polyurethane, varnish, and wood stain installations to cure prior to the installation of materials that adsorb VOCs, including[carpets,][textiles,][unprimed gypsum wallboard,][acoustical ceiling panels,][____].

1.5 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other
submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Samples of specified materials may be taken and tested for compliance with specification requirements.

SD-02 Shop Drawings
   Piping Identification

SD-03 Product Data
   Coating; G[, [______]]
   Product Data Sheets
   Sealant

SD-04 Samples
   Color; G[, [______]]
   Textured Wall Coating System; G[, [______]]
   [Sample Textured Wall Coating System Mock-Up; G[, [______]]]

SD-07 Certificates
1.6 QUALITY ASSURANCE

1.6.1 Regulatory Requirements

1.6.1.1 Environmental Protection

In addition to requirements specified elsewhere for environmental protection, provide coating materials that conform to the restrictions of the local Air Pollution Control District and regional jurisdiction. Notify Contracting Officer of any paint specified herein which fails to conform.

1.6.1.2 Lead Content

Do not use coatings having a lead content over 0.06 percent by weight of nonvolatile content.

1.6.1.3 Chromate Content

Do not use coatings containing zinc-chromate or strontium-chromate.

1.6.1.4 Asbestos Content

Provide asbestos-free materials.

1.6.1.5 Mercury Content

Provide materials free of mercury or mercury compounds.

1.6.1.6 Silica

Provide abrasive blast media containing no free crystalline silica.

1.6.1.7 Human Carcinogens

Provide materials that do not contain ACGIH 0100 confirmed human carcinogens (A1) or suspected human carcinogens (A2).

1.6.1.8 Carbon Based Fibers / Tubes

Materials must not contain carbon based fibers such as carbon nanotubes or
carbon nanofibers. Intelligence Bulletin 65 ranks toxicity of carbon nanotubes on a par with asbestos.

**************************************************************************
NOTE: Select only one of the following two bracketed paragraphs.
**************************************************************************

[1.6.2 Coating Contractor's Qualification

**************************************************************************
NOTE: When using the Contractor qualification clause rather than the SSPC Certification requirements, edit to require appropriate experience.
**************************************************************************

**************************************************************************
NOTE: Insert structure type comparable to those being painted in brackets.
**************************************************************************

Submit the name, address, telephone number, and e-mail address of the Contractor that will be performing all surface preparation and coating application. Submit evidence that key personnel have successfully performed surface preparation and application of coatings on [_____] on a minimum of three similar projects within the past three years. List information by individual and include the following:

a. Name of individual and proposed position for this work.

b. Information about each previous assignment including:

   Position or responsibility

   Employer (if other than the Contractor)

   Name of facility owner

   Mailing address and telephone number of facility owner

   Name of individual in facility owner's organization who can be contacted as a reference

   Location, size and description of structure

   Dates work was carried out

   Description of work carried out on structure

][1.6.3 SSPC QP 1 Certification

**************************************************************************
NOTE: For projects in continental U.S., Hawaii, Alaska, and Puerto Rico, require SSPC Certification. Use in other locations where qualified U.S. Contractor is desired. If project involves removal of paint containing hazardous materials, add requirement for SSPC QP 2 certification in section of specification where the
hazardous paint removal is specified, generally Section 02 83 00 LEAD REMEDIATION.

**************************************************************************

NOTE: **WARNING**WARNING**WARNING**WARNING**
Solicitations requiring SSPC Certification must point out the existence and location of the certification requirement, in the Project Information Form. To be enforceable, include the requirement in the solicitation documents. SSPC Certification is a special responsibility requirement pursuant to FAR 9.104-2 Special Standards. This is analogous to requiring bidders to have a specified level of experience or expertise and GAO has sustained these types of special requirements.

**************************************************************************

NOTE: Use bracket option below concerning SSPC QP 1 only when industrial coatings are required. Painting qualifications for projects such as BEQ's, training facilities and general administration buildings do not require QP 1 certification.

**************************************************************************

Contractors that perform surface preparation or coating application on steel substrates must be certified by the Society for Protective Coatings (formerly Steel Structures Painting Council) (SSPC) to the requirements of SSPC QP 1 prior to Contract award, and must remain certified while accomplishing any surface preparation or coating application. If a Contractor's certification expires, the firm will not be allowed to perform any work until the certification is reissued. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered. Notify the Contracting Officer of any change in Contractor certification status. Notify the Contracting Officer of all scheduled and unannounced on-site audits from SSPC and furnish a copy of all audit reports.

1.6.4 Approved Products List

The current MPI, "Approved Product List" which lists paint by brand, label, product name and product code as of the date of Contract award, will be used to determine compliance with the submittal requirements of this specification. The Contractor may choose to use a subsequent MPI "Approved Product List", however, only one list may be used for the entire Contract and each coating system is to be from a single manufacturer. Provide all coats on a particular substrate from a single manufacturer. No variation from the MPI Approved Products List is acceptable.

1.6.5 Paints and Coatings Indoor Air Quality Certifications

**************************************************************************

NOTE: The Government's preference is for use of products that have been certified for indoor air quality by a third-party organization such as MPI's MPI GPS-1-14 and MPI GPS-2-14 Green Performance Standards. Research has shown that all paints
except consolidated latex paints are available among three national manufacturers. Verify there is a certified product available when specifying consolidated latex paint that is both cost effective and appropriate for the project. Confirm local/regional availability of certified products when specifying consolidated latex paint that does not impact cost effectiveness.

**************************************************************************

Provide paint and coating products certified to meet indoor air quality requirements by MPI GPS-1-14, MPI GPS-2-14 or provide certification by other third-party programs. Provide current product certification documentation from certification body.

Provide certification of Indoor Air Quality for Paints and Primers. [Provide certification of Indoor Air Quality for Consolidated Latex Paints. ]Submit required indoor air quality certifications in one submittal package.

1.6.6 Field Samples and Tests

The Contracting Officer may choose up to two coatings that have been delivered to the site to be tested at no cost to the Government. Take samples of each chosen product as specified in the paragraph SAMPLING PROCEDURE. Test each chosen product as specified in the paragraph TESTING PROCEDURE. Remove products from the job site which do not conform, and replace with new products that conform to the referenced specification. Test replacement products that failed initial testing as specified in the paragraph TESTING PROCEDURE at no cost to the Government.

**************************************************************************

NOTE: The following paragraph is tailored for inclusion in ARMY projects only.

Only require the testing for large quantities of epoxy/polyurethane coatings or a single coating system that is used in large quantities on the project. A large quantity of epoxy/polyurethane coatings is considered to be 189 Liters 50 gallons or more, a large quantity of other coating systems is considered to be 757 Liters 200 gallons or more. List all coatings for testing by MPI or SSPC paint number in the following paragraph.

**************************************************************************

[ Another required testing is Batch Quality Conformance Testing to prove conformance of the manufacturer's paint to the specified MPI standard. This testing is accomplished before the materials are delivered to the job site. Provide testing for [_____] paint products. Test paint products as specified in the paragraph TESTING PROCEDURE. ]

1.6.6.1 Sampling Procedure

Select paint at random from the products that have been delivered to the job site for sample testing. The Contractor must provide one liter one quart samples of the selected paint materials. Take samples in the presence of the Contracting Officer, and label, and identify each sample. Provide labels in accordance with the paragraph PACKAGING, LABELING, AND STORAGE.
1.6.6.2 Testing Procedure

Provide Batch Quality Conformance Testing for specified products, as defined by and performed by MPI. As an alternative to Batch Quality Conformance Testing, the Contractor may provide Qualification Testing for specified products above to the appropriate MPI product specification, using the third-party laboratory approved under the paragraph QUALIFICATION TESTING laboratory for coatings. Include the backup data and summary of the test results within the qualification testing lab report. Provide a summary listing of all the reference specification requirements and the result of each test. Clearly indicate in the summary whether the tested paint meets each test requirement. Note that Qualification Testing may take 4 to 6 weeks to perform, due to the extent of testing required.

Submit name, address, telephone number, FAX number, and e-mail address of the independent third party laboratory selected to perform testing of coating samples for compliance with specification requirements. Submit documentation that laboratory is regularly engaged in testing of paint samples for conformance with specifications, and that employees performing testing are qualified. If MPI is chosen to perform the Batch Quality Conformance testing, the above submittal information is not required, only a letter is required from the Contractor stating that MPI will perform the testing.

1.6.7 Textured Wall Coating System

Three complete samples of each indicated type, pattern, and color of textured wall coating system applied to a panel of the same material as that on which the coating system will be applied in the work. Provide samples of wall coating systems minimum 125 by 175 mm 5 by 7 inches and of sufficient size to show pattern repeat and texture.

[1.6.8 Sample Textured Wall Coating System Mock-Up

**************************************************************************

NOTE: Include the following Mock-Up section when a textured wall coating system is included in the project.
**************************************************************************

After coating samples are approved and prior to starting installation, provide a minimum 2.43 m by 2.43 m 8 foot by 8 foot mock-up for each substrate and for each color and type of textured wall coating using the actual substrate materials. Use the approved mock-up samples as a standard of workmanship for installation within the facility. Submit at least 48 hour advance written notice to the Contracting Officer's Representative prior to mock-up installation.

]1.7 PACKAGING, LABELING, AND STORAGE

**************************************************************************

NOTE: The following paragraph includes tailoring for inclusion in Navy projects. Include the last two sentences for Navy projects only.

Materials with a high capacity to absorb VOC emissions include materials which are woven, fibrous or porous in nature, such as acoustical ceilings,
Provide paints in sealed containers that legibly show the Contract specification number, designation name, formula or specification number, batch number, color, quantity, date of manufacture, manufacturer's formulation number, manufacturer's directions including any warnings and special precautions, and name and address of manufacturer. Furnish pigmented paints in containers not larger than 20 liters 5 gallons. Store paints and thinners in accordance with the manufacturer's written directions, and as a minimum, stored off the ground, under cover, with sufficient ventilation to prevent the buildup of flammable vapors, and at temperatures between 4 to 35 degrees C 40 to 95 degrees F. Do not store paint, polyurethane, varnish, or wood stain products with materials that have a high capacity to absorb VOC emissions[, including [_____]]. Do not store paint, polyurethane, varnish, or wood stain products in occupied spaces.

1.8 SAFETY AND HEALTH

Comply with applicable Federal, State, and local laws and regulations, and with the ACCIDENT PREVENTION PLAN, including the Activity Hazard Analysis as specified in Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS and in Appendix A of EM 385-1-1. Include in the Activity Hazard Analysis the potential impact of painting operations on painting personnel and on others involved in and adjacent to the work zone.

1.8.1 Toxic Materials

To protect personnel from overexposure to toxic materials, conform to the most stringent guidance of:

a. The applicable manufacturer's Safety Data Sheets (SDS) or local regulation.

b. 29 CFR 1910.1000.

c. ACGIH 0100, threshold limit values.

NOTE: Delete following paragraph if no lead is contained in existing coating systems.

[ d. The appropriate OSHA standard in 29 CFR 1910.1025 and 29 CFR 1926.62 for surface preparation on painted surfaces containing lead. Removal and disposal of coatings which contain lead is specified in Section 02 83 00 LEAD REMEDIATION. Additional guidance is given in SSPC Guide 6 and SSPC Guide 7. Refer to drawings for list of hazardous materials located on this project. Coordinate paint preparation activities with this specification section.
]

NOTE: Delete following paragraph if no asbestos is contained in existing coating systems.

[ e. The appropriate OSHA standards in 29 CFR 1910.1001 for surface
preparation of painted surfaces containing asbestos. Removal and
disposal of coatings which contain asbestos materials is specified in
Section 02 82 00 ASBESTOS REMEDIATION. Refer to drawings for list of
hazardous materials located on this project. Coordinate paint
preparation activities with this specification section.

Submit manufacturer's Safety Data Sheets for coatings, solvents, and other
potentially hazardous materials, as defined in FED-STD-313.

1.9 ENVIRONMENTAL REQUIREMENTS

**************************************************************************
NOTE: Choose bracketed option in the following
paragraph if high emission paints or coatings, such
as epoxies or alkyds, will be used.
**************************************************************************

Comply, at minimum, with manufacturer recommendations for space ventilation
during and after installation.[ Isolate area of application from rest of
building when applying high-emission paints or coatings.]

1.9.1 Coatings

Do not apply coating when air or substrate conditions are:

a. Less than 3 degrees C 5 degrees F above dew point;

b. Below 10 degrees C 50 degrees F or over 35 degrees C 95 degrees F,
   unless specifically pre-approved by the Contracting Officer and the
   product manufacturer. Do not, under any circumstances, violate the
   manufacturer's application recommendations.

1.9.2 Post-Application

**************************************************************************
NOTE: The following paragraphs are tailored for
inclusion in NAVY projects only.
**************************************************************************

Choose the most appropriate option(s) for
ventilation. For instance, high-humidity regions
may generate too much condensate when using 100
percent outside air.

**************************************************************************
Vacate space for as long as possible after application. Wait a minimum of
48 hours before occupying freshly painted rooms. Maintain one of the
following ventilation conditions during the curing period, or for 72 hours
after application:

a. Supply 100 percent outside air 24 hours a day.

b. Supply airflow at a rate of 6 air changes per hour, when outside
temperatures are between 13 degrees C 55 degrees F and 29 degrees C 85
degrees F and humidity is between 30 percent and 60 percent.

c. Supply airflow at a rate of 1.5 air changes per hour, when outside air
   conditions are not within the range stipulated above.
PART 2   PRODUCTS

2.1 MATERIALS

**************************************************************************
NOTE: Reprocessed and consolidated latex paints are EPA designated products. Verify the availability of certified products within the region when specifying consolidated latex paint.
**************************************************************************

Conform to the coating specifications and standards referenced in PART 3. Submit Product Data Sheets for specified coatings and solvents. Provide preprinted cleaning and maintenance instructions for all coating systems. Submit Manufacturer's Instructions on Mixing: Detailed mixing instructions, minimum and maximum application temperature and humidity, pot life, and curing and drying times between coats.

[2.2 COLOR CODING FOR SHORE-TO-SHIP UTILITY CONNECTIONS

**************************************************************************
NOTE: Include the following bracketed paragraph and Table if the project includes painting of Shore-To-Ship Utility connections
**************************************************************************

Color Coding For Shore-To-Ship Utility Connections: Paint hose connection fittings and shut-off valves the designated color. In addition to color coding provide 50 mm 2 inch high stenciled letters using black stencil paint, clearly designating service for each connection.

<table>

* This includes connections serving domestic functions.
2.3 **COLOR SELECTION OF FINISH COATS**

Provide colors of finish coats as indicated or specified. Allow Contracting Officer to select colors not indicated or specified. Manufacturers' names and color identification are used for the purpose of color identification only. Named products are acceptable for use only if they conform to specified requirements. Products of other manufacturers are acceptable if the colors are approximately the colors indicated and the product conforms to specified requirements.

**************************************************************************
NOTE: On Navy projects, do not use Section 09 06 00 SCHEDULES FOR FINISHES. Provide color selection on the Contract drawings.
**************************************************************************

Provide color, texture, and pattern of wall coating systems as indicated in accordance with Section 09 06 00 SCHEDULES FOR FINISHES. Submit manufacturer's samples of paint colors. Cross reference color samples to color scheme as indicated. Submit color stencil codes. Tint each coat progressively darker to enable confirmation of the number of coats.

PART 3 EXECUTION

**************************************************************************
NOTE: Exercise caution when deviating from paint systems listed in tables of PART 3 EXECUTION. Verify compatibility and suitability of paint systems substituted by reviewing the Evaluation of Systems sections of the MPI Manuals.
**************************************************************************

3.1 PROTECTION OF AREAS AND SPACES NOT TO BE PAINTED

Prior to surface preparation and coating applications, remove, mask, or otherwise protect hardware, hardware accessories, machined surfaces, radiator covers, plates, lighting fixtures, public and private property, and other such items not to be coated that are in contact with surfaces to be coated. Following completion of painting, reinstall removed items by workmen skilled in the trades. Restore surfaces contaminated by coating materials, to original condition and repair damaged items.

[3.2 REPUTTYING AND REGLAZING

**************************************************************************
NOTE: Include this paragraph only for projects involving painting of existing windows but not including a glazing section. Reputting work should be covered in glazing section if such a section is used in the project specifications. This is
normally used in historical preservation. Avoid using linseed oil putty at building interior.

Remove cracked, loose, and defective putty or glazing compound on glazed sash and provide new putty or glazing compound. Where defective putty or glazing compound constitutes 30 percent or more of the putty at any one light, remove the glass and putty or glazing compound and reset the glass. Remove putty or glazing compound without damaging sash or glass. Clean rabbets to bare wood or metal and prime prior to reglazing. Provide linseed oil putty for wood sash. Patch surfaces to provide smooth transition between existing and new surfaces. Finish putty or glazing compound to a neat and true bead. Allow glazing compound time to cure, in accordance with manufacturer's recommendation, prior to coating application. Allow putty to set one week prior to coating application.

3.3 RESEALING OF EXISTING EXTERIOR JOINTS

NOTE: The following Article is tailored for inclusion in projects with exterior painting.

3.3.1 Surface Condition

NOTE: Include this paragraph only for projects involving resealing of existing exterior joints but not including a sealant Section 07 92 00 JOINT SEALANTS. Such work should be covered in sealant section if such a section is used in the project specifications.

Begin with surfaces that are clean, dry to the touch, and free from frost and moisture; remove grease, oil, wax, lacquer, paint, defective backstop, or other foreign matter that would prevent or impair adhesion. Where adequate grooves have not been provided, clean out to a depth of 13 mm 1/2 inch and grind to a minimum width of 6 mm 1/4 inch without damage to adjoining work. Grinding is not required on metal surfaces.

3.3.2 Backstops

In joints more than 13 mm 1/2 inch deep, install glass fiber roving or neoprene, butyl, polyurethane, or polyethylene foams free of oil or other staining elements as recommended by sealant manufacturer. Provide backstop material compatible with sealant. Do not use oakum and other types of absorptive materials as backstops.

3.3.3 Primer and Bond Breaker

Install the type recommended by the sealant manufacturer.

3.3.4 Ambient Temperature

Between 4 degrees C 38 degrees F and 35 degrees C 95 degrees F when applying sealant.
3.3.5 Exterior Sealant

For joints in vertical surfaces, provide ASTM C920, Type S or M, Grade NS, Class 25, Use NT. For joints in horizontal surfaces, provide ASTM C920, Type S or M, Grade P, Class 25, Use T. Color(s) will be selected by the Contracting Officer. Apply the sealant in accordance with the manufacturer's printed instructions. Force sealant into joints with sufficient pressure to fill the joints solidly. Apply sealant uniformly smooth and free of wrinkles.

3.3.6 Cleaning

Immediately remove fresh sealant from adjacent areas using a solvent recommended by the sealant manufacturer. Upon completion of sealant application, remove remaining smears and stains and leave the work in a clean condition. Allow sealant time to cure, in accordance with manufacturer's recommendations, prior to coating.

3.4 SURFACE PREPARATION

**************************************************************************

NOTE: Define existing coating systems compositionally before recoating.

1. Hazardous Materials: Follow regulatory restrictions when planning either partial or full removal of existing coatings. Records establishing the composition of materials in the coating systems, if available, may assist in a preliminary review of planned surface preparation and disposal. Generally an overall assessment of applicable regulations for personnel and environmental protection will be required, with appropriate sampling and testing, followed by use of proper material control procedures.

2. Determine compatibility of the existing coating system with a planned repair or overcoating system by procedures such as the following:

   a. Identification of the existing topcoat and any undercoats that will be exposed, by consulting local records.

   b. If binder extraction is possible, ASTM D2621, "Infrared Identification of Vehicle Solids from Solvent-Reducible Paints," can be used for vehicle identification.

   c. General compatibility considerations and chart listings of expected relationships between binder types are given in MPI Evaluation of systems, "Transition Coat and Architectural Paint Compatibility Chart". Consult coating specialist codes regarding questionable compatibilities indicated in the chart.

   d. For some maintenance operations, use of ASTM D5064, "Standard Practice for Conducting a Patch
Test to Assess Coating Compatibility," may be warranted. Interpretation of the results of patch testing is not always straightforward, therefore, consult appropriate coating specialists when considering patch testing.

**************************************************************************

NOTE: Specify nonhazardous cleaning agents when possible.

**************************************************************************

Remove dirt, splinters, loose particles, grease, oil, [disintegrated coatings], and other foreign matter and substances deleterious to coating performance as specified for each substrate before application of paint or surface treatments. Remove oil and grease prior to mechanical cleaning. Schedule cleaning so that dust and other contaminants will not fall on wet, newly painted surfaces. Spot-prime exposed ferrous metals such as nail heads on or in contact with surfaces to be painted with water-thinned paints, with a suitable corrosion-inhibitive primer capable of preventing flash rusting and compatible with the coating specified for the adjacent areas. Refer to MPI ASM and MPI MRM for additional more specific substrate preparation requirements.

[3.4.1 Additional Requirements for Preparation of Surfaces With Existing Coatings

**************************************************************************

NOTE: Delete inapplicable phrases or entire paragraph if no previously painted surfaces will be encountered.

**************************************************************************

Before application of coatings, perform the following on surfaces covered by soundly-adhered coatings, defined as those which cannot be removed with a putty knife:

a. Test existing finishes for lead before sanding, scraping, or removing. If lead is present, refer to paragraph Toxic Materials.

b. Wipe previously painted surfaces to receive solvent-based coatings, except stucco and similarly rough surfaces clean with a clean, dry cloth saturated with mineral spirits, ASTM D235 or as specified in MPI MRM. Wipe the surfaces dry with a clean, dry, lint free cloth. Wipe immediately preceding the application of the first coat of any coating, unless specified otherwise.

c. Sand existing glossy surfaces to be painted to reduce gloss. Brush, and wipe clean with a damp cloth to remove dust.

d. The requirements specified are minimum. Comply also with the application instructions of the paint manufacturer and specific surface preparation requirements as outlined in MPI MRM Exterior Surface Preparation and Interior Surface Preparation.

e. Thoroughly clean previously painted surfaces [specified to be repainted] [damaged during construction] of all grease, dirt, dust or other foreign matter.
f. Remove blistering, cracking, flaking and peeling or otherwise deteriorated coatings.

g. Remove chalk so that when tested in accordance with ASTM D4214, the chalk resistance rating is no less than 8.

h. Roughen slick surfaces. Repair damaged areas such as, but not limited to, nail holes, cracks, chips, and spalls with suitable material to match adjacent undamaged areas.

i. Feather and sand smooth edges of chipped paint.

j. Clean rusty metal surfaces in accordance with SSPC requirements. Use solvent, mechanical, or chemical cleaning methods to provide surfaces suitable for painting.

k. Provide new, proposed coatings that are compatible with existing coatings.

][3.4.2 Existing Coated Surfaces with Minor Defects

**************************************************************************
NOTE: Delete inapplicable phrases or entire paragraph if no previously painted surfaces will be encountered.
**************************************************************************

[Sand, spackle, and treat minor defects to render them smooth. Minor defects are defined as scratches, nicks, cracks, gouges, spalls, alligatoring, chalking, and irregularities due to partial peeling of previous coatings.][ Remove chalk by sanding or blasting so that when tested in accordance with ASTM D4214, the chalk rating is not less than 8.]

][3.4.3 Removal of Existing Coatings

**************************************************************************
NOTE: Delete this paragraph if project does not include removal of existing coatings.
**************************************************************************

Remove existing coatings from the following surfaces:

a. Surfaces containing large areas of minor defects;

b. Surfaces containing more than 20 percent peeling area; and

c. Surfaces designated by the Contracting Officer, such as surfaces where rust shows through existing coatings.

][3.4.4 Substrate Repair

a. Repair substrate surface damaged during coating removal;

b. Sand edges of adjacent soundly-adhered existing coatings so they are tapered as smooth as practical to areas involved with coating removal; and

c. Clean and prime the substrate as specified.
3.5 PREPARATION OF METAL SURFACES

3.5.1 Existing and New Ferrous Surfaces

**************************************************************************

NOTE: Surface preparation procedures must be compliant with any local or base restrictions. Specify use of nonhazardous cleaning agents when possible. For cleaning or blasting ferrous surfaces, select applicable options from the table below.

The considerations suggested here for painting over existing paint are covered in a Coating Condition Survey (CCS). Consult UFC 3-190-06 "Protective Coatings and Paints" for details. The intent of performing a CCS is to be able to design a maintenance coating project that carries minimum risk of coating failure.

Use the following table to help select a primer type and surface preparation to specify for steel surfaces. The table provides minimum requirements for mild or severe exposure. Mild exposure includes climate-controlled environments, project locations with Environmental Severity Classifications (ESC) C1 or C2, and low humidity locations. Severe exposure includes high humidity locations or project locations with ESC of C3 thru C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). See UFC 1-200-01 for determination of ESC for project locations. Severe exposure also includes marine, chemical, or immersion service, as well as application of heat resistant or nonslip floor coatings. A high-performing system may be a better choice for longer performance, even in mild exposure.

</table>
Ferrous Surface Preparation

a. If it is not possible to abrasive blast or use waterjetting, SP 11 is recommended. It is considered equivalent to SP 6. SP 11 is also preferred wherever SP 2 or SP 3 are shown in the Table.

b. For marine, chemical, or immersion service, or application of heat resistant or nonslip floor coatings. SP 10 is preferred for zinc-rich primers, and for extremely severe environments where long-term performance is desired.

c. Use water jetting to SSPC-SP WJ-3/NACE WJ-3, as alternate to SSPC SP 6 degree of cleanliness where abrasive blasting cannot be used.

d. Use only the steam clean, or non-alkaline detergent solutions of SP 1.

e. First, remove chalk and dirt with a non-alkaline detergent solution, and follow with power wash to SSPC-SP WJ-4/NACE WJ-4. Second, spot clean, in order of preference by SSPC SP 6, SSPC SP 11, SSPC SP 7, SSPC SP 3, or SSPC SP 2.

f. First, remove chalk and dirt with a non-alkaline detergent solution, and follow with power wash to SSPC-SP WJ-4/NACE WJ-4.

**************************************************************************

a. Ferrous Surfaces including Shop-coated Surfaces and Small Areas That Contain Rust, Mill Scale and Other Foreign Substances: [Solvent clean][ or ][detergent wash] in accordance with SSPC SP 1 to remove oil and grease. Where shop coat is missing or damaged, clean according to [SSPC SP 2, ][SSPC SP 3, ][SSPC SP 6/NACE No.3, ] or [SSPC SP 10/NACE No. 2]. [Brush-off blast remaining surface in accordance with SSPC 7/NACE No.4]; [Water jetting to SSPC-SP WJ-4/NACE WJ-4 may be used to remove loose coating and other loose materials. Use inhibitor as recommended by coating manufacturer to prevent premature rusting.]

**************************************************************************

NOTE: For rusted surfaces, modify surface preparation requirements to include near white blast cleaning in accordance with SSPC SP 10 or waterjetting equivalent of WJ-2 prior to coating application.

**************************************************************************

c. Metal Floor Surfaces to Receive Nonslip Coating: Clean in accordance with [SSPC SP 10/NACE No. 2][SSPC-SP WJ-2/NACE WJ-2].

SECTION 09 90 00 Page 34
3.5.2 Final Ferrous Surface Condition:

**************************************************************************
NOTE: Verify there are no local or base restrictions on use of abrasive blasting. Specify cleaning options as follows:

<table>
<thead>
<tr>
<th>Type Coating</th>
<th>Level of Cleaning, SSPC SP</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Latex or Alkyd</td>
<td>2, 3, 6 or SP 12 WJ-2. (7 and 10, SSPC-SP WJ-2/NACE WJ-2 or SSPC-SP WJ-1/NACE WJ-1 may be left in as Contractor options)</td>

<tr>
<td>b. High Performance (i.e. Epoxy, Urethane, others)</td>
<td>6,10</td>
</tr>
</tbody>
</table>

**************************************************************************

3.5.2.1 Tool Cleaned Surfaces

Comply with SSPC SP 2 and SSPC SP 3. Use as a visual reference, photographs in SSPC VIS 3 for the appearance of cleaned surfaces.

3.5.2.2 Abrasive Blast Cleaned Surfaces

Comply with SSPC 7/NACE No.4, SSPC SP 6/NACE No.3, and SSPC SP 10/NACE No. 2. Use as a visual reference, photographs in SSPC VIS 1 for the appearance of cleaned surfaces.

3.5.2.3 Waterjet Cleaned Surfaces

3.5.3 Galvanized Surfaces

**************************************************************************
NOTE: Choose bracketed items in paragraph below according to scope of project. Local restrictions may apply or limits imposed by project location.
**************************************************************************

a. New or Existing Galvanized Surfaces With Only Dirt and Zinc Oxidation Products: Clean with [solvent, ] [steam, ] [or ] [non-alkaline detergent solution] in accordance with SSPC SP 1. Completely remove coating by brush-off abrasive blast if the galvanized metal has been passivated or stabilized. Do not "passivate" or "stabilize" new galvanized steel to be coated. If the absence of hexavalent stain inhibitors is not documented, test as described in ASTM D6386, Appendix X2, and remove by one of the methods described therein.

**************************************************************************
NOTE: Delete the text below if there are no existing surfaces to receive coatings. Verify there are no local or base restrictions on the use of
abrasive blasting.

b. Galvanized with Slight Coating Deterioration or with Little or No Rusting: Water jetting to SSPC-SP WJ-3/NACE WJ-3 to remove loose coating from surfaces with less than 20 percent coating deterioration and no blistering, peeling, or cracking. Use inhibitor as recommended by the coating manufacturer to prevent rusting.

3.5.4 Non-Ferrous Metallic Surfaces

Aluminum and aluminum-alloy, lead, copper, and other nonferrous metal surfaces.

Surface Cleaning: Solvent clean in accordance with SSPC SP 1 and wash with mild non-alkaline detergent to remove dirt and water soluble contaminants.

3.5.5 Terne-Coated Metal Surfaces

Solvent clean surfaces with mineral spirits, ASTM D235. Wipe dry with clean, dry cloths.

3.5.6 Existing Surfaces with a Bituminous or Mastic-Type Coating

Remove chalk, mildew, and other loose material by washing with a solution of 0.20 liter 1/2 cup trisodium phosphate, 0.1 liter 1/4 cup household detergent, 1.6 liters one quart 5 percent sodium hypochlorite solution and 4.8 liters 3 quarts of warm water.

3.6 PREPARATION OF CONCRETE AND CEMENTITIOUS SURFACE

3.6.1 Concrete and Masonry

a. Curing: Allow concrete, stucco and masonry surfaces to cure at least 30 days before painting, and concrete slab on grade to cure at least 90 days before painting.

b. Surface Cleaning: Remove the following deleterious substances.

NOTE: Choose bracketed items in subparagraphs below according to scope of project that should be based on a coating condition survey.

(1) Dirt, [Chalking,] Grease, and Oil: Wash new[ and existing uncoated] surfaces with a solution composed of 0.2 liter 1/2 cup
trisodium phosphate, 0.1 liter 1/4 cup household detergent, and 6.4 liters 4 quarts of warm water. Then rinse thoroughly with fresh water. For large areas, water blasting may be used.

(2) Fungus and Mold: Wash [new][, existing coated,] [and existing uncoated] surfaces with a solution composed of 0.2 liter 1/2 cup trisodium phosphate, 0.1 liter 1/4 cup household detergent, 1.6 liters one quart 5 percent sodium hypochlorite solution and 4.8 liters 3 quarts of warm water. Rinse thoroughly with fresh water.

(3) Paint and Loose Particles: Remove by wire brushing.

(4) Efflorescence: Remove by scraping or wire brushing followed by washing with a 5 to 10 percent by weight aqueous solution of hydrochloric (muriatic) acid. Do not allow acid to remain on the surface for more than five minutes before rinsing with fresh water. Do not acid clean more than 0.4 square meter 4 square feet of surface, per workman, at one time.

(5) Removal of Existing Coatings: For surfaces to receive textured coating MPI 42, remove existing coatings including soundly adhered coatings if recommended by textured coating manufacturer.

c. Cosmetic Repair of Minor Defects: Repair or fill mortar joints and minor defects, including but not limited to spalls, in accordance with manufacturer's recommendations and prior to coating application.

d. Allowable Moisture Content: Latex coatings may be applied to damp surfaces, but not to surfaces with droplets of water. Do not apply epoxies to damp vertical surfaces as determined by ASTM D4263 or horizontal surfaces that exceed 169.0 micrograms moisture per second, square meter 3 lbs of moisture per 1000 square feet in 24 hours as determined by ASTM F1869. In all cases follow manufacturer's recommendations. Allow surfaces to cure a minimum of 30 days before painting.

3.6.2 Gypsum Board, Plaster, and Stucco

3.6.2.1 Surface Cleaning

Verify that plaster and stucco surfaces are free from loose matter and that gypsum board is dry. Remove loose dirt and dust by brushing with a soft brush, rubbing with a dry cloth, or vacuum-cleaning prior to application of the first coat material. A damp cloth or sponge may be used if paint is water-based.

3.6.2.2 Repair of Minor Defects

Prior to painting, repair joints, cracks, holes, surface irregularities, and other minor defects with patching plaster or spackling compound and sand smooth.

3.6.2.3 Allowable Moisture Content

Latex coatings may be applied to damp surfaces, but not surfaces with droplets of water. Do not apply epoxies to damp surfaces as determined by ASTM D4263. Verify that new plaster to be coated has a maximum moisture
content of 8 percent, when measured in accordance with ASTM D4444, Method A, unless otherwise authorized. In addition to moisture content requirements, allow new plaster to age a minimum of 30 days before preparation for painting.

[3.6.3 Existing Asbestos Cement Surfaces

**************************************************************************

NOTE: Delete entire paragraph if no asbestos cement surfaces will be encountered.
**************************************************************************

Remove oily stains by solvent cleaning with mineral spirits in accordance with MIL-PRF-680 or ASTM D235. Remove loose dirt, dust, and other deleterious substances by brushing with a soft brush or rubbing with a dry cloth prior to application of the first coat material. Do not wire brush or clean using other abrasive methods. Verify surfaces are dry and clean prior to application of the coating.

][3.7 PREPARATION OF WOOD AND PLYWOOD SURFACES

**************************************************************************

NOTE: Choose bracketed items in this Article according to scope of project.
**************************************************************************

Delete inapplicable phrases or entire Article if no wood surfaces will be encountered.
**************************************************************************

3.7.1 New[, Existing Uncoated,][ and][ Existing Coated] Plywood and Wood Surfaces, Except Floors:

a. Surface Cleaning: Clean wood surfaces of foreign matter. Verify that surfaces are free from dust and other deleterious substances and in a condition approved by the Contracting Officer prior to receiving paint or other finish. Do not use water to clean uncoated wood.[ Scrape to remove loose coatings. Lightly sand to roughen the entire area of previously enamel-coated wood surfaces.]

[ b. Removal of Fungus and Mold: Wash existing coated surfaces with a solution composed of 0.2 liter 3 ounces (2/3 cup) trisodium phosphate, 0.1 liter one ounce (1/3 cup) household detergent, 1.6 liters one quart 5 percent sodium hypochlorite solution and 4.8 liters 3 quarts of warm water. Rinse thoroughly with fresh water.

] c. Do not exceed 12 percent moisture content of the wood as measured by a moisture meter in accordance with ASTM D4444, Method A, unless otherwise authorized.

d. Prime or touch up wood surfaces adjacent to surfaces to receive water-thinned paints before applying water-thinned paints.

e. Cracks and Nailheads: Set and putty stop nailheads and putty cracks after the prime coat has dried.

f. Cosmetic Repair of Minor Defects:

(1) Knots and Resinous Wood[ and Fire, Smoke, Water, and Color Marker Stained Existing Coated Surface]: Prior to application of
coating, cover knots and stains with two or more coats of 1.3-kg-cut 3-pound-cut shellac varnish, plasticized with 0.14 liters 5 ounces of castor oil per liter gallon. Scrape away existing coatings from knotty areas, and sand before treating. Prime before applying any putty over shellacked area.

(2) Open Joints and Other Openings: Fill with whiting putty, linseed oil putty. Sand smooth after putty has dried.

(3) Checking: Where checking of the wood is present, sand the surface, wipe and apply a coat of pigmented orange shellac. Allow to dry before paint is applied.

g. Prime Coat For New Exterior Surfaces: Prime coat [wood doors, ][windows, ][frames, ][and ][trim] before wood becomes dirty, warped[ or weathered].

3.7.2 Wood Floor Surfaces, Natural Finish

a. Initial Surface Cleaning: As specified in Article SURFACE PREPARATION.

[ b. Existing Loose Boards and Shoe Molding: Before sanding, renaill loose boards. Countersink nails and fill with an approved wood filler. Remove shoe molding before sanding and reinstall after completing other work. At Contractor's option, new shoe molding may be provided in lieu of reinstalling old. Provide new wood molding of the same size, wood species, and finish as the existing.

] c. Sanding and Scraping: Sanding of wood floors is specified in Section [ 09 64 29 WOOD STRIP AND PLANK FLOORING] [09 64 23 WOOD PARQUET FLOORING] [09 64 66 WOOD ATHLETIC FLOORING] [09 64 00 PORTABLE (DEMOUNTABLE) WOOD FLOORING]. Fill floors of oak or similar open-grain wood with wood filler recommended by the finish manufacturer and the excess filler removed.

d. Final Cleaning: After sanding, sweep and vacuum floors clean. Do not walk on floors thereafter until specified sealer has been applied and is dry.

3.7.3 Interior Wood Surfaces, Stain Finish

**************************************************************************
NOTE: The following paragraph is tailored for inclusion in projects with interior painting.
**************************************************************************

Sand interior wood surfaces to receive stain. Fill oak and other open-grain wood to receive stain with a coat of wood filler not less than 8 hours before the application of stain; remove excess filler and sand the surface smooth.

3.7.4 Water Blasting of Existing Coated Wood Surfaces:

**************************************************************************
NOTE: Require water blasting for existing wood surfaces only for architectural restoration work where the cost is justified.
**************************************************************************

Add surfaces to be water blasted, such as wood
siding, in brackets.

Provide water blasting for the following surfaces: [____].

da. Sample Panel: Prior to the initial surface cleaning, water blast a representative surface designated by the Contracting Officer. Provide surface cleaning of the remaining work to match the sample panel approved by the Contracting Officer.

db. Initial Surface Cleaning: Water blast surfaces to receive paint with a high pressure spray, to remove loose paint, dirt, and other foreign or deleterious materials. Provide working pressure less than 17 MPa 2500 pounds per square inch gage (psig). Do not flood vents or damage windows and floors. If the pressure specified will cause damage to existing wood, advise the Contracting Officer and obtain permission to vary the pressure. Direct the wash nozzle at the surface at an angle of approximately 75 degrees with the surface and at a distance not greater than 1500 mm 5 feet to apply water pressure required to remove loose paint, dirt, chalking, and other foreign matter.

dc. Final Surface Cleaning: After allowing the surfaces to dry for a minimum of 24 hours, remove remaining dirt, splinters, loose particles, disintegrated and loose paint, grease, oil, and other foreign matter from the surface.

3.8 APPLICATION

3.8.1 Coating Application

NOTE: Use the second bracket option when fire protection sprinkler systems including valve, piping, conduit, hangers and other miscellaneous items are to be painted.

a. Comply with applicable federal, state and local laws enacted to ensure compliance with Federal Clean Air Standards. Apply coating materials in accordance with SSPC PA 1. SSPC PA 1 methods are applicable to all substrates, except as modified herein.

b. At the time of application, paint must show no signs of deterioration. Maintain uniform suspension of pigments during application.

c. Unless otherwise specified or recommended by the paint manufacturer, paint may be applied by brush, roller, or spray. Use trigger operated spray nozzles for water hoses. Use rollers for applying paints and enamels of a type designed for the coating to be applied and the surface to be coated. Wear protective clothing and respirators when applying oil-based paints or using spray equipment with any paints.

d. Only apply paints, except water-thinned types, to surfaces that are completely free of moisture as determined by sight or touch.

e. Thoroughly work coating materials into joints, crevices, and open spaces. Pay special attention to ensure that all edges, corners, crevices, welds, and rivets receive a film thickness equal to that of adjacent painted surfaces.
f. Apply each coat of paint so that dry film is of uniform thickness and free from runs, drops, ridges, waves, pinholes or other voids, laps, brush marks, and variations in color, texture, and finish. Completely hide all blemishes.

**************************************************************************
NOTE: Use broom cleaning when other means are not available.
**************************************************************************

g. Touch up damaged coatings before applying subsequent coats. [Broom clean and clear dust from interior areas before and during the application of coating material.]

**************************************************************************
NOTE: Delete inapplicable phrases or entire subparagraphs if no fire extinguishing sprinkler system surfaces will be encountered.
**************************************************************************

[  h. Apply paint to new fire extinguishing sprinkler systems including valves, piping, conduit, hangers, supports, miscellaneous metal work, and accessories. Shield sprinkler heads with protective coverings while painting is in progress. Remove sprinkler heads which have been painted and replace with new sprinkler heads. Unfinished spaces include attic spaces, spaces above suspended ceilings, crawl spaces, pipe chases, mechanical equipment room, and spaces where walls or ceiling are not painted or not constructed of a prefinished material. Upon completion of painting, remove protective covering from sprinkler heads.

i. Piping in Unfinished Areas: Provide primed surfaces with one coat of red alkyd gloss enamel (MPI 9) applied to a minimum dry film thickness of 0.025 mm 1.0 mil in attic spaces, spaces above suspended ceilings, crawl spaces, pipe chases, mechanical equipment room, and spaces where walls or ceiling are not painted or not constructed of a prefinished material.

j. Piping in Finished Areas: Provide primed surfaces with two coats of paint to match adjacent surfaces, except provide valves and operating accessories with one coat of red alkyd gloss enamel (MPI 9) applied to a minimum dry film thickness of 0.025 mm 1.0 mil or two component gloss polyurethane (MPI 72) in exterior applications.

k. Provide labeling on the surfaces of all feed and cross mains to show the pipe function such as "Sprinkler System", "Fire Department Connection", "Standpipe". For pipe sizes 100 mm 4-inch and larger provide white painted stenciled letters and arrows, a minimum of 50 mm 2 in in height and visible from at least two sides when viewed from the floor. For pipe sizes less than 100 mm 4-inch, provide white painted stenciled letters and arrows, a minimum of 18 mm 0.75 in in height and visible from the floor.

l. All fire suppression system valves must be marked with permanent tags indicating normally open or normally closed.

]  m. Drying Time: Allow time between coats, as recommended by the coating
manufacturer, to permit thorough drying, but not to present topcoat adhesion problems. Provide each coat in specified condition to receive next coat.

n. Primers, and Intermediate Coats: Do not allow primers or intermediate coats to dry more than 30 days, or longer than recommended by manufacturer, before applying subsequent coats. Follow manufacturer's recommendations for surface preparation if primers or intermediate coats are allowed to dry longer than recommended by manufacturers of subsequent coatings. Cover each preceding coat or surface completely by ensuring visually perceptible difference in shades of successive coats.

o. Finished Surfaces: Provide finished surfaces free from runs, drops, ridges, waves, laps, brush marks, and variations in colors.

p. Thermosetting Paints: Apply topcoats over thermosetting paints (epoxies and urethanes) within the overcoat window recommended by the manufacturer.

**************************************************************************
NOTE: Choose bracketed items in the subparagraph below according to scope of project.
Delete inapplicable phrases or entire subparagraph if nonslip surfacing to floors or ramps will not be encountered.
**************************************************************************

q. Floors: [For nonslip surfacing on level floors, as the intermediate coat is applied, cover wet surface completely with almandite garnet, Grit No. 36, with maximum passing U.S. Standard Sieve No. 40 less than 0.5 percent. When the coating is dry, use a soft bristle broom to sweep up excess grit, which may be reused, and vacuum up remaining residue before application of the topcoat.][For nonslip surfacing on ramps, provide MPI 77 with non-skid additive, applied by roller in accordance with manufacturer's instructions.]

3.8.2 Mixing and Thinning of Paints

Reduce paints to proper consistency by adding fresh paint, except when thinning is mandatory to suit surface, temperature, weather conditions, application methods, or for the type of paint being used. Obtain written permission from the Contracting Officer to use thinners. Verify that the written permission includes quantities and types of thinners to use.

When thinning is allowed, thin paints immediately prior to application with not more than 0.125 L one pint of suitable thinner per liter gallon. The use of thinner does not relieve the Contractor from obtaining complete hiding, full film thickness, or required gloss. Thinning cannot cause the paint to exceed limits on volatile organic compounds. Do not mix paints of different manufacturers.

3.8.3 Two-Component Systems

Mix two-component systems in accordance with manufacturer's instructions. Follow recommendation by the manufacturer for any thinning of the first coat to ensure proper penetration and sealing for each type of substrate.
3.8.4 Coating Systems

**************************************************************************
NOTE: Delete MPI Divisions from the Table listing below that are not required for the project.
**************************************************************************

a. Systems by Substrates: Apply coatings that conform to the respective specifications listed in the following Tables:

**************************************************************************
NOTE: The following Table is tailored for inclusion in projects with exterior painting.
**************************************************************************

<table>
<thead>
<tr>
<th>MPI Division</th>
<th>Substrate Application</th>

b. Minimum Dry Film Thickness (DFT): Apply paints, primers, varnishes, enamels, undercoats, and other coatings to a minimum dry film thickness
of 0.038 mm 1.5 mil each coat unless specified otherwise in the Tables. Coating thickness, where specified, refers to the minimum dry film thickness.

c. Coatings for Surfaces Not Specified Otherwise: Coat unspecified surfaces the same as surfaces having similar conditions of exposure.

d. Existing Surfaces Damaged During Performance of the Work, Including New Patches In Existing Surfaces: Coat surfaces with the following:

(1) One coat of primer.

(2) One coat of undercoat or intermediate coat.

(3) One topcoat to match adjacent surfaces.

e. Existing Coated Surfaces To Be Painted: Apply coatings conforming to the respective specifications listed in the Tables herein, except that pretreatments, sealers and fillers need not be provided on surfaces where existing coatings are soundly adhered and in good condition. Do not omit undercoats or primers.

3.9 COATING SYSTEMS FOR METAL

Apply coatings of Tables in MPI Division 5 for Exterior and Interior.

a. Apply specified ferrous metal primer to steel surfaces on the same day that surface is cleaned, to surfaces that meet all specified surface preparation requirements at time of application.

b. Inaccessible Surfaces: Prior to erection, use one coat of specified primer on metal surfaces that will be inaccessible after erection.

c. Shop-primed Surfaces: Touch up exposed substrates and damaged coatings to protect from rusting prior to applying field primer.

d. Surface Previously Coated with Epoxy or Urethane: Apply MPI 101, 0.038 mm 1.5 mils DFT immediately prior to application of epoxy or urethane coatings.

e. Pipes and Tubing: The semitransparent film applied to some pipes and tubing at the mill is not to be considered a shop coat. Overcoat these items with the specified ferrous-metal primer prior to application of finish coats.

f. Exposed Nails, Screws, Fasteners, and Miscellaneous Ferrous Surfaces. On surfaces to be coated with water thinned coatings, spot prime exposed nails and other ferrous metal with latex primer MPI 107.

3.10 COATING SYSTEMS FOR CONCRETE AND CEMENTITIOUS SUBSTRATES

Apply coatings of Tables in MPI Division 3, 4 and 9 for Exterior and Interior.

3.11 COATING SYSTEMS FOR WOOD AND PLYWOOD

a. Apply coatings of Tables in MPI Division 6 for Exterior and Interior.

b. Prior to erection, apply two coats of specified primer to treat and
prime wood[ and plywood] surfaces which will be inaccessible after
errection.

c. Apply stains in accordance with manufacturer's printed instructions.

d. Wood Floors to Receive Natural Finish: Thin first coat 2 to 1 using
thinner recommended by coating manufacturer. Apply all coatings at
rate of 30 square meters per 4 liters 300 to 350 square feet per gallon.
Apply second coat not less than 2 hours and not over 24 hours after
first coat has been applied. Apply with lamb's wool applicators or
roller as recommended by coating manufacturer. Buff or lightly sand
between intermediate coats as recommended by coating manufacturer's
printed instructions.

3.12 PIPING IDENTIFICATION

**************************************************************************
NOTE: If pipe marking is to be covered in the
mechanical section, delete this paragraph. Use the
Activity preferred bracketed reference.
**************************************************************************

Piping Identification, Including Surfaces In Concealed Spaces: Provide in
accordance with [MIL-STD-101][ASME A13.1]. Place stenciling in clearly
visible locations. On piping not covered by [MIL-STD-101][ASME A13.1],
stencil approved names or code letters, in letters a minimum of 13 mm 1/2
inch high for piping and a minimum of 50 mm 2 inches high elsewhere.
Stencil arrow-shaped markings on piping to indicate direction of flow using
black stencil paint.

3.13 INSPECTION AND ACCEPTANCE

In addition to meeting previously specified requirements, demonstrate
mobility of moving components, including swinging and sliding doors,
cabinets, and windows with operable sash, for inspection by the Contracting
Officer. Perform this demonstration after appropriate curing and drying
times of coatings have elapsed and prior to invoicing for final payment.

3.14 WASTE MANAGEMENT

**************************************************************************
NOTE: Take-back programs refer to programs in which
the product manufacturer "takes-back" scrap material
or packaging associated with its product.
Coordinate with Section 01 74 19 CONSTRUCTION WASTE
MANAGEMENT AND DISPOSAL.
**************************************************************************

As specified in the Waste Management Plan and as follows. Do not use
kerosene or any such organic solvents to clean up water based paints.
Properly dispose of paints or solvents in designated containers. Close and
seal partially used containers of paint to maintain quality as necessary
for reuse. Store in protected, well-ventilated, fire-safe area at moderate
temperature. Place materials defined as hazardous or toxic waste in
designated containers.[ Coordinate with manufacturer for take-back
program. Set aside scrap to be returned to manufacturer for recycling into
new product. When such a service is not available, contact local recyclers
to reclaim the materials.][ Set aside extra paint for future color matches
or reuse by the Government.][ Where local options exist for leftover paint

SECTION 09 90 00 Page 45
recycling, collect all waste paint by type and provide for delivery to recycling or collection facility for reuse by local organizations.

3.15 PAINT TABLES

**************************************************************************
NOTE: Choose coatings that meet the MPI Green Performance™ Standard (GPS-1-12), unless no such products are available for the specified application. An E3 rating is more stringent than an E2 rating, which is more stringent than an E1 rating. Where indoor air quality (odor) is an issue, use only MPI listed materials having a minimum E2 rating. Edit Interior Paint Tables to include only products that are listed in the MPI Green Approved Products List, available at http://www.specifygreen.com/APL/ProductIdxByMPInum.asp to maximize sustainability in all projects.
**************************************************************************
**************************************************************************
NOTE: MPI Division Numbers are in accordance with MPI designated divisions and also follow the CSI MasterFormat. MPI number designations are from MPI Product List.
**************************************************************************
**************************************************************************
NOTE: These paint tables largely include MPI designated coating systems and materials. The specifier may find the the Master Painters Institute (MPI) Architectural Painting Specification resources helpful when specifying paint systems for the multiple architectural substrates (both interior and exterior). Note that not all coatings and systems available in MPI are included in this specification. In the event of conflicts between MPI resources and these tables, use the paint materials specified in this table.

When using the MPI resources, such as the MPI Decision Tree, MPI designates systems for "Normal" or Aggressive" service and identifies the coating performance level which the specifier may find helpful when selecting from coating system options. When using the MPI resources, select "Normal" for locations defined as noncorrosive and select "Aggressive" for corrosive locations.
**************************************************************************
**************************************************************************
NOTE: Where available, select more durable coatings for projects located in corrosive environments and humid locations. Some of the coating systems for substrates listed in this table are explicitly for aggressive environments. Corrosive locations are defined in UFC 1-200-01, section titled "Corrosion Prone Locations". For exterior painting of metallic surfaces, corrosive locations include project
locations with Environmental Severity Classifications (ESC) of C3 thru C5, or humid locations. For exterior painting of nonmetallic surfaces, corrosive locations are project locations with ESC of C4 and C5, or humid locations. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 3C, 4C and 5C (as identified in ASHRAE 90.1). Corrosive locations also includes marine, chemical, or immersion service as well as application of heat resistant or nonslip floor coatings. Interior high humidity areas such as bathrooms, locker rooms, laundry rooms, pools, and trainers are also considered as corrosive locations and require more durable coatings.

**************************************************************************

All DFT's are minimum values. [Use only materials with a MPI GPS-1-14 green check mark having a minimum MPI "Environmentally Friendly" [E1] [E2] [E3] rating based on VOC (EPA Method 24) content levels.] Acceptable products are listed in the MPI Green Approved Products List, available at http://www.specifygreen.com/APL/ProductIdxByMPInum.asp.

**************************************************************************

NOTE: Eliminate paint systems and gloss levels from the paint tables below that are not to be used for this project.

**************************************************************************

NOTE: As guidance in selection of coating systems in the Paint Tables, VOC compliant materials may be selected, based on:

1. Regional air quality regulations for the site location,

2. The applicable rule, and

3. Any specialty or exemption category.

Environmentally acceptable coatings may be further ensured by avoiding hazardous materials and including, as a minimum, requirements in purchase order or bill of materials to prohibit coatings containing materials listed in paragraph entitled "Environmental Protection." ACGIH A1 confirmed human carcinogens include asbestos, benzene, chromates, and coal tar. ACGIH A2 suspected human carcinogens include cadmium and certain chromates. Specify new galvanized steel, in appropriate section, to be without hexavalent chromium stain inhibitors.

Where only topcoating for cosmetic purposes is required, select a compatible topcoat that hides substrate. There are proposed rules limiting VOC content in states other than California. These rules are for architectural and industrial maintenance paints and coatings. Check local and
State regulations concerning allowable VOC limits. The most stringent govern.

Water-based paints and acrylic latex paints are lower in VOCs than solvent-based paints. Water-based paints are generally safer to handle and can be cleaned up with water, reducing health risks to workers and minimizing or avoiding hazardous waste.

NOTE: Gloss levels are defined by MPI as follows:

<table>
<thead>
<tr>
<th>Gloss Level</th>
<th>Description</th>
<th>Units at 60 degrees</th>
<th>Units at 80 degrees</th>
</tr>
</thead>
<tbody>
<tr>
<td>G1</td>
<td>Matte or Flat</td>
<td>0 to 5</td>
<td>10 max</td>
</tr>
<tr>
<td>G2</td>
<td>Velvet</td>
<td>0 to 10</td>
<td>10 to 35</td>
</tr>
<tr>
<td>G3</td>
<td>Eggshell</td>
<td>10 to 25</td>
<td>10 to 35</td>
</tr>
<tr>
<td>G4</td>
<td>Satin</td>
<td>20 to 35</td>
<td>35 min</td>
</tr>
<tr>
<td>G5</td>
<td>Semi-Gloss</td>
<td>35 to 70</td>
<td></td>
</tr>
<tr>
<td>G6</td>
<td>Gloss</td>
<td>70 to 85</td>
<td></td>
</tr>
<tr>
<td>G7</td>
<td>High Gloss</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NOTE: The following paragraphs / Tables are tailored for inclusion in projects with exterior painting.

3.15.1 Exterior Paint Tables

NOTE: MPI paints No. 10 and No. 11 are mildew resistant paints. Specify these paints in the Tables for MPI Divisions 3, 4, 5, 6, 9, and 10 in high humidity locations or project locations with Environmental Severity Classifications (ESC) of C4 and C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 4C and 5C (as identified in ASHRAE 90.1).

NOTE: Edit following tables as needed based on the scope of the project. Use lower gloss levels in...
non-contact areas such as ceilings. Use higher gloss levels where ease of cleanliness or impact and abrasion resistance are critical such as barrack walls and floors.

3.15.1.1 MPI Division 3: Exterior Concrete Paint Table

NOTE: MPI DIVISION 3: Exterior Concrete Paint Table. For applications of high-build glaze finishes over concrete masonry units requiring block filler that meets resistance to wind-driven rain or resistance to hydrostatic pressure, specify filler materials and applications of Section 09 96 59 HIGH-BUILD GLAZE COATINGS.

Color: The main reason for painting concrete and stucco is to obtain desired color. Before specifying paint systems, coordinate with other specification sections to confirm that concrete does not have special waterproof finish or applied, colored cementitious finish and that stucco does not have color pigment integral with mix.

A. Concrete; Vertical Surfaces, Undersides of Balconies and Soffits

(1) [New and uncoated existing][ and ][Existing, previously painted] concrete; vertical surfaces, including undersides of balconies and soffits but excluding tops of slabs

Topcoat: Coating to match adjacent surfaces. Load non-skid additive (NSA) at manufacturer's recommendations.

3.15.1.5 MPI Division 9: Exterior Stucco Paint Table

**NOTE: (MPI DIVISION 9: EXTERIOR STUCCO PAINT TABLE)**

Color: The main reason for painting stucco is to obtain desired color. Before specifying paint systems, coordinate with other specification sections to confirm that stucco does not have special waterproof finish or applied, colored cementitious finish and that stucco does not have color pigment integral with mix.

A. [New] and Existing stucco

<table>

3.15.2 Interior Paint Tables

***********************************************************************************************************************************************
NOTE: The following Tables / paragraphs are tailored for inclusion in projects with interior painting.
***********************************************************************************************************************************************

***********************************************************************************************************************************************
NOTE: Consider latex paint options for occupied buildings and where strong odors would be objectionable. Where allowable, consider eggshell or semigloss enamel in lieu of flat paint for areas subject to soiling where gloss is not desired.

For existing surfaces with alkyd enamel coating, do not specify latex paint which does not bond well to enamel.
***********************************************************************************************************************************************

***********************************************************************************************************************************************
NOTE: MPI paint No. 54 is mildew resistant paint. Specify this paint in the Tables for MPI Division 3 and 5 in high humidity locations or project locations with Environmental Severity Classifications (ESC) of C4 and C5. Humid locations are those in ASHRAE climate zones 0A, 1A, 2A, 3A, 4C and 5C (as identified in ASHRAE 90.1).
***********************************************************************************************************************************************

E. Interior New[ and Existing, uncoated] wood surfaces in[ toilets,][ food-preparation,][ food-serving,][ restrooms,][ laundry areas,][ shower areas,][ areas requiring a high degree of sanitation,][ ____][ and other high humidity areas] not otherwise specified

**************************************************************************
NOTE: List other high humidity areas requiring enamel finishes. For tile-like finishes, filler materials, and applications, refer to Section 09 96 59 HIGH-BUILD GLAZE COATINGS. These high performance coatings are used for exposure-resistant requirements and can be applied to wood, metal, and concrete substrates.
**************************************************************************

High-Build Glaze Coatings
As specified in Section 09 96 59 HIGH-BUILD GLAZE COATINGS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for special coatings as required for harsh indoor locations or operations (any area subjected to chemical and/or abrasive action), and all outdoor installations.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically
place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**ASTM INTERNATIONAL (ASTM)**

ASTM SI10  

**MASTER PAINTERS INSTITUTE (MPI)**

MPI ASM  

**SOCIETY FOR PROTECTIVE COATINGS (SSPC)**

SSPC 7/NACE No.4  
(2007) Brush-Off Blast Cleaning

**U.S. GENERAL SERVICES ADMINISTRATION (GSA)**

QPL-TNT-AP-28  

### 1.2 SUBMITTALS

**NOTE:** Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes
following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

   Equipment List[; G[, [___]]]

SD-03 Product Data

   Heat-Resistant Coatings[; G[, [___]]]
   Epoxy Coatings[; G[, [___]]]
   Polyurethane Coatings[; G[, [___]]]
   Chlorinated-Rubber Coatings[; G[, [___]]]

SD-04 Samples

   Color Chips[; G[, [___]]]

SD-07 Certificates

   Heat-Resistant Coatings[; G[, [___]]]
   Epoxy Coatings[; G[, [___]]]
   Polyurethane Coatings[; G[, [___]]]
   Chlorinated-Rubber Coatings[; G[, [___]]]
   Manufacturer's Printed Instructions[; G[, [___]]]

1.3 QUALITY CONTROL

Comply with Master Painters Institute (MPI) Standards indicated and listed in "MPI Approved Products List." Comply with the requirements in "MPI Architectural Painting Specification Manual" before any project is started.

Submit an equipment list consisting of a list of proposed equipment to be used in performance of construction work.
Submit three color chips 75 millimeter by 100 millimeter 3-inch by 4-inch or manufacture's pull-down of each finish color and gloss as scheduled.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver special coating materials to the project in their original containers bearing manufacturer's name, descriptive label, and coating formulations. Provide new and unopened containers.

Store special coating materials in tightly closed containers in a covered, well-ventilated area where they are not exposed to excessive heat, fumes, sparks, flame, or direct sunlight. Protect water-based coatings against freezing.

Store solvents, thinners, and equipment cleaners with the same care as the coating materials with ambient temperatures continuously maintained at a minimum 7 degrees C 45 degrees F.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

Submit manufacturer's catalog data including manufacturer's name and identification. Include detailed data analysis of each special coating material required for the project, with all the coating constituents measured as percentages of the total weight of the coating. Also provide manufacturer's data concerning application, thinning, and average coverage per liter gallon.

2.1.1 Heat-Resistant Coatings

**************************************************************************
NOTE: Heat-resistant coatings are divided into four categories, with upper temperature limits of 204 degrees C, 316 degrees C, 427 degrees C and 649 degrees C. 400 degrees F, 600 degrees F, 800 degrees F and 1,200 degrees F.

Coatings above 649 degrees C 1,200 degrees F are ceramic coatings. Generally, coatings applied to substrates where surface temperatures vary radically, do not have a long life span due to vehicle solid degradation and thermoshock of the metallic pigments. In areas such as this, consider flame deposition of sacrificial metal coatings.

**************************************************************************

2.1.1.1 Category 1, 10 to 204 Degrees C 50 to 400 Degrees F

**************************************************************************
NOTE: Use the following for ferrous surfaces where surface temperature does not exceed 204 degrees C 400 degrees F.

**************************************************************************

Provide alkyd resin-based material for surface temperature coatings not exceeding 204 degrees C 400 degrees F. Apply a minimum two coats of coating with a dry-film thickness of a minimum 0.1 millimeter 4 mils.
Apply an epoxy zinc primer as a first coat conforming to MPI ASM, No. 20 with the resin solids and zinc pigment not less than 80 percent of the total weight of the material.

White and color pigmented finish coats are an alkyd resin-based material with the resin solids and pigments not less than 85 percent of the total weight of the material. Ensure pigments are heat-stable materials, formulated to colors as scheduled.

Ensure black-pigmented finish coats are an alkyd resin, carbon-black pigmented material with resin solids and pigments not less than 50 percent of the total weight of the material.

Provide aluminum pigmented finish coats that are an alkyd resin-based material with resin solids and pigments not less than 50 percent of the total weight of the material.

2.1.1.2 Category 2, 149 to 316 Degrees C 300 to 600 Degrees F

**************************************************************************
NOTE: Use the following for ferrous surfaces where surface temperature does not exceed 316 degrees C 600 degrees F.
**************************************************************************

Coatings for surface temperatures not exceeding 316 degrees C 600 degrees F are based on modified silicone and silicone-based resins. Apply coatings in not less than two coats with a dry-film thickness of not less than 3 mils.

Provide a silicone-based resin zinc-pigmented material with the resin solids and zinc pigment for the first coat not less than 80 percent of the total weight of the material.

Apply color pigmented finish coats using silicone-based resin material with the resin solids and pigments not less than 80 percent of the material's total weight. Pigments are heat-stable materials, formulated to colors as scheduled.

Ensure black-pigmented finish coat is a silicone-based resin carbon-black pigmented material with resin solids and pigments not less than 50 percent of the total weight of the material.

Aluminum-pigmented finish coats are a modified, silicone-based-resin material with the resin solids and pigments not less than 50 percent of the total weight of the material.

2.1.1.3 Category 3, 316 to 427 Degrees C 600 to 800 Degrees F

**************************************************************************
NOTE: Use the following for ferrous surfaces where surface temperature does not exceed 427 degrees C 800 degrees F.
**************************************************************************

Provide a modified silicone or a silicone-based material of coating for surface temperatures not exceeding 427 degrees C 800 degrees F. Apply a minimum two coats with a dry-film thickness of a minimum 0.07 millimeter 3 mils 1 mils per manufacturer's recommendations.
Provide a silicone-based resin, zinc-pigmented material first coat with the resin solids and zinc pigment for the first coat not less than 80 percent of the total weight of the material.

Ensure black-pigmented finish coat is a silicone-based resin, carbon-black pigmented material with resin solids and pigments not less than 50 percent of the total weight of the material.

Aluminum-pigmented finish coat is a modified, silicone-based-resin material with the resin solids and pigments not less than 50 percent of the total weight of the material.

2.1.1.4 Category 4, 427 to 649 Degrees C 800 to 1,200 Degrees F

**************************************************************************
NOTE: Use the following for ferrous surfaces where surface temperature does not exceed 649 degrees C 1,200 degrees F.
**************************************************************************

Provide an aluminum-pigmented, silicone-resin-based coating for surface temperatures not exceeding 649 degrees C 1,200 degrees F conforming to QPL-TNT-AP-28, as modified.

Apply a minimum two coats with a minimum 0.05 millimeter dry-film thickness of 2 mils.

Ensure the coating pigment contains a minimum 28 percent aluminum, based on the total weight of the material. Ensure coating contains a minimum of 22 percent silicone resin and a maximum of 49 percent of volatile thinners and driers based on the total weight of the material.

2.2 MATERIALS

2.2.1 Epoxy Coatings

Conform to MPI ASM, No. 116 for epoxy coatings and epoxy block filler, as modified.

Resins for finish coats are based on a polyamide-cured, epoxy-resin material. Apply finish coats with a dry-film thickness of not less than 0.1 millimeter 4 mils per coat. Finish color and gloss are as indicated.

**************************************************************************
NOTE: Use Epoxy resin coatings where surface coatings require high corrosion resistance, chemical resistance, bond strength, UV resistance, and toughness.
**************************************************************************

Amine-cured epoxy coatings have higher resistance to chemical attack and better color retention than polyamide-cured epoxy coatings. Polyamide-cured epoxy coatings have higher water resistance and bond strength than amine-cured coatings.

NOTE: Consider the Dry-film thickness given as a minimum and may be revised as required to suit conditions and surface use.
2.2.1.1 Concrete Surface Coatings

Apply a [epoxy coating system in conformance with MPI ASM, No. 77] [water-based epoxy coating system in conformance with MPI ASM, No. 115] for vertical concrete surfaces. Apply an epoxy slip-resistant deck coating system in conformance with MPI ASM, No. 82. Apply a prime coat to fill concrete surface pores with a total dry-film thickness of not less than 0.05 millimeter 2 mils.

2.2.1.2 Masonry Surfaces Coatings

Apply a [Water-Based, Light-Industrial Coating System in conformance with MPI ASM, No. 110] [Epoxy Coating System in conformance with MPI ASM, No. 77] [Water-Based Epoxy Coating System in conformance with MPI ASM, No. 115] [Polyurethane, Pigmented, Over Epoxy Coating System in conformance with MPI ASM, No. 72]. Apply a block filler to fill surface pores with a total dry-film thickness of not less than 0.2 millimeter 7 mils.

2.2.1.3 Ferrous and Galvanized Metal Surface Coatings

Coatings on ferrous and galvanized metal surfaces consist of a prime coat and not less than two finish coats. Comply with MPI ASM, No. 101 for an epoxy zinc primer with a metallic-zinc pigment for the substrate to be coated and the end use of the coated surface. Ensure resin solids and zinc pigment are not less than 80 percent of the total weight of the coating material. Apply prime coat with a total dry-film thickness of not less than 0.1 millimeter 4 mils. Provide an epoxy-based finished coat as specified.

2.2.1.4 Aluminum Surface Coatings

Apply an Epoxy Coating System in conformance with MPI ASM, No. 80 and MPI ASM, No. 77. Apply a prime coat with a total dry-film thickness of not less than 0.1 millimeter 4 mils.

2.2.2 Polyurethane Coatings

NOTE: Polyurethane-based coatings are used where surfaces to be coated require high abrasion resistance, good flexibility and chemical resistance, UV resistance, and are a two-part, prepolymer, catalytic-cured resin material.

The two-part prepolymer, catalytic-cured, resin based materials are used for heavy-duty coatings where abrasion resistance and chemical resistance are required. Catalytic-cured resins are formulated as clear coatings and in a limited range of pigmented coatings.

Ensure polyurethane coatings use ASTM SI10 and conform to MPI ASM for each substrate indicated.

NOTE: Dry-film thickness given are considered
Resins for finish coats are based on a two-part, prepolymer, catalytic-cured, polyurethane material. Apply catalytic-cured coatings with a total dry-film thickness of not less than 0.25 millimeter (10 mils) per coat. Indicate finish color and gloss on the schedules.

2.2.2.1 Concrete Surface Coatings

NOTE: Policy is to avoid coating of exposed concrete unless it is considered aesthetically desirable.

Apply a [polyurethane, pigmented coating system in conformance with MPI ASM, No. 72 and MPI ASM, No. 80] [Polyurethane, Clear, Two-Component Coating System in conformance with MPI ASM, No. 78]. Ensure the prime coat fills surface pores with a total dry-film thickness of not less than 0.05 millimeter (2 mils). Finish coats are polyurethane-based material as specified.

2.2.2.2 Masonry Surface Coatings

Apply a polyurethane, clear, two-component coating system in conformance with MPI ASM, No. 78. Apply block filler to fill surface pores with a total dry-film thickness of not less than 0.2 millimeter (7 mils). Finish coats are polyurethane-based material as specified.

2.2.2.3 Ferrous and Galvanized Metal Surface Coatings

Apply a [polyurethane, pigmented coating system in conformance with MPI ASM, No. 72, MPI ASM, No. 77, and MPI ASM, No. 101] [high-performance architectural latex coating system in conformance with MPI ASM, No. 134, No. 138, and MPI ASM, No. 140]. Apply a prime coat with a dry-film thickness of not less than 0.05 millimeter (2 mils). Finish coats are polyurethane-based material as specified.

2.2.2.4 Aluminum Surface Coatings

Apply a water base, light industrial coating system in conformance with [MPI ASM, No. 95] [MPI ASM, No. 77 and MPI ASM, No. 80 for epoxy coating] [MPI ASM, No. 80 for polyurethane] coats on aluminum surfaces. Prime coat is a polyurethane-resin material as recommended by the coating manufacturer for the substrate to be coated. Apply prime coat with a dry-film thickness of not less than 0.05 millimeter (2 mils). Finish coats are polyurethane-based material as specified.

2.2.2.5 Wood Surface Coatings

Apply a [pigmented polyurethane coating in conformance with MPI ASM, No. 72][clear polyurethane two-component coating in conformance with MPI ASM, No. 13 and MPI ASM, No. 78]. Apply prime coat with a dry-film thickness of not less than 0.12 millimeter (5 mils). Finish coats are polyurethane-based material as specified.
2.2.3 Chlorinated-Rubber Coatings

NOTE: Chlorinated-rubber-based coatings are used where the surface coating requires high resistance to water, salt spray, moist gases, and inorganic acids at 24 degrees C 75 degrees F.

Chlorinated rubber resins cannot be used in the unmodified state; they tend to deteriorate when exposed to heat and ultraviolet light. Chlorinated-rubber resins are generally modified with phenolic resins.

Chlorinated rubber coatings are based on modified, chlorinated-rubber, phenolic-resin materials. Coatings are formulated as gray and white coating with a wide range of tints for white base material.

NOTE: The dry-film thickness given is considered the minimum and may be revised to suit conditions and surface use.

Base resins for finish coats on a modified, chlorinated-rubber, phenolic-resin material. Ensure coating materials contain not less than 20 percent chlorinated rubber resin, based on the total weight of the material. Apply finish coats with a dry-film thickness of not less than 0.07 millimeter 3 mils per coat. Finish coating color is as indicated.

2.2.3.1 Concrete Surface Coatings

NOTE: Policy is to avoid coating of exposed concrete unless it is considered aesthetically desirable.

Apply a minimum three coats on concrete surfaces. Provide prime coats with a chlorinated-rubber resin material as recommended by the coating manufacturer for the substrate to be coated and the end use of the coated surfaces. Ensure the prime coat fills concrete surface pores with a total film thickness of not less than 0.05 millimeter 2 mils. Finish coats are chlorinated-rubber-based coatings as specified.

2.2.3.2 Masonry Surface Coatings

Apply a minimum of two finish coats of masonry block filler on masonry surfaces. Block fillers are based on an epoxy-ester resin material as recommended by the coating manufacturer for the substrate and end use of the coated surface. Fill surface pores with block filler at a total film thickness of not less than 0.2 millimeter 7 mils. Finish coats are chlorinated-rubber-based coatings as specified.

2.2.3.3 Ferrous and Galvanized Metal Surface Coatings

Apply a minimum two coats of high performance architectural latex coating
in conformance with MPI ASM, No. 79 on ferrous and galvanized metal surfaces. Apply prime coat with a dry-film thickness of not less than 0.07 millimeter 3 mils. Finish coats are chlorinated rubber-based coatings as specified.

2.2.3.4 Aluminum Surface Coatings

Apply a minimum three coats of quick drying primer for aluminum surfaces. Ensure prime coats conform to MPI ASM, No. 80 for aluminum coating system.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Surface Preparation

Protect adjacent materials and equipment against damage from spillage, dripping, and spatter of coating materials. Leave clean building materials and equipment with all damaged surfaces corrected. Provide "WET PAINT" signs to indicate newly painted surfaces.

Protect work of other trades against damage from coating operation. Correct damage by cleaning, repairing, replacing, and recoating, as approved by the Contracting Officer, and leave in an undamaged condition. At completion of construction activities of other trades, touch up and restore damaged or defaced coated surfaces.

Provide forced ventilation for interior spaces during application and drying of coatings to prevent the buildup of toxic or explosive concentrations of solvent vapors.

Provide fire extinguishers of the required quantity and correct type to combat flammable liquid fires.

Dispose of rags that are used to wipe up coating materials, solvents, and thinners by drenching with water and placing them in a covered metal container.

3.1.2 Cleaning

At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.

After completing coating application, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.

Clean application equipment promptly and thoroughly with a suitable solvent after each use and stored in a clean, covered, well-ventilated container.

3.1.3 Concrete Surfaces

Conform to MPI ASM for substrates indicated. Remove plates, machined surfaces, and similar items already in place that are not to be coated. Provide surface-applied protection before surface preparation and coating where removal is impractical or impossible. After completing coating operations, reinstall items that were removed.

Clean dirt, oil, grease, and incompatible paints from substrates to ensure
bonding. Coordination of shop-applied prime coats with high-performance coatings is critical. Remove incompatible primers. Reprime substrate with compatible primers as required to produce coating systems indicated.

3.1.3.1 Concrete Substrates

Remove release agents, curing compounds, efflorescence, and chalk. Maximum allowable moisture content of concrete is 12 percent. Measure moisture content with an electronic moisture meter.

Clean surfaces with pressurized water. Use pressure range of [10 350 to 27 580 kPa 1500 to 4000 psi at 150 mm to 300 mm 6 inch to 12 inch][27 580 to 68 950 kPa 4000 to 10,000 psi].

Comply with SSPC 7/NACE No.4 (NACE No. 4), "Brush-Off Blast Cleaning" for abrasive cleaning.

3.1.3.2 Clay Masonry Substrates

Remove efflorescence and chalk. Do not coat surfaces if moisture content or alkalinity of surfaces exceeds that permitted in manufacturer's written instructions.

Clean surfaces with pressurized water. Use pressure range of [690 to 4140 kPa 100 to 600 psi] [10 350 to 27 580 kPa 1500 to 4000 psi] at 150 to 300 mm 6 inch to 12 inch.

**************************************************************************
NOTE: Delete paragraph below if primers are shop applied and are not removed in the field.
**************************************************************************

3.1.3.3 Steel Substrates

Remove rust and loose mill scale. Clean using methods recommended in writing by coating manufacturer. Conform to SSPC 7/NACE No.4 for blast cleaning.

**************************************************************************
NOTE: Galvanized-metal substrates should not be chromate passivated (commercially known as "bonderized"). If galvanized metal is chromate passivated, consult manufacturers for appropriate surface preparation and primers.
**************************************************************************

3.1.3.4 Galvanized-Metal Substrates

Remove grease and oil residue from galvanized sheet metal fabricated from coil stock by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied coatings.

3.1.3.5 Aluminum Substrates

Remove surface oxidation.

3.1.3.6 Wood Substrates

Wood substrates that contain small surface knots are prepped by sanding
surfaces smooth. Apply a thin coat of knot sealer before applying an
interior latex-based wood primer. Prime edges, ends, faces, undersides,
and back sides of wood. After priming, fill holes and crevices to the
finished surface with putty or plastic wood filler. After finished surface
is dry, smooth surface by sanding, for a finished product.

3.1.4 Coating Material Preparation

Mix and prepare coating materials in accordance with the coating
manufacturer's printed instructions for applying the particular material
and coat. Keep materials which are not in actual use in closed containers.

Coating materials that have been mixed with an automatic shaker are allowed
to stand to let air bubbles escape, then given a final hand mixing before
application. Stir materials so as to produce a mixture of uniform
density. Stir at frequent intervals during application to prevent
skinning. Do not stir film which may form on the surface of the material.
Remove film and strain, if necessary.

3.1.4.1 Thinning

Thinning is done in accordance with coating manufacturer's printed
directions for the particular material and coat.

3.1.4.2 Tinting

Ensure prime and intermediate coats of paint are slightly different tints
from the finish coat to facilitate identification of each coat. Tinting is
done by the coating manufacturer and clearly identified as to color and
coat.

3.2 APPLICATION

Do not perform exterior painting in damp or rainy weather. Interior
painting is not allowed until the building is enclosed and has thoroughly
dried out. Painting is not allowed below 10 degrees C 50 degrees F or
above 35 degrees C 95 degrees F. Apply paint in accordance with the
coating manufacturer's recommendations, and as specified.

Ensure coating application is done by skilled applicators. Apply coatings
to clean and properly prepared surfaces. Apply coatings with clean,
high-quality application equipment. Allow sufficient time between coats to
ensure complete drying and curing. Sand and dust surfaces between
coatings, as required, to produce a surface free of visible defects.
Lightly sand high gloss coatings and clear finishes between coats to ensure
bond of following coats.

Apply coats to the surfaces in an even film. Cloudiness, spotting,
holidays, laps, application marks, runs, sags, and other similar surface
imperfections are not acceptable. Remove defective coating applications
and re-coat as directed.

Ensure coating lines such as wainscots are sharp, true, and well-defined.
Tape may be used to establish coating lines, providing tape is removed
before ragging or sawtooth edges form.

Ensure surfaces, including edges, corners, crevices, welds, and other
similar changes in surface plane, meet the dry-film thickness not less than
specified.
3.2.1 Brush Application

Use clean, proper size brushes for high-quality application of the specified coating materials. Brush out slow-dry coatings. Brush out quick-dry coatings only enough to spread out evenly.

3.2.2 Roller Application

Use clean roller covers of the proper nap length, nap texture, and material for high-quality application of the specified coating materials.

Ensure roller application is equivalent in all respects to the same coats applied by high-quality brush application.

3.2.3 Spray Application

Do not allow spray application of coatings. Spray application equipment is limited to airless-spray equipment and electrostatic-spray equipment. Ensure equipment is clean and operated by workmen skilled in high quality application of coating materials.

Spray application of coatings is limited to finish coats on metal frame works, siding, decking, wire mesh, and other surfaces where hand work would be inferior. Apply spray coatings as equivalent in all respects to the same coats applied by high quality brush application. Permit each spray coat to cure before the succeeding coat is applied. Do not double back with application equipment, for the purpose of building up film thickness of two coats in one operation.

Cover surfaces adjacent to sprayed areas to prevent damage from overspray, coating rebound, and spray drift.

3.3 FIELD QUALITY CONTROL

3.3.1 Field Test

Government may take dry-film tests from time to time on finished surfaces. Apply additional coatings to surfaces where there is less than the minimum specified dry-film thickness.

3.3.2 Repairing

Remove damaged and unacceptable portions of completed work and replace with new work to match adjacent surfaces at no additional cost to the Government.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for epoxy-polyamide, polyurethane, and epoxy polyester high performance, architectural wall coating systems for interior and exterior surfaces.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Except for moisture-curing polyurethane, they are two-component systems and contain fillers that help provide the high-build. They are intended for application to concrete, masonry, plaster or wallboard, and also may be used on wood, metal, or fiberglass. The coatings are available in gloss or semigloss and are sometimes called tile-like coatings or liquid glaze coatings. Some of the coatings are high in Volatile Organic Compounds (VOC). The specifier must ensure that selected products do not exceed allowable VOC requirements.

NOTE: On the drawings, show:
1. Locations for wall coating systems.

2. Finish schedule.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
High-Build Glaze Coatings
Submit three copies of coating manufacturer's printed product data.

SD-04 Samples
High-Build Glaze Coatings; G[, [_____]}
Submit color chips of standard colors.
Coating System; G[, [_____]]

Submit rigid panels on which the complete coating system is applied. Submit panels of the same materials as the surfaces to which the coating system is to be applied.

SD-06 Test Reports

Filler Material

Primers

Top Coating

SD-07 Certificates

Qualifications of Installer

SD-08 Manufacturer's Instructions

Wall Coating System

Submit instructions covering application of the wall coating system, including surface preparation, detailed application procedures, number and types of coats required, maximum and minimum application temperatures, and induction, pot life, and intercoat cure times. Safety Data Sheets (SDS) shall address all components of the paint coating system, including solvents, primers, and other hazardous materials.

1.3 DELIVERY, STORAGE, AND HANDLING

1.3.1 Acceptance at Site

Deliver materials to the project site in original, factory-sealed containers or packages labeled with identification of contents, manufacturer's name and address, manufacturer's tradename or trademark, date of manufacture, specification number, batch number, color, instructions for use, and recommendations for protective measures against toxicity.

1.3.2 Storage and Protection

Protect and store materials under cover in dry, well-ventilated areas. Keep in original tightly sealed containers or packages, and in such sequence that oldest stocks are used first. Store at temperatures between 4 and 49 degrees C 40 and 120 degrees F. Do not use material that is more than one year old from the date of manufacturing.

1.4 ENVIRONMENTAL REQUIREMENTS

1.4.1 Protection During Cleaning

Personnel engaged in solvent-cleaning of galvanized metal and aluminum, or cleaning concrete, masonry, or portland cement plaster with 5 to 10 percent solution of hydrochloric acid, shall wear the appropriate personal protective equipment to prevent skin and eye contact and fumes inhalation. Ventilate all work areas properly.
1.4.2 Personnel Protection During Coating Applications

Personnel painting with high-build glaze coating systems shall wear the appropriate personal protective equipment to prevent skin or eye contact or inhalation. Ensure employees use and maintain solvent-resistant, personal protective equipment for the whole body. Emergency eye wash and water supplies shall be available near the work area for emergency flushing of the eyes and body. Coating applications shall be performed only in areas with good ventilation. Smoking will not be permitted in the area where coating is being applied. Wall and room temperature at the time of coating application and curing shall be in accordance with the manufacturer's instructions.

1.4.3 Protection During Application of Polyurethane Paints

Mix and apply polyurethane paints only in specifically designated areas with local exhaust ventilation and other environmental control measures as recommended on the basis of an on-site industrial hygiene survey. Supply and use air respirators in closed areas where adequate ventilation cannot be obtained.

1.5 QUALIFICATIONS OF INSTALLER

Installation shall be by an applicator approved by the manufacturer of the surfacing materials. Furnish a written statement from the manufacturer indicating that the installer is acceptable.

PART 2 PRODUCTS

2.1 WALL COATING SYSTEM

2.1.1 Filler Material

As recommended by the coating system manufacturer.

2.1.2 Primers

As recommended by the coating system manufacturer.

2.1.3 Top Coating

**************************************************************************

NOTE: Select wall coatings compatible with the surfaces they are to cover and in accordance with:

1. High Performance Architectural Coatings (HIPAC). They are tough, durable, organic systems applied to a continuous (seamless) high-build film and cure to a hard glaze finish. They are resistant to continuous heat and humidity, abrasion, staining, chemicals, and biological growth. They are used in areas where high humidity, wear, or unusual chemical resistance requirements, particularly to soiling, are required, and where strong detergents are used to maintain sanitary conditions. Stall showers, public halls and stairways, lavatories, locker areas, animal pens, and biological laboratories are typical areas where these coatings are recommended.
Other areas of use are in food processing, dairies, restaurants, schools, and air terminals. HIPAC systems should be used only as complete systems, and as recommended by the manufacturer. Minimum dry film thickness is $0.075 \text{ mm} \ 3 \text{ mils}$ for each of two coats. Furnished in Gloss, and Semigloss.

These coatings are for interior use and are formulated with any one of the following resins: Epoxy-polyamide, epoxy polyester, or aliphatic or aromatic polyurethane resins:

b. Epoxy-polyester - chemical-resistant, abrasion-and impact-resistant, fire-resistant, low odor.

c. Aliphatic or aromatic polyurethane - flexible, abrasion- and impact-resistant.

2. Two component, epoxy-polyamide for interior use. For metal, wood, concrete, masonry surfaces, and painted surfaces where high gloss or glaze type finish, extreme workability and resistance to abrasion and stains is desired. Particularly useful for hallways, kitchens, bathrooms, laundries and hospitals where maintenance of sanitary conditions is important. Minimum dry film thickness is $0.075 \text{ mm} \ 3 \text{ mils}$ for each of two coats. Maximum volatile organic compounds (VOC) to be 340 grams/liter.

3. MPI 31 or MPI 71. Single component, moisture-curing urethane. For floors, walls, machinery, equipment and other surfaces where good abrasion resistance, color retention, gloss retention, graffiti resistance and good resistance to acids, alkalis, solvents, strong cleaners and sanitizers, fuel and chemicals are necessary. Can also be used on concrete floors, brick and masonry surfaces (properly conditioned), metals (properly primed), and wood (properly prepared and sealed.) Minimum dry film thickness is $0.075 \text{ mm} \ 3 \text{ mils}$ for each of 3 coats.

**************************************************************************

a. High Performance Architectural Coating, [Epoxy-Polyamide][Epoxy-Polyester][Polyurethane][, Gloss][, Semigloss]

b. Two component, epoxy-polyamide for interior use.

c. MPI 31, Single Component, Moisture-curing Urethane, clear, gloss top coat.]

d. MPI 71, Single Component, Moisture-curing Urethane, clear, flat top coat.]

SECTION 09 96 59 Page 8
2.1.4 High-Build Glaze Coatings Systems Requirements

Provide a complete coating system from a single manufacturer. The system shall have a flame spread index of not more than 25 and a smoke developed index of not more than [50] [____], when tested in accordance with ASTM E84.

2.2 COLORS

**************************************************************************
NOTE: Indicate colors on the finish schedule. When colors are identified by a manufacturer's name and designation, include the optional sentence in brackets. If the "architectural finishes display board" is used, it must be on display in the office of the Contracting Officer. The architectural display board should be used only to supplement the information contained on the drawings.
**************************************************************************

Top coating colors shall be [as indicated] [and] [as shown on the architectural finishes display board]. [Colors indicated by reference to manufacturer's name and designations are for color identification only and are not intended to limit selection of other manufacturer's products with similar colors.]

2.3 SOURCE QUALITY CONTROL

2.3.1 Top Coat Testing

**************************************************************************
NOTE: Choose one of the following options.
**************************************************************************

[High Performance Architectural Coating: Abrasion resistance with 100 mg maximum loss, scrubability, resistance to heat and humidity, and impact resistance tests.]

[Epoxy-polyamide: abrasion resistance and steam resistance tests.]  

[MPI 31 abrasion resistance and resistance to water tests [and, resistance to accelerated weathering test, for loss of gloss, and chalking, with continuous exposure to light and intermittent exposure to water spray].]

PART 3 EXECUTION

3.1 Examination

3.1.1 Verification of Surface Conditions

Before commencing work, inspect surfaces to receive coatings and report to the Contracting Officer, in writing, of unsatisfactory surfaces. Inspection shall include examining the nature and condition of surfaces before, during, and after painting application, and reporting the same on a systematic basis. Inspection shall include ensuring that manufacturer's recommended procedures are followed during each stage of surface preparation and paint application.
3.2 PREPARATION

3.2.1 Protection

Remove, mask, or otherwise protect hardware, fixtures, accessories, and parts in contact with coated surfaces, and other parts that are factory-finished such as motors, sensing devices, thermostats. Protect adjacent surfaces to confine coatings to designated areas. Correct defects caused by installed equipment prior to finishing. Reinstall removed work after completion of each area.

3.2.2 Moisture

NOTE: Select moisture percentage allowable in accordance with substrate materials: 15 percent maximum for concrete, masonry, and portland cement plaster surfaces and 8 percent maximum for gypsum plaster surfaces.

Surfaces shall be dry to receive finishes. Measure moisture content of substrate with probe-type moisture meter implanted into backing. Moisture content shall not exceed 15 percent.

3.2.3 Restoration

NOTE: Include this paragraph only for work on repair projects where painting of existing substrate surfaces is included.

Prior to application of coatings, touch up and restore all substrates where damaged or defaced.

3.2.4 Surface Preparation

Prepare surfaces in accordance with the coating manufacturer's printed instructions. Remove contaminants including splinters, mortars, rust and other products of corrosion, disintegrated coatings, and other substances that could interfere with adhesion of the coating system to the substrate.

3.2.5 Additional Preparation for Specific Materials

3.2.5.1 Sealants and Caulkings

Remove loose, cracked, or otherwise defective sealant materials and replace with new sealant as specified in Section 07 92 00 JOINT SEALANTS. Sealant materials shall be compatible with wall coating system materials.

3.2.5.2 Foreign Substances

Remove foreign substances by water washing, steam cleaning, cleaning compounds or detergents, or other procedures.

3.2.5.3 Previously Painted or Coated Surfaces
NOTE: The 25 percent area is visual only. Lesser area percentage may be removed fully at the recommendation of the user. Delete this paragraph if project does not include painting of existing surfaces.

**************************************************************************

Remove loose or scaling materials prior to application of wall coating. Repair, smooth, sand, spackle, or otherwise treat to render imperceptible in the finished work defects such as scratches, nicks, cracks, gouges, spalls, alligatoring, and irregularities due to partial peeling of previous paint coatings. Where impractical to satisfactorily eliminate defects by other means, remove existing coatings from the entire surface, repair surface as necessary, prime, and repaint. Completely remove coating in areas where more than 25 percent of the existing substrate material has failed.

3.2.5.4 Ferrous Metals

Prepare ferrous metals in accordance with SSPC SP 5/NACE No. 1, SSPC SP 6/NACE No.3, or SSPC SP 10/NACE No. 2, as recommended by the manufacturer.

3.2.5.5 Galvanized Metal

Clean and dry, using solvent, galvanized metal surfaces of detrimental foreign matter such as oil, grease, and other contaminants. Prior to coating application, pretreat the surface material in accordance with manufacturer's printed instructions for pretreatment compound mixing and application.

3.2.5.6 Aluminum

Using solvent, clean surfaces of oils, grease, and other lubricants. Remove dirt, water-soluble chemicals, and similar surface contaminants by washing with water, or water and detergent. When detergents are used, rinse with clear water. Pretreat these surfaces prior to coating application in accordance with manufacturer's printed instructions.

3.2.5.7 Concrete, Masonry, and Portland Cement Plaster

Cure new concrete and masonry surfaces a minimum of 30 days prior to painting. Repair concrete surfaces before coating. Clean surfaces to be coated, removing dirt, fungus, grease, oil, asphalt, tar, and other foreign substances. Remove efflorescence, chalk, and similar substances from concrete, masonry, portland cement, and plaster surfaces in the following manner:

a. Wash with a 5 to 10 percent aqueous solution of hydrochloric acid and rinse the surface with clean water and allow to dry.

b. Free surfaces from mortar deposits and form release agents.

c. Remove laitance from surfaces by etching with hydrochloric acid solution.

d. Rinse the surface again with clean water and allow to dry.

e. Sand cracked surfaces smooth and fill with filler compatible with the
substrate and coating materials.

f. Apply filler until surfaces are completely filled (pin-hole free) and smooth.

g. Sand lightly and wipe clean.

[h. Apply the filler in [one][two] coat[s], to a [wet] [dry] film thickness of [_____] millimeters [mils] [for each coat], measured with a Tooke gage or similar thickness measuring gage].

3.2.5.8 Gypsum Plaster

Thoroughly dry and clean gypsum plaster before application of coatings. Remove lime deposits by sanding lightly. Sand cracked surfaces smooth; and fill with joint treatment compound compatible with plaster and coating materials. Sand lightly and wipe clean. Surfaces of plaster shall age a minimum of 30 calendar days and pass the following test: Using an electric moisture meter, when more than 8 percent moisture is indicated, surfaces are not sufficiently cured to be coated.

3.2.5.9 Woodwork

**************************************************************************
NOTE: Select corresponding option or options applicable to the project. Delete this paragraph if project does not include woodwork areas.
**************************************************************************

Provide a surface which is dry, smooth, and free from raised grain or other imperfections. Fill nail holes, cracks, joints, crevices, and other blemishes with materials compatible with the coating materials, and sand smooth and flush with adjacent wood surfaces before application of coatings. Sand in the direction of the grain. Back-prime wood in contact with or built into concrete, masonry, or plaster as specified in Section 09 90 00 PAINTS AND COATINGS. Prime end cuts and edges. [Seal with a mixture of equal parts of shellac and alcohol or knot sealer.] [Treat as specified for defects such as knots, resins, gum, or extractives].

3.2.5.10 Gypsum Wallboard

Reinforce and conceal joints of gypsum wallboard panels as specified in Section 09 29 00 GYPSUM BOARD. Apply a skim coat of gypsum plaster over the gypsum wallboard. Sand smooth, fill with joint treatment compound, sand lightly, and wipe clean surfaces prior to application of glaze coating.

3.3 COATING APPLICATION

Apply coating system over specified filler where applicable.

3.3.1 Apply Coating

After preparing surface, apply coating system directly to metal, gypsum wallboard, gypsum plaster, and previously painted surfaces in accordance with the manufacturer's instructions. Provide alkali-resistant primers for concrete, masonry, and portland cement plaster surfaces.
3.3.2  Thickness Test

Measure dry film thickness of coating system, excluding filler coat, with a Tooke gage or similar thickness measuring gage. Any paint damaged during thickness measurement shall be repaired to match the original.

3.3.3  Interior Application

**************************************************************************
NOTE: Specify the dry film thickness of the coating required over the filler, in accordance with the type of substrate for specified coating.
**************************************************************************

Apply wall coating system in accordance with manufacturer's specifications with a spreading rate to produce a dry film thickness of [_____] mm mils for each of [two] [three] coats applied. Protect coated surfaces after application and during the curing periods.

3.3.4  Exterior Application

**************************************************************************
NOTE: Specify the dry film thickness of the coating required over the filler, in accordance with the type of substrate for specified coating.
**************************************************************************

Mix and apply wall coating system in accordance with manufacturer's specifications with a spreading rate to produce a dry film thickness of [_____] mm mils for each of [two][three] coats applied. Protect coated surfaces during curing periods.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the preparation of surfaces and the application of paints for hydraulic structures and appurtenant items. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1   LUMP SUM PRICE

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (LUMP SUM PRICE) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.
1.1.1 Painting: Hydraulic Structures

1.1.1.1 Payment

Payment will be made for costs associated with "Painting: Hydraulic Structures", which includes full compensation for furnishing all materials, equipment, and labor required to paint the hydraulic structures in accordance with this section.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SAFETY, HEALTH, AND ENVIRONMENTAL REQUIREMENTS

Perform work in accordance with all applicable health, safety, and environmental requirements as well as EM 385-1-1. Submit matters of interpretation of these requirements to the Contracting Officer for resolution before starting work. If no clarifications are sought, then the submittal is not necessary. Where the regulations conflict, the most stringent requirements apply. This paragraph supplements the health, safety, and environmental requirements of EM 385-1-1.

1.3.1 Safety

Submit an Accident Prevention Plan in accordance with the requirements of Section 01 of EM 385-1-1, including, but not limited to, each of the topic areas listed in Appendix A therein and the specified requirements. Develop each topic in a concise manner to include management and operational aspects. Submit a Ventilation Assessment Plan complying with all applicable safety standards.

1.3.1.1 Abrasive Blasting

For abrasive blasting comply with the requirements in Section 06.I of EM 385-1-1. In addition to the requirements in Section 20 of EM 385-1-1, use hoses and hose connections of a type to prevent shock from static electricity. Join hose lengths together by approved couplings of a material and type designed to prevent erosion and weakening of the couplings. The couplings and nozzle attachments must fit on the outside of the hose and be designed to prevent accidental disengagement.

1.3.1.2 Workers Other Than Blasters

Protect workers, other than blasting operators working in close proximity to abrasive blasting operations. Use MSHA/NIOSH-approved half-face or full-face air purifying respirators equipped with high-efficiency particulate air (HEPA) filters and eye protection meeting ANSI/ISEA Z87.1. Use hearing protectors (ear plugs and/or ear muffs) providing a noise reduction rating of at least 20 dBA or as needed to provide adequate protection. Provide personal protective equipment where required by 29 CFR 1910.146 and in accordance with 29 CFR 1910, Subpart I.

1.3.1.3 Cleaning Before and After Abrasive Blasting

Cleaning with compressed air must be in accordance with Section 20.B.5 of EM 385-1-1 and personnel protected as specified in 29 CFR 1910.134. When cleaning with solvents, provide ventilation where required by 29 CFR 1910.146 or where the concentration of solvent vapors exceeds 10 percent of the Lower Explosive Limit (LEL). Ventilation must be in accordance with 29 CFR 1910.94, paragraph (c)(5).

1.3.1.4 Pretreatment of Metals and Concrete with Acids

Personnel must be protected in accordance with 29 CFR 1910, Subpart I. In addition to the requirements of Section 05 of EM 385-1-1, provide an eyewash in accordance with ANSI/ISEA Z358.1, paragraph (6).

1.3.1.5 Paint Mixing

Provide local exhaust ventilation in the area where coatings are mixed. This ventilation system must be capable of providing at least 30.5 linear
meters per minute 100 linear fpm of capture velocity in the mixing zone. Avoid exposure of skin and eyes by wearing appropriate chemically resistant gloves, safety goggles, and face shields meeting the requirements of ANSI/ISEA Z87.1. Provide a personal eyewash unit within close proximity to the mixing operation in accordance with ANSI/ISEA Z358.1, paragraph (9). All powered mixing equipment must be either pneumatic or double insulated (intrinsically safe), in order to guard against fire or explosion. Individuals who have a history of, or develop a sensitivity to epoxy or polyurethane resin systems, must not conduct work tasks or otherwise be exposed to such chemicals.

1.3.1.6 Confined Spaces

When using solvent-based paint in confined spaces, prepare a Confined Spaces Plan. Provide ventilation to exchange air in the space at a minimum rate of 140 cubic meters 5,000 cubic feet per minute per spray gun in operation. It may be necessary to install both a mechanical supply and exhaust ventilation system to effect adequate air changes within the confined space. Locate and affix all air-moving devices to an opening of the confined space in a manner assuring that the airflow is not restricted or short circuited and is supplied in the proper direction. A suitable means of egress must be maintained at all times. Continue ventilation after completion of painting and through the drying phase of the operation. If the ventilation system fails or the concentration of volatiles exceeds 10 percent of the LEL (except in the zone immediately adjacent to the spray nozzle), stop painting and evacuate spaces until adequate ventilation is provided. Provide an audible alarm that signals system failure as an integral part of the ventilation system. Check the effectiveness of the ventilation by using ventilation smoke tubes and making frequent oxygen and combustible gas readings during painting operations. Exhaust ducts must discharge clear of the working areas and away from possible sources of ignition. Submit detailed written standard operating procedures for confined spaces in accordance with 29 CFR 1910.146 and EM 385-1-1, Section 6H, Section 34. The procedures must include:

a. Certificates of calibration for all testing and monitoring equipment. The certificates of calibration must include: type of equipment, model number, date of calibration, firm conducting calibration, and signature of individual certifying calibration.

b. Methods of inspection of personal protective equipment prior to use.

c. Engineering controls and other work practices designed to reduce airborne hazardous chemical exposures to a minimum.

d. Specification of the design and installation of ventilation systems which provide adequate oxygen content and provide for the dilution of paint solvent vapor, lead, and other toxic particulates within the confined space. Procedures must also include plans to evaluate the adequacy of air flow patterns.

1.3.1.7 Paint Spraying

Submit a comprehensive written Respiratory Protection Plan in accordance with 29 CFR 1910.134, 29 CFR 1926.62, and EM 385-1-1, Section 05.G. During all spray painting operations, spray painters must use approved SCBA or SAR (air line) respirators, unless valid air sampling has demonstrated contaminant levels to be consistently within concentrations compatible with the Assigned Protection Factor (APF) of an air-purifying respirator.
Persons with facial hair that may interfere with the seal or valve function of a half or full facepiece style respirator may wear a hood or helmet respirator provided the APF is sufficient for the exposure. Air-purifying chemical cartridge/canister respirators that have a particulate prefilter and are suitable for the specific type(s) of gas/vapor and particulate contaminant(s) may be used for nonconfined space painting, mixing, and solvent cleaning. These respirators may be used provided the measured or anticipated concentration of the contaminant(s) in the breathing zone of the exposed worker does not exceed the APF for the respirator and the gas/vapor has good warning properties or the respirator assembly is equipped with a NIOSH-approved end of service life indicator for the gas(es)/vapor anticipated or encountered. Where paint contains toxic elements that may become airborne during painting in nonconfined spaces, air-purifying half- and full-facepiece respirators or powered air-purifying respirators equipped with appropriate gas vapor cartridges, in combination with a high-efficiency filter, or an appropriate canister incorporating a high-efficiency filter, must be used.

1.3.1.8 Explosion Proof Equipment

Electrical wiring, lights, and other equipment located in the paint spraying areas must be of the explosion proof type designed for operation in Class I, Division 1, Group D, hazardous locations as required by the NFPA 70. Electrical wiring, motors, and other equipment, outside of but within 6 m 20 feet of any spraying area, must not spark and must conform to the provisions for Class I, Division 2, Group D, hazardous locations. Electric motors used to drive exhaust fans must not be placed inside spraying areas or ducts. Fan blades and portable air ducts must be constructed of nonferrous materials. Properly maintain and ground motors and associated control equipment. Electrically bond and ground the metallic parts of all air-moving devices, spray guns, connecting tubing, and duct work.

1.3.1.9 Further Precautions

a. Workers must wear nonsparking safety shoes.

b. Solvent drums taken into the spraying area must be grounded. Maintain metallic bonding between containers and drums when materials are being transferred.

c. Inspect insulation on all power and lighting cables to ensure that the insulation is in excellent working condition and is free of all cracks and worn spots. Ensure that no connections are within 15 m 50 feet of the operation, that lines are not overloaded, and that they are suspended with sufficient slack to prevent undue stress or chafing.

1.3.1.10 Ignition Sources

Ignition sources, including lighted cigarettes, cigars, pipes, matches, or cigarette lighters, and electronic smoking devices are prohibited in areas of solvent cleaning, paint storage, paint mixing, or paint application.

1.3.2 Health

**************************************************************************

NOTE: It is the responsibility of the designer to determine which structures are coated with a lead-based paint or other toxic material. Where
lead is present and the appropriate text from this guidance document is included in the contract, it is not necessary to include text from other UFGS documents that deal specifically with lead removal or disposal projects.

Prepare and submit a Medical Surveillance Plan and a statement from the examining physician indicating the name of each employee evaluated and any limitations which will preclude the employee from performing the work required. The statement must include the date of the medical evaluation, the physician's name, signature, and telephone number.

1.3.2.1 Air Monitoring

Prepare and submit an Air Monitoring Test Plan. Perform air sampling and testing as needed to assure that workers are not exposed to contaminants above the permissible exposure limit. In addition, provide the Contracting Officer with a copy of the Air Monitoring Test Report from the laboratory within five working days of the sampling date, including records of air monitoring plans and tests performed. Submit reports as soon as information is available. Also provide results from direct-reading instrumentation on the same day the samples are collected. Prepare and submit an Airborne Sampling Plan detailing the NIOSH 2003-154, Factory Mutual, or Underwriters Laboratories approved equipment, equipment calibration procedures, sampling methods, sampling to be performed, and analytical procedures to be used based on the type of work to be performed and anticipated toxic contaminants to be generated. Include the name of the accredited laboratory, listed by the American Industrial Hygiene Association (AIHA), that will be used to conduct the analysis of any collected air samples.

1.3.2.2 Medical Status

Prior to the start of work, and annually thereafter, submit a Report of Medical Status Records. This report will certify that Medical Status Records, in accordance with the requirements below are maintained for all required employees. The Contractor-maintained Medical Status Reports will document the medical evaluation of all employees working with or around paint systems, thinners, blast media, those required to wear respiratory protective equipment, and those who will be exposed to high noise levels for the particular type of exposure they may encounter. The Contractor-maintained Records must include the employee's name, the tests performed and the name of the physician responsible for performing the tests, and a physician's statement that medical status would permit specific task performance. Maintain medical records as required by 29 CFR 1910.20. The evaluation must include:

a. Audiometric testing and evaluation of employees who will work in a noise environment with a time weighted average greater than or equal to 85 dBA.

b. Vision screening of employees who will require eye protection (employees who use full-facepiece respirators cannot wear contact lenses).

c. Medical evaluation of employees who will be required to wear respiratory protection must include, but is not limited to, the following:
(1) Medical history including, but not limited to, alcohol use, with emphasis on liver, kidney, and pulmonary systems, and sensitivity to chemicals to be used on the job.

(2) General physical examination with emphasis on liver, kidney, and pulmonary system.

(3) Determination of the employee's physical and psychological ability to wear respiratory protective equipment and to perform job-related tasks.

(4) Determination of baseline values of biological indices for later comparison to changes associated with exposure to paint systems and thinners or blast media, which include: liver function tests to include SGOT, SGPT, GGPT, alkaline phosphates, bilirubin, complete urinalysis, EKG (employees over age 40), blood urea nitrogen (bun), serum creatinine, pulmonary function test, FVC, and FEV, chest x-ray (if medically indicated), blood lead and ZPP (for individuals where it is known there will be an exposure to materials containing lead), other criteria that may be deemed necessary by the Contractor's physician.

*****************************************************************************************************************************************
NOTE: 29 CFR 1926.62 Lead requires the development of a Worker Protection Plan for jobs involving removal of lead-containing coatings. It is the specifier's responsibility for determining when lead-containing paint will be removed and requiring the appropriate submittals including environmental compliance, worker protection, and waste management.
*****************************************************************************************************************************************

(5) For lead-based paint removal, prepare and submit a Worker Protection Plan in accordance with the requirements of 29 CFR 1926.62, addressing all necessary aspects of worker protection. The plan must include medical screening, activities emitting lead, means to achieve compliance, alternative technologies considered, air monitoring program, implementation schedule, work practice program, administrative controls, multi-Contractor site arrangements, and jobsite inspections.

1.3.2.3 Change in Medical Status

Any employee whose medical status has changed negatively due to work related chemical and/or physical agent exposure while working with or around paint systems and thinners, blast media, or other chemicals must be evaluated by a physician, and obtain a physicians statement as described in paragraph MEDICAL STATUS prior to allowing the employee to return to those work tasks. Maintain Change in Medical Status Records detailing any negative changes in employee medical status and the results of the physicians reevaluation statement. Submit a Change in Medical Status Report detailing the negative changes in medical status and a summary of the physician's reevaluation without including personal information of the impacted employee.

1.3.3 Environmental Protection

*****************************************************************************************************************************************

SECTION 09 97 02 Page 14
NOTE: An Environmental Compliance Plan for jobs involving removal of lead-containing coatings serves to demonstrate the Contractor's strategy for protecting the environment and the public from lead exposure. Elements of this plan may be redundant with other submittals listed herein including the Water Quality Plan, Soil Quality Plan, Ambient Air Monitoring Plan, and Visible Emissions Monitoring Plan. These submittals may be required for other jobs which do not involve the removal of lead-containing paint. The Environmental Compliance Plan integrates these plans as well as other lead-specific elements.

In addition to the requirements of Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, prepare an Environmental Protection Plan incorporating the submittals for Water Quality Plan, Containment Plan, Waste Disposal Plan, Soil Quality Plan, TSP Monitoring Plan, PM-10 Monitoring Plan, and Visible Emissions Monitoring Plan. The submitted plan must also address all aspects of establishing and demarcating regulated areas, ventilation/containment system performance verification, and reporting of accidental releases. Comply with the following environmental protection criteria.

1.3.3.1 Waste Classification, Handling, and Disposal

Prepare and submit a Waste Disposal Plan in accordance with the requirements of 40 CFR 261 and 40 CFR 262 including classification and handling. The Contractor is responsible for assuring the proper disposal of all hazardous and nonhazardous waste generated during the project. Regardless of the results of 40 CFR 261 App II, Mtd 1311, all waste generated from abrasive blasting, lead-containing paints with recyclable steel or iron abrasives must be either disposed of as a hazardous waste or be stabilized with proprietary pre-blast additives. Where stabilization is preferred, employ a proprietary blast additive, that has been blended with the blast media prior to use. Place hazardous waste in properly labeled, closed containers shielded adequately to prevent dispersion of the waste by wind or water. Any evidence of improper storage is cause for immediate shutdown of the project until corrective action is taken. Store nonhazardous waste in closed containers separate from hazardous waste storage areas. Transport all hazardous waste by a licensed transporter in accordance with 40 CFR 263 and 49 CFR 171, Subchapter C. Transport all nonhazardous waste in accordance with local regulations regarding waste transportation. In addition to the number of copies required by 40 CFR 262.22, supply one copy of each Waste Manifest to the Contracting Officer prior to transportation.

1.3.3.2 Containment

NOTE: It is the responsibility of the specifier to determine whether containment is required and if so, to specify it.

Specify the containment requirements using SSPC Guide 6. Where lead or other hazardous materials are present and abrasive blasting will be performed, specify either Class 1A or Class 2A containment.
Where Class 1A containment is specified, instrument verification of negative pressure should be required. Class 1A provides the greatest level environmental protection and should be specified in areas where high levels of lead are present and the work is in the vicinity of critical receptors (parks, schools, residences, or sensitive water sources). Class 2A containment is the most commonly specified level of containment for civil works structures in non-critical areas. Class 3A containment may provide an adequate degree of environmental protection for some lead-containing paint removal jobs, however, an adequate degree of worker protection may not be achievable under some circumstances.

Where lead or other hazardous materials are not present but abrasive blasting will be performed, specify Class 2A or 3A containment. Where the Contractor proposes to use a low-dusting recyclable abrasive such as steel grit, then the Contracting Officer should allow one class lower of containment. Classes 3A and 4A containment provide minimal control over emissions. Minimal control of emissions would be used in situations where critical receptors are not near the work site. Containment of dust producing abrasive blasting operations is recommended because of NAAQS for PM-10.

Where lead or other hazardous materials are present and power tool cleaning will be performed, specify Class 1P containment. Where the Contractor proposes to use vacuum-shrouded power tools then the Contracting Officer should allow their use with ground covers and/or free hanging tarpaulins. Classes 2P or 3P can be specified where the paint contains low-levels of lead, less than 1 percent. As an option the Contractor should be allowed to use vacuum shrouded power tools without additional protection. Containment is not generally specified for power tool removal of nonhazardous paint materials.

A Containment Plan should also be required for nonlead jobs where containment is specified.

**************************************************************************

Prepare a Containment Plan for containing debris generated during paint removal operations. Include drawings, load-bearing capacity calculations, and wind load calculations. When the design is such that the spent abrasive is allowed to accumulate in quantities greater than 453 kg 1,000 pounds, and/or impart a significant wind load on the structure, have the drawings approved by a registered structural engineer. The drawings and calculations must be stamped with the engineer's seal. Also identify the type and placement of water booms, methods for anchoring the booms, and the procedures for removing debris. Contain debris generated during paint removal operations in accordance with the requirements of SSPC Guide 6, Class [______]. Where required, verify the containment air pressure [by instrument] [visually].
1.3.3.3 Visible Emissions Monitoring

NOTE: It is the responsibility of the specifier to determine whether monitoring of visible emissions will be required and if so, to specify the requirements. The 40 seconds in 1-hour, 75 seconds in 2-hours, and 1 percent daily visible emissions criteria should be invoked for all lead and other hazardous paint removal jobs. The 200 seconds in 1-hour, 300 seconds in 2-hours, and 5 percent daily visible emissions criteria should be called for on jobs where abrasive blasting will be used to remove nonhazardous paints. Visible emissions monitoring should not be specified for power tool removal of nonhazardous paints. See NOTE for paragraph CONTAINMENT above.

Prepare a Visible Emissions Monitoring Plan including the provisions for halting work and correcting the containment in the event unacceptable emissions are observed. General statements must not be used; specific methods, procedures, and details are required. Measure the time of emissions in accordance with 40 CFR 60, App A, Mtd 22. Monitor visible emissions for not less than 15 minutes of every hour. Calculate visible emissions for each hour by extrapolation. Visible emissions must not extend greater than 45 m 150 feet in any direction horizontal from the containment. Visible emissions must not be observed in the area of any sensitive receptor. If such emissions occur shut down the job immediately and take corrective action. Notify the foreman whenever visible emissions exceed [40] [200] seconds in a 1 hour period. Whenever visible emissions exceed [75] [300] seconds in a 2 hour period notify the foreman, shut down the job, and take corrective action. If the total observed visible emissions from the containment exceeds [1] [5] percent of the work day, shut down the job and take corrective action to prevent such an occurrence. Document each time that the work is halted due to a violation of the visible emissions criteria. Documentation must include the cause for shutdown and the corrective action taken to resolve the problem.

1.3.3.4 PM-10 Monitoring

NOTE: It is the specifier's responsibility to contact the local authorities and state Bureaus of Air Pollution Control to determine if PM-10 (particulate matter less than 10 microns in size) monitoring is required. If so, include paragraph PM-10 MONITORING PLAN. The National Ambient Air Quality Standard (NAAQS) for lead does not apply to lead paint removal. However, if the (NAAQS) requirement for lead [total suspended particulate (TSP) lead] is invoked by a State or Local governing body on lead paint removal projects, include paragraph TSP MONITORING. In either case, air monitoring should be modified to address the specific state or local regulations. TSP lead monitoring is recommended for all lead paint removal jobs even where not required. TSP lead monitoring
data is useful in determining the efficacy of containment. PM-10 monitoring is not recommended for lead or other paint removal jobs where it is not required. It is a generally accepted fact that if there is no TSP-Pb exceedance predicted by TSP monitoring then there will also not be a PM-10 exceedance. For this reason SSPC recommends that just TSP monitoring be performed on lead jobs.

Prepare and submit a PM-10 Monitoring Plan for monitoring emissions of particulate matter 10 microns or less in size (PM-10) in compliance with the requirements of EPA regulation 40 CFR 50.6 and this paragraph. The plan must also include provisions for halting work and correcting the containment in the event unacceptable emissions occur. Position the air monitoring equipment in accordance with 40 CFR 58, App E, Subpart (8). In addition, a minimum of two PM-10 monitors must be used at the project site, one downwind from the project and one in the area of greatest public access (e.g., playground, school yard, or homeowner's yard). When the project is in an area where there are critical receptors nearby, monitoring must be conducted throughout the entire period that abrasive blasting and cleanup operations are performed. Otherwise, perform monitoring 4 of the first 8 days and on a regular basis thereafter for a sum total of 25 percent of the time surface preparation and debris cleanup are performed. If air quality regulatory limits are not met, take corrective actions and immediately repeat air monitoring. Conduct the preproject PM-10 monitoring a minimum of 2 weeks prior to the beginning of the project and continue for a minimum of 3 days to establish background levels. Submit a PM-10 Test Report to the Contracting Officer within 48 hours, that includes:

a. Name and location of jobsite.

b. Date of monitoring.

c. Time of monitoring (i.e., time monitoring begins and ends each day).

d. Identification and serial number of monitoring units.

e. Drawing showing specific location of monitoring units.

f. Drawing showing specific location of paint removal operation and the method of removal or work activity being performed.

h. Wind direction and velocity.

i. Name and address of laboratory.

j. Laboratory test procedure.

k. Laboratory test results.

l. Signatures of field and laboratory technicians conducting the work.

1.3.3.5 TSP Monitoring

Prepare a TSP Monitoring Plan for monitoring emissions of Total Suspended
Particulates (TSP) in compliance with the requirements of EPA regulation 40 CFR 50.12 and this paragraph. The plan must include provisions for halting work and correcting the containment in the event unacceptable emissions occur. Position the air monitoring equipment in accordance with 40 CFR 58, App E, Subpart (8). A minimum of two TSP monitors must be used at the project site, one downwind from the project and one in the area of greatest public access (e.g. playground, school yard, or homeowner's yard). When the project is in an area where there are critical receptors nearby, TSP-lead monitoring must be conducted throughout the entire period that abrasive blasting and cleanup operations are performed. Otherwise, perform monitoring 4 of the first 8 days and on a regular basis thereafter for a sum total of 25 percent of the time surface preparation and debris cleanup are performed. If air quality regulatory limits are not met, require air monitoring to be repeated immediately after corrective actions have been taken. Also conduct preproject TSP monitoring. Conduct the preproject TSP monitoring a minimum of 2 weeks prior to the beginning of the project and continue the monitoring for a minimum of 3 days to establish background levels. Submit a TSP Test Report to the Contracting Officer within 48 hours including:

a. Name and location of jobsite.

b. Date of monitoring.

c. Time of monitoring (i.e., time monitoring begins and ends each day).

d. Identification and serial number of monitoring units.

e. Drawing showing specific location of monitoring units.

f. Drawing showing specific location of paint removal operation and the method of removal or work activity being performed.

g. Wind direction and velocity.

h. A flow chart verifying the rate of air flow across the filter throughout the sampling period.

i. Name and address of laboratory.

j. Laboratory test procedure.

k. Laboratory test results.

l. Signatures of field and laboratory technicians conducting the work.

1.3.3.6 Water Quality

**************************************************************************
NOTE: If the work is proximate to storm sewers, rivers, bays, streams, or other bodies of water, include paragraph WATER QUALITY to prohibit contamination of the water from the project activities; otherwise delete paragraph WATER QUALITY. Modify if necessary to comply with State or local EPA requirements.
**************************************************************************

Prepare a Water Quality Plan for all job sites where lead-containing or
other hazardous paint will be removed, including provisions for halting work if spills or emissions are observed entering into bodies of water or found in areas where storm water runoff could carry the debris into bodies of water or storm sewers. The plan must also address cleanup and reporting procedures. Conduct operations in such a manner that lead-containing and other hazardous paint debris do not contaminate the water and so that NPDES permits in accordance with EPA regulation 40 CFR 122 are not required for the project. Any release of lead paint debris into the waterways having a reportable quantity of hazardous substance pursuant to Section 311 of the Clean Water Act, must be reported to the EPA in accordance with 40 CFR 117 and 40 CFR 355. The plan must require the thorough documentation of any release or spill that carries into waterways or storm sewers. Include the time and location of the release, amount of material released, actions taken to clean up the debris, amount of debris recovered, and corrective action taken to avoid a reoccurrence. Also report releases to the Coast Guard and other state and local authorities as appropriate. If the release is equivalent to \(4.5 \text{ kg } 10\text{ pounds}\) or more of lead-containing material in a 24-hour period, it is considered to be a reportable quantity under CERCLA. Comply with 40 CFR 302.

1.3.3.7 Soil Quality

Prepare a Soil Quality Plan for all job sites where lead-containing or other hazardous paint will be removed. The plan must include provisions for halting the work should soil contamination occur, correcting the deficiencies responsible for the contamination, and provide procedures for removing and replacing contaminated soil. Establish and implement practices and procedures for preventing contamination of the soil from the removal of lead-containing or other hazardous paints. Unless otherwise directed by the Contracting Officer, soil is considered to have been contaminated by the Contractor’s operation if an increase in the total lead content of 100 PPM or greater over background levels occurs. For purposes of computing the increase compute the mean background levels and the mean post-removal levels. The 100 PPM criteria is met if the difference between the means is less than 100 PPM plus the 95 percent confidence limit. Conduct soil sampling and testing prior to the beginning of the project and after the project is completed. Interim testing may also be performed in the event the Contractor or Contracting Officer wants to confirm that the containment system and work practices continue to provide satisfactory protection of the soil. Unless otherwise directed by the Contracting Officer, the following minimum test locations must be selected for soil analysis. Select two locations beneath or immediately adjacent to the structure being prepared. Take additional samples within \(30\text{ m } 100\text{ feet}\) in each direction of the project (i.e., N, S, E, W) in which soil is present. The number of soil sample locations must be sufficient to adequately characterize the soil contaminant levels within and around the project area. Collect five composite samples at each location. Each of the five samples must be comprised of five individual plugs of soil combined in a single bag. Use the following procedure to collect the composite samples:
a. Place a 0.093 square m 1-square foot template at each location.

b. Remove a sample of soil 19 mm 3/4 inch in diameter and 13 mm 1/2 inch in depth at the center of the template and at each of the four corners. Place the five soil plugs into a single bag. This represents one of the three samples to be removed at a given location.

c. Move the template 25 mm 1 inch in any direction and repeat the process to collect the second sample. Place all plugs in a separate bag. Move the template 5 mm 1 inch farther to collect the third sample.

d. Identify each sample bag with the date, specific location of the sample, name and signature of the sampling technician, and complete chain of custody records.

e. It is critical that the specific location of each sample be thoroughly measured and documented as the final project testing (and any interim testing) must be sampled in the precise locations.

Analyze three samples collected at each location. One of the remaining two samples is to be maintained by the Contractor for the duration of the project and the other by the Contracting Officer in the event reanalysis is required. Analyze lead-containing samples in accordance with EPA testing guidance as published in 40 CFR 261, App III, by a laboratory listed by the American Industrial Hygiene Association (AIHA) as being proficient in conducting the test. Note that if it is determined that contamination of the soil has occurred as a result of the paint removal operations, TCLP testing must be employed to determine if the soil must be handled and disposed of as a hazardous waste. The initial sampling of the soil for total lead content does not establish whether the soil will be considered hazardous by TCLP testing. As a result, at the Contractor's option, additional prework soil samples may be removed (minimum of 105 grams is required for a single test at each site) to conduct TCLP testing to establish whether the soil would be classified as hazardous prior to project startup. In the event that there is a release of lead paint debris onto the soil and if the release is 4.5 kg 10 pounds or more of lead-containing material in a 24-hour period, it is considered to be a reportable quantity under CERCLA. Comply with 40 CFR 302. Thoroughly document the occurrence of any spills of lead debris into the soil. The documentation must include the time and location of the release, amount of material released, actions taken to clean up the debris, amount of debris reclaimed, and corrective action taken to avoid a reoccurrence. Provide the documentation to the Contracting Officer including the Soil Quality Test Report with results of the prework and post work soil quality tests.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item,
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval.[for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Safety, Health, and Environmental Requirements; G[, [____]]
Accident Prevention Plan; G[, [____]]
Confined Spaces Plan; G[, [____]]
Respiratory Protection Plan; G[, [____]]

Qualified Hazardous Paint Removal Contractor; G[, [_____]]
Coating Thickness Gage Qualification
Qualified Coating Applicator; G[, [_____]]

1.5 QUALIFICATIONS

**************************************************************************
NOTE: USACE has identified an ongoing problem throughout the districts regarding poor paint
performance due to unqualified contractors and/or unskilled painters. Districts can require Contractor certification by requiring industry certification by SSPC: THE SOCIETY FOR PROTECTIVE COATINGS (SSPC-QP1, QP2, or QP3). While there are some industry certification programs for painters, none include the application of fast drying coatings such as the vinyl systems in this document. Guidance for attaining better and more economical paint jobs is provided in EM 1110-2-3400. Any consulting in reference to this guide specification or painting problems in general should be directed to the Paint Technology Center, U.S. Army Construction Engineering Research Laboratory, ATTN: CEERDC-CF-M, Champaign, IL; e-mail: paint@usace.army.mil; Phone: 217-373-7486.

Qualifications and experience must comply with the following.

1.5.1 Certified Environmental, Health, and Safety (EHS) Professionals

Provide a certificate for each Certified EHS Professional; submit qualifications and experience of qualified and competent persons employed to provide preconstruction and onsite environmental, safety, and health services. Obtain acceptance of this submission prior to the submission of other required environmental, safety, and health submittal items. Utilize a qualified and competent person as defined in EM 385-1-1, Section 01 to develop the required safety and health submittal and to provide onsite safety and health services during the contract period. The person must be a Certified Industrial Hygienist (CIH), an Industrial Hygienist (IH), or a Certified Safety Professional (CSP) with a minimum of 3 years of demonstrated experience in similar related work. The CIH, IH, or CSP may utilize other qualified and competent persons, as defined in EM 385-1-1, to conduct on-site safety and health activities as long as these persons have a minimum of 2 years of demonstrated experience in similar related work and are under the direct supervision of the CIH, IH, or CSP. For lead containing jobsites, the competent and qualified person must have successfully completed an EPA or state accredited lead-based paint abatement Supervisor course specific to the work to be performed and possess current and valid state and/or local government certification, as required.

1.5.2 Certified Lead Laboratory

Provide documentation which includes the name, address, and telephone number of the laboratories to be providing services. In addition, the documentation must indicate that each laboratory is an EPA National Lead Laboratory Accreditation Program (NLLAP) accredited laboratory and that each is rated proficient in the NIOSH/EPA Environmental Lead Proficiency Analytical Testing Program (ELPAT) and will document the date of current accreditation. Certification must include accreditation for heavy metal analysis, list of experience relevant to analysis of lead in air, and a Quality Assurance and Quality Control Program. Submit a certificate for the Certified Lead Laboratory.

1.5.3 Qualified Painting Contractor
NOTE: The specifier should decide whether the work is of sufficient complexity or size that the use of a Qualified Painting Contractor is warranted. In general, very large jobs of moderate complexity or small but very complex painting work should be performed by a Qualified Painting Contractor. Very complex work includes steel structures that will be painted and exposed in immersion. Large jobs are work where more than 9300 square m 100,000 square feet will be painted. SSPC utilizes an independent third party auditing firm to evaluate and certify painting Contractors for compliance with various types of work: QP-1 is for Field Application to Complex Structures; QP-2 requires QP-1 certification plus the ability to remove hazardous paint; QP-3 evaluates Shop Painting contractors. Lists of qualified Contractors are provided on the SSPC website at sspc.org. The designer may visit the site to determine the availability of qualified contractors in the project area.

**************************************************************************

The Painting Contractor must be a certified SSPC QP 1 Painting Contractor. Submit a copy of the applicable SSPC [QP-1][QP-2][QP-3] Certificate. The contractor must have been certified prior to award of this contract and must remain certified for the duration of this contract. Certifications scheduled to expire during the contract performance period must be renewed and submitted to the Contracting Officer prior to expiration.

][1.5.4 Qualified Hazardous Paint Removal Contractor

**************************************************************************

NOTE: The specifier should decide whether the work is of a nature such that the use of a Qualified Hazardous Paint Removal Contractor is warranted. A Qualified Hazardous Paint Removal Contractor is recommended for jobs involving more than the incidental removal of lead-containing paints. A qualified Contractor is not generally recommended for jobs where the lead paint contains low levels of lead, less than 1 percent. The risk of worker overexposure and environmental contamination is still significant for such jobs, but not to the extent necessary to warrant a certified hazardous paint removal Contractor. SSPC utilizes an independent third party auditing firm to evaluate and certify painting Contractors for compliance with Qualification Procedure SSPC QP 2, Standard Procedure for Evaluating The Qualifications of Painting Contractors To Remove Hazardous Paint. QP 2 provides two categories of qualification based on the level of containment. Category A qualifies the Contractor for work requiring a containment Class 1A or 2A – recommended classes for most Corps lead removal projects. Category B is for work in classes of containment with lesser requirements.

The specifier should select the necessary qualification category. The QP 2 certification is
an extension of QP 1 certification. QP 2 certification should also be considered by the specifier for removal of other toxic paints such as those that contain hexavalent chromium or cadmium. Lists of qualified Contractors are provided on the SSPC website at sspc.org. The designer may visit the site to determine the availability of qualified contractors in the project area.

The Painting Contractor must be a certified SSPC QP 2 [Category A] [Category B] Painting Contractor for all surface preparation or coating application. Submit a copy of the applicable SSPC Certificate. The contractor must have been certified prior to award of this contract and must remain certified for the duration of this contract. Submit all renewals if they occur during the contract performance period. Renewals must be achieved prior to expirations occurring.

][1.5.5 Qualified Shop Painting Contractor

NOTE: The specifier should decide whether the work is of sufficient complexity or size that the use of a Qualified Shop Painting Contractor is warranted. In general, large jobs of moderate complexity or small but very complex painting work that may be performed in a shop should be performed by a Qualified Shop Painting Contractor. Shops having the certification are typically dedicated painting shops; typical fabricating shops are generally not certified. Lists of qualified Contractors are provided on the SSPC website at sspc.org. The designer may visit the site to determine the availability of qualified contractors in the project area.

The Painting Contractor must be a certified SSPC QP 3 Painting Contractor for all off-site surface preparation or coating application. Submit a copy of the applicable SSPC Certificates. The contractor must have been certified prior to award of this contract and must remain certified for the duration of this contract. Submit all renewals if they occur during the contract performance period. Renewals must be achieved prior to expirations occurring.

][1.5.6 Qualified Coating Applicator

NOTE: The specifier should decide whether the work is of sufficient complexity or size that the use of Qualified Coating Applicators is warranted. In general, very large jobs of moderate complexity or small but very complex painting work should be performed by applicators who have shown they have the ability to apply the specified coating system. Very complex work includes steel structures that will be painted and exposed in immersion. Large jobs are work where more than 9300 square m 100,000 square feet will be painted. Application of vinyl
coating systems using conventional spray equipment frequently justifies the qualification of applicators. Applicators typically have more experience in the application of slower drying coatings such as epoxies and urethanes and use of airless spray equipment. This paragraph may also be modified replacing the panel described in ASTM D4228 with a selected area of the structure under contract.

Submit records of qualification tests for each Qualified Coating Applicator. Prior to the initiation of any work all coating applicators must be tested and certified as meeting the requirements of ASTM D4228. Certification must be administered by an authorized government representative. Applicators failing the certification procedure will not be permitted to apply any paint on the project.

1.5.6.1 Certification Test Procedure

Conduct certification testing of coating applicators at the job site in coordination with the Contracting Officer. Supply the fabricated test plates to be used for the tests and provide crane service, rigging, and any other work necessary to provide accessibility for the certification testing and inspection. The test plate must be painted in a near vertical position. In preparation, clean and prepare the test plate in accordance with the requirements of the contracted work. Perform abrasive blasting with the blast media to be used in the contract. The paints to be applied are Contractor supplied materials and are those previously tested and approved for use on the contract. Paints must be applied as specified in this contract. The painter being tested must mix and thin the paints to be used in the test and set up and adjust the application equipment for use. Each painter must apply each of the types of paint comprising the specified system. The contractor's QC inspector must be present during the procedure to monitor the actions of the painter being tested.

1.5.6.2 Certification Criteria

Evaluate the paint applicator based on the conformance of the applied paint system to the requirements of this specification. Deficiencies in the coatings, improper mixing or improper application methods are basis for failure. The authorized Government Representative is the sole judge as to the acceptability of each coating applicator's performance.

1.5.7 Coating Thickness Gage Qualification

Submit Coating Thickness Gage Qualification documentation of manufacturer's certification for all coating thickness gages. Use magnetic flux thickness gages as described in ASTM D7091 to make all coating thickness measurements on ferrous metal substrates. Use eddy current thickness gages as described in ASTM D7091 to measure coating thickness on all nonferrous metal substrates. Gages to be used on the job must have an accuracy of 3 percent or better and be certified by the manufacturer as meeting this requirement.

1.5.8 Certified Coating Inspector

Provide a certified coating inspector who is listed as either SSPC-PCI Level 2, or NACE CIP Level 2 for all surface preparation and painting activities. Submit a copy of the applicable SSPC or NACE Certificates. Submit all renewals if they occur during the contract performance period.
Renewals must be achieved prior to expirations occurring.

1.6 DELIVERY, STORAGE, AND HANDLING

Process and package paints to ensure that within a period of one year from date of manufacture, they will not gel, liver, or thicken deleteriously, or form gas in the closed container. Paints, unless otherwise specified or permitted, must be packaged in standard containers not larger than 20 L 5 gal, with removable friction or lug-type covers. Containers for vinyl-type paints must be lined with a coating resistant to solvents in the formulations and capable of effectively isolating the paint from contact with the metal container. Each container of paint or separately packaged component thereof must be labeled to indicate the purchaser's order number, date of manufacture, manufacturer's batch number, quantity, color, component identification and designated name, and formula or specification number of the paint together with special labeling instructions, when specified. Paint must be delivered to the job in unbroken containers. Paints that can be harmed by exposure to cold weather must be stored in ventilated, heated shelters. All paints must be stored under cover from the elements and in locations free from sparks and flames.

1.7 AMBIENT CONDITIONS

Paint must be applied in accordance with the manufacturers written instructions or to the special requirements contained herein. Surfaces that are less than 2.8 degrees C 5 degrees F above the dew point temperature must be monitored closely to assure that they are completely free of moisture as determined by sight and touch. Paint must not be applied to surfaces upon which there is detectable frost or ice. Except as otherwise specified, paint must not be applied if the temperature of the surfaces to be painted and of air in contact therewith is less than 9 degrees C 45 degrees F during paint application nor if the surfaces can be expected to drop to 0 degrees C 32 degrees F or lower before the film has dried to a reasonably firm condition. During periods of inclement weather, painting may be continued by enclosing the surfaces and utilizing climate control equipment (e.g. dehumidification, heaters, etc.), provided the minimum temperatures and surface dryness requirements prescribed previously are maintained. Paint must not be applied to surfaces heated by direct sunlight or other sources to temperatures that will cause detrimental blistering, pinholing, or porosity of the film.

PART 2 PRODUCTS

2.1 PRODUCT SAMPLES

****************************************************************************************************
NOTE: US Army Construction Engineering Research Laboratory provides paint testing services on a reimbursable basis. Allowing 30 days for testing of Special Formulation and Military Specification paints is sufficient. Complete testing commercial products submitted to meet SSPC requirements may take in excess of 6 months – the Contracting Officer may wish to discuss options with the Laboratory. Products listed on the MPI web site do not need further testing. Testing costs vary based on the type of paint. Specifier should contact ERDC-CERL for cost of testing. (E-mail: ) Samples may be submitted to US Army ERDC-CERL, ATTN: Paint
Submit product samples of each batch of thinner, solvent, and paint to the Government for testing. Submit manufacturer's Safety Data Sheet (SDS) for each type of paint used; for products that are specified to be applied in accordance with the manufacturer's recommendations, submit the paint manufacturer's product data sheet (PDS) or other written instructions for those products. Allow at least 30 days from time of delivery to the contracting officer for testing of samples of paints and thinners. Sampling may be at the jobsite or source of supply. Coordinate sampling and submission of all samples of paint and thinner with the Contracting Officer. Standard sample size for liquid paints and thinners is 1 L (1 quart); powders and other additives for multi component paints may be of appropriately smaller size. The sample must be labeled to indicate formula or specification number and nomenclature, batch number, batch quantity, color, date made, and applicable project contract number. Testing will be performed by the Government. Costs for retesting rejected material will be deducted from payments to the Contractor at the rate of [_____] dollars for each paint sample retested and [_____] dollars for each thinner retested.

2.2 SPECIAL PAINT FORMULAS

Special paints must have the composition as indicated in the formulas listed herein. Where so specified, package paint formulation components in separate containers for mixing on the job. If not specified or otherwise prescribed, the color must be that naturally obtained from the required pigmentation.

2.3 PAINT FORMULATIONS

Special paint formulas must comply with the following:

2.3.1 Formula V-102E

This formula is for Vinyl-Type Ready-Mixed Aluminum Impacted Immersion Coating, the ingredients are shown below.

<table>
<thead>
<tr>
<th>INGREDIENTS</th>
<th>PERCENT BY MASS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vinyl Resin, Type 3</td>

</tbody>
</table>

a. Furnish the paint with the aluminum pigment mixed into the vehicle.
b. The finished paint must show the proper proportions of specified materials when analyzed by chromatographic and/or spectrophotometric methods, and have a viscosity between 60 and 90 seconds using ASTM D1200 and a No. 4 Ford cup.

2.3.2 Formula V-103C

This formula is for Vinyl-Type Black-Finish Impacted Immersion Coating, the ingredients are shown below.

<table>
<thead>
<tr>
<th>INGREDIENTS</th>
<th>PERCENT BY MASS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vinyl Resin, Type 3</td>

</tbody>
</table>

a. Disperse the carbon black to a fineness of grind ASTM D1210 of not less than 7 on the Hegman scale. A paste composed of carbon black milled into a Type 3 vinyl resin dissolved in an appropriate solvent may be used provided the finished product has the specification composition and grind. Material must be free from seeding, gelling, and other deleterious effects. No grinding aids, antisettling agents, or any other materials except those shown in the formula will be permitted.

b. The finished paint must show the proper proportions of specified materials when analyzed by chromatographic and/or spectrophotometric methods, and have a viscosity between 60 and 90 seconds using ASTM D1200 and a No. 4 Ford cup.

2.3.3 Formula V-106D

This formula is for Vinyl-Type Red Oxide (Light or Dark Color) Impacted Immersion Coating, the ingredients are shown below.

<table>
<thead>
<tr>
<th>INGREDIENTS</th>
<th>PERCENT BY MASS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vinyl Resin, Type 3</td>

</tbody>
</table>
a. Disperse the pigment by means of pebble mills or other approved methods to produce a fineness of grind (ASTM D1210) of not less than 7 on the Hegman scale. Grinding in steel-lined or steel-ball mills will not be permitted. No grinding aids, antisettling agents, or any other materials, other than those listed in the formula, will be permitted.

b. The finished paint must show the proper proportions of specified materials when analyzed by chromatographic and/or spectrophotometric methods, and have a viscosity between 60 and 90 seconds using ASTM D1200 and a No. 4 Ford cup.

c. Furnish the paint in two colors which are obtained by the alternative use of synthetic red iron oxide pigments of different shade. The dark paint must reasonably approximate color 10076 of SAE AMS-SID-595A, and light colored paint must be readily distinguishable in the field from the dark. Furnish the two shades in the volume ratio designated by the purchaser.

2.3.4 Formula VZ-108D

This formula is for Vinyl-Type Zinc-Rich Impacted Immersion Coating, the ingredients are shown below.

</tr>
</tbody>
</table>
a. Disperse the iron oxide and suspending agents into the vehicle (Component A) to a fineness of grind of not less than 4 on the Hegman scale (ASTM D1210). Grinding in steel-lined containers or using steel-grinding media will not be permitted. The paint must show the proper proportions of specified materials when analyzed by chromatographic and/or spectrophotometric methods. The sole purpose of the iron oxide pigment is to produce a contrasting color. A red iron oxide-type 3 vinyl resin vehicle paste may be used in place of dry iron oxide provided compensating adjustments are made in the additions of Type 3 resin and methyl isobutyl ketone. The finished product with zinc dust added must produce a paint which has a red tone upon drying and a reflectance of not more than 16 (ASTM E1347).

b. Supply VZ-108D paint as a kit. Each kit must consist of 17 L 4.5 gal (15 kg 33.1 pounds) of Component A in a 20 L 5-gallon lug closure type pail, 12 kg 27.5 pounds of zinc dust (Component C) packaged in a 4 L 1-gal plastic pail, and 89 mL 3 fluid ounces of silane (Component B) packaged in a glass bottle of suitable size having a polyethylene lined cap. Place the bottle of silane on the zinc dust in the 4 L 1-gal pail. In addition to standard labeling requirements, identify each container of each component as to component type. Each container label of Component A must carry the following: MIXING AND APPLICATION INSTRUCTIONS: WARNING - THIS PAINT WILL NOT ADHERE TO STEEL SURFACES UNLESS COMPONENT B IS ADDED. Remove the 89 mL 3 ounces of bottled Component B (silane) from the Component C (zinc dust) container and add to the base paint Component A) with thorough stirring. Then sift the zinc dust into the base paint while it is being vigorously agitated with a power-driven stirrer and continue the stirring until the zinc dust has been dispersed. At some point strain the mixed paint through a 30-60 mesh screen to prevent zinc dust slugs from reaching the spray gun nozzle. Stir the paint continuously during application at a rate that will prevent settling. If spraying is interrupted for longer than 15 minutes, vigorously whip the entire length of the hose to redisperse the zinc. If the spraying is to be interrupted for more than 1 hour, empty the hose by blowing the paint back into the paint pot. Thinning will not normally be required when ambient temperatures are below about 26 degrees C 80 degrees F, but when the ambient and steel temperatures are higher, methyl isoamyl ketone (MIAK) or methyl isobutyl ketone (MIBK) should be used. If paint is kept covered at all times, its pot life will be about 8 days.

2.3.5 Formula V-766E

This formula is for Vinyl-Type White (or Gray) Impacted Immersion Coating, the ingredients are shown below.

<table>
<thead>
<tr>
<th>INGREDIENTS</th>
<th>PERCENT BY MASS</th>

</tbody>
</table>

a. Disperse the pigment by means of pebble mills or other approved methods to produce a fineness of grind (ASTM D1210) of not less than 7 on the Hegman scale. Grinding in steel-lined or steel-ball mills will not be permitted. No grinding aids, antisettling agents, or any other materials except those shown in the formula will be permitted. Measure the ortho-phosphoric acid accurately and dilute it with at least four parts of ketone to one part of acid. Add it slowly into the finished paint with constant and thorough agitation.

b. The finished paint must show the proper proportions of specified materials when analyzed by chromatographic and/or spectrophotometric methods, and have a viscosity between 60 and 90 seconds using ASTM D1200 and a No. 4 Ford cup.

c. Furnish the white and gray paints in the volume ratio designated by the purchaser. The gray paint must contain no pigments other than those specified. Include enough carbon black to produce a dry paint film having a reflectance of 20-24 (ASTM E1347). The resulting gray color must approximate color 26231 of SAE AMS-STD-595A.

2.3.6 Formula C-200A, Coal Tar-Epoxy (Black) Paint

The paint must conform to SSPC Paint 16 manufactured with Type 1 pitch. In addition to standard labeling, container labels must include the term, Corps of Engineers Formula C-200A.

2.4 INGREDIENTS FOR SPECIAL PAINT FORMULAS

The following ingredient materials and thinners apply only to those special paints whose formulas are shown above in detail.

2.4.1 Pigments and Suspending Agents

2.4.1.1 Aluminum Powder

For vinyl paint aluminum powder must conform to ASTM D962, Type 1, Class B.
2.4.1.2 Carbon Black

Carbon black must conform to ASTM D561, Type I or II.

2.4.1.3 Zinc Dust

Zinc dust pigment must conform to ASTM D520, Type II.

2.4.1.4 Iron Oxide

Iron oxide, (Dry) synthetic (red), must conform to ASTM D3721. In addition, the pigment must have a maximum oil absorption of 24 and a specific gravity of 4.90 to 5.20 when tested in accordance with ASTM D281 and ASTM D153, Method A, respectively. When the pigment is dispersed into specified vinyl paint formulation, the paint must have color approximating SAE AMS-STD-595A color 10076 (dark red paint), and show no evidence of incompatibility or reaction between pigment and other components after 6 months storage.

2.4.1.5 Titanium Dioxide

Titanium dioxide in vinyl paint Formula V-766E must be one of the following: Kronos 2160 or 2101, Kronos, Inc.; Ti-Pure R-960, E.I. Dupont DeNemours and Co., Inc.

2.4.1.6 Suspending Agent E

Suspending Agent E must be a light cream colored finely divided powder having a specific gravity of 2 to 2.3. It must be an organic derivative of magnesium aluminum silicate mineral capable of minimizing the tendency of zinc dust to settle hard without increasing the viscosity of the paint appreciably. M-P-A-14, produced by Elementis Specialties, has these properties.

2.4.1.7 Suspending Agent F

Suspending Agent F must be a light cream colored finely divided powder having a specific gravity of approximately 1.8. It must be an organic derivative of a special montmorillonite (trialkylaryl ammonium hectorite). Bentone 27, produced by Elementis Specialties, has these properties.

2.4.2 Resins, Plasticizer, and Catalyst

2.4.2.1 Plasticizer

The plasticizer must be either Di 2-propyl Heptyl Phthalate (DPHP) or Diisodecyl Phthalate (DIDP). DPHP must have an ester content of not less than 99.5 percent (ASTM D3465), must contain not more than 0.1 percent water, and must have an acid number (ASTM D1045) of not more than 0.07. DIDP must have a purity of not less than 99.0 percent, must contain not more than 0.1 percent water, and must have an acid number (ASTM D1045) of not more than 0.10.

2.4.2.2 Vinyl Resin, Type 3

Vinyl resin, Type 3, must be a vinyl chloride-acetate copolymer of medium average molecular weight produced by a solution polymerization process and must contain (by weight) 85 +/- 1.0 percent vinyl chloride and 15 +/- 1.0 percent vinyl acetate by weight. The resin must have film-forming
properties and must, in specified formulations, produce results equal to Vinnol H 15/50, as manufactured by Wacker Chemie AG.

2.4.2.3 Vinyl Resin, Type 4

Vinyl resin, Type 4, must be a vinyl chloride-acetate type produced by a solution polymerization process, must contain 1 percent interpolymerized dicarbonic acid, 84 +/- 1.0 percent vinyl chloride, and 15 +/- 1.0 percent vinyl acetate. The resin must have film-forming properties and must, in the specified formulations, produce results equal to Vinnol H 15/45 M, as manufactured by Wacker Chemie AG.

2.4.2.4 Ortho-phosphoric Acid

Ortho-phosphoric acid must be a chemically pure 85-percent grade.

2.4.3 Solvent and Thinners

2.4.3.1 Methanol

Methanol (methyl alcohol) must conform to ASTM D1152.

2.4.3.2 Methyl Ethyl Ketone

Methyl ethyl ketone (MEK) must conform to ASTM D740.

2.4.3.3 Methyl Isobutyl Ketone

Methyl isobutyl ketone (MIBK) must conform to ASTM D1153.

2.4.3.4 Methyl Isoamyl Ketone

Methyl isoamyl ketone (MIAK) must conform to ASTM D2917.

2.4.3.5 Toluene

Toluene must conform to ASTM D841.

2.4.4 Silane B

Silane B for Formula VZ-108D must be N-beta-(aminoethyl)-gamma-aminopropyltrimethoxy silane. Silquest A-1120, produced by Momentive Performance Materials Inc., and Silane Z-6020, produced by Dow Corning Corporation, are products of this type.

2.4.5 Propylene Oxide

Propylene oxide must be a commercially pure product suitable for the intended use.

2.5 TESTING

2.5.1 Chromatographic Analysis

Solvents in vinyl paints and thinners are subject to analysis by programmed temperature gas chromatographic methods and/or spectrophotometric methods, employing the same techniques that give reproducible results on prepared control samples known to meet the specifications. If the solvent being analyzed is of the type consisting primarily of a single chemical compound
2.5.2 Vinyl Paints

Vinyl paints are subject to the following adhesion test. When V-766 or V-106 formulations are tested, spray apply 125 to 175 microns 5 to 7 mils (dry) to mild steel panels. The steel panels must be essentially free of oil or other contaminants that may interfere with coating adhesion and be dry blast cleaned to a White Metal grade in compliance with SSPC SP 5/NACE No. 1. The surface must have an angular profile of 50 to 63 microns 2.0 to 2.5 mils as measured by ASTM D4417, Method C. When V-102 or V-103 formulations are tested, spray apply the product over 38 to 63 microns 1.5 to 2.5 mils (dry) of V-766 or V-106 known to pass this test. When VZ-108 is tested, the coating must be mixed in its proper proportions and then spray applied to a dry film thickness of 38 to 63 microns 1.5 to 2.5 mils above the blast profile. The VZ-108 must be top coated with a V-766 known to pass this test. In all cases, the complete system must have a total dry film thickness of 125 to 175 microns 5 to 7 mils above the blast profile. After being air dried for 2 hours at room temperature, dry the panel in a vertical position for 16 hours at 50 degrees C 120 degrees F. After cooling for 1 hour, immerse the panel in tap water at 30 to 32 degrees C 85 to 90 degrees F for 48 to 72 hours. Immediately upon removal, dry the panel with soft cloth and examine for adhesion as follows: With a pocket knife or other suitable instrument, make two parallel cuts at least 25 mm 1 inch long, 6 to 10 mm 1/4 to 3/8 inch apart through the paint film to the steel surface. Make a third cut perpendicular to and passing through the end of the first two. With the tip of the knife blade, loosen the film from the panel from the third cut for a distance of 3 to 6 mm 1/8 to 1/4 inch. With the panel being held horizontally, grasp the free end of the paint film between the thumb and forefinger and pulled vertically in an attempt to remove the film as a strip from between the first two cuts. Remove the strip of paint film at a rate of approximately 2 mm 1/10 inch per second and maintaining it in a vertical position during the process of removal. The adhesion is acceptable if the strip of paint breaks when pulled or if the strip elongates a minimum of 10 percent during its removal. Paints not intended to be self-priming must not exhibit any delamination from the primer.

PART 3 EXECUTION

3.1 CLEANING AND PREPARATION OF SURFACES TO BE PAINTED

**************************************************************************
NOTE: Although this section is primarily intended for new construction, surface preparation for maintenance painting is closely related; therefore this guide specification may be used for maintenance painting. For further guidance, see EM 1110-2-3400.
**************************************************************************

3.1.1 General Requirements

Clean surfaces to be painted before applying paint or surface treatments. Remove deposits of grease or oil in accordance with SSPC SP 1, prior to mechanical cleaning. Perform solvent cleaning with mineral spirits or other low toxicity solvents having a flash point above 38 degrees C 100 degrees F. Use clean cloths and clean fluids to avoid leaving a thin film
of greasy residue on the surfaces being cleaned. Protect items not to be prepared or coated from damage by the surface preparation methods. Protect machinery and electrical components against entry of blast abrasive and dust into working parts. Program cleaning and painting such that dust or other contaminants from the cleaning process do not fall on wet, newly painted surfaces. Protect surfaces not intended to be painted from the effects of cleaning and painting operations. Conduct welding of, or in the vicinity of, previously painted surfaces in a manner to prevent weld spatter from striking the paint and to otherwise reduce coating damage to a minimum. Restore any paint damaged by welding operations to original condition. Surfaces to be painted that will be inaccessible after construction, erection, or installation operations are completed must be painted before they become inaccessible.

3.1.2 Ferrous Surfaces Subject to Atmospheric Exposures

**************************************************************************

NOTE A: The option of power tool cleaning or brush-off blast cleaning is intended to be the Contractor’s choice and should be retained in project specifications. It is the intention of this Note and the following paragraphs to distinguish between the type of surface preparation necessary for normal atmospheric exposure and for severe exposure conditions such as fresh and saltwater immersion, abrasion, etc.

Experience has shown that high-grade blast cleaning is generally unnecessary to obtain an adequate paint job on structural steel surfaces that will be subject only to ordinary atmospheric exposure, provided that primers are used that have the ability to effectively wet the surfaces and penetrate to base metal beneath the edges of semi-adherent mill scale as well as through the residual and tightly adherent rust that is always present to some extent when methods short of very thorough blast cleaning are employed. Shop cleaning and priming of steel that is not required to be thoroughly blast cleaned reduces unnecessary breakdown of the mill scale and attendant rusting of the surfaces.

Weathering steel may be painted if desired using the same surface preparation and coating systems as used for mild steel.

For jobs where existing coatings, including lead-based paints, will be completely removed the specifier should select Commercial Blast Cleaning (SP 6). This recommendation applies to Paint Systems No. 1 and 23 (series).

This paragraph requires rounding of sharp edges. Rounding is desirable because paint pulls thin on sharp edges resulting in early rusting. This requirement may result in significant cost when the structure is severely corroded or pitted.

**************************************************************************
Clean ferrous surfaces that are to be continuously in exterior or interior atmospheric exposure and other surfaces as directed by means of [power tools or by dry blasting to the brush-off grade] [dry blasting to a commercial grade]. Perform cleaning and priming in the shop unless otherwise directed or permitted. [Conduct power tool cleaning in conformance with the requirements of SSPC SP 3.] [Conduct brush-off blast cleaning in conformance with the requirements of SSPC 7/NACE No.4.] [Conduct commercial blast cleaning in conformance with the requirements of SSPC SP 6/NACE No.3.] Clean welds and adjoining surfaces within a few inches (centimeters) of weld flux, spatter, and other harmful deposits by blasting, power impact tools, power wire brush, or such combination of these and other methods as may be necessary for complete removal of each type of deposit. The combination of cleaning methods need not include blasting when preparation of the overall surfaces is carried out by the power tool method; however, brush scrubbing and rinsing with clean water, after mechanical cleaning is completed is required unless the latter is carried out with thoroughness to remove all soluble alkaline deposits. Limit wetting of the surfaces during water-washing operations to the weld area required to be treated, and assure that wetted areas, including any crevices, are completely dry before painting. Welds and adjacent surfaces cleaned thoroughly by blasting alone will be considered adequately prepared provided that weld spatter not dislodged by the blast stream is removed with impact or grinding tools. Round all sharp edges including those caused by corrosion, to a minimum radius of 0.16 cm [1/16 inch] to ensure adequate paint coverage. Prime all surfaces as soon as practicable after cleaning and in all cases prior to contamination or deterioration of the prepared surfaces. To the greatest degree possible, clean (and prime) all steel surfaces prior to lengthy outdoor storage.

3.1.2.1 Coated Ferrous Surfaces Subject to Atmospheric Exposures

********************************************************************

NOTE B: Coated ferrous surfaces degrade with time. Touch up or spot painting mildly degraded coatings can extend the useful life of the coating system. Spot repair and overcoating can extend the useful life of moderately degraded coatings.

Coating System 23-D is well suited for maintaining degraded coatings. Overcoating does present a significant degree of risk, because of the possibility the overcoated system may either fail catastrophically or will not provide the desired period of protection. The applicability of overcoating is limited by the condition of the existing coating, the underlying substrate and the severity of the exposure environment. If the existing coating is too thick, brittle, or poorly adherent, then overcoating should not be performed. If the degree of substrate corrosion is significant, then the level of effort needed to prepare the substrate may indicate that overcoating is not economically viable. Overcoating is not recommended for severe exposure environments because an all new paint system will last significantly longer than overcoating and is more cost effective. For additional information on overcoating contact the Paint Technology Center.

********************************************************************
Power tool clean coated ferrous surfaces to be overcoated in accordance with SSPC SP 3. The entire surface to be overcoated does not have to be power tool cleaned provided that all surfaces are free of all loose rust, loose paint and visible surface contaminants. Following power tool cleaning, further clean surfaces by power washing using a rotating tip and pressures of 10.3 to 34.5 MPa, 1500 to 5000 PSI. Adjust water pressure such that all chalk is removed without significantly eroding the existing coating. After drying, spot prime all surfaces as soon as practicable and in all cases prior to contamination or deterioration of the prepared surfaces.

3.1.3 Ferrous Surfaces Subject to Severe Exposure

**************************************************************************

NOTE C: Thorough removal of mill scale, corrosion products, and other surface contaminants from surfaces subject to immersion is specified because very clean, blast-roughened surfaces are necessary to obtain adequate adherence of the coating in the severe exposure conditions involved and because the organic coatings that have good durability in immersed exposure are particularly unsuited to any except thoroughly cleaned surfaces.

This paragraph requires rounding of sharp edges. Rounding is desirable because paint pulls thin on sharp edges resulting in early rusting. This requirement may result in significant cost when the structure is severely corroded or pitted.

Except to provide laminar flow, excessive pit depth, or other special considerations, the filling of pits with weld or epoxy based filler materials is typically not justified. When a filler is required, a compatible coating system must be selected. Weld must be ground smooth and abrasive blasted to provide required surface profile. Typically, a vinyl coating will not adhere to an epoxy based filler. Epoxy coatings typically provide good adhesion to epoxy fillers, but a specific recoat window or roughening of the filler material may be required by the coating manufacturer.

The parenthetical provisions relative to blasting in the shop should not be included in project specifications except after consideration of such factors as: surface area of components, probable adequacy of shop inspection, probable amount of damage to shop coating during shipment, field assembly, and cleaning, and painting capabilities of fabricators in the geographical area. Shop blast cleaning should be permitted only where the facilities and experience of the fabricator assure a satisfactory blasting and priming job. Field blasting and painting gives, in general, more satisfactory results and is better adapted to thorough inspection. In no case should shop blasting be made mandatory, since many fabricators...
are not equipped for such work. Blasting,priming, and partial painting in the shop should not be considered in connection with epoxy systems because of the possibility of poor adhesion between shop and field coats.

**************************************************************************

Dry blast-clean ferrous surfaces subject to extended periods of immersion or as otherwise required to white metal according to SSPC SP 5/NACE No. 1. The blast profile must be angular with a minimum profile height of 38 microns 1.5 mils. Select appropriate abrasive size and equipment operating parameters to limit maximum surface profile on new steel to 63 microns 2.5 mils and to prevent increasing existing profile height on previously blasted steel. Where an existing profile is encountered, remove representative spots of existing coating with a chemical stripper and measure and document the existing profile prior to initiating blasting operations. Measure all surface profiles in accordance with ASTM D4417, Method C. Steel shot or other abrasives that do not produce an angular profile must not be used. If recycled blast media is used, maintain an appropriate particle size distribution so that the specified profile is consistently obtained. Round all sharp edges including those caused by corrosion, to a nominal 0.16 cm 1/16 inch radius and reblast the areas prior to painting. Remove weld spatter not dislodged by blasting with impact or grinding tools and reblast the areas prior to painting. Surfaces must be dry at the time of blasting. Conduct blast cleaning to SSPC SP 5/NACE No. 1 in the field and, unless otherwise specifically authorized, after final erection. Within 8 hours after blast cleaning, and in any case prior to the deposition of any detectable moisture, contaminants, or corrosion, clean all ferrous surfaces of dust and abrasive particles by brush, vacuum cleaner, and/or blown down with clean, dry, compressed air, and apply the first coat of paint. Authorization to extend this 8 hour coating requirement for shop application, application within dehumidified containment, or other conditions will not be granted. Upon written request by the Contractor, the Contracting Officer may authorize mill or shop cleaning of assembled or partially assembled components specified to receive one of the vinyl-type paint systems or Systems 6-A-Z and 21-A-Z employing the epoxy zinc-rich primer or Systems 23-A-Z and 23-B-Z employing SSPC Paint 40 moisture cure urethane zinc-rich primer. Shop coat all shop blasted surfaces with the first and second coats of the specified paint system. At the time field painting is initiated, apply an additional single spray coat of the zinc rich primer to the epoxy zinc-rich and moisture cure urethane primed surfaces as specified in the paint system instructions. Maintain the shop coating in good condition by cleaning and touching up of areas damaged during the construction period. If pinpoint or general rusting appears, the defective areas must be reblasted and repainted at no added cost to the Government. Prior to the field application of subsequent coats, thoroughly clean soiled areas of the shop coating and all welds or other unpainted or damaged areas must be cleaned and coated in a manner to make them equivalent to adjacent, undamaged paint surfaces.

3.1.4 Damp and Wet Ferrous Metal Surfaces

**************************************************************************

NOTE D: Painting of surfaces wet with condensation or standing and running water is not generally recommended. Dehumidification should be considered as a first choice for surfaces wet with condensation. However, in some cases it is not
possible to achieve a dry surface for painting. In such cases the procedures outlined here should be used. Thorough removal of mill scale, corrosion products, and other surface contaminants is specified because very clean, blast-roughened surfaces are necessary to obtain adequate adhesion of the coating in the severe application and exposure conditions involved.

Blast-clean ferrous surfaces that are wet with condensation or standing or running water, to white metal according to SSPC SP 5/NACE No. 1. The blast profile must be angular with a minimum profile height of 38 microns 1.5 mils. Select appropriate abrasive size and equipment operating parameters to limit maximum surface profile on new steel to 63 microns 2.5 mils and to prevent increasing existing profile height on previously blasted steel. Where an existing profile is encountered, remove representative spots of existing coating with a chemical stripper and measure and document the existing profile prior to initiating blasting operations. Measure all surface profiles in accordance with ASTM D4417, Method C. Steel shot or other abrasives that do not produce an angular profile are not to be used. If recycled blast media is used, maintain an appropriate particle size distribution so that the specified profile is consistently obtained. Round all sharp edges including those caused by corrosion, to a nominal 0.16 cm 1/16 inch radius and reblast the areas prior to painting. Remove weld spatter not dislodged by blasting with impact or grinding tools and reblast the areas prior to painting. Immediately after cleaning and prior to the formation of extensive corrosion products, clean all ferrous surfaces of residual abrasive particles, and apply the first coat of paint in accordance with manufacturer's recommendations. A slightly visible rust bloom is permitted on surfaces to be painted.

3.1.5 Non-Ferrous Metal Surfaces

Abrasive blast all non-ferrous metal surfaces to be painted in accordance with SSPC SP 16 in order to roughen the surface and promote adhesion. Only non-metallic abrasives are permitted. All existing coatings must be removed and a minimum surface profile of 1.5 mils must be produced. Measure the surface profile in accordance with ASTM D4417 Method C. Prime all surfaces as soon as practicable after cleaning and in all cases prior to contamination or deterioration of the prepared surfaces.

3.2 PAINT APPLICATION

3.2.1 General

Unless otherwise specified, the finished coating must be free from holidays, pinholes, bubbles, runs, drops, ridges, waves, laps, excessive or unsightly brush marks, and variations in color, texture, and gloss. Do not initiate the application of initial or subsequent coatings until the Contracting Officer has verified that atmospheric conditions and the surfaces to be coated are satisfactory. Each paint coat must be applied in a manner that will produce an even, continuous film of uniform thickness. Provide special attention to edges, corners, crevices, seams, joints, welds, rivets, corrosion pits, and other surface irregularities to ensure that they receive an adequate thickness of paint. Spray equipment must be equipped with traps and separators and where appropriate, mechanical agitators, pressure gauges, pressure regulators, and screens or filters. Air caps, nozzles, and needles must be as recommended by the spray
equipment manufacturer for the material being applied. Airless-type spray equipment may be used only on broad, flat, or otherwise simply configured surfaces, except that it may be employed for general painting if the spray gun is equipped with dual or adjustable tips of proper types and orifice sizes. The use of airless-type equipment is not allowed for the application of vinyl paints.

3.2.2 Mixing and Thinning of Coatings other than the Vinyl Formulations

Paints must be thoroughly mixed, strained where necessary, and kept at a uniform composition and consistency during application. Incorporate dry-powder pigments specified to be added at the time of use, into the vehicle or base paint with the aid of powered stirrers, in a manner that will produce a smooth, homogeneous mixture free of lumps and dry particles. Where necessary to suit conditions of the surface temperature, weather, and method of application, the paint may be thinned immediately prior to use. Thinning, induction time and pot life must comply with the manufacturers written instructions (PDS). Bring any paint that has been stored at a temperature below the manufacturer's application temperature range up to at least 21 degrees C (70 degrees F) before being mixed and thinned. Its temperature in the spray tank or other working container must not fall below the manufacturer's specified application temperature range during the application. Any paint that has deteriorated in any manner to a degree that it cannot be restored to essentially its original condition by customary field-mixing methods must not be used and must be removed from the project site. In order to determine its suitability for application, resample and submit for testing any paint and thinner that is more than 1 year from the date of manufacture or last documented testing. Moisture cure urethane paint must be resampled and resubmitted for testing to determine its suitability for application whenever the paint is more than six months beyond the date of manufacture on the container or more than 6 months beyond the last documented laboratory testing.

3.2.3 Time between Surface Preparation and Painting

Surfaces that have been cleaned and/or otherwise prepared for painting must be primed as soon as practicable after such preparation has been completed but, in any event, prior to any deterioration of the prepared surface.

3.2.4 Method of Paint Application

Unless otherwise specified, paint must be applied by brush, roller, or spray to ferrous and nonferrous metal surfaces. Special attention must be directed toward ensuring adequate coverage of edges, corners, crevices, pits, rivets, bolts, welds, and similar surface irregularities. Other methods of application to metal surfaces are subject to the specific approval of the Contracting Officer. Paint on plaster, concrete, or other nonmetallic surfaces must be applied by brush, roller, and/or spray.

3.2.5 Coverage and Film Thickness

Film thickness or spreading rates must be as specified hereinafter. Where no spreading rate is specified, apply the paint at a rate consistent with the manufacturer's written instructions. In any event, the combined coats of a specified paint system must completely hide base surface and the finish coats must completely hide undercoats of dissimilar color.
3.2.6  Coating Thickness Measurement on Metal

Where dry film thickness requirements are specified for coatings on metal surfaces, make measurements with a gage qualified in accordance with paragraph Coating Thickness Gage Qualification and calibrated and used in accordance with ASTM D7091. Prior to each use, establish the Base Metal Reading (BMR) for the gage as specified in the test method. Verify the accuracy of the gage using plastic shims as specified by the test method both prior to and following each set of measurements. Perform dry film measurements on all areas of the structure being coated in accordance with SSPC PA 2 with Level 1 thickness restrictions. Perform a sufficient number of thickness measurements to ensure that every area on every member is in compliance with the requirements of this contract. Report all thickness measurements as the mean for each spot determination.

3.2.7  Progress of Painting Work

Where field painting on any type of surface has commenced, complete the entire painting operation on that portion of the work, including priming and finishing coats, as soon as practicable and without prolonged delays. Allow sufficient time between successive coats to permit them to dry properly for recoating, modifying this period as necessary to suit adverse weather conditions. Paint is considered dry for recoating when it feels firm, does not deform or feel sticky under moderate pressure of the finger, and the application of another coat of paint does not cause film irregularities such as lifting or loss of adhesion of the undercoat. All coats of all painted surfaces must be unscarred and completely integral at the time of application of succeeding coats. At the time of application of each successive coat, clean undercoats of dust, grease, overspray, or foreign matter by means of air blast, solvent cleaning, or other suitable means. Cement and mortar deposits on painted steel surfaces, not satisfactorily removed by ordinary cleaning methods, must be brush-off blast cleaned and completely repainted as required. If necessary for establishment of good adhesion, scuff sand high gloss undercoats, and, solvent wipe, or otherwise treat prior to application of a succeeding coat. Apply field coats on metal after erection except as otherwise specified and except for surfaces to be painted that will become inaccessible after erection.

3.2.8  Contacting Surfaces

When riveted or ordinary bolted contact is to exist between surfaces of ferrous or other metal parts of substantially similar chemical composition, such surfaces will not be required to be painted, but any resulting crevices must subsequently be filled or sealed with paint. Contacting metal surfaces formed by high-strength bolts in friction-type connections must not be painted. Where a nonmetal surface is to be in riveted or bolted contact with a metal surface, the contacting surfaces of the metal must be cleaned and given three coats of the specified primer. Unless otherwise specified, corrosion-resisting metal surfaces, including cladding therewith, must not be painted.

3.2.9  Drying Time Prior to Immersion

Minimum drying periods after final coat prior to immersion are: epoxy and moisture cure urethane systems at least 5 days, vinyl-type paint systems at least 3 days, and cold-applied coal tar systems at least 7 days. Increase minimum drying periods twofold if the drying temperature is below 18 degrees C 65 degrees F and/or if the immersion exposure involves
considerable abrasion.

3.2.10 Protection of Painted Surfaces

Where shelter and/or heat are provided for painted surfaces during inclement weather, such protective measures must be maintained until the paint film has dried and discontinuance of the measures is authorized. Items that have been painted must not be handled, worked on, or otherwise disturbed until the paint coat is fully dry and hard. Store all metalwork coated in the shop or field prior to final erection out of contact with the ground in a manner and location that will minimize the formation of water-holding pockets; soiling, contamination, and deterioration of the paint film. Damaged areas of paint on such metalwork must be cleaned and touched up without delay. Apply the first field coat of paint within a reasonable period of time after the shop coat and in any event before weathering of the shop coat becomes extensive.

3.2.11 Vinyl Paints

3.2.11.1 General

Vinyl paints must be thoroughly mixed and kept at a uniform composition and consistency during application. Any paint that has deteriorated in any manner to a degree that it cannot be restored to essentially its original condition by customary field-mixing methods must not be used and must be removed from the project site. In order to determine its suitability for application, resample and submit for testing any paint and thinner that is more than 1 year from the previous documented testing. Each applied coat of vinyl paint must be free from any holidays, pinholes and bubbles. The finished coating must be free of excessive or unsightly brush marks, runs, drops, ridges, waves, laps and variations in color, and texture. Vinyl paints must be spray applied, except that areas inaccessible to spraying must be brushed. Vinyl Paints (Formulas V-102E, V-103C, V-106D, and V-766E) are ready-mixed paints designed to be spray applied over a wide range of ambient temperatures by field thinning with the proper type and amount of thinner. For spray application, they must be thinned as necessary up to approximately 25 percent (250 mL/L 1 quart/gallon of base paint) with the appropriate thinner; when ambient and steel temperatures are above normal, up to 40-percent thinning may be necessary for satisfactory application. The zinc-rich vinyl paint (Formula VZ-108D) will normally require thinning only under certain weather conditions.

Thinnings for vinyl paints must be as follows:

<table>
<thead>
<tr>
<th>APPROXIMATE AMBIENT AIR TEMPERATURE</th>
<th>MEK</th>
<th>MIBK</th>
<th>MIAK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Below 10°C 50°F</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>10 - 21°C 50 - 70°F</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Above 21°C 70°F</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Vary the amount of thinner to provide a wet spray and avoid deposition of particles that are semidry when they strike the surface. Do not apply vinyl paints when the temperature of the ambient air and receiving surfaces is less than 2 degrees C 35 degrees F nor when the receiving surfaces are higher than 51 degrees C 125 degrees F. Each double spray coat of vinyl paint must consist of a preliminary stripe coat applied by spray, brush, or combination thereof on edges, corners, interior angles, pits, seams, crevices, junctions of joining members, rivets, weld lines, and similar
surface irregularities followed by an overall double spray coat. A double spray coat of vinyl-type paint consists of applying paint to a working area of not less than several hundred square feet (meters) in a single, half-lapped pass, followed after drying to at least a near tack-free condition by another spray pass applied at the same coverage rate and where practicable at right angles to the first. Rivets, bolts, and similar surface projections must receive sprayed paint from every direction to ensure complete coverage of all faces. Pits, cracks, and crevices must be filled with paint insofar as practicable, but in any event, all pit surfaces must be thoroughly covered and all cracks and crevices must be sealed off against the entrance of moisture. Keep fluid and atomization pressures as low as practicable consistent with good spraying results. Application of more than 50 microns 2.0 mils, average dry film thickness, of vinyl paint per double spray coat typically indicates semidry application and must be avoided. Except where otherwise indicated, an undercoat of the vinyl-type paint may receive the next coat any time after the undercoat is tack-free and firm to the touch, provided that no speedup or delay in the recoating schedule results in film defects such as sags, runs, air bubbles, air craters, or poor intercoat adhesion. Do not walk on, or otherwise abrade the prime coat or any other coat until it has hardened sufficiently to resist mechanical damage.

3.2.11.2 Vinyl Zinc-Rich Primer

Primer must be field mixed combining components A, B, and C in accordance with label instructions. After mixing, keep the paint covered at all times to avoid contamination and apply the mixed paint within 8 days after mixing. When the ambient and/or steel temperature is below about 26 degrees C 80 degrees F, the paint will not normally require thinning; however, the paint must at all times contain sufficient volatiles (thinner) to permit it to be satisfactorily atomized and to provide a wet spray and to avoid deposition of particles that are semidry when they reach the surface. The paint must be stirred continuously during application at a rate that will prevent the zinc dust from settling. When spraying is resumed after any interruption of longer than 15 minutes, the entire length of the material hose must be whipped vigorously until any settled zinc is redispersed. Long periods of permitting the paint to remain stagnant in the hose must be avoided by emptying the hoses whenever the painting operation is to be suspended for more than 1 hour. Keep the material (paint) hoses as short as practicable, preferably not more than 15 m 50 feet in length. Equipment used for spraying this zinc primer must not be used for spraying other vinyl-type paints without first being thoroughly cleaned, since many of the other paints will not tolerate zinc contamination. Do not use any type of hot spray. An average dry film thickness of up to 63 microns 2.5 mils may be applied in one double-spray coat. Unless specifically authorized, any coat of VZ-108 must receive a succeeding coat within 8 days.

3.2.11.3 Repair of Vinyl Coating Defects

Coating defects should be repaired when they are first observed but must be repaired prior to coating acceptance. Runs and sags may be brushed out before becoming dry. Pinholes must be physically closed by scrubbing with a brush wet with ketone solvent before the succeeding coat is applied. Overspray that will not be melted smooth by the succeeding coat must be removed by scrubbing with a brush wet with ketone solvent. Minor overspray in the final coat that results only in a reduced gloss at the outer limits of the spray pattern is not considered a defect and requires no additional attention. Insufficient thickness or incomplete hiding must be corrected
with additional paint before the succeeding coat is applied. If any defect extends to the substrate, it must be determined if the substrate is corroding. In the case of pinholes it may be necessary to use magnification to observe the substrate. If the substrate is showing any corrosion, the required surface preparation must be restored by spot blasting, and the entire coating system replaced at that location. Following the spot blasting the edges of the remaining coating must be scrubbed with ketone solvent to assure all remaining coating is tightly adhering before the new coating is applied. If VZ-108 does not receive the required succeeding coat within the required 8 days, it must be removed by abrasive blasting and replaced.

3.2.12 Coal Tar-Epoxy (Black) Paint (Formula C-200A)

3.2.12.1 Mixing

Add Component B to previously stirred Component A and thoroughly mix together with a heavy-duty mechanical stirrer just prior to use. The use of not more than \( \frac{0.5 \text{ L}}{1 \text{ pint}} \) of xylene thinner per \( \frac{4 \text{ L}}{1 \text{ gal}} \) of paint is permitted to improve application properties and extend pot life. The pot life of the mixed paint, extended by permissible thinning, may vary from 2 hours in very warm weather to 5 or more hours in cool weather. Pot life in warm weather may be extended by precooling the components prior to mixing; cooling the mixed material; and/or by slow, continuous stirring during the application period. Apply the mixed material before unreasonable increases in viscosity take place.

3.2.12.2 Application

High-pressure airless spray equipment must be equipped with spray tips of appropriate size for the structural members being coated. Brush application must be with a stiff-bristled brush heavily laden with material and wielded in a manner to spread the coating smoothly and quickly without excessive brushing. The coverage rate of the material is approximately \( \frac{2.7 \text{ square meters}}{\text{L}} = \frac{110 \text{ square feet}}{\text{gal}} \) per coat to obtain 500 microns 20 mils (dry thickness) in a two coats of the C-200a. The paint must flow together and provide a coherent, pinhole-free film. The direction of the spray passes (or finish strokes if brushed) of the second coat must be at right angles to those of the first where practicable.

3.2.12.3 Subsequent Coats

Except at the high temperatures discussed later in this paragraph, the drying time between coal tar-epoxy coats must not be more than 72 hours, and application of a subsequent coat as soon as the undercoat is reasonably firm is strongly encouraged. Where the temperature for substrate or coating surfaces during application or curing exceeds or can be expected to exceed 52 degrees C 125 degrees F as the result of direct exposure to sunlight, the surfaces must be shaded by overhead cover or the interval between coats reduced as may be found necessary to avoid poor intercoat adhesion. Here, poor intercoat adhesion is defined as the inability of two or more dried coats of coal tar-epoxy paint to resist delamination when tested aggressively with a sharp knife. Under the most extreme conditions involving high ambient temperatures and sun-exposed surfaces, reduce the maximum drying time between coats to 10 hours, and the reduction of this interval to a few hours or less is strongly encouraged. Where the curing time of a coal tar-epoxy undercoat exceeds 72 hours at normal temperatures, 10 hours at extreme conditions, or where the undercoat develops a heavy blush, or when spot repair of damage is required, it must be given one of
the following treatments before the subsequent coat is applied:

a. Etch the coating surface lightly by brush-off blasting, using fine abrasive, low air pressure, and a nozzle-to-surface distance of approximately 1 m 3 feet.

b. Remove the blush and/or soften the surface of the coating by wiping it with cloths dampened with 1-methyl-2-pyrrolidone. The solvent may be applied to the surface by fog spraying followed by wiping, but any puddles of solvent must be mopped up immediately after they form. Apply the subsequent coat in not less than 15 minutes or more than 3 hours after the solvent treatment.

3.2.12.4 Repair of Coal Tar-Epoxy (Black) Paint (Formula C-200A) Defects

Coating defects should be repaired when they are first observed but must be repaired prior to coating acceptance. Runs, sags, pinholes and other visible application defects in any coat may be brushed out before the material cures. Excessive thickness as a result of runs, sags or heavy application of any coat that has been allowed to cure must be reduced to the specified thickness limitation. Any actions that damage the required surface profile must be followed by spot blasting to restore the profile prior to reapplication of the coating system in that area.

3.2.12.5 Ambient Temperature

Coal tar-epoxy paint must not be applied when the receiving surface or the ambient air is below 10 degrees C 50 degrees F nor if it can be reasonably anticipated that the average ambient temperature will be 10 degrees C 50 degrees F or higher for the 5-day period subsequent to the application of any coat.

3.2.12.6 Safety

In addition to the safety provisions in paragraph SAFETY, HEALTH, AND ENVIRONMENT, other workers as well as painters must avoid inhaling atomized particles of coal tar-epoxy paint and contact of the paint with the skin.

3.3 PAINT SYSTEMS APPLICATION

The required paint systems and the surfaces to which they are to be applied are shown in this paragraph, and/or in the drawings. Supplementary information follows.

3.3.1 Fabricated and Assembled Items

**************************************************************************
NOTE H: Thought should be given beforehand as to which items are considered suitable for receiving
the manufacturer's standard coating and which are not. In some cases, it may be advisable to include a listing of the items for which the manufacturer's coating is considered adequate. In general, it is believed that a manufacturer's standard coating will be at least reasonably adequate on most items that are to be in normal interior or exterior atmospheric exposure, free from difficult environmental factors, e.g., frequent condensation, water mists and spray, marine atmospheres, etc. Information relative to the type paint to be applied as a field topcoat should be included in each paragraph of the project specification containing a requirement for shop priming.

Items that have been fabricated and/or assembled into essentially their final form and that are customarily cleaned and painted in accordance with the manufacturer's standard practice will be exempted from equivalent surface preparation and painting requirements described herein, provided that:

a. Surfaces primed (only) in accordance with such standard practices are compatible with specified field-applied finish coats.

b. Surfaces that have been primed and finish painted in accordance with the manufacturer's standard practice are of acceptable color and are capable of being satisfactorily touched up in the field.

c. Items expressly designated herein to be cleaned and painted in a specified manner are not coated in accordance with the manufacturer's standard practice if different from that specified herein.

3.3.2 Surface Preparation

The method of surface preparation and pretreatment shown in the tabulation of paint systems is for identification purposes only. Cleaning and pretreatment of surfaces prior to painting must be accomplished in accordance with detailed requirements previously described.

3.3.3 System No. 1

NOTE I: This NOTE applies to System No. 1, System No. 16-A, and System No. 23 (series).

1. System No. 1, System No. 16-A and most of the System 23 (series) are all intended for ferrous surfaces subject to atmospheric exposure, e.g., Bridges, light standards, corner wall protection, gantries, exterior machinery and electric motors, adjacent piping and conduit, water tank exteriors, etc. (Exceptions are System No. 23-B-Z which is pigmented with coal tar and designed for immersion and System No. 23-E which does not have a durable topcoat and is designed for interior steel.) Systems No. 1, No. 16-A, and No. 23-D have the ability to adhere to poorly cleaned steel but have increased performance when applied over higher quality surface
preparation. The systems are not intended for coating steel subject to immersion in water. Surfaces to be immersed even once every few years for just a few weeks should be coated with a vinyl, moisture cure urethane or epoxy system designed for immersion. They may be used for interior or exterior atmospheric exposed surfaces of machinery, motors, etc., operating at a maximum temperature of 121 degrees C (250 degrees F). Where higher temperatures are involved, heat-resistant coatings as specified herein should be used. Systems No. 1 provides an aluminum finish; System No. 23-D provides a wide choice of colors including aluminum.

2. Systems No. 16-A and No. 23-D are easy to apply single component paints. System No. 16-A has a lower material cost and can be supplied tinted to custom colors. Color selection for System No. 23-D will be limited to the manufacturer's standard colors. Both may be used to touch-up and overcoat areas previously painted with FS TT-P-86, red lead primer. However, areas previously painted with FS TT-P-86 should be considered for total deleading prior to repainting and the primer upgraded to SSPC Paint 40 Type II. Non-galvanized iron and steel piping, conduit, hangers, etc., in interior unpainted spaces may also be coated with these systems or may be left bare where appearance is of no concern. System No. 23-D should be specified for miscellaneous adjacent galvanized and other nonferrous surfaces. System No. 16-A must not be applied directly to galvanized or zinc rich primed surfaces or to concrete or other masonry.

3. System No. 1 is an epoxy commercial product coating. Compatibility for use over existing oil-based coatings varies widely. Although not designed for immersion, System No. 1, when applied over a Commercial Blast, will withstand occasional immersion.

4. Systems No. 1 and 23-C-Z applied over a Commercial Blast are recommended where atmospheric conditions are more than normally severe. Applications include heavily industrialized locations, coastal structures over seawater or within a few hundred feet of the water's edge, exteriors of steel penstocks and similar surfaces exposed to long periods of condensation. System No. 21-A-Z with the optional urethane topcoat may also be specified in these applications for greater water resistance but less sunlight resistance. System No. 23-F-Z has the greatest sunlight resistance.

5. Power tool cleaning and brush-off blast cleaning are intended to be Contractor's options and should be specified for minor touch up and repair of previously painted surfaces that are in generally good condition. Commercial blast cleaning is
included as a specifier's option and should generally be used to prepare previously painted surfaces that are in poor condition or steel that has never been painted. When deleading is desired, a minimum of Commercial Blast, SSPC SP 6/NACE No.3, should be specified.

This epoxy paint system must have been tested and passed all the test requirements of SSPC PS 26.00. Application must be by spray, brush or roller in accordance with the manufacturer's written instructions. Application includes a preliminary stripe coat applied by brush to all edges, corners, welds, fasteners, and other surface irregularities. Allow the stripe coat to dry as recommended by the manufacturer, prior to the application of the first full coat. Dry film thickness per coat must be within plus or minus 20 percent of that recommended by the manufacturer. Application of the system in less than two coats will not be accepted. Mix and thin the epoxy coating in accordance with the manufacturers written directions. Mixed coating material that has exceeded the manufacturers pot life, that have been mixed for more than 8 hours or that have thickened appreciably must not be applied. The manufacturer's recommendations for minimum and maximum dry time between coats must be met.

3.3.4 System No. 3

NOTE J: This Note applies to the next 6 paragraphs also.

1. Air quality regulations refer to solvents and thinners as "volatile organic compounds" or VOC. VOC regulations place a maximum on the amount of VOC that may be in each type of paint. (Properly thinned vinyls have a VOC of less than 780 g/L.) These regulations have been enacted at the local, state, and federal levels. Generally the regulation of the smaller body is more restrictive, and takes precedence over that of the larger body (i.e.; a city regulation could preclude the application of a vinyl paint even though it is allowed by state and federal regulations). Content of the regulations varies widely. The 1998 federal emission standards for architectural coatings has approximately 60 categories. Its maximum allowable VOC for Industrial Maintenance paints was 450 g/L and for Impacted Immersion Coatings was 780 g/L. Prior to specifying vinyl paint systems the specifier should access the regulations which may exist in the area where the painting will take place. In many localities "architectural" painting is not regulated while shop painting is regulated. This may mean that a new tainter valve cannot be painted with vinyl paint in the fabricating shop but could be painted after it is installed in the field structure. The new federal regulation class "Impacted Immersion Coatings" would allow the use of vinyl on the gates of a dam but not on the service bridge. Some state regulations adopt the federal classifications and restrict the actual
specification or use of the coating to the purpose for which it was marketed. Enforcement of this type of regulation usually allows the application of the coating to the entire item even if only a portion meets the purpose; (i.e., Atmospheric and condensation areas of tainter gates could be painted with vinyl even though these areas do not meet the "impacted immersion" requirements).

2. All of the vinyl systems are extremely durable in exterior atmospheric exposure; therefore, lock gates, crest gates, and similar structures with both immersed and weather-exposed areas may be painted overall with the same coating system. Vinyl systems should not be employed in direct immersion in seawater or other saline waters containing over 1,000 ppm chlorides or tideland splash zone area; see notes to System No. 6-A-Z, 21-A-Z and 23-B-Z with respect to the latter exposures.

3. The aluminum topcoats make Systems No. 3 and No. 3-A-Z very water and sunlight resistant but somewhat soft. They are the standard systems for surfaces subject to immersion intermittently or continuously in quiet or low-velocity fresh water or to prolonged condensation. They are considered suitable for interior surfaces or roller and double-skinplate tainter gates, control gates that normally hang in relatively quiet water, lock gates, stoplogs, and to the interior of water tanks except those subject to severe debris and ice action. The zinc primer increases the resistance to underfilm corrosion and to corrosion-undercutting at scratches and breaks in the coating and should be specified in more corrosive waters or where the complexity of the structure makes void free application difficult.

4. Systems No. 4, 5-D, 5-C-Z, and 5-E-Z provide finish colors other than aluminum. All of the systems are considerably more resistant to erosion, abrasion, and gouging than the aluminum Systems No. 3 or 3-A-Z and the black System 5-A-Z. All may be used for immersed surfaces subject to waters of moderate-to-high velocity and turbulence, particularly where floating debris and/or ice is of some significance. Under such circumstances, surface configuration assumes importance in as much as paint on sharp edges, rivet heads, and similar projections tends to be more damage-prone than on smooth surfaces. Systems No. 4, 5-D, 5-C-Z, and 5-E-Z are considered suitable for most freshwater structures subject to moderate-to-high abrasive, erosive, and gouging stresses stemming from moving water carrying floating debris and ice, e.g., navigation dam gates, tainter valves, sluice gates, trash racks, crest gates in some circumstances, and water tanks if exposed to ice action. The systems are most generally recommended for penstocks, spiral cases, and surge tanks. The use of the Systems No.
5-C-Z and 5-E-Z undercoated with zinc-rich paint are preferred because of superior adhesion, resistance to underfilm corrosion, and to undercutting by corrosion at breaks or holidays in the film.

5. Systems No. 4, 5-D, 5-C-Z, and 5-E-Z may not perform satisfactorily on freshwater immersed gate, valve, and pipe surfaces subject to very high velocities and turbulence, either alone or in combination with the action of suspended matter, floating debris, or ice. Where such conditions are anticipated, metallizing system No. 6-Z-A, described in Section 09 97 10.00 10 METALLIC COATINGS FOR HYDRAULIC STRUCTURES, should be considered. (It must be understood that in immersion the failure mechanism of metallized coatings is different than paint coatings. A metallized coating may be able to withstand a more severe abrasion environment but absent that severe abrasion, paint coatings may provide better long term protection.)

6. Generally, entire surface areas of items such as crest gates, miter gates, etc., should be treated as though subject to immersion (e.g., painted overall with a vinyl system) even though exposed only in part to the weather to avoid the problems and costs introduced by applying a different system on the atmospheric areas. Because of its great durability in atmospheric exposure, the additional cost of the vinyl system will eventually be recovered in lower maintenance expenses.

7. The vinyl systems, particularly those including the zinc-rich undercoat, are resistant to damage by supplementary cathodic protection if the applied current is carefully limited to the minimum required for protection of holidays in the film.

8. Aluminum and aluminum alloy surfaces subject to extended continuous immersion lose the protective oxide coating and allow pitting corrosion to progress rapidly. Surfaces may be protected by abrasive blasting and applying a vinyl paint system employing V-766E as the first and second coats. Third and subsequent coats may be of V-766, V-102, V-103, or V-106, depending on the desired durability or color. Systems No. 3 and 4 may be specified without alteration to provide aluminum or gray colors, respectively; black and red colors may be obtained by modifying System No. 5-A-Z and 5-D, respectively, so that the first and second coats are V-766. (When paint systems are altered in this manner, the existing system number should not be used).

**************************************************************************

Apply paint by spray to an average dry film thickness of a minimum of 150 microns 6.0 mils for the completed system with a minimum thickness at any spot of not less than 125 microns 5.0 mils. Build up approximately 75
microns 3.0 mils with no spot less than 64 microns 2.5 mils of the total dry film thickness with Formula V-766E paint. The specified film thickness must be attained in any event, and any additional coats needed to attain specified thickness must be applied at no additional cost to the Government. Attaining the specified film thickness in fewer than the prescribed number of coats or spray passes will be acceptable provided the heavier applications do not cause pinholes, bubbles, blisters, or voids in the dried film. The application of more than 50 microns 2.0 mils (dry film thickness) per double spray coat or more than 25 microns 1.0 mil per single spray pass typically indicates the paint is not being applied wet enough to properly flow out and must be avoided.

3.3.5 System No. 3-A-Z

**************************************************************************

NOTE: See Note for System 3 above.
**************************************************************************

Apply paint by spray to an average dry film thickness of a minimum of 165 microns 6.5 mils for the completed system, and a thickness at any spot of not be less than 138 microns 5.5 mils. The dry film thickness of the zinc-rich coat must be approximately 63 microns 2.5 mils with no spot less than 51 microns 2.0 mils. The thickness of the V-766E mid coat must be sufficient to completely hide the primer. Specified film thickness, including the prescribed total, must be attained in any event, and any extra coats needed to attain specified thickness must be applied at no additional cost to the Government. Attaining of the specified film thickness in fewer than the prescribed number of coats or spray passes will be acceptable provided heavier applications do not cause pinholes, bubbles, blisters, or voids in the dried film. The application of more than 50 microns 2.0 mils (dry film thickness) per double spray coat or more than 25 microns 1.0 mil per single spray pass of nonzinc paint typically indicates the paint is not being applied wet enough to properly flow out and must be avoided.

3.3.6 System No. 4

**************************************************************************

NOTE: See Note for System 3 above.
**************************************************************************

Apply paint by spray applied to an average dry film thickness of a minimum of 190 microns 7.5 mils for the completed system, with a thickness at any spot of not less than 150 microns 6.0 mils. The specified total film thickness must be attained in any event, and additional coats needed to attain the specified thickness must be applied at no additional cost to the Government. Attaining the specified film thickness in fewer than the prescribed number of coats or spray passes will be acceptable provided heavier applications do not cause pinholes, bubbles, blisters, or voids in the dried film. The application of more than 50 microns 2.0 mils (dry film thickness) per double spray coat or more than 25 microns 1.0 mil per single spray pass of nonzinc paint typically indicates the paint is not being applied wet enough to properly flow out and must be avoided.

3.3.7 System No. 5-A-Z

**************************************************************************

NOTE: See Note for System 3 above.
**************************************************************************
Apply paint by spray to an average dry film thickness of a minimum of 165 microns 6.5 mils for the completed system with the thickness at any spot not be less than 125 microns 5.0 mils. The approximate dry film thickness after application of the first and second double spray coats must be 63 and 100 microns 2.5 and 4.0 mils, respectively. The zinc primer must not be less than 51 microns 2.0 mils at any spot. The specified film thickness must be attained in any event, and any additional coats needed to attain specified thickness must be applied at no additional cost to the Government. Attaining the specified film thickness in fewer than the prescribed number of coats or spray passes will be acceptable provided heavier applications do not cause pinholes, bubbles, blisters, or voids in the dried film. The application of more than 50 microns 2.0 mils (dry film thickness) per double spray coat or more than 25 microns 1.0 mil per single spray pass of nonzinc paint typically indicates the paint is not being applied wet enough to properly flow out and must be avoided.

3.3.8 System No. 5-C-Z

**************************************************************************
NOTE: See Note for System 3 above.
**************************************************************************

Apply paint by spray to an average dry film thickness of a minimum of 175 microns 7.0 mils for the completed system, and the thickness at any spot of not less than 140 microns 5.5 mils. The dry film thickness of the zinc-rich coat must be approximately 63 microns 2.5 mils with the thickness at any spot not less than 51 microns 2.0 mils. Specified film thickness, including the prescribed total, must be attained in any event, and any extra coats needed to attain specified thickness must be applied at no additional cost to the Government. Attaining of the specified film thickness in fewer than the prescribed number of coats or spray passes will be acceptable provided heavier applications do not cause pinholes, bubbles, blisters, or voids in the dried film. The application of more than 50 microns 2.0 mils (dry film thickness) per double spray coat or more than 25 microns 1.0 mil per single spray pass of nonzinc paint typically indicates the paint is not being applied wet enough to properly flow out and must be avoided.

3.3.9 System No. 5-D

**************************************************************************
NOTE: See Note for System 3 above.
**************************************************************************

Apply paint by spray to an average dry film thickness of a minimum of 190 microns 7.5 mils for the completed system, with the thickness at any spot of not be less than 150 microns 6.0 mils. The specified total film thickness must be attained in any event, and any additional coats needed to attain specified thickness must be applied at no additional cost to the Government. Attaining the specified film thickness in fewer than the prescribed number of coats or spray passes will be acceptable provided heavier applications do not cause pinholes, bubbles, blisters, or voids in the dried film. The application of more than 50 microns 2.0 mils (dry film thickness) per double spray coat or more than 25 microns 1.0 mil per single spray pass of nonzinc paint typically indicates the paint is not being applied wet enough to properly flow out and must be avoided.
3.3.10 System No. 5-E-Z

**************************************************************************
NOTE: See Note for System 3 above.
**************************************************************************

Apply paint by spray to an average dry film thickness of a minimum of 175 microns 7.0 mils for the completed system, with the thickness at any spot of not be less than 140 microns 5.5 mils. The dry film thickness of the zinc-rich primer must be approximately 63 microns 2.5 mils with no spot less than 51 microns 2.0 mils. The specified film thickness must be attained in any event, and any extra coats needed to attain the specified thickness must be applied at no additional cost to the Government. Attaining the specified film thickness by applying fewer than the prescribed number of coats or spray passes will be acceptable provided heavier applications do not cause pinholes, bubbles, blisters, or voids in the dried film. The application of more than 50 microns 2.0 mils (dry film thickness) per double spray coat nor more than 25 microns 1.0 mil per single spray pass of nonzinc paint typically indicates the paint is not being applied wet enough to properly flow out and must be avoided.

3.3.11 System No. 6

**************************************************************************
NOTE K: This NOTE also applies to the next paragraph.
**************************************************************************

1. Systems No. 6 and 6-A-Z are suitable for steel surfaces subject to immersion in fresh waters and, to a degree, their usefulness in this environment overlaps the vinyl systems. However, the vinyl systems are considered to be more suitable for components that are intermittently immersed or are partly immersed and partly in exterior atmospheric exposure. Also, the vinyl systems, except those with aluminum or black vinyl topcoats, are considered to be appreciably more resistant to gouging and abrasion than the No. 6 and 6-A-Z systems. The vinyls are adaptable to use under a wider range of application and drying temperatures than the coal tar-epoxy system. In addition, coal tar epoxy-coatings present more problems in application and inspection than vinyls. For interior surfaces of flooded compartments, spiral (turbine) cases, penstocks, and other large-diameter, low-to-moderate-velocity water conduits, and for exposed ferrous surfaces in dewatering and drainage sumps, the coal tar epoxy has excellent long-range performance capabilities and may be used (in place of vinyls) unless the specified application and curing temperature requirements would appear to unreasonably restrict construction progress. Also, while the vinyl systems perform very well in the great majority of fresh waters, Systems No. 6 and 6-A-Z may be better adapted to waters that have been made highly corrosive by intense industrial contamination, sewage, or mine waters. In general, system No. 6-A-Z is preferred to the No. 6 system by a margin.
2. Systems No. 6 and 6-A-Z are also recommended for exterior steel surfaces of buried tanks and pipe. The systems should not be specified indiscriminately for pipe since, in small-to-moderately large diameters and particularly in large quantities, pipe coated in the shop at reasonable cost with hot-applied coal tar enamel (AWWA C203), fusion bond epoxy coating (AWWA C213), or extruded polyethylene is easily obtainable, while coal tar epoxy is not widely available as mill-applied pipe coating. Where large quantities of underground pipe are involved, see coating and pipe materials information in the various guide specifications for underground utility lines. Steel pipe, shop coated with extruded polyethylene, and field joints, double wrapped with hot-applied coal tar tape (AWWA C203) or pressure-sensitive plastic tape (AWWA C209), warrant consideration for hydraulic and other lines subject to underwater immersion.

3. System No. 6 or 6-A-Z should be used for coating (prior to driving) of underground, underwater, and incidental atmospheric exposed sections of inland steel piling where protection is considered necessary. Piling in undisturbed soils will not in general require protection; see National Bureau of Standards Journal of Research (Vol. 66C, No. 3, July-September 62) paper, Corrosion of Steel Pilings in Soils, and Lower Mississippi Valley Division Report (December 1969) concerning same subject distributed to all districts and divisions.

4. System No. 6-A-Z may be used for sector gates, steel piling etc., immersed in seawater and diluted seawater. It is suitable also for the tidal zone, splash zone, and incidental weather-exposed sections of such structures. The coal tar-epoxy coating becomes quite hard and is not significantly damaged by fouling organisms; therefore, anti-fouling coats are not considered necessary except possibly for operations reasons, e.g., prevention of weight increase and surface roughness due to fouling and reduction of repainting difficulties. There is presently no thoroughly proven anti-fouling paint for use over the coal tar-epoxy coating. Contact the Paint Technology Center, U.S. Army Construction Engineering Research Laboratory, ATTN: ERDC-CERL-EM, Champaign, IL.

5. The fact that C-200A paint adheres well to clean, sound concrete and also has good resistance to many chemicals indicates the use of a system similar to System No. 6 on concrete surfaces in contact with sewage and other materials tending to cause chemical damage. When used for concrete exposed to such environments, the surface preparation instructions for System No. 6 should be
changed to read blast clean to etch surfaces and remove contaminants. Obviously, the use of coatings to upgrade the chemical resistance of concrete has limitations and should not be relied on to solve an exposure situation in which uncoated concrete would be quickly damaged to a gross degree.

6. SSPC PS 26.00 may be employed as aluminum finish coats for C-200A when such a finish is desired. It adheres well to the C-200A in all except constant immersion applications.

7. System No. 6-A-Z and, to a lesser extent, System No. 6 are suitable for use in conjunction with cathodic protection provided the potential of the steel is kept at the minimum required for protection of holidays in the film.

Apply paint by spray or brush with a minimum of two coats to provide a minimum total thickness at any spot of 400 microns 16 mils. Any spot having an excess of coal tar paint, here defined as more than 500 microns 20 mils in a single coat or 875 microns 35 mils in multiple coats must be repaired by sanding, grinding or abrasive blasting the excess material from the surface and reapplying the coatings to the above specified requirements. The specified film thickness must be attained in any event, and any additional (beyond two) coats needed to attain specified thickness must be applied at no additional cost to the Government.

3.3.12 System No. 6-A-Z

Apply epoxy zinc-rich primer 19C in accordance with the manufacturer’s directions in two single, half-lapped spray coats to an average dry film thickness of a minimum of 75 microns 3.0 mils. The thickness at any spot must not be less than 63 microns 2.5 mils or greater 200 microns 6 mils for the primer. After a minimum drying period of 6 hours and no more than 96 hours, apply at least two coats of coal tar epoxy paint to provide a minimum thickness at any spot of 400 microns 16 mils for the completed system. Any spot having an excess of coal tar paint, here defined as more than 500 microns 20 mils in a single coat or 875 microns 35 mils in multiple coats must be repaired by sanding, grinding or abrasive blasting the excess material from the surface and reapplying the coatings to the above specified requirements. If the epoxy zinc-rich paint has been applied in the shop or otherwise has been permitted to cure for longer than 96 hours, it must be abraded and recoated with an additional thin tack coat of the zinc-rich paint, which in turn must be overcoated within 96 hours with the first coat of coal tar-epoxy paint. The specified film thicknesses must be attained in any event, and any additional coats needed to attain specified thickness must be applied at no additional cost to the Government.

3.3.13 System No. 7

NOTE L: 1. The system is included specifically for
use on local protection projects and is not to be used on other types of projects in place of vinyl or coal tar-epoxy systems. It may be used for coating the ferrous surfaces of equipment located below the operating floor of pump stations (in the station sump), in gate wells, in surge chambers, etc. It may be used on both inside and outside discharge pipes with diameters of 20 inches and greater. The items usually involved are storm water and sanitary pumps, slide gates, flap gates, etc. The coating, when applied to equipment and other manufactured items, should generally be permitted to be applied in the shop. Final touch-up painting should be done after installation is completed.

2. Pump discharge lines, except when located wholly within the station sump, should be protected as stipulated in Section 9 of EM 1110-2-3105. Discharge lines wholly within the station sump should be considered as part of the pump. Items of fabricated structural steel used in pump stations and on other features of local protection projects are usually of small size and are generally hot dipped galvanized after fabrication. Only those items fabricated of structural steel of such a large size that galvanizing would be impracticable or unduly expensive would be painted.

3. Cleaning of the metal surfaces can be accomplished by (1) SSPC SP 6/NACE No.3 Commercial Blast Cleaning or (2) by SSPC SP 3 Power Tool Cleaning or SSPC 7/NACE No.4 Brush-Off Blast Cleaning. Only one of the alternative methods should be specified. Although the Commercial blast cleaning assures better performance of the coating, it is considered that it should only be used where large pumping units are used. For the smaller pumping units, that is, size 900 mm 36 inch and below, power tool or brush-off blast cleaning is considered adequate since it will, in all probability, be more in keeping with the standard practice of the industry for equipment of the above-mentioned size. For the cleaning of sluice gates, flap gates, and other similar items, power tool or brush-off blast cleaning should be used. For touch-up paints, cleaning should be by the solvent and wire-brush method.

**************************************************************************

Apply a special primer under the coal tar-based paint only if/as recommended by the coating manufacturer. The materials must be heavily applied by brush or with heavy-duty spray equipment at a coverage rate that will give a minimum total dry film thickness of 500 microns 20 mils at any spot for the completed system. The paint must not be thinned unless recommended by the manufacturer. If brushed, the final strokes must be at right angles to those of the preceding coat. Comply with the manufacturer's recommendations regarding the application and drying time between coats.
### 3.3.14 System No. 8

NOTE M: The Commercial Item Description describes commercially available coating systems for application to wet and damp surfaces. These are very unusual coatings and their use should be limited to only those locations where the surface cannot be made sufficiently dry for more typical coating systems.

Mix and apply the coating in accordance with the manufacturer's written instructions. The coating must be applied in one or more coats to achieve an average dry film thickness of a minimum of 305 microns (12 mils). Minimum thickness at any spot must be not less than 228 microns (9 mils). Roller application is preferred. Application to vertical surfaces by airless spray may be performed provided all condensed water droplets are removed by wiping with a terry cloth towel immediately prior to spray application. Application to horizontal surfaces or surfaces otherwise covered by standing or running water must be by roller. Brush application must be limited to inside corners, bolt heads and other surface irregularities that are difficult to coat by roller. Apply subsequent coats in the shortest recommended recoat interval. Comply with all manufacturer's recommendations regarding ambient and surface temperatures during application and curing of the coating.

### 3.3.15 System No. 10

NOTE N: 1. System No. 10 consists of 2 coats of inorganic zinc paint. SSPC Guide 12.00 discusses applications and limitations to the use of zinc-rich coatings. Use of this system within the Corps is anticipated to be limited to 2 basic applications: (a) For applications as a high temperature paint where exhaust stacks and other surfaces are to be protected from corrosion at dry heat temperatures up to 399 degrees C (750 degrees F); and, (b) To protect atmospheric steel exposed to high levels of condensation or salt air and where the appearance of an untopcoated zinc coating is acceptable.

2. Conventional good-quality alkyd enamels will withstand temperatures up to about 120 degrees C (250 degrees F). Heat resisting paints are available that provide many colors capable of withstanding 215 degrees C (400 degrees F). System No. 10 is resistant to temperatures up to 400 degrees C (750 degrees F) maximum. It is not to be expected that any paint system will exhibit long life on surfaces operating for long periods at very high temperatures (in excess of about 400 degrees C (750 degrees F)), particularly when combined with exterior weathering. As an alternative to conventional high temperature coatings, thermal-sprayed metals such as System No. 8-A found in Section 09 97 10.00 10 METALLIC COATINGS FOR HYDRAULIC STRUCTURES may be used. System No. 8-A will withstand temperatures up
to 900 degrees C 1650 degrees F.

3. Surface preparation for inorganic zinc is critical; mill scale, rust or other coatings remaining on the surface will result in poor adhesion and ineffective protection. Application by spray is most common; application of excessive thickness per coat often results in mudcracking. Topcoating of inorganic zinc with non-zinc organic coatings is not recommended.

Apply the paint in accordance with the manufacturer's recommendations to a minimum average dry film thickness of 125 microns 5 mils with a thickness at any spot of not less than 100 microns 4.0 mils. The specified film thickness may be obtained in a single coat provided this is allowed by manufacturer's recommendations and provided this does not result in improper cure or result in the development of mud cracking or other film defects.

3.3.16 System No. 12

NOTE O: 1. The inclusion of galvanizing provisions in the painting section of project specification may or may not be desirable and is not mandatory. A principal purpose here is to draw attention to certain information concerning galvanizing versus paint for protection of steel surfaces.

2. Galvanizing of open-mesh-type floor grating (without paint overcoats) is more effective than painting.

3. There would appear to be a mistaken belief that galvanizing is a cure-all method of protection. While very suitable for steel in rural and mildly industrialized atmospheres, galvanizing does not have a greatly extended life in highly industrialized atmospheres, particularly where the air contains sulphur compounds. Galvanizing is not as effective as the best of paint coatings for steel exposed to cold, fresh water, and in warm and hot waters, galvanizing may result in pitting of the steel deeper than with no coating at all. The performance of galvanized pipe buried in the ground is not consistently good, and it cannot be considered to be equivalent to a high-quality organic pipe coating, particularly since the latter can be supplemented by cathodic protection.

4. The use of galvanizing appears to be economically justified in aboveground structures exposed to mildly corrosive atmospheres, constructed of lightweight structural steel members, and presenting difficult-to-paint and inaccessible surfaces, e.g., transmission towers. The
feasibility and economy of galvanizing on structures that are more massive and more easily painted is open to question, but its use on such surfaces is growing. To be considered also is the amount and nature of field erection work that results in destruction of the galvanizing, since satisfactory repair of such damage is difficult and expensive. It should be kept in mind that galvanizing generally has a poor record as a paint-receiving surface, requiring special measures for reliable and permanent adhesion.

5. Other hot-dipped coatings exist that contain various ratios of zinc and aluminum. Some of these coatings may perform better than galvanizing in some exposures. For example, aluminum hot-dipped coatings of pure aluminum are recommended for chloride environments. The specifier may also review ASTM A780 or SSPC Guide 14 for other repair procedures for hot dip galvanized surfaces.

Wash galvanized surfaces to expose damaged areas. Clean mars and breaks in the galvanized coating by hand or power tool to remove all corroded substrate. Touch up the damaged areas with two coats of SSPC Paint 20, Type II.

3.3.17 System 16-A

**************************************************************************

NOTE: See Note I.
**************************************************************************

Brush or spray the first coat in the shop or field as indicated. Touch up the coating in the field as necessary to maintain its integrity at all times. Apply the second and third coats in the field. Procure all materials from the same coating manufacturer and apply each coat in accordance with the manufacturer's written instructions. The finish color must be as indicated. Do not apply paint to running surfaces of bearings and machinery. Remove pipe-threading and cutting compounds by solvent washing prior to application of paint to pipe surfaces.

3.3.18 System No. 17

**************************************************************************

NOTE P: This Note applies to System 18 also.

1. Systems No. 17 and 18 are intended primarily for interior surfaces of wood, concrete, masonry, plaster, wallboard, and incidental surfaces within interior painted spaces. System No. 17 provides an all latex system; System No. 18 provides paint systems with oil based alkyd finish coats. The latex system typically has less odor during and immediately after application. Latexes are compatible with alkaline surfaces but may be less durable when subjected to frequent cleaning with abrasive cleansers. Repainting of aged latex paints presents fewer intercoat adhesion problems than when
repainting aged semigloss and gloss oil based paints. Additional systems intended for similar surfaces are shown in guide specification Section 09 90 00 PAINTS AND COATINGS.

2. System 17 provides options for the specifier to select finish coats which are MPI 114 (high gloss), MPI 54 (semigloss), MPI 52 (egg shell), or MPI 53 (flat). See paragraph 4 below for guidance in selection of the proper finish coat. When multiple gloss levels are to be used in a contract the specifier should develop alternate systems using an additional letter (System No. 17A, vs. System No. 17B) and clearly identify the items to be coated with each system.

3. System 18 requires the specifier to select both the appropriate primer and the appropriate finish coats. MPI 46 primer is an alkyd. Products meeting this specification typically have superior adhesion to wood and existing oil based enamel coatings. They may be applied directly to clean ferrous surfaces but should not be applied directly onto sheet rock, masonry, galvanized metal, or other alkaline surfaces. MPI 50 primer is latex. Products meeting this specification are commonly applied to a wide range of sheet rock, masonry, and wood surfaces; however, they should not be applied directly to unprimed ferrous or aluminum surfaces. All finish coats are compatible with either primer. The options for finish coats include MPI 49 (Flat), MPI 47 (Semigloss), MPI 51 (Eggshell) and MPI 48 (Gloss). See paragraph 4 below for guidance in selection of the proper gloss. When multiple gloss levels are to be used on a contract the specifier should develop alternate systems using an additional letter (System No. 18A vs. System No. 18B) and clearly identify the items to be coated with each system.

4. Flat finishes tend to hide surface irregularities but are often more difficult to clean. They should be used for walls and ceilings constructed of concrete, block, plaster, or wallboard where no unusual soiling problems exist. Egg shell finishes are sometimes specified where flat finishes are desired but a higher level of cleanability is required. Semigloss finishes are specified on smooth plaster, wood, or other high quality surfaces when appearance requirements are above average. Semigloss and high gloss finishes should generally be used on wainscot areas, stairwells, washrooms, workrooms, etc., subject to moisture, soiling, or staining problems. Avoidance of very light colors on wainscots and other areas subject to high degree of soiling is suggested. Semigloss and high gloss finishes are frequently applied over an alkyd primer on interior wood and steel doors, windows, frames, etc.
5. The use of the systems for finishing complex spaces (such as in powerhouses) involving numerous ceiling, wall, wainscot, door, and trim colors and varying degrees of gloss in numerous rooms is more easily specified by preparing a separate room and door finish schedule.

6. Attention is directed to the absence of any requirements in this guide for rubbing, sacking, finish removal, etc., to improve the paintability or appearance of painted concrete surfaces; such requirements, if needed, should be included in the concrete section. Also, if coated interior concrete block surfaces are intended to be substantially free of surface voids, they should be first treated with MPI 4 Interior/Exterior Latex Block Filler.

7. System No. 18 with MPI 46 primer and semigloss or gloss finish coats is adequate for battery rooms in some divisions. However, System No. 21 conforms to the requirements of EM 1110-2-3001.

Except as otherwise required, apply the same finish paint to all metal ductwork, conduit, pipe, radiators, grilles, louvers, pull boxes, and exposed surfaces of miscellaneous embedded metalwork as is applied to adjacent ceilings or walls provided that:

a. The coat of MPI 50 may be omitted on metal surfaces primed with a shop or field coat of metal priming paint.

b. On bare ferrous surfaces and wood replace the coat of MPI 50 with a coat of MPI 46.

c. Solvent clean all galvanized and other nonferrous metal surfaces in accordance with SSPC SP 1 and prime with SSPC Paint 41 in place of the MPI 50 coat.

3.3.19 System No. 18

NOTE: See NOTE for System 17 above.

Thin oil based alkyd paints using only odorless mineral spirits (ASTM D235). Except as otherwise required, finish all metal ductwork, conduit, pipe, radiators, grilles, louvers, pull boxes, and exposed surfaces of miscellaneous embedded metalwork the same as adjacent ceilings or walls provided that:

a. The coat of MPI 46 or MPI 50 may be omitted on metal surfaces primed with a shop or field coat of metal priming paint.

b. Prime all bare ferrous surfaces with MPI 46.

c. Clean all galvanized and other nonferrous metal surfaces in accordance with SSPC SP 1 and prime with SSPC Paint 41 in place of MPI 46 or MPI 50.
3.3.20 System No. 21

**************************************************************************
NOTE Q: This NOTE applies to the next paragraph also.

1. MIL-DTL-24441 consists of a general specification for a two-component epoxy-polyamide paint and detail specification sheets numbered MIL-DTL-24441/19C through MIL-DTL-24441/40B. Each specification sheet contains the formulation and requirements for a specific coating. Variations include high-build and regular build types for various primers and topcoat colors. Type IV high-build topcoats may be used over the 19C primer in System 21-A-Z; however, Type III products offer superior performance in immersion. Any of the type III or Type IV topcoats may be used directly on concrete or wood surfaces. Primer 29B should be specified for aluminum substrates or steel surfaces that are not primed with zinc-rich primer 19C. The designer must specify the specific coatings desired.

2. System No. 21 is suggested for concrete and other incidental surfaces of battery rooms and other rooms where resistance to chemical fumes is desired and/or which will be subjected to heavy soils necessitating frequent cleaning. It may be used on interior concrete floors; however, System No. 22 is specifically designed for this purpose.

3. Attention is directed to the absence in this guide of any requirements such as sacking, fin removal, etc., that would improve the paintability or appearance of painted concrete surfaces; such requirements should be included in the concrete section.

4. System No. 21-A-Z can be used on steel sector gates, steel piling, etc., immersed in seawater and diluted seawater. It is suitable also for the tidal zone, splash zone, and incidental weather exposed sections of such structures. The system is satisfactory in applications subject to low-to-moderate water velocities and abrasion. System No. 6-A-Z should be specified for applications where more severe abrasion is anticipated.

5. Systems No. 21 and 21-A-Z are suitable for steel surfaces subject to immersion in fresh waters and to a degree their usefulness in the environment overlaps vinyl Systems No. 3 through 5-E-Z and Epoxy Systems 6 and 6-A-Z. However, the vinyl Systems are more suitable for components that are intermittently immersed or are partly immersed and partly in exterior atmospheric exposure. Also, the vinyl Systems, except those topcoated with aluminum vinyl, are more resistant to gouging and abrasion than the
epoxy systems, with vinyl Systems No. 5-C-Z and 5-E-Z being the best in this respect. Finally, the vinyls are adaptable to use under a wider range of applications and drying temperatures than the epoxy systems. In general, System No. 21-A-Z is preferred to System No. 21 by a margin wide enough to outweigh its additional cost.

6. System No. 21-A-Z is suitable for use on exterior steel exposed to a marine (salt) atmosphere.

7. Systems No. 21 and 21-A-Z are suitable for use on hydraulic piping immersed in fresh water and may be considered equivalent to Systems No. 6 and 6-A-Z in this exposure.

8. Generally, entire surface areas of items such as miter gates, crest gates, etc., should receive the selected epoxy system even though only a portion will be subjected to atmospheric weathering. Epoxy coatings subject to atmospheric weathering may erode by as much as 25 µm 1 mil per year. In such cases where systems No. 21 and 21-A-Z will be exposed to normal atmospheric weathering, it is recommended that one or two coats of polyurethane meeting SSPC Paint 36, Level 3, or MIL-PRF 85285 be applied over the final coat of the epoxy system. The polyurethane should be applied only to the portion of the item generally exposed to atmospheric weathering and not to the entire item. It should be specified in a color similar to that of the immersed area. The polyurethane should be applied in the number of coats and at the dry film thickness recommended by the manufacturer. Products marketed by many manufacturers for compliance with SSPC Paint 36 are not suitable for immersion and Level 3 performance is not available in safety and designer colors. For greater water resistance and color retention MIL-PRF-85285, Type IV should be specified.

******************************************************************************

Apply the paint in a minimum of two single coats to produce an average dry film thickness totaling 150 microns 6.0 mils with no less than 5.0 mils at any spot. No individual coat may be more than 150 microns 6.0 mils at any point. Apply MIL-DTL-24441 in compliance with the manufacturer's recommendations regarding type of thinner, amount of thinning, and required induction time. The drying time between coats must not be less than 8 hours nor more than 96 hours.

3.3.21 System No. 21-A-Z

******************************************************************************

NOTE: See NOTE in preceding paragraph.
******************************************************************************

Apply the epoxy zinc-rich paint 19C in two single half-lapped spray coats to an average dry film thickness of a minimum of 100 microns 3.0 mils and a thickness at any spot of not less than 64 microns 2.5 mils or greater than 200 microns 6.0 mils. After a drying period of not less than 6 hours or
more than 96 hours, apply at least two coats of epoxy polyamide paint to produce an average dry film thickness totaling 305 microns 12 mils and a thickness at any spot of not less than 254 microns 10 mils. If the epoxy zinc-rich paint has been applied in the shop or otherwise has been permitted to cure for longer than 96 hours, it must be abraded and recoated with an additional thin tack coat of the zinc-rich paint, which in turn must be overcoated within 96 hours with the first coat of the epoxy polyamide paint. Apply MIL-DTL-24441 in accordance with the manufacturer's recommendations regarding type of thinner, amount of thinning, and required induction time. The drying time between non-zinc coats must not be less than 12 hours nor more than 96 hours.

3.3.22 System No. 22

**************************************************************************
NOTE R: MPI Paint 212 describes commercially available floor coating systems suitable for concrete floors of maintenance and other similar facilities. Specifier should consult manufacturers for guidance and availability in specifying color, hardness, level of reflectance, level of slip resistance, and warranty necessary for specific application.
**************************************************************************

Apply the floor coating system MPI 212 in accordance with the manufacturer's written instructions. It must be a multi-coat system with the dry film thickness per coat as recommended by the manufacturer.

3.3.23 System No. 23-A-Z

**************************************************************************
NOTE S:

1. Paint System No. 23-A-Z is comprised of three-coats of moisture cure urethane. The primer is a zinc-rich coating conforming to SSPC Paint 40, Type II. The primer may be packaged as a single component paint containing the zinc or a two component material where the zinc must be incorporated into the liquid paint. The intermediate coat is a single component aromatic moisture cure urethane conforming to SSPC Paint 41. The topcoat is a single component aliphatic moisture cure urethane conforming to SSPC Paint 38. The specifier must specify a color. Gray topcoat should have a reflectance of 20–24 (ASTM E1347). The resulting gray color should approximate color 26231 of SAE AMS-STD-595A. Red topcoat should approximate SAE AMS-STD-595A color 10076. White and black may also be specified.

2. The usefulness of System 23-A-Z overlaps to a certain extent with the vinyl systems. However, System 23-A-Z is not as durable as the vinyl systems because it is less abrasion and water resistant. In locations where it has been determined that vinyl paints do not meet air pollution requirements, System 23-A-Z is a suitable alternative to vinyls.
for use on ferrous metal surfaces subject to fresh water immersion and adjoining atmospheric exposed surfaces.

**************************************************************************

Apply the coating system in accordance with the manufacturer's written instructions. It must be a 3-coat system plus an additional stripe coat applied by brush to all edges, corners, welds, fasteners, and other surface irregularities. Allow the stripe coat to dry as recommended by the manufacturer, prior to the application of the first full coat. Application of the system in less than three coats will not be accepted. Procure all materials from the same coating manufacturer. The individual paints comprising the system must have been tested and passed all requirements of the applicable SSPC standards. **SSPC Paint 38** topcoat must meet the requirements of Accelerated Weathering Level 3. Apply the coatings by spray in accordance with the manufacturer's written instructions. Limited use of brush and roller application is permitted provided the specified film thicknesses are achieved. Comply with the manufacturer's recommendations regarding mixing and thinning requirements, and pot life requirements, dry film thickness per coat and minimum and maximum dry time between coats. Do not use coating material that has thickened appreciably. Areas of bubbling noted upon curing of any individual coat must be removed by sanding or screening, the edges feathered, and the coat reapplied to the repaired areas before a subsequent coat is applied.

3.3.24 System No. 23-B-Z

**************************************************************************

NOTE T:

1. Paint System No. 23-B-Z is comprised of three-coats of moisture cure urethane. The primer is a zinc-rich coating conforming to SSPC Paint 40, Type II. The primer may be packaged as a single component paint containing the zinc or a two component material where the zinc must be incorporated into the liquid paint. The second and third coats are a single component aromatic moisture cure urethane conforming to SSPC Paint 41 and containing coal tar pitch resin.

2. Coating System 23-B-Z is recommended for application on ferrous metal surfaces subject to fresh water and brackish water immersion, atmospheric, and buried environments. In fresh water immersion its usefulness overlaps with the vinyl systems. However, System 23-B-Z is not as durable as the vinyl systems because it is less abrasion resistant. In locations where it has been determined that vinyl paints do not meet air pollution requirements, System 23-B-Z is a suitable alternative to vinyls for use on ferrous metal surfaces subject to fresh water immersion and adjoining atmospheric exposed surfaces. In brackish or dilute salt water immersion and buried applications the system is comparable to System No. 6-A-Z. Its chief advantage over epoxy system 6-A-Z is that it can be applied at lower temperatures and higher humidity.
Apply the coating system in accordance with the manufacturer's written instructions. It must be a 3-coat system plus an additional stripe coat applied by brush to all edges, corners, welds, fasteners, and other surface irregularities. Allow the stripe coat to dry as recommended by the manufacturer, prior to the application of the first full coat. Procure all materials from the same coating manufacturer. The individual paints comprising the system must have been tested and passed all requirements of the applicable SSPC standards. SSPC Paint 41 must be modified with coal tar pitch. Apply the coatings by spray in accordance with the manufacturer's written instructions. Limited use of brush and roller application is permitted provided the specified film thicknesses are achieved. Comply with the manufacturer's recommendations regarding mixing and thinning requirements, and pot life requirements, dry film thickness per coat and minimum and maximum dry time between coats. Do not use coating material that has thickened appreciably. Areas of bubbling noted upon curing of any individual coat must be removed by sanding or screening, the edges feathered, and the coat reapplied to the repaired areas before a subsequent coat is applied.

3.3.25 System No. 23-C-Z

**NOTE U:** Paint System No. 23-C-Z is comprised of three-coats. The primer is a moisture cure zinc-rich urethane coating conforming to SSPC Paint 40, Type II. The primer may be packaged as a single component paint containing the zinc or a two component material where the zinc must be incorporated into the liquid paint. The zinc-rich primer provides excellent corrosion resistance in atmospheric exposures. Type II is an immersion grade primer and is recommended because surfaces coated with this system could be subject to intermittent immersion and the Type II primer offers an added degree of security. The second coat and third coats are a two-component aliphatic polyurethane conforming to MIL-PRF-85285 Type IV. This product provides the ultimate color and gloss retention but is only available in gray and white and is quite costly. Where custom colors are desired, SSPC Paint 36 may be substituted. In addition to the excellent corrosion resistance afforded by the primer the MIL-PRF-85285 Type IV topcoat will also provide a very high degree of resistance to UV-induced color change, dulling, and chalking, making an excellent choice for highly visible items such as handrails. The SSPC Paint 36 topcoat provides a wide range of colors including safety colors but will exhibit moderate chalking. The specifier must select a finish coat color.

Apply the coating system in accordance with the manufacturer's written instructions. It must be a 3-coat system plus an additional stripe coat applied by brush to all edges, corners, welds, fasteners, and other surface irregularities. Allow the stripe coat to dry as recommended by the manufacturer, prior to the application of the first full coat. Procure all
materials from the same coating manufacturer. The individual paints comprising the system must have been tested and passed all requirements of the applicable standards. Apply the coatings by spray in accordance with the manufacturer's written instructions. Limited use of brush and roller application is permitted provided the specified film thicknesses are achieved. Comply with the manufacturer's recommendations regarding mixing and thinning requirements, and pot life requirements, dry film thickness per coat and minimum and maximum dry time between coats. Do not use coating material that has thickened appreciably. Areas of bubbling noted upon curing of any individual coat must be removed by sanding or screening, the edges feathered, and the coat reapplied to the repaired areas before a subsequent coat is applied.

3.3.26 System No. 23-D

**************************************************************************

NOTE V:

1. This system is comprised of three coats of moisture cure urethane paint conforming to SSPC Paint 41. The second and third coats may either be aluminum or a color such as grey. The choice of aluminum or color finish is the specifier's option. Light colors may tend to yellow when exposed to sunlight. See Systems 23-A-Z and 23-C-Z for more light stable topcoat colors.

2. This system is used for three distinctly different applications. Surface preparation Alternate 1 in the painting schedule is to be used for overcoating existing coatings as a means of extending their economic life. This approach may be particularly cost effective if the existing coating contains lead or other hazardous constituents. Coating System 23-D is well suited for maintaining degraded coatings. Overcoating is performed with a significant degree of risk, which refers to the chance that the overcoated system may either fail catastrophically or will not provide the desired period of protection. The applicability of overcoating is limited by the condition of the existing coating and underlying substrate and the severity of the exposure environment. If the existing coating is too thick, brittle, or poorly adherent, then overcoating should not be performed. If the degree of substrate corrosion is significant, then the level of effort needed to prepare the substrate may indicate that overcoating is not economically viable. Overcoating is not recommended for severe exposure environments because an all new paint system would last significantly longer than overcoating and is more cost effective. For additional information on overcoating contact the Paint Technology Center.

3. System 23-D is specified for coating ferrous metal surfaces that are cleaned in accordance with surface preparation Alternate 2, SSPC SP 3 Power Tool Cleaning. SSPC Paint 41 is generally quite
tolerant of minimally prepared surfaces. When used on SP 3 cleaned surfaces System 23-D is generally adequate for mild atmospheric exposures. For more severe atmospheric exposures it generally is worth the added cost to specify System No. 23-B-Z which uses the more expensive zinc-rich primer and more expensive commercial blast cleaning. Where an aluminum finish is specified in conjunction with Alternate 2, System No. 23-D is roughly equivalent to System No. 1 which employs two coats of aluminum pigmented epoxy. The chief advantage of System No. 23-D over System No. 1 is that it can be applied at lower temperatures and higher humidity.

4. System 23-D is specified for coating non-ferrous metal surfaces using surface preparation Alternate 3 shown in the Painting Schedule. Surface preparation for Alternate 3 uses SSPC SP 16 surface preparation for non-ferrous surfaces. Galvanized surfaces and other hot-dip coated surfaces will not generally be painted. However, in exterior industrial and marine exposures or in below grade galleries and passageways subject to high humidity and condensation, painting to extend the protective life of galvanizing is sometimes advisable. Also galvanized ductwork, conduit, piping, etc., in finished spaces is generally painted for appearance purposes. System No. 23-D aluminum color is intended generally for galvanized handrail, pipe, conduit, etc., subject to exterior or interior exposure for the purpose of extending the life of the zinc coating and/or matching the appearance of adjacent painted structural steel. If preferred, System No. 23-D in gray or other suitable color may be used for this purpose. Aluminum and aluminum alloy surfaces will not generally be painted; however, System No. 23-D may be desirable for isolating aluminum in contact with mortar or concrete. System No. 23-D can be used for protection in salt (marine) atmospheres and for those situations where the aluminum surfaces may be in contact with damp wood, leaves, mud, etc., that tend to prevent free access of oxygen to the surfaces, thus causing possible loss of the metal's protective oxide film. Copper and brass surfaces will rarely be painted except for the purpose of appearance, e.g., gutters, exposed flashing, exposed piping in finished spaces, etc. Paint System No. 23-D can be used to paint copper and brass.

**************************************************************************
Apply the coating system in accordance with the manufacturer's written instructions. It must be a 3-coat system plus an additional stripe coat applied by brush to all edges, corners, welds, fasteners, and other surface irregularities. Allow the stripe coat to dry as recommended by the manufacturer, prior to the application of the first full coat. The aluminum pigmented topcoat will not meet the SSPC Paint Procure all materials from the same coating manufacturer. The individual paints comprising the system must have been tested and passed all requirements of
the applicable SSPC standards. [The first coat of the overcoat system must be applied by brush or roller to those areas where power tool cleaning exposed the steel substrate. The second coat of the overcoat system must also be applied by brush or roller to those areas that received a first coat of paint as well as any area where power tool cleaning or power washing removed the old topcoat. The final coat of the overcoat system must be applied to the entire surface by spray, brush, or roller.] [Application must be by spray. Limited use of brush and roller application is permitted provided the specified film thicknesses are achieved.] [Application must be by spray, brush, or roller.] Comply with the manufacturer's recommendations regarding mixing and thinning requirements, and pot life requirements, dry film thickness per coat and minimum and maximum dry time between coats. Do not use coating material that has thickened appreciably. Areas of bubbling noted upon curing of any individual coat must be removed by sanding or screening, the edges feathered, and the coat reapplied to the repaired areas before a subsequent coat is applied.

3.3.27 System No. 23-E

**************************************************************************

NOTE W:

1. The system is intended for interior structural steel and other interior ferrous surfaces not otherwise specified with respect to painting. The category includes structural and miscellaneous steel exposed to view in unfinished spaces, concealed structural framework of buildings, and other ferrous surfaces that will be inaccessible for painting after construction, all of which are enclosed within a weather-tight structure. Care should be taken that requirements in this section are not in conflict with other painting requirements.

2. Where steelwork is permanently assured after erection of freedom from weathering, wind-driven rain, high humidity, condensation, etc., consideration should be given to limiting the painting (exclusive of decorative coats in finished areas) to the shop-applied first coat.

3. The specification provisions relative to substitution of finish paints for the second coat of primer in painted spaces is intended only to inform the Contractor that the second coat of primer is not always required. The details of the substitute finish painting should be taken care of elsewhere, e.g., in connection with painting of room walls and ceilings.

**************************************************************************

Apply the coating system in accordance with the manufacturer's written instructions. It must be a 2-coat system. Application of the system in less than two coats will not be accepted. Procure all materials from the same coating manufacturer. The individual paints comprising the system must have been tested and passed all requirements of the applicable SSPC standards. Application must be by spray, brush, or roller in accordance with the manufacturer's written instructions. Comply with the
manufacturer's recommendations regarding mixing and thinning requirements, and pot life requirements, dry film thickness per coat and minimum and maximum dry time between coats. Do not use coating material that has thickened appreciably. Areas of bubbling noted upon curing of any individual coat must be removed by sanding or screening, the edges feathered, and the coat reapplied to the repaired areas before a subsequent coat is applied.

3.3.28 System No. 23-F-Z

**************************************************************************

NOTE X:

1. Paint System No. 23-F-Z is comprised of three-coats of moisture cure urethane. The primer is a zinc-rich coating conforming to SSPC Paint 40, Type II. The primer may be packaged as a single component paint containing the zinc or a two component material where the zinc must be incorporated into the liquid paint. The second and third coats are a single component aromatic moisture cure urethane conforming to SSPC Paint 41 and containing aluminum.

2. Coating System 23-F-Z is recommended for general use on atmospheric steel applications where an aluminum color is desired. Typical applications include service bridges, exterior of penstocks, lifting machinery, cranes, motors, and similar miscellaneous items located at civil works navigation, flood control or hydropower installations. If applied over a white metal blast cleaned surface, the system does withstand long term fresh water immersion where its usefulness overlaps with the vinyl systems. However, System 23-F-Z is not as durable as the vinyl systems because it is less abrasion resistant.

3. The usefulness of this system also overlaps with System No.1, a two-coat aluminum epoxy mastic system. However, System No. 23-F-Z is superior to System No. 1 when systems are applied to a commercial blast cleaned surfaces. System No. 23-F-Z is more expensive than System No. 1.

**************************************************************************

Apply the coating system in accordance with the manufacturer's written instructions. It must be a 3-coat system plus an additional stripe coat applied by brush to all edges, corners, welds, fasteners, and other surface irregularities. Allow the stripe coat to dry as recommended by the manufacturer, prior to the application of the first full coat. Procure all materials from the same coating manufacturer. The individual paints comprising the system must have been tested and pass all of the requirements of the applicable SSPC standards. Apply the coatings by spray in accordance with the manufacturer's written instructions. Limited use of brush and roller application is permitted provided the specified film thicknesses are achieved. Comply with the manufacturer's recommendations regarding mixing and thinning requirements, and pot life requirements, dry film thickness per coat and minimum and maximum dry time between coats. Do
3.3.29 Protection of Nonpainted Items and Cleanup

Maintain walls, equipment, fixtures and all other items in the vicinity of the surfaces being painted free from damage by paint or painting activities. Promptly repair any paint spillage and painting activity damage.

3.4 INSPECTION

Surface preparation and painting inspections must be conducted by an inspector certified as meeting one of the following designations: SSPC-PCI Level 2, NACE-CIP Level 2. The inspector will inspect and document all work phases and operations on a daily basis and submit daily Inspection Reports. As a minimum the daily report must contain the following:

a. Inspections performed, including the area of the structure involved and the results of the inspection.

b. Surface preparation operations performed, including the area of the structure involved, the mode of preparation, the kinds of solvent, abrasive, or power tools employed, and whether contract requirements were met.

c. Thinning operations performed, including thinners used, batch numbers, and thinner/paint volume ratios.

d. Application operations performed, including the area of the structure involved, mode of application employed, ambient temperature, substrate temperature, dew point, relative humidity, type of paint with batch numbers, elapsed time between surface preparation and application, elapsed time for recoat, condition of underlying coat, number of coats applied, and if specified, measured dry film thickness or spreading rate of each new coating.

3.5 PAINTING SCHEDULES

**************************************************************************

NOTE Y: In the case of formulations in which the type and amount of pigment are fixed, the manufacturer may be limited in the latitude of shades and colors that can be obtained. Colors should be selected in advance and designated in the project specifications or in the drawings. Insofar as practicable, colors must be designated by making use of SAE AMS-STD-595A color designations. When a proprietary or SSPC paint is specified, colors can be specified as approximating those not necessarily as matching the SAE AMS-STD-595A color designation.

1. The number assigned to each paint system should not be changed locally even though on specific projects some systems are omitted. If other systems are added locally, they should be assigned numbers other than those used in this guide. See also final
general note below for instructions relative to numbering other systems.

2. For maintenance of existing paint systems use System No. 23-D. For further guidance in maintenance painting, see EM 1110-2-3400.

3. For quick guidance to the first choice coating systems for steel surfaces from each of several exposure conditions frequently incurred on civil works projects, the following will be helpful:

a. Normal exterior atmospheric exposure - System No. 23 D or 23-F-Z.

b. Prolonged condensation, high humidity, coastal structures not subject to immersion, System No. 23-C-Z (colors) or 23-F-Z (aluminum).

c. Immersion in relatively quiet, minimally abrasive waters - System No. 3-A-Z.

d. Immersion in moderately-to-highly turbulent, abrasive waters - System No. 5-C-Z or 5-E-Z.

e. Immersion in very turbulent, ice- and debris-laden waters - System No. 6-Z-A of Section 09 97 10.00 10 METALLIC COATINGS FOR HYDRAULIC STRUCTURES.

f. Immersion in sea water or other extremely corrosive waters - System No. 6-A-Z (coal tar) or 21-A-Z (colors).

g. Immersion in fresh water where protection from zebra mussel fouling is deemed critical - System No. 6-Z-A of Section 09 97 10.00 10 METALLIC COATINGS FOR HYDRAULIC STRUCTURES.

4. For further information regarding system selection refer to the notes in the following general index.

3.6 METALLIZING SYSTEMS AND METALLIZING SCHEDULE

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for preparation of surfaces and application of metallized coatings for hydraulic structures. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTES: The protective metallic coating systems listed have limited applicability at this time. Some states and municipalities have stringent regulations governing the use of architectural coatings containing volatile organic compounds (VOC). Many of the coating systems found in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, do not meet VOC regulations in some regions of the country.

The coating systems contained herein are suitable substitutes for the paint systems in Section 09 97 02 and may be used should air pollution regulations so
dictate. It should be noted that some of the sealer and paint coats recommended in this guide may also not be VOC-compliant in some regions of the country.

The use of metallizing system 6-Z-A is advocated for use on steel immersed in very turbulent, ice- and debris-laden fresh waters. Exposures such as this may erode and cause total failure of the standard abrasion-resistant paint systems found in Section 09 97 02 in as little as 1 year. System 6-Z-A, with appropriate sealing and top coating, will provide superior protection for this type of severe service.

The use of metallizing system 8-A is endorsed for high temperature atmospheric exposures. Paint coatings do not generally perform as well as thermal spray coatings of aluminum for high temperature exposures such as stacks. The use of metallizing system 6-Z-A is recommended for use as a zebra mussel repellent coating where the use of such a coating is deemed necessary. System 6-Z-A is longer lived and has a lesser environmental impact than conventional copper-containing antifouling coatings. The use of this guide specification should be limited to work described in this note.

The metallizing systems described in this document are intended for corrosion protection of cold and hot rolled steel. Metallizing systems described herein are not intended for use on stainless steel, aluminum, bronze, copper, plastic, rubber, wood, masonry, and painted surfaces. Coating systems contained herein should not be specified for potable water tank interiors, moving parts or wear surfaces of machinery, or for surfaces subject to strong acids or bases.

For further technical assistance contact:

US Army Construction Engineering Research Laboratory
Attn: CECER-FL-M (Tel 217-373-7237)
P.O. Box 9005
Champaign, IL 61826-9005

**************************************************************************
1.1 LUMP SUM PRICE
**************************************************************************

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (LUMP SUM PRICE) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.

**************************************************************************
1.1.1 Payment
**************************************************************************

Payment will constitute full compensation for furnishing all plant, labor,
materials and equipment and performing all operations necessary for metallizing hydraulic structures as specified.

1.1.2 Unit of Measure

Unit of measure: Lump Sum

1.2 REFERENCES

******************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 DEFINITIONS

1.3.1 Metallizing

Refers to any of several application methods for depositing sprayed-metal coatings.

1.3.2 Wire Flame-Spray

A metallizing process in which metallic wire is melted in an oxygen and fuel gas flame and is dispersed with an airstream.

1.3.3 Arc-Spray

A metallizing process in which metallic wire is melted by an electric arc and is dispersed with an airstream.

1.4 SYSTEM DESCRIPTION

Prepare a thermal spray Job Reference Standard (JRS) at the jobsite prior to the onset of production work. The JRS is used at the initiation of the contract to qualify the surface preparation, thermal spray application, and sealing processes and also serves as a standard of quality in case of dispute. To prepare the JRS, solvent and abrasive blast clean a steel plate measuring 600 x 600 x 10 mm (2 feet x 2 feet x 3/8 inch) of the same alloy as the surfaces to be metallized in accordance with the requirements of the contract. Use the same abrasive blast media and equipment that will be used on the job. Mask one-fourth of the JRS plate with sheet metal and apply thermal spray coating to the unmasked portion of the plate. Apply the thermal spray coating using the same equipment, approved wire, and spray parameters to be used on the job. Operate the gun in a manner substantially the same as will be used on the job. Measure and record the approximate traverse speed and standoff distance during spraying. Once the JRS is qualified, the operating parameters must not be altered, except as necessitated by the requirements of the job. Seal two-thirds of the thermal spray coated portion of the JRS in accordance with the requirements of the contract. Paint one-half of the sealed area in accordance with the contract if applicable. Apply the sealer and paint using the same paint spray equipment that will be used for production. Preserve and protect the prepared JRS in such a manner that it remains dry and free of contaminants for the duration of the contract. The Coating Inspector will verify and record surface cleanliness, blast profile shape and depth, thermal spray appearance, thickness, and adhesion, and sealer and paint thicknesses in accordance with the contract requirements.
1.4.1 General Requirements

Perform the work in accordance with the requirements of 29 CFR 1910, 29 CFR 1926, EM 385-1-1, and other references as listed herein. Submit matters of interpretation of the standards to the Contracting Officer for resolution before starting work. Where the regulations conflict, the most stringent requirements apply. This paragraph, with its subparagraphs, supplements the requirements of EM 385-1-1. In any conflict between Section 01 of EM 385-1-1 and this paragraph, the provisions herein govern. Submit a Safety Indoctrination Plan as specified in the Submittals paragraph.

1.4.2 Worker Hazard Communication Program

Submit the written program describing how the program is to be implemented, labels and other forms of warning, Safety Data Sheets (SDS), chemical inventory, employee information and training, methods the Contractor will use to inform employees of hazards associated with nonroutine tasks and unlabeled pipelines, and the methods the Contractor will use to inform Government employees and subcontractors of chemical hazards. The program must discuss the following items: 1) Treatment of airborne metal dusts, finely divided solids, or other particulate accumulations as explosive materials. 2) Maintaining proper ventilation, good housekeeping, and safe work practices to prevent the possibility of fire and explosion. 3) Danger of pointing thermal-spray equipment at a person or flammable material. 4) Avoiding thermal spraying in areas where paper, wood, oily rags, or cleaning solvents are present. 5) Use of conductive safety shoes in any work area where explosion is a concern. 6) Wearing of protective coveralls or aprons, hand protection, eye protection, hearing protection, and respiratory protection during metallizing operations, including the preparation and finishing processes. 7) Preparation and implementation of the Accident Prevention Plan as specified in the Submittals paragraph.

1.4.3 Surface Preparation Procedures

1.4.3.1 Abrasive Blasting

Ventilation and exhaust systems must comply with the requirements in Section 06.H of EM 385-1-1.

1.4.3.2 Hoses and Nozzles

In addition to the requirements in Section 20 of EM 385-1-1, use hoses and hose connections of a type to prevent shock from static electricity. Join hose lengths together by approved couplings of a material and type designed to prevent erosion and weakening of the couplings. The couplings and nozzle attachments must fit on the outside of the hose and be designed to prevent accidental disengagement.

1.4.3.3 Workers other than Blasters

Protect workers other than blasting operators, working in close proximity to abrasive blasting operations, by utilizing MSHA/NIOSH-approved half-face or full-face air purifying respirators equipped with high-efficiency particulate air (HEPA) filters, eye protection meeting or exceeding ANSI/ISEA Z87.1 and hearing protectors (ear plugs and/or ear muffs) providing at least 20 dBA reduction in noise level.
1.4.3.4 Personal Protective Equipment

Blasting operators must wear heavy canvas or leather gloves and apron or coveralls. Safety shoes must be worn to protect against foot injury. Hearing protection must be used during all blasting operations.

1.4.4 Metallizing Equipment

Submit for approval a tabulated list of equipment to be used on the job, including operating instructions.

1.4.4.1 Pressure Systems

Handle compressed gas cylinders in accordance with AWS Z49.1 and with CGA P-1. Use only special oxidation-resistant lubricants with oxygen equipment; do not use grease or oil. Install manifolding and pressure reducing regulators, flow meters, hoses, and hose connections in accordance with AWS Z49.1. Draw up tight, but do not over-tighten pressure connecting nuts. Replace any fitting if it cannot be sealed without excessive force. Use compressed air for thermal spraying or blasting operations only at pressures recommended by the equipment manufacturers. The air-line must be free of oil and moisture. Compressed air, oxygen, or fuel gas must not be used to clean clothing.

1.4.4.2 Flame-Spray Equipment

Maintain and operate flame-spray equipment according to the manufacturer's instructions. Metallizing operators must be fully trained in and familiar with specific equipment before starting an operation. Valves must be properly sealed and lubricated. Use friction lighters, pilot light, or arc ignition methods of lighting flame-spray guns. If a gun backfires, extinguish it as soon as possible. Do not attempt to reignite a gun that has backfired or blown out until the cause of the trouble has been determined. Do not hang flame-spray guns or hoses on regulators or cylinder valves. Release gas pressure from the hoses after equipment is shut down or when equipment will be left unattended. The pressure release sequence is as follows:

a. Close gun valves.
b. Close cylinder valve.
c. Open gun valves.
d. Turn regulator screw out until free.
e. Close gun valves.
f. Close tank valve or manifold valve ahead of regulator.

Do not allow oil to enter the gas mixing chambers when cleaning flame-spray guns. Use only special oxidation-resistant lubricants on valves or other parts of flame-spray guns that are in contact with oxygen or fuel gases.

1.4.4.3 Arc-Spray Equipment

Maintain and operate arc-spray equipment according to the manufacturer's instructions. Metallizing operators must be fully trained in and familiar with specific equipment before starting an operation.
1.4.5 Cleaning

1.4.5.1 Compressed Air

Perform cleaning with compressed air in accordance with Section 20.B.5 of EM 385-1-1; protect personnel as specified in 29 CFR 1910, Part 139.

1.4.5.2 Solvents

Provide ventilation where required by 29 CFR 1910, Part 146 or where the concentration of solvent vapors exceeds 10 percent of the Lower Explosive Limit (LEL). Ventilation must be in accordance with 29 CFR 1910, Part 94, paragraph (c)(5). Sources of ignition are not permitted in the vicinity of solvent cleaning if there is any indication of combustible gas or vapor present. Take special precautions when metallizing materials that have been cleaned with hydrocarbon solvents. Make specific measurements to ensure that such solvent vapors are not present during metallizing operations, especially in confined spaces. Submit Confined Space Procedures as specified in the Submittals paragraph and including requirements for toxic materials and air sampling in confined spaces, as specified below. Collect representative air samples from the breathing zone of workers involved in the cleaning process to determine the specific solvent vapor concentrations. Provide personal protective equipment where required by 29 CFR 1910, Part 146 and in accordance with 29 CFR 1910, Subpart I.

1.4.6 Other Submittals Requirements

Submit the following:

a. SDS for all products required to have them as specified in 29 CFR 1910, Part 1200 plus documentation of the safety indoctrination plan as described in Section 01.B of EM 385-1-1.

b. An Accident Prevention Plan, in accordance with the requirements of Section 01 of EM 385-1-1, including, but not limited to, each of the topic areas listed in Appendix A therein and the specified requirements. Develop each topic in a concise manner to include management and operational aspects.

c. Detailed written standard operating procedures for confined spaces in accordance with 29 CFR 1910, Part 146 and Section 6.I. of EM 385-1-1. The procedures must include:

   (1) Certificates of calibration for all testing and monitoring equipment including: type of equipment, model number, date of calibration, firm conducting calibration, and signature of individual certifying calibration.

   (2) Methods of inspection of personal protective equipment prior to use.

   (3) Work practices and other engineering controls designed to reduce airborne hazardous chemical exposures to a minimum.

   (4) Specification of the design and installation of ventilation systems which must provide adequate oxygen content and provide for the dilution of paint solvent vapor, lead, and other toxic particulates within the confined space. Include plans to evaluate
the adequacy of air flow patterns.

e. A written plan for ventilation assessments to be performed by a qualified person for all confined-space work, solvent cleaning, abrasive blasting, and metallizing operations.

g. A tabulated list of metallizing equipment to be used on the job and a listing of the type, brand name, size gradation, and supplier of each type of abrasive blast media to be used on the job.

h. A written record of physical examinations provided to all employees who may be required to wear a respirator, who may be exposed to excessive noise levels, or who may be exposed to toxic contaminants, including statements signed by the examining physician for each employee stating that the exam included the minimum requirements and that the employee is medically fit to perform the work.

i. Documentation of the Contractor's qualifications and experience. Prior to submission of other required safety and health submittal items, a statement of qualifications and experience for the Competent Person. Documentation of coating inspector qualifications and experience.

j. A working standard of the metallized coating. A 1 kg 2.2 lb unused sample of each blast media to be used on the job. And one liter quart samples of each type and batch of sealer and paint to be used on the job.

k. A 300 mm 12 inch sample of each lot and type of wire to be used on the job. Store batches or lots of metallizing wire at the project site or segregate them at the source of supply sufficiently in advance of need to allow 30 days for sampling and testing. Notify the Contracting Officer when and where the metallizing wire is available for sampling. Perform all sampling in accordance with ANSI/ASQ Z1.4. Sampling of each lot will be witnessed by a representative of the Contracting Officer unless otherwise specified or directed. Samples of metallizing wire must be clearly labeled to indicate type of coating material, lot number, date, name of manufacturer, total weight represented by lots, and contract number.

l. A test report showing the results of the required tests performed on the metallized coating test plates for each applicator and a statement that the specified requirements are met. A test report showing the results of the tests required for the metallizing wire and the arc spraying equipment qualification. A test report showing the results of the required tests performed on the Job Reference Standard (JRS) and a statement that all of the contract requirements of surface preparation, metallized coating, sealing, and painting are represented by the JRS.

m. Certificates of qualifications for each Coating Inspector. And manufacturer's certificates of compliance.
1.5 SUBMITTALS

********************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

********************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only.  When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.6 QUALITY ASSURANCE

1.6.1 Contractor Qualifications and Experience

The contractor must have a minimum of two years of documented experience in the field of thermal spray and have performed at least one similar project in the past.

1.6.2 Arc Spray Equipment Qualification

Each type and model of arc spray equipment to be used on the job must be qualified in accordance with the requirements of this subpart. Under conditions of continuous use, the equipment must be capable of keeping the actual current output, voltage, wire feed rate, atomization air pressure, and flow volume at set values and not deviate from them by more than 5 percent during a 15 minute period. The wire feed mechanism must be designed for automatic alignment. When operated continuously for 15 minutes the equipment and not sputter, pop, or stop operating. The equipment must be capable of continuous start and stop operation for a
minimum of fifteen cycles consisting of 10 seconds on and 5 seconds off, without fusing, sputtering or deposition of nodules. The applied coating must be uniform and free of blisters, cracks, loosely adherent particles, nodules, or powdery deposits. The required measurements of operating performance must be conducted and documented by the qualified Coating Inspector.

1.6.3 Metallizing Applicator Qualification

Perform the Applicator Qualification Test in the presence of the Contracting Officer unless otherwise specified or directed. Qualify each worker to apply metallized coatings on the job in accordance with the requirements of this paragraph. Use test plates to qualify applicators at the start of a job that are 305 x 305 x 9.5 mm 12 x 12 x 0.375 inch flat steel and are of the same chemical composition as the work surfaces to be coated. The cleaning method and abrasives used to prepare the test plate are the same as that to be used on the work surfaces. Measure and record the blast profile in accordance with ASTM D4417, Method C. Apply the specified coating thickness in not less than two half lapped passes applied at right angles to each other. Test the adhesion strength in accordance with ASTM D4541 using a self-aligning Type IV adhesion tester. Measure and record the adhesion strength at five randomly selected locations. The average adhesion must not be less than [6.9 kPa 1000 psi for 85-15 zinc-aluminum alloy] [11 kPa 1600 psi for aluminum] [5.2 kPa 750 psi for zinc]. Any test plate with an average adhesion value below the requirements of this paragraph or any plate with a single adhesion measurement of less than 80-percent of the specified minimum average adhesion value will be rejected. If the test fails repeat the test using a new test plate. If the test fails on the second plate the applicator will be deemed unacceptable. The specified surface profile and adhesion tests must be conducted and documented by the qualified Coating Inspector.

1.6.4 Coating Inspector Qualifications and Experience

**************************************************************************
NOTE: Specify NACE Basic for most projects, NACE Certified for large or complex projects. The specifier may add a requirement for the qualified coating inspectors to be employed by an independent 3rd party inspection firm.
**************************************************************************

Submit documentation of certification for all coating inspectors. The minimum certification requirement is a [Basic] [Certified] Inspector under the National Association of Corrosion Engineers Coating Inspector Training and Certification Program. The documentation must include the NACE inspector identification numbers, date of qualification, and expiration date. In addition to certification all coating inspectors must as a minimum have performed coating inspection on at least one previous thermal spray job or have attended an SSPC tutorial on thermal spray coating application.

1.6.5 Metallized Coating Thickness Gage Qualification

Submit documentation of certification for all coating thickness gages. Use magnetic flux-type thickness gages, as described in ASTM D7091, Method B, to make all metallized coating thickness measurements. Thickness gages used on the job must be certified by the gage manufacturer as having an accuracy of 3 percent or better.
1.6.6 Competent Person Qualifications and Experience

Utilize a qualified and competent person, as defined in Section 01 of EM 385-1-1, to develop the required safety and health submittal and to provide onsite safety and health services during the contract period. The person must be a Certified Industrial Hygienist (CIH), an Industrial Hygienist (IH), or a Certified Safety Professional (CSP) with a minimum of 3 years of demonstrated experience in similar related work. Certify that the Certified Industrial Hygienist (CIH) holds current and valid certification from the American Board of Industrial Hygiene (ABIH), that the IH is considered board eligible by written confirmation from the ABIH, or that the CSP holds current and valid certification from the American Board of Certified Safety Professionals. The CIH, IH, or CSP may utilize other qualified and competent persons, as defined in EM 385-1-1, to conduct onsite safety and health activities as long as these persons have a minimum of 3 years of demonstrated experience in similar related work and are under the direct supervision of the CIH, IH, or CSP.

1.6.7 Safety and Health Provisions

1.6.7.1 Electrical Shock Prevention

Control of electrical shock must include, but is not limited to, the following:

a. Properly maintain all cords and ground protection in good condition. Any damaged cords or grounding equipment must be immediately repaired or replaced. Cords must not be spliced.

b. Cords must be approved for wet or damp locations and be rated for hard usage or extra hard usage as specified in NFPA 70.

c. Use Ground Fault Circuit Interrupters (GFCI) in addition to appropriate overcurrent protection on all electrical outlets.

d. Switches and receptacles must have proper covers. Circuit breaker boxes must be closed.

e. Test all electrical circuit grounds and GFCI before beginning any actual work.

1.6.7.2 Respiratory Protection Program

Use appropriately certified respiratory equipment to protect the health of each employee who may be exposed to air contaminants. Select appropriate respirators from those currently approved and certified by NIOSH under the provisions of 42 CFR 84 and 29 CFR 1910, Part 134.

1.6.7.3 Eye Protection

Use helmets, handshields, faceshields, and goggles conforming to ANSI/ISEA Z87.1 and ANSI/ISEA Z89.1 to protect the eyes from infrared and ultraviolet radiation and flying particles during spraying or blasting operations. Provide helpers and adjacent operators with proper eye protection. Supplement faceshields with safety goggles.
1.6.7.4 Hearing Protection

1.6.7.5 Protective Clothing

Appropriate protective clothing is required for spray or blast operations.

1.6.7.6 Ventilation

Provide engineering controls, including local exhaust or general ventilation systems, to control toxic fumes and gases to the extent necessary. When toxic particulates are removed from a work area, use a dust collector to trap the dust and prevent contamination of the surrounding areas and the general environment. Submit a Ventilation Assessment Plan as specified in the Submittals paragraph.

1.6.7.7 Toxic Materials

Perform metallizing only with appropriate respiratory protection and adequate ventilation. When metallizing in a confined space provide either general or local ventilation. If ventilation cannot reduce exposures to safe levels, use respirators to reduce employee exposure to acceptable levels.

1.6.7.8 Air Sampling

Perform periodic air sampling as necessary to ensure that confined spaces are maintained within the limits of the acceptable entry conditions. Submit an Airborne Sampling Plan including a listing of approved equipment, equipment calibration procedures, sampling methods, sampling to be performed, and analytical procedures to be used based on the type of work to be performed and anticipated toxic contaminants to be generated. Include the name of the accredited laboratory, listed by the American Industrial Hygiene Association (AIHA), to be used to conduct the analysis of any collected air samples.

1.6.7.9 Medical Status

Prior to the start of work, and annually thereafter, submit a Medical Status Report. Medically evaluate all Contractor employees working with or around paint systems, thinners, blast media, flame- or arc-spray operations, those required to wear respiratory protective equipment, and those who will be exposed to high noise levels for the particular type of exposure they may encounter. The Report must include the employee's name, the tests performed, the name of the physician responsible for performing the tests, and a physician's statement that the employee's medical status would permit specific task performance. Maintain medical records as required by 29 CFR 1910.20. The evaluation must include:

a. Audiometric testing and evaluation of employees who will work in a noise environment with a time weighted average greater than or equal to 85 dBA.

b. Vision screening of employees who will require eye protection (employees who use full-facepiece respirators cannot wear contact lenses).
lenses).

c. Medical evaluation of employees who will be required to wear respiratory protection must include, but is not limited to, the following:

(1) Medical history including, but not limited to, alcohol use, with emphasis on liver, kidney, and pulmonary systems, and sensitivity to chemicals to be used on the job.

(2) General physical examination with emphasis on liver, kidney, and pulmonary system.

(3) Determination of the employee's physical and psychological ability to wear respiratory protective equipment and to perform job-related tasks.

(4) Determination of baseline values of biological indices for later comparison to changes associated with exposure to paint systems and thinners or blast media, which include: liver function tests to include SGOT, SGPT, GGPT, alkaline phosphates, bilirubin, complete urinalysis, EKG (employees over age 40), blood urea nitrogen (bun), serum creatinine, pulmonary function test, FVC, and FEV, chest x-ray (if medically indicated), blood lead and ZPP (for individuals where it is known there will be an exposure to materials containing lead), other criteria that may be deemed necessary by the Contractor's physician.

**************************************************************************
NOTE: 29 CFR 1926.62 Lead requires the development of a Worker Protection Plan for jobs involving removal of lead-containing coatings. It is the specifier's responsibility for determining when lead-containing paint will be removed and requiring the appropriate submittals including environmental compliance, worker protection, and waste management.
**************************************************************************

1.7 DELIVERY, STORAGE, AND HANDLING

1.7.1 Metallizing Wire

Package, ship, and store metallizing wire in conformance with ASTM D3951. Commercial packaging used for distribution directly to a using customer or subsequent redistribution is required to protect items against physical and environmental damage during shipment, handling, and storage. Clearly and durably label individual spool containers and shipping containers to indicate contract numbers, specification number, material type, lot number, net weight, date of manufacture (month and year), wire diameter, and manufacturer's and distributor's name. Deliver metallizing wire to the job in unbroken containers. Store all metallizing wire under cover from the elements.

1.7.2 Sealers and Paints

Process and package sealers and paints to ensure that within a period of one year from date of manufacture, they will not gel, liver, or thicken deleteriously, or form gas in the closed container. Package sealers and
paints, unless otherwise specified or permitted, in standard containers not larger than 20 L 5 gallons, with removable friction or lug-type covers. Label each container or separately packaged component thereof to indicate the purchaser's order number, date of manufacture, manufacturer's batch number, quantity, color, component identification and designated name, and formula or specification number of the paint together with special labeling instructions, when specified. Deliver materials to the job in unbroken containers. Store sealers and paints, that can be harmed by exposure to cold weather, in ventilated, heated shelters. Store all sealers and paints under cover from the elements and in locations free from sparks and flames.

1.8 ENVIRONMENTAL REQUIREMENTS

******************************************************************************
NOTE: Minimum and maximum application temperatures should be specified for metallized coating-sealer duplexes. The established limits for sealer and paint topcoats should be specified for the entire system. Vinyl sealers and paints are generally limited to a minimum application temperature of 2 degrees C 35 degrees F. All other sealers and topcoats have a minimum application temperature of 10 degrees C 50 degrees F. If no sealer or paint is to be applied then the minimum application temperature is unlimited, however, a practical limit of 2 degrees C 35 degrees F is recommended.
******************************************************************************

Apply metallic coatings only to surfaces that are a minimum of 3 degrees C 5 degrees F above the dew point and that are completely free of moisture as determined by sight and touch. Do not apply metallic coatings to surfaces upon which there is detectable frost or ice. Metallized coatings must not be applied when ambient and surface temperatures are below or are expected to drop below the minimum application temperature prior to completion of metallizing and curing of the sealer and paint. The minimum application temperature is equal to that specified by the manufacturer of the sealer or paint but not below 0 degrees C 32 degrees F. During periods of inclement weather characterized by extremes of humidity and temperature, metallizing may be continued by enclosing the work area and providing conditioned air, provided the proscribed ambient, surface, and dew point temperatures are maintained.

PART 2 PRODUCTS

2.1 METALLIZING WIRE

******************************************************************************
NOTE: For quick guidance to the first choice metallizing system, for steel surfaces in each of several exposure conditions frequently incurred on projects, the following will be helpful:

Normal atmospheric exposures - Systems No. 1-Z and 4-Z-A.

Severe industrial atmospheric exposures - Systems No. 2-Z and 5-Z-A.

Prolonged condensation or immersion in relatively
quiet, nonabrasive waters - System No. 5-Z-A.

Industrial atmosphere where longer service life is desired - Systems No. 3-Z and 6-Z-A.

Immersion in turbulent, ice- and debris-laden, abrasive waters - System No. 6-Z-A.

Zebra mussel control in fresh water immersion - System 6-Z-A.

Marine (salt) atmospheric exposures - System No. 7-A.

High temperature steel - System No. 8-A.

Immersion in sea water - System No. 8-A.

The following note paragraphs provide additional, useful information regarding the use of the different metallizing systems for specific applications.

For structural components that are only partially submerged, such as tainter gates, the designer should consider specifying a thicker system on the immersed surfaces and a thinner system on the atmospherically exposed surfaces. Systems using different metallizing materials should not be used for such applications. The use of multiple protective coating systems tailored to a specific structure may result in significant cost savings.

Systems No. 1-Z and 4-Z-A are considered equivalent and may be interchanged by the project specification writer. Systems No. 1-Z and 4-Z-A are intended for use on steel surfaces in normal atmospheric exposures.

Systems No. 2-Z and 5-Z-A are considered equivalent for atmospheric exposures only and may be interchanged by the project specification writer for this use. Systems No. 2-Z and 5-Z-A are intended for use on steel surfaces in normal and severe industrial atmospheres and for steel surfaces subject to prolonged periods of condensation. System 5-Z-A may also be used on steel surfaces in continuous or intermittent immersion in relatively quiet, nonabrasive fresh water.

For atmospheric exposures only, systems No. 3-Z and 6-Z-A are considered equivalent and may be interchanged by the project specification writer. Systems No. 3-Z and 6-Z-A may be used for steel surfaces exposed in normal and industrial atmospheres when a longer service life than would be provided by systems No. 2-Z or 5-Z-A is desired. System No. 6-Z-A is intended primarily for use on steel surfaces immersed in fresh waters.
System 6-Z-A is recommended for applications where a coating that prevents zebra mussel fouling is required.

System No. 7-A is recommended for use on steel surfaces in marine (salt) atmospheric exposures.

Metallizing system No. 8-A is recommended for use on high-temperature steel at temperatures up to 900 degrees C 1650 degrees F and for steel immersed in seawater. System No. 8-A may also be used for extended service on marine (salt) atmospheric steel.

**************************************************************************

Have the wire tested by a commercial laboratory or by the manufacturer of the wire. Acceptance of metallizing wire is based on the testing requirements described in AWS A5.01M/A5.01 Schedule H (chemical analysis). The tested wire must conform to the compositional requirements specified in AWS C2.25/C2.25M for [99.99 Zinc] [1100 Aluminum] [85/15 Zinc-Aluminum] wire. Submit a report of the test results.

2.2 SEALER AND PAINT

**************************************************************************

NOTE: See paragraph SPECIAL PAINTING INSTRUCTIONS for instructions not found in Section 09 97 02.

Metallizing systems will provide excellent atmospheric corrosion protection for extended periods without sealing or painting. However, painting is recommended to extend the life of the metallic coating, and in some cases, to achieve a desired appearance. Painting systems found in Section 09 97 02 may be used to seal and paint the metallized surface. It is often convenient to paint metallized surfaces with identical paint systems employed on adjacent or contacting surfaces that have not been metallized. Paint systems No. 3, 4, and 5-D are suitable for sealing atmospherically exposed portions of partially immersed items such as tainter gates. Systems 13, 14, and a modified version of system 21 where it is topcoated with SSPC Paint 34, are recommended for items only exposed to the atmosphere. Paint systems No. 14 and SSPC Paint 34 are available in safety colors. Paint system 13 provides an aluminum finish. Other coating systems found in Section 09 97 02 are not recommended.

When used for high temperature atmospheric applications system 8-A should not be sealed.

Sealing and painting of the metallized surfaces intended for immersion is generally recommended to extend the life of the metallic coating except that aluminum coatings to be immersed in salt water should not be painted. Paint systems No. 3, 4, 5-D, and 21 are recommended for immersion applications.

When used as a zebra mussel antifoulant, system
6-Z-A should not be sealed or painted.

All sealer and paint materials must conform to the requirements of Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

2.3 ABRASIVE MEDIA

Provide angular abrasive blast media capable of producing the specified surface profile listed in paragraph Abrasive Blasting. The blast media must be steel grit, garnet, iron oxide, coal slag, silicon carbide, or aluminum oxide. New steel grit must have a Rockwell C hardness of 51 or greater and conform to the requirements of SSPC AB 3 including paragraph 4.3.3.2 Steel Grit. Steel grit hardness must be Rockwell C of 51 or greater. Recycled steel grit must conform to the requirements of SSPC AB 2 and at no time contain greater than 15 per cent round or half-round particles when viewed under a 10X microscope or magnifying glass. Garnet abrasive must conform to the requirements of SSPC AB 1, Type 1, Class A. Iron oxide abrasive must be a commercial specular hematite material. Coal slag abrasive must conform to the requirements of SSPC AB 1, Type 2, Class A. Silicon carbide and aluminum oxide abrasives must be commercially pure.

PART 3 EXECUTION

3.1 PREPARATION

3.1.1 Pit, Edge, and Weld Preparation

Grind visibly rough flame-cut steel and weld metal with a disk wheel grinder or other tool to produce a smooth contour prior to abrasive blasting. Perform grinding of flame-cut edges and welds to the extent necessary to etch heat-hardened metal. Grind pits with an aspect ratio of greater than unity (as deep as they are wide) with an abrasive disk or other tool prior to blasting. Pits with sharp edges, undercut pits, and pits with an irregular horizontal or vertical orientation must also be ground smooth to the extent necessary to allow the entire surface of the pit to be blasted and coated. Grind sharp edges prior to abrasive blasting to a uniform minimum diameter of 3 mm 1/8 inch.

3.1.2 Abrasive Blasting

**************************************************************************

Note: Consideration should be given to high-pressure water washing when the substrate to be metallized has previously been exposed to a chloride environment. Chloride environments are marine exposures or bridges to which de-icing salts are applied. High-pressure washing should be performed before abrasive blasting.

A profile range is specified and is dependent on the type and thickness of metallizing to be applied.

Specify a 0.05 to 0.07 mm 2.0 to 3.0 mil profile for systems 1-Z, 4-Z-A, and 7-A; 0.06 to 0.09 mm 2.5 to 3.5 mils for systems 2-Z, 5-Z-A, and 8-A; and 0.07 to 0.10 mm 3.0 to 4.0 mils for systems 3-Z and 6-Z-A.

**************************************************************************

Solvent clean and blast all ferrous surfaces to be metallized to a white
metal grade in accordance with SSPC SP 5/NACE No. 1. The surface profile, as measured in accordance with subparagraph Blast Profile, must be between [0.05 and 0.07] [0.06 and 0.09] [0.07 and 0.10] mm [2.0 and 3.0] [2.5 and 3.5] [3.0 and 4.0] mils. Take special care to achieve the specified blast profile on welds and flame-cut edges. In some cases, it may be necessary to either grind these surfaces with a disk wheel grinder or other tool prior to blasting or to use a harder abrasive blast media. If recycled abrasives are used, the particle size distribution of the working mix must be maintained such that a consistent blast profile is obtained. Remove weld spatter not dislodged by blasting with impact or grinding tools and reblast the area to bring the surface to the required profile. Acceptable surfaces must be free of all visible contaminants including moisture, grease, oil, soot, and dust prior to receiving the first or any succeeding coat of metallizing.

3.1.3 Protection

Program cleaning, metallizing, and painting so that dust, dry spray, or other contaminants from the cleaning and painting operations do not contaminate surfaces ready for metallization or painting. Protect surfaces not intended to be metallized from the effects of cleaning and metallizing operations. Protect machinery against entry of blast abrasive and dust into working parts.

3.2 METALLIZING APPLICATION

Set up and operate metallizing equipment in the same manner as used to prepare the JRS. Validate equipment set up and operation using a bend test. The bend test is acceptable if the coating shows no cracks or exhibits only minor cracking with no lifting of the coating from the substrate. If the coating cracks and lifts from the substrate, the results of the bend test are unacceptable. Provide clean and dry compressed air to atomize the metallized coating.

3.2.1 Metallizing Application Technique

Preheat surfaces to be flame sprayed to prevent condensation of the flame on the surface to be coated. Arc spray application does not require preheating of the substrate. Surfaces to be metallized must be free of all visible contaminants including grease, oil, soot, and dust prior to receiving the first and subsequent coats of metallizing. Apply all metallizing coats in such a manner as to produce an even, continuous film of uniform thickness. Give special attention to edges, corners, crevices, seams, joints, welds, rivets, and other surface irregularities to ensure that they receive an adequate thickness of metallic coating. Operate metallizing equipment using qualified applicators in accordance with the manufacturer's recommendations. Overlap each spray pass of the sprayed metal a minimum of 40 percent on each spray pass to ensure uniform coverage. Perform manual spraying in a block pattern not exceeding 600 by 600 mm 2 by 2 feet square. Build up the specified thickness of coating in multiple layers of no fewer than 2 spray coats (overlapping at right angles). Hold the application gun at such a distance from the work surface that the metal remains plastic until impact with the surface. Do not metallize closer than 19 mm 3/4 inch to surfaces that are to be welded.

3.2.2 Metallizing Appearance

The thermal-sprayed coating prior to sealing must have a uniform appearance and not contain any of the following: blisters, cracks, chips or loosely
adhering particles, oils or other internal contaminants, pits exposing the substrate, or nodules.

3.2.3 Metallizing Thickness

Coat surfaces with the systems indicated in the metallizing schedule and/or as noted on the drawings in accordance with the following:

3.2.3.1 System No. 1-Z

Apply to a minimum average thickness of 0.15 mm 6.0 mils for the completed system and a thickness at any one spot of not less than 0.12 mm 5.0 mils.

3.2.3.2 System No. 2-Z

Apply to a minimum average thickness of 0.3 mm 12.0 mils for the completed system and a thickness at any one spot of not less than 0.25 mm 10.0 mils.

3.2.3.3 System No. 3-Z

Apply to a minimum average thickness of 0.4 mm 16.0 mils for the completed system and a thickness at any one spot of not less than 0.32 mm 13.0 mils.

3.2.3.4 System No. 4-Z-A

Apply to a minimum average thickness of 0.15 mm 6.0 mils for the completed system and a thickness at any one spot of not less than 0.12 mm 5.0 mils.

3.2.3.5 System No. 5-Z-A

Apply to a minimum average thickness of 0.3 mm 12.0 mils for the completed system and a thickness at any one spot of not less than 0.25 mm 10.0 mils.

3.2.3.6 System No. 6-Z-A

Apply to a minimum average thickness of 0.4 mm 16.0 mils for the completed system and a thickness at any one spot of not less than 0.32 mm 13.0 mils.

3.2.3.7 System No. 7-A

Apply to a minimum average thickness of 0.12 mm 5.0 mils for the completed system and a thickness at any one spot of not less than 0.10 mm 4.0 mils.

3.2.3.8 System No. 8-A

Apply to a minimum average thickness of 0.25 mm 10.0 mils and a thickness at any one spot of not less than 0.20 mm 8.0 mils.

3.2.4 Metallizing Adhesion

The minimum average adhesion of the metallized coating is [6.9 kPa 1000 psi for 85-15 zinc-aluminum alloy] [11.0 kPa 1600 psi for aluminum] [5.2 kPa 750 psi for zinc]. Any coating having an average adhesion value below the requirements of this paragraph or having any single adhesion measurement of less than 80-percent of the specified minimum average adhesion will be rejected.
3.2.5 Time Between Surface Preparation and Metallizing

Following surface preparation all surfaces approved for metallizing must receive the first coat of metallizing within 4 hours or prior to the appearance of flash rust, whichever is sooner.

3.2.6 Time Between Metallizing and Painting

**************************************************************************
NOTE: Dry time prior to immersion, if applicable, should be in accordance with the painting schedule. There is no dry time associated with thermal-spray coatings. A brief cool-down period prior to painting is necessary and may be addressed in the painting schedule by specifying a maximum temperature for surfaces to be sealed.
**************************************************************************

Within 8 hours or prior to the appearance of condensation on the receiving surfaces, whichever is sooner, seal approved sections of metallizing as metallized coatings must not be allowed to become contaminated prior to application of sealers. Apply subsequent paint coats in a timely manner consistent with the painting schedule.

3.2.7 Approved Methods of Metallizing

Metallizing methods, which employ metal wire feed stock with oxygen-fuel gas flame spray or electric-arc spray that produce coatings in conformance with requirements of this specification, are acceptable.

3.3 FIELD INSPECTION

3.3.1 Quality Control Inspection and Testing

The qualified Coating Inspector must be present during all work phases to perform and document all of the tests and inspections in paragraphs Ambient Conditions Inspection, Presurface Preparation Inspection, Surface Preparation Inspection, and Metallized Coating Inspection.

3.3.1.1 Ambient Conditions Inspection

Ambient air and surface conditions including humidity, dew point, and surface and ambient air temperature before and during all work phases. Determine humidity in accordance with ASTM E337. Conditions specified in paragraph Environmental Requirements must be met before work is initiated.

3.3.1.2 Presurface Preparation Inspection

Identify and mark all areas requiring preparation prior to abrasive blasting as specified in paragraph Pit, Edge, and Weld Preparation as well as areas requiring solvent-type cleaning. The entire work surface does not need to be inspected at one time, but rather the Coating Inspector may choose to mark up work areas with an indelible marker as the job progresses. Measure pit depth with any suitable pit depth gage. Identify irregular shaped pits visually.

3.3.1.3 Surface Preparation Inspection

Inspect all prepared surface for compliance with the specification.
Blasted surfaces must meet the requirements of SSPC SP 5/NACE No. 1. Surfaces not meeting this requirement must be reblasted and reinspected.

3.3.1.3.1 Abrasive Blast Air Cleanliness

Evaluate the compressed air cleanliness on a daily basis at the beginning of the work shift in accordance with ASTM D4285. Allow the air compressor to warm up and discharge air under normal operating conditions to allow accumulated moisture to be purged. Hold an absorbent clean white cloth in the stream of compressed air not more than 600 mm 24 inch from the point of discharge for a minimum of one minute. Check the air as near as possible to the point of use and always after the position of the in-line oil and water separators. Inspect the cloth for moisture or staining. Do not use the compressed air source if there is any oil or water contamination present.

3.3.1.3.2 Recycled Blast Media Cleanliness and Shape

Evaluate the cleanliness of blast media on a daily basis at the beginning of the work shift. A clear glass container is half filled with new or recycled abrasive and distilled or deionized water is added to fill the container. The resulting slurry mixture is stirred or shaken and allowed to settle. The water is then examined for the presence of an oil sheen. If a sheen is present, the media must not be used and the source of contamination must be identified and corrected. Inspect recycled steel grit blast media at minimum once for every four hours of blasting for compliance with paragraph Abrasive Media requirements for number of round and half-round particles. Recycled steel grit working mixtures with greater than 15 percent round or half-round particles must be disposed or reconstituted by the addition of a suitable quantity of new steel grit abrasive to the working mixture. Retest the particle shape of the reconstituted steel grit prior to the commencement of blasting.

3.3.1.3.3 Blast Profile

Measure the surface profile depth in accordance with ASTM D4417, Method C. The mean value of three profile measurements taken within a 103 cm 2 16 in 2 area constitutes a spot measurement. Conduct a minimum number of 3 spot measurements at random per unit area per 45 m 2 500 ft 2. The average surface profile for each 45 m 2 500 ft 2 area must conform to the requirements of paragraph Abrasive Blasting. Perform spot measurements on weldments and flame-cut edges. Perform at least one spot measurement for each 15 m 2 50 ft 2 of weld and at least one spot measurement for each 3 m 2 10 ft 2 of flame-cut edge. Each spot measurement on welds or flame-cut edges must conform to the requirements of paragraph Abrasive Blasting. Surfaces not meeting the profile requirement must be reblasted and reinspected.

3.3.1.3.4 Contaminants on Prepared Surface

Visually inspect abrasive blasted surfaces that have been swept, blown down, or vacuum cleaned to remove residual debris and dust for grease, oil, and dust. Use any suitable test to enhance the visual inspection for grease and oil including water break, solvent evaporation, and heat tests. Inspect for grease and oil at least once per workday or every four hours of blasting. Inspect the cleaned surfaces for residual dust using the tape test. The tape test is performed by adhering a clear piece of tape to the surface. The removed tape is inspected for adherent particles. Perform
the tape test once per $45 \text{ m}^2$ $500 \text{ ft}^2$ of prepared surface.

3.3.1.4 Metallized Coating Inspection

3.3.1.4.1 Equipment Setup Validation Bend Test

Record and confirm that the operating parameters are the same as were used to prepare the JRS each day or every time the thermal spray equipment is to be used. The thermal spray applicator must then apply the coating to prepared test panels and conduct the bend test. The bend test is a qualitative test used to confirm that the equipment is in proper working condition. The test consists of bending coated steel panels around a cylindrical mandrel and examining the coating for cracking. Record the results of the bend test and label and save the test panels. The test panels consist of five cold rolled steel panels measuring $50 \times 150 \times 1.25$ mm $2 \times 6 \times 0.050$ inch. The panels are cleaned, blasted, and coated using the identical surface preparation procedures and spray parameters as used to prepare the working surface. The coating is applied in a cross-hatch pattern using the same number of overlapping spray passes as used to prepare the JRS. The coating thickness is measured to confirm that the coating thickness is within the specified range. Test panels are bent 180 degrees around a steel mandrel of a specified diameter. Thermal spray coating systems 1-Z, 2-Z, 4-Z-A, 5-Z-A, 7-A, and 8-A are tested using a 12.5 mm 0.5 inch diameter mandrel. Systems 3-Z and 6-Z-A are tested using a 15.6 mm 0.625 inch diameter mandrel. Use a pneumatic or manual mechanical bend test apparatus to bend the test panels. Visually examine the test panels without magnification. If the bend test fails, corrective action must be taken and the bend test repeated until acceptable results are achieved. Successful completion of the bend test is required before any metallizing is applied to the working surface.

3.3.1.4.2 Atomization Air Cleanliness

Test compressed air used for atomizing metallized coatings using the method described in paragraph Abrasive Blast Air Cleanliness.

3.3.1.4.3 Metallized Coating Appearance

Visually inspect the appearance of the applied metallized coating prior to sealing for compliance with the requirements of paragraph Metallized Coating Appearance. Report areas of defective coating to the Contracting Officer and document, and mark them for repair.

3.3.1.4.4 Metallized Coating Thickness

Evaluate the thickness of the thermal spray coating for compliance with paragraph Metallizing Thickness. Make measurements using an approved and calibrated magnetic film thickness gage. Calibrate the gage on metal substantially the same in composition and surface preparation to that being coated and having a similar thickness or a minimum thickness of 6 mm 1/4 inch. Use calibration thickness standards (shims) of a metallic composition and a thickness to that of the material being sprayed. Follow calibration instructions and obtain thickness standards from the manufacturer or supplier of the gage. Make thickness readings either in a straight line with individual readings taken at 25 mm 1 inch intervals or spaced randomly within a 25 cm$^2$ 4 in$^2$ area as appropriate for the configuration of the surface being inspected. The average of five readings comprises one spot measurement. Make a minimum of 5 randomly spaced spot measurements per $9 \text{ m}^2$ $100 \text{ ft}^2$. For each $9 \text{ m}^2$ $100 \text{ ft}^2$ area
evaluated the minimum average and minimum spot thickness requirements must be met. Make areas of deficient coating thickness for correction before sealing begins. Document the results of the thickness measurements.

3.3.1.4.5 Metallized Coating Adhesion

Evaluate the adhesion of the thermal spray coating for compliance with paragraph Metallizing Adhesion in accordance with ASTM D4541 using a self-aligning type IV tester described in Annex A4 of the specification. Perform a total of three randomly spaced adhesion tests for each 45 m² 500 ft² of work area. Where deficiencies are noted, additional testing may be performed to help delineate the extent of area with poor adhesion. Repair areas of deficient adhesion by removing and reapplying the metallized coating. Repair areas damaged by adhesion testing by abrasive blasting and reapplication of the metallic coating. As an alternative to testing to the failure point, the tests can be interrupted when the minimum specified adhesion value is achieved. This method precludes the need to repair coatings damaged by the test. The adherent pull stubs can then be removed by heating to soften the glue or by firmly striking the side of the stub. Use a strong (minimum 20.7 MPa 3000 psi) adhesive with a rapid cure (maximum 1-hour at 21 degrees C 70 degrees F) to adhere the pull stubs to the metallized coating. Some methyl methacrylate adhesives are known to achieve a 27.6 MPa 4000 psi bond strength in 1-hour.

3.3.2 Quality Assurance Hold Point Evaluations

The Coating Inspector must perform and document the Quality Assurance Hold Point evaluations and report the results to the Contracting Officer. The Contracting Officer will have sole authority to approve progression from one work phase to the next. Work phases are delineated by the Inspection Hold Points.

3.3.2.1 Surface Preparation Quality Assurance Hold Point Evaluation

At the completion of surface preparation on a given work area and prior to metallization, submit to the Contracting Officer the completed documentation resulting from the inspections performed in paragraphs Ambient Conditions Inspection, Presurface Preparation Inspection, Surface Preparation Inspection, Abrasive Blast Air Cleanliness Inspection, Blast Media Cleanliness and Shape, Blast Profile, and Contaminants on Prepared Surface.

3.3.2.2 Metallized Coating Quality Assurance Hold Point Evaluation

At the completion of metallized coating application on a given work area and prior to sealing, submit to the Contracting Officer the completed documentation resulting from the inspections performed in paragraphs Ambient Conditions Inspection, Atomization Air Cleanliness, Metallized Coating Appearance, Metallized Coating Thickness, and Metallized Coating Adhesion.

3.3.2.3 Sealed System Quality Assurance Hold Point Evaluation

At the completion of sealer and paint coat application on a given work area and prior to the placement of the coated item in service, submit to the Contracting Officer the completed documentation resulting from all inspections and tests including those specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.
3.4 METALLIZING SYSTEMS TO BE APPLIED

Apply the required metallizing systems as shown on the drawings.

3.5 SPECIAL PAINTING INSTRUCTIONS

Note: Thinning instructions in the painting specification should be modified as follows: the first coat of systems No. 3, 4, 5-D, and 21 must be thinned with 25 percent by volume of the recommended thinner. Subsequent paint coats must be thinned in accordance with the standard instructions found in Section 09 97 02. The first coat of paint systems No. 13 and 14 should not receive extra thinning. It is not required.

In geographic regions where air pollution regulations prohibit the use of impacted immersion paint systems No. 3, 4, and 5-D, for architectural painting, paint system No. 21 should be substituted for immersion applications. If system 21 does not comply with air pollution regulation then no sealer should be used. Where systems 13 and 14 do not comply with VOC regulations then do not specify a sealer system for atmospheric service.

Perform sealing and painting in accordance with the painting schedule and with the requirements of Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES. The clean, dry metallized surface is the receiving surface for the specified paint systems.

3.6 METALLIZING SYSTEMS AND METALLIZING SCHEDULE

Note: By inserting specific item component names or surface description in the blank spaces provided in the tabulation, the metallizing to be done on a project can be shown in schedule form. Alternately, the metallizing system number can be shown on the applicable drawings.

The number assigned to each metallizing system in the listing should not be changed locally, even though on specific projects some systems are omitted. If other systems are added locally, they should be assigned numbers other than those used in this guide.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for polyamide epoxy coating system for interior of newly constructed Navy and Air force water tanks, potable and non-potable, where shop applied coatings are not being considered.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: This guide specification should be used for all new welded steel water tanks. For maintenance coating design, see notes herein.

NOTE: This specification should be edited by an SSPC certified Protective Coatings Specialist (PCS) that has five or more years of experience preparing coating specifications.

The designer should not alter the products and processes specified herein without thorough knowledge of the need for the changes and the
implications of those changes.

**************************************************************************

NOTE: This guide specification should be used with Section 09 97 13.27 HIGH PERFORMANCE COATING FOR STEEL STRUCTURES (Navy & AF) when complete interior and exterior coating systems are required.

**************************************************************************

NOTE: The metric standard for measuring coating thickness is microns (25.4 microns=1 mil - use nominal 25 microns=1 mil).

**************************************************************************

NOTE: The specified system is a 3 Coat, thin film system, which is compliant with EPA VOC regulations as of June 2000.
