Tested the individual prestressing tendons selected by the Contracting Officer to verify the sustentation of prestress forces by being subjected to a force equal to the design force between 7 and 14 days after the complete tensioning of all tendons. A tendon which sustains the applied force without being unseated is considered to be satisfactory. Test no more than 10 percent of all tendons unless a tested tendon is unable to sustain the required test force. If a tested tendon is unable to sustain the required test force, retest all tendons and retension if required to the initial prestress. Retest retensioned tendons after 7 days at no additional cost to the Government.

3.1.5.6 Grouting

Grout prestressing assemblies immediately after complete tensioning of prestressing tendons and verification of prestressing forces. Provide grout in conformance with the requirements specified in paragraph GROUT. Provide grouting equipment capable of continuous mechanical mixing and placing of grout, measuring grout mix volume and measuring volume of grout placed within 2500 cubic mm 0.1 cubic foot. Provide a positive displacement type grout pump with the capacity to develop a pressure of 1.38 MPa 200 psi. Provide stand-by water flushing equipment for flushing out ducts partially grouted and stopped due to blockage or equipment breakdown. Flush ducts for prestressing tendons free of water, dirt or any other foreign substance and blow out with compressed air until no water
comes through just prior to grouting. Pressure grout ducts at a minimum pressure of 690 kPa 100 psi immediately after post-tensioning has been completed. Continue grouting until all air within the duct has been displaced with grout. Continue the grouting of a system of prestressing tendons and ducts once started until that system has been completely grouted. Compile and track grout placement records.

3.1.6 Appurtenant Items

Attach side seal plates, sill beams, stop beams and other items to be embedded in second-pour concrete to anchors, align, level and rigidly block to prevent displacement during the placement of concrete. Align side seal plates in planes normal to the axis of rotation of the gates and check before embedding in concrete to ensure they do not vary more than 2.5 mm 3/32-inch from the established alignment in an arc length of 3.6 m 12 feet. Grind welded field splices in exposed metals smooth to assure proper sealing. Provide continuous metal supports for rubber seals that are free of waves, winds and distortions. Install rubber seals after the [skinplate water-tightness test and] gate painting operations have been completed. Adjust seals after installation so that they are slightly compressed in the closed, unwatered condition to prevent excessive depression and wear in the closed, watered condition. [Install the heating system for seals as shown on the drawings and specified in Section [_____] CREST-GATE-SEAL.]

3.1.7 Second-Pour, High-Strength Concrete [and Concrete Grout] Fills

**************************************************************************
NOTE: The zones and strengths of high-strength concrete and concrete grout should be shown on the drawings.
**************************************************************************

Execute the second-pour, high-strength concrete fills for the sections of piers adjacent to the face of trunnion girders [and the space between the base of trunnion yokes and trunnion girders] [and the concrete grout fills between the yokes of trunnion yokes and the piers] as shown on the drawings and as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.1.8 Painting

Paint exposed parts of gates and appurtenances, except machined surfaces, stainless steel surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.9 Seal Assemblies

Install rubber seal assemblies after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Fasten rubber seals securely to metal retainers. Before operating the gates, apply a suitable lubricant to the rubber seal rubbing plates to protect the rubber.

3.2 FIELD QUALITY CONTROL

Non-Destructive testing of field welds are required to meet the same quality control requirements of shop-welded components.
3.3 SYSTEM START-UP

3.3.1 Trial Operations

Perform gate trial operations after the complete installation of gates and appurtenant items. Perform trial operations and receive approval prior to placing the second-pour, high-strength concrete fills around embedded appurtenant items [and between trunnion yokes and trunnion girders and prior to the complete tensioning of the prestressing tendons anchoring the trunnion yokes]. Adjust hoist lifting cables and lubricate trunnion bushings through the permanent lubrication fittings with an approved, extreme-pressure lubricant before operating the gates. Adjust guide shoes, guide rollers, and bulb seals as necessary. Ensure gates move smoothly and without binding or lateral sway when raised and lowered through the complete range of travel. Correct defects disclosed from trial operations and repeat trial operations at no cost to the Government. Repeat trial operations after complete tensioning and grouting of all prestressing assemblies. Refer to Section 35 01 70.13 WIRE ROPE FOR GATE OPERATING DEVICES for wire rope tensioning procedures.

3.3.2 Acceptance Trial Operation

After completion of the gate installation, conduct an examination of the gates in the presence of the Contracting Officer for final acceptance. First examine the gates to determine whether or not the workmanship conforms to the specification requirements. Operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer’s satisfaction that all parts are functioning properly. Adjust guide shoes, guide rollers, and bulb seals as necessary. The workmanship in the fabrication and installation of gates is the result in a condition where when the gates are in the closed position watertight barrier is formed across the opening. The contractor is required to make all repairs or replacements to correct defects, as determined by the Contracting Officer, at no cost to the Government. Repeat the trial operation after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.4 PROTECTION

Protect finished work in conformance with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of vertical lift slide gate, vertical lift wheel gate, and vertical lift tractor gate and appurtenant items. This section was originally developed for USACE Civil Works projects.

Certain components of a Vertical Lift Gate may be considered fracture critical. These components may include the gudgeon hood, gudgeon anchorage, diagonals, as well as others. AWS D1.1 does not include provisions for fracture critical welding. The Designer should consider using guide specification SECTION 05 59 20 FABRICATION OF HYDRAULIC STEEL STRUCTURES for specifying fracture-critical welding utilizing a Fracture Control Plan. A Fracture Control Plan and the use of appropriate materials and welding is required by ER 1110-2-8157, "Responsibility for Hydraulic Steel Structures."

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
PART 1   GENERAL

1.1 UNIT PRICES

**************************************************************************
NOTE:  If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (LUMP SUM PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.

Select Alternate 1 (one pay item) or Alternate 2 (two pay items).  Delete all paragraphs of Alternate not selected.
**************************************************************************

1.1.1 Furnish & Install Vertical Lift Side Gate & Appurtenances

**************************************************************************
NOTE:   Alternate 1, Vertical Lift Slide Gate.
**************************************************************************

1.1.1.1 Payment

Payment is to be made for costs associated with furnishing and installing vertical lift slide gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift slide gate and appurtenant items including gate leaf, stem, stem guides, leaf nuts, leaf nut wrench, seal collars, frame, [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate] for supporting operating machinery, [lock assembly,] [leaf springs,] [air vent liner,] and other appurtenances necessary for complete installation.

1.1.1.2 Unit of Measure

Unit of measure:  lump sum.

1.1.2 Furnish Vertical Lift Side Gate & Appurtenances

**************************************************************************
NOTE:  Alternate 2, Vertical Lift Slide Gate.
**************************************************************************

1.1.2.1 Payment

Payment is to be made for costs associated with furnishing vertical lift slide gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery, of vertical lift slide gate and appurtenant items including gate leaf, stem, stem guides, leaf nuts, leaf nut wrench, seal collars, frame, [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate] for supporting operating machinery, [lock assembly,] [leaf springs,] [air vent liner,] and other appurtenances necessary for complete installation.

1.1.2.2 Unit of Measure

Unit of Measure:  lump sum.
1.1.3 Install Vertical Lift Side Gate & Appurtenances

******************************************************************************
** NOTE: Alternate 2, Vertical Lift Slide Gate. **
******************************************************************************

1.1.3.1 Payment

Payment is to be made for costs associated with installing vertical lift slide gate and appurtenant items, which includes full compensation for the complete installation and testing of vertical lift slide gate and appurtenant items.

1.1.3.2 Unit of Measure

Unit of measure: lump sum.

1.1.4 Furnish & Install Vertical Lift Wheel Gate & Appurtenances

******************************************************************************
** NOTE: Alternate 1, Vertical Lift Wheel Gate. **
******************************************************************************

1.1.4.1 Payment

Payment is to be made for costs associated with furnishing and installing vertical lift wheel gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift wheel gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.4.2 Unit of Measure

Unit of measure: lump sum.

1.1.5 Furnish Vertical Lift Wheel Gate & Appurtenances

******************************************************************************
** NOTE: Alternate 2, Vertical Lift Wheel Gate. **
******************************************************************************

1.1.5.1 Payment

Payment is to be made for costs associated with furnishing vertical lift wheel gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of vertical lift wheel gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.5.2 Unit of Measure

Unit of Measure: lump sum.
1.1.6 Install Vertical Lift Wheel Gate & Appurtenances

**************************************************************************
** NOTE: Alternate 2, Vertical Lift Wheel Gate. **
**************************************************************************

1.1.6.1 Payment

Payment is to be made for costs associated with installing vertical lift wheel gate and appurtenant items, which includes full compensation for the complete installation and testing of vertical lift wheel gate and appurtenant items.

1.1.6.2 Unit of Measure

Unit of measure: lump sum.

1.1.7 Furnish & Install Vertical Lift Tractor Gate & Appurtenances

**************************************************************************
** NOTE: Alternate 1, Vertical Lift Tractor Gate. **
**************************************************************************

1.1.7.1 Payment

Payment is to be made for costs associated with furnishing and installing vertical lift tractor gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift tractor gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.7.2 Unit of Measure

Unit of measure: lump sum.

1.1.8 Furnish Vertical Lift Tractor Gate & Appurtenances

**************************************************************************
** NOTE: Alternate 2, Vertical Lift Tractor Gate. **
**************************************************************************

1.1.8.1 Payment

Payment is to be made for costs associated with furnishing vertical lift tractor gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of vertical lift tractor gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.8.2 Unit of Measure

Unit of Measure: lump sum.

1.1.9 Install Vertical Lift Tractor Gate & Appurtenances
NOTE: Alternate 2, Vertical Lift Tractor Gate.

1.1.9.1 Payment

Payment is to be made for costs associated with installing vertical lift tractor gate and appurtenant items, which includes full compensation for the complete installation and testing of vertical lift tractor gate and appurtenant items.

1.1.9.2 Unit of Measure

Unit of measure: lump sum.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN WELDING SOCIETY (AWS)

AWS D1.1/D1.1M (2020; Errata 1 2021) Structural Welding Code - Steel

AWS D1.2/D1.2M (2014; Errata 1 2014; Errata 2 2020) Structural Welding Code - Aluminum

ASTM INTERNATIONAL (ASTM)

ASTM A53/A53M (2022) Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated,
Welded and Seamless

ASTM A240/A240M (2023a) Standard Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications

ASTM A320/A320M (2022a) Standard Specification for Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service

ASTM A572/A572M (2021; E 2021) Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel

ASTM A709/A709M (2021) Standard Specification for Structural Steel for Bridges

ASTM A992/A992M (2022) Standard Specification for Structural Steel Shapes

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval.[for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders and Welding Operators

Ensure all qualifications of welders and welding operators conforms to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.5 DELIVERY, STORAGE, AND HANDLING

Perform delivery, handling, and storage of materials and fabricated items in accordance with the requirements specified [herein and] in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Unload material and equipment delivered to the site as approved by the Contracting Officer. Verify the condition and quantity of the items delivered and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.5.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Do not distort rubber seals during handling.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Detail Drawings

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.
2.1.1.1 Fabrication Drawings

Ensure fabrication drawings show complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.1.1.2 Shop Assembly Drawings

Ensure shop assembly drawings provide details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.1.1.3 Delivery Drawings

Ensure delivery drawings provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.1.1.4 Field Installation Drawings

**************************************************************************
NOTE: If zinc filler is not specified, delete requirements for procedures and equipment for it.
**************************************************************************

Ensure field installation drawings provide a detailed description of the field installation procedures. Include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for prestressing gate leaf diagonals, to include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler; procedures and equipment used for heating and placing of the zinc filler; and methods for installing other appurtenant items.

2.2 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract. Ensure materials orders, materials lists and materials shipping bills conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Submit approved samples prior to use of the represented materials or items in the work. Submit samples of standard and shop fabricated items that are both full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded.

2.2.1 Metals

**************************************************************************
NOTE: Consider the use of ASTM A709/A709M steel for fabrication of all steel components. A709 material is available in 36 and 50 ksi and provides improved toughness and maximum yield to tensile ratios to ensure ductile performance.
**************************************************************************

Ensure structural steel, steel forgings, steel castings, stainless steel, bronze, aluminum bronze and other metal materials used for fabrication
conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1.1 Structural Steel

Conform to [ASTM A36/A36M][ASTM A572/A572M][ASTM A992/A992M][ASTM A709/A709M ].

2.2.1.2 Structural Steel Plates

Conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50].

2.2.1.3 Steel Pipe

Conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.2.1.4 Stainless Steel Bars and Shapes

Conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.2.1.5 Stainless Steel Plate, Sheet, and Strip

Conform to ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,]. Finish plates by hot-rolling, annealing or heat-treating, and blast-cleaning or pickling. Provide No. 1 sheet and strip finish.

2.2.2 Rubber Seals

Provide rubber seals that are [fluorocarbon (Teflon) clad rubber seals of the mold type only, and] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers.

2.2.2.1 Physical Characteristics

Ensure seals exhibit physical characteristics that meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>20.7 MPa3,000 psi (min.)</td>

<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

Perform the "Water Absorption" test using distilled water. Blot the washed specimen dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees for 22 plus or minus 1/4 hour. Remove the specimen and allow to air cool to room temperature, and weigh the specimen. Record the weight the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). Ensure the immersion temperature is 70 degrees C plus or minus 1 degree and the immersion duration is at least 166 hours.

#### 2.2.2.2 Fabrication of Rubber Seals

Provide rubber seals with a fluorocarbon film that is vulcanized and bonded to the sealing surface of the bulb. Ensure the film thickness is [0.762] [1.524] mm [0.030] [0.060] inch and is Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and has the following physical properties:

- **Tensile strength**: 13.8 MPa [2,000 psi] (min.)
- **Elongation**: 250 percent (min.)

Flush the outside surface of the bonded film with the surface of the rubber seal and ensure it is free of adhering or bonded rubber. Mold strips and corner seals in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, mask the fluorocarbon film during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

#### 2.3 MANUFACTURED UNITS

Ensure that bolts, nuts, washers, screws and other manufactured units conform with the requirements as shown and as specified and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

##### 2.3.1 Bolts, Nuts and Washers

Ensure high-strength bolts, nuts, and washers conform to ASTM F3125/F3125M, Grade A325, [hot-dip galvanized]. Ensure bolts, nuts, studs, stud bolts and bolting materials other than high-strength conform to ASTM A307, Grade A, [hot-dip galvanized] [_____] or ASTM A320/A320M, [Ferritic Steel, Grade [_____] [Austenitic Steel, Grade [_____] , Class [_____] ]. Provide bolts 13 mm 1/2 inch and larger with hexagon heads. Ensure the finished shank of bolts is long enough to provide full bearing. Ensure washers for use with bolts conform to the requirements specified in the applicable specification for bolts.
2.3.2 Screws

Provide screws of the type indicated.

2.3.3 Sheaves

Provide sheaves of cast steel conforming to ASTM A27/A27M, sized for the wire rope used.

2.3.4 Wire Rope

Provide wire rope conforming to FS RR-W-410, Type [____], Class [____], Construction [____], [wire size,] [strand seizing] as indicated.

2.3.5 Wheels

Provide wheels that are short hub or long hub, rigid type, heavy duty steel casters fabricated with steel castings conforming to ASTM A148/A148M. Provide wheels of the size and load capacity shown. Provide wheel with lubrication fittings, roller bearings, and removable axle or shaft. Machine-finish wheel treads as shown. Unless otherwise specified or shown, provide stainless steel shafts for wheels conforming to ASTM A276/A276M, UNS S 30400.

2.4 FABRICATION

2.4.1 Structural Fabrication

Ensure structural fabrication conforms to the requirements as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Provide dimensional tolerances as specified and as shown. Splice only at locations where shown. Bore pin holes in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening are to be straightened by methods which will not damage the material. Press-fit bushings with supporting components. Provide bolt connections, lugs, clips, or other pick-up assembly devices for components as shown and required for proper assembly and installation. Make provisions for the installation of [cathodic protection system devices ]and other appurtenances as required.

2.4.2 Welding

****************************************************************************************************************************

NOTE: List applicable welds requiring radiographic examination.

NOTE: Specification Section 05 50 14 STRUCTURAL METAL FABRICATIONS includes welds subjected to Ultrasonic Testing (UT), Dye Penetrant Testing (PT) and Magnetic Testing (MT). AWS D1.1 does not specify nondestructive testing of any completed weld. Designer must take this into account and specify any Nondestructive Testing (NDT) requirements as well as specifying which welds are to be subjected to nondestructive testing.

The designer is to consider whether any components included are likely to be fracture critical.
Fracture critical components should be identified as requiring fabrication in accordance with a Fracture Control Plan.

Ensure welding conforms to the requirements of AWS D1.1/D1.1M, AWS D1.2/D1.2M, the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Provide welds of the types shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [____]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests. All components are to be stress-relief heat treated after welding where shown. Perform stress-relieving of components prior to the attachment of miscellaneous appurtenances. Submit a Stress Relieving Plan for approval which follows the minimum requirements for thermal stress relief in accordance with AWS D1.1. Stress-relief heat treat all components after welding where shown. Perform stress-relieving of components prior to the attachment of miscellaneous appurtenances. Refer to Specification SECTION 05 50 14 STRUCTURAL METAL FABRICATIONS for nondestructive testing requirements. Submit a Fracture Control Plan (FCP) for fracture critical components.

2.4.3 Bolted Connections

Ensure bolted connections conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.4 Machine Work

Ensure machine work conforms to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.5 Miscellaneous Provisions

Ensure miscellaneous provisions for fabrication conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.6 Operating Machinery

NOTE: Specify appropriate section for vertical lift gate operating machinery.

Conform operating machinery to Section [____].

2.4.7 Slide Gate Leaf

Provide slide gate leaves constructed of single-component structural fabrication. Shop fabricate slide gates and provide complete with gate stem, stem guides, leaf nut, leaf nut spanner wrench, bar seals, seal collars, [lock assembly,] [leaf springs,] and other appurtenant items as required for installation. Ensure that surfaces of leaf framing elements to which skin plates are to be welded do not vary from a true plane by more
than 2 mm 1/16 inch to provide uniform bearing. Ensure the outside surfaces of skin plates welded to framing elements do not vary from a true plane by more than 2 mm 1/16 inch. Locate splices in skin plates only where shown. Ensure the overall width and height of the fabricated gate leaf does not vary from the respective dimensions shown by more than 2 mm 1/16 inch. Stress-relieve gate leaves prior to the attachment of bar seals. Machine surfaces where bar seals are attached accurately to provide uniform bearing for the full contact dimensions. Butt the top and side bar seals together firmly at the corners. Ensure the ends of side bar seals are flush with the bottom seating surface of the gate leaf. Perform final machining of bar seals after they are attached to the gate leaf. Machine the bottom seat of the gate leaf for a tight fit with the gate frame sill.

2.4.8 Slide Gate Frame and Bonnet

**************************************************************************
NOTE: Edit this paragraph to fit the project.
**************************************************************************

Shop fabricate the slide gate frame and bonnet. Ensure the guiding and seal surfaces of slide gate frame and bonnet are in a true vertical plane and are machined finished. Unmachined surfaces exposed to water flow are required to match at joints between component parts, and are not depart from true planes shown by more than 2 mm 1/16 inch and are to be free of offsets or irregularities greater than 2 mm 1/16 inch. Grind allowable offsets or irregularities less than 2 mm 1/16 inch to a bevel of not greater than one on twenty-four. Machine the bottom seat of the gate leaf for a tight fit with the gate frame sill. Ensure the gate frame and bonnet are stress relieved prior to the attachment of bar seals. Accurately machine surfaces where bar seals are attached to provide uniform bearing for the full contact dimensions. Butt top, side, and invert bar seals firmly together at the corners. Perform final machining of bar seals after they are attached to the gate frame and bonnet. Pour babbit in the gate frame sill and peen before machining the frame. When machining the gate frame sill, ensure the tool travel is parallel to the long dimension of the babbit.

2.4.9 Slide Gate Bonnet Cover, Pedestal and Base Plate

**************************************************************************
NOTE: Edit this paragraph to fit the project.
**************************************************************************

Accurately machine the flanges of the bonnet cover, pedestal and base plate for the supporting the operating machinery for the slide gate and drill to match mating flanges and provide the required true alignment. Coat unmachined oil-contacting surfaces of bonnet cover and pedestal with alkyd resin as specified for the unmachined oil-contacting surfaces of hydraulic cylinder heads. Base plate dimensions may be altered to fit the operating machinery furnished, provided the basic configuration, plate thickness, and number and sizes of fasteners are equal to that shown and the altered dimensions are approved.

2.4.10 Wheel Gate Leaf

**************************************************************************
NOTE: Delete first sentence if not applicable for the project.
**************************************************************************
Provide wheel gate leaves of single-component structural fabrication. Ensure wheel gate leaves are shop fabricated and are provided complete with lifting brackets, wheel assemblies, seal assemblies, [guide shoes,] [plates,] [dogging brackets,] and other appurtenant items as required for installation and proper operation. Check the design center of gravity of the gate leaf prior to fabrication and notify the Contracting Officer if an unreasonable amount of counter-weighting is required to attain the center of gravity as designed. Ensure surfaces of leaf framing elements to which skin plates are to be welded do not vary from a true plane by more than 2 mm 1/16 inch to provide uniform bearing. Ensure the outside surfaces of skin plates welded to framing elements do not vary from a true plane by more than 2 mm 1/16 inch. Locate splices in skin plates only where shown. Ensure the overall width and height of the fabricated gate leaf does not vary from the respective dimensions shown by more than 2 mm 1/16 inch. Stress relieve the gate leaves prior to the attachment of seal assemblies and other appurtenant items.

2.4.10.1 Wheel Gate Leaf Lifting Brackets

Coordinate the fabrication details of wheel gate leaf lifting brackets closely with the details of the [lifting sling] [lifting hoist] [engaging and disengaging mechanism of the lifting beam assembly] to assure proper operation.

2.4.10.2 Wheel Gate Leaf Wheel Assembly

Provide wheel assemblies from a manufacturer regularly engaged in the manufacture of such products. Provide each wheel assembly complete with wheel, shaft, roller bearing, lock washer, lock nut, bearing cover, seal housing, grease seal, seal retainer, shaft lock plate, lubrication fittings, fasteners, and other accessories as required for complete and proper installation. Provide wheel diameter and thickness shown without variation. Only change the dimensions and tolerances of other components as required for compatibility with the manufacturer's product.

2.4.10.3 Wheel Gate Leaf Seal Assembly

Provide seal assemblies consisting of rubber seals, stainless steel retainer and spacer bars, and fasteners. Provide rubber seals that are continuous over the full length. Accurately fit seals accurately fit and drill for proper installation. Drill bolt holes in the rubber seals by using prepared templates or the retainer bars as templates. Fully mold splices in seals to develop a minimum tensile strength of 50 percent of the unspliced seal, and place them only at locations shown. Vulcanizing of splices is only allowed to be done in the shop. Locate the vulcanized splices between molded corners and straight lengths as close to the corners as practicable. Place splices on a 45 degree bevel related to the "thickness" of the seal. Ensure the surfaces of finished splices are smooth and free of irregularities. Field splice stainless steel retainer bars only where shown and machine finish them after splicing.

2.4.11 Wheel Gate Frame and Guides

**************************************************************************
NOTE: Delete last sentence if not applicable to the project.
**************************************************************************
Ensure the exposed unmachined surfaces of wheel gate frame and guides match at joints between component parts, do not depart from true planes shown by more than 2 mm 1/16 inch, and are free of offsets or irregularities greater than 2 mm 1/16 inch. Grind allowable offsets or irregularities less than 2 mm 1/16 inch to a bevel of not greater than one on twenty-four. Accurately machine surfaces of frames and guides to receive seal bars and wheel track bars to provide uniform bearing for the full contact dimensions. Butt seal bars firmly together at corners. Machine bearing surfaces of wheel track bars and sealing surfaces of seal bars to the tolerances shown to provide uniform bearing and sealing at all points of contact. Perform the final machining of seal bars and wheel track bars after they are attached to the gate frame and guides. Locate the anchor bolt holes for gate frame and guides accurately using Government-furnished templates which provide the installation location of anchor bolts.

2.4.12 Wheel Gate Lifting Sling

Provide wheel gate lifting sling made of wire rope with thimble and socket fittings attached to the wire rope in a manner that develops the full strength of the wire rope.

2.4.13 Wheel Gate Lifting Beam Assembly

Fabricate the wheel gate lifting beam assembly as shown for automatic engaging and disengaging with the lifting brackets of the gate leaf. Stress relieve the lifting beam prior to final machining and attachment of the roller and counterweight assemblies.

2.4.14 Tractor Gate Leaf

*******************************************************************************
NOTE: Delete first sentence if not applicable for the project.
*******************************************************************************

Fabricate the tractor gate leaf as a single-component structure. Shop fabricate the tractor gate leaf and provide complete with roller train assemblies, lifting brackets, seal assemblies, guide [shoes,] [plates,] [dogging brackets,] [pier guides,] [pier ties,] and other appurtenant items as required for installation and proper operation. Check the design center of gravity of the gate leaf prior to fabrication and give notification if an unreasonable amount of counterweighting is required to attain the center of gravity as designed. Ensure the surfaces of leaf framing elements to which skin plates are to be welded do not vary from a true plane by more than 2 mm 1/16 inch to provide uniform bearing. Ensure the outside surfaces of skin plates welded to framing elements do not vary from a true plane by more than 2 mm 1/16 inch. Locate splices in skin plates only where shown. Ensure the overall width and height of the fabricated gate leaf does not vary from the respective dimensions shown by more than 2 mm 1/16 inch. Stress relieve the gate leaf prior to the attachment of seal assemblies and other appurtenant items.

2.4.14.1 Tractor Gate Leaf Lifting Brackets

Coordinate the fabrication details of tractor gate leaf lifting brackets closely with the details of the [lifting sling] [lifting hoist] [engaging and disengaging mechanism of the lifting beam assembly] to assure proper operation.
2.4.14.2 Tractor Gate Leaf Roller Train Assemblies

Provide roller train assemblies consisting of roller guides, track plates, roller train, and roller train cover. Provide adjustable roller guides that are removable without dismantling the roller train. Provide turned bolts, jack screws, shims for mounting and adjusting roller guides, and cap screws for attaching track plates as shown. Attach track plates to the gate leaf so that the side faces of the track plates are parallel to a vertical plane within 2 mm 1/16 inch. Machine finish the track surfaces of track plates to a plane parallel to a common plane within 2 mm 1/16 inch after being attached to the gate leaf. Provide roller train complete with pins, link bars, retaining rings, and other appurtenances as shown and as required for proper installation and operation.

2.4.14.3 Tractor Gate Leaf Guide Shoes

Attach guide shoes to the gate leaf for drilling and reaming for bolting. Locate the guide shoes accurately on the gate leaf in a true vertical plane with each other in the upstream-downstream direction. Lines passing through face of guide shoes on each side of leaf are required to be parallel within 2 mm 1/16 inch.

2.4.14.4 Tractor Gate Leaf Seal Assemblies

Provide seal assemblies consisting of rubber seals, stainless steel retainer and spacer bars, and fasteners. Provide rubber seals continuous over the full length that are accurately fitted and drilled for proper installation. Drill bolt holes in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals are required be fully molded, developing a minimum tensile strength of 50 percent of the unspliced seal, and occurring only at locations shown. Shop vulcanizing all splices. Locate the vulcanized splices between molded corners and straight lengths as close to the corners as practicable. Place splices on a 45 degree bevel related to the "thickness" of the seal. Ensure the surfaces of finished splices are smooth and free of irregularities. Field splice stainless steel retainer bars only where shown and machine finish after splicing.

2.4.15 Tractor Gate Frame and Guides

**************************************************************************
NOTE: Delete last sentence if not applicable for the project.
**************************************************************************

Ensure exposed unmachined surfaces of tractor gate frame and guides match at joints between component parts, do not depart from true plane shown by more than 2 mm 1/16 inch, and are free of offsets or irregularities greater than 2 mm 1/16 in. Grind allowable offsets or irregularities less than 2 mm 1/16 inch to a bevel of not greater than one on twenty-four. Machine the surfaces of frames and guides to receive roller track plates and seal plates accurately to provide uniform bearing for the full contact dimensions. Butt seal plates firmly together at corners. Machine roller bearing surfaces of track plates and sealing surfaces of seal plates to the tolerances shown to provide uniform bearing and sealing at all points of contact. Perform final machining of track plates and seal plates after they are attached to the gate frame and guides. Locate the anchor bolt holes for gate frame and guides accurately using Government furnished templates which provide the installation location of anchor bolts.
2.4.16 Tractor Gate Lifting Sling

Provide tractor gate lifting sling made of wire rope with thimble and socket fittings attached to the wire rope in a manner that develops the full strength of the wire rope.

2.4.17 Tractor Gate Lifting Beam Assembly

Fabricate the tractor gate lifting beam assembly as shown for automatic engaging and disengaging with the lifting brackets of the gate leaf. Stress relieve the lifting beam prior to final machining and attachment of the roller and counterweight assemblies.

2.4.18 Appurtenant Items

Ensure the fabrication requirements for [air vents,] [air vent liner,] [conduit liner,] [dogging devices,] [pier tie anchors,] [gate leaf pier guides,] and other appurtenant items conform to the details shown.

2.4.19 Shop Assembly

Provide shop assembly requirements for gate, gate frame and appurtenant items as shown and as specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Assemble gate, frame, guides, and appurtenant items completely in the shop to assure satisfactory field installation. Carefully preserve the match-marking of unassembled components until the components are assembled. Provide adequate support during assembly to maintain components within 2 mm 1/16 inch of actual installation planes. Coat mating surfaces and machined surfaces with a rust preventive coating until assembled. Thinly coat other connecting surfaces which are not required to be disassembled for shipment with an approved rust preventive coating before being joined. Fit and bolt adjoining components together to facilitate field connections. Deliver shop assembled components assembled, if practically permitted by shipping and field installation conditions. Shop weld assembled components in their final positions as much as delivery and field installation conditions allow. Perform shop assembly and disassembly work in the presence of the Contracting Officer unless otherwise approved. The presence of the Contracting Officer in no way relieves the Contractor of any responsibility under this contract.

2.4.19.1 Gate Leaf

**************************************************************************
NOTE: This paragraph must be edited to fit the project.
**************************************************************************

Shop assemble the gate leaf in the [vertical position] [and] [horizontal position with the skin side of the gate leaf facing down]. Include in the shop assembly the attachment of all accessories to the gate leaf. Lift the [wheel gate leaf] [and] [tractor gate leaf] by the lifting brackets and inspect for balance about the center of gravity after being shop assembled. If the gate leaf is out of plumb by more than 6 mm 1/4 inch in the total length in a vertical plane in the upstream-downstream direction, or by more than 2 mm 1/16 inch in the total width in a vertical plane perpendicular to the vertical plane in the upstream-downstream direction, balance it by counterweighting or some other method as approved at the Contractor's expense.
2.4.19.2 Wheel Assemblies

Support the gate leaf in the horizontal position for adjusting wheel assemblies so that the wheels of the attached wheel assemblies are free to rotate to allow the proper adjustment. Adjust attached wheel assemblies so that the wheels remain perpendicular to the gate leaf and the contact surfaces of the wheels on each side of the gate leaf are in a single plane within 0.127 mm 0.005 inch when rotated 360 degrees. Make the final adjustment of wheel assemblies after the gate leaf is assembled with the gate frame and guides in the horizontal position. Tap the top of each wheel to ensure that the weight of the wheel assembly has caused the shaft to bear firmly on the supporting framing of the gate leaf. Adjust wheel assemblies so that the tolerance on the distance between the plane through the downstream faces of the wheels and the plane through the downstream machined surfaces of the side bar supports for the seal assemblies does not exceed 1 mm 1/32 inch. After wheel assemblies have been adjusted, lock them in position by drilling the lock plate, support plate, and shaft and installing cap screws as shown. Lubricate the wheel assemblies after being locked in position with a lubricant that is suitable for underwater operation, equal to the lubricant recommended by the manufacturer of the wheel roller bearings, and as approved. Apply additional lubricant at regular intervals until final acceptance of the work.

2.4.19.3 Roller Train Assemblies

Mount roller trains on the track plates with the gate leaf in the vertical position. Adjust roller guides so that the roller trains are in alignment and can traverse freely without binding and with a maximum sag of 19 mm 3/4 inch at the bottom. After the roller trains are mounted, maintain the gate leaf in a vertical position unless the roller trains are securely restrained from sagging.

2.4.19.4 Guide Shoes

Drill and ream guide shoes for bolting to the gate leaf while attached to the gate leaf. Locate the guide shoes accurately on the gate leaf in a true plane with each other in the upstream-downstream direction and parallel to the plane established by the downstream machined surfaces of the side bar supports for the seal assemblies. Provide shims as required.

2.4.19.5 Seal Assemblies

Attach seal assemblies to the gate leaf during shop assembly and remove for shipment. Fit the rubber seals of the assemblies accurately drill to match the seal retainers, match mark, and remove for shipment.

2.4.19.6 Lifting Beam Assembly

Shop assemble the lifting beam assembly in the sequence and manner shown. Check the balance of the completed assembly by lifting the assembly by the pick-up pin. If the lifting beam is out of true horizontal by more than 10 mm 3/8 inch, use counterweighting or some other method approved to balance the assembly at the Contractor's expense.

2.4.19.7 Dogging Devices

Shop assemble dogging devices completely. Drill pin holes in base plates and dogs with these components in assembly.
2.5 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.5.1 General

Perform tests, Inspections, and Verifications for materials the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.5.2 Testing of Rubber Seals

Test the fluorocarbon film of rubber seals for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. Cut a 25 mm 1 inch long piece of seal from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. Ensure there is no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUOROCARBON FILM</th>
<th>MACHINE METHOD AT 50 MM2</th>
<th>DEADWEIGHT METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.762 mm 0.030 inch</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
</tr>
<tr>
<td>1.524 mm 0.060 inch</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
</tr>
</tbody>
</table>

PART 3 EXECUTION

3.1 INSTALLATION

Installation per the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Assemble miter gates and appurtenant items for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Thoroughly clean and lubricate bearing surfaces requiring lubrication with an approved lubricant before assembly and installation. Ensure components to be field-welded are placed in correct alignment before welding is commenced. Design and submit handling attachments and pick points required to be added to any specified items herein prior to installation.

3.1.1 Embedded Metals

Accurately install sill assemblies, seal plates, frames, bases and other embedded metal items required for proper and complete installation to the alignment and grade required to ensure accurate fitting and matching of components. Primer coat all embedded metals with the required paint on all surfaces prior to installation in concrete forms. Install anchors for embedded metals as shown. Attach items requiring two concrete pours for installation to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Grind smooth welded field splices in sealing surfaces of embedded items.

3.1.2 Gate Frame and Guides

**************************************************************************

SECTION 35 20 16.53 Page 23
Connect gate frame and guides to embedded anchors, align, and rigidly block in place prior to the placement of second-pour concrete. Use the sealing surfaces of the slide gate frame seal bars as the reference plane for the installation alignment. Alignment by using two theoretical control planes described as control plane "A" and control plane "B". Control plane "A" is a vertical plane that is normal to the water passageway and is located at the sealing surface of the gate frame seal bars. Control plane "B" is a vertical plane that is parallel to the water passageway and is located at the centerline of the water passageway. Align the gate frame to within 0.381 mm \(0.015 \text{ inch}\) of control planes "A" and "B". Use a taut piano wire and an electric micrometer or some other approved method to measure the vertical alignment tolerances. Align the [wheel gate] [and] [roller gate] frame and guides such that planes through the bearing surfaces of track plates and the sealing surfaces of seal plates align to within 2 mm \(1/16 \text{ inch}\) of the alignment shown. Test gate frame and guides for proper alignment and clearances prior to being embedded in concrete by lowering and raising the gate leaf through the full operating range.

3.1.3 Gate Leaf

Assemble gate leaf completely, including the attachment of all components and accessories, prior to being placed in the gate frame. Take all necessary precautions to avoid distortion of the gate leaf and attached components during installation. Fasten rubber seals securely to metal retainers. Before operating the gate, apply a suitable lubricant to the rubber seal rubbing plates to protect the rubber.

3.1.4 Operating Machinery

Position and align the operating machinery for the gate assembly and supporting components, including [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate], to the installed location of the gate frame and guides and anchored in place. Project the location of the slide gate stem to the sill and scribe on the sill of the installed gate frame to serve as a reference point for the alignment of operating machinery and supporting components. Align operating machinery and components to within 0.762 mm \(0.030 \text{ inch}\) of the reference point. Bolt an alignment template, prior to being embedded in concrete, to the [bonnet,] [bonnet cover,] marked, and drilled to match the exact center point of the gate stem.

3.1.5 Concrete and Concrete Grout Placement

Perform the embedment of the gate frame and other components in concrete in an approved manner to fill all voids, secure anchorage, prevent seepage, and provide uniform finish surfaces. After embedment concrete has cured...
for at least 7 days, fill voids around embedded components by pumping concrete grout around the components. After the pumped grout has cured for at least 7 days, use hammer blows to the components to detect any remaining voids. Where remaining voids are located, drill 25 mm 1 inch diameter grout holes in the components and fill the voids pressure grouting through the grout holes. Plug the grout holes in the components by welding and grinding flush.

3.1.6 Painting

Paint exposed parts of the gate and appurtenance components, except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, and other specified surfaces, as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.2 FIELD QUALITY CONTROL

Non-Destructive Testing of field welds are required to meet the same quality control requirements of shop-welded components.

3.3 SYSTEM START UP

3.3.1 Trial Operation

After the gate assembly has been installed, including operating machinery, the Contracting Officer will examine the complete system for final acceptance. Furnish all operation and test results to the Contracting Officer. The assembly will be examined first to determine whether or not the workmanship conforms to the specification requirements. Operate the gate throughout its full operating range a sufficient number of times to demonstrate proper operation. [Operate the gate from the remote control vault and the control panel in the control tower.] [Operation of hydraulic cylinders by use of compressed air will not be permitted.] Conduct the initial operation of the gate assembly in the dry. [With the gate leaf in the seated position and uniformly blocked so that the [wheels] [rollers] are in uniform contact with the track plates, check the rubber seals to ensure that they are uniformly compressed against the seal plates.] [Test the gate lock assembly by destructing one set of lock pins by inserting one set of pins in the lock position, permitting the weight of the gate leaf to rest on the pins, and using the hydraulic pressure system to break the pins by applying pressure to the top of the hydraulic cylinder. Adjust the pressure at the pressure reducing valve to its lowest setting and gradually increase it until the pins fail. Record the pressure reading at failure of the lock pins in the operation and test report. After completion of the test, replace the broken pins with new ones.] Conduct the second trial operation and testing of the gate assembly with the reservoir normal operating pool hydrostatic pressure. Ensure the workmanship in the fabrication and installation of the gate assembly causes the gate leaf to form a watertight barrier when lowered to the seated position. Make adjustments to the operation and control apparatus until all components function as required. Inspect the [lifting beam assembly,] [lifting sling,] [dogging devices,] and other appurtenances to assure proper operation. Make any and all required repairs or replacements to correct defects, as determined by the Contracting Officer, at no additional cost to the Government. Repeat the trial operation and testing after defects are corrected.
3.4 PROTECTION

Protect finished work in conformance with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of slide gates and actuators. This section was originally developed for USACE Civil Works projects.

Brackets are used in the text to indicate designer choices or locations where text must be supplied by the designer.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 SCOPE

The work provided for herein consists of furnishing all plant, labor, materials and equipment and designing, manufacturing, factory testing, delivering, storing, installing and field testing [__#____] slide gates and actuators complete with all necessary accessories and appurtenances, all as shown on the contract drawings and specified herein. Cast-Iron slide gates must be constructed and assembled in accordance with AWWA C560. Fabricated Stainless-Steel slide gates must be constructed and assembled in accordance
with AWWA C561. Electric actuators must meet the requirements of AWWA C542. Electrical work is specified in the applicable sections of Division 26 - ELECTRICAL.

1.2 GENERAL REQUIREMENTS

> The contract drawings indicate the requirements and general arrangement of the slide gates and actuators. The slide gates and assembly must fit into the allotted space and allow adequate acceptable clearances for installation, replacement, servicing, and maintenance. The following paragraphs may at times describe or refer to only one item, assembly or arrangement, but these requirements apply to all such items, assemblies or arrangements furnished and installed under these specifications.

1.3 MEASUREMENT AND PAYMENT

The slide gates will not be measured for payment. Payment will be made at the contract job price for "Slide Gates." Price and payment constitute full compensation for furnishing all plant, labor, material and equipment and designing, manufacturing, assembling, factory testing, preserving, delivering, storing, installing and field testing the gates, [including painting] and all appurtenant work, services and parts required.

1.4 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.5 DESIGN

The slide gates must be products of a manufacturer who has been regularly engaged during the past five years in the production of similar-sized gates for the design heads specified herein. Based on the heads specified, working stresses must not exceed the lower value of either one-half of the yield strength or one-fifth of the ultimate strength of the material. Design the gates accessories and appurtenances for installation as shown on the contract drawings.

1.6 ERECTING ENGINEER

Furnish the services of a competent erecting engineer to supervise and direct the installation and testing of the gates furnished under this section. Provide erecting engineer that is a full-time employee of, and designated as such by, the gate manufacturer, has at least five years of experience with the type of gate furnished under these specifications and will be subject to the approval of the Contracting Officer. The services of the engineer will be furnished at no extra cost to the Government. The installation and testing of the gates under the direction and supervision of the erecting engineer in no way relieves the Contractor of sole responsibility for the gates meeting all requirements of the specifications and fulfilling all the Contractor's guarantees.

1.7 WORKMANNISH

All workmanship, whether in the factory or the field, must be performed in a skillful and workmanlike manner by qualified mechanics under competent supervision and direction and in accordance with the best modern practice for the various trades involved and for the manufacture of high-grade machinery. All parts must have accurately machined mounting and bearing surfaces so that they can be assembled without fitting, chipping or remachining. All parts must conform to the design dimensions and be free of defects in either workmanship or material that will impair their service. All attaching bolt holes must be accurately drilled to the layout indicated on the shop drawings and dimensional outline drawings.

1.8 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item,
if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Shop Drawings; G[, [______]]

Dimensional Outline Drawings; G[, [______]]

Furnish the Contracting Officer for his review and approval dimensional outline drawings, catalog data and other information and calculations for each size unit which will include at least the following:

(1) Name of actuator manufacturer.

(2) Model number and weight.

(3) Dimensional drawing.

(4) Descriptive bulletin, including a breakaway drawing illustrating all operating components, a parts list and materials of construction.

(5) Strength and durability HP ratings per AGMA 6010.

(6) The electric motor's HP rating, the starting, running, and locked rotor torques, full load and locked rotor amps.
(7) The maximum and operating stem opening and closing load.

(8) Equipment sizing calculations, including all related factors and supporting literature.

(9) The maximum output of the motor operated actuator with the torque limiting switch inoperative.

(10) Calculations showing the required stem size and bracing required under condition (9) above for L/R < 200.

(11) Control wiring diagram.

SD-06 Test Reports

Quality Control Field Test Report; G[, [_____]]

Within three (3) days of a successful Quality Control Field Test, the Contractor must submit the Quality Control Field Test Report.

SD-10 Operation and Maintenance Data

Provide both electronic (PDF) and hard copies of Operation and Maintenance Manuals. All manuals and parts lists must be bound separately, be approximately 8-1/2 inches by 11 inches, printed on good quality paper and bound between flexible, durable covers. Drawings incorporated in the manual and/or parts lists may be reduced to page size provided they are clear and easily legible, or may be folded into the manual to page size. Photographs and/or catalog cuts of components may be included for identification. Submit the operation and maintenance manual and parts lists at the time of shipment of the gate actuators. Provide manuals for each type of slide gate and gate actuator.

Installation Manual; G[, [_____]]

Operation And Maintenance Manuals; G[, [_____]]

1.9 SUBMITTAL DESCRIPTIONS

The following subparagraphs describe in detail the submittals pertaining to the work specified in this section.

1.9.1 Shop Drawings

Submit complete shop drawings of the gate to the Contracting Officer for approval. Drawings of any items made specially or specifically for this project must be true shop drawings, but catalog cuts are sufficient for standard manufactured articles, and outline drawings of such equipment may be used in the assembly drawings. However, for those items for which true shop drawings are not required, sufficient descriptive data and/or other information, in addition to the catalog cuts, must be submitted to demonstrate compliance with the specifications. The embedded items and structural openings and clearances, which are dependent upon the gate design, must be included with the shop drawings.

1.9.2 Installation Manual

A minimum of 30 days prior to shipment of the slide gate and gate actuator,
submit three (3) copies of the gate manufacturer's standard manual describing procedures to be followed by the field service representative in installing and adjusting the slide gates, gate actuators and appurtenances not furnished by the Government. The installation manual must be of such a nature that it may be comprehended by an engineer or mechanic without extensive experience in erecting slide gates of this type. The description must be a step by step explanation of operations required, and include, where applicable, such things as gate component alignment procedures, bolt torque values, limit switch setting adjustment, wedge block adjustment and similar details.

1.9.3 Operation and Maintenance Manuals

Submit five (5) hard copies of all operation and maintenance, lubrication, and repair manuals for all equipment not furnished by the Government. Submit also in electronic format (PDF). Furnish operation and maintenance manuals containing complete information in connection with the operation, lubrication, adjustment, routine and/or special maintenance, disassembly, repair and reassembly of the manual and electric motor driven gate actuators and appurtenances furnished under this section. Furnish copies of the manufacturer's spare parts lists and/or bulletins for the gate actuators and appurtenances. Clearly show all details and parts, and adequately describe all parts or have proper identification marks. Submit the operation and maintenance manual and parts lists at the time of shipment of the gate actuators.

1.10 QUALITY CONTROL

1.10.1 General

Establish and maintain quality control for slide gate operations to assure compliance with contract requirements and maintain records of quality control for all construction operations, including but not limited to the following:

1. Machine work and electrical work.
2. Shop painting.
4. Use of specified materials and equipment.
5. Shop assembly and tests.
6. Preparation for shipment and storage.
7. Inspection at the worksite for damage to and defects in all material and equipment.
8. Storage at the worksite.
10. Installation and tests.
11. Operation and maintenance after installation.
1.10.2 Reporting

The original and four copies of these records of inspection and tests, as well as the corrective action taken, must be furnished to the Government daily. Format report as prescribed in Section 01 45 00 QUALITY CONTROL.

1.11 PREPARATION FOR SHIPMENT

Prior to shipment from the manufacturer's plant, prepare the gate for shipment as described herein. All large, bulky and/or heavy, greater than [50][_____] kilograms [100][_____] pounds, elements must be mounted on skids or pallets of ample size and strength to facilitate loading and unloading. Pack all small parts in sturdy wood or heavy corrugated paperboard boxes. Provide a packing list, indicating the contents of each such box and enclose in a moisture-proof envelope securely fastened to the outside of the box. The skid and/or pallet mounting and the boxing must be done in a manner which will prevent damage to the gate during loading, shipment, unloading, storage and any associated and/or subsequent handling. Provide weatherproof covers during shipment to protect all items which the Contracting officer designates as requiring such protection. Any special slings, strong backs, skidding attachments or other devices used in loading the equipment at the manufacturers' and/or fabricators' plants must be furnished for unloading and handling at the destination and become the property of the Government.

1.12 PREPARATION FOR STORAGE

At the conclusion of all shop tests, the gate must be protectively processed for not less than 24-month storage either outdoors or indoors as the case may be, at the destination. Furnish for approval, a complete description of the processing method or methods intended to use, including complete instructions for maintaining the protection during the storage period. Surfaces of items or portions of items which are to be embedded in or rest on concrete, must be cleaned of all dirt, rust, and other foreign coatings, not including closely-adhering mill scale, and then coated with a rust preventative.

1.13 STORAGE

Upon delivery at the worksite, bulky parts of the gates, such as the frames, slides and wall thimbles, which have been coated with a complete paint system in the manufacturer's plant, may be stored outdoors provided these parts are stored on wood blocking not less than 8 inches above a base of washed gravel or crushed stone not less than 2 inches thick. All other parts of the gates such as the gate stem, fasteners, and actuators store in a weathertight building. A framework covered with a plastic film, or any other such expedient or makeshift arrangement, will not be acceptable. Inspect the storage site at least once per day. Submit a detailed description of the proposed storage facilities, and a plan for storage maintenance and inspection, before any storage actually begins.

1.14 SAFETY

The Contractor is responsible for selection of plant operating equipment to ensure safe installation of the equipment specified herein, at the worksite, based upon the local working conditions, including site-specific restrictions for utilities, access or environmental conditions. Provide all equipment, labor and power, required for ventilation at the worksite in order to ensure a safe working environment in accordance with EM 385-1-1,
Safety and Health Requirements Manual, as well as any local, State, or National codes which apply to the work or work environment. The Contractor must test the air quality for toxicity, flammable gas and percentage of oxygen content prior to entering, and continuously during any work in an enclosed area. Use an air quality monitor from a recognized manufacturer to test the air quality.

1.15 WARRANTY

The Contractor must furnish to the Government, under separate cover, the manufacturer's standard commercial warranty for each size sluice gate and gate actuator, but not less than a minimum of 1 year warranty must be provided.

1.16 MAINTENANCE

After completion of the installation, continue to maintain and protect the gate and keep it ready for operation at any time until acceptance thereof. Provide electrical power in accordance with applicable Sections in Division 26 - ELECTRICAL for all operation and testing of the gates until final acceptance by the Government.

PART 2 PRODUCTS

2.1 MATERIALS

All materials must be free from defects and imperfections, of recent manufacture and unused, and of the classifications and grades specified herein unless otherwise approved by the Contracting Officer. Material not specifically described, as far as practicable, conform to the latest specifications of the American Society for Testing and Materials. All materials, supplies and articles not manufactured by the Contractor must be the products of recognized reputable manufacturers. Submit samples of materials for approval when so directed. Equipment, materials and articles installed or used without such approval are at risk of subsequent rejection.

2.1.1 Iron Castings

Material for iron castings must meet the applicable requirements of either ASTM A48/A48M for Class Nos. 30A, 30B or 30C or ASTM A126 for Class B.

2.1.2 Structural Steel

Structural steel used for shop fabricated items such as the gate actuator pedestals must meet the applicable requirements of ASTM A36/A36M. The Contractor may submit other gate material for approval.

2.1.3 Bronze

Bronze castings for such items as wedges, thrust nuts, lift nuts and couplings must meet the applicable requirements of ASTM B584 for Copper Alloy No. 865. Bronze extrusions for seat facings in the frame and slide must meet the applicable requirements of ASTM B21/B21M for Copper Alloy No. 464 or No. 482. Bronze for adjusting screws and lock nuts must meet the applicable requirements of ASTM B98/B98M for Copper Alloy No. 651 or No. 655. or ASTM B150/B150M for Copper Alloy No. 614, No. 623, or No. 630.
2.1.4 Stainless Steel

Stainless steel rods for stems must meet the applicable requirements of ASTM A276/A276M for Type 304 or 316. Stainless steel for fasteners must meet either the above-mentioned specification or the applicable requirements of ASTM F593 alloy group 1 Type 304. Stainless steel for slides and frames must meet the applicable requirements of ASTM A276/A276M for Type 304 or 316 or ASTM A240/A240M for Type 304L or 316L.

2.2 EQUIPMENT

The following equipment, together with all necessary accessories and appurtenances, must be installed. The following paragraphs may at times describe or refer to only one item, assembly, or arrangement, but these requirements apply to all such items, assemblies, or arrangements furnished under these specifications.

2.2.1 Gate

The [_____] gates for control structure [_____] must fit an opening [xx inches] wide X [xx inches] high, be designed for a maximum head of [xx feet] and an operating head of [x feet], and withstand an unseating head of [x feet]. Each gate must be cast-iron, fully bronze mounted, have side wedging devices for seating heads, and be the rising stem type. Each gate must be stainless steel, non self-contained, rising stem, standard bottom closure type. Cast-iron gates must meet the requirements of AWWA C560. Fabricated stainless steel gates must meet the requirements of AWWA C561.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2.2.2 Frame

The frame must be the flat back type and of one piece, cast-iron construction. All contact surfaces of the frame must be machine-finished. The frame must have machined dovetail type grooves on its front face to accommodate the seat facings. The back face of the frame must be drilled and machined to bolt directly to the machined face of the thimble. Drill all bolt holes using templates to match the thimble. The frame must have integrally cast pads with machined surfaces and keyways to receive the side, wedging devices.

Construct the frame assembly of formed stainless steel plate with a minimum thickness of 1/4 inch. The frame must be of the flange back type design for mounting on a concrete wall with the use of embedded adhesive anchor bolts and grout pad. Size and spacing of anchor bolt holes must be suitable for the operating conditions of the gate. Anchor bolt hole spacing must not exceed [12 inches]. The frame must be of the [non self-contained] [self-contained] design. Design the frame sufficiently rigid to transfer hydrostatic loads to the gate anchorage. The frame must positively retain the polymer guide/seal strip and the neoprene loading pad on studs welded to it. Use non-loosening fasteners on the gate guide.
2.2.3 Guides and Seals

The guides must be of one-piece, cast-iron construction, conservatively designed to withstand the total thrust due to the water pressure and the wedging action. The guides must be machine-finished on all contact surfaces, and machine a groove the full length of the guide to provide sufficient clearance between the slide tongue and the guide groove to permit free movement and ensure proper engagement of the wedging devices. The guides must have machined areas on their front faces for at least one-half the vertical gate opening and be sufficiently long to retain and support at least one-half of the slide when the gate is in the full-open position. Attach the guides to the frame with steel and bronze fasteners and dowel to prevent relative motion between the guides and frame. Provide integrally cast pads with machined surfaces for attachment of the wedging devices.

The length of the guide must retain at least 2/3 of the slide height in the full open position. The guides must be conservatively designed to withstand the total thrust due to the water pressure. The guide seals must be specially milled or molded ASTM D4020 to positively retain the slide, form a tight seal, and restrict leakage. Seals must prevent metal to metal contact between the frame and slide. Sealing must be accomplished by pinching action of the polymer guide seal. Provide gate with a self-adjusting seal system to restrict leakage in accordance with the requirements of this specification. The guide seal assembly must be field adjustable and replaceable. The UHMW sealing system must maintain efficient sealing in any gate position.

2.2.4 Slide

The slide must be either square or rectangular and of one-piece, cast-iron construction with integrally-cast vertical and horizontal ribs and a reinforced section around the perimeter to provide for the seat facings. The slide must have machined areas on its seating face to accommodate the seat facings. Provide a tongue on each side of the slide, which extends its full length and machined on all sides to provide sufficient clearance between the tongue and the guide groove to permit free movement. Integrally cast pads must be provided and machine-finished to receive the wedges. A stem nut pocket must be cast integrally on the vertical centerline and above the horizontal center and be shaped to receive the stem nut.

The slide must be either square or rectangular and formed of welded stainless steel plate with integrally formed reinforcements at the top and bottom with welded interior reinforcements. The slide must have at least one vertical reinforcement on or adjacent to the vertical center line. All edges and corners must be rounded and polished for smooth operation within the guide seal assembly. Incorporate measures for attaching the stem to the gate with a clevis-type connection welded to the slide.

2.2.5 Wedging Devices

The gate must be provided with sufficient side wedging devices to limit leakage to 0.1 gallon per minute per foot of perimeter at the specified maximum seating heads. The wedging devices must be of solid cast bronze, machine-finished on all contact surfaces and keyed to the cast-iron pads to maintain adjustment. The wedging devices must be attached with either
UFGS

bronze or steel studs and bronze nuts, and the adjustable element be provided with a bronze adjusting screw with either a bronze lock nut or another approved locking device.

The gate must be provided with top wedging devices if recommended by the manufacturer to provide a practical degree of water-tightness. The wedging devices must be stainless steel castings and held onto the slide reinforcing member with two inline welded studs with backing plate. The wedging devices must be adjustable and provided with a positive means of locking. Wedging devices must be one piece and removable and replaceable without disassembly of other gate parts. Material for stainless steel castings must meet the requirements of ASTM A351/A351M–CF8M.

2.2.6 Seat Facings

Seat facings must be of extruded bronze. The facings must be of a special shape which, when impacted into place, will fill and be locked permanently into the dovetail-type grooves in the frame, and gate slide. Other methods of attachment will not be permitted. The width of the facing must be not less than 3/4-inch. After attachment, machine the facing to a plane surface and to at least a 63 micro-inch finish. The seal must be a specially molded shape designed to produce a wide sealing area on the machined stop bar bolted to the frame. The differential sealing pressure of the seal on the stop bar must be capable of being varied by adjustment of the side wedging devices. When the gate slide is in the fully closed position and wedged into position against the frame, the maximum clearance between the seating faces must not exceed 0.004 inch.

2.2.7 Wall Thimble

The wall thimble must be of one-piece, square front flange with a square opening made of cast-iron construction ASTM A126 or approved equal. The wall thimble must be of the "F" Type design unless the gate manufacturer requires an "E" type design based on the unseating heads present. Provide the thimbles with an integrally cast ring or water stop. The front flange face must be machine finished to a plane surface and provided with tapped holes, using a template to match the drilling of the frame. The vertical centerline must be clearly shown by permanent marks at the top and bottom of the machined surface and permanently mark the word "TOP" thereon. Provide the thimble with holes in the invert to permit satisfactory concrete placement. Provide a permanent gasket of uniform thickness between the front face of the thimble and the back face of the frame.

2.2.8 Stem, Couplings and Stem Guides

The stem must be of sufficient diameter to withstand, without buckling or permanent distortion, the stresses induced by closing the gate under locked torque conditions. Stem threads must be either machine-cut or cold rolled and of the double-lead ACME type. The stem and nut threads must have sufficient contact area so that the contact pressure will not exceed 5,000 psi when the maximum stem thrust is exerted. The stem thread surfaces in contact with the lift nut must have not rougher than a 63 micro-inch finish if machine cut and not rougher than a 32 micro-inch finish if roll-formed. The exterior corners of the threads, either during or after machining, must be given a slight radius of approximately 0.015-inch in order to prevent them from acting as cutting edges as the stem passes through the lift nut. The stem must be of corrosion-resisting steel. Fit the stem with a tapped hole in the top end for handling. Make the tapped hole of sufficient diameter and depth for the insertion of an eyebolt of sufficient strength.
to pick up the entire stem from a horizontal position. Provide the stem at its lower end with a bronze thrust nut which will fit into the pocket provided on the gate slide and which will positively prevent rotation of the stem. Stem guides must be of cast-iron, bronze bushed and mounted on cast iron brackets. Drill and slot stem guides to be adjustable in two directions and space at close enough intervals to support the stem adequately with an L/R ratio of not more than 200. The bronze bushing must be machine-bored 1/16-inch to 1/8-inch larger than the stem diameter. The stem guide, including the bronze bushing, must be the two-piece collar type which can be installed and removed with the stem in place. Attach stem guides with corrosion resistant steel anchor bolts.

2.2.9 Top and Bottom Seal

The top seal must be made of UHMW polyethylene attached to the top horizontal frame member. Provide seals with elastomer loading pads or continuous compression cords in order to ensure contact between the UHMW polyethylene and gate. Corners or intersections of seals and loading pads or compression cords be interlocked and sealed for a leak-proof joint. The bottom seal must be made of resilient neoprene attached to the bottom horizontal frame member and form a tight seal.

2.2.10 Anchor Bolts

New anchor bolts must be installed for the stem guides and actuator pedestal and fabricated slide gate frame if required. The anchor bolts must be adhesive anchors with stainless steel threaded rods provided with bronze nuts. The quantity, size, spacing, minimum pullout strength and required effective embedment depth of the anchors must be determined and provided by the manufacturer.

2.2.11 Fasteners

All fasteners must be of either silicon bronze or stainless steel. The quantity and size of fasteners per recommended by the gate manufacturer. Thread standards must meet the requirements of ASME B1.1

2.2.12 Stem Cover

Provide a stem cover for each slide gate actuator. The stem cover must be of galvanized steel pipe of sufficient diameter and length to permit full travel of the stem without obstruction or binding. The top of the cover is to be closed with a galvanized steel pipe cap. The pipe cap must have a drilled and tapped hole fitted with an eyebolt of sufficient strength for lifting the assembly from a horizontal position. The stem cover must have a grease fitting, which can be used for lubricating the stem, installed above the threads used for mounting the cover to the actuator. The cover is to be threaded into the top of the actuator to prevent rainwater entry. Prior to assembly, threaded portions of the stem cover, cap, and eyebolt are to be coated with pipe compound. After installation of the cover, clean exposed threads and degrease, then apply a heavy coat of an approved zinc-rich protective coating.

**************************************************************************
NOTE: Designer select either paragraph MANUALLY OPERATED GATE ACTUATOR or paragraph ELECTRIC MOTOR DRIVEN GATE ACTUATOR based on project requirements.
**************************************************************************
[2.3 MANUALLY OPERATED GATE ACTUATOR]

Open and close each slide gate by means of a manual crank-operated actuator having either a single or double gear reduction depending upon the load and mounted as shown on the drawings. The actuator must have cast bronze lift nuts threaded to match and engage with the stem threads. Provide the lift nuts with ball thrust or tapered roller bearings both above and below the flanges on the lift nut to accommodate the opening and closing thrusts. The actuator housing must be cast iron. Provide adjustable stop collars for installation on the stem just above the lift nut and accessibly below the hoist. All gearing must be steel and have accurately machine-cut teeth. Positive mechanical seals to retain lubricant and exclude dirt and moisture are to be provided on the lift nut and pinion shafts where they extend through the housing. Provide lubrication fittings for lubrication of all gears and bearings. A removable cast-iron crank with a rotating brass grip and a maximum radius of 380 mm15 inches must be provided. Fit the actuator with a 2 inch square nut for operation with a portable electric drill. Design the actuator such that a maximum force of 178 N40 pounds at a 380 mm15 inch radius will unseat the slide from its wedging devices at maximum design head. After the slide is unseated from its wedges a maximum force of 111 N25 pounds at a 380 mm15 inch radius must operate the gate.

The actuator unit must include a cast-iron pedestal, drilled and machined to accommodate the gear and lift nut housing, arranged to be bolted to the operating platform, and designed to position the input shaft about 900 mm36 inches above the platform. An arrow or arrows, with the word "OPEN" adjacent thereto, must be either permanently attached to or cast on the housing to indicate the direction of rotation to open the gate. Affix a brass instruction plate to the gate actuator stating manufacture, lubrication cycle and type of lubricant to be used.

[2.4 ELECTRIC MOTOR DRIVEN GATE ACTUATOR]

2.4.1 General

*******************************************************************************************
NOTE: Designer - The process for calculating gate actuation forces are described in AWWA C560 and AWWA C561 and Engineering Manual EM 1110-2-3105. EM 1110-2-3105 provides detailed sketches showing how these forces are applied.
*******************************************************************************************

Each slide gate must be opened and closed by means of an individual electric motor actuator unit driven by an electric motor and mounted on the operating platforms as shown on the contract drawings. The unit must consist of complete, compact, rugged assemblies specially designed and manufactured for the required service by a manufacturer regularly engaged for at least 5 years in the production of this type of device, and be delivered completely wired, assembled and ready for installation. All parts of the lift mechanism must be designed to move the gate slide at a rate of approximately 1 foot per minute under the specified operating head condition. The actuator must be designed in conformance with the latest edition of standard practices of AGMA 6010. Gate actuation forces must follow the requirements as shown in Appendix A of AWWA C560 and AWWA C561.

The gate actuator requirements must be computed using the following formula:
(a) \( F_u = 62.4 \times H \times A \times f_u + (W_g + W_s) \)

(b) \( F_n = 62.4 \times H \times A \times f_n + (W_g + W_s) \)

\( F_u \) = Minimum required unseating stem force, pounds

\( F_n \) = Minimum required stem force, pounds, after unseating

\( H \) = Operating head of water at gate disk centerline, feet

\( A \) = Area of gate opening, square feet

\( f_u \) = 0.6 unseating friction factor

\( f_n \) = 0.3 friction factor after unseating

\( W_g \) = Weight of gate disk, pounds

\( W_s \) = Weight of gate stem, pounds

2.4.2 Electric Gate Actuator Assembly

The electric motor for the gate actuator must have a continuous duty rating, be suitable for operation on a [240] [480] volt, 3 phase, 60 Hz circuit, have sufficient horsepower to operate the actuator unit through the full gate travel in both directions without exceeding the full load ampere rating, and conform to applicable requirements of NEMA MG 1. All bearings must be the anti friction type.

Actuator limit switches, torque switches and unit wiring must be provided in accordance with applicable section of Division 26 - ELECTRICAL. All components including the motor, reversing contactors and overload relays, pushbuttons, indicating lights, control transformer, reductions gearing, stem lift nuts, bearings and limit switches, must be enclosed in NEMA Type 4 enclosures and mounted on a cast iron pedestal with flanged base plate, complete with stainless steel anchor bolts and silicon bronze or stainless steel nuts. Design the pedestals to position the handwheel approximately 3 feet above the operating room floor on the standard slide gate installation.

a. Reduction gearing must consist of generated helical gears of heat-treated steel. Worms are to be of hardened alloy steel with threads ground and polished. The worm gear must be in one piece of high strength cast bronze. Run all reduction gearing in lubricant. All gears, the stem lift nuts and other working components must be carried on heavy duty ball or tapered roller bearings adequate for all torque and thrust loads imposed by operation of the gate at the specified maximum heads. Provide suitable seals at all points as required to retain the lubricant. Design the motor actuator to permit manual operation of the unit in event of power failure or as necessary during servicing.

b. Provide a handwheel, and an arrow with the word "OPEN" cast on the rim of the wheel, indicating the direction of opening. Effort required to operate the actuator manually with the gate in motion must not exceed 40 pounds at the wheel rim, and 80 pounds at the wheel rim to unseat the gate. The motor actuator must include a built in clutch mechanism so that the handwheel will not rotate during motor operation nor turn during manual operation. Locate a dial type indicator at the top of the motor actuator to show gate position during both hand and
motor operation. The indicator must be graduated to show "FULL OPEN" when the bottom of the gate is at the fully open position. House the indicator in a watertight enclosure. Indicators which are of the 3-position type showing fully open, fully shut or in an intermediate position are not acceptable. The actuator must be able to watch the indicator from the same position one stands in to operate the controls.

c. The operating unit must include a built in, lost motion device which will permit the motor to attain full speed after which a hammer blow must be imparted to the hoisting mechanism to initiate gate motion in either the opening or closing direction of travel. Supply bronze lift nuts, made in two pieces with accurately machined splines or keys and threads. The two piece nut consists of an outer member, having a flange or flanges on the exterior and splines on the interior, which mates with an inner member having splines on the exterior and threads on the interior. The outer member must be mounted in the unit housing. Secure the inner member to the outer member by either a threaded retainer ring or another suitable arrangement.

d. After the gate has been either completely closed or securely supported in the partially open position, this inner member must be capable of being easily removed by disassembling its retaining arrangement and turning the handwheel. Each stem nut must be adequately designed, factory tested and inspected with the stem with which it will operate. Run each nut by hand throughout the length of the stem with which it will operate. Suitable marks must be used to identify the matched sets once they have been established in the shop. The internal thread must have the lower or non working face relieved 1/64 inch to ensure that the threads will bottom out before wedging can occur. Drill the lift nut or otherwise provide with adequate oil recesses and passages to ensure passage of lubricant to all interior threaded surfaces of the nut. The internal arrangement of the motor actuator units must be such that all moving parts run in lubricant, with adequate fittings and seals provided to retain the lubricant. Use lubricant per recommendations by the gate actuator manufacturer.

2.4.3 Limit Switches

The closing and opening travel of each gate must be protected against overload by torque-responsive mechanical switches, one for each direction of travel. Provide geared limit switches for stopping the gate at both the fully closed and the normal fully open positions. The torque switches must be operative during the entire travel of the gate to protect the stem and gate against possible damage in the event an obstruction is met. The torque switches must function without auxiliary relays or other devices and be field-adjustable to ensure (1) stopping the lowering operation of the gate should the stem load for any reason become compressive to a degree greater than the normal seating requirements, and (2) stopping the raising operation should a 100 percent overload develop. Provide position limit switches that are adjustable and of the intermediate gear type, governed by rotation of the motor driving mechanism. Internal motor control wiring for 120 volt operation and motor power wiring for 240 volt, 3 phase, 60 Hz operation must be provided complete to a suitable terminal block in the limit switch compartment, and clearly mark terminal blocks in a suitable manner to facilitate external control and power connections under another section of these specifications. All internal wiring must be not smaller than No. 12 stranded copper conductor with not less than 3/64-inch thick "NEOPRENE" or equal insulation and not less than a 1/64-inch thick
"NEOPRENE" or equal jacket.

2.4.4 Gate Actuator Controls

2.4.4.1 Controls

Mount all controls on the side of limit switch compartment door with a hinged, padlockable, vandal resistant cover of at least 1/8 inch plate thickness and of NEMA Type 4 construction.

(a) Control Switch: One (1) selector switch with two positions, Open and Close.

(b) Selector Switch: One (1) heavy duty selector switch, five-position type with legend plate. Label the five positions LOCAL-STOP-OFF-STOP-REMOTE.

(c) Pilot Lights: Two (2) solid-state indicator LEDs for long life and ease of replacement with legend plates. Green for fully opened and red for the fully closed position.

(d) Legend Plates: Made of corrosion-resistant metal with permanent marking made by machine engraving or machine stamping; hand engraving, such as would be done with an engraving pencil, is not acceptable. Plates must be screwed or bolted in place.

2.4.4.2 Internal Control Features

In addition to the limit switches specified above, provide the following control features:

(a) A motor overload protective device in each phase.

(b) A terminal block with connectors for all external control signals. Route all leads from the actuator motor and limit switch assembly to terminal connections in the controller for external connections to other station control devices.

(c) A reversing controller which is both mechanically and electrically interlocked and provided with the necessary direct operated auxiliary contacts for required interlocking and control.

PART 3 EXECUTION

3.1 PAINTING

Each cast-iron slide gate and actuator must be painted with a complete coating system in accordance with the manufacturer's standard practice, in which case it will be exempted entirely from the surface preparation and painting requirement specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, provided the coating system is approved by the Contracting Officer, is of acceptable color and is touched up as necessary prior to shipment. Requests for such exemption must be accompanied by a description of the manufacturer's standard coating system, including the surface preparation, type of primer and finish coat or coats, dry film thickness and whether baked on or air dried. Fabricated stainless steel slide gates do not require painting.
3.2 LUBRICATION AND LUBRICANTS

Lubricate each actuator prior to any use or operation, either in the shop or in the field. Lubricate each bearing through its associated lubrication fitting, and pack the gears with lubricant at assembly. After shop testing, and prior to shipment, relubricate the bearings. Prior to testing in the shop, and to initial operation in the field, the gate seat facings and wedging devices must be cleaned of all foreign material and lubricated thoroughly with a light grease. Just prior to field assembly, lubricate the lift nut and stem threads. All lubricants must be as recommended by the gate and actuator manufacturer and be submitted by manufacturer's name and number as part of the shop drawings. Furnish an additional 20 pounds of each different actuator lubricant at no additional expense to the Government.

3.3 SHOP ASSEMBLY AND TESTS

After completion of initial machining, all gates must be completely assembled, in the vertical position, and the wedging devices adjusted to exclude a 0.004-inch thickness gage between the frame and slide seating surfaces. Perform any additional machining needed to achieve this condition, any discrepancies or deficiencies discovered as a result of this procedure must be corrected, and a retest conducted. Open and close the slide in the guides several times to ensure that it operates freely. Disassemble the gate to the extent necessary for shipment. The Contractor must notify the Contracting Officer sufficiently in advance (minimum 72 hours) so that a representative of the Contracting Officer may witness the assembly, testing and disassembly work, unless this requirement is waived in writing by the Contracting Officer. Any malfunctions or discrepancies disclosed as a result of these tests must be promptly remedied by the Contractor at no additional expense to the Government, and retests conducted.

3.4 FIELD INSTALLATION AND TESTS

3.4.1 Installation

Installation of the gates, actuators and appurtenances must be in accordance with the manufacturer's installation instructions and under the supervision and direction of the field service representative specified in paragraph "Erecting Engineer". Clean all elements of the gate of any protective coatings used thereon during shipment and storage, and remove all rust, dirt, grit and other foreign matter. The gate and actuator must then be "touch-up" painted. The actuator and each element of the gate must be carefully and accurately aligned so that after it is fastened in place there will be no binding or excessive pressure or wear in any moving part and no distortion of any member. Where the frame is attached to the structure by use of a wall thimble, apply mastic to the wall thimble contact surface per the manufacturer's recommendation. Internally brace the wall thimble during concrete placement. Adjust each wedge assembly to ensure the specified minimum seal clearances without bending of wedge hooks or other damage to the wedges. Tighten fasteners uniformly and firmly, but take care to not overstress either the fastener or the member with which it is associated. Where specific torque values or ranges are cited in the installation instructions, an accurately calibrated torque-wrench, having the proper capacity range, is required. Stilson wrenches, cold chisels, or other tools likely to cause injury to the surface of any part, are not permitted for use in the work of assembly or tightening. Install all fasteners with an anaerobic locking compound. Cleaning prior to
application of the locking compound per the manufacturer's recommendations. All shims must be of either bronze or corrosion-resisting steel. Where grouting is required, either an epoxy grout or a ready-to-use, non-shrinking grouting material conforming to the applicable requirements of ASTM C1107/C1107M, requiring only mixing with water at the worksite, must be used, and use of any grouting as recommended by the manufacturer. All blocking and wedges used for support during initial grouting are to be removed prior to final grouting.

3.4.2 Field Tests

3.4.2.1 Quality Control Tests

The gates and actuators must be operated and tested by and at the expense of the Contractor and under the supervision and direction of the Erecting Engineer to determine if they have been properly manufactured, assembled, and installed and if they meet the requirements of the specifications. No Government representatives will be present during these tests. After all position and torque limit switches have been set, raise and lower the gate slide not less than three times using the electric motor operated gate actuator. Measure and record the operating current each time the gate is raised. Also raise and lower the gate slide approximately 6 inches using the manual handwheel. After completion of these tests the gates are to be fully closed and an inspection made of each of the seals to verify proper clearance between the seals at all points as specified or per the manufacturer's recommendation. Adjust gate wedges and seals as required to achieve necessary clearance for a proper seal. The Contractor must prepare a Quality Control Field Test Report indicating the test date, personnel present, number of times the gate was operated, operating current measured and written verification from the gate manufacturer's Erecting Engineer that all gates have been properly installed and adjusted and tested successfully.

3.4.2.2 Quality Assurance Tests

The gates and actuators must be operated and tested by and at the expense of the Contractor, under the supervision and direction of the Erecting Engineer and in the presence of representatives of the Contracting Officer to determine if they have been properly manufactured, assembled, and installed and if they meet the requirements of the specifications. These tests will be conducted a minimum of ten (10) days after receipt of the Quality Control Field Test Report. Raise and lower the gate a minimum of three times using the electric motor operated gate actuator. The Contractor must measure and record the operating current and motor amperage each time the gate is raised and lowered. Recorded operating current and motor amperage must be within manufacturer specified tolerance. The gate slide must also be raised and lowered approximately 6 inches using the manual handwheel. After the raising and lowering of the gates is completed the gates are to be fully closed and an inspection made of each of the seals to ensure that there is less than 0.004 inch clearance between the seals at all points or per recommended by the gate manufacturer if otherwise approved. If any gate indicates a seal clearance in excess, that gate will be adjusted as required the rechecked. Any malfunctions or discrepancies disclosed as a result of these tests must be promptly remedied by the Contractor at no additional expense to the Government, and retests conducted. [Contractor to develop a gate leakage test and submit for approval.]
3.5 MAINTENANCE

After completion of the installation, the Contractor must maintain and protect the gates and gate actuators and keep them ready for operation at any time until acceptance thereof.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing all plant, equipment, labor, and materials (except materials specified to be furnished by the government) for fabricating, assembling, delivering, and installing closure gates in accordance with these specifications and applicable drawings. This section was originally developed for USACE Civil Works projects.

Certain components of a Closure Gate may be considered fracture critical. These components may include the gudgeon hood, gudgeon anchorage, diagonals, as well as others. AWS D1.1 does not include provisions for fracture critical welding. The Designer should consider using guide specification SECTION 05 59 20 FABRICATION OF HYDRAULIC STEEL STRUCTURES for specifying fracture-critical welding utilizing a Fracture Control Plan. A Fracture Control Plan and the use of appropriate materials and welding is required by ER 1110-2-8157, "Responsibility for Hydraulic Steel Structures."

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
PART 1   GENERAL

1.1  UNIT PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.

Select Alternate 1 (one pay item) or Alternate 2 (two pay items). Delete all paragraphs of Alternate not selected.

1.1.1  Furnishing and Installing Closure Gates

NOTE: Alternate 1.

1.1.1.1  Payment

Payment is made for costs associated with furnishing and installing closure gates and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of closure gates and appurtenant items including gate leaves, diagonals, strut connections, miter guides, closure latches, recess latch strikes, quoin and closure blocks, gudgeon top anchorages, pintle assemblies, [walkways,] [bridgeways,] gudgeon embedded anchorages, wall quoins, sill assemblies, seal assemblies, recess latches, bumpers, fenders, and all other items necessary for complete installation.

1.1.1.2  Unit of Measure

Unit of measure: lump sum.

1.1.2  Furnishing Closure Gates

NOTE: Alternate 2.

1.1.2.1  Payment

Payment is made for costs associated with furnishing closure gates and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of closure gates and appurtenant items including gate leaves, diagonals, strut connections, closure guides, closure latches, recess latch strikes, quoin and closure contact blocks, gudgeon top anchorages, pintle assemblies, [walkways,] [bridgeways,] gudgeon embedded anchorages, wall quoins, sill assemblies, seal assemblies, recess latches, bumpers, fenders, and other items necessary for complete installation.
1.1.2.2 Unit of Measure

Unit of Measure: lump sum.

1.1.3 Installing Closure Gates

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

1.1.3.1 Payment

Payment is made for costs associated with the installation of closure gates and appurtenant items, which includes full compensation for the complete installation and testing of closure miter gates and appurtenant items.

1.1.3.2 Unit of Measure

Unit of measure: lump sum.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 Sequencing and Scheduling

******************************************************************************
NOTE: The name of the appropriate railroad company or roadway agency should be inserted as indicated.
******************************************************************************

Submit a sequencing and scheduling plan, approved before the work is commenced, which illustrates that work affecting [railroads] [roadways] has been coordinated with [____]. Include in the plan schedules, lists of
labor or materials to be provided the affected [company] [agency], and any other aspects of the work that may impact on the operations of these entities as specified in Section SPECIAL CONDITIONS. Ensure the protection plan clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed. Refer to Section SPECIAL CONDITIONS for other requirements such as warning signs, flagmen, permits, and debris removal.

1.4 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.} Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Fabrication Drawings; G[, [_____]]
1.5 QUALITY ASSURANCE

1.5.1 Qualification of Welders

Welders and welding operators are required to conform to the qualification requirements included in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.6 DELIVERY, STORAGE, AND HANDLING

Perform delivery, handling, and storage of materials and fabricated items conforming to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Unload materials and equipment delivered to the site as approved by the Contracting Officer. Verify the condition and quantity of the items delivered and acknowledge receipt and condition thereof in writing. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.

1.6.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber
seals free of oils, grease, and other materials which would deteriorate the rubber. Ensure rubber seals do not become distorted during handling.

[1.6.2  Epoxy Filler]

Receive epoxy filler from the manufacturer just prior to use in the work to ensure receipt of recently manufactured material and store the filler under cover, out of direct sunlight, at a temperature between 20 to 30 degrees C 65 to 85 degrees F.

PART 2  PRODUCTS

2.1  SYSTEM DESCRIPTION

2.1.1  Design Requirements

Submit detail drawings as specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS, of closure gates and appurtenant items, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings.

2.1.1.1  Fabrication Drawings

Within the fabrication drawings, show complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.1.1.2  Shop Assembly Drawings

Within the shop assembly drawings, provide details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.1.1.3  Delivery Drawings

Within the delivery drawings, provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.1.1.4  Field Installation Drawings

Within the field installation drawings, provide a detailed description of the field installation procedures. Include in the description the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; [plan for prestressing gate leaf diagonals, including descriptions of connections, riggings, anchorages, and measuring equipment;] [methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler;] [procedures and equipment used for heating and placing of the zinc filler;] [method for installing hinge anchor plates, including checking and maintaining alignments of the plates during concreting and placement of epoxy filler;] and methods for installing other appurtenant items.

2.2  MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work before
completion of the contract. Furnish materials orders, materials lists and materials shipping bills conforming with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.2.1 Metals

**************************************************************************
NOTE: Consider the use of ASTM A709/A709M steel for fabrication of all steel components. A709 material is available in 36 and 50 ksi and provides improved toughness and maximum yield to tensile ratios to ensure ductile performance.
**************************************************************************

All structural steel, steel forgings, steel castings, stainless steel, bronze, [aluminum alloy,] and other metal materials used for fabrication are required to conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1.1 Structural Steel

Structural steel shapes are required to conform to ASTM A36/A36M. Structural steel plates are required to conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50][ASTM A709/A709M, Grade 50].

2.2.1.2 Steel Pipe

Provide steel pipe conforming to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.2.1.3 Self-Lubricating Bearings

Ensure self-lubricating bearings conform to ASTM B823, Type II. Impregnate the bearings with a turbine grade lubricant containing oxidation and rust inhibitors and a polar anti-wear additive.

2.2.1.4 Bronze Castings

Provide bronze castings conforming to ASTM B22/B22M, Copper Alloy UNS No. C91300 [and ASTM B148].

2.2.1.5 Stainless Steel Bars and Shapes

Provide stainless steel bars and shapes conforming to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.2.1.6 Stainless Steel Plate, Sheet, and Strip

Provide stainless steel plate, sheet, and strip that conforms to ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,] [S 41008]. Hot-roll, anneal or heat-treat, and blast-clean or pickle plate finish. Provide No. 1 sheet and strip finish.
[2.2.1.7  High-Strength Steel Bar

Provide high-strength steel bar conforming to \textit{ASTM A722/A722M}, Type I or II, and all supplementary requirements.

2.2.2  Rubber Seals

2.2.2.1  Physical Characteristics

Provide rubber seals [fluorocarbon (Teflon) clad rubber seals of the mold type only and] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and containing reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. The physical characteristics of the seals are listed below:

<table>

</tbody>
</table>

Perform the "Water Absorption" test with distilled water. Bolt the washed specimen dry with filter paper or other absorbent material and suspend by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees C for 22 plus or minus 1/4 hours. Remove the specimen, allow to cool to room temperature in air, and weigh it. Record the weight to the nearest 1 mg as M1 (M1 is defined in \textit{ASTM D471}). Ensure the immersion temperature is 70 degrees C plus or minus 1 degree C and the duration of immersion is 166 hours.

[2.2.2.2  Fabrication of Rubber Seals

Provide rubber seals with a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. Ensure the film is [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, possessing the following minimum physical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>

</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa 2,000 psi</td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent</td>
</tr>
</tbody>
</table>

Ensure the outside surface of the bonded film is flush with the surface of the rubber seal and is free of adhering or bonded rubber. Mold strips and corner seals in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the
adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, mask the fluorocarbon film during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.2.3 Epoxy Filler

Use epoxy filler that is an approved epoxy resin formulation equal to "Loctite Nordback," a product of Hennkel Adhesives, or an approved equal, with a specific gravity of 1.90 to 1.95, minimum compressive strength after 72 hours at 20 degrees C 70 degrees F of 89.6 MPa 13,000 psi, and maximum shrinkage of 0.15 percent. Submit Manufacturer's certificate for epoxy filler stating that it meets or exceeds the specified physical properties; Deliver material to the site.

2.2.4 Zinc Filler

Provide zinc filler that conform to ASTM B6.

2.2.4.1 Safety Provisions for Zinc Filler

The following special safety provisions are required for heating and placing zinc filler:

a. Workers are required to wear protective clothing including hard hats with fine wire mesh screen, goggles, leather sleeves, chaps, apron, and leather gloves.

b. Workers are required to wear air-line respirators certified by NIOSH or MSHA. In enclosed spaces, utilize both local exhaust ventilation and air-line respirators. The local exhaust ventilation system is required to include movable hoods placed close to the work to remove fumes at the source.

c. Pre-heat ladles, equipment, and material before use to ensure they are moisture-free.

d. Place heating devices and ladles on a level, firm foundation, and protect against traffic, accidental tipping, or similar hazard.

e. Do not carry hot zinc up or down ladders.

f. Ensure all buckets or vessels used for handling and transporting hot zinc are substantially constructed and not filled higher than 100 mm 4 inches from the top.

2.3 MANUFACTURED UNITS

Provide bolts, nuts, washers, screws and other manufactured units that conform with the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.3.1 Bolts, Nuts and Washers

Provide high-strength bolts, nuts, and washers that conform to ASTM F3125/F3125M, Grade A325, [hot-dip galvanized] . Bolts, nuts, studs, stud bolts and bolting materials other than high-strength are required to conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [______]] [Austenitic Steel, Grade [______]], Class
2.3.2 Screws

Provide screws of the type indicated.

2.3.3 Shackles and Turnbuckles

Provide shackles and turnbuckles of forged steel conforming to ASTM A668/A668M, zinc coated. End-thread turnbuckles right and left hand and provide the size shown.

2.3.4 Screw Jacks

Provide screw jacks with a [_____] ton (metric) (2000 lb) rated capacity and ensure they conform to the details shown.

2.3.5 Hoists

Provide hoists with a [_____] ton (metric) (2000 lb) capacity, with [_____] m(m) foot lift, link type chain and safety latch hook. Provide hoists of a light weight design, weighing not over [_____] kg lb and requiring not more than [_____] kg lb lever pull to lift the full-rated load.

2.3.6 Winches

Winches are required to be [_____] ton (metric) (2000 lb) marine winches with [_____] mm(m) inch drum and adjustable handle. Equip each winch with [_____] mm(mm) foot of [_____] mm(mm) inch diameter wire cable suitable for exterior exposure.

2.3.7 Sheaves

Provide cast steel sheaves conforming to ASTM A27/A27M, sized for the wire rope used.

2.3.8 Rails

Provide rails conforms to ASTM A1, [No. 1] [No. 2], weighing [_____] kg/m. lb/yd. Provide rail stops as recommended by rail manufacturer for [_____] kg/m lb/yd rails and for the wheel diameters indicated.

2.3.9 Wire Rope

Provide wire rope that conforms to FS RR-W-410, Type [____], Class [____], Construction [____], [wire size,] [strand seizing] as shown.

2.3.10 Wheels

Provide short hub or long hub wheels, rigid type, heavy duty steel casters fabricated from steel castings conforming to ASTM A148/A148M. Provide wheel of the size and load capacity shown complete with lubrication fittings, roller bearings and removable axle. Machine finish wheel treads to conform to the indicated rail. Unless otherwise specified or shown, wheel axles are required to be stainless steel bars conforming to ASTM A276/A276M, UNS S30400.
2.3.11 Bridge Planks

Fabricate bridge planks of steel conforming to ASTM A1011/A1011M, Grade 33, with a minimum thickness and minimum section modulus as shown.

2.3.12 Chains and Attachments

Provide chains and attachments conforming to FS RR-C-271, Type [____], Grade [____], Class [____], Style [____], Size [____], Finish [____].

2.3.13 Padlocks and Hasps

Provide padlocks conforming to CID A-A-1928, Type [I][II]. Key all padlocks alike and provide with two keys. Wrought steel hasps are to be provided and sized to accommodate padlocks.

2.3.14 Elastomeric Bearing Pads

Provide elastomeric bearing pads conforming to the requirements of ASTM F3125/F3125M, and reinforced with steel plates.

2.4 FABRICATION

2.4.1 Structural Fabrication

Structural fabrication is required to conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Shop fabricate components from the materials specified and shown. Provide all dimensional tolerances as specified and shown. Splices are only allowed where shown. Bore pin holes in components after welding, straightening, stress-relieving, and threading operations are completed. Straighten brackets, eye bar sections, and other components requiring straightening by methods which will not damage the material. Press-fit bronze bushings with supporting components. Provide bolt connections, lugs, clips, or other pick-up assembly devices for components as shown and required for proper assembly and installation.

2.4.2 Welding

**************************************************************************

NOTE: List applicable welds requiring radiographic examination.

NOTE: Specification Section 05 50 14 STRUCTURAL METAL FABRICATIONS includes welds subjected to Ultrasonic Testing (UT), Dye Penetrant Testing (PT) and Magnetic Testing (MT). AWS D1.1 does not specify nondestructive testing of any completed weld. Designer must take this into account and specify any Nondestructive Testing (NDT) requirements as well as specifying which welds are to be subjected to nondestructive testing.

The designer is to consider whether any components included are likely to be fracture critical. Fracture critical components should be identified as requiring fabrication in accordance with a Fracture Control Plan.
Ensure welding conforms to the requirements of AWS D1.1/D1.1M, AWS D1.2/D1.2M, the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Provide welds of the types shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [____]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests. All components are to be stress-relief heat treated after welding where shown. Perform stress-relieving of components prior to the attachment of miscellaneous appurtenances. Submit a Stress Relieving Plan for approval which follows the minimum requirements for thermal stress relief in accordance with AWS D1.1. [Stress-relief heat treat all components after welding where shown. Perform stress-relieving of components prior to the attachment of miscellaneous appurtenances.] [Refer to Specification SECTION 05 50 14 STRUCTURAL METAL FABRICATIONS for nondestructive testing requirements.] [Submit a Fracture Control Plan (FCP) for fracture critical components.]

2.4.3 Bolted Connections

Ensure bolted connections conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.4 Machine Work

Ensure machine work conforms to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.5 Miscellaneous Provisions

Ensure miscellaneous provisions for fabrication conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.6 Fabrications

Submit samples approved prior to use of the represented materials or items in the work. Submitted samples of standard and shop fabricated items are required to be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded. Fabrications are required to conform to the following requirements.

2.4.6.1 Gate Leaf

The gate leaf is required to be a welded structural steel fabrication provided complete with [quoin and miter contact [blocks] [posts],] [miter guide assembly] [elastomeric bearing pads,] [hinge assemblies,] [pintle assembly,] [wheel assemblies,] [trolley assembly,] [tie-down assembly], [gate hooks,] seal assemblies, and other appurtenant components as specified and shown. [Proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved and performed as shown on approved detail drawings. Fabricate segments to permit easy field-assembly in as few segments as practicable to minimize the number of...
joints to be field-welded. Ensure the overall height of gate leaf does not vary from the nominal dimension [or differ from mating gate leaf] by more than 6 mm. 1/4 inch. The surfaces of framing elements to which [skin plates] [bridge planks] are to be welded are not to vary from a true plane by more than 6 mm. 1/4 inch. [Locate splices in [skin plates] [bridge planks] only where shown.] [In addition to welds specifically indicated for nondestructive testing, perform nondestructive testing on [_____] percent of the welds in the girders, verticals and [skin plate] [bridge planks] of the gate leaf. Locate these additional welds for testing as directed.]

2.4.6.2 Wall Quoin

The wall quoin consists of a welded structural steel frame with adjustable base anchors and adjustable quoin contact [block] [post].

2.4.6.3 Quoin and Miter Contact [Blocks] [Posts]

Quoins and miter contact [blocks] [posts] are to be made of stainless steel bars conforming to ASTM A276/A276M or ASTM A564/A564M. Make splices in the contact [block] [post] by an offset method so that there will not be a continuous joint across the [block] [post]. Mill contact faces of the contact [block] [post] at splices to assure watertight joints. [Locate splices in the gate leaf contact [block] [post] only at the centerlines of horizontal girders.] Provide contact [blocks] [posts] with adjusting bolts as shown.

2.4.6.4 Hinge Assembly

The outer cylinder of the hinge assembly is to be made of steel pipe conforming to ASTM A53/A53M, Type S, Grade B. The cylinder bushing and thrust washer are to be made of bronze casting conforming to ASTM B22/B22M, Copper Alloy UNS No. C91300. Fabricate hinge pin [and bearing pedestal for the lower hinge assembly] of stainless steel conforming to ASTM A276/A276M, UNS S 21800. [Fabricate the pedestal base plate for the lower hinge assembly] of stainless steel conforming to ASTM A240/A240M, UNS S 30400. The hinge assembly gusset, stiffener, and anchor plates are to be made from structural steel conforming to ASTM A36/A36M. [In addition to welds specifically indicated for nondestructive testing, perform nondestructive testing on [_____] percent of the welds in the hinge assembly and the welds connecting the hinge assembly to the gate framing. Locate the additional welds for testing as directed.] After all welding is completed, stress-relieve the hinge assembly by heat-treating. Perform stress-relieving prior to machining.

2.4.6.5 Pintle Assembly

The pintle assembly for miter gates consists of pintle socket, pintle, and pintle base as shown. Fabricate the pintle socket from cast nickel alloys and press-fit with an aluminum bronze bushing with bearing surfaces finished truly hemispherical. Fabricate the pintle of [cast alloy steel] [forged alloy steel] with bearing surfaces of corrosion-resisting steel. Finish the pintle ball to a 0.4 micrometer 16 microinch finish and fit into the bushing by scraping until uniform contact is attained over the entire bearing surface as determined by testing with carbon paper or other approved coloring. Match-mark the pintle ball with the bushing when fitted and so erected in the field. Fabricate the pintle base of cast steel. Drill and ream bolt holes for attaching pintle socket to gate leaf after the pintle socket is assembled with gate leaf.
Trolley Gate Trolley Assembly

The trolley gate trolley assembly consists of trolley beam, two (2) four-wheeled, push type trolleys, and trolley hangers. Provide trolleys that are of steel fabrication, a manufacturer's standard product, rated for a minimum load of [_____] tons (metric) (2000 lb) and suitable for operation on the trolley beam of the type and size shown. Provide single-flanged trolley wheels with a diameter of [_____] mm inches and with machine-finished wheel treads to conform with the trolley beam. Mount trolley wheels on weather-protected roller bearings and a removable axle and provide with accessible lubrication fittings. Support trolley hangers by the wheel axle and provided with a cross pin with machined grooves and retaining rings spaced at intervals of [_____] mm inches to accommodate a [_____] mm inch thick suspension lug. Locate the centerline of the cross pin [_____] mm inches below the bottom of the trolley beam. For proper clearance, ensure the maximum horizontal dimension from the centerline of the trolley beam to the end of the cross pin does not exceed [_____] m. [_____] ft [_____] in. Provide trolleys designed for continuous outdoor service and painted with the manufacturers standard paint system for outdoor operation.

Trolley Gate Overhead Support Beam

The trolley gate overhead support beam is required to conform to the details shown. The post-tensioned anchorage for support beam consists of ASTM A722/A722M, Type [_____] [_____] high-strength steel bars and prestressing system as specified in Section 03 23 00 STRESSED TENDON REINFORCING.

Rolling Gate Wheel Assembly

Provide the rolling gate wheel assembly complete with cast steel wheels as specified herein and fittings, couplings and hoses for lubrication of wheels. Fittings are required to be 6 mm 1/4 inch threaded-pipe fitting. Couplings are required to be 6 mm 1/4 inch stainless steel half coupling. Provide 6 mm 1/4 inch inside diameter, double-braided stainless steel flexible hoses. Ensure all couplings and hoses provided have a pressure rating of 21 MPa. 3,000 psi.

Rolling Gate Stabilizing Trolley Assembly

Fabricate the stabilizing support for trolley wheels from structural steel conforming to ASTM A36/A36M. Fabricate trolley wheels from steel rated for the minimum load shown. Provide single-flanged trolley wheels and ensure the wheel treads are machined-finished to conform with the guiding gate girder. Mount trolley wheels on weather-protected roller bearings and a removable axle and provide with lubrication fittings.

Seal Assembly

the seal assembly consists of rubber seals, steel retainer and spacer bars, [retractable support,] and fasteners. Provide continuous rubber seals over the full length. Fit the seals accurately and drill for proper installation. Drill bolt holes in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals are required to be fully molded and develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. Shop vulcanize splices. Locate the vulcanized splices between molded corners and straight
lengths as close to the corners as practicable. Place splices on a 45
degree bevel related to the "thickness" of the seal. Ensure the surface of
finished splices is smooth and free of irregularities. Field-splice steel
retainer bars only where shown. Machine-finish steel retainer bars after
splicing. [Provide the retractable support complete with hinge and
operating winch.]

2.4.6.11 Miscellaneous Embedded Metals

Provide wall armor, shear anchors, protection and seal plates and shapes,
and other miscellaneous embedded metals structural steel or
corrosion-resisting steel conforming with the details specified herein and
shown.

2.4.7 Shop Assembly

Shop assembly requirements for gates and appurtenant items are required to
be provided as shown and specified herein and in Section 05 50 14
STRUCTURAL METAL FABRICATIONS. Completely shop assemble gates and
appurtenant items, unless otherwise approved, to assure satisfactory field
installation. Fit and bolt together adjoining components to facilitate
field connections. Carefully preserve the match-marking of unassembled
items until the items are assembled. Cover mating surfaces and machined
surfaces with a rust preventive until assembly. Shop-weld assembled
components in their final positions as much as delivery and field
installation conditions will permit. Fit and drill rubber seals to match
the seal retainers, match-marked them, and remove for shipment. [Suspend
the trolley gate in the shop to verify its center of gravity location. If
the trolley gate is more than 3 mm 1/8 inch out-of-plumb in the suspended
position, balance it by means as directed.] Perform shop assembly and
disassembly work in the presence of the Contracting Officer unless waived
in writing. The presence of the Contracting Officer does not relieve the
Contractor of any responsibility under this contract.

2.5 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials
delivered to the site.

2.5.1 General

Tests, inspections, and verifications for materials are required to conform
to the requirements specified herein and in Section 05 50 14 STRUCTURAL
METAL FABRICATIONS.

[2.5.2 Testing of Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not
used, delete this paragraph.
**************************************************************************

Test the fluorocarbon film of rubber seals for adhesion bond in accordance
with ASTM D413 using either the machine method or the deadweight method.
Cut 25 mm 1 inch long piece of seal from the end of the seal which has been
masked and subjected to tension at an angle approximately 90 degrees to the
rubber surface. Ensure there is no separation between the fluorocarbon
film and the rubber when subjected to the following loads:
THICKNESS OF FLUOROCARBON FILM | MACHINE METHOD AT 50 MM 2 INCHES PER MINUTE | DEADWEIGHT METHOD
---|---|---
0.762 mm0.030 inch | 13.6 kg per 25 mm30 pounds per inch width | 13.6 kg per 25 mm30 pounds per inch width
1.524 mm0.060 inch | 13.6 kg per 25 mm30 pounds per inch width | 13.6 kg per 25 mm30 pounds per inch width

PART 3 EXECUTION

3.1 INSTALLATION

Installation per the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Assemble miter gates and appurtenant items for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Thoroughly clean and lubricate bearing surfaces requiring lubrication with an approved lubricant before assembly and installation. Ensure components to be field-welded are placed in correct alignment before welding is commenced. Design and submit handling attachments and pick points required to be added to any specified items herein prior to installation.

3.1.1 Embedded Metals

Accurately install sill assemblies, seal plates, frames, bases and other embedded metal items required for proper and complete installation to the alignment and grade required to ensure accurate fitting and matching of components. Primer coat all embedded metals with the required paint on all surfaces prior to installation in concrete forms. Install anchors for embedded metals as shown. Attach items requiring two concrete pours for installation to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Grind smooth welded field splices in sealing surfaces of embedded items.

3.1.2 Lower Hinge Assembly

Embed the base anchors for the lower hinge assembly in the first pour concrete. Attach the base plate to base anchors, set to the final position, and place epoxy fill in the void behind the base plates and then allow fill to reach the strength as shown and the approved field installation drawings. After the gate leaf is set in place, adjust the hinge assembly to provide for continuous contact between the sealing surfaces over the full height and length of the gate leaf. Make allowances for the seals which are not attach until painting operations are completed. Place second pour concrete after final adjustments are completed.

3.1.3 Gate Leaf

Assemble gate leaf components not assembled in the shop in the field as required for installation. [Coat lower hinge assembly bearings] [pintle ball] with grease prior to setting the gate leaf in place. [Flush the grease pipes prior to connecting to bearing.] Take all necessary precautions to avoid distortion of the gate leaf or any component parts. Exercise special care during installation to prevent any sag of the ends of the gate leaf due to compression of blocking or other causes. After the gate leaf has been set in place and the top hinge assembly installed, plumb the gate leaf and bring into correct position.
3.1.4 Diagonals

Attach gate leaf diagonals to the gate leaf after the leaf is set in place. Perform diagonals prestressing before the final adjustment of the quoin and miter contact [blocks] [post] are made. Prestress diagonals as specified, shown, and as approved on the Diagonals Prestressing Plan developed by the Contractor. Submit approved diagonal prestressing plan prior to initiating the prestressing operations. Submit diagonal prestressing record immediately after completion of the prestressing operations. Within the plan for prestressing the diagonals, describe the method of prestressing, including the materials, connections, rigging, anchorages, and stress measuring equipment. Compile a record of the prestressing operations consisting of the information indicated in the following table:

<table>
<thead>
<tr>
<th>Gate Leaf Location:</th>
<th>Date:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td>Diagonal</td>
<td></td>
</tr>
<tr>
<td>Strain Gage</td>
<td></td>
</tr>
<tr>
<td>Initial Readings</td>
<td></td>
</tr>
<tr>
<td>Final Readings</td>
<td></td>
</tr>
<tr>
<td>E (mm)(in.)</td>
<td>[_____]</td>
</tr>
<tr>
<td>D (mm)(in.)</td>
<td>[_____]</td>
</tr>
<tr>
<td>d (mm)(in.)</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

1. Collect initial strain gage readings after slack is removed.
2. Collect final strain gage readings after prestressing is complete.
3. E is the total elongation over the full length of the diagonal, computed from the strain gage readings.
4. D is the prestress deflection of the leaf as shown on the drawings.
5. d is the field deflection of the leaf measured after completion of the prestress operation; it is the deflection when final strain gage readings are taken.

[3.1.5 Top Hinge Assembly]

After the gate leaf has been set in place, install and adjust the top hinge assembly so that the center of the hinge pin is in vertical alignment with the center of the [pintle] [bottom hinge assembly pin]. When the top hinge pin is inserted, the gate leaf is required to swing horizontally throughout its range of movement. [Make any required final adjustments to the top hinge assembly after the gate leaf diagonals have been prestressed.] Make the second pour concrete after final adjustments are completed.

[3.1.6 Gate Leaf Quoin and Miter Contact [Blocks] [Posts]]

After the wall quoin has been adjusted and concreted in place and final adjustments made to the top hinge assembly, adjust the gate leaf quoin and miter contact [blocks] [posts] to provide continuous contact over the full height of the gate leaf in the mitered position. After the gate leaf diagonals are prestressed and final adjustments of gate leaf quoin and
miter contact [blocks] [posts] have been made with the gate leaf in the
mitered position, swing the gate leaf out of miter and pour [epoxy] [zinc]
filler behind the quoin and miter contact [blocks] [posts]. Prior to
pouring of the filler, ensure the surfaces to receive the filler are free
of dirt, rust, and other foreign materials. Coat the adjusting and holding
bolts with grease or other bond breaker to prevent adherence of the filler.

3.1.6.1 Placing [Epoxy] [Zinc] Filler

Epoxy Filler: Explicitly follow the manufacturer's instructions for
placing the epoxy filler. Take special precautions to prevent leakage of
the filler during placement. Ensure that the complete masses of the metals
whose surface areas are to receive the epoxy filler have a temperature of 15
to 30 degrees C. 60 to 90 degrees F. Keep the epoxy filler free from
moisture or other foreign materials during mixing and placement and for at
least 48 hours after placement. Conduct a field test to determine the
indentation hardness of the epoxy filler compound prior to placement. The
field test procedures are as follows:

a. Cast a 50 mm 2 inch cube sample of mixed epoxy filler compound in a
mold and cure at room temperature 20 to 25 degrees C 70 to 80 degrees F
for 24 plus or minus 8 hours.

b. Remove from mold and cut sample to expose interior surface.

c. Sand exposed interior surfaces to remove saw marks and provide a smooth
surface.

d. Using a Type D Durometer conforming to ASTM D2240, measure the hardness
across the exposed interior surface, taking a minimum of three readings
on each half of the sample. Take necessary care during the durometer
reading to insure the spring loaded pin used to penetrate the surface
is not in a depressed surface caused by either residual saw marks or an
exposed air bubble. The average reading should be at least 85, with no
individual reading below 82. If the durometer readings fall below the
required minimum values, the material will be rejected.

Zinc Filler: Immediately preceding the pouring of the zinc filler,
pre-heat the adjacent metal components to a temperature of 100 to 150
degrees C 212 to 300 degrees F by an approved method which does not buckle
the metal components. Pour the zinc filler at a temperature which will
insure that it will completely fill all interstices. Maintain pouring
temperature of zinc filler between 430 and 480 degrees C 810 and 900
degrees F to minimize volatilization and oxidation of the zinc.

3.1.6.2 Adjusting Contact [Blocks] [Posts]

After the [epoxy has set] [zinc has cooled], draw the quoin and miter
contact [blocks] [posts] against the filler by tightening the adjusting
bolts. After the contact [blocks] [posts] are adjusted, swing the gate
leaves into the mitered position without interference of the quoin contact
[blocks] [posts] and ensure the gate leaf quoin contact [block] [post]
makes tight contact with the wall quoin contact [block] [post].

3.1.7 Anchorage of Overhead Support Beam

Submit record of the post-tensioning operation for the trolley gate
overhead beam anchors, immediately after the anchorage is completed, set in
place and post-tensioned anchored as shown and as specified in Section

SECTION 35 20 16.59 Page 23
03 23 00 STRESSED TENDON REINFORCING.

]3.1.8 Rolling Gate Stabilizing Trolley Assemblies

Install rolling gate stabilizing trolley assemblies after the gate is set in place and properly adjusted. Place assemblies on the top girder of the gate leaf, attach to anchors embedded in the top of the supporting concrete wall, shim as required, and secure in place.

]3.1.9 Painting

Paint exposed parts of gates and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, and other specified surfaces as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.10 Seal Assemblies

Install rubber seal assemblies after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Fasten rubber seals securely to metal retainers. Before operating the gate[s], apply a suitable lubricant to the rubber seal rubbing plates to protect the rubber.

3.2 SYSTEM STARTUP

3.2.1 Trial Operation

After completion of the gate installation, conduct an examination of the gates in the presence of the Contracting Officer for final acceptance. First examine the gates to determine whether or not the workmanship conforms to the specification requirements. Operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates is the result in a condition where when the gates are in the closed position watertight barrier is formed across the opening. The contractor is required to make all repairs or replacements to correct defects, as determined by the Contracting Officer, at no cost to the Government. Repeat the trial operation after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.3 FIELD QUALITY CONTROL

Non-Destructive testing of field welds are required to meet the same quality control requirements of shop-welded components.

3.4 PROTECTION

Protect of finished work in conformance with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the technical requirements for hoist applications using a squirrel-type induction motor commonly used for control gates for outlet works; penstock gates, crest gates, spillway tainter gates, and other similar applications. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This specification is to be used as a section of a supply specification for the procurement of hoisting equipment, or, with only minor modification, it may be used as a section in a general contract specification.

The specification is general and covers all types and ratings of hoist applications used by the Corps of Engineers on Civil Works structures where a squirrel cage induction-type hoist motor is used.
The specification must be accompanied by a drawing or drawings showing the schematic wiring diagram of the control system for the particular application, along with a description of the scheme of operation and illustrations showing the several items of electrical equipment.

In adapting this specification to any project, the form and phraseology will be changed as necessary to properly specify the work contemplated. When technical deviations from this specification are considered necessary and the specification is not submitted to Headquarters, US Army Corps of Engineers (HQUSACE), for review, prior approval of (HQUSACE) will be obtained. Instructions for the preparation and submission of specifications for approval are included in ER 1110-2-1200.

The electrical equipment requirements contained herein are based upon experience and information gained from similar equipment now in service and are considered the most suitable for use on hydraulic structures.

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 RELATED REQUIREMENTS

Section 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS and Section 26 08 00 APPARATUS INSPECTION AND TESTING apply.

1.3 SYSTEM DESCRIPTION

All equipment furnished under these specifications will be subjected to [severe moisture] [moderately moist] conditions, [that operate over a temperature range of [_____] to [_____] degrees C F], and designed to render it resistant to corrosion. The general requirements to be followed are specified below; any additional special treatment or requirement considered necessary for any individual item is specified under the respective item.

1.3.1 Fastenings and Fittings

Where practicable, provide corrosion-resistant screws, bolts, nuts, pins, studs, springs, washers, and other miscellaneous fastenings and fittings or treat in an approved manner to render them resistant to corrosion.

1.3.2 Corrosion-Resisting Materials

Corrosion-resisting steel, copper, brass, bronze, copper-nickel, and nickel-copper alloys are acceptable corrosion-resisting materials. However, avoid contact between dissimilar metals as much as practicable, except where one of the dissimilar metals is steel or in the case of wiring and connections.

1.3.3 Corrosion-Resisting Treatments

Provide hot-dip galvanizing in accordance with ASTM A123/A123M or ASTM A153/A153M as applicable. Other corrosion-resisting treatments may be used if approved by the Contracting Officer.

1.3.4 Frames, Enclosing Cases, and Housings

Clean all surfaces of the enclosing cases or housings of controllers, brakes, limit switches, control stations, and other similar equipment, if other than plastic or stainless steel construction, of rust, grease, mill scale, and dirt and then treated with an approved iron and zinc phosphate solution followed by rinsing with a chromic acid solution, bonderizing, or equivalent process. Immediately after rinsing and drying, apply one coat of a zinc molybdate primer to the inside and outside surfaces and cure as required. For items of cast construction, the iron and zinc phosphate treatment may be omitted.

1.3.5 Finish Painting

**************************************************************************
NOTE: If severely moist conditions exist, a separate paint system should be specified using

SECTION 35 20 20 Page 7
Civil Works Guide Specification UFGS Section 09 97 02

PAINTING: HYDRAULIC STRUCTURES, system 21, epoxy finish or equivalent. When such painting is specified, care must be taken to specify a paint that will adhere to and not be injurious to the protective painting provided under these specifications.

**************************************************************************

Apply a minimum of two coats of paint to all equipment in accordance with the manufacturer's standard process for the conditions specified.

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

1.5 NAMING CONVENTION

Submit method of identifying conductors, terminal leads, and terminal blocks.
PART 2   PRODUCTS

2.1   HOIST MOTOR

**************************************************************************
NOTE: Coordinate with the respective electrical or mechanical designers to ensure motors are not being specified elsewhere in the contract documents and that all motor requirements are satisfied.
**************************************************************************

Submit motor characteristics, curves or tabulated data (tested or calculated), indicating the speed, power factor, efficiency, current and kilowatt input, all plotted or tabulated against torque or percent of rated motor load.

a. Submit calculations to determine the required horsepower rating of each motor.

b. Submit detailed descriptive specifications of the motor, with necessary cuts, photographs, and drawings to clearly indicate the construction of the machine. Place special emphasis on describing and illustrating features of "Insulated Windings," "Winding Heaters," "Bearings and Lubrication," and "Terminal Leads."

2.1.1   Motor Type

**************************************************************************
NOTE: When a single-speed motor or two single-speed motors in lieu of a two-speed motor is acceptable for the application, the designer will specify NEMA MG 1 standard design letter. The torque requirements listed in paragraph MOTOR LIMITS must be met, and the designer will verify that the design specified is sufficient. Design "C" and "B" have a 5 percent or less slip limit and are used where load inertia is lower. Design "D" has a 5 percent or greater slip and must be used where inertia is high. Designs "B," "C," and "D" provide progressively higher torques and get progressively more expensive. Design "B" will generally apply to motors from 745 to 2240 W 1 to 3 hp, design "C" to motors between 2.24 to 11 kW 3 and 15 hp, and design "D" for motors larger than 11 kW 15 hp. This a general guide according to NEMA minimum standards and may vary with manufacturer's specific equipment.

Totally-enclosed motors can be used in outdoor locations but are not suitable for submersion. At reduced cost, dripproof encapsulated construction may be used in protected locations. Consult manufacturer's data for information on application of this type motor to specific environmental conditions.
**************************************************************************

Provide a motor of the horizontal-shaft, squirrel-cage induction type [two-speed, two-winding, constant torque] [NEMA design [B] [C] [D]], designed for [full-voltage starting][adjustable speed drive operation], [of
water-proof, totally enclosed, fan-cooled or nonventilated frame construction], [dripproof, encapsulated frame construction]. The motor must conform to the applicable requirements of NEMA MG 1. Ensure the weep hole is at the lowest point of the motor for the intended installation.

2.1.2 Motor Rating

**************************************************************************
NOTE: For a two-speed motor, use single-voltage rating. Specify load conditions when Contractor designed. (Second Option) This specification covers three-phase motors which are suitable for most applications and must be used whenever possible. When utility three-phase power is unavailable and forces use of single-phase motors, this specification may be modified accordingly. Generally, single-phase motors used for this application should be below 19 kW 25 horsepower. The torque limits should be carefully evaluated, and the testing requirements should be changed. Please consult Engineering Manual (EM) 1110-2-2610.
**************************************************************************

[The motor must be rated [_____] horsepower, [_____] rpm synchronous speed for the machinery design shown on the drawings or, if the design is changed as permitted by [____], must have a horsepower rating as required by performance requirements specified to [____].] [The motor must have a horsepower rating as required by the load conditions specified in [____].] The motor must be rated for continuous full-load operation without exceeding the standard temperature rise for the class of insulation and frame construction used, and it must be wound for [_____] [230/460] [460] volts, three-phase, 60-Hz.

2.1.3 Motor Torque

**************************************************************************
NOTE: The torque values are those required by design guidance given in EM-1110-2-2610. The gate design must be coordinated with the requirements of this document to ensure that torque limits are met. Reducing the upper limit or raising the lower limit will result in significant cost increase and should be avoided where ever possible.
**************************************************************************

2.1.3.1 Motor Limits

The torque limits for each individual winding must be as follows:

a. Upper Limit: The upper limit of the torque between locked-rotor and breakdown must be not more than 280 percent of the rated full-load torque of the motor.

b. Lower Limit: The lower limit of the torque between locked-rotor and breakdown must be as high as possible consistent with good design but not less than 150 percent of the rated full-load torque of the motor.

c. When the characteristics of a motor or the winding of a motor results in a speed torque curve without a definite value of breakdown torque,
the limitations on the minimum value of torque must apply between locked-rotor and 75 percent of synchronous speed.

[2.1.3.2 Single-Speed Motor Limits

**************************************************************************
NOTE: Permit the use of two single-speed motors in lieu of a single two-speed motor where space is not a concern, and a two-speed motor cannot meet the specifications requirements.
**************************************************************************

Two single-speed motors may be used in lieu of a two-speed motor, providing the synchronous speed of the high-speed motor is not more than 1,800 rpm's and the low-speed motor will conform to the 50 percent over-speed requirements of the high-speed motor.

[2.1.4 Frames and Shafts

**************************************************************************
NOTE: Shafts of stainless steel may be specified in lieu of manufacturer's standard treatment where extremely corrosive atmospheres exist. The use of stainless steel will change the motor design and increase the shaft diameter at a significant cost. Manufacturer's should be consulted before specifying stainless steel in a given application.
**************************************************************************

Size and dimensions of frames must conform to NEMA MG 1. Provide eye bolts on all motors. Provide each motor with a drain-breather which must be located to prevent accumulation of water inside the motor. Frames must have corrosion prevention in accordance with the requirements of paragraph CORROSION PREVENTION AND FINISH PAINTING. Exposed portions of shafts must be treated with manufacturer's standard primer and two coats of moisture proof varnish in accordance with the manufacturer's recommendation.

2.1.5 Windings and Insulation

**************************************************************************
NOTE: Select insulation class based on NEMA temperature requirements as follows:

<table>
<thead>
<tr>
<th>CLASS</th>
<th>LIMITING TEMPERATURE (in degrees Celsius)</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>130</td>
</tr>
<tr>
<td>F</td>
<td>155</td>
</tr>
<tr>
<td>H</td>
<td>180</td>
</tr>
</tbody>
</table>

Selection of insulation class should be left to the Contractor when he is also responsible for motor design, but in no case should it be less than Class B. Class F is typical.

Designer will provide ambient temperature values
where possible.

Insulation must be Class [B] [F] [H] [B or better as required for design conditions] with special moisture, [fungus], and oil proof treatment. Design and construct motors to withstand the environmental conditions specified. The following specifications describe the minimum requirements for acceptable insulation and are not intended to restrict or prohibit the use of materials or methods which will give equal or better performance. Temperature rise must be no greater than [80] [_____] degrees C [176] [_____] degrees F.

2.1.5.1 Insulated Windings

Unless otherwise approved, completely assemble insulated windings in the motor core before impregnating with the insulating compound. Insulating compound must be 100 percent solid. Use the vacuum impregnation method followed by baking to impregnate the windings with the insulating compound. Repeat the procedure as often as necessary to fill in and seal over the interstices of the winding, but in no case must the number of dips and bakes be less than two dips and bakes when the vacuum method of impregnation is used.

2.1.5.2 Magnet Wire

The magnet wire must have an insulation or combination of insulations with an insulation thickness not less than that required for the environment specified and the temperature rating as required by the hot-spot temperature of the motor.

2.1.6 Winding Heaters

NOTE: Delete this paragraph and the requirement for "Winding Heaters," if dripproof encapsulated motor is used. Additionally, the designer should consider elimination of winding heaters if possible in other situations, i.e. where the probability of condensation is low. In the past, heaters have been a maintenance problem and have been disconnected by project personnel.

A heater or heaters must be installed in the motor frame or end bells or wrapped around the winding end turns. Heaters must meet the requirements of paragraph HEATERS-GENERAL. Heaters installed around the winding end turns must consist of the required turns of heating cable wrapped around the end turns and secured in place before the motor windings are impregnated.

2.1.7 Bearings and Lubrication

NOTE: The use of sealed bearings should be limited to special applications. Sealed bearings do not require as much maintenance but reduce the overall life of the motor.
UFGS

Provide the motors with antifriction bearings. The design of the housing and method of assembly must permit ready removal of the end brackets and prevent escape of lubricant and entrance of foreign materials. Bearings must be fitted with bronze or other approved bushings to prevent any binding of moving parts. Approved antifriction bearings of corrosion resisting construction may be used. Bearings [must be of an approved prelubricated type requiring no addition or change of lubrication for a period of at least 5 years] [must have fitted openings located on the top and bottom of the bearing housing. The openings must be readily accessible for applying and draining the lubricant]. Pressure lubrication fittings may be used provided the housings are properly vented to prevent damage to the seals. When the brake housing or other equipment is to be assembled adjacent to or bolted to the motor end bell, provide suitable filler and drain pipe extensions, with the ends properly fitted and easily accessible. For those applications where the brake wheel is mounted on a shaft extension on the front end of the motor, the bearing housing, or a suitable flange, must provide a suitable surface and connecting means to allow the fastening of the brake enclosure to the bearing housing (see paragraph BRAKE ENCLOSING CASE).

2.1.8 Terminal Leads

Terminals leads must extend outside the frame; must have insulation equivalent to that of the motor winding; must be terminated in a two-piece, watertight terminal box secured rigidly to the motor frame; and must be suitably identified. Position and seal leads where they pass through the frame with a water-resistant seal of a synthetic rubber material or a synthetic rubber gasket. Terminal box must have threaded conduit entrances on a minimum of four sides.

2.1.9 Machine Work

Machine work must be accurate, of high quality, and in conformity with approved standard practice. Threads must be in accordance with ASME B1.1. Thread fittings must be Class 2. Threads on all body-bound bolts must be chased a sufficient length so that when the nut is tightened there will be approximately one and one-half full threads under the nut. Provide all bolts and cap screws with lock washers.

2.1.10 Designation and Markings

Attach motor nameplates of a suitable corrosion-resisting material to the frame of each motor. Motor nameplates must indicate clearly the motor NEMA temperature and insulation class, continuous amperage rating, voltage rating, operating frequency, rated RPM, horsepower rating, nominal efficiency, NEMA locked rotor code letter and serial number. In addition, the nameplate must show a lead connection diagram. Identification or serial numbers must be die stamped on the frame.

2.1.11 Heaters

2.1.11.1 Heater Ratings

Heaters must be of such rating that, when energized, the temperature of the windings or enclosure will be held approximately 10°C above ambient. They must be designed for 120 volts AC and for continuous operation under the conditions of installation. The rate of heat dissipation must be uniform throughout their effective length.
2.1.11.2 Insulation

Insulation for the heating cable (winding wrap around type) heaters must be suitable for a conductor temperature of 180°C.

2.1.11.3 Heater Terminals

The terminals of the heater, including the leads, must be watertight. The leads must be terminated and sealed in a watertight terminal box located as selected by the motor manufacturer. The method of sealing must be as specified for the motor winding leads.

2.2 BRAKE

**************************************************************************

NOTE: Coordinate with the respective electrical or mechanical designers to ensure brakes are not being specified elsewhere in the contract documents and that all brake requirements are satisfied.

**************************************************************************

Submit detailed descriptive data covering the brake, with necessary cuts, photographs, and drawings to indicate clearly the construction of the brake and the materials used. Include releasing device specifications and characteristics, including input current minimum voltage required for brake release.

2.2.1 Brake Type

The brakes must be of the shoe type, spring set, type and must be completely enclosed in a watertight and dusttight enclosing case arranged for [floor mounting] [motor mounting].

2.2.2 Brake Rating

**************************************************************************

NOTE: Delete paragraph b. if constant torque two-speed motor or a single-speed motor is specified.

**************************************************************************

a. The brake must have a torque rating not less than 150 percent of the full load torque of the motor when referred to the shaft on which the brake wheel is mounted, efficiency of speed reducer not being considered. The torque rating must be based on open construction, [1-hour] [continuous] duty.

b. [The brake must have a torque rating of [_____] pound-feet as shown on the plans, or if the design is changed as permitted by [____], the brake must have a torque rating not less than 150 percent of the full-load torque of the motor when referred to the shaft on which the brake wheel is mounted, efficiency of speed reducer not being considered.] [For a two-speed motor, compute the rating from the full-load torque of the low-speed winding of the motor.]

2.2.3 Adjustment

Provide means for varying torque required for holding. Additionally, the brake must have means of adjusting the position of the shoes to compensate for wear, unless the design is such that compensation for shoe wear is
2.2.4 Release

2.2.4.1 Releasing Magnets and Rectifier

**************************************************************************
NOTE: Coordinate voltage requirements with paragraph MOTOR RATING.
**************************************************************************

The releasing magnets must be of the DC or AC shunt type and of standard stock design, suitable for operation on [_____] [230] [460]-volt, 60-Hz, AC electrical power. Supply direct current by means of a self-contained rectifier unit of proper rating. The complete unit must be suitable for connection to the control circuit or the power circuit of the motor with which the brake is used so that the brake will set or release when the motor is deenergized or energized, respectively. The brake releasing magnet must be rated in accordance with the brake rating requirements of paragraph MOTOR RATING. The brake releasing magnet must be sufficient to release and hold the brake in the released position with 85 percent of rated voltage impressed on the incoming terminals. When a rectifier is required, mount it in the motor controller enclosing case unless otherwise noted.

2.2.4.2 Hand Release

Provide hand release. Hand release must be operable only when the enclosing case cover is removed and must be self-resetting.

2.2.5 Terminal Leads

Connecting leads from the releasing magnet must be extended outside the enclosing case and must terminated on a terminal block located in a watertight terminal box. The terminal box must be rigidly bolted or equally secured to and on the outside of the lower or fixed half of the enclosing case. The terminal box must provide for conduit entrances on four sides. All conduit entrances to the brake terminal box must be threaded. The leads inside the brake enclosing case must be suitably protected. Terminate enclosing case space heater leads in the same manner in separate terminal boxes.

2.2.6 Brake Enclosing Case

**************************************************************************
NOTE: Manufacturers do not generally weld enclosures. Welding required only where conditions require substantial construction and costs may be justified.
**************************************************************************

Submit dimensioned outline drawings showing specific relationships and clearances between equipment and their component parts. The outdoor NEMA Type 4-watertight enclosing case must be [welded type] [in accordance with the manufacturer's standard practice for the conditions indicated]. In order that the brake mechanism will be accessible from above, when the upper half or cover of the enclosing case is removed, the enclosing case must be constructed to give equal accessibility to all portions of the brake. Make the joint between the two halves with a synthetic rubber
gasket, not less than 6 mm 1/4 inch in width, and held in place by embedding in a groove or by other equally effective means. For those applications where the brake wheel is mounted on a shaft extension on the front end of the motor, the enclosing case must be arranged to permit bolting to the bearing housing of the motor, the joint being made watertight with a gasket. For those applications where the brake wheel is mounted on a shaft of the operating machine or on a flange and shaft extension on the front end of the motor, suitable watertight seals must be provided on each part of the housing. The shaft seals must be arranged for pressure lubrication and must be adjustable for alignment relative to the shaft. An automatic drain breather, located in a protected location, must be provided in the lower part of the enclosing case. If the drain breather cannot be located in a protected location, the tapped hole must be plugged and the drain furnished separately for installation in the field. Provide enclosing case space heaters conforming to the applicable part of paragraph HEATERS-GENERAL. The enclosing case must be treated to render the steel resistant to corrosion as required by paragraph CORROSION PREVENTION AND FINISH PAINTING.

2.2.7 Mechanical Construction

Use no cast iron in brake construction, except for brake wheels, shoes, and electrical parts. All pins, fittings, and other miscellaneous small metal parts must be of approved corrosion-resisting metal or must be treated to render them corrosion-resistant as required by paragraph CORROSION PREVENTION AND FINISH PAINTING. Bearings must be fitted with bronze or other approved bushings to prevent any binding of moving parts. Approved antifriction bearings of corrosion-resisting construction may be used. Provide approved means for lubrication for all bearings, unless bearings are of an approved self- or prelubricated type. The machine work must conform to the requirements for the motor with which the brake is used.

2.2.8 Designation and Markings

Provide and attach a nameplate of suitable corrosion-resisting material to a part of the brake which ordinarily will not be renewed during its service life. The nameplate must conform to standard practice and clearly indicate the manufacturer's name, identification symbols, serial number, and salient design features such as type, frame, torque, rating, voltage, phase, and frequency. If adjustment is required, pertinent information for making the adjustments is necessary.

2.3 CONTROL SYSTEM

**************************************************************************
NOTE: The scheme of control shown on the applicable plate at the end of this document should be retained where possible.

The Plates listed below, containing the related control sequences, are attached at the end of this spec.

PLATE NO. SUBJECT
1. Crest Gate, Electrical Control System (With Approximately 300 mm 1.0 Foot Increments)
2. Crest Gate, Electrical Control System (With Approximately 150 mm 0.5 Foot Increments)

3. Crest Gate, Electrical Control System (With Remote Control and Approximately 300 mm 1.0 Foot Increments)

4. Crest Gate, Electrical Control System (With Remote Control and Approximately 150 mm 0.5 Foot Increments)

5. Outlet Control Gate, Electrical Control System (Single-Speed Motor)

6. Outlet Control Gate, Electrical Control System (Multispeed Motor)

7. Intake Gate, Electrical Control System.

In some instances, where control for a penstock intake gate hoist where the emergency lower control switch is to be located in the powerhouse, the length of the connecting circuit may be such that its mutual inductance may render the circuit susceptible to false operation. In such cases, it will be necessary to use direct current and interpose an additional control relay. The direct current can be provided from a rectifier located in the control cabinet or from a circuit on the powerhouse control battery.

Use Section 40 60 00 or similar specification if PLC control is required.

**************************************************************************

The scheme of operation of the [outlet control gate] [tainter gate] [intake gate] hoist motor control system must be as described and indicated. The control system must include the controller, limit switch[es], control station[s], and such other items as may be required to accomplish the operating features specified. Each item must be [installed and] tested as specified and must be complete and ready for operation [, when installed under another contract,] in accordance with the scheme of operation.

2.4 CONTROLLER

**************************************************************************

NOTE: Separate mounting of the controller is usually the preferred practice. When mounting the controller on the hoist frame is desired, the Contractor will be required to submit a drawing showing the arrangement of the controller and other electrical equipment on the hoist frame. In this case, the electrical equipment should be wired in the shop complete and ready for operation upon bringing the power connection to the line side of the controller disconnect switch.

**************************************************************************

Submit a description of the operation scheme, if other than herein
specified or shown on the drawings; a dimensioned outline drawings showing specific relationships and clearances between equipment and their component parts, detailed panel layouts, schematic wiring diagrams, and a panel wiring diagram dimensioned outline drawings showing specific relationships and clearances between equipment and their component parts. Submit detailed descriptive data covering all component parts of the controller.

2.4.1 Controller Type

**************************************************************************
NOTE: Adjustable speed drives (ASD) are appropriate for gates hoisted on each side and requiring skew control. Full-voltage magnetic starters are appropriate when using a torque shaft across the gate or when using wound-rotor motors to form a virtual shaft for skew control.
**************************************************************************

The hoist motor controller must be an adjustable speed drive (ASD) in accordance with Section 26 29 23 ADJUSTABLE SPEED DRIVES (ASD) SYSTEMS UNDER 600 VOLTS. The controller must be of the full-voltage magnetic type initiated by the push-button control station and controlled automatically by a limit switch or limit switches. Limit switch(es) must be driven by the hoist mechanism or other auxiliary operating devices as indicated or required to provide the sequence of operation specified or indicated on the plans.

2.4.2 Protection

The controller must provide under-voltage protection, inverse-time-limit overload protection, or other protection as indicated or specified. In addition, the controller must provide protection from single-phase faults. Accomplish the protection by suitable relays conforming to the requirements of paragraph RELAYS. Overload relays must provide protection during both the starting and running condition, and provide means to manually reset the relays without opening the enclosing case of the controller. All forward and reversing contactors must be electrically interlocked. Controller disconnecting circuit breaker[s] must be interlocked with the controller enclosing case access door to permit opening or closing the access door only when the disconnect is in the "OPEN" position.

2.4.3 Enclosure

**************************************************************************
NOTE: When controller is mounted in a dry room or gallery adjacent to the hoist equipment adjacent to the hoist equipment, a NEMA Type 12, industrial-use enclosure should be specified and the drawings and specifications revised accordingly. Hubs must be specified for all conduit entrances.
**************************************************************************

Wall mounting is generally the least costly alternative and should be used whenever practical.

Designer must coordinate padlock requirements with local physical security standards.
Enclosing cabinet must be of the NEMA Type [3R (stainless steel)] [4 watertight (stainless steel) and moisture-resisting] [12 industrial use] construction with interior dead-front panel meeting the requirements of NEMA ICS 6. Design the enclosing cabinet for [floor mounting] [mounting on the hoist frame] [wall mounting]. Provide suitable padlock eyes to allow locking the exterior door in the closed position. Provide padlocks, conforming to [______,], with each controller and chained to the enclosing case. The chain must be of a nonferrous material resistant to corrosion. Use only front-connected devices, and clearances must be in accordance with NEMA ICS 1 requirements. Provide threaded hubs for conduit entrance of the welded-in type as indicated on the drawings or as required to make the wiring connections. Provide an automatic breather-drain, not less than 3/8-inch size and located in a protected location and at the lowest point of the enclosure.

2.4.4 Circuit Breakers

Provide and assemble circuit breakers as shown on the drawings or specified in the housing of each controller.

2.4.4.1 Circuit Breakers - General

Each circuit breaker must be listed for UL 489. The circuit breakers must be manually operated and must be of the instantaneous trip type, unless otherwise specified or indicated on the drawings. Circuit breakers for cabinet heaters, lights, and receptacles must be of the inverse-time trip type. All poles of each breaker must operated simultaneously by means of a common handle and must be enclosed in a common molded plastic case. The contacts of multipole breakers must open simultaneously when the breaker is tripped manually or automatically. The operating handles must clearly indicate whether the breakers are in "ON," "OFF," or "TRIPPED" position. Each circuit breaker must be externally operated [and interlocked] as specified in paragraph PROTECTION. Provide approved means for padlocking the breaker[s] operating handle in the "OFF" position. Provide a padlock of the same type as specified in paragraph ENCLOSURE for each breaker[ and chained the padlock to the enclosing case]. The circuit breakers must be products of only one manufacturer and must be interchangeable when of the same frame size.

2.4.4.2 Trip Units

Except as otherwise indicated on the drawings, provide the circuit breakers with combination thermal and instantaneous magnetic trip units unless otherwise indicated. The minimum frame sizes and the trip unit ratings must also be as required for the equipment controlled. Nonadjustable instantaneous magnetic trip unit must be set as approximately 10 times the continuous current ratings of the circuit breakers.

2.4.4.3 480-Volt AC Circuits

Circuit breakers for 480-volt AC circuits must be rated 600 volts AC and must have a minimum NEMA interrupting capacity of 14,000 symmetrical amperes at 600 volts AC.

2.4.4.4 120-Volt AC Circuits

Circuit breakers for 120-volt AC circuits must be rated not less than 120/240 or 240 volts AC and must have a minimum NEMA interrupting capacity of 10,000 symmetrical amperes.
2.4.4.5 125-Volt DC Circuits

Circuit breakers for 125-volt DC circuits must be two-pole rated 125/250 or 250 volts DC and must have a minimum NEMA interrupting capacity of \([5,000]\) \([10,000]\) amperes DC.

2.4.5 Assembly of Controller

Furnish all necessary circuit breakers, contactors, relays, resistors, interlocks, master switches, limit switches, or other devices required by the scheme of operation. The panel for mounting the relays and contactors must be sheet steel of sufficient thickness to provide rigid support for the equipment mounted thereon. Give the steel panel a corrosion resisting treatment in accordance with the requirements of paragraph CORROSION PREVENTION AND FINISH PAINTING.

2.4.5.1 Wiring

Submit data sufficient to demonstrate that the proposed wire and cable conform to these specifications. Insulated wire must conform to the requirements of paragraph CONDUCTORS. Securely hold all wiring in place and arrange in a neat and orderly manner in horizontal and vertical runs. Protect with grommets all wiring passing through steel gutters, unless the openings in the steel gutter are formed to protect the wiring from damage. [All controllers must be wired in like manner as to location of parts and phase sequence.] Neatly and legibly identify the wire and terminal numbers in an approved manner. Use terminal blocks for making all external connections.

2.4.5.2 Terminal Blocks

Terminal blocks for control wiring must be molded type with barriers, rated not less than 600 volts. Provide terminal blocks with covers. The terminals must be removable, screw type, or of the stud type with contact and locking nuts. The terminals must not be less than No. 10 AWG in size and must have sufficient length and space for connecting at least two indented terminals on No. 10 AWG conductors to each terminal. The terminal arrangement must approved by the Contracting Officer.

a. Provide not less than 10 percent, but in no case less than 2, spare terminals on each block. Terminal blocks for conductors larger than No. 10 AWG or with a capacity of more than 30 amperes must be adequate for the purpose intended, having length and space for at least two indented terminals of the size required on the conductors to be terminated.

b. For conductors rated more than 50 amperes, all screws must have hexagonal heads. For conductors rated 50 to 99 amperes, the minimum screw size must be \(8 \text{ mm } 5/16\) inch. Conducting parts between connected terminals must have adequate contact surface and cross section to operate without overheating.

c. Provide white or other light-colored marking strips, fastened by screws to the molded sections at each block, for circuit designation. Each connected terminal of each block must have the circuit designation or wire number placed on the marking strip with permanent marking fluid. Furnish one reversible or one spare marking strip with each block.
2.4.6 Magnetic Contactors

2.4.6.1 Contactor Ratings

All heavy-duty magnetic contactors must be of the voltage rating indicated on the drawings or otherwise required. They must have a horsepower rating not less than the horsepower rating of the motor with which the controller is to be used, but the contactor used must not be smaller than NEMA, Size 1. The contactors must meet the requirements of NEMA ICS 2 and have continuous current ratings for the duty indicated. Contactors must be suitable for at least 200,000 complete operations under rated load without more than routine maintenance. They must operate successfully on 10 percent over-voltage and 15 percent under-voltage. The interrupting capacity must conform to NEMA standards. Provide mechanical interlocking between contactors as indicated or required and without any mechanical attachment between the interlocking mechanism and the moving parts of the contactor, unless otherwise approved by the Contracting Officer.

2.4.6.2 Arcing Protection

For each pole, the interruption arc and flame must be minimized by suitable arc chutes or other means so that no damage will be done to other portions of the device. The arc chutes, if provided, must be easily removable without removing or dismantling other parts.

2.4.6.3 Contactors

All current carrying surfaces must be of a silver alloy or of copper faced with a silver alloy and must be easily accessible and removable for replacement. Contactors must operate without chatter or perceptible noise while energized. Coils must be suitable for continuous operation on the voltage specified.

2.4.6.4 Construction

Provide each contactor with a minimum of three auxiliary contacts which may be easily changed from normally open to normally closed. Construct contactor to prevent corrosion in accordance with paragraph CORROSION PREVENTION AND FINISH PAINTING.

2.4.7 Relays

2.4.7.1 Control

**************************************************************************
NOTE: The numerical portion of the contact rating indicates the maximum operating voltage (e.g. 600 for 600 volts). The letter portion indicates the maximum operating current and AC or DC. Over-sizing the current rating will increase the life of the contacts. See NEMA ICS 5. Choose A600 for the highest-rated contacts on AC control circuits. Choose N600 for the highest-rated contacts on DC control circuits.
**************************************************************************

Control relay devices must meet applicable requirements of NEMA ICS 5 for Class [A600][N600] contacts. All contacts must be of a silver alloy or copper faced with a silver alloy.
2.4.7.2 Overload

Overload relays must meet the requirements of NEMA ICS 2 rated Class [20]_. Relays must be the adjustable electronic type with normally closed control circuit contacts having a pilot and control circuit contact rating per paragraph CONTROL. Overload relays must have combination manual and automatic-type reset. They must have inverse-time tripping characteristics simulating the heating characteristics of the motor, must protect the motor against exceeding its specified temperature rise under any overload, stalled rotor, or single-phase condition, and must be self-protecting under all conditions, except short circuit. The relay must measure the current and electronically model the motor's thermal condition. The means of adjusting the nominal rating must be sufficiently accurate to allow setting the relay at the full-load current value of the motor with which used. Reset mechanism must be trip free and arranged for manual reset in accordance with paragraph PROTECTION, unless automatic reset is indicated. Design the reset mechanism to permit changing from manual to automatic reset or vice versa without the use of special tools. Submit curves showing the overload relay tripping time versus current characteristics of the overload relays for the controller.

2.4.8 Control Transformer

The control transformer must be a standard, single-phase, 60-Hz, dry-type, [480]_—120 volts, and with kVA rating sufficient to supply the control [and heater] circuits.

2.4.9 Control Voltage

******************************************************************************
NOTE: Control circuits and pilot devices operating under 50 volts are safer for operating and maintenance personnel per NFPA 70E.
******************************************************************************

Provide a switched-mode power supply for control circuits and pilot devices unless otherwise indicated for specific devices. Feed the power supply from the control transformer. Output voltage must be [24 volts DC]_.

2.4.10 Control Circuit Breakers

The control circuit breakers must conform to the requirements of paragraph CIRCUIT BREAKERS, except that an external operating mechanism is not required.

2.4.11 Indicating Lights

Indicating lights must be complete with LED lamps, full-voltage with internal power supplies, [push-to-test, ]and lens or color caps. Lens and lamp must be removable from the front. They must be suitable for flush or semiflush mounting to the exterior cabinet door with [plastic][metallic] bevel and size [20 mm][30mm]_. Exterior mounting of the indication lights must meet the requirement for the enclosure NEMA type. Use hinge wire for connections between the indicator lights and the terminal block.
2.4.12 [Plug Receptacle for Inching Pendant Control Switch

**************************************************************************

NOTE: Inching pendant control switch in paragraph INCHING STATION, and receptacle is not required on crest gates. Omit requirement for receptacle on controller enclosure and mount receptacle on wall of gate inspection room if inspection room is above maximum flood.

**************************************************************************

The receptacle body must be weather resistant with threaded cap and gasket complete with polarized female contact unit, four-wire, five-pole, grounded through shell and extra pole, and rated 30A, 460 volts.]

2.4.13 Equipment and Door Nameplates

Submit schedule of nameplates. Provide nameplates for the front of the cabinet door and for each item of equipment within the enclosure. Use anodized aluminum, stainless steel, or a laminated plastic sheet with black surface layer and a white bottom layer not less than 1/16 inch thick for the nameplate material. Identify equipment within the enclosure with nameplates or other suitable marking on the equipment unit base or on the panel.

2.4.14 Heater

[Where indicated,] [Each] control panel(s) must be provided with a thermostatically controlled electric heater capable of maintaining an enclosure temperature of [2] [_____] degrees C [35] [_____] degrees F when continuously exposed to an ambient temperature of [_____] degrees C degrees F.

2.4.15 Grounding

Make the ground connection for the controller enclosing cabinet by a threaded post fitting which extends through the enclosure wall and which is provided with fittings to connect No. 6 AWG stranded copper ground wire both inside and outside the enclosure. Inside the enclosure, the ground circuit must be extended with No. 6 AWG stranded copper wire from the connector to the panel.

2.5 CONTROL STATION[S]

**************************************************************************

NOTE: If possible, select contact ratings greater than the load to increase the lifespan of the contacts.

**************************************************************************

Control station[s] must be of the push-button type and must provide the number of indicating lights and individual switches of the type or types required by the scheme of operation. Enclosure must be NEMA 250 Type [3R] [4 watertight [stainless steel]] [12 industrial use] construction. All contacts must be of the double-break bridging type and must have a pilot and control circuit rating designation of [A600][N600][_] in accordance with NEMA ICS 5. Provide switch cases with threaded bosses for conduit or cable connection and provide ample wiring space for conductors of the size and insulation specified. Submit detailed descriptive data covering the
control station[s] for approval before fabrication. Data must include schematic diagrams, wiring diagrams, layout drawings, and parts lists.

2.5.1 Primary Station

**************************************************************************
NOTE: Use padlocked stop switch on all hoists except intake gate hoists provided with remote lowering. Intake gate hoists may use either padlock or "substantial metal cover" alternate. If metal cover alternate is used, the emergency lower contact "ELS" in parallel with the stop switch contact should be deleted.
**************************************************************************

**************************************************************************
NOTE: Use lamp colors in accordance with the "safety" scheme of NFPA 79-2015 Table 10.3.3.

**************************************************************************

Arrange the primary station with the elements stacked vertically and with [____]-inch conduit entrance from the bottom. The station must provide [a red indicating light and] [3] [4] operating rocker handle-type push buttons. Arrange the station starting at top with [a red light followed by] the "RAISE," ["CONDUIT OPEN,"] "LOWER," and "STOP" push buttons. The station switch elements must have nameplates with the above designations. [Provide the "STOP" switch with means of padlocking the switch in the stop or in the open position.] [Provide the station with a substantial removable or hinged metal cover which can be locked in the closed position to prevent operation of the switch elements.] The padlock must be chained to the enclosing case with a chain made of nonferrous material.

2.5.2 Inchling Station

Arrange the inching station with the elements stacked vertically and with conduit entrance on the top for a cable clamp. The cable must be [____] feet of five-conductor, No. 12 AWG portable cable with extra flexible conductors, heat and moisture resistant insulation, and outer Neoprene jacket. The station must have two rocker handle-type push buttons. The switch elements must be designated "INCH UP" and "INCH DOWN" from top to bottom, respectively.
2.6 PROGRAMMABLE LIMIT SWITCH

Submit dimensioned outline drawing of the limit switch. Show on the Drawings specific relationships and clearances between equipment and their component parts.

a. Submit all limit switch computations used to determine the selection of gear ratios and calibration for gate travel.

b. Submit complete descriptive data covering the limit switch with necessary cuts, photographs, and drawings to indicate clearly the construction, materials used in the parts, rating, accuracy of tripping and reset, method of adjustment, and safeguards.

2.6.1 Normal Operation

The limit switch must be the programmable type with digital display and must operate on [24 volts DC][120 volts AC]. It must contain all the contacts required for making and breaking all control and interlocking circuits necessary for the proper control and operation in the manner specified or required.

2.6.2 Construction

The limit switch must be of compact and rugged construction, totally enclosed in a NEMA Type 12 case, and housed within the controller enclosure. The digital display must be visible without opening the enclosure door. This viewing port in the door must have a replaceable gasketed piece of clear plastic mounted to maintain the NEMA rating of the enclosure. Provide the cover with cap screws or other approved means for readily breaking the cover free for removal unless the gasket is so designed that it will not stick. All parts must be of corrosion-resisting metal or treated in an approved manner to render it resistant to corrosion. The switch must permit final adjustment in the field. Provide tapped bosses for making all conduit connections to the switch. Provide a clamp-type connector bolted to the outside of the case for making ground connections.

2.6.3 Switches

Switches must be solid state with current rating as required. Assemble or combine switches into operating units as indicated on the plans. Provide them with suitable terminals for connecting the external conductors. Switches must provide one remote digital readout. Each terminal must be suitably marked or tagged with the wire number shown on the contract drawings. Design the tripping mechanism for fail-safe operation and resetting the contacts when moving in the reverse direction. The switch must have an operator lockout feature which permits programming only by authorized personnel.

2.6.4 Transducer

**************************************************************************
NOTE: Consider using a resolver if the point of measurement is exposed to significant heat, moisture, or vibration because resolvers do not contain optics or electronics. However, encoder feedback systems are simpler.
**************************************************************************
The position sensor must be heavy-duty [resolver][encoder] enclosed in an outdoor NEMA 4 watertight enclosure. Provide a cable [chain] connector for the enclosure which is suitable for No. 16 AWG shield twisted pair.

2.6.5 Accuracy of Trip and Reset

**************************************************************************
NOTE: For installations where water control requires gate travel of over 9 m 30 feet, measurement of gate travel may become nonlinear. This is due to stretching of the wire rope. The attachment point for measurement of travel should be as near the switch as possible and need not be at the top of the gate. The designer must investigate possible options, including use of chain and additional limit switches.
**************************************************************************

Design the switch elements and operating mechanism of the limit switch to provide uniform and accurate setting. The switch must accurately transmit position within + 75 mm/- 3 inches and must reset gate for drift exceeding 150 mm 6 inches.

[2.7 OVERTRAVEL LIMIT SWITCHES]

**************************************************************************
NOTE: The requirements for positively-driven and force-guided limit switches imply a safety style.
**************************************************************************

Provide dry-contact limit switches for overtravel protection. [The limit switches must be positively-driven with the mechanical force of the hoisting system must be transmitted directly to the contacts to force them open. The limit switches must be force-guided with the contacts mechanically linked to ensure the normally-open and normally-closed contacts are not simultaneously closed.] Hardwire the normally-closed contacts of the switches to the motor starting circuit. Include provisions to backout of overtraveled positions using momentary pushbuttons to defeat the limit switch protection.

]2.8 WIRE AND CONDUIT

2.8.1 Conductors

Conductors must be of annealed copper wire. Insulate copper conductors with cross-linked thermosetting polyethylene (XLPE) of type XHHW-2. Conductors must be Class B or Class C stranding, except for hinge wire which must be Class D or K stranding. Unless otherwise specified, all wire and cable for power and control must be single conductor. Insulation thickness must be that required for a rated circuit voltage of 0 to 600 volts. Apply a moisture resisting thermoplastic jacket over the insulated conductor. The method of accomplishment must be in accordance with the current practice of the industry. Wire for power and motor circuits must have a current carrying capacity corresponding to the ampere rating of the circuit's circuit breaker and not less than No. 12 AWG and the full-load current of the motor or the circuit. Wire for control circuits must not be smaller than No. 14 AWG.
2.8.2 Control Wire

All control wire entirely within an enclosure must be type SIS switchboard wire meeting the requirements of UL 44. All other control wire must be type XHHW-2 wire meeting the requirements of UL 44.

2.8.3 Conduit

Rigid steel conduit must conform to ANSI C80.1 and must be zinc-coated (galvanized) both inside and outside by the hot-dip method.

2.8.4 Fittings

Conduit fittings must conform to the requirements of NEMA FB 1 and CID A-A-50553.

2.8.5 Conductive Corrosion Inhibiting Compounds

Provide conductive corrosion inhibiting compounds meeting the requirements of UL 546. Compounds must be compatible with aluminum and copper conductors, must inhibit oxidation at the conductor-to-connector interface, and must not damage the conductive or insulating materials.

Provide non-gritted conductive corrosion inhibiting compound that are non-petroleum based and non-toxic and contain no grit filler. Ensure non-gritted conductive corrosion inhibiting compound is specified by the manufacturer for application to the conductor-to-connector interface of mechanical connectors such as bolted joints, flat-to-flat contact surfaces, terminal and lug tongues, and grooves of bolted parallel connectors or clamps.

2.8.6 Assembly

**************************************************************************
NOTE: For contracts where all conduit and wiring are furnished and installed by others, use paragraph 'a.'

For contracts where all conduit and wiring are on the hoist and are furnished and installed under this contract, use paragraph 'b.'

For contracts where the conduit and wiring on the hoist are furnished and installed under this contract and the connections to remotely located items are made under a subsequent contract, use paragraph 'c.'
**************************************************************************

Install the hoist motor, motor brake, controller, limit switch, and primary control station on the [hoist frame] [as shown on contract drawings].

[a. The conduit and wiring connections external to the items of electrical equipment previously mentioned will not be furnished or installed under this contract.]

[b. Furnish, install, completely connect, and make ready for operation the conduit and wiring connections external to these previously mentioned items of electrical equipment. The conduit, wiring, and connections...}
for the incoming power will be made by others under a subsequent contract.]

c. Furnish, install, completely connect, and make ready for operation the conduit and wiring connections external to these previously mentioned items of electrical equipment which are installed on the hoist frame. The conduit and wiring connections to the remotely located control equipment and the incoming power connections will be made by others under a subsequent contract.]

d. Install all wiring in rigid hot-dip galvanized metal conduit with threaded-type fittings (Condulets) and zinc-coated watertight outlet and pull boxes. Securely mount and fasten the conduit to the hoist framework in a neat and workmanlike manner. Change direction of a conduit run by means of threaded-type fittings (Condulets) or factory fabricated bends. Install the conduit to fit close to the hoist framework. Use conduit unions whenever it is necessary to join conduits that are to be turned right and left. No running threads will be permitted. Carefully ream ends of conduits. All threaded connections must be made up with electrically conductive colloidal copper rust-inhibiting compound or other suitable compound. Provide separate conduit systems for power and control circuits. Ground the entire conduit system and install so that any moisture will be drained away from terminal boxes and equipment. All conduit connections to equipment enclosures must be of the watertight threaded type. Provide suitable “drain-breather” devices at all low points of the conduit system to prevent an accumulation of water. Terminate all conductors in an approved manner. Use indented terminals on No. 12 AWG and larger conductors and terminate on screw or stud terminals. Use toothed lock washers on all screw terminals, and use locking nuts or lock washers on all stud terminals.

2.9 FACTORY TESTING

**************************************************************************
NOTE: If designer elects to do operational tests of the gate hoist equipment, in conjunction with testing of the hoist itself, the hoist specification number must be included.
**************************************************************************

Give a complete test of each item of equipment furnished, one of each rating and type and selected at random by the Contracting Officer. Give a routine test of the remaining items of equipment. All complete tests required herein will be witnessed by the Contracting Officer, unless waived in writing. Ship no equipment until it has been approved for shipment by the Contracting Officer. Notify the Contracting Officer sufficiently in advance of the date of the tests so that arrangements can be made for the Contracting Officer to be present at the tests. The test equipment and the test methods used must conform to the applicable requirements of ANSI, IEEE, and NEMA standards and will be subject to the approval of the Contracting Officer. Submit certified reports of all complete and routine tests, including complete test data. Certified copies of the results of a complete test for duplicate equipment will be accepted in lieu of the requirement of the complete test specified. Include analysis and interpretation of test results in reports, and properly identify the test systems and materials. Provide test reports for "complete tests" on the motor, brake, and controller. Certified copies of "Complete Tests" on duplicate equipment may be accepted with the approval of the Contracting
Officer. No substitute will be accepted for the routine test. The Contractor must bear the cost of performing all tests include the cost in the price bid. Perform operational tests on the equipment in conjunction with the tests specified in [_____] for the assembled hoist. Perform operational tests on equipment after it is installed. Performance curves indicating the results of the motor tests must be furnished as follows:

a. Excitation Tests. Volts or percent of rated voltage vs. amperes and watts as ordinates.

b. Impedance Tests. Volts or percent of rated voltage vs. amperes and watts as ordinates.

c. Performance Test. Torque or percent of rated horsepower output as abscissa vs. efficiency, power factor, amperes watts, and rpm or percent slip as ordinates.

d. Speed-Torque Test. Torque in foot-pounds as abscissa vs. speed in rpm or percent of synchronous speed as ordinates.

e. Temperature Test. Time in minutes as abscissa vs. temperature rise in degrees C as ordinate.

f. Insulation Resistance Test. Plot test result values on semilogarithmic graphs, the insulation resistance values as logarithmic ordinates, and the temperature values as uniform abscissa.

g. Include analysis and interpretation of test results in the routine test reports and properly identify the test systems and materials. No substitute will be accepted for the routine test. Provide test reports for "routine tests" on the motor, brake, controller, limit switch, [interrupter,] and wiring.

h. Submit description of "Interrupter" drive including copies of dimensioned outline drawing of the interrupter. Show on the Drawings specific relationships and clearances between equipment and their component parts.

2.9.1 Motor Tests

Perform all tests in accordance with the requirements of IEEE 112 for three-phase induction motors.

2.9.1.1 Complete Motor Tests

The complete tests must include the following:

a. Excitation test.

b. Impedance test.

c. Performance and speed-torque test (Prony brake or other approved method).

d. Temperature test.

e. Insulation resistance tests. Take measurements following temperature test with readings taken at approximately 10C intervals. Temperature must be determined by the resistance method.
2.9.1.2 Routine Motor Tests

The routine tests must include the following:

a. Excitation test: (One point - no load, volts, amperes, and watts.)
b. Impedance test: (One point - half-voltage amperes and watts.)
c. General operation.
d. Insulation resistance - temperature test (one point).
e. Resistance measurements.
f. Dielectric.
g. Motor winding heater test.
   (1) Successful operation.
   (2) Dielectric.

2.9.2 Brake Tests

2.9.2.1 Complete Brake Tests

The complete tests must include the following:

a. Check operation of brake release at the specified rated brake torque for rated and 85 percent terminal voltage.
b. Heat run on release magnet at the specified rated brake torque and voltage.
c. Insulation resistance of release magnet including leads and terminal block.
d. Resistance measurements of release.
e. Dielectric test of release magnet including leads and terminal block.
f. Brake space heater test.
   (1) Successful operation.
2.9.2.2  Routine Brake Tests

The routine tests of the brake must be the same as specified in paragraph COMPLETE BRAKE TESTS, except that the heat run tests must be omitted.

2.9.3  Controller Tests

2.9.3.1  Complete Controller Tests

The complete tests must include all tests listed in paragraph ROUTINE CONTROLLER TESTS, and the following:

a. Effect of voltage and frequency variation.

b. Temperature Test.

2.9.3.2  Routine Controller Tests

The routine tests must include the following:

a. Adjustment, fit, and material.

b. Successful operation.

c. Resistance.

d. Dielectric.

e. Insulation Resistance.

f. Enclosure space heater test.

   (1) Successful operation.

   (2) Dielectric.

2.9.4  Limit-Switch Tests

Test each limit switch in the manufacturer's shop by suitable means, simulating service conditions, to ascertain that it will transmit the correct information for the control sequence specified. In addition, the routine tests must include the following:

a. Adjustment, fit, and material.

b. Accuracy of trip and reset.

c. Successful operation.

2.9.5  Wiring Tests

Give all wiring outside an enclosure a dielectric test following installation by applying, for 1 minute, a voltage test of 500 volts dc for 300-volt rated cable and 1000 volts dc for 600-volt rated cable. Apply voltage to each circuit and ground and between each conductor and all other conductors in the same conduit.
PART 3  EXECUTION

**************************************************************************
NOTE: Designer should add a reference to this
Section in Part 3 of Section 26 08 00 APPARATUS
TESTING AND INSPECTION.
**************************************************************************

3.1  FIELD QUALITY CONTROL

Perform acceptance checks and tests in accordance with NETA ATS and Section
26 08 00 APPARATUS INSPECTION AND TESTING.

3.1.1  Circuit Breakers

**************************************************************************
NOTE: See UFC 3-560-01 for requirements to perform
acceptance testing of certain overcurrent protective
devices in accordance with ANSI/NETA ATS. Field
testing with actual settings will demonstrate proper
trip timing and device operation for arc flash
protection.
**************************************************************************

Perform the following tests for [each main breaker and each breaker rated
225 amps or higher.][each three-phase, molded-case circuit breaker.]

A. Visual and Mechanical Inspection

1. Compare equipment nameplate data with drawings and specifications.

2. Inspect physical and mechanical condition.

3. Inspect anchorage, alignment, and grounding.

4. Verify the unit is clean.

5. Operate the circuit breaker to insure smooth operation.

6. Inspect bolted electrical connections for high resistance using a
low-resistance ohmmeter.

7. Inspect operating mechanism, contacts, and arc chutes in unsealed
units.

8. Perform adjustments for final protective device settings in
accordance with the coordination study.

B. Electrical Tests

1. Perform insulation-resistance tests for one minute on each pole,
phase-to-phase and phase-to-ground with the circuit breaker closed, and
across each open pole. Apply voltage in accordance with manufacturer’s
published data. In the absence of manufacturer’s published data, use
500 volts dc for 300-volt systems and 1000 volts for 600-volt systems
and record the ambient temperature. Minimum insulation resistance must
be 25 Megohms for 300-volt systems and 100 Megohms for 600-volt systems
after correcting for temperature in accordance with NETA ATS Table
2. Perform a contact/pole-resistance test.

3. Determine long-time pickup and delay by primary current injection.

4. Determine short-time pickup and delay by primary current injection.

5. Determine ground-fault pickup and time delay by primary current injection.

6. Determine instantaneous pickup by primary current injection.

7. Perform minimum pickup voltage tests on shunt trip and close coils in accordance with manufacturer’s published data.

8. Verify correct operation of auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, anti-pump function, and trip unit battery condition. Reset all trip logs and indicators.

9. Verify operation of charging mechanism.
Plate No. 1

CREST GATE
ELECTRICAL CONTROL SYSTEM
(With Approximately 1.0 Foot Increments)
DESCRIPTION OF CONTROL SYSTEM

1. SCHEME OF OPERATION

a. General. The control system for the gate must be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor must be controlled by:

   (1) A push button station located on the gate hoist with momentary contacts designated "RAISE," "LOWER," and "STOP."

   (2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

c. Operating Features

   (1) Actuation of the "RAISE" and "LOWER" contacts must provide seal-in operation.

   (2) A limit switch geared or directly connected to the hoist machine, must control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

   (3) Actuation of the "STOP" contact during any operation must stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

   (1) When the gate is between the closed and the intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.

   (2) When the gate is at or above the intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

   (1) When the gate is between the over travel raised position and the intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the intermediate position and stop.

   (2) When the gate is at or above the intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to
stop when the gate reaches the raised or closed positions, the over
travel limit switch contacts must stop the hoist motor after over
travel by de-energizing the "main" or "line" contactor of the
controller. To operate the gate after an over travel, the appropriate
backout must be held closed to permit operation of the gate only in the
direction away from the over travel position after operation of either
the "RAISE" or "LOWER" contact on the primary control station.
1. SCHEME OF OPERATION

a. General. The control system for the gate must be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor must be controlled by:

(1) A push button station located on the gate hoist with momentary contacts designated "RAISE," "LOWER" and "STOP."

(2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

c. Operating Features

(1) Actuation of the "RAISE" and "LOWER" contacts must provide seal-in operation.

(2) A limit switch geared or directly connect to the hoist machine, must control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

(3) Actuation of the "STOP" contact during any operation must stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

(1) When the gate is between the closed position and the first intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 0.5 foot and stop.

(2) When the gate is at or above the first intermediate position and is below the second intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.

(3) When the gate is at or above the second intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and the second intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the second intermediate position and stop.
(2) When the gate is at or below the second intermediate position and above the first intermediate position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

(3) When the gate is at or below the first intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 0.5 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts must stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate gate after an over travel, the appropriate backout switch contact must be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the primary control station.
1. SCHEME OF OPERATION

a. General. The control system for the gate must be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor must be controlled by:

   (1) A push button selector switch station located on the gate hoist with momentary push button contacts designated "RAISE", "LOWER", and "STOP" and selector switch contacts designated "LOCAL" and "REMOTE."

   (2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

   (3) A push button station, located on the spillway gate remote control board with momentary contacts designated "RAISE", "LOWER", and "STOP."

   (4) A synchronous type indicator, located on the spillway gate remote control board to show the gate position.

c. Operating Features

   (1) Actuation of the "RAISE" and "LOWER" contacts of the control station[s] must provide seal-in operation.

   (2) The position of the "REMOTE-LOCAL" control switch will determine which station is operative.

   (3) The remote control must utilize direct current interposing relays.

   (4) A limit switch geared or directly connected to the hoist machine, must control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

   (5) Actuation of the "STOP" contact during any operation must stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

   (1) When the gate is between the closed position and the intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.

   (2) When the gate is at or above the intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously
to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and the intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the intermediate position and stop.

(2) When the gate is at or below the intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts must stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate the gate after an over travel, the appropriate backout switch contact must be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the primary control station.
1. SCHEME OF OPERATION

a. General. The control system for the gate must be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor must be controlled by:

(1) A push button selector switch station located on the gate hoist with momentary push button contacts designated "RAISE", "LOWER", and "STOP" and selector switch contacts designated "LOCAL" and "REMOTE."

(2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

(3) A push button station, located on the spillway gate remote control board with momentary contacts designated "RAISE", "LOWER", and "STOP."

(4) A synchronous type indicator, located on the spillway gate remote control board to show the gate position.

c. Operating Features

(1) Actuation of the "RAISE" and "LOWER" contacts of the control station[s] must provide seal-in operation.

(2) The position of the "REMOTE-LOCAL" control switch will determine which station is operative.

(3) The remote control must utilize direct current interposing relays.

(4) A limit switch geared or directly connected to the hoist machine, must control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

(5) Actuation of the "STOP" contact during any operation must stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

(1) When the gate is between the closed position and the first intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 0.5 foot and stop.

(2) When the gate is at or above the first intermediate position and is below the second intermediate position, each actuation of the
"RAISE" contact will cause the gate to raise approximately 1 foot and stop.

(3) When the gate is at or above the second intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and the second intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the second intermediate position and stop.

(2) When the gate is at or below the second intermediate position and above the first intermediate position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

(3) When the gate is at or below the first intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 0.5 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts must stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate the gate after an over travel, the appropriate backout switch contact must be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the primary control station.
1. SCHEME OF OPERATION

a. General. The control system for the gate must be as indicated by schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor must be controlled by:

   (1) A push button station located on the gate hoist with contacts designated "RAISE," "CONDUIT OPEN," "LOWER," and "STOP."

   (2) A push button station located on the gate hoist with momentary contacts designated "BACKOUT FROM LOWER OVER TRAVEL" and "BACKOUT FROM RAISE OVER TRAVEL."

   (3) A pendant push button station with momentary contacts designated "INCH UP" and "INCH DOWN," provided with a portable cable of suitable length to permit operation from the inspection room. The cable must terminate in a polarized plug matching receptacle located on motor controller cabinet or other suitable place.

c. Operating Features

   (1) Actuation of the "RAISE", "CONDUIT OPEN", and "LOWER" contacts of the push button station must provide seal-in operation.

   (2) Actuation of the "INCH UP" and "INCH DOWN" contacts of the pendant push button station must not provide seal-in operation.

   (3) Actuation of the "STOP" contact during any operation must stop the hoist motor and set the brake.

   (4) A limit switch geared to directly connected to the hoist machine must control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

2. SEQUENCE OF OPERATION

a. Raising

   (1) When the gate is between the closed position and the raised position, actuation of the "RAISE" contact will cause the gate to open continuously to the raised position.

   (2) When the gate is between the closed position and the conduit open position, actuation of the "CONDUIT OPEN" contact will cause the gate to open continuously to the conduit open position.

b. Lowering. When the gate is between the over travel raised position and the closed position, actuation of the "LOWER" contact will cause the gate to lower continuously to the closed position.
c. Inching

(1) To raise the gate above the raised position the "INCH UP" contact must be held closed. The gate will be stopped at upper inch position by the limit switch.

(2) To lower the gate when it is above the raised position the "INCH DOWN" contact must be held closed. The gate will be stopped at the raised position by the limit switch.

d. Over Travel

(1) Over travel limit switches must stop the driving motor if it fails to stop at the raised or closed position on the gate.

(2) The "BACKOUT FROM LOWER OVER TRAVEL" or "BACKOUT FROM RAISE OVER TRAVEL" contact must be held closed to operate the gate from over travel closed and over travel raised, respectively.
OUTLET CONTROL GATE
ELECTRICAL CONTROL SYSTEM
DESCRIPTION OF CONTROL SYSTEM
(Multispeed Motor)

1. SCHEME OF OPERATION
a. General. The control system for the gate must be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor must be controlled by:
   (1) A push button station located on the gate hoist with momentary contacts designated "RAISE", "CONDUIT OPEN", "LOWER", and "STOP."
   (2) A push button station located on the gate hoist with momentary contacts designated "BACKOUT FROM LOWER OVER TRAVEL" and "BACKOUT FROM RAISE OVER TRAVEL."
   (3) A pendant push button station with momentary contacts designated "INCH UP" and "INCH DOWN", provided with a portable cable of suitable length to permit operation from the inspection room. The cable must terminate in a polarized plug matching receptacle located on motor controller cabinet or other suitable place.

c. Operating Features
   (1) Actuation of the "RAISE", "CONDUIT OPEN", and "LOWER" contacts of the push button station must provide seal-in operation.
   (2) Actuation of the "INCH UP" and "INCH DOWN" contacts of the pendant push button station must not provide seal-in operation.
   (3) Actuation of the "STOP" contact during any operation must stop the hoist motor and set the brake.
   (4) A limit switch geared to be directly connected to the hoist machine must control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

2. SEQUENCE OF OPERATION
a. Raising
   (1) When the gate is between the closed position and the raised position, actuation of the "RAISE" contact will cause the gate to open continuously at low speed to the conduit open position.
   (2) When the gate is between the closed position and the conduit open position, actuation of the "CONDUIT OPEN" contact will cause the gate to open continuously at low speed to the conduit open position where the limit switch must cause the gate to open continuously at high speed to the raised position. (3) When the gate is between the conduit open position and the raised position, actuation of the "RAISED" contact will cause the gate to open continuously at high speed to the raised position.
b. Lowering

(1) When the gate is between the over travel raised position and conduit open position, actuation of the "LOWER" contact will cause the gate to lower continuously at high speed to the conduit open position where the limit switch must cause the gate to close continuously at low speed to the closed position.

(2) When the gate is between the conduit open position and the closed position, actuation of the "LOWER" contact will cause the gate to lower continuously at low speed to the closed position.

c. Inching

(1) To raise the gate above the raised position the "INCH UP" contact must be held closed. The gate will be stopped at upper inch position by the limit switch.

(2) To lower the gate when it is above the raised position the "INCH DOWN" contact must be held closed.

(3) The gate will be stopped at the raised position by the limit switch.

d. Over Travel

(1) Over travel limit switches must stop the driving motor if it fails to stop at the raised or closed position or the gate.

(2) The "BACKOUT FROM LOWER OVER TRAVEL" or "BACKOUT FROM RAISE OVER TRAVEL" contact must be held closed to operate the gate from over travel closed and over travel raised, respectively.
INTAKE GATE
ELECTRICAL CONTROL SYSTEM
DESCRIPTION OF CONTROL SYSTEM

1. SCHEME OF OPERATION

a. General. The control system for the gate must be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor must be controlled by:

(1) A push button station located on the gate hoist with momentary contacts designated "RAISE," "LOWER," and "STOP."

(2) A push button station located on the door of the controller with momentary contacts designated "BACKOUT FROM LOWER OVER TRAVEL" and "BACKOUT FROM RAISE OVER TRAVEL."

(3) A pendant push button station with momentary contacts designate "INCH UP" and "INCH DOWN," provided with a portable cable of suitable length to permit operation from the inspection room. The cable must terminate in a polarized plug matching receptacle located on motor controller cabinet or other suitable place.

c. Operating Features

(1) Actuation of the "RAISE" and "LOWER" contacts of the push button station must provide seal-in operation.

(2) Actuation of the "INCH UP" and "INCH DOWN" contacts of the pendant push button station must not provide seal-in operation.

(3) Actuation of the "CLOSE" contact of the emergency lower switch must provide seal-in operation.

(4) Actuation of the "STOP" contact during any operation must stop the hoist motor and set the brake.

(5) A "balanced-pressure switch" with normally closed contact.

(6) A limit switch geared or directly connected to the hoist machine must control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

(7) Gate position indicating lights as follows:

(a) A red light on push button station and with emergency lower switch indicating gate is in normal operating position.

(b) A green and blue light with emergency lower switch indicating gate is in closed and raised position, respectively.

(c) An amber light with emergency lower switch indicating gate is closing.
2. SEQUENCE OF OPERATION

a. Raising. When the gate is between the closed position and the raised position, actuation of the "RAISE" contact will cause the gate to open continuously to the raised position. If there is a pressure difference between the two sides of the gate, the gate will stop at the cracked position. After pressure is balanced actuation of the "RAISE" contact will cause the gate to open to the raised position.

b. Lowering. When the gate is between the over travel raised position and the closed position, actuation of the "LOWER" contact will cause the gate to lower continuously to the closed position.

c. Normal Operating Position

(1) The gate is placed in the normal operating position by either the raising or lowering operation described above.

(2) The red light indicates the gate is in normal position.

(3) Actuation of the "STOP" contact of the push button station stops the gate.

d. Emergency Closing. When the gate is between the normal position and the closed position, actuation of the "CLOSE" contact of the emergency lower switch will cause the gate to lower continuously to the closed position.

e. Inching

(1) To raise the gate above the raised position the "INCH UP" contact must be held closed. Gate will be stopped at upper inch position by the limit switch.

(2) To lower the gate when it is above the raised position the "INCH DOWN" contacts must be held closed. Gate will be stopped at the raised position by the limit switch.

f. Over Travel

(1) over travel limit switches must stop the driving motor if it fails to stop at the raised or closed position of the gate.

(2) The "BACKOUT FROM LOWER OVER TRAVEL" or "BACKOUT FROM RAISE OVER TRAVEL" contact must be held closed to operate the gate from over travel closed and over travel raised, respectively.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for dredging.

Adhere to [UFC 1-300-02](https://www.navfac.mil/policies/ufc/) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://www.navfac.mil/policies/).

NOTE: The techniques of sounding, sweeping, or a combination thereof are applicable methods in the acceptance examination, depending upon specific requirements of the project. In general, for maintenance dredging or for new dredging on soft bottom, the acceptance examination by soundings will be acceptable; for new dredging on hard coral or rock bed, and also for dredging below existing channel bottom on hard coral or rock bed, sweepings are required. For new dredging on hard bed harbor channel and turning basin for capital ships (such as aircraft carriers), the combination of soundings and sweepings is required. If modification of navigation charts is required after completion of dredging work, the EFD must coordinate with Naval Facilities Engineering Systems Command Code 04A3 for the proper data transfer procedures to the Defense Mapping Agency. In the case of inland rivers all
navigation chart updates must be coordinated with Inland Electronic Navigation Chart (IENC) team of the Corps of Engineers.

PART 1   GENERAL

1.1   GENERAL INFORMATION

NOTE: Identify any known site specific information that would impact the contract work. Identification of known subsurface/submerged materials does not relieve the Contractor for doing their own investigations and should be noted in the contract.

This Section covers furnishing suitable dredging plant and performing all work required to remove the specified materials from within the prescribed work area limits as indicated, and placement of the dredge material within the prescribed material placement areas. The Contractor is responsible for making their own investigation of submerged, surface, and overhead structures in the work areas and other locations they find necessary to traverse. The exact location, depths, and heights of various structures including, but not limited to submarine cables, pipes, highlines, docks, piers, bulkheads, and bridges (as applicable), are not known and it will be necessary for the Contractor to ascertain interference problems and notify the respective owners in advance of dredging operations. The Contractor is responsible for making necessary arrangements with the respective owners of the structure(s) to assure satisfactory completion of dredging in the vicinity with a minimum interruption of service, and must perform their operations in such a manner as will avoid damage to these facilities.

1.2   DEFINITIONS

1.2.1   Maintenance Material

Maintenance material is defined as that comprising shoaling which has occurred since the channel areas were last dredged.

1.2.2   New Work Material

New work material is defined as previously undredged material.

1.2.3   Hard Material

Hard material is defined as material requiring [blasting or] [the use of] special equipment for economical removal, and includes boulders or fragments too large to be removed in one piece by the dredge.

1.3   SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that
require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Submerged Pipelines

Soundings or Sweepings; G[, [______]]

Indicate pipeline location and installation details. Submit drawings of surveys during progress of work by soundings or sweepings.

SD-07 Certificates

Protection Plan

1.4 METHOD OF COMMUNICATION

NOTE: Where appropriate, also require communications between dredging crews, placement area, and the US Coast Guard or Port Services Department of the Naval installation. Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS should be
1.5 OTHER DREDGING OPERATIONS

The Contractor should anticipate the possibility of concurrent dredging operations, adjacent to or nearby the dredge and placement areas in this contract. Delays should be anticipated in transiting to, and through, the placement sites during concurrent dredging and placement operations. As a standard safety precaution, observe all placement site specific restrictions pertaining to the limit of dredges operating within at any given time. Coordination with other dredge plant in the vicinity of the dredge and placement areas is required.

1.6 ENVIRONMENTAL COMPLIANCE AND PROTECTION

Provide a system of communication between the dredge crew and the crew at the placement area. A portable two-way radio is acceptable.

NOTE: USACE Division 01 specification concerning environmental compliance should be referenced to ensure there is no redundancy or discrepancy.

Comply with conditions and requirements of State or Federal permits. The Government will secure the permit for dredging and placement of material as indicated. Coordinate with [_____] for placement of excavated materials.

During the life of the contract, provide and maintain environmental protective measures. Also, environmental protective measures required to correct conditions, such as oil spills or debris, that occur during the dredging operations, must be provided. Comply with Federal, State, and local regulations pertaining to water, air, and noise pollution.

1.7 BASIS FOR BIDS

NOTE: USACE will reference Division 00 and Division 01 to ensure there is no redundancy or discrepancy.

Where applicable, choose one of the following options. Choose the first option for lump sum bidding of dredging, in projects where exact quantities can be practically determined prior to the actual work. Choose the second option for unit price bidding of dredging. Specify unit price bid items for dredging for projects where exact quantities cannot be practically determined prior to the actual work.

[Base bids on the quantity of dredging indicated. Should the total quantity of dredging vary from that specified as the basis for bidding, the contract price will be adjusted in accordance with FAR 52.243-4 Changes. The dredging conditions specified and indicated describe conditions which are known. However, the Contractor is responsible for other conditions encountered which are not unusual when compared to the conditions recognized in the dredging business as usual in dredging activities such as...]

SECTION 35 20 23 Page 6
those required under this contract.]

**************************************************************************
NOTE: For NAVFAC PAC projects, edit contract's prices schedule for inclusion in Bid Items.
**************************************************************************

For unit price bid, see paragraph entitled "Basis of Bids, Measurement, and Payment" in Section 01 20 00 PRICE AND PAYMENT PROCEDURES.

**************************************************************************
NOTE: For NAVFAC LANT projects, use the following for unit price bidding.
**************************************************************************

[Payment will be at the contract unit price per cubic meter cubic yard, multiplied by total cubic meters cubic yards of acceptable dredging. Base bids on total cubic meters cubic yards of dredging. Include a bid unit price per cubic meter cubic yard of dredging based on the quantity [as specified or indicated.] If the Contracting Officer requires an increase or a decrease in total volume of dredging, the contract price will be adjusted in accordance with the FAR 52.211-18 Variation in Estimated Quantity. Dredging conditions specified and indicated describe conditions which are known. However, the Contractor is responsible for other conditions encountered which are not unusual when compared to conditions recognized in the dredging business as usual in dredging activities such as those required under this contract.]

PART 2   PRODUCTS

2.1   CHARACTER OF MATERIAL

**************************************************************************
NOTE: Include silt, sand and mud if project is for maintenance dredging. Delete new material if area has been previously dredged to design depth. New material is material which has never been dredged. Provide the site specific material description if it is known. For USACE, review any site investigations specifications, as applicable, to ensure consistency as it relates to material characterization.
**************************************************************************

The material to be removed is [silt, sand, and mud] [new material] [maintenance material] [______]. The in situ bulk density of the predominant material to be dredged is as follows:

a. Dredge Area 1 has an in situ bulk density of [_____] grams/liter, and consists of [_____] percent sand, [_____] percent gravel, and [_____] percent fines.

b. The Contractor is ultimately responsible for determination of the characteristics of materials to be dredged.

**************************************************************************
NOTE: When blasting will not be permitted, so state. When blasting is permitted, incorporate the project specification information relative to maximum amount of charge that will be permitted and

SECTION 35 20 23  Page 7
detailed requirements applicable to the specific project.

Remove hard material as needed to achieve the required template. Use of blasting operations will be permitted. Reference Section 31 00 00 EARTHWORK for blasting requirements.

PART 3   EXECUTION

3.1   INSPECTION

**************************************************************************

NOTE: Choose one of the following options. Choose the first option for projects which incorporate Contractor Quality Control. Choose the second option for projects which do not incorporate Contractor Quality Control.

**************************************************************************

[Inspect the work, keep records of work performed, and ensure that gages, targets, ranges, and other markers are in place and usable for the intended purpose. Provide, at the request of the Contracting Officer, boats, boatmen, laborers, and materials necessary for inspecting, supervising, and surveying the work. When required, provide transportation for the Contracting Officer and inspectors to and from the placement area and between the dredging plant and adjacent points on shore.]

[The Government will keep a record of work performed and will require that gages, ranges, and other markers are usable for the intended purpose. Provide, at the request of the Contracting Officer, boats, boatmen, laborers, and materials necessary for inspecting, supervising, and surveying the work. When required, provide transportation for the Contracting Officer and inspectors to and from the placement area and between the dredging plant and adjacent points on shore.]

The dredge plant will be inspected by the Contracting Officer, or their representative, prior to beginning work to ensure total dredging plant is in safe working condition. Before any machinery or mechanized equipment is placed in service, it must be inspected and tested by the Contractor and certified to be in safe operating condition.

3.2   DREDGING

3.2.1   Order of Work

**************************************************************************

NOTE: Special scheduling requirements, restrictions, or other similar features bearing on the Contractor performing the work, should be specified in this paragraph or reference made to "Special Scheduling Requirements" paragraph in Section 01 14 00 WORK RESTRICTIONS.

**************************************************************************

The Contracting Officer will direct the Contractor on the order of work. The Government reserves the right to change the order of work at any time.
3.2.2 Interference with Navigation

**************************************************************************
NOTE: If known, include types of vessel and volume of traffic expected to be encountered. USACE review Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS for Contractor requirements to ensure there is no redundancy or duplication.
**************************************************************************

Minimize interference with the use of channels and passages. The Contractor is responsible for shifting or moving of dredges or the interruption of dredging operations to accommodate the movement of vessels and floating equipment, if necessary. Adhere to Coast Guard Regulations for passing vessels.

3.2.3 Lights

Each night, between sunset and sunrise and during periods of restricted visibility, provide lights for floating plants, pipelines, ranges, and markers. Also, provide lights for buoys that could endanger or obstruct navigation. When night work is in progress, maintain lights from sunset to sunrise for the observation of dredging operations. Lighting must conform to United States Coast Guard requirements for visibility and color.

3.2.4 Navigation Warnings

Furnish and maintain navigation warning signs along the pipeline. Provide notice to increase public awareness of potential hazards presented by dredge plant equipment by stating the location, date of construction, equipment mooring, marshaling areas, using local newspapers, radios, television, waterway users associations, or other appropriate area specific communication networks. Ensure that an announcement is made through the same networks at the beginning of the dredging operation. Make periodic updates/status announcements at intervals of not more than a month throughout the contract life.

Display a sturdy and prominent warning sign at all public boat marinas within 10 miles of dredging operations or moored equipment. The Contractor is responsible for keeping this sign current with respect to the dredging operations or equipment.

3.2.5 Ranges, Gages, and Lines

Provide, set, and maintain ranges, buoys, and markers needed to define the work and to facilitate inspection. Establish and maintain gages in locations observable from each part of the work so that the depth may be determined. Suspend dredging when the gages or ranges cannot be seen or followed. The Contracting Officer will furnish, upon request by the Contractor, survey lines, points, and elevations necessary for the setting of ranges, gages, and buoys.

3.2.6 Dredge Plant and Equipment

**************************************************************************
NOTE: Include either (dredge type) or option for (clamshell) (hydraulic cutterhead) (trailing suction hopper) (other) after bracket.
**************************************************************************
a. A [_____] dredge will be used to perform all dredging work under this contract.

NOTE: Include (number) or (count).

b. [_____] dredge(s) may be in operation under this Contract at a time.

c. Maintain all dredge plant and associated equipment such as, but not limited to, scows, coamings, barges, and pipelines, to meet the requirements of the work. Promptly repair leaks or breaks along pipelines.

3.2.7 Layout of Work

The Contractor will be provided layout charts for all dredging areas based on the schedule of work, the Contractor's hydrosurvey requests, and/or the results of Government hydrographic survey monitoring. The most current Government hydrosurvey information will be displayed on the dredging layout charts and provided to the Contractor. All depths are measured from [______]. Other pertinent information to be included with each layout package will be: payment method, required and maximum dredging depths, coordinates for the material placement site, distance one-way from dredging location to placement site, specific placement site instructions, supplemental tide gauge information, horizontal control locations, and computed hydrosurvey quantities.

NOTE: For USACE, quantities for project dredging, overdepth dredging, and total in the blanks are included in the Bid Schedule and should be deleted from herein.

The total estimated quantity of material to be removed is computed as that material that is within the specified limits, including side slopes, but excluding unpaid overdepth. The quantities listed are estimates only. All estimated quantities are subject to FAR 52.211-18 Variation in Estimated Quantity.

3.2.7.1 Overdepth Dredging

To cover unavoidable inaccuracies of dredging processes, material actually removed to a depth of [_____] meters feet below the minimum required depth specified and within the dredging limits will be measured and paid for at full contract price.

The maximum amount of allowable unpaid overdepth dredging is [_____] meters feet below the specified maximum paid dredging depth.
3.2.7.2 Side Slopes

**************************************************************************
NOTE: Use the first bracketed item when the side slope overdredge allowance is specified; use second bracketed item when side slope overdredge allowance is not specified. For first bracketed item, insert allowable depth for dredging of side slopes beyond the indicated or specified side slopes for which payment will be made.

Ensure project requirements consider slope natural angle of repose and potential for sloughing when selecting appropriate language herein. Dredge equipment used will impact the resultant amount of material required to be removed.
**************************************************************************

Side slopes in the dredge areas within this contract will be measured and paid based on a [_____] meter feet horizontal to [_____] meter feet vertical ratio. Dredging on side slopes must follow, as closely as practicable, the dredge area limits indicated on associated layout drawings.

[ A [_____] meter feet allowance will be made for dredging beyond the indicated or specified side slopes, except as provided herein. Material removed from within the allowance area will be unpaid. The allowance will be determined by projecting a line upwards, paralleling the project design side slopes, from the intersection of the overdepth dredging limit (at a point located vertically below the limit of dredging at the top of slope). The amount of material excavated from side slopes will be determined by either cross-sections or computer, or both.

][No allowance will be made for dredging beyond the dredge area limits as indicated on the associated layout drawings. No dredging can occur outside of the dredge area and side slope limits.

3.2.8 Obstructions and Debris

**************************************************************************
NOTE: Choose one of the following options. Choose the first option where no known obstructions exist and site is not near existing piers. Choose the second option where known obstructions exist or for dredging around existing piers.
**************************************************************************

[ The Government has no knowledge of cables, pipes, or other artificial obstructions or of any wrecks, wreckage, or other material that would necessitate the use of explosives or the employment of additional equipment for economical removal. Contractors should however exercise due diligence in determining the existence of any obstructions within proposed work areas during bid preparation.

][The Government has knowledge of debris such as, but not limited to, metal bands, pallets, pieces of broken cable, rope, fire hose, and broken piles. The Contractor is responsible for the disposal of the removed debris. This disposal must occur outside the limits of government property, and done so in accordance with all federal, state, and municipal regulations.
The Government has no knowledge of existing wrecks, wreckage, or other material of such size or character as to require the use of explosives or special or additional plant for its economical removal.

3.2.9 Dredging Requirements

**************************************************************************
NOTE: Include requirements for various dredge areas. The current text is a template for use.
**************************************************************************

Dredge Areas

1) Dredge Area 1
   a) As determined by the results of a hydrographic survey monitoring, the Government will direct the Contractor to dredging areas within [______]. Dredging depths at this area will be between plus or minus [______] and plus or minus [______] meters feet [datum] including paid overdepth, unless otherwise stated in the layout drawing.

   b) Material placement will be [______] site. See Section [01 20 00 PRICE AND PAYMENT PROCEDURES] for more details.

2) Dredge Area 2

3.2.10 Quality Control

Establish and maintain quality control for operations to assure compliance with contractual requirements and maintain records of this quality control for dredging operations.

While performing all dredging work control the horizontal positioning of the dredge with electronic positioning.

3.2.11 Surveys during Progress of Work

Quality of dredging depth will be determined by soundings or sweepings taken behind the dredge as work progresses. The [Government will][Contractor will] take progress soundings or sweepings.

3.2.12 Skimming of Hoppers

Skimming of hoppers must be performed in compliance with environmental requirements and ABS/USCG load line marks.

3.2.13 Salvaged Material

Anchors, chains, firearms, and other articles of value, which are brought to the surface during dredging operations, must remain or become the property of the Government and will be placed on shore at a convenient location near the site of the work, as directed.

3.2.14 Safety of Structures

The prosecution of work must ensure the stability of piers, bulkheads, and other structures lying on or adjacent to the site of the work, insofar as
structures may be jeopardized by dredging operations. Repair damage resulting from dredging operations is the responsibility of the Contractor, insofar as such damage may be caused by variation in locations or depth of dredging, or both, from that indicated or permitted under the contract. The Contractor is responsible for coordinating with the owner of the structure for any necessary repairs.

3.2.15 Protection Plan

Prior to blasting, submit a plan for protection of surrounding structures, equipment, and vessels in accordance with Section 31 00 00 EARTHWORK for blasting requirements.

3.3 PLACEMENT OPERATIONS

3.3.1 Placement of Excavated Materials

******************************************************************************
NOTE: Delete inapplicable language for placement area; insert other placement area language as appropriate.
******************************************************************************

Provide for safe transportation and placement of dredged materials. Transport and placement of dredged material in the [___][placement area][area designated for placement of dredged material]. [The Contractor may, at his option, place dredge material at [___] or provide placement at an government approved placement area.] The placement of dredged materials in unauthorized places is forbidden. Comply with rules and regulations of all, federal, state and local authorities.

3.3.2 Method of Placement

******************************************************************************
NOTE: Delete inapplicable method of placement and include only the language appropriate for the method of placement to be used. Details should be specified regarding exact location for discharge into the placement area, maximum allowable elevation of buildup, and any other limitations or special provisions for placement. It is not recommended to pay based on scow measurement.
******************************************************************************

Place all dredged material by [the hydraulic process][hopper dredge][self-dumping scow or barge].[ Coordinate completion of load with the Government. Notify the Government when scows or barges are returned to the dredge area.][ Pipeline for hydraulic dredging must discharge into the placement area.]

3.3.3 Placement in Indicated Site(s)

******************************************************************************
NOTE: Include any special requirements for the construction and maintenance of fill area bulkheads and weirs. Delete when fill areas are not shown on the contract drawings. Require bulkheads and weir submittals for Contracting Officer review.
******************************************************************************
In placing excavated material for fill, uniformly grade and allow for shrinkage. Provide and maintain necessary bulkheads, dikes, ditches, weirs, spillways, and other construction necessary to confine and retain the fill in the dredge fill area.

3.3.4 Charges for Material Placement

**************************************************************************
NOTE: Insert "Department of the Army" in the first blank where placement area is under jurisdiction of the Corps of Engineers. Insert name of placement area in second blank. Delete entire paragraph when not applicable.
**************************************************************************

The [Government][Contractor] is responsible for payment of charges imposed by the [_____] for placement of material in the [_____] placement area.

3.3.5 Operation of Sluiceways

**************************************************************************
NOTE: Insert Corps of Engineers or other controlling agency in the blank provided. Delete when not applicable to the project.
**************************************************************************

Sluiceways on the placement area levees will be operated and maintained by the [______]. The Government will relieve the Contractor of operations thereof.

3.3.6 Misplaced Dredged Material

Any dredged materials deposited at locations other than in areas designated or approved by the Contracting Officer will be considered misplaced material and will not be paid for until the Contractor, at his own expense, removes and deposits such misplaced material where directed. This required removal and redeposit of the misplaced material and any necessary placement site restoration work is not the basis for a time extension or additional compensation under this contract.

3.3.7 Submerged Pipelines

If a leak occurs in the discharge pipeline, immediately discontinue using the line until leaks are repaired. Following a leak, the Contractor should conduct, or request the Government to conduct, a hydrosurvey to ensure that any dredged material discharged through the leak did not accumulate or cause mounding. If accumulation did occur, the Contractor must coordinate with the Government to remove the accumulated material, if deemed necessary. The Contractor is responsible for any resulting costs of repair and restoration.

3.4 MEASUREMENT

**************************************************************************
NOTE: FOR US Army Corps of Engineers Projects, the measurement is discussed in Division 01 Measurement and Payment and should not be included in the specification herein.
**************************************************************************
The [Government will be] [Contractor is] responsible for taking soundings before and after dredging.

Final quantities will be subject to deductions or correction of deductions previously made because of excessive overdepth, dredging outside or authorized areas, or placement of material in an unauthorized manner.

3.4.1 Method of Measurement

NOTE: The method of survey must be defined by the Government. Details for the method of measurement, calculations, and time frame for measurements to be made must all be defined herein.

Quantity of material removed that will be paid for will be measured by cubic meter cubic yard [in place] [by means of volume difference from soundings taken before and after dredging] [by means of topographic surveys of fill sites taken before and after dredging] [______]. The drawings represent existing conditions based on current available information, but will be verified and corrected, if necessary, by soundings taken before dredging in each locality. Areas sounded within [_____] of completion of work. The Contractor has the option of being present when such soundings are made.

3.4.2 Monthly Estimates

NOTE: The progress payments requirements for US Army Corps of Engineers Contracts are typically included in Division 01 Measurement and Payment, as well as the front end clauses, and if so, must be deleted from herein.

Monthly estimates of work completed will be based on the result of soundings taken during the progress of the work [or, at the option of the Contracting Officer, on 85 percent of the scow or barge measurement]. Deductions will be made for dredging and placement not in accordance with the specifications.

3.5 FINAL EXAMINATION AND ACCEPTANCE

NOTE: The techniques of sounding, sweeping, or a combination thereof are applicable methods in the acceptance examination, depending upon specific requirements of the project. In general, for maintenance dredging or for new dredging on soft bottom, the acceptance examination by soundings will be acceptable; for new dredging on hard coral or rock bed, and also for dredging below existing channel bottom on hard coral or rock bed, sweepings are required. For new dredging on hard bed harbor channel and turning basin for capital ships (such as aircraft carriers), the combination of soundings and...
sweepings is required. If modification of navigation charts is required after completion of dredging work, the EFD must coordinate with Naval Facilities Engineering Systems Command Code 04A3 for the proper data transfer procedures to the Defense Mapping Agency. In the case of inland rivers all navigation chart updates must be coordinated with Inland Electronic Navigation Chart (IENC) team of the Corps of Engineers.

For USACE, do not use if removal requirements are included in other specification sections.

As soon as practicable after the completion of areas, which in the opinion of the Contracting Officer, will not be affected by further dredging operations, each area will be examined by the Government by sounding or sweeping, or both. Remove shoals and lumps as required by methods approved by the Government. However, if the bottom is soft and the shoal areas form no material obstruction to navigation, removal may be waived at the discretion of the Government. The Contractor will be notified when soundings or sweepings are to be made and will be permitted to accompany the sounding or sweeping party and to inspect the data and methods used in preparing the final quantity for payment. When areas are found to be in a satisfactory condition, the work therein will be accepted as complete.

Re-dredging at the Contract price, within the limit of available funds, may be completed with the consent of both the Government and the Contractor when infill or shoaling beyond the Contractor's control occurs in any area previously accepted.

3.6 PLANT REMOVAL

Upon completion of the work, remove all dredging plant, including ranges, buoys, piles, and other markers or obstructions within [_____] days.

3.3 PERFORMANCE REQUIREMENTS
3.4 LIST OF ITEMS TO BE PROVIDED BY THE CONTRACTOR

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the National Dredging Quality Management Program for the scow monitoring and ullage profile.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

When to Choose a Specific Profile Tailoring Option. Use the following information to determine which profile to choose:

Monitoring Profile - The Monitoring Profile includes scow position, heading, hull status, draft sensors, and displacement tables to give a relative indication of when most of the material has left the scow (or the length of time the material takes to dump). Increases in draft can show digging locations and changes in loading can show leakage in gross relative terms.

Ullage Profile - The Ullage Profile contains all the instrumentation from the previous profile, adding ullage sensors and ullage volume tables. This profile may be used when dredging a material like mud, which will (for the most part) seek its own level, and ullage can be accurately measured to get an idea of bin volume.

Remove information and requirements not required in respective project, whether or not brackets are present.
Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**************************************************************************

PART 1   GENERAL

1.1 DESCRIPTION

The work under this contract requires use of the National Dredging Quality Management Program (DQM) to monitor the dredge's status at all times during the contract and to manage data history. For the purpose of these specifications, a scow is defined as any non-self-propelled vessel used to transport dredged material. This includes, but is not limited to, split-hull scows, pocket scows, hopper barges, and deck barges.

This performance-based specification section identifies the minimum required output and the precision and instrumentation requirements. The requirements may be satisfied using equipment and technical procedures selected by the Contractor.

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

SECTION 35 20 23.13 Page 4
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-07 Certificates**

National Dredging Quality Management Program Certification, [_____] District; G, [_____]

**1.3 PAYMENT**

Separate payment for installation, operation, and maintenance of the DQM-certified system as specified herein for the duration of the dredging operations is not allowed; all costs in connection therewith are considered a subsidiary obligation of the Contractor and are covered under the contract unit price for dredging in the bidding schedule.

**1.4 NATIONAL DREDGING QUALITY MANAGEMENT PROGRAM CERTIFICATION**

**1.4.1 Certification**

The Contractor is required to have a current certification from DQM for the scow instrumentation system to be used under this contract. Criteria for certification is based on the most recent specification posted on the DQM website http://dqm.usace.army.mil/Specifications/Index.aspx, Verify compliance with these criteria by onsite quality assurance (QA) checks conducted by the DQM Support Center Data Acquisition and Analysis Team and by periodic review of the transmitted data. If a system is installed specifically for this contract, in order to ensure that it is capable of transmitting quality data to the DQM database, the QA checks should take place either prior to the start of the contract or, with prior approval of the local USACE District, as soon as practical after dredging commences. DQM Certification is valid for one year from the date of certification and is contingent upon the system's ability to meet the performance requirements as outlined in paragraph PERFORMANCE REQUIREMENTS. If issues with data quality are not corrected within 48 hours, the system certification will be revoked and additional QA checks by the Data Acquisition and Analysis Team may be necessary. Annual DQM Certification must be based on the following:

A series of QA checks as outlined on the DQM website https://dqm.usace.army.mil/Certifications/Index.aspx

Verification of data acquisition and transfer as described in paragraph PERFORMANCE REQUIREMENTS

Review of the Dredge Plant Instrumentation Plan (DPIP) as described in paragraph DREDGE PLANT INSTRUMENTATION PLAN (DPIP)

**1.4.2 Quality Assurance (QA)**

The Dredging Contractor must have personnel who are familiar with the system instrumentation and who have the ability to recalibrate the sensors on site during the QA process. The Dredging Contractor must coordinate
pickup times and locations and provide transportation to and from any platform with a DQM system to team personnel in a timely manner. The Dredging Contractor must also have on site for the QA checks a tug capable of towing the scow. As a general rule, DQM Data Acquisition and Analysis Team personnel will come with personal protective equipment (PPE) consisting of hardhats, steel toe boots, and life jackets. If additional safety equipment is needed, such as eye protection, safety harnesses, work gloves, or personal location beacons, provide these items to the team while on site. Submit a test data package to the DQM database from the system on each scow and have it accepted by the DQM Support Center prior to scow compliance checks. Also submit data collected during the QA Checks from the scow monitoring system to the DQM database and the Data Acquisition and Analysis Team personnel while on site. It is the Dredging Contractor's obligation to inform the QA team if the location designated for the QA checks has any site-specific safety concerns prior to their arrival on site.

The owner or operator of the scow must contact DQM at DQM-AnnualQA@rpsgroup.com on an annual basis, or at least three weeks prior to the proposed beginning of dredging, to schedule QA checks. This notification is meant to make the Data Acquisition and Analysis Team aware of a target date and the contract on which the plant will be used. At least one week prior to the target date, the Dredging Contractor must contact the Data Acquisition and Analysis Team and verbally coordinate a specific date and location. The Contractor must then follow up this conversation with a written email confirmation. The owner/operator must coordinate the QA checks with all local authorities including, but not limited to, the local USACE Contracting Officer's Representative (COR).

1.4.3 Recertification

Recertification is required for any yard work which produces modification to displacement (for example, a change in scow lines, or repositioning or repainting hull marks), modification to bin volume (change in bin dimensions or addition or subtraction of structure), or changes in sensor type or location; report these changes in the sensor log section of the DPIP. A system does not have to be transmitting data between jobs; however, in order to retain certification during this period, the system sensors or hardware should not be disconnected or removed from the scow. If the system is powered down, retain calibration coefficients.

1.5 DREDGE PLANT INSTRUMENTATION PLAN (DPIP)

The Contractor must have a digital copy of the DPIP on file with the DQM Support Center. While working on site, the Contractor must also maintain on the dredge a copy of the DPIP which is easily accessible to Government personnel at all times. This document must describe the sensors used, configuration of the system, how sensor data will be collected, how quality control on the data will be performed, and how sensors/data reporting equipment will be calibrated and repaired if they fail. A description of computed scow-specific data and how the sensor data will be transmitted to the DQM database must also be included. The Contractor must submit to the DQM Support Center any addendum or modifications made to the plan, subsequent to its original submission, prior to start of work.

A complete list of the required DPIP contents is provided on the DQM website https://dqm.usace.army.mil/Certifications/Index.aspx. Submit to the DQM Support Center any addendum or modifications made to the plan, subsequent to its original submission, prior to the start of work. Any changes to the computation methods must be approved by the DQM Support...
Center prior to their implementation.

PART 2   PRODUCTS

Not used.

PART 3   EXECUTION

3.1   REQUIREMENTS FOR REPORTED DATA

Provide, operate, and maintain all hardware and software to meet these specifications. The Contractor is responsible for replacement, repair, and calibration of sensors and other necessary data acquisition equipment needed to supply the required data. Complete repairs within 48 hours of any sensor failure. Notify the Contracting Officer's Representative (COR) upon completion of a repair, replacement, installation, modification, or calibration. The COR may request recalibration of sensors or other hardware components at any time during the contract as deemed necessary.

Keep a log of sensor repair, replacement, installation, modification, and calibration in the onsite copy of the DPI. The log must contain a three-year history of sensor maintenance, including the time of sensor failures (and subsequent repairs), the time and results of sensor calibrations, the time of sensor replacements, and the time that backup sensor systems were initiated to provide the required data. It must also contain the name of the person responsible for the sensor work. Install sensors that are capable of collecting parameters within specified accuracies and resolutions indicated in the following subparagraphs.

With the exception of position and any value calculated, reported sensor values should represent a weighted average with the highest and lowest values not included in the calculated average for the given interval. The averaging routine used should be consistent across all event triggers. This information should be documented in the DPI sections that say "Calculations done external to the instrumentation." These data-reporting requirements cover the collection of electronic data on a scow through the entire dredging cycle. Disposal events can consist of both open-water disposal and offloading. Open-water disposal is the placement of material via bottom doors or split hull. Offloading is the placement of material via either hydraulic or mechanical means.

3.1.1   Scow Name

Assign a unique name for each scow that will remain constant from one dredging operation to the next.

3.1.2   Contract Number

The USACE-assigned contract number for the project will be reported.

3.1.3   Load Number

A DQM load number must document the end of a disposal event for a given scow.

3.1.4   Horizontal Positioning

Record horizontal positioning as the geographic coordinates of the vessel as indicated by the location of the Global Positioning System (GPS)
antenna. Obtain all locations using a positioning system operating with a minimum accuracy level of 1 to 3 meters 3 to 10 feet horizontal Circular Error Probable (CEP). Report positions as Latitude/Longitude WGS 84 in decimal degrees. West Longitude and South Latitude values are reported as negative.

3.1.5 Date and Time

Report the date and time to the nearest second and referenced to Universal Time Coordinated (UTC) based on a 24-hour format: yyyy-mm-dd hh:mm:ss.

3.1.6 Hull Status

Hull status is meant to reflect a condition when material could be removed or released from the scow. For this contract, hull status must register closed prior to leaving the disposal area.

3.1.6.1 Open-Water Disposal

Indicate an open split hull or open bottom door of a scow by reporting an "OPEN" value. Indicate a closed split hull or closed bottom door of a scow by reporting a "CLOSED" value. An open status must be indicated as the bin starts to open, and a closed status must be indicated only once the bin is fully closed. For pocket scows, the open/closed status must correspond to the compartment which is first to open and last to close.

3.1.7 Offloading

Offloading occurs when the scow is being unloaded, either by hydraulic or mechanical means. When offloading is occurring, a value of "true" must be reported; otherwise, a "false" value must be reported. The only permissible values are "true" and "false".

3.1.8 Course

Provide scow course-over-ground (COG) using industry-standard equipment. Provide scow course-over-ground (to the nearest whole degree) with values from 000 (true north) to 359 degrees referenced to a clockwise positive direction convention.

3.1.9 Speed

Provide scow speed-over-ground in knots using industry-standard equipment with a minimum accuracy of 1.0 knot and resolution to the nearest 0.1 knot.

3.1.10 Heading

Provide scow heading using industry-standard equipment. The scow heading must be accurate to within 5 degrees and reported to the nearest whole degree with values from 000 (true north) to 359 degrees referenced to a clockwise positive direction convention.

3.1.11 Draft

Report all draft measurements in feet, tenths, and hundredths with an accuracy of plus or minus 0.1 foot relative to observed physical draft readings. Report the measurements at a resolution of two decimal places (hundredths of a foot). The reported forward draft value must be equal to the sum of the visual forward port and starboard draft mark readings.
divided by two. The reported aft draft value must be equal to the sum of
the visual aft port and starboard draft mark readings divided by two.
Forward draft, aft draft, and average draft will be reported. Place
sensors at an optimum location on the scow to be reflective of observed
physical draft mark readings at any trim or list. Minimum accuracies are
conditional to relatively calm water. The reported sensor value is an
average of at least ten samples per event, with at least one maximum value
and one minimum value removed, and the minimum eight remaining values
averaged. When the average draft is calculated for the purpose of
determining displacement, maintain significant digits for average draft
such that if forward draft were 0.15 and aft draft were 0.1, then the
average draft would be 0.125.

3.1.12 Displacement

Report scow displacement in long tons, based on the most accurate method
available for the scow. The minimum standard of accuracy for displacement
is interpolation from the displacement table, based on the average draft.
For this contract the density of water used to calculate displacement is
[_____]* kg/cubic meter lbs/cubic foot and is used for an additional
interpolation between the fresh and salt water tables.

*The water density used is project-/location-specific. Enter the
appropriate water density in the blank:

Fresh Water: 1000 kg/m3 (1 g/cm3) 62.43 lbs/cubic foot
Salt Water: 1027-1030 kg/m3 (1.027-1.03 g/cm3) 64.11 - 64.30 lbs/cubic
foot

3.1.13 Bin Ullage Sounding

Report all ullage soundings in meters feet, tenths, and hundredths with an
accuracy of plus or minus 0.1 foot with respect to the combing and be
representative of the forward and aft extents of the hopper as close to
the centerline as is possible. Report the measurements at a resolution of
two decimal places (hundredths of a foot). If sensors must be offset from
the centerline of the bin, they should be offset to opposite sides of the
vessel. Forward ullage, aft ullage, and average ullage soundings will be
reported. The reported sensor value is an average of at least ten samples
per event, with at least one maximum value and one minimum value removed,
and the minimum eight remaining values averaged. When the average ullage
is calculated for the purpose of determining the hopper volume, maintain
significant digits for the average ullage such that if the forward ullage
were 0.15 and aft ullage were 0.1, then the average ullage would be 0.125.
Special arrangements for pocket scows may be made in consultation with the
DQM Support Center.

3.1.14 Bin Volume

Report scow bin volume in cubic meters yards based on the most accurate
method available for the scow. The minimum standard of accuracy for bin
volume is interpolation from the bin volume table based on the average
ullage soundings.

3.2 NATIONAL DREDGING QUALITY MANAGEMENT PROGRAM SYSTEM REQUIREMENTS

The Contractor's DQM system must be capable of collecting, displaying, and
transmitting information to the DQM database. The parameters which must be
reported to the DQM database include trip number, date and time, hull
status, offloading status, scow course, scow speed, scow heading, draft, displacement, ullage, and bin volume. Provide an easily accessible, permanent visual display on the scow to show in real time the parameters collected by the system in the same units as the data submitted to the DQM database. In the event a reported parameter is calculated based on multiple sensors, the sensor values as used in the equation must be able to be viewed in addition to the required parameter. If a hardware problem occurs, or if a part of the system is physically damaged, the Contractor is responsible for repairing it within 48 hours of determination of the condition.

3.2.1 Telemetry

The Contractor may select any commercial satellite, cellular phone, or other data communications systems available, as long as it is capable of transmitting real-time data as well as enough additional bandwidth to clear historically queued data when a connection is reobtained. If connectivity is lost, queue and transmit unsent data upon restoration of connectivity. Delays in pushing real-time data to the DQM database should not exceed four hours. Exceptions to these requirements may be granted by the DQM Center on a case-by-case basis with consideration for contract-specific requirements, site-specific conditions, and extreme weather events.

The data transmission process from the scow to the DQM database must be automated. The data may be sent from the scow directly to the DQM database or to a shore-based system. Data transmitted to the DQM database should be raw data; use repeatable automated software or programming routine to process any shoreside data. Include a description of this process in the DPIP.

3.2.2 Data Reporting Frequency

Log disposal activities with high temporal and spatial resolution. Log data as a series of events. Each set of measurements (time, position, etc.) will be considered an event. Collect any required information in paragraph REQUIREMENTS FOR REPORTED DATA, that is not an averaged variable (that is, draft and ullage) within 1 second of the reported time. Measure data with sufficient frequency by the scow system to resolve the events to the accuracy specified in the following table. Any averaged variable must be collected and computed within this sampling interval. Reporting intervals must be consistent and not change for the data collected on a given scow. This interval should be documented by the Contractor in the DPIP.

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Event Trigger Descriptions</th>
<th>Event Time Resolution</th>
<th>Event Position Resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loading</td>
<td>No change in position with hull status closed&lt;br&gt;An elapsed time of 1 hour since the last event.</td>
<td>1 minute</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td>NONCLOSURE&lt;br&gt;In the event a scow has completed an open water disposal and transited back to a holding station without closing the hull, the sampling must be changed to once per hour.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Event Type</td>
<td>Event Trigger Descriptions</td>
<td>Event Time Resolution</td>
<td>Event Position Resolution</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------</td>
<td>-----------------------</td>
<td>---------------------------</td>
</tr>
</tbody>
</table>
| Sailing           | *Change in position with hull status closed*  
|                   | Time from the last sample equals 1 minute.                                                  | 1 second              | plus or minus 3 m 10 ft   |
| Offloading        | *Offloading material, hull status reported as open*                                         | 1 second              | plus or minus 3 m 10 ft   |
|                   | A position must be recorded within 1 minute arrival at the offload location and within one second of the material starting to be removed from scow. The time from the last sample equals 1 minute.  
|                   | **STANDBY OFFLOADING**  
|                   | In the event a scow is not being actively offloaded at the offload location for a time equal to one hour, the sampling interval must be equal to once an hour. | 1 minute              |                                           |
| Open Water        | *Hull status open*                                                                         | 1 second              | plus or minus 3 m 10 ft   |
| Disposal          | A data point must be recorded within 1 second of the hull status going from closed to open and again within 1 second of the hull status going from open to closed. Between these events, report the data at equal interval from 6 to 12 seconds. This interval must always remain consistent for the dredge plant. |                                           |                                           |

Example: The scow is stationary for 1 hour and 15 minutes, and then it sails to the disposal area. You should have a "Loading/Stationary" event at time 0, time 1 hour, and time 1 hour and 15 minutes. Then, for "Sailing," within 1 second of an elapsed time of 1 minute from the 1 hour and 15 minutes event, another event occurs.

3.2.3 Data Transmission to the Web Service

Use a Simple Object Access Protocol (SOAP) web service to report sensor data to the DQM database. Transmit data as it is collected in real time and pushed to the DQM web service. If the web service is not available or returns an error message, store the data in a queue and transmit upon re-establishment of the connection, starting with the oldest data in the queue and continuing until real-time transmission is restored. Delays in
pushing real-time data to the DQM database should not exceed four hours. Exceptions to these requirements may be granted by the DQM Support Center on a case-by-case basis with consideration for contract-specific requirements, site-specific conditions, and extreme weather events.

Contact dqm-support@usace.army.mil to obtain the web service URL and the appropriate key credentials and communication protocol.

The data transmission method call takes two arguments: a string containing the plant identifier assigned by the DQM Support Center and a second string containing the XML-formatted sensor data. The method returns the string "OK" if the data is received. If the data is not received, either the web service or the client application throws an error.

3.2.4 XML-Formatted Sensor Data String

Pass each scow event as a string on one continuous line of data. The example below is broken up by variable for ease of reading:

```xml
<?xml version="1.0"?>
<SCOW_DREDGING_DATA version="2.5">
  <SCOW_NAME>AU1994</SCOW_NAME>
  <PLANT_IDENTIFIER>1999</PLANT_IDENTIFIER>
  <CONTRACT>W123BA-09-D-0087_RL01</CONTRACT>
  <TRIP_NUMBER>34</TRIP_NUMBER>
  <X_POSITION>-81.670632</X_POSITION>
  <Y_POSITION>41.528987</Y_POSITION>
  <DATE_TIME>2010-08-14 10:50:15</DATE_TIME>
  <SCOW_SPEED>0.0</SCOW_SPEED>
  <SCOW_COURSE>0.0</SCOW_COURSE>
  <HULL_STATUS>OPEN</HULL_STATUS>
  <OFFLOADING>FALSE</OFFLOADING>
  <SCOW_HEADING></SCOW_HEADING>
  <SCOW_FWD_DRAFT></SCOW_FWD_DRAFT>
  <SCOW_AFT_DRAFT></SCOW_AFT_DRAFT>
  <SCOW_AVG_DRAFT></SCOW_AVG_DRAFT>
  <ULLAGE_FWD></ULLAGE_FWD>
  <ULLAGE_AFT></ULLAGE_AFT>
  <ULLAGE_AVG></ULLAGE_AVG>
  <SCOW_BIN_VOLUME></SCOW_BIN_VOLUME>
  <SCOW_DISPLACEMENT></SCOW_DISPLACEMENT>
  <ADDITIONAL_DATA>Some more scow info, if needed</ADDITIONAL_DATA>
</SCOW_DREDGING_DATA>
```

Format DATE_TIME values as YYYY-MM-DD HH:MM:SS, as shown above. If, for any reason, a field has no value, the enclosing XML tags should be sent with nothing between them (for example, <DRAFT_AFT></DRAFT_AFT>). The web service cannot handle a "null" value or any other indicators of no value collected.

3.2.5 Contractor Data Backup

Maintain an archive of all data sent to the DQM database during the dredging contract. The Contracting Officer's Representative (COR) may require, at no increase in the contract price, that the Contractor provide a copy of these data covering specified time periods. Provide the data in the HTML format which would have been transmitted to the DQM database. Submit data via storage medium acceptable to the COR.
At the end of the dredging contact, contact the DQM Support Center prior to discarding the data. The DQM Support Center will verify that all data has been received and appropriately archived before giving the Contractor discard permission. Record in a separate section at the end of the scow's onsite copy of the DPIP the following information:

Person who made the call  
Date of the call  
DQM representative who gave permission to discard

3.3 PERFORMANCE REQUIREMENTS

The Contractor's DQM system must be fully operational at the start of dredging operations and fully certified prior to moving dredge material on the contract (see paragraph NATIONAL DREDGING QUALITY MANAGEMENT PROGRAM CERTIFICATION). To meet contract requirements for operability, in addition to certification, the Contractor's system must provide a data string with values for all parameters while operating, as described within the specifications. Additionally, all hardware must be compliant with DPIP requirements (see paragraph DREDGE PLANT INSTRUMENTATION PLAN (DPIP)). Quality data strings are considered to be those providing values for all parameters reported when operating according to the specification. Make repairs necessary to restore data return compliance within 48 hours. Failure by the Contractor to report the required data within the specified time window for scow measurements (see paragraph DATA REPORTING FREQUENCY, and paragraph DATA TRANSMISSION TO THE WEB SERVICE) and failure to receive DQM certification prior to dredging will result in withholding of up to 10 percent of the contract progress payment.

3.4 LIST OF ITEMS TO BE PROVIDED BY THE CONTRACTOR

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the National Dredging Quality Management Program for hopper dredging.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

**PART 1  GENERAL**

**1.1  DESCRIPTION**

The work under this contract requires use of the National Dredging Quality Management Program (DQM) to monitor the dredge's status at all times during the contract and to manage data history.

This performance-based specification section identifies the minimum required output and the precision and instrumentation requirements. The requirements may be satisfied using equipment and technical procedures selected by the Contractor.

**1.2  SUBMITTALS**

**NOTE: Review Submittal Description (SD) definitions**
in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-07 Certificates

National Dredging Quality Management Program Certification,
[_____] District; G[, [_____]]

1.3 PAYMENT

Separate payment for installation, operation, and maintenance of the DQM-certified system as specified herein for the duration of the dredging operations is not allowed; all costs in connection therewith are considered a subsidiary obligation of the Contractor and are covered under the contract unit price for dredging in the bidding schedule.
1.4 NATIONAL DREDGING QUALITY MANAGEMENT PROGRAM CERTIFICATION

1.4.1 Certification

The Contractor is required to have a current certification from DQM for the hopper dredge instrumentation system to be used under this contract. Criteria for certification is based on the most recent specification posted on the DQM website: [http://dqm.usace.army.mil/Specifications/Index.aspx](http://dqm.usace.army.mil/Specifications/Index.aspx). Verify compliance with these criteria by annual onsite quality assurance (QA) checks conducted by the DQM Support Center Data Acquisition and Analysis Team and by periodic review of the transmitted data. DQM Certification is valid for one year from the date of the annual QA checks. Certification is contingent upon the system's ability to continuously meet the performance requirements as outlined in paragraph PERFORMANCE REQUIREMENTS. If issues with data quality are not corrected within 48 hours, the system certification will be revoked and additional QA checks by the Data Acquisition and Analysis Team may be necessary.

Annual DQM Certification must be based on the following:

b. Verification of data acquisition and transfer as described in paragraph Performance Requirements.

c. Review of the Dredge Plant Instrumentation Plan (DPIP) as described in paragraph DREDGE PLANT INSTRUMENTATION PLAN (DPIP).

1.4.2 Recertification

The owner or operator of the dredge must contact DQM at DQM-AnnualQA@rpsgroup.com on an annual basis, or at least three weeks prior to certification expiration, to schedule QA checks for renewal. This notification is meant to make the Data Acquisition and Analysis Team aware of a target date for the annual QA checks for the dredge. At least one week prior to the target date, the Contractor must contact the Data Acquisition and Analysis Team and verbally coordinate a specific date and location. The Contractor must then follow up this conversation with a written email confirmation. The owner/operator must coordinate the QA checks with all local authorities, including but not limited to, the local USACE Contracting Officer's Representative (COR).

Recertification is required for any yard work which produces modification to displacement (change in dredge lines, or repositioning or repainting hull marks), modification to bin volume (change in bin dimensions, or addition or subtraction of structure), or changes in sensor type or location; report these changes in the sensor log section of the DPIP. A system does not have to be transmitting data between jobs; however, in order to retain its certification during this period, the system sensors or hardware should not be disconnected or removed from the dredge. If the system is powered down, retain calibration coefficients.

1.5 DREDGE PLANT INSTRUMENTATION PLAN (DPIP)

The Contractor must have a digital copy of the DPIP on file with the DQM Support Center. While working on site, the Contractor must also maintain on the dredge a copy of the DPIP which is easily accessible to Government personnel at all times. This document must describe the sensors used,
configuration of the system, how sensor data will be collected, how quality control on the data will be performed, and how sensors/data reporting equipment will be calibrated and repaired if they fail. A description of the computed dredge-specific data and how the sensor data will be transmitted to the DQM database will also be included. A complete list of the required DPIP contents is provided on the DQM website https://dqm.usace.army.mil/Certifications/Index.aspx

Submit to the DQM Support Center any addendum or modifications made to the plan, subsequent to its original submission, prior to the start of work. Any changes to the computation methods must be approved by the DQM Support Center prior to their implementation.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 REQUIREMENTS FOR REPORTED DATA

Provide, operate, and maintain all hardware and software to meet these specifications. The Contractor is responsible for replacement, repair, and calibration of sensors and other necessary data acquisition equipment needed to supply the required data. Complete repairs within 48 hours of any sensor failure. Notify the COR upon completion of a repair, replacement, installation, modification, or calibration. The COR may request recalibration of sensors or other hardware components at any time during the contract as deemed necessary.

Keep a log of sensor repair, replacement, installation, modification, and calibration in the dredge's onboard copy of the DPIP. The log must contain a three-year history of sensor maintenance, including the time of the sensor failures (and subsequent repairs), the time and results of sensor calibrations, the time of sensor replacements, and the time that backup sensor systems were initiated to provide required data. It must also contain the name of the person responsible for the sensor work. Install sensors that are capable of collecting parameters within specified accuracies and resolutions indicated in the following subparagraphs. Reported sensor values for ullage, draft, and draghead depth should represent a weighted average with the highest and lowest values not included in the calculated average for the given interval. This information should be documented in the DPIP sections that say "Calculations done external to the instrumentation."

3.1.1 Date and Time

Report the date and time to the nearest second and referenced to UTC time based on a 24-hour format: mm/dd/yyyy hh:mm:ss. The reported time must be the time reported by the GPS in the NMEA string.

3.1.2 Load Number

A load number must document the end of a disposal event. Load numbering will begin at number 1 at the start of the contract and will be incremented by 1 at the completion of each disposal event or emptying of the hopper. Whenever possible, calculate the load number off of the sensors aboard the dredge, which must be a mathematically repeatable routine. Make efforts to include logic that avoids false load number increments. Do not allow the
routine to miss any disposal event. If manual incrementing of the load number is in place, pay extra attention to this value in the quality control process.

3.1.3 Horizontal Positioning

Obtain all locations using a positioning system operating with a minimum accuracy level of 1 to 3 meters 3 to 10 feet horizontal Circular Error Probable (CEP). Report positions as Latitude/Longitude WGS 84 in decimal degrees. West Longitude and South Latitude values are reported as negative.

3.1.3.1 Vessel Horizontal Positioning

Record vessel horizontal positioning as geographic coordinates of the vessel as indicated by the location of the GPS antenna.

3.1.3.2 Draghead Horizontal Positioning

Record draghead horizontal positioning as geographic coordinates of the heel on the centerline of the draghead(s). Describe any offset calculations from the GPS antenna in the DPIP.

3.1.4 Hull Status

Monitor open/closed status of the hopper dredge, corresponding to the split/non-split condition of a split-hull hopper dredge. For dredges with hopper doors, the status of a single door that is the first opened during normal disposal operations may be monitored. An "open" value indicates that the hopper door is open or, in the case of split-hull dredges, that the hull is split. A "closed" value indicates that the hopper doors are closed or, in the case of split-hull dredges, that the hull is not split.

For this contract, hull status must register closed prior to leaving the disposal area.

3.1.5 Dredge Course

Provide dredge course-over-ground (COG) using industry-standard equipment. Provide dredge course-over-ground to the nearest whole degree with values from 000 (true north) to 359 degrees referenced to a clockwise positive direction convention.

3.1.6 Dredge Speed

Provide dredge speed-over-ground in knots using industry-standard equipment with a minimum accuracy of 1 knot and resolution to the nearest 0.1 knot.

3.1.7 Dredge Heading

Provide dredge heading using industry-standard equipment. The dredge heading must be accurate to within 5 degrees and reported to the nearest whole degree with values from 000 (true north) to 359 degrees referenced to a clockwise positive direction convention.

3.1.8 Tide

Obtain tide data using appropriate equipment to give the water level with an accuracy of plus or minus 0.03 meter 0.1 foot and a resolution of 0.003 meter 0.01 foot. Enter tide values above project datum described in the
dredging specification with a positive sign and those below with a negative sign.

3.1.9 Draft

Report all draft measurements in meters feet, tenths, and hundredths with an accuracy of plus or minus 0.03 meter 0.1 foot relative to observed physical draft readings. Report the measurements at a resolution of two decimal places (hundredths of a meter foot). The reported forward draft value is equal to the sum of the visual forward port and starboard draft mark readings divided by two. The reported aft draft value is equal to the sum of the visual aft port and starboard draft mark readings divided by two. Forward draft, aft draft, and average draft will be reported. Place sensors at an optimum location on the vessel to be reflective of observed physical draft mark readings at any trim or list. Minimum accuracies are conditional to relatively calm water. The sensor value reported must be an average of at least ten samples per event, with at least one maximum value and one minimum value removed, and the minimum eight remaining values averaged. When the average draft is calculated for the purpose of determining displacement, maintain significant digits for average draft such that if forward draft was 0.15 and aft draft was 0.1, the average draft would be 0.125.

3.1.10 Hopper Ullage Sounding

Report all reported ullage soundings in meters feet, tenths, and hundredths with an accuracy of plus or minus 0.03 meter 0.1 foot with respect to the combing and be representative of the forward and aft extents of the hopper as close to the centerline as is possible. Report the measurements at a resolution of two decimal places (hundredths of a foot). Report forward ullage and aft ullage soundings. Mount sensors to avoid discharge flume turbulence, foam, and any structure that could produce sidelobe errors. If sensors must be offset from the centerline of the hopper, they should be offset to opposite sides of the vessel. If more than one fore or one aft sensor are used, place the sensors near the corners of the hopper, and report the average value of the fore sensors and the average value of the aft sensors. The sensor value reported must be an average of at least ten samples per event, with at least one maximum value and one minimum value removed, and the minimum eight remaining values averaged. When the average ullage is calculated for the purpose of determining hopper volume, maintain significant digits for average ullage such that if forward ullage was 0.15 and aft ullage was 0.1, then the average ullage would be 0.125.

3.1.11 Hopper Volume

Report hopper volume in cubic meters yards, based on the most accurate method available for the dredge. The minimum standard of accuracy for hopper volume is interpolation from the certified hopper volume table, based on the average fore and aft ullage soundings.

3.1.12 Displacement

Report dredge displacement in long tons, based on the most accurate method available for the dredge. The minimum standard of accuracy for displacement is interpolation from the displacement table, based on the average draft. For this contract the density of water used to calculate displacement is [_____]² kg/cubic meter lbs/cubic foot, and it will be used for an additional interpolation between the fresh and salt water tables.
The water density used is project-/location-specific. Enter the appropriate water density in the blank:

- **Fresh Water:** 1000 kg/m³ (1 g/cm³) 62.43 lbs/cubic foot
- **Salt Water:** 1027-1030 kg/m³ (1.027-1.03 g/cm³) 64.11 - 64.30 lbs/cubic foot

3.1.13 Empty Displacement

Report empty displacement in long tons, which is the lightship value of the dredge, or the weight of the dredge with no material in the hopper, adjusted for fuel and water consumption.

3.1.14 Draghead Depths

Report draghead depths with an accuracy of plus or minus 0.15 meter 0.5 foot and a resolution to the nearest 0.03 0.1 foot as measured from the surface of the water with no tidal adjustments. Minimum accuracies are conditional to relatively calm water. The sensor value reported must be an average of at least ten samples per event, with at least one maximum value and one minimum value removed, and the minimum eight remaining values averaged.

3.1.15 Slurry Densities

Use a density metering device, calibrated according to the manufacturer's specifications, to record the slurry density of each dragarm to the nearest 0.001 g/cc with an accuracy of plus or minus 0.01 g/cc. If the manufacturer does not specify a frequency of recalibration, conduct calibration prior to commencement of work.

3.1.16 Slurry Velocities

Use a flow metering device, calibrated according to the manufacturer's specifications, to record the slurry velocity of each dragarm to the nearest 0.003 mps 0.01 fps with an accuracy of plus or minus 0.15 mps 0.5 fps. If the manufacturer does not specify a frequency of recalibration, conduct calibration prior to commencement of work. Measure the slurry velocity in the same pipeline inside diameter as that used for the slurry density measurement.

3.1.17 Pump RPM

Measure the RPM of any pump being used to move material with the highest level of accuracy that is standard on the vessel operational displays, either at the bridge, at the drag tender's controls, or in the engine room. Dredges with multiple pumps per side must report RPM for the pump that best describes the dredging process (typically the outboard pump).

3.1.18 Sea Suction Valve for Dragarm

If sea suction can be taken to bypass suction through the draghead, the sea suction location and valve status will be reported. The status of the valve will change from "closed" to "open" when the valve starts to open and will register "closed" when the valve is fully closed. When applicable, the state of the latch will be reported as "true" or "false." Report the sea suction location in a standard non-changing name string of no more than 20 characters. These field values will always occur in the XML string as a set. The DQM system can accommodate only up to four unique sea suction locations. Suggested options for the naming convention can be found in the

---

SECTION 35 20 23.23 Page 9
3.1.19 Pumpout

When the hopper dredge is being pumped out, report a "true" value; when it is not, report a "false" value. The only permissible values are "true" and "false."

3.2 NATIONAL DREDGING QUALITY MANAGEMENT PROGRAM SYSTEM REQUIREMENTS

The Contractor's DQM system must be capable of collecting, displaying, and transmitting information to the DQM database. Record the applicable parameters from paragraph REQUIREMENTS FOR REPORTED DATA as events locally and continually transmitted to the DQM database anytime an Internet connection is available. Equip the Dredge with a DQM computer system, consisting of a computer, monitor, keyboard, mouse, data modem, UPS, and network hub. Provide a standalone computer system, exclusive to the DQM monitoring system, and with USACE DQM software installed on it. If a hardware problem occurs, or if a part of the system is physically damaged, the Contractor is responsible for repairing it within 48 hours of determination of the condition.

3.2.1 Computer Requirements

Provide a dedicated onboard computer for use by the DQM system. This computer must run USACE software and receive data from the Contractor's data-reporting interface. This computer must meet or exceed the following performance specifications:

| CPU: Intel or AMD processor with a (non-overclocked) clock speed of at least 1.6 gigahertz (GHz) |
| Hard drive: 250 gigabytes (GB); internal |
| RAM: 4 gigabytes (GB) |
| Ethernet adapter: Internal network card with an RJ-45 connector |
| Ports: 1 free serial port with standard 9-pin connectors; 1 free USB port |
| Other hardware: Keyboard, mouse, monitor |

Install a fully licensed copy of Windows 10 Professional Operating System or higher on the computer specified above. Also install any necessary manufacturer-provided drivers for the installed hardware. Locate and orient the computer to allow data entry and data viewing, as well as to provide access to data ports for the connection of external hardware.

3.2.2 Software

The DQM computer's primary function is to transmit data to the DQM shoreside database. Do not install software which conflicts with this function on this computer. The DQM computer must have the USACE-provided Dredging Quality Management Onboard Software (DQMOBS) installed on it by DQM personnel along with USACE-selected software for remote support and management.
3.2.3 UPS

Supply an Uninterruptible Power Supply (UPS) for the computer and networking equipment. The UPS must provide backup power at 1 kVA for a minimum of ten minutes. The UPS must interface with the DQM computer to communicate UPS status. Ensure that sufficient power outlets are available to run all specified equipment.

3.2.4 Internet Access

Maintain an Internet connection capable of transmitting real-time data to the DQM server and supporting remote access, as well as enough additional bandwidth to clear historically queued data when a connection is re-obtained. If connectivity is lost, queue and transmit unsent data upon restoration of connectivity. Delays in pushing real-time data to the DQM database should not exceed four hours. Exceptions to these requirements may be granted by the DQM Support Center on a case-by-case basis with consideration for contract-specific requirements, site-specific conditions, and extreme weather events.

Acquire and install all necessary hardware and software to make the Internet connection available for data transmission to the DQM web service. Configure the hardware and software to allow the DQM Support Center remote access to this computer. Coordination between the dredging company's IT and the DQM Support Center may be required in order to configure remote access though any security, firewall, router, and telemetry systems. Telemetry systems must be capable of meeting these minimum reporting requirements in all operating conditions.

3.2.5 Data Routing Requirements

Onboard sensors must continually monitor dredge conditions, operations and efficiency and route this information into the shipboard dredge-specific system (DSS) computer to assist in guiding dredge operations. Portions of this Contractor-collected information must be routed to the DQM computer on a real-time basis. Use an RS-232 9600- or 19200-baud serial interface to send standard sensor data to the DQM computer. Configure the serial interface as 8 bits, no parity, and no flow control.

3.2.6 Data Reporting Frequency

Log data as a series of events. Each event will consist of a dataset containing dredge information in accordance with paragraph REQUIREMENTS FOR REPORTED DATA. Each set of measurements (time, position, etc.) will be considered an event. Collect any required information in paragraph REQUIREMENTS FOR REPORTED DATA that is not an averaged variable (draft and ullage) within 1 second of the reported time. Send a data string for an event to the DQM computer every 6 to 12 seconds. This interval must remain constant throughout the contract; do not transmit data strings more than once per every 5 seconds. Collect and compute any averaged variable within this sampling interval.

3.2.7 Data Format

Report data as an extensible Markup Language (W3C standard XML 1.0) document as indicated below. Line breaks and spaces are added for readability, but the carriage return, line feed character combination is added only to delineate records (HOPPER_DREDGING_DATA tag) for actual data transmission.
```xml
<?xml version="1.0"?>
<HOPPER_DREDGING_DATA version = "2.0">

3.2.8 Data Reporting

The system must transmit correctly formatted event data XML strings to the DQM database continuously from mobilization until the last USACE post-dredging survey has been accepted. If the Internet connection (paragraph INTERNET ACCESS) is non-operable, perform manual backups from the dredge computer of the XML data string which would have been transmitted to the DQM computer over the serial connection for each day the device is inoperable and submit to the DQM Support Center within 48 hours. This submission does not replace the requirement of correcting the issue affecting the automatic transmission of data. In the event of data...
transfer, transmission, or hardware failure, maintain a manually recorded disposal log consisting of a series of events. These events are start of dredging, end of dredging, pre-disposal, and post-disposal. Include time stamp (GMT), position (Latitude and Longitude WGS84), draft, ullage, volume, and displacement for each event. Submit disposal logs on a daily basis to the COR during the time when the system is not operational.

3.2.9 Contractor Data Backup

Maintain an archive of all data sent to the DQM computer during the dredging contract. The COR may require, at no increase in the contract price, that the Contractor provide a copy of these data covering specified time periods. Provide the data, transmitted to the DQM computer, in the XML format with no line breaks between the parameters and each record string on a separate line. The naming convention for the files is \{dredgename\}_{StartYYYYMMddhhmmss}_{EndYYYYMMddhhmmss}.txt. Submit data via storage medium acceptable to the COR.

At the end of the dredging contract, contact the DQM Support Center prior to discarding the data. The DQM Support Center will verify that all data has been received and appropriately archived before giving the Contractor discard permission. Record the following information in a separate section at the end of the dredge's onboard copy of the DPIP:

- Person who made the call
- Date of the call
- DQM representative who gave permission to discard

3.3 PERFORMANCE REQUIREMENTS

The Contractor's DQM system must be fully operational at the start of dredging operations and fully certified prior to moving dredge material on the contract (see paragraph NATIONAL DREDGING QUALITY MANAGEMENT PROGRAM CERTIFICATION). To meet contract requirements for operability, in addition to certification, the Contractor's system must provide a data string with all values for all parameters while operating, as described in the specifications. Additionally, all hardware must be compliant with hardware requirements (paragraph COMPUTER REQUIREMENTS). Quality data strings are considered to be those providing values for all parameters reported when operating according to the specification. Make repairs necessary to restore data return compliance within 48 hours. Failure by the Contractor to report the required data within the specified time window for dredge measurements (see paragraph DATA REPORTING FREQUENCY and paragraph DATA REPORTING) will result in withholding of up to 10 percent of the contract progress payment per FAR 52.232-5 Payments under Fixed-Price Construction Contracts.

3.4 PERFORMANCE REQUIREMENTS

3.5 LIST OF ITEMS TO BE PROVIDED BY THE CONTRACTOR

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the National Dredging Quality Management Program for pipeline hydraulic dredging.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1   DESCRIPTION

The work under this contract requires use of the National Dredging Quality Management Program (DQM) to monitor the dredge's status at all times during the contract and to manage data history.

This performance-based specification section identifies the minimum required output and the precision and instrumentation requirements. The requirements may be satisfied using equipment and technical procedures selected by the Contractor.

1.2   SUBMITTALS

NOTE: Review Submittal Description (SD) definitions
in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-07 Certificates

National Dredging Quality Management Program Certification,
[_____] District; G[, [____]]

1.3 PAYMENT

Separate payment for installation, operation, and maintenance of the DQM-certified system as specified herein for the duration of the dredging operations is not allowed; all costs in connection therewith are considered a subsidiary obligation of the Contractor and are covered under the contract unit price for dredging in the bidding schedule.

1.4 NATIONAL DREDGING QUALITY MANAGEMENT PROGRAM CERTIFICATION

The Contractor is required to have a current certification from the DQM Program for the cutter/suction head hydraulic dredge instrumentation system
to be used under this contract. Standard Operating Procedures (SOP) and criteria for certification are presented on the DQM website at https://dqm.usace.army.mil.

1.5 DREDGE PLANT INSTRUMENTATION PLAN (DPIP)

The Contractor must have a digital copy of the Dredge Plant Instrumentation Plan (DPIP) on file with the DQM Support Center. While working on site, the Contractor must also maintain on the dredge a copy of the DPIP, which is easily accessible to Government personnel at all times. This document must accurately describe the sensors used, the configuration of the system, how sensor data will be collected, how quality control on the data will be performed, and how the sensors/data-reporting equipment will be calibrated and repaired if it fails. A description of the computed dredge-specific data and how the sensor data will be transmitted to the DQM database will also be included. Prior to the start of work, the Contractor must submit to the DQM Support Center any addendum or modifications made to the plan subsequent to its original submission. Requirements and a template for the DPIP are available on the DQM website at https://dqm.usace.army.mil.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 REQUIREMENTS FOR REPORTED DATA

Provide, operate, and maintain all hardware and software to meet these specifications. The Contractor is also responsible for the replacement, repair, and calibration of the sensors and other necessary data acquisition equipment needed to supply the required data. Document and complete the procedure to complete a repair as soon as practical. If repair is not possible within two business days of any sensor failure, submit a plan and timeline to complete the repair. Upon completion of a repair, replacement, installation, modification, or calibration, notify the Contracting Officer's Representative (COR). The COR may request recalibration of the sensors or other hardware components at any time during the contract as deemed necessary.

Keep a log of sensor repair, replacement, installation, modification, and calibration in the dredge's onboard copy of the DPIP. The log must contain a three-year history of sensor maintenance, including the time of the sensor failures (and subsequent repairs), the time and results of sensor calibrations, the time of sensor replacements, and the time that backup sensor systems were initiated to provide the required data. It must also contain the name of the person responsible for the sensor work. Install sensors that are capable of collecting parameters within the specified accuracies and resolutions indicated in the following subparagraphs and transmit these parameters to the DQM database. Transmit all data in JSON message bundles. Each bundle can contain multiple message types. Transmit sensor data as work event messages, and transmit data which relates to the operational state of the dredge or its sensors as state event messages. (See paragraph PARAMETER TRANSMISSION TO THE WEB SERVICE.)

3.1.1 Message Bundle Data

Every message bundle must contain descriptive data that relates the message to a given dredge plant and date/time. Identify the start of a message
3.1.1.1 Messages

Messages contain operational data that populates the DQM database for a dredge plant. A message must consist of an event type and its associated data (as defined in paragraph DREDGE EVENTS - WORK EVENT and paragraph DREDGE EVENTS - STATE EVENT), a date/time stamp indicating when the event occurred or started, and a comment providing clarification or metadata about the situation. There are multiple event types, but they all fall into one of two categories - work events and state events.

3.1.1.1.1 Message Time

In a work event message, message time is the date and time that the data is collected from the sensors; in a state event message, message time is the date and time that the state event begins. Report and reference the message time to the nearest second and to Coordinated Universal Time (UTC) time based on a 24-hour format (YYYY-MM-DD HH:MM:SS). In order to ensure accuracy and reliability, synchronize the time stamp to UTC format from an accurate, unchangeable source (for example, a GPS National Marine Electronics Association [NMEA] datastring). Identify message time by the tag "msg_time".

3.1.1.1.2 Comment

Comments concerning the work event or state event messages being transmitted provide descriptive information that relates to the data. An example of a comment for work event data is information about a sensor issue; an example of a comment for state event data is a description of operations. Identify a comment by the introductory tag "comment", and the comment must not consist of more than 250 characters.

3.1.1.2 Dredge Events - Work Event

There are two types of dredge event messages - work event messages and state event messages. Work event messages contain data that are instantaneously collected or calculated from sensors and are logged as a series of events. Work events are triggered by a time interval change (as described in paragraph WORK EVENT MESSAGES). Initiate all work event messages by the header tag "work_event".

3.1.1.2.1 Vertical Correction

Obtain the variation of the water level from the vertical datum for the river stage or tidal gage described in the state events using appropriate equipment to give the water level with an accuracy of plus or minus 0.1 ft. Enter vertical correction values above project datum described in the dredging specification with a positive sign and those below with a negative sign. The tag for vertical correction is "vert_correction".

3.1.1.2.2 Cutter/Suction Head Location and Movement

Monitor the X, Y, and Z components of the cutter/suction head location. Additional calculations made from the observed values determine the rates of movement to track the progress of the dredge.
3.1.1.2.2.1 Cutter/Suction Head Horizontal Position

Obtain the forwardmost point of the cutter/suction head using a positioning system operating with a minimum accuracy level of 3-10 feet horizontal Circular Error Probable (CEP). Report it as Latitude/Longitude WGS 84 in decimal degrees with West Longitude and South Latitude values reported as negative. Identify position values by the tags "ch_latitude" and "ch_longitude".

3.1.1.2.2.2 Cutter/Suction Invert Depth

Cutter/suction invert depth is the depth of the invert of the suction mouth relative to the surface of the water. Instrumentation must be capable of reporting to an accuracy of plus or minus 0.5 foot and a resolution to the nearest 0.1 foot with no tidal adjustments. Minimum accuracies are conditional to relatively calm water. Use the tag "ch_depth" to identify the cutter/suction head depth.

3.1.1.2.2.3 Cutter/Suction Head Heading

The cutter/suction head heading is the angle of the centerline of the cutter/suction head and dredge ladder measured relative to true north. Provide all headings using industry-standard equipment. The heading must be accurate to within 5 degrees and reported to the nearest whole degree with values from 000 (true north) to 359 degrees referenced to a clockwise positive direction convention. Use the tag "ch_heading" to identify the cutter/suction head heading.

3.1.1.2.3 Dredge Activity

Monitor dredge activity using a combination of the following parameters.

3.1.1.2.3.1 Slurry Velocity

Slurry velocity is not a mandatory field for the Small Business profile; however, if the dredge is outfitted with a velocity meter, then it is expected that velocity data will be included within the DQM string and will meet the standard DQM requirements outlined below.

Use a flow-metering device, calibrated according to the manufacturer's specifications, to record the slurry velocity to the nearest 0.01 fps with an accuracy of plus 0.5 fps. If the manufacturer does not specify a frequency of recalibration, conduct calibration prior to the commencement of work. Measure the slurry velocity for the same pipeline inside diameter as that used for the slurry density measurement. Associate the tag "slurry_velocity" with this value.

3.1.1.2.3.2 Slurry Density

Slurry density is not a mandatory field for the Small Business profile; however, if the dredge is outfitted with a density meter, then it is expected that density data will be included within the DQM string and will meet the standard DQM requirements outlined below.

Use a density-metering device, calibrated according to the manufacturer's specifications, to record the slurry density to the nearest 0.01 g/cc. It is understood that the accuracy of this sensor can vary based on several factors, including the type of material, the magnitude of the cut, and the length of time since calibration. If the manufacturer does not specify a
frequency of recalibration, conduct calibration prior to the commencement of work. Continuous monitoring of this sensor ensures that drift and other factors inherent in the dredging process can be accounted for in monitoring dredge activity. Associate the tag "slurry_density" with this value.

3.1.1.2.3.3 Pump RPM

The pump rpm is the number of revolutions per minute measured for the slurry pump shaft. Measure the shaft revolution rate (rev/min) with the highest level of accuracy that is standard on the vessel's operational displays either at the bridge or in the engine room. Identify this value by the tag "rpm".

3.1.1.2.3.4 Pump Vacuum

Measure the vacuum pressure of the dredge pump(s) (inches of mercury) as near to the eye as practicable in the pump's suction pipe with the highest level of accuracy that is standard on the vessel's operational displays either at the leverman's controls or in the engine room. Identify vacuum pressure by the tag "vacuum".

3.1.1.2.3.5 Pump Outlet Pressure

Measure the pump outlet pressure in the discharge line on the pump side of the flap valve in terms of pounds per square inch (psi) on a gauge. Identify pump outlet pressure by the tag "outlet_psi".

3.1.1.2.4 Outfall Information (Open Water/Spill Barge Disposal)

Monitor the X and Y position of the terminal end of the outfall pipe continuously and report the position as part of the work event string.

3.1.1.2.4.1 Discharge Horizontal Position

Obtain the horizontal position of the outfall end of the discharge pipe using a positioning system operating with a minimum accuracy level of 3-10 feet horizontal Circular Error Probable (CEP). Report it as Latitude/Longitude WGS 84 in decimal degrees with West Longitude and South Latitude values being reported as negative. Identify position values by the tags "outfall_latitude" and "outfall_longitude".

3.1.1.3 Dredge Events - State Event

There are two types of dredge event messages - work event messages and state event messages. State event messages provide information about the current state of the dredge equipment or operations. They are created and sent only when a state changes. Since state events often cannot be collected in real time, state events are tagged with a date time stamp (referenced to Coordinated Universal Time [UTC]) that indicates when the state change happened relative to the work event message tag. This data is considered to be "true" until another state event tag of the same type is received. Indicate each type of state event message by a specific header tag as enumerated in the following subparagraphs. State events can be transmitted along with work event message bundles directly by the contractor using the indicated format, or they can be entered on the "State" tab in the DQM-provided software. However, they should be sent only if the state value changes.
3.1.1.3.1 Message Time

The state event time is the date and time that the event starts. Enter the leverman's time to the nearest second as local time and automatically convert to and report in UTC based on a 24-hour format (YYYY-MM-DD HH:MM:SS). Identify message time by the tag "msg_time".

3.1.1.3.2 Contract Event

Report information concerning the contract under which dredging is being performed at the start and completion of each contract using the header tag "contract_event".

3.1.1.3.2.1 Contract Number

Report the USACE-assigned contract number for the project using the tag "contract_number".

3.1.1.3.2.2 Contract Start and End

Report the start and end of a contract using the tag "event_type" with the appropriate value of "start" or "end".

3.1.1.3.3 Tide Station/River Stage Gage Event

Group together properties associated with the vertical correction (see paragraph VERTICAL CORRECTION) for the tide station/river stage gage under the header tag "station_event". This information must be sent at the start of the contract and each time the dredge has moved enough to change the station being used.

3.1.1.3.3.1 Station Name

The station name is a concise name defining the tide station/river stage gage begin referred to. It must be introduced by the tag "station_name", and it must not consist of a descriptor of more than 25 characters.

3.1.1.3.4 Length of Pipe Event

Report the leverman's estimate of the length of pipe downflow from the dredge pump, measured to the nearest whole foot, under the header tag "pipe_length_event". This information must be sent at the start of the contract and at the completion of each 24-hour period ending at midnight local time.

3.1.1.3.4.1 Floating Pipe

Report the total length of floating pipe with the tag "length-floating".

3.1.1.3.4.2 Submerged Pipe

Report the total length of floating pipe with the tag "length_submerged".

3.1.1.3.4.3 Shore Pipe

Report the total length of shore pipe with the tag "length_land".
3.1.1.3.5 Booster Pump

Include information concerning the booster pumps being used under the header tag "booster_pump_event". A message must be sent to indicate any change in the status of the booster pumps being used.

3.1.1.3.5.1 Number of Booster Pumps

Upon the addition or removal of a booster pump, report the total number of booster pumps being used with the tag "booster_total".

3.1.1.3.6 Dredge Advance

Measure the dredge advance, the total forward progress of the dredge relative to the centerline of the cut, to the nearest whole foot and cumulatively calculate over a 24-hour period from midnight to midnight local time. Identify it by the tag "advance_daily". Report in Greenwich Mean Time (GMT) the msg_time associated with this tag as the first timestamp of the following 24-hour period (based on the local time) rather than as midnight of the day for which the value was calculated.

3.1.1.3.7 Outfall Information

Monitor and send the X and Y position of the terminal end of the outfall pipe at the start of the contract and thereafter according to the following table. Discharge Heading and Pipe Elevation may be omitted if the dredge is not discharging into an upland disposal site. For beach nourishment, the horizontal X and Y position of the outfall must be sent at the start of the contract and at the completion of each 24-hour period ending at midnight local time.

<table>

</tbody>
</table>

3.1.1.3.7.1 Discharge Location

Report information on where the slurry is being discharged with the tag "outfall_location". Acceptable values include "upland", "open water", "beach", and "scow".

3.1.1.3.7.2 Discharge Horizontal Position

Obtain the horizontal position of the outfall end of the discharge pipe using a positioning system operating with a minimum accuracy level of 3-10 feet horizontal Circular Error Probable (CEP). Report it as Latitude/Longitude WGS 84 in decimal degrees with West Longitude and South Latitude values being reported as negative. Identify position values by the tags "outfall_latitude" and "outfall_longitude".
3.1.1.3.7.3 Discharge Outfall Heading

The discharge outfall heading is the angle relative to true north measured from the centerline of the pipe in the direction of discharge. Provide all headings using industry-standard equipment. They must be accurate to within 5 degrees and report to the nearest whole degree with values from 000 (true north) to 359 degrees referenced to a clockwise positive direction convention. Identify the discharge heading by the tag "outfall_heading".

3.1.1.3.7.4 Discharge Pipe Elevation

The discharge pipe elevation is the height of the outfall measured in feet and tenths of a foot relative to the project datum. The required accuracy is contingent upon contract requirements. Use the tag "outfall_elevation" to identify this elevation.

3.1.1.3.8 Non-effective Work Event

Report delays and dredge downtime at the conclusion of the event. Submit the reason for the non-effective work time under the header tag "non_eff_event" within 24 hours of the event.

3.1.1.3.8.1 Non-effective Work Interval

Report the start and end times for the non-effective work event using the tags "msg_start_time" and "msg_end_time".

3.1.1.3.8.2 Dredge Function Code

Transmit the dredge operator indication of production delays, as listed on Form 4267, at the end of the non-effective interval. Identify dredge function event messages by the tag "function_code" consisting of one of the following standardized entries to indicate the operation:

AGV     Assisting Grounded Vessels
CCH     Change Cutterhead
CCSH    Clear Cutter Suction
CLPJ    Change Location Bar
COLL    Collision
CPPL    Clear Pump Pipeline
CPR     Change Impeller
DR      Dike Repair
FBD     Fire Boat Drills
HPL     Handling Pipe Line
HSL     Handling Swing Line
HSP     Handling Shore Pipe
LDNE    Loss Due to Natural Elements
LDPV    Loss Due to Passing Vessel
LNL     Transfer to New Location
MISC    Miscellaneous
MOB     Mobilization & Demobilization
MSC     Miscellaneous/Non-pay
OC      Out of Commission
OR      Operating Repairs
P       Preparation
PREP    Preparation & Making Up Tow
RPL     Repair Pipeline
SB      Sounding & Buoying
3.1.1.3.8.3 Additional Comments

Use the "comment" tag to provide additional explanation for the noted delays or downtimes. For example, when the code "LDPV" (Loss Due to Passing Vessel) is indicated, list the name of the vessel and the number of tows with the "comment" tag.

3.2 NATIONAL DREDGING QUALITY MANAGEMENT PROGRAM SYSTEM REQUIREMENTS

The Contractor's DQM system must be capable of collecting and transmitting information to the DQM system. Record the applicable parameters from paragraph REQUIREMENTS FOR REPORTED DATA as local events and transmit continuously to the DQM database anytime an Internet connection is available. To accomplish this transmission, there are two options. The first option is to equip the vessel with a DQM computer system consisting of a computer, monitor, keyboard, mouse, data modem, Universal Power Supply (UPS), and network hub. Provide a standalone computer system, exclusive to the DQM monitoring system, with USACE DQM software installed on it. If a hardware problem occurs, or if a part of the system is physically damaged, the Contractor is responsible for repairing it within two business days of the determination of the condition or submitting a plan and timeline for repair if the repair will take more than two business days.

The second option is to send data directly to DQM's web endpoint as outlined in paragraph DIRECT DATA TRANSMISSION.

3.2.1 Computer Requirements

Provide a dedicated onboard computer for use by the Dredging Quality Management system. This computer must run the USACE DQM software and receive data from the Contractor's data-reporting interface. This computer must meet or exceed the following performance specifications:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU:</td>
<td>Intel or AMD processor with a (non-overclocked) clock speed of at least 1.6 gigahertz (GHz)</td>
</tr>
<tr>
<td>Hard drive:</td>
<td>250 gigabytes (GB); internal</td>
</tr>
<tr>
<td>RAM:</td>
<td>4 gigabytes (GB)</td>
</tr>
<tr>
<td>Ethernet adapter:</td>
<td>Internal network card with an RJ-45 connector</td>
</tr>
<tr>
<td>Ports:</td>
<td>1 free serial port with standard 9-pin connectors; 1 free USB port</td>
</tr>
<tr>
<td>Other hardware:</td>
<td>Keyboard, mouse, monitor</td>
</tr>
</tbody>
</table>

Install a fully licensed copy of Windows 10 Professional Operating System or higher on the computer specified above. Also install any necessary manufacturer-provided drivers for the installed hardware.

Locate and orient this computer to allow data entry and data viewing as well as to provide access to data ports for connection of external hardware.
3.2.2 Software

The DQM computer's primary function is to transmit data to the DQM shoreside database. Do not install software which conflicts with this function on this computer. The DQM computer must have the USACE-provided Dredging Quality Management Onboard Software (DQMOBS) installed on it by DQM personnel.

3.2.3 UPS

Supply an Uninterruptible Power Supply (UPS) for the computer and networking equipment. It must interface with the DQM computer to communicate UPS status, and it must provide backup power at 1 kVA for a minimum of 10 minutes. Ensure that sufficient power outlets are available to run all specified equipment.

3.2.4 Direct Data Transmissions

Option 2: Direct Data Transmissions to the DQM Web Service – Use the web service to report sensor data to the DQM database. Data must be transmitted as it is collected in real time and pushed to the DQM web service. If the web service is not available or returns an error message, the data must be stored in a queue and transmitted upon re-establishment of the connection, starting with the oldest data in the queue and continuing until real-time transmission is restored.

Contact dqm-support@usace.army.mil to obtain the web service URL and the appropriate key credentials and communication protocol. If this option is chosen, a display of the raw data being transmitted to DQM must be easily accessible and visible onboard the dredge.

3.2.5 Internet Access

Maintain an Internet connection capable of transmitting real-time data to the DQM server as well as enough additional bandwidth to clear historically queued data when a connection is re-established. If connectivity is lost, queue and transmit unsent data upon restoration of connectivity. Delays in pushing real-time data to the DQM database should not exceed four hours. Exceptions to these requirements may be granted by the DQM Support Center on a case-by-case basis with consideration for contract-specific requirements, site-specific conditions, and extreme weather events.

Acquire and install all necessary hardware and software to make the Internet connection available for data transmission to the DQM web service. Configure the hardware and software to allow the DQM Support Center remote access to this computer, and the telemetry system must be capable of meeting these minimum reporting requirements in all operating conditions.

In areas with poor cellular service and at the local District's discretion, it may be required to manually download the data on a daily basis using the protocol for retrieving and submitting backup files provided by the DQM Support Center. This method of data transmission should be used only if Internet connectivity is unavailable at the dredging site, and it should be considered a temporary measure.

3.2.6 Data Routing Requirements

Onboard sensors continually monitor dredge conditions, operations, and
efficiency and route this information to the shipboard dredge-specific system (DSS) computer to assist in guiding dredge operations. Portions of this Contractor-collected information, as described in this specification, must be routed to the DQM computer on a real-time basis utilizing one of the two options outlined in this section. Use an RS-232 serial interface with a baud rate of 9600 or 19200 bps to send standard sensor data to the DQM computer. Configure the serial interface as 8 bits, no parity, and no flow control.

Digitally log and transmit information regarding changes in the state of the dredge as close to the time of the occurrence as possible. These events can either be included in a separate message bundle going to the DQM onboard computer, or they can be entered on the "State" tab in the DQM Pipeline Software, or entered online in the DQM State Data Tool.

3.3 DREDGE MONITORING DATA

3.3.1 General

Onboard sensors continuously collect dredging data in support of the dredge Contractor's operations. Portions of this Contractor-collected information, as described in this specification, and store and transmit calculations based on them to the DQM database on a near real-time basis. Additionally, digitally log and transmit information regarding the state of the dredge.

3.3.2 Data Measurement Frequency

The frequency of data transmission is dependent on the type of message being sent. Work Event messages contain data that are instantaneously collected or calculated from sensors and are logged as a series of events. State event messages are activated by a change in the dredge state.

3.3.2.1 Work Event Messages

Log data as a series of events. Each event must consist of a dataset containing dredge information (as defined in paragraph REQUIREMENTS FOR REPORTED DATA). Consider each set of measurements (for example, time and position) an event with a 6-12 second interval between work events. This interval must remain consistent across event types for the dredge plant.

Record a standard data string within one second of an event trigger with the time stamp and all parameters reflecting when the event happened.

3.3.2.2 State Event Messages

Consider a set of descriptive information (event name, time, description, comment) a state event. Record these events within 24 hours of a change in state with the time stamp reflecting when the event happened.

3.3.3 Parameter Transmission to the Web Service

Format the data as JSON (JavaScript Object Notation, as defined at http://www.json.org) strings of arbitrary length. These JSON strings represent a hierarchical data structure consisting of a message bundle which may contain 0-3 automatic data messages and any number of manual data messages.

A tag/parameter is reported only when it contains a value. Do not include
"Null" value strings in a message bundle.

```
3.3.4 Contractor Data Backup

Maintain an archive of all data sent to the DQM computer during the dredging contract. The COR may require, at no increase in the contract price, that the Contractor provide a copy of these data covering specified time periods. Provide the data in the same JSON format as would have been transmitted to the DQM computer. There must be no line breaks between the parameters, and each record string must be on separate line. The naming convention for the files must be <dredgename>_StartYYYYMMddhhmmss_EndYYYYMMddhhmmss>.txt.

Data submission must be via a storage medium acceptable to the COR. At the end of the dredging contact, call the National DQM Support Center prior to discarding the data. The DQM Support Center will verify that all data has been received and appropriately archived before giving the Contractor discard permission. Record the following information in a separate section at the end of the dredge's onboard copy of the DPIP:

Person who called the National DQM Support Center
Date of the call
DQM representative who gave permission to discard the data

3.4 PERFORMANCE REQUIREMENTS

The Contractor's National Dredging Quality Management Program's data transmission must be fully operational at the start of dredging operations. To meet contract requirements for operability, the Contractor's system must provide an accurate data string return and be
compliant with hardware requirements. Data string return is defined as the number of quality records within an event or state tag sent by the contractor's system to the DQM database. Quality data strings are considered to be those providing accurate values for all parameters reported when operating according to the specification. Make repairs necessary to restore data return compliance within two business days, or submit a plan and timeline for repair if the repair will take more than two business days. Failure by the Contractor to report quality data within the specified time window for dredge measurements as stated in the specifications (see paragraph INTERNET ACCESS, paragraph DATA MEASUREMENT FREQUENCY, and paragraph PARAMETER TRANSMISSION TO THE WEB SERVICE, will result in withholding of up to 10 percent of the contract progress payment.

gradation curve

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for stone protection, including foundation preparation, bedding layers and filters, for the slopes and bottom of channels, ditches, structures, lock approaches, etc.; constructing trenchfill revetment, bank paving, and outlet drains; stone revetment, stonefill dikes, stoneroots, and junctions; constructing stone capouts and revetment reinforcing along the river; revetment repairs; shoreline/coastal protection. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Field adjustments may be made at the direction of the Contracting Officer’s Representative (COR/ACO) to the location of stone placement that do not alter the design intent or pay quantities. Such field adjustments should be documented as to the justification, location, and documentation of the adjustments should be included in the permanent Contract Documentation and As-Built drawings. The Contracting Officer and Designer of Record should be notified as soon as practicable.

Comments, suggestions and recommended changes for this guide specification are welcome and should be
submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: The EMs and ETLs referenced in this guide specification can be found on the Internet at http://www.usace.army.mil/inet/usace-docs.

To clarify the difference between Stone Protection, Channel Protection, and Shoreline Protection, the following definitions are provided. Stone Protection is defined as a system which includes a layer of bedding material or layers of filter material beneath a layer or layers of riprap. Stone protection is placed around structures in slack water or within a dewatered site. Stone protection may also be used to protect channel banks when it is placed in the dry or in slack water. Riprap is defined as a material having a gradation band similar to those specified in EM 1110-2-1601, Chapter 3. Channel Protection is stone placed in a current as revetment, dikes, or slope paving without the use of a separate layer of bedding or filter material. In this type of environment, bedding sand or geotextiles and materials with gradation bands with a top size of 150 mm 6 inches will not stay where placed. Shoreline Protection is defined as a system of bedding or filter materials and stone used to protect coastlines of lakes and oceans and for harbor protection.

Grouted riprap should only be used when the quantity of larger stone on a project is very small and in a noncritical area. Also, grouted riprap should be considered only when minor settlement is expected in the foundation, potential of undermining is very low, and the density of the fill material is at a minimum of 95 percent Standard Proctor. Additional information provided in ETL 1110-2-334.

EM 1110-2-2302, Construction with Large Stone, presents criteria and gives guidance for selection, evaluation, and use of large-stone materials in construction. This document also references other EM’s that have additional related guidance for the protection design. One additional reference not listed is EM 1110-2-1614, Design of Coastal Revetments, Seawalls, and Bulkheads. However, the quality criteria specified in this document was based upon a limited review of criteria being used by Corps. Quality criteria that is specified by a District should be that which has been selected to be used on its projects or criteria specified by a Division to be used by the District to meet the durability requirements for the project being constructed.
"Riprap Quality Criteria in Standard Specification and Engineering and Guidance", Rock for Erosion Control, ASTM STP 1177; and TR-GL-81-8, Evaluation of Quality and Performance of Stone as Riprap or Armor, both support the need to perform freeze-thaw testing by COE CRD-C 144 instead of ASTM procedures. Also, both indicate that soundness tests and L.A. Abrasion tests are of limited use when evaluating Riprap and Armor Stone.

NOTE: The designation of types of materials (sand, filter, stone, riprap, bedding, etc. should be consistent with the nomenclature of the project and entities involved - and defined within PART 1 and/or PART 2 of the Specification. Such designations as "Type 1, Type A, must be well-defined and consistently used in order to avoid confusion and to limit the apparent numbers of different materials required by the Contract. The designations between the definitions in the Technical Specification, the Drawings and the Bid Schedule MUST BE CONSISTENT.

**************************************************************************

1.1 UNIT PRICES

**************************************************************************

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.

**************************************************************************

1.1.1 [Bedding][ and ][Filter] Layer(s)

1.1.1.1 Payment

Payment for gravel, crushed stone, and sand placed for bedding and/or filter material will be made at the applicable contract unit prices for [Sand "[_____"]",[ and ][Gravel "[_____"]",[ and ][Filter Stone,] [Bedding Stone]. Price(s) and payment(s) include all costs of furnishing, hauling, placing and maintaining the bedding and/or filter material until placement of the riprap cover is completed and accepted. Geotextiles used as filters will be paid for in accordance with provisions of Section [01 20 00 PRICE AND PAYMENT PROCEDURES]. Preparation of the base will not be paid for separately and all costs incidental thereto will be included in contract prices for other items for which payment will be made. No payment will be made for excess thickness of bedding and/or filter material, nor for material required to replace subgrade material lost by rainwash, wind erosion, overexcavation or otherwise.

1.1.1.2 Measurement

**************************************************************************

NOTE: Alternative 1.

**************************************************************************

[[Gravel,][ crushed stone,][ and sand] placed for bedding and/or filter
layers will be measured for payment by the ton (metric) ton. Quantities will be computed to the nearest whole ton. Gravel, crushed stone, and sand will be measured for payment, in the presence of the Contracting Officer, by weighing on approved, accurately calibrated scales furnished by and at the expense of the Contractor. [The scales must be capable of printing a weight ticket including time, date, truck number, and weight.] Weight certificates furnished by a public weighmaster will be acceptable. Submit Weigh Scale Certification and Certified Weight Scale Tickets, by a copy of the certification from the regulation agency, attesting to the scale’s accuracy and a copy of each certified weight scale ticket after [_____] working day(s) after weighing.

**************************************************************************

NOTE: Alternate 2.
**************************************************************************

[[Gravel,][crushed stone,][and sand] placed for bedding and/or filter layers will be measured for payment as the volume determined by multiplying the area[, as measured in the field,] of the surface on which the gravel, crushed stone, or sand is placed, by the thickness measured perpendicular to the surface of the gravel, crushed stone, or sand as dimensioned on the contract drawings.] Geotextiles used as filters will be measured in accordance with provisions of Section [01 20 00 PRICE AND PAYMENT PROCEDURES]. Preparation of the base will not be measured for payment.

1.1.1.3 Unit of Measure

Unit of measure: [ton] [ton (metric)][cubic yard] [cubic meter].

1.1.2 [Riprap] [[Manufactured] Derrick Stone] [Capstone] [Graded Stone] [Stone] [Bedding/Mattress Stone] [Splash/Fill Stone] [Armor/Cover Stone] [Core/Underlayer/Scour Stone]

[Due to the variable nature of broken concrete or construction debris, it is prohibited for stone channel, shoreline, or coastal protection.][_____]
Stone, Bedding/Mattress Stone, Splash/Fill Stone, Armor/Cover Stone, Core/Underlayer/Scour Stone. Price(s) and payment(s) constitute full compensation for furnishing all plant, labor, materials and equipment and constructing the stone protection in the work as specified. [No separate payment will be made for the stockpiling of [riprap] [and] [stone], and include all cost in connection with stockpiling in the contract unit price for [riprap] [and] [stone].]

Payment for stone satisfactorily placed in constructing the [trenchfill revetment] [stonefill dikes] [stonefill revetments and junctions, excluding trenchfill revetments, wrap-around, dike capouts, reinforcements, bank paving, and outlet drains] will be made at the contract unit price for [Graded Stone "A" "B" and/or "C", [57][___]-kg [125][___]-pound stone]. Price(s) and payment(s) constitute full compensation for furnishing all plant, labor, stone, and performing all work necessary in placing the stone in constructing the trenchfill revetment, bank paving, and drainage structures as specified herein or shown on the drawings. Full payment for stone will not be permitted until trenchfill bank paving has been completed in a satisfactory manner. Twenty (20) percent of the payment for stone will be retained until bank paving has been completed in a satisfactory manner.

1.1.2.2 Measurement

**************************************************************************
NOTE: Alternative 1.
**************************************************************************

[[Riprap] [Stone] will be measured for payment by the ton (metric) ton. Quantities will be computed to the nearest whole ton.] [[Riprap] [Stone] will be measured for payment, in the presence of the Contracting Officer, by weighing on approved, accurately calibrated scales furnished by and at the expense of the Contractor.][ The scales must be capable of printing a weight ticket including time, date, truck number, and weight.][ Weight certificates furnished by a public weighmaster will be acceptable.]

**************************************************************************
NOTE: Alternative 2.
**************************************************************************

[[Riprap] [Stone] will be measured for payment by the ton (metric) ton as determined by [barge][vessel] displacement, [certified railroad weights,] where direct placement into structure(s) is practicable, or by weighing by the truckload on approved scales meeting the requirements of paragraph TRUCKLOAD.]

a. Truckload. Weigh each truck load to the nearest 0.10 ton (metric) 0.1 ton and the final quantity rounded to the nearest whole ton. Weigh [Riprap] [and] [Stone] for payment by weighing on approved scales before being placed in the work. Provide scales of sufficient length to permit simultaneous weighing of all axle loads and with an accuracy within 0.2 percent throughout the range of the scales. Ensure the scale's accuracy conforms to the applicable requirements of NIST HB 44 and is certified [by an acceptable scales company representative] [by an inspector of the State Inspection Bureau charged with scales inspection within the state in which the project is located] prior to weighing any [riprap] [and] [stone].[ Locate the scales at the site of work.][ Ensure the scales are capable of printing a weight ticket including time, date, truck number, and weight.][ If commercial scales
are readily available in close proximity (within [_____] [16] km [_____] [10] miles) of site of work, they are to be used with the approval of the Contracting Officer and documentation certifying that the scales meet the requirements of the specification are to be provided.[ Furnish the scales and weigh the [riprap] [and] [stone] in the presence of the Contracting Officer,[ who will read and record the weights thereof][ who will certify the correctness thereof].[ The Contracting Officer may elect to accept certified [railroad weights or] weight certificates furnished by a public weighmaster in lieu of scale weights at the jobsite.][ Quarry weights will not be accepted.] Scales will be checked and certified before hauling [riprap] [and] [stone] [and after each [50 000] [_____] tons (metric) [50,000] [_____] tons increment of [riprap][ and][stone] weighed under this contract].

b. [Barge][ or vessel] Load

(1) If delivered by [barge][ or vessel], [riprap][ and ] [stone] will be measured for payment by the Contracting Officer by weight determined by [barge][vessel] displacement. Furnish the Contracting Officer a [barge][vessel] displacement table not less than 10 work days prior to unloading the [riprap][ and ] [stone] from any [barge][vessel]. Submit each table showing the name and/or number of the [barge][vessel] owner, the name of the fabricator, and the certification and date of certification of the person or firm preparing the table. Furnish with the [barge] [vessel] displacement tables a drawing or sketch of each [barge][vessel], dimensioned in sufficient detail to permit checking of the tables. Show, as a minimum, the length, width, depth of the [barge][vessel], and dimensions of the rake or rakes. A person or firm customarily performing this function other than the Contractor must certify the accuracy of each such table. Submit each table containing, in parallel columns, the freeboard of the [barge][vessel] in meters feet and tenths from zero to the full depth of the [barge][vessel] and the corresponding gross displacement to the nearest ton. Mark each [barge][vessel] suitably with [two][three] displacement gaging locations on each side near each end of the [barge][vessel] and two amidships on opposite sides. Mark each gaging location by a line perpendicular to the edge of the [barge][vessel], 100 mm 4 inches wide and 300 mm 1 foot long, on both the deck and side of the [barge][vessel][and two amid ship on opposite sides]. Provide [barges][vessels] with rakes that have the displacement gaging lines placed at each corner of the box section between the rakes. If a [barge][vessel] has a box end or ends, place the gaging locations approximately 1200 mm 4 feet from the box end(s). The freeboard will be measured at the [four][six] gaging locations and the displacement determined by the use of "STANDARD [BARGE][VESSEL] TABLES" from the average of these measurements. The displacement will be determined before and after being unloaded and the difference between these values is the quantity delivered. Submit the Gaging Table Data, stone hauling vessel, gaging tables[ and a copy of the data and calculations used for the preparation of the tables]. [Load [barges][vessels] so that the readings taken at the gaging locations do not vary more than 450 mm 1.5 feet port to starboard fore and aft and do not vary more than 150 mm 0.5 feet port to starboard. If such is not the case, trim the carrier by shifting the stone until this limit is reached, before the measurement will be accepted.][ Determine the draft from the average of all six readings weighting the readings
of the middle gage at double those of the end gages. \((G_1 + G_2 + 2G_3 + 2xG_4 + G_5 + G_6)\) divided by 8 = average draft. 

Ensure all carriers used in transporting stone are free of leaks such as would render accurate gauging difficult. Provide facilities for inspecting the hold of each carrier to determine whether leakage is occurring. Provide each carrier with adequate pumping facilities, and if water is found to be accumulating in the hold, pump the carrier dry before each gaging, both before and after unloading.

Lightening by pumping or by transfer of crew or supplies will not be permitted while stone is being transferred.

Leave rejected [riprap] [stone] [_____] and unacceptable material aboard the [barge][vessel] until after the final readings are taken.

(2) If [barge][vessel] tables are furnished for fresh water and if it is believed that [barge][vessel] displacement measurements made within the contract limits of the work are being taken in water that has salinity, the Contractor has the option of obtaining water samples and determining densities or unit weights of these samples. Take these water samples in accordance with ASTM D3370 (Practice A - Grab Samples) at depths of 1200 and 2400 mm 4 and 8 feet in the area where measurements are made. Perform water sampling when the [barges][vessels] are measured for quantities, both when fully loaded and when empty. Take water samples, as witnessed by the Contracting Officer, with the use of "Polypro" 2000 ml water sampler, or equal. Determine densities as specified in ASTM D1429 (Method D-Hydrometer Method). Perform testing for the Contractor by a [certified] [validated] testing laboratory, and ensure test results are certified by the laboratory. After review and approval of the test results by the Contracting Officer, the average of the densities obtained at 1200 and 2400 mm 4 and 8 feet will be used as the suitable salt water conversion factor. In all calculations, the unit weight of 1000 kN/m³ 62.4 pounds per cubic foot will be used for fresh water.

c. Stockpiled [Riprap] [Stone] [______]. If the Contractor elects to stockpile [riprap] [stone] [_____] on the worksite or offsite, weigh the [riprap] [stone] [_____] immediately before placement by [either] the method described above. [Riprap] [Stone] [_____] placed in temporary storage on the worksite as specified in paragraph WORKSITE STOCKPILE will not be required to be re-weighed prior to placement. [If the [barge][vessel] displacement method is elected, a minimum of [one-third the total maximum displacement of the [barge][vessel]] [_____] [500] tons (metric) [_____] [500] tons of [riprap] [stone] [_____] is required on each [barge][vessel].]

(1) Determination of Excess Stone. All stone outside the limits and tolerances of the cross sections of the structure, except variations so minor as not to be measurable, will be deducted from the quantity of new stone for which payment is to be made. Weight of excess stone will be determined from the cross sections obtained by the method provided for in paragraph FINAL SURVEYS, on the basis that the cubic meters feet of volume (including voids) for each type of stone, as listed in the Table in paragraph FACTORS USED FOR CONVERTING IN PLACE VOLUME TO WEIGHT, is equal to one ton (metric) or 1000 kg one ton or 2,000 pounds for the bulk specific gravity and percentage of voids shown. If the bulk specific gravity of the stone furnished or the percentage of voids is other than as listed below, recompute the cubic meters feet of
volume equaling **1000 kg 2,000 pounds** as described in paragraph REVISIONS OF BIDDING SCHEDULE QUANTITIES. Should any excess stone be disclosed above the tolerance line as defined in paragraph TOLERANCES, its volume will be computed by the average end area method, based upon the cross section in the following manner. The average end area of excess stone above the tolerance line for two (2) successive cross sections, multiplied by the distance between the cross sections will be accepted as the volume. [The Contractor will not be required to remove such excess stone and deductions for the weights thereof will be made from contract payments for new stone.] In addition to the above, deduct stone, which has been delivered to the site and has been lost or wasted or otherwise not properly incorporated into the final required work, from the quantity for which payment is to be made.

(2) Final Surveys. Perform survey work and measurements required for determination of excess volume computations for stone materials in the presence of the Contracting Officer. Notify the Contracting Officer not less than 3 days in advance of each survey. [In the event of unavailability of the Contracting Officer, perform the survey and certify to the Contracting Officer that it complies with the specifications.] Take cross section surveys perpendicular to the axis of the structures. Take elevations and soundings on lines [8][_____] m [25][_____] feet apart measuring along the structure reference line, with the readings at 1.5-meter 5-foot intervals and at breaks in the grade along the line. Other survey intervals and readings may be used if deemed appropriate or advisable by the Government's on-site representative. Additional cross sections, elevations, and soundings may be taken if determined necessary by the Government's on-site representative. Determination of quantities will be made by the Government's on-site representative and having once been made, will not reopen, except on evidence of collusion, fraud or obvious error. Prior to performing any work under this Section, coordinate all operations with the Government's on-site representative so that excess volume surveys will be made at the appropriate time. The surveys made under paragraph CHECK SURVEYS may be used when deemed appropriate by the Government's on-site representative, as part of the surveys required herein. Base stone quantity computations entirely upon weights of new stone as determined from carrier displacement or certified scale weight tickets. [Existing stone placed in lieu of new stone from off-site sources is excluded from measurement and payment.]

1.1.2.3 Unit of Measure

Unit of measure: [ton (metric)] [cubic meter] [ton] [cubic yard].

1.1.3 [Concrete Grout for Grouted Stone Protection]

1.1.3.1 Payment

Payment will be made for cost associated with concrete grout for grouted stone protection, which includes full compensation for furnishing all plant, labor, material, equipment and other items necessary and incidental to the completion of the work.
1.1.3.2 Measurement

Concrete grout for grouted stone protection will be measured for payment based upon the volume determined from the calculated batch volume and the number of mixed batches delivered to the site and acceptably placed in the work.

1.1.3.3 Unit of Measure

Unit of Measure: cubic meter cubic yard.

1.1.4 Bedding Sand

1.1.4.1 Payment

Payment for bedding sand will be made at the contract unit price for "Bedding Sand" and constitute full compensation for material and placement of bedding sand in constructing drainage structures as specified herein.

1.1.4.2 Measurement

Measure bedding sand for payment by the ton (metric) ton of sand satisfactorily in-place in accordance with the requirements for stone measurement in paragraph STONE.

1.1.4.3 Unit of Measure

Unit of measure: ton (metric) ton.

1.1.5 Revetment Repairs

1.1.5.1 Earthwork, Small Repairs

When less than 8000 cubic meters 10,000 cubic yards of earthwork is specified, consider the earthwork as Earthwork, Small Repairs.

a. Payment will be made for costs associated with grading and excavation, which includes furnishing all equipment, labor and materials, and performing all clearing, except range clearing, drift removal and disposal of debris; grading and excavation; disposal of material from grading, whether or not used for fill; dressing; and all other operations incidental thereto.

b. Earthwork, Small Repairs will be measured for payment based upon on-site surveys, taken under the direction of the Government Representative, of the required grading or excavation areas prior to commencement and on-site surveys taken after completion of the work. All quantities removed will be determined from these surveys computed to the nearest cubic meter yard.

c. Unit of measure: cubic meter yard.

1.1.5.2 Earthwork, Large Repairs

When 8000 cubic meters 10,000 cubic yards or more of earthwork is specified, consider the earthwork as Earthwork, Large Repairs.

a. Payment will be made for costs associated with grading and excavation, which includes furnishing all equipment, labor and materials, and
b. Earthwork, Large Repairs will be measured for payment based upon on-site surveys, taken under the direction of the Government Representative, of the required grading or excavation areas prior to commencement and after completion of the work. All quantities removed will be determined from these surveys computed to the nearest cubic meter yard.

c. Unit of measure: cubic meter yard.

1.1.5.3 Breaking Out Pavement

a. Payment will be made for costs associated with breaking out asphalt and/or concrete pavement, which includes furnishing all material, equipment and labor for breaking out pavement, breaking concrete or asphalt into the required sizes, and using the broken pavement as fill where required, disposing of any excess material, and performing all work incidental thereto. Broken concrete or asphalt is prohibited as part of the designed structure. No payment will be made for breakout in those areas where only restoration or dressing of subgrade is necessary.

b. Breaking Out Pavement will be measured for payment based upon the number of square meters feet broken out, computed to the nearest 1/10 square meter 1/100 square foot.

c. Unit of measure: square meter feet.

1.1.5.4 Bedding Stone

a. Payment will be made for costs associated with Bedding Stone satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. Bedding Stone will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.5 [[57][____]-kg [125][____]-Pound Stone] [[____] Riprap]

a. [Payment will be made for costs associated with [[57][____]-kg [125][____]-Pound Stone] [[____] Riprap] satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. [[57][____]-kg [125] [____]-Pound stone] [[____] Riprap] will be measured for payment based upon the quantities of stone satisfactorily
placed.

c. Unit of measure: ton (metric) ton.

1.1.5.6 [Graded Stone "A" ["B"] ["C"]] [[_____] [Stone][Riprap]], Small Repairs

a. Payment will be made for costs associated with [Graded Stone "A" ["B"] ["C"]] [[_____] [Stone][Riprap]], Small Repairs, satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. [Graded Stone "A" ["B"] ["C"]] [[_____] [Stone][Riprap]], Small Repairs, will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.7 [Graded Stone "A" ["B"] ["C"]] [[_____] [Stone][Riprap]], Large Repairs

a. Payment will be made for costs associated with [Graded Stone "A" ["B"] ["C"]] [[_____] [Stone][Riprap]], Large Repairs, satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. [Graded Stone "A" ["B"] ["C"]] [[_____] [Stone][Riprap]], Large Repairs, will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.8 Stone Placement Premium

a. A premium payment will be made for costs associated with [Crushed Stone][[57][_____]-kg [125][_____]-Pound] [Riprap][Stone][Graded Stone A, Small Repairs][Graded Stone A, Large Repairs] satisfactorily placed in overbank paving, overbank stone spur, or stone landward of an obstruction satisfactorily constructed or repaired, which includes furnishing all material, equipment, and labor; preparing the subgrade; hauling or rehandling stone; shaping spurs to the lines and grades specified; and performing other work incidental thereto.

b. Stone Placement Premium will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.
1.1.6 Reworking and Utilizing Existing Stone Materials

1.1.6.1 Payment

Payment for reworking existing stone materials and utilizing existing stone in lieu of required materials from off-site sources will be paid for separately from construction utilizing materials obtained from off-site sources. [Specifications pertaining to construction with existing onsite materials are included in Section 31 00 00 EARTHWORK for Site Preparation.]

1.1.6.2 Measurement

Reworking and Utilizing Existing Stone Materials will be measured for payment based upon [_____] [cubic] [square] meters [cubic yards] [square feet] of surface area of existing protection.

1.1.6.3 Unit of Measure

Unit of measure: [ton (metric)] [square meter] [ton] [square foot].

1.3 DEFINITIONS

1.3.1 Bank Stabilization

This paragraph explains certain terminology which is common to construction of bank stabilization work on the [_____] and which may not be self explanatory in the subsequent applicable provisions of the technical specifications and on the drawings.

1.3.1.1 Revetments

The term "revetment" applies to various types of stabilization structures that are constructed along the river approximately parallel to the current. The revetments are constructed of stone or piling.

1.3.1.2 Dikes

The term "dike" applies to the types of stabilization structures that are constructed along the river at an angle to the current. The dikes are constructed of stone or piling.

1.3.2 Standard Drawings

Details of various types of structures in general use on the [_____] are shown on standard drawings forming a part of these specifications.

1.3.3 Stone Protection

Stone Protection is defined as a system which includes a layer of bedding material or layers of filter material beneath a layer or layers of riprap. Stone protection is placed around structures in slack water or within a dewatered site. Stone protection may also be used to protect channel banks when it is placed in the dry or in slack water.

1.3.4 Riprap

Riprap is defined as a material having a gradation band similar to those specified in EM 1110-2-1601, Chapter 3, uniform graded material. Riprap is normally produced by mechanical methods, with a jaw crusher and grizzly after the stone has been mined by blasting in a quarry. Riprap gradations have a maximum top size of 3.5 tons.

1.3.5 Graded Stone

Graded Stone is defined as material with gradations that are produced by the mining technique and minimal additional processing other than the use of a skeleton bucket or a bar grizzly. The gradation band have more fines than riprap and have gradations with top size up to 3.5 tons and could be classified as being well graded.

1.3.6 Channel Protection

Channel protection is stone placed in a current as revetment, dikes, or slope paving without the use of a separate layer of bedding or filter material. In this type of environment, bedding sand or geotextiles and materials with gradation bands with a top size of 150 mm (6 inches) will not stay where placed.
1.3.7 Shoreline Protection

Shoreline Protection is defined as a system of bedding or filter materials and stone used to protect coastlines of lakes and oceans and for harbor protection.

1.4 SYSTEM DESCRIPTION

1.4.1 Factors Used for Converting In-Place Volume to Weights

The following factors were used in converting the in-place volume to the quantities shown in the BIDDING SCHEDULE.

1.4.1.1 Revision of Bidding Schedule Quantities

The estimated quantities of stone listed in the BIDDING SCHEDULE were computed on the basis of stone having a percentage of voids and a bulk specific gravity (saturated surface dry (SSD) basis) as shown in the above table based on water having a unit weight of 1000 kg per cubic meter 62.4 pounds per cubic foot. When the bulk specific gravity (SSD) of the stone to be used in the work is other than that shown in the above table, the estimated quantities will be revised by multiplying them by the fraction which results when the bulk specific gravity (SSD) of the stone furnished is divided by the value shown in the above table for each respective stone gradation. Revision for the percentage of voids will likewise be made. The Contracting Officer will issue a modification to the contract in accordance with FAR 52.243-4 Changes, to adjust the estimated quantities in the BIDDING SCHEDULE. The revised quantities will then be the
quantities from which the allowable fifteen percent (15 percent) variation in estimated quantity, for payment purposes, will be determined as defined in FAR 52.211-18 Variation in Estimated Quantity.

1.4.1.2 Re-revision of Estimated Quantities

If during the progress of the work it is determined that the delivered stone actually placed has a percentage of voids or a bulk specific gravity range different from that on which the BIDDING SCHEDULE is based, the BIDDING SCHEDULE will be further revised in accordance with paragraph REVISION OF BIDDING SCHEDULE QUANTITIES.

1.4.2 Bulk Specific Gravity of Stone and Redesign

If the Contractor, after award of the contract, requests approval of stone from a source(s) which has a range of bulk specific gravity (SSD), whose limits are lower or higher than the specified design range of [2.5 to 2.9] [_____] as specified in paragraph MATERIAL QUALITY, consideration will be given to revising the project design through modification of the design range under the following conditions:

a. The modification of the specified design range will result in a savings to the Government. Such savings are not subject to FAR 48 Value Engineering.

b. Only one (1) such proposal for modification will be allowed. In addition, do not extend the required completion time more than [thirty (30) [_____] calendar days as a result of redesign for any reason, including acts of the Government.

c. The modified design range of bulk specific gravity (SSD) to be used must not have a lower limit of less than [2.30] [_____] nor higher than [3.50] [_____] .

d. The stone sections of the required structure are to be redesigned by the Government. Such redesign will be based upon the Contractor’s proposed modifications to the specified design range of bulk specific gravity (SSD) and will include any required revisions to allowable tolerances. Only one such redesign will be made. A charge of [$5,000] [$_____] will be assessed the Contractor whether the redesign is used or not.

(1) The above redesign will be made upon written request from the Contractor. State the proposed modified design range of bulk specific gravity (SSD). With the request, submit records of laboratory tests performed on the proposed stone source(s) indicating the range of bulk specific gravity (SSD) of the stone source(s). Ensure the laboratory tests are performed by a Government validated commercial laboratory.

(2) The Government is allowed a period of [twenty-one (21)] [_____] calendar days after receipt of the request to make the redesign. The redesign will be made based upon the lower limit of the proposed modified design range of bulk specific gravity (SSD) furnished.

(3) Upon completion, redesign will be furnished to the Contractor, including revised estimated quantities for the BIDDING SCHEDULE, based upon the average bulk specific gravity (SSD) of the proposed
modified design.

(4) Upon receipt of the redesign, make a formal proposal to modify the allowable range and to perform the work in accordance with the redesign, within fifteen (15) calendar days after receipt of the Government's redesign; if the Contractor proposes to utilize stone having a specific gravity outside of the specific design range, and as a result thereof, the Government provides the Contractor with a redesign. Include a statement of the direct savings to the Government and a tabulation in the form of a revised BIDDING SCHEDULE showing unchanged unit prices for the revised quantities.

e. Submit any proposal to modify the specified design range within fifteen (15) calendar days after receipt of the Government's redesign and include a statement as to the savings which will result from the modification. If a formal proposal is not submitted within the time limit, perform the work in accordance with the specified design, in which case use of stone having a bulk specific gravity (SSD) less than the specified design range is not allowed.

f. The statement of savings must be in the form of a proposed revised BIDDING SCHEDULE showing unchanged unit prices for the revised quantities.

g. If the Contractor elects to perform the work in accordance with the redesign, the estimated quantities to be shown in the BIDDING SCHEDULE will be the quantities derived from the Government's redesign. See the above paragraph REVISION OF BIDDING SCHEDULE QUANTITIES.

1.5 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy or Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding
Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval].[for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

1.6 QUALITY ASSURANCE

1.6.1 Stone

NOTE: For contracts having a short duration or awarded for emergency repair, there will be insufficient time to allow a Contractor to propose an unlisted source and have it evaluated; therefore, the bracketed sentences in paragraph STONE, subparagraphs SOURCES and EVALUATION TESTING, should be deleted.

Submit suitable stone samples prior to delivery of any such material to the worksite if stone is not from one of the stone sources listed at the end of this section.

1.6.1.1 General

All stone must be durable material as approved by the Contracting Officer. [Selected stone from the required excavation may be used if it satisfies all requirements as to quality and dimensions.] In case an unlisted source is to be used, show that an adequate quantity of material is available and provide quality test data.[ Unlisted sources necessitate an evaluation by the Contracting Officer to determine their acceptability based upon a combination of laboratory test results, prior use in projects of a similar size and scope, and a site inspection by a Government geologist.] Provide stone of a suitable quality to ensure permanence in the structure and in the climate in which it is to be used. Ensure stone is free from cracks, blast fractures, bedding, seams and other defects or discontinuities that would tend to increase its deterioration from natural causes.[ Inspect for discontinuities, cracks, fractures, seams and defects by visual examination. If, by visual examination, it is determined that [10][20] percent or more of the stone produced contains significant hairline cracks, then reject all stone produced by the means and measures which caused the fractures.] A hairline crack that is defined as being detrimental must have a minimum width of 0.1 mm 4 mil and continuous for one-third the dimension of at least two sides of the stone. [Provide stone that is clean and reasonably free from soil, quarry fines, and contains no refuse.] [Provide stone that is clean and adequately free from all foreign matter. Remove any foreign material adhering to or combined with the stone as a result of stockpiling prior to placement.]
the abrasion resistance of the riprap is COE CRD–C 63, Abrasion–Erosion Resistance of Concrete. Assume that an Abrasion–Erosion Loss, percent by Mass of approximately 4 is equal to an L.A. Abrasion of 20 percent for a chert aggregate, and 8 is equal to an L.A. Abrasion of 20 percent for limestone.

The number of work days specified in this paragraph are based on the assumption that to tentatively approve the use of a source under a single contract requires data for unit weight, absorption, and petrographic analysis of the stone. A minimum of 80 work days would be required to have available data from the freeze and thawing test. Arrangements need to be made with the testing laboratory when notice is given to evaluate source not after samples are collected.

On the form attached at the end of this section, the Specifier must insert a listing of POTENTIALLY acceptable sources, giving at the minimum quarry locations, addresses, and telephone numbers applicable for the contract or a more detailed list as presented in EM 1110–2–2302, Figure 4–2.

[ Stone approval is based on lab testing, in-service performance of stone in this or other projects from this source, quarry inspection and a demonstration stockpile on site at the quarry. Provide Lab testing results obtained not more than 5 years prior to date of Contract Award to ensure the data are representative and that the quarry has not moved into a section of substantially different material. Each source approval request is evaluated on a case by case basis. Evaluation requires submission of up-to-date lab testing results with every source approval. Approval testing will be at the contractor or quarry's expense. Test results will be accepted from a [certified] [validated] independent laboratory in lieu of testing at the government's laboratory at the discretion of the Contracting Officer.]

If approved, furnish stone from any of the sources listed at the end of this section or from any other source designated by the Contractor and accepted by the Contracting Officer, subject to the conditions herein stated.[ Non-listed sources are prohibited.][ If the Contractor proposes to furnish stone from a source not currently listed at the end of this section, the Government will conduct a quarry investigation and evaluate the quality test data provided by the Contractor to determine whether acceptable quantity and quality stone can be produced from the proposed source.] Satisfactory service records on other similar work may be considered by the Contracting Officer in the investigation. In order for stone to be acceptable on the basis of service records, stone of a similar quantity and size must have been placed in a similar thickness and exposed to weathering under similar conditions as are anticipated for this contract, and must have satisfactorily withstood such weathering for a minimum of [5][20] years. If no such records are available, the Government may choose to have tests conducted [at the Contractor's expense] [at the Government's expense] to assure the acceptability of the stone.[ In addition to an acceptable 5 year service record, the Contracting Officer has the option to have representative samples taken and tested.]
[ a. List of Sources. On the basis of information and data available to the Contracting Officer, stone meeting the quality requirements of these specifications has been produced from the sources listed at the end of this section.]

[ a. List of Sources

(1) Category I Sources: Category I sources have been inspected and evaluated within the last five years by the Government and have produced stone materials of acceptable quality from satisfactory geological formations. The Category I sources have previously demonstrated effective quality control programs at the source and the test results of the materials furnished have been verified that some material are of satisfactory quality. In a like manner, the source would be capable of providing the quality[, quantity,][ and] [gradation] of required stone materials. Further evaluation and testing of the source will not be required unless the preparation of the required demonstration stockpile reveals an adverse condition not previously taken into account.

**************************************************************************
NOTE: Lists may be provided either categorized indicating the level of confidence in a source's ability to meet the criteria of a specification based on how recent the previous usage, testing or inspections have been, by designating Category 1 and Category 2, or the list may simply provide sources with which there is some familiarity and that have a prior record. For emergency or expedited Contracts, or in the interests of common understanding between the agency, suppliers and contractors, or for reasons of cost or material availability, it may be useful to utilize State Highway Department gradations of materials. This should be done with caution as there is potentially great difference in quality requirements for highway department materials and Erosion Protection stone. When using highway department gradations it must be emphasized that the designation is FOR GRADATION ONLY, and that QUALITY/STONE CHARACTERISTICS properties MUST STILL BE MET, REGARDLESS OF STATE HIGHWAY DEPARTMENT CERTIFICATION.
**************************************************************************

(2) Category II Sources: Category II sources either have not been inspected and evaluated within the past five years or have had a deficiency in the past which may or may not affect its qualifications to provide stone materials for this project. Deficiencies may include, but are not limited to: ineffective quality control program; unsatisfactory production techniques; unacceptable quality of material in the geological formation being quarried; insufficient quantities of required materials; or unsatisfactory durability of stone materials previously furnished. These factors of this kind do not disqualify the source for this project. A current inspection and evaluation of the source by the [Government][Contractor] would be necessary [to determine whether acceptable stone can be produced from the proposed source][before allowing the source to proceed with preparation of demonstration]
stockpiles]. Disapproval of a proposed Category II source based on the inspection and evaluation would necessitate having the Contractor name a replacement source from the Category I list.]

b. Selection of Source. Designate in writing only one source or one combination of sources from which he proposes to furnish stone. [If the Contractor proposes to furnish stone from a source not listed at the end of this section, he may designate only a single unlisted source for stone and notify the Contracting Officer at least [60] [30] workdays before the stone leaves the quarry.] It is the Contractor's responsibility to determine that the stone source or combination of sources selected is capable of providing the [quality,] quantities and gradation needed and at the rate needed to maintain the scheduled progress of the work. [Provide samples for acceptance testing in accordance with paragraph EVALUATION TESTING below. If a source for stone so designated by the Contractor is not accepted for use by the Contracting Officer, the Contractor may not propose other sources but must furnish the stone from a source listed[ in Category I] at the end of this section with no additional payment.]

c. Acceptance of Materials. [Acceptance of a source of stone is not to be construed as acceptance of all material from that source. The right is reserved to reject materials from certain localized areas, zones, strata, or channels, when such materials are unsuitable for stone as determined by the Contracting Officer. The Contracting Officer also reserves the right to reject individual units of produced specified materials in stockpiles at the quarry, all transfer points, and at the project construction site when such materials are determined to be unsuitable. During the course of the work, the stone may be tested by the Government, if the Contracting Officer determines that testing is necessary. If such tests are determined necessary, the testing will be done in [the Government's testing laboratory][ or ][commercial laboratory selected by the Government]. Materials produced from a listed or unlisted source must meet all the requirements herein. The cost of testing will be at the Government's expense.][ During the contract period, both prior to and after materials are delivered to the job site, visual inspections and measurements of the stone materials may be performed by the Contracting Officer. If the Contracting Officer, during the inspections, finds that the stone quality, gradation or weights of stone being furnished are not as specified or are questionable, re-sampling and re-testing is required. Sampling of the delivered stone for testing and the manner in which the testing is to be performed must be as directed by the Contracting Officer. Perform this additional sampling and testing at the Contractor's expense when test results indicate that the materials do not meet specified requirements. When test results indicate that materials meet specified requirements, an equitable adjustment in the contract price will be made for the sampling and testing. Remove or dispose of any rejected material as specified and at the Contractor's expense.]

1.6.1.3 Evaluation Testing of Stone

**************************************************************************
NOTE: Alternate 1 – Use this paragraph if testing is to be performed by the Government at the Material Testing Center at CEWES or at a Government selected commercial laboratory that has been validated to being able to perform the required tests; delete paragraph EVALUATION TESTING OF STONE (Alternate 2)
in PART 2 PRODUCTS.

For contracts having a short duration or are awarded for emergency repair, there will be insufficient time to allow a Contractor to propose and unlisted source and have it evaluated; therefore, delete the bracketed sentences in paragraph STONE above; and subparagraphs SOURCES, above, and this paragraph, EVALUATION TESTING OF STONE, should be deleted.

Table 6-1 of EM 1110-2-2302 gives a broad generalization of desired quality criteria for stone. However, the quality criteria specified in this document was based upon a limited review of criteria being used by Corps. Each District or Division should specify the desired quality of stone necessary to meet performance criteria. It is recommended that at a minimum the stone should be evaluated using petrographic analysis, specific gravity, unit weight, freezing and thawing, and resistance of rock to wetting and drying. The freezing and thawing testing should be performed in accordance with COE CRD-C 144 or ASTM D5312/D5312M on the largest sawn sections of stone, between [_____] mm² (144-2304 square inches), so that bedding planes or any potential planes of weakness can be evaluated. These size samples require stone samples that range between 70 kg and 3400 kg 150 pounds and 7400 pounds. If ASTM D5313/D5313M are required, the test specimen must be of the same size range as specified above. LRD has testing and evaluation procedures for shoreline protection that require larger samples for evaluation of material being used on their projects due to the severity of their environment and the larger sizes of stone used for shoreline protection. These procedures should be investigated if the standard procedures specified are not giving you adequate durability for stone placed on past projects.

A special test that could be used to evaluate the abrasion resistance of stone is COE CRD-C 63, Abrasion-Erosion Resistance of Concrete.

The number of work days specified in this paragraph are based on the assumption that to tentatively approve the use of a source under a single contract requires data for unit weight, absorption, and petrographic analysis of the stone. A minimum of 80 work days would be required to have available data from the freeze and thawing test. Arrangements need to be made with the testing laboratory when notice is given to evaluate source not after samples are collected.

The size of a sample has been reduced to three pieces of stone weighing 70 kg 150 pounds minimum each for stone gradations with a nominal top size less than 1400 kg 3000 pounds. The number of pieces
has been reduced by the COR being a geologist or materials engineer and present during the sample collection. Also, the pieces need to be washed to make sure they are similar and only three pieces are required by the Laboratory for evaluation of sample. Larger size stones may be required for evaluating stone used for shoreline protection.

Delete this submittal if evaluation testing of stone will be performed by the Government at a Government Laboratory.

**************************************************************************
NOTE: The Drop Test should not be used to determine stone durability as it is entirely qualitative, and may produce fine fractures that are not immediately discernible. Further, it may damage stone that may very well be later incorporated into the work, if not discarded following the "test."
**************************************************************************

Submit a copy of the laboratory inspection report along with actions taken to correct deficiencies and a copy of the test reports, prior to delivery of such material to the worksite; since quality test on the stone in accordance with PART 2 paragraph EVALUATION TESTING OF STONE is the responsibility of the Contractor. The tests to which the stone may be subjected will include petrographic analysis, specific gravity, unit weight, absorption, wetting and drying, freezing and thawing and such other tests as may be considered necessary to demonstrate that the stone is of a satisfactory quality which is at least equivalent to stone from the sources listed at the end of this section.

a. [Unit Weight][Bulk Specific Gravity, saturated surface dry (SSD)] and Absorption. Stone must [weigh more than [_____] [2500] kN/m$^3$ [_____] [155] pounds per cubic foot][have a bulk specific gravity, saturated surface dry, (SSD), greater than [_____] [2.48]]. Provide stone with an absorption less than [2][_____] percent unless other tests and service records show that the stone is satisfactory. The method of test for [unit weight][bulk specific gravity (SSD)] and absorption will be ASTM C127.

b. Samples. Take samples of stone from a source not listed at the end of this section by a representative of the quarry under the supervision of the Contracting Officer for testing and acceptance prior to delivery of any stone from this source to the site of the work. Samples consist of at least three pieces of stone, roughly cubical in shape and weighing no less than [70][_____] kg [150][_____] pounds each from each unit that will be used in the production of the required stone. If the source is an undeveloped quarry[, or if the operation has been dormant for more than one year such that fresh samples are not available,] expose fresh rock for 6 m 20 feet horizontally and for the full height of the face proposed for production, prior to the field evaluation.[ The Contracting Officer may also require documentation of subsurface exploration of an undeveloped quarry in order to determine whether or not sufficient reserves are available.] Ship samples at the Contractor's expense to [Waterways Experimental Station, Structures
Laboratory, 3909 Halls Ferry Road, Vicksburg, MS 39180, Attn: [____], and notify [Mr.] [Ms.] [____], [____] Branch, [____] District to arrange for testing at least [40][60][_____] workdays before the stone leaves the quarry.

c. Tests. The tests will be conducted in accordance with applicable Corps of Engineers methods of tests given in the Handbook for Concrete and Cement or ASTM methods of tests. [The cost of testing one new source will be borne by the Government.]

[1.6.1.4 Random Sampling]

The stone produced by each source will be sampled by the Government for Quality Assurance testing on the basis of a minimum once each year or once during the production of each [____][25 000][50 000] tons (metric) tons of stone produced each year for the Government. The samples will be evaluated based upon petrographic analysis, specific gravity, [unit weight, ][bulk specific gravity (SSD),][____], and absorption.

[1.6.2 Concrete Grout for Stone Protection]

**************************************************************************
NOTE: If the Designer elects to specify grouting requirements for the project under another section, special care should be taken to delete all grouting requirements specified in this section and appropriate references added identifying the section specifying the grouting requirements.
**************************************************************************

1.6.2.1 General

The Government reserves the right to sample and test the aggregates and grout to determine compliance with the specifications. Provide facilities and labor as may be necessary to assist the government in procurement of representative test samples. Samples of aggregates will be obtained at the point of batching in accordance with ASTM D75/D75M. Grout will be sampled in accordance with ASTM C172/C172M. The slump and air content will be determined when cylinders are molded in accordance with ASTM C143/C143M and ASTM C231/C231M, respectively. Compression test specimens will be made, cured and transported in accordance with ASTM C31/C31M. Samples for strength tests will be taken not less than once each shift in which grout is produced. A minimum of three specimens will be made from each sample, two will be tested at 28 days (90 days if pozzolan is used) for acceptance and one will be tested at 7 days for information.

1.6.2.2 Concrete Grout Mixture Proportions

Concrete rout mixture proportions is the responsibility of the Contractor.[Submit the mixture proportions that will produce grout of the qualities required, ten days prior to placement.][Submit grout mixture proportions for grouting manufactured derrick stone.] Submit mixture proportions for review [____] [10] days prior to being used under this contract. Include mixture proportions of the dry weights of cementitious material(s); the specific gravities, absorptions, and saturated surface-dry weights of the fine and coarse aggregates; the quantities, types, and names of admixtures; and quantity of water per cubic meters cubic yards of grout. Also, submit applicable test reports, such as air content,
compressive strength, and unit weight of the grout, to verify the proportions selected will produce grout of the quality specified. Do not change the approved grout mixture proportions without approval by the Contracting Officer. The air content must be between 4.5 and 7.5 percent. The specified compressive strength $f'c$ is $[1.4][1.8][_____]$ kg/mm$^2$ [2000][2500][_____] pounds per square inch at 28 days (90 days if pozzolan is used). The maximum water cement ratio is $[_____]0.70$. The slump of the grout mix is 150 mm 6 inches plus or minus 25 mm 1 inch. For maximum coarse aggregate size see paragraph AGGREGATES FOR CONCRETE GROUT.

1.6.2.3 Evaluation and Acceptance of Grout

The acceptance test results will be the average of the strengths of the two specimens tested at 28 days (90 days if pozzolan is used). The strength of the concrete grout will be considered satisfactory so long as the average of three consecutive acceptance test results equal or exceed the specified compressive strength $f'c$ and no individual acceptance test result falls below the specified strength $f'c$ by more than $[350]$ g/mm$^2$ 500 pounds per square inch.

1.7 REGULATORY REQUIREMENTS

**************************************************************************
NOTE: Insert the appropriate State Highway Department specifications as applicable.
**************************************************************************

The regulatory requirements listed below form a part of this specification to the extent referenced. The regulatory requirements are referred to in the text by basic designation only.

[_____] STATE HIGHWAY AND TRANSPORTATION DEPARTMENT (____))

[____] [(____)] Standard Specifications for Highway Construction

1.8 CONSTRUCTION TOLERANCES

**************************************************************************
NOTE: For tolerances in general, 1/2 of the D-50 stone dimension of gradation range is allowed above the neatline and 1/4 of the same dimension is allowed below the neatline for stone gradation with a maximum size of 300 kg 650 pounds. For large stone the tolerance may be reversed. It is critical to make sure that layer thicknesses are physically possible for the stone materials specified - you cannot require two layers of stone in space too small for even one individual stone. Check both the Specifications and the Drawings to verify that the slopes and grades are constructable with the sizes of materials specified.
**************************************************************************

The finished surface and stone layer thickness is not allowed to deviate from the lines and grades shown by more than the tolerances listed below. Tolerances are measured perpendicular to the indicated neatlines. Ensure extreme limits of the tolerances given are not continuous in any direction.
for more than [_____] [five] times the nominal stone dimension nor for an area greater than [9.3][18.6][93] m² [100][200][1000] square feet of the structure surface.

The intention is that the work is built generally to the required elevations, slope and grade and that the outer surfaces are even and present a neat appearance. Remove or rearrange placed material not meeting these limits as directed by the Contracting Officer. Payment will not be made for excess material which the Contracting Officer allows to remain in place.

PART 2   PRODUCTS

2.1   BEDDING MATERIAL

**************************************************************************
NOTE: This paragraph presents gradation bands of materials that were developed based upon seepage criteria presented in EM 1110-2-1913. Each bedding material system should be designed to be used with a specific range of riprap gradations, foundation conditions, and channel conditions.
**************************************************************************

2.1.1 General

Submit the source for materials used in riprap[,] [ and] [filter][,] [ and] [bedding]. Provide bedding material consisting of [a washed ] [gravel or] crushed stone. Submit test reports attesting that the [bedding material] [,] [and] [filter material] meet specified requirements.
2.1.2 Material

******************************************************************************
NOTE: Delete gradation limits that are not required.
******************************************************************************

Ensure bedding material is composed of tough, durable particles, adequately free from thin, flat and elongated pieces, and contains no organic matter nor soft, friable particles in quantities considered objectionable by the Contracting Officer. Provide aggregates meeting the quality requirements of ASTM C33/C33M[ or paragraph REGULATORY REQUIREMENTS]. Use gradation conforming to the following requirements:

<table>

Provide bedding material well-graded between the limits shown. Perform at least one test on each [_____] 1000 tons [to be delivered to the project site][placed] for each specified gradation in accordance with ASTM C136/C136M.[ Remove a representative sample weighting no less than 45 kg 100 pounds from the bedding layer placed at locations directed by the Contracting Officer.] Ensure all points on individual grading curves obtained from representative samples of bedding material lie between the boundary limits as defined by smooth curves drawn through the tabulated
gradation limits plotted on ENG FORM 2087 or similar form. The individual gradation curves within these limits are not allowed to exhibit abrupt changes in slope denoting either gap grading or scalping of certain sizes or other irregularities which would be detrimental to the proper functioning of the bedding layers.

2.2 FILTER MATERIAL

**************************************************************************

NOTE: This paragraph presents gradation bands of materials that were developed based upon seepage criteria presented in EM 1110-2-1913. Each filter material system should be designed to be used with a specific range of riprap gradations, foundation conditions, and channel conditions.

The Specifier should use Alternative 1 if there is a concrete section in the specifications and if the gradations therein are satisfactory for filter materials. If there is no concrete section, or if the gradations therein are unsatisfactory for filter materials, the Specifier should use Alternative 2.

NOTE: Alternative 1.

**************************************************************************

Submit certificates of compliance attesting that the materials meet specification requirements. [Provide filter material consisting of [washed] [sand and gravel] [and crushed stone] [filter stone and geotextile]. Provide [sand and gravel] [and crushed stone] for filter materials which meets the applicable requirements of Section 03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE, paragraph MATERIALS, subparagraph AGGREGATES.][ Provide geotextiles as specified in Section 31 05 19.13 GEOTEXTILES FOR EARTHWORK.]

**************************************************************************

NOTE: Alternative 2.

**************************************************************************

[Provide filter material consisting of [Sand "[_____]"], [Gravel "[_____]"], [Filter Stone] [Filter Stone and Geotextile]. Ensure the [filter material] [filter stone] is composed of tough, durable particles, adequately free from thin, flat and elongated pieces, and contains no organic matter nor soft, friable particles in quantities considered objectionable by the Contracting Officer. Provide aggregate meeting the quality requirements of ASTM C33/C33M [or paragraph REGULATORY REQUIREMENTS]. Ensure grading conforms to the following requirements:

tabulated gradation limits plotted on ENG FORM 2087 or similar form. The individual gradation curves within these limits are not allowed to exhibit abrupt changes in slope denoting either gap grading or scalping of certain sizes or other irregularities which would be detrimental to the proper functioning of the filter. Provide geotextile as specified in Section 31 05 19.13 GEOTEXTILES FOR EARTHWORK.

2.3 [BEDDING] SAND [FILL] [CUSHION LAYER]

**************************************************************************
NOTE: Sand fill is used to bring areas which are below grade in paragraph BASE PREPARATION to within allowable minus tolerance instead of using filter or bedding materials.
**************************************************************************

[Provide a clean, free draining sand in accordance with classification SP in ASTM D2487, except that no more than 5 percent by weight of the material smaller than a No. 4 sieve, must pass a No. 200 sieve. If sand meeting this criteria is available on site it may be used.] [Sand must meet [paragraph REGULATORY REQUIREMENTS specification][ASTM C33/C33M] gradation requirements for fine aggregate.]

2.4 STONE

2.4.1 General

2.4.1.1 Evaluation Testing of Stone

**************************************************************************
NOTE: Alternate 2 – Use this paragraph if testing is to be performed by the Contractor at a Commercial Laboratory; delete paragraph EVALUATION TESTING OF STONE (Alternate 1) in PART 1 GENERAL.
**************************************************************************

For contracts having a short duration or are awarded for emergency repair, there will be insufficient time to allow a Contractor to propose an unlisted source and have it evaluated; therefore, delete the bracketed sentences in paragraph STONE above, and subparagraphs SOURCES, above, and this paragraph EVALUATION TESTING OF STONE, should be deleted.

Table 6-1 of EM 1110-2-2302 gives a broad generalization of desired quality criteria for stone. However, the quality specified in this document was based on a limited review of criteria being used by the Corps. Each District or Division should specify the desired quality of stone necessary to meet performance criteria. It is recommended that at a minimum the stone should be evaluated using petrographic analysis, specific gravity, unit weight, absorption, freezing and thawing, and resistance of rock to wetting and drying. The freezing and thawing testing should be performed in accordance with COE CRD-C 144 or ASTM D5312/D5312M on the largest sawn sections of stone, between 0.09-1.49 m² 144-2304 square inches so that bedding planes or any potential planes of weakness
can be evaluated. These size samples require stone samples that range between 70 kg and 3400 kg 150 pounds and 7400 pounds. If ASTM D5313/D5313M is required, the test specimen must be of the same size range as specified above. Some organizations have testing and evaluation procedures for shoreline protection that require larger samples for evaluation of material being used on their projects due to the severity of their environment and the larger sizes of stone used for shoreline protection. These procedures should be investigated if the standard procedures specified are not giving adequate durability information for stone placed on past projects.

A special test that could be used to evaluate the abrasion resistance of the stone is COE CRD-C 63, Abrasion-Erosion Resistance of Concrete.

The number of work days specified in this paragraph is based on the assumption that to tentatively approve the use of a source under a single contract requires data for unit weight, absorption, and petrographic analysis of the stone. A minimum of 80 work days would be required to have available data from the freeze and thawing test. Arrangements need to be made with the testing laboratory when notice is given to evaluate source not after samples are collected.

The size of a sample has been reduced to three pieces of stone weighing 70 kg 150 pounds minimum each for stone gradations with a nominal size less than 1400 kg 3000 pounds. The number of pieces has been reduced by the COR being a geologist or materials engineer and present during the sample collection. Also, the pieces need to be washed to make sure they are similar and only three pieces are required by the laboratory for evaluation of sample. Larger size stones may be required for evaluating stone used for shoreline protection.

**************************************************************************

For stone from an unlisted source, have evaluation tests performed on stone samples collected from the proposed source. Perform quarry investigation by a registered geologist or registered engineer. The tests include petrographic examination (ASTM C295/C295M), bulk specific gravity (SSD), unit weight, absorption (ASTM C127), resistance of stone to freezing and thawing ([COE CRD-C 144][ASTM D5312/D5312M]), resistance to wetting and drying (ASTM D5313/D5313M). The laboratory to perform the required testing must be validated based on relevant paragraphs of ASTM D3740, and no work requiring testing is permitted until the laboratory has been inspected and validated unless approved prior to testing by the Contracting Officer. A copy of the documents, provided by the Materials Testing Center (MTC) at CEWES[ or other governmental agency], that validates that the laboratory can perform the required tests. List the individual tests for which the validation covers along with the date of the inspection. The first inspection of the facilities is at the expense of the Government and any subsequent inspections required because of failure
or deficiencies identified by the first inspection are at the expense of the Contractor.

[ a. Bulk Specific Gravity Range. All stone must have a minimum bulk specific gravity, saturated surface dry (SSD), of [_____] [2.50] and a maximum bulk specific gravity of not more than [_____] [2.90] based upon water having a unit weight of 9.8 kN/m³ 62.4 pounds per cubic foot. The method of test for bulk specific gravity (SSD) is ASTM C127. Reference is made to paragraph FACTORS USED FOR CONVERTING IN-PLACE VOLUME TO WEIGHT for instructions for converting in-place volume to bid quantities and for instructions on adjusting bid schedule quantities for variations in bulk specific gravity and percentage of voids.]

b. Unit Weight and Absorption. Stone must [weigh more than [24][_____] kN/m³ [155][_____] pounds per cubic foot][have a bulk specific gravity, saturated surface dry, greater than [2.48][_____] [2.60]]. Provide stone with an absorption less than [1][2][_____] percent unless other tests and service records show that the stone is satisfactory. The method of test for unit weight and absorption is ASTM C127.

c. Petrographic Examination. Evaluate stone in accordance with ASTM C295/C295M which includes information required by ASTM D4992, paragraph 10. Use COE CRD-C 148 to perform Ethylene glycol tests required on rocks potentially containing smectite as specified in ASTM D4992 and on samples identified to contain swelling clays.

d. Resistance to Freezing and Thawing. Use stone with a maximum loss of [_____][5][10] percent after the number of cycles specified in ASTM D5312/D5312M, Figure 1, when determining the durability of stone when subjected to freezing and thawing in accordance with [COE CRD-C 144][ASTM D5312/D5312M], except the surface area of one side of the sample must be between [0.09][_____] and [1.49][_____] m² [144][_____] and [2304][_____] square inches.

e. Resistance of Rock to Wetting and Drying. Use stone with a maximum loss of [1][_____] percent when determining the durability of stone when subject to wetting and drying in accordance with ASTM D5313/D5313M, except the surface area of one side of the sample must be between [0.09][_____] and [1.49][_____] mm² [144][_____] and [2304][_____] square inches.

f. Samples. Take samples of stone from a source not listed at the end of this section by a representative of the quarry or source under the supervision of the Contracting Officer for testing and acceptance prior to delivery of any stone from this source to the site of the work. Include in the information provided with the samples the location within the quarry or source from which the sample was taken along with a field examination of the quarry or source. Include the information outline in ASTM D4992, paragraph 7, in the field examination. Samples consist of at least three pieces of stone, roughly cubical in shape and weighing no less than [70][_____] kg [150][_____] pounds each from each unit that is used in the production of the required stone. If the source is an undeveloped quarry, or if the operation has been dormant for more than one year such that fresh samples are not available, expose fresh rock for 6 m 20 feet horizontally and for the full height of the face proposed for production, prior to the field evaluation. The Contracting Officer may also require documentation of subsurface exploration of an undeveloped quarry in order to determine whether or
not sufficient reserves are available.] Ship samples at the Contractor's expense to a laboratory validated by the government to perform the required tests.

g. Tests. Conduct the tests in accordance with applicable ASTM and Corps of Engineers methods of tests, given in the Handbook for Concrete and Cement, in a laboratory validated by the government. The cost of testing are borne by the Contractor.

2.4.1.2 Quarry Operations

Conduct quarry operations in a manner to produce stone conforming to the requirements specified. This may involve selective quarrying, handling, processing, blending, and loading as necessary, [as specified in Section 01 45 00 QUALITY CONTROL]. Controlled blasting and handling of rock to produce rock of the size ranges and quality specified. Techniques such as the use of proper hole diameter, hole depth, hole angle, burden and spacing distances, types and distribution of explosives, delay intervals and sequence, removal of muck piles between each shot, and special handling techniques are required as necessary to produce the specified materials. Specifically design all aspects of blasting operations so that the end product is not damaged from the blasting technique and that the stone is suitable for the intended purpose.

a. Curing Stone

Conduct curing operations on freshly quarried stone to allow it to release stored energy and moisture. This will allow the stone to exhibit initial and subsequent post blasting stress relief and reveal any significant fractures during the energy release and drying-out phase. Stockpile stones of sizes which are individually picked temporarily at the quarry site a minimum of [_____] calendar days before being shipped to the project site, unless this requirement is waived by the Contracting Officer. Such waiver will be granted only if the stone has characteristics that make curing unnecessary.

b. Stone Quarrying Exclusion Period

*****************************************************************************
NOTE: Exclude the possibility of waiving the quarrying period restrictions unless the District Geologist authorizes inclusion of the language in the specification for the project.
*****************************************************************************

Stone quarried between the [_____] [15th of September and the 15th of April] will not be approved for use in the project. [If the stone is not affected by freeze-thaw cycles, and the durability history of the stone demonstrates that quarrying during the exclusion period has not adverse effect on the durability of the stone and the Contracting Officer approves the use of stone quarried during the exclusion period, the stone quarrying period exclusion may be waived by the Contracting Officer.] Stone quarried before the the exclusion period at a time which will not permit sufficient curing time before being subjected to freezing conditions, and which is subject to fracturing as a result of freeze-thaw cycles, will not be approved for use.

c. Temporary Storage at Quarry
Prolonged storage of stone materials prior to shipment from the quarry and prior to permanent placement in the required work are subject to approval of the Contracting Officer. [Underwater storage of stone materials is prohibited.]

2.4.1.3 Gradation Test

**************************************************************************
NOTE: As a rule of thumb the sample size should be between 20 to 100 times the weight of the maximum size stone within a specified gradation (see ASTM D5519, Note 2). Recommend using either the calculated minimum sample size or the following size samples for the ranges specified.

15 metric ton sample required for riprap with a top size up to 225 kg 500 pounds. 25 metric ton sample required for riprap or stone with top size between 225 kg 500 pounds and 1000 kg 2200 pounds and 50 metric ton sample required for riprap or stone with top size larger than 1000 kg 2200 pounds up to 3400 kg 7500 pounds.

For sources which have riprap or stone as a standard production item: One gradation test minimum, at the quarry, required for each 50 000 metric tons of riprap or stone with a top size of 460 kg 1,000 pounds or larger, or one test required for each 25,000 metric tons of smaller riprap or stone.

To allow the Contractor to perform a gradation test without the Contracting Officer present, the quantity of riprap or stone required for the project must be less than 10,000 metric tons.

Use consistent terminology - if the CLIN in the Bid Schedule refers to Jetty Stone or Armor Stone, use terms exclusively in the text of the Specifications that apply to each - and cross check that the terms are used correctly in the Drawings.

**************************************************************************
Perform a gradation test or tests on the riprap, stone, or [_____] at the quarry in accordance with paragraph GRADATION TEST METHOD FOR RIPRAPP, GRADED STONE, AND [____]. Take the sample in the presence of the Contracting Officer. Notify the Contracting Officer not less than 3 days in advance of each test. Submit the gradation tests using the GRADATION TEST DATA SHEET enclosed at end of this section for riprap or stone. [In the event of unavailability of the Contracting Office, perform the tests and certify to the Contracting Officer that the riprap, stone, or [____] shipped complies with the specifications.] Perform at least [one] [____] gradation test(s) per [50,000] [____] tons(metric) tons of each size of riprap, stone, or [____] placed, but do not perform less than one test. Report gradation tests using the forms, GRADATION TEST DATA SHEET and ENG FORM 4794-RM 4794-R, attached at end of this section or approved alternative.[ Designate on the test form that portion in tons (metric) tons of the lot tested which is applicable to this contract. Correct any deviation from the reported tonnage and record on a revised GRADATION TEST DATA SHEET.][ Provide sample consisting of no less than [15] [25] [50]
[_____] tons(metric) tons of [_____] riprap, stone, or [______], and collect in a random manner which will provide a sample which accurately reflects the actual gradation arriving at the jobsite.][ Provide sample consisting of between 30 to 35 pieces of armor stone and jetty stone. A minimum of two tests are required for acceptance of armor stone and jetty stone. Mark the weight of the individual pieces of armor stone and jetty stone, representing the minimum, maximum and 50 percent greater than sizes for the specified armor stone and jetty stone gradation, on each stone [and place at the quarry to provide visual comparison during production at the quarry ] and place in a location adjacent to the work site in order to provide a basis for visual comparison during placement of the armor stone and jetty units. Use these stones in the last placement if needed.] Failure of the test on the initial sample and on an additional sample will be considered cause for rejection of the quarry and/or quarry process, and set aside all riprap, stone, or [______] represented by the failed tests and do not incorporate into the work. Any additional tests required because of the failure of an initial test sample will not be considered as one of the other required tests. If collected by the truckload, each truckload must be representative of the gradation requirements. [The Contracting Officer may direct additional testing of the riprap, stone or [______] at the project site if the riprap, stone, or [______] appears, by visual inspection, to be out of gradation.] [Perform additional tests on in-place materials at the locations directed, or on random loads selected by the Contracting Officer.][ In-place test areas must be no less than 3.6 by 3.6 m 12 by 12 feet [______] and include the full thickness of the placed riprap, stone, or [______] layer, without disturbing or including the underlying material and meet the minimum sample size specified above]. Refill and rework each pit or void excavated for an in-place test sample to provide a surface void of signs of disturbance.[ Perform [one][additional] in-place gradation on each [3800 cubic meters][7500 tons (metric) [5,000 cubic yards][7,500 tons] or portion thereof placed.][ If the gradation test fails, additional gradation tests will be required at the Contractor's expense to delineate the limits of unacceptable stone. Do not count additional gradation tests as part of the minimum number of gradation tests required. Rework and replace the unacceptable stone as necessary to correct the deficiency within the specified gradation or remove the stone from the project site as determined by the Contracting Officer.] The Contracting Officer may direct this testing under FAR 52.246-12 Inspection of Construction. Provide all necessary screens, scales and other equipment, and operating personnel, to grade the sample. Certification and test results represent riprap, stone, or [______] shipped from the quarry. Certification and tests results must be received by the Contracting Officer at the jobsite before the riprap, stone, or [______] is used in the work.

2.4.1.4 Proportional Dimension Limitations

[The maximum aspect ratio (greatest dimension:least dimension) of any piece of stone for size ranges [which are not graded with a screen or grizzly,] must be not greater than 3:1 when measured across mutually perpendicular axis. Allow no more than 25 percent of the stones within a gradation range to have an aspect ratio greater than 2.5:1.][ A maximum of [5][10][15] percent flat and elongated pieces by weight will be acceptable. A flat and elongated piece of riprap is defined as having a ratio of width to thickness or length to width greater than 3:1. Use ASTM D4791 as a guide to perform the test.]
2.4.1.5 [Riprap][Stone][_____] Stockpile

Storage of [riprap][stone][_____] at the worksite is not to be confused with off-site stockpiling of riprap, stone, or [______]. If the Contractor elects to provide off-site stockpiling areas, notify the Contracting Officer of all such areas.[ The Contractor's stockpile must be a maximum of 3.6 m 12 feet high and formed by a series of layers of truckload dumps, where the rock essentially remains where it is placed. Start subsequent layers 3 m 10 feet from the edge of the previous layer so that the rock will not roll down the edges of the previous layers.] The first layer must be a maximum of 1.8 m 6 feet high. After being stockpiled, do not put any riprap, stone, or [_____] which has become contaminated with soil or refuse into the work unless the contaminating material has been removed from the riprap, stone, or [_____] prior to placement.

a. Worksite Stockpile. [Place riprap, stone, or [_____] delivered to the work sites, which requires temporary storage[ landward of top of slope], in a container suitable for storing the riprap, stone, or [_____] without waste[, or a sand-clay-gravel or crushed stone pad may be constructed for the storage area and removed upon completion of the work. If the sand-clay-gravel or crushed stone pad method is used, use pad with a minimum thickness of at least 150 mm 6 inches.] The container[ or sand-clay-gravel or crushed stone pad method] is subject to approval by the Contracting Officer prior to delivery of the riprap, stone, or [______]. Upon completion of the work, clean the storage areas of all storage residues and return to their original condition.[ Temporary storage of riprap, stone, or [_____] at the worksite will be allowed, provided the stockpile toe of the riprap, stone, or [_____] be no closer than [18][30] m [60][100] linear feet from the closest edge of the [excavation's][stream's] top slope, and the amount must not exceed 200 t 200 T[ unless otherwise approved].]

b. Off-site Stockpile. In areas where riprap, stone, or [_____] is stockpiled for placement, remove excess or residual rock prior to completion of work. Remove all rock and spalls greater than 75 mm 3 inches in diameter. Where rocks may have become buried due to soft ground or operation of the equipment, [dispose of rock as directed][ put rock in a disposal area][buried in acceptable soil]. After the excess or residual rock has been removed, grade, dress, and fill the storage area to return the ground surface as near as practical to the condition that existed prior to construction unless otherwise approved by the Contracting officer.

2.4.2 Riprap

**************************************************************************
NOTE: At the end of this section, the Specifier must attach copies (Plates) of ENG FORM 4794-RM RIPRAP GRADATION CURVES for M40, M65, M90, M180, or M300 (ENG FORM 4794-R RIPRAP GRADATION CURVES FOR R90, R140, R200, R400, or R650), etc., as applicable for this contract.

The riprap gradations presented were developed in Lower Mississippi Valley Division in 1981 and were standardized to limit the number of gradation bands that a producer would have to produce. These gradation bands were developed from gradation bands presented in EM 1110-2-1601, Chapter 3. All bands
were modified slightly after meetings with producers in AR, MO, and IL to reduce production costs. These five of thirteen gradation bands are provided as examples.

Riprap gradations may be designated by state highway department standard specifications in areas where quarries are more familiar with producing these products, provided the gradations meet the project needs. Care must be taken in accepting sources of state highway department gradations of riprap to verify the STONE QUALITY CRITERIA other than merely gradation also meet the project needs, as state highway departments may not design to the same long-term performance durations.

Riprap is typically specified by the weight of the maximum D100 size of the riprap gradation.

**************************************************************************
Use only quarried stone. Provide well graded stone conforming to [the table(s) below and to Plate(s) [_____], [_____], [_____] and [_____] attached at the end of this section][the gradation requirements for [_____], [_____], and [_____] as specified in [paragraph REGULATORY REQUIREMENTS][_____]].

| TABLE [_____] - FOR RIPRAP "M40""R90" |
|---------------------------------------|--------------------------------|
| PERCENT LIGHTER BY WEIGHT (SSD)       | LIMITS OF STONE WEIGHT, KGLB. |
| 100                                   | 40 - 2090 - 40                 |
| 50                                    | 20 - 1040 - 20                 |
| 15                                    | 10 - 320 - 5                   |

| TABLE [_____] - FOR RIPRAP "M90""R200" |
|---------------------------------------|--------------------------------|
| PERCENT LIGHTER BY WEIGHT (SSD)       | LIMITS OF STONE WEIGHT, KGLB. |
| 100                                   | 90 - 35200 - 80                |
| 50                                    | 40 - 2080 - 40                 |
| 15                                    | 20 - 540 - 10                  |

| TABLE [_____] - FOR RIPRAP "M300""R650" |

2.4.3  [Riprap][Stone] Paving

Use stone for [riprap][stone] paving in pieces approximately rectangular in cross section, each piece having its greatest dimension no more than three times its least dimension and with one dimension not varying more than 50 mm 2 inches from the thickness of the paving as shown.

2.4.4  [Manufactured ]Derrick Stone

**************************************************************************
NOTE: Specifier should insert weight limits, a weight tabulation to define the desired range of sizes (similar to a riprap gradation), or a range of sizes.
**************************************************************************

[Manufactured derrick][Derrick] stone must be unreinforced concrete shapes weighing not less than 2300 kN/m$^3$ 145 pounds per cubic foot. Provide concrete as specified in Section [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE] [03 70 00 MASS CONCRETE].[ Submit the design of the shapes of the manufactured derrick stone prior to commencing their manufacture. Form [either handling][handling] holes in the shapes[ or embed handling hardware in the shapes] at the time they are manufactured.] Derrick stone must consist of [pieces weighing [_____] kg plus or minus [_____] kg pounds plus or minus [_____] pounds] [pieces as tabulated below:] [rectangular pieces [_____] m feet long by [_____] m feet wide by [_____] m feet thick.] [pieces with dimensions as tabulated below:]
2.4.4.1 Grout for Manufactured Derrick Stone

Use materials required to make the grout as specified in Section [03 70 00 MASS CONCRETE] [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE]. Mix grout in the proportions of one part cement to [_____] parts sand, [and] sufficient water to produce a workable mixture[, and that amount of admixture which will entrain sufficient air to produce durable grout. Submit grout mixture proportions in accordance with paragraph SUBMITTALS.]

2.4.4.2 Epoxy Materials

Epoxy material must meet the requirements of ASTM C881/C881M, [Type IV, when mixed with packaged sand to form a mortar] [Type VII, for a sealer.]

2.4.5 [Capstone] [and] [Derrick Stone]

[Capstone] [and] [Derrick stone] must consist of [pieces weighing [_____] kg plus or minus [_____] kg pounds plus or minus [_____] pounds] [pieces as tabulated below:] [rectangular pieces [_____] m feet long by [_____] m feet wide by [_____] m feet thick.] [pieces with dimensions as tabulated below:]

| [_____] | [_____] |
| [_____] | [_____] |
| [_____] | [_____] |

[Provide stone that is [roughly] graded as to size between the several limits.] [Provide stone in pieces generally rectangular in cross section, each piece having its greatest dimension no more than three times its least dimension.]

2.4.6 Graded Stone "A"

Graded Stone "A" must conform to the following table:

<table>
<thead>
<tr>
<th>GRADED STONE &quot;A&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>STONE WEIGHT (kg) (Pounds)</td>
</tr>
<tr>
<td>23005000</td>
</tr>
<tr>
<td>11502500</td>
</tr>
</tbody>
</table>
GRADED STONE "A"

<table>
<thead>
<tr>
<th>STONE WEIGHT (kg) (Pounds)</th>
<th>CUMULATIVE PERCENT (Finer by Weight)</th>
</tr>
</thead>
<tbody>
<tr>
<td>230500</td>
<td>40-65</td>
</tr>
<tr>
<td>45100</td>
<td>20-45</td>
</tr>
<tr>
<td>25</td>
<td>0-15</td>
</tr>
<tr>
<td>0.51</td>
<td>0-5</td>
</tr>
</tbody>
</table>

A plot of the gradation curve is attached at the end of this section.

2.4.7 Graded Stone "B"

[____].

2.4.8 Graded Stone "C"

[____].

2.4.9 57-kg 125-Pound Stone

Except as indicated by the following tolerances, 57-kg 125-pound riprap stone must be in pieces weighing no less than 2.7 kg 6 pounds each nor more than 57 kg 125 pounds each, and no dimension must be over 500 mm 20 inches. Grade each shipment as follows:

<table>
<thead>
<tr>
<th>WEIGHT OF PIECES (KG) (LBS)</th>
<th>PERCENT OF TOTAL WEIGHT</th>
</tr>
</thead>
<tbody>
<tr>
<td>34 to 5775 to 125</td>
<td>10 Maximum</td>
</tr>
<tr>
<td>11 to 3425 to 75</td>
<td>40 to 60</td>
</tr>
<tr>
<td>3 to 116 to 25</td>
<td>20 to 40</td>
</tr>
<tr>
<td>0 to 30 to 6</td>
<td>0 to 15</td>
</tr>
</tbody>
</table>

Note: Not more than 5 percent passing a 25 mm1-inch sieve.

**************************************************************************

NOTE: For any of the following four paragraphs, when the size of the largest stone within a gradation is 115 kg 250 pounds or less, specify gradation by dimension (mm (inches)) instead of by weight.

**************************************************************************

2.4.10 [Bedding/Mattress] Stone

Furnish stones that weigh between [_____] kg pounds and [_____] kg pounds each, free of fines and well graded within the following limits:
### 2.4.11 [Core/Underlayer/Scour] Stone

Furnish stones that weigh between \([ \_\_\_\_ ]\) kg pounds and \([ \_\_\_\_ ]\) kg pounds each, free of fines and well graded within the following limits:

<table>
<thead>
<tr>
<th>STONE WEIGHT IN KG LBS</th>
<th>PERCENT LIGHTER BY WEIGHT OF TOTAL MIXTURE</th>
</tr>
</thead>
<tbody>
<tr>
<td>([ ____ ])</td>
<td>([ ____ ])</td>
</tr>
<tr>
<td>([ ____ ])</td>
<td>([ ____ ])</td>
</tr>
</tbody>
</table>

### 2.4.12 [Armor/Cover] Stone

**************************************************************************

NOTE: The design of armor/cover stone should be based upon criteria presented in EM 1110-2-2904. Quality Control and gradations for especially large armor stone may be more stringent than riprap. Armor stone quarries are less common because the geology, strata or rock mass necessary to produce large intact and durable pieces free from weak discontinuities is less common.

**************************************************************************

Furnish stones that weigh between \([ \_\_\_\_ ]\) kg pounds and \([ \_\_\_\_ ]\) kg pounds each, free of fines. Ensure seventy-five percent (75 percent) of the stones weigh greater than \([ \_\_\_\_ ]\) kg pounds each.

### 2.4.13 Splash/Fill Stone

Furnish stones for splash/fill stone behind the steel sheet pile wall that are well graded from \([ \_\_\_\_ ]\) mm inch to \([ \_\_\_\_ ]\) mm inches, free of fines and contain no more than five percent (5 percent) stones larger than \([ \_\_\_\_ ]\) mm inches in any dimension.

### 2.5 CONCRETE GROUT

**************************************************************************

NOTE: If concrete grouting is not required for the project, delete this paragraph and its subparagraphs in their entirety.

Requirements are written to match an abridged version of Section 03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE or applicable Grout specs. Do not use grouted riprap in areas where frost heave or ice in the sub-base can be expected to cause

SECTION 35 31 19 Page 49
uplift failure and on the river-side slopes of levees. A system designed for pressure relief and drainage should be provided beneath the area to be grouted along with edge and toe design to prevent undercutting and lateral movement of water beneath the grouted riprap.

2.5.1 Cementitious Materials

Submit manufacturer's certificate of compliance, or mill test reports, stating that the materials meet the requirements of the furnished specification.

2.5.1.1 Portland Cement

ASTM C150/C150M, Type [I,] [IA,] [II,] [IIA], low alkali.

2.5.1.2 Pozzolan

ASTM C618, Class C or F, including requirements of Tables 1A and 2A. Pozzolan in amount not to exceed 25 percent, based on absolute volume, may be substituted for an equivalent amount of portland cement in the grout mixture proportions.

2.5.2 Aggregates for Concrete Grout

NOTE: Insert the appropriate State Highway Department gradation requirements if applicable.

Use fine aggregates for grout meeting the quality and gradation requirements of either ASTM C33/C33M or paragraph REGULATORY REQUIREMENTS. Use coarse aggregates meeting the quality and gradation requirements of ASTM C33/C33M, Class designation 4M, Size No. 67, 7 or 8[ or paragraph REGULATORY REQUIREMENTS], Class designation [____], Size No. [____].

2.5.3 Admixtures

Submit manufacturers' literature for the concrete admixtures and curing materials. Use admixtures, when required or approved, that comply with the following:

b. Water-Reducing or Retarding Admixture: ASTM C494/C494M, Type A, B, or D.

2.5.4 Curing Materials

Provide curing materials as follows:

a. Impervious Sheet Materials: ASTM C171, type optional, except polyethylene film, if used, must be opaque white.

b. Membrane-Forming Curing Compound: ASTM C309, Type 1-D or 2, Class [A] [B].
2.5.5 Water

Use fresh, clean, potable water for mixing and curing. Ensure water is free from injurious amounts of oil, acid, salt, alkali, except that nonpotable water may be used if it meets the requirements of COE CRD-C 400.

2.5.6 Equipment

Batching and mixing equipment will be accepted on the basis of manufacturer's data which demonstrates compliance with the applicable specifications.

PART 3 EXECUTION

3.1 DEMONSTRATION SECTION

Prior to placement of stone, construct a section of [stone][channel] protection consisting of [toe stone][riprap][grouted stone][_____] to demonstrate his proposed operations for production placement. Demonstrate procedures and capability of grading, placing [toe] stone and bank protection[, and placing grout, and curing of the grouted stone] within the tolerances specified. The demonstration section must be[30][_____] m [100][_____] feet in length and must conform to all applicable specifications.

3.1.1 Methods and Equipment

Demonstrate means, methods and equipment employed for placement of [toe stone][riprap][grouted stone][_____] conform to the requirements specified. Accurately tabulate quantities of all materials placed within the section and provide immediately to the Contracting Officer for comparison with computed quantities.

3.1.2 Demonstration Section Evaluation

Do not proceed with placing [stone][channel] protection prior to the approval of the demonstration section. Within a period of 7 days after completion of the section, the Contracting Officer will determine the adequacy of the section to function as part of the permanent construction. The Contractor will be notified as to the acceptability of the section and may be directed to modify methods of construction[, mix design,] and remove the section if necessary.

3.1.3 Removal of Demonstration Section

If removal of the demonstration section is required, conduct it in such a manner as to maintain the integrity of the underlying subgrade. Dispose of unused demonstration section materials at an offsite location.

3.2 BASE PREPARATION

******************************************************************************

NOTE: Sand fill is specified for the filling of low areas below the waterline around structures in slack water and giving the Contractor the option of using bedding or filter materials. However, if fill material is required where the designer assumes there will be flowing water, the designer will have to determine the minimum size of materials that will

SECTION 35 31 19 Page 51
stay in place until the stone protection can be completed. This may require the fill material to be specified as bedding/filter material or riprap.

Tolerances plus 50 to 75 mm 2 to 3 inches (Above water placement).

Tolerances plus 300 mm 1 foot and minus 600 mm 2 feet (Below water placement).

Grade and/or dress areas on which [geotextile and riprap are] [filter layers and riprap are] [bedding material and riprap are] to be placed to conform to cross sections shown on the contract drawings within an allowable tolerance of plus 50 mm 2 inches and minus 100 mm 4 inches from the theoretical [slope] lines and grades. The prepared base must be approved by the Contracting Officer. Where such areas are below the allowable minus tolerance limit, restore to grade by fill [with earth similar to the adjacent material] [with sand fill] and then compact to a density equal to the adjacent in place material. Subaqueous areas on which [bedding material and riprap] [filter materials and riprap] are to be placed must be geotechnically stable as determined by a qualified geotechnical engineer. Grade and/or restore subaqueous material to conform to cross sections shown on the contract drawings within an allowable tolerance of plus 300 mm 1 foot and minus 600 mm 2 feet from the specified [slope] line and grades. Where such areas are below the allowable minus tolerance limit, fill with sand or other suitable fill as determined by the existing bottom conditions. As an alternative, these areas may be filled with [bedding material] [filter material] if approved by the Contracting Officer. No payment will be made for any material thus required. Immediately prior to placing the [geotextile] [bedding layers] [filter layers], the prepared base will be inspected by the Contracting Officer and do not place material thereon until that area has been approved.

3.3 PLACEMENT OF BEDDING LAYERS

3.3.1 General

NOTE: The following construction tolerances will be used for bedding layer placement. Tolerances will vary based upon District experience and project conditions.

Plus or minus 50 mm 2 inches

Plus 100 mm 4 inches or minus 50 mm 2 inches

Plus 150 mm 6 inches or minus 50 mm 2 inches (below water) should be possible if water depths are less than 3 m 9 feet. Placement tolerances at greater depths should be deleted and replaced with tons/square as specified for under water placement of stone.

Place a bedding layer, consisting of a [_____] -mm -inch layer of [gravel or] crushed stone, on the prepared base as described below, in accordance with the details shown on the contract drawings, and within the limits...
shown on the contract drawings or staked in the field. A tolerance of plus 50 mm 2 inches and minus 25 mm 1 inch from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the bedding, except ensure that the extreme of this tolerance is not continuous over an area greater than 18 m² 200 square feet.

3.3.2 Placement of Bedding Material on Prepared Base

Spread bedding material uniformly on the prepared base to the [slope] lines and grades as indicated on the contract drawings and in such manner as to avoid damage to the prepared base. Placing of [gravel or] crushed stone by methods which tend to segregate the particle sizes within the bedding layer [or cause mixing of the separate layers] is prohibited. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material in such a manner as to ensure a relatively homogenous mass. Replace or repair any damage to the surface of the prepared base that occurs during placement. Compaction of material placed on the prepared base will not be required, but finish [the material surface] [each layer] to present an adequately even surface, free from mounds or windrows.

3.4 PLACEMENT OF FILTER LAYERS

3.4.1 General

**************************************************************************
NOTE: The following construction tolerances will be used for filter layer placement. Tolerances will vary based upon District experience and project conditions.

Plus or minus 50 mm 2 inches

Plus 100 mm 4 inches or minus 50 mm 2 inches

Plus 150 mm 6 inches or minus 50 mm 2 inches (below water) should be possible if water depths are less than 3 m 10 feet. Placement tolerances at greater depths should be deleted and replaced with tons/square as specified for under water placement of stone.
**************************************************************************

**************************************************************************
NOTE: Alternative 1.
**************************************************************************

Place [filter layers, composed of geotextile [and a [_____] -mm -inch layer of filter stone][ and a [_____] -mm -inch layer of sand (cushion layer)] on the prepared base as described below, in accordance with the details shown on the contract drawings, and within the limits either shown on the contract drawings or stake in the field. [A tolerance of plus 50 mm 2 inches and minus [25][50] mm [1 inch][2 inches] from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the filter layers, except ensure that the extreme of this tolerance is not continuous over an area greater than 18 m² 200 square feet.]

**************************************************************************
NOTE: Alternative 2.

Place [filter layers composed of a [_____] -mm -inch lower layer of [Sand "[_____]"]], [a [_____] -mm -inch middle layer of Gravel "[_____]"], and a [_____] -mm -inch upper layer of [Gravel "[_____]"] [Filter Stone] on the prepared base as described below, in accordance with the details on the contract drawings, and within the limits shown on the contract drawings or stake in the field.] [A tolerance of plus [_____] mm inch(es) and minus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the filter layers, except ensure that the extreme of this tolerance is not continuous over an area greater than 18 m² 200 square feet].

3.4.2 Geotextile

NOTE: Delete this paragraph if Alternate 2 is used.

Install geotextile as specified in Section 31 05 19.13 GEOTEXTILES FOR EARTHWORK.

3.4.3 Placement of [Filter Material] [Sand Cushion Layer] on Geotextile

NOTE: Delete this paragraph if Alternate 2 is used.

Uniformly spread [crushed stone][filter material] on the geotextile to the [slope] lines and grades as indicated on the contract drawings and in such manner as to avoid damage to the geotextile. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material in such a manner as to ensure a relatively homogenous mass. Placing of [crushed stone][filter stone][sand cushion layer] by methods which tend to segregate the particle sizes within the filter layer is prohibited. Repair or replace any damage to the surface of the geotextile during placement of [crushed stone][filter stone][sand cushion layer] before proceeding with the work. Compaction of material placed on the geotextile will not be required, but finish to present an adequately even surface, free from mounds or windrows.

3.4.4 Placement of Filter Material on Prepared Base

Uniformly spread filter material on the prepared base to the [slope] lines and grades as indicated on the contract drawings and in such manner as to avoid damage to the prepared base. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material in such a manner as to ensure a relatively homogenous mass. Placing of [sand,] [gravel,] and [crushed stone] by methods which tend to segregate the particle sizes within the filter layers or cause mixing of the separate layers is prohibited. Repair or replace any damage to the surface of the prepared base during placement of the material before proceeding with the work. Compaction of material placed on the prepared base will not be required, but finish each layer to present an adequately even surface, free from mounds or windrows.
3.5 Placement of Riprap

NOTE: At the end of this section, the Specifier must attach copies (Plates) of ENG FORM 4794-RM RIPRAP GRADATION CURVES for M40, M____ (ENG FORM 4794-R RIPRAP GRADATION CURVES for R90, R_____), etc.

3.5.1 General

NOTE: The Specifier will not specify riprap by layer thickness. Specify riprap by the weight of the maximum D100 size of the riprap gradation.

Place riprap on the [filter] [and] [bedding] layers specified in paragraph(s) [BEDDING MATERIAL] [and] [FILTER MATERIAL] within the limits shown on the contract drawings.

3.5.2 Placement

NOTE: Select appropriate Alternative.

[Use under water placement rates when the top of the layer to be placed is covered by more than 900 mm 3 feet of water.]

3.5.2.1 Above Water

NOTE: Alternative 1.

For placement of riprap above water on a bedding layer or filter layer(s).

For tolerances in general, 1/2 of the average stone dimension of gradation range is allowed above the neatline and 1/4 of the same dimension is allowed below the neatline.

Use bottom hinged tailgates on dump trucks used in placing the riprap if larger than M180 R400 riprap is specified.

Place riprap in a manner which will produce a well-graded mass of rock with the minimum practicable percentage of voids, and construct, within the specified tolerances, to the lines and grades shown on the contract drawings or stake in the field. A tolerance of plus [_____] mm inch(es) and minus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the riprap, except ensure that the extreme of this tolerance is not continuous over an area greater than 18 m² 200 square feet. The average tolerance above or below the neat lines for the entire job must have no more than 50 percent of the tolerances specified above. [Place riprap by means of truck, crane operated skip-pan (box), dragline bucket, clamshell, rock-bucket, hydraulic...
excavator, trackhoe, or other approved equipment. [The use of tractor loaders or other equipment commonly referred to as front end loaders is prohibited. [Pneumatic tired front end loaders may be used provided that in the opinion of the Contracting Officer no degradation of the rock occurs.]]] Place riprap to its full course thickness in one operation and in such manner as to avoid displacing the [bedding] [filter] material. Distribute large stones well and grade the entire mass of stones in their final position to conform to the gradation specified in paragraph RIPRAP, subparagraph GENERAL. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material in such a manner as to ensure a relatively homogenous mass. Provide finished riprap that is free from objectionable pockets of small stones and clusters of larger stones. Placing riprap in layers will not be permitted. Placing riprap by dumping it into chutes, or by similar methods likely to cause segregation of the various sizes, is prohibited. Placing riprap by dumping it at the top of the slope and pushing it down the slope is prohibited. Do not operate equipment directly on the completed stone protection system. Produce the desired distribution of the various sizes of stones throughout the mass by selective loading of the material at the quarry or other source; by controlled dumping of successive loads during final placing; or by other methods of placement which will produce the specified results. Each truckload must be representative of the gradation requirements. [Equip all dump trucks used in placing the riprap with bottom hinged tailgates. Arrange the gate releasing mechanism so that it may be operated only from, at, or near the front of the truck.] Rearrange individual stones to the extent necessary to obtain a well-graded distribution of stone sizes as specified above.[ However, manipulating stone by means of dozers or other blade equipment is prohibited.][ Unless otherwise authorized by the Contracting Officer, place riprap in conjunction with the construction of the embankment and with only sufficient lag in construction of the stone protection as may be necessary to prevent mixing of embankment and stone protection materials.][ Maintain the stone protection until accepted by the Contracting Officer; replace any material displaced prior to acceptance due to the Contractor's negligence with no additional payment and to the lines and grades shown on the contract drawings.]

NOTE: Alternative 2.

For placement of riprap on geotextile or geotextile and filter stone.

Tolerance +100 mm and -50 mm +4 inches and -2 inches for riprap with a top size up to 230 kg 500 pounds riprap and a tolerance of +150 mm and -150 mm +6 inches and -6 inches for large riprap.

Add bottom hinged tailgates to dump trucks used in placing the riprap if larger than M180 R400 riprap is specified.

Drop heights of 900 mm 3 feet specified in this paragraph are based on the geotextile having a minimum puncture strength of 0.51 kN 115 pounds and a minimum tensile strength of 1.07 kN (240 pounds) and the riprap has a top size larger than 90 kg 200 pounds. For riprap with a top size larger than 90 kg 200 pounds and less than 225 kg 500 pounds, the
drop height is reduced to 600 mm 2 feet without a layer of filter stone or a sand cushion layer is required.

[Place riprap to produce a well graded mass of rock with the minimum practicable percentage of voids, and construct within the specified tolerances to the lines and grades indicated. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material to ensure a relatively homogenous mass. A tolerance of plus [_____] mm inch(es) or minus [_____] mm inch(es) from the slope lines and grades indicated will be allowed in the finished surface of the riprap, except ensure that either extreme of such tolerance is not continuous over an area greater than 18 m² 200 square feet.

The average deviation from the neat line of the entire job must not be more than 50 percent of the tolerance specified above. Do not drop stone through air from a height greater than 900 mm 3 feet and do not drop stones heavier than 230 kg 500 pounds from a height greater than 600 mm 2 feet.

[The drop height greater than 300 mm 1 foot for riprap with a top size of 225 kg 500 pounds is prohibited, except, if approved by the Contracting Officer, it may be, increased by placing a cushioning layer of sand [or [_____] on top of the geotextile before placing the riprap, or other methods deemed necessary if demonstrated in the field to not damage the geotextile.] Distribute the larger stones and roughly grade the entire mass of stones in their final position to conform to the gradation specified in paragraph RIPRAP, subparagraph GENERAL. Provide finished riprap that is free from objectionable pockets of small stones and clusters of larger stones. Placing riprap in layers will not be permitted. Placing riprap by dumping into chutes or by similar methods likely to cause segregation of the various sizes will not be permitted. Placing riprap by dumping it at the top of the slope and pushing it down the slope is prohibited. Do not operate equipment directly on the completed stone protection system. Obtain the desired distribution of the various sizes of stones throughout the mass by selective loading of the material at the quarry or other source, by controlled dumping of successive loads during final placing, or by other methods of placement which will produce the specified results. Equip all dump trucks used in placing the riprap with bottom hinged tailgates. Arrange the gate releasing mechanism so that it may be operated only from, at, or near the front of the truck. Rearrange stones to the extent necessary to obtain a well-graded distribution of stone sizes as specified above. Maintain the stone protection until accepted by the Contracting Officer; replace any material displaced by any cause, with no additional payment, to the lines and grades indicated.]

][3.5.2.2 Under Water

**************************************************************************

NOTE: The equation presented in this paragraph (Alternative 3) was developed to simplify the relationship between required riprap layer thickness and underwater placement rate in slack water. This equation assumes that riprap weighs approximately 1.8 tons metric per cubic meter 1.5 tons per cubic yard and that the underwater placement rate is based upon a required layer thickness 1.5 times the layer thickness required to be constructed in the dry. The quantities are based on a placement to be performed in two passes with the second pass being perpendicular to the first. This equation is
provided as an example and should be modified to meet project design criteria.

\[
\frac{(1.36t)(1.5)}{(25M^2)(304 \text{ mm})} = T_{mm} = R_M
\]

\[
T_{mm} = \text{Required theoretical thickness if placed in the dry. (Layer thickness given in mm.)}
\]

\[
R_M = \text{Required placement rate in Tons/sq m/pass}
\]

180 kg placement rate is 10 T/sq m/pass (assume required thickness in the dry is 750 mm for high turbulent flow criteria).

90 kg placement rate is 5 T/sq m/pass (assume required thickness in the dry is 400 mm for low turbulent flow criteria).  

\[
\frac{(1.5 \text{ T/yd}^3)(100 \text{ ft}^2)(1.5)}{(27 \text{ ft}^3/\text{yd}^3)(12 \text{ in./ft})(2)} = T(0.347) = \frac{\text{-----------------------------}}{\text{-----------------------------------}} = R
\]

\[
T = \text{Required theoretical thickness if placed in the dry. (Layer thickness given in inches.)}
\]

\[
R = \text{Required placement rate in Tons/sq/pass. Where a square is referring to 100 square feet.}
\]

400 pound placement rate is 10 T/sq/pass (assume required thickness in the dry is 30 inches for high turbulent flow criteria).

200 pound placement rate is 5 T/sq/pass (assume required thickness in the dry is 16 inches for low turbulent flow criteria).

Alternative 3:

The depth of water over the geotextile is based on the puncture strength of the geotextile being a minimum of 0.61 kN 140 pounds and the impact energy of 1.74 kN 400 pounds top size riprap being placed without a layer of filter stone or sand cushion layer.

**************************************************************************

When riprap [with a maximum size of 180 kg 400 pounds] is placed under water onto geotextile it may be dropped from the water surface if the water depth over the geotextile is greater than 1.5 m 5 feet. Place riprap in the wet evenly at a rate of [_____] tons per square (9.3 m²) tons per square (100 square feet) per pass for M[_____] R[_____] riprap and [_____] tons per square (9.3 m²) tons per square (100 square feet) per pass for M[_____] R[_____] riprap. Prior to starting work, submit the proposed method of placing riprap under water. Riprap to be placed in the wet must be done during periods of low water levels during the months of June through November. Place riprap in two passes, with the second pass
perpendicular to the first pass. The total quantity of [M_____] [R_____] riprap placed in two passes must be [_____] tons per square and the total quantity of [M_____] [R_____] riprap placed in two passes must be [_____] tons per square.

][3.6  PLACEMENT OF GROUTED RIPRAP

3.6.1  General

Place riprap on the [filter] [and] [bedding] material specified in paragraph(s) [FILTER MATERIAL] [and] [BEDDING MATERIAL] within the limits shown. [Install pressure relief holes every 3 m 10 feet and formed by 75-mm 3-inch] diameter pipe. Install the end(s) of the pipe into the [bedding][filter] layer so that it will not become clogged with grout. Use perforated or slotted cap end(s) of the pipe buried in the [bedding][filter] layer. Exercise necessary care to prevent grout from entering the weep holes.]

3.6.2  Placement

**************************************************************************

NOTE: Placement of grouted riprap must be placed in the dry on filter layers or bedding layer.

Tolerances of +150 mm +6 inches for riprap up to 300 kg 650 pounds and a tolerance of +300 mm +12 inches for large riprap.

Add bottom hinged tailgates to dump trucks used in placing the riprap if larger than 180-kg 400-pound riprap is specified.

**************************************************************************

[Place riprap in a manner which will produce a well-graded mass of rock with the minimum practicable percentage of voids, and construct, within the specified tolerance, to the lines and grades either shown on the contract drawings or staked in the field. A tolerance of not less than plus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the riprap except ensure that the extreme of this tolerance is not continuous over an area greater than 18 m² 200 square feet. The average deviation from the lines on the drawing for the entire job must have no more than 50 percent of the tolerances specified above. Place riprap to its full course thickness in one operation and in such manner as to avoid displacing the [filter] [bedding] material. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material in such a manner as to ensure a relatively homogenous mass. Distribute large stones well and grade the entire mass of stones in their final position to conform to the gradation specified in paragraph RIPRAP, subparagraph GENERAL. Ensure the finished riprap is free from objectionable pockets of small stones and clusters of larger stones. Placing riprap in layers is prohibited. Placing riprap by dumping it into chutes, or by similar methods likely to cause segregation of the various sizes, is prohibited. Placing riprap by dumping it at the top of the slope and pushing it down the slope is prohibited. Do not operate equipment directly on the completed stone protection system. Obtain the desired distribution of the various sizes of stones throughout the mass by selective loading of the material at the quarry or other source; by controlled dumping of successive loads during final placing; or by other
methods of placement which will produce the specified results. Each truckload is representative of the gradation requirements. [Equip all dump trucks used in placing the riprap with bottom hinged tailgates. Arrange the gate releasing mechanism so that it may be operated only from, at, or near the front of the truck.] Rearrange individual stones to the extent necessary to obtain a well-graded distribution of stone sizes as specified above. [Unless otherwise authorized by the Contracting Officer, place riprap in conjunction with the construction of the embankment and with only sufficient lag in construction of the stone protection as may be necessary to prevent mixing of embankment and stone protection materials.] Maintain the stone protection until accepted by the Government; replace any material displaced prior to acceptance due to the Contractor's negligence at no additional cost, and to the lines and grades shown on the contract drawings.]

3.6.3 Grouting of Riprap

Place grout as specified in paragraph PRODUCING, CONVEYING AND PLACING GROUT.

3.7 [PLACEMENT OF RIPRAP PAVING STONE]

3.7.1 General

Place riprap paving on the [filter] [and ] [bedding] material specified in paragraph(s) [FILTER MATERIAL] [and ] [BEDDING MATERIAL] within the limits shown.

3.7.2 Placement

Place riprap paving stone carefully, by hand or machine, resulting in a compact paving to the lines and grades either shown on the drawings or staked in the field. Place the stone in a single layer with the dimensions of the stones corresponding to the thickness of the paving laid normal to the plane of the slope. Select adjacent stones for size and shape and lay in such close contact as to produce a reasonable minimum of voids. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material in such a manner as to ensure a relatively homogenous mass. Place the stones in roughly coursed array with courses running horizontally and breaking joints with the preceding course as far as practicable. Double-decking of the flat stones to obtain the required depth of paving is prohibited. Fill spaces between the stones in the face of the paving with tightly driven spalls and tamp the paving if necessary to produce a compact mass and an adequately even surface. A tolerance of plus or minus [_____] mm inch(es) from the slope lines and grades shown will be allowed in the finished surface of the riprap paving, except ensure that the extreme of this tolerance is not continuous over an area greater than 18 m² 200 square feet.

3.8 [PLACEMENT OF HAND-PLACED RIPRAP]

3.8.1 General

Place hand-placed riprap on the [filter] [and ] [bedding] material specified in paragraph(s) [FILTER MATERIAL] [and ] [BEDDING MATERIAL] within the limits shown. Stone must conform to the requirements of [paragraph RIPRAP][Part 2 of this Section]. Except for spalls for wedging, stone must be roughly rectangular in shape of which the least dimension must be no less than one-third the length.
3.8.2 Placement

Carefully place riprap by hand in such a manner that adjacent stones are in close contact and, in general, have their greatest dimensions across the slope. Place "through stones" well-distributed throughout the mass and the sum of their cross sections, parallel to the slope being protected, and covering not less than than two-thirds of such area. As used in this specification a "through stone" is defined as a stone with dimension normal to the surface being riprapped is not less than the full depth of the riprap. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material in such a manner as to ensure a relatively homogenous mass. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material on the slope immediately adjacent to previously placed material in such a manner to ensure a relatively homogenous mass. The riprap along the lower edge of an area must consist of the largest stones set in a trench so as to form a band. Except for spalls used to fill voids between larger stone, do not use stone in the exposed face of the riprap which will extend less than one-half the thickness of the riprap. Fill spaces between the larger stones with spalls and smaller stones of the largest feasible size to form a compact mass. Do not place spalls and small stone in nests in lieu of larger size stone. A tolerance of plus or minus [_____] mm inch(es) from the slope lines and grades shown will be allowed in the finished surface of the riprap paving, except ensure that the extreme of this tolerance is not continuous over an area greater than 18 m² 200 square feet.

3.9 [PLACEMENT OF GROUTED HAND-PLACED RIPRAP]

3.9.1 General

Place hand-placed riprap on the [filter][ and ][bedding] material specified in paragraph(s) [FILTER MATERIAL][ and ][BEDDING MATERIAL] within the limits shown. Stone must conform to the requirements of paragraph RIPRAP. Except for spalls for wedging, stone must be roughly rectangular in shape of which the least dimension must be no less than one-third the length.

3.9.2 Placement

Carefully place the riprap paving to form a layer [_____] mm inch(es) in thickness. Place the riprap in conformance with the general requirements of paragraph PLACEMENT OF HAND-PLACED RIPRAP, except lay the stone with open joints to facilitate grouting and do not fill the smaller spaces between stones in the face of the paving with spalls but leave open to receive grout readily. [Install pressure relief holes every 3 m 10 feet and form by 75-mm 3-inch diameter pipe. Install the end(s) of the pipe into the [bedding][filter] layer so that it will not become clogged with grout. Use slotted or perforated caps on the end(s) of the pipe, which is buried in the [bedding][filter] layer. Exercise necessary care to prevent grout from entering the weep holes.]

3.9.3 Grouting of Hand-Placed Riprap

Place grout as specified in paragraph PRODUCING, CONVEYING AND PLACING GROUT.
3.10 [PLACEMENT OF GROUTED RIPRAP PAVING]

3.10.1 General

Place riprap paving on the [filter] and [bedding] material specified in paragraph [FILTER MATERIAL] and [BEDDING MATERIAL] within the limits shown. Stone must conform to the requirements of paragraph RIPRAP PAVING.

3.10.2 Placement

Carefully place riprap paving to form a layer [_____] mm inch(es) in thickness. Place riprap in conformance with the general requirements of paragraph PLACEMENT OF RIPRAP PAVING except place the stone with open joints to facilitate grouting. Do not fill the smaller spaces between stones. Filling joints with spalls is prohibited in this case. Leave open space to receive grout readily. [Install pressure relief holes every 3 m 10 feet and form by 75-mm 3-inch diameter pipe. Install the end(s) of the pipe into the [bedding] [filter] layer so that it will not become clogged with grout. Cap the end(s) of the pipe which is buried in the [bedding] [filter] layer and perforate with holes or slots. Take care to prevent grout from entering the weep holes.]

3.10.3 Grouting of Riprap Paving

Place grout as specified in paragraph PRODUCING, CONVEYING AND PLACING GROUT.

3.11 [PLACEMENT OF [DERRICK STONE] [AND] [CAPSTONE]]

******************************************************************************
* NOTE: The tolerance for the riprap layer may have to be tightened in paragraph PLACEMENT OF RIPRAP to meet tolerance required for this layer.  
******************************************************************************

3.11.1 General

Place [derrick stone] [and] [capstone] carefully with equipment suitable for handling the stone of the size(s) specified on a [_____] mm inch(es) thick layer of [M40] [M____] [R90] [R____] riprap specified in paragraph PLACEMENT OF RIPRAP.

3.11.2 Placement

Place the various sizes of [derrick stone] [and] [capstone] in such a manner as to produce a compact, uniform, well-graded mass [within the limits shown on the contract drawings.] [to the lines and grades indicated on the contract drawings and staked in the field.] Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material in such a manner as to ensure a relatively homogenous mass. Select adjacent stone with reasonable care as to size and shape and place in close contact, the smaller stones filling the spaces between the larger ones so as to leave a reasonable minimum of voids. Distribute "through stones" well throughout the mass, and ensure the sum of their cross sections parallel to the surface being protected is no less than 70 percent of such area. As used herein, a "through stone" is defined as a stone whose dimension normal to the surface being protected is not less than the full depth of the protection. A tolerance of no less than plus [_____] mm inch(es) from the slope lines and
grades shown on the contract drawings will be allowed in the finished surface of the stone except ensure the extreme of deviation from lines and grades is not continuous over an area greater than 18 m\(^2\) or 200 square feet. The average deviation from lines and grades of the entire job must have no more than 50 percent of the tolerances specified above. Maintain the stone until accepted by the Government; replace to the lines and grades shown on the contract drawings any material displaced prior to acceptance at no additional cost to the Government.

3.12 GROUTING OF STONE PROTECTION

Place grout as specified in paragraph PRODUCING, CONVEYING AND PLACING OF GROUT.

3.12.1 Producing, Conveying and Placing of Grout

3.12.1.1 Producing Grout

Use batching and mixing equipment with provide sufficient capacity to prevent cold joints. Stockpile materials and utilize batching methods that prevent segregation or contamination of aggregates and insure accurate proportioning of the ingredients of the mixture. Follow applicable portions of ASTM C476 requiring clean a potable water. Mixing in additional water in excess of the amount required by the job mix to the grout mixture during mixing, hauling, or after arrival at the delivery point[, except as required and approved] is prohibited.

a. **Ready-Mixed Concrete Grout** must conform to ASTM C94/C94M except as otherwise specified.

b. **Volumetric Batching and Continuous Mixing** must conform to ASTM C685/C685M.

c. **Onsite Batching and Mixing.** The Contractor has the option of using an onsite batching and mixing facility. The facility must provide sufficient capacity to prevent cold joints and be able to batch the cement and aggregate by weight, and the water and admixtures by weight or volume. The method of measuring materials, the batching operation, and the mixer must be approved in accordance with paragraph SUBMITTALS. On-site plant must conform to the requirements of either ASTM C94/C94M or ASTM C685/C685M.

3.12.1.2 Preparation for Placing

[Take adequate precautions to prevent grout from penetrating the upper filter layer. ]Flush the rock with water to remove the fines from the rock prior to placing the grout. Keep the rock moist just ahead of the actual placing, but keep free of flowing or standing water during the grout operation. Remove any snow and ice. Ensure all equipment needed to place, protect, and cure the grout is at the placement site and in good operating condition. The entire preparation must be accepted by the Contracting Office prior to placing the grout.

3.12.1.3 Conveying and Placing

Grout placement will not be permitted when weather conditions prevent proper placement, except upon approval. Submit the methods and equipment for transporting, handling, depositing, and consolidating the grout prior to first grout placement. Do not place the grout mixture until the stone
protection has been inspected and approved. Ensure grout is in place within 15 minutes after discharge from the mixer. Do not drop grout more than 1.5 m 5 feet vertically unless suitable equipment is used to prevent segregation.

a. Conveying

When the grout is mixed [and] [or] transported by a truck mixer, deliver the grout to the site of the work and complete discharge within 1-1/2 hours after introduction of the cement to the aggregate and water. When the air temperature is 29 degrees C 85 degrees F or greater) or under conditions contributing to quick stiffening of the grout, the time between the introduction of the cement and discharge of the grout must not exceed 45 minutes. The Contracting Officer may allow a longer time, provided the setting time of the grout is increased a corresponding amount by the addition of an approved set-retarding admixture. Deposit grout as close as possible to its final position by methods that will prevent segregation of the aggregates or loss of mortar.

b. Placing

Keep the riprap moist just ahead of the actual grout placement, but free of standing or flowing water when placing grout. Grout placed on inverts or other nearly level areas may be placed in one course. On slopes, place the grout in two (2) courses in successive lateral strips approximately 3 m 10 feet in width starting at the toe of the slope and progressing to the top. Deliver the grout to the place of final deposit and discharge directly on the surface of the riprap, using a splash plate of metal or wood to prevent displacement of the rock directly under the discharge. Direct the flow of grout with brooms, spades or baffles to prevent it from flowing excessively along the same path and to assure that all intermittent spaces are filled. Perform sufficient barring to loosen tight pockets of riprap and otherwise aid the penetration of grout so that all voids are filled and the grout fully penetrates the riprap [as specified][from the base of the riprap layer to at least two-thirds of the thickness of the stone layer]. Ensure all brooming on slopes is uphill and after the grout has stiffened, rebroom the entire surface to eliminate runs, to fill voids caused by sloughing, and to remove grout from the top surface and pockets or depressions of the upper stones.

3.12.1.4 Cold-Weather Requirements

Do not place grout when the ambient temperature is below 2 degrees C 35 degrees F, nor if the ambient temperature is below 5 degrees C 40 degrees F and falling. Provide suitable covering and other means, as approved, for maintaining the grout at a temperature of at least 10 degrees C 50 degrees F for no less than 72 hours after placing and at a temperature above freezing for the remainder of the curing period. When freezing conditions prevail, riprap to be grouted must be covered and heated to a range of 5 to 16 degrees C 40 to 60 degrees F for at least 24 hours prior to placing the grout. Mixing salt, chemicals, or other foreign materials with the grout to prevent freezing is prohibited. Remove and replace any grout damaged by freezing at the expense of the Contractor.

3.12.1.5 Hot Weather Requirements

When the rate of evaporation of surface moisture, as determined by use of
Figure 2.1.5 of ACI 305R, is expected to exceed 100 g/m² 0.2 pounds per square foot per hour, provide windbreaks, shading, fog spraying, or wet covering with a light-colored material in advance of placement, and deploy protective measures as quickly as finishing operations will allow.

3.12.2 Curing and Protection of Grouted Stone Protection

Beginning immediately after placement and continuing for at least 7 days, cure all grout and protect from premature drying, extremes in temperature, rapid temperature change, freezing, mechanical damage, and exposure to rain or flowing water. Make all materials and equipment needed for adequate curing and protection available and at the site of the placement prior to the start of grout placement. After completion of any strip or panel, no workman or other load is permitted on the grouted surface for a period of twenty-four (24) hours. Keep exposed surfaces continuously moist for the entire curing period, or until curing compound is applied. Preserve moisture for grout surfaces by one of the following methods:

a. Continuous sprinkling and ponding.
b. Application of absorptive mats or fabrics kept continuously wet.
c. Application of sand kept continuously wet.
d. Application of impervious sheet material conforming to ASTM C171.
e. Application of membrane-forming curing compound conforming to ASTM C309.

Spray the compound on the moist surface as soon as free water has disappeared, but do not apply to any surface until finishing of that surface is completed. Apply at a uniform rate of not less than 300 ml/m² (1 gallon per 150 square feet) of surface and form a continuous adherent membrane over entire surface to be cured. Curing compound on surfaces requiring bond to subsequently placed grout is prohibited. If the membrane is damaged during the curing period, reapply compound to damaged area at the rate of application specified above.

3.13 TRENCHFILL REVETMENT, BANK PAVING, AND OUTLET DRAINS

3.13.1 Trenchfill Revetment

Stone for the trenchfill must be Graded Stone "A" ["B"] ["C"] [[_____] -kg [[_____] -Pound] Stone and must be back-dumped from the dump trucks, placed by skip, clamshell, or other approved method directly in the trench excavated at the toe of the graded revetment slope. Do not place stone more than 300 m 1,000 feet in advance of the completed trenchfill section, including upper bank paving, unless otherwise permitted by the Contracting Officer. Construct the trenchfill to the elevations and cross sections shown on the drawings. A tolerance of [150] [_____] mm [6] [_____] inches above or below the lines and grades of final excavation will be permitted provided the area of the finished section is not less than the area of the theoretical section. Complete placement of the trenchfill prior to placement of the bank paving. Bulldozing of stone from the upper bank into the excavated trench is prohibited.

3.13.2 Bank Paving

Stone bank paving must be Graded Stone "C" [[57] [_____] -kg [125] [_____] -pound stone] [_____] -kg -Pound riprap. Excess stone placed directly in the trench at the toe of the graded revetment slope may be
dragged up the slope a maximum of 3 m 10 feet vertically above the [Average Lower Water Plane (ALWP)] [Lowe Water Datum (LWD)]. The remainder of the upper bank paving stone may be placed in continuous stockpiles at 3 m 10 feet intervals above the [ALWP][LWD] by means of back-dumping from dump trucks or by skip, clamshell, or other approved method, and dragged up the slope a maximum of 3 m 10 feet vertically. The remainder of the upper bank paving stone may also be back-dumped from dump trucks; placed by skip, clamshell, or other approved method; and spread by bulldozing except that pushing stone down the slope will not be permitted and maximum allowed drop heights are not to be exceeded. Place the stone in such a manner to achieve a minimum of segregation of sizes in the in-place upper bank paving stone, with uniform gradation from the bottom of the slope to the top elevation of the stone as indicated on the drawings. Prior to placing the stone, bring graded slopes to final grade and dress to conform to the limits specified in Section 31 00 00 EARTHWORK and to the lines and grades in the contract drawings. A tolerance of 75 mm 3 inches above and below the specified bank paving thickness will be allowed provided the area of the finished section is not less than the area of the theoretical section. To prevent overtopping of the paved portion of the slope by rising river stages, place bank paving in strips parallel to the water’s edge when directed by the Contracting Officer. Repair any damage to the graded bank or paving occasioned by such overtopping of the paving because of failure to keep paving operations above the water surface.

3.13.3 Outlet Drains

Where required, construct standard outlet drains or special drainage ditches. A tolerance of 150 mm 6 inches above or below the lines and grades will be permitted provided the area of the finished section is not less than the area of the theoretical section. Place Graded Stone "C" [[_____] -kg -Pound stone] [[_____] -kg -pound riprap] for all outlet drain paving to provide a minimum of segregation of sizes in the in-place materials. Place a layer of 150-mm 6-inch thick bedding stone under the Graded Stone "C" [[_____] -kg -pound stone] [[_____] -kg -pound riprap] in the manner and at the locations shown on the drawings. A thickness tolerance of plus 25 mm 1 inch for the 150-mm 6-inch thick bedding material will be allowed. Where the outlet drains must be constructed in silts or silty sands, place a 150-mm 6-inch layer of bedding sand beneath the bedding stone. The bedding sand must meet the quality and gradation requirements as specified in paragraph BEDDING MATERIALS.

3.13.4 Toe Trench Revetment

Construct toe trench revetment, when so ordered on the construction schedule, at locations where the existing bank or riverbed at the structure azimuth line is 3 m 10 feet or less below [Average Low Water Plane (ALWP)] [____]. The Toe Trench Revetment must consist of stone placed along the toe of the bank excavated as specified in [Section 31 00 00 EARTHWORK] [____] and on the graded slope of the upper bank as applicable. Provide two types of Toe Trench Revetment as shown on the contract drawings for the following conditions:

a. Type "A" - For conditions where the top of the graded slope is 2700 mm 9 feet or more above [Average Low Water Plane (ALWP)] [LWD] [____].

b. Type "B" - For conditions where the top of the graded slope is less than 2700 mm 9 feet above [Average Low Water Plane (ALWP)][LWD] [____].
3.13.4.1 Trench Fill

Place a fill consisting of stone along the excavated toe of the bank to the elevation and cross section designated on the contract drawings for both types of toe trench revetment. Ensure fill consists of no less than 27 tons 9 tons nor more than 41 tons 14 tons of stone per meter linear foot of fill, unless otherwise specified on the construction schedule. A dozer to move stone from the upper bank into the trench is prohibited.

3.13.4.2 Upper Slope Fill

For Type "A" revetment, place a fill consisting of stone on the graded slope to a minimum depth normal to the slope of 250 mm 10 inches at the top of the slope and increasing uniformly to a minimum depth of 375 mm 15 inches where it abuts the trench fill. Arrange the upper slope fill uniformly with the larger stone at the bottom of the slope and the small stone at the top and do not exceed 0.7 t/m² 7 T per 100 square foot of upper slope fill. Rearrange the upper slope fill stone as necessary to conform to these specifications. The use of a dozer in placing the upper slope fill is prohibited.

3.13.4.3 Crown Fill

For Type "B" revetment, place a fill consisting of stone, abutting the trench fill, to the elevation and crown width specified on the construction schedule and drawings. The crown fill must have a riverward side slope of 1V on 3H, a landward side slope of 1V on 2H, and a minimum thickness of 375 mm 15 inches as shown on the contract drawings.

3.13.4.4 Juncture With Other Types of Revetment

Where toe trench revetment joins an existing structure and the alignment and riverward slopes of the stone fills in the structures are not the same, construct a transition by gradually adjusting the alignment and slope of the toe trench revetment over a distance of approximately 30 m 100 feet so that it conforms to the alignment and slope of the existing stone fill at the junction of the structures. Construct the transition in a workmanlike manner and as directed by the Contracting Officer.

3.13.4.5 Intermittent Repair of the Trench Fill and Upper Slope Area of Revetment

Intermittent repair consists of stone placed along the trench fill and/or upper slope area of the revetment to the elevation and cross section designated on the drawings for trench fill or upper slope, and is ordered on the construction schedule. When specified by the Contracting Officer, adjustment in the line and grade may be authorized to accomplish necessary repairs to conform to alignment and grade of undamaged sections. Do not perform trench fill repair when the river stage exceeds [Average Low Water Plane (ALWP)] [LWD] [_____] and do not perform upper slope repair when the river stage exceeds 1.5 m 5 feet above [ALWP] [LWD][______], unless otherwise directed by the Contracting Officer.

3.13.5 Stone Fill Revetment

Construct stone fill revetment, when so ordered on the construction schedule, that consists of a stone fill placed as specified in [Section 31 00 00 EARTHWORK] [______]. If required to obtain proper placement of material, the Contractor has the option of using either mooring piles,
anchors, spud barges, or other suitable methods approved by the Contracting Office to obtain the proper configuration and alignment while placing stone.

3.13.5.1 Stone Fill

Place a fill consisting of stone along the structure azimuth line to a cross-section as shown on the contract drawings and to such elevation and crown width as specified on the construction schedule. The [riverward][lakeward][inboard] slope must be [1V on 1.5H][ ] and must intersect the structure azimuth line 900 mm 3 feet below [ALWP][LWD] [_____] unless otherwise specified; minor irregularities must be approved by the Contracting Officer. Place the stone in lifts of such height and length as the Contracting Officer considers necessary to prevent or reduce scour ahead of the fill.

3.13.5.2 Juncture With Other Types of Revetment

Where stone fill revetment joins and existing structure and the alignment and riverward slope of the stone fills in the structures are not the same, construct a transition by gradually adjusting alignment and slope of the stone fill revetment over a slope of the existing stone fill at the junction of the structures. Construct the transition in a workmanlike manner and as directed by the Contracting Officer.

3.14 STONE REVETMENT, STONEFILL DIKES, STONEROOTS, AND JUNCTIONS

3.14.1 Excavation and Grading

Where required for bank protection, excavate and grade the existing ground at the proposed structures to provide a foundation for the complete placement of stone. Perform excavation and grading in accordance with Section 31 00 00 EARTHWORK.

3.14.2 Construction Method

Construct the stonefill revetment and dikes of [Graded Stone ["A"] ["B"] ["C"])] to the lines, grades, and sections shown or as noted on the drawings. Commence construction of the stonefill revetments and stonefill dikes at the upstream end and continue progressively to the downstream end. The initial work consists of a stone blanket approximately 600 mm 2 feet thick and extending over the full width and length of the revetment or dike. If stone is placed by land based equipment, this stone blanket is not unless directed by the Contracting Officer. Place the remaining stone required to complete the underwater portion of the revetment or dike from the shoreward to the [riverward] [lakeward] end of the revetment or dike in approximately uniform layers not exceeding 1.5 m 5 feet in thickness and extending over the full width and length of the revetment or dike. The portion of the revetment or dike above the water may be placed in one lift.

3.14.3 Placement

Place stone in the revetment and dikes by skip or clamshell, cast off barges by hand or machine, or by other methods approved by the Contracting Officer. Distribute the larger stone well throughout the mass, and ensure the finished revetment or dike is free from pockets of small stone and clusters of larger stone. A tolerance of plus or minus 300 mm 1 foot will be allowed on the prescribed crown elevation and width. Determine the side slopes by the natural angle of repose of the stone, varying from 1V on 1.25H to 1V on 2H.
3.14.4 Stoneroots

Place stoneroots consisting of [Graded Stone "A" | "B" | "C" | [_____] -kg -pound stone] ([_____] -kg -pound riprap) in the excavated trench as specified in paragraph PLACEMENT and as shown on the drawings.

3.14.5 Junctions

Construct junctions consisting of [Graded Stone "A" | "B" | "C" | [_____] -kg -pound stone] ([_____] -kg -pound riprap]. The 60 m 200 feet trenchfill revetment wraparound portion of the junction must consist of Graded Stone "B".

3.15 CAPOUT AND REINFORCEMENT

The work covered by this section consists of furnishing all plant, labor and stone, and performing all work necessary in placing the stone for the revetments and dikes capouts, and reinforcement, complete, all as specified herein and shown on the drawings. Ensure stone is Graded Stone "B".

3.15.1 Debris Removal

Remove debris from the structures to allow for the placement of the stone in the capout and reinforcement to the extent directed by the Contracting Officer. There will be no measurement nor payment for the debris removal and all costs will be considered incidental to the contract. Dispose of debris [landward of the existing structures] [_____] so as not to interfere with placement of capouts and reinforcement.

3.15.2 Construction Method

Construct capouts and reinforcement of Graded Stone "B" at the lines, grades and sections shown or as noted on the drawings. Commence construction at the upstream end of each structure or portion thereof and continue progressively to the downstream end. Place stone required to complete the underwater portion of the capouts and reinforcement from the upstream to the downstream end of the revetments and landward end to the riverward end of the dikes in approximately uniform layers not exceeding [1.5][_____] m [5]feet[_____] in thickness and extending over the full width and length of the revetment. The portion of the revetments or dikes above the water may be placed in one lift. Where reinforcement is required to be placed below water, place the stone from barges or by other approved methods to provide a close compact paving with a required thickness of [600][_____] mm [2][_____] feet. Ensure that the stone placement methods for placement of stone between Structural Azimuth Line (SAL) stations [_____] to [_____] will not result in damages to the "sensitive historic site." Prior to the start of work submit, for approval, the proposed method or methods for placing stone underwater.

3.15.3 Placement

Place stone in the capouts and reinforcement by skip, clamshell, cast off barges by hand or machine, or by other methods approved by the Contracting Officer. Distribute the larger stone well throughout the mass and ensure the finish revetment is free from pockets of small stone and clusters of larger stone. A tolerance of plus or minus [150][_____] mm [6][_____] inches will be allowed for reinforcement and a tolerance of plus or minus [300][_____] mm [1][_____] foot will be allowed for capouts on the
prescribed crown elevation and width provided the area of the finished section is not less than the area of the theoretical section. Ensure the allowable tolerances from the prescribed theoretical cross section are not continuous for more than \([60][_____] \text{ m} \ [200][_____] \text{ linear foot}\) of revetment and/or dike. When completed, abrupt changes in the revetment and/or dike crown widths and elevations are not permitted. The side slopes may be determined by the natural angle of repose of the stone, varying from 1V on 1.25H to 1V on 2H.

3.16 STONE DIKE

3.16.1 Dike Stone Placement

Construct diked to the elevations, cross sections, and minimum thicknesses and within the limits shown on the contract drawings. Determine side slopes by the angle of repose of the stone, approximately 1V on 1.25H. Construct dikes of Graded Stone "A" as specified in paragraph GRADED STONE "A". Place stone in the dikes in such a manner as to produce a well-graded mass of stone with the minimum practicable percentage of voids. A tolerance of 300 mm 1 foot will be allowed in the specified elevation, and 300 mm 1 foot under and 600 mm 2 feet over in the specified crown width provided these variations are gradual over a minimum distance of 30 m 100 feet measured along the dikes centerlines. The stone may be placed by either backhoe or dragline equipped with rock bucket; by [either bulldozer or ]front-end loader or bulldozer, except when placing the base blanket subaqueously; and by trucks and other methods, if approved by the Contracting Officer. Add additional stone if either soundings or sections indicate such to be necessary to attain required lines and grades. Arrange large stones throughout the mass distributed and finished sodikes are free from pockets of small stones and clusters of large stones. Buldozing stone into excavated trenches is prohibited. Subaqueous placement of stone is prohibited at river stage limitations specified in [Section [_____] [_____] paragraph [RIVER STAGE LIMITATIONS], without prior approval, in writing, by the Contracting Officer or at any river stage when site and current conditions prevail which, in the opinion of the Contracting Officer, make construction operations either impractical or uneconomical.

3.16.2 Placement Control

Furnish, operate, maintain necessary equipment, and furnish all necessary material and supplies while maintaining control of the placement of stone in the dikes. At all times when stone placement from floating plant is underway, the means by which the Contractor positions the plant, equipment, and stone supply barges must function accurately and consistently. The plant and equipment must have a dragline or backhoe capable of being mobile on the spud barge and the flexibility to perform stone placement by the drag-off method. Do not use the kick-off method for stone placement unless approved by the Contracting Officer. Whatever the method employed, it must readily permit the Contractor and the Government inspector to determine the exact position of the stone-placing operation. Do not not place anchors for the purpose of holding floating plant in place over existing or partially completed dikes.

3.16.2.1 Alignment Control

The method of alignment control must be either a manned transit or laser or colored or polarized light beams, or any other method demonstrated to be practicable and sufficiently precise and reliable as approved by the Contracting Officer.
3.16.2.2 Distance Control

The method of distance control for floating plant engaged in the subaqueous placement of stone must be either wire distance wheel or another equally accurate measuring device as approved by the Contracting Officer.

3.16.2.3 Depth Finder

Provide an electronic recording depth finder, approved by the Contracting Officer, in writing, during the construction of the dikes. Provide depth finder with a recording scroll no less than 150 mm 6 inches wide with a scale of not more than 3 m of depth to 25 mm 10 feet of depth to the inch. Ensure the depth finder is capable of obtaining accurate profiles and cross-sections during construction of the dikes and use it to monitor anticipated and actual scour and as an aid in the control of stone placement. Furnish and maintain an adequate stock of recording paper for the depth finder.

3.16.2.4 Nonpermitted Devices

The use of buoys and piles of stone placed above the water surface as placement control devices will not be permitted. The use of bank targets for alignment control will not be permitted for work distances of more than 120 m 400 feet without prior approval, in writing, by the Contracting Officer.

3.16.2.5 Skiff or Boat

Furnish an aluminum skiff or boat with a minimum length of 5.5 m 18 feet and equipped with a 38 kW 50 hp outboard motor.

3.16.3 Longitudinal Stone Dike Placement

**************************************************************************
NOTE: For use with stone under 180 kg 400 pounds top size.
**************************************************************************

Place stone in the longitudinal peaked stone dikes, stone tiebacks and transverse stone dikes by skip, grapple, hand, or other approved method, in such a manner as to produce a well graded mass or stone with the minimum practicable percentage of voids. Do not drop stone from a height greater than 900 mm 3 feet. A variation of 300 mm 1 foot above or 150 mm 6 inches below the specified deviation and 150 mm 6 inches under or 300 mm 1 foot over the specified crown width will be allowed provided these variations are gradual over a minimum distance of 3 m 10 feet measured along the dike's centerline. Bulldozing stone into excavated trenches will not be permitted. Store stone delivered on-site as specified in paragraph STONE.

3.17 CORRECTIVE EARTHWORK

3.17.1 Grading

Grading consists of the sloping of bluff banks damaged by failures in the bank paving and the preparation of the subgrade for placement of new paving; reshaping of damaged drains and constructing new drains; reshaping of overbank areas; and any incidental work as may be required in the prosecution of the work. Most of the grading will be in areas where
mechanical equipment can be used, but some hand grading will be required. Use material resulting from grading operations, including broken pavement, if any, for making fills where required, including the restoration of deficient slopes. Perform all grading and filling to the lines and grades as staked in the field or as specified. Roots, trees, brush, roots, trash and organic materials are prohibited for use in fills. Restored subgrade must be free from roots, brush or other debris; and placed in layers not to exceed 300 mm (1 foot) in thickness. Thoroughly compact each layer to a density at least equal to that of the adjacent undisturbed earth. If environmentally approved, spread excess clean fill material on the adjacent slopes.

3.17.2 Excavation in Failure Areas

Perform excavation in failures where protrusion of stone above adjacent surface is objectionable. Where specified, excavate subgrades 250 to 300 mm 10 to 12 inches below the surface of the adjacent paving. Large areas may not require excavating throughout, but excavation to the depths specified above will be required only for a distance of 1.5 m 5 feet inside the perimeter of the failure. Most of the excavation can be accomplished by mechanical means, but some hand work around the edges will be required. Perform all excavation to the lines and grades as staked in the field or as specified. Use material resulting from the operation for making fills where required as specified in paragraph GRADING. Excess material may be wasted or spread on the adjacent slopes.

3.18 BREAKING OUT PAVEMENT

The work consists of the breaking out of concrete or asphalt pavement in damaged or undermined areas of pavement. The concrete pavement is approximately [100][_____] mm [4][_____] inches in thickness, and the asphalt pavement is approximately [125][_____] mm [5][_____] inches in thickness. The area of pavement to be broken out will be marked by the Contracting Officer prior to the start of work. Any additional areas to be broken out adjacent thereto will be marked as required as the work progresses. Repair or replace any pavement outside the limits marked to be broken out that is damaged by the Contractor's operations at no additional cost to the Government. The breaking out may be done by any approved method which will accomplish the results desired and will not damage paving outside the limits marked. [Blasting is prohibited.]

3.18.1 Concrete Breakout

Break up damaged or undetermined monolithic, articulated or slab concrete into pieces not exceeding 450 mm 18 inches in any dimension. Leave the pieces on the subgrade where broken. In areas where grading may be required, break out the concrete to the extent necessary to permit grading the bank to slopes suitable for paving and the broken concrete used in making fills adjacent to the breakout. Using broken concrete for riprap or armor stone is prohibited.

3.18.2 Asphalt Breakout

Generally, asphalt breakout will be limited to areas requiring grading of the bank to slopes suitable for paving. Use the broken asphalt to the extent possible in making fills adjacent to the breakout. When broken asphalt is used in making fills, the pieces must not exceed 450 mm 18 inches in any dimension. Spread out the broken asphalt that is not used for fill sufficiently to avoid abrupt humps on the adjacent paving. In areas where
asphalt is damaged and grading of bank is not required, stone may be placed on top of the broken or damaged asphalt to the extent necessary to cover the damaged area.

3.18.3 Removal of Drift and Clearing

Remove accumulations of drift from the areas to be repaired. Clearing will not generally be necessary; however, cut off any trees, stumps or brush in the areas where repair work is prescribed flush with the ground or to an elevation 300 mm 1 foot below the top of the fill, and remove from the area. Dispose of debris as specified in [Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL][ and ][Section 31 11 00 CLEARING AND GRUBBING].

3.18.4 Preparation of Subgrade

In areas where grading or excavation is required, dress the subgrade to a uniform surface suitable for paving. In other areas where crushed stone or [riprap][stone] is specified, dress the subgrade as necessary to provide an even surface for paving or to provide for a suitable tie to the existing paving.

3.19 STONE WORK

Use bedding stone, [_____] -kg -pound [riprap] [stone][, and/or] [Graded Stone ["A"] ["B"] ["C"]] to repair failure areas in existing paving or to protect the upstream, downstream, and landward areas adjacent to an existing paved bank; for constructing or repairing drains; for making stone fills, both above and below the water surface; and for constructing overbank spurs. Place stone on the bank or overbank area by crane or dragline equipped with skip, grapple, clamshell, or rock bucket; by front-end loader[ or bulldozer]; or by trucks or other methods approved by the Contracting Officer. Unless otherwise approved by the Contracting Officer, the maximum capacity of dragline buckets used to place [riprap] [stone] paving on the bank will be limited to 2.3 cubic meters 3 cubic yards.

3.19.1 Placement

It is contemplated that the quantities required will be in increments of a barge load of approximately [_____] [1000] tons (metric) [_____] [1,000] tons for placement at a single revetment. When less than [_____] [10 000] tons (metric) [_____] [10,000] tons of [Graded Stone ["A"] ["B"] ["C"]] [_____] is specified at a single revetment, consider the stone "Graded Stone "A", Small Repairs" for payment purposes. When [_____][10 000] tons (metric) [_____] [10,000] tons or more of Graded Stone "A" is specified at a single revetment, consider the stone "Graded Stone ["A"] ["B"] ["C"] [_____], Large Repairs" for payment purposes.

3.19.1.1 Bedding Material

Bedding stone may be required for use under [riprap] [stone] paving or to fill scoured areas or depressions in the subgrade, or as a blanket in the construction or repair of drains. Bedding stone is normally placed [100] [_____] mm [4] [_____] inches in thickness above the water surface, [150] [_____] mm [6] [_____] inches in drains and in the amount of 1.8 t per square (9.3 m²) [two] [_____] T per square (100 square feet) when placed below the water surface. Place materials above the water must be to the lines and grade specified or as staked in the field; below the water surface, in the amount specified or as directed at the time of placing.
3.19.1.2 [Riprap] [Stone] Paving

**************************************************************************
NOTE: For determining the placement rate for under
water placement, see notes at paragraph PLACEMENT OF
RIPRAP, subparagraph [UNDER WATER].
**************************************************************************

Place [riprap][stone] of the specified maximum size on the dry slope or
overbank areas and rearrange by hand as necessary to provide complete
coverage of the specified area with an average thickness of [250][_____] mm
for [57][_____]-kg [10][_____] inches for [125][_____]-pound
[riprap][stone]. A tolerance of 50 mm 2 inches above or below the average
thickness will be allowed. Openings between stones exposing more than 2600
mm² 4 square inches of the graded slope will not be allowed. Spalls and
quarry chips may be used as a base but not as a filler. Place stone for
underwater portions of the work uniformly distributed at the rate of
[_____] [7.3] tons per square [_____] [8] tons per square unless another rate
is shown or specified. [Riprap] [Stone] may be required for use in
constructing stone fills and making other repairs to revetments. [It is
contemplated that the quantities of [_____] -kg -pound [riprap][stone]
required will be in increments of a barge load of approximately 1000 tons
for placement at one or more nearby locations.]

3.19.1.3 Overbank Paving

[Riprap] [Stone] paving may be required to repair scour damage behind top
bank. Overbank paving will generally consist of a blanket of stone 250 mm
10 inches thick and up to 15 m 50 feet wide placed behind the top bank or
landward of the existing paving. Place overbank paving in accordance with
paragraph [RIPRAP] [Stone] PAVING above or as specified.

3.19.1.4 Stone Fills

Stone fills may be required to be constructed of [_____] -kg -pound
[riprap][stone] or Graded Stone ["A"] ["B"] ["C"] as specified. Place
stone fills specified above the water surface to the lines and grades
specified or as staked in the field. Where specified below the water
surface, the material may be placed by any method elected by the
Contractor, subject to approval by the Contracting Officer.

3.19.1.5 Overbank Stone Spurs

In the repair or prevention of overbank scour, [riprap][ stone] is required
to construct or repair spurs landward of the top of bank at some
locations. Provide spurs consisting of stone fill with variable crown
widths and side slopes, usually tying into the revetment paving and
extending landward at varying angles with the top of bank. Extensions of
existing overbank spurs may also be required. The height of stone spurs
will usually be from 900 to 1800 mm 3 to 6 feet, with maximum heights
depending upon the depth of overbank scour. Generally, work will not
extend beyond 90 m 300 feet landward of the top of the bank, but conditions
at some locations may require construction beyond this limit. The
location, alignment, and dimensions of the overbank spurs are as shown or
as directed. [Riprap] [Stone] that can be placed entirely by the floating
plant will not be considered Overbank Stone Spur.
3.19.1.6 Stone Landward of an Obstruction

Occasionally in the repair of a revetment, stone must be placed on the revetment slope behind or landward of a structure which prevents placement of stone by a barge-mounted dragline or at a revetment location which, in the opinion of the Contracting Officer, is inaccessible by floating plant for other reasons. These repairs may be accomplished by hauling or other means approved by the Contracting Officer.

3.20 SLOPE DRESSING AND [RIPRAP] [STONE] PAVING

3.20.1 Slope Dressing

The work consists of furnishing all plant, labor and materials and performing all work in strict accordance with these specifications, schedules and drawings for construction of [riprap] [stone] paving on the [river banks] [banks of the [_____] River between [_____] and [_____]]. Perform work at several localities which will be selected after the award of the contract and will be designated in the jobsite specifications and "Before Construction" drawings to be issued pursuant to paragraph [____], Section 01 35 13 [SPECIAL CONTRACT REQUIREMENTS] [____]. Perform the work regardless of the number of localities involved. Work may not be required under these specifications at all localities at which mattress sinking operations will be performed; however, work may be required at locations where articulated concrete mattress is not required. The work to be performed normally includes the final preparation of the slopes and procuring and placing the [riprap] [stone] on the graded bank. At some locations, underwater and/or overbank paving may be required. Such locations will be specified in the jobsite specifications or indicated on the "Before Construction" drawings. The Government reserves the right to accomplish all or any portion of the work at any location by other means.

3.20.1.1 General

The bank will be graded, including finish grading, by others. However, preparatory to placing the paving, dress the slope to eliminate any irregularities, including irregularities in the bedding material placed by others, due to rain or wave wash or operations of the Contractor's equipment. Fill irregularities in the ungraveled slope with layers of earth no greater than 300 mm 1 foot in uncompacted thickness and firmly compact into place. If directed by the Contracting Officer, fill irregularities in graveled areas with stone, and payment will be made at the applicable contract unit price for "[Riprap] [Stone] Paving" for stone so placed. Acquire earth fill material from adjacent areas within the limits of the right-of-way. Redress and/or clean out any landside drainage ditch damaged by the operations.

[3.20.1.2 Regrading

Any regrading necessitated by slides in the bank occurring before or during construction of the bank paving will be done by others and will in no way be the responsibility of the Contractor except that evidence of such slides should be reported promptly to the Contracting Officer. Do not place paving on such a disturbed area until the slide has been graded out or otherwise corrected.

]3.20.1.3 Repairs

Repair, with no additional payment, any damage to the graded bank or strip
paving caused by failure to place paving at the rate required by paragraph [_____] of Section 01 35 13 [SPECIAL CONTRACT REQUIREMENTS] [_____]. If strip paving is ordered by the Contracting Officer due to reasons beyond the control of the Contractor and the graded bank or strip paving is damaged by rain wash or overtopping, make the repairs as ordered by the Contracting Officer and an adjustment in the contract price and time of performance as appropriate for that portion of the work will be made in accordance with the Contract Clause, CHANGES.

3.20.2 [Riprap] [Stone] Paving

3.20.2.1 General

[Riprap] [Stone] upper bank paving consists of a course of stone with an average thickness of 250 mm 10 inches, measured normal to the slope, except where other thickness is specified or indicated on the drawings. Cover the surface of the bank between the limits of work as shown on the site plans or surface of the bank between the limits of work as shown on the site plans or as determined by the Quality Assurance Representative in the field. The landward limit of [riprap] [stone] paving may include an overbank strip not exceeding a distance of 15 m 50 feet landward of the top of the bank. The bank to be paved will have been graded by others to a slope that will vary from approximately 1V on 3H to 1V on 5H and any overbank area to be paved will have been dressed by others to a surface suitable for paving. In general, the width of the paving will vary between approximately 15 m 50 feet and 60 m 200 feet slope measurement.

3.20.2.2 Strip Paving

When directed by the Contracting Officer, pave the bank in strips parallel to the water's edge. It is anticipated that strip paving will be required whenever there is more than 600 m 2,000 linear feet of unpaved bank available to the Contractor for paving or whenever rising river stages threaten overtopping of the inshore limit of mattress within that area. In areas where an articulated concrete mattress has been placed, provide strip paving consisting of placing [riprap] [stone] paving in a strip along and parallel to the inshore edge of mattress. Unless otherwise authorized or directed, the strip paving must be 9 m 30 feet wide except it must include complete paving of drains within the area. At locations requiring only stone paving, place the underwater paving along with a strip 9 m 30 feet wide above and parallel to the water's edge and include paving of drains. Once strip paving operations are directed, continue this method of paving as long as required by the Contracting Officer, and conduct at such locations and in such order of precedence as required in order to protect the interest of the Government. If strip paving operations and moving, as required by the Contracting Officer to be performed the most essential work, prevent the Contractor from maintaining the required production rate, an equitable adjustment in contract time will be allowed upon written request and justification. Additional towing required to move between jobs as prioritized by the Contracting Officer and to return to unfinished jobs to complete them will be paid for as provided in Section 01 35 13 [SPECIAL CONTRACT REQUIREMENTS] [_____] , paragraph [PAYMENT FOR EXCESS TOWING] [_____] .

3.20.2.3 Underwater Paving

Where specified in the Plans and Specifications or indicated on the "Before Construction" drawings, place underwater [riprap] [stone] paving on subaqueous areas not covered by articulated concrete mattress. Distribute
the underwater [riprap] [stone] paving uniformly over the area to be paved in the amount of 7.3 tons per square (9.3 m²) 8 tons per square (100 square feet) or such other amount as indicated in the Specifications.

3.20.2.4 Placement

Place the stone on the graded slopes by crane or dragline equipped with skip, grapple, clamshell, or rock bucket or by other method approved by the Contracting Officer and rearranged by use of a trackhoe or by hand as necessary to provide complete coverage of the banks to the specified average thickness. If the entire upper bank cannot be paved from floating plant and stone is windrowed on the upper slope, spread the windrowed stone to the prescribed thickness by pulling the stone up the slope with a trackhoe or by other approved methods. Pulling stone downslope is prohibited. A tolerance of 50 mm 2 inches above and below the specified average thickness will be allowed. Openings between stones exposing more than 2600 mm² 4 square inches of the graded slope or gravel blanket will not be permitted. In underwater placement, distribute the stone uniformly in the amount specified. Control placement of [riprap] [stone] underwater to the extent necessary to provide coverage as indicated on the "Before Construction" drawings and/or to assure a connection between articulated concrete mattress and [riprap] [stone] paving placed above water.

3.20.2.5 Connections

Construct connections between [riprap] [stone] upper bank paving and concrete mattress or paving as detailed on the drawings. Remove any stone placed or spilled onto the concrete mattress and place by hand into the paving and mattress connection area. Ensure the thickness of stone in the connection is no less than 450 mm 18 inches at a point 1200 mm 4 feet from the concrete mattress or paving, and taper to an average thickness of 250 mm 10 inches at the edge of the mattress and at a point 1800 mm 6 feet from the mattress or paving, unless other thickness is specified. At the connection between [riprap] [stone] paving and existing asphalt paving, increase the thickness of the [riprap] [stone] paving to 250 mm 18 inches in a strip approximately 1200 mm 4 feet in width along the connection of the [riprap] [stone] and existing asphalt paving.

3.20.2.6 Bedding Material

Bedding material approximately 100 mm [_____] inches thick will have been placed by others at most locations from approximately the [_____] contour to the [_____] contour. Exercise reasonable care in placing [riprap] [stone] so that the bedding material will not be damaged.

3.20.2.7 Exposed Flanks

When the bank paving ends with a flank or flanks not connected with existing work, the Contracting Officer may direct that the last 18 m 60 linear feet be paved with [riprap] [stone] averaging 500 mm 20 inches in thickness from a point 1200 mm 4 feet landward of the articulated concrete mattress to the landward limit of the paving.

3.20.2.8 Ditch Outlets

Pave the bottom and side slopes of drainage ditches for a distance of 3 to 8 m 10 to 25 feet landward of the top bank as specified in [the Supplementary Specifications] [_____] [or in the jobsite specifications].
3.21 DIKE REPAIRS

The work requires grading and paving areas of damaged dike bankheads, placing stone fill in areas of dikes where damage has occurred, and performing other stone repairs necessary to maintain integrity of the dike field. Except as provided below, work will be required only on portions of dike fields which are accessible by floating plant. Jobsite work orders will be issued for each dike field where work is required, setting forth the details and limits of work. It is anticipated that at some locations where dike field repairs are specified, the site may be inaccessible to floating plant, and hauling of stone may be necessary to restore the integrity of the dike field or to extend a dike landward. In such cases, except for work at [____], the Contractor will be given the option of performing work at the applicable contract unit prices or omitting the work. However, should the Contractor agree to do the work, the entire work specified at that location must be satisfactorily completed. The Contractor will be furnished a jobsite work order with details as necessary to perform the work. After a review of the jobsite work order and an inspection of the site, notify the Contracting Officer, in writing, whether the work will be performed at the contract unit price or omitted from the job. It is anticipated that the length of a landward dike extension will not exceed [150][____] m [500][____] feet. Grading and dressing of the bank and excavation may be required. The type of stone required may be [57][____] kg [125][____] pounds [riprap] [stone], or Graded Stone ["A"] ["B"] ["C"]. The placing of any of the above types of stone may include placing fill in a dike, bank paving and the filling of key trench. Where the Contractor agrees to perform stone dike repair work, which is inaccessible by floating plant and must be hauled, additional compensation for the tonnage hauled will be made at the applicable contract unit price for "Stone Placement Premium".

3.21.1 Tolerances

The following tolerances will be allowed in the specified repairs, provided the extremes do not occur adjacent to each other.

a. Surface Elevations

(1) [Upstream [____] m feet of dike crown - zero to minus 300 mm 1 foot] [____].

(2) [Downstream 2700 mm 9 feet of crown and apron - plus or minus 150 mm 6 inches] 56.

b. Crown line (each side) -150 mm 6 inches inside to 300 mm 1 foot outside.

c. Slopes - plus or minus 300 mm 1 foot.

3.21.2 Earthwork

3.21.2.1 Grading

Grade or fill the bank with material available from grading to the slopes indicated in the Plans and Specifications and as staked in the field. Slopes must be no steeper than 1V on 3H except that steeper slopes may be authorized in making connection with existing paving. The grade of the slope must conform to the prescribed grade within the limits of plus or minus 300 mm 1 foot. When less than 7600 m³ 10,000 cubic yards is specified in the for a single dike field, consider the grading "Earthwork,
Small Repairs” for payment purposes. When 7600 m$^3$ 10,000 cubic yards or more of grading is specified in the Plans and Specifications for a single dike field, consider the grading "Earthwork, Large Repairs” for payment purposes.

3.21.2.2 Key Trench

A key trench may be required along the downstream limit of the [riprap] [stone] paving or at other locations on the bankhead. Unless otherwise specified or directed, the key trench must extend from top of bank to waters edge, have a bottom width of 3 m 10 feet and side slopes of 1V on 1H. The bottom grade must be 1.5 m 5 feet below the prescribed grade of [riprap] [stone] paving.

3.21.2.3 Disposal of Material

Dispose of material from grading in excess of that used as fill by depositing riverward of the top of bank upstream or downstream from the limits of the repair work.

3.21.2.4 Stone Work

a. Provide stone quality and size as specified.

b. Where [riprap] [stone] is required in dike repairs, the size is [57] [_____] kg [125] [_____] pound [riprap] [stone].

(1) [Riprap] [Stone] Paving – Unless otherwise specified, provide [riprap] [stone] paving consisting of a course of graded stone with an average thickness of 300 mm 12 inches measured normal to the slope. Where paving is placed under water, the amounts required are 7.3 tons 8 tons per square unless otherwise shown in the Contract Drawings or as directed by the Contract Office. Placing of stone must follow grading and excavation as soon as practicable. Preparatory to placing the [riprap] [stone] paving, dress the slope to eliminate any irregularities due to wave or rain wash, or operation of the Contractor's equipment. Place the stone by crane or dragline equipped with skip, clamshell, or rock bucket; by frontend loader or bulldozer; or by trucks or other methods approved by the Contracting Officer and rearrange by hand as necessary to provide complete coverage of the bank to the specified average thickness. A tolerance of 20 percent above or below the specified average thickness will be allowed. Openings between stones exposing more than 2600 mm$^2$ 4 square inches of the graded slope will not be permitted. In underwater areas, place the stone uniformly distribute in the amount specified.

(2) Stone-Filled Key Trench – Fill the excavated key trench to the elevation of adjacent [riprap] [stone] with stone of the specified size to provide a thickness of 1.5 m 5 feet with a tolerance of 300 mm 1 foot. Bulldozing stone into the excavated trenches is prohibited.

(3) [Riprap] [Stone] Fill – Restore eroded areas of stone dikes and fill minor gaps with [riprap] [stone] of the specified size. Place the stone fill to the elevations and sections of adjacent portions of the dike or in accordance with the Contract Drawings or as directed by the Contracting Officer. Construct underwater portion of the repairs in uniform horizontal layers of about 1.5 m.
5 feet thickness. Construct each lift across the entire length of the dike repairs. Generally a 1800 mm 6 feet crown width with slopes of angle of repose (approximately 1V on 1 1/4 H) will be required. A tolerance of plus or minus 300 mm 1 foot will be allowed in the specified elevation and crown width. Place the stone by a crane or dragline equipped with a skip, grapple, clamshell, or rock bucket; by frontend loader or bulldozer; or by trucks or other equipment approved by the Contracting Officer. Placing of stone along the dike when river stages are above the top of dike without prior approval of the Contracting Officer or at any river stages when site and current conditions prevail which, in the opinion of the Contracting Officer, make operations impracticable or uneconomical is prohibited.

3.21.2.5 Placement Control

Control placement of stone in the dikes, and furnish, operate, and maintain the necessary equipment, and all necessary material and supplies. At all times, when stone placement from floating plant is underway, the means by which the plant, equipment, and stone supply barges are positioned must function accurately and consistently. Whatever the method employed, it must permit the Contractor and the Government Quality Assurance Representative to readily determine the exact position of the stone-placing operation. Prior approval of the contracting Officer will be required in each instance before placing any stone subaqueously without the aid of any equipment listed below.

a. The method of alignment control may consist of piles or pile clumps. Other acceptable methods of alignment control include the use of a manned transit, laser, colored or polarized light beams, or other method demonstrable to be practicable and sufficiently precise and reliable.

b. Acceptable methods of distance control for floating plant engaged in subaqueous placement of stone may consist of piles or pile clumps at intervals of 90 to 120 m 300 to 400 feet. Supplement piles or pile clumps, if used, by a wire distance wheel or other equally accurate measuring device for use in conjunction with the piles. Other acceptable methods include the use of electronic distance surveying instruments or other method demonstrable to be practicable and sufficiently precise and reliable.

c. Provide suitable recording electronic depth finder at each location of work under this contract. Provide a depth finder with a recording scroll no less than 100 mm 4 inches wide with a scale of no more than 3 m of depth to 25 mm 10 feet of depth to the inch. Ensure the depth finder is capable of obtaining accurate soundings and use as an aid in the control of subaqueous stone placement. Ensure that the depth finder is in proper working order at all times and furnish and maintain an adequate stock of recording paper for the depth finder. Submit to the Contracting Officer, for approval, the manufacturer's name, model number, and/or model name of the electronic depth finder proposed for use prior to the unit being place in service.

d. The use of buoys as placement control devices will not be permitted. The use of bank targets for alignment control will not be permitted for working distance of more than 1200 mm 400 feet without prior approval of the Contracting Officer.
3.22 PLACEMENT OF SHORELINE PROTECTION

3.22.1 Debris

Remove any timbers, unsatisfactory material and debris within the reaches for construction except as otherwise directed by the Contracting Officer, and upon removal is the property of the Contractor. Properly dispose of all materials in accordance with the requirements of Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, including any applicable local requirements.

3.22.2 Limitations of Placement Procedures

Stone construction in advance of completed permanent protection except as specified herein is performed at the Contractor's risk. Keep the Contracting Officer informed as to any and all situations that may result in a possible interruption of work.

3.22.2.1 Interruptions

If the Government can anticipate that the stone construction will be interrupted for more than [_____] [four (4)] continuous days, including weekends and holidays, the Contractor may be required to complete the placement of [_____] and [_____] stone on both sides of the breakwater and provide protection of the exposed ends prior to the start of the interruption. The above-required protection for the exposed ends of the breakwater must consist of the same type of stone protection required on the lake side of the breakwater. Remove all material used for protecting the exposed ends of the breakwater after the need therefore has ended and incorporate appropriately into the required permanent construction. All materials which are removed and placed in the permanent construction, in accordance with the provisions of this section, will be measured and paid for only once. When temporary protection of exposed ends of construction in progress is ordered or directed by the Contracting Officer, an equitable adjustment will be made for the work of temporarily placing and removing the stone materials. The Government has no obligation to order that exposed ends be protected. If the Government takes no action to have exposed ends protected, then the provisions of the paragraph MATERIAL PLACEMENT IN ADVANCE apply.

3.22.2.2 Material Placement in Advance

Do not construct the breakwater more than [_____] m feet in advance of completed placement of the [_____] and [_____] stone. If at the completion of a day's placement operations the unprotected portion (maximum [_____] m feet) is surveyed to determine the shape and grade of the materials placed, the Government will assume the responsibility for the cost to replace it (maximum [_____] m feet) if it is displaced or lost due to a storm during the nonwork period but not exceeding a continuous [_____] [four (4)] day nonwork period. In the event an unprotected section of any length unsurveyed is left during a nonwork period or is left unprotected for a period longer than four continuous days and is damaged or causes damage to a completed section, replace or reshape the damaged portion(s) as approved by the Contracting Officer with no additional payment.

3.22.3 Core/Mattress/Bedding Stone

Place stone to the lines, grades and thickness shown on the Contract Drawings. Use placement method such that any soft and organic materials on
the lake floor will be displaced outward towards the extreme outside toes of the required sections of the structure and in the direction of the construction. Start stone placement at the centerline of the stone structure and extend outward to the toes of the structure in a fashion whereby the line of stone advancement takes an inverted "U" shape. Placement by self-unloading lake carriers [will be allowed] is prohibited. Place with reasonably systematic care that segregation of particle sizes will not occur. If the materials are placed by clam shell, dragline, or other similar equipment, do not drop the stone from a height exceeding [_____][600] mm [_____][two] feet above the existing lake bottom or previously placed material. [Placement with bottom dump scows [is prohibited] [will be allowed].] Ensure the finished surface of the stone is adequately smooth and free of mounds or windrows. [Ensure the finished work is free of clusters or small stones and cluster of larger stones.]

[3.22.4 Armor/Cover/Riprap Stone]

Place stone in the locations and at the thickness shown without deviating from the lines and grade shown, including allowance for tolerances. Perform final shaping of the slope concurrently with the initial placement of the stone. Randomly select stones and set in contact with each other so that the interstices between adjacent stones are as small as the character of the stone will permit. Place the face of stone having the largest area against the surface of the underlying material. Begin placement at the bottom of the slope. Place the heaviest stones as toe stones. Place stones in a manner to avoid displacing underlying materials or placing undue impact force on underlying material that would cause the breaking of stones. Unless otherwise specified, do not drop stone from a height greater than [_____][600] mm [_____][two] feet. Use equipment in placing the stone suitable for handling materials of the sizes required including the ability to place the stone over its final position before release and if necessary pick up and reposition the stone. Do not use dragline buckets and skips in placement. Moving stone by drifting or manipulating down the slope is prohibited. The finished work must be a well distributed mass, free of pockets of either smaller or larger stone, having a minimum of voids and with the maximum of interlocking of stones. It should be anticipated that rehandling of individual stones after initial placement will be required to achieve the above requirements. Do not drop stones required to be placed over or adjacent to drains and subsurface pipes, but gently lower and place in their final position by material handling equipment.

[3.22.5 Underlayer Stone]

Place stone, to a full zone thickness, in one operation in a manner to avoid displacing the underlying material or placing undue impact force on underlying materials and supporting subsoils. Place underlayer stone in a manner to produce a resultant graded mass of stone with minimum voids. Rearranging of individual stones may be required to achieve this result. Placement by any method which is likely to cause segregation of the various sizes is prohibited. Lower unsegregated stone in a bucket or container and place in a systematic manner directly on the underlying material. Begin placement at the bottom of the slope and proceed upward. Casting or dropping of stone over [_____][600] mm [_____][2] feet or moving by drifting and manipulating down the slope is prohibited. Construct final finish of the slope as the material is placed.
3.22.6 Scour/Riprap Stone

Place stone, to a full zone thickness, in one operation in a manner to avoid displacing the underlying material or placing undue impact force on underlying materials and supporting subsoils. Place the stone in a manner to produce a resultant graded mass of stone with minimum voids. Rearranging of individual stones may be required to achieve this result. Placement by any method which is likely to cause segregation of the various sizes will not be permitted. Lower unsegregated stone in a bucket or container and place in a systematic manner directly on the underlying material. Begin placement at the bottom of the slope and proceed upward. Casting or dropping of stone over [_____] [300] mm [_____] (one) foot or moving by drifting or manipulating down the slope is prohibited. Construct final finish of slope as the material is placed.

3.22.7 Fill Stone

Do not place fill stone within steel sheet pile walls until tie-rods, wales, and connections are installed, tightened, and inspected; and the structure is aligned within the required tolerances. Uniformly place the fill materials in maximum [_____] [900]-mm [_____] [3]-foot lifts and in such a manner that there will be no undue later settlement of the materials and that the structure will not be subjected to undue strains, deformations, or other damage. Responsibility for damage to the structure due to filling operations rests with the Contractor. Distribute and consolidate the stone by use of a vibratory hammer or similar vibrating hammer or similar vibrating equipment affixed to a steel beam inserted into the fill at intervals no greater than [_____] [1.5] m [_____] [5] feet. Continue vibratory operations until there is no visual continuation of settlement. Other distribution or consolidation methods may be used when approved by the Contracting Officer. Compact stone above water to [_____] (ninety percent (90 percent) of maximum density obtained at optimum moisture content as determined by the Contractor in accordance with [EM 1110-2-1906] [_____]). Perform at least [_____] (one (1)) compaction test for each [_____] metric ton of material placed.

3.22.8 Splash Stone

Place stone to the lines and grades shown and in a manner that will avoid tearing the underlying geotextile.

3.22.9 Fitted Cap Stone

Place fitted cap stone upon the geotextile covering the fill stone within the limits of the steel sheet pile structure to the lines and grades shown. Use stones of assorted sizes and place to tightly fit against each other in the space bounded by the perimeter [_____] [concrete sidewalk]. Use individual stones of the maximum size which will fill a given space between larger stones to minimize the need for chinking. Ensure the flattest face of each stone is the top surface of the placed stone. Following placement of the cap stones, fill the remaining spaces between individual stones with pieces of the next smaller stone obtained from the required [underlayer] stone gradation materials being supplied for this contract. Fill the spaces between cap stones with selected stones of the maximum size which will fit in each remaining space. At the elevation of the upper horizontal surface of the cap stones, place the stones used for chinking with their elongated dimension in a vertical direction and force into place in the spaces between cap stone spaces such that they become firmly wedged in place.
3.22.10 Slides

In the event of the sliding or failure of any part of the structure during its construction, or after its completion, but prior to its acceptance, cut out and remove the slide from the structure and then rebuild that portion of the structure with new materials or reuse the displaced materials for rebuilding if deemed appropriate. The Contracting Officer will determine the nature and cause of the slide. In case the slide is caused through fault of the Contractor, perform the foregoing operations without cost to the Government.

3.23 TESTS AND INSPECTIONS

3.23.1 Concrete Grout

3.23.1.1 General

**************************************************************************
NOTE: Select the first bracketed option if ACI International references are cited in the project specification; select and verify the correctness of the second bracketed option if ACI International references are not cited in the project specifications.
**************************************************************************

Ensure individuals who sample and test grout as required by this section have demonstrated a knowledge and ability to perform the necessary test procedures equivalent to ACI minimum guidelines for certification of Concrete Transportation Construction Inspector or ACI Concrete Construction Inspector Level II, obtainable from [the address and telephone number for ACI INTERNATIONAL specified in Section 01 42 00 SOURCES FOR REFERENCE PUBLICATIONS] [ACI INTERNATIONAL, P.O. Box 9094, Farmington Hills, MI 48333-9094, Ph: 248-848-3700, Fax: 248-848-3701, Internet: http://www.aci-int.inter.net].

3.23.1.2 Preparations for Placing

Inspect riprap in sufficient time, prior to each grout placement, in order to certify that it is ready to receive the grout.

3.23.1.3 Air Content

Check air content at least [once] [twice] during each shift during which grout is placed. Obtain samples in accordance with ASTM C172/C172M and test in accordance with ASTM C231/C231M. Whenever a test result is outside the specification limits, do not deliver the grout to the area to be grouted and adjust future air-entrainment admixture proportions.

3.23.1.4 Slump

Check slump [once][twice] during each shift during which concrete grout is produced. Obtain samples in accordance with ASTM C172/C172M and test in accordance with ASTM C143/C143M.

3.23.1.5 Placing

The placing foreman must verify that adequate equipment, supplies and
workmen are available before permitting placement to begin on a shift.

3.23.2 Pre-Production

3.23.2.1 Bulk Specific Gravity

Submit, at least [120] [_____] calendar days in advance of shipment of stone to the work site, a copy of bulk specific gravity test results for each gradation range of stone proposed to be furnished. Furnish the information prior to preparation of pre-production demonstration stockpiles. Quantity determinations are contingent upon the range of bulk specific gravity (saturated surface dry (SSD) basis) of stone to be supplied. Therefore, during the process of selecting a source or sources of stone for the project, make an investigation to determine the lowest and highest bulk specific gravity (SSD) of stone available at the source or sources proposed to be utilized for each gradation range of stone. Perform tests at a Government [approved][validated] testing laboratory in accordance with [______]. Submit testing results in accordance with paragraph SUBMITTALS. Test results which display an extraordinarily wide range of values may necessitate additional testing to determine whether the source contains strata or units with stones of an acceptable range of bulk specific gravity. For Category I sources which have been acceptably tested not more than two years earlier, and the material is of an acceptable quality and bulk specific gravity, the Contracting Officer may waive the requirement for bulk specific gravity testing.

3.23.2.2 Material Quality

Before selecting a source for preparation of a demonstration stockpile, be reasonably certain that the source is capable of meeting the quality and source requirements specified in paragraphs SOURCES and EVALUATION TESTING OF STONE, including their respective subparagraphs.

3.23.2.3 Borderline Material Quality

If the COR's evaluation of a demonstration stockpile results in not being able to determine by visual examination whether the material is acceptable or unacceptable, the COR will select at least one but not more than three representative stones from the demonstration stockpile to be prepared for shipment to the Government's laboratory for testing in accordance with paragraph EVALUATION TESTING OF STONE. Where specified sizes are in excess of 900 kg 2,000 pounds, cut or break a representative piece, weighing approximately 900 kg 2,000 pounds each, off of the selected stones. For specified stone sizes of less than 900 kg 2,000 pounds but more than 230 kg 500 pounds, individual samples must be the size of the largest stone specified for the size range. Samples of stone groupings with a maximum size less than 230 kg 500 pounds must contain at least two (2) stones representative of the higher limit of the stone weights specified. In addition, the sample is representative of the gradation specified and the minimum weight of the total sample must be greater than 230 kg 500 pounds. Repeat sampling and testing procedures for each strata or distinct rock type being quarried. Ship the samples to the laboratory as specified in paragraph EVALUATION TESTING OF STONE. If the laboratory testing reveals the materials are unacceptable, submit a replacement source for approval and proceed with the demonstration stockpile procedures anew.

3.23.2.4 Demonstration Stockpile at Source

Following submittal of the Contractor's Quality Control (CQC) Plan and
selection of a source, but prior to the Government's approval of a source and the CQC Plan, make arrangements to provide a pre-production demonstration stockpile for each of the stone size ranges for the project. Assemble the stockpiles at the source of the stone and shape in windrow fashion. Place stones with a size range greater than [_____] [2.7] tons [_____] [3] tons in a single layer with [_____] [300] mm [_____] [1] foot or more of clear space around each stone. Do not stack stones in smaller sizes under [_____] [2.7] tons [_____] [3] tons in weight higher than [_____] [1200] mm [_____] [4] feet. The stones placed in the demonstration stockpiles are representative of the overall quality of materials in the source and must not consist of the best specimens unless it is reasonable to determine that the source will provide the required amount of stone of the applicable size range with a degree of quality no less than that existent in the demonstration stockpile. Prepare separate examples of unacceptable stones so labeled demonstrating characteristics that are outside of acceptability for the project, to be used as guidance by personnel. The quantity of stone required in each demonstration stockpile is dependent upon the gradation size range to be produced for the project.

The following parameters apply:

<table>
<thead>
<tr>
<th>SIZE OF INDIVIDUAL STONES WITHIN A RANGE</th>
<th>DEMONSTRATION STOCKPILE QUANTITY BASED ON PROJECT QUANTITY FOR SIZE RANGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Ensure stones placed in the stockpile have been preselected by the Contractor's Quality Control Plan (QCP) inspector or supervisor and acceptable stones over 230 kg 500 pounds in size have been marked with spray paint on three mutually perpendicular sides with a coded mark to denote acceptability for a certain size range. Assemble a stockpile of representative reject stones marked with a red "X" at the [site][source] as examples of unacceptable materials or shapes.

3.23.2.5 Evaluation of Demonstration Stockpile at Source

Notify the Contracting Officer when stockpiles are ready for evaluation. The Contractor's approved Quality Control Plan (QCP) supervisor and all QCP inspectors must accompany the Contracting Officer's Representative (COR) during the Government's evaluation of the demonstration stockpiles and source. Arrange to have individual stones turned as necessary to accommodate the COR's evaluation. The COR will mark rejected stones with a red "X" and remove such stones to the reject stockpile or to a crusher if one is available. If more than [_____] [3 percent] unacceptable stones are found within a stockpile, the entire stockpile will be rejected by the Government and a replacement stockpile will be created for re-evaluation. If the replacement stockpile is rejected, revise and resubmit the Quality Control Plan (QCP) and create another replacement demonstration stockpile for evaluation. If the third demonstration stockpile for a particular size range at a single source is found unacceptable, the source will be disapproved for such size range and submit a new source for approval. In addition, submit the name and qualifications for a person to replace the
QCP supervisor. The Contractor may choose a replacement source at the time a first or second demonstration stockpile is found unacceptable. The replacement of demonstration stockpiles or stone sources is at no additional cost to the Government and with no change in the time of completion.

3.23.2.6 Approval of Demonstration Stockpile at Source

At the time the COR finds the contents of a demonstration stockpile to be acceptable, either through visual examination or through laboratory testing, the Contractor will be notified in writing that the source, the QCP plan and QCP staff are approved, whereupon the Contractor may proceed with production of materials for the project provided they are consistent with demonstration stockpiles.

3.23.2.7 Duration of Demonstration Stockpile at Source

Other than for being shipped as the final quantities of materials to be placed in the work, each demonstration stockpile must remain unchanged at the source until all other required material of the size range represented by the stockpile has been shipped from the source.

3.23.3 Placement Control

3.23.3.1 Quality Control Measures

Establish and maintain quality control for all work performed at the job site under this section to assure compliance with contract requirements. Maintain records of the quality control tests, inspections and corrective actions. Cover all construction operations including, but not limited to, the placement of all materials to the slope and grade lines shown and in accordance with this section.

3.23.3.2 Check Surveys

**************************************************************************
NOTE: EM 1110-2-1003 should be referred to for spacing requirements for a Hydrographic Survey.
**************************************************************************

Surveys made by the Contractor are required on each material placed for determining that the materials are acceptably placed in the work. Make checks as the work progresses to verify lines, grades and thicknesses established for completed work. Perform at least one (1) check survey as specified below for each [_____] [twenty-five (25)] foot section as shown as practicable after completion. Following placement of each type of material, the cross section of each step of the work must be approved by the Contracting Officer before proceeding with the next step of the work. Approval of cross sections based upon check surveys does not constitute final acceptance of the work. Perform cross sections on lines [_____] [8] m [_____] [25] feet apart, measure along the structure reference line, with readings at [_____] [1.5]-m [_____] [5]-foot intervals and at beaks along the lines. However, other cross section spacing and reading intervals may be used if determined appropriate by the Contracting Officer. Take additional elevations and soundings as the Contracting Officer may deem necessary. Conduct surveys in the presence of an authorized representative of the Contracting Officer, unless this requirement is waived by the Contracting Officer.
a. Above Water: Determine the elevation of stone above the water surface by the use of a leveling instrument and a rod having a base 300 mm 12 inches in diameter. If approved by the Contracting Officer other means may also be used.

b. Below Water: For portions of the work that are under water, perform sounding surveys either by means of a sounding pole or a sounding basket weighing about 4 kg 8 1/2 pounds, each of which has a base measuring 300 mm 12 inches in diameter.

c. Gage Board: Check the gage prior to any survey. Install a gage board at the project site.

d. Electronic Depth Recorder Method: When using an electronic depth recorder, use the following procedures.

(1) Calibrate and adjust the depth recorder for the gage, with check bar, at least [_____] [six (6)] times within a normal eight (8) hour work day.

(2) Normal calibration times is at the beginning of the work day, mid-morning, close of morning's work, start of afternoon's work, mid-afternoon, and the end of the day.

(3) Perform further calibrations whenever there is any malfunction within the depth recorder or transducer which might affect the soundings, a major gage change, or change in water temperature due to industrial discharge or other causes.

(4) Set the check bar at approximately the deepest sounding in the area to be sounded.

(5) Calibrate the depth recorder to read at low water datum.

(6) When checking the calibration at mid-morning, end of morning, mid-afternoon and end of work, use the same setting used for the previous calibration.

(7) If the calibration check does not agree with the previous calibration, calibrate the depth recorder to the proper setting.

(8) Do not change the setting of the depth recorder between calibrations.

e. Electronic Depth Recorder: The survey depth recorder used must be a standard model acceptable to the Contracting Officer using a sounding chart that can be read directly to the nearest 300 mm foot and estimated to the nearest 30 mm tenth (0.1) of a foot. Ensure accuracy is better than 1/2 of 1 percent.

f. Tagline Method of Horizontal Location Along Station: If a tagline is used with a depth recorder, mark the soundings with a fix every [_____] [1.5] m [_____] [5] feet.

g. Predetermined Transit Angle Method or Ranges Method: The interval between predetermined angles or ranges along a sounding line must not exceed [_____] [60] m [_____] [200] feet along the entire length of the sounding line. Do not allow predetermined angle to form an intersection with the sounding line of less than 45 degrees.
h. Speed of the Sounding Boat: When sounding, ensure the speed of the sounding boat is as constant as possible, preferably between 55 and 67 m per minute 180 and 220 feet per minute.

i. Checking Gage: Check the gage prior to each calibration and record on the sounding chart or in the field notes.

3.23.4 Bedding Layers, Filter Layers, and Sand Fill

3.23.4.1 General

Perform gradation tests to assure compliance with contract requirements and maintain detailed records. Sample bedding material, filter materials and/or sand fill in accordance with ASTM D75/D75M and test in accordance with ASTM C136/C136M. Perform the tests before and after surveys of each layer of stone protection material placed.

3.23.4.2 Reporting

Reporting must be in accordance with paragraph GRADATION TEST.

3.23.5 [Trenchfill Revetment, Bank Paving, and Outlet Drains

Establish and maintain quality control for stone placement operations to assure compliance with contract specifications and maintain records of his quality control for all construction operations including, but not limited to, the following:

a. Check grades of trenchfill and bank paving for compliance with design sections.

b. Record tonnage of stone placed in each station of trenchfill revetment and check quantity for compliance with design sections.

c. Check for uniform thickness of paving stone and specified elevation of top paving on graded slopes.

d. Check for even distribution of spalls used in paving.

e. Insure that outlet drains conform with design sections.]

3.23.6 [Stonefill Revetment and Stonefill Dikes

Check grade, slope, and placement of stone for compliance with design sections and specifications.]

3.23.7 [Stone Dike

[Establish and maintain quality control for all stone dike operations to assure compliance with contract requirements and maintain detailed records of this quality control for all construction operations, including, but not limited to, the following:

a. Placement and alignment of stone in the dike.

b. Periodic fathometer surveys as directed by the Contracting Officer.]

c. Record of the tonnage of stone placed in each station.]
3.23.8  [Revetment Repairs]

Inspect the revetment repairs for compliance with the contract requirements and record the inspection of all operations including, but not limited to, the following:

a. Bank grading, excavating or reshaping damaged drains through the paving, placing graded material into areas, and disposing of waste material.

b. Breaking out pavement within specified limits.

c. Disposition of cleared material, drift, and other debris.

d. Preparation of subgrade for paving.

3.23.9  [Stone] [Riprap] Paving

Establish and maintain quality control for slope dressing and riprap paving to assure compliance with contract requirements, and maintain records of his quality control for all construction operations, including but not limited to the following:

a. Dressing the slope to eliminate any irregularities, including irregularities in the gravel blanket placed by others, due to rain or wave wash or operations of the Contractor's equipment.

b. Grading and dressing necessary to secure a suitable connection with the riprap paving in place.

c. Underwater paving to assure proper connection with concrete mattress and complete coverage.

d. Above-water connection between riprap paving and concrete mattress.

e. Connection between riprap paving and asphalt paving.

f. Placement of riprap on gravel blanket, upper bank slope, and if applicable, overbank areas for thickness and proper coverage.

g. Placement of riprap in ditch outlets.

3.23.10  Dike Repairs

Inspect all dike stone repair operations for compliance with contract requirements and record the inspection of all operations including, but not limited to the following:

a. Grading of slopes to design grade within tolerance.

b. Disposition of material from grading and excavation.

c. Dressing of slope before placement of paving.

d. Placement of slope and underwater paving.

e. Grade and section of stone fill.
Furnish to the Contracting officer a copy of these records an tests, as well as records of corrective action taken.

3.23.11 Gradation Tests for Stone

3.23.11.1 [Gradation Test Method for Riprap]

Perform gradation tests in accordance with ASTM D5519, Test Method A [______].

3.23.11.2 [Standard Test Method for Gradation of Quarry Run Stone or Stone Paving]

******************************************************************************

NOTES: Alternative 2. The gradation test method was developed to provide guidance to field personnel and Contractors so that the procedures would be uniform. This test procedure is provided as an example.

This test method should not be used in contract specifications that cover stone, upper bank and stone, overbank, and quarry run stone.

******************************************************************************

a. Select a representative sample (Note No. 1), weigh and dump on hard stand.

b. Select specific sizes (see example) on which to run "individual weight larger than" test. (See Note No. 2). Procedure is similar to the standard aggregate gradation test for "individual weight retained".

c. Determine the largest size stone in the sample. (100 percent size)

d. Separate by "size larger than" the selected weights, starting with the larger sizes. Use reference stones, with identified weights, for visual comparison in separating the obviously "larger than" stones. Stones that appear close to the specific weight must be individually weighed to determine size grouping. Weigh each size group, either individually or cumulatively.

e. Paragraph d above will result in "individual weight retained" figures. Calculate individual percent retained (heavier than), cumulative percent retained, and cumulative percent passing (lighter than).

NOTE NO. 1: Sample Selection: The most important part of the test and the least precise is the selection of a representative sample. No "standard" can be devised; larger quarry run stone is best sampled at the shot or stockpile by given direction to the loader; small graded stone is best sampled by random selection from the transporting vehicles. If possible, all parties should take part in the sample selection and agree before the sample is run that the sample is representative.

NOTE NO. 2: Selection of Size for Separation: For these types of stone gradations the separation points need to be selected as the smallest size stone at each break in the gradation specified.

### 3.23.11.3 Standard Test Method for Gradation of Riprap, Graded Stone, and

-----------------------------

**NOTE:** Alternative 2. The STANDARD TEST METHOD FOR GRADATION OF RIPRAP AND GRADED STONE gradation test method was developed to provide guidance to field personnel and Contractors so that the procedures would be uniform. This test procedure is provided as an example.

This test method should be presented in contract specifications that require riprap or graded stone. This test method should not be used in contract specifications that only cover stone, upper bank and stone, overbank.

-----------------------------

a. Select a representative sample (Note No. 1), weigh and dump on hard stand.

b. Select specific sizes (see example) on which to run "individual weight larger than" test. (See Note No. 2). Procedure is similar to the standard aggregate gradation test for "individual weight retained".
c. Determine the largest size stone in the sample. (100 percent size)

d. Separate by "size larger than" the selected weights, starting with the larger sizes. Use reference stones, with identified weights, for visual comparison in separating the obviously "larger than" stones. Stones that appear close to the specific weight must be individually weighed to determine size grouping. Weigh each size group, either individually or cumulatively.

e. Paragraph d above will result in "individual weight retained" figures. Calculate individual percent retained (heavier than), cumulative percent retained, and cumulative percent passing (lighter than). Plot percent passing, along with the specification curve on ENG Form 4794-RM 4794-R.

NOTE NO. 1: Sample Selection: The most important part of the test and the least precise is the selection of a representative sample. No "standard" can be devised; larger quarry run stone is best sampled at the shot or stockpile by given direction to the loader; small graded stone is best sampled by random selection from the transporting vehicles. If possible, all parties should take part in the sample selection and agree before the sample is run that the sample is representative.

NOTE NO. 2: Selection of Size for Separation: It is quite possible and accurate to run a gradation using any convenient sizes for the separation, without reference to the specifications. After the test is plotted on a curve, then the gradation limits may be plotted. Overlapping gradations with this method are no problem. However, it is usually more convenient to select points from the gradation limits, such as the minimum 50 percent size, the minimum 15 percent size, and one or two others, as separation points. For these types of stone gradations the separation points need to be selected as the smallest size stone at each break in the gradation specified.

3.8 QUALITY CONTROL TESTING

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for commercially available concrete block products for revetments.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: PART 2 PRODUCTS is based on commercial items, and does not address field casting of blocks or manufacturing of non standard blocks.

This guide specifications assumes the ACB is Government designed for issues such as hydraulic stability and geotextile filters. Maximum flexibility is desirable for Contractor product selection, installation sequence, construction equipment, and block orientation.

Notes before paragraphs are provided to present assumptions in preparation of the guide specification, make suggestions for conditions that
warrant project revisions, and provide background technical information or references for further information. They should be reviewed prior to revising wording for use in project specifications.

The drawings should show appropriate details for toe key-in, anchor trenches, revetment termination, transition to riprap, anchors, geotextiles, horizontal and vertical joint thickness between ACB, joint/placement pattern of ACB’s.

1.1 MEASUREMENT AND PAYMENT

Measurement of ACB revetment for payment will be made on the basis of the face area. The pay lines of ACB revetment will be neat lines taken off the approved shop drawings; and will include embedded blocks and anchor trenches. Work includes incidental grading and preparatory work, furnishing and installing the geotextile and ACB, filling the voids, securing cable fasteners, installing soil anchors, and seeding (where specified). Engineering services and product testing are incidental, if required. Placing cast-in-place concrete joints and cutting blocks are incidental, if required. Payment will be made at the respective unit price per square meter foot listed on the Bidding Schedule. Payment will be full compensation for all material, labor and equipment to complete the work.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

1.3 DEFINITIONS

1.3.1 Articulating Concrete Block (ACB) Revetment System

A matrix of interconnected concrete block units for erosion protection. Units are connected by geometric interlock and/or cables, geotextiles, or geogrids, and typically include a geotextile underlayment for subsoil retention.
1.3.2 Blocks

Articulating concrete block revetment units will be referred to as blocks.

1.3.3 Interlocking Blocks

For each pair of abutting blocks provide interlocking keys that limit lateral expansion. Provide key and keyhole with an interference fit such that the joint movement has a minimum aperture at closure, and a maximum aperture when pulled apart. The joint freeplay must allow articulation of each individual block.

1.3.4 Freeplay

Freeplay is the maximum lateral joint movement for interlocking blocks (difference between maximum and minimum aperture).

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy or Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for
Contractor Quality Control approval.[for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Block Installation; G[, [____]]

Geotextile Installation; G[, [____]]

SD-03 Product Data

Articulating Concrete Block; G[, [____]]

Flume Test

1.5 DELIVERY, STORAGE, AND HANDLING

Check products upon delivery to assure that the proper material has been received and is undamaged. For geosynthetics, follow the guidelines presented in ASTM D4873/D4873M.

1.5.1 Blocks

Provide blocks which are sound and free of defects that would interfere with proper placement or that would impair the strength or longevity of the installation. Discard blocks with the following defects:

a. Broken appendages.
b. Chips larger than 50 mm 2 inches in any dimension.
c. Cracks wider than 0.5 mm 0.02 inches and longer than 33 percent of the nominal height.
d. Exposed skin reinforcement or rebar.
e. Displaying evidence of the Alkali-Silica Reaction (ASR) such as map cracking.
f. Discard/remove blocks exhibiting efflorescence over 25 percent of the surface if directed by the Contracting Officer.

Minor cracks, incidental to the usual method of manufacture, or chipping that results from customary methods of handling in shipping, delivery and placement will not be deemed grounds for rejection. Store blocks in a suitable location away from mud, paint, wet cement, and other contamination or disturbance.
1.5.2 Geotextiles

1.5.2.1 Labeling

Label each roll with the manufacturer's name, product identification, roll dimensions, lot number, and date manufactured.

1.5.2.2 Handling

Handle and unload geosynthetic rolls by hand, or with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Do not drag geosynthetic rolls, lift by one end, lift by cables or chains, or drop to the ground.

1.5.2.3 Storage

Protect geotextiles from cement, paint, excessive mud, chemicals, sparks and flames, temperatures in excess of 70 degrees C 160 degrees F, and any other environmental condition that may degrade the physical properties. If stored outdoors, elevate the rolls from the ground surface and protected with an opaque waterproof cover. Deliver geotextiles to the site in a dry and undamaged condition.

1.6 SCHEDULING

To limit ultraviolet light exposure of the geotextile, place the blocks within 7 days after placing the geotextile, and the void filler within 14 days after placing the geotextile.

PART 2 PRODUCTS

2.1 ARTICULATING CONCRETE BLOCK

******************************************************************************
NOTE: Hand placed (interlocking) ACB typically provides a neater, more pleasing appearance in parks and public areas. Cabled ACB can have superior hydraulic stability to interlocking products, it is more difficult to remove (such as by vandalism), and it has improved constructability when placed in water.

The table of ACB requirements is comprehensive, and many of the properties are interrelated. Including all listed properties will be specification overkill for most projects. Renumber notes where properties are deleted.

The critical shear stress is preferred by the industry over critical velocity because the critical shear is relatively constant for a product. Critical velocity varies depending on flow characteristics (such as depth and turbulence); so that the critical velocity in the flume test is not comparable to the required critical velocity in the field.

The surface void area ratio, DCF, and curvature radius can be used to specify products best suited
to placement on curved surfaces, and turf establishment. Some blocks are available with open cells or solid cores. Most products marketed specifically for ACB revetments are within reasonable limits for general use.

Modifying the requirements for a performance specification may be considered for small low hazard projects or negotiated contracts, and may be preferred by some manufacturers. However, performance requirements for firm fixed price (low bid) contracts is not recommended for ACB's because of the price level jumps between product sizes, and because there is no control in how bidders incorporate risk for a low frequency design event.

Interface friction for soil/fabric and fabric/blocks should be considered by the designer. Because typical design values for soil/fabric are available in geosynthetic design guides, and because the Contractor generally has no control over the soil, the soil/fabric interface friction angle is not addressed in the specification (although for certain critical applications, this may need to be added to verify design assumptions). Interface friction for fabric/blocks is addressed in the specification because it is affected by geotextile and block combinations, it can affect installation, and because the interface friction for fabric/block is highly variable dependent on manufacturing characteristics of both products.

Submit descriptive technical data on the blocks, cables, cable fittings, soil anchors, and geotextile. Include all material properties specified under paragraph PRODUCTS. Submit catalog cuts, technical data sheets, or test data showing that the products meet the specifications. Also include a copy of any standard manufacturer's warranties for the products. See below under "geotextile" for more requirements. Meet the following criteria:

<table>

</tbody>
</table>

a. Determine the weight of the mattress per unit area with the nominal joint spacing, in a non-submerged condition.
b. The curvature radius must be indicative of the ability of the assembled mattress to conform to one dimensional subgrade curves without binding, such as for anchor trenches and swales. The curvature radius must be demonstrated, if requested by the Contracting Officer.
c. The surface void area ratio must be determined at the visible (with filled voids) surface of the blocks, with the joints spaced in a neutral position (50 percent), and express as a percentage of the gross mat area. The void area must include area between the blocks and open cells within the block.
d. The drainage correction factor must the minimum void area ratio (usually taken at the base of the blocks), with the joints spaced in a neutral position (50 percent freeplay in each direction), and must be expressed as a percentage of the gross mat area.
e. The concrete surface must be sufficiently rough to prevent sliding of the blocks on the geotextile. The interface friction must be matched with the selected block and geotextile combination, and must be included with the ACB and Geotextile Data submittal. Demonstrate the block/geotextile interface friction angle, if requested by the Contracting Officer.

2.1.1 Hydraulic Stability

**************************************************************************
NOTE: The velocity and shear stress conditions derived from this test are critical state conditions, and do not represent allowable design values. The surface tolerances for block placement are generally better in the test than field conditions.

FHWA RD-89-199 is a research document, not a standard test method. ASTM committee D18.25.04 has a draft standard based on a flume test, similar to FHWA RD-89-199. The flume test is very expensive: testing expenses can be on the order of $30,000.

FHWA RD-89-199 included a 20 mm 3/4 inch Enkamat fabric below the blocks for the purpose of
installing instrumentation to research block behavior. The Enkamat provided a very effective drainage layer that is not integral to the test method. A drainage layer provides a very significant improvement in the ACB stability in the flume test. Regardless of the flume test conditions, the designer should consider including a granular drainage layer in areas with high turbulence flow.

2.1.1.1 Flume Test

Submit a report of testing for the ACB in conformance with FHWA RD-89-199. Usage of a drainage layer as prescribed in FHWA RD-89-199 is not required. Clearly state if the critical shear stress associated with the stability threshold of the ACB system was derived from laboratory testing that included a sub-block drainage layer as a component of the tested system. Test the ACB product in a flume chamber satisfying the requirements of FHWA RD-89-199. If the product was tested with a drainage layer, the installed product must incorporate a similar drainage layer with adequate filtration design for the site soils. Base the flume test on conservative assumptions for field placement of the blocks (such as block orientation, and joint spacing within construction tolerances). Indicate the critical shear stress (and critical velocity) in the test report. Submit the Flume Test results at the same time as the ACB and Geotextile Data.

2.1.1.2 Extrapolation of Hydraulic Stability

NOTE: Preliminary research has indicated that extrapolation is conservative when extrapolating to thicker blocks, and unconservative when extrapolating to thinner blocks. The paragraph has no description for similar footprint, interlocking mechanism, and industry standards. Recommend that additional requirements be for those description be inserted based on actual field conditions.

Extrapolation of critical shear stress for untested blocks within a similar family of ACB are subject to limitations. Use extrapolation only for blocks having a similar footprint area and interlock mechanism, but with variable thickness or net weight/area. Accept extrapolation only if the following conditions are met:

a. The extrapolation is in strict accordance with hydraulic similitude methods commonly accepted by the industry, and includes quantitative treatment for a block overturning failure mode.

b. The tested block is the smaller product size in both thickness and net weight/area, and extrapolation does not extend the critical velocity more than 3 meters per second 10 feet per second from the tested product size.
2.1.2 Matrix Assembly - Interlocking Blocks

Interlocking blocks are assumed to function without the use of cables or similar restraints. Place void filler to inhibit lateral movement and block pullout, cover the geotextile, and increase hydraulic stability.

2.1.3 Matrix Assembly - Cabled Systems

Interconnect cable tied concrete block by flexible cables running through the blocks. Penetrate each block by a cable that allows articulation of the blocks, but restrains removal of individual blocks. Place void filler to inhibit lateral movement, cover the geotextile, and increase hydraulic stability. [Fabricate articulating concrete block, cables, and fittings into transportable mattresses at the manufacturer's plant.]

2.1.4 Structural requirements

**************************************************************************

NOTE: Freeze-thaw Testing - The specifier should edit this paragraph based on the project's location. The default values correspond to the default values in ASTM C1372, Segmental Concrete Retaining Wall Units. The freeze thaw requirements for retaining wall blocks are referenced since they are similar products, ACB blocks can be produced by similar manufacturing methods, and retaining walls have been the subject of more freeze thaw durability research. The number of seasonal freeze thaw cycles for typical ACB's is likely less than for retaining walls. Chloride from deicing salts or sea water increases saturation of the concrete, and thus has a very pronounced affect on freeze thaw degradation. New procedures has been developed and should be investigated and specify to measure the rate of freeze thaw degradation from chloride. The amount of degradation that is unacceptable should be stated.

**************************************************************************

Provide wet cast articulating concrete block using concrete as specified herein, or dry-cast by a vibratory block forming machine. Manufacture the blocks to the following requirements:

2.1.4.1 Compressive Strength

Provide a minimum compressive strength of 28 MPa 4000 psi for an average of 3 units, and 24 MPa 3500 psi for an individual unit. Determine compressive strength by ASTM C42/C42M for wet cast blocks, or by ASTM C140/C140M for dry cast blocks.

2.1.4.2 Water Absorption for Dry Cast Units

Provide a maximum water absorption for dry cast units of 145 kg/m^3 9 pcf for an average of 3 units, and 195 kg/m^3 12 pcf for an individual unit. Determine water absorption by ASTM C140/C140M.

2.1.4.3 Saturated Surface-Dry Density

Provide a minimum saturated surface-dry density of [140] [_____] for
average of 3 units, and [140] [_____] for an individual unit.

][2.1.4.4 Air Entraining

Air entrain wet cast concrete to contain between 4 and 7 percent total air determined in accordance with ASTM C138/C138M.

][2.1.4.5 Freeze-Thaw Durability

For freeze-thaw durability tested in accordance with ASTM C1262/C1262M, specimens must comply with either of the following: (1) the weight loss of each of 5 specimens after 100 cycles must not exceed 1 percent; or (2) the weight loss of each of 5 specimens after 150 cycles must not exceed 1.5 percent.

]2.2 GEOTEXTILE

**************************************************************************

NOTE: The AASHTO M 288 table provides survivability requirements. Class 1 is recommended for harsh or severe installation conditions where there is a potential for vehicular traffic, or where irregular sections may require removal and replacement of mattresses to achieve proper alignment. Class 2 is allowed where no vehicle traffic will occur on the installation, and where mattress placement is in regular, even reaches. Reference Protection of Work paragraph in Part 3.

Some manufactures require minimum geotextile properties for warranty coverage. Most manufacturers have recommended geotextiles, but these should be verified for compatibility with the subgrade soils.

Filters should not impede seepage. Clogging resistance is critical for uplift stability. Site specific design should be performed if any of the following problematic soil conditions are encountered: highly erodible soils such as non-cohesive silts, gap graded soils, or laminated sand/silt.

Some references for geotextile design include:
2. FHWA, "Geosynthetic Design and Construction Guidelines."

Geosynthetic Selection - The Federal Acquisition Regulations require full and open competition. Usually justification is not necessary if 3 products meet the specifications. In combining various material requirements, it is easy to specify a geosynthetic product that does not exist. Design utilizing geosynthetics should include a listing with the calculations that verify the specified
products are commercially available. The Geotechnical Fabrics Report magazine publishes an annual specifiers guide that is ideal for this purpose.

Submit two samples of the proposed block at the same time as the ACB and Geotextile Data submittal. Provide samples that are typical of the size, texture, color, and finish. If the Contracting Officer is familiar with the product, this submittal may be waived. Geotextile used as filters below the ACB must be a [woven] [non-woven] fabric. The geotextile must meet the material properties specified in AASHTO M 288 for Class [2] strength property requirements and for permanent erosion control. Base filter requirements in AASHTO M 288 on in-situ soil with [less than 15 percent] [15 percent to 50 percent] [greater than 50 percent] passing the 0.075 mm sieve opening. Geotextile used as a filter below the ACB must be a [woven] [non-woven] fabric, meeting the requirements specified in Table 2. The property values (except for AOS) represent minimum average roll values (MARV) in the weakest principal direction.

### 2.3 CABLE

#### 2.3.1 Installation Requirements for Cable

Use cable for preassembled mattresses that is sufficiently sized and fastened for the size/weight of the assembled mattresses such that the assembled mattresses can be placed in compliance with OSHA standards. The manufacturer is responsible for determining the minimum cable strength compatible with the mattress size for safe handling. Base cable strength on a minimum factor of safety of 5, and include appropriate reduction factors for mechanically crimped cable, and other fasteners. If applicable, include the use of a spreader bar for placing the mattresses in loading conditions.
2.3.2 Fasteners Other than Cable

Any systems which rely on geotextiles (or other fabric integral with the mattress) to maintain block-to-block interconnection must meet the applicable portions of this specification for cables. Geosynthetics strength must include appropriate factors of safety, with particular attention given to the grab points.

2.3.3 Design Requirements for Cable

******************************************************************************
NOTE: The designer may need to research survivability of cables in the environment where the ACB will be placed. The installation requirements for cable strength usually govern, unless anchors are used.
******************************************************************************

Use ropes manufactured from polyester, stainless steel wire, or galvanized steel wire for ACB's that rely on cables to maintain block to block interconnection. Provide cable with a minimum breaking strength of [_____] pounds. Construct polyester rope of high tenacity, large elastic modulus, continuous filament polyester fibers; and consisting of a core construction comprised of parallel fibers contained within an outer jacket or cover.

2.3.4 Anchors

******************************************************************************
NOTE: Anchors require a cabled system. Anchors should be used with caution. Control of mattress uplift may only be successful for short term, low frequency, overload. ACB mattresses that are locally uplifted, with or without anchors, may show significant subgrade distortion, which could be a precursor to failure. Anchors spaced throughout the revetment also require special details to maintain integrity of the geotextile filter.

Because anchors are not required for typical installations, this paragraph may commonly be deleted. Where anchors are used for specialized applications, add requirements for anchor materials, minimum property requirements, and design characteristics.

Drawings must detail location and spacing of anchors.
******************************************************************************

Submit calculations for the anchor pullout capacity. Tabulated manufacturer's data is acceptable, provided the embedment soils are proven applicable to the project site. Select anchors with an ultimate vertical pullout resistance for the project site soil conditions of at least [_____] pounds. Provide anchors that are capable of being attached directly to the ACB mat in a manner which will achieve little or no slack in the cable system or gaps in the ACB mattress. Attach anchors to the mat in such a manner that they will not be affected by tampering or vandalism. Anchors must have the capability of being load-tested to the specified pull-out capacity.
2.4 VOID FILLER

2.4.1 Aggregate

******************************************************************************
NOTE: Aggregate is used below the normal water level, or where turf can not be established.
Department of Transportation specifications for road base aggregate have been used, such as ASTM D1241, Gradation B.
******************************************************************************

Provide aggregate for filling the voids in the block meeting the requirements of [_____.]

2.4.2 Topsoil and Seed

Provide topsoil for filling the voids in the block and seed for turf establishment meeting the requirements of Section 32 92 19 SEEDING.

PART 3 EXECUTION

3.1 SUBGRADE PREPARATION

Place the ACB revetment on undisturbed native soils, or acceptably placed and compacted fill. Do not place the ACB on surfaces that contain mud, frost, organic soils, embankment that has not met compaction requirements, or where the Contracting Officer determines that unsatisfactory material remains in or under the subgrade.

3.1.1 Clearing

Completely remove all vegetation as specified in Section [31 00 00 EARTHWORK] [31 11 00 CLEARING AND GRUBBING]. Completely remove root balls and stump. Remove remaining roots from trees and brush to a depth of 0.3 meters 1 foot below the subgrade surface. Rake and remove loose roots and twigs, turf clods, stones larger than 13 mm 1/2 inch diameter, and other debris from the final surface. Correct rills and gullies from erosion.

3.1.2 Bank Grading

Finish grading to a smooth surface, typical of that obtainable with a dozer and blade. A rough surface typically obtained with a backhoe or dragline will not be acceptable. When ACB placement in water is shown on the drawings, the slope stability and grading requirements must be determined by a qualified geotechnical engineer. [When natural shorelines require grading in preparation for ACB installation, observe the bank stratification and document in daily Contractor Quality Control reports. Use grading practices that avoid spreading fine grained soils over more pervious soils, particularly near the toe of slopes. If inadequate material is available to comply with this requirement, notify the Contracting Officer.].

3.1.3 Compaction and Subgrade Finishing

[Compact fill soils to the specified density in Section 31 00 00 EARTHWORK.] Compact incidental grading (where embankment is not otherwise specified) by heavy equipment or by tamping with a bucket to a density characteristic of the surrounding soils. Compact the final surfaces
accessible by compaction equipment with a smooth drum roller or vibratory plate tamper until there is no further evidence of consolidation. Where slopes limit operation of compaction equipment, the final surface conditions must be determined by a qualified geotechnical engineer. Correct localized loose or soft zones.

3.1.4 Grade Tolerances

Provide grading tolerance within 50 mm 2 inches from the prescribed elevations, with no abrupt variations that would cause unacceptable projections of individual blocks.

3.1.5 Subgrade Surface Tolerances

Maintain the subgrade in a smooth condition between installation of the geotextile and the blocks. Rake windrows, stones, clods of cohesive soil, and irregularities smooth. Correct ruts, rills and gullies resulting from traffic, precipitation runoff, groundwater seepage, prior to installation of blocks.

3.2 GEOTEXTILE INSTALLATION

3.2.1 General

See "block installation" paragraph for drawing requirements. Lay the geotextile flat and smooth so that it is in direct contact with the subgrade. Provide geotextile that is free of tension, folds, and wrinkles. Minimize the number of seams and overlaps by selective orientation of geotextile panels, within the limitations of maintaining a consistent pattern. Place geotextile in accordance with the requirements of paragraph GEOTEXTILE. Place immediately prior to block installation, if necessary to limit damage to the geotextile from equipment or repeated pedestrian traffic and limit disturbance of the subgrade from precipitation or runoff.

3.2.2 Geotextile Seams

**************************************************************************
NOTE: Sewn, welded or glued seams are desirable for shoreline protection (or where flow reversal occurs). Substitute the following for sewn seams:

Seams must be continuously sewn at the locations shown on the drawings. The minimum distance from the geotextile edge to the stitch line nearest to that edge must be 75 mm 3 inches. Seam strength must meet the minimum requirements specified in AASHTO M288 for a class 2 geotextile. Take quality assurance samples at the request of the Contracting Officer. Tie off the thread at the end of each seam run to prevent unraveling. Seams must be on the top side of the geotextile to allow inspection. Sew skipped stitches or discontinuities with an extra line of stitching with a minimum of 450 mm 18 inches of overlap.

Pins/staples may not be desirable where filtration is critical.
**************************************************************************
Overlap seams a minimum of 450 mm 18 inches or according to manufacturers recommendations, whichever is the most stringent requirement. Provide shingled seams on slopes and butt end seams so that runoff and channel flow passes over the fabric. Secure geotextile panels before block placement by adequate sandbags, spare blocks, or pins/staples.

3.3 BLOCK INSTALLATION

Place all blocks in accordance with the manufacturer's recommendations and the Contractor's approved shop drawings. Submit drawings showing details of the ACB and Geotextile Installation, including the block layout patterns in relation to the feature alignment, anticipated locations of cast-in-place concrete joints, mattress junction details, soil anchors, and proposed installation methods for void filling materials.

3.3.1 Placement of Pre-Assembled Mattresses

***************
NOTE: The spreader bar may be deleted where tolerances are a minor concern. The spreader bar may have associated cost when placing one end of the mattress in water, due to work in disconnecting the rigging on the wet end.

***************

[Place pre-assembled ACB mattresses with mattresses attached to a spreader bar to aid in lifting, aligning and placing the mattresses. ]Place mattresses directly into position, with a maximum space or gap between mattresses of 75 mm 3 inches in excess of the nominal joint spacing of blocks within the mattress. Lift and reset mattresses out of alignment. Do not push or pull mattresses laterally after they are in contact with the geotextile. Do not accept overlapping of mats and blocks that project vertically more than 25 mm 1 inch beyond the adjacent blocks are not permitted. [As adjacent mats are placed, secure them to each other by fastening the protruding horizontal and vertical cable connections and end cable loops together along each side of the mats.]

3.3.2 Hand Placement of Interlocking Blocks

Space hand placed blocks to maximize the ACB ability to articulate. Use adequate alignment control, such as string lines, to keep the block pattern in alignment and the joint spacing consistent and uniform. Initially, no more than two working block rows must progress simultaneously in the direction of placement. Additional working rows may be added after experience shows that true lines are maintained. Choose a convenient location as the starting position for ACB placement for control of the block pattern alignment. Submit the starting position for placement of the ACB to the Contracting Officer for approval.

3.3.2.1 Target Joint Spacing

Install interlocking blocks with a uniform aperture in the interlocking connections. Neutrally space the target joint spacing with equal free-play for the joint to open and close.

3.3.2.2 Correction of Joint Spacing

If the block pattern becomes skewed to an extent that blocks bind, joints
close, or blocks stickup, then remove and replace the placed ACB that is determined to be out of tolerance. Where the nonconformance of the joint spacing is due to project features, such as warped slopes or anchor trenches, then field locate cast-in-place concrete joints in concurrence with the Contracting Officer.

3.3.2.3 Maintenance of Joint Spacing

If the block pattern becomes skewed to an extent that the joint freeplay is not acceptable to the Contracting Officer, then field locate cast-in-place concrete joints as directed by the Contracting Officer.

3.3.2.4 Block Layout Pattern Dependent on Project Features

If the block pattern is shown to be maintained parallel and perpendicular to selected project features, such as the crest/toe of levee/channel slopes, then implement field location of cast-in-place concrete joints as needed, and as directed by the Contracting Officer.

3.3.3 Tolerances

3.3.3.1 Vertical Tolerance

Maximum acceptable block projections (vertical offset from adjacent blocks) for "installation in the dry" must not exceed 0.5 inches for interlocking blocks, 25 mm 1.0 inch for cabled systems. Typical block projections must be less than half the maximum projections.

3.3.3.2 Horizontal Tolerance

Less than half the maximum projections.

3.4 ANCHORS

Carefully position anchors for attachment to the ACB. Align rigid shafts with the ACB cables. Flexible anchors (cables, ropes, and tie offs) must be linear between the ACB fastener and the restraining device before tensioning. Seal gaps and penetrations in the geotextile to allow for penetration of the anchor [in accordance with the drawing details].

3.5 CONCRETE JOINTS

3.5.1 General Requirements

Minimize use of cast in place concrete joints to the extent practicable. All concrete joints not shown on the shop drawings must be reviewed and approved by the Contracting Officer prior to field placement. Joints that require concrete include:

a. Joints between cable tied mattresses where the joint is 75 mm 3 inches wider than the nominal joint.

b. Joints where block interlock is discontinuous.

b. Abutments where the ACB meets headwalls, pipe penetrations, or sidewalks.

c. Any areas where there are partial blocks (to avoid small blocks with reduced hydraulic stability).
Field placed concrete must have a specified strength that is 1000 psi greater than the specified strength of the ACB concrete mixture. The durability properties of the ACB concrete must meet applicable portions of Section [03 30 00 CAST-IN-PLACE CONCRETE] [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE]. Complete all cable ties and anchoring prior to placing concrete.

3.5.2 Abutments

The ACB must abut pipe outlets, retaining walls, flood walls, head walls, sidewalks, and other abutments in a neat appearance. Unless a specific detail is indicated on the drawings, fill voids with partial blocks and fill the gap with cast-in-place concrete. Place the concrete flush with the surface of the blocks, and float finish. Strike control joints both vertically and horizontally in locations where gap fills exceed the width or height of a single ACB. Fill control joints with a polyurethane base sealant to be approved by the Contracting Officer prior to usage.

3.6 VOID FILLER AND SEEDING

**************************************************************************
NOTE: Topsoil will consolidate in the voids. Overfilling above the top of block is common to increase the topsoil fill level, but may increase sedimentation during turf establishment.

Broadcast seeding of ACB is difficult because it is difficult to rake the seed in. Hydroseeding of ACB is difficult because of channelization of runoff and susceptibility of the void filler to desiccation. In areas where establishment of quality turf is important, it has been successful to blend a rich mixture of seed (about 10 times the normal application rate, or about 0.5 to 1 kg/cubic m to 2 pounds per cubic yard) into the topsoil prior to placing. Hanging geogrids and retaining wall geogrids, now exist to facilitate vegetation, which may be useful in establishing vegetation. Watering during establishment is more critical than typical turf due to the heat absorption of the concrete blocks and capillary break of the geotextile.
**************************************************************************

Fill the voids of the articulating concrete block mats with topsoil, except fill voids below the normal water level with aggregate void filler. Complete all cable ties and anchoring prior to filling voids. Complete seeding and maintenance in accordance with Section 32 92 19 SEEDING.

3.7 PROTECTION OF WORK

Protect work against damage from subsequent operations. Remove and replace displaced or broken blocks to conform to all requirements of this section. Do not incorporate damaged material. Do not allow equipment on the ACB that could crack, cause abrasion, or otherwise damage the blocks. Do not operate vehicles directly on geotextile, except that rubber tired vehicles may operate directly on short reaches of geotextile that meets or exceeds AASHTO M 288 survivability requirements for Class 1 geotextile, if there is
no rutting, if the vehicle access is necessary to accomplish the work, and if the Contracting Officer observes the operation and approves. Do not operate vehicles on the ACB until (during or after) placement of void filler. Restrict vehicle traffic on the ACB to light weight rubber tired vehicles, and where intermittent access is necessary to accomplish the work. Do not establish routine haul routes on the ACB. These allowances do not waive the Contractor's obligation to maintain the installation until acceptance, and verify that vehicle access does not crack, or in any way damage, the ACB.

3.8 QUALITY CONTROL TESTING

**************************************************************************
NOTE: The manufacturer should have completed similar testing for it's own QC. The following testing is suggested as an acceptance check on a schedule typical for QA. The suggested frequency is on the order of 0.5 percent of construction cost.
**************************************************************************

Perform the following testing independent of the manufacturing process, by an agency other than the manufacturer. Sample and test the ACB blocks for compressive strength, water absorption and unit weight. The sample frequency must be 3 specimens for each 2500 m$^2$ 3000 SY. Test methods are consistent with those specified in PART 2 PRODUCTS.

LEVEE CONSTRUCTION

11/18, CHG 1: 02/20

**************************************************************************

NOTE: This guide specification covers the requirements for levee construction. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections.

This guide specification includes paragraphs for construction activity that may have their own UFGS Guide Specifications. These include Section 31 00 00 EARTHWORK, Section 31 66 10 ROCK FOUNDATION PREPARATION and Section 31 11 00 CLEARING AND GRUBBING among others. If those Guide Specifications are to be referenced, remove the appropriate paragraphs from this section or those as is appropriate.

Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

**************************************************************************

PART 1   GENERAL

**************************************************************************

NOTE: This guide specification includes the installation of settlement gages for the
determination of increases in quantities of embankment materials resulting from settlement of the embankment foundation during construction and for payment to the Contractor for such increases in quantities. These provisions should be included in a project specification when it is determined that settlement in the range of 5 percent or more of the planned embankment height is anticipated over a considerable portion of the embankment foundation area. They will also be used when gages are needed for engineering control purposes, required in critical locations or called for if adverse contractual relationships are expected. When settlement gages are to be used the following information will be indicated on the plans:

1. The location of the gages as well as the stations at which zero settlement will be assumed.

2. The detail construction of the foundation settlement gages to be used. Any applicable type of gage may be selected.

The requirements for rock as prescribed herein are intended to be used on embankments involving rock fill sections. Where rock for slope protection is specified, Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES should be used.

Approval of testing laboratory is addressed in ER 1110-1-8100, dated 31 Dec 1997, Laboratory Investigations and Testing.

1.1 [LUMP SUM] [UNIT] PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title ([LUMP SUM] [UNIT] PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00 as appropriate.

1.1.1 Clearing, Grubbing, and Stripping

NOTE: If Section 31 66 10 ROCK FOUNDATION PREPARATION or Section 31 11 00 CLEARING AND GRUBBING is included in the project specifications, this paragraph title Clearing, Grubbing, and Stripping should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 31 66 10 or Section 31 11 00 as appropriate.
1.1.1.1 Payment

Payment will be made for clearing, grubbing and stripping at the contract [lump sum] [unit price] for clearing, grubbing and stripping. This price will constitute full compensation for all equipment, labor, materials and incidentals necessary to complete the work specified herein. Payment for refilling of holes resulting from grubbing will be included in the contract [lump sum] [unit price] for clearing, grubbing and stripping. No separate or direct payment will be made for stockpiling and disposition of stripped materials. All costs in connection therewith will be considered as a subsidiary obligation of the Contractor. If regrowth of vegetation or trees occurs after clearing and grubbing and before placement of embankment, and the Contractor is required to clear and grub again prior to embankment construction, no payment will be made for this additional clearing and grubbing.

1.1.1.2 Measurement

**************************************************************************
Note: If clearing, grubbing, and stripping is to be paid for with a unit price bid item include the method of measurement. Delete this paragraph if payment is by lump sum.
**************************************************************************

Clearing, grubbing, stripping, stockpiling and the disposition of the materials from these operations will [not] be measured for payment. Refilling of grubbing holes will not be measured for payment.

1.1.1.3 Unit of Measure

Unit of measure: [lump sum] [unit price].

1.1.2 Demolition and Removal of Existing Structures

1.1.2.1 Payment

Payment will be made for demolition or removal of existing drainage structures, pavements, foundations, superstructure, walls, fences, or any other manmade object at the contract [lump sum] [unit price] for demolition and removal of existing structures. This price will constitute full compensation for all equipment, labor, materials and incidentals necessary to complete the work specified herein. Payment for refilling of holes resulting from removal of structures will be included in the contract [lump sum] [unit price] for demolition and removal of existing structures. No separate or direct payment will be made for stockpiling and disposition of removed materials. All costs in connection therewith will be considered as a subsidiary obligation of the Contractor.

1.1.2.2 Measurement

**************************************************************************
NOTE: If removal or demolition of existing drainage structures is to be paid for with a unit price bid item include the method of measurement. Delete this paragraph if payment is by lump sum.
**************************************************************************
Plugging or removal of existing structures required from these operations will [not] be measured for payment.

1.1.2.3 Unit of Measure

Unit of measure: [lump sum] [unit price].

1.1.3 Excavation

**************************************************************************
NOTE: If Section 31 00 00 EARTHWORK is used, this item should be deleted.

If excavation will not be measured or paid for separately, select the following paragraph and delete subparagraphs PAYMENT, MEASUREMENT, and UNIT OF MEASURE. Delete the following paragraph if excavation is to be measured and paid for separately. If significant quantities of rock excavation is anticipated measurement and payment for rock excavation should be addressed separately. A definition of rock excavation should also be included.
**************************************************************************

No separate measurement or payment will be made for Excavation. All costs in connection with excavation will be considered a subsidiary obligation of the Contractor.

1.1.3.1 Payment

Payment will be made for Excavation at the contract unit price which includes full compensation for all equipment, labor, materials, and incidentals necessary to complete the work specified. [No separate payment will be made for stockpiling.]

1.1.3.2 Measurement

Excavation will be measured for payment by use of the average end area method. The basis of measurement will be a survey of the area prior to the excavation [and clearing and grubbing] and a second survey of the same area after the completion of the excavation. For areas where lines and grades are shown on the drawings, measurement will be limited to those lines and grades. Slides caused by fault of the Contractor, over excavation, and excavation performed for will not be measured for payment.

1.1.3.3 Unit of Measure

Unit of measure: cubic meters yards.

1.1.4 Fill Material

**************************************************************************
NOTE: There are restrictions in guidance for the use of Hydraulic fill in levee construction. Designer should refer to EM 1110-2-1913 for guidance.
**************************************************************************
1.1.4.1 Payment For Embankment Fill

Payment will be made for material placed as required in embankments, backfills and ramps, and including additional material placed by reason of foundation settlement and by reason of soft material in the foundation being forced outward from the section during construction, for [Embankment Material Type [_____]],[Semicompacted Fill] [Uncompacted Fill] [Hydraulic Fill]. Payment will constitute full compensation for furnishing all plant, labor, equipment and material, [except earth material, and] performing all operations necessary for foundation preparation and placing and compacting the material [materials testing,] and moisture control. [This payment is in addition to any payment for excavating and transporting of the material as required in paragraph EXCAVATION.]

1.1.4.2 Measurement of Fill Material

******************************************************************************
NOTE: The last sentence of the following paragraph (in brackets) should be deleted if surveys are taken "after" clearing and grubbing operations. The last sentence should be included if surveys are taken "prior" to clearing and grubbing operations.
******************************************************************************

Submit a copy of the records of each compliance survey the next work day following the survey.

1.1.4.2.1 Fill Materials Specified for Embankment

Fill materials specified for embankment will be measured for payment by the cubic meter yard, and quantities will be determined by the average end area method. The basis for measurement will be cross sections of the areas to be filled taken [prior to] [after] clearing, grubbing, and stripping operations and the [theoretical cross sections] [actual cross sections] of the embankments constructed within the specified tolerance[ plus additional fill placed as the result of displacement or settlement of foundation material as calculated below].[ Cross sections will be performed at significant breaks in grade except that the maximum distance between cross sections will not exceed [_____] meters feet.] Embankments not constructed to design grade and section including allowable tolerance as indicated on the Contractor's compliance survey will not be accepted.[ Volumes occupied by drainage structures will not be included in measurement of embankment for payment.] [Material removed as a result of the clearing, grubbing, and stripping operations will not be included in measurement of embankment for payment.]

1.1.4.2.2 Fill Due to Soft Material in the Foundation

The basis for measurement of fill placed by reason of soft material in the foundation being forced outward from the section will be a survey of the area taken prior to fill placement and a second survey of the same area after completion of fill placement. The cross sections will extend [_____] meters feet beyond the toes of the fills.[ A cross section will be taken at each settlement measurement location.]

1.1.4.2.3 Levee Settlement

******************************************************************************
NOTE: The designer can choose to measure settlement
******************************************************************************
Measurement of additional fill material placed in each settlement measurement range, shown on the drawings by reason of foundation settlement, will be based on measurements [taken on the respective settlement gage] at the respective settlement measurement locations as specified and will be determined as follows:

a. The settlement measured at each settlement measurement location will be considered to apply to the foundation area throughout the length of the settlement ranges shown on the drawings.

b. The foundation settlement under the embankment at each transverse cross section within a settlement range will be considered to vary uniformly between break points in the cross section.

c. At each breakpoint, the settlement allowance will be based upon the proportion that the specified fill height at the break point bears to the specified fill height at the settlement measurement locations, in accordance with the following formula.

\[ S = h \times \frac{sm}{hm} \]

where:

<table>
<thead>
<tr>
<th>S</th>
<th>settlement to be computed at a break point</th>
</tr>
</thead>
<tbody>
<tr>
<td>h</td>
<td>specified gross fill height at S</td>
</tr>
<tr>
<td>sm</td>
<td>measured or adjusted vertical change at settlement measurement location</td>
</tr>
<tr>
<td>hm</td>
<td>specified gross fill height at settlement measurement location</td>
</tr>
</tbody>
</table>

d. Symbols used in the formula and the break points are [shown on a typical settlement cross section on the drawing] [included in these specifications].

1.1.4.2.4 Forfeiture of Payment for Settlement of Foundation

Failure to utilize settlement gages in strict accordance with the specifications and drawings will result in total forfeiture of any payment which will otherwise be due the Contractor for settlement of the foundation. Payment for settlement of the foundation will be totally forfeited for the reach attributable to the each settlement measurement location in each case for the following reasons: embankment over a settlement measurement location is constructed to a height in excess of the specified construction lines plus the tolerance permitted; settlement plates have been set and cannot be found after completion of the embankment; failure to take the settlement measurement within [_____] hours after the final cross sections have been taken over the completed embankment.

1.1.4.3 Unit of Measure

Unit of measure: cubic meters yards.

1.1.5 Mortar and Concrete for Foundation Preparation
NOTE: If Section 31 66 10 ROCK FOUNDATION PREPARATION, specifically paragraphs DENTAL CONCRETE or DENTAL MORTAR is a part of the project specifications, this section should be deleted.

1.1.5.1 Payment

Payment will be made for costs associated with mortar and concrete used in foundation and abutment preparation, which includes full compensation for furnishing all labor, equipment, material, and incidentals, and performing all operations necessary for placement of concrete and mortar for foundation and abutment preparation.

1.1.5.2 Measurement

Mortar and concrete used in filling spaces beneath rock overhangs and around protrusions will be measured for payment as the actual volumes of such mortar and concrete in cubic meters yards as determined by field surveys made before and after placement of the mortar and concrete. No measurement will be made for the mortar used in filling the open joints and cracks in the rock surface. Measurement of mortar or concrete used in filling the open joints and cracks in the rock surface will be made by the square meter yard based on the horizontal projection of the area obtained from a survey performed before application. Measurement of mortar or concrete used in filling the open joints and cracks in the rock surface will be the bags of cement used.

1.1.5.3 Unit of Measure

Unit of measure: cubic meters yards.

1.1.6 Settlement Gages

No separate payment will be made for furnishing, installing, and maintaining settlement gages during embankment construction as specified herein, if used, including measurements required to be made by the Contractor, and will be at the expense of the Contractor. No separate payment will be made for compaction of fill around and over the settlement gages or for interference with the Contractor's operations resulting from the settlement gage installations.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)**

**AASHTO M 43** (2005; R 2018) Standard Specification for Sizes of Aggregate for Road and Bridge Construction

**ASTM D4253** (2016; E 2019) Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table
1.3 DEFINITIONS

****************************************************************************************
NOTE: Add applicable definitions.
****************************************************************************************

1.3.1 Clearing

Clearing consists of the removal and satisfactory disposal of all [above ground and below ground] trees, downed timber, snags, slash, brush, garbage, trash, debris, fencing, and other items occurring in the designated areas to be cleared.

1.3.2 Grubbing

Grubbing consists of the removal and satisfactory disposal of stumps, roots larger than [_____] mm inches in diameter, and matted roots from the designated grubbing areas. Grubbing also includes filling of holes from the grubbing operation.

1.3.3 Stripping

Stripping consists of the removal and satisfactory disposal of crops, weeds, grass, and other vegetative materials to the ground surface[ and topsoil to a depth of [_____] mm inches].

1.3.4 Satisfactory Materials

****************************************************************************************
NOTE: Use of CH material should be avoided if possible. As a minimum, constraints should be set governing their use.
****************************************************************************************
Satisfactory materials consists of materials classified in accordance with ASTM D2487 as CL, [CH], CL-ML, ML, SC, SP, SW, [_____] free from: roots and other organic matter; contamination from hazardous, toxic or radiological substances; trash, debris; and frozen materials. Not all satisfactory materials can be used in levee. Only the satisfactory materials stated above, meeting the additional or modified requirements of paragraph TYPES OF FILL MATERIALS, can be used for levee construction.

1.3.5 Unsatisfactory Materials

Do not use unsatisfactory materials in any levee or other required fill. Unsatisfactory materials includes all other materials that are not defined above as satisfactory materials. Materials which do not comply with the requirements for satisfactory materials are unsatisfactory. Unsatisfactory materials also include, man-made fills (unless excavated, sorted/separated/stockpiled, and tested); trash; refuse; backfills from previous construction; and material classified as satisfactory which contains root and other organic matter or frozen material.

1.3.6 Embankment

The term "embankment" as used in these specifications is defined as the earth [and rock] fill portions of the levee structure or other fills related to the levee structure, including [cut-off trench] and includes all types of earth fill [and filter materials] for the levee [and cut-off trench] and all other fills within the limits of the levee as shown on the project drawings. [Stone and other rock materials used for slope protection are described in paragraph [_____]].

1.3.7 Backfill

Backfill as used in this section is defined as that fill material which cannot be placed around or adjacent to a structure until the structure is completed or until a specified time interval has elapsed after completion.

1.3.8 Excavation

Excavation consists of removal of material to the lines and grades shown on the drawings, or as otherwise directed or approved by the Contracting Officer and as described in paragraph [_____] EXCAVATION in PART 3 EXECUTION.

1.3.8.1 Over-excavation

Excavation performed beyond lines and grades shown on the plans that is made at the convenience of contractor. No separate payment will be made for over-excavation or for additional embankment materials needed to backfill the over-excavation.

1.3.8.2 Additional Excavation

Excavation performed beyond lines and grades shown on the plans that is performed at the direction of the Government, and to be paid at unit prices for excavation and backfill, or as negotiated.

1.3.9 Classification of Soils

Materials used to construct the embankments and for backfills will be
classified in accordance with ASTM D2487 (Unified Soil Classification System). Cohesionless materials include materials classified in ASTM D2487 as GW, GP, SW, and SP. Cohesive materials include materials classified as GC, SC, ML, CL, MH, and CH. Materials classified as GM and SM will be identified as cohesionless only when the fines are nonplastic.

1.3.10 Degree of Compaction

1.3.10.1 Cohesive Material

**************************************************************************
Note: If a higher compactive effort than is attainable by ASTM D698 is desired, ASTM D1557 may be utilized and references to ASTM D698, relative to compactive effort, should be changed to ASTM D1557.
**************************************************************************

Degree of compaction is expressed as a percentage of the maximum density obtained by the test procedure presented in [ASTM D698] [ASTM D1557], abbreviated hereinafter as percent laboratory maximum density.

1.3.10.2 Cohesionless Material

**************************************************************************
Note: Factors such as (but not limited to) site specific materials, availability of testing equipment and local practice may make it more practical to utilize methods other than ASTM D4253 and ASTM D4254 to control the degree of compaction of cohesionless material. If other methods are utilized the appropriate sections of the specifications should be modified to reflect method selected. The other methods used include comparison of in-place density to either the maximum Proctor density or the maximum density obtained by ASTM D4253 (if vibratory table is available).
**************************************************************************

Degree of compaction is expressed as a percentage of the relative density in accordance with ASTM D4253 and ASTM D4254.

1.4 SYSTEM DESCRIPTION

**************************************************************************
NOTE: This section should describe all appropriate activities to be performed to accomplish the completed projects as planned, including any special work items that must be conducted.
**************************************************************************

The work covered by this section consists of furnishing all equipment, labor, materials, and incidentals, and performing all operations necessary for the clearing, grubbing, and stripping of the areas specified herein or indicated on the drawings, and for the removal and disposal of cleared, grubbed, and stripped materials,[ removal or plugging of existing drainage structures], and refilling of holes resulting from grubbing; excavation of borrow areas [and existing levees], and for all other required excavations or excavations incidental to the construction of levees[, channels] [, ditches] [, structures] [, and ponding areas] as specified and shown;
foundation preparation and the construction of levee embankments, including new levee, enlargement of existing levee, backfill of inspection trenches, cutoff trenches, berms, road crossings, backfill at drainage structures, and other incidental earthwork as may be necessary to complete the levee as specified herein and as shown on the drawings. All work under this section will comply with the requirements of EM 385-1-1.

1.4.1 Embankment and Backfill Materials

*************************************************************************
NOTE: All available sources of materials for embankment and backfill should be designated.
*************************************************************************

At least [30] [_____] days prior to delivery of any Contractor-furnished material to the site of the work, submit soil classification test results, moisture-density curves, gradation curves, and laboratory results of the required tests of the proposed material. Materials for embankment and backfill construction will be obtained from [the borrow sources] [sources provided by the Contractor] [required excavation]. Materials obtained from required excavation which meet or which can be processed to meet the requirements for each embankment material, or any other material required for this project, as specified herein, may be utilized [in the appropriate zone of] [in] the embankment or as backfill. Submit to the Contracting Officer the source or sources intended to provide materials for embankment construction. If a source is selected other than a commercial quarry or other commercial entity from which earth or rock material will be directly purchased and where the Contractor or his subcontractor will perform the borrow excavation, a written statement will be provided to the Contracting Officer indicating permission to utilize the area. It is the Contractor's responsibility to obtain Federal, State, and local permits which may be required for excavation and reclamation of the borrow area. A copy of the plan and procedures to be utilized for reclamation will be furnished to the Contracting Officer as required in Section [_____] paragraph [______]. The Contracting Officer will require material samples from any proposed borrow source to be submitted as indicated in paragraph FIELD QUALITY CONTROL.

1.4.2 Haul Roads

*************************************************************************
NOTE: Haul roads are highly project specific. Contractor should be given as much latitude as feasible to determine his traffic patterns. Haul roads must be safe, not interfere with public traffic, environmentally friendly and generally must be restored to preconstruction conditions.
*************************************************************************

Locate and construct haul roads [as indicated and] [as] [approved by the Contracting Officer] [within the project boundaries shown on the drawings]. [Prior to the commencement of construction submit for approval a site plan detailing the location of all haul roads within the project limits.] [Locate haul road[s] between the borrow site[s] and the levee embankment within the limits [shown on the drawings] [approved by the Contracting Officer].] [Mark the limits of the borrow haul road in the field using construction fencing or similar methods approved by the Contracting Officer. Areas on each side of the borrow haul road corridor must not be disturbed.] Construct haul roads to maintain the intended traffic, be free draining, and remain in good condition throughout the
Any haul road which crosses any creek or drainage channel must be constructed, and maintained so as to not flood either upstream areas by restricting stream flows or flood downstream areas by the release of any stored water in the event that the crossing fails for any cause. Remove haul roads constructed during the contract duration after work is completed and the impacted area restored to its preconstruction conditions. Plow and/or scarify or otherwise loosen all access and haul roads other than existing roads to a minimum of [_____] mm inches deep and leave the surface in a smooth condition. All haul roads within the right-of-way that will remain as public thoroughfares after construction must be cleaned daily and maintained in the preconstruction condition. Consider all costs associated with these haul roads as a subsidiary obligation of the Contractor.

1.4.3 Ramps and Crossings

Construct ramps and crossings at the locations shown on the drawings by placement of a fill as specified in paragraph [______]. Construct ramps and crossings by adding material to the levee crown and slopes. Provide ramps that have a [_____] meter foot crown width, a grade not to exceed [_____] percent, and IV on [_____]H side slopes.

1.4.4 Runways

**************************************************************************
NOTE: Runways are temporary haul roads over a levee.
**************************************************************************

Where material is hauled over an existing levee for construction, the Contractor, at no extra cost, will be permitted to construct temporary runways over the levee by the addition of material to the levee cross section. For the construction of runways, if the Contractor so desires, the existing levee may be cut, [but not to exceed a depth of [_____] meters feet below the crown] [not to exceed [_____] meters feet below the project flowline] [or 100-year level] [not to excavate below elevation [_____] or one half the height of the levee, whichever is less], and provided that the cut is made with side slopes not steeper than 1V on 1H, and with a minimum width of haul road of [_____] [7.6] m [_____] [25] feet for one-way traffic, and [_____] [18.3] m [_____] [60] feet for two-way traffic. Cutting into the existing levee at intervals of less than [_____] [152] m [_____] [500] linear feet for the [_____] [7.6]-m [_____] [25]-foot bottom widths or less than [_____] [304] m [_____] [1,000] linear feet for the [_____] [18.3]-m [_____] [60]-foot bottom widths will not be allowed, and no more than [_____] runways will be open at one time. Stockpile, as directed by the Contracting Officer, sufficient suitable levee embankment material to construct emergency closure of the cuts.

1.4.5 Closure of Runways

Where runways have been cut through the levee, the Contracting Officer reserves the right to order their closure at no additional cost to the Government at any time that such runways may endanger the security of the levee. Just prior to restoration of the runway, the bottom of any cut made in the levee must be broken to a depth of [_____] [300] mm [_____] [6] inches and the side slopes thoroughly scarified. The restoration must be made with suitable embankment material, placed and compacted as provided in paragraph [_____]. Remove material used in the construction of the approach ramps of the runways and use for fill, if satisfactory. If not used for fill, dispose the material by placing it in abandoned portions of
the borrow areas or by any other method specified in paragraph disposal of
material. [No section of the levee will be degraded or weakened to provide
runways nor will existing runways remain open during the nonwork season
described in [GENERAL CONTRACT REQUIREMENTS], [paragraph] [Clause]
EXCLUSION OF PERIODS IN COMPUTING COMPLETION SCHEDULES, unless otherwise
approved in writing by the Contracting Officer.]

1.4.6 Stockpiling

**************************************************************************
NOTE: Cost of stockpiling embankment fill material
should be included in the price for placing fill in
the levee embankment.
**************************************************************************

Any on-site stockpiling of embankment materials will be in accordance with
paragraph [_____] Stockpiles. [No payment will be made for such
stockpiling nor for the reloading and hauling of these materials to their
final position.]

1.4.7 Slides and Foundation Failures

When sliding occurs in any part of the embankment and backfills prescribed
in this section after they have been placed, but prior to final acceptance
of all work under the contract, either cut out and remove the slide from
the embankment and then rebuild that portion of the embankment, or
construct a stability berm of such dimensions, and place in such manner as
prescribed by the Contracting Officer. When the slide is caused through
the fault of the Contractor, the repair will be made at no cost to the
Government.

1.4.8 Drainage Requirements

**************************************************************************
NOTE: Modify the following paragraph for specific
job conditions such as fill placed in/under water.
**************************************************************************

Submit written evidence consisting of an authenticated copy of the
[conveyance] [easement] under which the Contractor acquired the property
rights and access thereto, prepared and executed in accordance with
applicable State and local requirements. Do not block or restrict the flow
in a natural drain, existing culvert, ditch or channel at any time without
obtaining prior written approval from the Contracting Officer. This
approval will not relieve the Contractor from responsibility for any damage
caused by the operation. Monitor the [river] [canal] [stream] flow and
provide sufficient free discharge areas so that conditions are not worsened
upstream or downstream by possible floods during construction. Surface
water will be directed away from excavations and construction sites so as
to prevent erosion and undermining of foundations. Diversion ditches,
dikes, and grading will be provided and maintained as necessary during
construction. Protect excavated slopes and backfill surfaces to prevent
erosion and sloughing. Perform excavation so that the site and the area
immediately surrounding the site and affecting operations at the site will
be continually and effectively drained. If private property is to be used
for drainage, submit written evidence that the right has been obtained from
the property owner for drainage on his property.
1.5 SUBMITTALS

******************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

******************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Plan Of Operations; G[, [_____]]

Submit complete and detailed descriptions of proposed earthwork plan. This plan must include, but not be limited to, the Contractor's proposed sequence of construction for all earthwork including backfill and embankment items; methods and types of equipment to be utilized for all earthwork operations, including transporting, placing and compacting; quantity, type and final disposition of stockpiled materials; location and drainage of proposed stockpiles; proposed disposition of all excavated materials, including items which are anticipated to be disposed of
off-site. Submit the earthwork plan to the Government not less than 30 days prior to initiating any earthwork operation.

**Embankment And Backfill Materials; G[, [_____]]**

At least 30 days prior to delivery of any Contractor-furnished material to the site of the work, submit soil classification test results, moisture-density curves, gradation curves, and laboratory results of the required tests of the proposed material.

**Excavation; G[, [_____]]**

Submit complete and detailed descriptions of proposed excavation plan. Obtain approval of the detailed plan from the Contracting Officer prior to starting the work. If necessary, modify the plan as required to meet field conditions, and the modifications must be approved prior to use. This plan must include:

a. Proposed methods for preventing interference with, or damage to, existing underground or overhead utility lines, trees designated to remain and other man-made facilities or natural features designated to remain within or adjacent to the construction rights-of-way.

b. Provision for coordinating the work with other Contractors working in the construction rights-of-way or on facilities crossing or adjacent to this work.

c. The proposed methods for controlling surface and ground water in the borrow areas and required excavations.

d. Stockpiling plan for embankment material before it is transported to the project site showing locations, stockpile heights, slopes, limits, and drainage around the stockpile areas.

e. A complete listing of equipment used for excavation and to transport the excavated material.

f. The proposed sequence of work for excavating the borrow areas with plan and cross sectional views showing starting and final work locations and clearing, grubbing and stripping limits.

g. The proposals for conserving arable land and for making optimum use of available borrow, including the Contractor's proposed methods for grading the bottom of the borrow areas after completing use of the borrow areas.

h. The proposed haul road and haulage patterns, and plan for implementing dust control measures.

i. Proposed disposition of all excavated materials, including items which are anticipated to be disposed of off-site.

**SD-02 Shop Drawings**

**Drainage Requirements**

**SD-03 Product Data**
1.6 PROJECT SITE CONDITIONS

**************************************************************************

NOTE: The following paragraphs are commonly included with Division 02, EXISTING CONDITIONS. If those sections are to be used, the following paragraphs should be deleted.

**************************************************************************

1.6.1 Protection of Man-Made Facilities and Natural Features

Trees within the clearing area will be felled in such a manner as to avoid damage to trees left standing and trees outside the clearing area, existing buildings, man-made facilities and natural features, with due regard to the safety of employees and others, and in compliance with EM 385-1-1. Excavation will follow the same requirements specified above for felling trees and will be in compliance with EM 385-1-1. Existing utility lines that are shown on the drawings or the locations of which are made known to the Contractor prior to excavation and that are to be retained will be protected from damage during excavation. When utility lines that are to be removed are encountered within the area of operations, notify the applicable utility companies in sufficient time for measures to be taken to prevent interruption of the services.

1.6.2 Historical, Archeological, and Cultural Resources

Historical, archeological, and cultural resources within the Contractor's work limits [are known to exist] [may exist]. If, during construction activities, the Contractor observes items that may have historical or archeological value, such observations will be reported immediately to the Contracting Officer so that appropriate authorities may be notified and a determination made as to their significance and what, if any, special disposition of the finds should be made. Cease all activities that may result in the destruction of these resources and prevent the workers from trespassing on or otherwise damaging such resources.

1.6.3 Subsurface Data

Subsurface soil boring logs are [shown on the drawings] [included in these specifications] [found in the Project Geotechnical Report]. Subsurface investigation reports and samples of materials obtained from subsurface investigations may be examined at the [_____] District Office. These data represent subsurface information at the boring locations; however, variations may exist in the subsurface between boring locations. The
Contractor is ultimately responsible for subsurface interpretation across the entire project site. Groundwater levels indicated on the soil boring logs were levels found at the time of exploration. The groundwater table can vary significantly depending on time of year, variation from normal precipitation, and river stage or tide level. Contractor is ultimately responsible for subsurface interpretation across the entire project site.

1.7 MERCHANTABLE TIMBER

**************************************************************************
NOTE: The following paragraphs are commonly included with Division 02, EXISTING CONDITIONS. If those sections are to be used, the following paragraphs should be deleted.
**************************************************************************

Merchantable timber remaining within the areas to be cleared on or after the date of award of this contract may be disposed of as the Contractor sees fit, as long as such merchantable timber is either removed from the rights-of-way or is satisfactorily disposed of in accordance with the paragraph DISPOSITION OF CLEARED, GRUBBED, AND STRIPPED MATERIAL DISPOSITION OF EXCAVED MATERIAL and the Contractor complies with all applicable State and local regulations and laws.

1.8 SEQUENCING

1.8.1 Clearing and Grubbing

**************************************************************************
NOTE: If the specification for this project includes Section 31 11 00, CLEARING and GRUBBING, the following paragraph should be deleted.
**************************************************************************

Complete all clearing and grubbing work at least [100] [_____] meters [300][_____] feet in advance of embankment construction.[ In locations where work on drainage structures is performed prior to embankment construction, complete all clearing and grubbing for the structure at least [_____] meters feet on each side of the structure, measured along the levee centerline and [_____] meters feet perpendicular to the structure.] If regrowth of vegetation or trees occurs after clearing and grubbing and before placement of embankment, the Contractor will be required to clear and grub again prior to embankment construction.

1.8.2 Stripping

After inspection and acceptance of cleared and grubbed areas, stripping may proceed. All stripping work must be completed not more than [_____] meters feet in advance of embankment construction.

PART 2 PRODUCTS

**************************************************************************
NOTE: After "PART 2 PRODUCTS" above, insert the following "(NOT APPLICABLE)", if there are no subparagraphs in PART 2. PART 2 material requirements should be added for contracts in which the Contractor is required to supply materials.
**************************************************************************
2.1 HAUL ROAD MATERIALS

[____].

2.2 TYPES OF FILL MATERIALS

**************************************************************************

NOTE 1: The types of fill materials used for levee construction usually depend on the availability of materials from required construction excavation and the nearby borrow sources. The material types listed below as satisfactory materials are often used in levee construction.

2: Separate paragraphs, such as those below, should be included for EACH material type that is to be placed under a contract. The plans should clearly show, with labels, the location of the fill types. Embankment fills should include, but not be limited to, the levee, berms, inspection trench, cutoff trenches and any other specified fill or backfill. This allows the Designer and Specifications Engineer to use multiple fill types within the same contract and clearly indicate locations of each type. The types of satisfactory materials should be edited for each type of fill. The bid schedule should include a line for each type of fill. Where multiple fills are placed in layers or zoning, the measurement, payment and tolerance paragraphs should be edited to specify the interfaces of the multiple fill types.

Omit the following soil types which are not applicable to the specific project.

**************************************************************************

2.2.1 [Select Fill]

Obtain select fill embankment material from [the borrow site provided by the Government] [sources provided by the Contractor] [required excavation]. Provide select fill material consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].

2.2.2 [Impervious Fill]

**************************************************************************

NOTES: Caution should be exercised regarding the use of high plasticity clay and silt (CH, MH) soils with Plasticity Indices greater than about 40 (30 in dry climates and 50 in humid climates). Spreading and compacting CH or MH materials can also present constructability problems due to difficulty maintaining proper moisture content. These soils are susceptible to shrinkage and cracking upon drying. Seasonal cycles of swelling and shrinkage can also result in loss of shear strength, which may ultimately result in slope instability. Chemical treatment, such as lime, has been used to reduce the PI and potential for cracking.
Compact Impervious Fill material using self-propelled or towed sheeps-foot rollers.
**************************************************************************
Provide material consisting of satisfactory impervious material classified as lean clay (CL), fat clay (CH), low plasticity silt (ML), high plasticity silt (MH), sand containing more than 30 percent of clay (CL), and borderline clay and silt (CL-ML) in accordance with ASTM D2487.
2.2.3 Pervious Fill
**************************************************************************
NOTE: The designer should define the types of material which are acceptable as Pervious Fill.
**************************************************************************
Provide material consisting of satisfactory pervious material classified as well graded sand (SW), poorly graded sand (SP), poorly graded gravel (GP) or well graded gravel (GW) in accordance with ASTM D2487.
2.2.4 Random Fill
Provide random fill consisting of any satisfactory materials (other than those classified in ASTM D2487 as [_____] and any silt or sand with a uniformity coefficient (Cu) less than 6. Random fill may consist of select fill, impervious fill, and pervious fill, or a combination of them.]
2.2.5 Random Rock
**************************************************************************
NOTE: Random rock is sometimes used in levee construction to build up an underwater levee toe foundation or to buttress a slope in a constricted area. Due to its high permeability, random rock or pervious fill should not be used alone as levee fill material. The designer should select the types of acceptable rock material and the maximum allowable percent fines.
**************************************************************************
Provide random rock consisting primarily of [_____] (shale, siltstone, sandstone, granite or limestone) obtained from a source provided by the Contractor. Provide random rock that is free of silt, clay, or other earth material in quantities greater than [_____] [5] percent by weight, and containing no debris or organic material. Random rock must be reasonably well-graded and the largest stones must have a maximum dimension not exceeding [_____] [450] mm [_____] [18] inches. Control rock production at the source such that not more than 20 percent of the material has a maximum dimension between adjacent earth fill choke off with a layer of finer random rock material. Random rock placed within 1 meter 3 feet of any structure must have a maximum size of 125 mm 5 inches.
2.2.6 Coarse Drainage Gravel
**************************************************************************
NOTE: It is important to use appropriate filter criteria in the design of the drainage features. Selection of the gradation for the coarse and fine
drainage materials should be developed with 
consideration of filter compatibility with native
soils and the materials to be obtained for use.

Obtain coarse gravel material for the [rectangular and trapezoidal] toe
drains [landside seepage berms] [road stone] from a source [provided by the
Contractor]. Provide coarse drainage gravel that is non-calcareous,
composed of tough durable particles, and does not contain any organic
material or soft, friable particles in quantities. Blast furnace slag will
not be permitted. The gravel material in-place must meet the quality
requirements of [AASHTO M 43, Size No. 57][ASTM C33/C33M No. 57].

][2.2.7 Fine Drainage Gravel

NOTE: Identify source of materials. It is
important to use appropriate filter criteria in the
design of the drainage features. Selection of the
gradation for the coarse and fine drainage materials
should be developed with consideration of filter
compatibility with native soils and the materials to
be obtained for use.

Obtain fine drainage gravel material for the [rectangular and trapezoidal]
[toe drains] [landside seepage berms] [road stone] from a source [provided
by the Contractor]. Provide fine drainage gravel material that is
non-calcareous, composed of tough durable particles, and does not contain
organic material. The fine drainage gravel in-place must meet the
requirements of [AASHTO M 43, Size No. 8][ASTM C33/C33M].

][2.2.8 Filter Sand

NOTE: It is important to use appropriate filter
criteria in the design of the drainage features.
Selection of the gradation for the coarse and fine
drainage materials should be developed with
consideration of filter compatibility with native
soils and the materials to be obtained for use.

At least [30] [_____] days prior to delivery of any Contractor-furnished
material to the worksite, submit soil classification test results and a
gradation curve for each of the proposed filter materials to be used. Fine
aggregate for the filter sand in-place must meet the quality requirements
of ASTM C33/C33M grading for fine aggregate with additional limits on the
allowable percentage passing the No. 200 sieve as specified below.

<table>

</tr>
</tbody>
</table>
Additionally, the filter sand must not contain any organic matter or soft friable particles.

2.2.9 Bedding

Bedding material, placed as a backing layer must consist of satisfactory pervious fill material satisfying the material requirements presented in [Section 31 36 00 GABIONS] and [Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES].

2.2.10 Topsoil

Provide topsoil consisting of organic soil and place on the levee slopes as shown on the contract drawings and as specified in Section [32 92 23 SODDING] [____].

2.2.11 Semicompacted Fill

******************************************************************************
NOTE: The designer should list the material types that are acceptable for semicompacted fill, which can be defined in terms of previously defined fill types or basic material types.
******************************************************************************

Provide material for semicompacted fill consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].

2.2.12 Uncompacted Fill

******************************************************************************
NOTE: The designer should list the material types that are acceptable for uncompacted fill, which can be defined in terms of previously defined fill types or basic material types.
******************************************************************************

Provide material for uncompacted fill consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].

2.2.13 Hydraulic Fill for Berms and Depressed Areas

******************************************************************************
NOTE: Caution should be used when specifying hydraulic fill. Hydraulic fill is to be used only in stability berms, pit fills, and seepage berms. Hydraulic fill will normally not be used in construction for levee embankment. In addition to

<table>
<thead>
<tr>
<th>SIEVE SIZE U.S. STANDARD SQUARE MESH</th>
<th>PERCENTAGE BY WEIGHT PASSING INDIVIDUAL SIEVE</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>
requiring a large levee footprint, the levee embankment constructed by hydraulic fill is susceptible to soil liquefaction, and excessive seepage. Hydraulic fill also erodes quickly in a situation where a levee is overtopped or where an impervious covering is penetrated. See the appropriate Engineering Manuals for further guidance.

Tie this back to Section 01 45 00 QUALITY CONTROL requirement for inspection and validation of CQC laboratories by the government.

Place fill shown on the drawings as hydraulic fill by hydraulic methods in accordance with the plan of operations approved by the Contracting Officer. Thirty (30) days prior to commencement of haul road construction or placing embankment and backfill, whichever is earlier, submit for approval a Plan of Operations for accomplishing all embankment and backfill construction and for the location and construction of haul roads. This plan must include, but not be limited to, the proposed sequence of construction for embankment and backfill items, and methods and types of equipment to be utilized for all embankment and backfill operations, including transporting, placing, and compaction. This plan must also include the names and addresses of the engineering firms which will perform the soil testing and inspection and describe how all required soils testing will be performed. The dredged material must have, as placed, not less than [_____] percent by weight passing U.S. Standard Sieve No. [_____] and not less than [_____] percent by weight passing a U.S. Standard Sieve No. [_____]....
2.6.2 Settlement Markers and Survey Monuments

Install survey monuments and settlement markers as shown.

2.6.3 Settlement Gages

Provide settlement gages as shown.

PART 3 EXECUTION

3.1 CONSTRUCTION

3.1.1 Lines and Grades

Construct embankment and backfill to the lines, grades, and cross sections indicated on the drawings, unless otherwise directed by the Contracting Officer. The Government reserves the right to increase or decrease the foundation widths and embankment slopes or to make such other changes in the embankment or backfill sections as may be deemed necessary to produce a safe structure. Changes in quantities resulting from such revisions will not constitute justification for change in contract unit prices, except as provided for in FAR 52.211-18 Variation in Estimated Quantities Clause. Increases in height of section, made to compensate for settlement or consolidation of the embankment material subsequent to the completion of the embankment, will not exceed [_____] percent of the height above the foundation at the levee centerline indicated. Provide end slopes and side slopes of partial fill sections no steeper than [one vertical on [_____] horizontal] [, unless otherwise shown on the drawings].

3.1.2 Conduct of the Work

Maintain and protect the embankment and backfill in a satisfactory condition at all times until final completion and acceptance of all work under the Contract. If, in the opinion of the Contracting Officer, the hauling equipment causes horizontal shear planes or slicken sides, rutting, quaking, heaving, cracking, or excessive deformation of the embankment or backfill, limit the type, load, or travel speed of the hauling equipment on the embankment or backfill. The Contractor may be required to remove, at no additional payment, any embankment material placed outside of prescribed slope lines. Replace approved embankment or backfill material which is lost in transit or rendered unsuitable after being placed in the embankment or backfill and before final acceptance of the work in a satisfactory manner and no additional payment will be made therefore.

Excavate and remove from the embankment or backfill any material which is unsatisfactory, dispose of such material, and refill the excavated area as directed, all at no cost to the Government.

3.2 CLEARING

Accomplish clearing within the [limits][construction limits shown on the drawings] of existing ground to receive embankment [and structures], together with strips [1.5] [_____] meters [5] [_____] feet wide, beyond and contiguous thereto, existing levees to be degraded, ponding areas, ditches, structures, traverses, channels, riprap, revetment, borrow areas and ramps. Clear trees, downed timber, snags, slash, brush, garbage, trash, debris, fencing and other items [_____] mm inches above [flush with] the existing ground surface. Protect trees and vegetation designated to be left standing or to remain from damage from construction operations. Limit
clearing of borrow areas to the minimum area required for construction operations.

3.3 GRUBBING

Accomplish grubbing within the [limits][construction limits shown on the drawings] of existing ground to receive embankment [and structures], together with strips [1.5] [_____] meters [5] [_____] feet wide, beyond and contiguous thereto, existing levees to be degraded, ponding areas, ditches, structures, traverses, channels, riprap, revetment, borrow areas and ramps. Accomplish grubbing to a depth of at least [1] [_____] m [3] [_____] feet below the existing ground surface. Fill holes caused by grubbing operations and removal of pipes and drains, excluding holes in borrow areas, channels and ditches [above required grade], with satisfactory material as specified in paragraph [______]. Place material in [_____] mm inch layers to the elevation of the adjacent ground surface and each layer compacted to a density at least equal to that of the adjoining undisturbed material.

3.4 STRIPPING

The entire area within the [limits][construction limits shown on the drawings] of existing ground to receive embankment and structures, together with strips [1.5] [_____] meters [5] [_____] feet wide, beyond and contiguous thereto, existing levees to be degraded, ponding areas, and ditches [shown on the drawing must be stripped to remove crops, weeds, grass, and other vegetative materials to the ground surface [and topsoil to a depth of [_____] mm inches]].

3.5 DISPOSITION OF CLEARED, GRUBBED, AND STRIPPED MATERIAL

**************************************************************************
NOTE: Delete undesirable options for Disposition of Cleared, Grubbed, and Stripped Materials.
**************************************************************************

Except as otherwise specified or indicated on the drawings, dispose all materials resulting from clearing and grubbing operations at the Contractor's option, by windrowing or stockpiling within construction limits, burying within construction limits, burning, chipping, removal from the site, or a combination thereof. Do not bury or place any material resulting from clearing and grubbing operations within the levee foundation or any structural foundation. Make a reasonable effort to channel merchantable material into the commercial market and to make beneficial use of the materials resulting from clearing and grubbing. [Temporarily stockpile the topsoil material resulting from the stripping operations within the rights-of-way.]

3.5.1 Windrows

Place cleared, grubbed and stripped material [as shown on the drawings] in a neat windrow or in piles with tree limbs trimmed sufficiently to make the windrow as small as practicable. Do not extend cleared, grubbed or stripped material beyond the construction limits.

3.5.2 Burning

Subject to applicable Federal, State and local burning restrictions, the Contractor may burn material within the contract rights-of-way. Conduct
burning operations to prevent damage to adjacent man-made facilities and natural features. The Contractor is responsible for any damage to life and property resulting from fires that are started by the Contractor's employees or as a result of the Contractor's operations. Furnish, at the site of burning operations, adequate fire fighting equipment to properly equip personnel for fighting fires. Guard fires at all times and provide constant surveillance until they have been extinguished. Remove all unburned material (material not reduced to ash) from the site or dispose of by [____].

3.5.3 Burying

Subject to applicable Federal, State and local burying restrictions, the Contractor may bury the cleared and grubbed material in the area(s) as shown on the drawings or in [____]. Do not bury material within [____] meters feet of any standing timber. Cover all buried material with a minimum of [____] mm inches of earth.

3.5.4 Chipping

All cut timber, down timber, dead timber, branches, and brush may be chipped. Haul the chips to stockpiles indicated on the drawings or to other locations approved by the Contracting Officer or remove from site of work. Deposit chips in these areas in piles or windrows [above] [below] elevation [____] NGVD.

3.5.5 Removal from Site of Work

The Contractor may elect to remove all or part of the cleared and grubbed materials from the site of the work[ in accordance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS]. The Contractor may opt either to retain any such materials of value or dispose of them by sale or otherwise. The Government is not responsible for the protection and safekeeping of any materials retained by the Contractor. [Materials resulting from the clearing and grubbing operations must be removed from the site [weekly] [monthly].][ Remove such materials from the site of the work before the date of completion of the work.]

3.6 REMOVAL OR PLUGGING OF ABANDONED PIPE AND CONDUITS

**************************************************************************
NOTE: The terms and conditions in any permits and environmental commitments obtained by the Government must be made a part of the contract. The designer must include technical requirements necessary to comply with these terms and commitments.
**************************************************************************

Remove abandoned pipes and conduits to the limits shown on the drawings or abandon in place by grouting or filling with concrete as shown on the plans a minimum distance of [____] meters feet from [____]. Prior to plugging, clean the interior of the pipe to be plugged and place the concrete in such a manner as to insure a dense, well bonded plug.

3.7 SHORING, SHEETING, AND BRACING

**************************************************************************
NOTE: Add applicable minimum requirements for the shoring, sheeting and bracing plan based upon site
**************************************************************************
Submit a detailed shoring, sheeting and bracing plan [_____] days prior to the beginning of any excavation so supported. The plan for shoring, sheeting and bracing will be prepared and certified by licensed professional engineer, registered in [______]. All shoring must be designed so that it is effective to the bottom of the excavation, and must be based upon calculation of pressures exerted by the earthen materials to be retained, including the condition and nature of those materials as well as any surcharge loads imparted to the excavation by slopes, equipment, traffic, or stored materials. Include in the plan drawings and design computations of the proposed shoring, sheeting, and bracing, and documentation, showing details of the coordination and approval of shoring, sheeting, and bracing by the applicable parties. Obtain approval of the detailed plan from the Contracting Officer prior to starting the work. If necessary, modify the plan as required to meet field conditions, and the modifications must be approved prior to use. Install shoring, sheeting, and bracing where required for the protection of existing natural features and man-made facilities, for the safety of workers and the public, in compliance with EM 385-1-1, and to insure the integrity of the embankment. Design, furnish and install sheet piling, cribbing, bulkheads, bracing, shores or whatever means that may be necessary to support earthen material carrying structures and other improvements, and maintain such piling, cribbing, bulkheads, bracing, shores in position until they are no longer needed. Do not use shoring, sheeting and bracing in lieu of the required excavation slopes. Design and properly install shoring, sheeting, and bracing to withstand anticipated loads. Remove all shoring, sheeting and bracing as embankment and backfill operations progress so that the backfill is placed directly against the undisturbed excavation face. Shoring deemed necessary by the Contracting Officer must remain in place during the backfill operations. Remove shoring in such a manner as not to disturb or damage the completed work or any adjacent property. If any problems are encountered during excavation, stop excavation operation and notify the Contracting Officer.

3.8 DEWATERING AND DIVERSION

Accomplish surface and groundwater control in coordination with the required excavation and embankment construction. Surface and/or groundwater control may necessitate the use of temporary diversion ditches, cofferdams and/or dewatering by the use of pumping. Methods for care of surface water and for controlling the surface and groundwater levels will be subject to approval of the Contracting Officer. Borrow pits must be drained and kept dry during excavation, as excavation will not be permitted in water nor will excavated material be scraped, dragged or otherwise moved through water. Drain borrow areas by ditching, sump pumping, or other approved methods. Drain borrow areas excavated under this contract and flooded from rains or high river stages and allow to dry as quickly as practicable after the high river stage has passed.

Minimize surface runoff from entering the work areas. Complete the necessary ditching or earthwork shaping at the end of each workday or as necessary to prevent surface runoff from entering the work area. Drain excess precipitation that collects in the work areas and allow to dry as quickly as practicable before work resumes.
3.9 EXCAVATION

Excavation will consist of removal of material in preparing the foundations to the lines and grades shown on the drawings, removal of material from ditches and channels to the lines and grades shown on the drawings, removal of objectionable materials and obtaining required fill materials from the borrow areas. Blasting will [not] be permitted. Over excavation will be backfilled to grade with satisfactory material and compacted to a density of at least that of the surrounding material. Backfill and compact excavation beyond the lines shown on the plans in accordance with adjacent materials as directed.

3.9.1 Inspection Trench

Excavate an inspection trench and maintain free of standing water to the dimensions and locations shown on the drawings or as indicated by the Contracting Officer. Excavate the trench at least [_____] meters feet in advance of but not more than [_____] meters feet in advance of construction. When the inspection trench excavation is complete, notify the Contracting Officer's representative in order to examine the foundation stratigraphy in the side walls and bottom of the inspection trench.

3.9.2 Structures

Provide excavations for structures conforming to the dimensions and elevations indicated for each structure and footing, except as specified hereinafter, and include trenching for utility and foundation drainage systems to a point [_____] meters feet beyond each structure and all work incidental thereto[ except where the concrete for walls and footings is authorized to be deposited directly against excavated surfaces]. Excavation must extend a sufficient distance from walls and footings to allow for placing and removal of forms. Replace satisfactory material removed below the depths indicated without specific direction of the Contracting Officer at no additional cost to the Government and fill in accordance with paragraph OVER EXCAVATION above.[ Backfill over excavation below required invert elevations or bottoms of footings with concrete at no additional cost to the Government. Do not construct footings on unsatisfactory material as determined by the Contracting Officer.] [ Remove and replace excessively wet and/or soft material in subgrades resulting from water ponding in footing excavations with [lean concrete] [satisfactory material compacted to the density of the surrounding undisturbed material]].

3.9.3 Channels

Excavate channels at the locations and to the lines and grades shown on the drawings and in accordance with paragraph TOLERANCES.

3.9.4 Ditches

Excavate drainage ditches at the locations and to the lines and grades shown on the drawings and in accordance with paragraph TOLERANCES.

3.9.5 Slopes and Surcharges

Temporary excavation slopes for any channel, structure excavation, or other required excavation must not be steeper than the specified finished slope or the specified construction slope. Any field deviations from this provision must be approved by the Contracting Officer. Temporary slopes
must be benched such that the average slope is not steeper than the specified slope. In addition, do not surcharge temporary, permanent, or construction slope with excavated or stockpiled material or with heavy construction equipment which would have the same effect as the surcharge material. Maintain the toe of stockpiled material a minimum distance back from the top of the finished excavation equal to the depth of the excavation. Determine the maximum height of such stockpile without causing instability of the excavation slope and provide justification for such in the Excavation Plan submittal.

3.9.6 **Borrow Areas**

Submit a written statement to the Government not later than [_____] days after receipt of Notice to Proceed indicating the Contractor's intention to use the specified Government-furnished borrow area(s), Contractor-furnished borrow area(s), dredged borrow areas, or a combination of these borrow areas.

3.9.6.1 **Government-Furnished**

Excavate borrow areas to the extent necessary to obtain satisfactory material within the lines and grades as shown on the drawings. When the material necessary for the construction of the embankment and berms cannot be obtained from adjacent borrow areas, obtain it from other Government-furnished borrow areas. [The permissible depth(s) in the borrow areas are indicated on the drawings.] Backfill any excavation below the depths and slopes specified herein or shown on the drawings, at the Contractor's expense, to the specified permissible excavation line, with satisfactory [material(s)] [cohesive material] [or] [other material] as specified by the Contracting Officer to a density of at least that of the surrounding material. Drain borrow areas and keep dry during excavation. In so far as is practicable, do not remove unsatisfactory materials in borrow areas unless otherwise directed by the Contracting Officer.

3.9.6.2 **Contractor-Furnished**

Proposed borrow areas will be subject to approval by the Contracting Officer. Any borrow sources proposed, accepted and approved by the Contracting Officer must meet all applicable Federal, State and local requirements including written evidence to the Contracting Officer that the Contractor has obtained property rights and access to the material therein. [Proposed sources located within [_____] meters feet landward and [_____] meters feet riverward of the levee between Stations [_____] and [_____] will not be permitted.] No payment will be made for Contractor-furnished borrow areas.

3.9.6.3 **Dredged**

Dredging operations may be conducted to obtain material for the pervious zones or the random zones subject to the requirements and the conditions specified herein. Dredging operations may be conducted at approved locations in the present stream bed of [_____] or as shown on the drawings. Dredging operations will not be permitted within [_____] meters feet of the levee centerline and no material will be obtained within [_____] meters feet of any revetment, stabilized channel line, bridge pier and/or abutment.
3.9.7 Cut-Off Trenches

Excavate and maintain cutoff trench free of standing water to the dimensions and locations shown on the drawings. Excavate the trench at least [_____] meters feet in advance of but not more than [_____] meters feet of construction.

3.9.8 Existing Levees and Spoil Banks

Remove existing levees and spoil banks as shown on the drawings. In areas where the existing levee is located within the random or berm zone of the levee, incorporate it into the embankment. Remove portions of existing embankments which lie within the impervious zone of the levee. Utilize existing levees located within the rights-of-way landward of the levee and berms to be constructed, as borrow material, but only after equal protection has been provided by construction of the new levee. When excavated for borrow material, remove the existing levee to the adjacent ground surface in a uniform manner, and shape to maintain drainage in accordance with the adjacent natural drainage pattern. When lower levels of flood protection would be caused by levee construction provide the Contracting Officer a plan to maintain existing levels of protection during the construction period.

3.9.9 Toe Drains

Excavate toe drains to the dimensions and the locations indicated on the drawings.

3.9.10 Utilities

Shape excavations for pipe beds to fit the contour of the pipe over a width of not less than 0.6 of the pipe diameter, or as shown on the drawings.

3.9.11 Rock

Clean rock and other hard foundation materials of loose debris and cut to a firm surface, either level, stepped, or serrated, as shown on the drawings. Remove loose disintegrated rock and thin strata. Rock excavation will not be measured for payment. Rock excavation will not be paid for as a separate bid item.

3.9.12 Riprap and Bedding

Perform excavations for riprap and bedding at the locations and to the lines and grades shown.

3.10 TOLERANCES

Allow a tolerance of [_____] mm inches above or below the prescribed grade in the excavation for channels, ditches, inspection trenches, cutoff trenches, excavations for riprap and bedding, and mandatory borrow areas. Allow a tolerance of [_____] mm inches below the prescribed grade in the excavation for all other borrow areas.

Construct all embankments and backfills to the grades, lines, and cross-sections shown on the drawings. At all points a tolerance of [100] [_____] mm [4] [_____] inches above or below the prescribed grade will be permitted in the final dressing, provided that any excess material is so distributed that the crown of the levee drains and that there are no abrupt
humps or depressions in any surfaces. For topsoil, a tolerance of [_____] mm inches above the thickness as shown on the drawings will be permitted.

3.11 SLIDES

In case sliding or slope failure occurs in any part of the excavations prescribed in this section after they have been excavated, but prior to final acceptance of all work under the contract, repair the slide or slope failure as directed by the Contracting Officer. In case the slide or slope failure is caused through the fault or negligence of the Contractor, repair at no cost to the Government.

3.12 TRAVERSES

Leave traverses unexcavated between borrow areas at the locations [and to the cross sections] shown on the drawings. [Provide traverses with minimum top widths of [_____] meters feet with side slopes no steeper than 1 on 3 or as shown on the drawings.]

3.13 STOCKPILES

Provisions of paragraph SLOPES AND SURCHARGES are applicable to all stockpiled materials. Upon completion of construction operations, remove and dispose of all remaining stockpiled material by the disposal methods specified in paragraph DISPOSITION OF EXCAVATED MATERIALS.

3.14 SURFACE DRAINAGE OF COMPLETED AREAS

Grade the areas shown on the drawings designated as "GRADE FOR SURFACE DRAINAGE", the borrow areas, and the finished embankment areas to the lines and grades shown on the drawings. Provide surface that is free from sharp ridges, gullies, potholes, sinkholes, and any other surface irregularities. A tolerance of [_____] mm inches above or below the prescribed grade will be allowed provided that the surface drains in the direction as indicated on the drawings.

3.15 MAINTENANCE OF WORK

3.15.1 Debris Removal

Maintain all ditch and channel excavations free from leaves, brush, sticks, trash, and other debris until final acceptance of all work under the contract at no additional cost to the Government.

3.15.2 Sediment Removal

Prior to final acceptance of all work under this contract, remove sediments from ditch or channel excavations to restore design grade and section at no additional cost to the Government.

3.16 DISPOSITION OF EXCAVATED MATERIALS

3.16.1 Satisfactory Materials

Incorporate satisfactory excavated material in the appropriate zones of the embankment. Provide satisfactory material consisting of material as defined in paragraph definitions, subparagraph satisfactory materials. When direct placement is not practicable, satisfactory material from the excavation [may] [must] be stockpiled for subsequent use in parts of the
work for which it is specified herein and/or as indicated on the drawings. Dispose satisfactory materials in excess of the quantity necessary to construct backfills and embankments as specified for unsatisfactory materials.

3.16.2 Unsatisfactory Materials

Unsatisfactory materials will be as defined in paragraph DEFINITIONS, subparagraph UNSATISFACTORY MATERIALS. Permanently dispose unsatisfactory materials from the excavations prescribed in this section by [removal from the site to a Contractor-furnished disposal area] [placing in the disposal area shown on the drawings] [placing in abandoned portions of the borrow areas]. [Shape the material so that its surface is free from abrupt changes in grade and slope to drain.] [No additional payment will be made for Contractor-furnished disposal areas] [placing in abandoned portions of the borrow areas].] [Shape the material so that its surface is free from abrupt changes in grade and slope to drain.] [No additional payment will be made for Contractor-furnished disposal areas.]

3.17 PREPARATION OF FOUNDATION, PARTIAL FILL SURFACES AND ABUTMENTS

**************************************************************************
NOTE: If Section 31 66 10 ROCK FOUNDATION PREPARATION is to be used, the following sections may be deleted or modified as appropriate.
**************************************************************************

3.17.1 Earth

**************************************************************************
NOTE: Modify and or add to this paragraph to be compatible with the embankment construction procedures. If uncompacted or semicompacted fill is being utilized major modifications may be required.
**************************************************************************

After excavation (as described in paragraph EXCAVATION) or stripping (as described in paragraph CLEARING, GRUBBING AND STRIPPING) of the embankment foundation [and excavation of the [cut-off trench][inspection trench]] to the extent indicated or otherwise required, break down the sides of stump holes, test pits, and other similar cavities or depressions to flatten out the slopes, and scarify the sides of the cut or hole to provide bond between the foundation material and the fill. [Scarify the slopes and bottom of the cut-off trench as directed.] Perform all scarifying and breaking of ground surface parallel to the centerline of the levee. Unless otherwise directed, fill each depression with the same material type that is to be placed immediately above the foundation. Place the fill in layers, moistened, and compacted in accordance with the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION for the specific material type. Compact materials which cannot be compacted by roller equipment because of inadequate clearances with power tampers in accordance with the paragraph COMPACTION for the specific material type.

After filling of depressions [and cut-off trench] and immediately prior to placement of compacted fill in any section of the embankment, thoroughly loosen the foundation of such section by scarifying, plowing, discing or harrowing to a minimum depth of [_____] [150] mm [_____] [6] inches, and adjust the moisture content to the amount specified in paragraph MOISTURE CONTROL for the appropriate type of material. [After removal of roots or
other debris turned up in the process of loosening, compact the entire surface of the embankment foundation area by [_____] complete coverages of the compaction equipment as specified for the appropriate type of fill. Immediately prior to placement of compacted fill on or against the surfaces of any partial fill section, remove all soft or loose material, all material containing cracks or gullies, and all material that does not conform with the specified zoning of the embankment. Loosen the remaining surface of the partial fill by scarifying, plowing, discing or harrowing to a minimum depth of [_____] [150] mm [_____] [6] inches, and adjust the moisture content as specified in paragraph MOISTURE CONTROL for the appropriate type of material. Compact the surface of the partial fill section upon which fill is to be placed as specified for the appropriate type of fill. No separate payment will be made for loosening and rolling the foundation area, the abutment area, or the surfaces of partial fill sections, but the entire cost thereof will be included in the applicable contract price for fill.

3.17.2 Rock Foundation

Excavate all rock surfaces upon which or against which embankment materials are to be placed (as described in paragraph EXCAVATION) or strip (as described in paragraph CLEARING, GRUBBING AND STRIPPING).

Prior to the placement of embankment material upon or against a rock surface, fill all open joints and cracks in that surface with mortar to the depths cleaned. Fill those portions of such rock surfaces where, in the opinion of the Contracting Officer, the compaction of the embankment materials cannot be accomplished satisfactorily with power tampers or other specified compaction equipment, with mortar or concrete as directed to the extent necessary to permit satisfactory use of the compaction equipment. Do not leave a thin coat of mortar on smooth, intact rock surfaces[ as shown on Drawing No. _____ Foundation Preparation and Treatment]. Remove large rock overhangs and protrusions and lay back rock surfaces to a slope no steeper than 4V on 1H by the use of pre-splitting or line drilling techniques in such a manner as to minimize damage to the underlying rock, or fill the spaces beneath overhangs and around protrusions with tamped concrete so that satisfactory compaction of embankment materials can be accomplished. Rock surfaces must not be more than 0.67 m 2 feet in height, and provide benches of sufficient width as necessary so that the average slope of any rock face is not steeper than [_____]V on [_____]H. Mortar and concrete, including forming as necessary, must conform with the applicable provisions of Section [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE] [_____]..

3.17.3 [Benching

Benching into existing levee embankment and abutments is required in order to place and compact the material in horizontal layers. The vertical face cut into the existing embankment or abutment resulting from the benching operation must be a minimum of [_____] mm inches in height but can not exceed [_____] mm inches in height.]

3.17.4 [Preloading

**************************************************************************

NOTE: Insert applicable language for preloading as required. Identify the extent of the area over which preloading will be required by designating the stationing along the centerline of the levee.

SECTION 35 41 00 Page 38
Indicate the length of time the preload will be left in place or define the settlement conditions which must occur before construction in the preloaded area can proceed. Address whether or not the preload embankment will become part of the permanent levee.

Preloading of the levee foundation will be required between Station [_____] and Station [______]. The preload embankment will be constructed to the cross section shown on the drawings for the applicable location. No additional construction is permitted after completion of the construction of the preload embankment in the preloaded areas [for [_____] days] [until the required settlement has occurred].

3.17.5 [Settlement of Foundation]

NOTE: Modify the following as necessary for determining foundation settlement, which may be achieved by installing settlement gages.

The Contractor [must] [may elect to] furnish and install settlement gages, at the settlement measurement locations shown on the plans, for determination of settlement of the foundation during construction within the settlement measurement ranges shown on the drawings. [Locate each settlement measurement location on the prepared foundation at a point directly under the crown of the planned levee section prior to placing of fill material. Level gage beds by removing the minimum amount of earth necessary to produce an even foundation and in such manner that the density of gage beds will remain at the same density as the undisturbed adjacent ground. Leveling of gage beds by the addition of fill will not be permitted. Maintain gages and extend, if necessary, during the construction. The type and arrangement of the gages are as shown on the drawings. Make such measurements and determine such elevations on the gages prior to the placing of fill material and again within 72 hours [or longer] after final cross sections have been taken over the completed embankment at the locations of the gages.] [Perform a cross section at the settlement measurement location prior to the placing of fill material to establish the elevation of the foundation/embankment interface.] Settlement measurements will be [verified] [subject to verification] by the Contracting Officer.

3.18 TEST FILL STRIPS

NOTE: Test strips are needed when the volume of the project is large, the compaction requirement will be obtained by specifying the type of compaction equipment and the number of passes on each lift (i.e. a method or procedure specification is being utilized) and there is not sufficient information on the compaction characteristics of the proposed fill materials and equipment to be used for the project. On projects where the levees are small (no greater than 5 meters 15 feet high) and on levee raising projects where fill placement zones are narrow (3.3 meters 10 feet), some of the larger compaction equipment specified herein (such as 50-ton rubber
tired roller and some tamping rollers) are not appropriate. Consistently Contractors propose using smaller equipment with shorter tamping feet. Test fills, therefore, may also be an appropriate means of evaluating performance and setting placement and compaction criteria to assure satisfactory result.

**************************************************************************
3.18.1 [General]

Before beginning embankment construction, construct test strip(s) for [_____] fill materials to demonstrate that the equipment and compaction procedure will achieve the moisture density relationship as specified. The test strips may be incorporated as part of the final embankment, if the fills meet the requirements of the specifications. Construct the test strips using materials from the borrow sources which have been approved by the Contracting Officer. Perform a test strip for each of the following type of fill materials [______]. Each test strip must be of sufficient size to allow compaction equipment to achieve normal operating speed over a [_____] meter [_____] foot length. The test strip must be a minimum of two (2) times wider than the compaction equipment. Construct each test strip with a minimum of 4 lifts. Prior to the construction of the test strips, proof roll the foundation (subgrade) as specified in paragraph [_____] and install [a][an] 200 mm 8 inch thick subbase layer. Provide a subbase layer consisting of the same material to be used in the test strip and spread and compact to the same requirements. Construct the test strips in accordance with the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION for the specific material type. Place and spread the fill material in layers in accordance with the applicable provisions of paragraphs PLACEMENT AND SPREADING for the specific material type. Compact each layer of the fill with a minimum of four (4) complete coverages using the specified compaction equipment, and as many additional coverages as may be required to achieve the specified density. Even if the results from the test strips show that the required densities can be obtained with less than four coverages by the compaction equipment, compaction of the impervious and random fills with a minimum of (4) complete coverages is still required. If the use of the proposed compaction equipment causes shearing of the fill, laminations in the fill, or results in inadequate compaction, the Contracting Officer may direct that such roller be removed from the fill and that another appropriate tamping roller be used.]

3.18.2 Testing and Reporting Requirements for Test Strips

Prior to construction of the test strips, perform [_____] laboratory compaction test[s] for each type of material used in test strips. Perform compaction tests in accordance with the requirements specified in paragraph MATERIALS TESTING. Submit test results to the Contracting Officer before construction of the test strips. After placement and spreading of the fill in the test strip, but prior to compaction, obtain five samples from each lift for moisture content determination in accordance with ASTM D2216. Use nuclear density testing equipment in accordance with ASTM D6938. In addition, the following condition applies:

a. Prior to using the nuclear density testing equipment on the site, submit to the Contracting Officer a certification that the operator has completed a training course approved by the nuclear density testing equipment manufacturer[, the most recent data sheet from the manufacturer's calibration, and a copy of the most recent statistical
check of the standard count precision.

b. Provide nuclear density testing equipment capable of extending a probe a minimum of 150 mm 6 inches down into a hole.

After compaction of the fill, perform a minimum of [_____] [5] in-place nuclear density and moisture content tests (in accordance with ASTM D6938) and one (1) sand cone density test (in accordance with ASTM D1556/D1556M) on each lift. Obtain one sample from each test strip for classification testing as specified in paragraph MATERIALS TESTING. All testing and sampling locations will be determined by the Contracting Officer. The Contractor's QC personnel will monitor and document construction and testing of the test strips. Documentation must include weather conditions, soil type, spreading and compaction equipment type, lift thickness, number of coverages, moisture content, dry density, and a plan showing approximate location of sampling and testing. Provide documentation of the test strip construction procedures and results of all testing to the Contracting Officer. Do not commence full scale embankment construction until the equipment and placement methods are approved by the Contracting Officer.

3.19 PLACEMENT AND SPREADING

3.19.1 General

[Prior to beginning embankment placement on the levee foundation, notify the Government that the foundation is ready to receive fill.] [Do not place fill on any part of the embankment foundation until such areas have been inspected and given final approval in writing by the Contracting Officer.]

3.19.1.1 Gradation and Distribution

The gradation and distribution of materials throughout each zone of the levee must be such that the embankment will be free from lenses, pockets, streaks, and layers of material differing substantially in texture or gradation from surrounding material of the same class. If lenses, pockets, or layers of materials differing substantially in texture or gradation from surrounding material occur in the spread material, mix the layer by harrowing or any other approved method to blend the materials. During the placing and spreading process, maintain at all times a force of workers adequate to remove all roots, debris, and oversize stone from all embankment materials. Remove all stones and rock fragments larger than [2/3 of the placement lift thickness measured by the greatest dimension] [75 mm 3 inches in any dimension] [at the source prior to hauling to] [from] the fill. Do not place fill upon a frozen surface, nor incorporate snow, ice, or frozen earth in the embankment.

3.19.1.2 Foundations and Partial Embankment Fills

Keep the foundations and all partial embankment receiving fills thoroughly drained. Placing operations will be such as to avoid mixing of materials from adjacent sections as much as practicable.

3.19.1.3 Equipment Traffic

Route equipment traffic on any embankment zone to distribute the compactive effort as much as practicable. Ruts formed in the surface of any layer of spread material will be filled before that material is compacted. If, in the opinion of the Contracting officer, the compacted surface of any layer
of material is too smooth to bond properly with the succeeding layer, loosen the surface by scarifying or other approved methods before material from the succeeding layer is placed.

3.19.2 Placement on Surfaces Containing Frozen Materials

Do not place embankment on a foundation which contains frozen material, [or which has been subjected to freeze-thaw action]. This prohibition encompasses all foundation types, including the natural ground, all prepared subgrades (whether in an excavation or on an embankment, and all layers of previously placed and compacted earth fill which become the foundations for successive layers of earth fill. Remove all material that freezes or has been subjected to freeze-thaw action during the construction work, or during periods of temporary shutdowns, such as, but not limited to nights, holidays, weekends, or winter shutdowns of earthwork operations, to a depth that is acceptable to the Contracting Officer and replace with new material. Alternatively, thaw, dry, rework and recompact the material to the specified criteria before placing additional material. The Contracting Officer will determine when placement of fill must cease due to cold weather. The Contracting Officer may elect to use average daily air temperatures, and/or physical observation of the soils for the determination. Levee embankment material must not contain frozen clumps of soil, snow or ice.

3.19.3 Placement of Embankment and Backfill Against Rock

Clean all rock surfaces upon which or against which embankment materials are to be placed in accordance with paragraph PREPARATION OF FOUNDATION, PARTIAL FILL SURFACES AND ABUTMENTS, subparagraph ROCK. In restricted areas where material can not be placed in large lifts with normal spreading and compaction equipment, spread material in lifts not exceeding [_____] mm inches and compact with mechanical hand tampers, vibrating plates, or other approved methods and equipment.

3.19.4 Placement of Embankment and Backfill Against Structures

Do not place embankment or backfill on or against concrete less than [14][7] days after placement or 70 percent of the design strength, without prior approval of the Contracting Officer. Do not use crawler-type tractors, vibratory equipment and other similar compaction equipment within [_____] [1] meter [_____] [4] feet of any completed or partially completed structure. Accomplish compaction within [_____] [1] meter [_____] [4] feet of completed or partially completed structures by the use of mechanical hand tampers, vibrating plates, or other approved methods and equipment. Ensure that compaction operations do not damage any existing utilities. Any damage caused by the Contractor's operation must be repaired at the Contractor's expense.

3.19.5 Select Fill

**************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected and the following should be substituted into the appropriate paragraphs below.
[Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not
Place and spread select fill material in layers not more than 200 mm 8 inches in uncompacted thickness, except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [150] [_____] mm [6] [_____] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.6 Coarse Drainage Gravel and Filter Sand

3.19.7 Impervious Fill

***************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.
***************

Place and spread the impervious fill material in layers not more than [_____] [200] mm [_____] [8] inches in uncompacted thickness, except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [_____] [100] mm [_____] [4] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.8 Pervious Fill

***************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.
***************

[Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.9 Random Fill

**************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.
**************************************************************************

Place and spread random fill material in layers not more than [_____] [200] mm [_____] [8] inches in uncompacted thickness, except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [_____] [150] mm [_____] [6] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.10 Random Rock

Place random rock within the limits indicated on the drawings in such a manner as to produce a reasonably well graded mass of stone with a minimum percentage of voids. Place random rock in layers that will will produce a compacted [_____] [600] mm [_____] [24] inch thick layer as shown on the drawings. [Provide sufficient dewatering of the foundation beneath the random rock zone to allow the random rock material to be placed and compacted as specified herein to produce a firm, dense surface upon which to place select earth fill.] Grade the outside slope of the random rock zone to produce a reasonably even surface, within a tolerance of plus or minus [_____] [300] mm [_____] [12] inches measured [vertical] [normal] to the slope from the lines indicated on the drawings, upon which slope protection layers can be placed.

3.19.11 Fine Drainage Gravel Placed Around Structures

Place fine drainage gravel placed for drainage around [_____] structures in horizontal layers not exceeding [_____] mm inches in loose lift thickness, or within [_____] [1] m [_____] [4] feet when hand operated compactors are used. After placing, uniformly spread, moisten or aerate each layer as necessary to obtain the specified moisture content, thoroughly mix and compact as specified. Do not backfill until construction below finish grade has been approved, forms removed, and the excavation cleaned of trash and debris. Use power driven hand operated compactors along the closure structure for compaction within [_____] [0.7] m [_____] [2] feet of concrete structures. Do not place backfill against concrete prior to 7 days after placement. As far as practicable, bring backfill up evenly on each side of the structure and slope to drain away from the structure.
3.19.12  Semicompacted Fill

**************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.
**************************************************************************

The location and extent of the semicompacted fill are as shown on the drawings. Do not place semicompacted fill in water. Place and spread semicompacted fill material in layers not more than [_____] [300] mm [_____] [12] inches in uncompacted thickness, [except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [_____] [150] mm [_____] [6] inches]. Layers must be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction. Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.

3.19.13  Uncompacted Fill

**************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the second bracketed sentence should be selected.
**************************************************************************

Place uncompacted fill in approximately horizontal layers not exceeding [_____] mm inches in thickness. Uniformly spread, distribute, and manipulate the layers during placement such that individual loads of material deposited on the fill will not remain intact, and large, open voids in the fill will be eliminated. Do not place lifts in a manner which causes shrinkage cracks and open voids from developing in previously placed lifts. Start layers full out to the slope stakes and must be carried in lifts approximately horizontal and parallel to the centerline with sufficient crown or slope to provide satisfactory drainage during construction. Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.

Compaction other than that obtained by the controlled movement of the hauling and spreading equipment over the area will not be required. Where material must be placed in water, dump therein until it reaches an elevation [_____] mm foot above the water surface, or until a stable fill surface is obtained before layer construction will be required. The material deposited under water must be placed in such a manner to ensure that any soft material will be forced progressively outward from the section and not be trapped within the base of the embankment.

Do not place material containing more than [_____] [15] percent fines passing the No. 200 sieve below the water surface.

3.19.14  Hydraulic Fill

3.19.14.1  Discharge Pipe

At all times when the dredge discharge pipe is being washed out or when the
discharge consists of a high percentage of water with only a minimum amount of solid material being pumped, close all control plates at the bottom openings along the spill-pipe sections of the discharge pipe lines immediately and remain in a closed position until the pumping operation produces a minimum of \(10\) \% percent solid materials in the discharge.

3.19.14.2 Discharge Pipe Outlets

During placement operations of the fill, provide free outlets to conduct discharge water away from the embankment at intervals of not more than \(610\) \([\) feet, for 300-mm 12-inch dredges or smaller; \(915\) \([\) feet, for 325 to 400 mm 13- to 16-inch dredges; and \(1219\) \([\) feet, for dredges over 400 mm 16 inches. The size of dredges are determined by the minimum inside diameter of the discharge pipe. No obstruction to free flow will be permitted in these outlets or at any point in the fill area, between the end of the discharge pipe and the outlet. Construct a retaining dike, transverse to the fill area center line, immediately beyond each outlet and do not breach until the end of the discharge pipe has approached the retaining dike to within 76 m 250 feet, in the case of 300 mm 12-inch dredges or smaller; 114 m 375 feet, in case of 325 to 400 mm 13- to 16-inch dredges; or 152 m 500 feet, in the case of dredges over 400 mm 16 inches.

3.19.14.3 Control of Materials in Hydraulic Construction

In general, distribute the materials in the fill in a way to produce a section of relatively uniform permeability. In order to maintain uniform permeability of the fill, do not place strata and large pockets of gravel, not containing sufficient fines. Whenever they occur promptly blend with finer materials. Take necessary precautions to prevent damage from discharge water or other causes.

3.19.14.4 Rehandling Hydraulic Material

Rehandling of hydraulic material to bring the fill area to required grade and cross section must conform to paragraph \([\) . If, in the opinion of the Contracting Officer, the rehandled material is too dry to permit its placement by compacted fill method, then the soil placement must conform to paragraph \([\).

3.20 MOISTURE CONTROL

3.20.1 General

The materials in each layer of the fill must contain the amount of moisture, within the limits specified below or as directed by the Contracting Officer, necessary to obtain the required compaction. Rework material that is not within the specified moisture content limits after compaction to obtain the specified moisture content, regardless of density.

3.20.1.1 Insufficient Moisture for Suitable Bond

If the top or contact surfaces of a partial fill section become too dry to permit suitable bond between these surfaces and the additional fill to be placed thereon, loosen the dried materials by scarifying or discing to such depths as may be directed by the Contracting Officer, dampen the loosened material to an acceptable moisture content, and compact this layer in accordance with the applicable requirements of paragraph COMPACTION.
3.20.1.2 Excessive Moisture for Suitable Bond

If the top or contact surfaces of a partial fill section become too wet to permit suitable bond between these surfaces and the additional fill to be placed thereon, scarify and dry the wet material, assisted by discing or harrowing, if necessary, to such depths as may be directed by the Contracting Officer. Dry the material to an acceptable moisture content, and compact in accordance with the applicable requirements of paragraph COMPACTION.

3.20.1.3 Drying Wet Material

Material that is too wet must [be spread on the embankment and permitted to dry,] [be dried in the borrow area prior to bringing to the levee embankment] be assisted by discing or harrowing, if necessary, until the moisture content is reduced to an amount within the specified limits.

3.20.1.4 Increasing Moisture in Dry Material

The moisture content of material that is too dry, [will be adjusted on the levee embankment] [will be adjusted in the borrow area prior to bringing to the levee embankment]. Add water to the fill material and by harrowing, or other approved methods, work the moisture into the material until a uniform distribution of moisture within the specified limits is obtained. Control the amount of water applied on a layer of fill on the levee embankment so that free water will not appear on the surface during or subsequent to rolling. Should too much water be added to any part of the embankment, delay the rolling on that section of the embankment until the moisture content of the materials is reduced to an amount within the specified limits. If it is impracticable to obtain the specified moisture content by wetting or drying the material on the fill, the Contractor may be required to pre-wet or dry back the material at the source of excavation or in the borrow area.

3.20.2 Select Fill

The moisture content after compaction must be within the limits of [_____] percentage points above optimum to [_____] percentage point below optimum moisture content as determined by ASTM D698.

3.20.3 Impervious Fill

The moisture content after compaction must be within the limits of [2] [_____] percentage points above optimum to [2] [_____] percentage point below optimum moisture content as determined by ASTM D698.

3.20.4 Pervious Fill

**************************************************************************
NOTE: Saturation of the pervious fill may not be appropriate if the fill is placed in a zone or area (trenches, etc.) which can not readily drain.
**************************************************************************

Place, work and compact each layer of material in a saturated condition.

3.20.5 Random Fill

**************************************************************************
NOTE: The moisture control of random earth must be conformed to the requirements of the material type it most closely approximates in behavior.

The moisture content after compaction must be within the limits of [_____] percentage points above optimum to [_____] percentage point below optimum moisture content as determined by ASTM D698. [The moisture content must be that which will facilitate obtaining the specified compaction.]

3.20.6 Coarse Drainage Gravel and Filter Sand

Control the moisture content such that hauling, spreading, and compacting equipment can operate with normal procedure without excessive rutting of the fill. If the material is too wet or too dry to facilitate proper compaction, wet or dry the coarse drainage gravel or filter sand as required by the procedures specified in paragraph [______].

3.20.7 Fine Drainage Gravel

Place, work, and compact fine drainage gravel in a saturated condition. The moisture content after compaction must be as uniform as practicable throughout any one layer of fine drainage gravel.

3.20.8 Semicompacted Fill

[Place semicompacted fill within plus or minus [_____] percent of optimum moisture content.] [Semicompacted fill will be placed at their in situ moisture content.] [Control the moisture content of semicompacted fill such that hauling, spreading, and compacting equipment can operate with normal procedure without excessive rutting of the fill.] [The moisture content must be that which will facilitate obtaining the specified compaction.]

3.20.9 Uncompacted Fill

Uncompacted fill will be placed at their in situ water content. [Control the moisture content such that hauling, spreading, and compacting equipment can operate with normal procedure without excessive rutting of the fill.]

3.20.10 Hydraulic Fill

No moisture control is required for Hydraulic Fill.

3.21 COMPACTION

NOTE: The designer should edit the following paragraphs to account for the use of either an end product specification (i.e., the Contractor is required to obtain a specified degree of compaction) or a method specification (i.e., when the Contractor is required to compact the embankment by a specified number of coverages of a specified/approved roller and is not responsible for the obtained degree of compaction). If the method specification is used and the required degree of compaction is not achieved within the specified number of passes using the specified compaction equipment, the Contractor
should be paid for additional rolling for compaction under a separate bid item as specified in paragraph ADDITIONAL ROLLING FOR COMPACTION.

3.21.1 Compaction Equipment

NOTE: If an end-product (production) specification is to be used, the following paragraphs may not be necessary at the judgment of the designer and specification writer.

With reference to the use of compaction equipment in this paragraph, the following precautions should be noted:

1. Specifications should be written to ensure that the type of compaction equipment will be used is best suited to obtain the desired compaction of the material being used. When the size of the contract can justify the costs a requirement should be included in the specifications for the performance evaluation of each type of compaction equipment conforming with the specifications and intended for use by the Contractor at an early stage of embankment construction. This equipment evaluation should be accomplished through analysis of test fill areas that are carefully constructed under representative working conditions with materials and moisture contents as specified. Test fill areas may either be separate or part of the permanent work, and for clarity to prospective bidders, payment under a separate item is recommended to equitably cover costs of required variations in equipment coverages, possible changes in equipment loading or foot sizes, as well as intensified field soils testing. The following paragraphs are provided to serve as examples of the information that should be included within the specifications.

2. For tamping rollers that are either towed or self-propelled, with drums capable of being ballasted with fluid, the provision for a pressure relief valve and safety head is optional, and should be included at the discretion of the designer based on local experience and practice. Over-pressurization of fluid ballasted compaction drums to the level of a safety hazard has been rare, but has occurred on several occasions at locations of high elevation and temperature.

3. In compacting materials consisting of shales, sandstones, weathered rock and similar random materials, consideration should be given to specifying sheepfoot-type tamping equipment that has been modified by replacing the standard feet with "chisel" point tamper feet generally referred to as "shale breakers". The end areas of these modified
tamper feet range from 650 to 1000 square mm 1 to 1-1/2 square inches and tend to break up weathered rock to prevent the bridging effect sometimes created by large rock particles.

4. For compaction of sand and gravel fills or filter and drainage layers, equipment characteristics for both a large and small vibratory roller have been provided for optional selection by the designer, depending upon location, selected lift thickness, gradation, grain shape, and durability properties of the materials. The smaller roller, which utilizes an upper limit of 40 kN/m 9000 lbs. per foot of drum length applied force, should be specified for materials which exhibit degradation under compaction. Other options, based on construction experience may also be exercised. For example, it has been found that improved trafficability can often be achieved when compacting clean, fine grained, uniform sands by specifying a drum driven self-propelled vibratory roller.

Compaction equipment must conform to the following requirements and be used as prescribed in subsequent paragraphs.

3.21.1.1 Tamping Rollers

[3.21.1.1.1 Towed]

Provide tamping rollers consisting of a heavy duty double drum unit, with a drum diameter not less than 1.5 m 60 inches, and an individual drum length of not less than 1.5 m 60 inches. Provide drums that are capable of being ballasted with water or a combination of sand and water. Each drum must have staggered feet uniformly spaced over the cylindrical surface to provide approximately three tamping feet for each 0.19 square meter 2 square feet of drum surface. Provide tamping feet that are 175 to 225 mm 7 to 9 inches in clear projection from the cylindrical surface of the roller and have a face area of not less than 3226 square mm 5 square inches nor more than 4516 square mm 7 square inches. The roller must be equipped with cleaning fingers, designed and attached to prevent the accumulation of material between the tamping feet. Maintain these cleaning fingers at their full length throughout the periods of use of the roller. The weight of the roller must be a minimum of 5200 kg/m 3500 psf of linear drum length weighted, and no more than 2975 kg/m 2000 psf of drum length empty. Yoke the two drums comprising one roller unit such that they will oscillate when traversing uneven surfaces. The design and operation of the tamping roller will be subject to the approval of the Contracting Officer who has the right at any time during the prosecution of the work to direct such repairs to the tamping feet, minor alterations in the roller and variations in the weight as may be found necessary to secure optimum compaction of the earth fill materials. The Contractor may be required to add ballast to the roller to the maximum capacity specified by the manufacturer of the roller. Draw the roller by a crawler-type or a rubber-tired tractor at a speed not to exceed 5.6 km 3.5 miles per hour. Discontinue the use of the rubber-tired tractor if the tires leave ruts that prevent uniform compaction by the tamping roller. If tamping rollers are used in tandem, not more than two rollers in tandem will be permitted and in such case, one trip of the tandem rollers over any surface will be considered as two
passes. When tamping rollers are used in tandem, the tamper foot spacing must be offset so that the circumferential rows on the rear drums are in line with the mid-point of the circumferential rows on the forward drums.

3.21.1.1.2 Self-Propelled

[Conditioned upon satisfactory performance, self-propelled tamping rollers may be used in lieu of tractor-drawn tamping rollers. Self-propelled rollers exceeding the empty weight requirement may be used provided that by the substitution of tamping feet, having a face area not exceeding [_____] [9030 square mm 14 square inches], the nominal foot pressure on the tamping feet of the self-propelled roller can be adjusted to approximate the nominal foot pressure of the towed roller for the particular working condition required for the towed rollers. The tamping feet must be 175 to 225 mm 7 to 9 inches in clear projection from the cylindrical surface of the roller. For self-propelled rollers, in which steering is accomplished through use of rubber-tired wheels, the tire pressure must not exceed [_____] [276 kPa 40 psi]. [Operate self-propelled rollers at a speed not to exceed 5.6 km 3.5 miles per hour.] [Self-propelled tamping rollers may be used in lieu of tractor drawn tamping rollers provided the foot pressure on the tamping feet of the self-propelled roller are approximately the same as the foot pressure on the towed roller.] For self-propelled rollers steered with rubber-tired wheels, the tire pressure must not exceed [_____] [276 kPa 40 psi]. Operate self-propelled rollers at speeds not exceeding 5.6 km 3.5 miles per hour. The Contracting Officer has the authority to limit or eliminate the use of self-propelled rollers if they are found to cause shearing or laminations of the compacted fill.]

3.21.1.2 Vibratory Rollers

Equip vibratory rollers for compacting rock fills, pervious sand and gravel fills, or filter and transition drainage layers with a smooth steel compaction drum and operate at a frequency of vibration during compaction operations between 1100 and 1500 vpm. Vibratory rollers may be either towed or self-propelled with an unsprung drum weight that is a minimum of 60 percent of the rollers' static weight. Towed rollers must have at least 90 percent of their weight transmitted to the ground through the compaction drum when the roller is standing in a level position hitched to the towing vehicle. Rollers for compacting rockfill, [sand and gravel fills, or filter and drainage layers] must have a minimum static weight of 90 kN 20,000 pounds, a minimum dynamic force of 180 kN 40,000 pounds when operating at 1400 vpm, and an applied force not less than 130 kN/m 9,000 pounds per foot of compaction drum length. [Rollers for compacting sand and gravel fills or filter and drainage layers] must have a minimum static weight of 36 kN 8,000 pounds, a minimum dynamic force of 71 kN 16,000 pounds when operating at 1400 vpm, and an applied force not less than 22 kN 5,000 pounds nor greater than 130 kN/m 9,000 pounds per foot of compaction drum length. The level of amplitude and vibration frequency during compaction will be maintained uniform throughout the embankment zone within which it is operating. Operate rollers at speeds not to exceed 2.4 km/h 1.5 mph. The equipment manufacturer must furnish sufficient data, drawings, and computation for verification of the above specifications, and the character and efficiency of this equipment will be subject to approval.

3.21.1.3 Rubber-tired Rollers

Provide rubber-tired rollers that have a minimum of four wheels equipped with pneumatic tires. The tires must be of such size and ply as to be capable of being operated at tire pressures between 550 and 690 kPa 80 and
100 psi at an 11,340 kg 25,000 pound wheel load. The roller wheels must be located abreast and designed so that each wheel will carry approximately equal load in traversing uneven ground. The spacing of the wheels must be such that the distance between the nearest edges of adjacent tires will not be greater than 50 percent of the rated tire width of a single tire at the operating pressure for an 11,340 kg 25,000 pound wheel load. The roller must have a body suitable for ballast loading such that the load per wheel may be varied, as directed by the Contracting Officer, from 8,165 to 11,340 kg 18,000 to 25,000 pounds. Tow the roller at a speed not to exceed 8 km 5 miles per hour. The character and efficiency of this equipment will be subject to the approval of the Contracting Officer.

3.21.1.4 Hand Operated Compactors

Perform compaction of material, in areas where it is impracticable to use a roller or tractor compaction, using approved hand operated power compactors.

3.21.1.4.1 Power Tampers

Power tampers must be hand operated equipment capable of compacting material in confined areas. Provide compactors that are either an internal combustion or pneumatic activated tamper. Tampers must have sufficient weight and striking power to produce the specified compaction. The character and efficiency of this equipment will be subject to the approval of the Contracting Officer.

3.21.1.4.2 Vibratory Plate Compactor

Vibratory compactors operated by hand in confined areas must utilize the oscillating cam principal and must deliver an impact of not less than 9 kN 2000 lbf at a rate of approximately 2000 impulses per minute. The character and efficiency of this equipment will be subject to the approval of the Contracting Officer.

3.21.1.5 Crawler-type Tractors

Crawler-type tractors used for spreading or compaction must have a minimum weight of [_____] [9,070] kg [_____] [20,000] pounds, exert a minimum unit tread pressure of [_____] [41.4] kPa [_____] [6] psi, and operate at a maximum speed of [_____] [5.6] km [_____] [3.5] miles per hour.

3.21.1.6 Sprinkling Equipment

Provide sprinkling equipment consisting of tank trucks, pressure distributors or other equipment designed to apply water uniformly and in controlled quantities to variable width of surface.

3.21.1.7 Miscellaneous Equipment

Provide scarifiers, disks, spring-tooth or spike-tooth harrows, spreaders, and other equipment that is suitable for use in embankment construction and approved by the Contracting Officer. Equipment used for blending fill material must be capable of penetrating the full loose lift thickness of the specific material type.

3.21.2 Compaction of Select Fill

**************************************************************************

NOTE: Experience indicates that by the time the
After a layer of material has been dumped and spread, harrow it to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. When the moisture content and the condition of the layer are satisfactory, compact the lift [to a minimum of [95] [_____] percent of the maximum dry density as determined by the Contractor in accordance with ASTM D698] [with not less than [six] [_____] complete coverages of an approved tamping roller or [four] [_____] complete coverages of an approved 45 metric ton 50-ton rubber-tired roller traversing in a direction parallel to the axis of the levee]. In areas which are not accessible by roller, place the fill in layers not more than 100 mm 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.

3.21.3 Compaction of Random Fill

NOTE: Random fill must be compacted in accordance with the requirements of the material type it most closely approximates in behavior.

After a layer of material has been dumped and spread, harrow it to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. If one pass of the harrow does not accomplish the breaking up and blending of the materials, additional passes of the harrow are required, but in no case will more than [_____] [three] passes of the harrow on any one layer be required for this purpose. When the moisture content and the condition of the layer are satisfactory, compact the lift [to a minimum of [95] [_____] percent of the maximum dry density as determined by the Contractor in accordance with ASTM D698] [with not less than [six] [_____] complete coverages of an approved tamping roller or [four] [_____] complete coverages of an approved 45 metric ton 50-ton rubber-tired roller traversing in a direction parallel to the axis of the levee]. In areas which are not accessible by roller, place the fill in
layers not more than 100 mm 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.

3.21.4 Compaction of Impervious Fill

After a layer of material has been dumped and spread, harrow it to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. If one pass of the harrow does not accomplish the breaking up and blending of the materials, additional passes of the harrow are required, but in no case will more than [_____] [three] passes of the harrow on any one layer be required for this purpose. When the moisture content and the condition of the layer are satisfactory, compact the lift with not less than [six] [_____] complete coverages of an approved tamping roller traversing in a direction parallel to the axis of the levee. In areas which are not accessible by roller, place the fill in layers not more than 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] meter [_____] [3] feet.

3.21.5 Compaction of Pervious Fill

After a layer of material has been dumped and spread, harrow it as required to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. If one pass of the harrow does not accomplish the breaking up and blending of the materials, additional passes of the harrow are required, but in no case will more than [_____] [three] passes of the harrow on any one layer be required for this purpose. When the moisture content and the condition of the layer are satisfactory, compact the lift to a [minimum] [80] [_____] percent relative density in accordance with ASTM D4253 and ASTM D4254 [with not less than [six] [_____] complete coverages of an approved vibratory roller]. In areas which are not accessible by roller, place the fill in layers not more than 100 mm 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.

3.21.6 Compaction of Random Rock

After the random rock has been placed and spread to the thickness specified herein, and oversized rock has been removed or broken down, compact by not less than [_____] [3-6] complete coverages of the specified [crawler
tractor] [vibratory roller]. [ Each coverage of the tractor must consist of sufficient trips to provide complete coverage of the area by the treads of the tractor. The tractor coverages specified are in addition to spreading operations.] [Operate the vibratory roller such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than _____] [1] m [_____] [3] feet.]

}[3.21.7 Compaction of Semicompacted Fill

After a layer of material has been dumped and spread, harrow it as required to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. When the moisture content and the condition of the layer are satisfactory, compact the new layer of fill by the controlled movement of the hauling equipment over the area of the fill. Equipment will be routed so as to prevent excessive rutting of the fill surface. Dumping, spreading, sprinkling, and compaction may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously.

}3.21.8 Compaction of Uncompacted Fill

No compaction other than that obtained by the controlled movement of the hauling equipment over the area of the fill is required. Route equipment to prevent excessive rutting of the fill surface.

}[3.21.9 Compaction of Hydraulic Fill

Hydraulic fill will be compacted as uncompacted fill. If the rehandled hydraulic fill is too dry to permit its placement by uncompacted full method, then compact the fill material using the method specified in paragraph [_____] [COMPACTION OF SEMICOMPACTED FILL].

}[3.21.10 Compaction of Random Fill Within the MSE Walls

Place and compact random earth fill within the limits of the Mechanically Stabilized Earth (MSE) walls in accordance with [the vendor's requirements, subject to the approval of the Contracting Officer] [requirements specified in Section [____]].

]3.21.11 Compaction of Coarse Drainage Gravel and Filter Sand

Place coarse drainage gravel placed in the drains in maximum [_____] [300] mm [_____] [12] inch loose lifts and compact by not less than four (4) complete coverages with a [static] [vibratory] roller. Compact each lift of gravel within confined spaces which is not accessible to rollers by at least [_____] [3] complete coverages with a vibratory plate compactor [and as many additional coverages as necessary to achieve the same density obtained with full-size compaction equipment]. Compact filter sand placed along the existing rock fill in accordance with the requirements for the adjacent select earth fill material.

3.21.12 Compaction of Fine Drainage Gravel

Place fine drainage gravel placed in the drains in maximum [_____] [300] mm [_____] [12] inch loose lifts and compact by not less than four (4) complete coverages with a [static] [vibratory] roller. Compact each lift of gravel within confined spaces which is not accessible to rollers by at least three [_____] [3] complete coverages with a vibratory plate compactor
[and as many additional coverages as necessary to achieve the same density obtained with full-size compaction equipment].

3.21.13 Compaction Adjacent to Structures and Utilities

3.21.14 Additional Rolling for Compaction

**********************************************************************************************************************************************
NOTE: Use the following paragraph only when a method specification is utilized. A bid item for "Additional Rolling for Compaction" should be included in the bid form so that payment can be made. Measurement and payment information should also be added to paragraph [UNIT][LUMP SUM] PRICES or Section 01 20 00 PRICE AND PAYMENT PROCEDURES as applicable.
**********************************************************************************************************************************************

If the Contracting Officer determines that the desired compaction of any portion of the embankment is not achieved by the number of coverages specified, additional complete coverages will be made over the surface area as directed by the Contracting Officer. Payment for additional rolling directed by the Contracting officer will be made in accordance with Bid Item No. [_____] ADDITIONAL ROLLING FOR COMPACTION; however, no payment will be made for additional rolling not specifically directed by the Contracting Officer.

][3.21.15 Topsoil

Place topsoil on the embankment surfaces as shown on the contract drawings and as specified in SECTION [32 92 23 SODDING] [____].

3.22 FIELD QUALITY CONTROL

**********************************************************************************************************************************************
NOTE: FAR 46.312 Construction Contracts establishes a requirement for Contractor Quality Control (CQC) in construction contracts and ER 1180-1-6 requires that a CQC section based on Section 01 45 00 QUALITY CONTROL be included in contracts of $1,000,000 or more. Use of Section 01 45 00 for contracts of less than $1,000,000 is discretionary. This part of the specifications must be consistent with the CQC section.

Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of mica, halloysite, some other chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density. The chemical composition and "non-free" water of the sample may also dramatically (sometimes over 10 percent) affect the measurement of moisture content (see the paragraph entitled
"Interferences" in ASTM D2922 and D3017. Also see paragraph 5-10.d.(2).(b). entitled "Nuclear Method" in EM 1110-2-1911). When water content can not be accurately measured using nuclear method, a computer controlled microwave oven system for water content measurement combined with nuclear method for wet density has been successfully used by some districts. Sand Cone or similar field density tests should be performed periodically at the same location as Nuclear Tests to assure nuclear testing is providing accurate information.

3.22.1 Clearing, Grubbing, and Stripping

Establish and maintain quality control for clearing, grubbing, and stripping operations to assure compliance with contract requirements, and maintain records of the quality control for all construction operations including but not limited to the items indicated below. Furnish these records, as well as the records of corrective actions taken, to the Government in accordance with Section 01 45 00 QUALITY CONTROL.

3.22.1.1 Clearing

Station to station limits, transverse clearing limits from applicable centerline; percentage of area complete; types of materials cleared.

3.22.1.2 Grubbing

Station to station limits, transverse grubbing limits from applicable centerline; percentage of area complete; type of material; filling of grubbed holes.

3.22.1.3 Stripping

Station to station limits, transverse stripping limits from applicable centerline; percentage of area complete; type of material; depth of stripping.

3.22.2 Excavation

Establish and maintain quality control for excavation operations to assure compliance with contract requirements, and maintain records of the Contractor's quality control for all construction operations including but not limited to the following:

a. Equipment; type, size, suitability for the work,

b. Lines, grades and tolerances,

c. Segregation/Disposition of materials,

d. Disposal and/or stockpiling of materials,

e. Unsatisfactory materials,

f. Conditions that may induce seepage or weaken the foundation or embankment,
g. Stability of excavations,

h. Quantity surveys.

Furnish records of inspections and tests, as well as the records of corrective actions taken, to the Government in accordance with Section 01 45 00 QUALITY CONTROL.

3.22.3 Embankment

3.22.3.1 General

As a part of the Contractor Quality Control (CQC) system required by SECTION 01 45 00 QUALITY CONTROL, establish and maintain field quality control for foundation preparation, embankment and backfill operations to assure compliance with contract requirements and maintain detailed records of field quality control for all operations including but not limited to the following:

3.22.3.1.1 Earthwork Equipment

Type, size, number of units and suitability for construction of the prescribed work.

3.22.3.1.2 Foundation Preparation

Methods of preparing the foundations in advance of embankment and backfill construction and methods for providing drainage of the foundation and partially completed fills.

3.22.3.1.3 Construction

Layout, maintaining existing drainage, moisture control, thickness of layers, spreading and compacting.

3.22.3.1.4 Grade and Cross Section

Crown width, crown slope, side slopes, and grades.

3.22.3.1.5 Roads and Ramps

Location of temporary roads to fields or buildings, location and placement of fills for ramps in accordance with specified dimensions and grades.

3.22.3.1.6 Grade Tolerances

Check fills to determine if placement conforms to prescribed grade and cross section.

3.22.3.1.7 Slides

Location and limits; methods and equipment used where remedial work has been directed.

3.22.3.1.8 Quantity Surveys

Accuracy and timeliness.
3.22.3.2 Materials Testing

**************************************************************************
NOTE: Types of tests and frequency of testing should be detailed below. Types of tests and frequency of testing will be dependent upon the types of materials utilized, configuration of foundation and embankment, placement and compaction procedures required, moisture control requirements etc. Testing requirements are material type specific rather than embankment fill type specific. It is desirable to present the testing frequency and type in tabular form.
**************************************************************************

Perform sufficient testing to insure that the fill is being constructed as specified. Consider the testing program specified below the minimum acceptable frequency of testing. This does not relieve the Contractor from the responsibility of performing additional testing, if required to ensure compliance with these specifications.

[3.22.3.2.1 Soil Classification Tests

Perform soil classification tests in accordance with ASTM D2487. Perform one initial classification test for each different classification of material to be utilized as embankment fill or backfill. As prescribed in ASTM D2487, perform grain size analyses in accordance with ASTM D422 and Atterberg limits in accordance with ASTM D4318 on each different classification. Submit additional tests for every [_____] cubic m[20,000 cubic yards] of embankment or backfill material. Perform soil classification tests on foundation material as required to determine the acceptability of the in-situ soils. Additional tests will be required if noticeable changes in the material occur.

][3.22.3.2 Cohesive Material Testing

**************************************************************************
NOTE: Edit the following to comply with the method selected to determine the optimum properties (i.e., density and moisture content, LL, PL, PI).
**************************************************************************

3.22.3.2.1 Moisture Density Relationships

Determine the moisture-density relations for each different classification of cohesive material utilized in accordance with [_____] [ASTM D698], [Method A] [Method B] [Method C]. Prior to placing any fill material containing cohesive material, perform a minimum of [_____] five-point [_____] compaction test on representative samples of the material to be used as fill.] During fill placement perform a minimum of one additional moisture-density test for every [_____] cubic m[20,000 cubic yard] placed. Additional tests will be required each time a new material is encountered.[ The moisture-density curves will be compiled to form a family of curves which will be utilized to estimate optimum properties (maximum dry density and optimum moisture content) to be used with field density test.]
3.22.3.2.2  Water (Moisture) Content Tests

Perform determination of water content in accordance with ASTM D2216. [ASTM D4643 may be used when rapid moisture content results are needed. Confirm all rapid results obtained by ASTM D4643 by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern.] One water content test will be performed for each [_____] cubic m cubic yards of material placed [or each lift of material whichever is less]. [These test will be in addition to the water content tests performed in conjunction with in-place density tests.] Retest backfill and fills not meeting the required specifications for water content after corrective measures have been applied.

3.22.3.2.2.3  In-place Density Testing for Cohesive Materials

**************************************************************************
NOTES: The designer should pick the method or methods of In-place density which are acceptable. If uncompacted fill is specified density control may not be required.

Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of certain chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density. When water content can not be accurately measured using nuclear method, a microwave oven system for water content measurement may be used.
**************************************************************************

Determine the in-place density of the cohesive materials in accordance with [ASTM D1556/D1556M] [, ASTM D2167] [, ASTM D6938] [, ASTM D2937] [, or ] [ASTM D5195]. Perform at least one (1) in-place density test on [each lift of material][shift][day] or [every [_____] cubic m cubic yards of completed fill whichever is more frequent with the horizontal locations randomly staggered in the fill. [At each field density test location, obtain soil samples and perform one [one-point] [two-point] compaction test, one moisture content, [one grain size analysis,] [and one Atterberg limits test,] [if applicable,] on the sample. [The results of the [one-point] [two-point] compaction test and the moisture content test will be utilized to obtain the optimum properties to compare to the results of the in-place density test.] [For use with the family of curves to determine the optimum properties of the material, perform a [one-point] [two-point] compaction test in conjunction with each in-place density. Use a portion of the soil from the in-place field density test and soil obtained immediately adjacent to the field density test location for a [one-point] [two-point] compaction test. The minus 19 mm 3/4-inch portion of the soil must be subjected to [_____] compactive effort using a 150 mm 6-inch compaction mold in accordance with the procedures presented in ASTM D [_____] [ASTM D698] [ASTM D1557]]. Retest fill not meeting the required specifications for in-place density after additional compaction has been completed. [When nuclear method is used for in-place density testing according to ASTM D6938, include a sand cone correlation test in accordance with ASTM D1556/D1556M for the first test and every fifth test thereafter for each material type. Perform the sand cone test adjacent to the location of the nuclear test, including a nominal 150 mm 6 inch diameter sand cone, and including a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. Do not
use nuclear density testing equipment during rain. Submit the density correlations with test results. For each transmittal including density test data, include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
   Station.
   Coordinates.
c. Elevation of Lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.
l. Pass/Fail.
m. Retest.
n. Comments.

3.22.3.2.3 Cohesionless Material Testing

3.22.3.2.3.1 Compaction Tests

Run not less than one relative density test for every 3,000 cubic yards of cohesionless fill in accordance with ASTM D4253 and ASTM D4254.

3.22.3.2.3.2 In-Place Density Tests

Determine the in-place density of the cohesionless materials in accordance with ASTM D1556/D1556M, ASTM D2167, ASTM D6938, ASTM D2937, ASTMD5195. Run not less than one (1) field in-place density test on each lift of material or every 3,900 cubic yards of completed embankment fill or backfill whichever is less. Randomly stagger horizontal locations in the fill. When nuclear method is used for in-place density testing according to ASTM D6938, include a sand cone correlation test in accordance with ASTM D1556/D1556M for the first test and every tenth test thereafter for each material type. Perform the sand cone test adjacent to the location of the nuclear test, including a nominal 6 inch diameter sand cone, and including a minimum wet soil weight of 6 pounds extracted from the hole. Submit the density correlations with test results. For each transmittal including density test data, include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
   Station.
   Coordinates.
c. Elevation of lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.

[3.22.3.2.3.3 Water (Moisture) Content Tests

Perform determination of water content in accordance with ASTM D2216. [ASTM D4643 may be used when rapid moisture content results are needed. Confirm all rapid results obtained by ASTM D4643 by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern.] One water content test will be performed for each [_____] cubic m cubic yards of material placed[ or each lift of material whichever is less].[ These test will be in addition to the water content tests performed in conjunction with in-place density tests.] Retest backfill and fills not meeting the required specifications for water content after corrective measures have been applied.

][3.22.3.2.4 Additional Testing

The Contracting Officer may request additional tests if there is reason to doubt the adequacy of the compaction, or special compaction procedures are being used, or materials change or if the Contracting Officer determines that the Contractor's testing is inadequate or the Contractor is concentrating backfill and fill operations in a relatively small area.

]3.22.3.3 Materials

Suitability of materials for use in embankment and backfill.

3.22.3.4 Fill Placement

Layout, maintaining existing drainage, moisture control, thickness of layers, removal of oversized material, spreading and compaction for embankment and backfill.

3.22.3.5 Grade and Cross Section

Surveys to verify that the dimensions, slopes, lines and grades conform to those shown on the drawings.[ Surveys to monitor settlement gages to measure foundation settlement.]

3.22.3.6 Testing by the Government

During the life of this contract, the Government [or its Contractors] will perform quality assurance tests. The performance of such tests may temporarily delay the Contractor and must not be the basis for additional compensation and/or time. Make available to the government [or its Contractors] the equipment to perform these tests.

3.22.3.7 Reporting

On a daily basis, furnish the inspection records and all material testing results, [the quantity of fill placed,] as well as the records of corrective action taken, in accordance with Section 01 45 00 QUALITY CONTROL.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steepened soil slopes using geosynthetic soil reinforcement. It does not include soil reinforcements such as segmented type retaining walls, metal reinforcing strips, soil nails, and combi walls. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification does not address requirements for dewatering, shoring, or earthwork below foundation level. Geometric requirements such as slope height, crest, toe, length, and construction limits should be shown on the drawings.

Notes before paragraphs are provided to present assumptions in preparation of the guide specification, make suggestions for conditions that warrant revisions, and provide background technical
1.1 MEASUREMENT AND PAYMENT

1.1.1 Excavation

The unit of measurement for excavation is the cubic meter (CM) yard (CY), computed by the average end area method from cross sections taken before and after the excavation operations. The volume to be paid for will be the material measured in its original position and removed from the excavation areas when the material is acceptably utilized or disposed of as herein specified. The excavation is unclassified and includes material of all types. The measurement will not include material excavated without authorization. Payment will be made at the respective unit price listed on the bidding schedule. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work. Shoring is incidental to excavation.

1.1.2 Fill

Material of all types not otherwise paid for is included under the unit price for fill. The unit of measurement for fill is the cubic meter (CM) yard (CY) computed by the average end area method from cross sections taken of the final slope and after the excavation operations. The volume to be paid for will be the material measured in its final position and placed within the designated areas when the material is acceptably placed and compacted as herein specified. Payment will be made at the respective unit price listed on the bidding schedule. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.1.3 Soil Slope Reinforcement

The unit of measurement for reinforcement is the square meter (SM) yard (SY). The pay lines of the reinforcement will be neat lines taken off the approved shop drawings. Overlaps for splicing (if allowed) and for the Contractors convenience will not be measured for payment. Overlaps in curved sections will be measured assuming the slope is linear. Payment will be made at the respective unit price listed on the bidding schedule. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.1.4 Soil Slope Drainage System

The drainage system, including associated pipe, geotextile, and aggregate will not be measured for payment and will be paid for on a job basis (JB), complete. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.1.5 Soil Slope Facing and Seeding

Facing and seeding of the soil slope will be measured by the square meter (SM) yard (SY) of exposed face, measured in the plane of the slope face. The pay lines will be neat lines taken off the approved shop drawings. The work includes [seed, mulch, turf reinforcement mat, erosion control blankets, erosion control netting, and staples]. Payment will be made at
the respective unit price listed on the bidding schedule, and will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.2 REFERENCES

1.3 DEFINITIONS

**************************************************************************
NOTE: Subparagraph "Reinforcement" - This guide specification only applies to geosynthetic (extensible) reinforcement. There are differences in design and construction applicable to steel soil (inextensible) reinforcement.
1.3.1 Drainage Aggregate

Granular soil or aggregate which is placed in or around drains.

1.3.2 Fill

Soil or aggregate placed in, behind, or below the embankment or slope will be referred to as fill.

1.3.3 Reinforced Fill

Soil which is placed and compacted within the neat line volume of reinforcement as outlined on the plans.

1.3.4 Retained Fill

Soil which is placed and compacted behind the reinforced fill.

1.3.5 Reinforcement

Reinforcement consisting of a geogrid or a geotextile product manufactured for use as reinforcing. Reinforcement does not include steel products.

1.3.6 Long Term Design Strength

The long term design strength (LTDS) is:

\[ LTDS = \frac{\text{T}_{\text{ult}}}{(\text{RF}_D \times \text{RF}_{ID} \times \text{RF}_{CR})} \]

where:

- \( \text{T}_{\text{ult}} \) is the ultimate tensile reinforcement strength
- \( \text{RF}_D \) is the reduction factor for chemical and biological durability
- \( \text{RF}_{ID} \) is the reduction factor for installation damage
- \( \text{RF}_{CR} \) is the reduction factor for creep

1.4 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-02 Shop Drawings**

Detailed Drawings; G[, [____]].

Shoring; G[, [____]]

**SD-03 Product Data**

Geotextile Reinforcement

Geogrid Reinforcement

Geotextile Filter

Calculations; G[, [____]].

**SD-04 Samples**

Reinforcement

**SD-06 Test Reports**

Field Testing Results

**SD-07 Certificates**

Certificates of Compliance
1.5 QUALITY ASSURANCE

1.5.1 Manufacturer Representative

Provide a qualified and experienced representative from the reinforcement manufacturer available on an as-needed basis during the construction. Visit the site for consultation [at least once during construction] [as requested by the Contracting Officer].

1.5.2 Detailed Drawings

Submit the fabrication and installation drawings indicating fabrication and erection details for the slope, including sequencing and construction procedures. If approved by the Contracting Officer, shop drawings may consist of marked up contract drawings showing exact dimensions for the reinforcement supplied, and other minor revisions. The design and layout of the internal reinforcement are subject to the following:

a. Incorporate all features indicated in the contract documents in the final design and construction.

b. Run each reinforcement level as continuous as practical throughout the profile. If a geotextile filter is present, lay out the reinforcement so that interference with the geotextile is minimized.

c. Identify any reinforcement not placed with the machine direction as the design reinforcement direction on the shop drawings.

1.5.3 Classification of Soil Materials

Perform classification of soil materials in accordance with ASTM D2488. The Contracting Officer reserves the right to revise the Contractor classifications. In the case of disagreement, the Contracting Officer's classification will govern unless the soils are classified in accordance with ASTM D2487. All testing completed by the Contractor in conjunction with soil material classification is considered incidental to the contract work.

1.6 DELIVERY, STORAGE, AND HANDLING

Check products upon delivery to assure that the proper material has been received and is undamaged. Protect the materials from damage and exposure following the guidelines presented in ASTM D4873/D4873M.

1.6.1 Labeling

Label each roll with the manufacturer's name, product identification, roll dimensions, lot number, and date manufactured.

1.6.2 Handling

Handle and unload geosynthetic rolls by hand, or with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Do not drag, lift by one end, lift by cables or chains, or drop geosynthetic rolls to the ground.

1.6.3 Storage

Protect geosynthetics from cement, paint, excessive mud, chemicals, sparks
and flames, temperatures in excess of 70 degrees C 160 degrees F, and any other environmental condition that can degrade the physical properties. If stored outdoors, elevate the rolls from the ground surface. Protect geosynthetics, except for extruded grids, with an opaque waterproof cover. Deliver geosynthetics to the site in a dry and undamaged condition. Do not expose geotextiles to direct sunlight for more than 7 days.

PART 2 PRODUCTS

2.1 REINFORCEMENT

**************************************************************************
NOTE: Polyester is susceptible to hydrolysis in alkaline conditions. A high molecular weight and low carboxyl end group number limit the hydrolysis. Normally, a mill certificate or certification of these properties is adequate. The molecular weight of polyester geosynthetics is determined from GSI GRI GG6, "Determination of the Number Average Molecular Weight of Polyethylene Terephthalate (PET) yarns Based on a Relative Viscosity Value", and ASTM D4603, "Determining Inherent Viscosity of Poly(Ethylene Terephthalate) (PET) by Glass Capillary Viscometer." The carboxyl end group number is determined from GSI GRI GG7, "Carboxyl End Group Content of Polyethylene Terephthalate (PET) Yarns."

Survivability - The AASHTO M 288 requirements are minimum requirements and will not normally control in the product selection. The AASHTO reference can be avoided by listing the grab, tear, burst, and puncture strengths. These properties are listed in AASHTO M 288. The puncture strength (ASTM D4833/D4833M), the trapezoidal tear strength (ASTM D4533/D4533M/D4533M) and the mullen burst strength (ASTM D3786) are recognized as important geotextile properties. For the intended application, the commonly specified values for puncture, burst and tear seldom control the product selection.

Geosynthetic Selection - The Federal Acquisition Regulations require full and open competition. Usually justification is not necessary if 3 products meet the specifications. In combining various material requirements, it is easy to specify a geosynthetic product that does not exist. Design utilizing geosynthetics should include a listing with the calculations that verify the specified products are commercially available. The Geosynthetics Fabrics Report magazine publishes an annual specifiers guide that is ideal for this purpose.

The geogrid sample is intended to be for visual demonstration prior to product delivery. Quality assurance testing, if performed, should be obtained from material actually delivered to the job. If testing is to be performed for pre qualification,
the minimum sample size should be 1 m 36 inches in length and the full roll width. Although 1 square meter yard will provide enough material for testing, the full roll width should be sampled since it provides a better selection of specimen locations, it clearly shows the machine and cross directions, and the difference in waste and shipping costs is negligible.

**************************************************************************
Submit Certificates of Compliance for the materials; and calculations of the long term design strength for the reinforcement in accordance with the NCMA TR127B or FHWA NHI-00-043. Submit an affidavit certifying that the reinforcement and seams meets the project specifications. Provide the certificates and affidavits a minimum of 30 days prior to delivery of materials. Have the affidavit signed by an official authorized to certify on behalf of the manufacturer and include a mill certificate that verifies physical properties were tested during manufacturing and lists the manufacturer's quality control testing. [If the affidavit is dated after award of the contract and/or is not specific to the project, attach a statement certifying that the affidavit addressed to the wholesale company is representative of the material supplied.] Include a statement confirming that all purchased resin used to produce reinforcement is virgin resin. Include the tensile strength tested in accordance with either ASTM D4595 or ASTM D6637 in the mill certificate. Base the ultimate strength or index strength on the minimum average roll value tensile strength of the product using the wide width strength test in ASTM D4595 or the single rib test in ASTM D6637. Itemize each reduction factor and include backup data to justify each reduction factor in the calculations. Demonstrate splice efficiency from testing, if used. Submit and label samples of each type of reinforcement with a minimum size of 200 by 250 mm 8 by 10 inches. Include at least 2 apertures in each direction for the geogrid.

2.1.1 Geogrid Reinforcement

Provide geogrid, which is a geosynthetic manufactured for reinforcement applications. The geogrid must be a regular network of integrally connected polymer tensile elements with aperture geometry sufficient to permit significant mechanical interlock with the surrounding soil, aggregate, or other fill materials. The geogrid structure must be dimensionally stable and able to retain its geometry under manufacture, transport and installation. Manufacture the geogrid with 100 percent virgin resin consisting of polyethylene, polypropylene, or polyester, and with a maximum of 5 percent in-plant regrind material. Polyester resin must have a minimum molecular weight of 25,000 and a carboxyl end group number less than 30. Stabilize polyethylene and polypropylene with long term antioxidants.

2.1.2 Geotextile Reinforcement

Submit descriptive technical data on the reinforcement and geotextile filter materials. Include all material properties specified under paragraph PRODUCTS. Geotextile must be a pervious sheet of polymeric material consisting of long-chain synthetic polymers composed of at least 95 percent by weight polyethylene, polypropylene, or polyesters. Manufacture the geotextile with 100 percent virgin resin, and with a maximum of 5 percent in-plant regrind material. Form geotextile into a network such that the filaments or yarns retain dimensional stability
relative to each other, including the selvages. Polyester resin must have a minimum molecular weight of 20,000 and a carboxyl end group number less than 50. Stabilize polyethylene and polypropylene with long term antioxidants. For survivability during installation, and in addition to installation damage used in calculating the long term design strength, the geotextile must meet the minimum requirements in AASHTO M 288 Class 1, and have a minimum mass per unit area of 270 g/m² 8 oz/sq.

2.1.3 Reinforcement Properties

**************************************************************************
NOTE: Permittivity - Reinforcement geotextiles should not puddle or impede infiltration or seepage. AASHTO M 288 provides some default guidance.
**************************************************************************

2.1.3.1 Primary Reinforcement Properties

Meet the property requirements listed in Table 1 for reinforcement shown on the contract drawings. Reinforcement strength requirements represent minimum average roll values in the machine direction.

2.1.3.3 Long Term Design Strength

Base the long term design strength on reduction factors for installation damage and durability that are applicable to the fill that will be used. Minimum reduction factors for durability include: 1.1 for polyethylene and polypropylene geosynthetics, 1.15 for coated polyester geogrids, and 1.6 for polyester geotextiles. Minimum reduction factors for creep include: 2.5 for polyester, 4 for polypropylene, and 2.6 for high density polyethylene.

Ranges for damage reduction factors in accordance with FHWA NHI-10-024 are listed in Table 3.

* Minimum weight 270 g/m2 8.0 oz/yd2.

2.1.4 Reinforcement Splices

Provide reinforcement splices consisting of a standard method or device recommended and approved by the manufacturer of the reinforcing. Splices less than 90 percent efficient (width wide tensile strength of splice to mean average roll value tensile strength of reinforcing) are not...
acceptable. Demonstrate and submit the splice efficiency. Splicing may consist of overlaps, fusion wedge welding, sewing, or bodkin connections. Splicing methods that are dependent on installer experience and skill level, such as hot air and torch-applied open flame, are not acceptable. Perform sewing by 2 lines of stitching with a Federal 401 double thread lock stitch with a thread of the same polymer type and UV protection as the geotextile. [Perform overlaps as indicated on the drawings.][Overlaps must be a minimum of \( 300 \) [600] \( \text{mm} \) [12] [24] \( \text{inches} \) for linear runs along the slope face where the primary design strength axes of adjacent reinforcement panels are parallel.] The overlap is to be protected from folding and/or bunching during installation of fill.

### 2.1.5 Seams

Test seams in accordance with method ASTM D4884/D4884M.

### 2.2 GEOTEXTILE FILTER

Meet the requirements specified in Table 4. The property values (except for AOS) represent minimum average roll values (MARV) in the weakest principal direction. For survivability during installation, meet the minimum requirements in AASHTO M 288 Class 2, and have a minimum mass per unit area of 270 g/m\(^2\) 8 oz/sq.

2.4 EROSION CONTROL BLANKET

**************************************************************************
**************************************************************************

Erosion control blanket (ECB) must consist of biodegradable open weave blankets used for establishing vegetation and have a minimum mass per unit area of [_____] g/m² oz/SY, determined in accordance with ASTM D5261.

2.5 SOILS AND AGGREGATES

Classify all material placed as fill by ASTM D2487 as GW, GP, GC, GM, SP, SM, SC, CL, ML, or SW and be free of ice; snow; frozen earth; trash; debris; sod; roots; organic matter; contamination from hazardous, toxic or radiological substances; or stones larger than 75 mm 3 inches in any dimension. Obtain each material entirely from one borrow source, unless the Contracting Officer determines that quality control is adequate and the alternate source produces material that is similar in gradation, texture, and interaction with the reinforcement. All materials must be of a character and quality satisfactory for the purpose intended.

a. Reinforced Fill. Soil placed in the reinforced fill zone must consist of [soils with less than 50 percent passing the 75 µm No. 200 sieve, maximum particle size of 1.9 cm 3/4-inch, and Plasticity Index less than or equal to 20] [alternate properties of available fill soils consistent with soil strengths and reinforcement damage assessment utilized in design]. The reinforced fill soils must have a minimum drained friction angle of 28 [_____] degrees.

b. Retained Fill. Soil in the retained fill zone [consists of existing in-situ soils][meets the material classification and requirements listed above].

c. Drainage Aggregate. Meet the requirements of ASTM D448, size No.7].
2.6 DRAINAGE PIPE

Corrugated polyethylene pipe meeting requirements of AASHTO M 252.

2.7 SEED

Provide state-certified seed of the latest season's crop in original sealed packages bearing the producer's guaranteed analysis for mixture percentage, purity, germination, weed seed content, and inert material. Provide labels that are in conformance with AMS Seed Act and applicable state seed laws. Proportion the seed mix by weight as follows: [____].

PART 3 EXECUTION

3.1 SHORING

Construct shoring in accordance with the safety requirements of EM 385-1-1. Submit drawings and calculations, certified by a registered professional engineer, describing the methods for shoring and sheeting of excavations at least 30 days prior to installation. Also include sequencing and methods of shoring installation and removal that will facilitate verification that the methods will not leave voids, seepage paths, or other deficiencies. The Contractor is responsible for design and maintenance of all shoring to be installed. Do not negatively impact existing and proposed work during installation. Unless otherwise authorized, remove all sheeting and bracing when backfill is completed. Do not negatively impact completed work during removal.

3.2 EARTHWORK

**************************************************************************
NOTE: Notification of the Contracting Officer - It is beyond the scope of a specification to provide remedies to all possible problems. If the specification indicates the Contracting Officer must be notified, it is assumed qualified assistance will be utilized to assess the situation when necessary.
**************************************************************************

Bear the reinforced fill zone on undisturbed native soils, or acceptably placed and compacted fill. In the event that it is necessary to remove material or place fill below the excavation lines shown on the drawings, or not otherwise provided for in the contract, notify the Contracting Officer prior to work and an adjustment in the contract price will be considered in accordance with the contract. It is at the Contractor's expense if additional work not authorized by the Contracting Officer is performed.

3.2.1 Excavation

Excavate to contours, elevation, and dimensions indicated. Reuse excavated materials that meet the specified requirements for the material type required at the intended location. Keep excavations free from water. Excavate soil disturbed or weakened by Contractor's operations, soils softened or made unsuitable for subsequent construction due to exposure to weather. Excavations below indicated depths will not be permitted except to remove unsatisfactory material. [_____][Remove as directed] unsatisfactory material encountered below the grades shown.[ Refill with backfill and fill material][satisfactory material][select material][porous fill] and compact to [95][_____] percent of [ASTM D698][ASTM D1557] maximum

SECTION 35 42 34 Page 17
Unless specified otherwise, refill excavations cut below indicated depth with backfill and fill material and compact to 95% percent of ASTM D698[ASTM D1557] maximum density. Replace satisfactory material removed below the depths indicated, without specific direction of the Contracting Officer, with satisfactory materials to the indicated excavation grade; except as specified for spread footings. Determination of elevations and measurements of approved overdepth excavation of unsatisfactory material below grades indicated will be done under the direction of the Contracting Officer. Perform excavation and fill in a manner and sequence that will provide proper drainage at all times. The Contractor is responsible for disposal of surplus material, waste material, and material that does not meet specifications, including any soil which is disturbed by the work operations or softened due to exposure to the elements and water.

3.2.2 Stockpiles

Stockpile material for backfilling in a neat and orderly manner at a sufficient distance from the banks of the excavation to avoid overloading and to prevent slides or caving. Keep stockpiles of all material to be incorporated into the work in a neat and well drained condition, giving due consideration to drainage at all times. Clear, grub, and seal the ground surface at stockpile locations. Stockpile topsoil separately from suitable backfill material. Protect stockpiles of aggregates and granular soils from contamination which can destroy the quality and fitness of the stockpiled material. If the Contractor fails to protect the stockpiles, and any material becomes frozen, saturated, intermixed with other materials, or otherwise out of specification or unsatisfactory for the use intended, remove such material and replace with new material from approved sources at no additional cost to the Government.

3.3 SUBGRADE PREPARATION

Remove unsatisfactory material in surfaces to receive fill or in excavated areas and replace with satisfactory materials as directed by the Contracting Officer. Scarify the surface to a depth of 150 mm 6 inches before the fill is placed. Plow, step, bench, or break up sloped surfaces steeper than 1 vertical to 4 horizontal so that the fill material will bond with the existing material. When subgrades are less than the specified density, break up the ground surface to a minimum depth of 150 mm 6 inches, pulverized, and compacted to the specified density. When the subgrade is part fill and part excavation or natural ground, scarify the excavated or natural ground portion to a depth of 300 mm 12 inches and compact as specified for the adjacent fill. Do not place material on surfaces that are muddy, frozen, or contain frost. Accomplish compaction by sheepfoot rollers, pneumatic-tired rollers, steel-wheeled rollers, or other approved equipment well suited to the soil being compacted. Moisten material or aerate as necessary [to plus or minus [_____] percent of optimum moisture] [to provide the moisture content that will readily facilitate obtaining the specified compaction with the equipment used]. Minimum subgrade density is as specified herein. Smooth the surface to be free of windrows, sheepfoot impressions, and rocks. Do not place reinforcement directly on native soil unless the upper 0.3 meter 1 foot of soil meets specification of fill materials.

3.4 PROOF ROLLING

**************************************************************************
NOTE: Specify proof rolling when the quality of the existing subgrade is questionable. Proof rolling can be used to verify that no unsatisfactory material is present (no bid quantity required, location shown or specified) or to locate suspected unsatisfactory material (indicate a bid quantity to be removed).

Perform proof rolling on an exposed subgrade free of surface water at near optimum, or at the moisture content that was used to achieve the required compaction. [If proof-rolling is performed after installation of pipe underdrains, do not use the proof-roller within 0.5 m 1-1/2 feet of the underdrains.] Perform proof-rolling with a 22,680 kg 25 ton pneumatic-tired tandem axle roller with at least three wheels on each axle, a minimum tire pressure of 5.2 kg per square centimeter 75 pounds per square inch, and a minimum rolling width of 1.9 m 75 inches. Operate proof-rolling equipment at a speed between 2.4 to 4.8 km per hour 1.5 to 3 miles per hour. Notify the Contracting Officer a minimum of 3 days prior to proof rolling. Carry out proof-rolling in two directions at right angles to each other with no more than 60 cm 24 inches between tire tracks of adjacent passes. Operate the proof-roller in a pattern that readily allows for the recording of deformation data and complete coverage of the subgrade.

Take the following actions based on the results of the proof-rolling activity in accordance with FHWA NHI-10-025:

1. Rutting less than 6 mm 1/4 inch – The grade is acceptable.
2. Rutting greater than 6 mm 1/4 inch and less than 38 mm 1-1/2 inches – Scarify and re-compact the grade.
3. Rutting greater than 38 mm 1-1/2 inches – Remove and reconstruct the compacted area.
4. Pumping (deformation that rebounds, or materials that are squeezed out of a wheel’s path) greater than 25 mm 1 inch – Remediate the area as directed by the Engineer.

3.5 REINFORCEMENT INSTALLATION

a. Place reinforcement at the elevations and to the extent shown on the construction drawings and the approved shop drawing submittal. Orient the reinforcement with the design strength axis perpendicular to the slope face. Place reinforcement strips as indicated on the drawings to provide 100 percent coverage of the reinforced area. Keep reinforcement from being exposed to direct sunlight after installation. [This can be accomplished by requiring coverage with reinforced fill material during the same work shift.]

b. Install the reinforcement in tension. Pull the reinforcement taut and anchor with pins, staples, or stakes prior to placing the overlying lift of fill. Maintain uniform tension along the length of the slope and consistent between layers.

c. Where the slope bends, place a veneer of fill to a nominal thickness of 75 mm 3 inches to separate overlapping reinforcement. [Overlap a minimum of 150 mm 6 inches along the edges perpendicular to the slope for wrapped face structures.] [With grid reinforcement, clip or tie the
edges together.][When reinforcements are not required for face support, no overlap is required and edges should be butted.]

d. Splicing. Splicing is not allowed unless identified on the shop drawings. Limit splicing to only one splice per reinforcing strip and do not include a splice with two consecutive reinforcing. Place splices randomly without a pattern. Discard individual reinforcing lengths less than 3 meters 10 feet. Place seams facing upward for inspection purposes.

3.6 FILL PLACEMENT

**************************************************************************
NOTE: Subparagraph "b." below - Studies have documented rubber tired heavy equipment traveling on geogrids with minimal or no damage. However, it is regarded as poor practice and usually unnecessary. Problematic conditions include coarse crushed gravel and coated geogrids. The intent of the specification is to minimize equipment on the geogrid so that it occurs only when necessary.
**************************************************************************

a. Place reinforced fill from the slope face back toward the fill area to ensure that the reinforcement remains taut. Place, spread, and compact fill in such manner that minimizes the development of wrinkles in or movement of the reinforcement.

b. A minimum fill thickness of 150 mm 6 inches is required prior to operation of vehicles over the reinforcement. Avoid sudden braking and sharp turning. Do not turn tracked equipment within the reinforced fill zone to prevent tracks from displacing the fill and damaging the reinforcement. Do not operate construction equipment directly upon the reinforcement as part of the planned construction sequence. Rubber tired equipment can operate directly on the reinforcement if the travel is infrequent, equipment travels slow, turning is minimized, and no damage or displacement to the reinforcement is observed.

c. At the end of each day, slope the last lift of fill away from chimney drains in a manner that will allow drainage and direct runoff away from aggregate.

3.7 COMPACTION

Do not place fill on surfaces that contain mud, frost, organic soils, fill soils that have not met compaction requirements, or where the Contracting Officer determines that unsatisfactory material remains in or under the fill. Spread fill and compact in lifts[ not exceeding the height of the face wrapping].

3.7.1 Degree of Compaction

Degree of compaction required is expressed as a percentage of the maximum density obtained by the test procedure presented in ASTM D698 or ASTM D1557. The maximum density is hereafter abbreviated as the "Standard Proctor" or "Modified Proctor" value.
3.7.2 Moisture Control

**************************************************************************
NOTE: Moisture content limits for compaction should be included in these paragraphs when necessary for obtaining strength and stability in embankments and fill, for controlling movement of expansive soils and when, in the opinion of the project geotechnical engineer, moisture control is required for the soils being used. Specify an acceptable variation from the optimum moisture if justified from experience with similar soils or where demonstrated from moisture-density tests for the borrow material during planning.
**************************************************************************

Maintain control of moisture in the fill to provide acceptable compaction. In the stockpile, excavation or borrow areas, a minimum of two tests per day per type of material or source of materials being placed is required during stable weather conditions. During unstable weather, perform tests as dictated by local conditions and test approved moisture content in accordance with ASTM D2216. Include moisture content test results in daily report. Disking and plowing will not be allowed in the reinforced fill zone. Adjust moisture content of cohesive soils at the borrow source before placement. Only conduct adding water directly to the reinforced fill zone under conditions where the soil has sufficient porosity and capillarity to provide uniform moisture throughout the fill during compaction. Ensure that moisture content is within plus or minus [2][_____] percentage points of optimum moisture content as determined in ASTM D698 or ASTM D1557.

3.7.3 Compaction

Compact reinforced and retained fill to 95[_____] percent of the Standard Proctor as determined in ASTM D698.

3.8 SOIL TESTING

3.8.1 General

All testing expenses is the Contractor's responsibility. Prior to sampling and testing the work, inspect testing laboratories and approve in accordance with Section 01 45 00 QUALITY CONTROL. The Contracting Officer reserves the right to direct the location and select the material for samples to be tested and to direct where and when moisture-density tests are to be performed.

3.8.2 Transmittal

Inform the Contracting Officer of test results daily for direction on corrective action required. Provide draft copies of field testing results to the Contracting Officer on a frequent and regular basis, as directed. Submit testing data specific to the reinforcement to be supplied:

a. Establish the coefficient for direct shear of the reinforcement on a soil similar in gradation and texture to the material that will be used for fill in the reinforced zone in accordance with ASTM D5321/D5321M.
b. Establish the coefficient of interaction for pull-out resistance of the reinforcement in a soil similar in gradation and texture to the material that will be used for fill in the reinforced zone in accordance with ASTM D6706.

3.8.3 Corrective Action

Tests of materials which do not meet the contract requirements (failed test) will not be counted as part of the required testing. If testing indicates material does not meet the contract requirements, do not place the material represented by the failed test in the contract work or recompact or remove. Determine the quantity of material represented by the failed test by the Contracting Officer up to the quantity represented by the testing frequency. The Contractor may increase testing frequency in the vicinity of a failed test in order to reduce removal requirements, as approved by the Contracting Officer. Such increases in testing frequency are at the Contractor's expense and at no additional cost to the Government.

3.8.4 Testing Schedule

a. Moisture-Density Relations (ASTM D698 or ASTM D1557)

One test for each material variation[, not less than [_____] tests total].

b. In-Place Densities (ASTM D1556/D1556M or ASTM D6938)

**************************************************************************
NOTE: Density test frequency can vary from one test per 10 square meter 100 square feet for small areas up to one test per 900 square meter 10,000 square feet. The following table will also help establish test frequency for various situations:

<table>
<thead>
<tr>
<th>Borrow</th>
<th>Any</th>
<th>One test per lift per 400 cubic m placed.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Material Type</th>
<th>Location of Material</th>
<th>Test Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Undisturbed native soil</td>
<td>Structures</td>
<td>Two random tests in native soil building footings and two tests on subgrade within building line.</td>
</tr>
<tr>
<td>Fills and backfills</td>
<td>Structures (adjacent to)</td>
<td>One test per structure per 2,000 sq. ft taken 12 inches below finished grade.</td>
</tr>
<tr>
<td>Material Type</td>
<td>Location of Material</td>
<td>Test Frequency</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------</td>
<td>----------------------------------------------------</td>
</tr>
<tr>
<td>Subgrades</td>
<td>Site (except airfields)</td>
<td>One test per lift per 2,500 sq. ft</td>
</tr>
<tr>
<td>Embankments or borrow</td>
<td>Any</td>
<td>One test per lift per 500 cubic yds placed.</td>
</tr>
<tr>
<td>Native soil subgrade other than structures and parking</td>
<td>Any</td>
<td>One test or one test per 10,000 sq. ft whichever is greater.</td>
</tr>
<tr>
<td>Borrow</td>
<td>Any</td>
<td>One test per lift per 500 cubic yds placed.</td>
</tr>
</tbody>
</table>

Test each lift at randomly selected locations every [200] [_____] square meters [2000][_____] square feet of existing grade in fills for structures and concrete slabs, and every [250] [_____] square meters [2500][_____] square feet for other fill areas and every [200] [_____] square meters [2000][_____] square feet of subgrade in cut. Test density in accordance with ASTM D1556/D1556M, or ASTM D6938. When ASTM D6938 density tests are used, verify density test results by performing an ASTM D1556/D1556M density test at a location already ASTM D6938 tested as specified herein. Perform an ASTM D1556/D1556M density test at the start of the job, and for every ten ASTM D6938 density tests thereafter. Include density test results in daily report.

c. Sieve Analysis, (ASTM C136/C136M)

Drainage Aggregate, 1 test for each source.

3.9 REINFORCEMENT TESTING

NOTE: Primary reasons for testing geosynthetics include verification of quality control by the manufacturer, detecting degradation during shipping and storage, and verifying the correct product is supplied. Verification of quality control by the manufacturer and detecting degradation during shipping and storage is not economically justified for small jobs. Unlike reinforcing steel for concrete, geosynthetics are difficult to identify in the field, and even experienced personnel can sometimes mistake the product identity of unlabeled material. Testing after delivery to verify the correct product was supplied may be advisable for critical structures. The strength is usually the most critical property to verify an acceptable product is furnished.

It is the Contractor's responsibility for all testing expenses. Perform testing by a commercial testing laboratory selected by the Contractor and approved by the Contracting Officer or performed by the Contractor if approved by the Contracting Officer. The Contracting Officer reserves the right to direct the location and select the material for samples.
### TABLE 6. REINFORCEMENT TESTING

<table>
<thead>
<tr>
<th>PROPERTY</th>
<th>TEST DESIGNATION</th>
<th>FREQUENCY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wide Width Strip Tensile Strength (Geotextiles)</td>
<td>ASTM D4595</td>
<td>[_____]</td>
</tr>
<tr>
<td>Single Rib Tensile Strength (Geogrids)</td>
<td>ASTM D6637</td>
<td>[_____]</td>
</tr>
<tr>
<td>Specific Gravity (HDPE only)</td>
<td>ASTM D1505</td>
<td>[_____]</td>
</tr>
<tr>
<td>Melt Flow Index (PP &amp; HDPE)</td>
<td>ASTM D1238</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Modify ASTM D4595 for geogrids considering recommendations in GSI GRI GG6; and express the tensile strength on a unit length basis by substituting \( n \cdot a \) for \( W_s \), where:

- \( W_s = \) specimen width, (mm inches)
- \( n = \) number of ribs in the sample (must be a whole number)
- \( a = \) nominal rib spacing for the product tested, (mm inches)

#### 3.10 DRAINAGE PIPE

Place drain pipe as indicated on the drawings. Lay drain lines to true grades and alignment with a continuous fall in the direction of flow. Keep the interior of the pipe clean from soil and debris; and temporarily cap open ends as necessary.

#### 3.11 EROSION CONTROL

Install erosion control in accordance with the manufacturer's recommendations. Clear the ground surface of vegetation, cobbles, rubbish, or debris prior to placement.

#### 3.12 SEEDING

Apply seed at the rate of 18 square m/kg 10 square yards per pound of seed. Evenly distribute the seed by hand or using broadcast seeders. Cover seed to a nominal 13 mm 1/2 inch depth by rakes.

#### 3.13 CONSTRUCTION TOLERANCES

- **Horizontal:** Ensure the slope crest and toe are within 150 mm 6 inches of the plan location.
- **Vertical:** Ensure the slope crest elevations are within 90 mm 0.3 feet above to 90 mm 0.3 feet below the prescribed elevations shown on the drawings.

#### 3.14 PROTECTION OF WORK

Protect work against damage from subsequent operations.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for vertical axial-and mixed-flow impeller-type pumps, having a pump discharge diameter up to and including 2100 mm 84 inches, for flood control and hurricane protection projects. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

TO DOWNLOAD UFGS GRAPHICS
Go to http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms
This specification is written to obtain reliable, long-lasting pumps that are suited for the purpose intended at the most economical price. It requires the use of grease-, water- or oil-lubricated bearings and packing glands, and permits the manufacturer to use his standard castings for the suction bell and the bowls.

Alternate specifications for the "FACTORY TEST" have been provided in this specification. Alternate 1 gives the manufacturer the option of testing either the prototype pump or a homologous model of the pump. This alternative should be used for all pumps having a diameter up to and including 1200 mm 48 inches. Alternate 2, which requires a homologous model of the pump be tested for performance and NPSHR characteristics, should be used for pumps having a diameter greater than 1200 mm 48 inches. Alternate 2 can also be used for pumps smaller than 1200 mm 48 inches in diameter if the expected annual operating time is greater than 500 hours per year or for the special case when there is no published NPSHR curve available.

If this guide specification is used for a supply contract, the flexible mechanical couplings and harness bolts should be obtained under the construction contract, except when the pump manufacturer is required to furnish the discharge piping.

With a construction contract, it is the prime Contractor's responsibility to have equipment delivered when ready for installation. Inevitably, delays occur. Some storage will most likely be required. These requirements may be modified as required, but in no case should they be deleted when the storage of equipment is contemplated.

With a supply contract, the delivery of the equipment being furnished should be arranged to coincide with the date of installation, when possible. This will obviate the need for long-term storage of the equipment in Government-furnished space.

This specification has been prepared on the basis that it will be used in construction contracts. If this guide specification is to be used for supply contracts, paragraphs to be included in Part IV - TECHNICAL PROVISIONS should be arranged to follow the format listed below. Section 5 should be deleted when a reduction gear is not to be furnished, and the word "DELETED" should be substituted in lieu thereof. Section 1 should include appropriate provisions of Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, Section 05 50 14 STRUCTURAL METAL FABRICATIONS and Section 05 50 15 CIVIL WORKS FABRICATIONS.
1.1 PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below be inserted into Section 01 20 00.

1.1.1 Vertical Pumps, Axial-Flow and Mixed-Flow Impeller-Type

1.1.1.1 Payment

Payment will be made for costs associated with furnishing and installing the vertical pumps, axial-flow and mixed-flow impeller-type, as specified.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Contractor's Erection Engineer(s)

1.1.2.1 Payment

Payment will be made for costs associated with the services of the Contractor's erection engineer(s) for the period of time that erecting engineers are in service of the Government within the Continental United States, including time required by them to travel. No payment will be made for days the erecting engineers are absent from the jobsite, except for non-work days, National Legal Holidays, and authorized travel time. No additional or overtime payment will be made to the Contractor when the erecting engineers are required to work in excess of 8 hours per calendar day or 40 hours per week. If delays occur during periods of assembly, erection, or testing, wherein services of erecting engineers are not required, the Contracting Officer may direct the engineers to return to their home station, in which case they will not be paid for time they are not at the site of work, except for travel time; or direct engineers to remain at the site of work, in which case they will be paid as provided by contract.

1.1.2.2 Measurement

Services of the Contractor's erection engineer(s) will be measured for payment based upon contract unit price per calendar day for the number of calendar days that their services are required, including Sundays and National Legal Holidays. Time for travel will be measured for payment by the most direct commercial airline or rail route from their home station or
port of entry, or from their duty station when travel time from the duty station is less than that required from home station or port of entry, to site of erection and return. When travel time from the duty station is greater than that required from home station or port of entry, only time from home station or port of entry will be allowed. Travel time will be allowed only from time of the first available transportation after release for return to home station or port of entry.

1.1.2.3 Unit of Measure

Unit of measure: per calendar day.

1.1.3 Transportation Expenses of Contactor's Erecting Engineer(s)

1.1.3.1 Payment

Payment will be made for costs associated with the travel and transportation expenses of the Contractor's erecting engineer(s). No payment will be made for daily commuting expenses or subsistence or other personal expenses while in route or at the jobsite. Also, no payment will be made for fare and transportation expenses outside of continental limits of the United States. Payment may be made for travel by privately owned conveyance if used in lieu of travel by common carrier.

1.1.3.2 Measurement

Travel and other necessary transportation expenses of the Contractor's erecting engineer(s) will be measured for payment based upon the travel fare by scheduled airline using less than first class accommodations, when available, or railroad and sleeping car fare when air travel accommodations are not available. Payment for travel by privately owned conveyance is made at the applicable mileage rate of [_____] cents per km mile, provided that such payment do not exceed the constructive cost of air coach accommodations, including consideration of the cost to the Government for the rate per calendar day bid for the services of the erecting engineer and regardless of whether space would have been available. When air accommodations are not available, the mileage reimbursement will be limited to the constructive cost of first class rail, when the elapsed time of rail travel is more than 4 hours; coach class when the elapsed time of rail travel is 4 hours or less; or when neither air nor rail accommodations are provided, the mileage reimbursement will be limited to the constructive cost of bus transportation.

1.1.3.3 Unit of Measure

per km mile.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of
the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**1.3 SUBMITTALS**

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

1.4 QUALITY ASSURANCE

Provide one or more competent erecting engineers who is knowledgeable about the installation of vertical pumps and associated drive machinery. Erecting engineers provided by this section must include those from the Contractor's suppliers. This Contractor's erecting engineers are responsible for providing complete and correct direction during initial
starting and subsequent operation of equipment until field tests are completed. The Contractor’s erecting engineer must initiate instructions for actions necessary for proper receipt, inspection, handling, uncrating, assembly, and testing of equipment. The erecting engineer(s) must keep a record of measurements taken during erection, and submit one copy to the Contracting Officer on request or on completion of installation of the assembly or part. The erecting engineer must instruct the Contracting Officer in operation and maintenance features of work. Submit qualifications of erecting engineer for approval.

1.4.1 Detail Drawings

**************************************************************************
NOTE: Select appropriate alternate paragraph "d".
The first paragraph choice may be used for pump with discharge diameters up to and including 1350 mm 54 inch. The second paragraph choice should be used for pumps with discharge diameters above 1350 mm 54 inch.
**************************************************************************

Submit drawings of sufficient size to be easily read, within [90] [_____] days of notice of award of contract. Submit information in the English language. Provide with English (IP) dimensions[, or metric with English conversion]. Submit drawings requiring changes as a result of model test within 45 days after approval of model test.] Drawings must consist of complete designs of the pump, pump installation instructions, performance charts, brochures, and other information required to illustrate that the entire pumping system (including the pump, [engine] [motor] [and speed reducer] has been coordinated and will function as a unit.

a. Outline drawings of the pump showing pertinent dimensions and weight of each component of the pump. Prepare drawings to scale.

b. Drawing showing details and dimensions of pump mounting design or layout including any embedded items[ and the FSI].

c. Cross-sectional drawings of the pump showing each component. Show major or complicated sections of the pump in detail. Indicate on each drawing an itemized list of components showing type, grade, and class of material used and make and model number of standard component used.

[d. Detail and assembly drawings required for manufacturing showing dimensions, tolerances, and clearances of shafts, [sleeve journals], bearings, including dimensions of grooving, couplings, and packing gland, and diameter and tip clearance of propeller.]

[e. Detail and assembly drawings of entire pump. Include all dimensions required to manufacture pump.]

e. Drawings covering erection and installation, that are intended to be furnished to the erecting engineer.

f. Drawings of the pump; base plate showing its dimensions.

1.4.2 Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, procedures and welders must be qualified
in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1. Perform welder qualification tests for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests. Perform the qualification tests at the work site if practical. The welder or welding operator must apply their assigned symbol near each weld made as a permanent record.

The names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, and standards tested to.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Outfit major pump components with lifting lugs or eye bolts to facilitate handling. Design and arrange lugs or bolts to allow safe handling of pump components singly or collectively as required during shipping, installation, and maintenance. Submit copies of certified shipping bills to the Contracting Officer or memorandums of all shipments of finished pieces or members to designated site, giving designation mark and weight of each piece, number of pieces, total weight, and if shipped by rail in carload lots, car initial and number.

1.5.2 Processing for Storage

Prepare pumps [and spare parts] for storage indoors. Indoor storage consists of a permanent building that has a leak-proof roof, full walls to contain stored equipment, and a concrete floor or temporary trailers. A temporary structure may also be built at the job site for equipment storage that will contain features of the permanent building above except that provision for ventilation must be provided and floor may be crushed rock. Provide a vapor barrier below the crushed rock. Use cribbing below equipment stored on crushed rock so that equipment does not come in contact with crushed rock. Provide a plastic barrier between equipment and wood cribbing. Submit a list of equipment and materials requiring humidity-controlled storage to the Contracting Officer no later than 30 days prior to shipment of pumping units. Store long term (greater than 6 months) in accordance with Contractor selected pump specifications.

1.6 PROJECT/SITE CONDITIONS

1.6.1 Datum

**************************************************************************
NOTE: Datum Selection
NAVD 1988 Datum is required for new projects. NGVD is only appropriate if this contract is for, or relates to, an existing project where National Geodetic Vertical Datum (NGVD) was used originally.
**************************************************************************

Elevations shown or referred to in this contract, are above [plus] or below [minus] [mean sea level] North American Vertical Datum of 1988 (NAVD) [____].
Elevations shown or referred to in this contract, are above [plus] or below [minus] [mean sea level] National Geodetic Vertical Datum (NGVD) [_____].

1.6.2 [Static][Pool-To-Pool][Bowl] Head

**************************************************************************

NOTES: Select appropriate alternate paragraph.

Static head (1st alternate) is generally used for pumping stations having discharges over the protection, free discharge or a discharge chamber type pumping station. If this alternate is selected, the Specifier should attach FIGURE 1, SYSTEM LOSS CURVE to the end of this section.

Pool-to-pool heads (2nd alternate) are usually specified when the discharge and suction systems are complex and total head is found by model test or determined by the Contractor.

Bowl Head (3rd alternate).

**************************************************************************

Static head is the difference, in meters feet, between water surface elevation in the [sump bay] [sump] [immediately inside trash rack] and [top of discharge pipe at highest elevation] [water surface elevation of [river] [lake] [discharge chamber] [centerline of discharge flap gate in discharge chamber] [____]]. Total head includes static head, friction losses outside of equipment being furnished, plus velocity head loss. [A curve showing friction losses plus velocity head for pumped capacities is included at the end of this section.]

Pool-to-pool head is the difference in meters feet between the water surface elevation in the [sump bay] [sump] and water surface elevation in [discharge chamber] [discharge channel] [river] [____]. Submit computations of total head and losses. Total head includes losses from the water surface on the suction side of the pump to discharge water surface.

Bowl head is the difference in meters feet between the water surface elevation in the [sump bay] [sump] [immediately inside of trash rack] and the elevation of the diffuser exit plus head of water occurring at the diffuser exit. The Contractor must determine total head. Total head includes losses beyond the pump diffuser plus velocity head loss.

1.7 MAINTENANCE

1.7.1 Special Tools

**************************************************************************

NOTE: Add applicable sections for drive units used.

**************************************************************************

Include one set of special tools required to completely assemble, disassemble, or maintain the pumps. Special tools refer to oversized or specially dimensioned tools, special attachments or fixtures, or any similar items. If required, provide a device for temporarily supporting
the pump shaft and impeller during assembly, disassembly, and reassembly of the [motor] [gear reducer] when the thrust bearing is not in place. Provide lifting devices required for use in conjunction with [the overhead ] [a truck] crane. [Provide a portable steel cabinet large enough to accommodate all special tools included under this paragraph and as required by Section(s) [26 29 01.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL INDUCTION TYPE] [26 29 02.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL SYNCHRONOUS TYPE], [41 65 10.00 10 DIESEL][NATURAL GAS] FUELED ENGINE PUMP DRIVES] and [35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS]. Mount the cabinet on four rubber-tired casters. Provide drawers to accommodate tools. Fit front of cabinet with doors hinged to swing horizontally. Furnish doors with necessary stops, catches, and hasps for completely securing the cabinet with a padlock. Furnish the padlock complete with three keys. Pack special tools in wooden boxes if the size and weight do not permit storage in the tool cabinet. Provide slings if the box and tools are heavier than 34 kg 75 pounds.

[1.7.2 Extra Materials]

******************************************************************************

NOTE: Spare parts should be required if estimated station operating hours are greater than 500 hours per year. Spare parts should also be considered for pumps located in remote locations and for pumps with unusual design. Spare parts for pumping stations having more than three pumps of identical construction should be considered, since acquisition of these spares will be more economical when purchased with the pumping units. Decisions on requiring spare parts can also be based on including spare parts for stations in remote areas or having unusually designed pumps where parts could take considerable time to obtain. When spare parts are included as part of the original supply contract, their cost would probably be half of their cost if obtained after original construction. When spare parts are included as part of the original purchase of the pumping units, their cost could be less than one half of the cost when obtained at a later date.

Select appropriate alternate paragraphs for subparagraphs "d" and "f", below.

******************************************************************************

Provide the following spare parts:

a. One complete replacement set of bearings, bearing shells, journal sleeves, shaft coupling, if applicable, and seals for each size pump.

b. One complete replacement set of wearing parts for the packing gland for each size pump, and sufficient packing for all pumps.

c. Fifty percent of each size and length of bolt, nut, and washer used on each size pump assembly.

d. [One lube pump, complete with motor and timer control, for the centralized lubrication system.] [One complete manually operated centralized lubrication system.] [One oil storage container including drip device and solenoid oil valve.]
e. One complete main pump shaft, including keys and thrust collars.

f. [One complete pump impeller for each size pump.] [One complete main pump impeller bowl assembly for each size pump, consisting of the impeller bowl, diffuser bowl, suction bell if so equipped, impeller shaft with sleeves, bearings, impeller, and all fasteners required to make a complete assembly.] All spare parts must be duplicates of the original parts furnished and be interchangeable therewith. Pack spare parts in crates as specified in paragraphs under DELIVERY, STORAGE, AND HANDLING. Provide slings if the crates and parts are heavier than 75 pounds.

g. Provide copies of complete parts list showing all parts, spare parts, and bulletins for each size pump. Clearly show all details and parts, and adequately describe parts or have proper identification marks.

][1.8 WARRANTY

**************************************************************************
NOTE: Consider including an extended warranty for the pumping equipment if there is a likelihood that the pumping equipment will be operated very little during the first years due to a lack of water, ongoing interconnected projects, or permitting issues.
**************************************************************************

Provide a warranty for all equipment included under this section against defective workmanship, materials, design, and performance for a period of [_____] years from the date the equipment is accepted. If the equipment or part does not conform to these warranties, and the Government notifies the Contractor within a reasonable time after its discovery, the Contractor must promptly correct such nonconformity by repair or replacement. Coordinate the down time and repair for the equipment with the Contracting Officer. The Contractor is liable during the warranty period for the direct cost of removal of the equipment from the installed location, transportation for repair, and reinstallation on site. The expense of removing adjacent apparatus, installing spare equipment, costs of supplying temporary service, is not included in this warranty provision.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Design and provide [_____] [identical] vertical [axial-flow] [or] [mixed-flow], single [or two-]stage impeller-type pumps, as indicated. The pumping systems include pumps, [diesel engine pump drives], [electric motor pump drives], [and reduction gears].

2.1.1 Design Requirements

**************************************************************************
NOTE: Delete the reference to the pump operating in the dry if the pump is product- water lubricated. Select appropriate alternate paragraph for subparagraph "d". A discharge line is used for all applications, except for stations that have the discharge system integral with the wall of the pumping station.
**************************************************************************
a. Pumps are for the purpose of pumping [_____] from [_____] into [______]. Water pumped will not exceed [_____] degrees C F, will be relatively turbid, and may contain sand, silt, and vegetative trash capable of passing through the trash rack. Trash racks will have [_____] mm inch clear openings. [Design pumps to operate in the dry.]

b. Drive the pumps with the [vertical] [horizontal] [induction] [synchronous] [motors described in Section [26 29 01.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL INDUCTION TYPE] [26 29 02.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL SYNCHRONOUS TYPE]] [horizontal crankshaft diesel engines described in Section [41 65 10.00 10 [DIESEL][NATURAL GAS] FUELED ENGINE PUMP DRIVES],] [through right angle, vertical shaft, reducers described in Section [35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS]] as indicated.

c. Design pumps so that no major modifications, alterations, or additions will be required to the pumping station or suction bays to accommodate them. Design pumps so that pump parts will fit within the limiting horizontal and vertical dimensions shown and that installation and maintenance can be accomplished by the [interior; overhead traveling crane,] [truck crane using hatch in roof.] Pumps, [or pump parts assembled at pumping station] must be capable of being lowered through floor openings shown with a minimum of 25 mm 1 inch clearance around each side.

d. Each pump must discharge into discharge system shown. System loss curve, which includes friction losses from pump discharge elbow to [end of discharge line], [beginning of down [riverward] leg of discharge line], including bend losses, exit loss, and velocity head, is included as Figure 1 at end of this section to permit determination of total head. Determine losses within the pump.

d. Each pump discharge system downstream of pump [discharge elbow] [diffuser] must be compatible with Contractor selected pumps. It must be of type shown and fit within limiting dimensions and elevations shown. Determine all losses for discharge system and submit for approval.

d. Each pump must discharge into discharge chamber shown. System loss curve(s) furnished includes all losses beyond the discharge elbow. Determine losses within the pump.

e. Accomplish priming of siphon [with] [without] assistance of vacuum equipment.

f. Design the pump and column to be installed and removed using the [_____] kg ton overhead crane indicated. Design the pump and column section lengths with the indicated crane lift as a limiting factor.

g. Design documents must be signed and sealed by a professional engineer.

2.1.2 Capacities

NOTE: Select appropriate alternate paragraphs. Capacities are those determined from earlier design studies for the station. If hydrology/hydraulic
studies indicate that gross over-capacity may cause a problem, as in certain discharge chambers, a maximum capacity should be specified. If a siphon discharge system is to be used, there should be a minimum of two design points listed; one for the priming condition and one for the design operating condition.

Each pump must:

[a. The guarantee point for the pump is \([\_\_\_] \text{ L/s gal/min}\) with a differential head pressure of \([\_\_\_] \text{ m feet}\) with water surface in sump at Elevation \([\_\_\_] \text{ m feet}\).

[b. Be capable of constant-speed operation from a total head corresponding to a [pool-to-pool][static][bowl] head of \([\_\_\_] \text{ m feet}\) down to total head corresponding to a [pool-to-pool][static][bowl] head of \([\_\_\_] \text{ m feet}\) with water surface in the sump at Elevation \([\_\_\_]\).

2.1.2.1 Primed Condition

Each pump must discharge more than \([\_\_\_] \text{ m3/scfs} [\_\_\_] \text{ L/gal/min}\) against a total head corresponding to a [pool-to-pool][static][bowl] head of \([\_\_\_] \text{ m feet}\) down to and including a pool-to-pool head of \([\_\_\_] \text{ m feet}\) with water surface in the intake sump ranging from elevation \([\_\_\_] \text{ m feet}\) to elevation \([\_\_\_] \text{ m feet}\). Once the system is primed, the water level in the discharge impoundment can range from elevation \([\_\_\_] \text{ m feet}\) to elevation \([\_\_\_] \text{ m feet}\).

2.1.2.2 Start-Up Condition

Upon startup, each pump must discharge sufficient water for the pumps to become primed and siphon recovery to begin. Since the head conditions will be higher prior to the pump discharge pipe becoming filled, the pump may be operated at a higher speed for a short period of time. The pump flow must be sufficient to result in a flow velocity in the discharge pipe of no less than \(2 \text{ m per second} 7 \text{ feet per second}\). The pump speeds may be changed during the pump priming period, but after priming is accomplished, the pumps must operate as constant-speed pumps. Siphon breaker valves will be used to help prime the pumps.

2.1.3 Pump Curves

Indicate on the pump curves for the submitted pumps that the pumps are capable of operating over the entire total head corresponding to the [full pool-to-pool] [static head range]. [Also provide pump curves for the startup condition for pumps that are operated at a different speed during startup.]

Submit preliminary pump curves with the initial pump submittal. Indicate the pump's expected total head, static heads, brake horsepower, and efficiency, as ordinates. Plot against the pump discharge as the abscissa. The curves must indicate that the pump meets all specified conditions of capacity, head, brake horsepower, and efficiency.
2.2 MATERIALS

**************************************************************************
NOTE: The Designer should discuss materials and design details for specific site application with pump manufacturers; and the Designer should edit Sections 05 50 14, 05 50 15, and 08 31 00 as appropriate.

The use of corrosion resistant materials for pump fabrication such as composite impellers or components may be appropriate on a case by case basis. If a designer believes conventional pump materials are not suitable or reliable. The Designer should specifically consult pump fabricators while developing contract documents when considering the use of composite material. Some standards which govern structural composite materials are ASTM D638, ASTM D790, ASTM D695, ASTM D2344, ASTM D3846, ASTM D3433, ASTM D696, ASTM D2583, ASTM D785 and ASTM D570.

**************************************************************************

If not specified, materials and fabrication must conform to the requirements of Section (08 31 00 ACCESS DOORS AND PANELS) [05 50 14 STRUCTURAL METAL FABRICATIONS] and Section 05 50 15 CIVIL WORKS FABRICATIONS. Material selection not specified is guided by HI 9.1-9.5 for corrosion, erosion, and abrasion resistance. Submit copies of purchase orders, deviations from the specified materials, mill orders, shop orders for materials, and work orders, including orders placed or extended by each supplier. Furnish a list designating materials to be used for each item at time of submittal of drawings. Within 60 days of notice of award submit names of Contractor selected manufacturers of machinery and other equipment contemplated to be incorporated in the work, together with performance capacities and other relevant information pertaining to the equipment. Submit samples of materials as directed. Equipment, materials, and articles installed or used without the approval of the Contracting Officer are at risk of subsequent rejection.

a. Identify each pump by means of a separate nameplate permanently affixed in a conspicuous location. The plate must bear the manufacturer's name, model designation, serial number if applicable, and other pertinent information e.g. horsepower, speed, capacity, type, direction of rotation. Make the plate of corrosion-resisting metal with raised or depressed lettering and a contrasting background.

b. Equip each pump with suitably located instruction plates, including any warnings and cautions, describing any special and important procedures to be followed in starting, operating, and servicing the equipment. Make the plates of corrosion-resisting metal with raised or depressed lettering and contrasting background.

c. Provide safety guards and/or covers wherever necessary to protect the operators from accidental contact with moving parts. Make guards and covers of sheet steel, expanded metal, or another acceptable material and removable for disassembly of the pump.
2.3 METALWORK FABRICATION

2.3.1 Designated Materials

Designated materials must conform to the following specifications, grades, and classifications.

<table>
<thead>
<tr>

2.3.2 Bolted Connections

2.3.2.1 Bolts, Nuts, and Washers

Bolts, nuts, and washers must conform to requirements of paragraphs under METALWORK FABRICATION, and paragraphs under VERTICAL PUMPS for types required. Use beveled washers where bearing faces have a slope of more than 1:20 with respect to a plane normal to bolt axis.

2.3.2.2 Materials Not Specifically Described

Materials not specifically described must conform to latest ASTM specification or to other listed commercial specifications covering class or kinds of materials to be used.

2.3.3 Metalwork

2.3.3.1 Flame Cutting of Material

Flame cutting of material other than steel is subject to approval of the Contracting Officer. Shear accurately, and neatly finish all portions of work. Steel may be cut by mechanically guided or hand-guided torches, provided an accurate profile with a smooth surface free from cracks and notches is secured. Prepare surfaces and edges to be welded in accordance with AWS D1.1/D1.1M. Do not chip or grind except where specified and as necessary to remove slag and sharp edges of mechanically guided or hand-guided cuts not exposed to view. Visible or exposed hand-guided cuts must be chipped, ground, or machined to metal free of voids, discontinuities, and foreign materials.

2.3.3.2 Alignment of Wetted Surfaces

Exercise care to assure that correct alignment of wetted surfaces being joined by a flanged joint is being obtained. ([Where plates of the water passage change thickness, transition on the outer surface, leaving inner surface properly aligned.]) When welding has been completed and welds have been cleaned, but prior to stress relieving, carefully check joining of plates in the presence of the Contracting Officer for misalignment of adjoining parts. Localized misalignment between inside or wetted surfaces of an adjoining flange-connected section of pump or formed suction intake cannot exceed the amount shown in Column 4 of Table 1 for the respective radius or normal distance from the theoretical flow centerline. Correct misalignments greater than the allowable amount by grinding away offending metal, providing the maximum depth to which metal is to be removed does not exceed amount shown in Column 5 of Table 1. Do not remove metal until assuring the Contracting Officer that no excessive stresses will occur in the remaining material and that excessive local vibration will not result from removal of the material. Where required correction is greater than the amount in Column 5 of Table 1, reject pipe for use. Proposed procedure for all corrective work, other than minor grinding, must be approved by the Contracting Officer prior to start of corrective work. Finish corrective
work by grinding corrected surface to a smooth taper. Length of the taper along each flow line element must be 10 times the depth of the offset error at the flow line. Wetted surface irregularities that might have existed in an approved model cannot be reason for accepting comparable surface irregularities in the prototype pump.

2.3.3.3 Stress-Relieving Procedure

After all fabrication welding is completed, and prior to any machining, stress-relieve the bell and the impeller (if it is fabricated) by heat treatment. Submit proposed stress-relieving procedure.

2.3.4 Examination of Castings

Clean and carefully examine all castings for surface defects. Examine all discovered defects by nondestructive means. Examination personnel must be qualified/certified in accordance with applicable ASTM requirements. Submit the examination procedure and qualification of the examiner. Conduct examination tests in the presence of the Contracting Officer. Choose the examination procedure best suited for the application.

2.3.4.1 Examination Procedures

2.3.4.1.1 Ultrasonic

Conform inspection to the applicable provisions of ASTM A609/A609M.

2.3.4.1.2 Magnetic Particle

Conform inspection to the applicable provisions of ASTM E709.
2.3.4.1.3 Liquid Penetrant

Conform inspection to the applicable provisions of ASTM E165/E165M.

2.3.4.2 Acceptance and Repair Criteria

Acceptance and repair criteria must be in accordance with Section [08 31 00 ACCESS DOORS AND PANELS] [05 50 14 STRUCTURAL METAL FABRICATIONS].

2.4 VERTICAL PUMPS

2.4.1 Speed

**************************************************************************

NOTE: Select appropriate alternate paragraph. Alternate 1 is used when cavitation testing is part of the contract. Alternate 2 is used when the pump will not be tested to determine the cavitation characteristics and the designer has determined the maximum speed to be specified based on the NPSHA. The following criteria should be used by the designer in determining the maximum rotative speed:

\[
N_{ss} = \frac{(SS) \times (NPSHA)^{3/4}}{Q^{1/2}}
\]

where:

- \(N_{ss}\) = pump rotative speed, in revolutions per minute
- \(SS\) = suction-specific speed
- \(Q\) = flow, in gallons per minute
- \(NPSHA\) = net positive suction head available

Maximum value of \(SS\) to be used in the formula:

\(SS = 8,500\)

A more conservative value of suction specific speed may be used when operating for extended periods of time above or below the optimum efficiency point.

**************************************************************************

[ Rotative speed of pump must be no greater than [_____] r/min rpm. Verify that rotative speed of pump at which the NPSH is produced is no less than required, as determined by cavitation tests specified in paragraph FACTORY TEST (Alternate 2).]

Rotative speed of pump must be no greater than [_____] r/min rpm.]

2.4.2 Reverse [Rotation] [Flow]

**************************************************************************

NOTE: Select appropriate alternate paragraph: Reverse Rotation (1st alternate) and Reverse Flow (Alternate 2). 1st alternate (bracketed paragraph) is used when the pumping unit does not have a non-reverse device. 2nd alternate (bracketed paragraph) is used when the pumping unit is equipped
with a non-reverse device.

Each pump must withstand, with no damage, full rotative speed caused by subjecting the pump to reverse flow. The head used to determine this reverse rotative speed is calculated from specified highest discharge side water elevation and lowest pump intake side water elevation. Each pump and its connected electric motor must be capable of full reverse rotative speed when acting as a turbine by reverse water flow. Use the highest head specified in paragraph [STATIC][POOL-TO-POOL][BOWL] HEAD to determine the reverse speed. Provide a non-reverse device for drive systems containing reduction gears or engines with .]

The pump(s) must withstand, with no damage, the full force exerted on it, with the impeller subjected to reverse flow and the upper end locked in place by a backstop. Calculate the head to determine the force developed by this reverse flow from the specified highest discharge side water elevation and lowest pump intake side water elevation. Reverse rotative speed must be [0.0][_____] with instantaneous activation of the backstop.

2.4.3 Efficiency

All pump specifications should require some minimum efficiency at the primary or normal operating design point. This minimum efficiency should be based on the pump selections made during pump station layout and design.

Alternate 1 is used when pool-to-pool head is specified in paragraph PROJECT/SITE CONDITIONS, and the pump manufacturer is required to model the discharge system (Alternate 2). Alternate 2 is a measure of pump efficiency as defined in HI ANSI/HI 14.6. The stated efficiency is based on the pump selection made during station layout and design.

Pool-to-pool efficiency at head-capacity condition(s) specified in paragraph CAPACITIES must not be less than [_____] percent when calculated as follows:

\[
\text{Efficiency} = \frac{Q \times H}{366 \times \text{BKW}} \times 100
\]

Where: $Q =$ Discharge, cubic meter/hour
      $H =$ Pool-to-pool total head, meters
      $\text{BKW} =$ Pump brake kilowatt

\[
\text{Efficiency} = \frac{Q \times H}{3960 \times \text{BHP}} \times 100
\]

Where: $Q =$ Discharge, gallons per minute
      $H =$ Total head, feet
      $\text{BHP} =$ Pump brake horsepower
Pump efficiency, as defined in HI ANSI/HI 14.6, must include losses from the suction bell to the discharge elbow outlet and must not be less than [_____] percent at the head-capacity condition(s) specified in paragraph CAPACITIES.

2.4.4 Suction Bell

**************************************************************************

NOTE: The recommended minimum thickness of steel pipe to be specified is:

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER</th>
<th>MINIMUM THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mminch</td>
<td>mm inch</td>
</tr>
<tr>
<td>Up to and including 750 30</td>
<td>103/8</td>
</tr>
<tr>
<td>Above 750 30 and up to and including 1200 48</td>
<td>131/2</td>
</tr>
<tr>
<td>Above 1200 48 and up to and including 2100 84</td>
<td>165/8</td>
</tr>
</tbody>
</table>

More detailed procedure for computing minimum pipe thickness can be found in AWWA M11 Steel Pipe or ASME B31.3 Process Piping. If a formed suction inlet (FSI) is specified, this paragraph should be deleted.

**************************************************************************

Make each suction bell of [either cast iron, cast steel, or welded steel plate,] [stainless steel plate]. Provide a flanged connection for mating with the impeller bowl with a rabbet fit or four equally spaced dowels installed in the vertical position for initial alignment purposes and to maintain concentric alignment of the pump. [Steel plate, if used,][Stainless steel plate] must have thickness of not less than [_____] mm inch. Each suction bell must be [made in one piece][split vertically with bolted flanges joining the two pieces together]. Maintain alignment by use of dowels. Support each suction bell entirely by the pump casing. Supports from sump floor will not be acceptable, [except those that are part of a formed suction intake].[ Support umbrellas, if used, by the suction bowl. Construct the umbrella in two pieces if a single piece umbrella could not be removed using the pump opening in the operating floor. Provide bolted flanges on each half of the umbrella and provide for and easily removable bolted connection to the suction bowl. Provide sufficient lifting lugs on the umbrella to aid in handling.]

2.4.5 Impeller Bowl

**************************************************************************

NOTE: The recommended minimum thickness of steel plate to be specified is:

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER</th>
<th>MINIMUM THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mminch</td>
<td>mm inch</td>
</tr>
<tr>
<td>Up to and including 750 30</td>
<td>131/2</td>
</tr>
</tbody>
</table>
### DISCHARGE DIAMETER

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER</th>
<th>MINIMUM THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Above 750 and up to and including 1200</td>
<td>165/8</td>
</tr>
<tr>
<td>Above 1200 and up to and including 2100</td>
<td>193/4</td>
</tr>
</tbody>
</table>

Make each impeller bowl of [either cast iron, cast steel, welded steel plate or a combination of cast steel and steel plate][stainless steel plate]. [Steel plate, if used,][Stainless steel plate] must have thickness of not less than [_____] mm inch after machining is completed. Heat-treat and stress-relieve welds before final machining. Provide flanges for mating with the [suction bell][formed suction intake] and the impeller bowl or two-piece construction of the impeller. Provide flanged connections with the suction bell and the diffuser or split construction with a rabbet fit or four equally spaced dowels installed in the vertical position for initial alignment purposes and to maintain concentric alignment of the pump. Machine finish the impeller-swept area in the impeller bowl to at least 3.2 µm 125 microinch rms and concentric with the impeller axis. For mixed-flow impellers, the angle in the impeller bowl must equal the outside angle of the impeller blade tips. Tolerance for concentricity of the impeller with the impeller axis is not greater than 20 percent of the operating clearance between the impeller and the impeller bowl.

#### 2.4.6 Diffuser Bowl

**NOTE:** Use the same thickness for the steel plate as specified in paragraph IMPELLER BOWL.

Make each diffuser bowl of [cast iron, cast steel, welded steel plate, or a combination of cast steel and steel plate][stainless steel plate]. [Steel plate, if used,][Stainless steel plate] must have a thickness of not less than [_____] mm inch after machining is completed. The diffuser must contain support for the upper impeller shaft bearing and have vanes to guide the pumped flow. Equip the diffuser bowl with a bypass drain, if required, to outside of the pump from the diffuser cavity located between the enclosing tube connection and the impeller. Furnish throttle bushing located in the cavity immediately above the impeller. Design bypass drain and throttle bushing to reduce water pressure on the lower seal. Impeller back-wear rings can also be used to reduce water pressure on the lower seal.

#### 2.4.7 Pump Column and Discharge Elbow

##### 2.4.7.1 Column and Discharge Elbow

**NOTE:** Use the same thickness for the steel plate as specified in paragraph IMPELLER BOWL, above. For most pumps, space should be provided for using a long radius type elbow. Unless the elbow is made of cast materials, the elbow will be the mitered type. The roundness tolerance should be specified when the
flexible coupling is not part of the contract. Turning vanes must be used in pumps having an access door to inspect/remove trash.

The following tolerance should be used for specifying the tolerance for the plain end of the elbow.

<table>
<thead>
<tr>
<th>NOMINAL PIPE SIZE</th>
<th>TOLERANCE ON ACTUAL O.D.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than or equal to 400</td>
<td>Plus/minus 1.5 0.06</td>
</tr>
<tr>
<td>16</td>
<td></td>
</tr>
<tr>
<td>Above 400 16 and up to and including 600 24</td>
<td>Plus/minus 2.0 0.08</td>
</tr>
<tr>
<td>Above 600 24 and up to and including 1050 42</td>
<td>Plus/minus 2.5 0.10</td>
</tr>
<tr>
<td>Greater than 1050 42</td>
<td>Plus 3.0 0.12/Minus 1.5 0.06</td>
</tr>
</tbody>
</table>

**************************************************************************

Make each column and discharge elbow of [either cast iron, cast steel, or welded steel plate] [stainless steel plate]. [Steel plate, if used,[Stainless steel plate] must have a thickness of not less than [_____] mm inch after machining is completed. Provide elbow of [short radius type][long radius type][mitered type].[ Do not use turning vanes.][ Space turning vanes, if used, at least twice the space of clear space of the trash rack.] If turning vanes made of welded steel plate are used, provide an access door in the discharge elbow to allow personnel to inspect turning vanes and remove trash if necessary. Design column and discharge elbow to withstand internal pressures and external loadings associated with various conditions of pump operation. Provide flanges for mating individual segments together and for mating the pump column to the diffuser bowl. Flanges must have rabbeted fits or four equally spaced dowels installed in flanges for initial alignment purposes and to maintain concentric alignment. Terminate the elbow in a plain-end circular section. Diameter tolerance of plain end is [_____] mm inch. Provide diameter of discharge end of elbow as indicated and allow standard diameter flexible couplings to be used. Use adjustable thrust rods and thrust lugs to transfer the load by bridging the coupling between the pump discharge elbow and discharge piping. Determine the size and number of thrust rods needed for the expected loading. Use a minimum of four thrust rods. Maintain complete access to the discharge piping until the discharge pipe installation is complete, inspected, and approved.

2.4.7.2 Column and Discharge Elbow Support

**************************************************************************

NOTE: Select appropriate alternate paragraph. Pump Column and Discharge Elbow (1st alternate) is used for conventional pumps supported from the base-plate. Design Pump Unit (2nd alternate) is used for large stations having pumps over 1800 mm 72 inches in discharge diameter and supported from different floors.

**************************************************************************
Design pump column and discharge elbow for suspension from a baseplate assembly specified in paragraph BASEPLATE AND SUPPORTS and located at operating floor level.

Design each pumping unit for installation as indicated. Install the baseplate for supporting the [electric motor] [gear reducer] at elevation of operating floor, EL [____]. Support the pump casing at intermediate floor, EL [____]. Provide the [support system] [support system consisting of columns extending from baseplate to intermediate floor]. The support system must transfer the entire load on the baseplate to the intermediate floor. Design the support system to maintain proper alignment of the pumping unit and propeller blade setting. Include the support system in the dynamic analysis.

2.4.7.3 Pumps Discharge Diameter

**************************************************************************
NOTE: A manhole is used if the pump has a shaft enclosing cover that can be removed without disassembly of the pump.
**************************************************************************

Pumps having a discharge diameter greater than 1500 mm 60 inches must contain a manhole. Provide a structural steel bracket with a platform of raised-pattern floor plate similar to the one(s) indicated as a support for maintenance personnel for access to the pump through a manhole. Provide a manhole 600 by 750 mm 24 by 30 inches, or largest practicable size with a gasketed cover, in the column above the diffuser bowl. Provide jack bolts in the cover together with eye bolts to facilitate removal.

[2.4.7.4 Formed Suction Intake

**************************************************************************
NOTE: Select appropriate alternate paragraph.
**************************************************************************

Alternate 1 should be used when a rectangular sump is designed using criteria established by U.S. Army Engineer Research and Development Center (ERDC).

The use of a Formed Suction Intake (FSI) (Type 10), Alternate 2, is determined during the design phase of the station/pump. The Government will furnish all dimensions and be responsible for the design. The FSI was developed by ERDC and is now included in HI ANSI/HI 9.8.

The sump floor elevations should be determined in the design of the pumps/station. The impeller datum elevation should allow the necessary submergence as determined by the computations in EM 1110-2-3105, and verified with pump manufacturers' data.

The Designer should contact at least 3 pump manufacturers early in the project design phase to verify the Designer's pump size estimate. Normally the eye of the impeller is located at minimum sump elevation, and the geometry of the FSI determines sump floor elevation. The early verification is
important for the pump house structural design FSI hydraulics are very sensitive to change, and the pump diameter determines the dimensions of the FSI.

In designs where the FSI is not constructed of concrete, it is recommended that all materials indicated, or combination of these materials, should be specified. A hatch in the operating floor is generally provided in each pump bay to permit the placement of the FSI sections into the sump. If the station design/size does not have space for a hatch, then the opening for the pump is used for placement and removal of the FSI or is designed so that it can be removed using the sump gates and trash rack. The minimum thickness of fabricated material for the FSI should be:

<table>
<thead>
<tr>
<th>EXIT DIAMETER OF FSI</th>
<th>THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mm/ inch</td>
<td>mm/ inch</td>
</tr>
<tr>
<td>Up to and including 450 18</td>
<td>103/8</td>
</tr>
<tr>
<td>Above 450 18 and up to and including 900 36</td>
<td>131/2</td>
</tr>
<tr>
<td>Above 900 36 and up to and including 1350 54</td>
<td>165/8</td>
</tr>
<tr>
<td>Above 1350 54 and up to and including 2100 84</td>
<td>193/4</td>
</tr>
</tbody>
</table>

When a FSI is used, paragraphs SUCTION BELL and IMPELLER BOWL should be changed to coordinate with the FSI requirements.

The thickness of the rubber gasket must be as follows:

<table>
<thead>
<tr>
<th>FSI EXIT DIAMETER</th>
<th>THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mm/ inch</td>
<td>mm/ inch</td>
</tr>
<tr>
<td>Up to and including 1200 48</td>
<td>131/2</td>
</tr>
<tr>
<td>Above 1200 48 and up to and including 2100 84</td>
<td>193/4</td>
</tr>
</tbody>
</table>

**************************************************************************

[ Sump has been designed using information obtained by sump model testing. Changes to sump layout will not be permitted.]

[ Formed Suction Intake (FSI):

a. Provide the FSI water passage with the pump, sized to fit within the limiting elevations and dimensions indicated. Do not locate bearing below the impeller when an FSI is used.

b. Dimensions of the intake elbow and conical transition section of the FSI are relative to the diameter at the top of the cone, as defined on
the drawings. The diameter at top of the cone and related dimensions are determined to accommodate the size of pump, providing limiting values for discharge and submergence are not exceeded, the floor of the FSI remains at elevation [____], and impeller datum is set no higher than elevation [____]. The rectangular transition section of the FSI upstream of the elbow can be modified in length to match the width of the individual pump bay or sump intake. Any modification must be limited to surfaces and dimensions indicated, and must be approved.

c. Construct each FSI of [fabricated steel,][ cast iron,][ cast steel,][ or a combination of these materials embedded in concrete][formed concrete as indicated]. Stiffeners used must be on the outside of the FSI to allow smooth flows in the FSI. Size subassemblies of the FSI, unless constructed of formed concrete, to permit placement and removal through [a hatch in operating floor] [the pump opening in the operating floor] [through the sump gate and trash rack]. Bolts used to connect flanges must be stainless steel with bronze nuts. Minimum thickness of fabricated material must be [10][13][16][19] mm [3/8][1/2][5/8][3/4] inch for fabricated portions. Provide grout holes in floor of the FSI to permit full grouting. [FSIs formed in concrete must meet the surface requirements specified in Section 03 30 00 CAST-IN-PLACE CONCRETE and conform to the construction tolerances given in TABLE 1.][ FSIs constructed of iron or steel must conform to the construction tolerances given in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.]

<td>502</td>
</tr>
</tbody>
</table>

See AWWA C207 for additional flange thickness details.

Machine flanges and drill bolt holes concentric with pump shaft vertical centerline, having a tolerance of plus or minus one fourth of the clearance between the bolt and bolt hole. When fabricated from steel plate, flanges must not be less than [25][32][38][50] mm [1][1-1/4][1-1/2][2] inch thick after machining. Flange thickness after machining cannot vary more than 10 percent of greatest flange thickness. Provide external stiffeners, if needed. Construct fabricated flanges, as a minimum, to the dimensions of AWWA C207, Class B. Design flanges on major components of pump casing (suction bell, impeller bowl, diffuser bowl, and column and elbow piping) such that blind holes necessitating use of cap screws or stud bolts are not used. Design flanges for connection to column pipe by at least two continuous fillet welds. Connect the inside diameter of the flange to pump column with one weld, and connect the outside diameter of the pump column to the flange with the other weld. Final design of welds rests with the manufacturer, and specified welds are the minimum requirement. Parallel machine, when provided on each end of the same component, and mount parallel to a plane that is normal to pump shaft centerline. Flanges on each end of the same component must have parallel tolerance of 0.051 mm 0.002 inch. Finish machine mating surface on flange to 3.2 µm 125 microinch finish or better. Provide flanges with a minimum of three jacking bolts to aid in disassembly of the pump.

2.4.7.6 Flanged Joints

Design flanged joints to be air-and water-tight, without the use of preformed gaskets, against positive and negative operating pressures that will be experienced, except that permanent gasketing compound will be permitted. Provide mating flanges, unless of the male-female rabbet type, with not less than four tapered dowels equally spaced around each flange. If rabbeted fit is not used, then provide the method used to determine concentricity of connected pieces.

2.4.7.7 Nuts and Bolts

Use 300 series stainless steel for bolts used in assembling the pump and
its supporting members, including anchor bolts and dowels. Use only bronze nuts and hexagonal bolts and nuts. Also use 300 series stainless steel washers.

2.4.7.8 Galvanic Protection

***********************************************************************

NOTE: Select appropriate alternate paragraph.

Alternate 1 should be used for pumps having discharge diameters of 500 mm 20 inches or less.

Alternate 2 should be used for pumps having a discharge diameter greater than 500 mm 20 inches. This may also be used for pumps with sidecharge diameters of 500 mm 20 inches or less when manufacturers' information indicates that this method will be the least expensive. The total weight of anodes to be used for each pump is:

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER mm inch</th>
<th>MINIMUM NUMBER OF ANODES USED</th>
<th>TOTAL WEIGHT OF ANODES USED kg lbs</th>
</tr>
</thead>
<tbody>
<tr>
<td>From 500 20 up to and including 900 36</td>
<td>2</td>
<td>1840</td>
</tr>
<tr>
<td>Above 900 36 up to and including 1200 48</td>
<td>4</td>
<td>3680</td>
</tr>
<tr>
<td>Above 1200 48 up to and including 2100 84</td>
<td>7</td>
<td>68150</td>
</tr>
</tbody>
</table>

***********************************************************************

[When dissimilar metals are used, electrically isolate dissimilar parts. Verify isolation by checking joint with an ohmmeter.] [When dissimilar metals are used, use zinc anodes. Provide machined mounting pads and install anodes on carbon steel or cast iron parts. Fasten anodes to bare material on the pump so that continuity is obtained between the anode and the pump. Verify continuity by checking the joint with an ohmmeter. Locate anodes on the exterior of the pump below normal sump level. Total weight of anodes used per pump must be [18][36][68] kg [40][80][150] pounds. Electrically bond pump joints at the joints.]

2.4.7.9 Harnessed Coupling

***********************************************************************

NOTE: This alternative is used when the flexible coupling is to be furnished by the pump Contractor. The applicable connection should be stated.

***********************************************************************

Provide a flexible mechanical coupling or split-sleeve type coupling that either conforms to ASTM F1476, Type II, Class 3, stainless steel or ASTM F1476, Type 1, to connect the pump discharge elbow to the [transition section] [wall thimble] [discharge piping]. Install a minimum of four harness bolts (sized by the pump manufacturer) at each coupling.
2.4.7.10 Wall Thimble

**NOTE:** This alternative is used when the discharge piping includes the piece that will be embedded in the wall of the station. The size of vent to be used is determined from information in EM 1110-2-3105.

Provide each wall thimble with one plain end to accommodate the flexible mechanical coupling and one flanged end to mate with the [flap gate] [multiple shutter gate] [discharge piping]. The plain end must match the pump discharge elbow in thickness and diameter and drill the flanged end to match, and be capable of supporting without distortion, the [flap gate] [multiple shutter gate]. Provide the seal ring on the wall thimble located so that it is centered in the wall when embedded. In addition, provide a [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 Standard 125 pound flange and locate where indicated. Fabricate the wall thimble from steel plates.

2.4.7.11 Discharge Piping

**NOTE:** Include applicable discharge pipe description.

Provide discharge piping consisting of a transition section and a wall thimble. Provide a transition section with one plain end and one flanged end, and have a change in cross section from round to [square] [rectangular]. On the plain end, match the pump discharge elbow in thickness and diameter. Arrange the wall thimble for embedment and with the flanges on each end. Mate one end with the flange on the transition section and mate the other end with the flap gate. Fabricate the discharge flange with a minimum dimension of AWWA C207, Class D, and drill to match. The discharge flange must be capable of supporting without distortion, the multiple shutter gate. Provide a seal ring on the wall thimble and locate it so that it is centered in the wall when embedded. In addition, provide a [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 Standard 125 pound flange and locate where indicated. Fabricate the discharge piping from steel plate.

Install the discharge piping as indicated. Match the plain end of each discharge pipe with the pump discharge elbow in thickness and diameter and be able to allow a flexible mechanical coupling to connect it to the pump discharge elbow. [Terminate the discharge piping in a flanged end to mate with a flap gate. Drill the flanged end to match, and be capable of supporting the flap gate without distortion.] [Terminate the discharge piping in an open end.] Provide the discharge pipe with pipe supports or cradles as recommended by the pump manufacturer. Locate the supports between the flexible coupling and the wall, as indicated. Provide suitably-sized thrust restraints at each flexible coupling as indicated. The supports must provide support for the weight of the pipe, the water that will pass through the pipe, and any dynamic forces that may develop due to water flowing through the pipe. Furnish a minimum [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 standard 125 pound flange and locate where indicated. The discharge pipe must be non-galvanized piping of welded or seamless pipe or welded steel plate. Use steel pipe conforming to AWWA C200 with dimensional requirements as given in
Design the flap gate for pump discharge service with flange-frame with a resilient seat of neoprene or BUNA-N to prevent closing shock. Make the size of the flap gate the same as the discharge pipe size. [Use cast iron for the body of the valve and the flap in compliance with ASTM A126. Use high-tensile bronze ASTM B584- CA 865 for the hinge arms. Design the hinge pins in double shear and of silicon bronze, ASTM B98/B98M- CA 655.][Fabricate the flap gate entirely of stainless steel. Use only stainless steel hardware.] Provide lubrication fittings on the hinge arms. Extend the grease lines to a convenient location for lubricating. Provide an anti-locking bar to prevent excessive rotation about the lower hinge pin. Provide a stainless steel leaf spring with rubber pad to safely limit the travel of the flap gate during pumping.

2.4.8 Impeller

**************************************************************************
NOTE: Cast steel and aluminum bronze are normally used when pumps are less than 2100 mm 84 inch. Fabricated steel impellers are used with pumps having discharge diameters 2100 mm 84 inch or greater. Cast stainless steel is used for pumps where the difference between pump NPSHA and NPSHR is small (less than 600 mm 2 feet) or, when severe corrosion is expected.
**************************************************************************

Make the impeller of [cast steel, ] [cast stainless steel, ] [aluminum bronze] or [fabricated of welded steel plate].

2.4.8.1 Removal and Prior To Finishing

After removal from mold, and prior to finishing of surface imperfections, the Contracting officer will inspect castings. Fill and grind minor surface imperfections as necessary to preserve correct contour and outline of impeller and to restore surface imperfections to the same degree of finish as surrounding surfaces. Correct surface pits, depressions, projections, or overlaps showing greater than 2 mm 1/16 inch variation from the general contour for that section. Method and procedure for accomplishing repair must be as required in Section [08 31 00 ACCESS DOORS AND PANELS] [05 50 14 STRUCTURAL METAL FABRICATIONS]. Castings that exhibit surface imperfections (as defined above) covering an area of more than 10 percent of blade surface will be rejected.

2.4.8.2 Balance

**************************************************************************
NOTE: The maximum operating speed is used for driver/pumps which operate at different speeds. The rated operating speed is used with a single speed driver. The g-mm oz-inch used in this paragraph are determined from ISO 1940-1 for grade G6.3. Impellers for pumps having a discharge diameter greater than 600 mm 24 inch must have the impeller weighted. The amount of allowable unbalance or the level of balance in the acceptable standards must be
chosen and included in this guide specification.
This includes choosing acceptable standard(s). A
suggested standard is balance quality grade G6.3 in
accordance with ISO 1940-1.

**************************************************************************
Balance each impeller by the two-plane balancing technique. Balance each
impeller at [maximum] [rated] operating speed. Check the balance at 110
percent of balance speed, and make needed corrections. Amount of allowable
unbalance is in accordance with grade G6.3 of ISO 1940-1. Securely fasten
weights needed to obtain the required level of balance to the inside cavity
of the impeller hub. In no case can portions of the impeller be removed or
weights be added to the outside of the hub, vanes, or water passages.
Submit balancing procedure at least four weeks prior to the date of
balancing. Weigh each finished impeller and weight stamped on the bottom
of the hub with weight accurate to 0.5 percent of the total weight of the
impeller. Weighing and balancing will be witnessed by the Contracting
Officer. Submit all impeller weights and the results of impeller balancing.

2.4.9 Shafts

2.4.9.1 Shaft

**************************************************************************
NOTE: Stainless steel shafting should be used when
the potential for corrosion is high such as a pump
used in a station where the pump/station sump is not
capable of being dewatered. The shaft lengths are
limited in length by the headroom available. Shaft
sections are usually less than 3000 mm 10 feet in
length. Vertical adjustment of the shaft should be
performed above the operating floor. The motor and
gear reducer are normally specified to be hollow
shaft type to allow the pump shaft to pass
concentrically through the reducer and motor
allowing finite impeller elevation adjustments.

**************************************************************************
Each impeller shaft must be stainless steel and intermediate shaft(s) must
be [cold-rolled carbon steel] [same material as the impeller shaft].
Design shafting so that [shaft sections do not exceed [_____] mm feet in
length and that] any necessary vertical adjustment of the impeller can be
made [from the operating room floor] without interfering with shaft
alignment. Also provide for removal of the impeller from below without
disassembly of the pump above the impeller bowl. If the pump is
multi-staged, design to permit the lower bowls and impeller to be easily
removed for in-place inspections of upper propeller and bowl. Design
shafts for two different design cases. The first uses a factor of safety
of 5 based on ultimate tensile strength of the shaft material and rated
wattage horsepower of the [motor] [engine]. The second uses 75 percent of
the yield strength of the shaft material and [the locked rotor torque of
the motor] [maximum wattage horsepower of the engine].

2.4.9.2 Couplings

**************************************************************************
NOTE: Rigid flange couplings should be specified
only for pumps having discharge diameters greater
than 1800 mm 72 inch. The rigid flange coupling may
be specified as an option for all pumps less than 1800 mm 72 inch. Sleeve type couplings should be used for pumps having discharge diameters from 600 mm 24 inch to 2100 mm 84 inch. Threaded shaft couplings can be used for pumps with discharge diameters less than 600 mm 24 inch.

Couple the pump and [motor] [gear reducer] shafts[ and pump shaft sections] together using rigid flanged coupling capable of transmitting the forces and torques involved. Bolt coupling halves together and maintain concentric with each other, by means of a rabbet fit, to within 500 µm 0.002 inch. Retain a shaft coupling nut, if used, by fitted bolts, and comply with all tolerances specified for the coupling. Finish machine the flange and bore in one setup to insure that the flange of the coupling is true to the bore. Each flange must be perpendicular to the bore, and parallel to the opposite end and mating flanges to within 500 µm 0.002 inch. Each flange must be concentric to the centerline of the shaft to within 0.50 mm 0.002 inch. [Join together pump shaft sections with [sleeve-type couplings capable of taking rotation in either direction. Threads, except on fasteners, cannot be employed in construction of sleeve-type couplings] [threaded couplings in which the threaded shaft ends are threaded into the coupling].] Construct couplings, including keys and fasteners, of stainless steel materials. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The finished shaft assembly must be concentric about the shaft centerline to within 100 µm 0.004 inch. Shop assemble couplings and the pump shaft, and inspect for compliance with contract requirements. After inspection, matchmark parts, including fitted bolts, to their mating pieces.

2.4.9.3 Journals

NOTE: Select the appropriate alternate paragraph. The first alternate is used when plain steel shafting is used for the intermediate shafting. The second alternate is used when all the shafting is stainless steel. If self-lubricated bearings are used ensure to specify those in 35 05 40.17.

Provide replaceable stainless steel one-piece journal sleeves at each guide bearing, packing gland and seal locations. [For self-lubricated bearings see 35 05 40.17 SELF-LUBRICATED MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY]. Finish sleeves at all bearings and packing gland locations to at least 32 rms and finish sleeves at seal locations to 16 rms. Securely fasten sleeves to the shaft to prevent movement. Make keys and fasteners, if used, from corrosion resisting steel; fastening by adhesive or welding is not acceptable. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The surface hardness of the sleeves at the bearing and packing gland locations must be as recommended by the pump manufacturer.

Finish the shaft journal at all guide bearing and packing gland locations to at least 32 rms and finish the shaft at seal journal locations to 16 rms. The option exists to install replaceable stainless steel one-piece sleeves at each bearing, packing gland, and seal locations with the finishes stated above. Securely fasten sleeves to the shaft to prevent movement. Make keys and fasteners, if used, from corrosion resisting
steel; fastening by adhesive or welding is not acceptable. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The surface hardness at the seal locations must be as recommended by the seal manufacturer.

2.4.9.4 Circumferential Line

**************************************************************************

NOTE: The circumferential line with pointer should be used for pumps having 1200 mm 48 inch and greater discharge diameters. The following information will be used for determining whether the pump driver is specified as using a hollow or solid shaft.

Pump drivers with rating less than 745 kW 1000 horsepower are equipped with hollow shafts permitting vertical shaft adjustment from the top of the driver.

Pumps drivers over 745 kW 1000 horsepower are equipped with hollow shafts whenever possible but as a minimum the pump will have a means of vertical adjustment above the operating floor.

**************************************************************************

Inscribe or etch a circumferential line on the shaft above the stuffing box and mount an adjustable pointer opposite this line in order to indicate a change in vertical position of shaft and to permit realignment after [motor] [gear reducer] removal.

2.4.10 Shaft Enclosure

**************************************************************************

NOTE: Shaft enclosure tubes are tensioned for pumps with discharge diameters less than 1350 mm 54 inch. Rigid enclosing tubes are used on pumps having discharge diameters 1350 mm 54 inch and greater. External supports or bracing located in the pump water passage are used for pumps with tensioned enclosing tube of 6000 mm 20 ft in length or greater. Self-supported enclosing tubes 4500 mm 15 feet length or greater should have external supports. The enclosing tube is split when pump size is 1800 mm 72 inch or larger. Select appropriate bracketed statements based on the type of pump lubrication being called for.

**************************************************************************

Provide a shaft enclosure to cover the intermediate shaft and coupling. It [must be placed in tension or ]must be rigid enough to be self-supporting. [Do not use external supports or bracing located in the pump water passage for support of the enclosing tube unless necessary to support intermediate bearings or indicated to be necessary or advantageous by the dynamic analysis required in paragraph DYNAMIC ANALYSIS. Consider the effect of external supports, including rubber inserts, in the dynamic analysis required in paragraphs under TEST, INSPECTIONS, AND VERIFICATIONS.] Design each enclosure [to be watertight and] for easy assembly and disassembly in the field.[ Split each enclosure longitudinally to permit easy removal without removing or disassembling the pump shaft.] [ Perforate each
enclosure tube sufficiently to allow a free flow of pump discharge water (i.e., product water) to lubricate the shaft bearings. Construct enclosing tubes, constructed with screw type joints and using tension in the tube to hold alignment, to prohibit the tension tube from unscrewing when the packing gland adjustments are made. [Provide a shaft enclosure for grease-lubricated pumps with a drain having a shut-off valve located outside of the pump to permit draining the enclosure between operation periods. Locate the drain at the bottom of the shaft enclosure.] [On oil-lubricated pumps, fit the enclosing tube below the lowest bearing and above the oil seals with an oil/water drain line to the outside of the pump. The drain line must have a check valve outside of the pump to preclude the entrance of sump water.]

2.4.11 Guide Bearings and Seals

**************************************************************************
NOTE: The Clean Water Act requires all in water bearings to meet the standard EAL criteria (Vessel General Permit (VGP), or EPA 800-R-11-002). Confirm submitted EAL product data conforms to EM 1110-2-1424. Grease lubrication can be used with all size pumps. Oil lubrication may be used in pumps having discharge diameters of 900 mm 36 inch or smaller. Select appropriate bracketed statements based on the type of pump lubrication being called for. The first water-lubricated bearing alternative is for product lubricated bearings. The second water-lubricated alternative if for externally-provided water.
**************************************************************************

2.4.11.1 Guide Bearings

All in water bearing lubrication must conform EPA 800-R-11-002 for environmental acceptability. Submit in water bearing lubrication product data to show bearings meet environmental, performance, and comparability requirements for the application.

[ Provide each pump with sleeve-type bearings designed for [grease] [oil] lubrication. Each bearing must have a bronze lining in contact with shaft journal and must be replaceable type. Arrange the bearing liner for maximum distribution of [grease] [oil] for lubrication of journal surface. Bearings must have a surface finish of 0.80 µm 32 microinches rms or better to match the journal finish. Since pumped water may contain some fine sand and silt in suspension, give special attention to the design and selection of bearing parts, especially seal rings, to preclude entrance of foreign material between the bearing and journal due to differential water pressure.

][Provide elastomeric polymer alloy bearings, sealed in the shaft enclosure. Support the bearings in threaded bronze sleeves acting as an enclosing tube. Ensure the bearings are submerged in water when the pump is in operation. Accomplish lubrication by pump discharge water (product water) free-flowing through perforations in the shaft enclosure tube.

][Provide each pump with bearings that are grooved and continuous. Machine the bearings to marine clearances for strained canal water lubrication and of sufficient length and diameter to keep bearing pressure to the allowable design. Select bearing thicknesses and marine clearances to allow for material swell from water submergence. Shaft bearings may be located as
the design dictates with the following exceptions. Provide no fewer than three bearings in the pump with a maximum bearing spacing of 1.5 m 5 feet. Locate bearings at the top of the diffuser section, above the impeller, and near the baseplate. Bearings in the right angle gear, other than the thrust bearing, are not acceptable for use as pump shaft support. Support the line shaft bearing by the diffuser inner cone fabricated assembly. Secure tubing for bearing lubrication water to and routed on the outside of the casing for each bearing. The tubing must be continuously welded to a diffuser vane or bearing support to cross from the outside of the casing to the bearing mounting assembly.

Bears must be easily removable for servicing in the field.]

2.4.11.2 [Oil][Grease] Lubrication Shaft Seals

**************************************************************************

NOTE: Select appropriate alternate paragraph. The designer must select the appropriate seal material which is compatible with the selected oil lubrication.
**************************************************************************

[Pumps designed for oil lubrication must have a shaft seal system located below the upper pump shaft bearing. The seal system consists of a seal containing two lip elements. The element facing the bearing must have a stainless steel garter spring back-up and be constructed of [tetrafluoroethylene][fluoropolymer elastomer][Buna N]. The secondary element faces the impeller and is constructed of tetrafluoroethylene. Use a bullet-shaped assembly tool or other special tool over the end of the shaft or grooves in the shaft to preclude damage to the lip element during assembly. Assembly tools used are considered a special tool and must be furnished to the Government as part of special tools specified in paragraph SPECIAL TOOLS. Pumps having two stages must have seals to protect the extra bearings required by two stages of construction.

][Pumps designed for grease lubrication must have a shaft seal consisting of lip seals. The seal system consists of a lip-type seal located on each end of the bearing. Each seal must contain a lip element having a stainless steel garter spring back-up and be constructed of [tetrafluoroethylene][fluoropolymer elastomer][Buna N]. Face the lip element out, away from the bearing to keep water from intruding into the bearing chamber. The lowest bearing must have an additional grease seat with the lip facing away from the bearing. Use a bullet-shaped assembly tool or other special tools over the end of the shaft and shaft grooves to preclude damage to the lip element during assembly. The assembly tool used is considered a special tool and must be furnished to the Government as part of special tools specified in paragraph SPECIAL TOOLS.

][2.4.11.3 Product Lubricated Pump Bearings

Submerged pump bearing must be [product lubricated][externally supplied water lubricated] and meet the following requirements:

a. Fabricated from an elastomeric material or polymer composite material and not require petroleum lubricants for operation.

b. Operate in [brackish][fresh] water that may contain [sand] [silt] [vegetative trash].
c. Does not require service or replacement for [50,000] [_____] operating hours.

2.4.12 Bearing Heat Sensors

**************************************************************************
NOTE: Bearing heat sensors may be used in pumps having a discharge diameter larger than 600 mm 24 inches. Pumps with large discharge diameters should be furnished with heat sensors for the impeller bearings only, when the estimated annual operation is less than 100 hours per pump. Pumps with greater operating hours per year may be equipped with bearing heat sensors for all bearings in the pump. Schedule 80 guard pipes must be used when the unsupported length is 450 mm 18 inches or less. Schedule 120 should be used for greater unsupported lengths.
**************************************************************************

Fit [the impeller shaft bearings] [each bearing] with temperature-sensing elements, inserted in the bearings to within 3 mm 1/8 inch of shaft. Provide these temperature-sensing elements with temperature readouts mounted [on the [engine] [motor] instrument board] [at a central location as shown]. Provide a visual and audible alarm system to warn of bearing overheating. Provide temperature indicator with dual outputs that have setpoints that are separately adjustable. Support leads and protect them from water and mechanical damage. Terminate the leads outside of the pump casing in a waterproof connection head and cap until final connections are made in the field. The connection head must be rated watertight to 175 kPa 25 psi. Lead protection consists of pipes fastened to the pump with brackets using bolts and nuts to permit their removal, and constructed with enough unions to be completely disassembled. Leads passing through the pump water passage in the pump must either be contained in a guide vane or be protected by [Schedule 80] [Schedule 120] pipe. Make protection pipe removable if connected to the shaft-enclosing tube. Install bearing heat sensors as [shown in Figure 2 at end of the section] [indicated]. Run leads and wiring to a junction box located on the baseplate. Provide a terminal strip in the junction box for connection of wiring to temperature readouts.

2.4.13 Thrust Bearing

Provide a thrust bearing in the [speed reduction gear][motor] to carry total thrust load[ as specified in [____]].

2.4.14 Packing Gland

Provide [grease-] [water-] lubricated packing gland split longitudinally to facilitate removal or renewal. Arrange it to permit inspection, repair, removal, or replacement of packing without entering pump from below operating room floor. Provide eye bolts and tapped holes in each half of the split gland if halves weigh over 14 kg 30 pounds each.

[2.4.15 Siphon Breaker Valve

Provide a siphon breaker valve assembly for each of the vertical axial-flow pumps. Provide [mechanical, self-actuating] [electrically-operated] valves. Install each assembly at the top (summit) of the discharge pipe
and must vent air from the discharge pipe when the pump is started. The assembly must also permit air to enter the discharge pipe through the siphon breaker valve to prevent reverse siphoning of water when the pump is stopped. Size the valves based on the pumping conditions (e.g. flow, head, discharge pipe diameter) of the specific system. If a mechanically-actuated valve is chosen, size the valve to allow air to relieve at a maximum of $90 \text{ m per second}$ or $300 \text{ feet per second}$. Provide a means to operate the valve manually to stop back-siphoning through the pump in case the normal operator of the siphon breaker valve fails.

\section*{LUBRICATION SYSTEM}

\begin{verbatim}
NOTE: Select appropriate alternate paragraph. Oil lubrication may be used for pumps with discharge diameters up to and including 900 mm or 36 inch. Grease lubrication may be used for all size pumps. The centralized pressure lubrication system will be used when grease lubrication is selected. Select the water-lubricated bearings bracketed information if this type of lubrication is being used. The Clean Water Act requires all in water bearings to meet the standard EAL criteria (Vessel General Permit (VGP), or EPA 800-R-11-002). Confirm submitted EAL product data conforms to EM 1110-2-1424.
\end{verbatim}

Oil lubrication of shaft bearings consists of introducing oil at the top line shaft bearing and allowing oil to run down the shaft for the lubrication of the lower bearings. Oil lubrication consists of an oil reservoir mounted on the pump baseplate or pump driver at such height to permit gravity flow of oil to the highest lubrication point of the pump shaft. Construct the reservoir of transparent material to permit observation of the quantity of oil in the reservoir. The oil reservoir must have a minimum capacity of 1 L or 1 quart. The reservoir must have a solenoid valve to permit oil flow whenever the pump driver is in operation. The flow rate from the oil reservoir must be adjustable from five drips per minute to constant flow. The reservoir valve must permit manual flow of oil when the pump driver is not operating for prelubrication of the shaft bearing. Construct the oil line from the oil reservoir to the pump line shaft of stainless steel tubing and support at sufficient locations to preclude vibration of tubing when the pump is operating. If the pump has a bearing located below the impeller, this bearing must be grease-lubricated. Provide a grease line with a grease fitting from this bearing to a location on top of the baseplate. Provide a grease reservoir with this bearing configuration for containing extra grease. Lubricate shaft packing by grease. Run the grease lines to a location outside of the driver pedestal and provide with a fitting for manual lubrication.

Support grease lines to each bearing and protect them from water and mechanical damage. Grease line protection consists of channels fastened to the pump with brackets, using bolts and nuts to permit removal. Grease lines passing through the pump water passage must either be contained in a
guide vane or be protected by Schedule [80] [120] pipe. This protection pipe must be removable if connected to the shaft-enclosing tube. Prefill grease lines before connection to bearings. Terminate grease lines above baseplate for connection to the lubricating grease pump.

Provide lubrication for the bearings from the water being pumped (i.e., product water) by means of perforations in the shaft enclosure. Design the perforations such that the shaft tube is constantly filled with water during pump operation, thereby continually covering the contact surfaces of the bearings. If upper bearings will not receive sufficient pumped water for lubrication, use another means to provide sufficient water to these bearings using either product water or water from the intake canal. Provide a means to indicate visually that the upper bearing(s) and packing gland are obtaining sufficient lubrication water.

2.5.1 Supplemental Lubrication Water

If it is determined that the pumped product water cannot be lifted sufficiently to lubricate the upper bearing(s), it is the Contractor's responsibility to design and provide a complete water lubrication system. Provide a separate water lubrication system for each pump. The water cannot come from the potable/well water system. This water lubrication system must include a means for providing sufficient lubrication water to the upper bearing(s). The supplemental lubrication water system must include an alarm and shutdown in case of low-flow or no-flow to the upper bearing(s), along with electrical input to the [engine] [motor] control panel and SCADA/PLC systems as needed. Provide any necessary filtering, flow switches, time delays, to ensure that the upper bearings are satisfactorily lubricated. Coordinate any additional electrical power and controls requirements with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and other electrical sections. The supplemental lubrication water system must be fully maintainable. If the supplemental lubrication water system is needed, provide shop drawings, operations and maintenance data, and as-built drawings as required.

2.5.2 Centralized Pressure Lubrication System

2.5.2.1 General

Provide each pump with its own individual electric motor-driven centralized pressure lubrication system, designed to deliver the proper predetermined or metered quantity of lubricant to each individual bearing and stuffing box. Positively indicate proper or improper functioning of any individual metering device. Mount the pressure pump, individual metering devices, and any required auxiliary operating accessories on the baseplate. Furnish the system complete and ready for operation, including sufficient lubricant to fill each pressure pump lubricant reservoir. Submit the complete centralized pressure lubrication system for review and approval. Provide the lubricant recommended for the selected pumps, subject to approval of Contracting Officer.

2.5.2.2 Pumping Unit

Provide an electric motor-driven central pumping unit as a complete assembly, consisting of a positive displacement type pump, flow-directing valve (if required), lubricant reservoir, suitable pressure gage to indicate pump discharge pressure, operation counter, pressure protective device, and other auxiliary accessories as required to give a complete and
workable unit conforming to the requirements specified. The pump must be of multiple individual piston, positive displacement type utilizing hardened steel pistons, closely fitted to the cylinder bores to eliminate the need for packing. Spring-actuated check valves is not be required for its operation. The pump must deliver not less than 100 mL 6 cubic inches of lubricant per minute against a pressure of not less than 13.8 MPa 2000 psi measured at the most remote bearing connection. The lubricant reservoir must be of a suitable metallic construction, with a capacity of not less than 11 kg 24 pounds of lubricant, and provided with a means that will ensure positive priming of the pump at all times (such as an atmospheric or spring-loaded follower plate), an indicator to show quantity of lubricant in the reservoir, and a screened fill connection to permit filling the reservoir by a transfer pump without exposing the lubricant to the atmosphere. Provide the pump unit with a fully automatic control system, capable of suitable or proper scheduling by an adjustable synchronous motor-driven timing device, and other required auxiliaries necessary to give a complete and workable system. Provide the controller with a "Hand-Off-Automatic" selector master switch to permit selection between push button manual and automatic time clock operation, and to deenergize the system. Supply electric power at 115 volts single phase, 60 cycles. Use the time clock setting recommended for the selected pumps.

][2.5.2.3 Metering Valves

Provide a metering or measuring valve for each bearing and stuffing box. It must be fully hydraulic in its operation, requiring no internal springs or check valves. Size the valve based on requirements of the selected pumps.

][2.5.2.4 Piping

The system piping must be stainless steel tubing (ASTM A269/A269M, Type 410 or equal) using flared or compression-type connectors. Adequately protect and rigidly support the piping located below the operating room floor in a manner approved by the Contracting Officer. Provide each individual grease line with a "Tee" fitting, located immediately below the respective metering valve and accessible from the operating room. Provide the piping with a standard 6 mm 1/4 inch grease fitting so that each individual line may be fully charged without using the lubricating system pump. The size, strength of pipe, and type and strength of fittings must be as recommended and guaranteed by the Contractor for the selected pumps, but in no case can the bursting pressure of the pipe or tubing used be less than three times the maximum working pressure. Provide a check valve located between the discharge outlet of the measuring valve and the "Tee" fitting specified above in each bearing lubricating line that is exposed to water pressure to prevent entrance of water into the respective measuring valves.

][2.5.3 Lubrication System Accessories

2.5.3.1 Grease Gun

Provide a hand operated, heavy duty lever grease gun for charging lubrication lines and for emergency lubrication. Provide grease as recommended for the Contractor's selected pumps.

[2.5.3.2 Service Facilities

Provide a service facility consisting of a portable hand operated transfer pump, a hand-towed dolly, and a 55 kg 120 pound drum of lubricant, all
assembled and ready for operation. The pump must be self-contained and designed for mounting on the grease drum to protect the contents from the entrance of foreign matter. The pump must deliver not less than 0.45 kg one pound in not more than eight strokes of the pump handle under normal temperature conditions. Provide the necessary hose and quick disconnect coupling for a complete system. The hand-towed dolly must have a rigid platform with four anti-friction bearing mounted wheels, a towing handle, and a provision for securing the lubricant barrel. Use the type of lubricant recommended for the Contractor's selected pumps.

2.6 PAINTING

NOTE: The painting paragraph refers to Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES. Edit UFGS Section 09 97 02 to require the use of System No. 21-A-Z Formula 151 for ferrous parts of the pump located above the finish floor. For the interior and exterior surfaces of the pump located below the baseplate, except for stainless steel or galvanized, the required paint system should be System No. 6-A-Z. Contact the CERL Paint Lab for all painting questions.

Perform painting in accordance with Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

2.7 FACTORY ASSEMBLY

The pump must be assembled at the Contractor's selected manufacturer's plant[ in a vertical position] to assure proper fitting and alignment of all parts. Tolerances cannot exceed those specified or shown on the manufacturing drawings. Check rotating elements for binding. The suction bell, impeller housing, diffuser, and the discharge elbow must be properly match marked and have their centerlines clearly marked on the outside of all flanges to facilitate erection and alignment in the field. Notify the Contracting Officer sufficiently in advance to permit a representative of the Contracting Officer to inspect and witness the pump assembly. Matchmark all parts disassembled for shipment.

2.8 BASEPLATE AND SUPPORTS

NOTE: If Alternate 2 or 3 of paragraph [CRITICAL SPEEDS] [DYNAMIC ANALYSIS] is part of the contract, the results of the dynamic analysis are included as a load.

Seismic design criteria are provided in UFC 3-301-01 SEISMIC DESIGN FOR BUILDINGS.

Design and proportion the [soleplate and] baseplate to support the entire pump assembly, the [reduction gear] [motor] and the loads (including the results of the dynamic analysis) to which it may be subjected during operation.[ Support and anchor is as indicated.] Furnish lifting lugs or eye bolts, special slings, strongbacks, or other devices necessary to handle the pump during loading, unloading, erection, installation, and
subsequent disassembly and assembly. [Provide a sole plate [as indicated] under the baseplate. Install, level and grout the sole plate in accordance with API RP 686, Chapter 5 - Mounting Plate Grouting.] Provide [leveling nuts][jacking bolts] for leveling the baseplate assembly. Provide an anchor bolt layout to aid in placement of anchor bolts.[ Back off all leveling jacking bolts after grouting so that they do not support any of the load.] The pedestal supporting the [motor][right-angle reduction gear] must contain a 25 mm 1-inch lip to contain water leakage from the shaft packing. [ Provide a sole plate [as indicated] under the baseplate.][ Seismic requirements must be in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC.] Provide the calculations used in the design of the baseplates and the anchoring bolts to ensure that the proper forces (e.g. shear, torsion, bending) have been considered. Submit product data for grout used as pump supports. The baseplates must be structural steel plate of adequate thickness to support the weight of the pump and right angle hear or motor (as applicable) plus the maximum hydraulic thrust of the pump. Provide plates of the length, width, and thickness as determined by the Contractor.

2.9 TESTS, INSPECTIONS, AND VERIFICATIONS

**************************************************************************

NOTE: Testing, inspections, and verifications should take place with the pump(s) installed on the baseplate(s). Typically after successful testing is complete, pumps can remain on baseplates for shipment to the Government.

**************************************************************************

2.9.1 Pump Testing

**************************************************************************

NOTE: When specifying well established pumps which are mass produced and exist in catalogs, the designer may chose to simply require pumps be tested in accordance with HI 14.6 "Rotodynamic Pumps for Hydraulic Performance Acceptance Tests". Table D.1 in HI 14.6 provides recommendations for which tests are appropriate for given conditions. For pumps which are highly custom, irregular, or unconventional the following alternate paragraphs may be included.

**************************************************************************

Test specified pumps in accordance with HI ANSI/HI 14.6. For all pumps include [Performance][hydrostatic][NPSH][and mechanical] testing as described in HI ANSI/HI 14.6.

[2.9.2 [Critical Speeds][Dynamic Analysis]

**************************************************************************

NOTE: For the case of custom, irregular, or unconventional pumps, select appropriate alternate paragraph.

Alternate 1, Critical Speeds is used when the estimated operating hours for the pumping station is less than 50 hours per year.
Alternate 2, Dynamic Analysis is used when operating hours are greater than 50 hours per year and the pump is driven by an electric motor. The motor described is a vertical shaft type without a speed reducer. If the decision is made to use a horizontal shaft motor, then Alternate 2 needs to be revised to include the speed reducer in the analysis as described in Alternate 3. Select the first and second bracketed paragraphs for Alternate 2.

Alternate 3, Dynamic Analysis, is used when operating hours are greater than 50 hours per year and the pump is driven by a diesel engine/gear reduction unit or when an FSI is used. Select the first bracketed paragraph and the TORSIONAL ANALYSIS and LATERAL FREQUENCY ANALYSIS paragraphs.

The designer should specify performance testing of the assembled pump in the factory to check that the requirements of the specification have been met.

The Performance Test is a required test, whereas the Cavitation, Hydrostatic, Submersible Motor Integrity, and Vibration tests are optional. The designer should be familiar with ANSI/HI 14.6 to determine which tests are needed to balance technical adequacy and cost.

The Cavitation test, or NPSHR test, is costly due to the complexity. The designer should include cavitation testing whenever the cavitation characteristics of the proposed pump have not been determined (by test) by any one of the prospective suppliers. Testing should be conducted on a full-scale (prototype) pump. It should also establish the structural and operating integrity of the complete pumping unit. The prototype pump would be the first pump built. This test may not be necessary if there is sufficient inlet head pressure and the pump has a stated NPSHR that would be acceptable with a suitable margin (see ANSI/HI 9.6.1). The pump could be tested at the minimum design head pressure to verify that the guaranteed head and power at the specific rate of flow instead of performing the NPSHR test. ANSI/HI 14.6 provides guidance for testing in Appendix D.
pump/motor structure must be analyzed by the Contractor for harmful natural frequencies in the lateral and torsional directions. A natural frequency that occurs within 25 percent above or below normal operating speed is unacceptable. Construct a dynamic analysis model using a commercially available program such as Ansys, Cosmos/M, or equivalent, which utilize finite element methods. Incorporate effects of column pipes, cover pipes, shafts, bearings, mass concentrations, and other such features as necessary to accurately model the pump structure. Analyze the structure in the run (wet) condition and consider the effect of water mass in the column and damping effect of water in the sump (vertical units only) at highest and lowest sump water levels. Incorporate Reed critical frequency and mass elastic diagram information for the Contractor’s selected motors. If the Contractor cannot demonstrate to the satisfaction of the Contracting Officer (based on impact tests of similar units) that the Reed critical frequency value is accurate, the Contractor must conduct a dynamic analysis using finite element methods as described to determine motor Reed critical frequency for use with the Contractor selected pumps. Submit the complete detailed dynamic analysis report including the following information:

a. Computer program used.

b. Schematic diagram of the model depicting nodes and elements.

c. Input data consisting of node coordinates, element types, material properties, element characteristics, element connectivities, and specified displacements.

d. Motor mass elastic and Reed critical information (or dynamic analysis, if required).

e. Analysis results, including significant natural frequencies.

f. Interpretation of results.

Impact the test motor provided before shipment to determine actual Reed critical frequency of motor. Include results of impact tests included in motor test data to be submitted. The Contractor must address any discrepancy between calculated and actual motor Reed critical frequency values to determine whether design changes are required to prevent harmful natural frequencies in the pump/motor structure. Incorporate any design changes which are required to correct these discrepancies.]  

[2.9.2.1  Torsional Analysis

Before the pump, gear drive, and engine are released for manufacture, the Contractor must analyze the system for harmful torsional natural frequencies using mass elastic information for the selected pump(s) and gear drive(s). A natural frequency that occurs within 25 percent above or below [normal operating speed][any of the operating speeds required for pump operating conditions] is considered to be unacceptable.

][2.9.2.2  Lateral Frequency Analysis

Before each pump, engine, and gear drive provided under Section(s) [41 65 10.00 10 [DIESEL][NATURAL GAS] FUELED ENGINE PUMP DRIVES][, ] [35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS], respectively, are released for manufacturing, the pump/gear drive structure must be analyzed by the Contractor for harmful natural frequencies in the lateral directions. A natural frequency that occurs within 25 percent above or
below [normal operating speed] [any operating speeds required for pump operating conditions] is considered to be harmful. Construct the dynamic analysis model using a commercially available program such as Ansys, Cosmos/M, or equivalent that utilizes finite element methods. Incorporate effects of column pipes, cover pipes, shafts, bearings, mass concentrations, and other such features in the model as necessary to accurately model the pump structure. Analyze the structure in the run (wet) condition and consider the effect of water mass in the column and the damping effect of water in the sump at the highest and lowest sump water levels. The model must incorporate Reed critical frequency and mass elastic diagram information provided by the contractor. If the Contractor cannot demonstrate to the satisfaction of the Contracting Officer (based on impact tests of similar units) that the Reed critical frequency value is accurate, a dynamic analysis using finite element methods as described herein must be conducted by the Contractor to determine gear drive Reed critical frequency for use by pump manufacturer. Submit the complete dynamic analysis report including the following information:

a. Computer program used.

b. Schematic diagram of the model depicting nodes and elements.

c. Input data consisting of node coordinates, element types, material properties, element characteristics, element connectivities, and specified displacements.

d. Gear mass elastic and Reed critical information (or dynamic analysis, if required).

e. Analysis results including all significant natural frequencies.

f. Interpretation of results.

Impact-test the gear drive before shipment to determine the actual Reed critical frequency of the drive. Submit results of impact tests. The Contractor must address any discrepancy between calculated and actual gear drive Reed critical frequency values as to whether or not design changes are required to prevent harmful natural frequencies in the pump/gear drive structure. If any design changes are required, incorporate at no cost to the Government.

[[2.9.3 Lubricating System Tests]]

**********************************************************************************************

NOTE: Delete these paragraphs if water-lubricated pumps are called for.

**********************************************************************************************

Test the complete lubricating system for each pumping unit, as deemed necessary by the Contracting Officer, to determine that the system meets the operational requirements specified. Test at least one valve of each size furnished with the lubrication line removed from its bearing and fitted with a pressure relief valve and pressure gage. Adjust the pressure relief valve to discharge it at the operating pressure specified and operate the system through one or more cycles as required to obtain an accurate measurement of the quantity of lubricant delivered. This must be within plus or minus 20 percent of the theoretical delivery of the respective valve. Replace, reinstall, and retest any component parts that are damaged as the result of these tests or that fail to meet the
requirements of the specification.

2.9.4 Factory Test

**************************************************************************

NOTE: Test each different size pump for performance.

Alternate specifications for the "Factory Test" have been provided in this specification. Alternate 1 gives the manufacturer the option of testing either the prototype pump (first pump produced) or a homologous model of the pump. This alternative should be used for all pumps having a diameter up to and including 1200 mm 48 inch. Alternate 2, which requires a homologous model of the pump be tested for performance and NPSHR characteristics, should be used for pumps having a diameter greater than 1200 mm 48 inch. Alternate 2 can also be used for pumps smaller than 1200 mm 48 inch in diameter if the expected annual operating time is greater than 500 hours per year or for the special case when there is no published NPSHR curve available.

The designer should specify performance testing of the assembled pump in the factory to check that the requirements of the specification have been met.

The Performance Test is a required test, whereas the Cavitation, Hydrostatic, Submersible Motor Integrity, and Vibration tests are optional. The designer should be familiar with ANSI/HI 14.6 to determine which tests are needed to balance technical adequacy and cost.

The Cavitation test, or NPSHR test, is costly due to the complexity. The designer should include cavitation testing whenever the cavitation characteristics of the proposed pump have not been determined (by test) by any one of the prospective suppliers. Testing should be conducted on a full-scale (prototype) pump. It should also establish the structural and operating integrity of the complete pumping unit. The prototype pump would be the first pump built. This test may not be necessary if there is sufficient inlet head pressure and the pump has a stated NPSHR that would be acceptable with a suitable margin (see ANSI/HI 9.6.1). The pump could be tested at the minimum design head pressure to verify that the guaranteed head and power at the specific rate of flow instead of performing the NPSHR test. HI ANSI/HI 14.6 provides guidance for testing in Appendix D.

**************************************************************************

2.9.4.1 General

**************************************************************************

NOTE: Select the appropriate alternate paragraph.
In the second alternate, the inclusion of the discharge water passage is based on the complexity of the passage and should be decided in earlier design documents.

Allow government access for witness testing upon request. [Provide means for remote witness test upon Government request.]

[Performance of [the] [each size] pump to be furnished will be accepted on the basis of the factory test. Conduct this test using either a scale model of [pump or first pump produced for this contract.] [each size of pump or one of each size of pump produced for this contract.] [Perform cavitation testing in accordance with HI ANSI/HI 14.6][NPSH testing is not required].

[Determine the performance and cavitation limits of the proposed pump [and the shape of the discharge water passage] by a series of tests made on a scale model of the pump[ and discharge water passage]. Complete the model test within [180] [240] days after the date of notice to proceed.

][2.9.4.2 Test Setup

******************************************************************************

NOTE: Select the appropriate alternate paragraph.
First paragraph, Alternate 1; second paragraph, Alternate 2.

If an FSI is used that does not use the dimensions/ratios as furnished by the Government, a complete pump should be tested.

******************************************************************************

[Alternate 1) [A model pump, if used, must be homologous to the proposed prototype pump, installed with the shaft in the vertical position, and have an impeller inlet diameter of not less than 275 mm 11 inches. Complete the model test within [150] [180] days after date of notice of award. Include a model of the[[ sump] [ including sump closure gate] [ and discharge water passage]] [[ Contractor's standard sump] [ and discharge water passage]].[ Install a model of the formed suction intake (FSI) specified on the model pump that is tested.]

[Prototype Pump(s) - Set prototype (first pump built) pump(s), if selected, with the shaft in the vertical position. A factory test elbow may be used in lieu of the prototype elbow for testing purposes, providing test results are adjusted to reflect the difference in losses. Complete tests prior to assembling any pump except the [one] [ones] to be tested. (Install the FSI specified on the prototype pump that is tested.))]

[Alternate 2) [The model pump must be homologous to the proposed prototype pump, and mounted with the shaft in the vertical position.[ Equip the sump where the pump suction occurs with windows strategically located for viewing those areas where separation is likely to occur. Windows may be rings of transparent material approximately 100 to 125 mm 4 to 5 inches wide securely anchored between flanges.] The impeller inlet diameter and the datum for this test specification must be as indicated on Figure 3 at the end of this section. The inlet diameter must be not less than 275 mm 11 inches.[ If a formed suction intake (FSI) is specified for the pump, include the complete FSI, including the [gate][bulkhead] slot, in the model
The FSI used in the model test must be geometrically the same as that used for the proposed pump.

NOTE: Delete paragraph below if Alternate 2, above, is selected.

[2.9.4.3 Instrumentation and Procedures]

In the test report describe each instrument to be used in the tests in detail, giving all data applicable, such as manufacturer's name, type, model number, certified accuracy, coefficient, ratios, specific gravity of manometer fluid to be used, and smallest scale division. Provide calibration data on each of the instruments used. When necessary for clarity, include a sketch of the instrument or instrument arrangement. Include fully detailed narrative description of each proposed method of instrumentation, procedures to be used, and a sample set of computations. State the lowest equivalent static head that is obtainable with the testing when operating along the head-capacity curve of the proposed pump. Perform test procedures, except as specified, in accordance with applicable provisions of HI ANSI/HI 14.6.

2.9.4.3.1 Head Measurements

Make head measurements using either a direct reading water column, mercury-air, mercury-water, a Meriam fluid manometer, or a pressure transducer. Measure vacuums with either a mercury-air manometer, a mercury-water manometer, or a pressure transducer. Dampen fluctuations sufficiently to permit column gages or a differential pressure transducer to be read to either closest 2 mm 0.01 foot of water or Meriam fluid or 2 mm 0.1 inch of mercury. Use manometers as indicated by ISA RP2.1. When pressure transducers are used, check their accuracy with a manometer.

2.9.4.3.2 Capacity

Determine capacity by a calibrated venturi flowmeter or long-radius ASME flow nozzle. Do not use orifice plates. Connect the venturi or nozzle taps to the column gages equipped with dampening devices that permits differential head to be determined to either the closest 2 mm 0.01 foot of water or Meriam fluid or 2 mm 0.1 inch of mercury. Magnetic flowmeters and flowmeters utilizing ultrasonic flow measurements will be acceptable if calibration of flowmeter has been completed within the last 6 months.

2.9.4.3.3 Rotational Speed of Pump

Measure the rotational speed of the pump in accordance with "Method of Rotary Speed Movement" in HI ANSI/HI 14.6, except that revolution counters cannot be used. Non-contacting hand-held electronic tachometers are acceptable. The device used must permit the speed to be determined to 1 rpm.

2.9.4.3.4 Power Input

Measure power input to the pump in accordance with "Power Measurements" in HI ANSI/HI 14.6. Use a method to permit pump brake wattage horsepower to be determined to the closest 0.5 kW 0.5 horsepower.
2.9.4.3.5 Cavitation Tests

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

Use instruments suited for cavitation testing. However, do not use instruments that yield results less accurate than those obtained with the performance test. (may not be applicable in some situations, for instance very high head.)

2.9.4.3.6 Mechanical Tests

**************************************************************************
NOTE: This mechanical test is highly involved and should only be used in specific circumstances of newly designed or custom pumps.
**************************************************************************

Take vibration measurements of the assembled pumping units per HI ANSI/HI 14.6.

2.9.4.4 Pump Test

**************************************************************************
NOTE: Tolerance Bands
The designer may use AISI/HI 14.6 to specify different testing tolerance bands based on size and application of specified pumps.
**************************************************************************

Demonstrate that the proposed pump complies with the specified performance. The pump must be capable of operation without instability over the entire range of heads specified in paragraph CAPACITIES. Tolerances must be in accordance with HI requirements. Instability is defined, for this specification, as when one or more of the following conditions occur:

a. the pump has two or more flow rates at the same total head;
b. The head-capacity curve has a dip (region on curve where change in flow rate produces an abnormally low head);
c. When any point in the usable range of head-capacity curve cannot be repeated within 3 percent.

Rerun the test if this occurs. Compliance with specifications will be determined from curves required by paragraph TEST RESULTS. Test procedures, except as specified, must be in accordance with applicable provisions of HI ANSI/HI 14.6. The acceptance grade is 1U as described in HI ANSI/HI 14.6. [Pumps are acceptable if they achieve the guarantee point requirements stated in paragraph CAPACITIES.] Use water at approximately the same temperature for all tests run and record the temperature during test runs.

2.9.4.5 Motor, Cables, and Controller Test

Test the pump motor per NETA ATS. For induction motors use NETA ATS 7.15.1. For Synchronous motors use NETA ATS 7.15.2.
2.9.4.6 Test Procedure

**************************************************************************
NOTE: The suction water elevation is that level indicated in paragraph CAPACITIES.
**************************************************************************

2.9.4.6.1 Performance of The Pump

Determine the performance of the pump by a series of test points sufficient in number to develop a constant-speed curve over the range of total heads corresponding to the [static] [pool-to-pool] [bowl] heads in paragraph CAPACITIES. The performance/test range must include additional testing at total heads 600 mm 2 feet higher than the total head determined in paragraph CAPACITIES. The lowest total head for testing must be, as a minimum, the total head determined from paragraph CAPACITIES. If the test setup permits testing at lower total heads, extend the range of total heads 600 mm 2 feet lower. Testing must be inclusive for [each] [the] speed(s) involved with the sump at elevation[s] [_____] [and [_____] NGVD feet]. Conduct tests using prototype [total] [pool-to-pool] heads. Head differentials between adjacent test points cannot exceed 900 mm 3 feet, but in no case may fewer than 10 points be plotted in the pumping range. If the plot of the data indicates a possibility of instability or dip in the head-versus-capacity curve, a sufficient number of additional points on either side of instability must be made to clearly define the head-capacity characteristics. When a scale model of the pump is tested, consider the efficiency of the prototype pump to be the efficiency of the model. No other computation or adjustment of model efficiency to prototype conditions will be permitted.

2.9.4.6.2 Sump Elevations

Conduct tests at two different sump elevations (approximately a 1500 mm 5 foot differential) to determine the effect of test sump geometry on the performance of the pump. Should the test results indicate that the performance is not the same in all respects for both sump conditions, take whatever corrective action is necessary to produce congruent results. [One of the two sump elevations used may be at the specified elevation.] [Use the sump elevations specified in paragraph CAPACITIES.] The test results with this sump elevation must meet all specified conditions of capacity, head, and brake kW horsepower. (Submit) curves indicating test results.

2.9.4.6.3 Tests Results

Plot results of tests to show total head, [[static] [pool-to-pool] [bowl] heads], brake kW horsepower and efficiency as ordinates; all plotted against pump discharge as the abscissa. Plot curves showing prototype performance to a scale that will permit reading head directly to [60] [150] mm [0.2] [0.5] foot, capacity to [190] [380] [760] [1900] L/min [50] [100] [200] [500] gpm, [0.14] [0.28] [1.4] m³/s [5] [10] [50] cfs, efficiency to 1 percent, and power input to [3.7] [7.5] [18.6] [37.2] kW [5] [10] [25] [50] horsepower.

2.9.4.6.4 Demonstration

Demonstrate to the Contracting Officer that the blade templates fit the tested pump. Perform the demonstration immediately after testing is completed. Retain all templates for the tested pump, and provide them to

SECTION 35 45 01 Page 57
the Government upon request of the Contracting Officer, to permit the Government to verify geometric similarity with the Contractor's pump. In addition to providing templates, submit dimensioned drawings of the impeller that contain all dimensions needed to manufacture it. Stamp the tested impeller with identification marks. Provide necessary facilities and instruments needed to permit the Government to verify that pump[s] [is] [are] in complete geometric similarity with the tested pump.

2.9.4.7 Cavitation Tests

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

2.9.4.7.1 Model Test

The model test must include the determination of net positive suction head required (NPSHR) at five or more points on [the constant speed curve] [each constant speed curve when more than one speed is involved]. Determine NPSHR, as a minimum, for five or more capacities corresponding to prototype capacities over the total range of specified operating conditions. If the pump has a capacity greater than that specified for the lowest and/or highest operating condition, then use these over-capacity conditions. Equally space the other test capacity points between the highest and lowest capacities.

2.9.4.7.2 NPSHR

Determine NPSHR on a constant-capacity, constant-speed basis, using arrangement Figure F.3 or F.4 as described under paragraph NET POSITIVE SUCTION HEAD REQUIRED TEST in HI ANSI/HI 14.6. Vary suction conditions to produce cavitation. NPSHR must be the maximum value at which any one or all of the plotted curves, head, kW horsepower, and efficiency depart from the constant values (point of tangency). Obtain a sufficient number of points to accurately locate the departure point.

2.9.4.7.3 Value of NPSHR

**************************************************************************
NOTE: The amount head margin used to determine adequacy of NPSHR is determined during the design of the pumping station as indicated in Engineering Manual EM 1110-2-3105.
**************************************************************************

The value of NPSHR must be [300] [600] [900] mm [1] [2] [3] feet less than the corresponding available net positive suction head available (NPSHA). Determine NPSHA using the temperature of the water in the model at the time the tests are run and the datum shown on Figure 3 at the end of this section. Use the water elevations specified in paragraph CAPACITIES to determine the NPSHA for the pumps.

2.9.4.7.4 Plotting Test Results

Plot the test results to the scales determined by the Contracting Officer at the time of the test. Draw curves showing [static] [pool-to-pool] [total] head, brake kW horsepower, and [pool-to-pool] efficiency as ordinates and NPSH as the abscissa. In addition, draw curves showing NPSHR versus capacity with NPSH as the ordinate and capacity as the abscissa.
Show NPSHA points on the curves.

2.9.4.7.5 Curves

Should it be considered necessary by the Contractor to take into account measurement inaccuracies when drawing the curve needed to determine NPSHR in accordance with paragraph NPSHR, use the following method. No other method is acceptable. Determine the inaccuracy for each parameter, and submit the calculations to the Contracting Officer for approval. Using the calculated inaccuracy as the radius and the test point as the center, draw a circle for each test point. Draw two curves, one a maximum and the other a minimum, and pass through or touch each circle. The maximum curve must touch the top and the minimum curve must touch the bottom of as many circles as is practicable while maintaining smooth curves. Should the plot indicate that a test point is obviously erroneous, it may be ignored by mutual consent or the test may be rerun. Halfway between the maximum and minimum curves, draw another curve (the mean). The point at which the mean curve departs from the constant values (point of tangency) is considered to be the NPSHR of the pump for the capacity at which the test was run.

2.9.5 Intake Tests

**************************************************************************
NOTE: Delete this paragraph if a model test of the intake to the pumping system(s) is not required.
**************************************************************************

Provide complete performance model testing of the pump intake systems. Use the model testing to confirm the configuration of the intake systems, including the proposed intake conduit, hydraulic losses to the pump, the position of the pump in the intake bay, and to confirm the selection of the pump. The Contracting Officer will witness the final tests confirming the geometry for the intake conduit. Notify the Contracting Officer with not less than 14 days written notice of the time and location for the final tests.

2.9.5.1 Qualifications

Perform the modeling work in a hydraulic laboratory located within the United States where this type of work has been performed for a period of at least ten years. The individual in responsible charge of the modeling work must be a registered professional engineer in the U.S. state where the model testing will be performed with at least ten years' experience in pump and intake modeling work for similar projects. The engineer must seal and sign all reports and data documents generated as a part of the test work prior to submitting them.

2.9.5.2 Intake Model Setup and Objectives

The model intake setup must be of the intake system, custom designed for this installation and suitable for operation at atmospheric pressure for observation of the intake basin performance. The intake model must be suitable for use with a model pump. Use clean and clear water for the test to allow proper observation. The temperature of the water during any test cannot exceed 30 degrees C 85 degrees F. For the FSI, provide a setup to determine flow patterns in the suction basin approaching the intake, along with losses to the pump. Provide further tests to identify flow patterns in the intake itself and approach patterns at the entrance to the pump.
In the intake model, include all items in the intake path, including, but not limited to: models of the trash rack, stoplog slots, access ladders, and the stilling wells in the intake bays.

2.9.5.3 Intake Model Tests

The objective of the modeling work is to define the performance of the proposed pumping unit and to confirm the geometry to be used for the pump intake. The model must have a model-to-prototype Froude number ratio of 1, based upon the pump impeller diameter. Arrange the model in the same relative orientation as the prototype structure and include the bay configuration and screening system. Perform all testing with the same model.

Intake Tests: For the formed suction intake geometry shown on the drawings, use the model setup to determine flow characteristics in the suction basin intake bay and at the entrance to the FSI at all specified operating conditions. In addition, use the model to determine the effect of the intake system on pump operating characteristics. Use a siphon generated by a separate pump to examine flow characteristics in the intake bay using Froude relationships to model intake operation in the first set of tests. Use second test to develop information on the effect of the intake on pump operation. Use these values to forecast the performance of the pump-intake conduit combination.

[Alternate Intake Geometry: If an intake geometry differing from that indicated is proposed, or other modifications such as baffling, test the proposed intake and/or modifications to demonstrate its suitability for use in the project and compliance with Appendix I in EM 1110-2-3105. For that reason, design the laboratory setup specifically to monitor free and sub-surface vortices, swirl and pre-rotation approaching the pump impeller, flow separation at hydraulic surfaces in the intake conduit and at the hydraulic surfaces approaching the pump impeller, and axial velocity distribution at the entrance to the impeller.]

a. The intake conduit and pump inlet must contain several clear windows and similar appurtenances and adequate lighting at all critical areas to allow visual determination of the presence of vortices, turbulence, and other defects. Make provisions to insert dye at intervals in the intake conduit and at the entrance to the impeller during operation of the test. Reynolds and Weber numbers for all model runs must be greater than 30,000 and 120, respectively. The Contractor must develop scale factors for velocity, flow, and time for use in evaluation of model results. Scale factors are subject to review by the Contracting Officer. In addition to model runs at all specified operating conditions, conduct no fewer than five runs at 1.5 times Froude-scaled flows after final geometrics for the intake conduit and intake bays have been established, keeping the submergences at the geometrically scaled values. Track and document circulation contributing to development of vortices.

b. Determine vortex formation in the model every 15 seconds extending over a period of 10 minutes. Classify vortices in accordance with the strength classification system in HI ANSI/HI 9.8 for both surface and subsurface vortices, using dye wand injection to assist in classification. The Contractor must provide both photographic and video documentation of vortex formation. Direct particular attention to subsurface vortex formation at the intake conduit entrance and on intake conduit surfaces leading to the impeller entrance.
c. Provide a swirl meter or other satisfactory device to determine liquid rotation (swirl) at the entrance to the impeller. Obtain swirl readings at intervals of 20 seconds for a period of not less than 10 minutes after the model has achieved steady-state operation at any specified operating condition. Swirl angle is defined by the relationship:

\[
\text{swirl angle} = \frac{1}{\tan(\pi/d/n)} \div u
\]

Where:
- \(u\) = average axial velocity at the swirl meter.
- \(d\) = diameter of the conduit at the swirl meter.
- \(n\) = revolutions/second at the swirl meter.

d. Headloss Measurements: Measure headloss from the upstream model boundary to just upstream of the pump inlet for each documentation test and include a minimum of the following conditions:

<table>
<thead>
<tr>
<th>Pump No.</th>
<th>Avg On/Off El. (m) (feet)</th>
<th>Individual Pump Q (cubic m per second) (fps)</th>
<th>Total Pump Q (cubic m per second) (fps)</th>
</tr>
</thead>
</table>

**************************************************************************

NOTE: Provide an expected order of pump operations and expected intake elevations at start-up for each pump.

**************************************************************************

e. Also record the head loss from just upstream of the FSI to the throat of one model pump for a minimum of 10 flow rates after the model Euler number is determined to be constant and at least one point (near the middle of the data) must be within 2 percent of the scaled rated flow of the pump. Measure head loss with a differential manometer or differential stilling basin. Install a minimum of four pressure taps around the pump throat measurement point and joined to form an average pressure reading. Calculate a dimensionless head loss coefficient for the formed inlet that includes the entrance loss into the formed inlet.

f. Determine the velocity profile in the channel cross section approaching the intake and performing the velocity traverses on perpendicular axes at the intake throat, just upstream from the impeller. Velocity measurement instruments must be capable of an accuracy of plus or minus 2 percent.

g. Use the following as criteria for acceptance of the proposed design:

(1) Free surface and sub-surface vortices entering the pump intake must be less severe than Type 1, as defined in HI ANSI/HI 9.8, unless dye core vortices appear for less than 10 percent of the time or only for pump operating conditions that are expected to be infrequent, such as the listed maximum or minimum operating conditions.

(2) Swirl angles, both maximum and average, indicated by swirl meter readings, must be less than 5 degrees. Swirl angles as great as 7 degrees will be accepted if occurring less than 10 percent of the
time or for operating conditions that are expected to be infrequent, such as the listed maximum or minimum operating conditions.

(3) Velocities at points of equal radii at the throat of the intake conduit must be within 10 percent of each other.

(4) Determine NPSHR on the basis of a one percent reduction of efficiency.

(5) Time-varying velocity fluctuation (turbulence) levels as defined by a standard deviation over average velocity at a point within the pump throat must be less than 10 percent.

h. Unless otherwise specified, conform accuracy of all measurements to the levels established in HI ANSI/HI 14.6.

2.9.5.4 Recommendations from the Model Test

If the results of the intake model testing indicate that any features of the design are deficient, report this to the Contracting Officer in writing immediately. If the intake modeler has recommendation for improving the flows in the pumps, provide them in the Intake Model Test Report. Flag these as important information that requires the Contracting Officer's immediate attention. Note all recommendations considered major changes. Provide any minor recommended changes to the intake as variations in the shop drawings.

2.10 PUMP DRAINAGE

Provide drain holes for all parts of the pump to eliminate trapped water. These drain provisions must be self-draining without any requirement to enter the sump.

2.11 WITNESS TEST

**************************************************************************

NOTE: The time to review test data should be 2 weeks. Longer times may be used when the District has staffing difficulties or special arrangements are required to have data reviewed by others. The shortest period is preferred since this may permit the pump tested to remain in place during the review period. If the pump/test instruments are not moved, then the possibility of changes to the test results for the witness test are less likely to occur. The cost of the tests would be less also.

**************************************************************************

When the Contractor is satisfied that the tested pump performs in accordance with the requirements of the specifications and the guaranteed values, notify the Contracting Officer that the witness tests are ready to be run and provide copies of the curves required in paragraph PUMP TESTING [and paragraphs under CAVITATION TESTS] along with a set of sample calculations with constants and conversion factors. Also, provide instrument calibration data in this report. [Two] [Three] [Four] weeks will be required to review this data before the Contracting Officer will be available to visit the Contractor's laboratory for witnessing the test. Should the results of the witness test reveal that the tested pump does not
perform in accordance with the requirements of the specification and the guaranteed values, make such changes as are required to make it acceptable before again notifying the Contracting Officer that the witness tests are ready to be run. Immediately upon completion of each witness test, submit copies of all data taken during the test to the Contracting Officer witnessing the test. Furnish computations of test results and plotted preliminary curves to the witness.

2.12 CERTIFIED TEST REPORT

**************************************************************************
NOTE: The certified test report is appropriate when testing required under the contract was of the general requirements outlined in HI 14.6 and pumps are of a common conventional type.
**************************************************************************
Submit Contractor's pump manufacturer certified completed test report stating the specified pumps meet HI ANSI/HI 14.6 after testing is complete.

[2.13 TEST REPORT

**************************************************************************
NOTE: This section is not necessary if Contractor's pump fabricator is required to provide a certified test report.

Require this more detailed report when more custom and specific testing was outlined in the specifications.

If used, delete item "o" if water passage is not included in the contract.
**************************************************************************
Submit, in accordance with HI ANSI/HI 14.6, and within 30 days of receipt of approval of the witness test, to Government [3] [4] [7] [hard bound] [digital] copies of a report covering completely the test setup and performance[ and cavitation] tests. Include, as a minimum, the following in each test report:

a. Provide a statement of the purpose of the test, the name of the project, contract number, and design conditions. Also provide where guaranteed values differ from specified values.

b. A resume of preliminary studies, if such studies were made.

c. A description of the test pump and motor, including serial numbers, if available. Information required under "b" may be included here.

d. A description of the test procedure used, including dates, test personnel, any retest events, and witness test data.

e. A list of all test instruments with model numbers and serial numbers.

f. Sample computations (complete).

g. A discussion of test results.
h. Conclusions.

i. Photographic evidence in the form of either multiple color photographs of test equipment, test setup, and representative test segments, and a digital recording on optical disc, at least 30 minutes in length, covering the same information as photographs. Label all photographic evidence with the Contract number, location, date/time, and test activity. Voice annotate the digital recording with the same information.

j. Copies of instrument calibration.

k. Copies of all recorded test data.

l. Curves required by paragraph TESTS RESULTS.

m. Curves showing the performance of the test pump.

n. Drawings of the test setup showing all pertinent dimensions and elevations and a detailed dimensioned cross section of the pump.

o. Drawings including cross sections of water passages that must be incorporated in the construction contract.

p. The name and credentials of the Contractor's Erecting Engineer(s) who was(were) responsible for the pump testing.

PART 3 EXECUTION

3.1 INSTALLATION

******************************************************************************
NOTE: Designers should be come familiar with API RP 686 so details can be specified appropriately.
******************************************************************************

Install the [soleplate and] baseplate in accordance with API RP 686. Provide [leveling nuts] [jacking bolts] for leveling the baseplate assembly. Provide an anchor bolt layout to aid in placement of anchor bolts. [Back off all leveling jacking bolts after grouting so that they do not support any of the load.] The pedestal supporting the [motor] [right-angle reduction gear] must contain a 25 mm 1-inch lip to contain water leakage from the shaft packing. Provide a threaded drain to the sump.

3.1.1 Equipment

a. Install the equipment specified under this section and related drive machinery specified under other sections of this specification in accordance with the approved Installation and Erection Instructions Manual; no later than time of pump delivery, submit a typed or printed, and bound, [digital] manual describing procedures to be followed by the erecting engineer in erecting, assembling, installing, and dry- and wet-testing the pump. To the extent necessary or desirable, coordinate and consolidate description of the pump with similar descriptions specified for the [gear reducer and diesel engine] [motor] [gear reducer].
(1) The description must be a complete, orderly, step-by-step explanation of operations required, and also include such things as alignment procedures, bolt torque values, permissible blade/bowl clearances; permissible bowl out-of-roundness; permissible shaft misalignment; recommended instrument setups; recommended gages and instruments; bearing clearances; and similar details.

(2) Complement and supplement the description with drawings, sketches, photos, and similar materials to whatever extent necessary or desirable, resulting in a description that may be comprehended by an engineer or mechanic without extensive experience in erecting or installing pumps of this type.

b. The Contractor's erection engineer(s), familiar with the equipment to be installed, must supervise the handling, installation, start-up and testing of the equipment as required by paragraph QUALITY ASSURANCE.

c. Submit [digital] copies of Operation and Maintenance Instructions Manual containing complete information on operation, lubrication, adjustment, routine and special maintenance, disassembly, repair, reassembly, and trouble diagnostics for the pump and auxiliary units. [Print the operation and maintenance manual and both parts lists on good quality ANSI size A 216 by 280 mm 8-1/2 by 11-inch paper, bound separately between flexible, durable covers.] [Provide the operation and maintenance manual and both parts lists on optical disc, formatted to print on ANSI size A 216 by 280 mm 8-1/2 by 11-inch paper.] Drawings incorporated in manual or parts lists, may be reduced to page size provided they are clear and legible[, or may be folded into the manual to page size]. Photographs or catalog cuts of components may be included for identification. [Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.]

3.1.2 Pipes and Joints

Install pipes and joints in accordance with AWWA M11.

3.2 FIELD TESTS

**************************************************************************
NOTE: Select appropriate bracketed statement. Different projects will have different site conditions to perform these field tests. It's likely that many projects will be accepted outside of flood conditions with very little water available for a long term test run. Edit these testing requirements carefully and account for the anticipated field conditions.
**************************************************************************

After the pumping unit is installed and prior to start-up, completely clean the sump area of any accumulated construction debris. Once final cleaning of the sump area is completed, the area will be area reviewed by a representative of the Government. Correct any damage to the pumping units or related equipment during initial start-up due to foreign objects left in the sump areas.

Prior to proceeding with construction of the [test setup but not later than [60] [90] days after date of notice to proceed, submit a description of the
test setup and test procedure proposed. Include dimensioned drawings and cross-sectional views of the setup and pump, respectively, with location of instruments and points of their connection shown. [model, but not later than 90 days after the date of notice to proceed, submit a description of the proposed model and test procedure. Include dimensioned drawings and cross-sectional views of the model pump showing with the location of all instruments and the point of their connection to the model.]

3.2.1 Dry Tests

**************************************************************************

NOTE: Specify an operating field test duration which is reasonable. This could be as little as 15-30 minutes, or as much as a few hours. All three tests below give you confidence that your pump will operate as designed in its installed location. Whenever possible a combination of both field tests should be performed, even if it it limited.

• Factory Test (shop or model)
  PRO - captures the actual design points while pumping
  CON - pump not captured in final installed location (in situ per ISO), but rather on a pump stand that is perfectly level and rigidly supported

• Field Dry Test
  PRO - isolates the pump assembly in the installed location (in situ)
  CON - could face limited test time due to cooling issues with the lack of pump medium (bearings, keel coolers, etc.) thus have higher bearing temps; no hydrodynamic load

• Field Wet Test
  PRO - hydrodynamic load present; pump medium available for cooling
  CON - not likely pumping at design points, so possible to have some cavitation; could have less test time due to limited water in the intake canal.

Dry tests cannot be conducted on pumps that are lubricated with product water.

**************************************************************************

Test each pumping unit, consisting of a pump [and motor] [and gear reducer] [right-angle gear reducer, and diesel engine] in the dry to determine whether it has been properly erected and connected. [Conduct such test when, and as, directed by Contracting Officer.] [After each pumping unit has been completely assembled, including all rotating elements and the lubrication system, operate at the full rated speed for [15 minutes][30 minutes][ a period of 1 hour][three 15 minute periods][a period of 2 hours], to assure proper alignment and satisfactory operation.] Submit field test results.

[ a. Take vibration measurements in accordance with HI 9.6.4. Vibration limits cannot exceed those recommended by HI Figure 9.6.4.2.5.1b. If it is not possible to operate the pump at its best efficiency point, vibration limits may be adjusted in accordance with the requirements of the stated standard.
][b. Operate each pumping unit at full-rated speed until the temperature rate of rise has stabilized for all bearings. Consider the bearings' temperature stabilized when the rate of rise does not exceed 0.5 degree Celsius in five minutes 1 degree Fahrenheit in five minutes [_____] degree(s) [____] in [_____] minutes].

][c. Repeat the dry test run if it is necessary to interrupt the test before all bearing temperatures have become stable. [If after a run of reasonable duration][If after a test run of [_____] hours] the temperature rate of rise for any bearing has not stabilized, terminate the test until the cause of overheating is determined and corrections are made. Then repeat the dry test run. Should tests reveal that there is a design deficiency or a manufacturing error in the pumping unit components, promptly correct the problem.

][d. Perform testing in accordance with ISO 20816-3]

3.2.2 Wet Tests

********************************************************************************
NOTE: The longest period should be used if water for testing will be available. The estimated water available and the number of pumps requiring tests should be considered when specifying length of tests. Sound testing, if required would only establish a base line for future reference. Consult HI 9.1-9.9.
********************************************************************************

Test each pump unit under load, at or near normal operating conditions, for at least [_____] hours or as directed by the Contracting Officer; the test will be witnessed by the Government. Provide all supplies and equipment required to conduct the test. During the test observe, measure and record the operation of the pumps during the test for[ sound,] vibration and bearing temperatures in accordance with [HI 9.6.4][ISO 10816-3]. Submit field test results. Without additional costs to the Government, make all changes and correct any errors. The Contracting Officer may waive or postpone the test if sufficient water is not available.

FIGURE 1

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirement for submersible axial-flow and mixed-flow pumps for a turbid water pumping station. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification is for use in construction contracts. It may be used in supply contracts, but should be changed as appropriate. Differences between the technical paragraphs written for Contractor-supplied pumps versus Corps supply specification should be minimal.

This pump specification will be used with the design criteria in EM 1110-2-3105, "Mechanical and Electrical Design of Pumping Stations", and the references listed in those publications. To the extent possible the Hydraulic Institute (HI)
Standards have been referenced as the primary reference standard, and the minimum for manufacturers' compliance, for the manufacture, material, design, test, and performance specifications. The vibration analysis often required of pumps is eliminated and a vibration limit specified.

Hydraulic Institute (HI) Standards have been referenced as the primary reference standard, and the minimum for manufacturers' compliance, for the manufacture, material, design, test, and performance specifications. The vibration analysis often required of pumps is eliminated and a vibration limit specified.

Pertinent HI standards are:
HI/ANSI 9.1-9.5    General Design
HI/ANSI 9.6.4     Vibration Analysis
HI/ANSI 11.6      Testing
HI/ANSI 14.1-14.2 Nomenclature and Definitions
HI/ANSI 14.3      Design and Application

The pumps are of the pre-engineered (catalog) type, used at flood control and storm water projects. Over specifying can prove costly and even double the cost of an otherwise inexpensive pump. In general, the two most important attributes to a successful specification will be to obtain a qualified, experienced manufacturer and to properly specify the pumping conditions so that the correct pump is obtained.

Model testing is not included as an alternative for these pumps. Manufacturers assemble and performance test the pumps at the factory. The pumps are shipped assembled.

Witness tests and factory visits have been limited to one visit during the performance test and a pump inspection at the time of the test.

1.1 SUMMARY

The other elements of the pumping unit designed for this project should be stated; e.g., electric submersible motor, reduction gear (if needed), and controls.

Coordinate the bar spacing in the trash rack with the structural designer and with pump manufacturers.

The planetary gear reduction unit, on rare occasion, may be required in the larger volume propeller pumps
such that a smaller, high-speed motor can be used. The design of the gear is an integral part of the design of the pumping unit.

Axial and mixed flow pumps are well suited for higher flow and lower head applications. Centrifugal pumps should be considered for higher pressure applications or where larger passing of solids is needed.

Design, furnish, and install [_____] identical pumping units for the [_____] Pumping Station shown. Water pumped will be less than [_____] degrees C F, will be relatively turbid, and may contain sand, silt, and trash capable of passing the trashrack [having 41 mm 1-5/8 inch clear openings].

1.2 LUMP SUM PRICE

a. Payment will be made for costs associated with [furnishing] [furnishing and installing] [installing] the submersible pump, axial-flow or mixed-flow type, as specified.

b. Unit of measure: lump sum.

1.3 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.4 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in
accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 QUALITY ASSURANCE

1.5.1 Contractor's Pump Supplier Qualifications

**************************************************************************
NOTE: Submersible pumps are designed as a single machine even though specifications may not always recognize that unity. Clearly state that a single manufacturer is to design and supply all parts of the pump unit including pump, motor, discharge tube, reduction gear, and cables. That manufacturer should also have demonstrated capability in sump design for pumps of the larger size.
**************************************************************************

The Contractor's pump manufacturer has overall responsibility to supply the pumping unit (submersible pump/motor, [reducing gear (if needed)], discharge tube, [discharge elbow,] cables, and related [instrumentation and accessories]) that meet the requirements of this specification. Supply a list of similar installations which have been operating for at least 2 years.

1.5.2 Contractor's Installation and Start-up Engineer

Furnish a competent installation engineer (including those from Contractor's suppliers) who is knowledgeable and experienced with the installation and start-up procedures for submersible pumps and the associated equipment specified to act on behalf of the Contractor. Submit the installation and start-up engineer's qualifications. The Contractor's installation engineer is responsible for providing complete and correct direction during installation, initial starting, and subsequent operation of equipment until field tests are completed. The Contractor's installation engineer initiates instructions for actions necessary for proper receipt, inspection, handling, uncrating, assembly, and testing of equipment. Submit an installation report including a record of measurements taken during erection and furnish one copy to the Contracting Officer upon request or upon the completion of the installation of assembly or part. The erecting engineer conducts training on the operation and maintenance features of the pump units.

1.5.3 Detail Drawings

Submit drawings within [90] [_____] days of Notice of Award for review and approval. Dimension in the metric (SI) with English conversion inch-pound-second system. Furnish the following:

a. Outline drawings of the pump showing dimensions and weight of the pump/motor.

b. Drawings showing details and dimensions of pump mounting design and layout including any embedded items and lifting connections.

c. Cross-sectional drawings of each different size of pump, showing each component, and major or complicated sections of the pump in detail. On each drawing indicate an itemized list of components showing type, grade, class of material used, and make and model of the standard component used. Include detail and assembly drawings of entire pumping unit assembly.
d. Provide drawings covering the installation which are intended for the Contractor's installation engineer.

e. Indicate efficiency, kW bhp, and NPSHR with the capacity-head curve.

f. Motor characteristic curves or tabulated data (test or calculated) to indicate the speed, power factor, efficiency, current, and kilowatt input, all plotted or tabulated against percent load as abscissas.

1.5.4 Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1. Perform welder qualification tests for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests. Perform the qualification tests at the work site if practical. The welder or welding operator must apply their assigned symbol near each weld made as a permanent record.

Submit the names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, standards tested to.

1.6 DELIVERY, STORAGE, AND HANDLING

Inspect each pump for damage or other distress when received at the project site. Store each pump and associated equipment indoors as recommended by the pump manufacturer, protected from construction or weather hazards at the project site. Provide adequate short-term storage for each pump and equipment in a covered, dry, and ventilated location prior to installation. Follow the manufacturer's instructions for extended storage. Supply proper equipment for handling the pump and consider the equipment as special tools if not completely standard. Follow the manufacturer's recommendations for handling of the pump.

1.7 EXTRA MATERIALS

**************************************************************************
NOTE: The spare parts noted herein are from other Corps documents. For any specific project, it would be appropriate to discuss an adequate spare parts and spare pump list during the designer's plant visitations or discussions with the end user as suggested by EM 1110-2-3105.
**************************************************************************

a. Furnish the following spare parts:

(1) One complete set of bearings and seals for each size pump.
(2) Replacement wearing rings and O-rings for each size pump.
[ (3) One impeller for each size pump.]

b. Furnish one set of all special tools required to completely assemble, disassemble, or maintain the pumps. Special tools refers to oversized or specially dimensioned tools, special attachments or fixtures, or any...
similar items. Furnish lifting devices required for use in conjunction with the [overhead] [truck] crane. Provide the tools in a toolbox or toolboxes.

c. Submit copies of parts list showing all parts, spare parts, and bulletins for each pump. Clearly show all details, parts, and adequately describe parts or have proper identification marks. Provide the parts lists [on good quality 216 by 279 mm 8-1/2 by 11 inch paper][on optic disk with default letter print size of, 8-1/2 by 11 inch ], bound separately from the Operation and Maintenance manual[ with a flexible, durable cover]. Drawings incorporated in the parts lists may be reduced to page size provided they are clear and legible[, or they may be folded to page size and inserted into the bound lists]. Photographs or catalog cuts of components may be included for identification.

d. Provide [one][two][three][four] spare pumps as required.

1.8 WARRANTY

**************************************************************************
Consider including an extended or hourly based warranty for the pumping equipment if there is a likelihood that the pumping equipment will be operated very little during the first years due to a lack of water, ongoing interconnected projects, or permitting issues.
**************************************************************************

Provide a warranty for the submersible pumps and all equipment furnished under this section against defective workmanship, materials, design, and performance for a period of [_____] years from the date the equipment is accepted. If the equipment or any part thereof does not conform to these warranties, and the Government notifies the Contractor within a reasonable time after its discovery, the Contractor must promptly correct such nonconformity by repair or replacement. Coordinate the down time for the equipment with the Government, and keep to a minimum duration that is mutually agreed to by the Contractor and the Government. The Contractor is liable during the warranty period for the direct cost of removal of the equipment from the installed location, transportation to the Contractor's factory or service shop for repair and return, and reinstallation on site. The Contractor must be given the opportunity to perform the removal and reinstallation and to select the means of transportation. The expense of work required to perform warranty repair e.g., removing adjacent equipment, installing spare equipment, supplying temporary service is not included in this warranty provision.

PART 2 PRODUCTS

2.1 SYSTEM REQUIREMENTS

**************************************************************************
NOTE: The designer should include in this section those factors of the project design that relate to the specification of the pump. These are factors that will be data inputs to the manufacturer, and are examined during the pump selection procedure. The specifications as written are for water of normal chemistry and abrasive quality. The
Contractor must be informed in the specification of any unusual project conditions.

2.1.1 Pumping Unit Description

NOTE: Provide a pumping plant design that will accommodate the available pumps and their structural and hydraulic requirements. Pumps are designed to be contained in a discharge tube and able to be lifted from the discharge tube for maintenance and repair.

Each pumping unit includes a pump/motor, discharge tube, [discharge elbow], air vent, [lifting chain], cable, and controls. Each pump must be of the vertical, axial, or mixed-flow submersible type for [storm water,] [flood control,] [attached to the same shaft with a submersible electric motor] [direct coupled through a reducing gear to a submersible motor]. Use an electrically operated pump/motor installed in a discharge tube. Except as otherwise stated or noted, the terms pump and pump/motor both refer to a pump/motor integral unit.

2.1.2 Spare Pumps

Provide a total of [_____] spare pumps. Spare pumps must be identical to the other pumps provided under this contract. For the spare pumps only, access covers and the guide rail systems are not required. Tag and label spare pumps as spares.

2.1.3 Service Availability

The pumps furnished must be supported by a service organization. Service and parts must be available within [500] miles of the [_____] area. Provide this information in a shop drawing.

2.1.4 Pump Station Start-up Services

The installation and start-up engineer must be present at the installation for each location. Provide for two days on-site for each location. In addition, provide for two days for pump/motor start-up at each location.

2.1.5 Name Plates

Secure a name plate to each major item of equipment to include the manufacturer's name, address, type/style, model, serial number, and catalog number. Provide nameplates made of corrosion resisting metal with raised or depressed lettering on a contrasting colored background.

2.1.6 Instruction Plates

As necessary, equip each item of equipment with suitably installed instruction plates including warnings and cautions describing special and important procedures to be followed during starting, operating, and servicing the equipment. Provide plates made of corrosion resisting metal with raised or depressed lettering on a contrasting colored background.
[2.1.7  Factory Test Location]

Factory testing facility must be in the continental United States. Submit the proposed testing facility as a shop drawing.

[2.1.8  General Design Requirements]

a. Provide the pump meeting head, capacity, speed, efficiency, range of operation, cavitation, and vibration requirements as specified. [Reduction gears or adjustable impeller blades may be utilized to meet the specification performance requirements.]

b. Design the pump for runaway speed as calculated for the system shown and specified. Calculate the reverse speed assuming a power failure and the discharge valves fail to close.

c. The pump must, as a minimum, meet the applicable design, materials, and manufacturing requirements of HI 9.1-9.5, HI ANSI/HI 14.1-14.2, HI ANSI/HI 14.3, AWWA E102 and these specifications.

d. The pumping unit design and performance must have been demonstrated by previous successful operation of pumps of the required type and of equal design complexity by the Contractor.

e. Operate the pump in a discharge tube that fits within the dimensions shown, and so that installation and maintenance can be carried out by an [overhead bridge] [jib] [mobile] crane. The weight of the pump/motor integral unit must not exceed [___] kg lb.

f. Design the pump for the calculated hydraulic pressure including a water hammer to which the pump parts are exposed.

g. The pump must have a continuously rising head characteristic with decreasing capacity over the required range of operation specified. The pump must not have an unstable operating characteristic over the required range of operation.

h. The pump must meet all requirements for net positive suction head required (NPSHR) and operate without surging.

i. Use associated pumping equipment including, but not limited to, electrical controls, instrumentation, [and pump control center] that is suitable for [indoor] [outdoor] operation.

j. Include water hammer calculations.]

[2.1.9  Design of Discharge System]

**************************************************************************
NOTE: A number of installation designs are possible depending on the project site conditions. The designer normally designs the discharge system but, has the option to allow the Contractor to design as much of the discharge system as desired. The calculations must be in accordance with EM 1110-2-3105, with the hydraulic definitions as stated in the HI standards. If used it is the designer's responsibility to develop FIGURE 1.
**************************************************************************
a. [Discharge the pumping unit into the discharge system indicated. The system loss curve is included as FIGURE 1 at the end of this section to permit determination of total head. Determine losses within the pumping unit.] [The pump discharge system downstream of the pumping unit must be designed by the pump manufacturer; of the type indicated and fitting within limiting dimensions and elevations indicated. Determine all losses for the discharge system and submit the design head loss computations. Provide sufficient hydraulic computations to substantiate pump selection and demonstrate that the selected pump will meet the project design and operating requirements as specified. Determine losses within the pumping unit.] [Discharge the pumping unit into the discharge chamber indicated. The system loss curve(s) furnished includes all losses beyond the pumping unit. Determine losses within the pumping unit.]

b. Accomplish priming of the siphon without the assistance of vacuum equipment.

2.1.10 Operating Conditions

a. The pump must be capable of operating in the dry (for the purpose of maintenance and operating checks) for short periods of time as stated in the manufacturer's operating instruction.

b. The pump manufacturer establishes and states in the operating manual the procedures for starting and stopping the pumps, including setting of valves or any sequential operations.

2.1.11 Performance Requirements

a. The maximum level of vibration of the assembled pumping unit cannot be greater than the value of the lower limit of the good range of vibration severity per ISO 20816-1. Take measurements at pump operating speed during the Factory Test and the field start-up test.

b. The pump must be capable of operating without instability over the required range of head.

2.1.12 Capacities

**************************************************************************

NOTES: The Corps' policy and procedures for plant design and pump selection are explained in detail in EM 1110-2-3105. Using the data from hydrology and hydraulic studies, the designer will establish the performance requirements of the pumps. Using the manufacturers' catalogs that tabulate the characteristics of their pre-engineered units, select a pump. The designer should then locate other pumps with the described characteristic and establish contact with manufacturers.

Any pump selected results from careful analysis of the relationships of speed, net positive suction head (NPSH) (cavitation), head-capacity, range of plant operation, sump design requirement, and to a lesser extent, efficiency. During the selection process the manufacturer's input to the design is
obtained and integrated into the selection.

The specification will then state specific values to be attained so that a pump with the desired performance can be obtained. It is necessary to state the requirements so that more than one manufacturer can respond. All manufacturers must meet the previous experience and manufacturing standards requirements.

Compliance with the performance requirements will be established using procedures stated in the HI Standards and at the time when the pump is assembled and tested at the factory. Efficiency, heads, and other hydraulic values for purpose of specification should conform to HI definitions, even though Corps manuals are used for the purpose of design criteria.

Each pump installation will be uniquely different and may require a slightly different head-capacity specification to establish that the correct pump will be obtained. During the pump selection procedure, the designer will establish certain capacities that must be met over a range of heads. The designer may state more than one operating point on the performance curve or utilize different points on the curve such as rated head, design head best efficiency point (BEP), maximum head, and minimum head. The heads defined are as stated in EM 1110-2-3105 and applicable HI standards.

ANSI/HI 11.6 provides various acceptance grades for testing tolerances. In accordance with the standard, pumps smaller than 10 hp would have a greater tolerance band as defined in the standard, unless otherwise specified.

ANSI/HI 11.6 allows the option of either verifying the minimum pump efficiency, or verifying the maximum power input, but not both. The efficiency and power requirements would be for the guarantee point only unless otherwise stated. Also, the efficiency and power requirement would need to be defined if the units were a combined pump and motor unit, or just the pump. HI ANSI/HI 14.6 provides guidance for testing in Appendix D.

The selection of pumps for flood and storm water projects will not usually depend on the economics of efficiency. However, a low efficiency can usually be correlated with poor pump hydraulics resulting in a shortened pump life. Therefore, an efficiency relating to the values from the manufacturer’s catalog curves should be specified.

**************************************************************************

a. The guarantee point is [_____] L/s gpm with a differential pressure of [_____] m ft. [The minimum pump and motor unit efficiency is [_____] m percent.] [The maximum power pump unit input power is [_____] kW hp.]
The tolerance band is HI ANSI/HI 11.6 class [1B][1E][1U][2B][2U][3B].

b. The pumps must continuously pump water without signs of distress, including cavitation, with a Net Positive Suction Head Available (NPSHA) of [_____] m ft.

2.1.13 Efficiency

**************************************************************************
TAKE NOTE: In the last bracketed option, specify the point at which the efficiency percentage should be reached.
**************************************************************************

The pump must have an efficiency of not less than [_____] percent at [____].

2.1.14 Equipment

Submit, within 60 days of Notice of Award, a list of equipment as specified, catalog data, performance capacities, and other relevant information for the machinery and other equipment contemplated to be incorporated into the work.

2.2 METALWORK FABRICATION

**************************************************************************
NOTE: Refer to HI 9.1 and ANSI/AWWA E102 for design assistance with material selection.
**************************************************************************

Submit a list designating materials to be used for each pump part. If deviation from specified materials is desired, submit complete specifications for the proposed deviating materials after award of the contract.

[Provide materials and fabrication conforming to the requirements specified herein and to Section 08 31 00 ACCESS DOORS AND PANELS and Section 05 50 15 CIVIL WORKS FABRICATIONS and to additional specified requirements.] Classifications and grade of material incorporated in the work must be in accordance with designated specifications. Submit deviations from the specified materials in accordance with paragraph SUBMITTALS.

The materials of construction must comply with the following:

2.2.2 Bolted Connections

2.2.2.1 Bolts, Nuts, and Washers

Bolts, nuts, and washers must conform to requirements herein specified and paragraphs SUBMERSIBLE PUMP, DISCHARGE TUBE [AND DISCHARGE ELBOW], and subparagraph, NUTS AND BOLTS for types required. Use beveled washers where bearing faces have a slope of more than 1:20 with respect to a plane normal to bolt axis.

2.2.2.2 Materials Not Specifically Described

Conform materials not specifically described to the latest ASTM specification or to other listed commercial specifications covering class or kinds of materials to be used.

2.2.2.3 Regular Bolt Holes

Holes for regular bolts must be drilled or sub-drilled and reamed in the
shop. Holes must be accurately located, smooth, perpendicular to the member, and cylindrical.

2.2.2.4 Fitted Bolt Holes

Match ream or drill holes for fitted bolts in the shop. Holes must be smooth, perpendicular to the member, and cylindrical. Remove burrs resulting from reaming. The threads must be entirely outside of the holes. The body diameter of the bolt must have tolerances as recommended by ASME B4.1 for the class of fit required. Fitted bolts must be fitted in reamed holes by selective assembly to provide an LN 2 fit.

2.2.2.5 High Strength Bolt Holes

Holes for high strength bolts must be accurately spaced, perpendicular to the member, and cylindrical. If the thickness of the material is greater than the diameter of the bolt, the holes must be either drilled full size or must be sub-drilled and then reamed to full size. Poor matching of holes will be cause for rejection. Drifting done during assembly must not distort the metal or enlarge the holes. For slight mismatching, reaming to a larger diameter for the next standard size bolt will be allowed.

2.2.3 Flame Cutting of Material

Flame cutting of material, other than steel, is subject to Contracting Officer approval. Accurately perform shearing, and neatly finish all portions of work. Steel may be cut by mechanically guided or hand-guided torches, provided an accurate profile with a smooth surface free from cracks and notches is secured. Prepare surfaces and edges to be welded in accordance with Section 3 of AWS D1.1/D1.1M. Chipping and grinding are not permitted except where specified and as necessary to remove slag and sharp edges of technically guided or hand-guided cuts not exposed to view. Chip, grind, or machine visible or exposed hand-guided cuts to metal free of voids, discontinuities, and foreign materials.

2.2.4 Alignment of Wetted Surfaces

Exercise care to ensure that the correct alignment of wetted surfaces being joined by a flanged joint is being obtained. Where plates of the water passage change thickness, provide a transition on the outer surface, leaving the inner surface properly aligned. When welding has been completed and welds have been cleaned, but prior to stress relieving, carefully check joining of plates in the presence of a Government inspector for misalignment of adjoining parts.

2.2.5 Metallic Zinc Coatings

Apply zinc coatings in a manner, thickness, and quality conforming to ASTM A123/A123M. Where the zinc coating is destroyed by cutting, welding, or other causes, re-galvanize the affected areas to the thickness and quality required for the original zinc coating.

2.3 SUBMERSIBLE PUMP

2.3.1 Design and Manufacture

**************************************************************************
NOTE: Under paragraph PUMP SUPPLIER QUALIFICATIONS the Contractor is required to submit names of
previous installations where the selected manufacturer has documented the operating performance for pumps of this design. While the general venturi configuration of the pumps built by different suppliers is similar, the details (e.g., number of bearings, wearing ring design, cast versus fabrication, impeller design, and materials) can be different. Based on design details available, there seems to be little justification to prefer one manufacturer’s design over another. The pump portion of the specification is a low tech design compared with the motor and housing internal design, 70 to 80 percent of the cost may be contained in the motor. The emphasis on the pump portion should be on rugged, reliable, long-lasting components that are trouble-free.

The submersible pump may be either of cast or fabricated construction. The level of manufacture must be consistent with the standards referenced in the specifications. The Government reserves the right to observe and witness the manufacturing of the pumps and to inspect the pumps for compliance with contract requirements during factory assembly.

2.3.2 Speed

**NOTE:** HI 2000 bases the maximum operating pump speed calculations on a value of suction-specific speed of 8500. EM 1110-2-3105, Appendix B uses 8000. When calculating the maximum specified pump speed use the more conservative value of suction-specific speed for application where pumps will operate continuously or for extended periods of time above or below point of optimum efficiency.

2.3.2.1 Pump Speed

Rotative speed of the pump cannot be greater than [_____] rpm.

2.3.2.2 Runaway Speed

Design the pump to sustain full runaway speed without damage at maximum head difference across the pump. Based on the system design as indicated, the manufacturer must compute the maximum reverse runaway speed, and design the pump and motor to sustain that reverse rotation without damage.

2.3.3 Pump Construction

2.3.3.1 General

The major pump components must be of materials as described in Table 1. [Design the entire support assembly in accordance with UFC 3-301-01 [and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC BRACING FOR HVAC].] All exposed nuts and bolts must be stainless steel. Machine and fit all mating surfaces where watertight sealing is required with nitrile rubber O-rings. The fitting must be such that the sealing is accomplished by metal-metal contact between machined
surfaces which results in controlled compression of the O-rings. Sealing compounds, grease, or secondary devices are not acceptable.

2.3.3.2 Pump Lifting Handle And Lifting Lugs

Design the lifting handle to bear the entire weight of the pumping unit at a factor of safety of 5. Provide lifting lugs where the weight of the separate part requires a lug.

2.3.3.3 Pump and Motor Bearing Arrangement

The pump and motor bearings must be the standard design of the manufacturer for the pump supplied under this specification. The type and number must be of proven design as used in previous operating units supplied by the manufacturer. Provide bearings of the grease lubricated and sealed type; having a minimum B-10 bearing life of 50,000 hr. Each bearing must be of the correct design to resist the radial and thrust loads applied. Provide enough bearings to ensure the pump rotating elements are supported so that the possibility of excessive vibration is eliminated. Conform ball and roller bearings life and load ratings to ABMA 9 and ABMA 11.

2.3.3.4 Mechanical Seals

Provide a mechanical rotating shaft seal system between the impeller and motor to ensure the motor housing is sealed properly. The mechanical seals must be in tandem, lapped and face type seals running in lubricant reservoirs for cooling and lubrication. The mechanical seals must contain both stationary and rotating tungsten carbide face rings unless otherwise specified. In order to avoid failure from sticking, clogging, and misalignment from elements contained in the mixed media. Only the seal faces of the outer seal assembly and its retaining clips can be exposed to the mixed media. Contain all other components in the lubricant housing. All seal faces must be solid material capable of being relapped. The seals must not require maintenance or adjustment, but be easy to inspect and replace. Shaft seals without positively driven rotating members are not considered acceptable or equal.

2.3.3.5 Lubricant Housing

**************************************************************************
NOTE: The designer will need to consider the use of Environmentally Acceptable Lubricant (EAL) based on current local requirements. EAL installation is specified in EM 1110-2-1424. EAL may affect the seal material for compatibility.
**************************************************************************

Provide an oil housing with oil, as recommended by the Contractor's pump manufacturer, to lubricate the shaft sealing system and to dissipate the heat generated by the motor and bearings. [Oil must be environmentally acceptable lubricant (EAL). EAL must meet the requirements of EPA 800-R-11-002 or VGP (Vessel General Permit). The oil must have performance characteristics that are suitable for this application, meets the compatibility requirements for the system components, and is technically acceptable by the pump manufacturer. Submit the physical and performance properties as well as the certification that the oil meets the above requirements.]
2.3.3.6 Impeller

The impeller design and manufacture must be standard to the Contractor's proposed pumps. The impeller surface must be smooth, without holes and fabrication offsets. The attachments to shaft must be with keys or other fasteners that are made of stainless steel, and of sturdy construction designed to not loosen, but be easily removed for maintenance. The impeller construction may be cast or fabricated. At the time of assembly the impeller clearances must be those shown on assembly drawings and may be checked in the field or at the factory at the Contracting Officer's option. Balance the impeller at the design operating speed. The standard balance quality grade is G6.3 in accordance with ISO 1940-1. Balance in accordance with the procedure in HI 9.6.4, except that a two-plane balance is required. Submit the results of impeller balancing.

2.3.3.7 Shaft

The shaft must be [one piece integral with the motor] [two piece with gear reduction] of high-strength cold-rolled carbon steel or stainless steel with a factor of safety of five measured against the ultimate strength. Design the shaft for all torque conditions during normal operation and for runaway speed during reverse flow.

2.3.3.8 Bowl Assembly

**************************************************************************
NOTE: This portion of the pump is composed of the venturi section and consists of the suction bell, pump bowl, and discharge bowl. The entire unit acts as a venturi to hydraulically guide and stabilize the flow as it passes through the pump. Heads and stresses are low, and its major design consideration is for rugged, reliable, and long-lived materials.
**************************************************************************

The bowl assembly may be cast or fabricated. The hydraulic design must be the design shown in the submitted general drawings. The general manufacture quality relating to flange design, drilling, bolts, alignments, must be in accordance with industry standard practice.

2.3.3.9 Column Check Valve

Provide a spring loaded column check valve within 20 feet above the bowl section.

2.3.3.10 Flow Shroud

Provide a flow shroud to direct flow to pump over motor surface for motor cooling.

2.3.3.11 Strainer

Provide a strainer to prevent large objects from entering the pump. The maximum opening of the strainer must not be more than 75 percent of the maximum opening of the water passage through the bowl or impeller.

2.3.4 Motor

The motor must be submersible and conform to the requirements of NEMA MG 1.
Size the motor to avoid overload when operating at any point along the characteristic curve of the pump. Provide 3-phase, 60-Hz, [_____] V, squirrel cage induction type motors, NEMA Design B Type. Insulate the stator windings and stator leads with a moisture-resistant Class F insulation with temperature resistance of 155 degrees C 311 degrees F. Use a service factor of 1.0. The temperature rise above ambient for continuous full load rated conditions and for the class of insulation used cannot exceed the values in NEMA MG 1. The motor must be rated for continuous duty when submerged and also be capable of operation in the dry for short periods of time for testing and maintenance purposes.

2.3.4.1 Torque

Starting torque must be sufficient to start the pump, but in no case less than 60 percent of full-load torque. Break-down torque cannot be less than 150 percent of full-load torque.

2.3.4.2 Support

Provide thrust bearing support of sufficient strength and rigidity to support the weight of the entire rotating element of the motor, pump impeller and shaft, and the hydraulic thrust.

2.3.5 Cable

a. Specifically design power and instrumentation cable for use with a submersible pump application and conform to the requirements of NEMA WC 70 and NEMA WC 72. Use submersible cable suitable for continuous immersion in water at the maximum depth encountered. Cable must have an ampacity of not less than 125 percent of the motor full load current. [The cable length must be [_____] m ft].

b. Power and instrumentation cables must enter the motor through a sealing system that prevents water entry into the unit and provides strain relief. The cable entry may be comprised of rubber bushings, flanked by stainless steel washers, having a close tolerance fit against the cable outside diameter and the entry inside diameter for sealing by compression of the bushing, or the entry may be sealed by other gland compression methods.

2.3.6 Pump Control and Monitoring

Provide a self-contained pump control and monitoring system. Provide pump controls and control panels in accordance with [Section [_____] [____)]. Provide independent local indication of the alarm and separate contacts for the remote indication of each alarm and local reset. Sensors must alarm and shut down the pump at an abnormal operating condition. provide separate red alarm indicator lamps and green pump running lamps and label in the enclosure specified in [Section [_____] [____)]. Provide the following sensors:

[2.3.6.1 Thermal Sensor

A thermal sensor in the gear reduction unit (if used) to monitor oil temperature.

]2.3.6.2 Temperature Sensor

Temperature sensors in the stator windings to protect the motor against
overheating.

Temperature sensors to monitor the main and support bearings.

2.3.6.3 Float Switch Sensor

Float-switch sensor positioned between the bearings and the stator-end coils to detect if liquid penetrates the stator housing.

2.3.6.4 Detectors

A junction box leakage detector and a water-in-oil detector.

2.3.7 Air Vent

Provide an air vent and a combination air and vacuum valve type. The valve must be a minimum 862 kPa 125 lb class and sized for the design flow rate. Provide an isolation valve at the valve's inlet. Materials of construction must be cast iron for the valve body; stainless steel for the internal linkage, float, and float stem; and Buna-N for the needle and seat. The valve must provide a dual function to release air during pump start-up and to permit air to re-enter to break the vacuum during pump shutdown.

2.4 DISCHARGE TUBE [AND DISCHARGE ELBOW]

2.4.1 General

a. Design, manufacture, and install the discharge tube [and discharge elbow]. For purposes of performance and this specification it is treated as part of the pumping unit. Provide the discharge tube of such size to accommodate the dimensions of the pump supplied in accordance with its specific requirements. Furnish the discharge tube with lifting points to aid in the handling and installation of the tube. Permanently install it in the pump sump as indicated.

b. Design so the pumps are automatically and firmly connected to the discharge tube when lowered into place and in accordance with the pump manufacturer's instructions. Provide a locking device that prohibits rotational movement of the pump within the tube.

c. The pumps must be easily removable for inspection or service without need to enter the pump sump. The pumps must not require any bolts, nuts, or fasteners for connection to the discharge housing. Provide stiffening, guides, or other features at the pump support to ensure concentric positioning of the pump in the discharge tube. provide means such that an effective seal is obtained between the pump and discharge tube. Power cable penetrations must be watertight.

[ d. Install a sole plate as indicated. Design the entire support assembly to the requirements of UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC.]

2.4.2 Flanged Joints

Design flanged joints to be airtight and watertight, without the use of preformed gaskets, except that the use of a gasketing compound will be permitted. Mating flanges must be male/female rabbet type or doweled with not less than four tapered dowels equally spaced around the flange.
Machine flanges and drill bolt holes concentric with the centerline, having a tolerance of plus or minus 1/4 of the clearance between the bolt and the bolt hole. When fabricated from steel plate, flanges must not be less than 40 mm 1-1/2 inch thick after machining. Flange machining must not vary more than 10 percent of the greatest flange thickness. Construct fabricated flanges, as a minimum, to the dimensions of AWWA C207, Class B. Connect flanges to the column tube [and discharge elbow] with two continuous fillet welds, one at the inside diameter of flange-to-pump-tube and the other at the outside diameter of pump-tube-to-flange. Machine mating flanges parallel to a tolerance of 0.05 mm 0.002 inch. Finish the machine mating flange surface to 125 microns or better.

2.4.3 Nuts and Bolts

Use hexagonal type nuts and bolts; with bolts, including assembly, anchor, harness, and dowels of 300 stainless steel. Provide bronze nuts and 300 series stainless steel washers.

[2.4.4 Bolted Lid

Provide a watertight lid, hinged and bolted to the top of the discharge tube.

]2.4.5 Harnessed Coupling

Provide a flexible mechanical coupling or split-sleeve type coupling that either conforms to ASTM F1476, Type II, Class 3, or ASTM F1476, Type 1, to connect the pump discharge elbow to the [transition section] [wall thimble] [discharge piping]. Finish the middle ring without pipe stop to facilitate the installation and removal of the coupling. Install a minimum of four harness bolts at each coupling.

]2.4.6 Wall Thimble

******************************************************************************
NOTE: This alternative is used when the discharge piping includes the piece that will be embedded in the wall of the station. The size of vent to be used is determined from information in EM 1110-2-3105.
******************************************************************************

Each wall thimble must have one plain end to accommodate the flexible mechanical coupling and one flanged end to mate with the [flap gate] [multiple shutter gate] [discharge piping]. Match the plain end with the pump discharge elbow in thickness and diameter and drill the flanged end to match, and be capable of supporting without distortion, the [flap gate] [multiple shutter gate]. Provide the seal ring on the wall thimble located so that it is centered in the wall when embedded. In addition, furnish a [ ] mm inch flanged vent nozzle equipped with an ASME B16.5 standard 125 pound flange and locate where indicated. Fabricate the wall thimble from steel plates.

2.4.7 Discharge Piping

******************************************************************************
NOTE: Include applicable discharge pipe description.
******************************************************************************
Provide discharge piping consisting of a transition section and a wall thimble. Transition section must have one plain end and one flanged end, and provide a change in cross section from round to rectangular. The plain end must match the pump discharge elbow in thickness and diameter. Arrange the wall thimble for embedment and with the flanges on each end. One end mates with the flange on the transition section and the other end mates with flap gate. Fabricate the discharge flange with a minimum dimension of AWWA C207, Class D, and drill to match. The discharge flange must be capable of supporting, without distortion, the multiple shutter gate. Provide a seal ring on the wall thimble and locate it so that it is centered in the wall when embedded. In addition, furnish a [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 standard 125 pound flange and locate it where shown. Fabricate discharge piping from steel plate.

Install the discharge piping as indicated. Match the plain end of each discharge pipe to the pump discharge elbow in thickness and diameter, and configured to allow a flexible mechanical coupling to connect it to the pump discharge elbow. [Terminate the discharge piping in a flanged end to mate with a flap gate. Drill the flanged end to match, and configure to be capable of supporting the flap gate without distortion.] [Terminate the discharge piping in an open end.] The discharge pipe must have pipe supports or cradles as recommended for the Contractor's selected pumps. Locate the supports between the flexible coupling and the wall, as indicated. Provide suitably-sized thrust restraints at each flexible coupling as indicated. The supports must provide support for the weight of the pipe, the water that will pass through the pipe, and any dynamic forces that may develop due to water flowing through the pipe. Furnish a minimum [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 standard 125 pound flange and locate as indicated. The discharge pipe must be non-galvanized piping of welded or seamless pipe or welded steel plate. The steel pipe must conform to AWWA C200 with dimensional requirements as given in ASME B36.10M. Fittings must comply with AWWA C208.

2.4.8 Flap Gate

Design the flap gate for pump discharge service with flange-frame with a resilient seat of neoprene or nitrile butadiene rubber to prevent closing shock. Size the flap gate to be the same as the discharge pipe size. [The body of the valve and the flap must be cast iron ASTM A126. The hinge arms must be high-tensile bronze ASTM B584- CA 865. Design the hinge pins in double shear and of silicon bronze, ASTM B98/B98M- CA 655.] [Fabricate the flap gate entirely of stainless steel. Use only stainless steel hardware.] Provide lubrication fittings on the hinge arms. Extend the grease lines to a convenient location for lubricating. provide an anti-locking bar to prevent excessive rotation about the lower hinge pin. provide a stainless steel leaf spring with rubber pad to safely limit the travel of the flap gate during pumping.

2.4.9 Dissimilar Metals

When dissimilar metals are used in intimate contact, apply suitable protection against galvanic corrosion. Protect the anodic member by proper electrical insulation of the joint.

2.5 INTAKE DESIGN

**************************************************************************
NOTE: Information on intake design is available in
**************************************************************************

SECTION 35 45 02.00 10 Page 29
EM 1110-2-3105, Hydraulic Institute standards, manufacturers' catalogs, and model tests from the U.S. Army Engineer Research and Development Center (ERDC). The designer should be aware of.net positive suction head available (NPSHA) and NPSHR from pump performance curves and the plant design operation. If the approach inlet conditions to the pumping station are unique or unusual, the designer should consider having the contractor perform a model intake test, or the contractor may consult ERDC about the need for a model test or to learn about results from previous testing.

Detailed design information about using a formed suction intake is available in EM 1110-2-3105.

2.5.1 General

The intake sump design will be provided by the Government. Supply a pump that will meet the performance requirements without undue modifications to the sump as indicated on the drawings. Any such modifications are at no cost to the Government and must receive prior approval.

2.5.2 Formed Suction Intake (FSI)

Provide an FSI for each pump to the dimensional requirements and arrangement shown on the drawings. Connect the FSI to the inlet of the discharge tube. Use flanged joint as specified in paragraph FLANGED JOINTS as the method of connection. Assume the FSI has a K value of 0.15 for head loss calculations. Construct the FSI of [fabricated steel], [cast iron], [a combination of fabricated steel and cast iron]. Any stiffeners used must be on the outside of the FSI to allow smooth flow within. Use stainless steel bolts with bronze nuts. The minimum thickness of fabricated material must be [10 mm 3/8 inch] [12 mm 1/2 inch] [16 mm 5/8 inch] [19 mm 3/4 inch]. Provide grout holes in the floor [and sides] of the FSI to permit grouting during installation.

[2.6 INTAKE TESTING

NOTE: Delete this paragraph if a model test of the intake to the pumping system(s) is not required.

Provide complete performance model testing of the pump intake systems. Use the model testing to confirm the configuration of the intake systems, including the proposed intake conduit, hydraulic losses to the pump, the position of the pump in the intake bay, and to confirm the selection of the pump. The Contracting Officer will witness the final tests confirming the geometry for the intake conduit. Notify the Contracting Officer with at least 14 days notice of the time and location for the final tests.

2.6.1 Contractor's Modeling Engineer Qualifications

Perform the modeling work in a hydraulic laboratory located within the United States where this type of work has been performed for a period of at least ten years. The individual in responsible charge of the modeling work
must be a registered professional engineer in any U.S. state with at least ten years of experience in pump and intake modeling work for similar projects. The engineer must seal and sign all reports and data documents generated as a part of the test work prior to submitting them.

][2.6.2 Intake Model Setup and Objectives

The model intake setup must be of the intake system, custom designed for this installation and suitable for operation at atmospheric pressure for observation of the intake basin performance. The intake model must be suitable for use with a model pump. Use clean and clear water for the test to allow proper observation. The temperature of the water during any test cannot exceed 30 degrees C 85 degrees F. [ For the FSI, provide a setup to determine flow patterns in the suction basin approaching the intake, along with losses to the pump. Provide further tests to identify flow patterns in the intake itself and approach patterns at the entrance to the pump.]

In the intake model, include all items in the intake path, including, but not limited to: models of the trash rack, stoplog slots, access ladders, and the stilling wells in the intake bays.

][2.6.3 Intake Model Tests

The objective of the modeling work is to define the performance of the proposed pumping unit and to confirm the geometry to be used for the pump intake. The model must have a model-to-prototype Froude number ratio of 1, based upon the pump impeller diameter. Arrange the model in the same relative orientation as the prototype structure and include the bay configuration and screening system. Perform all testing with the same model.

Intake Tests: For the formed suction intake geometry shown on the drawings, use the model setup to determine flow characteristics in the suction basin intake bay and at the entrance to the FSI at all specified operating conditions. In addition, use the model to determine the effect of the intake system on pump operating characteristics. Use a siphon generated by a separate pump to examine flow characteristics in the intake bay using Froude relationships to model intake operation in the first set of tests. Use second test to develop information on the effect of the intake on pump operation. Use these values to forecast the performance of the pump-intake conduit combination.

Alternate Intake Geometry: If an intake geometry differing from that indicated is proposed, or other modifications such as baffling, test the proposed intake and/or modifications to demonstrate its suitability for use in the project and compliance with Appendix I in EM 1110-2-3105. For that reason, design the laboratory setup specifically to monitor free and sub-surface vortices, swirl and pre-rotation approaching the pump impeller, flow separation at hydraulic surfaces in the intake conduit and at the hydraulic surfaces approaching the pump impeller, and axial velocity distribution at the entrance to the impeller.

a. The intake conduit and pump inlet must contain several clear windows and similar appurtenances and adequate lighting at all critical areas to allow visual determination of the presence of vortices, turbulence, and other defects. Make provisions to insert dye at intervals in the intake conduit and at the entrance to the impeller during operation of the test. Reynolds and Weber numbers for all model runs must be greater than 30,000 and 120, respectively. The manufacturer must develop scale factors for velocity, flow, and time for use in
evaluation of model results. Scale factors are subject to review by the Contracting Officer. In addition to model runs at all specified operating conditions, conduct no fewer than five runs at 1.5 times Froude-scaled flows after final geometrics for the intake conduit and intake bays have been established, keeping the submergences at the geometrically scaled values. Track and document circulation contributing to development of vortices.

b. Determine vortex formation in the model every 15 seconds extending over a period of 10 minutes. Classify vortices in accordance with the strength classification system in HI ANSI/HI 9.8 for both surface and subsurface vortices, using dye wand injection to assist in classification. Provide both photographic and video documentation of vortex formation. Direct particular attention to subsurface vortex formation at the intake conduit entrance and on intake conduit surfaces leading to the impeller entrance.

c. Provide a swirl meter or other satisfactory device to determine liquid rotation (swirl) at the entrance to the impeller. Obtain swirl readings at intervals of 20 seconds for a period of not less than 10 minutes after the model has achieved steady-state operation at any specified operating condition. Swirl angle is defined by the relationship:

\[ \text{swirl angle} = \frac{1}{\tan} \left( \frac{\pi \times d \times n}{u} \right) \]

Where:
- \( u \) = average axial velocity at the swirl meter.
- \( d \) = diameter of the conduit at the swirl meter.
- \( n \) = revolutions/second at the swirl meter.

d. Headloss Measurements: Measure headloss from the upstream model boundary to just upstream of the pump inlet for each documentation test and include a minimum of the following conditions:

<table>
<thead>
<tr>
<th>Pump No.</th>
<th>Avg On/Off El. (m) (feet)</th>
<th>Individual Pump Q (cubic m per second) (fps)</th>
<th>Total Pump Q (cubic m per second) (fps)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**************************************************************************

NOTE: Provide an expected order of pump operations and expected intake elevations at start-up for each pump.

**************************************************************************

e. Also record the head loss from just upstream of the FSI to the throat of one model pump for a minimum of 10 flow rates after the model Euler number is determined to be constant and at least one point (near the middle of the data) must be within 2 percent of the scaled rated flow of the pump. Measure head loss with a differential manometer or differential stilling basin. Install a minimum of four pressure taps around the pump throat measurement point and joined to form an average pressure reading. Calculate a dimensionless head loss coefficient for the formed inlet that includes the entrance loss into the formed inlet.

f. Determine the velocity profile in the channel cross section approaching the intake and performing the velocity traverses on perpendicular axes
at the intake throat, just upstream from the impeller. Velocity measurement instruments must be capable of an accuracy of plus or minus 2 percent.

g. Use the following as criteria for acceptance of the proposed design:

(1) Free surface and sub-surface vortices entering the pump intake must be less severe than Type 1, as defined in HI ANSI/HI 9.8, unless dye core vortices appear for less than 10 percent of the time or only for pump operating conditions that are expected to be infrequent, such as the listed maximum or minimum operating conditions.

(2) Swirl angles, both maximum and average, indicated by swirl meter readings, must be less than 5 degrees. Swirl angles as great as 7 degrees will be accepted if occurring less than 10 percent of the time or for operating conditions that are expected to be infrequent, such as the listed maximum or minimum operating conditions.

(3) Velocities at points of equal radii at the throat of the intake conduit must be within 10 percent of each other.

(4) Determine NPSHR on the basis of a one percent reduction of efficiency.

(5) Time-varying velocity fluctuation (turbulence) levels as defined by a standard deviation over average velocity at a point within the pump throat must be less than 10 percent.

h. Unless otherwise specified, conform accuracy of all measurements to the levels established in HI ANSI/HI 11.6.

2.6.4 Recommendations from the Model Test

Submit an intake model test report. If the results of the intake model testing indicate that any features of the design are deficient, report this to the Contracting Officer in writing immediately. If the intake modeler has recommendation for improving the flows in the pumps, provide them in the Intake Model Test Report. Flag these as important information that requires the Contracting Officer's immediate attention. Note all recommendations considered major changes. provide any minor recommended changes to the intake as variations in the shop drawings.

2.7 MOTOR TESTING

Field test the motors per NETA ATSNETA ATS. For induction motors test per part 7.15.1. For synchronous motors test per part 7.15.2.

2.8 SHOP ASSEMBLY

Assemble the discharge tube [and discharge elbow] to ensure the proper fitting and alignment of all parts. Prior to disassembly, match-mark all parts to facilitate the correct assembly in the field.

2.9 FACTORY TESTS

**************************************************************************
NOTE: The designer should specify performance
testing of the assembled pump in the factory to check that the requirements of the specification have been met.

Perform the following factory tests in accordance with HI ANSI/HI 11.6. [Testing is nonwitnessed factory testing. The pump manufacturer is responsible for maintaining all test results, however reporting of these test results is not required.][Testing is certified nonwitnessed factory testing. The pump manufacturer is responsible for maintaining all test results, however reporting of these test results is not required.][Testing is certified nonwitnessed factory testing. The pump manufacturer must provide certification and data to indicate that the testing meets the testing standard.][Testing must be witnessed by a Government Representative. When satisfied that the pump performs in accordance with the specified requirements, notify the Contracting Officer, [two weeks] in advance, that the witness tests are ready to be run and furnish two copies of curves required in paragraph TEST RESULTS. If the tests reveal that the pump does not perform in accordance with the specifications, make necessary changes before again notifying the Contracting officer that witness tests are ready to be run. Provide copies of all data taken during the witness testing and plotted preliminary curves to the Contracting Officer with the factory test report.]

2.9.1 Performance Test

Compliance with specifications will be determined from curves required by paragraph TEST RESULTS. Test procedures, except as herein specified, must be in accordance with applicable provisions of HI ANSI/HI 11.6. Use water for testing at approximately the same temperature (68 degrees F) for all tests run and record it during test runs.

2.9.1.1 Performance of the Pump

Determine performance of the pump by a minimum of 5 test points sufficient to develop a constant speed curve over the range of total heads corresponding to the requirements of paragraph CAPACITIES. Testing must be inclusive for the speed involved.

2.9.1.2 Test Results

Plot test results to show the total head, static heads, bkW bhp, and efficiency as ordinates. Plot the results against pump discharge in L/s gpm as the abscissa. Plot curves showing pump performance to a scale that will permit reading the head directly to 0.15 m 0.5 ft, capacity to 30 L/s 500 gpm, efficiency to 1 percent, and power input to 20 bkW 25 bhp. Establish that the performance requirements of these specifications under this contract have been fulfilled at the best efficiency point, preferred operating region, and the acceptable operating region of the pump on the plotted curves developed during the factory performance testing. Perform the performance test with the pump and motor assembled as an operating unit to simulate field installation unless otherwise approved in writing by the Contracting Officer. Conduct the test in accordance with accepted practices at full speed; and, unless otherwise specified, conform to HI ANSI/HI 11.6 procedure and instruments.

[2.9.2 Cavitation Test]

Use the testing procedures provided in HI ANSI/HI 11.6 to determine the net
positive suction head required (NPSHR) by the pump. Select the test arrangement and procedure, from the choices provided in HI ANSI/HI 11.6, that best suits the test facility. NPSHR must be determined for five or more capacities over the total range of the specified operating conditions. Plot the test results and define NPSHR as the point where a 3 percent drop in performance occurs. The value of NPSHR must be 1 m 3.3 ft less than the corresponding net positive suction head available (NPSHA). Use the temperature of the water at the time the tests are run in determining the NPSHR. Use the water elevations specified in paragraph CAPACITIES to determine the NPSHR for pumps.

][2.9.3 Hydrostatic Test

Perform a hydrostatic test of the pump to verify the absence of leakage from the pressure containing walls and the joints of the pump assembly in accordance with HI ANSI/HI 11.6. The hydrostatic test pressure is based on the differential pressure of the pump as specified in paragraph CAPACITIES. [Submit the certification that the Hydrostatic Test meets the requirements of HI ANSI/HI 11.6 with no visible signs of leakage.] [Submit a full report of the Hydrostatic Test in accordance with HI ANSI/HI 11.6.]

][2.9.4 Vibration Test

Perform a vibration test to verify that the tested pump does not exceed a guaranteed vibration velocity level as specified in HI ANSI/HI 11.6. Submit the certification that the Vibration Test meets the requirements of HI ANSI/HI 11.6 and summarize findings in a report.

][2.9.5 Submersible Motor Integrity Test

Perform a submersible motor integrity test to verify the sealing and electrical integrity of a submersible motor in accordance with HI ANSI/HI 11.6. Submit the certification that the Submersible Motor Integrity Test meets the requirements of HI ANSI/HI 11.6.

][2.9.6 Factory Test Report

Submit, within 30 days of receipt of approval of the witnessed factory test,[bound] [digital] copies of a report covering test setup and performance tests. Include the specified information in the factory test report that meets the guidance identified in HI ANSI/HI 11.6.

2.10 PAINT

Paint the pump/motor in accordance with the Contractor's pump manufacturer's standard coating system. External unmachined and non-mating machined surfaces (except for stainless steel) must be thoroughly cleaned and painted with a hydrocarbon-resistant, anti-corrosive (lead and chromate free) primer and topcoat. Painting external surfaces of nonferrous parts and components is not required but is permissible to avoid excessive masking. Identification plates must not be painted or oversprayed. Submit paint catalog data. Paint the discharge tube [and discharge elbow] and appurtenances in accordance with Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES. [Provide the manufacturer's standard coating which is rated for use in brackish conditions.]

][2.11 CORROSION PROTECTION

Provide mounted zinc anodes on the pump casing to prevent against corrosion
for pumps which will operate in brackish conditions. Size zinc anodes with enough material to last for at least 3 years of normal operation. [Verify with potential tests the effectiveness of the mounted zinzs.]

PART 3 EXECUTION

3.1 INSTALLATION

Perform correct installation and assembly of the pumping unit in accordance with the drawings and with the installation instruction manual. Submit, no later than 30 days prior to time of pump delivery, three copies of a typed and bound manual describing procedures to be followed by the installation engineer in assembling, installing, and dry- and/or wet-testing the pump. Coordinate and consolidate the description of the pump with similar descriptions for other specified pump parts. The description must be of such a nature that it may be comprehended by an engineer or mechanic without extensive experience in erecting or installing pumps of this type. The description must be a step-by-step explanation of operations required, and include, where applicable, such things as alignment procedures, bolt torque values, recommended instrument setups, recommended gauges and instruments, and similar details. Furnish all bolts, shims, tools, and other devices necessary for installing the pumping units. The manufacturer's representative(s) familiar with the equipment being installed must supervise the handling, installation, start-up, and testing of the equipment as required in the paragraph Contractor's Installation And Start-Up ENGINEER.

3.2 CLEANUP PRIOR TO START

After the pumping unit is installed and prior to start-up, completely clean the sump area of any accumulated construction debris. This final cleaning of the sump area will be witnessed by a representative of the Government. Correct any damage to the pumping units or related equipment during initial start-up due to foreign objects left in the sump areas.

3.3 PUMP FIELD TESTS

**************************************************************************
NOTES: Compliance with specification performance has been made a part of the factory tests; therefore, field tests are for the purpose of baseline measurements. Pump integrity, vibration, and inspection of manufacturing quality are witnessed at the factory.

Perform field testing to ensure proper alignment and installation, start-up and shutdown procedures, checking out controls, and establishing baseline measurements. Two field test methods are available, dry or wet testing, depending on availability of water. Wet testing is preferred, but dry testing may be all that is possible when the pumps are prepared for initial start-up.

If a wet test cannot be conducted at the time of initial start-up because of a lack of water, it should be conducted at a later time, if possible, and does not unduly extend the contract period.
**************************************************************************
Submit a field test plan prior to field testing. Field testing must be conducted by an experienced field test engineer and will be witnessed by the Contracting Officer. Before initially energizing the pump/motors, ensure that all pumping plant control, monitoring, and protective circuits have been successfully tested. This thorough electrical checkout procedure must follow a detailed step-by-step approved test plan. Also check the motor and other pumping unit elements undergoing tests at this time. Field test the plan prior to field testing.

[3.3.1 Dry Test]

Test each pumping unit in the dry in accordance with the pump's instructions to determine whether it has been properly installed. Operate the pump at full rated speed. If tests reveal a design or installation deficiency or a manufacturing error in pumping unit components, promptly correct the problem.

[3.3.2 Wet Test]

Test each unit under load for a period of at least [_____] hours or as directed by the Contracting Officer. Conduct the tests to be witnessed by the Government. During the tests, observe, measure, and record the operation of the pumping units [noise (in accordance with HI 9.1-9.5),] motor-bearing temperatures, voltage, and current for each pump. Measured parameters must be within the pump's published limits. Make vibration measurements at the top of the discharge tube [and flange of the discharge elbow] for each pump. Vibration limits must not exceed those recommended by HI 9.6.4.

3.3 Field Test Report

Submit the field test report that summarizes results of the testing.

3.3.4 Operation and Maintenance Manual

Prepare and submit the field test report and a manual of Operating and Maintenance Instructions for the completed system. Submit the instructions containing complete information on operation, lubrication, adjustment, routine and special maintenance disassembly, repair, reassembly, and trouble diagnostics of pump and auxiliary equipment. [Print the operation and maintenance manual and both parts lists on good quality ANSI size A 216 by 280 mm 8-1/2 by 11-inch paper, bound separately between flexible, durable covers.] [Provide the operation and maintenance manual and both parts lists on optical disc, formatted to print on ANSI size A 216 by 280 mm 8-1/2 by 11-inch paper.] Drawings incorporated in manual or parts lists, may be reduced to page size provided they are clear and legible[, or may be folded into the manual to page size]. Photographs or catalog cuts of components may be included for identification.

3.3.5 Pump Removal and Installation

Install and remove each maintenance pump unit a minimum of three times to demonstrate proper pump alignment and installation. Verify that the pump can be removed and installed without sticking or binding. [Verify proper sealing at the discharge elbow.]

-- End of Section Table of Contents --
NOTES: This guide specification covers the requirements for speed reducers used with vertical impeller pumps.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: This guide specification, as written, is for use in construction contracts for the building of pumping stations. If it is to be used in supply contracts, it should be changed as appropriate.

The pump, motor, base, electrical power, engine, and clutch (if used) are all related components but are not included in this specification.

The epicyclic reducer is reliable and especially well suited to high power applications. It should not normally be deleted as an option if the prime mover has a vertical shaft.
1.1 UNIT PRICES

NOTE: If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00.

1.1.1 Speed Reducers for Storm Water Pumps

Make payments for costs associated with furnishing and installing the speed reducers for storm water pumps as specified.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SYSTEM DESCRIPTION

1.3.1 General Product Requirements

This section is intended to be used along with Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE. The designer is responsible for determining whether a speed reducer is required or whether a direct drive vertical induction motor can be used to drive the pump. Guidance for making this decision is EM 1110-2-3105, MECHANICAL AND ELECTRICAL DESIGN OF PUMPING STATIONS. An additional section for the prime mover, an electric motor or diesel engine, is also normally added. The intention is for these components to be purchased and installed by the Construction Contractor. Purchase of the three components in a single contract allows the supplier to obtain the most optimum combination of components thus reducing costs while not sacrificing reliability. This also makes it feasible for the Contractor to perform dynamic analysis as described in Section 35 45 01 and be solely responsible for acquiring the necessary data to perform such analysis. The dynamic analysis is important to ensure the pump, reducer, and motor or engine combination is free of detrimental vibration. If the reducer and prime mover are purchased separately, the designer is responsible to provide additional plans and specifications covering reducer instrumentation. Provisions for a pump, reducer, and Provisions for a pump, reducer, and prime mover base plate are described in Section 35 45 01. Pump and reducer alignment is described in Section 35 45 01. The "Buy American Act" which will be included in the non-technical portion of the contract will preclude the use of nondomestic reducers and appurtenances.

Provide speed reducers which are designed and manufactured by an organization that is regularly engaged in the manufacture of speed reducers of the type utilized for these installations which conform to the requirements of ANSI/AGMA 6113AGMA 6013 or AGMA 6123. Submit complete computations, design loads, and catalog data. Display the certified Contractor's manufacturer's ANSI/AGMA insignia as evidence of conformance to these standards on the reducers nameplate. Cite the Contractor's selected manufacturer's name, model designation, serial number, unit rating, application factor, reduction ratio, and other applicable information on the nameplate. Provide a [single reduction spiral bevel] [spiral bevel primary, helical secondary stage] [single reduction parallel shaft] [double reduction parallel shaft] [epicyclic] gear type equipped with thrust bearings to make the speed reducer suitable for use with a vertical impeller pump. Equip the reducer with a thrust bearing where upthrust is possible during pump startup or shutdown. Provide a backstop to prevent reverse rotation of the pump.
1.3.2 Design Conditions

1.3.2.1 Operating Conditions

**************************************************************************
NOTES: The speed reducer, pump, and prime mover are intended to be purchased together; responsibility for establishing operating loads should be placed on the Contractor. If the speed reducer is purchased separately, the designer must determine the operating loads from pump and prime mover data.

For motor stall torque, 350 percent of rated load should be used for induction motors. For diesel engines, the maximum torque should equal the slip torque of the overload protection device. An air actuated clutch should be used as overload protection.

**************************************************************************

Include the following operating conditions as a minimum: maximum input power, motor or engine speed, speed reducer ratio, maximum pump reverse overspeed, low-speed shaft downward thrust including weight[, low-speed shaft momentary upward thrust during startup or shutdown], high-speed shaft direction of rotation, low-speed shaft direction of rotation, overhung load, motor stall torque, or maximum engine overload torque transmitted through the clutch, reverse torque load on the backstop.

1.3.2.2 Runaway

**************************************************************************
NOTE: Delete this paragraph for engine-driven units. If emergency closure might not be achieved within 30 minutes, this time period must be increased.
**************************************************************************

Design the speed reducer to withstand backstop failure and maximum pump reverse runaway speed for a period of [30] [_____] minutes.

1.3.3 Arrangement

**************************************************************************
NOTE: In making choices as to the reducer arrangement, the designer must coordinate with the pump (Section 35 45 01) and prime mover specifications. These contain statements on shaft configuration. The hollow output shaft arrangement is preferred for ease of installation. If the reducer is purchased separately from the pump and prime mover, the designer is responsible for determining input and output shaft details and ensuring the reducer will be compatible. For reducers driven by a diesel engine, an air actuated clutch is recommended. The clutch should be part of the diesel engine specification.
**************************************************************************

[Provide a true hollow low-speed shaft where the pump shaft passes}
concentrically through the reducer shaft allowing finite impeller elevation adjustment. [Provide a speed reducer output shaft connected to the pump using a rigid coupling.] [Connect speed reducer input shaft to the motor shaft by a flexible coupling.] [Connect the speed reducer input shaft to the engine with two universal joints and an intermediate shaft.] [Connect the speed reducer input shaft to the engine with a flexible coupling.] Ensure compatibility and fit of the reducer high-speed and low-speed shafts with that of the pump and prime mover. Provide a speed reducer mounting which is designed to permit removal of the reducer and reinstallation without requiring realignment of the reducer and shafting. Before assembly, dynamically balance each gear and shaft assembly.

1.4 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 DELIVERY, STORAGE, AND HANDLING

Protect material and equipment from weather, humidity, temperature variation, dirt, dust, and other contaminants during delivery and storage.

1.6 EXTRA MATERIALS

*****************************************************************************************************************************************
NOTE: The designer is responsible for providing a list of spare parts requirements. This should be based on consideration of whether the purchase of a complete spare reducer is justified and the consequences of downtime of one or more units. Spare parts might otherwise include spare gears, bearings, seals, lubrication system parts, instrumentation components, or heat exchanger. The designer should consult with the end user of the system to determine spare parts requirements.

SECTION 35 45 03.00 10 Page 9
Submit the following: [______]

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

NOTE: Application factors of 1.25 (electric motor) and 1.50 (diesel engine) are the values recommended by EM 1110-2-3105 MECHANICAL AND ELECTRICAL DESIGN OF PUMPING STATIONS. These are suitable for most applications. Where reducer operating conditions are considered severe, the application factors of 1.75 (electric motor) and 2.0 (diesel engine) may be used to increase reliability.

ISO 20816-3 was added in the event any vibration testing may be required by the designer.

Provide new materials and equipment which are the standard products of the Contractor's manufacturers who are regularly engaged in the production of gear reducers for vertical pump drives and that essentially duplicate products which have been in prior satisfactory use for at least 2 years prior to bid opening. Submit detail drawings consisting of a complete list of equipment and materials, including descriptive and technical literature; performance charts and curves; catalog cuts; and installation instructions. Show on the drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of work including clearances for maintenance and operation. Rate the reducer assembly in accordance with ANSI/AGMA 6113 or AGMA 6123 as applicable. Provide reducers which are equal to or exceed the maximum input power times an application factor of 1.25 for reducers driven by electric motors and 1.75 for reducers driven by diesel engines. For vibration testing conform to ISO 20816-3.

2.2 BEARINGS

NOTE: The selection of thrust bearing type should be left to the reducer manufacturer. The selection of bearing type is based upon thrust load. For very high thrust loads, a hydrodynamic fluid film thrust bearing may be needed. If the designer has specific experience which relates to which bearing type is best for the application, one of the options for thrust bearing type may be omitted.

2.2.1 Thrust Bearings

Provide thrust bearings which are either hydrodynamic fluid film type or antifriction type. Antifriction thrust type bearings can be either tapered roller or spherical roller type. Size the thrust bearing for the pump thrust plus the weight of the impeller and shaft. Size the bearings to be able to sustain continuous operational load as well as startup and shutdown loads. For hydrodynamic fluid film thrust bearings use pivoted segmental...
shoes with the babbitted face surfaced as recommended by the bearing manufacturer to maintain an optimum oil film.

2.2.2 Radial Bearings

Use antifriction type radial bearings for spiral bevel and parallel shaft reducers. Use either hydrodynamic fluid film type or antifriction type radial bearings for epicyclic reducers.

2.2.3 Hydrodynamic Fluid Film Bearings

Design the bearings to have a minimum oil film thickness of $12.5 \, \mu m = 0.0005 \, \text{inch}$ under the most severe operating conditions. The bearing loads can not exceed $2400 \, \text{kPa} = 350 \, \text{psi}$ for the maximum load. Where hydrodynamic fluid film thrust bearings are used, make suitable hydrostatic lift provisions if required to prevent bearing damage during startup. Provided thrust bearings with either spring loaded or embedded instrumentation to monitor operating temperatures.

2.2.4 Antifriction Bearings

Use antifriction bearings which are rated for an L-10 life of 100,000 hours at the operating load of the reducer. Conform to ABMA 9 for ball bearing load ratings. Conform to ABMA 11 for roller bearing load ratings.

2.3 GEARS

*************************************************************************
NOTE: Designer must delete inapplicable statements which pertain to the gear types not used.
*************************************************************************

[Provide double helical designs for Epicyclic gearing.] [Provide helical designs for parallel shaft gearing.][ Provide spiral bevel designs for right angle gearing.] Gas nitride or carburize, then harden and ground spiral bevel, helical, and double helical gears. For epicyclic gearing the annulus ring may be cut by gear shaper. Crown the pinion or gear of each helical set to eliminate end loading. For helical gears, use standard normal diametral pitches. In addition to rating the gears according to ANSI/AGMA 6113 AGMA 6013 or AGMA 6123 as applicable, ensure gear stresses do not exceed 80 percent of yield strength for any overload, motor stall, or engine overload condition. Use 350 percent of motor rated torque for motor stall condition minimum.

2.4 SHAFTS

Provide heat treated alloy steel for gear shafts. Ensure input shaft sizes and configurations are compatible with the motor or engine and clutch. Ensure output shaft sizes and configurations are compatible with the pump. Welded shafts are not acceptable.

2.5 [COUPLINGS] [UNIVERSAL JOINTS]

*************************************************************************
NOTE: The designer must delete inapplicable statements. Couplings are to be used with electric motor prime movers. Universal joints are to be used with diesel engine prime movers. In some cases, flexible couplings may be used with diesel engines.
*************************************************************************
Connect the speed reducer to the motor (engine) by [flexible coupling] [universal joints]. Specify a service factor of 2 based on maximum rated load for [couplings] [universal joints]. Do not exceed 80 percent of yield strength at maximum overload conditions. [Provide couplings which transmit torque by means of a steel grid spring fitted into grooves in the periphery of the coupling hubs or by means of external gears on hubs engaging in internal gears on the coupling sleeves or by hubs engaged with flexible self-lubricating members. Couplings with sleeves held in place by snap rings are not acceptable.] [Provide universal joints which have forged steel yokes and spiders and sealed needle roller bearings. Install universal joints in pairs. Conform the angles between each shaft and the intermediate shaft as required. Set the driving pins on the yokes attached to the intermediate shaft parallel to each other.] [Enclose and seal couplings to exclude contaminants and retain the lubricant under both static and operating conditions.] [Provide ANSI/AGMA 9000 class 7 or better flexible couplings with grease unless self-lubricated.]

2.6 BACKSTOPS

NOTE: Mounting of the backstop with the inner member and rollers stationary will decrease wear and heat generation and consequently increase the life of the backstop. The outward radial load on the rollers is decreased in this mounting situation. This mounting method can be obtained without undue cost but is not the standard mounting method for these backstops. The designer may opt for the standard method (inner member and rollers rotating) but is advised that better life has been obtained with the inner member stationary. For smaller wattage horsepower units (375 kW (500 hp and below), the drop-pin type backstop is a satisfactory alternative and may be added to the specification. Spragtype backstops perform adequately in many installations but have been more prone to problems such as wear and excessive heat generation than the other types and are not listed as an option here. If a diesel engine is used, the idle speed and duration should be listed for proper consideration during backstop sizing.

Provide a backstop on the output shaft to prevent reverse rotation of the pump. For double reduction reducers, the backstop may be mounted on the output or intermediate shaft. Size the backstop for the resulting torque at the reducer during maximum reverse flow at pump and apply a service factor of 2.0 to the equipment's published rating. In addition provide a backstop which is suitable for continuous operation at engine idle speed of [800] [_____] rpm that's of a type with cylindrical rollers on inclined cam planes or drop-pin type. Arrange the backstop with the outer race moving and the inner race fixed. The backstop temperature cannot exceed 160 degrees F under all operating conditions with an ambient temperature up to 40 degrees C 100 degrees F. Provide a circulating oil lubrication system with sufficient flow to provide the required cooling. The lubrication system may be part of the gear reducer lubrication system.
2.7 HOUSING

2.7.1 General

Provide a housing made from cast or fabricated steel. Stress relieve prior to machining, and reinforce to carry all applied loads and to maintain gear alignment. Provide a sole plate under the reducer. Level and grout the sole plate in accordance with API RP 686. Use jacking bolts for leveling before grouting, and back off jacking bolts after leveling to transfer the load to the grout pad. Provide an anchor bolt layout to aid in placement of the anchor bolts. Machine the housing bottom. Paint the interior of the reducer with an oil compatible coating. Paint the exterior with the Contractor's standard coating system. Provide an oil fill connection and a drain connection with a magnetic plug. Provide lifting lugs for lifting the entire reducer assembly and any subassembly or component which cannot be lifted using web slings.

2.7.2 Seals

Use a drywell design seal for vertical down output shafts. Use a lip seal on the input shaft to prevent leakage of oil and exclude dirt and utilize hardened steel wear sleeves.

2.7.3 Inspection Covers

Provide inspection holes with cover plates located above the maximum oil level to permit viewing of gear teeth allowing evaluation of the contact patterns of each gear mesh and to allow inspection of internal features of the lubrication system.

2.8 LUBRICATION SYSTEM

*****************************************************************************************************************************************
NOTE: Consult with EM 1110-2-1424 when designing an Environmentally Acceptable Lubricant (EAL) system.
*****************************************************************************************************************************************

2.8.1 General

Provide an oil lubrication system that will provide continuous lubrication to the gears, bearings, and oil lubricated-type backstop consisting of an oil circulating pump, [oil-to-water][air] heat exchanger, piping, filters, and controls for each reducer driven directly from the speed reducer shaft. The maximum oil sump temperature at rated speed allowable is \(160 \text{ degrees F}\) at an ambient temperature of \(40 \text{ degrees C}\) \(100 \text{ degrees F}\). If a hydrodynamic thrust bearing is used, its lubrication system may be part of the gear reducer lubrication system, or a separate lubrication system may be provided.

2.8.2 Lubricating Oil

Provide mineral oil or Polyalphaolefine (PAO) synthetic hydrocarbon lubricating oil as recommended in ANSI/AGMA 6113AGMA 6013 or AGMA 6123 for an ambient temperature range of \([-10 \text{ to } +50 \text{ degrees C}] [15 \text{ to } 125 \text{ degrees F}]\) for use in the gear reducer(s) and backstop(s). Provide viscosity rating and necessary lubricant additives as recommended by the Contractor's fabricator. [Provide environmentally acceptable lubricant in accordance with EPA 800-R-11-002 which is compatible with the lubrication system.]

SECTION 35 45 03.00 10 Page 13
Submit catalog data for the proposed lubricant. Provide a manufacturer of oil which has a minimum of 15 years of experience in the processing and manufacture of similar oil. Provide gear oil which is the standard product of the manufacturer and from a standard product line.

Provide gear oil which meets all requirements of ANSI/AGMA 9005 which can operate at both extreme high temperatures and low temperatures. Use gear oil which provides rust and corrosion protection for the gear sets and bearings. Submit lubrication manufacturer data which clearly indicates the lubrication meets the general performance requirements.

a. Thermal and oxidative stability under high temperatures
b. Operation under extreme low temperatures
c. Operation under high temperature
d. Extreme pressure and extreme wear properties to protect the gears and bearings
e. Operation under boundary lubrication to protect gear sets
f. High viscosity index
g. Sludge protection
h. Resistance to water and moisture
i. Hydrolytic stability and water separability data
j. Resistance to foaming

Provide oil with a cleanliness rating that conforms to ISO 4406 and meets the following three digit rating code: 17/15/13. Acceptable water content is below 300 ppm. Provide at least 3 random samples and corresponding test data of gear oil from each delivery to show it conforms to the cleanliness rating and water concentration requirements.

2.8.3 Oil Pumps

Provide positive displacement type oil pumps equip with a relief valve which discharges to the sump which is reversible so it continues to function during a runaway condition.

2.8.4 Prelubrication Pump

**************************************************************************
NOTE: An electric motor-driven prelubrication pump is recommended where hydrodynamic thrust bearings will be used to ensure an optimum oil film is developed prior to startup. Many applications with hydrodynamic thrust bearings do not use electric motor-driven pumps. The designer has the option of omitting the requirement for an electric motor-driven pump.
**************************************************************************

Provide a prelubrication pump which is positive displacement. [Provide a hand-operated type where antifriction thrust bearings are used.][ Provide a positive displacement electric motor-driven pump where hydrodynamic thrust bearings are used]. Provide an electric motor-driven pump capable of delivering sufficient pressure to lift the thrust bearing runner from the shoes. Provide the means to operate in manual and automatic modes. Automatic mode consists of automatically supplying oil prior to reducer startup, operating at least 30 seconds after reducer startup, then automatically shutting down. Manual mode, consists of the prelubrication pump being started and stopped from a local push button station.
[Available power for the pump and controls will be 480 V, 3 Ph, 60 Hz and 120 V, 1 Ph, 60 Hz.] Supply oil from the lubrication system prior to reducer startup. Utilize zero-leakage check valves to isolate it from the lubrication system during operation of the reducer. Valve operation is not permitted to execute the prelubrication cycle or to return to normal operation.

2.8.5 Oil and Breather Filters

Provide two oil filters on the pump outlet side, one for removing particles and the other for water removal. Provide a particle filter with a Beta rating of B6 greater than 200 at 400 kPa 60 psi differential tested in accordance with ISO 16889. [The reducer manufacturer may propose an alternate Beta rating by submitting proof that B6 greater than 75 is unsuitable for the lubricant to be used.] Incorporate an oil-filled differential pressure gauge to indicate the pressure drop across the filter. Equip the filter with an internal magnetic element. Provide a water removal filter which can maintain a water content in the oil to no greater than 200 ppm. Size all filter assemblies so the pressure drop across the clean filter is no greater than 30 kPa 4 psi. Size the particle filter to avoid bypass at a startup oil temperature of 25 degrees C 80 degrees F. Provide a filter bypass setting of 300 to 400 kPa 45 to 60 psi. The minimum element collapse rating 1050 kPaais 150 psi. Provide a breather filter with a Beta rating of B6 greater than 75 and a desiccant chamber to remove water.

2.8.6 Heat Exchanger

**************************************************************************
NOTES: When using an oil-to-air heat exchanger, use the second bracketed paragraph.

The designer must consider the water source. Where possible, potable water is the first choice. When flows are excessive, other sources must be used. Depending on the turbidity of the water, different methods will be needed to clean the water such as a cyclonic separator. If the water through the heat exchanger tubes is turbid, velocities should be kept above 2 m/s 7 fps to prevent clogging. Where the water is brackish or otherwise highly corrosive, 70-30 tube material should be used. Plate heat exchangers should be left as an option as they are generally easier to maintain. Where suitable cooling water is unavailable or may cause maintenance problems, an oil-to-air heat exchanger should be used.
**************************************************************************

[ Provide a heat exchanger which is either a water-cooled shell and tube type, water-cooled plate type, or internal water-cooled coils within the reducer sump. Compose heat exchanger tubes of [90-10 Copper Nickel Alloy][70-30 Copper Nickel Alloy] with a minimum tube thickness of 1.519 mm 0.0598 inch (16 gauge) which adequate for the specified pressure rating. Provide heat exchanger plates type 316 corrosion resistant steel. Circulate water through the tubes or plates. Provide a design which will allow tubes or plates to be cleaned. Maximum temperature of cooling water provided is [25 degrees C 80 degrees F][____], at a pressure of [ 550 kPa 80 psi][____], at a maximum flow rate of [0.6 L/s 10 gpm][____]. Strain
the cooling water to a maximum [3 mm 1/8 inch] [____] particle size. The maximum pressure drop through the clean heat exchanger allowable is [55 kPa (gage) 8 psig] [____]. Design the heat exchanger for a working pressure of [550 kPa (gage) 80 psig] [____]. Pressure test the heat exchanger to 150 percent of the design pressure for a period of 4 hours and monitor the heat exchanger for leakage during the test. Any leakage will be cause for rejection.

[ Provide an oil-to-air type heat exchanger with size based upon a maximum ambient temperature of 40 degrees C 100 degrees F. composed of copper or copper alloy tubes. Design the heat exchanger to withstand a test pressure of 150 percent of the design pressure held for a period of 4 hours and monitor the heat exchanger for leakage during the test. Leakage is cause for rejection. Include a fan, motor, and controls in the oil-to-air heat exchanger system for maintaining the specified oil temperature.]

2.8.7 Cooling Water Control Valve

**************************************************************************
NOTE: Delete if an oil-to-air heat exchanger is used.
**************************************************************************

Provide a thermo-mechanical control valve to adjust the flow rate of water through the heat exchanger to maintain a minimum oil temperature of 50 degrees C 120 degrees F in the housing sump.

2.8.8 Piping and Tubing

Use seamless steel tubing oil lines up to 50 mm 2 inches o.d. with 37 degree flare or flareless fittings. Use steel pipe with welded fittings where pipe sizes of 50 mm 2 inches and over are required. Use copper or copper alloy with brazed or 95-5 soldered joints for water pipes. Ensure all piping, tubing, and fittings conform to ASME B31.1. Use vibration isolating tubing and piping supports. Keep oil tubing or ports within the gear case where feasible. Keep dissimilar metals electrically isolated to prevent corrosion.

2.8.9 Oil Heater

**************************************************************************
NOTE: In regions where the temperature during flood season is rarely below 10 degrees C 50 degrees F, consideration may be given to omission of the oil heater. However, omission of the oil heater is generally not recommended because it results in poor oil circulation at startup and it is impractical to size the filter to avoid a bypass condition at temperatures below 20 to 25 degrees C 70 to 80 degrees F. Accumulated contaminants can be passed at unacceptable concentrations during a bypass condition. The oil heater should be used since it will help ensure adequate oil flow during unit startup. Caking of the oil on the heater is prevented by using a low watt density heater, 9300 watts per square meter 6 watts per square inch.
**************************************************************************

Install a thermostatically operated oil heater to maintain the oil at a
temperature of 25 degrees C 80 degrees F. Size the heater based on a minimum ambient temperature of [minus 10 degrees C 15 degrees F] [____]. Equip the heater with the ability to be shut off if the unit is to be out of service for an extended period. The heaters watt density can not be greater than 9300 W/square m 6 W/inch squared.

2.9 INSTRUMENTATION

**************************************************************************
NOTE: Provided that the prime mover and reducer are purchased and installed under a single contract, the Contractor must deliver the instrumentation as a complete working package. If the reducer is purchased separately, the designer is responsible for taking care of additional plans and specifications for the instrumentation. On noncritical applications, consideration may be given by the designer to delete the high temperature switch, flow switch, and vibration switch. The designer would then delete all electrical requirements for instrumentation.
**************************************************************************

Provide instrumentation for the reducer supplied and installed as a complete working package. Conform electrical work to NFPA 70. Provide NEMA 250, Type 4 electrical enclosures. Provide an electrical termination cabinet. [Available power is 120 V, 1 ph.] Provide the following devices within the speed reducer at a minimum:

a. High oil temperature switch in unit sump.
   (1) Alarm at 80 degrees C 180 degrees F.
   (2) Shut down prime mover at 95 degrees C 200 degrees F.
   (3) Lower settings may be used if recommended by the Contractor's manufacturer.

b. Oil pressure gauge.
   (1) After oil pump.
   (2) Electric motor-driven prelubrication pump (if used).
   (3) Gauges which are oil or glycerin filled and with snubbers and isolation valves.

c. Thermometer. Mercury is not allowed.
   (1) Sump
   (2) Oil line after heat exchanger
   (3) Backstop

d. Oil Level Sight Gauge, with built in reflector.

e. Resistance Temperature Detector (RTD), Hydrodynamic Thrust Bearing, if used.
(1) Alarm at 80 degrees C 180 degrees F.
(2) Shut down prime mover at 95 degrees C 200 degrees F.
(3) Lower settings may be used if recommended by the reducer and bearing manufacturers.

f. Oil Flow Switch.
(1) Alarm at 80 percent of design flow.
(2) Shut down prime mover at 60 percent of design flow.

g. Vibration Switch - Alarm at 13 mm/s 0.5 inch/sec or at baseline level recommended by the reducer manufacturer.

PART 3 EXECUTION
3.1 TESTS, INSPECTIONS, AND VERIFICATIONS
3.1.1 Shop Testing
Submit a shop test report fully documenting the test. In addition to or as part of the Contractor's normal shop testing procedure, test the reducer at rated speed with no load to check for potential problems prior to field testing. Check gear contact patterns, sound level, lubrication and cooling, and all other operational characteristics. [90 dBA is the maximum sound pressure level of the speed reducer and prime mover allowed in the shop test measured at a distance of 1 m 3 feet from the equipment.] Measure sound in accordance with ANSI/AGMA 6025. Provide any preventative measures to control background noise. Notify the Contracting Officer 2 weeks prior to performing the shop test.

3.1.1.1 Critical Speeds

**************************************************************************
NOTE: Dynamic analysis of the pump, reducer, and engine or motor assembly will be performed by the pump manufacturer as described in Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE. If the reducer is purchased separately from the pump, this paragraph should be deleted and responsibility for dynamic analysis, if done, is that of the designer.
**************************************************************************

Perform dynamic analysis of the pump, reducer, and motor (engine) assembly. Make any design modifications to the reducer which are necessary to avoid resonances in the system. A torsional or lateral natural frequency within 25 percent of normal operating speed of any shaft or gear mesh frequency is unacceptable.

3.1.2 Installation

**************************************************************************
NOTE: If the reducer is not furnished installed, this paragraph must be modified or eliminated.
**************************************************************************
Install the speed reducer under the supervision of the reducer Contractor's representative and ensure all features and systems are operational. Provide all necessary lifting devices, attachments, and special tools required for maintenance. Submit an OPERATIONS AND MAINTENANCE (O&M) MANUAL which provides detailed startup and operating procedures, lubrication instructions, installation and alignment procedures, routine maintenance requirements and procedures, complete detailed procedures for disassembly and assembly of the reducer, parts list for all parts detailed, assembly drawings of the reducer showing all parts, suppliers for all parts, settings and adjustment for protective devices, and a list of all tools, handling devices, and spare parts furnished.

3.1.3 Field Testing

Field test the speed reducer at rated speed and load to demonstrate that reducer operation, lubrication, cooling, and instrumentation meet contract requirements. Ensure the duration of the test is long enough to reveal verifiable gear contact patterns. Inspect gear contact patterns and provide to the Contracting Officer. Ensure gear contact patterns are at least 70 percent of face width. Ensure spiral bevel gears have a central toe contact pattern with contact of 50 percent of face width at full load. Photograph and include as part of the field test report the observed gear contact patterns. Document all data collected for load and speed measurement, lubrication, oil temperature and flow, ambient temperature, cooling water temperature and flow, gear contact patterns, and any other data required to show compliance with specifications. Should there be insufficient water available to perform the test, the Contracting Officer may delay the test [for up to [9][____] months ] or waive the test.

3.2 OPERATIONS AND MAINTENANCE DATA

[ For specifications on the furnishing, installation, operations and maintenance instructions, refer to Section 01 78 23 OPERATION AND MAINTENANCE DATA. Unless otherwise specified, all operation and maintenance manuals are to be comprehensive to the gear reducer system with independent sections for each unique piece of equipment. Operation and Maintenance manuals are to comply with the requirements of Data Package 3 in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

] a. Safety precautions
b. Operator prestart
c. Startup, shutdown, and post-shutdown procedures
d. Normal operations
e. Emergency operations
f. Environmental conditions
g. Lubrication data
h. Preventive maintenance plan and schedule
i. Cleaning recommendations
j. Troubleshooting guides and diagnostic techniques
k. Wiring diagrams and control diagrams
l. Maintenance and repair procedures
m. Removal and replacement instructions
n. Spare parts and supply list
o. Product submittal data
p. O&M submittal data
q. Parts identification
r. Warranty information
s. Testing equipment and special tool information
t. Testing and performance data
u. Contractor information

Submit six copies of the OPERATIONS AND MAINTENANCE (O&M) MANUAL [in accordance with paragraph OPERATIONS AND MAINTENANCE MANUALS and] in compliance with Data Package 3 in Section 01 78 23 OPERATION AND MAINTENANCE DATA.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for submersible centrifugal pumps for a turbid water pumping station. Note that the guide specification for submersible axial flow and mixed flow pumps is provided in Section 35 45 02.00 10 SUBMERSIBLE PUMP, AXIAL-FLOW AND MIXED-FLOW TYPE.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification is for use in construction contracts. It may be used in supply contracts, but should be changed as appropriate. Differences between the technical paragraphs written for Contractor-supplied pumps versus Corps supply specification should be minimal.

This pump specification will be used with the design criteria in EM 1110-2-3105, "Mechanical and Electrical Design of Pumping Stations", and the references listed in those publications. To the
extent possible the Hydraulic Institute (HI) Standards have been referenced as the primary reference standards, and the minimum for manufacturers' compliance, for the manufacture, material, design, test, and performance specifications:

HI/ANSI 9.1-9.5 General Design
HI/ANSI 9.6.4 Vibration Analysis
HI/ANSI 11.6 Testing
HI/ANSI 14.1-14.2 Nomenclature and Definitions
HI/ANSI 14.3 Design and Application

The vibration analysis often required of pumps is eliminated and a vibration limit specified.

The pumps are of the pre-engineered (catalog) type, used at flood control and storm water projects. Over specifying can prove costly and even double the cost of an otherwise inexpensive pump. In general, the two most important attributes to a successful specification will be to obtain a qualified, experienced manufacturer and to properly specify the pumping conditions so that the correct pump is obtained.

Model testing is not included as an alternative for these pumps. Manufacturers assemble and performance test the pumps at the factory. The pumps are shipped assembled.

Witness tests and factory visits have been limited to one visit during the performance test and a pump inspection at the time of the test.

**************************************************************************

1.1 SUMMARY

**************************************************************************

NOTES: Centrifugal pumps have greater solid passing capability and are well suited for higher pressure applications. However if this is not a concern then axial flow or mixed flow pumps should be considered.

This specification is for flood risk management pumping stations or similar applications. Specifications for centrifugal solids handling sanitary sewerage pumps are available at Section 22 13 29 SANITARY SEWERAGE PUMPS.

**************************************************************************

Design, furnish, and install [_____] identical pump/motors. Water pumped will not exceed [_____] degrees C F, will be relatively turbid, and may contain sand, silt, and trash and fibrous materials with spherical solids up to [three] inches in diameter.
1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a RID outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

**SD-10 Operation and Maintenance Data**

Operating and Maintenance Instructions; G[, [_____]]

1.4 QUALITY CONTROL

1.4.1 Pump Supplier Qualifications

The pump manufacturer has overall responsibility to supply the pumping unit (submersible pump/motor, discharge elbow, and cables) that meet the requirements of this specification. Thus, during start-up, installation,
and performance evaluation, the pump manufacturer is the sole responsible party. The pump manufacturer must supply a list of installations at which pumps of his manufacture, and ones similar to those specified, have been operating for at least two years. The components and materials of the pumping unit may occur at different facilities, and be the product of other manufacturers.

1.4.2 Installation and Start-up Engineer

Furnish a competent installation engineer (including those from Contractor's suppliers) who is knowledgeable and experienced with the installation and start-up procedures for submersible centrifugal pumps and the associated equipment specified. Submit the installation and start-up engineer's qualifications. When so requested, the installation engineer is responsible for providing complete and correct direction during installation, initial starting, and subsequent operation of equipment until field tests are completed. The installation engineer initiates instructions for actions necessary for proper receipt, inspection, handling, uncrating, assembly, and testing of equipment.

1.4.3 Detail Drawings

Submit drawings of sufficient size to be easily read, within [90] days of Notice of Award. Submit information in the English language. Dimension in the metric (SI) with English conversion inch-pound-second system. Furnish the following:

a. Outline drawings of the pump showing dimensions and weight of the pump/motor.

b. Drawings showing details and dimensions of pump mounting design and layout including any embedded items and lifting connections.

c. Cross-sectional drawings of each different size of pump, showing each component, and major or complicated sections of the pump in detail. On each drawing indicate an itemized list of components showing type, grade, class of material used, and make and model of the standard component used. Include detail and assembly drawings of entire pumping unit assembly.

d. Provide drawings covering the installation that is intended for the installation engineer.

e. Indicate efficiency, kW bhp, and NPSHR with the capacity-head curve.

f. Motor characteristic curves or tabulated data (test or calculated) to indicate the speed, power factor, efficiency, current, and kilowatt input, all plotted or tabulated against percent load as abscissas.

g. Submit shop drawings for each size access cover supplied. Include all dimensional data necessary for installation. Include installation details for access cover shop drawings.

1.4.4 Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified
employer may be accepted as permitted by ASME B31.1. Perform welder qualification tests for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests. Perform the qualification tests at the work site if practical. The welder or welding operator must apply their assigned symbol near each weld made as a permanent record. Submit the names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, standards tested to.

1.4.5 Operating and Maintenance Instructions

Prior to delivery of any pumps, submit manuals containing complete information in connection with the operation, lubrication, adjustment, routine and special maintenance, disassembly, repair, and re-assembly of the pumps and accessories. Submit a total of [five] copies for each pump size and type. Include a listing of special tools required for working on the pumps. Include comprehensive as built drawings, photographs, factory test results, and sketches of the pumps. Include complete diagnostic information on the pumps and all approved shop drawing submittals on the pumps. Include in the Operation and Maintenance Instructions all approved shop drawings on the access covers, interface modules, and sump pumps.

a. Parts list: provide a complete parts list for the pumps including furnished spare parts and special tools. Clearly show all details and parts. Provide identification markings and sources for all parts.

b. Provide manuals with hard cover post type binders or 3-ring binders and printed on 8-1/2 inch by 11 inch high quality paper with indexed, tabbed section dividers. Provide large sheets that are neatly folded and installed with post hole reinforcements such that sheets can unfold without need to open binder posts. Drawings, sketches, and parts lists incorporated in the manual may be reduced to page size provided such reductions are clear and easily legible, otherwise they may be folded into the manual.

1.5 DELIVERY, STORAGE, AND HANDLING

Inspect each pump for damage or other distress when received at the project site. Store each pump and associated equipment indoors as recommended by the pump manufacturer, protected from construction or weather hazards at the project site. Provide adequate short-term storage for each pump and equipment in a covered, dry, and ventilated location prior to installation. Follow the manufacturer's instructions for extended storage. Supply proper equipment for handling the pump and consider the equipment as special tools if not completely standard. Follow the manufacturer's recommendations for handling of the pump.

1.6 EXTRA MATERIALS

**************************************************************************
NOTE: The spare parts noted herein are from other Corps documents. For any specific project, it would be appropriate to discuss an adequate spare parts list during the designer's plant visitations or discussions with the end user as suggested by EM 1110-2-3105.
**************************************************************************
a. Furnish the following spare parts:

(1) One complete set of bearings and seals for each size pump.
(2) Replacement wearing rings and O-rings for each size pump.
(3) One impeller for each size pump.

b. Furnish one set of all special tools required to completely assemble, disassemble, or maintain the pumps. Special tools refers to oversized or specially dimensioned tools, special attachments or fixtures, or any similar items. Furnish lifting devices required for use in conjunction with the [overhead] [truck] crane. Provide the tools in a toolbox or toolboxes.

1.7 WARRANTY

Provide a manufacturer's warranty for the submersible centrifugal pumps and all equipment furnished under this section against defective workmanship, materials, design, and performance for a period of [____] years from the date the equipment is accepted. If the equipment or any part thereof does not conform to these warranties, and the Government so notifies the manufacturer within a reasonable time after its discovery, the manufacturer must thereupon promptly correct such nonconformity by repair or replacement. Coordinate the down time for the equipment with the Government, and keep to a minimum duration that is mutually agreed to by the manufacturer and the Government. The manufacturer is liable during the warranty period for the direct cost of removal of the equipment from the installed location, transportation to the manufacturer's factory or service shop for repair and return, and reinstallation on site. The manufacturer must be given the opportunity to perform the removal and reinstallation and to select the means of transportation. For instance, the expense of removing adjacent apparatus, installing spare equipment, costs of supplying temporary service, is not included in this warranty provision.

PART 2 PRODUCTS

2.1 GENERAL REQUIREMENTS

2.1.1 Spare Pumps

Provide a total of [____] spare pumps. Spare pumps must be identical to the other pumps provided under this contract. For the spare pumps only, access covers and the guide rail systems are not required. Tag and label spare pumps as spares.

2.1.2 Service Availability

The pumps furnished must be supported by a service organization. Service and parts must be available within [500] miles of the [____] area. Provide this information in a shop drawing.

2.1.3 Pump Station Start-up Services

The installation and start-up engineer must be present at the installation for each location. Provide for two days on-site for each location. In addition, provide for two days for pump/motor start-up at each location.

2.1.4 Name Plates

Secure a name plate to each major item of equipment to include the
manufacturer's name, address, type/style, model, serial number, and catalog number. Provide nameplates made of corrosion resisting metal with raised or depressed lettering on a contrasting colored background.

2.1.5 Instruction Plates

As necessary, equip each item of equipment with suitably installed instruction plates including warnings and cautions describing special and important procedures to be followed during starting, operating, and servicing the equipment. Provide plates made of corrosion resisting metal with raised or depressed lettering on a contrasting colored background.

2.1.6 Factory Test Location

Factory testing facility must be in the continental United States. Submit the proposed testing facility as a shop drawing.

2.2 SYSTEM REQUIREMENTS

2.2.1 Pumping Unit Description

**************************************************************************
NOTE: Pumps are designed to be lifted from the sump for maintenance and repair.
**************************************************************************

Each pumping unit includes a pump/motor, discharge elbow, guide rail system, and cable. Each pump must be of the centrifugal submersible type for [storm water,] [flood control,] attached to the same shaft with a submersible electric motor. Except as otherwise stated or noted, the terms pump and pump/motor both refer to an assembled pump motor unit complete with discharge elbow, guide rail system, and cable.

2.2.2 Design Requirements

a. The pump must, as a minimum, meet the applicable design, materials, and manufacturing requirements of HI ANSI/HI 9.1-9.5, HI ANSI/HI 14.1-14.2, HI ANSI/HI 14.3, and these specifications.

b. Operate the pump so that installation and maintenance can be carried out by an [overhead bridge] [jib] [mobile] crane. The weight of the pump/motor integral unit must not exceed [_____] kg lb.

2.2.3 Operating Conditions

a. The pump must be capable of operating in the dry (for the purpose of maintenance and operating checks) for short periods of time as stated in the manufacturer's operating instruction.

b. The pump manufacturer establishes and states in the operating manual the procedures for starting and stopping the pumps, including setting of valves or any sequential operations.

2.2.4 Capacities

**************************************************************************
NOTES: The Corps' policy and procedures for plant design and pump selection are explained in detail in EM 1110-2-3105. Using the data from hydrology and
hydraulic studies, the designer will establish the performance requirements of the pumps. Using the manufacturers' catalogs that tabulate the characteristics of their pre-engineered units, select a pump. The designer should then locate other pumps with the described characteristic and establish contact with manufacturers.

Any pump selected results from careful analysis of the relationships of speed, net positive suction head (NPSH) (cavitation), head-capacity, range of plant operation, sump design requirement, and to a lesser extent, efficiency. During the selection process the manufacturer's input to the design is obtained and integrated into the selection.

The specification will then state specific values to be attained so that a pump with the desired performance can be obtained. It is necessary to state the requirements so that more than one manufacturer can respond. All manufacturers must meet the previous experience and manufacturing standards requirements.

Compliance with the performance requirements will be established using procedures stated in the HI Standards and at the time when the pump is assembled and tested at the factory. Efficiency, heads, and other hydraulic values for purpose of specification should conform to HI definitions, even though Corps manuals are used for the purpose of design criteria.

Centrifugal submersible pumps can range in size from approximately 500 gpm to over 25,000 gpm. Horsepower can range from under 10 hp to over 200 hp. The designer should be aware that for the larger size pumps over 200 hp and 25,000 gpm the weight of the pump and motor combination can be significant. The designer should compare against vertical mixed flow pumps for these size pumps.

Each pump installation will be uniquely different and may require a slightly different head-capacity specification to establish that the correct pump will be obtained. During the pump selection procedure, the designer will establish certain capacities that must be met over a range of heads. The designer may state more than one operating point on the performance curve or utilize different points on the curve such as rated head, design head best efficiency point (BEP), maximum head, and minimum head. The heads defined are as stated in EM 1110-2-3105 and applicable HI standards.

ANSI/HI 11.6 provides various acceptance grades for testing tolerances. Class 2B would be acceptable for most pumping stations that have pumps greater than 10 hp and less than 124 hp. Larger pumps could use class 1B. In accordance with the standard,
pumps smaller than 10 hp would have a greater tolerance band as defined in the standard, unless otherwise specified.

ANSI/HI 11.6 allows the option of either verifying the minimum pump efficiency, or verifying the maximum power input, but not both. The efficiency and power requirements would be for the guarantee point only unless otherwise stated. Also, the efficiency and power requirement would need to be defined if the units were a combined pump and motor unit, or just the pump. HI ANSI/HI 14.6 provides guidance for testing in Appendix D.

The selection of pumps for flood and storm water projects will not usually depend on the economics of efficiency. However, a low efficiency can usually be correlated with poor pump hydraulics resulting in a shortened pump life. Therefore, an efficiency relating to the values from the manufacturer's catalog curves should be specified.

**************************************************************************

a. The guarantee point is [_____] L/s gpm with a differential pressure of [_____] m ft. [The minimum pump and motor unit efficiency is [_____] m percent.] [The maximum power pump unit input power is [_____] m hp.]

The tolerance band is HI ANSI/HI 11.6 class [1B][1E][1U][2B][2U][3B].

b. The pumps must continuously pump water without signs of distress, including cavitation, with a Net Positive Suction Head Available (NPSHA) of [_____] m ft.

2.3 MATERIALS

**************************************************************************

NOTE: The designer usually establishes communication with pump manufacturers concerning materials and design details appropriate for a specific site. Consideration needs to be given to the end user's input. The designer should utilize appropriate HI Standards. Additionally, AWWA Standards 101-88 (withdrawn) and E102-17 (Vertical Pumps) have useful guidance.

**************************************************************************

Submit the generic material for all parts and material specifications including class and grade for all major components (casing, impeller, discharge elbow, shaft, and wear rings) of the pump assembly. Include the latest ASTM specification or to other listed commercial specifications covering class or kinds or materials to be used. Materials must be consistent with the guidelines of HI ANSI/HI 9.1-9.5 and HI ANSI/HI 14.3. Designated items must conform to the following

<table>

2.4 SUBMERSIBLE PUMP

2.4.1 Design and Manufacture

**************************************************************************
NOTE: Under paragraph PUMP SUPPLIER QUALIFICATIONS
the Contractor is required to submit names of
previous installations where the selected
manufacturer has documented the operating
performance for pumps of this design. While the
general venturi configuration of the pumps built by
different suppliers is similar, the details (e.g.,
number of bearings, wearing ring design, cast versus
fabrication, impeller design, and materials) can be
different. Based on design details available, there
seems to be little justification to prefer one
manufacturer's design over another. The pump
portion of the specification is a low tech design
compared with the motor and housing internal design,
70 to 80 percent of the cost may be contained in the
motor. The emphasis on the pump portion should be
on rugged, reliable, long-lasting components that
are trouble-free.

The design elements described in this section are
taken from drawings, manuals, catalogs, and
brochures requested from two manufacturers, one
domestic and one foreign. Both have over 30 years
of experience and thousands of operating pumps
worldwide. A primary concern in the specification
was to avoid making it restrictive and yet to ensure
that only qualified manufacturers would respond.
**************************************************************************

The submersible pump may be either of cast or fabricated construction. The
level of manufacture skill must be consistent with the standards referenced
in the specifications. All work performed in the manufacturing of the
pumps must be in a skillful and workmanlike manner in accordance with the
best modern shop practice and manufacturing of finished products similar in
nature to those specified herein. The Government reserves the right to
observe and witness the manufacturing of the pumps and to inspect the pumps
for compliance with contract requirements during factory assembly.
2.4.2 Speed

2.4.2.1 Pump Speed

Rotative speed of the pump cannot be greater than [_____] rpm.

2.4.2.2 Runaway Speed

Design the pump to sustain full runaway speed without damage at maximum head difference across the pump. Based on the system design as indicated, the manufacturer must compute the maximum reverse runaway speed, and design the pump and motor to sustain that reverse rotation without damage.

2.4.3 Pump Construction

2.4.3.1 General

All the exposed nuts and bolts must be stainless steel. Machine and fit all mating surfaces where watertight sealing is required with nitrile rubber O-rings. The fitting must be such that the sealing is accomplished by metal-metal contact between machined surfaces which results in controlled compression of the O-rings. Sealing compounds, grease, or secondary devices are not acceptable.

2.4.3.2 Casing

The casing may be of cast or fabricated manufacture. The hydraulic design must be the manufacturer's standard design as used in previous operating installations. The general manufacture quality relating to flange design, drilling, bolts, alignments, must be in accordance with industry standard practice.

2.4.3.3 Discharge Elbow

The maintenance pump discharge elbow must be furnished by the pump supplier. The elbow must be matched marked to its respective pump and shipped and crated with the pump. Manufacture the discharge elbow of either cast iron or cast steel. Include a flange for automatically mating with the pump discharge bowl when the pump is lowered into place. Elbow must be a long radius type. Include a cast iron or cast steel shoe for anchoring to the sump floor. The seal between the pump volute and discharge shoe must remain tight and intact under any pump thrust. Pump thrust must not be induced on the guide rails. Provide installation instructions for setting the discharge elbow.

2.4.3.4 Trash Stand

The trash stand must be furnished by the pump supplier. The trash stand must be bolted to the bottom of the pump at the inlet. The trash stand must support the pump/motor assembly and keep the pump positioned above the bottom of the sump.

2.4.3.5 Shaft

The shaft must be one piece integral with the motor of [stainless steel] [high-strength cold-rolled carbon steel]. Design the shaft for all torque conditions during normal operation and for runaway speed during reverse flow.
2.4.3.6 Impeller

The impeller design and manufacture must be the manufacturer's standard. The impeller surface must be smooth, without holes and fabrication offsets. The attachments to shaft must be with keys or other fasteners that are made of stainless steel, and of sturdy construction designed to not loosen, but be easily removed for maintenance. The impeller construction may be cast or fabricated. The impellers must be capable of handling solids found in storm water such as trash and fibrous materials. Impellers must be capable of passing [three] inch solids. At the time of assembly the impeller clearances must be those shown on assembly drawings and may be checked in the field or at the factory at the Contracting Officer's option. Balance the impeller at the design operating speed. The standard balance quality grade is G6.3 in accordance with ISO 1940-1. Balance in accordance with the procedure in HI ANSI/HI 9.6.4, except that a two-plane balance is required. Submit the results of impeller balancing.

2.4.3.7 Wear Ring

A wear ring system must be installed to provide efficient sealing between the volute and impeller. The wear ring must consist of a stationary ring made of bronze insert press fitted into the volute inlet, and a rotating stainless steel ASTM A276/A276M, Type 316 ring force fitted into the impeller runner.

2.4.3.8 Nuts and Bolts

Provide bolts used in assembling each pump and its supporting members of corrosion resisting steel and hexagonal type. Stainless steel cap screws conforming to ASTM A276/A276M, Type 316, and used with silicon bronze nuts or stainless steel nuts will be permitted as will silicon bronze cap screws with tapped casting holes.

2.4.3.9 Pump Lifting Handle And Lifting Lugs

Design the lifting handle to bear the entire weight of the pumping unit at a conservative factor of safety. Provide lifting lugs where the weight of the separate part requires a lug.

2.4.3.10 Pump and Motor Bearing Arrangement

The pump and motor bearings must be the standard design of the manufacturer for the pump supplied under this specification. The type and number must be of proven design as used in previous operating units supplied by the manufacturer. Provide bearings of the grease lubricated and sealed type; having a minimum L-10 bearing life of 50,000 hr. Each bearing must be of the correct design to resist the radial and thrust loads applied. Provide enough bearings to ensure the pump rotating elements are supported so that the possibility of excessive vibration is eliminated. Conform ball and roller bearings life and load ratings to ABMA 9 and ABMA 11.

2.4.3.11 Mechanical Seals

Provide a mechanical rotating shaft seal system between the impeller and motor to ensure the motor housing is sealed properly. The mechanical seals must be in tandem, lapped and face type seals running in lubricant reservoirs for cooling and lubrication. The mechanical seals must contain both stationary and rotating tungsten carbide face rings unless otherwise
specified. In order to avoid seal failure from sticking, clogging, and misalignment from elements contained in the mixed media, only the seal faces of the outer seal assembly and its retaining clips can be exposed to the mixed media. Contain all other components in the lubricant housing. All seal faces must be solid material capable of being relapped. The seals must require neither maintenance nor adjustment, but be easy to check and replace. Shaft seals without positively driven rotating members are not considered acceptable or equal.

2.4.3.12 Lubricant Housing

Provide an oil housing with oil, as recommended by the pump manufacturer, to lubricate the shaft sealing system and to dissipate the heat generated by the motor and bearings.

2.4.3.13 Guide Rail System

Furnish each maintenance pump with a stainless steel guide rail system for lifting the pump in and out of the wetwell and connecting to the discharge elbow. The guide rail system must be either a single or double rail system. Guide bars (pipe) must be Type 304 stainless steel. The upper guide bar brackets and intermediate guide bar brackets must be furnished by the pump manufacturer. Match Mark the guide bar brackets to their respective pump. Ship the brackets with the pumps. Brackets must be Type 304 stainless steel. Provide a stainless steel lifting chain of adequate length for removing and installing the pump unit.

2.4.3.14 Cooling System

**************************************************************************
NOTE: An air cooled system could be considered depending on the application.
**************************************************************************

Each pump unit must have an adequately designed cooling system, consisting of a water jacket which encircles the stator housing. Provide a water jacket with a separate circulation of the pumped liquid. Cooling media channels and ports must be non-clogging by virtue of their dimensions. All cooling paths or ports must be internal to the pump and motor water jacket to preclude clogging or physical abuse. Design the cooling system to allow for continuous pump operation at rated capacity with the external water level at the minimum pump submergence level.

2.4.4 Motor

The motor must be submersible and conform to the requirements of NEMA MG 1. Size the motor to avoid overload when operating at any point along the characteristic curve of the pump. Provide 3-phase, 60-Hz, [480][_____]V, squirrel cage induction type motors, NEMA Design B Type. Insulate the stator windings and stator leads with a moisture-resistant Class F insulation with temperature resistance of 155 degrees C 311 degrees F. The motor must have a service factor of [1.15]. The temperature rise above ambient for continuous full load rated conditions and for the class of insulation used cannot exceed the values in NEMA MG 1. The motor must be rated for continuous duty when submerged and also be capable of operation in the dry for short periods of time for testing and maintenance purposes. Starting torque must be sufficient to start the pump, but in no case less than 60 percent of full-load torque. Break-down torque cannot be less than 150 percent of full-load torque.
2.4.5 Cable

a. Specifically design power and instrumentation cable for use with a submersible pump application and conform to the requirements of NEMA WC 70 and NEMA WC 72. Use submersible cable suitable for continuous immersion in water at the maximum depth encountered. Cable must have an ampacity of not less than 125 percent of the motor full load current. The cable length must be determined by the pump manufacturer for the installation shown but cannot be less than [_____] m ft.

b. Power and instrumentation cables must enter the motor through a sealing system that prevents water entry into the unit and provides strain relief. The cable entry may be comprised of rubber bushings, flanked by stainless steel washers, having a close tolerance fit against the cable outside diameter and the entry inside diameter for sealing by compression of the bushing, or the entry may be sealed by other gland compression methods.

2.4.6 Alarms

Provide the following alarm features for all the pump/motors.

a. Over temperature alarm: The motor over temperature alarm circuit must be actuated by three thermal sensors embedded in the stator windings of the pump motor (one switch in each stator phase). The pump motor must stop on over temperature and not restart until the over temperature alarm is manually reset and the motor temperature has cooled to the appropriate temperature.

b. Overload alarm: The motor overload circuit on the pump motor must stop the motor upon overload and not restart until the overload condition is corrected and manually reset.

c. Lower seal failure alarm: Provide a leakage sensor in the oil chamber. The sensor must activate an alarm when water concentration exceeds 30 percent.

d. Stator Leakage Sensor: Sensor must activate an alarm and stop the motor when any water is detected.

2.4.7 Pump Interface Modules

The pump supplier must furnish any electrical interface modules necessary for the pump sensors to communicate with the motor control center and control system. Interface modules must be adaptable to any type of standard control system. Match mark interface modules to each pump.

2.4.8 Painting

Paint the pump/motor in accordance with the pump manufacturer's standard coating system. External unmachined and non-mating machined surfaces (except for stainless steel) must be thoroughly cleaned and painted with a hydrocarbon-resistant, anti-corrosive (lead and chromate free) primer and topcoat. Painting external surfaces of nonferrous parts and components is not required but is permissible to avoid excessive masking. Identification plates must not be painted or oversprayed.
2.5 PUMP ACCESS HATCHES (COVERS)

The pump supplier must furnish the access hatches required for each pump. Match mark the access covers to their respective pump. Ship and crate the access covers with the pump. Hatch sizes must be adequate to install or remove pumps in a single action without tipping or tilting the pumps. Covers must be minimum 1/4" thick, extruded 6061 aluminum construction, and designed for incorporating the guide rail system for each pump. Cover must be double leaf design and rated for 300 pounds per square foot and have diamond tread surfacing. Hatches must be complete including framing, flush locking mechanism, handles, and hardware. Frame must be extruded aluminum, minimum 1/4" thick, with concrete anchors as part of the extrusion. All hardware must be stainless steel. Covers must have stainless steel hinges and open to 90 degrees and lock automatically in the open position. Covers must close flush with the frame, resting on a 1/2" wide lip around the entire perimeter of the frame. Attach a stainless steel safety chain to both cover leafs. The chain must help prevent a person from falling into the wetwell when the hatch covers are open. Provide installation manuals for the access covers as noted.

2.6 FABRICATION AND MACHINING

2.6.1 Machine Work

All tolerances, allowances, and gauges for metal fits between plain, non-threaded cylindrical parts must conform to ASME B4.1 for the class of fit required.

2.6.2 Castings

Each casting must have a mark number cast or stamped upon it. In addition, each casting weighing more than 500 pounds must have the heat number cast or stamped upon it. Warped or otherwise distorted castings that are oversize to an extent that could interfere with proper fit with other parts of the machinery or structure will be rejected. Cracked castings of non-weldable materials (i.e., cast iron) will be rejected. Repairs to castings must not be made without prior approval.

2.6.3 Casting Repair

Remove all unsound material or defects from castings by chipping, machining, air arc gouging, or grinding; and repair by welding. Conform welding repairs to the welding procedures that have been submitted and approved for the type material involved. Accomplish stress relief annealing, where required, prior to final machining.

2.6.4 Bolted Connections

Conform bolts, nuts, and washers to the applicable requirements of ASTM A193/A193M and ASTM A194/A194M for the types required.

2.6.5 Regular Bolt Holes

Holes for regular bolts must be drilled or sub-drilled and reamed in the shop. Holes must be accurately located, smooth, perpendicular to the member, and cylindrical.
2.6.6 Fitted Bolt Holes

Match ream or drill holes for fitted bolts in the shop. Holes must be smooth, perpendicular to the member, and cylindrical. Remove burrs resulting from reaming. The threads must be entirely outside of the holes. The body diameter of the bolt must have tolerances as recommended by ASME B4.1 for the class of fit required. Fitted bolts must be fitted in reamed holes by selective assembly to provide an LN 2 fit.

2.6.7 High Strength Bolt Holes

Holes for high strength bolts must be accurately spaced, perpendicular to the member, and cylindrical. If the thickness of the material is greater than the diameter of the bolt, the holes must be either drilled full size or must be sub-drilled and then reamed to full size. Poor matching of holes will be cause for rejection. Drifting done during assembly must not distort the metal or enlarge the holes. For slight mismatching, reaming to a larger diameter for the next standard size bolt will be allowed.

2.6.8 Metallic Coating

Apply zinc coatings in a manner, thickness, and quality conforming to ASTM A123/A123M. Where the zinc coating is destroyed by cutting, welding, or other causes, re-galvanize the affected areas to the thickness and quality required for the original zinc coating.

2.7 FACTORY TESTS

**************************************************************************

NOTE: The designer should specify performance testing of the assembled pump in the factory to check that the requirements of the specification have been met.

The Performance Test is a required test, whereas the Cavitation, Hydrostatic, Submersible Motor Integrity, and Vibration tests are optional. The designer should be familiar with ANSI/HI 11.6 to determine which tests are needed to balance technical adequacy and cost.

The Cavitation test, or NPSHR test, is costly due to the complexity. The designer should include cavitation testing whenever the cavitation characteristics of the proposed pump have not been determined (by test) by any one of the prospective suppliers. Testing should be conducted on a full-scale (prototype) pump. It should also establish the structural and operating integrity of the complete pumping unit. The prototype pump would be the first pump built. This test may not be necessary if there is sufficient inlet head pressure and the pump has a stated NPSHR that would be acceptable with a suitable margin (see ANSI/HI 9.6.1). The pump could be tested at the minimum design head pressure to verify that the guaranteed head and power at the specific rate of flow instead of performing the NPSHR test. HI ANSI/HI 14.6 provides guidance for testing in Appendix D.
Perform the following factory tests in accordance with HI ANSI/HI 11.6. [Testing is nonwitnessed factory testing. The pump manufacturer is responsible for maintaining all test results, however reporting of these test results is not required.][Testing is certified nonwitnessed factory testing. The pump manufacturer must provide certification and data to indicate that the testing meets the testing standard.][Testing must be witnessed by a Government Representative. When satisfied that the pump performs in accordance with the specified requirements, notify the Contracting Officer, [two weeks] in advance, that the witness tests are ready to be run and furnish two copies of curves required in paragraph TEST RESULTS. If the tests reveal that the pump does not perform in accordance with the specifications, make necessary changes before again notifying the Contracting officer that witness tests are ready to be run. Provide copies of all data taken during the witness testing and plotted preliminary curves to the Contracting Officer with the factory test report.]

2.7.1 Performance Test

Compliance with specifications will be determined from curves required by paragraph TEST RESULTS. Test procedures, except as herein specified, must be in accordance with HI ANSI/HI 11.6. Use clean water for testing at approximately the same temperature (68 F) for all test runs and record it during test runs.

2.7.1.1 Performance of the Pump

Determine performance of each pump by a minimum of 5 test points to develop a constant speed curve over the range of total heads corresponding to the requirements of paragraph CAPACITIES. Testing must be inclusive for the speed involved. Perform tests using the heads and suction water elevation specified in paragraph CAPACITIES. Test results with this sump elevation must meet all specified conditions of capacity, head, and bkW bhp.

2.7.1.2 Test Results

Submit the factory test report for performance testing in accordance with HI ANSI/HI 11.6. Plot test results to show the total head, static heads, bkW bhp, and efficiency as ordinates. Plot the results against pump discharge in L/s gpm as the abscissa. Plot curves showing pump performance to a scale that will permit reading the head directly to 0.15 m [0.5] ft, capacity to 30 L/s [500] gpm, efficiency to [1] percent, and power input to 20 bkW [25 bhp]. Establish that the performance requirements of these specifications and the warranties under this contract have been fulfilled. Perform the performance test with the pump and motor assembled as an operating unit to simulate field installation unless otherwise approved in writing by the Contracting Officer. Conduct the test in accordance with accepted practices at full speed; and, unless otherwise specified, conform to HI ANSI/HI 11.6 procedure and instruments.

2.7.2 Cavitation Test

Use the testing procedures provided in HI ANSI/HI 11.6 to determine the net positive suction head required (NPSHR) by the pump. Select the test arrangement and procedure, from the choices provided in HI ANSI/HI 11.6, that best suits the test facility. NPSHR must, as a minimum, be determined for five or more capacities over the total range of the specified operating conditions. Plot the test results and define NPSHR as the point where a
three percent drop in performance occurs. The value of NPSHR must be 0.6 m [3.3] ft less than the corresponding NPSHA. Use the temperature of the water at the time the tests are run in determining the NPSHR. Refer to the paragraph CAPACITIES for the NPSHA.

][2.7.3 Hydrostatic Test

Perform a hydrostatic test of the pump to verify the absence of leakage from the pressure containing walls and the joints of the pump assembly in accordance with HI ANSI/HI 11.6. The hydrostatic test pressure is based on the differential pressure of the pump as specified in paragraph CAPACITIES. [Submit the certification that the Hydrostatic Test meets the requirements of HI ANSI/HI 11.6 with no visible signs of leakage.] [Submit a full report of the Hydrostatic Test in accordance with HI ANSI/HI 11.6.]

][2.7.4 Submersible Motor Integrity Test

Perform a submersible motor integrity test to verify the sealing and electrical integrity of a submersible motor in accordance with HI ANSI/HI 11.6. Submit the certification that the Submersible Motor Integrity Test meets the requirements of HI ANSI/HI 11.6.

][2.7.5 Vibration Test

Perform a vibration test to verify that the tested pump does not exceed a guaranteed vibration velocity level as specified in HI ANSI/HI 11.6. Submit the certification that the Vibration Test meets the requirements of HI ANSI/HI 11.6 and summarize findings in a report.

]PART 3 EXECUTION

3.1 INSTALLATION

Perform correct installation and assembly of the pumping unit in accordance with the drawings and with the manufacturer's installation instruction manual. Submit, no later than 30 days prior to time of pump delivery, three copies of a typed and bound manual describing procedures to be followed by the installation engineer in assembling, installing, and dry- or wet-testing or both of the pump. Coordinate and consolidate the description of the pump with similar descriptions for other specified pump parts. The description must be of such a nature that it may be comprehended by an engineer or mechanic without extensive experience in erecting or installing pumps of this type. The description must be a step-by-step explanation of operations required, and include, where applicable, such things as alignment procedures, bolt torque values, recommended instrument setups, recommended gauges and instruments, and similar details. Furnish all bolts, shims, tools, and other devices necessary for installing the pumping units. The manufacturer's representative(s) familiar with the equipment being installed must supervise the handling, installation, start-up, and testing of the equipment as required in the paragraph INSTALLATION AND START-UP ENGINEER.

3.2 CLEANUP PRIOR TO START

After the pumping unit is installed and prior to start-up, completely clean the sump area of any accumulated construction debris. This final cleaning of the sump area will be witnessed by a representative of the Government. Correct any damage to the pumping units or related equipment during initial start-up due to foreign objects left in the sump areas.
3.3 **PUMP FIELD TESTS**

**********************************************************************

NOTES: Compliance with specification performance has been made a part of the factory tests; therefore, field tests are for the purpose of baseline measurements. Pump integrity, vibration, and inspection of manufacturing quality are witnessed at the factory.

Perform field testing to ensure proper alignment and installation, start-up and shutdown procedures, checking out controls, and establishing baseline measurements. Two field test methods are available, dry or wet testing, depending on availability of water. Wet testing is preferred, but dry testing may be all that is possible when the pumps are prepared for initial start-up.

If a wet test cannot be conducted at the time of initial start-up because of a lack of water, it should be conducted at a later time, if possible, and does not unduly extend the contract period.

**********************************************************************

Submit a field test plan prior to field testing. Field testing must be conducted by an experienced field test engineer and will be witnessed by the Contracting Officer. Before initially energizing the pump/motors, ensure that all pumping plant control, monitoring, and protective circuits have been successfully tested. This thorough electrical checkout procedure must follow a detailed step-by-step approved test plan. Also check the motor and other pumping unit elements undergoing tests at this time. Field test the plan prior to field testing. Submit the Field Test Report that summarizes the results of the testing.

[3.3.1 Dry Test]

Test each pumping unit in the dry in accordance with the pump manufacturer's instructions to determine whether it has been properly installed. Conduct such test when, and as, directed by Contracting Officer. Operate the pump at full rated speed. If tests reveal a design or installation deficiency or a manufacturing error in pumping unit components, promptly correct the problem.

[3.3.2 Wet Test]

Test each unit under load for a period of at least [_____] hours or as directed by the Contracting Officer. Conduct the tests to be witnessed by the Government. During the tests, observe, measure, and record the operation of the pumping units, motor-bearing temperatures, voltage, and current for each pump. Measured parameters must be within the pump manufacturer's published limits.

3.3.3 Pump Removal and Installation

Install and remove each maintenance pump unit a minimum of three times to demonstrate proper pump alignment and installation. Verify that the pump can be removed and installed without sticking or binding. Verify proper
sealing at the discharge elbow.

NOTE: This guide specification covers the requirements for precast non-prestressed concrete floating piers and associated hardware and accessories.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

1.2 MODIFICATIONS TO REFERENCES

In the ACI publications, the advisory provisions shall be considered to be mandatory, as though the word "shall" has been substituted for "should" wherever it appears; reference to the "Building Official," the "Structural Engineer" and the "Architect/Engineer" shall be interpreted to mean the Contracting Officer.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.
The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Drawings of Precast Floats; G[, [____]]
   Gangways
   [ Receptacle Stations; G[, [____]]
   ]

SECTION 35 51 13.00 20  Page 10
Submit quality control procedures established in accordance with PCI MNL-116 by the precast manufacturer.

1.4 PRECAST FLOATS

The work includes the provision of precast, non-prestressed concrete floating pier modules herein referred to as precast floats, and all other items relating to the precast floating pier system. Precast floats shall be the product of a manufacturer specializing in the production of precast concrete floats with a minimum of 10 years experience in the manufacture of precast concrete floating piers.

1.5 QUALITY CONTROL

1.5.1 Precast Concrete Float Design

ACI 318M, ACI 318 and the PCI MNL-120. Design precast floats (including connections) for the design load conditions and spans indicated, and for additional loads imposed by the work of other trades. Design precast floats for handling without cracking in accordance with the PCI MNL-120.

1.5.1.1 Pier Loading

Float and anchorage systems shall be designed for the following load conditions as a minimum. Load cases shall be combined based upon their probability of simultaneous occurrence, and in accordance with applicable codes and standards. Wind and current exposure areas shall be based on average vessel profile and draft, respectively. To account for sheltering effects, 15 percent of the full load shall be applied to all vessels sheltered by the vessels exposed to full load. Calculations shall be performed for wind and current loads both parallel and perpendicular to the pier.

**************************************************************************

NOTE: Designer should consult with a manufacturer of precast concrete floats to determine maximum allowable loadings for a given float size. The use of values exceeding the recommended default maximums should be confirmed with a reputable manufacturer prior to inclusion.

Environmental loadings (wind, wave, current & tide surge) will be site specific.

Default values for berthing and mooring loads are recommended maximum values, based on limitations of the precast modules. Berthing load is vessel and pier configuration specific. Mooring load is maximum, based on anchorage strength of (default) cleat size (confirm with manufacturer). The designer should input berthing and mooring loads based on the actual vessels berthed.

**************************************************************************

a. Dead load, including all work of other trades (utilities, etc.)

b. Live load: [_____] [3.83] kPa [80 PSF]

c. Wind pressure: As indicated on drawings
Acting on the projected area of the pier and moored vessels, assuming full occupancy. For vessel area, assume an average height of [_____] m feet above the waterline.

d. Minimum current pressure: [_____] kPa [PSF][FPS velocity]
Acting on the projected area of the pier and moored vessels, assuming normal occupancy.

e. Berthing load: [_____] [136] N/m [100] PLF horizontal

Line pull acting in any direction at a 45 degree angle from the horizontal.

g. Vertical wave load: As determined from a [_____] [0.9] m [3] ft. wave height

h. Lateral wave load: As determined from a [_____] [0.9] m [3] ft. wave height

i. Lateral pile loads at maximum surge level: For surge level indicated on drawings

1.5.1.2 Performance

a. Precast float modules shall be sized so that a single module (excluding walers) is used to attain the indicated pier width. The use of more than one module connected side by side to attain pier width is unacceptable.

b. Freeboard under dead load only shall not be less than [_____] 610mm 24 in. nor exceed [_____] 762mm 30 in. Precast floats shall be designed to float level under dead load only. Maximum out of level tolerance for transverse and longitudinal slope is [_____] 25mm per 3m 1 in. per 10 ft. Freeboard under dead and live load shall not be less than [_____] 203mm 8 in.

Special precast floats must be designed to support the additional concentrated loads as imposed by gangways, transformers, or other equipment. Modules with special loadings shall have the same freeboard as standard modules without special loading, so that there will be no residual stresses or tilting when modules are interconnected.

d. Flotation units shall be located within the structure so as to be capable of supporting a [_____] 136 kg 300 lb moving point load in any area on a module without causing excessive rolling or tilting of the pier. The pier shall be capable of supporting a [_____] 181 kg 400 lb point load at 305mm 1 ft from the offshore end of the pier and loose no more than 101mm 4 in of freeboard; and supporting a [_____] 136 kg 300 lb point load applied to the corner of the offshore end of the pier and loose no more than 51mm 2 in of freeboard differential per 914mm 3 ft of pier width between the offshore corners.

e. Precast floats shall have PVC sleeves and pull boxes embedded as required for electrical and communications systems. Pull boxes shall have a nominal 25mm 1 in concrete bottom with a light brushed, slip resistant finish. All bolts and inserts for pull box lids shall be 316 stainless steel. Pull box lids shall be flush with the deck surface and rated for the pier deck loading. Sleeves shall remain above water
surface under dead load conditions and shall be designed to facilitate installation, removal, and servicing of utilities. Pull boxes and access openings shall be sized and located as indicated on the drawings.

1.5.2 Gangway Design

Provide gangways of prefabricated aluminum for floating pier access, including connections at the bulkhead and bearing on the floating pier. Gangway shall be designed in accordance with "Specifications for Aluminum Structures", AA, latest edition, using allowable stresses for bridges.

1.5.2.1 Gangway Loading

Gangways shall be subject to the same load conditions identified in the paragraph titled "Pier Loading", except for berthing, mooring, current, wave, and pile loading conditions. Additionally, the gangway bulkhead end connections shall be designed to withstand a lateral force equal to 20 percent of the total dead load and 50 percent of the live load acting simultaneously with the dead and live loads. Handrails shall be designed for the following independent load cases: 1) a continuous horizontal load of 27.1 N/m 20 PLF applied along the full length of the top rail, and 2) a horizontal point load of 113.4 kg 250 lbs acting at any point along the top rail.

1.5.2.2 Performance

a. Gangways shall have a minimum clear walkway width of [_____] 1.07m 3.5 ft, and an overall outside width not to exceed [_____] 1.37m 4.5 ft. Length of gangways shall be as indicated on the drawings. Gangways shall have continuous handrails that are a minimum of 1.07m 3.5 ft above the walking surface, but not to exceed 1.14m 3.75 ft.

b. Walking surface shall be skid resistant.

c. Gangway pier end connections shall allow unrestricted vertical movement through tidal variation. Gangway bearing on floating piers shall be fitted with UHMW polyurethane rollers of adequate bearing area. Gangways shall be fitted with hinged apron plates to assure a safe uniform transition between gangway and deck surfaces. Apron plates will be designed so as to not damage or mar the floating pier surface.

d. Maximum midspan deflection under live load shall not exceed L/240.

e. Contact between aluminum and dissimilar metals or concrete shall be avoided, except for the use of compatible stainless steel pins. Where potential for galvanic corrosion exists, the aluminum shall be isolated from direct contact with other metals or concrete by use of suitable non-conducting insulators or bushings.

1.5.3 PCI Quality Certifications

**************************************************************************
NOTE: For normal routine projects, use the first paragraph. For complex or large precast/prestressed projects, use the second paragraph. Note that use of the second paragraph may limit competition. Verify the availability of certified PCI precasters in the bidding area.
**************************************************************************
PCI MNL-116. At the precast manufacturer's option, in lieu of core samples, ACI 318M and ACI 318, full scale load tests may be performed. Perform on randomly selected precast floats, as directed by the Contracting Officer.

[1.5.3.1 Product Quality Control]

PCI MNL-116 for PCI enrolled plants. Where precast floats are manufactured by specialists in plants not currently enrolled in the PCI "Quality Control Program," provide a product quality control system in accordance with PCI MNL-116 and perform concrete and aggregate quality control testing using an approved, independent commercial testing laboratory. Submit test results to the Contracting Officer.

1.6 DELIVERY AND STORAGE

Lift and support precast floats at the lifting and supporting points indicated on the shop drawings. Store precast floats off the ground. Separate stacked precast floats by battens across the full width of each bearing point. Protect from weather, marring, damage, and overload.

1.7 FACTORY INSPECTION

At the option of the Contracting Officer, precast floats shall be inspected by the QC Representative prior to being transported to the job site. The Contractor shall give notice 14 days prior to the time the units will be available for plant inspection. Neither the exercise nor waiver of inspection at the plant will affect the Government's right to enforce contractual provisions after units are transported or erected.

1.8 QUALITY ASSURANCE

1.8.1 Drawing Information

Submit drawings indicating complete information for the fabrication, handling, and erection of the precast floats and gangways. Drawings shall not be reproductions of contract drawings. Design drawings of precast floats and gangways (including connections) shall be prepared and sealed by a registered professional engineer, and submitted for approval prior to fabrication. The drawings shall indicate, as a minimum, the following information:

a. Floating pier system layout
b. Marking of floats for assembly
c. Connections between floats, and connections between floats and other construction
d. Location and anchorage of mooring fittings
e. Waler size and splice pattern
f. Guide pile size, length, location and connection to pier
g. Reinforcing details
h. Material properties of all materials used
i. Lifting and assembly inserts and embedded items
j. Dimensions and surface finishes of each float
k. Erection sequence and handling requirements
l. All loads used in design (such as live, dead, wind, current, berthing, handling, and erection)
m. Bracing/shoring required
n. Gangways

o. Utility routing and connections for work of other trades

1.8.2 Design Calculations

Submit calculations reflecting design conforming to requirements of paragraph entitled "Precast Concrete Float Design" and "Gangway Design". Design calculations of precast floats and gangways (including connections) shall be prepared and sealed by a registered professional engineer, and submitted for approval prior to fabrication. In addition to member sizing calculations, submit calculations for the pier system which include:

a. Anchorage attachment points to insure reactions shall be appropriately and rationally distributed throughout the system
b. Overall system loads under full occupancy, with consideration for shielding factors, and deflection of the system and its effects on anchor loading
c. Anchorage system capacity for individual and overall load considerations
d. Guide pile size, length, cross section, and minimum embedment

1.8.3 Concrete Mix Design

Thirty days minimum prior to concrete placement, submit a mix design for each strength and type of concrete. Include a complete list of materials including type; brand; source and amount of cement, pozzolan, and admixtures; and applicable reference specifications.

1.8.4 Paint Coating System

Submit IEEE C57.12.29 coating system performance requirements test on "test specimens" of the same material used in fabrication of the receptacle stations.

PART 2 PRODUCTS

2.1 CONTRACTOR-FURNISHED MIX DESIGN

**************************************************************************
NOTE: Normal precast design is based on concrete having a compressive strength of 35 MPa 5000 psi at 28 days. Some precast manufacturers like to speed up production by using Type III (high early strength) concrete.
**************************************************************************
NOTE: Delete air entraining requirements when the project is located in a nonfreezing climate.

ACI 211.2, using weight method. The minimum compressive strength of concrete at 28 days shall be \[ _____ \] [35] MPa [5000] psi with a unit weight of 1800 kg/m\(^3\) 115 pcf dry. Mix shall contain a corrosion inhibitor[ and air-entraining admixtures at the mixer to produce between 5 to 7 percent air by volume]. The use of foaming agents is prohibited.

2.2 PRECAST FLOAT MATERIALS

2.2.1 Cement

NOTE: For normal precasting (not requiring sulfate resistance), use the first bracketed item. If sulfate resistance is required, use the second bracketed item.

ASTM C150/C150M, Type [I][II]; or ASTM C595/C595M Type IP(MS) or IS(MS) blended cement, except as modified herein. The blended cement shall consist of a mixture of ASTM C150/C150M cement and one of the following materials: ASTM C618 pozzolan or fly ash, or ASTM C989/C989M ground iron blast furnace slag. The pozzolan/fly ash content shall not be less than 20 percent nor exceed 40 percent by total mass of cementitious material. The content of ground granulated blast-furnace slag shall not exceed 50 percent of the mass of cement. The minimum amount of portland cement is 50 percent of the total mass of cementitious material. For exposed concrete, use one manufacturer for each type of cement, ground slag, fly ash, and pozzolan.

2.2.1.1 Fly Ash and Pozzolan

ASTM C618, Type N, F, or C, except that the maximum allowable loss on ignition shall be 6 percent for Type N and F.

2.2.1.2 Ground Iron Blast-Furnace Slag

ASTM C989/C989M, Grade 100 or 120.

2.2.2 Water

Water shall be fresh, clean, and potable.

2.2.3 Aggregates

2.2.3.1 Aggregates Selection

NOTE: Select gradation(s) based on job requirements and constraints. The maximum aggregate size shall not exceed three-quarters the minimum cover over reinforcing. Aggregate grading sizes with their general grading ranges are as follows: Size 57 (25 mm one inch to No. 4 sieve), Size 67 (20 mm 3/4 inch to No. 4 sieve), and Size 7 (12 mm 1/2 inch to
2.2.4 Grout
2.2.4.1 Nonshrink Grout
   ASTM C1107/C1107M.
2.2.4.2 Cementitious Grout

NOTE: Delete air entraining requirements when the project is located in a nonfreezing climate.

Shall be a mixture of portland cement, sand, and water. Proportion one part cement to approximately 2.5 parts sand, with the amount of water based on placement method. [Provide air entrainment for grout exposed to the weather.]

2.2.5 Admixtures
[2.2.5.1 Air-Entraining

NOTE: Delete air entraining requirements when the project is located in a nonfreezing climate.

ASTM C260/C260M.
]
2.2.5.2 Accelerating
   ASTM C494/C494M, Type C or E.
2.2.5.3 Water Reducing
   ASTM C494/C494M, Type A, E, or F.
2.2.5.4 Corrosion Inhibitor
   Calcium nitrite, ASTM G109. Add at the rate of 22.25 l per cubic meter 4.5 gallons per cubic yard.

2.2.6 Reinforcement

All reinforcement shall be hot-dipped galvanized, ASTM A123/A123M or ASTM A153/A153M.

2.2.6.1 Rebar

NOTE: Specify ASTM A706/A706M reinforcing where
welding or bending of reinforcement bars is important.

ASTM A615/A615M[ASTM A706/A706M], Grade 420 [40] [60].

2.2.6.2 Welded Wire Fabric

ASTM A1064/A1064M. Provide flat sheets of welded wire fabric, rolled fabric is not acceptable. Maximum fabric grid is 50mm x 50mm 2 in. x 2 in.

2.2.7 Metal Accessories

Provide ASTM A123/A123M or ASTM A153/A153M, hot-dipped galvanized.

2.2.7.1 Inserts

ASTM A47/A47M, Grade 22010 32510 or 35018, or ASTM A27/A27M Grade 415-205 U-60-30.

2.2.7.2 Structural Steel

ASTM A36/A36M.

2.2.7.3 Bolts

ASTM A307 and ASTM A36/A36M. Waler rods shall be continuous laterally through the pier, with a minimum diameter of 19 mm 3/4 inch. All continuous waler rods shall be placed within PVC sleeves cast into the precast float modules.

2.2.7.4 Nuts

ASTM A563M ASTM A563.

2.2.7.5 Washers

ASTM F844 washers for ASTM A307 bolts.

2.2.7.6 Cleats

Provide [_____] 457 mm 18 in boat cleats spaced at approximately [_____] 6100 mm 20 ft.

2.2.8 Foam Core

Closed cell, expanded polystyrene (EPS), ASTM C578. Foam core laminations shall be glued with a low solvent glue. Core shall not be made from more than four laminated sections. Horizontal laminations in the upper 254mm 10 in are not permitted. Core shall be strapped to prevent de-lamination during transportation and handling. Core shall not contain more than 10 percent reground EPS foam material. Reground foam pieces shall not exceed 10mm 3/8 in diameter.

Unit Weight: 12 - 48 kg/m³ 0.70 - 3.00 pcf

Water absorption (ASTM C272/C272M): 3 percent (by volume)

Dimensional tolerance: plus or minus 3mm 1/8 in
2.3  FABRICATION

PCI MNL-116 unless specified otherwise.

2.3.1 Precast Floats

Precast floats shall be cast monolithically, cold joints of any type are not acceptable. Modules shall have a minimum deck and wall thickness of 51mm 2 in. Precast float decks shall be constructed to drain freely and there shall be no floodable enclosed spaces.

2.3.2 Forms

Brace forms to prevent deformation. Forms shall produce a smooth, dense surface. Chamfer exposed edges of floats 13 mm 1/2 inch, unless otherwise indicated. Form tolerance shall not exceed 3mm 1/8 in dimensions indicated on shop drawings. When measured diagonally, floats more than 13mm 1/2 in out of square shall be rejected.

2.3.3 Reinforcement Placement

ACI 318M and ACI 318 for placement and splicing. Reinforcement may be preassembled before placement in forms.

2.3.4 Concrete

2.3.4.1 Concrete Mixing

ASTM C94/C94M. Mixing operations shall produce batch-to-batch uniformity of strength, consistency, and appearance.

2.3.4.2 Concrete Placing

ACI 304R, ACI 305R for hot weather concreting, ACI 306.1 for cold weather concreting, and ACI 309R, unless otherwise specified. Concrete shall be vibrated internally and/or externally to assure a smooth, dense finish.

2.3.4.3 Concrete Curing

Commence curing immediately following the initial set and completion of surface finishing. Provide curing procedures to keep the temperature of the concrete between 10 and 90 degrees C 50 and 190 degrees F. When accelerated curing is used, apply heat at controlled rate and uniformly along the casting beds. Monitor temperatures at various points in a product line in different casts. Cure for a minimum of seven days prior to transporting, launching and assembly.

2.3.5 Surface Finish

Precast floats containing hairline cracks which are visible and are less than 0.5 mm 0.02 inches in width, may be accepted, except that cracks larger than 0.1 mm 0.005 inches in width for surfaces exposed to the weather shall be repaired. Precast floats which contain cracks greater than 0.5 mm 0.02 inches in width shall be approved by the Contracting Officer, prior to being repaired. Any precast float that is structurally impaired or contains honeycombed section deep enough to expose reinforcing shall be rejected.
2.3.5.1 Unformed Surfaces

Provide a steel troweled and broomed finish for pier deck surface. Slip resistant broomed deck finish shall be transverse to pier orientation. All deck edges shall have a 10mm 3/8 in tooled radius with a minimum 38mm 1 1/2 in wide, smooth, hard steel finished face.

2.3.5.2 Formed Surfaces

******************************************************************************
NOTE: PCI MNL-116 different grades of formed surface finishes:

Commercial Grade: Concrete produced in forms that produce a rough finish. Fins are removed and large surface blemishes filled. Sharp edges that will be visible in the finished structure are ground down.

Standard Grade: Same finish as commercial grade, except the forms do not produce a texture on the concrete. Surface can be painted, but will have surface voids.

Finish Grade B: Same as standard grade, except all surface blemishes should be filled or finished to provide a smooth surface or uniform appearance if painted.

Finish Grade A: Same as Finish Grade B, except that the components of the completed structure, where exposed, shall be reasonably color matched. This finish is difficult to obtain.
******************************************************************************

PCI MNL-116 (Appendix A - Commentary), Chapter 3, for grades of surface finishes. Provide a standard grade surface finish for both exposed and unexposed areas.

2.3.6 Float Identification

All precast floats are to be clearly identified on one side and one end, between the bottom of the waler and the waterline. Identification shall include name of manufacturer, date of manufacture, specific float type, and job number.

2.4 TIMBER AND WOOD PRODUCTS

All walers shall be fabricated from parallel strand lumber (PSL) engineered structural beams. PSL structural beams shall be in accordance with ASTM D5456 All other structural lumber shall be No. 1 Southern Yellow Pine.

2.4.1 Preservative Treatment

Treat wood to be used in contact with salt water or salt water splash in accordance with AWPA C2 (Material Subject to Marine Borer Exposure) with waterborne preservative AWPA P5, (ACA - Ammoniacal Copper Arsenate, ACZA - Ammoniacal Copper Zinc Arsenate, CCA - Chromated Copper Arsenate) to 0.6 pcf retention. For wood continuously immersed, treat in accordance with
AWPA C1 and AWPA C18 as applicable, to 2.5 pcf retention. For glue laminated engineered structural beams treat in accordance with AWPA C28 and AWPA C33 as applicable.

2.5 **RUBBING SURFACE - ULTRA-HIGH MOLECULAR WEIGHT POLYETHYLENE (UHMWPE)**

Materials including additives shall be traceable by original lot number. Materials used shall be FDA approved or otherwise harmless to marine life. Fabricated form shall be from virgin resin.

2.5.1 Resin

**ASTM D4020.** Virgin resin shall be homopolymer of ethylene and have an intrinsic viscosity (IV) between 22.0 and 28.0 dl/g. No reprocessed resin shall be used. Resin shall be oil and moisture free (0.2 percent weight maximum).

2.5.2 Composition and Fabricated Form

Resin shall comprise a minimum 95.0 percent by weight concentration in the formulation. The finished form shall maintain ultraviolet stability for a minimum of 25 years and be free of saltwater or petroleum product leachable materials. No unfused areas or light patches greater than 300 micrometers No. 50 sieve shall be in the final fabricated form. Form shall be 38mm 1 1/2 in thick, depth equal to design depth of waler, and length as required but not less than 3m 10 ft. Exterior edges shall be rounded to 19mm 3/4 in radius. Color shall be black. The fabricated form shall have the following properties:

<table>

2.6 GUIDE PILES

Guide piles shall be prestressed concrete piles; fabricated and installed in accordance with section 31 62 13.20 PRECAST/PRESTRESSED CONCRETE PILES. Pile size, length, cross section and embedment shall be determined by pier manufacturer's design. [Recommended pile butt elevation is [1.5] m [5.0] ft above [extreme] high water.] Pile quantity and location shall be as indicated on the drawings. Relocation of pile layout and additional piles required by the manufacturer's design to resist the indicated design loads, shall be subject to approval by the government.

2.6.1 Guide Pile Caps

Provide heavy UV-resistant, low density polyethylene piling caps with an estimated life in excess of 10 years. Caps shall be cone or pyramid shaped and attached to the piling top with stainless fasteners.

2.7 GANGWAYS

2.7.1 Aluminum

2.7.2 Stainless Steel

Type 316 L.

2.7.3 Castings

F-214 Cast aluminum. Castings shall be true to pattern, structurally sound and free from blow holes or other defects.

2.7.4 Insulators

MIL-I-24768/14. Bushings or separation sheets shall be a minimum of 1.5mm 1/16 in thickness.

2.7.5 Rollers

CID A-A-55619, UHMW polyurethane, with UV inhibitors added. Color shall be black.

[2.8 Receptacle Stations

Receptacle stations shall include enclosure, mechanical interlocks, and related wiring and devices as indicated.

2.8.1 Enclosure

Enclosure shall be NEMA ICS 6, type 3R, fabricated of 12 gauge stainless steel. Paint ASTM D1535 light gray No. 61. Paint coating system shall comply with IEEE C57.12.29.
2.8.2 Mechanical Interlocks

**UL 231, UL 1686, UL 98.** Mechanical interlock devices shall incorporate a fused disconnect safety switch and IEC receptacle in a non-metallic, watertight, enclosure. The interlock mechanism shall prevent making and breaking of power under load. Enclosure shall be rated NEMA 4X and also rated IP67 in accordance with CENELEC EN 60529. Include matching plug for each mechanical interlock provided. Plugs and receptacles shall be classified to EN 60309-1 and EN 60309-2.

2.8.3 Circuit Breakers

**UL 489.** Individual molded case circuit breakers with voltage and continuous current ratings, number of poles, overload trip setting, and short circuit current interrupting rating as indicated.

2.8.4 Ground-Fault Circuit Interrupter Receptacles

**************************************************************************
NOTE: For NAVFAC LANT projects, use GFI terminology in lieu of GFCI. NAVFACENGCOM has established these GFCI/GFI safety standards at a higher level of protection than NFPA 70's minimum requirements as a result of a GAO report and DOD concern about health and safety.
**************************************************************************

**UL 943,** duplex type for mounting in standard outlet box. Device shall be capable of detecting current leak of 6 milliamperes or greater and tripping per requirements of UL 943 for Class A GFI devices. Provide screw-type, side-wired wiring terminals or pre-wired (pigtail) leads. Provide in nonmetallic box with gasketed, weatherproof, nonmetallic cover plate and gasketed cap over each receptacle opening. Provide caps with a spring-hinged flap. Receptacle shall be UL listed for use in "wet locations with plug in use."

PART 3 EXECUTION

3.1 SURFACE REPAIR

Prior to erection, and again after installation, precast floats shall be checked for damage, such as cracking, spalling, and honeycombing. As directed by the Contracting Officer, precast floats that do not meet the surface finish requirements specified in Part 2 in paragraph entitled "Surface Finish" shall be repaired, or removed and replaced with new precast floats.

3.2 LAUNCH AND ASSEMBLY

Precast floats shall be launched after the concrete has attained the specified compressive strength, unless otherwise approved by the precast manufacturer. Assemble in accordance with the approved shop drawings. PCI MNL-116 and PCI MNL-120 (Chapter 8), for tolerances. Brace precast floats, unless design calculations submitted with the shop drawings indicate bracing is not required. Follow the manufacturer's recommendations for maximum construction loads.
3.3 ANCHORAGE

Provide anchorage for fastening work in place. Conceal fasteners where practicable. Make threaded connections up tight and nick threads to prevent loosening.

3.4 WELDING

AWS D1.4/D1.4M for welding connections and reinforcing splices. Protect the concrete and other reinforcing from heat during welding. Weld continuously along the entire area of contact. Grind smooth visible welds in the finished installation. Welding of epoxy-coated reinforcing is not allowed.

3.5 OPENINGS

Holes or cuts requiring reinforcing to be cut, which are not indicated on the approved shop drawing, shall only be made with the approval of the Contracting Officer and the precast manufacturer. Drill holes less than 300 mm 12 inches in diameter with a diamond tipped core drill.

3.6 GALVANIZING REPAIR

Repair damage to galvanized coatings using ASTM A780/A780M zinc rich paint for galvanized surfaces damaged by handling, transporting, cutting, welding, bolting, or acid washing. Do not heat surfaces to which repair paint has been applied.

3.7 GROUTING

Clean and fill indicated areas, solidly with nonshrink grout or cementitious grout. Provide reinforcing where indicated. Remove excess grout before hardening.

3.8 SEALANTS

Provide as indicated and as specified in Section 07 92 00 JOINT SEALANTS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for prestressed concrete fender piling.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The extent and location of the work to be accomplished should be indicated on the project drawings or included in the project specification.

NOTE: Refer to NFESC TM 53-89-03, "Prestressed Concrete Fender Piling User Data Package" for details of these fender piles. The following information shall be shown on the drawings:

1. Locations and design loads of piles.

2. Size, shape, and length of piles.

3. Locations, sizes, and number of prestressing steel strands. Unit stresses for prestressing
strands or wire.

4. Details of reinforcement and tendons.

5. Soil data, where required.

6. Embedment depth.

Note: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up...
to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Piles

Driving helmets, capblocks, and pile cushions

SD-05 Design Data

Concrete mix design

Submit a concrete mix design before concrete is placed, for each type of concrete used for the piles.

SD-06 Test Reports

Aggregates

Fly ash and Pozzolan

Ground Slag

Silica fume

Concrete

Submit concrete cylinder compressive strength test results.

SD-07 Certificates

Precasting manufacturer's quality control procedures
Suitability of pile driving equipment

[ Curing of piles

][ Silica fume manufacturer's representative

] Prestressing steel

Portland cement

Concrete mix design

Reinforcing steel

[ Rubbing surface

] Bolts, nuts, and washers

1.3 REQUIREMENTS

1.3.1 Piling Lengths and Quantity

Provide prestressed pretensioned concrete piles. Base bids upon the number, size, and length of piles as indicated. Adjustments in the contract price will not be made for cutting off piles or for broken, damaged, or rejected piles.

1.3.2 Piles

Prepare in accordance with ACI SP-66. Indicate placement of reinforcement including tendons. Indicate location of special embedded or attached lifting devices, employment of pick-up points, support points other than pick-up points, and any other methods of pick-up. [Provide certification of a professional engineer registered in any jurisdiction in the U.S. or its territories, that layout and details of reinforcement and tendons conform with that shown on the structural design drawings.]

1.3.3 Driving Helmets, Capblocks, and Pile Cushions

Show details of driving helmets, capblocks, and pile cushions. Submit 2 weeks prior to [test] pile installation.

1.4 QUALITY ASSURANCE

1.4.1 Quality Control Procedures

Submit [_____] copies of precasting manufacturer's quality control procedures established in accordance with PCI MNL-116.

[1.4.1.1 Curing of Piles

Submit proposed materials and methods.

]1.4.2 Silica Fume Manufacturer's Representative

Provide statement that the manufacturer's representative will be present at plant to ensure proper mix, including high range water reducer (HRWR), and batching methods.
1.4.3  **Aggregates**

Prior to pile fabrication, submit certified test reports for the following tests specified in ASTM C33/C33M:

a. Grading
b. Amount of material finer than 75 micrometers No. 200 sieve
c. Organic impurities
d. Soundness
e. Clay lumps and friable particles
f. Coal and lignite
g. Weight of slag
h. Abrasion of coarse aggregate
i. Fineness modulus
j. Reactive aggregates
k. Freezing and thawing

1.4.4  **Fly Ash and Pozzolan**

Furnish fly ash and pozzolan test results performed within 6 months of submittal date. Sampling and testing shall be in accordance with ASTM C311/C311M.

1.4.5  **Silica Fume**

Furnish silica fume test results performed within 6 months of submittal date. Sampling and testing shall be in accordance with ASTM C311/C311M.

1.4.6  **Portland Cement**

Certification identifying cement; brand name, type, mill location, quantity to be used, size of lot represented by quality control sample, lot number, and destination of shipment.

1.4.7  **Concrete Mix Design**

Certify, using a Government-approved independent commercial testing laboratory, that proportioning of mix is in accordance with ACI 211.1 or ACI 318M for specified strength and is based on aggregate data which has been determined by laboratory tests during last 12 months.

1.5  **DELIVERY, STORAGE, AND HANDLING**

Piles shall be stored, handled, and transported in accordance with PCI MNL-116 except as follows. Methods used for handling and storage of piles shall be such that the piles are not subjected to excessive bending stress, cracking, spalling, or other damage.
1.5.1 Damaged Piles

The Contractor shall inspect each pile for sweep and structural damage such as cracking and spalling before transporting them to the project site and immediately prior to placement in the driving leads. Any unusual cracks (cracks other than crazing, surface drying, shrinkage cracks and end cracks) shall be brought to the attention of the Contracting Officer. Piles which are damaged during delivery, storage, or handling to the extent they are rendered unsuitable for the work, in the opinion of the Contracting Officer, shall be rejected and removed from the project site, or may be repaired, if approved, at no cost to the Government.

1.5.1.1 Repairable Cracks

Piles with cracks equal to or greater than 0.15 mm 0.006 inches but less than 1.5 mm 0.06 inches shall be rejected or repaired. As an alternate to pile rejection, the Contractor may submit a proposal to repair deficient piles, which shall be restored prior to driving to provide its required design capacity, perform its intended function in the structure, and take into consideration long term durability in corrosive environment.

1.5.1.2 Non-Repairable Cracks

Piles with cracks equal to or greater than 1.5 mm 0.06 inches shall be rejected.

1.5.2 Pile Sweep

Sweep shall be limited to 3 mm per 3 M 1/8 inch per 10 feet over the length of the pile. Piles having excessive sweep shall be rejected.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Cementitious Materials

Cementitious materials shall be portland cement, [blended cement] or portland cement in combination with natural pozzolan or fly ash [or ground granulated blast furnace slag] and conforms to appropriate specifications listed below.

2.1.1.1 Cement

**************************************************************************

NOTE: Insert type of cement required. Generally, Types II, or I/II, is preferred. Type I, or Type III with 8 percent maximum C3A and "low alkali" may be used. Do not use Type III in conjunction with silica fume. In very special cases, Type V, "low alkali," which has limited availability, may be used.

**************************************************************************

**************************************************************************

NOTE: Cement type and quantity of cement required in mix design is dependent upon the environment, soil conditions, need for corrosion protection, and
location of piling:

(a) CHLORIDE PROTECTION:

Normal Use. In fresh water or air environment, specify Type I or Type II cement. Type III may be permitted provided tricalcium aluminate (C3A) content is limited to 8 percent and it is low alkali.

Marine Use. In soil or water environments, subject to chlorides above 1,000 ppm, within about 300 m 1000 feet of the ocean or tidal water, specify Type II or Type III (with a maximum tricalcium aluminate (C3A) content of 8 percent and low alkali) cement, a minimum cementitious materials content of 335 kilograms per cubic meter 564 pounds per cubic yard and a maximum water to cementitious materials ratio of 0.40.

Seawater Exposure. In direct contact with ocean water, specify Type II or Type III (with a maximum tricalcium aluminate (C3A) content of 8 percent and low alkali) cement, a minimum cementitious materials content of 390 kilograms per cubic meter 658 pounds per cubic yard and a maximum water to cementitious materials ratio of 0.40.

(b) SULFATE RESISTANCE: A minimum cementitious materials content of 335 kilograms per cubic meter 564 pounds per cubic yard is recommended.

Normal Use. In soils with negligible amount of sulfate, specify Type I or Type II cement. Type III cement may be permitted provided tricalcium aluminate (C3A) content is limited to 8 percent and it is low alkali.

Moderate Sulfate Exposure. In exposures with moderate sulfate content (between 0.10 and 0.20 percent in soil and less than 1500 ppm in water), specify Type II or Type III (with a maximum tricalcium aluminate (C3A) content of 8 percent and low alkali) cement and a maximum water to cementitious materials ratio of 0.40. Do not use Class C fly ash, blast furnace slag, or silica fume for cement replacement.

Severe Sulfate Exposure. In exposures with high sulfate content (exceeds 0.20 percent in soil or 1500 ppm in water), specify Type V or Type II (with a maximum tricalcium aluminate content of 5 percent) cement, and a maximum water to cementitious materials ratio of 0.40. Do not use Class C fly ash, blast furnace slag, or silica fume for cement replacement.

Alkali-Silica Reactivity. When alkali-silica reactivity is a concern, it is recommended to limit the maximum alkali content of cement to 0.40 or
0.50, when it is locally available, otherwise use 0.60.

**************************************************************************

ASTM C150/C150M, [Type I, II, or III] with a maximum alkali content of [0.40] 0.60 percent; or][ASTM C595/C595M, Type [IP(MS) or IS(MS)] [_____] blended cement except as modified herein. The blended cement shall consist of a mixture of ASTM C150/C150M cement (with alkali content not exceeding [0.40] 0.60 percent) and one of the following materials: ASTM C618 pozzolan or fly ash, or ASTM C989/C989M ground iron blast-furnace slag, or ASTM C1240 silica fume. If no satisfactory test results are available (made within the past six months) to prove that the cement alkali content is less than 0.40 percent, then cement with a maximum of 0.60 percent alkali shall be used. Cement certificates shall include test results in accordance with ASTM C150/C150M, including equivalent alkalies indicated in the optional chemical requirements. [Use cement with a tricalcium aluminate (C3A) content of less than [8][5] percent.] Type III cement shall not be used in conjunction with silica fume.

**************************************************************************

NOTE: Fly ash, pozzolan, and ground iron blast-furnace slag increase durability. They may produce uneven discoloration of the concrete during the early stages of construction, depending upon the type of curing provided. Use fly ash/pozzolan (loss on ignition not exceeding 3 percent) for frost areas to reduce carbon interference with air entraining admixture. Straight replacement with fly ash or natural pozzolan beyond 15 percent may decrease the concrete’s strength gain rate. The following options can help mitigate this slower gain rate: (1) a lower water/cement ratio may be used, (2) partial cement replacement can be completed, e.g., 1 sack of cement can be replaced by 1.5 sacks of fly ash, as long as the final replacement ratio meets the requirements, and (3) very fine fly ashes or pozzolans (e.g. with average particle sizes below 5 microns) can be used.

**************************************************************************

2.1.1.2 Fly Ash and Pozzolan

**************************************************************************

NOTE: Loss on ignition greater than 3 percent may result in significant variations in air content. The air entrainment admixture content may need to be varied often to maintain the same level of entrained air.

**************************************************************************

ASTM C618, Class N, or F except that the maximum total alkalies shall be 3 [6] percent. If the aggregates are reactive the maximum calcium oxide content shall be 13.0 percent. Class C shall not be used.
2.1.1.3  Ground Iron Blast-Furnace Slag

ASTM C989/C989M, Grade 120.

2.1.1.4  Silica Fume

**************************************************************************
NOTE: Use silica fume concrete for marine structures where low permeability and enhanced durability are necessary. The silica fume and HRWR additive should be from the same manufacturer. The Contractor and batch plant may need help from the manufacturer. Select weight percentage based on performance required. If used, a replacement of 7 percent is recommended.
**************************************************************************

**************************************************************************
NOTE: Use for high durability and low permeability. The initial cost of the concrete will increase, and supervision at the batch plant, finishing, and curing is necessary. A HRWR must be used with silica fume. The slump can be increased 50 to 125 mm 2 to 5 inches without reducing strength. Finishing may be more difficult. Proper curing is essential because there is a tendency for plastic shrinkage cracking.
**************************************************************************

ASTM C1240, provide silica fume that is a by-product of silicon or ferrosilicon production. Provide percent by weight of the total cementitious materials as indicated in table below.

2.1.1.5  Supplemental Cementitious Materials (SCM) Content

The concrete mix shall contain one of the four SCMs listed below, or a linear combination thereof.

<table>

#### 2.1.2 Water

Water shall be fresh, clean, and potable; free from injurious amounts of oils, acids, alkalis, salts, organic materials, or other substances deleterious to concrete or steel.

#### 2.1.3 Aggregates

---

**NOTE:** For piles in areas where reactive aggregates are likely to be supplied, provide for additional tests and certification to ensure that reactive aggregates will not be used. While not wholly conclusive, petrographic examination (ASTM C295/C295M), chemical test (ASTM C289/C289M), and mortar bar method (ASTM C227) are valuable indicators. While more reliable, the concrete prism test (ASTM C1293) takes 1 to 2 years to complete and is not practical. The accelerated mortar bar method (ASTM C1260) is similarly reliable and takes only 16 days to yield results. In areas where reactive aggregates can not be avoided, specify use of low alkali cement, and/or cements modified to mitigate alkali-silica reactivity. Service records of concrete made with these materials along with tests should be used in evaluating these materials.

---

**NOTE:** Include modification to ASTM C33/C33M when reactive aggregates could be encountered. More modifications may be required. Additional tests and certifications may be required in the submittal paragraphs.

---

**ASTM C33/C33M[ , except as modified herein. Provide aggregate free from any substance which may be deleteriously reactive with alkalis in cement in an amount sufficient to cause excessive expansion of concrete]. Do not mix, store in same stockpile, or use fine aggregates from different sources of supply in same concrete mix or same structure without approval. The fineness modulus of fine aggregate shall be not less than 2.40 or greater than 3.0. For piles that will be exposed to freezing and thawing, fine and coarse aggregate subjected to five cycles of the sodium sulfate soundness test shall show a loss not greater than 10 percent. If the selected aggregates fail the soundness test, the Contractor may use the aggregate source, provided concrete specimens made with the aggregates to be used for the piles shall have a durability factor of not less than 80 based on 300 cycles of freezing and thawing when tested in accordance with ASTM C666/C666M. Prior to pile fabrication, submit certified test reports for the following tests specified in ASTM C33/C33M[ , in addition, [twice]
during each shift when the concrete plant is operating, the
gradation of each size of aggregate shall be tested in accordance with
ASTM C136/C136M):

a. Grading
b. Amount of material finer than 75 micrometers No. 200 sieve
c. Organic impurities
d. Soundness
e. Clay lumps and friable particles
f. Coal and lignite
g. Weight of slag
h. Abrasion of coarse aggregate
i. Fineness modulus
j. Reactive aggregates
k. Freezing and thawing

2.1.3.1 Alkali-Silica Reactivity (ASR)

Fine and coarse aggregates to be used in all concrete shall be evaluated
and tested by the Contractor for alkali-aggregate activity.

The fine and coarse aggregates shall be evaluated separately, using
ASTM C1260. Test results of the individual aggregates shall have a
measured expansion equal to or less than 0.08 percent at 16 days after
casting. Should the test data indicate an expansion of greater than 0.08
percent, the aggregates(s) shall be rejected or additional testing, using
ASTM C1567 shall be performed as follows: utilize the Contractor's proposed
low alkali portland cement [blended cement] and SCM in combination with the
proposed aggregate for the test portioning. The SCM quantity shall be
determined that will meet all the requirements of these specifications and
that will lower the ASTM C1567 expansion to equal or less than 0.08 percent
at 16 days after casting.

If the above option does not lower the expansion to less than 0.08 percent
at 16 days after casting, reject the aggregate(s) and submit new aggregate
sources for retesting. Submit the results of testing to the Contracting
Officer for evaluation and acceptance.

2.1.4 Admixtures

**************************************************************************
NOTE: For guidance in use of either water-reducing
admixtures, set retarding admixtures, or combination
of admixtures, refer to ACI 543R, "Recommendations
for Design, Manufacture, and Installation of
Concrete Piles."
**************************************************************************
2.1.5 Prestressing Steel

Use seven-wire stress-relieved or low-relaxation strand conforming to ASTM A416/A416M, Grade 270 psi. Use prestressing steel free of grease, oil, wax, paint, soil, dirt, and loose rust. Do not use prestressing strands or wire having kinks, bends, or other defects.

2.1.6 Reinforcing Steel

**NOTE:** Minimum cover for reinforcing steel in concrete structures is dependent upon the environment, soil conditions, need for corrosion protection, and location of piling. For normal exposure minimum cover is 50 mm 2 inches. For piles exposed to marine conditions (chloride content above 1000 ppm) in or within about 300 m 1000 feet of the ocean or tidal water, use 75 mm 3 inches minimum cover including chamfered corners. For additional detailed guidance, see following publications: ACI 543R, "Recommendations for Design, Manufacture and Installation of Concrete Piles" (ACI Manual, Part 3); State of California, Department of Public Works, Design Specifications, Volume 1, Bridge Planning and Design Manual, Chapter 6. Piles to be used in a marine environment may receive a protective coating, particularly if the piles are steam cured. The protective coating should be applied to that portion of pile which remains aboveground or water line. Show areas to be protected on drawings.

**NOTE:** Insert grade of reinforcement. Specify ASTM A706/A706M reinforcing where welding or bending of reinforcement bars is important. In addition, ASTM A934/A934M may be specified for epoxy coating of reinforcing where extra reinforcement protection is required.

[ASTM A615/A615M, Grade [300][420] [40][60];] [ASTM A706/A706M, Grade [420] [60];] [ASTM A996/A996M, Grade [420] [60]]. Weld reinforcing steel in accordance with AWS D1.4/D1.4M.

2.1.7 Ties and Spirals

**NOTE:** If project has been designed for epoxy rebar, add ASTM A934/A934M, "Epoxy-Coated Prefabricated Steel Reinforcing Bars" in this paragraph and in the paragraph entitled "References."
Steel, ASTM A1064/A1064M for spirals and ASTM A615/A615M[ASTM A706/A706M] for ties.

2.1.8 Pipe Sleeves

Use ASTM A53/A53M, Grade B, or ASTM A501/A501M galvanized pipe. Sleeves shall be galvanized in accordance with ASTM A153/A153M with chromate wash. Do not place galvanized pipe in contact with any prestressing or reinforcing steel.

2.1.9 Bolts, Nuts, and Washers

2.1.9.1 Bolts

ASTM A307, Grade A.

2.1.9.2 Nuts

ASTM A563M ASTM A563, Grade A, hex style.

2.1.9.3 Washers

ASTM F844.

2.1.10 Ultrahigh Molecular Weight Polyethylene (UHMWPE) Rubbing Surface

2.1.10.1 General

a. Materials including additives shall be traceable by original lot number.

b. Materials used shall be FDA approved or otherwise harmless to marine life.

c. Fabricated form shall be virgin resin.

2.1.10.2 Resin

a. ASTM D4020. Virgin resin shall be homopolymer of ethylene and have an intrinsic viscosity (IV) between 22.0 and 28.0 dl/g.

b. No reprocessed resin shall be used.

c. Resin shall be oil and moisture free (0.2 percent weight maximum).

2.1.10.3 Composition and Fabricated Form

a. Resin shall comprise a minimum 95.0 percent by weight concentration in the formulation.

b. The finished form shall maintain ultraviolet stability for a minimum of 25 years and be free of saltwater or petroleum product leachable materials.

c. No unfused areas or light patches greater than 300 micrometers No. 50 sieve shall be in the final fabricated form.

d. The fabricated form shall have the following properties:
<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>

e. Color shall be black.

## 2.2 CONCRETE

### 2.2.1 Contractor-Furnished Concrete Mix Design

NOTE: Insert the specified compressive strength, f'c. Consider reducing average overstrength factor to produce a more economical concrete mix design, since these piles are not critical structural elements. ACI 318M may be modified for a specified compressive strength, f'c, over 35 MPa 5000 psi to permit a required average compressive strength, f'cr, of f'c plus 4.8 MPa 700 psi. Concrete may be proportioned in accordance with ACI 214R for the probability of 1 test in 10 falling below the specified compressive strength, f'c, if the mix design reflects actual concrete plant standard deviations and the resulting production concrete conforms to specified requirements. Do not use lightweight or fiber-reinforced concrete.

Concrete shall have a minimum specified compressive strength, f'c, of [_____] psi at 28 days. The minimum cementitious materials content shall be 354 kg per cubic meter 600 pounds per cubic yard of concrete. The design shall be prepared in accordance with ACI 211.1 or ACI 318M. The mix design shall be based on current materials previously evaluated by the concrete producer whose established methods of statistical quality control is in conformance with ACI 318M. In the absence of such data, the Contractor
shall sample and test the aggregates for the design of concrete.

2.2.2 Concrete Mix Design Proportioning

a. Water and cement ratio shall be equal to or less than 0.40. If fly ash is used, the water and cement ratio shall be calculated as the weight of water divided by the weight of cement plus 60 percent of the weight of fly ash. If silica fume is used, the water and cement ratio shall be calculated as the weight of water divided by the weight of cement plus the weight of silica fume.

b. Maximum aggregate size shall not exceed 19 mm 3/4 inch.

******************************************************************************
NOTE: Air-entrainment may be considered optional only in regions that do not experience freezing temperatures.
******************************************************************************

c. Air-entrainment shall be 4.5 to 7.5 percent. Determine air void structure in accordance with ACI 212.3R. Spacing factor shall be less than 2.5 mm 0.01 inch, the specific surface area shall be greater than 0.39 square meter per 0.000016 cubic meter 600 square inches per cubic inch of air void volume, and the number of air voids per mm inch of traverse shall be significantly greater than the numerical value of the percentage of air in the concrete.

2.2.3 Trial Mixtures

Trial mixtures having proportions and consistencies of the proposed mix design shall be made to document the Contractor's ability to produce workable concrete which does not segregate or show excessive slump loss characteristics.

2.3 FABRICATION OF PRETENSIONED PILES

Piles shall be pretensioned concrete piles. Workmanship shall conform to standard commercial practice in prestressing plants.

2.3.1 Formwork

Provide forms of metal, braced and stiffened against deformation, accurately constructed, watertight, and supported on unyielding casting beds. Forms shall permit movement of pile without damage during release of the prestressing force. Make piles to dimensional tolerances in accordance with PCI MNL-116 and as follows:

a. Length: 10 mm per 3 meters 3/8 inch per 10 feet.

b. Cross section: plus 13 mm to minus 6 mm plus 1/2 inch to minus 1/4 inch.

c. Deviation from straight lines: not more than 3 mm per 3 meters 1/8 inch per 10 feet of length.

d. Pile head: plus or minus 6 mm per 0.30 meter 1/4 inch per foot of head dimension from true right angle plane. Surface irregularities: plus or minus 3 mm 1/8 inch.

e. Location of reinforcing steel
(1) Main reinforcement: 3 to 6 mm 1/8 to 1/4 inch from position designated on drawings.

(2) Spacing of spiral: plus or minus 13 mm 1/2 inch from position designated on drawings.

f. Location of pipe sleeves from true position: plus or minus 10 mm 3/8 inch.

2.3.2 Pretensioning

Measure tension to which steel is to be pretensioned by jack pressure read on a calibrated gage and verify by elongation of steel. Use gage calibrated within last 6 months by a laboratory approved by Contracting Officer. Provide means for measuring elongation of steel to nearest 3 mm 1/8 inch. When difference between results of measurement and gage reading is more than 5 percent, determine cause of discrepancy and correct. Give tensioning steel a uniform prestress prior to being brought to design prestress. Induce same initial prestress in each unit when several units of prestressing steel in a pile are stretched simultaneously.

2.3.3 Casting

2.3.3.1 Conveying

Clean conveying equipment thoroughly before each run. Convey concrete from mixer to forms as rapidly as practicable by methods which will not cause segregation or loss of ingredients. Deposit concrete as nearly as practicable to its final position. During placing, make any free vertical drop of the concrete less than one meter 3 feet. Remove concrete which has segregated in conveying or placing.

2.3.3.2 Placing and Casting

**************************************************************************
NOTE: Select chamfer required. Consult with local producers. Where project requires a large quantity of piling, a specific value may be specified, otherwise, use a minimum or a range of values.
**************************************************************************

Perform concrete casting within 3 days after pretensioning steel; however, do not deposit concrete in forms until placement of reinforcement and anchorages have been inspected and approved by pile manufacturer's quality control representative. Produce each pile of dense concrete straight with smooth surfaces with reinforcement retained in its proper position during fabrication. Use vibrator with heads smaller than the minimum distance between steel for pretensioning. Make surface of pile ends perpendicular to axis of pile. Chamfer, [a minimum of 19 mm 3/4 inch,] [between 19 and 31 mm 3/4 and 1 1/4 inch,] ends of piles and corners of square piles.

2.3.4 Curing of Piles

Cure piles using moist or accelerated curing.
2.3.4.1 Moist Curing

a. Impervious sheeting: ASTM C171; waterproof paper, clear or white polyethylene sheeting, or polyethylene-coated burlap.

b. Pervious sheeting: AASHTO M 182.

c. Liquid membrane-forming compound: ASTM C309, white pigmented, Type 2, Class B.

2.3.4.2 Accelerated Curing

After placement of concrete, moist cure for a period of 4 hours. Follow by accelerated curing until concrete has reached specified release strength. Enclose casting bed for accelerated curing with a suitable enclosure. During application of steam or heat, increase the air temperature at a rate not to exceed 22 degrees C 40 degrees F per hour. Cure at a maximum temperature of 65 degrees C 150 degrees F until concrete has reached specified release strength. Reduce temperature at a rate not to exceed 11 degrees C 20 degrees F per hour until a temperature of 11 degrees C 20 degrees F above ambient air temperature is reached. After accelerated curing, moist cure using either water or membrane curing until a total accelerated and moist curing time of 72 hours is achieved.

2.3.5 Detensioning

**************************************************************************

NOTE: Specify "release strength." Release strength of 30 MPa 4000 psi (design strength of 35 MPa 5000 psi) or 0.8 of the 28 day design strength is desirable; however, some regions use 0.7 of the design strength (25 MPa 3500 psi for design strength of 35 MPa 5000 psi). A minimum release strength of 0.6 of the design strength is required. Check with local pile manufacturers.

**************************************************************************

Perform releasing of prestressed steel in pretensioned piles in such an order that eccentricity of prestress will be minimized. Gradually release tension in strands from anchorage. Detension after approval by pile manufacturer's quality control representative. Perform transfer of prestressing force when concrete has reached a minimum compressive strength of [_____] MPa psi.

2.3.6 Marking

Mark pile to identify in-place impact face. Marking shall be clearly visible during driving.

2.4 PRODUCT QUALITY CONTROL

Where piling is manufactured in a plant with an established quality control program as attested to by a current certification in the PCI Certification Program for Quality Control, perform product quality control procedures in accordance with PCI MNL-116. Where piling is manufactured by specialists or in plants not currently enrolled in the PCI Certification Program for Quality Control, set up a product quality control system in accordance with PCI MNL-116 and perform concrete and aggregate quality control testing using an independent commercial testing laboratory approved by the
Contracting Officer in accordance with the following.

2.4.1 Aggregate Tests

Take samples of fine and coarse aggregate at the concrete batch plant and test. Perform mechanical analysis (one test for each aggregate size) in accordance with ASTM C136/C136M including determination of the specific gravity. Tabulate the results of the tests in accordance with ASTM C33/C33M.

2.4.2 Strength Tests

Sample concrete in accordance with ASTM C172/C172M at the time the concrete is deposited for each production line. Compression tests shall conform to methods of ASTM C39/C39M and ASTM C31/C31M. Perform slump tests in accordance with ASTM C143/C143M. Mold at least six cylinders per day or for every 15 cubic meter 20 cubic yards of concrete placed, whichever is greater. Test two cylinders of the set at 7 days of 14 days, or at a time for establishing transfer of prestressing force (release strength) and removal of pile from forms. Perform strength tests 28 days after molding using the remaining cylinders of the set. Cure the cylinders in the same manner as the piles and place at the point where the poorest curing conditions are offered. This is the coolest point in the bed for steam curing. Cylinders to be tested at 28 days shall be moist cured.

2.4.3 Changes in Proportions

If, after evaluation of strength test results, the compressive strength is less than the specified compressive strength, make adjustments in the proportions and water content and changes in the temperature, moisture, and curing procedures as necessary to secure the specified strength. Submit changes to the Contracting Officer in writing.

2.4.4 Compressive Strength Test Results

Evaluate compression test results at 28 days in accordance with ACI 214R using a coefficient of variation of 10 percent. Evaluate the strength of concrete by averaging the test results (two specimens) of each set (four specimens) of standard cylinders tested at 28 days. Not more than 10 percent of the individual specimens tested shall have an average compressive strength less than specified average compressive strength.

2.4.5 Chloride Ion Concentration

Sampling and determination of water soluble chloride ion content in accordance with ASTM C1218/C1218M. Maximum water soluble chloride ion concentrations in hardened concrete at ages from 28 to 42 days contributed from the ingredients including water, aggregates, cementitious materials, and admixtures shall not exceed 0.06 percent by weight of cement.

2.4.6 Chloride Ion Penetration

To ensure the durability of concrete in marine environment, concrete shall be proportioned to have the chloride ion penetration test in accordance with ASTM C1202, and be below 3000 coulombs for concrete specimens tested at 56 days.
3.1 PILE DRIVING

3.1.1 Driving Piles

Piles shall not be driven until 100 percent of design strength has been attained and until at least 14 days after detensioning. Drive piles to the indicated tip elevation and to the minimum embedment depth shown on the drawings. Pile driving shall be conducted as one continuous operation. The pile shall be driven until the resistance criterion is met. During the initial driving and until the pile tip has penetrated beyond layers of very soft soil or below the bottom of prejetted or preformed holes, use a reduced rated driving energy of the hammer of not more than 20,235 Joules or 15,000 foot-pounds per blow or as otherwise directed by the Contracting Officer, to prevent high tension-wave driving stresses which could damage the pile. Resistance criterion shall be 20 blows for 0.3 m one foot or less. The Contracting Officer may modify the criteria based upon the actual hammer being used and its rated energy and its compatibility as verified by a pile test program. If a pile fails to reach the indicated butt elevation or minimum embedment, the Contractor shall notify the Contracting Officer and perform corrective measures as directed. Provide hearing protection when noise levels exceed 140 dB.

3.1.2 Pile Driving Leads and Templates

Piles shall be driven with the hammer positioned in a fixed or swinging lead. "Free hammer" will not be permitted. Swinging lead shall be used only in conjunction with a template system to spot the piles.

3.1.3 Installation of Piles

Take care to avoid damage to piles during handling, when placing the pile in leads, and during pile-driving operations. Inspect piles when delivered, when in leads immediately before driving, and after installation. Notify the Contracting Officer of any unusual cracks and perform corrective measures as directed. Laterally support piles during driving, but allow rotation in leads. Take special care to maintain the pile orientation during driving. Square the top of the pile to the longitudinal axis of the pile. Maintain axial alignment of pile hammer with that of pile.

3.1.4 Tolerances in Driving

Drive piles with a variation of not more than one percent from vertical for plumb piles. Maintain and check axial alignment of pile and leads at start of pile driving and when the pile top is approximately 1.5 m 5 feet above the indicated elevation. Make intermediate checks of pile alignment if there is evidence of pile drifting. If subsurface conditions cause pile drifting beyond the allowable axial alignment tolerance, notify the Contracting Officer and perform corrective measures as directed. Place butts within 50 mm 2 inches of the location indicated. Manipulation of pile within specified tolerances is permitted, but do not manipulate piles more than one percent of their exposed length above the mudline. Check piles for heave. Redrive, to the indicated elevation, piles found to be heaved.
3.1.5 Jetting of Piles

*NOTE: Jetting should generally not be permitted for piles:*

1. Dependent on side friction in fine-grained low permeability soils (high clay or silt content) where considerable time is required for the soil to reconsolidate around the piles.
2. Subject to uplift or lateral forces.
3. Adjacent to existing structures.
4. In closely spaced clusters unless the load capacity is confirmed by test.

Water jets will not be permitted. Jetting may be used to assist driving piles through strata that cannot be penetrated practicably by use of the hammer alone. Driving shall be restricted to a static weight while water is being injected to prevent inducing tensile stresses in the piles which damage the concrete. After the penetration of the strata requiring jetting has been accomplished, jetting shall be discontinued and hammer driving shall be resumed. Discontinue jetting when the pile tip is approximately 1.5 m 5 feet above the indicated pile tip elevation. Drive pile the final 1.5 m 5 feet of penetration. Adequate measures shall be taken for collecting and disposing of runoff water. Jetting method and equipment shall be approved by the Contracting Officer prior to commencing jetting operation. Before starting final driving, firmly seat piles in place by application of a number of reduced energy hammer blows. Measures, including use of a silt curtain, shall be employed to contain turbid water created by jetting piles.

3.1.6 Pre-drilling of Piles

*NOTE: Predrilling should generally not be permitted for piles:*

1. Dependent on side friction in fine-grained low permeability soils (high clay or silt content) where considerable time is required for the soil to reconsolidate around the piles.
2. Subject to uplift or lateral forces.
3. Located in cohesionless soils.
4. In closely spaced clusters unless the load capacity is confirmed by test.

Predrilling to remove soil or other material representing the bulk of the volume of the pile to be driven will not be permitted. The diameter of the hole should not exceed two-thirds the width of the pile. Predrill only to a depth of [_____] meters feet below...
cut-off elevation prior to setting piles. Discontinue drilling when the pile tip is approximately 1.5 m 5 feet above the [calculated] [indicated] pile tip elevation. Drive pile the final 1.5 m 5 feet of penetration.

3.1.7 Splices

Splicing of piles is not permitted.

3.1.8 Buildup

Buildups are not permitted.

3.1.9 Pile Cutoffs

Cut off piles with a smooth level cut using pneumatic tools, sawing, or other suitable methods approved by the Contracting Officer. The use of explosives for cutting is not permitted.

3.1.10 Patching

a. Embedded Lifting Loops. Provide a 25 mm one inch minimum conical depression around embedded lifting loops. Cut off lifting loops at bottom of depression and patch depression with epoxy mortar.

b. Pile Butt. Apply 25 mm one inch thick layer of epoxy mortar cover over exposed prestressing strand on pile butt after driving.

3.2 EQUIPMENT

3.2.1 Pile Hammers

Furnish a hammer having a capacity at least equal to the hammer manufacturer's recommendation for the total weight of pile and character of subsurface material to be encountered. Obtain the required driving energy of the hammer, except for diesel hammers, by use of a heavy ram and a short stroke with low-impact velocity. The pile hammer shall be capable of operating at a reduced energy level (1/2 to 2/3 of rated energy level) during seating of the piles in preformed holes and when driving through soft or loose materials. The driving energy of the hammer, at final driving, shall be not less than 40.650 Joules 30,000 foot-pounds. At final driving, operate the pile hammer in accordance with the manufacturer's recommendation. At final driving, operate diesel-powered hammers at the rate recommended by the manufacturer for hard driving. Maintain sufficient pressure at the steam hammer so that (1) for double-acting hammer, the number of blows per minute during and at the completion of driving of a pile is equal approximately to that at which the hammer is rated; (2) for single-acting hammer, there is a full upward stroke of the ram; and (3) for differential-type hammer, there is a slight rise of the hammer base during each downward stroke.

3.2.2 Driving Helmets, Capblocks, and Pile Cushions

3.2.2.1 Driving Helmets or Caps and Pile Cushions

**************************************************************************

NOTE: Insert minimum and maximum thicknesses for pile cushion. An absolute minimum would be 75 mm 3 inches and the actual required thickness would depend upon pile length, hammer energy, design load,
required final penetration resistance, and character of subsurface material to be encountered. Generally thicker blocks are required for longer piles, larger hammers, and harder driving. A wave equation analysis is useful in determining required thicknesses for pile cushion. Minimum thickness is to protect head of pile. Pile cushion should also have a maximum thickness to ensure effective driving. Select when pile cushion is to be replaced. It is generally recommended that a new pile cushion be used at the start of driving of each pile.

**************************************************************************
Use a steel driving helmet or cap, including a pile cushion between top of pile and driving helmet or cap, to prevent impact damage to pile. The driving helmet or cap-and-pile cushion combination shall be capable of protecting the head of the pile, minimize energy absorption and dissipation, and transmit hammer energy uniformly over the top of the pile. The driving helmet or cap shall fit sufficiently loose around the top of the pile so that the pile may be free to rotate without binding within the driving helmet. The Contractor shall demonstrate to the satisfaction of the Contracting Officer that the equipment to be used on the project performs the above function. The pile cushion shall be of laminated construction using softwood boards with the grain parallel to the end of the pile. The thickness of the pile cushion shall be 300 mm 12 inches minimum. The cushion shall not be changed near the end of driving. Replace the pile cushion when it has become compressed beyond two-thirds of its original thickness, charred, or burned, or has become spongy or deteriorated in any manner. Use new cushions for initial driving of each pile. During redriving or restriking of piles, a used cushion assembly shall be used. The Contractor shall submit to the Contracting Officer at least 2 weeks before the start of pile driving operations detailed drawings of the driving helmet and pile cushion to be used.

3.2.2.2 Hammer Cushion or Capblock

**************************************************************************
NOTE: Select either wood or aluminum/micarta capblock. Delete inappropriate sentences. An aluminum/micarta capblock is recommended because of its consistent elastic properties and long life. If final pile penetration resistance is based on a wave equation analysis, the type capblock used should be the same as that used in the analysis.

**************************************************************************
Use a hammer cushion or capblock between driving helmet or cap and hammer ram consisting of [a solid hardwood block with grain parallel to the pile axis and enclosed in a close-fitting steel housing] [aluminum and micarta (or equal) discs stacked alternately in a steel housing]. Use steel plates at top and bottom of capblock. [Replace wood capblock when it becomes highly compressed, charred or burned, or becomes spongy or deteriorated in any manner.] [Replace aluminum or micarta discs that have become damaged, split, or deteriorated in any manner.] [Do not replace wood capblock during final driving of any pile.] Do not use small wood blocks, wood chips, rope, or other materials that permit excessive loss of hammer energy.
3.3 FIELD QUALITY CONTROL

3.3.1 Pile Records

For each pile, keep a record of the number of blows required for each \( 0.30 \text{ m} \) \( 0.985 \text{ feet} \) of penetration and the number of blows for the last \( 150 \text{ mm} \) \( 6 \text{ inch} \) penetration or fraction thereof. Include in the record the beginning and ending times of each operation during driving of pile, type and size of the hammer used, rate of operation, stroke or equivalent stroke for diesel hammer, type of driving helmet, and type and dimension of the hammer cushion (capblock) and pile cushion used. Record re-tap data and any unusual occurrence during driving of the pile. Include in the record performance characteristics of jet pump, unassisted penetration of pile, jet-assisted penetration of pile, and tip elevation before driving and at end of driving. Notify Contracting Officer 10 days prior to driving of piles. Submit complete and accurate records of installed piles to Contracting Officer within 15 calendar days after completion of the pile driving. Make pile-driving records available to the Contracting Officer at the job site within 24 hours of each day's pile driving. A preprinted form for recording pile driving data, the Pile Driving Log, is included at the end of this section.

Pile Driving Log

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for polymeric marine fender piling. The specification is tailored for lateral load-bearing (fender) piling, bracketed items will require editing for axial load-bearing and lateral load-bearing piles. The intended use of bearing piles is for low-capacity (40 ton or less) "short" piles. Further testing will be required before these products can be used to replace concrete or steel marine bearing piles for primary piling on a berthing pier but may have applications at Magnetic Silencing Facilities.

Load combinations for polymeric piling are in accordance with UFC 4-152-01.

Axial load-bearing piles may require a site specific geotechnical report, pile drivability studies, and dynamic or static load tests; this type of testing may not be required for typical "secondary" fender pile system placed in soft marine soils.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
NOTE: The extent and location of the work to be accomplished should be indicated on the project drawings or included in the project specification.

NOTE: For lateral load-bearing fender piles, show the following information on the drawings:

1. Locations and types of the fender piles. If more than one type of fender pile (primary, secondary, corner) is used, indicate the location of each pile type.

2. Design loads (design vessel(s), berthing angle, berthing velocity).

3. Size, shape, and length of piles.

5. Length of polymeric pile protection. (Ensure that the camels, separators or watercraft bear on the protective layer throughout the entire tidal range.)

6. Soil data, where available.

7. Embedment depth. (The piles are typically designed as pinned/pinned, therefore ensure that the bottom of the piles have lateral restraint but not moment fixity.)

PART 1  GENERAL

1.1  REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D2310  (2006; R 2012) Machine-Made "Fiberglass" (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe

ASTM D3350  (2021) Polyethylene Plastics Pipe and Fittings Materials

1.2 DEFINITIONS

See ASTM D883 for standard terminology related to plastics.

Axial load-bearing pile — A vertical or battered member driven into the ground to help support a load of any structure bearing upon it. Axial load-bearing piles are commonly divided into two kinds; point-bearing (end-bearing) and friction. A point-bearing pile derives a significant proportion of capacity at its tip and much less from contact with soil along the pile shaft. A friction pile derives its support principally from the soil along the pile shaft through the development of shearing resistance between the soil and the pile.

CFRP - Carbon Fiber Reinforced Polymers - Composite materials which consist of a polymer resin matrix, and carbon fiber reinforcement.

Extrusion - A manufacturing process where molten polymer is forced through a die of a desired shape to encapsulate fiberglass reinforced plastic or steel bars which run continuously throughout the length of the product without joints.

FRP - Fiber reinforced polymer. A polymer matrix, either thermoset or thermoplastic, reinforced with a fiber or other material with a sufficient aspect ratio (length to thickness) to provide a discernable reinforcing function in one or more directions.

GFRP - Glass fiber reinforced plastic. A composite made from fiberglass reinforcement in a plastic (polymer) matrix.

Lateral load-bearing pile — a vertical or battered member driven into the ground to resist lateral loads imposed upon it or a structure. A common application for a lateral load-bearing pile is to absorb lateral forces at points of impact and dissipate them horizontally into a structure and/or soil stratum. A fender pile is an example of a lateral load-bearing pile.

Polymer - Any of numerous natural and synthetic compounds of usually high molecular weight consisting of up to millions of repeated linked units, each a relatively light and simple molecule.

Polymeric Pile - Piling products characterized by the use of polymers, whereby (1) the pile strength or stiffness requires the inclusion of the polymer or (2) a minimum of 50 percent of the weight or volume is derived from the polymer. Polymeric piles may be reinforced by composite design for increased stiffness or strength.

Pultrusion - A continuous process for manufacturing composites that have a cross sectional shape. The process consists of pulling a fiber
reinforcing material through a resin impregnation bath and through a shaping die, where the resin is subsequently cured.

Resin - Any of numerous physically similar polymerized synthetics or chemically modified natural resins. Two main types of polymers used for resins include thermoset and thermoplastic materials.

Thermoset Plastics (thermosets) - Refer to a range of polymer materials that once cured do not flow or melt when heated. Thermoset materials are transformed through the addition of energy into a stronger substance. Thermoset materials are usually liquid or malleable prior to curing and designed to be molded into their final form; or used as adhesive. Thermoset polymer resins can be transformed into plastics or rubbers by cross-linking. A thermoset material cannot be melted and re-molded after it is cured. Thermoset materials are generally stronger than thermoplastic materials. They are also better suited to high temperature applications. They are not easily recyclable like thermoplastics, which can be melted and re-molded. Examples of thermoset plastics include: natural rubber, Bakelite, Urea-Formaldehyde, Melamine, Polyester Resin, and Epoxy Resin.

Thermoplastics - Most thermoplastics are high molecular weight polymer chains, mostly joined through weak dispersion forces and more rarely dipole-dipole interactions. Thermoplastic polymers are usually contrasted with thermosetting polymers, which cannot go through melt/freeze cycles. Many thermoplastic materials are addition polymers (chain growth polymers), such as polyethylene and polypropylene.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification.
and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Material Test Reports; G[, [____]]
1.4 DELIVERY, STORAGE, AND HANDLING

Inspect each pile for surface damage, cracks, blemishes, scaring and straightness upon delivery. Record the condition of each pile and submit the delivery inspection list to the Contracting Officer. Do not incorporate materials damaged in transport from plant to site. Handle the piles with ropes or nylon slings without dropping, breaking, bruising or penetrating outer surface with tools. Do not use cant dogs, peaveys, hooks or pikepoles. Protect piles from damage. Store piles above the ground on blocking which is shaped or padded and prevent scaring or sagging of the piles. Cover and arrange storage racks to permit air circulation.

1.5 BASIS OF BIDS

1.5.1 Polymeric Piles

Base bids on the type, number, diameter, and length of piles as indicated. Should the total number of piles vary from that specified as the basis for bidding, the Contract price will be adjusted in accordance with Contract Clause entitled "Changes". Adjustment in Contract price will not be made for cutting off piles, for any portion of a pile remaining above the cutoff elevation, or for broken, damaged or rejected piles.

PART 2 PRODUCTS

2.1 PILE CLASSIFICATION

1. Type I - Polymeric only

*************************************************************************
NOTE: Solid and tubular polymeric section are included.
*************************************************************************

2. Type II - Polymeric with reinforcement in the form of chopped, milled or continuous fiber or mineral

*************************************************************************
NOTE: The most common Type II piles are recycled
*************************************************************************
HDPE reinforced with chopped glass fibers and composite plastic lumber.

3. Type III - Polymeric with reinforcement in the form of metallic bars, or cages, or shapes

NOTE: The most common Type III piles are plastic piles with steel reinforcing or a steel pipe core.

4. Type IV - Polymeric with reinforcement in the form of non-metallic bars or cages

NOTE: The most common Type IV piles are plastic piles with a fiberglass reinforcing cage.

5. Type V - Polymeric composite tube with a concrete core

NOTE: The most common Type V piles are fiberglass tubes with concrete fill placed prior to driving.

6. Type VI - Any other polymeric piling meeting the requirements of this specification and not otherwise described above, such as hollow polymeric composite tubes driven without a concrete core.

NOTE: The Type VI pile section provides for new types of polymeric pilings. Examples of "new" piling types with respect to ASTM D7258, include polymeric composite tube installed (driven) without a concrete core.

2.2 POLYMERIC PILES

Provide polymeric piles manufactured as specified. Include dimensions, material specifications, and method of manufacturing. Provide all polymeric piles of a particular type manufactured by a single manufacturer. Permanently tag each pile with the pile's serial number, date of fabrication and manufacturer's name. Place the stamp or tag two to four feet from the top of the pile and ensure it is visible after installation. Splices will not be permitted, unless approved by the Contracting Officer. Provide pile driving tips, when required, per manufacturer's recommendations.

2.3 PERFORMANCE REQUIREMENTS

NOTE to Designer: Polymeric piles are not recommended for the replacement of single fender piles when the polymeric pile stiffness is different than that of the pile being replaced. When this
occurs, the more flexible pile will not carry its share of the berthing load. As an example, polymeric piles will usually be more flexible than timber piles, in which case the timber piles adjacent to the polymeric piles will take increased loads, which may cause the piles to fail. Therefore, single or limited replacement of the timber piles are not recommended. Transverse misalignment of the piles can also cause individual piles to fail, and precautions to minimize this occurrence should be taken.

Comparison values for a typical timber pile

Typical ASD Design Properties for treated Southern Yellow Pine (SYP) marine pile per ASTM D25:
Allowable Axial compression: 1250 psi
Allowable Bending Strength 1950 psi
Allowable Shear Perpendicular to Grain 160 psi
Allowable Compression Perp. to grain 440 psi
Modulus of Elasticity 1,500,000 psi
Modulus of Rupture(MOR) 7,300 psi
90 percent MOR (accidental berthing) 6,570 psi
"Operational" Bending Strength 3,900 psi

For a 12 in. butt 50 ft long SYP pile with a 7 in. tip treated for marine use (Bending moments taken at mid height).

Allowable Axial Capacity "short" 24 ton (48 kip)
Mid Height Diameter 9.5 in.
Mid Height Section Modulus 84.2 in.^3
Mid Height Moment of Inertia 400.0 in.^4
Stiffness = 'E' x 'I' 600,000.0 kip-in^2
Allowable Moment Capacity (FS = 3.73) 13.7 kip-ft
Operational Moment Capacity (FS = 1.87) 27.3 kip-ft
Accidental Moment Capacity (FS = 1.11) 46.1 kip-ft

See UFC 4-152-01 Section 5-4.4.3(a) for allowable timber stresses on fender piles for normal/operational and accidental berthing. FS = Factor of Safety based on rupture strength = 7.3 ksi x 84.2 in^3/12 = 51.2 kip-ft. Axial capacity does not consider Euler buckling (Short Column).

For pultruded members the minimum factor of safety is 2.5 for flexure and 3.0 for compression, shear, and connections.

Determine the cross-sectional dimensions of piles on the basis of the ability to perform satisfactorily under the physical loading and environmental conditions imposed and to effectively perform the energy absorption properties desired. Submit the Performance Test Data to substantiate the performance. The performance requirements listed are allowable (service level) values. For berthing/flexure the minimum factor of safety is [2.0][2.5] for normal/operational loads. For compression and shear, the minimum factor of safety is [2.5][3.0].
2.4 PERFORMANCE CHARACTERISTICS

**************************************************************************
NOTE: The designer must fill in the required performance characteristics for each pile, for a particular application. Provide a separate table for each pile type and application.
**************************************************************************

Provide the following performance characteristics for each pile:

<table>
<thead>
<tr>
<th>DESCRIPTION</th>
<th>VALUE</th>
<th>UNITS</th>
<th>TEST METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structural Outer Dimension/Diameter</td>
<td>[_____]</td>
<td>mm in.</td>
<td>N/A, +/- 10 percent</td>
</tr>
<tr>
<td>Allowable Moment Capacity</td>
<td>[_____]</td>
<td>kNm kip-ft</td>
<td>ASTM D7258</td>
</tr>
<tr>
<td>Allowable Axial Capacity - Short Column</td>
<td>[_____]</td>
<td>kg kip</td>
<td>ASTM D7258</td>
</tr>
<tr>
<td>Flexural Rigidity (EI)</td>
<td>[_____]</td>
<td>kg-mm² lb-in²</td>
<td>ASTM D6109, +/- 10 percent</td>
</tr>
<tr>
<td>Allowable Shear Capacity</td>
<td>[_____]</td>
<td>kg kip</td>
<td>ASTM D7258</td>
</tr>
</tbody>
</table>

2.4.1 Allowable Moment Capacity

Submit the allowable bending moment for the particular pile selected based on the ASTM testing procedures indicated.

2.4.2 Allowable Axial Capacity

**************************************************************************
NOTE: Allowable axial capacity is the structural capacity of the piling. See UFC 3-220-01 for geotechnical capacity. A load test may be appropriate for critical load bearing applications to allow the use of the lowest geotechnical factor of safety.
**************************************************************************

Submit the allowable axial capacity based on the ASTM testing procedures indicated. Unless noted otherwise the allowable axial capacity must be based on a short member without considering slenderness effects.

2.4.3 Flexural Rigidity (EI)

**************************************************************************
NOTE: Maximum deflection and operational level deflections are based on the Flexural Rigidity of the member. Consider service level deflections under all operational load combinations in UFC 4-152-01. Pay special attention to environmental
loads which may cycle the product into a state of fatigue. For bearing piles consider deflection limits stated in UFC 1-200-01.

Flexural rigidity "EI" is defined as the product of Modulus of Elasticity "E" times Moment of Inertia "I". "EI" is related to the slope of a moment-deflection curve in accordance with ASTM D6109. Determine the values for "EI" from the peak load at failure.

2.4.4 Allowable Shear Capacity

Submit the allowable shear capacity based on the ASTM testing procedures indicated.

2.4.5 Allowable Stresses

Submit the following: allowable flexural stress, allowable shear stress, allowable bearing stress perpendicular to the member, allowable bearing stress parallel to the member, allowable tensile stress, and allowable compressive stress. See paragraph PERFORMANCE REQUIREMENTS for minimum factor of safety. [Use allowable tensile and compressive stresses for Wave Equation Analysis.]

2.5 SIZE TOLERANCES

Unless specified otherwise refer to the tolerances listed in ASTM D7258.

2.6 MATERIALS

2.6.1 Physical Properties

NOTE: The designer must select the appropriate pile types and fill in the required physical properties for each pile. Properties which do not apply to a particular pile type may be deleted or indicated as n/a.

Submit Material Test Reports, as applicable, for each type of material. See below for the required:

1. Water Absorption, ASTM D570, < 3 percent at 24 hours.

2. Brittleness, ASTM D746, no break.

3. Hardness, ASTM D2240 Shore D, [60].

2.6.2 Type III and IV Polymeric Piles

2.6.2.1 Placement of Reinforcing

In accordance with ASTM D7258, place longitudinal reinforcement within 5
percent of the specified radial location as measured from centroid of the cross-section of the pile. Longitudinal reinforcement will not twist more than 5 degrees over any 6.1 m 20 foot section of the pile. The minimum cover is 25 mm 1 inch.

2.6.3 Type V Polymeric Piles

2.6.3.1 Polymeric Composite Tube

Manufacture polymeric composite pile comprising of material which provides the tube strength. Manufacture the tube in accordance with ASTM D2996 and ASTM D2310.

2.6.3.2 Outer Surface

Furnish an outer surface comprising of a suitable, high impact, marine grade coating that provides a protective barrier as well as wear and impact resistance. It must provide an ultraviolet and chemical resistant barrier of at least 0.75 mm 0.03 inch thickness and be of a black opaque color.

2.6.3.3 Inner Surface

Provide an inner surface of a pure polymeric liner layer of at least 0.64 mm 0.025 inch thickness for alkalinity resistance. Roughen or wrinkle the inner surface to provide adhesion of the inner shell to the concrete fill.

2.6.3.4 Concrete Fill

Fill the composite tube completely with concrete in accordance with the manufacturer's written instructions. Furnish concrete with a minimum 28-day compressive strength of 41.4 MPa 5,000 psi. Submit a concrete mix design certifying that the proportioning of the mix is in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE for specified strength and is based upon aggregate data which has been determined by laboratory tests during the last twelve months.

2.6.3.5 HDPE Sleeve

Provide HDPE sleeve per paragraph POLYMERIC PILE PROTECTION.

2.6.3.6 Type VI Hollow Polymeric Piles

2.6.3.6.1 Hollow Polymeric Composite Tube

Furnish hollow polymeric composite tube satisfying the requirements of ASTM D7258.

2.6.3.6.2 Concrete Fill

**************************************************************************
NOTE: For lateral-load bearing (fender) piles, at a minimum place a concrete "plug" a distance D above and a distance of 2*D below the upper support to prevent crushing/local buckling of the hollow tube at the point of impact (D = outside diameter of the pile).
**************************************************************************

Fill the composite tube with concrete [to [_____] m [_____] ft below the
pile top][from the pile top to the mudline] after driving. Provide concrete with a minimum 28-day compressive strength of 34.5 MPa 5,000 psi. Submit a concrete mix design certifying that the proportioning of the mix is in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE for specified strength and is based upon aggregate data which has been determined by laboratory tests during the last twelve months.

2.6.3.6.3 HDPE Sleeve

Provide HDPE sleeve per paragraph POLYMERIC PILE PROTECTION.

2.7 PILE FINISHING

2.7.1 Polymeric Pile Protection

Provide the polymeric piles such that the rubbing surface of the piles has an abrasion resistance less than 0.5g per ASTM D4060. If the materials are reactive to seawater, protect the pile by encasing in an HDPE sleeve or abrasion resistant polymer, with a minimum thickness of 13 mm 1/2 inch. Extend the protective encasement, as a minimum, from 0.6 m 2 feet below the mean lower low water (MLLW) to 0.3 m 1 feet below the pile support, unless indicated otherwise.

**************************************************************************
NOTE: The length of protection may need to be increased for barges or other flat sided vessels and for systems supporting deep draft separators. The contact surface for barges may be near the deck level if there is a rail, or if the piles are sloped the contact area may be near the bottom of the hull. The contact areas must consider the upper and lower rub strips for deep draft separators.
**************************************************************************

2.7.1.1 HDPE Sleeve

Provide ASTM D3350, 2 - 3 percent carbon black UV stabilized HDPE sleeve. Attach as indicated or per Manufacturer's recommendation to protect the lateral load-bearing pile. Provide length as indicated in paragraph POLYMERIC PILE PROTECTION. Furnish sleeve with minimum wall thickness of 13 mm 1/2 inch, and hardness of 62 (Shore D) per ASTM D2240.

2.7.2 Surface Condition

Ensure that the pile surface exhibiting roughness or corrugations due to manufacturing processes, do not have depressions or projections greater than 12 mm 1/2 inch and less than 5,800 mm² 9 in² in surface area. The surface of the pile is required to be free of any cracks or splits, in any orientation.

2.7.3 Pile Cover

Furnish the polymeric piles with approved pile tops, concrete fill sloped to drain, or encapsulated in polymeric material.

2.7.3.1 Pile Tops

Furnish the polymeric top with a thickness of approximately 6 mm 0.25 inches and color to match the pile. Secure the top in place with 6 mm diameter
by 38 mm 1/4 inch diameter by 1 1/2 inch long Type 316 stainless steel screws spaced a maximum of 100 mm 4 inches on center. Center the screws in the ribbon band of the top. Use appropriate screw types for the matrix material and place in pilot holes.

2.8 SOURCE QUALITY CONTROL

2.8.1 Plant Inspection

The Contracting Officer reserves the right to perform plant inspection of the polymeric pile manufacturing process. Provide the Contracting Officer a minimum two weeks advance notice, indicating the date manufacturing is to start and tests that will be conducted. Allow the Contracting Officer unlimited access to the plant and inspection privileges for each facet of the manufacturing process.

2.8.2 Curing

2.8.2.1 Type I, II, III, IV and VI Polymeric Piles

Cure piles at the plant as recommended by the manufacturers prior to shipment to the site.

2.8.2.2 Type V Polymeric Piles

Fill Type V piles with concrete prior to driving. Support the pile to prevent sag during concrete placement and curing. Cure a minimum of one week prior to placement of the concrete fill. Move piles to curing table within 20 minutes of wet concrete placement. Do not handle or transport piles for seven days or until concrete has reached 85 percent of the 28 day compressive strength. Drive concrete filled piles after full strength has been obtained or after 28 days of curing.

2.9 DRIVABILITY

Furnish piles capable of being driven by contractors vibratory, air, steam, diesel or hydraulic hammers without damage to the pile anywhere along its length, with the exception of a sacrificial 0.6 m 2 ft at pile head.

2.10 MANUFACTURER'S WARRANTY

Warranty all polymeric piles to be free from defects in materials and workmanship for a period of ten years. The Contracting Officer has the right to require complete replacement of any pile with material or workmanship defects. All construction costs related to the repair or replacement of the defective piles are at Manufacturer's expense. This warranty need not cover repairs required as a result of normal wear and tear, misuse, mishandling, extreme weather, failure to perform routine maintenance, non-recommended or improperly executed alterations by anyone other than the Manufacturer, tampering, loading of the pile beyond its rated capacity, improper installation, or other use inconsistent with Manufacturer's specifications.

2.11 CONTRACTOR'S WARRANTY

Warranty all polymeric piles to be free from defects in materials caused by mishandling prior to installation and improper installation for a period of 5 years. The Contracting Officer has the right to require complete replacement of any pile deemed by the Contracting Officer to have defects.
due to mishandling or improper installation. All construction costs related to the repair or replacement of the defective piles are at the Contractor's expense.

PART 3 EXECUTION

3.1 PILE DRIVING EQUIPMENT

Select the proposed pile driving equipment, including hammers and other required items, and submit complete descriptions of the proposed equipment. Provide driving helmet, pile caps, pile driving tips and driving pads as recommended by the pile Manufacturer for the polymeric piles.[ Final approval of the proposed equipment is subject to the satisfactory completion and approval of pile tests.] Changes in the selected pile driving equipment will not be allowed after the equipment has been approved except as specified and directed. No additional contract time will be allowed for Contractor proposed changes in the equipment.

3.1.1 Pile Driving Hammers

Provide impact[ or vibratory] type pile driving hammers.

3.1.1.1 Impact Hammers

Use an air, steam, diesel or hydraulic powered hammer, of an approved type. The capacity of the driving hammer is required to meet or exceed the hammer manufacturer's recommendation for the total weight of pile and character of subsurface material to be encountered. In accordance with paragraph SUBMITTALS, submit the following information for each impact hammer proposed:

a. Make and model.

b. Ram weight.

c. Anvil weight.

d. Rated stroke.

e. Rated energy range.

f. Rated speed.

g. Steam or air pressure, hammer, and boiler[ and][ or] compressor.

[ h. Rated bounce chamber pressure curves or charts, including pressure correction chart for type and length of hose used with pressure gage.

] i. Pile driving cap, make, and weight.

j. Cushion block dimensions and material type.

k. Power pack description.

3.1.1.2 Vibratory Hammers

[The use of vibratory hammers is dependent upon satisfactory driving and load testing of piles. ]}[Final approval of the proposed hammer and other driving equipment is subject to the satisfactory completion and approval of
the pile tests.  [The size or capacity of hammers must be as recommended by the hammer manufacturer for the total pile mass weight and the character of the soil formation to be penetrated. ] Provide a rigid connection between the hammer and the pile. In accordance with paragraph SUBMITTALS, submit the following information for each vibratory hammer proposed:

a. Make and model.
b. Eccentric moment.
c. Dynamic force.
d. Steady state frequency or frequency range.
e. Vibrating weight.
f. Amplitude.
g. Maximum pull capacity.
h. Non-vibrating weight.
i. Power pack description.

3.1.2 Pile Driving Leads

Support and guide hammers with fixed extended leads or fixed underhung leads. Operate vibratory hammers free hanging without leads. For driving battered piles, support and guide impact hammers with three-axis, fixed-extended leads capable of 1 H and 2-1/2 V fore and aft batter and 1 H on 6 V side batter, with 30 degree rotation each side of an axis running along the center line of rotation of the crane through the center line of the leads. For driving battered piles, support and guide vibratory hammers with fixed extended leads or templates. Provide two intermediate supports for the pile in the leads to reduce the unbraced length of the pile during driving.

3.1.3 Pile Extractors

Use vibratory pile extractors for pile extraction.

3.1.4 Jetting Equipment

Provide jetting equipment with at least removable or fixed jet of the water or combination air-water type. Design water jet so that the discharge volume and pressure are sufficient to freely erode the material immediately under and adjacent to piles without resulting in pile drift. Submit jetting equipment including plant description, volume of water and pressure, and size and length of hoses and pipes in accordance with paragraph SUBMITTALS.

[3.2 PRELIMINARY WORK

[3.2.1 Wave Equation Analysis of Pile Drivability

**************************************************************************
NOTE: This section may be applicable for axial load-bearing piles only.
**************************************************************************
a. Prior to driving any pile, submit a pile Wave Equation Analysis, performed by the Contractor's Geotechnical Consultant, for each size pile and distinct subsurface profile condition. Take the following into account for the analysis: the proposed hammer assembly, pile cap block and cushion characteristics, the pile properties and estimated lengths and the soil properties anticipated to be encountered throughout the installed pile length based on static capacity analysis with consideration of driving gain/loss factors. Only one specific model of pile hammer may be used for each pile type and capacity.

b. Demonstrate with the Wave Equation Analysis that the piles will not be damaged during driving and the driving stresses will be maintained within the limits stated in paragraph ALLOWABLE STRESSES. Indicate the blow count necessary to achieve the required ultimate static pile capacities.

c. Upon completion of the dynamic and static testing programs outlined in this specification section, perform a refined Wave Equation Analysis taking into consideration the evaluated capacities, gain/loss factors and recommended production pile lengths. Develop production pile driving criteria based on the results of the refined Wave Equation Evaluations.

d. Furnish pile driving equipment approved by the Contractor's Geotechnical Consultant. Complete the attached pile and driving equipment data form, including hammer information, in full as part of the submittal of the results of the Wave Equation Analyses.

e. The cost of performing the Wave Equation Analyses must be paid for by the Contractor. Include the cost in the base bid.

][3.2.2 Order List

Submit an itemized list for piles to the Contracting Officer for approval prior to placing the order with the supplier. Indicate the pile lengths required at each location as shown on the plans and the corresponding ordered length of each pile on the list. [Complete load testing and refined wave equation analysis prior to submission of an order list.]

][3.3 INSTALLATION

3.3.1 On Site Storage

Continually support all stored piles in a manner which minimizes creep, saddling and sag.

3.3.2 Preexcavation

3.3.2.1 Jetting of Piles

**************************************************************************

NOTE: Jetting should generally not be permitted for piles:

1. When capacity is dependent on side friction in fine-grained, low-permeability soils high clay or silt content) where considerable time is required for soil to reconsolidate around the piles.
2. Subject to uplift.

3. Adjacent to existing structures.

4. In closely spaced clusters unless the load capacity is confirmed by test and unless all jetting is done before final driving of any pile in the cluster.

Jetting of piles is not permitted without the approval of the Contracting Officer.

3.3.2.2 Spudding of Piles

Spudding of piles is not permitted without the approval of the Contracting Officer. If spudding is allowed, limit it to an elevation 1.5 meters 5 feet above the specified pile tip elevation.

3.3.2.3 Predrilling of Piles

NOTE: If predrilling is permitted by the Geotechnical Engineer of Record, it is recommended to use an auger smaller than the diameter of the pile.

Predrilling of piles is not permitted without the approval of the Contracting Officer. If predrilling is allowed, limit it to an elevation 1.5 meter 5 feet above the specified pile tip elevation.

3.3.3 Driving Piles

Notify Contracting Officer 10 days prior to driving of [test] piles [and load test]. Drive piles to [indicated] [or below calculated] tip elevation to reach a driving resistance established by the wave equation analyses (WEAP) in accordance with the schedule which the will prepare from the test-pile driving data. During initial driving and until pile tip has penetrated beyond layers of very soft soil [or below bottom of predrilled or prejetted holes], use a reduced driving energy of the hammer as required to prevent pile damage. Refusal criteria must be established by the Contracting Officer. If a pile fails to reach the indicated [or calculated] tip elevation, [or if a pile reaches [calculated] tip elevation without reaching required driving resistance,] notify Contracting Officer, provide pile record and perform corrective measures as directed. Provide hearing protection in accordance with EM 385-1-1. Piles may be driven without pile guides or leads providing a hammer guide frame is used to keep the pile and hammer in alignment.

3.3.3.1 Protection of Piles

Square the heads and tips of piles to the driving axis. Laterally support piles during driving, but do not unduly restrain piles from rotation in the leads. The use of swinging or hanging leads is at the Contractor's risk. Repair any damage incurred by such use at the Contractor's expense.
3.3.3.2 Tolerances in Driving

Drive piles in the locations indicated. Place each pile, at its contact with the design mudline or mudline elevation indicated in the construction documents, no further than 40 mm per meter 0.5 inch per foot of free pile length (length in meters feet above the average soil contact line at each pile) in a direction parallel to the pier face and 10 mm per meter 0.125 inch per foot of the free pile length in a direction perpendicular to the pier face. Remove and replace with new piles those damaged, mislocated, driven below the design cutoff, or driven out of alignment.

3.3.4 Buoyant Piles

After driving buoyant piles, provide temporary framing or weights to prevent the pile from floating up out of the ground. Keep the temporary framing or weights in place until the pile is secured in place. If there is sufficient friction provided by the soil to prevent the pile from floating, the Contractor may, at his own risk, waive the temporary framing or weight requirement.

3.3.5 Pile Cutoff

Provide each polymeric pile a minimum of 0.6 meter 2 feet longer than the specified length to allow the top to be cut off if it is damaged during driving. Cut off piles with a smooth level cut using pneumatic tools, sawing, or other suitable methods per the polymeric pile Manufacturer's recommendations. Use of explosives for cutting is not permitted. Cut off pile heads level and sound. Cut off piles at no additional cost to the Government.

3.3.6 Fastening

Fasten the polymeric piles as indicated.

[3.4 PILE TESTS

**************************************************************************
NOTE: Pile tests may be applicable for axial load-bearing piles.

This specification allows for two types of pile tests: pile driving tests and pile load tests. Pile driving tests are used to determine the blow count required to drive a pile to a given penetration or to refusal on a hard layer. Pile driving tests may be performed with a pile driving analyzer attached to piles to record the information listed below. Pile load tests are used to determine pile capacity. The combination of pile driving tests and pile load tests gives information on pile capacity versus refusal blow count. Pile driving analyzer data may be used in some instances in place of pile load tests to reduce the number of load tests required for a project.

**************************************************************************

[3.4.1 Dynamic Testing of Piles

[Provide ][Employ ]a specialty engineering firm to perform dynamic testing
of piles[ and job piles] to determine velocity of stress wave propagation, acceleration, monitor hammer and drive system performance, assess pile installation stresses and integrity[, and to evaluate pile capacity]. Furnish personnel experienced in performing wave equation analysis, dynamic testing, the use of the Pile Driving Analyzer and its related equipment, and interpretation of results to install and operate the testing equipment and to interpret its results. Furnish equipment to obtain dynamic measurements, record, reduce and display its data and meet the requirement of ASTM D4945. The equipment must have been calibrated within 12 months thereafter throughout the contract duration. Supply all power requirements for operating the equipment. Submit Pile Driving Analyzer data within one [day][week] after each test is completed.

3.4.1.1 Test Piles

Perform dynamic testing on [_____] test piles as indicated. Test piles are at least [3 m10 ft] longer than minimum indicated job pile length. Perform testing during the full length of pile driving.[ Restrike piles installed as part of pile driving test after a minimum waiting period of [_____] days.][ Warm up the hammer prior to restriking.][ Restrike the pile for 50 blows or until the pile penetrates an additional 75 mm 3 inches, whichever occurs first. In the event the pile movement is less than one-quarter inch during restrike, the restrike may be terminated after 20 blows.]

3.4.1.2 Job Piles

Perform dynamic pile testing on [_____] job piles during the full length of initial driving[ and during restrike driving]. Tested piles must be as [indicated] [selected by the Contracting Officer over the duration of installation]. The Contracting Officer will direct testing of additional piles if the hammer or driving system is modified or replaced.

3.4.1.3 Reports

Prepare and submit a summary report of dynamic test results for test piles. Submit reports of the dynamic testing of piles within[ seven days][ two weeks] after dynamic testing is completed. Discuss in the report pile capacity obtained from dynamic testing, velocity of stress wave propagation, acceleration, evaluation of hammer and driving system performance, driving stress levels, and pile integrity. Perform[ a CAPWAPC, or similar, analysis of the dynamic test data on data obtained from the end of initial driving and the beginning of restrike for [_____] test piles as directed. Use the analysis to predict pile capacity, establish resistance distribution, and predict quake and damping factors.] Include refined wave equation analyses incorporating the results of dynamic testing and analysis.[ For job piles, prepare and submit a field summary report. Include energy transferred to the pile, calculated driving stresses, pile integrity and estimated pile capacity at the time of testing in the field summary report.] Include in the report for the test piles[ and the monthly report for job piles] the pile driving record as an attachment and also address the items listed in ASTM D4945, paragraph titled "Dynamic Testing."

][3.4.2 Pile Load Tests

**************************************************************************

NOTE: Each ASTM pile load test specification listed offers a number of options as to how the test is
performed. Specify the required load testing option and any modifications to include other desired requirements.

Insert the number of test piles to be load tested. The safe design capacity of a test pile to be determined based on the failure criteria indicated.

Perform load tests at locations shown, or as directed. Provide testing and measuring equipment, perform loading, and provide observation facilities for personnel to inspect, record, and analyze settlement/movement and deflection of piles under test loads. Do not mobilize load test equipment until directed by the Contracting Officer. Perform pile load tests under the supervision of a registered professional engineer provided by the Contractor and experienced in conducting pile load tests. Loading frames and equipment for pile load tests must be ready to be placed in operation as soon as a load test pile has been driven. Provide loading equipment of sufficient capacity to apply the maximum load specified in a safe manner. Start loading of each test pile when directed.

The Contractor is responsible for the application of loads. Accurately determine and control the magnitude of applied loads using a calibrated load cell and readout device. The design working load, as confirmed by the results of load tests, will be determined by the Contracting Officer. Load test piles indicated or directed to be driven in permanent locations may be incorporated into the work if, after satisfactory completion of load test, they are approved for inclusion in the work. Any pile load test not accomplished in accordance with this specification will be rejected. A new pile load test must be conducted for each rejected pile load test. The Contractor must compile a report for each pile load test including, as a minimum, all applicable information required by the specified test.

[3.4.2.1] Compressive Load Test

Perform [_____] pile compressive load tests in accordance with ASTM D1143/D1143M [as modified]. Apply a compressive load of [_____] kN to each compressive load test pile.

[3.4.2.2] Tensile Load Test

Perform [_____] pile tensile load tests in accordance with ASTM D3689 [as modified]. Apply a tensile load of [_____] kN tons to each tensile load test pile.

[3.4.2.3] Lateral Load Test

Perform [_____] pile lateral load tests in accordance with ASTM D3966/D3966M [as modified]. Perform lateral load tests consisting of jacking two piles apart with a hydraulic jack, with one pile serving as the reaction pile for the other. Apply a lateral load of [_____] kN tons to each pair of lateral load test piles. Take required movement readings and record for each pile.

[3.4.2.4] Safe Design Capacity

Load test piles to twice the anticipated working load unless failure occurs first. The safe design capacity of a load test as determined from the
results of load tests is the lesser of the two values computed according to the following:

a. One-half the load that causes a net settlement after rebound of not more than 0.029 mm per kN 0.01 inch per ton of total test load.

b. One-half the load that causes a gross settlement of not more than 25 mm 1 inch provided the load settlement curve shows no sign of failure.

3.5 FIELD TREATMENT

3.5.1 Polymeric Work

Field treat cuts, bevels, notches, refacing and abrasions made in the field in accordance with the Manufacturer’s recommendations.

3.6 FIELD QUALITY CONTROL

3.6.1 Inspections

Inspect piles when delivered and when in the leads immediately before driving. Secure piles in their proper alignment.

When Government inspections result in product rejection, promptly segregate and remove rejected material from the premises. The Government may also charge the Contractor an additional cost of inspection or testing when prior rejection makes reinspection or retesting necessary.

3.6.1.1 Straightness

ASTM D7258. Reject piles not meeting with the straightness criteria.

3.6.1.2 Cracks and Defects

Inspect each pile for cracks and defects prior to driving. After the piles are installed and all connections to the structure are completed, inspect each pile again for cracks and defects. Notify the Contracting Officer of any cracking or other defects observed and await direction. The Contracting Officer may reject any piles with defects. The Contractor is responsible for all costs incurred to replace the rejected piles.

3.6.2 Pile Driving Inspection

Perform special inspection of the pile installation. Employ approved Special Inspectors as required in the paragraph QC SPECIALIST DUTIES AND QUALIFICATIONS in Section 01 45 00 QUALITY CONTROL.

3.6.3 Pile Records

For each pile, keep a legible record of the number of blows required for each 0.30 m foot of penetration[ and the number of blows for the last 150 mm 6 inch penetration or fraction thereof]. Include in the record the beginning and ending times of each operation during driving of pile, type and size of the hammer used, rate of operation, stroke or equivalent stroke for diesel hammer, type of driving helmet, and type and dimension of the hammer cushion (capblock) and pile cushion used. Record re-tap data and any unusual occurrence during driving of the pile. Include in the record performance characteristics of jet pump, unassisted penetration of pile, jet-assisted penetration of pile, and tip elevation before driving and at
end of driving. Notify Contracting Officer 10 days prior to driving of piles. Submit complete and accurate records of installed piles to Contracting Officer within 15 calendar days after completion of the pile driving. Make pile-driving records available to the Contracting Officer at the job site within 24 hours of each day's pile driving. A preprinted form for recording pile driving data, the Pile Driving Log, is included at the end of this section.

NOTE: This guide specification covers the requirements for extruded and molded marine fenders.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Fender type should be selected based on the following considerations:

1. Performance, including energy, berthing angle, reaction, and hull pressure.

2. Geometry, including stand-off, dock configuration, vessel configuration, and tidal variation.

3. Configuration and construction, including corrosion resistance, netted vs not netted, magnetic permeability, buoyancy and portability.
The following information shall be shown on the project drawings:

1. Location, size, and mounting elevation (if applicable) of each fender type.

2. Connection details to the waterfront structure. Include connection sizes, material type, embedment, plate sizes and hole sizes and locations, as applicable.

PART 1  GENERAL

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN WELDING SOCIETY (AWS)

AWS D1.1/D1.1M  (2020; Errata 1 2021) Structural Welding Code - Steel

ASTM INTERNATIONAL (ASTM)

ASTM A479/A479M (2023a) Standard Specification for Stainless Steel Bars and Shapes for Use in Boilers and Other Pressure Vessels

ASTM A563 (2021; E 2022a) Standard Specification for Carbon and Alloy Steel Nuts

ASTM D575 (1991; R 2012) Rubber Properties in Compression

ASTM D1894 (2014) Static and Kinetic Coefficients of Friction of Plastic Film and Sheeting

1.2 SYSTEM DESCRIPTION

1.2.1 Extruded Fenders

**************************************************************************
NOTE: Extruded fender systems typically absorb a minimum amount of energy. Therefore, they are typically used at the wale elevation of fender pile systems. They have also been used as festoon fenders, rub strips and as an energy absorbing element in a separator.
**************************************************************************

Extruded fenders are elements typically manufactured in a long length by an extrusion process. After manufacture, the elements are cut to length. These fender elements are typically used as fenders for small craft, rub strips on marine structures, and energy absorbing elements at the wale. Examples of extruded fender shapes are 'Side Mounted Hollow Bore', 'Cylindrical', 'D', 'Square', 'W' and 'Wing'.

1.2.2 Molded Fenders

**************************************************************************
NOTE: Molded fenders are typically mounted to the vertical face of a marine structure. These systems are used to berth ships of similar size and hull curvature. Therefore, they are usually found in commercial ports.
**************************************************************************
Molded fenders are elements manufactured by the molded process. They typically have embedded metal plates cast into the molds. The fender elements are typically used as fenders for medium to large, flat sided vessels. The elements can be used as stand-alone fenders, combined with multiple fenders and a face panel, and energy absorbing elements at the wale. They include the shear fenders which absorb energy by deflecting parallel to the attachment plane. Examples of molded fender shapes are 'Leg Type', 'Arch Type', 'Cell Type', and 'Cone Type'.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Panels; G[, [_____]]
SD-03 Product Data

Stainless Steel Hardware; G[, [____]]
Galvanized Steel Hardware; G[, [____]]
Restraint Chains; G[, [____]]
Facing; G[, [____]]
Extruded Fender; G[, [____]]
Molded Fender; G[, [____]]

SD-05 Design Data

**************************************************************************

NOTE: Performance requirements: the rated energy of the fender shall be no less than the calculated berthing energy and the rated fender reaction shall not exceed the allowable load on the structure supporting it.

The maximum reaction divided by the corresponding contact area, shall be less than or equal to the maximum specified hull pressure for fender panels.

Structural components shall be sized in accordance with the latest edition of AISC allowable stress design, including effects for internal spacing of stiffeners. Panel loads shall be based on the greater of:

1. Horizontal line contact applied at any elevation over the flat height of the panel.
2. Simultaneous horizontal line contacts at top and bottom edge of the front face of the panel.

Design factor for attachment points, restraints and nets shall be based on 1.5 times the dynamic shear. The end attachment load shall not exceed 80 percent of yield. Restraints shall be sized such that the load applied to the weakest component does not exceed 50 percent of its breaking strength.

A weak link, preferably a shackle, swivel or other readily replaceable, cost effective component shall be designed to fail first. Concrete embedments shall have a break out capacity of at least 1.5 times the characteristic load of the weakest link.

Mechanical hardware, such as fasteners shall be sized with a design working load that does not exceed 60 percent of the lower of the yield or breaking load.

**************************************************************************

Rubber Fenders; G[, [____]]
1.4 DELIVERY, HANDLING AND STORAGE

Fenders must be undamaged when delivered. Handle and store fenders so as to prevent damage, such as bending or abrading end fittings, cutting of rubber, or damage to coating of hardware. Protect fenders from exposure to damaging liquids, oils, greases and extended exposure to sunlight.

1.4.1 Rejection

Fenders that are delivered to the site in a damaged condition or that are not in conformance with this specification are subject to rejection. Replace any rejected materials with suitable materials, at no additional cost to the Government.
1.4.2 Fender Marking

Unless unsuitable for specified fender or otherwise specified, identify all fenders in readable characters at least 25 mm (1 in) high, either directly or on corrosion- and sunlight resistant permanently attached tags. The markings must include the following:

a. Full or abbreviated manufacturer name,

b. fender size model or part number designation,

c. fender serial number, and

d. other information as the purchase specification or contract requires.

1.4.3 Fender Instructions and Manual

Provide installation instructions and a fender manual describing maintenance requirements for each fender type.

1.4.4 Handling Coated Material

Store, handle and place coated material in a manner that will minimize damage to the coating and will not reduce its effective protective value. Repair damaged surfaces as directed and per the Manufacturer's recommendations. Handle coated work which is flexible in a manner that will prevent flexing sufficient to crack coating, especially when temperature is below 4 degrees C (40 degrees F). Do not place coated surfaces on strips or skids until coating has hardened thoroughly. Wide fabric slings used for lifting, and strips, slings, blocks, skids, cradles, and other supports must provide ample bearing areas. In transporting, fasten and protect coated materials in a manner that will prevent movement and preclude chafing and rubbing, and when unloading, do not dump or drop. Place coated material in position carefully on suitably prepared beds and with a minimum of handling.

1.5 QUALITY ASSURANCE

1.5.1 Extruded Fenders, Molded Fenders

Fender elements must be manufactured of rubber, homogeneous and free from any defects, impurities, pores or cracks. Where internal plates are used, the rubber must be bonded to integral steel mounting plates. The plates must be fully encased in rubber to a minimum thickness of 2 mm (1/16 inch).

1.5.2 Elastomer Skin

The elastomer skin of the fender must be free from cracks, burrs, warpage, checks, chipped or blistered surfaces, and must have a smooth surface.

1.5.3 Steel Fabrication

The steel used in fabrication must be free from kinks, sharp bends, and other conditions which would be detrimental to the finished product. Manufacturing processes must not reduce the strength of the steel to a value less than intended by the design. Manufacturing processes must be done neatly and accurately. Make bends by controlled means to insure uniformity of size and shape.
1.5.4 Welding

AWS D1.1/D1.1M. Provide sufficient size and shape welds to develop the full strength of the parts connected by the welds. Welds must transmit stress without permanent deformation or failure when the parts connected by the weld are subjected to proof and service loadings.

PART 2 PRODUCTS

2.1 EXTRUDED AND MOLDED FENDERS

2.1.1 Configuration

Provide dimensions, material specifications, and method of manufacture for each type of fender.

2.1.1.1 Extruded Fender

Fenders must be extruded and continuous in the length indicated. The fenders must be black in color. The fenders must have a truncated "A" cross section shape and be attached to the structure at the base, the widest dimension, of the arch. The connecting hardware must be fully exposed. No encased hardware or molded fenders are allowed. The fender and hardware must be designed and factory tested to the loads per linear meter foot of fender specified in paragraph PERFORMANCE. Fender anchor bolts and method of anchorage must be of the size and spacing required by the manufacturer's design and testing; however, the size and spacing of anchor bolts indicated must be construed to be the minimum required, unless exceeded by the requirements of the fender manufacturer's design.

2.1.1.2 Molded Fender

Fenders must be molded and continuous in the length indicated up to the maximum mold size available. Molded sections must not be mechanically bonded. The fenders must be black in color. Each fender must be molded of rubber, homogeneous and free from any defects, impurities, pores or cracks, and bonded to integral, steel mounting plates. The mounting plates must be fully encased in rubber with a minimum thickness of 2 mm 1/16 inch. The fender and hardware must be designed for and be factory tested to the loads specified. Fender anchor bolts and method of anchorage must be of the size and spacing dimensions required by the manufacturer's design and testing; however, the size and spacing of anchor bolts indicated must be construed to be the minimum required, unless exceeded by the requirements of the fender manufacturer's design.

2.1.2 Elastomer

The elastomer must be the ethylene propylene dimonomer (EPDM) or a blend of NR/SBR, as specified in ASTM D2000, with the following line callout:

**************************************************************************
NOTE: Coordinate values with calculated design requirements. The 3BA 720 compound is the typical compound. The 3BA 620 compound has approximately 70 percent of the energy capacity and a reduced reaction. Other compounds may be available.
**************************************************************************

a. 3BA 720 A_{14} B_{13} C_{12} EA_{14} Fl_{7}
The elastomer must have the following properties:

---

**NOTE: Coordinate values with calculated design requirements.**

---

---

2.1.3 Performance Requirements

---
NOTE: This performance criteria should be tailored for extruded and molded shapes. Coordinate values with calculated design requirements.

**************************************************************************
Submit rated performance data (RPD) and published performance curves per ASTM F2192 or PIANC 2002 for the rubber fenders.

Each of the rubber fenders must have the following performance characteristics:

<table>
<thead>
<tr>
<th>SIZE</th>
<th>ENERGY ABSorption</th>
<th>REACTION FORCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>[<em><strong><strong>] m x [</strong></strong></em>] m</td>
<td>[_____] kN-m</td>
<td>[<em><strong><strong>] kN x [</strong></strong></em>]</td>
</tr>
<tr>
<td>[<em><strong><strong>] ft x [</strong></strong></em>] ft</td>
<td>[_____] ft-kips</td>
<td>[_____] kips</td>
</tr>
</tbody>
</table>

When vertically compressed by a plate extending the full length and width of a 1 meter 3.28 feet section of the fender, the fender must absorb [_____] [_____] newton-meters [_____] foot-pounds of energy with a corresponding load of not more than [_____] [_____] N [_____] [_____] pounds.

2.1.4 Test Reports

Perform tests on the specified fender within 5 years of submittal of the reports for approval. Test reports must be accompanied by notarized certificates from the manufacturer certifying that the tested material is of the same type, size, quality, manufacture and make as that proposed to be supplied. Perform the following tests:

a. Minimum Tensile Strength
b. Shore Hardness (Durometer)
c. Modulus at 200 Percent Elongation
d. Maximum Compression Set
e. Tear Resistance
f. Minimum Elongation
g. Ozone Resistance
h. Low Temperature Impact Resistance
i. Water Absorption
j. Heat Resistance
k. Compression Deflection Resistance
l. Fender Compression Test

**************************************************************************
NOTE: Coordinate values with calculated design
Compress fender along its longitudinal axis between two parallel flat plate surfaces to its rated deflection. Record load and the corresponding deflection at 6 mm \(\frac{1}{4}\) inch increments and plot as a graph of load versus deflection. The Load-Deflection curve must then be integrated to generate an Energy-Deflection curve for the fender.

2.1.5 Break-In Deflection

Break-in deflection is required for buckling type fenders with reaction ratings of 100 tonnes or more, or if the energy-absorbing material has a reaction decrease of more than 10 percent between its original deflection and its fifth deflection. Break-in deflection must be to at least the manufacturer's rated deflection. The number of break-in cycles must be sufficient to assure each elements first on-dock reaction will not exceed it fully broken-in reaction by more than 10 percent.

2.1.6 Fender Hardware

Provide manufacturer's product data for all fender hardware, including bolts, anchor bolts, inserts, nuts, washers, chains, turnbuckles, dimensions, material specifications, working loads and ultimate loads, as applicable. For anchor bolts and inserts, include methods and materials for installation.

2.1.6.1 Stainless Steel Hardware

Submit stainless steel hardware certificates of compliance certifying that materials meet the requirements specified herein.

NOTE: It is recommended that all concrete inserts be of stainless steel materials.

2.1.6.1.1 Plates and Angles

ASTM A479/A479M, Type 316L stainless steel for plates, angles, and miscellaneous hardware required to attach the fenders to the structure.

2.1.6.1.2 Bolts, Nuts, and Washers

ASTM F593 or ASTM F594, Group 2 (316 alloy) stainless steel for nuts and bolts. ASTM F844 for washers, except fabricate washers of 316 alloy stainless steel.

2.1.6.1.3 Antiseize Compound

MIL-PRF-907.

2.1.6.2 Galvanized Steel Hardware

NOTE: Galvanized steel hardware may be used at locations where the hardware can be easily replaced.
All hardware must be hot-dip galvanized in accordance with ASTM A123/A123M, ASTM A153/A153M or ASTM B695, as applicable.

Submit galvanized steel hardware certificates of compliance certifying that materials meet the requirements specified herein. In addition, when the coating is shop applied, submit certificates of conformance or compliance certifying that surface preparation, coverage, and thickness meet the requirements specified.

2.1.6.2.1 Plates

ASTM A36/A36M.

2.1.6.2.2 Bolts, Nuts and Washers

2.1.6.2.3 Restraint Chains and Shackles

Chain and shackles must meet the requirements of FS RR-C-271. The chain assembly must have a design safety factor of 3:1 based on minimum breaking strength.

2.1.7 Panels

Panel design must be of closed box construction for optimum strength and corrosion resistance. Material thickness must be 10 mm 3/8 inch minimum when one side is exposed and 12 mm 1/2 inch minimum when both sides are exposed. Submit shop drawings indicating the dimensions of the panels.

2.1.7.1 Facing

Provide UHMWPE (ultra high molecular weight polyethylene) facing per ASTM F648 on the panels that is ultraviolet stabilized with 2.5 percent carbon black or equivalent, minimum 12 mm 1/2 inch wear thickness and 12 mm 1/2 inch clamping thickness, with a 0.20 maximum coefficient of friction per ASTM D1894. The UHMWPE must exhibit no failure when tested per ASTM D256, Method B. Configure the facing connections to account for the thermal properties of the polyethylene.

PART 3 EXECUTION

3.1 EXTRUDED FENDERS AND MOLDED FENDERS

Tighten the bolts per the manufacturers requirements.

3.2 WELDING

Perform welding in accordance with AWS D1.1/D1.1M.

3.3 CONNECTIONS

3.3.1 Antiseize Compound

Coat threads of bolts prior to applying washers and nuts. Recoat bolt thread projection beyond nut after tightening.

NOTE: This guide specification covers the requirements for foam-filled marine fenders.

Adhere to [UFC 1-300-02](https://www تحقيق المواءة والمعافاة بين المستخدمين) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://www تحقيق المواءة والمعافاة بين المستخدمين).

NOTE: Fender type should be selected based on the following considerations:

1. Performance, including energy, berthing angle, reaction, and hull pressure.

2. Geometry, including stand-off, dock configuration, vessel configuration, and tidal variation.

3. Configuration and construction, including corrosion resistance, netted vs not netted, magnetic permeability, buoyancy and portability.

The following information shall be shown on the project drawings:
1. Location, size, and mounting elevation (if applicable) of each fender type.

2. Connection details to the waterfront structure. Include connection sizes, material type, embedment, plate sizes and hole sizes and locations, as applicable.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN BUREAU OF SHIPPING (ABS)

ABS 2  (2019) Rules for Building and Classing Steel Vessels

AMERICAN WELDING SOCIETY (AWS)

AWS D1.1/D1.1M  (2020; Errata 1 2021) Structural Welding Code - Steel

ASTM INTERNATIONAL (ASTM)

1.2 SYSTEM DESCRIPTION

1.2.1 Foam-Filled Fenders

**NOTE:** Foam-filled fenders are typically used at berths that support ships of various sizes and with a variety of hull curvatures. Due to the wide variety of ship types that berth at Naval facilities, the foam-filled fenders are typically the fender of choice.

Foam-Filled fenders are fenders typically manufactured by wrapping closed cell foam with a nylon reinforcement embedded in a polyurethane coating. The fenders typically used for fendering have an internal chain, though fenders having an external chain/tire netting have also been used. The fenders are typically used for berthing of medium to large vessels; vessels with considerable hull curvature; and at berths that support various ship types and sizes. The fenders can be used as stand-alone fenders, fendering between ships, or between a ship and a berthing structure.
1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Foam-Filled Fenders; G[, [_____]]

SD-05 Design Data

**************************************************************************

NOTE: Performance requirements: the rated energy of the fender shall be no less than the calculated berthing energy and the rated fender reaction shall not exceed the allowable load on the structure supporting it.
The maximum reaction divided by the corresponding contact area, shall be less than or equal to the maximum specified hull pressure for fender panels.

Deflected standoff at specified energy must be greater than or equal to minimum specified standoff. The undeflected standoff, including nets if any, shall not be greater than any specified undeflected standoff.

Fender design load shall be less than the rated reaction of the fender. Static shear force shall use the minimum static coefficient of friction. Dynamic shear force for foam-filled, pneumatic and hydro-pneumatic shall be the rated reaction times the difference between the coefficient of friction between the structure and fender and the coefficient between the fender and vessel times a factor of safety of 1.5. Dynamic shear force for rubber fenders for slicing surfaces shall be twice the maximum published dynamic coefficient of friction. For UHMW against steel, use 0.20 or the maximum published for the coefficient of friction.

The ultimate elastomeric elongation shall be at least three times the maximum elongation anticipated at maximum design conditions. The bond strength of the elastomer to its substrate shall be greater than the elastomer's tensile strength at the ultimate elongation.

Structural components shall be sized with a design load that does not exceed 80 percent of yield. Panel loads shall be based on the greater of:

1. Horizontal line contact applied at any elevation over the flat height of the panel.
2. Simultaneous horizontal line contacts at top and bottom edge of the front face of the panel.

Design factor for attachment points, restraints and nets shall be based on 1.5 times the dynamic shear. The end attachment load shall not exceed 80 percent of yield. Restraints shall be sized such that the load applied to the weakest component does not exceed 50 percent of its breaking strength.

A weak link, preferably a shackle, swivel or other readily replaceable, cost effective component shall be designed to fail first. Concrete embedments shall have a break out capacity of at least 1.5 times the characteristic load of the weakest link.

Mechanical hardware, such as fasteners shall be sized with a design working load that does not exceed 60 percent of the lower of the yield or breaking load.
Foam-filled fenders should have at least 50 percent of the contact dimension in bearing on the supporting structure, or as recommended by the manufacturer. The contact surface for all floating fenders when not under load, should have low abrasion characteristics. Typically UHMWPE or plastic is used to face concrete or composite elements in the wear area.

SD-08 Manufacturer's Instructions

Installation Instructions

SD-10 Operation and Maintenance Data

Fender Manual

SD-11 Closeout Submittals

Foam-Filled Fenders - Warranty; G

1.4 DELIVERY, HANDLING AND STORAGE

Fenders must be undamaged when delivered and must be handled and stored so as to prevent damage, such as bending or abrading end fittings, cutting of rubber, or damage to coating of hardware. Protect fenders from exposure to damaging liquids, oils, greases and extended exposure to sunlight.

1.4.1 Rejection

Fenders that are delivered to the site in a damaged condition or that are not in conformance with this specification are subject to rejection. Remove and replace any rejected materials with suitable materials, at no additional cost to the Government.

1.4.2 Fender Marking

Unless otherwise specified, all fenders must be identified in readable characters at least 25 mm 1 inch high, either directly or on corrosion- and sunlight resistant permanently attached tags. The markings must include the following:

a. full or abbreviated manufacturer name,
b. fender size model or part number designation,
c. fender serial number,
d. other information as the purchase specification or contract requires.

1.4.3 Fender Instructions and Manual

Provide installation instructions and a fender manual describing maintenance requirements for each fender type.

1.4.4 Handling Coated Material

Store, handle, and place coated material in a manner that will minimize damage to the coating and will not reduce its effective protective value. Repair damaged surfaces as directed and per the Manufacturer's recommendations. Handle coated work which is flexible in a manner that will prevent flexing sufficient to crack coating, especially when temperature is below 4 degrees C 40 degrees F. Do not place coated surfaces on strips or skids until coating has hardened thoroughly. Wide fabric slings used for lifting, and strips, slings, blocks, skids, cradles, and other supports must provide ample bearing areas. In transporting, fasten and protect coated materials in a manner that will prevent movement and preclude chafing and rubbing, and when unloading, do not dump or drop. Place coated material in position carefully on suitably prepared beds and with a minimum of handling.

1.5 QUALITY ASSURANCE

1.5.1 Elastomer Skin

The elastomer skin of the fender must be free from cracks, burrs, warpage, checks, chipped or blistered surfaces, and have a smooth surface.

1.5.2 Foam Core

The foam core must be homogeneous and of one piece fabricated construction and not be in chip or granular form. The foam core must not contain scraps, strips, or sheets of foam either rolled or stuffed into the required shape unless pieces are bonded together in layers of uniform patterns to form a homogeneous, one piece core. Foam widths less than 48 inches are not acceptable. Homogeneous foam rings of adequate thickness to insure performance of the fender are acceptable if a minimum 5-year performance of similar fenders is provided.

1.5.3 Steel Fabrication

The steel used in fabrication must be free from kinks, sharp bends, and other conditions which would be detrimental to the finished product. Manufacturing processes must not reduce the strength of the steel to a value less than intended by the design. Manufacturing processes must be done neatly and accurately. Make bends by controlled means to insure uniformity of size and shape.

1.5.4 Welding

AWS D1.1/D1.1M. Provide welds of sufficient size and shape to develop the full strength of the parts connected by the welds. Welds must transmit
stress without permanent deformation or failure when the parts connected by the weld are subjected to proof and service loadings.

1.6 **FOAM-FILLED FENDERS - WARRANTY**

**************************************************************************

NOTE: The warranty requirements in this guide specification have been approved by a Level I Contracting Officer in accordance with the requirements of Naval Facilities Acquisition Supplement (NFAS).

NFAS can be found at the following link:
https://www.navfac.navy.mil/

The paragraphs in this guide specification may be used without further approval.
**************************************************************************

Furnish the manufacturer's warranty. Issue the warranty directly to the Government. It must not be limited in dollar value. The warranty period must not be less than 1 year from the date of Government acceptance of the work.

**PART 2  PRODUCTS**

2.1 **FOAM-FILLED FENDERS**

Prior to fabrication, submit copies of the manufacturer's catalog data including reaction, energy and percent compression curves, dimensions material specifications, and method of manufacture.

2.1.1 Configuration

Fenders must have cylindrical mid-bodies with conical or hemispherical shaped ends terminating in an end fitting on the cylinder's centerline at each end. The diameter of the mid-body must be 60 inches minimum, and the length of the mid-body must be 73 inches minimum. If conical ends are provided, they must have an angle of 60 to 75 degrees, when measured from the central axis of the fender. The fittings at either end must be connected through the center of the fender by a chain, must terminate in a clevis fitting sized for the indicated shackle and must swivel to allow the end fitting to rotate freely on the axis of the fender. Design end fitting as small as possible to transmit the ultimate load of the shackle to the fender. Size the end fitting so as not to contact loading surfaces when the fender is compressed to 30 percent of its original diameter (70 percent compression). Each end fitting must not be a continuous member; however, each independent end fitting must be of sufficient length to span all of 3 feet in the center of the fender. Permanently affix the end fitting to the fender core with urethane elastomer prior to applying the skin. Fill interior of the fender with energy absorbing closed-cell foam as specified. The use of chipped or particulate foam is not acceptable.

Dimensional tolerance: plus or minus 4 percent for diameter and length.

2.1.2 Foam Core

The energy absorbing foam core must be a closed-cell cross-linked polyethylene foam with the following properties:
a. Density, ASTM D1667, [52 to 104] \([\text{____} \text{ to } \text{____}]\) kg/m\(^3\) [3.3 to 6.5] \([\text{____} \text{ to } \text{____}]\) lbs/ft\(^3\)

b. Tensile strength, ASTM D3575 or ASTM D412, [550] \([\text{____} \text{ kPa} \text{ or } \text{____} \text{ psi}] \) minimum

c. Elongation (ultimate), ASTM D3575 or ASTM D412, [40 percent] \([\text{____} \text{ to } \text{____}]\) minimum

d. Water absorption percent volume after 24 hour exposure, ASTM D1667, [5.0 percent] \([\text{____} \text{ maximum}]\)

e. Continuous service temperature, [minus 54 to 49 degrees C] [minus 65 to 120 degrees F] \([\text{____} \text{ to } \text{____}]\)

f. 25 percent compressive set, ASTM D1667, [8 percent] \([\text{____} \text{ maximum} *]\)

g. 50 percent compressive set, ASTM D3575, [12 percent] \([\text{____} \text{ maximum} *]\)

* Option: Compressive Set of foam core material must be based on either the 25 percent or the 50 percent requirement listed.

2.1.3 Fender Skin

The outer fender skin must be minimum [32] \([\text{____} \text{ mm} \text{ or } \text{____} \text{ inches}]\) thick and constructed of elastomer as specified. Produce the fender skin with a singular homogeneous material. Multiple material types or layers are not permitted. Reinforcing is mandatory. Reinforcement utilizing a fabric is prohibited. Filament reinforcing is required. [Twelve][____] separate filament reinforcing wraps must be applied as specified under Filament Wrap. Evenly distribute the filament wraps in the inner 80 percent to 90 percent of the coating thickness. The outer 10 percent to 20 percent of elastomer must have no filament reinforcing. Apply the elastomer and filaments in a continuous manner to assure adhesion between the various layers. Design and size the connection of the skin to the end fittings to transmit twice the safe tensile capacity of the chain into the fender skin.

Dimensional Tolerance: -10 percent

2.1.3.1 Elastomer

The elastomer used in the fender skin must be non-marking solvent free 100 percent PTMEG (polytetramethylene ether glycol) polyether urethane elastomer, ultraviolet stabilized with 2.5 percent carbon black or equivalent, with the following unreinforced properties:

a. Shore A. hardness, ASTM D2240, [80 to 95] \([\text{____} \text{ to } \text{____}]\).

b. Tensile strength, ASTM D412, [19.3] \([\text{____} \text{ MPa} \text{ or } \text{____} \text{ psi}] \) minimum.

c. Elongation (ultimate), ASTM D412, [300 percent] \([\text{____} \text{ minimum}]\).

d. Tear strength, ASTM D470, [1.25] \([\text{____} \text{ kg per mm} \text{ or } \text{____} \text{ lbs/inch}] \) minimum.

e. Flex life (Ross), ASTM D1052, [200,000] \([\text{____} \text{ cycles minimum}]\).
2.1.3.2 Filament Wrap

Construct each filament reinforcing wrap of continuous filaments applied in a helical pattern, at a helix angle of 0.79 to 1.05 rad (45 to 60 degrees) to the longitudinal axis of the buoy. A wrap must consist of two such filament helixes of equal but opposing helix angles. The spacing between the filaments in the same helix must be no more than 3 mm (1/8 inch), measured in a direction parallel to the longitudinal axis of the fender. Each wrap must extend along the entire longitudinal axis of the fender and also encase the fender end fittings and secure them to the fender body. The reinforcing filaments must be nylon tire cord of 0.00028 kg per m (2540 denier) weight with the following properties:

b. Elongation (ultimate), [18] [_____] percent

2.1.3.3 Color

Fender skin color must be black throughout the entire thickness. Galvanized hardware must be unpainted.

2.1.3.4 Repairability

The fender casing must be repairable in the event of tears or punctures in the elastomer skin. The repaired area must have not less than 90 percent of the properties as specified in paragraph ELASTOMER. Required repair materials must be readily available from the fender manufacturer.

2.1.4 Internal Hardware

The internal chain connecting the two end fittings and the two end fittings must be galvanized in accordance with ASTM A123/A123M or ASTM A153/A153M as appropriate. The chain and end clevis fitting must have a minimum ultimate tensile capacity of [640,000] [_____] N [144,000] [_____] pounds. The internal chain and end clevis fitting must have a minimum ultimate tensile capacity of [578,000] [_____] N [130,000] [_____] pounds. Shackles must be [45] [_____] mm (1 3/4) [_____] inches and have a minimum ultimate tensile capacity of [289,000] [_____] N [65,000] [_____] pounds.

2.1.5 Performance Requirements

Each foam-filled fender must have the following performance characteristics:

<table>
<thead>
<tr>
<th>SIZE</th>
<th>ENERGY ABSORPTION</th>
<th>REACTION FORCE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>at 60 percent compression</td>
<td>at predicted energy attainment</td>
</tr>
<tr>
<td>[<em><strong><strong>]mm x [</strong></strong></em>]mm</td>
<td>[_____] kN-m</td>
<td>[<em><strong><strong>] kN x [</strong></strong></em>]</td>
</tr>
<tr>
<td>[<em><strong><strong>]ft x [</strong></strong></em>]ft</td>
<td>[_____] ft-kips</td>
<td>[_____] kips</td>
</tr>
</tbody>
</table>

Design the resilient, foam filled marine fenders so that when compressed across its diameter by two parallel flat plates extending the full length and width of the fender, the fender absorbs [221,500] [_____] foot-pounds.
of energy plus 15 percent when [60] percent compressed (i.e. to a dimension of [40] percent of its original diameter) with a corresponding load of not more than [712,000] N [160,000] pounds plus 15 percent. Also design the fender to withstand a sustained reaction force of 667,200 N [150,000] pounds for a duration of not less than 24 hours each occurrence for at least 200 occurrences during its 10-year predicted life.

Submit the foam-filled marine fenders rated performance data (RPD) and published performance curves per ASTM F2192 or PIANC 2002.

2.1.6 Test Reports

Perform tests on the specified fender within 5 years of submittal of the reports for approval. Test reports must be accompanied by notarized certificates from the manufacturer certifying that the tested material is of the same type, size, quality, manufacture and make as that proposed to be supplied. Perform the following tests:

2.1.6.1 Fender Cyclic-Compression Test

Compress the fender along its diameter between two parallel flat plate surfaces to a compressed dimension of 40 percent of its original diameter. Repeat the compression and release cyclic loadings for a minimum of 10 full cycles of compression. Permanent deformation, cracking, or tearing of the fender skin, fender core, or end fittings must constitute failure of this test.

2.1.6.2 Fender Sustained-Load Test

Apply a [667,000] N [150,000] pound compressive load and hold this load for 24 hours. Record load and deflection each hour. Immediately after release of the load, measure rebound of the fender. Continue to record fender rebound for 24 hours. Failure of the fender or foam core to rebound to 90 percent of its original diameter after 24 hours must constitute failure of this test. If the foam core is not bonded to the skin of the fender, devise and execute a means for measuring rebound of the foam core and for measuring the void between the foam core and the skin. The maximum rate of compression per minute must be 20 percent of the total reaction force at 60 percent compression. The full compression cycle, not including rebound, must take a minimum of 5 minutes.

2.1.6.3 Fender Pull-Through Test

Devise and perform a test which will measure the resistance of the end fittings and internal chain to pull through the longitudinal axis of the fender. Failure of the chain, end fittings, or skin to resist at least [178,000] N [40,000] pounds of pull-through tension must constitute failure of this test. After loading, evidence of permanent deformation, cracking, or tearing of the fender or end fittings must also constitute failure of this test.

2.1.6.4 Skin Thickness Core Test

******************************************************************************

NOTE: The suggested number of fenders that should be tested is as follows:

SECTION 35 59 13.17  Page 13
<table>
<thead>

</tbody>
</table>

[After fabrication of all of the fenders and prior to fender shipment to the construction site, perform a minimum of 3 skin thickness tests per fender for each of 1 2 3 4 fenders to be selected at random by the Contracting Officer. ]Test locations on the fenders will be selected by the Contracting Officer. Verify testing by an ABS inspector prior to fender shipment. Each test must consist of taking a 6 mm 1/4 inch diameter (minimum) to 13 mm 1/2 inch diameter (maximum) core from the fender skin which can be removed from the skin and examined for thickness of elastomer and placement of reinforcing (when reinforcing is required). Take skin thickness measurements from the core sample and record measurements noting placement of reinforcing. Where the skin thickness measurement is less than the specified minimum, or the minimum required by the design (whichever is greater) by more than 10 percent, reject the fender. In addition, if the average of skin thickness tests for one fender is not equal to or greater than the specified minimum, or the minimum required by the design (whichever is greater), reject the fender. If tested fender is rejected, at the option of the Contracting Officer, the conduct thickness tests for additional fenders. Replace rejected fenders with fenders meeting the provisions of this specification. Test replacement fenders for skin thickness as specified herein. Skin thickness tests will be witnessed by the Contracting Officer. Notify the Contracting Officer 10 working days prior to conducting skin thickness tests. After skin thickness testing, patch core holes with elastomer of the same composition and thickness as the specified elastomer skin. Nylon reinforcing is not required in core hole patches.

2.1.6.5 Foam Core Density Test

During the skin thickness testing the fender must be cored to the center of the fender (up to the internal chain). A hole saw long enough to reach the center of the fender must be used to extract the foam sample. The fender manufacturer must provide the ABS inspector with the appropriate hole saw to perform the test. Test the foam sample at one-foot incremental depths to determine the conformance to the density requirements of this specification. Reject fenders with nonconforming foam.

After skin thickness and foam core testing, patch core holes with foam of the same density (provided by the fender manufacturer with the delivery of the fenders) and elastomer of the same composition and thickness as the specified elastomer skin. Nylon reinforcing is not required in core hole patches.

Testing must be verified by an ABS inspector prior to fender shipment.
2.1.7 Connecting Hardware

The connecting chain, swivel and shackles must be galvanized in accordance with ASTM A123/A123M or ASTM A153/A153M, as appropriate. The hardware must be as follows:

<table>
<thead>
<tr>
<th>Item</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chain</td>
<td>ABS 2, Grade 2, Stud Link or Open Link</td>
</tr>
<tr>
<td>Shackle</td>
<td>FS RR-C-271, Type IVA, Class 3, Grade A</td>
</tr>
<tr>
<td>Swivel</td>
<td>FS RR-C-271, Type VII, Class 2</td>
</tr>
</tbody>
</table>

All connecting bolts and pins must be of mild steel, matching the properties of the shackle bow. For Class 3 shackles, secure the bolt or pins in place with stainless steel (Type 316) cotter pins or locking pins.

PART 3 EXECUTION

3.1 FOAM-FILLED FENDERS

Install fenders as indicated on the drawings and in accordance with the manufacturer's specifications and shop drawings. Tighten bolts an additional 1/3 turn of the nut, from the snug tight condition, and secured with cotter pins.

3.2 WELDING

Perform welding in accordance with AWS D1.1/D1.1M.

3.3 CONNECTIONS

3.3.1 Antiseize Compound

Coat threads of bolts prior to applying washers and nuts. Reccoat bolt thread projection beyond nut after tightening.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for pneumatic and hydro-pneumatic marine fenders.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Fender type should be selected based on the following considerations:

1. Performance, including energy, berthing angle, reaction, and hull pressure.

2. Geometry, including stand-off, dock configuration, vessel configuration, and tidal variation.

3. Configuration and construction, including corrosion resistance, netted vs not netted, magnetic permeability, buoyancy and portability.

The following information shall be shown on the project drawings:
1. Location, size, and mounting elevation (if applicable) of each fender type.

2. Connection details to the waterfront structure. Include connection sizes, material type, embedment, plate sizes and hole sizes and locations, as applicable.

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SYSTEM DESCRIPTION

1.2.1 Pneumatic and Hydro-pneumatic Fenders

***NOTE: Pneumatic fenders are inflated with air and float on the surface of the water to serve as a protective buffer for ships. Hydro-pneumatic fenders are similar, but contain water in addition to the pressurized air, with a counterweight at one end so the fender is partially submerged and are specifically designed for the berthing of submarines.***

Pneumatic and hydro-pneumatic fenders are constructed of an inner rubber layer, reinforcing cord layers and an outer rubber layer that form a synthetic-cord-rubber sheet, which forms a cylindrical air-bag with
hemispherical heads at each end, which can be inflated with air. These fenders can be used as stand-alone fenders, fendering between ships, or between a ship and a berthing structure. In hydro-pneumatic fenders, the upper hemispherical head has a top plate that allows internal placement of water and air into the bag, and the lower hemispherical head has a bottom plate that provides a connection location for the counterweight. The air-bag typically has a long cylindrical shape and is counter-weighted to float vertically. Hydro-pneumatic fenders are typically used as fenders for submarines, acting as buffers between submarines and berthing structures and as separators between submarines. Hydro-pneumatic fenders can be used in combination with foam-filled fenders or pneumatic fenders to support both ships and submarines at the same berth, if designed appropriately.

1.3 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
NOTE: Performance requirements: the rated energy of the fender shall be no less than the calculated berthing energy and the rated fender reaction shall not exceed the allowable load on the structure supporting it.

The maximum reaction divided by the corresponding contact area, shall be less than or equal to the maximum specified hull pressure for fender panels.

Deflected standoff at specified energy must be greater than or equal to minimum specified standoff. The undeflected standoff, including nets if any, shall not be greater than any specified undeflected standoff.

Fender design load shall be less than the rated reaction of the fender. Static shear force shall use the minimum static coefficient of friction. Dynamic shear force for pneumatic and hydro-pneumatic shall be the rated reaction times the difference between the coefficient of friction between the structure and fender and the coefficient between the fender and vessel times a factor of safety of 1.5. Dynamic shear force for rubber fenders for slicing surfaces shall be twice the maximum published dynamic coefficient of friction. For UHMW against steel, use 0.20 or the maximum published for the coefficient of friction.

The ultimate elastomeric elongation shall be at least three times the maximum elongation anticipated at maximum design conditions. The bond strength of the elastomer to its substrate shall be greater than the elastomer's tensile strength at the ultimate elongation.

Structural components shall be sized with a design load that does not exceed 80 percent of yield. Panel loads shall be based on the greater of:

1. Horizontal line contact applied at any elevation over the flat height of the panel.

2. Simultaneous horizontal line contacts at top and bottom edge of the front face of the panel.

Design factor for attachment points, restraints and nets shall be based on 1.5 times the dynamic shear.
The end attachment load shall not exceed 80 percent of yield. Restraints shall be sized such that the load applied to the weakest component does not exceed 50 percent of its breaking strength.

A weak link, preferably a shackle, swivel or other readily replaceable, cost effective component shall be designed to fail first. Concrete embedments shall have a break out capacity of at least 1.5 times the characteristic load of the weakest link.

Mechanical hardware, such as fasteners shall be sized with a design working load that does not exceed 60 percent of the lower of the yield or breaking load.

Pneumatic and hydro-pneumatic fenders should have at least 50 percent of the contact dimension in bearing on the supporting structure, or as recommended by the manufacturer. The contact surface for all floating fenders when not under load, should have low abrasion characteristics. Typically UHMWPE or plastic is used to face concrete or composite elements in the wear area.

Pneumatic and Hydro-Pneumatic Fenders - Warranty; G

1.4 DELIVERY, HANDLING AND STORAGE

Deliver fenders undamaged. Handle and store fenders as to prevent damage, such as bending or abrading end fittings, cutting of rubber, or damage to coating of hardware. Protect folded fender corners from forklift and/or maintenance while tires that could possibly damage the outer rubber and reinforced layers of the fender. Protect fenders from exposure to damaging liquids, oils, greases and extended exposure to sunlight.

1.4.1 Rejection

Fenders that are delivered to the site in a damaged condition or that are not in conformance with this specification are subject to rejection. Replace any rejected materials with suitable materials, at no additional cost to the Government.

1.4.2 Fender Marking

Unless otherwise specified, identify all fenders in readable characters at least 25 mm 1 inch high, either directly or on corrosion- and sunlight resistant permanently attached tags. For fenders 2500 mm 8 feet in diameter, the letter heights must be a minimum of 100 mm 4 in. The markings must include the following:

a. International Standard number and applicable year, i.e. ISO 17357-1:2014.

b. size (Diameter and Length),

c. initial internal pressure,

d. date of manufacture or its abbreviation,

e. full or abbreviated name of manufacturer

f. individual serial number,

g. type of reinforcement layer,
h. other information as the purchase specification or contact requires.

1.4.3 Fender Instructions and Manual

Provide installation instructions and a fender manual describing maintenance requirements for each fender type.

1.4.4 Handling Coated Material

Store, handle, and place coated material in a manner that will minimize damage to the coating and will not reduce its effective protective value. Repair damaged surfaces as directed and per the Manufacturer's recommendations. Handle coated work which is flexible in a manner that will prevent flexing sufficient to crack coating, especially when temperature is below 4 degrees C 40 degrees F. Do not place coated surfaces on strips or skids until coating has hardened thoroughly. Wide fabric slings used for lifting, and strips, slings, blocks, skids, cradles, and other supports must provide ample bearing areas. In transporting, fasten and protect coated materials in a manner that will prevent movement and preclude chafing and rubbing, and when unloading, do not dump or drop. Place coated material in position carefully on suitably prepared beds and with a minimum of handling.

1.5 QUALITY ASSURANCE

1.5.1 Certificates

Submit pneumatic certificates of compliance and hydro-pneumatic certificates of compliance certifying that materials meet the requirements specified herein.

1.5.2 Elastomer Skin

The elastomer skin of the fender must be free from cracks, burrs, warpage, checks, chipped or blistered surfaces, and must have a smooth surface.

1.5.3 Steel Fabrication

The steel used in fabrication must be free from kinks, sharp bends, and other conditions which would be detrimental to the finished product. Manufacturing processes must not reduce the strength of the steel to a value less than intended by the design. Manufacturing processes must be done neatly and accurately. Make bends by controlled means to insure uniformity of size and shape.

1.5.4 Welding

AWS D1.1/D1.1M. Provide welds of sufficient size and shape to develop the full strength of the parts connected by the welds. Welds must transmit stress without permanent deformation or failure when the parts connected by the weld are subjected to proof and service loadings.

1.6 PNEUMATIC AND HYDRO-PNEUMATIC FENDERS - WARRANTY

**************************************************************************
NOTE: The warranty requirements in this guide specification have been approved by a Level I Contracting Officer in accordance with the requirements of Naval Facilities Acquisition

SECTION 35 59 13.18 Page 10
Supplement (NFAS).

NFAS can be found at the following link:
https://www.navfac.navy.mil/

The paragraphs in this guide specification may be used without further approval.

**************************************************************************

Furnish the manufacturer's warranty. Issue the warranty directly to the Government. It must not be limited in dollar value. The warranty period must be not less than 1 year from the date of Government acceptance of the work.

PART 2  PRODUCTS

2.1  PNEUMATIC AND HYDRO-PNEUMATIC FENDERS

2.1.1  Manufacturer's Data

2.1.1.1  Pneumatic Fenders Manufacturer's Data

Prior to fabrication, submit copies of the manufacturer's catalog data, performance curves per ISO 17357-1, dimensions, material specifications, and method of manufacture.

2.1.1.2  Hydro-Pneumatic Fenders Manufacturer's Data

Prior to fabrication, submit copies of the manufacturer's catalog data, performance curves per ISO 17357-1, dimensions, material specifications, and method of manufacture.

2.1.2  Design Data

2.1.2.1  Pneumatic Fenders Design Data

Submit rated performance data (RPD) and published performance curves per ISO 17357-1.

2.1.2.2  Hydro-Pneumatic Fenders Design Data

Submit rated performance data (RPD) and published performance curves per ISO 17357-1.

2.1.3  Configuration

Manufacture fenders in accordance with ISO 17357-1. Fenders must have cylindrical mid-bodies with hemispherical shaped ends terminating in an end fitting on the cylinder's centerline at each end. Size the flange opening fittings (not to exceed 12 percent of fender diameter) so as not to contact loading surfaces when the fender is compressed to 20 percent of its original diameter (80 percent compression). Incorporate a safety valve for Pneumatic and Hydro-Pneumatic fenders 2500 mm 8 feet diameter or larger and pressure monitoring system in their manufacture.

2.1.4  Dimensions

Diameter and length as indicated on the drawings.
2.1.5 Fender Skin

The fender skin must have a minimum strength in accordance with ISO 17357-1. When designing the skin thickness, consider skin strength and the stress induced by the internal operating and berthing pressure, and the abrasion and impact loads caused by handling and berthing operations. Ensure an adequate margin of safety is incorporated for the fender's intended use. Design the connection of the skin to the end fittings to resist the specified minimum endurable pressure at 60 percent compression in ISO 17357-1 for the respective operating pressure. For hydro-pneumatic fenders, the Minimum Endurable Pressure value in Table 5 of ISO 17357-1 (Pneumatic 80 fender pressure requirements) must be used.

2.1.5.1 Elastomer

Provide rubber material test proving the elastomer meets the requirements of ISO 17357-1, material test of rubber.

**************************************************************************
NOTE: After aging refers to air oven aging at 70 degrees C 158 degrees F plus/minus 1 degree C 33.8 degrees F, 96 hours.
**************************************************************************

Per ISO 17357-1, the elastomer used in the outer skin must be rubber, with the following unreinforced properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Before Aging</th>
<th>After Aging</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Durometer Hardness, Shore A</td>
<td>[50 to 70] [_____]</td>
<td>Not to exceed the original property by more than 8</td>

</tbody>
</table>

2.1.5.2 Color

Fender skin color must be black throughout the entire thickness. Galvanized hardware must be unpainted.

2.1.5.3 Repairability

The fender casing must be repairable in the event of tears or punctures in the elastomer skin. The repaired area must have not less than 90 percent of the properties as specified in paragraph ELASTOMER. Required repair materials must be readily available. Each fender must include a detailed repair procedure from the manufacturer that outlines a step by step process.
for mending tears, punctures or severe abrasions to fender casings.

2.1.6 Test Reports

Perform tests on the specified fender within 5 years of submittal of the reports for approval. Test reports must be accompanied by notarized certificates from the manufacturer certifying that the tested material is of the same type, size, quality, manufacture and make as that proposed to be supplied. Perform the following tests:

2.1.6.1 Performance Requirements

The performance of each fender must meet the requirements of ISO 17357-1. Confirm the performance of the fender with a prototype fender performance confirmation per ISO 17357-1. The tests must include a parallel performance, angular compression, durability, compression-recovery, and puncture-resistance test.

2.1.6.1.1 Design Proof

Design proof must document minimum endurable pressure based on at least 30 test samples that cover entire range of compression from 0 percent to 60 percent plus or minus 5 percent deflection.

2.1.6.1.2 Pneumatic Fenders Performance Characteristics

*****************************************************************************
NOTE: Refer to ISO 17357-1 for guaranteed energy absorption and reaction force values for nominal size of fender under consideration.
*****************************************************************************

Provide the performance characteristics of each pneumatic fender ensuring they meet the following:

<table>
<thead>
<tr>
<th>SIZE</th>
<th>GUARANTEED ENERGY ABSORPTION (GEA) at 60 +/- 5 percent deflection</th>
<th>REACTION FORCE (R) at GEA deflection (+/- 10 percent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[<em><strong>]mm x [</strong></em>]mm [<em><strong>]ft x [</strong></em>]ft</td>
<td>[<em><strong>] kN-m [</strong></em>] ft-kips</td>
<td>[<em><strong>] kN [</strong></em>] kips</td>
</tr>
</tbody>
</table>

2.1.6.1.3 Hydro-pneumatic Fenders Performance Characteristics

*****************************************************************************
NOTE: The performance of the hydro-pneumatic fenders vary according to the size, water/air ratio and internal pressure. The Manufacturer should be consulted in the selection of the desired performance characteristics.
*****************************************************************************

*****************************************************************************
NOTE: Refer to ISO 17357-1 for guaranteed energy absorption and reaction force values for nominal size of fender under consideration.
*****************************************************************************
Provide the performance characteristics of each hydro-pneumatic fender ensuring they meet the following:

<table>
<thead>
<tr>
<th>SIZE</th>
<th>GUARANTEED ENERGY ABSORPTION (GEA) at 60 +/- 5 percent deflection</th>
<th>REACTION FORCE (R) at GEA deflection (+/- 10 percent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[<em><strong><strong>] mm x [</strong></strong></em>] mm [_____] ft</td>
<td>[<em><strong><strong>] kN-m [</strong></strong></em>] ft-kips</td>
<td>[<em><strong><strong>] kN [</strong></strong></em>] kips</td>
</tr>
</tbody>
</table>

2.1.6.2 Dimensional Inspection

Perform and submit the dimensional inspection results proving the dimensions of all fenders meet the requirements of ISO 17357-1.

NOTE: The dimensional tolerances per ISO 17357-1 are as follows:
- length: plus 10 percent, minus 5 percent
- diameter: plus 10 percent, minus 5 percent

The diameter shall be obtained from the average of at least two different measurements taken at the middle of the cylindrical section of the fender.

The diameters of bead ring or other steel material around the flange opening shall be inspected, and the results shall be less than 0.20 fender diameters.

2.1.6.3 Air-leakage Test

Perform and submit the results of the air leakage test per ISO 17357-1. The test must confirm that there is no air leakage when the initial pressure is held for more than 30 minutes.

2.1.6.4 Hydrostatic-pressure Test

Perform and submit the Hydrostatic-pressure test results per ISO 17357-1. Perform the test for 10 minutes at the hydrostatic pressure shown as "Testing pressure at 0 percent deflection" in Tables 4 and 5 in ISO 17357-1. There must be no leakage of water and no defects during the test.

NOTE: The frequency of the test shall be one per 20 fenders of each size and pressure. If the customer so requests, one per order of each size and pressure if the quantity is less than 20.

Circumferential and longitudinal lengths shall be measured at 10 kPa pressure and at the test pressure shown in Table 4 or Table 5 in ISO 17357-1. The temporary elongation shall be as follows:

a) maximum circumferential temporary elongation: 10
b) maximum longitudinal temporary elongation: 10 percent.

The increase in diameter and length shall be obtained by measuring the distance of two points marked circumferentially and longitudinally, at 10 kPa 1.45 psi pressure, on the middle of the fender's body.

The distance between the two points shall be larger than one-fifth of the fender's diameter.

2.1.6.5 Pressure Relief Valve Test

Mount the pressure relief valve to a test chamber for a pressure relief test. After mounting, the chamber internal pressure must be slowly increased until the specified relief pressure is attained. Set the pressure relief valve to relieve pressure according to the manufacturers recommendations. If the pressure relief valve opens at a higher or lower pressure than allowed, it must be adjusted as required and tested again until within the specified limits. Maintain a written test procedure and records pertaining to this test.

2.1.7 Connecting Hardware

Galvanize the connecting chain, swivel, and shackles in accordance with ASTM A123/A123M or ASTM A153/A153M, as appropriate. The hardware must be as follows:

<table>
<thead>
<tr>
<th>Item</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chain</td>
<td>ABS 2, Grade 2, Stud Link or Open Link</td>
</tr>
<tr>
<td>Shackle</td>
<td>FS RR-C-271, Type IVA, Class 3, Grade A</td>
</tr>
<tr>
<td>Swivel</td>
<td>FS RR-C-271, Type VII, Class 2</td>
</tr>
</tbody>
</table>

All connecting bolts and pins must be of mild steel, matching the properties of the shackle bow. For Class 3 shackles, secure the bolt or pins in place with stainless steel (Type 316) cotter pins or locking pins.

2.1.7.1 Hydro-pneumatic Guy Chain

Provide guy chains for attachment from the upper fender end fitting assembly to the pier. Cover the portion of the chain extending from the fender itself with protective rubber sleeves to a point beyond which the fender will be contacted for fender body protection.

2.1.7.2 Hydro-pneumatic Hanging Chain

Provide hanging chains for attachment from the counterweight to the pier.

2.1.7.3 Hydro-pneumatic Lower End Fitting Assembly

Fabricate the lower end fitting from steel and provide connecting points for the connecting chain and the hanging chain.
2.1.7.4 Hydro-pneumatic Upper End Fitting Assembly

Fabricate the upper end fitting from steel and design to house all necessary valves and fitting necessary to charge and discharge the fender body with air and water necessary for proper installation and operation of the deployed fender. Include the air charging assembly, the water charging assembly, the pressure safety relief valve assembly and lifting eyes adequately sized for guy chain attachment. Attach all valves and related hardware to the inner assembly plate. Include an outer assembly blind flange plate to provide protection during handling and operations. The pressure relief valve must be bronze, adjustable to ensure maintenance of the proper setting, and capable of adequate flow (volume of air released per second) to maintain a safe internal pressure. Make certain a changeable rubber gasket is installed between the top flange and plate to prohibit moisture from collecting inside the upper end fitting assembly that could possibly corrode valve handles and cause debris that could foul the pressure relief valve assembly.

2.1.7.5 Hydro-pneumatic Counterweight

Provide a steel counterweight for attachment to the fender's lower flange assembly by two shackles. Include an upper eye for shackle attachment of the hanging chain and coat with a marine coating system. The counterweight must be sized in accordance with the Manufacturer's recommendation.

PART 3 EXECUTION

3.1 PNEUMATIC AND HYDRO-PNEUMATIC FENDERS

Install the fendering system in accordance with the manufacturer's specifications and shop drawings. Tighten bolts an additional 1/3 turn of the nut, from the snug tight condition, and secured with cotter pins or screw lock.

3.2 WELDING

Perform welding in accordance with AWS D1.1/D1.1M.

3.3 CONNECTIONS

3.3.1 Antiseize Compound

Coat threads of bolts prior to applying washers and nuts. Recoat bolt thread projection beyond nut after tightening.

-- End of Section Table of Contents --
NOTES: This guide specification covers the requirements for preparing the embankment and blanket foundations and placing and compacting all permanent fills and backfills for earth and rock fill dams. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

This guide specification has removed paragraphs for related construction activities that have their own UFGS Guide Specifications. These include Section 31 00 00 EARTHWORK, Section 31 66 10 ROCK FOUNDATION PREPARATION and Section 31 11 00 CLEARING AND GRUBBING among others. Those Guide Specifications should be included and referenced as is appropriate.

REMOVE INFORMATION AND REQUIREMENTS NOT REQUIRED IN RESPECTIVE PROJECT, WHETHER OR NOT BRACKETS ARE PRESENT.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification provides for furnishing all plant, labor, and equipment, and performing all operations in connection with the
placement of embankment materials for earthen or rockfill dams.

The requirements for rock as prescribed herein are intended to be used on embankments involving rock fill sections. Where rock for slope protection is specified, Section 35 31 19 STONE, CHANNEL. SHORELINE/COASTAL PROTECTION FOR STRUCTURES should be used.

This specification provides for furnishing all materials, labor, and equipment, and performing all operations in connection with the placement of embankment materials for construction of the [earthen][rockfill] dam.

1.1 UNIT PRICES

1.1.1 Compacted Fill, [Impervious][Pervious][Random]

Payment will be made for costs associated with placement of compacted [impervious] [pervious] [random] fill embankment; spreading, harrowing, moisture control, compacting, removing objectionable materials; and all other incidental work required for the construction, protection, and maintenance of the dam embankment. [This payment is separate to any payment for excavating and transporting of material as specified in Section 31 00 00 EARTHWORK.] Payment for preparation of foundations to receive compacted [impervious] [pervious] [random] fill will be made in accordance with Section 31 66 10 ROCK FOUNDATION PREPARATION.

1.1.1.2 Measurement of Fill Material

Compacted [impervious][pervious][random] fill will be measured for payment in place based upon the established limit lines and the payment lines shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation [including the cut-off trench] and[ accomplishment of foundation preparation (except scarifying)] and the lines, grades and slopes of the accepted embankment.
1.1.1.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.2 Backfill, [Impervious][Pervious][Random]

**************************************************************************
NOTE: Include separate paragraphs for each type of backfill material that will be required for the construction of the dam, and select the appropriate bracketed description for each.
**************************************************************************

1.1.2.1 Payment

Payment will be made for costs associated with preparation of contacting surfaces, including the spreading, compacting, moisture control, and all other operations incidental to the placement of [impervious] [pervious] [random] backfill. [This payment is in addition to any payment for excavating and transporting of the material as specified in Section 31 00 00 EARTHWORK.] Payment for preparation of rock foundations to receive [impervious] [pervious] [random] backfill will be done in accordance with Section 31 66 10 ROCK FOUNDATION PREPARATION.

1.1.2.2 Measurement

Backfill, [impervious][pervious][random], will be measured for payment in place based upon the established limit lines and the payment lines indicated on the cross sections shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation [and accomplishment of foundation preparation (except scarifying) ]and the lines, grades and slopes of the accepted embankment.

1.1.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.3 Filter [Sand][Gravel][Rock]

**************************************************************************
NOTE: If several classes of material are to be used to include transition zones or a multi-stage filter, a separate pay item should be included for each class.
**************************************************************************

1.1.3.1 Payment

Payment will be made for costs associated with obtaining filter [sand] [gravel] [rock], [transportation to the site (whether from required excavation, borrow, or commercial source),] mixing the materials to the required gradation, spreading, moisture control, compacting, removing objectionable materials, and all other incidental work required for the construction, protection, and maintenance of the filter. This payment is in addition to any payment for excavation (from required excavation or borrow) of the material as specified in Section 31 00 00 EARTHWORK.
1.1.3.2 Measurement

Filter [sand][gravel][rock] will be measured for payment in place based upon the established limit lines and the payment lines indicated on the cross sections shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation and [accomplishment of foundation preparation (except scarifying)] and the lines, grades and slopes of the accepted embankment.

1.1.3.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.4 Rock Fill

**************************************************************************
NOTE: If several classes of rock fill material are used, a separate pay item should be included for each class of material.
**************************************************************************

1.1.4.1 Payment

Payment will be made for costs associated with rock fill, including all operations with excavation, quarrying, stockpiling, hauling, placing, moisture conditioning, removing objectionable material, and all other operations incidental to the placement of the rock fill.

1.1.4.2 Measurement

Rock fill will be measured for payment in place based upon the established limit lines and the payment lines indicated on the cross sections shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation [and accomplishment of foundation preparation (except scarifying)] and the lines, grades and slopes of the accepted embankment.

1.1.4.3 Unit of Measure

Unit of measure: cubic meter yard.

[1.1.5 Additional Rolling for Compaction

**************************************************************************
NOTE: If an end result (production) specification is used for compaction in section COMPACTION, delete this item.
**************************************************************************

1.1.5.1 Payment

Payment will be made for costs associated with additional rolling for compaction.

1.1.5.2 Measurement

**************************************************************************
NOTE: Delete the bracketed reference to Section 35 73 13 if this paragraph is not moved to Section 01 20 00.

Additional rolling for compaction will be measured for payment on the basis of the number of roller hours the compaction equipment is operated in accomplishing the compaction specified in [Section 35 73 13 EMBANKMENT FOR EARTH DAMS, ]paragraph COMPACTION.

1.1.5.3 Unit of Measure

Unit of measure: hour.

1.1.6 Instrumentation [Piezometer][Settlement Gage][Survey Marker]

NOTE: The installation of instrumentation is not strictly speaking an activity of construction of an embankment dam. This activity should be placed within its own specification division as an item of SPECIAL CONSTRUCTION. There is presently no UFGS guide specification for this item. The specification writer should consider the use of a section for SPECIAL CONSTRUCTION, and if so, delete the following paragraphs.

Include paragraphs for all types of instruments as may be utilized.

1.1.6.1 Payment

Payment will be made for costs associated with furnishing, installing, [monitoring] and maintaining the [piezometers] [settlement gages] [survey markers] during construction as specified[ in Section 35 73 13 EMBANKMENT FOR EARTH DAMS] during construction, including measurements required to be made by the Contractor.

1.1.6.2 Measurement

[Piezometers] [Settlement gages] [Survey markers] to be installed will be measured for payment on the basis of the number specified[ in Section 35 73 13 EMBANKMENT FOR EARTH DAMS].

1.1.6.3 Unit of Measure

Unit of measure: each.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM C33/C33M (2023) Standard Specification for Concrete Aggregates

ASTM D422 (1963; R 2007; E 2014; E 2014) Particle-Size Analysis of Soils

ASTM D698 (2012; E 2014; E 2015) Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/cu. ft. (600 kN-m/cu. m.))

ASTM D1557 (2012; E 2015) Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³) (2700 kN-m/m³)

ASTM D2167 (2015) Density and Unit Weight of Soil in Place by the Rubber Balloon Method

ASTM D2487 (2017; E 2020) Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)

ASTM D4253  (2016; E 2019) Standard Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table

ASTM D5195  (2014) Density of Soil and Rock In-Place at Depths Below the Surface by Nuclear Methods

ASTM D6938  (2017a) Standard Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)

1.3  DEFINITIONS

******************************************************************************

NOTE: Add applicable definitions as appropriate for the project.
******************************************************************************

1.3.1  Embankment

Embankment, as used in these specifications, is defined as the earth [and rock] fill portions of the dam structure and includes all types of earth [and rock] fill and filter materials for the dam [and cut-off trench,] and all other specified or directed earth and rock fills within the limits of the dam[, excepting those stone and filter materials used for slope protection in accordance with Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES].

1.3.2  Compacted Fill

Compacted fill includes all fill, except backfill and rock fill, deposited in layers and compacted by rolling or tamping. The types of compacted earth fill are:

a. Impervious fill for the [cut-off trench][, horizontal and inclined impervious blankets,][ and ]impervious section of the embankment;

b. Random fill where indicated on the plans;

c. Pervious fill forming the upstream and downstream sections of the embankment or where indicated on the plans, and
d. Filter drainage layers forming the horizontal [and/or vertical or inclined] pervious drainage blankets.

1.3.3 Uncompacted Fill

All fill, deposited in layers but not compacted except by the controlled movement of hauling and spreading equipment.

1.3.4 Backfill

Backfill, as used in these specifications, is defined as that excavation refill which cannot be placed around or adjacent to a structure until the structure is completed and reached a specified concrete strength, requires special compaction efforts, and is defined by limits indicated on the plans and specifications.

1.3.5 Filter Materials

Filter materials are defined as material used as drainage or transition zones between various types of fill and backfill (impervious, pervious, random, and rock fill).

1.3.6 Rock Fill

Those portions of the embankment where rock is used as embankment fill.

1.3.7 Unsatisfactory Materials

******************************************************************************

NOTE: Unsatisfactory material will be defined in accordance with ASTM D2487. This paragraph should be edited as appropriate to delete inapplicable materials.

******************************************************************************

[Materials which do not comply with the requirements for satisfactory materials are unsatisfactory.] [Materials unsatisfactory for use as fill and backfill are those earth and earth mixtures that classify by ASTM D2487 as [CH], [MH], OL, OH, and PT. In addition all topsoil, organics, roots and other organic matter, biodegradable materials, debris, trash, rubble and contaminated soil is unsatisfactory for use as embankment, backfill or engineered fills. Unsatisfactory materials or processes are not in compliance with these specifications.] Notify the Contracting Officer when encountering any contaminated materials.

1.3.8 Unsatisfactory vs Satisfactory

The use of the terms satisfactory and unsatisfactory in this section is in reference to the Contract requirements. Satisfactory materials or processes are in full compliance with these specifications and unsatisfactory materials or processes are not in compliance with these specifications.

1.4 SYSTEM DESCRIPTION

1.4.1 Haul Roads

******************************************************************************
NOTES: Where roads are to be used by other Contractors, the limits of responsibility should be stated in the specifications.

With reference to the coverage in this paragraph, it has been found advantageous to establish a project traffic pattern for jobs of considerable scope and to indicate on the plans acceptable haul road locations and to specify maximum grades and minimum road widths which are considered suitable. Where project operations are varied and the use of haul roads by other Contractors is required, the specifications should so indicate. Detailed requirements for haul roads should be based upon the anticipated length of time the roads will be in use, traffic load and probable types of hauling equipment applicable to the specific project. This paragraph should be modified as necessary to clarify the requirements of the particular project.

**************************************************************************

Haul roads must be [located as indicated and] located and constructed as approved. Design haul roads to maintain the intended traffic, to be free draining and maintain good condition throughout the contract period, unless otherwise directed. Remove haul roads within the area of contact between the embankment and its foundation and abutments and treat the area as specified in paragraph PREPARATION OF FOUNDATION, PARTIAL FILL SURFACE, AND ABUTMENTS.

Submit a Plan of Operations for approval thirty days prior to commencement of haul road construction or placing embankment and backfill, whichever is earlier, for accomplishing all embankment and backfill construction and for the location and construction of haul roads.

1.4.2 Stockpiling from [Approved Borrow Sources][Required Excavations]

When the excavation from [approved borrow sources][or required excavations] progresses at a faster rate than placement in the fill is being accomplished, stockpile excavated material at approved locations adjacent to the work until its use is authorized. No payment will be made for such stockpiling nor for the reloading and hauling of this material to its final position in the embankment.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.
For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, and Air Force.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Plan of Operations; G, DO

30 days prior to commencement of haul road construction or placing embankment and backfill, whichever is earlier, submit for approval a Plan of Operations for accomplishing all embankment and backfill construction and for the location and construction of haul roads. This plan must include, but not be limited to, the proposed sequence of construction for embankment and backfill items, and methods and types of equipment to be utilized for all embankment and backfill operations, including transporting, placing, and compaction. Also include the names and addresses of the commercial testing labs which will perform the soil testing and inspection and describe how all required soils testing will be performed in this plan.

Embankment and Backfill Materials; G, DO

At least 30 days prior to delivery of any Contractor-furnished material to the site of the work, submit soil classification test results, moisture-density curves, gradation curves, and laboratory results of the required tests of the proposed material.

SD-06 Test Reports

Foundation Inspection; G, DO

Provide a foundation inspection report, certified by a registered
Professional Geotechnical Engineer or Geologist, documenting the inspection. The report must include, at a minimum, a description of each geologic stratum encountered along the slopes and excavation bottom, laboratory testing results if any tests were performed, and other pertinent information. The report's main body must be a color copy submitted to the Government within four calendar days of completion of the inspection by the Contractor's geologist. Include figures, tables and photographs as necessary.

Measurement of Fill Material; G, RO

Submit a copy of the records of each compliance survey the next work day following the survey.

Testing; G, RO

Within 24 hours of conclusion of physical tests, three copies of test results, including calibration curves and results of calibration tests.

SD-07 Certificates

Testing; G, RO

Qualifications of the [USACE validated] [validate] commercial testing laboratory or the Contractor's validated testing facilities.

Nuclear Density; G, RO

Use nuclear density testing equipment in accordance with ASTM D6938. In addition, the following conditions are applicable:

a. Prior to using the nuclear density testing equipment on the site, submit to the Contracting Officer a certification that the operator has completed a training course approved by the nuclear density testing equipment manufacturer, the most recent data sheet from the manufacturer's calibration, and a copy of the most recent statistical check of the standard count precision.

b. Provide nuclear density testing equipment capable of extending a probe a minimum of 12 inches down into a hole.

c. Field density reports must include the laboratory density reports applicable to the field data presented.

PART 2  PRODUCTS

2.1  MATERIALS

**************************************************************************
NOTE: This paragraph may be modified to specify soils for various types of fill in accordance with the Unified Soil Classification System. When this is done, the optional sentence should be selected.
**************************************************************************

[ Classification of soils will be in accordance with ASTM D2487.]
2.1.1 General

The origin of any fill material in no way determines where it may be used in the embankment. Obtain materials for embankment fills from required excavations, from the borrow areas indicated, or from off-site commercial sources as required. The intention is to use the most suitable materials obtainable from these sources. Material to be wasted will be specifically designated at the time the material is excavated. Materials containing brush, roots, sod, organics or other perishable materials will not be considered suitable. The suitability of the materials are subject to approval and their disposition in the embankment will be as directed. Excavate in the borrow areas in the location determined by the Contracting Officer, whenever such control is necessary to obtain the type of material required for the embankment. Use borrow pits in accordance with Section 31 00 00 EARTHWORK paragraph SELECTION OF BORROW MATERIAL and paragraph OPENING AND DRAINAGE OF EXCAVATION AND BORROW PITS. Mixing of materials during the excavating process at the borrow area may be required.

**************************************************************************
NOTE: The designer may choose to limit the definition of impervious with restriction on liquid limit, plasticity index, or fines content. If so, those restrictions should be added to paragraph 2.1.2.
**************************************************************************

2.1.2 Impervious Fill

Provide material for compacted impervious fill consisting of [GC SC ML CL MH CH clays, silty clays, or clayey silts ] classified as cohesive materials in accordance with ASTM D4318, ASTM C136/C136M and ASTM D1140 obtained from the designated borrow areas [or required excavation] [or off-site commercial sources].

2.1.3 Random Fill

Provide material for compacted random fill consisting of any or all types of satisfactory material which are suitable for use in the dam embankment.

2.1.4 Pervious Fill

Material for compacted pervious fill must be clean, free draining sand or sand and gravel obtained from natural deposits [within borrow areas and from designated excavations][ or ][from sources designated]. Provide particles of material that are free from any objectionable coating and not more than [_____] percent of the material, by weight, and passing a 0.075 mm No. 200 sieve.

2.1.5 Uncompacted Fill

Except as otherwise [indicated or ]required, material for uncompacted fill may consist of any or all types of material available from required excavations and designated borrow areas with the exception of material that is considered unsatisfactory as defined in Unsatisfactory Materials.

2.1.6 Backfill

Provide backfill consisting of material of a type and quality conforming to that specified for the contiguous embankment fill material, unless
otherwise directed.

2.1.7 Filter Drainage Layers

Filter materials must meet the quality requirements of ASTM C33/C33M concrete aggregate except as stated herein. Filter materials must consist of sand, gravel, or crushed stone composed of tough, durable, angular particles; must be free from thin, flat and elongated pieces, and must contain no organic matter or soft, friable particles. The material must be washed with clean water such that the final product has no visible soil, soil slurry, or objectionable coatings.

Gradation of the material must be determined in accordance with ASTM D2487, ASTM D422, ASTM D1140, and ASTM D4318. All points on individual grading curves obtained from representative samples of filter material must lie between the boundary limits as defined by smooth curves drawn through the tabulated grading limits plotted on a mechanical analysis diagram. The individual grading curves within these limits must not exhibit abrupt changes in slope denoting skip grading, scalping of certain sizes or other irregularities which would be detrimental to the proper functioning of the filter; and will be well-graded between the limits specified below:

<table>
<thead>
<tr>
<th>SIEVE SIZE</th>
<th>PERCENT BY WEIGHT PASSING</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2.1.8 Rock Fill

2.1.8.1 Rock

Stone classed as "rock" must be sound; well graded and free draining. The presence of rock meeting the requirements of slope protection, Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES, will not be objectionable. Obtain rock from required excavation and from already existing stockpiles and from designated quarries. Shales, mudstone and other rock and excavated material unsuitable for use as rock fill, will be wasted in designated spoil areas.

PART 3 EXECUTION

3.1 CONSTRUCTION

3.1.1 Lines and Grades

**************************************************************************
NOTE: If settlement of the foundation is expected during construction, install settlement gages as detailed in 3.9.2 and 1.1.11.
**************************************************************************

Construct the embankment to the lines, grades and cross sections indicated, unless otherwise directed. The Government reserves the right to increase or decrease the foundation widths or the embankment slopes or make such other changes in the embankment sections as may be deemed necessary to produce a safe structure. Increases in height of section, made to
compensate for shrinkage or consolidation of the embankment material or
foundation during construction of the embankment, will not exceed five
percent of the height above the foundation indicated without the approval
of the Contracting Officer. The end slopes and side slopes of partial fill
sections must not be steeper than[ one vertical on [_____] horizontal][
those shown].

3.1.2 Conduct on the Work

Maintain and protect the embankment in a satisfactory condition at all
times until final completion and acceptance of all work under the
contract. At all times protect pervious fills, filters, and drainage
layers from erosion, runoff, and contamination from different soils or
other materials. These materials must be uncontaminated for minimum
dimensions shown on the plans. Minimize equipment travel on these zones to
prevent segregation, contamination, and breakdown of materials.

If in the opinion of the Contracting Officer the hauling equipment causes
horizontal shears or slickensides, rutting, quaking, heaving, cracking or
excessive deformation of the embankment, limit the type, load or travel
speed of the hauling equipment on the embankment. Replace any embankment
material rendered unsuitable after being placed in the embankment and
before final acceptance of the work in a satisfactory manner and no
additional payment will be made therefor. Excavate and remove from the
embankment any material which the Contracting Officer considers
objectionable, dispose of such material, and refill the excavated area as
directed, all at no cost to the Government. Do not place unsatisfactory
materials in the embankment. The Contractor may be required to remove,
without additional payment, any embankment material placed outside of
prescribed slope lines.

3.2 PREPARATION OF FOUNDATION, PARTIAL FILL SURFACES AND ABUTMENTS

**************************************************************************
NOTE: General preparation of the foundation for dam
construction should be addressed in Section 31 66 10
ROCK FOUNDATION PREPARATION. The following
paragraphs may be deleted or modified as appropriate
to provide explicit direction to preparation of
surfaces for placement of embankment fill.
**************************************************************************

3.2.1 Earth

After excavation or stripping of the embankment foundation[ and excavation
of the cut-off trench] to the extent indicated or otherwise required, break
down the sides of stump holes, test pits, and other similar cavities or
depressions where so directed to flatten out the slopes, and scarify the
sides of the cut or hole to provide bond between the foundation material
and the fill.[ Scarify the slopes and bottom of the cut-off trench as
directed.] Unless otherwise directed, fill each depression with either
pervious, random, or impervious[, or rockfill] material dependent upon the
type of material which is to be placed immediately above the foundation.
Place the fill in layers; moisten and compact in accordance with the
applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and
COMPACTION. Spread materials which cannot be compacted by roller equipment
because of inadequate clearances in [_____]-mm-inch layers and compact with
power tampers to an extent equal to that of the contiguous embankment fill
material. After filling of depressions[ and cut-off trench] and
immediately prior to placement of compacted fill in any section of the embankment, loosen the foundation of such section thoroughly by scarifying, plowing, discing or harrowing to a minimum depth of [_____] mm [_____] inches, and adjust the moisture content to the amount specified in paragraph MOISTURE CONTROL for the appropriate type of material, except in areas where this requirement is waived by the Contracting Officer. After removal of roots or other debris turned up in the process of loosening, compact the entire surface of the embankment foundation area [by [_____] complete coverages of the compaction equipment as specified for the appropriate type of fill in accordance with paragraph COMPACTION.] [compacted to a density of [_____] percent in accordance with paragraph COMPACTION.][ Proof roll foundation areas in accordance with Section 31 00 00 EARTHWORK paragraph PROOF ROLLING.]

Prior to placement of compacted fill on or against the surfaces of any partial fill section, remove all soft or loose material, all material containing cracks or gullies, and all material that does not conform with the specified zoning of the embankment. Loosen the remaining surface of the partial fill by scarifying, plowing, discing or harrowing to a minimum depth of 150 mm 6 inches, and adjust the moisture content as specified in paragraph MOISTURE CONTROL for the appropriate type of material. Compact the surface of the partial fill section upon which fill is to be placed as specified in paragraph COMPACTION for the appropriate type of fill. No separate payment will be made for loosening and rolling the foundation area, the abutment area, or the surfaces of partial fill sections, but include the entire cost in the applicable contract price for fill.

3.2.2 Rock

Clena all rock surfaces upon which or against which embankment materials are to be placed in accordance with the applicable provisions of Section 31 00 00 EARTHWORK and Section 31 66 10 ROCK FOUNDATION PREPARATION.[ Prior to the placement of embankment material upon or against a rock surface, fill all open joints and cracks in that surface with mortar to the depths cleaned. Fill those portions of such rock surfaces where, in the opinion of the Contracting Officer, the compaction of the embankment materials cannot be accomplished satisfactorily with power tampers or other specified compaction equipment with mortar or concrete as directed to the extent necessary to permit satisfactory use of the compaction equipment. Do not leave a thin coat of mortar on smooth, intact rock surfaces. Remove large rock overhangs and protrusions by pre-splitting or line drilling techniques in such a manner as to minimize damage to the underlying rock, or the spaces beneath overhangs and fill around protrusions with consolidated concrete so that satisfactory compaction of embankment materials can be accomplished. Provide vertical surfaces that are no more than [_____] meters [_____] feet in height, and provide benches of sufficient width as necessary so that the average slope of any rock face is not steeper than [_____] vertical on [_____] horizontal. Provide mortar and concrete, including forming as necessary, conforming with the applicable provisions of Section [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE][03 30 00 CAST-IN-PLACE CONCRETE][_____.]

[3.2.3 Foundation Inspection and Mapping Procedures

Foundation means any area of the excavation to receive concrete, backfill, or embankment, including the entire excavation bottom and side slopes.

Inspections to determine the adequacy of the foundations will be performed by the Contracting Officer in all foundation areas between completion of
the surface preparation and placement of Embankment Fill, Filter Material, Mud Mat, or concrete. The Contractor will cooperate to the extent necessary to assist in the inspection. This will include having equipment and personnel available to assist excavating, compacting, proof rolling, cleaning, etc. The Contractor must coordinate his schedule for foundation preparation and final cleanup with the Contracting Officer to ensure that the cleanup and inspection proceed in an orderly manner.

][3.2.4 Foundation Condition Evaluation

Government will perform foundation condition inspection of the completed foundation after final cleanup, dental treatment (if required) and mapping/documentation are complete. Notify the Contracting Officer at least seven days before foundation cleanup will be completed and ready for inspection by the Government. Maintain the foundation in a cleaned condition for a period of at least [____] [days] [hours] for Government foundation inspection. The [____] [days][hours] for Government evaluation starts after the Contracting Officer receives notification from the Contractor that the foundation is completed and ready for mapping and inspection. Government will evaluate excavation surfaces to receive backfill or structures. As used in this Section, evaluation means inspection, testing, mapping, exploratory test pits, interpretation, and decision making. Government will perform inspection of excavated foundation subgrade and cut slopes at each site to obtain a geologic record.

][Proof roll the earth foundation by a fully loaded dump truck or approved roller to detect and eliminate soft spots in the foundation.

][During inspection, following cleanup for geologic mapping, if the Contracting Officer determines that additional excavation is required to improve foundation conditions, perform additional excavation as directed. Clean the areas of additional excavation. The Government will map and inspect the surfaces of additional excavation.

][3.2.5 Excavation and Foundation Mapping

Foundation mapping will be performed by Government personnel throughout excavation, foundation cleanup, and foundation acceptance inspection. Permit and facilitate safe access to the excavation by Government personnel for geologic mapping, sampling, inspection, and testing of surfaces exposed during construction.

a. Keep traffic and equipment away from test areas during testing to ensure personnel safety and to prevent ground vibrations;

b. Keep traffic and equipment away from personnel performing mapping to ensure personnel safety;

c. Provide support, such as excavating equipment, to permit proper inspection.

Foundation mapping will require excavated surfaces to be closely inspected and documented. The Government will require surfaces to be cleaned by the Contractor to facilitate mapping. Cleaning will require cutting of fresh surface on the excavation bottom and on excavated slopes, and excavation of test pits on excavated slopes and excavation bottom. The Contractor must provide Government personnel access to the excavation bottom for a period of [____] [days] [hours] after final cleanup and foundation preparation, and before dental treatment. During excavation and foundation mapping,
remove any temporary ramps covering side slopes such that the excavation side slopes can be documented and mapped by the Government. The Contractor must provide equipment to perform test pits as deemed necessary by the Government geologist and engineers performing the excavation mapping.

3.2.6 Equipment for Foundation Excavation and Mapping

The Contractor must have on site and make available to Government personnel performing mapping and inspection the following equipment with equipment operators to aid in performing excavations for test pits, sampling, inspection and cutting fresh surfaces for inspection and mapping:

a. Excavating equipment - Backhoe with smooth edge bucket and bulldozer.
b. Proof roller - Fully loaded dump truck.
c. Hand tools - Shovels, bars, picks, wedges, and brooms.
d. Water jet - A water jet consists of a high flow nozzle with a supply hose connected to a suitable source of water. Provide a system capable of delivering up to 24 gpm. The flow rate must be controllable at the nozzle.

3.3 PLACEMENT

3.3.1 General

Do not place fill on any part of the embankment foundation until such areas have been inspected and approved by the Contracting Officer in writing. The gradation and distribution of materials throughout the compacted earth fill section of the dam must be such that the embankment will be free from lenses, pockets, streaks, and layers of material differing substantially in texture or gradation from surrounding material of the same classification. Dump successive loads of material at locations on the fill as directed or approved. Do not place fill upon a frozen surface, nor incorporate snow, ice, or frozen earth in the embankment. Fill will not be placed on or against any dry surface, but against a surface that is moist or damp.

3.3.2 Frozen Material

Do not place embankment on frozen material, or on material which has been subjected to freeze-thaw action. This prohibition encompasses natural ground, all prepared subgrades, whether in an excavation or on an embankment, and all layers of previously placed and compacted earth fill upon which successive layers of embankment fill will be placed. Remove all material that freezes or has been subjected to freeze-thaw action during the construction work, or during periods of temporary shutdowns, such as, but not limited to, nights, holidays, weekends, or winter shutdowns or earthwork operations, to a depth that is acceptable to the Contracting Officer and replace with new material. Alternatively, the material must be thawed, dried, reworked, and recompacted to the specified criteria before additional material is placed. The Contracting Officer will determine when placement of fill must cease due to cold weather. Embankment material containing frozen clumps of soil, snow, or ice is not acceptable.

3.3.3 Rate of Placement

*****************************************************************
NOTE: If construction of the embankment involves a
Closure section, the following considerations should be taken into account and specified by the designer, if required.

Placement of rock fill in the closure section may be delayed until completion of the compacted fill to elevation [_____] meters feet m.s.l. The rate of placement of materials in the embankment closure section will be such that this section will be completed to elevation [_____] meters feet m.s.l. within a period of [_____] calendar days from the authorized date of diversion, but in no event will the rate of placement in this section be faster than required to construct the embankment to elevation [_____] meters feet m.s.l. within [_____] days from the beginning of fill operations. Subsequent to completion of the embankment closure section to elevation [_____] meters feet m.s.l. and prior to the beginning of topping operations a period of [_____] calendar days will elapse, unless this provision is waived in writing by the Contracting Officer at the time of construction.

Rate of placement of clay fill materials should be governed by the potential for development of high pore pressures in the fill that could lead to instability of the embankment slopes. Appropriate paragraphs should be included to identify elevations where placement may need to cease until pore pressures have dissipated sufficiently to prevent slides or failure of the embankment.

**************************************************************************

Unless otherwise directed, maintain the embankment at approximately the same level regardless of the number of types of materials being placed,[ except place rock fills and the adjoining filter blankets with sufficient lag to prevent mixture of embankment and filter blanket and/or rock materials].

3.3.4 Impervious Fill

Place impervious fill in the impervious section of the embankment as shown on the plans[, cut-off trench,][ and impervious blanket].

3.3.5 Random Fill

Place random fill in the random sections of the embankment as shown on the plans.

Except as specified below, limits of random sections shown indicate the maximum extent of random material. In general, place the finer grained random material toward the impervious section or blanket and place the coarser-grained random material toward the outer edge of the random section so that a transition in permeability is effected from the impervious section to the [pervious section][outer portions of the embankment].
3.3.6 Pervious Fill

Place pervious fill in the pervious sections of the embankment as shown on the plans.

3.3.7 Filter Drainage Layers

**************************************************************************
NOTE: Where there are vertical or inclined filters and horizontal filters, a different tolerance may be indicated for each.
**************************************************************************

Place [sand filters][, gravel filters,][ and ][sand and gravel filters] in the embankment in the manner described and to the lines and grades indicated. Tolerance of plus or minus [_____] mm inches will be allowed.

3.3.8 Rockfill

Construct the [upstream][,][ and ][downstream][ and rock drain] sections of the embankment of quarry run sizes of durable rock dumped and bulldozed into place in not greater than [_____] mm foot lifts to the lines and grades shown, or as staked in the field, and in such manner as to produce a reasonably well graded mass with no objectionable pockets of small stones or clusters of larger stones. A tolerance of plus 300 mm 12 inches and minus 150 mm 6 inches from the slope lines and grades shown will be allowed in the finished surfaces of the rock fills, except that the extreme minus tolerance must not be continuous over an area greater than 20 square meters 200 square feet. Break all bridging in rock fills as well as all slabs and slabby rock. Stone having a length to thickness ratio greater than 3:1 are considered flat, elongated, or flat and elongated and will be rejected. Special care must be exercised in placing rock fill in all areas within 1 m 3 feet of structures to avoid damage to such structures.

3.3.9 Spreading

After dumping, spread the materials by bulldozers or other approved means in approximately horizontal layers over the entire fill areas. Unless otherwise directed, the thickness of these layers before compaction with tamping type rollers must not be more than [_____] mm inches for impervious materials, nor more than [_____] mm inches for other embankment materials, except backfill which must be spread in accordance with paragraph BACKFILL. Unless otherwise directed, the thickness of layers before compaction with rubber-tired rollers must not be more than [_____] mm inches for impervious materials, nor more than [_____] mm inches for other embankment materials except backfill. Spread pervious fill and filters in layers not more than [_____] mm inches in thickness. As soon as practicable after commencement of construction of any section of the embankment, raise or crown the [central portion thereof][area adjacent to the inclined or vertical filter drain] with grades not to exceed [_____] percent so that the surface of the fill will drain freely and maintain throughout construction. Filter material placement should lead the placement of adjacent material to avoid contamination of the filter material. If the compacted surface of any layer of material, exclusive of filter material[ and rock fill], is determined to be too smooth to bond properly with the succeeding layers, loosen it by harrowing, or by any other approved method, before the succeeding layer is placed. At all times during the dumping and spreading processes, maintain a force of men adequate to remove all roots and debris from all embankment materials and
all stones of greater than [___] mm inches in maximum dimension from impervious materials and greater than [___] mm inches in maximum dimension from pervious materials, except filters. Remove stone, roots, and debris from the embankment and dispose of in an approved manner. Maintain the entire surface of any section of the embankment under construction in such condition that construction equipment can travel on any part of any one section. Remove ruts in the surface of any layer by scarifying before placing and compacting additional material.

3.4 MOISTURE CONTROL

Provide materials in each layer of the fill containing the amount of moisture, within the limits, specified below or as directed, necessary to obtain the specified compaction. Rework material that is not within the specified limits after compaction regardless of density.

3.4.1 Impervious Sections

**************************************************************************
NOTE: It is preferable to moisture condition the impervious fill material either at the excavation site, borrow site, or another area that is not on the embankment itself.
**************************************************************************

The moisture content after compaction must be uniform throughout any one layer of impervious materials placed. The moisture content after compaction as determined by ASTM D2216 must be within the limits of [___] percentage points above optimum and [___] percentage points below optimum moisture content.

Process material such that the moisture content is within [___] percent of the specified range prior to placing the material on the embankment. This may require material processing either at the borrow/excavation site or other location near the embankment. Harrowing, or other approved methods may be required ensure a uniform distribution of moisture.

Accurately control the amount of water applied on a layer of fill such that free water does not appear on the surface during spreading and rolling. Should too much water be added to any part of the embankment, so that the material is too wet to obtain the specified compaction, the rolling on that section of the embankment will be delayed until the moisture content of the material is reduced to an amount within the specified limits. Material that is too wet may be worked by discing or harrowing, if necessary, until the moisture content is reduced to an amount within the specified limits. Wet material may also be blended with drier material to produce a product that meets the moisture requirements of this specification.

If, in the opinion of the Contracting Officer, the top or contact surfaces of the partial fill section become too dry to permit suitable bond with the succeeding lift, the Contractor will be required to moisture condition the materials on the fill. The Contractor will loosen the dried materials by scarifying or discing to such depths as may be directed by the COR, dampen the loosened material to an acceptable moisture content, and compact this layer in accordance with the applicable requirements of paragraph COMPACTION, subparagraph IMPERVIOUS FILL.
3.4.2 Random Sections

NOTE: The designer should determine if specified control of the moisture content of the random portions of the embankment is important. In many cases, the density is the only consideration and the random sections may be specified to achieve a certain density regardless of moisture content.

The upper and lower limits of moisture content, and the moisture control procedures for random materials must be [the same as that specified for impervious material, or pervious material, dependent upon which of these types it most nearly resembles][such that the specified density can be achieved].

3.4.3 Pervious Section

Wet pervious material by sprinkling after spreading on the embankment and [maintain the moisture content of each layer at the optimum for compaction] [keep each layer in an approximately saturated condition] during rolling. Prewetting of pervious material at the sources of excavation or borrow will not be required. Sprinkle with hoses connected to header pipes along the faces of the embankment, by water trucks with pressure spray bars, or by any other approved method. All connections in the water supply system, including the hose connections to the header pipes, must be watertight. Do not direct jets at the embankment with such force that the finer materials will be washed out. Provide capacities of pumps and sizes of header pipes sufficient to supply the required amount of water at all times.

3.4.4 Filter Drainage Layers

Moisture control of graded gravel filter and bedding layers will not be required and sluicing will not be permitted. Moisture control of filters containing a predominate amount of sand particles will be as required to achieve the density specified in paragraph COMPACTION.

3.4.5 Rock Fill

[No moisture control will be necessary on rock fills. ][The moisture content of the rock fill must be reasonably uniform throughout each layer of material placed prior to and during compaction. Add water in an amount equal to [15][_____] percent of the volume of the fill to the material on the embankment prior to compaction by uniform spraying from a water truck. The required water amount may be modified based on results of a test fill, as approved by the Contracting Officer.]

3.5 COMPACTION

3.5.1 Equipment

NOTES: In determining the use of a method specification versus an end-result (production) specification, the following should be considered:

a. The use of a method specification involving restrictions on material type, lift thickness,
moisture content, and a specified number of passes with approved compaction equipment, a test fill should be required at the start of embankment work, to include foundation preparation. This will allow for the evaluation of the results achieved for particular efforts prior to the beginning of production work.

b. If the designer chooses an end-result (production) specification which would specify material type, lift thickness, moisture content, and in-place density, the requirements of COMPACTION EQUIPMENT and ADDITIONAL ROLLING FOR COMPACTION may be either removed or tailored to fit the project requirements.

With reference to the use of compaction equipment in this paragraph, the following precautions should be noted:

a. The following paragraphs are provided as examples of the information that should be provided within the specifications to describe the selection of equipment to perform construction. Specifications should be written to ensure that the type of compaction equipment will be used which, in the judgment of the designer and Contracting Officer, is best suited to obtain the desired compaction of the material being utilized. Consideration must be given to soil type, lift thickness and placement location. A requirement should be included in the specifications for the performance evaluation of each type of compaction equipment conforming with the specifications and intended for use by the Contractor at an early stage of embankment construction. This equipment evaluation should be accomplished through analysis of test fill areas that are carefully constructed under representative working conditions with materials and moisture contents as specified. Test fill areas may either be separate or part of the permanent work, and for clarity to prospective bidders, payment under a separate item is recommended to equitably cover costs of required variations in equipment coverages, possible changes in equipment loading or foot sizes, as well as intensified field soils testing.

b. For tamping rollers that are either towed or self-propelled, with drums capable of being ballasted with fluid, the provision for a pressure relief valve and safety head should be included. Over-pressurization of fluid ballasted compaction drums to the level of a safety hazard has been rare, but has occurred on several occasions at locations of high elevation and temperature.

c. In compacting materials consisting of shales, sandstones, weathered rock and similar random materials, consideration should be given to
specifying sheepfoot-type tamping equipment that has been modified by replacing the standard feet with "chisel" point tamper feet generally referred to as "shale breakers". The end areas of these modified tamper feet tend to break up weathered rock to prevent the bridling effect sometimes created by large rock particles.

d. For compaction of sand and gravel fills or filter and drainage layers, equipment characteristics for both a large and small vibratory roller have been provided for optional selection by the designer, depending upon location, selected lift thickness, gradation, grain shape, and durability properties of the materials. The smaller roller should be specified for materials which exhibit degradation under compaction. Other options, based on construction experience may also be exercised. For example, it has been found that improved trafficability can often be achieved when compacting clean, fine grained, uniform sands by specifying a drum driven self-propelled vibratory roller.

Provide compaction equipment conforming to the following requirements and use as prescribed in subsequent paragraphs.

3.5.1.1 Tamping Rollers

3.5.1.1.1 Towed

Provide tamping rollers consisting of two or more non-vibratory roller drums mounted side-by-side in a suitable frame and towed by either a crawler-type or rubber tired tractor having sufficient power to pull the roller satisfactorily when the drums are fully ballasted. Each drum must be free to pivot about an axis parallel to the direction of travel. Control rollers operating in tandem sets in a manner such that the prints produced by the tamping feet of the tandem units are staggered. Each drum must have an outside diameter of not less than \[\text{[_____] m [_____] feet} \] and must be not less than \[\text{[_____] m [_____] feet} \] in length. The space between two adjacent drums, when on a level surface, must not be less than \[\text{[_____] m [_____] feet} \] nor more than \[\text{[_____] m [_____] feet} \].

[Equip each drum ballasted with fluid with at least one pressure-relief valve and with at least one safety head. The safety head must be equal to union-type safety heads equipped with rupture discs suitable for rupturing pressures between 350 and 500 kPa50 and 75 psi. The pressure relief valve is a manually operated valve and must be opened periodically. Instruct personnel responsible for opening pressure-relief valves periodically to ascertain that valve openings are free from plugging to assure that any pressure developed in roller drums is released at each inspection.]

Provide at least one tamping foot for each \[\text{[_____] square mm[_____] square} \]
feet of drum surface. The length of each tamping foot from the outside surface of the drum must be not more than [_____] mm [_____] inches and must be maintained at not less than [_____] mm [_____] inches. The bearing surface of each tamping foot must be flat with a surface area not less than [_____] mm [_____] inches nor more than [_____] mm [_____] inches. During the operation of rolling, the spaces between the tamping feet must be maintained clear of materials which would impair the effectiveness of the tamping rollers. The weight of a roller when fully loaded must be not less than [_____] N/m[_____] pounds per foot of drum length, and the weight of a roller empty must be not more than [_____] N/m[_____] pounds per foot of drum length. The bearing surface, tamping foot size, the drum loading, and the operation of the rollers must be as required to obtain the desired compaction. If more than one roller is used on any one layer of fill, all rollers so used must be of the same type and essentially of the same dimensions. Draw rollers by crawler-type or rubber-tired tractors at a speed not to exceed [_____] km/h[_____] mph. Discontinue the use of rubber-tired towing equipment if the tires leave ruts that prevent uniform compaction by the tamping roller, and the substitution of crawler-type towing equipment may be directed.

3.5.1.1.2 Self-propelled

The use of self-propelled non-vibratory tamping rollers conforming with the following specification will be permitted, and their design and operation will be subject to approval, and subject to the right, at any time during the prosecution of the work, to direct such modifications to the tamping feet or variations in roller drum weight where applicable, as may be found necessary to secure optimum compaction of the earth fill materials. If use of self-propelled tamping rollers causes shearing of the fill, laminations in the fill, or results in inadequate compaction, the Contracting Officer may direct that such rollers be removed from the fill and that appropriate towed tamping rollers be used. Two-or three-drum side-by-side units that are either in drive position or drawn by separate power equipment must have a clearance between adjacent drums not less than [_____] mm[_____] inches nor more than [_____] mm[_____] inches. Two-drum or four-drum equipment separated by cab and differential and arranged in tandem must have its static weight equally distributed to all compaction drums and must have the tandem drums positioned such that the prints of the tamping feet produced by the tandem drums are staggered. The surface on which the tamping feet are mounted must have a minimum outside diameter of [_____] mm[_____] feet and at least one tamping foot for each [_____] square mm[_____] square feet of drum surface. The distance between the centers of any two adjacent tamping feet must be not less than [_____] mm[_____] inches. The length of each tamping foot from the outside mounting surface of the drum must be not more than [_____] mm[_____] inches and must be maintained at not less than [_____] mm [_____] inches. The bearing surface of each tamping foot must be flat and have a surface area not less than [_____] square mm[_____] square inches nor more than [_____] square mm[_____] square inches. Cupped recesses within the bearing surface of each tamping foot will be permitted but must not exceed [_____] mm[_____] inches in depth. During rolling operations, keep the spaces between the tamping feet clear of materials which would impair the effectiveness of the tamping roller. The weight of all roller drums during compaction of fill materials must be maintained uniform and with the weight per foot of drum length not less than [_____] N [_____] pounds. [For self-propelled rollers with drums capable of being ballasted with fluid, equip each drum with at least one pressure-relief valve and with at least one safety head. The safety head must be equal to union type safety heads equipped with rupture discs suitable for rupturing pressures between 350 and 500 kPa 50 and 75 psi. The pressure relief valve
is a manually operated valve and must be opened periodically. Instruct personnel responsible for opening pressure-relief valves periodically to ascertain that valve openings are free from plugging to assure that any pressure developed in roller drums is released at each inspection.) For self-propelled rollers in which steering is accomplished through the use of rubber-tired wheels, the tire pressure must not exceed [_____] kPa[_____] psi. Discontinue use of the compactor if the tires leave ruts that prevent uniform compaction by the tamping roller and the substitution of appropriate towed tamping rollers may be directed. When a self-propelled roller is provided with a dozer blade, do not count coverages made with the blade in operation as compaction coverages. Operate self-propelled rollers at a speed not to exceed [_____] km/h[_____] mph.

3.5.1.2 Vibratory Rollers

Equip vibratory rollers for compacting rock fills, pervious sand and gravel fills, or filter and transition drainage layers with a smooth steel compaction drum and operate at a frequency of vibration during compaction operations between 1100 and 1500 vibrations per minute (vpm). Provide vibratory rollers that are either towed or self-propelled and that have an unsprung drum weight that is a minimum of 60 percent of the rollers' static weight. Provide towed rollers that have at least 90 percent of their weight transmitted to the ground through the compaction drum when the roller is standing in a level position hitched to the towing vehicle. Rollers for compacting rock fill, [sand and gravel fills, or filter and drainage layers] must have a minimum static weight of [_____] kN [_____] pounds, a minimum dynamic force of [_____] kN [_____] pounds when operating at 1400 vpm, and an applied force not less than [_____] kN/m [_____] pounds per foot of compaction drum length. [Rollers for compacting sand and gravel fills or filter and drainage layers must have a minimum static weight of [_____] kN [_____] pounds, a minimum dynamic force of [_____] kN [_____] pounds when operating at 1400 vpm, and an applied force not less than [_____] kN [_____] pounds nor greater than [_____] kN/m [_____] pounds per foot of compaction drum length.] The level of amplitude and vibration frequency during compaction will be maintained uniform throughout the embankment zone within which it is operating. Operate rollers at speeds not to exceed [_____] km/h [_____] mph.

3.5.1.3 Rubber-tired Rollers

Provide rubber-tired rollers that have a minimum of four wheels equipped with pneumatic tires. The tires must be of such size and ply to maintain tire pressures between [_____] and [_____] kPa [_____] and [_____] psi for a [_____] kN [_____] pound wheel load during rolling operations. Locate the roller wheels abreast and design so that each wheel will carry approximately equal load in traversing uneven ground. The spacing of the wheels will be such that the distance between the nearest edges of adjacent tires will be greater than 50 percent of the tire width of a single tire at the operating pressure for a [_____] kN [_____] pound wheel load. Provide the roller with a body suitable for ballast loading such that the load per wheel may be varied, from [_____] to [_____] kN [_____] to [_____] pounds. Tow roller at speeds not to exceed [_____] km/h [_____] mph. The character and efficiency of this equipment will be subject to approval.

3.5.1.4 Power Tampers

Perform compaction of material, in areas where it is impracticable to use a roller or tractor, as provided in paragraph EARTHWORK, by the use of approved power tampers.
3.5.2 Impervious Fill

After a layer of impervious fill material has been dumped and spread, harrow it if required, to break up and blend the fill materials, to remove laminations, ruts or smooth surfaces to enhance bonding between layers. Perform harrowing to the full depth of the layer.

When the moisture content and the condition of the layer is satisfactory, compact the lift [to at least [_____] percent of maximum dry density as determined by ASTM D698, prior to placement of the next layer. Determination of in-place density must be in accordance with ASTM D1556/D1556M and ASTM D6938.[by not less than ][_____] complete coverages of the tampering roller][_____] complete coverages of the rubber-tired roller]. Provide complete coverage consisting of the coverage of the entire lift to be compacted with the roller specified. A complete coverage must consist of the application of compactive effort to the entire lift to be compacted with a single roller drum having the characteristics as specified in paragraph SELF-PROPELLED. The use of four-drum self-propelled equipment that is laterally separated by operator's cab and differential may be used; however, two complete coverages of the lift to be compacted will be achieved by a subsequent offset trip of the roller for coverage of the previously uncompacted central portion of the roller path. Place portions of the fill which are not accessible to the roller [_____] mm inch layers loose measurement and compacted with power tampers to a degree equal to that obtained on the other portions of the compacted fill by rolling as specified in accordance with paragraph BACKFILL. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously.

3.5.3 Pervious Fill

After each layer of pervious material has been dumped and spread, and the moisture content is in accordance with the provisions of paragraph PERVIOUS SECTION, compact the entire surface of the layer [to an average of [_____] percent minimum relative density][by not less than [_____] complete coverages of [the rubber-tired roller][the vibratory roller]].

3.5.4 Additional Rolling for Compaction

If, in the opinion of the Contracting Officer, the desired compaction of any portion of the embankment is not achieved by the minimum number of coverages specified, make additional complete coverages over the surface area of such designated portion until the desired compaction has been obtained.

3.5.5 Filter and Transition Drainage Layers

**************************************************************************
NOTE: The following paragraph for Transition Layers does not include bedding for riprap slope protection, which should be provided under Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION.
**************************************************************************

Accomplish compaction of filter soil using the compaction equipment
The roller must make a minimum of two (2) passes, acting in vibratory mode, across the initial lift of filter material. Upon completion of these first 2 passes, check the density of the filter material. Make additional passes of the vibratory roller until a relative density between [_____] and [_____] percent is attained based on the maximum dry density obtained in accordance with ASTM D4253 and minimum dry density as determined by ASTM D4254. The number of passes required to achieve a relative density of [_____] percent must be the minimum required number of passes on subsequent lifts of filter material. Compaction equipment must be clean and free from other fill types or debris and must not result in contamination of the filter material. Slightly slope adjacent lifts of other fill types to drain away from the filter material. Remove and replace any contaminated filter material at no additional cost. Placement methods must not result in segregation of the filter material (such as but not limited to placement via conveyer of chute).

3.5.6 Rock Fill

After the rock fill has been dumped and spread to the thickness specified, compact the entire surface of the layer by not less than [_____] complete coverages of the vibratory roller specified in paragraph VIBRATORY ROLLERS. Provide a complete coverage consisting of the entire coverage of the area with one trip of the equipment specified. Each trip of the roller must overlap the adjacent trip not less than [_____] mm feet.

3.6 BACKFILL

3.6.1 General

Do not place embankment fill, filter soil or backfill against a concrete structure until the top of the structure has been completely placed, and has reached 80 percent of its design strength. Bring fill up in lifts evenly on both sides of structure and headwall structures with no more than [_____] mm[_____] feet difference in elevation on opposing sides of the structure.

Subsequent to the concrete structure attaining 80 percent of design strength, backfill operations may be initiated but no rolling or hauling equipment will be permitted to pass over the structure, or within [_____] mm [_____] feet of any part of the structure. During this period, backfill may be placed against the sides of the structure and to a minimum thickness of [_____] mm [_____] feet over the top of the structure, if compaction is accomplished by power tampers as specified in paragraph POWER TAMPERS. Before passage of hauling and rolling equipment over the top of the conduit or other structure will be permitted, the depth of fill over the concrete must be sufficient to permit such passage without inducing harmful stresses or vibrations in the structure.

3.6.2 Placement

Place backfill in [_____] mm inch layers and thoroughly compact. Unless otherwise directed, the placing and compacting of all backfill material and the control of its moisture content must conform to the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION. Keep fill in back of wing walls at approximately the same elevations as that of the backfill, gravel blankets, riprap, or derrick stone on the opposite side of the wall until placement has reached the maximum elevation of the materials to be placed on the toe of the wall. Keep drainage openings...
through walls open at all times.

3.7 FIELD QUALITY CONTROL

**************************************************************************

NOTE: FAR Part 46.312 establishes a requirement for Contractor Quality Control (CQC) in construction contracts and ER 1180-1-6 requires that a CQC section based on Section 01 45 00 QUALITY CONTROL be included in contracts of $1,000,000 or more. Use of Section 01 45 00 for contracts of less than $1,000,000 is discretionary. This part of the specifications must be consistent with the CQC section.

Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of mica, halloysite, some other chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density. Sand Cone or similar field density tests should be performed periodically at the same location as Nuclear Tests to assure nuclear testing is providing accurate information.

Specifier may desire the use of a tabular format for frequency of testing of materials.

**************************************************************************

Establish and maintain field quality control for embankment and backfill operations to assure compliance with contract requirements and maintain detailed records of field quality control for all operations including but not limited to the following:

3.7.1 Materials Testing

**************************************************************************

NOTE: Types of tests and frequency of testing should be detailed below. Types of tests and frequency of testing will be dependent upon the types of materials utilized, configuration of foundation and embankment, placement and compaction procedures required, moisture control requirements etc. Testing requirements are material type specific rather than embankment fill type specific. It is desirable to present the testing frequency and type in tabular form.

**************************************************************************

Perform sufficient testing to ensure that the fill is being constructed as specified. The testing program specified below will be considered the minimum acceptable frequency of testing. This does not relieve the Contractor from the responsibility of performing additional testing, if required to ensure compliance with these specifications.

[3.7.1.1 Soil Classification Tests

Soil classification tests will be performed in accordance with ASTM D2487. One initial classification test will be required for each different
classification of material to be utilized as embankment fill or backfill. As prescribed in ASTM D2487, grain size analyses in accordance with ASTM D422 and Atterberg limits in accordance with ASTM D4318 will be performed on each different classification. Submit additional tests for every [_____] cubic m cubic yards of embankment or backfill material. Soil classification tests will be performed on foundation material as required to determine the acceptability of the in-situ soils. Additional tests will be required if noticeable changes in the material occur.

3.7.1.2 Cohesive Material Testing

NOTE: Edit the following to comply with the method selected to determine the optimum properties (i.e., density and moisture content, LL, PL, PI).

3.7.1.3 Moisture Density Relationships

The moisture-density relations for each different classification of cohesive material utilized will be determined in accordance with [_____] [ASTM D698], [Method A] [Method B] [Method C]. Prior to placing any fill material containing cohesive material, a minimum of [_____] five-point [_____] compaction test will be performed on representative samples of the material to be used as fill. During fill placement a minimum of one additional moisture-density test will be performed for every [_____] cubic m cubic yard placed. Additional tests will be required each time a new material is encountered. The moisture-density curves will be compiled to form a family of curves which will be utilized to estimate optimum properties (maximum dry density and optimum moisture content) to be used with field density test.

3.7.1.4 Water (Moisture) Content Tests

Determination of water content will be performed in accordance with ASTM D2216. ASTM D4643 may be used when rapid moisture content results are needed. All rapid results obtained by ASTM D4643 will be confirmed by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern. One water content test will be performed for each [_____] cubic m cubic yards of material placed [or each lift of material whichever is less]. These tests will be in addition to the water content tests performed in conjunction with in-place density tests. Backfill and fills not meeting the required specifications for water content will be retested after corrective measures have been applied.

3.7.1.5 In-place Density Testing for Cohesive Materials

NOTE: The designer should pick the method or methods of In-place density which are acceptable. If uncompacted fill is specified density control may not be required.

Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of certain chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density.
The in-place density of the cohesive materials will be determined in accordance with [ASTM D1556/D1556M], [ASTM D2167], [ASTM D6938], [ASTM D2937], or [ASTM D5195]. At least one (1) in-place density test will be performed on each lift of material or every _____ cubic yards of completed fill whichever is more frequent with the horizontal locations randomly staggered in the fill. At each field density test location, soil samples will be obtained and one [one-point] [two-point] compaction test, one moisture content, [one grain size analysis], and one Atterberg limits test, if applicable, will be performed on the sample. The results of the [one-point] [two-point] compaction test and the moisture content test will be utilized to obtain the optimum properties to compare to the results of the in-place density test. For use with the family of curves to determine the optimum properties of the material a [one-point] [two-point] compaction tests will be performed in conjunction with each in-place density. A portion of the soil from the in-place field density test and soil obtained immediately adjacent to the field density test location will be used for a [one-point] [two-point] compaction test. The minus 19 mm 3/4-inch portion of the soil will be subjected to _____ compactive effort using a [150 mm] [6-inch] compaction mold in accordance with the procedures presented in ASTM D[_____] [ASTM D698] [ASTM D1557]. Fill not meeting the required specifications for in-place density will be retested after additional compaction has been completed. When nuclear method is used for in-place density testing according to ASTM D6938, the first test and every tenth test thereafter for each material type will include a sand cone correlation test in accordance with ASTM D1556/D1556M. The sand cone test will be performed adjacent to the location of the nuclear test, will include a nominal 150 mm 6 inch diameter sand cone, and will include a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. Nuclear density testing equipment will not be used during rain. The density correlations will be submitted with test results. Each transmittal including density test data will include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
   Station.
   Coordinates.
c. Elevation of Lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.
l. Pass/Fail.
m. Retest.
n. Comments.

3.7.1.6 Cohesionless Material Testing

3.7.1.6.1 Compaction Tests

Run not less than one relative density test for every [3,000] [_____] cubic m [3,900] [_____] cubic yards of cohesionless fill in accordance with
In-place Density Tests

The in-place density of the cohesionless materials will be determined in accordance with ASTM D1556/D1556M, ASTM D2167, ASTM D6938, ASTM D2937, or ASTM D5195. Run not less than one field in-place density test on each lift of material or every shift/day [_____] cubic m cubic yards of completed embankment fill or backfill whichever is less. Horizontal locations will be randomly staggered in the fill. When nuclear method is used for in-place density testing according to ASTM D6938, the first test and every tenth test thereafter for each material type will include a sand cone correlation test in accordance with ASTM D1556/D1556M. The sand cone test will be performed adjacent to the location of the nuclear test, and will include a nominal 150 mm 6 inch diameter sand cone, and will include a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. The density correlations will be submitted with test results. Each transmittal including density test data will include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

- Test Identification Number.
- Test location.
  - Station.
  - Coordinates.
- Elevation of Lift.
- Lift number (if appropriate).
- Photo number (if appropriate).
- Meter serial number and operators initials.
- Standard count for each test.
- Material type.
- Probe depth.
- Moisture content by each test method and the deviation.
- Wet density by each test method and the deviation.

Water (Moisture) Content Tests

Determination of water content will be performed in accordance with ASTM D2216. ASTM D4643 may be used when rapid moisture content results are needed. All rapid results obtained by ASTM D4643 will be confirmed by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern. One water content test will be performed for each [_____] cubic m cubic yards of material placed[ or each lift of material whichever is less]. These tests will be in addition to the water content tests performed in conjunction with in-place density tests.] Backfill and fills not meeting the required specifications for water content will be retested after corrective measures have been applied.

Additional Testing

The Contracting Officer may request additional tests if there is reason to doubt the adequacy of the compaction, or special compaction procedures are being used, or materials change, or if the Contracting Officer determines that the Contractor's testing is inadequate, or the Contractor is concentrating backfill and fill operations in a relatively small area.
3.7.1.7 Materials

Suitability of embankment and backfill materials.

3.7.1.8 Fill Placement

Layout, maintaining existing drainage, moisture control, thickness of layers, removal of oversized material, spreading and compaction for embankment and backfill.

3.7.1.9 Grade and Cross Section

Surveys to verify that the dimensions, slopes, lines and grades conform to those shown on the drawings. Surveys to monitor settlement gages to measure foundation settlement. [Surveys to locate core boring locations and elevations to determine foundation settlement.]

3.7.1.10 Testing by the Government

During the life of this contract, the Government [or its Contractors] will perform quality assurance tests. Make available to the Government [or its Contractors] the equipment to perform these tests.

3.7.1.11 Reporting

On a daily basis, furnish the inspection records and all material testing results, [the quantity of fill placed,] as well as the records of corrective action taken, in accordance with Section 01 45 00 QUALITY CONTROL.

3.8 SLIDES

In the event of slides, in any part of the embankment prior to final acceptance of the work, remove material from the slide area, as directed, and rebuild such portion of the embankment. In case it is determined that the slide was caused through the fault of the Contractor, perform the removal and disposal of material and the rebuilding of the embankment without cost to the Government; otherwise this work will be paid for at the applicable contract unit prices for borrow excavation and compacted fill or backfill.

3.9 PIEZOMETERS, SETTLEMENT GAGES AND SURFACE REFERENCE MARKS

**************************************************************************
NOTE: The installation of instrumentation is not strictly speaking an activity of construction of an embankment dam. This activity should be placed within its own specification division as an item of SPECIAL CONSTRUCTION. There is presently no UFGS guide specification for this item. The specification writer should consider the use of a section for SPECIAL CONSTRUCTION, and if so, delete the following paragraphs.

Include paragraphs for all types of instruments to be utilized.
**************************************************************************
[3.9.1 Government Installed Piezometers]

A number of piezometers will be installed on the embankment foundations by the Government with its own forces. Connections and extensions of riser pipes must be made by the Contractor with materials furnished by the Contractor. Determine the elevation of the top of the riser pipe immediately before and immediately after each extension is added to the pipe. Keep the top of such pipes at least 600 mm 2 feet above the embankment surface. During construction, place a mound of fill around the riser pipes and compact to the same density and moisture content as the surrounding fill material. Conduct the required operations in such a manner that the devices will not be damaged. Place suitable markers and guard posts around the gages for protection. No separate payment will be made for such protection or for special measures required in connection with the installation of these devices; include all costs in the contract prices bid for related items of work.

[3.9.2 Location and Installation of Settlement Gages]

Furnish and install settlement gages for determining foundation and embankment settlement during construction. Provide type, arrangement and location of gages as shown. The areas in which adjustment in quantities will be made as a result of foundation settlement are as indicated on the plans. Place the base plate on a level surface of well compacted foundation material. Determine the elevations of the base plates before placing fill material and again within 48 hours after completion of the embankment. Determine the elevation of the stem immediately before and immediately after each extension is added. These elevations will be verified by the Contracting Officer. Carefully install the stem plumb. Extend the stem in increments as the embankment rises with the top of the stem at a minimum of 600 mm 2 feet above the surface of the embankment. Conduct these operations in such a manner that the gages will not be damaged. Place suitable guard posts around the gages for protection. Compact fill around the stem to the same density and moisture content as the surrounding material. Restore or replace any settlement gage damaged or destroyed due to fault or negligence at no additional cost to the Government. No additional payment will be made for compaction of fill around and over the settlement gages or for interference with the Contractor's operations resulting from the settlement gage installations.

[3.9.3 Surface Reference Marks]

Furnish and install surface reference marks as shown. Furnish the horizontal and vertical location of each reference mark with respect to established bench marks at the time of installation, and every [_____] calendar days thereafter until completion of the contract. Conduct these operations in such a manner that the reference marks will not be disturbed or damaged. Replace or repair any reference mark disturbed or damaged due to negligence on the Contractor's part and furnish the correct horizontal and vertical locations the Contractor's expense.

2.24.1.6 Hangers
2.24.1.7 Hanger Rods

2.24.2 Pipe Guides
2.24.2.1 Intermediate Guides
2.24.2.2 Alignment Guides

2.24.3 Flashing Sleeves

2.24.4 Wall Penetrations
2.24.4.1 Above Grade Wall Penetrations
2.24.4.2 Below Grade Wall Penetrations
2.24.4.3 Galvanizing

2.25 MISCELLANEOUS MATERIALS

2.25.1 Pipe Insulation Material
2.25.2 Heat Trace
PART 3 EXECUTION

3.1 EXAMINATION

3.2 PREPARATION
  3.2.1 Protection
  3.2.2 System Preparation
    3.2.2.1 Pipe and Fittings
    3.2.2.2 Damaged Coatings
    3.2.2.3 Field Fabrication

3.3 EXPOSED PIPING INSTALLATION
  3.3.1 Anchors and Fasteners
    3.3.1.1 Drilled-In Expansion Anchors and Fasteners
    3.3.1.2 Drilled-In Adhesive Anchors
  3.3.2 Piping Expansion and Contraction Provisions
  3.3.3 Piping Flexibility Provisions
  3.3.4 Couplings, Adapters and Service Saddles
  3.3.5 Piping Equipment/Component Installation
    3.3.5.1 Backflow Preventers
    3.3.5.2 Local Indicators
  3.3.6 Pipe Flanges
  3.3.7 Valve Locations
  3.3.8 Pipe Tap Connections
  3.3.9 Plastic Pipe Installation
    3.3.9.1 PVC Piping
    3.3.9.2 FRP Piping
  3.3.10 Double Containment Piping Installation
  3.3.11 Insulation

3.4 BURIED PIPE PLACEMENT
  3.4.1 Excavation and Backfilling
  3.4.2 Fittings
  3.4.3 Thrust Restraint
    3.4.3.1 Thrust Blocks
    3.4.3.2 Restrained Joints
  3.4.4 Marking Tape
  3.4.5 Plastic Pipe Installation

3.5 CONNECTING DISSIMILAR PIPE

3.6 EXTERNAL CORROSION PROTECTION
  3.6.1 Underground Metallic Piping
  3.6.2 Above Grade Metallic Piping
    3.6.2.1 Ferrous Piping
    3.6.2.2 Aluminum Alloy Piping

3.7 DOUBLE CONTAINMENT PIPING LEAK DETECTION SYSTEM

3.8 FLEXIBLE JOINTS AT CONCRETE STRUCTURES

3.9 CLOSURES

3.10 PENETRATIONS

3.11 VALVE INSTALLATION
  3.11.1 Valve Orientation
    3.11.1.1 Butterfly Valves
    3.11.1.2 Plug Valves
  3.11.2 Line Size Ball Valves
  3.11.3 Isolation Valve
  3.11.4 Operator Extension Stems
  3.11.5 Torque Tube
  3.11.6 Chain Wheel and Guide

3.12 AIR RELEASE, DRAINS AND SAMPLE PORTS

3.13 PIPING SUPPORT SYSTEMS INSTALLATION
  3.13.1 General Support Requirements
  3.13.2 Support of Insulated Piping
  3.13.3 Dielectric Barriers
3.13.4 Support Spacing
   3.13.4.1 Acceptable Limits for Metallic Piping
   3.13.4.2 Acceptable Limits for Thermoplastic Piping
   3.13.4.3 Acceptable Limits for Rubber/Elastomer Piping
3.13.5 Support Methods
3.13.6 Supports and Hangers for Stainless Steel Piping

3.14 PIPE IDENTIFICATION, PAINTING AND COLOR CODING

3.15 FIELD QUALITY CONTROL
   3.15.1 Hydrostatic Tests
      3.15.1.1 Buried Piping
      3.15.1.2 Exposed Piping
         3.15.1.2.1 Rigid Piping
         3.15.1.2.2 [Non-Rigid, Non-Metallic Piping] [and] [Metallic Piping with a Non-Metallic Liner]
      3.15.1.3 Double Containment Primary Piping
      3.15.1.4 Time for Making Test
   3.15.2 Pneumatic Tests
      3.15.2.1 Pressure Relief Device
      3.15.2.2 Pneumatic Testing Procedures
      3.15.2.3 Double Containment Secondary Piping
   3.15.3 Pipe Leakage Tests
   3.15.4 Testing New to Existing Connections
   3.15.5 Valve Testing

3.16 FINAL CLEANING
   3.16.1 Interim Cleaning
   3.16.2 Flushing
   3.16.3 Disinfection

3.17 WASTE WATER DISPOSAL

3.18 TABLES

3.19 MANUFACTURER'S FIELD SERVICES

-- End of Section Table of Contents --
PART 1  GENERAL

NOTE: Show the following information on the project drawings:

a. Location of pipelines indicating pipe designation, diameter and valves.

b. Pipe schedule relating pipe designation and service.

c. Valve schedule indicating valve designation and service.

d. Piping details.
1.1 UNIT PRICES

**NOTE: This paragraph does not apply to invitation for bid (IFB) contracts. If it is determined that a lump sum contract may be more advisable, this paragraph will be deleted. If a unit price contract is to be used, the bid items for the unit price contract will be defined for each unit to be furnished and installed.**

Measurement and payment will be based on completed work performed in accordance with the drawings, specifications and the contract payment schedules. No payment will be made under this section for excavation, trenching, or backfilling. Payment for such work will be made under Section 31 00 00 EARTHWORK.

1.1.1 Measurement

Determine the length of pipelines, for which payment will be made, by measuring along the centerlines of the various piping systems and sizes as furnished and installed. Measure pipe from the center of fitting to center of fitting and from center of main header to end of pipe. Make no deduction for the space occupied by valves or fittings.

1.1.2 Payment

Payment will be made at the price per linear meter foot listed in the bid form for the various types and sizes of piping, and will be full compensation for all pipes, joints, fittings and specialties, complete in place. Payment for valves and other appurtenances will be made at the respective contract unit price for each item complete in place. Payment will include the furnishing of all testing, plant, labor, and material and incidentals necessary to complete the work, as specified and as shown in contract documents.

1.1.2.1 Connections to Existing Piping

Connections to existing piping systems where new fittings in the existing line are required will be paid for according to the contract prices for such connection. The price will be considered as full compensation for material and labor required for the removal and replacement of the existing pipe as necessary.

1.1.2.2 Connections to Existing Equipment

Connections to existing equipment where new fittings for the existing equipment are required will be paid for according to the contract prices for such connection. The price will be considered as full compensation for material and labor required for the installation of new fittings or the removal and replacement of existing fittings, as necessary.

1.2 REFERENCES

**NOTE: This paragraph is used to list the**
publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard’s Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard’s Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up
to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

SD-10 Operation and Maintenance Data
Piping and Appurtenances; G[, [_____]]

1.4 QUALIFICATIONS

1.4.1 Experience

Submit a statement certifying that the Contractor has the specified experience. Ensure Contractor has successfully completed at least [three] [_____] projects of the same scope and size or larger within the last [six] [_____] years. Demonstrate specific experience in regard to the system installation to be performed.

1.4.2 Double Containment Piping System Manufacturer

**************************************************************************
NOTE: Delete the following paragraph when it is not required.
**************************************************************************

The double containment piping system manufacturer will have at least [ten] [_____] years of installation experience with leak detection/location sensor cable technology.

1.4.3 Welders

Submit the names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, standards tested to, etc. Weld pressure piping systems in accordance with qualifying procedures using performance qualified welders and operators. Use procedures and welders in accordance with Section 40 05 13.96 WELDING PROCESS PIPING. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.

1.5 DELIVERY, STORAGE, AND HANDLING

Materials delivered and placed in storage must be stored with protection
from the weather, excessive humidity variation, excessive temperature variation, dirt, dust and/or other contaminants. Proper protection and care of material before, during and after installation is the Contractor's responsibility. Any material found to be damaged must be replaced at the Contractor's expense. During installation, piping must be capped to keep out dirt and other foreign matter. A Safety Data Sheet in conformance with 29 CFR 1910 Section 1200(g) must accompany each chemical delivered for use in pipe installation. At a minimum, this includes all solvents, solvent cements, glues and other materials that may contain hazardous compounds. Handling must be in accordance with ASTM F402. Storage facilities must be classified and marked in accordance with NFPA 704. Materials must be stored with protection from puncture, dirt, grease, moisture, mechanical abrasions, excessive heat, ultraviolet (UV) radiation damage, or other damage. Pipe and fittings must be handled and stored in accordance with the manufacturer's recommendation. Plastic pipe must be packed, packaged and marked in accordance with ASTM D3892.

1.6 PROJECT/SITE CONDITIONS

1.6.1 Environmental Requirements

**************************************************************************
NOTE: HTRW sites are typically well studied and investigated. Site conditions found during these previous investigations (e.g., soil resistivity testing for corrosion control design) must be incorporated into the design. The next paragraph must be edited carefully to address existing site conditions.
**************************************************************************

Buried piping at the site may be subject to corrosion from the surrounding soil. Conduct testing and measurements in accordance with [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM]. Ensure piping system design, supply and installation addresses the external corrosion conditions so indicated.

1.6.2 Existing Conditions

**************************************************************************
NOTE: Connection locations and wet/dry connections must be clearly indicated to avoid confusion and claims.
**************************************************************************

Verify existing piping and penetrations. Prior to ordering materials, expose all existing pipes which are to be connected to new pipelines. Verify the size, material, joint types, elevation, horizontal location, and pipe service of existing pipes, and inspect size and location of structure penetrations to verify adequacy of wall sleeves, and other openings before installing connecting pipes.

1.7 SEQUENCING AND SCHEDULING

For slab, floor, wall, and roof penetrations, keep on site pertinent wall pipes and sleeves before they are required for placement in concrete forms. Verify and coordinate the size and location of building and structure pipe penetrations before forming and placing concrete.
1.8 MAINTENANCE

1.8.1 Service

**************************************************************************
NOTE: Selectively require manufacturer's service. Automatic valves in critical or hazardous systems require service assistance. Coordinate these services with specification sections that address instrumentation and control.
**************************************************************************

Provide services for [automatic valve] [double containment leak detection monitoring system] [double containment leak sensor cable] [_____] systems by a manufacturer's representative who is experienced in the installation, adjustment and operation of the equipment specified. Inspect the installation, and supervise the adjustment and testing of the equipment.

1.8.2 Extra Materials

**************************************************************************
NOTE: Include items needed for future maintenance and repair, items that might be difficult to obtain because of color or pattern match, or spare parts to ensure operation of critical systems.
**************************************************************************

Submit the manufacturer's installation recommendations or instructions for each material or procedure to be utilized, including materials preparation. Concurrent with delivery and installation of the specified piping systems and appurtenances, furnish spare parts for each different item of material and equipment specified that is recommended by the manufacturer to be replaced any time up to [3 years] [_____] of service. For each type and size of valve, provide the following extra materials: lubricator, lubricant (with appropriate temperature rating), lubricator/isolating valve; [galvanized operating wrench, [1.2] [____]m [4.1] [_____] feet long, for T-handled operators;] [galvanized operating key for cross handled valves;] [______]. Extra materials include [2] [_____] of the following spare parts for each type and size of valve: gaskets; [O-ring seals;] [diaphragms (molded);] all elastomer parts; stem packing; [seat rings [and seat ring pulling tool;] [______].

PART 2 PRODUCTS

**************************************************************************
NOTE: All materials of construction specified will be retained except under conditions where they would not be suitable (see UFC 3-240-01); upon specific instructions of HQUSACE; as stipulated in specific project directives.; and as described within notes throughout the specification. A study of the process conditions will be made to determine the suitability of the materials. Where a material would be altogether unsuitable, every mention of the unsuitable material and referenced publications that pertain only to the unsuitable material will be deleted. If a material would be suitable in a part of the system and unsuitable in other parts, the
locations where the material may and may not be used will be stated in the contract specifications and shown on the contract drawings.

Soil conditions that may affect the corrosion rate of buried ferrous piping should be evaluated. The evaluation and corrosion control design will be performed in accordance with the directions provided in UFC 3-570-02A.

**************************************************************************

2.1 SYSTEM REQUIREMENTS

This specification covers the requirements for above and below grade liquid process pipe, pipe supports, fittings, equipment and accessories located both inside and outside of treatment plants.

2.1.1 Design Requirements

**************************************************************************

NOTE: Determine the design wind speed from ASCE 7-16 and/or UFC 3-301-01 STRUCTURAL ENGINEERING, although a minimum of 161 km/h (100 miles per hour) will be used. Similarly, use 1.2 kPa 25 psf snow load for most heavy snow climates. In some cases, local climates and topography will dictate that a larger value is required. This may be determined from ANSI A58.1, local codes or by research and analysis data of the effect of local climate and topography. Snow load requirements can be deleted for locations where the maximum snow is insignificant. Provide seismic requirements and show on the drawings. Delete the bracketed phrase if seismic details are not included. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.

**************************************************************************

Select and design support systems in accordance with MSS SP-58 within the specified spans and component requirements. The absence of pipe supports and details on the contract drawings does not relieve the Contractor of responsibility for sizing and providing supports throughout facility. The structural design, selection, fabrication and erection of piping support system components must satisfy the seismic requirements in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MISCELLANEOUS EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC [as indicated], accounting for a [_____] MPa psf soil bearing capacity, a maximum wind speed of [_____] km/h mph, a ground snow load of [_____] kPa psf, a maximum ambient air temperature of [_____] degrees C degrees F and a minimum ambient air temperature of [_____] degrees C degrees F.

2.1.2 Performance Requirements

The pressure ratings and materials specified represent minimum acceptable standards for piping systems. Provide piping systems suitable for the services specified and intended. Coordinate each piping system to function as a unit. Provide flanges, valves, fittings and appurtenances with a pressure rating no less than that required for the system in which they are
installed.

2.1.2.1 Buried Piping Systems

Provide piping systems suitable for design conditions, considering the piping both with and without internal pressure. Give consideration to all operating and service conditions both internal and external to the piping systems. Ensure buried ferrous piping has cathodic protection in accordance with [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM].

2.1.2.2 Above Grade Piping Systems

Provide piping systems suitable for design conditions, considering the piping both with and without internal pressure, and installation factors such as insulation, support spans, and ambient temperatures. Give consideration to all operating and service conditions both internal and external to the piping systems.

2.2 MATERIALS AND EQUIPMENT

**************************************************************************
NOTE: Verify that the pipe schedule is included in the contract drawings.
**************************************************************************

Submit manufacturer's descriptive and technical literature for each piping system, including design recommendations; pressure and temperature ratings; dimensions, type, grade and strength of pipe and fittings; thermal characteristics (coefficient of expansion and thermal conductivity); and chemical resistance to each chemical and chemical mixture in the liquid stream. Provide piping materials and appurtenances as specified and as shown on the drawings, and suitable for the service intended. Ensure piping materials, appurtenances, and equipment supplied as part of this contract are of equal material and ratings as the connecting pipe, new and unused except for testing equipment. Ensure components that serve the same function and are the same size are identical products of the same manufacturer. Provide general materials to be used for the piping systems in accordance with TABLE I and indicate by service in the [Pipe Schedule] [contract drawings] [______]. Submit a list of piping systems, pressure ratings and source of supply for each piping system broken out by material, size and application as indicated on the contract drawings. A list of any special tools necessary for each piping system and appurtenances furnished for adjustment, operation, maintenance and disassembly of the system. Provide pipe fittings compatible with the applicable pipe materials.

2.2.1 Standard Products

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacturing of the products and that essentially duplicate items that have been in satisfactory use for at least [2] [____] years prior to bid opening. Submit the following: Equipment shop drawings and support system detail drawings showing piping systems and appurtenances, such as mechanical joints, valves, local indicators and hangers, including a complete list of equipment and materials. As-built drawings showing pipe anchors and guides, and layout of piping systems relative to other parts of the work including clearances for maintenance and operation. As-built piping and instrumentation
diagrams (P&IDs) identifying and labeling equipment, instrumentation, valves, vents, drains, and all other inline devices; if the contract drawings contained P&IDs, revise the P&IDs found in the contract drawings to reflect the constructed process system, as directed by the Contracting Officer. Use nominal sizes for standardized products. Provide pipe, valves, fittings and appurtenances supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.2.2 Identification and Tagging

Each piece of pipe must bear the ASTM designation and all other markings required for that designation. Mark valves in accordance with MSS SP-25 and securely attach an identification tag using [No. 12 AWG copper wire] [stainless steel wire] [chrome-plated beaded chain] [plastic straps designed for that purpose]. Identification tags must be [35 mm 1.375 inch] [____ mm inches] minimum diameter, made of [brass] [engraved laminated plastic] [engraved anodized aluminum] [stamped stainless steel] [____]. [Use black indentations for reading clarity.] Display service, valve identification number shown on the [Operator Schedule] [Valve Schedule] in the contract drawings, the manufacturer's name, and the valve model number.

2.3 DUCTILE IRON PIPING SYSTEM

2.3.1 Ductile Iron Pipe

**************************************************************************
NOTE: Standard thicknesses of ductile iron pipe are governed by AWWA C150/A21.50 or AWWA C151/A21.51, except for integral flanged piping. The thickness of integral flanged pipe is regulated in AWWA C115/A21.15. If restrained joint pipe is used, thickness must conform to AWWA C151/A21.51.
**************************************************************************

Provide ductile iron pipe for pressure service with a design and wall thickness conforming to [AWWA C150/A21.50] [AWWA C151/A21.51] [AWWA C115/A21.15]. Provide ductile iron pipe with a [[standard] [double thickness] cement lining conforming to AWWA C104/A21.4] [standard asphaltic lining] [____].

2.3.2 Ductile Iron Joints

**************************************************************************
NOTE: Flanged connections should not be used for buried service. Use joints for pipe and fittings installed underground (buried).
**************************************************************************

Provide joints with a working pressure rating for liquids equal to the pressure rating of the connected pipe. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.3.2.1 Mechanical Joints

Provide mechanical joints conforming to AWWA C110/A21.10 and AWWA C111/A21.11. [Furnish gaskets, glands, bolts and nuts in sufficient quantity for the complete assembly of each mechanical joint. Provide [ductile] [or] [gray] iron glands with an [asphaltic] [____] coating.
Provide gaskets consisting of [vulcanized synthetic rubber, reclaimed rubber is not acceptable] [____]. [For grooved shoulder piping, use self-centering gasketed couplings designed to mechanically engage piping and lock in a positive watertight couple.] [Compose housing of [malleable iron, ASTM A47/A47M] [or] [ductile iron, ASTM A536] and use gaskets of molded synthetic rubber, [halogenated isobutylene isoprene] [nitrile] [____]. Bolts and nuts must be [heat treated carbon steel, ASTM A183, minimum tensile 760 MPa 110,000 psi] [____]. [Mechanical joints must have bolt holes oriented [straddling the vertical centerline of the valves and fittings] [____].]

2.3.2.2 Push-on Joints

Provide push-on type joints conforming to AWWA C111/A21.11. Supply each push-on joint complete with gasket and lubricant. Ensure gaskets are compatible with joint design and are comprised of [vulcanized synthetic rubber, reclaimed rubber is not acceptable] [____]. Provide lubricant that is specifically formulated for use with push-on joints, non-toxic, odorless, tasteless and does not support bacteria growth.

2.3.2.3 Restrained Joints

Provide restrained joints conforming to the requirements of AWWA C111/A21.11, and designed for a working pressure equal to connected pipe rating. When using ductile iron pipe with restrained joints, supply field cuts with a lock ring complete with retainer, retainer lock and roll-pin, as required by manufacturer's recommendations, procedures and/or installation instructions.

2.3.2.4 Flanged Joints

Provide flanged joints conforming to AWWA C110/A21.10. Provide gaskets, bolts and nuts with flanged joints in sufficient quantity for the complete assembly of each joint. Gaskets must be [vulcanized synthetic rubber, reclaimed rubber is not acceptable] [____].

2.3.3 Ductile Iron Fittings

**************************************************************************
NOTE: Fittings for ductile-iron or gray-iron piping involving 1.03 MPa 150 psi and 1.72 MPa 250 psi service are specified in AWWA C110/A21.10; for 2.41 MPa 350 psi service use AWWA 153. Typically, either gray or ductile iron fittings are acceptable. Specify the exact material if service conditions warrant.

Take special precaution with mating flanges specified in this paragraph; that is, mating flanges conforming to AWWA C110/A21.10 with flanges that are specified elsewhere using ASME B16.1 or B16.5 standards.
**************************************************************************

Fittings must be gray iron ASTM A48/A48M or ductile iron [AWWA C110/A21.10] [AWWA C153/A21.53]. Up to [300] [____] mm [12] [____] inches inclusive, the fittings must be [1.7] [____] MPa [250] [____] psig rated. Gray iron fittings must be cement mortar lined [standard] [double] thickness. Provide flanges and flanged fittings conforming to [AWWA C110/A21.10] [SECTION 40 05 13 Page 32]
ASME B16.1] and rated for [1.03 MPa 150 psig] [1.72 MPa 250 psig] [[_____] MPa psig] service. Provide [ductile iron] [or] [gray iron] [_____] materials. For tie-in to existing flanges, field check existing flanges for nonstandard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolts and nuts must be [carbon steel conforming to ASTM A307, Grade [B] [_____]] [_____]. Provide bolts with washers of the same material as the bolts. Gaskets must be [rubber] [ring] [_____] [full face], maximum [3.2] [_____] mm [0.125] [_____] inch thick.

2.3.4 Corrosion Control

Ductile iron piping must be [coated with the manufacturer's standard asphaltic coating, approximately [0.025 mm 1 mil] [[_____] mm mil] thick, applied to the outside of pipe and fittings] [hot-dipped galvanized in accordance with ASTM A153/A153M] [_____]. Coat and wrap buried pipe, and provide with cathodic protection in accordance with [Section 26 42 13 GALVANIC (Sacrificial) Anode Cathodic Protection (GACP) System] [Section 26 42 17 Impressed Current Cathodic Protection (ICCP) System].

2.4 CARBON STEEL PIPING SYSTEM

**************************************************************************
NOTE: Consult the referenced standards for the proper carbon steel use and fittings. For example, ASTM A53/A53M carbon steel piping is a good general piping material and ASTM A106/A106M carbon steel is for high temperature applications. In addition, some of the types and grades may not be suitable for certain joining methods or cold bending; etc. Steel pipe meeting API Spec 5L is specified only with 50 mm 2 inch and smaller pipe that is subject to a low pressure application and the use of taper-threaded couplings.
**************************************************************************

2.4.1 Carbon Steel Pipe

2.4.1.1 General Service

Provide carbon steel pipe meeting the requirements of [ASTM A53/A53M [seamless] [butt welded] [electric-resistance welded], Grade [A] [B] [API Spec 5L, Schedule [40] [80] [_____]] and [in accordance with Pipe Schedule] [, hot-dipped galvanized]. Provide Schedule [80] [_____] buried carbon steel piping and fittings.

2.4.1.2 High Temperature Service

Seamless carbon steel pipe for high temperature service must [conform to ASTM A106/A106M Grade [A] [B] [C], [hot-finished] [cold-drawn], Schedule [40] [80] [_____]] [be in accordance with Pipe Schedule] with dimensions conforming to ASME B36.10M.

2.4.1.3 Chemical Process Service

Provide electric-resistance welded low-carbon steel pipe conforming to ASTM A587 with a nominal wall thickness [of [_____] mm inch] [in accordance with Pipe Schedule].
2.4.2 Carbon Steel Tubing

Provide tubing meeting the requirements of [ASTM A334/A334M, [seamless] [welded], Grade [1] [_____] carbon steel] [ASTM A423/A423M, [seamless] [electric-resistance-welded], Grade [1] [2] low-alloy carbon steel] with nominal size and wall thickness [in accordance with Pipe Schedule] [____].

2.4.3 Carbon Steel Joints

Join carbon steel piping by [straight-threaded couplings] [taper-threaded couplings] [welding fittings] [flanges] [mechanical joints for grooved ends meeting the requirements of AWWA C606]. Join tubing using [compression] [____] fittings. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.4.4 Carbon Steel Fittings

[Fittings must be [cast malleable iron] [carbon steel] [heat-treated low-carbon steel] [____].] [Where cast fittings are not available, fabricate segmental welded steel fittings, ASTM A53/A53M, Grade B, meeting the requirements of manufacturer's recommended wall thicknesses.]

2.4.4.1 Threaded Fittings

Threaded fittings must be Class [150] [300] [____], [malleable iron, ASTM A47/A47M, conforming to ASME B16.3, black, banded] [forged carbon steel ASTM A105/A105M, conforming to ASME B16.11] [low carbon steel, ASTM A858/A858M, conforming to ASME B16.11] [____], and threaded in accordance with ASME B1.20.2MASME B1.20.1. Threaded, rigid couplings must be [welded] [seamless], [black] [Type I (hot-dipped galvanized)] [Type II (electrogalvanized)] carbon steel in accordance with [ASTM A865/A865M] [____] and threaded in accordance with ASME B1.20.2MASME B1.20.1. [Use polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [____] for lubricant/sealant.

2.4.4.2 Welding Fittings

Provide [butt-welding] [or] [socket-welding] welding fittings. Provide welding fittings consisting of forged [steel, ASTM A105/A105M Class [150] [300] [____]] [low-carbon steel, ASTM A858/A858M [seamless] [or] [welded]] [____] conforming to [ASME B16.9] [____] and threaded in accordance with [ASME B16.11].

2.4.4.3 Flanged Fittings

Ensure the internal diameter bores of flanges and flanged fittings are the same as that of the associated pipe. The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Flanges and flanged fittings must be [forged steel, ASTM A105/A105M] [ASTM A727/A727M] [____] [____], faced and drilled to ASME B16.5 Class [150] [300] [____] with a [1.6 mm 0.0625 inch raised face] [flat face] [____]. [Drill cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, in conformance with ASME B16.5] [ASME B16.1] Class [150] [____].

For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Provide bolting consisting of [alloy-steel ASTM A193/A193M Grade [B5] [B7] [____] hex head bolts and ASTM A194/A194M Grade [____] hex head nuts] [____]. When mating flange on valves or equipment is cast iron, use [ASTM A193/A193M Grade [B8 Class 1] [____] bolts and ASTM A194/A194M Grade [8] [____] heavy hex head nuts] [____].
Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 that are a maximum [3.2] [_____] mm [0.125] [_____] inch thick [chloroprene rubber, durometer hardness No.80,] [_____] 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [_____]].

2.4.4.4 Compression Fittings for Tubing

Provide compression fittings consisting of [carbon steel [ASTM A108] [_____] nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

2.4.5 Carbon Steel Coatings

*******************************************************************************
NOTE: Carbon steel piping system components will be coated with corrosion resistant materials suitable for exposure to the environmental and process conditions of the site. For potential exposures to pressures less than 70 kPa 10 psi, temperatures less than 100 degrees C 212 degrees F and mild chemicals, prepare the surfaces in accordance with SSPC SP 6/NACE No.3.

For potential exposures to pressures and temperatures greater than those previously mentioned, and mild chemicals, intermediate options may be appropriate. For severe chemical exposures, the thermoplastic resin system should be used.
*******************************************************************************

Coat carbon steel piping components with corrosion resistant materials. Ensure coatings and finishes are 100 percent holiday free.

2.4.5.1 Silicone Coating

Prepare carbon steel piping surfaces in accordance with SSPC SP 6/NACE No.3. Provide surfaces with an alkyd primer of [0.0625] [_____] mm [2.5] [_____] mils dry film thickness followed by two alkyd modified silicone final coats.

2.4.5.2 Zinc Coating

Galvanizing must be hot-dip applied and meet the requirements of ASTM A153/A153M; electroplated zinc or cadmium plating is unacceptable. Stainless steel components may be substituted where galvanizing is specified.

2.4.5.3 Thermoplastic Resin Coating System

continuously extruded polyethylene and adhesive coating system materials conform to NACE SP0185 Type A.]

2.4.6 Carbon Steel Cathodic Protection

Buried ferrous piping must have cathodic protection.

2.5 LINED STEEL PIPING SYSTEM

2.5.1 Outer Pipe Shell

**************************************************************************
NOTE: For the outer shell, carbon steel is most common; stainless steel will considerably limit suppliers. Flanged joining, Class 150 or 300, is commonly used. Most thermoplastic liners allow some vapors to permeate and become trapped between the liner and the shell. Therefore, venting via weep holes in the outer shell or venting flange collars (note that a single manufacturer has a patent on venting collars) are required to avoid gas accumulation. These are not required for nonpermeable liners such as PVDC. The use of thermoplastics with aggressive chemicals may result in a lower maximum operating temperature than that rated for an unlined pipe composed of the same material.
**************************************************************************

The outer shell of the lined piping system must be [carbon steel meeting the requirements of [ASTM A53/A53M (electric-resistance welded) [_____], Grade [B] [_____]], Schedule [40] [80] (in accordance with Pipe Schedule)] [TP304 stainless steel, [ASTM A312/A312M (seamless) (welded)] [_____], Schedule [10S] [40S] [80S] [5S] (in accordance with Pipe Schedule)] [_____]. Equip outer pipe with [3] [_____] mm [0.125] [_____] inch vent holes spaced axially at [_____] mm inches on center or locking and venting collars at each flange. If insulated, equip the vents of the lined piping system with the manufacturer's standard vent extensions to avoid blocking. [Coat carbon steel piping components externally with corrosion resistant materials. Ensure coatings and finishes are 100 percent holiday free.]

2.5.2 Lined Steel Joints

Join lined piping by [[cast steel] [forged steel] flanges] [____].

2.5.3 Lined Steel Fittings

Fittings must be [cast gray iron, [ASTM A126 Grade B] [_____], conforming to ASME B16.1] [cast ductile iron, [ASTM A395/A395M] [_____], conforming to ASME B16.42] [cast carbon steel, [ASTM A216/A216M Grade WCB] [_____], conforming to ASME B16.5] [cast, fabricated or forged carbon steel, [ASTM A587] [ASTM A106/A106M Grade B] [ASTM A53/A53M] [ASTM A105/A105M]] [stainless steel, [ASTM A312/A312M Grade 304L] [ASTM A276/A276M] [_____], conforming to ASME B16.5] [_____].

2.5.4 Lined Steel Flanged Fittings

Ensure the internal diameter bores of flanges and flanged fittings are the
same as that of the associated pipe. [Cast steel, [ASTM A216/A216M Grade [WCB] [_____] [_____].] [Forged steel, [ASTM A105/A105M] [_____] ],] [Stainless steel, [ASTM A312/A312M Grade 304L] [_____] ],] flanges and flanged fittings must be faced and drilled to ASME B16.5 Class [150] [300] [_____.] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must be [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____.]. When mating flange on valves or equipment is cast iron, use [ASTM A193/A193M Grade [B8 Class 1] [_____] bolts and ASTM A194/A194M Grade [8] [_____] heavy hex head nuts] [_____.]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5 and nonmetallic conforming to ASME B16.21.

2.5.5 Lined Steel Spacers

For making connections between lined piping systems and other types of pipe or equipment, use spacers. Ensure spacers are composed of the same material as the liner with a bore identical to the internal diameter of the associated lined pipe. Unless otherwise specified for the liner systems, use a gasket between the spacer and the unlined piping system or equipment that conforms to the gaskets required for the unlined piping system or equipment nozzle. Spacers must be [standard ring] [standard full face] [lined steel ring] [as indicated on the contract drawings] [_____] for flanged connections. Provide spacers that are a minimum of [13] [_____] mm [1/2] [_____] inch thick for piping 200 mm 8 inches and smaller in diameter, and a minimum of [15] [_____] mm [5/8] [_____] inch thick for piping larger than 200 mm 8 inches in diameter. [Use] [Do not use] a tapered face spacer for piping directional changes less than [5] [_____] degrees, and do not use for piping directional changes larger than [5] [_____] degrees.

2.5.6 Glass Liner

***************************
NOTE: A pressure rating of 2 MPa 300 psi is available for the lining and piping system if Class 300 split flanges are used as joints.
***************************

Lock the liner to the shell. The liner must consist of [1.6] [_____] mm [1/16] [_____] inch of [chemical resistant, low-expansion, Type-I borosilicate glass, Glass A] [porcelain enamel] [_____] conforming to ASTM E438 rated to operate between -29 and plus 66 degrees C -20 and plus 450 degrees F at a nominal working pressure of [1.03] [_____] MPa [150] [_____] psig and full vacuum. [Test thermal shock resistance in accordance with ASTM C600.] [Use polytetrafluoroethylene (PTFE)] [_____] enveloped gaskets that conform to ASTM F336.

2.5.7 Perfluoroalkoxy (PFA) Liner

***************************
NOTE: Liner thicknesses range from 1.5 to 3.8 mm 60 to 150 mil, depending on the size of the pipe. Nominal pipe diameters 25 mm 1 inch through 80 mm 3 inches are rated for full vacuum up to 230 degrees C 450 degrees F; 100 mm 4 inches diameter pipe is rated for full vacuum to 150 degrees C 300 degrees F;
**150 mm 6 inches** diameter pipe is rated for full vacuum at **120 degrees C 250 degrees F**; and **200 mm 8 inches** diameter pipe is rated for full vacuum at **65 degrees C 150 degrees F**. Larger pipe diameters are available.

**************************************************************************
Lock the liner to the shell. The liner must consist of PFA, ASTM D3307 Type II, conforming to ASTM F1545, and rated to operate between -29 and plus 260 degrees C -20 and plus 500 degrees F. Ensure the lined piping system is rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. Provide pipe liner with a minimum wall thickness of [_____] mm mil. Provide liner for fittings with a minimum wall thickness and minimum uniform face thickness of [_____] mmmil. The part of the liner that extends onto a gasket face must have a uniform thickness of no less than 80 percent of the pipe liner wall thickness.

**2.5.8 Polypropylene (PP) Liner**

**************************************************************************
NOTE: Liner thicknesses range from 3.8 to 8.6 mm 150 to 340 mil), depending on size of pipe. Nominal pipe diameters 25 mm 1 inch through 300 mm 12 inch are rated for full vacuum up to 107 degrees C 225 degrees F, if the liner is of swaged construction. For interference fit type liners, pipe diameters 25 mm 1 inch through 200 mm 8 inch are rated for full vacuum to 107 degrees C 225 degrees F; 250 mm 10 inch and 300 mm 12 inch diameter pipe is rated for full vacuum to 38 degrees C 100 degrees F.

**************************************************************************
Lock the liner to the shell. The liner must consist of PP, ASTM D4101, must conform to ASTM F1545, and rated to operate between -18 and plus 107 degrees C 0 and 225 degrees F. Ensure the lined piping system is rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. Provide pipe liner with a minimum wall thickness of [_____] mm mil. Provide liner for fittings with a minimum wall thickness and minimum uniform face thickness of [_____] mmmil. The part of the liner that extends onto a gasket face must have a uniform thickness of no less than 80 percent of the pipe liner wall thickness.

**2.5.9 Polytetrafluoroethylene (PTFE) Liner**

**************************************************************************
NOTE: Liner thicknesses range from 1.5 to 3.8 mm 60 to 150 mil, depending on pipe dimensions. Nominal pipe diameters 25 mm 1 inch through 300 mm 12 inch are rated for full vacuum up to 107 degrees C 225 degrees F, if the liner is of swaged construction. For interference fit type liners, pipe diameters 25 mm 1 inch through 100 mm 4 inch are rated for full vacuum to 230 degrees C 450 degrees F; 150 mm 6 inch and 200 mm 8 inch diameter pipe is rated for full vacuum at 180 degrees C 350 degrees F. For swaged fit type liners, pipe diameters 25 mm 1 inch through 200 mm 8 inch are rated for full vacuum to 230 degrees C 450 degrees F. For slip fit type liners, pipe diameters 25 mm 1 inch through 100 mm 4 inch
are rated for full vacuum to 230 degrees C 450 degrees F.

Lock the liner to the shell. The liner must consist of PTFE, must conform to [____], and rated to operate between -29 and plus 260 degrees C -20 and plus 500 degrees F. Ensure the lined piping system is rated at a maximum pressure of [____] MPa psig at a temperature of [____] degrees C degrees F. Provide pipe liner with a minimum wall thickness of [____] mm mil. The part of the liner that extends onto a gasket face must have a minimum uniform face thickness of [____] mm mil.

2.5.10 Polyvinylidene Fluoride (PVDF) Liner

NOTE: Liner thicknesses range from 3.81 to 5.33 mm 150 to 218 mil depending on the pipe dimensions. Proper liner thickness assures a non-permeable lining. Nominal pipe diameters 25 mm 1 inch through 200 mm 8 inch are rated for full vacuum up to 135 degrees C 275 degrees F, if the liner is of swaged or interference fit construction. For loose fit type liners, nominal pipe diameters 25 mm 1 inch through 100 mm 4 inch are rated for full vacuum to 135 degrees C 275 degrees F, and 150 mm 6 inch and 200 mm 8 inch diameter pipe is rated for 64.2 kPa 19 inch of mercury of vacuum to 135 degrees C 275 degrees F.

2.5.11 Rubber Liner

NOTE: Liner thicknesses range from 3.2 mm 0.125 inch to 12.7 mm 0.5 inch. Rubber lined pipe is not rated for vacuum service. Use a standard gasket for hard rubber lining. For soft rubber use a coating or sheet of polyethylene or similar material consistent with the application as a gasket. Operating temperature ranges are as follows:

<table>
<thead>
<tr>
<th>Liner Type</th>
<th>Temperature Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>natural rubber</td>
<td>-54 to plus 82 degrees C -65 to plus 180 degrees F</td>

</tbody>
</table>

**Lock the liner to the shell.** The liner must consist of [_____] mm inch of elastomeric material, ASTM D1418 Class [____], with a hardness of [____]. Terminate lining inside of the bolt holes. Fill remaining space from the liner to the flange edge with a [____] mm inch [polytetrafluoroethylene (PTFE)] [polyvinylidene fluoride (PVDF)] [polypropylene (PP)] [____] spacer. Provide flange gaskets that are [a maximum [3] [_____] mm [1/8] [_____] inches thick [polyethylene (PE)] [_____] [sheet] [or] [coating]] [[_____] gasket].

2.5.12 Polyvinylidene Chloride (PVDC) Liner

**NOTE:** No vents are needed in the outer pipe for PVDC. Liner thicknesses range from 3.8 to 5.5 mm 150 to 218 mil depending on the pipe dimensions.

Lock the liner to the shell. The liner must consist of PVDC conforming to ASTM F1545 and rated to operate between -18°C and +79°C 0°F and 175°F. Ensure the lined piping system is rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. Provide pipe liner with a minimum wall thickness of [_____] mm mil. Provide fittings liner with a minimum wall thickness and minimum uniform face thickness of [_____] mm mil. The part of the liner that extends onto a gasket face must have a uniform thickness of no less than 80 percent of the pipe liner wall thickness.

2.5.13 Lined Steel Cathodic Protection

Buried ferrous piping must have cathodic protection.

2.6 STAINLESS STEEL PIPING SYSTEM

**NOTE:** The following paragraphs specify general liquid service use of stainless steel piping. To specify the material, review the application. For example, of the austenitic steels, TP316 or TP316L have better resistance to pitting corrosion than TP304 or TP304L where brines, sulphur-bearing waters or halogen salts, such as chlorides, are present.

The option for crimped couplings and fittings
requires a low pressure application – less than 1.03 MPa 150 psig, service where the stainless steel piping materials (TP304, TP304L, TP316 and TP316L) are compatible to the fluid and thin wall (schedule 5S) pipe or tubing. A limited number of manufacturers are available so include other joint/fitting option(s).

2.6.1 Austenitic Piping

2.6.1.1 Stainless Steel Pipe

Stainless steel pipe intended for general corrosive service must meet the requirements of [ASTM A312/A312M, [seamless] [welded]] [ASTM A813/A813M for fit-up and alignment quality, Class [SW] [DW]] [ASTM A814/A814M for flanged and cold-bending quality, Class [SW] [DW]] [_____], Grade [TP304] [TP304L] [TP316] [TP316L] [_____], Schedule [10S] [40S] [80S] [5S] [in accordance with Pipe Schedule] [_____] with dimensions conforming to ASME B36.19M.

2.6.1.2 Stainless Steel Tubing

Provide stainless steel tubing meeting the requirements of [ASTM A269/A269M] [ASTM A632], [seamless] [welded], Grade [TP304] [TP304L] [TP316] [TP316L] [_____], [ASTM A789/A789M], [seamless] [welded], Grade [S32760] [_____] with nominal size and wall thickness [in accordance with Pipe Schedule] [_____].

2.6.1.3 Stainless Steel Joints

Join stainless steel piping by [threaded couplings] [welded fittings] [flanges] [crimping couplings]. Join tubing using [crimping couplings] [compression] [_____] fittings. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.6.1.4 Stainless Steel Threaded Fittings

Provide threaded fittings consisting of [austenitic stainless steel, [ASTM A182/A182M Grade [TP304] [TP304L] [TP316] [TP316L] [_____], conforming to [ASME B16.11] [_____], and threaded in accordance with ASME B1.20.2M ASME B1.20.1.]] Use [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.6.1.5 Stainless Steel Welding Fittings

Provide [butt-welding] [or] [socket-welding] welding fittings. Provide welding fittings consisting of forged austenitic stainless steel, [ASTM A403/A403M Grade [TP304] [TP304L] [TP316] [TP316L] [_____], [butt-welding fittings, Class [CR], conforming to ASME B16.9 [socket-welding fittings, Class [WP-S] [WP-W] [WP-WX] [WP-WU], conforming to ASME B16.11].] [_____].

2.6.1.6 Stainless Steel Flanged Fittings

Provide internal diameter bores of flanges and flanged fittings that are the same as that of the associated pipe. Ensure flanges are [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Provide flanges and flanged fittings consisting of [forged austenitic stainless steel, ASTM A182/A182M Grade [TP304] [TP304L] [TP316] [TP316L] [_____]] [_____],
Class [150] [300] [______], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [______]. [Drill cast austenitic stainless steel backing flanges, ASTM A351/A351M Grade [______]. Van Stone type, to [ASME B16.5] [ASME B16.1] Class [150] [______].] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must be [alloy-steel ASTM A193/A193M Grade [B8] [B8C] [______] hex head bolts and ASTM A194/A194M Grade [8] [8C] [______] hex head nuts] [______]. When mating flange on valves or equipment is cast iron, use [ASTM A193/A193M Grade [B8 Class 1] [______] bolts and ASTM A194/A194M Grade [8] [______] heavy hex head nuts] [______]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 and that are a maximum [3] [______] mm [1/8] [______] inch thick [chloroprene rubber, durometer hardness No.80] [______], 10.34 MPa 1,500 psi minimum tensile strength, [125] [______] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [______].]

2.6.1.7 Stainless Steel Crimping Fittings

Crimping fittings must be cold drawn, [TP304] [TP304L] [TP316] [TP316L] austenitic stainless steel. O-ring seals must be [butadiene acrylonitrile] [ethylene propylene diene monomer (EPDM)] [fluoro-elastomeric] [______].

2.6.1.8 Compression Fittings for Tubing

Provide compression fittings consisting of [ASTM A479/A479M] [______] stainless steel, Grade TP316, nuts, ferrules and bodies rated to a minimum [______] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

2.6.1.9 Stainless Steel Cathodic Protection

Buried ferrous piping must have cathodic protection.

2.6.2 Ferritic and Martensitic Piping

2.6.2.1 Pipe

Provide stainless steel pipe meeting the requirements of [ASTM A268/A268M, seamless] [welded], Grade [S44627] [S43035TP430] [______], Schedule [5S] [10S] [40S] [80S] [in accordance with Pipe Schedule]] [______] with dimensions conforming to ASME B36.19M.

2.6.2.2 Tubing

Provide stainless steel tubing meeting the requirements of [ASTM A268/A268M, seamless] [welded], Grade [TP410] [______] [ASTM A789/A789M, seamless] [welded], Grade [S31500] [______] [ASTM A268/A268M, welded, unannealed Grade [S44627] [______]] with nominal size and wall thickness [in accordance with Pipe Schedule] [______].

2.6.2.3 Joints

Join stainless steel piping by [threaded couplings] [welding fittings] [flanges]. Join tubing using [compression] [______] fittings. Provide dielectric fittings or isolation joints between all dissimilar metals.
2.6.2.4 Threaded Fittings

Provide threaded fittings consisting of [stainless steel, ASTM A182/A182M Grade [TP430] [6a Class 1] [____], conforming to [ASME B16.11] [____], and threaded in accordance with [ASME B1.120.2/MASME B1.20.1]. [Use polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.6.2.5 Welding Fittings

Provide [butt-welding] [or] [socket-welding] welding fittings. Provide welding fittings consisting of forged stainless steel, [ASTM A815/A815M Grade [TP430] [TP410] [____], [butt-welding fittings, Class CR, conforming to ASME B16.9] [socket-welding fittings, Class [WP-S] [WP-W] [WP-WX], conforming to ASME B16.11]. [_____].

2.6.2.6 Flanged Fittings

Provide internal diameter bores of flanges and flanged fittings that are the same as that of the associated pipe. Ensure flanges are [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Provide flanges and flanged fittings consisting of [forged stainless steel, ASTM A182/A182M Grade [TP430] [6a Class 1] [____], Class [150] [300] [____], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. [Drill cast stainless steel backing flanges, ASTM A352/A352M Grade [____], Van Stone type, to [ASME B16.5] [ASME B16.1] Class [150] [____].] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must be [alloy-steel ASTM A193/A193M Grade [L7] [L7A] [____]] heavy head bolts and [ASTM A194/A194M Grade [7] [7A] [____]] hex head nuts [_____]. When mating flange on valves or equipment is cast iron, use [ASTM A193/A193M Grade Grade [B8 Class 1] [____]] bolts and [ASTM A194/A194M Grade [8] [____]] heavy hex head nuts [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 and a maximum [3] [_____] mm [1/8] [____] inch thick [chloroprene rubber, durometer hardness No.80] [_____], 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [____].]

2.6.2.7 Compression Fittings for Tubing

Provide compression fittings consisting of [ASTM A479/A479M] [____] stainless steel, Grade TP316, nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

2.6.2.8 Cathodic Protection

Buried ferrous piping must have cathodic protection.

2.7 NICKEL AND NICKEL ALLOYS PIPING SYSTEMS

******************************************************************************

NOTE: The preferred method for joining nickel and nickel alloy pipe is welding due to cost of...
flanges. In all cases, only Schedules 40S and 80S can be threaded due to wall thickness. Flanges should be used when attaching nickel pipe to pumps, process vessels, and other equipment that requires removal periodically. Generally, for temperatures up to 115 degrees C or 240 degrees F, and normal pressures encountered, the chloroprene gasket specified is appropriate for most "dilute" process liquids, water and sludge services. However, other liquids may require other, more suitable gasket materials.

2.7.1 Nickel

NOTE: Alloy N02200 and alloy N02201 are the 2 basic compositions of nickel pipe. Alloy N02200 is limited to a maximum operating temperature of 315 degrees C or 600 degrees F.

2.7.1.1 Nickel Pipe

[Alloy N02200] [Alloy N02201] nickel pipe must be [seamless conforming to ASTM B161 and ASTM B629] [welded conforming to ASTM B725 and ASTM B775/B775M], and dimensioned Schedule [5S,] [10S,] [40S,] [80S] [in accordance with the Pipe Schedule in the contract drawings].

2.7.1.2 Nickel Joints

Joining must use [welded] [or] [threaded] [_____] methods, except that connections to equipment or spool pieces that may be periodically removed must be [flanged] [_____]. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.7.1.3 Nickel Fittings

Fittings including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43 must be [butt] [or] [socket] welding and meet the requirements of ASTM B366/B366M. Provide fittings for alloy N02200 that are [corrosion resistant, Grade CRN] [Class [150] [_____], Grade WPN] and for alloy N02201, provide fittings that are [corrosion resistant, Grade CRNL] [Class [150] [_____], Grade WPNL].

2.7.1.3.1 Welding Fittings

Conduct welding in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.1.3.2 Threaded Fittings

Provide threads in accordance with ASME B1.20.2MASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.7.1.3.3 Flanged Fittings

Provide flanges and flanged fittings consisting of [ASTM B564 forged nickel
alloy [N02200] [_____] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system] [______], Class [150] [300] [600], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [______]. Ensure flanges are [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Use cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, drilled to [ASME B16.5] [ASME B16.1] Class [150] [______]. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [nickel-copper alloy, ASTM B164 alloy [N04400] [______] Temper [______], bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [______] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [______] hex head bolts and ASTM A194/A194M Grade [______] hex head nuts] [______]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Nonmetallic gaskets must conform to ASME B16.21 and be a maximum [3] [______] mm [1/8] [______] inch thick [chloroprene rubber, durometer hardness No.80] [______], 10.34 MPa 1,500 psi minimum tensile strength, [125] [______] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [______].]

2.7.2 Nickel-Molybdenum-Chromium (NMC) Alloy

2.7.2.1 NMC Pipe

[Alloy N06022] [Alloy N06455] [Alloy N10276] [Hastelloy] [______] NMC alloy pipe must be [seamless conforming to ASTM B622 and ASTM B829] [welded conforming to ASTM B619/B619M and ASTM B775/B775M], and dimensioned Schedule [5S], [10S], [40S], [80S] [in accordance with the Pipe Schedule].

2.7.2.2 NMC Tubing

Provide seamless tubing conforming to ASTM B622 NMC alloy [N06022] [N06455] [Hastelloy] [______] with nominal size and wall thickness [in accordance with Pipe Schedule] [______].

2.7.2.3 NMC Joints

Use [welded] [or] [threaded] [______] joining methods, except use [flanged] [______] connections to equipment or spool pieces that may be periodically removed. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.7.2.4 NMC Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43, must be [butt] [or] [socket] welding and meet the requirements of ASTM B366/B366M. Provide fittings for alloy N06022 that are [corrosion resistant, Grade CRHC22] [Class [150] [______], Grade WPHC22]; for alloy N06455, provide fittings that are [corrosion resistant, Grade CRHC4] [Class [150] [______], Grade WPHC4]; and for alloy N10276, provide fittings that are [corrosion resistant, Grade CRHC276] [Class [150] [______], Grade WPHC276] [______].
2.7.2.4.1 Welding Fittings

Conduct welding in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.2.4.2 Threaded Fittings

Provide threads in accordance with ASME B1.20.2/ASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.7.2.4.3 Flanged Fittings

Provide flanges and flanged fittings consisting of [ASTM B564 forged NMC alloy [N06022] [N10276] [Hastelloy] [_____]] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system, Class [150] [300] [600] and drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Use cast steel backing flanges, [ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, and drilled to [ASME B16.5] [ASME B16.1 Class [150]] [_____]. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [low carbon NMC alloy, ASTM B574 alloy [N06022] [_____]] Tempered [_____], bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [_____] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____]] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 and a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [_____], 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [_____].]

2.7.2.5 NMC Compression Fittings for Tubing

Compression fittings must be of ASTM B574 [low carbon NMC alloy] [Hastelloy], nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

2.7.3 Nickel-Copper Alloy

2.7.3.1 Nickel-Copper Pipe

Alloy [N04400] [_____] nickel-copper alloy pipe must be [seamless conforming to ASTM B165, [annealed] [stress-relieved] condition, and ASTM B829] [welded conforming to ASTM B725 and ASTM B775/B775M], and dimensioned Schedule [5S] [10S] [40S] [80S] [in accordance with the Pipe Schedule].

2.7.3.2 Nickel-Copper Tubing

Provide seamless tubing conforming to ASTM B165 nickel-copper alloy N04400, [annealed] [stress-relieved] condition, with nominal size and wall thickness [in accordance with Pipe Schedule] [_____].
2.7.3.3 Nickel-Copper Joints

Use [welded] [or] [threaded] [_____] joining methods, except use [flanged] [_____] connections to equipment or spool pieces that may be periodically removed. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.7.3.4 Nickel-Copper Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43, must be [butt] [or] [socket] welding and meet the requirements of ASTM B366/B366M. Fittings for alloy [N04400] [_____] must be [corrosion resistant, Grade CRNC] [Class [150] [_____]], Grade WPNC [_____] .

2.7.3.4.1 Welding Fittings

Conduct welding in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.3.4.2 Threaded Fittings

Provide threads in accordance with ASME B1.20.2/ASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.7.3.4.3 Flanged Fittings

Flanges and flanged fittings must be [ASTM B564 forged nickel-copper alloy [N04400] [_____] ] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system] [_____] , Class [150] [300] [600] , and drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____] . The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. [Use cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, and drilled to [ASME B16.5] [ASME B16.1] Class [150] [_____] .] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [nickel-copper alloy, ASTM B164 alloy [N04400] [_____] Temper [_____] , bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [_____] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____] . Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. [Provide nonmetallic gaskets conforming to ASME B16.21 that are a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [_____] , 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336.] [Provide metallic ring joint gaskets conforming to ASME B16.20 and constructed of [_____] .]

2.7.3.5 Nickel-Copper Compression Fittings for Tubing

Compression fittings must be of ASTM B164 nickel-copper alloy [N04400] [N04405] nuts, ferrules and bodies rated to a minimum [_____] kPa psig.
Threads must be straight, conforming to [ISO 228-1] [ASME B1.1].

2.7.4 Nickel-Chromium-Iron (NCI) Alloy

2.7.4.1 NCI Pipe

Alloy [N06600] [N06025] [N06045] [_____] NCI alloy pipe must be [seamless conforming to ASTM B167 and ASTM B829] [welded conforming to ASTM B517 and ASTM B775/B775M] [electric fusion-welded conforming to ASTM B546, and dimensioned Schedule [5S] [10S] [40S] [80S]] [in accordance with the Pipe Schedule in the contract drawings].

2.7.4.2 NCI Joints

Use [welded] [or] [threaded] [_____] joining methods, except use [flanged] [_____] connections to equipment or spool pieces that may be periodically removed. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.7.4.3 NCI Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43, must be [butt] [or] [socket] welding and meet the requirements of ASTM B366/B366M. Fittings for alloy N06600 must be [corrosion resistant, Grade CRNCl] [Class [150] [_____], Grade WPNC1]; for alloy N06025, fittings must be [corrosion resistant, Grade CRV602] [Class [150] [_____], Grade WPV602]; and for alloy N06045, fittings must be [corrosion resistant, Grade CRV45TM] [Class [150] [_____], Grade WPV45TM] [_____].

2.7.4.3.1 Welding Fittings

Conduct welding in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.4.3.2 Threaded Fittings

Provide threads in accordance with ASME B1.20.2M ASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.7.4.3.3 Flanged Fittings

Provide flanges and flanged fittings consisting of [ASTM B564 forged NCI alloy [N06600] [_____]] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system] [_____], Class [150] [300] [600], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. [Use cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, and drilled to [ASME B16.5] [ASME B16.1] Class [150] [_____].] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [NCI alloy, ASTM B164 alloy [N06600] Temper [_____], bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [_____] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____]. Provide bolts with washers of the same material as the bolts. Provide gaskets.
meeting the requirements of ASME B16.5. Provide nonmetallic gaskets conforming to ASME B16.21 that are a maximum [3] \[_____] mm [1/8] \[_____] inch thick [chloroprene rubber, durometer hardness No.80] \[_____], 10.34 MPa 1,500 psi minimum tensile strength, [125] \[_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges. Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336. Provide metallic ring joint gaskets conforming to ASME B16.20 and be constructed of [_____].]

2.8 ALUMINUM PIPING SYSTEM

**************************************************************************

NOTE: Alloys 1060, 3003, 5052, 6061 and 6063 are the most common compositions of aluminum pipe. Alloy 6063 is most widely used due to economical cost, good corrosion resistance and mechanical properties.

The preferred method for joining aluminum pipe to handle corrosives is welding. Be aware that welding reduces tensile strength. Threading is not recommended for aluminum piping systems that handle corrosives. Flanges are usually limited to connecting aluminum pipe to pumps, process vessels, etc.

**************************************************************************

2.8.1 Aluminum Pipe

Aluminum and aluminum alloy pipe must be seamless alloy [6063] [6061] [5052] [3003] [1060], Temper [TL] \[_____] , Schedule [5S] [10S] [40S] [80S] [in accordance with the Pipe Schedule], with AA ANSI H35.2M standard dimensions, and conforming to [ASTM B241/B241M with ASME B1.20.2M threaded] [standard] ends [ASTM B345/B345M with ASME B1.20.2M threaded] [grooved] [beveled] [standard] \[_____] ends.

2.8.2 Aluminum Tubing

Tubing must be drawn seamless and conform to ASTM B210/B210M alloy [6061, temper T6,] \[_____] with nominal size and wall thickness [in accordance with Pipe Schedule] \[_____] .

2.8.3 Aluminum Joints

Use [welded] [mechanical coupling] [or] [threaded] \[_____] joining methods, except use [flanged] \[_____] connections to equipment or spool pieces that may be periodically removed. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.8.4 Aluminum Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, must be [butt] [or ] [socket] welding and meet the requirements of ASTM B361. Provide Grade [WP1060] [WP3003] [WP Alclad 3003] [WP6061] [or] [WP6063] fittings.
### 2.8.4.1 Aluminum Welding Fittings

Welding fittings must be [butt-welding] [or] [socket-welding] and factory made, wrought alloy [WP6063] [_____] in accordance with ASTM B361. [Provide butt-welding fittings conforming to ASME B16.9.] [Provide socket-welding fittings conforming to ASME B16.11.] Conduct welding in accordance with AWS A5.3/A5.3M and AWS A5.10/A5.10M.

### 2.8.4.2 Aluminum Threaded Fittings

Provide threaded fittings consisting of forged aluminum alloy [3003] [6061] [_____], Temper [_____], in accordance with ASTM B247M ASTM B247 and conforming to ASME B16.11. Provide threads in accordance with ASME B1.20.2M ASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

### 2.8.4.3 Aluminum Flanged Fittings

Design flanges and flanged fittings in accordance with ASME B31.3. Flanges must be forged aluminum alloy [3003] [6061] [_____], Temper [_____], conforming to ASTM B247M ASTM B247, Class [150] [300] [600] [_____], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____]. The flanges must be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must consist of [aluminum bolting material, conforming to ASTM B211/B211M and ASME B16.5, dimensioned to ASME B18.2.1 and ASME B18.2.2 and with ASME B1.1 coarse threads] [_____]. Provide bolts with washers of the same material as the bolts. [Gaskets listed in ASME B16.5, Annex E, Fig. E1, Group la may be used with any flange rating class and bolting.] [Use nonmetallic enveloped gaskets for corrosive service conforming to ASTM F336.]

### 2.8.4.4 Aluminum Compression Fittings for Tubing

Provide compression fittings consisting of ASTM B211/B211M aluminum alloy [2014], temper [T4] [T6], nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Provide straight threads conforming to [ISO 228-1] [ASME B1.1].

### 2.8.5 Aluminum Piping Supports

**************************************************************************
NOTE: Galvanic corrosion must be prevented from occurring on piping support systems. Conventional steel hangers should not be used. Galvanized steel is acceptable only as long as the galvanizing is intact; therefore, a galvanized system should not be used where expansion/contraction or other piping movement is likely.
**************************************************************************

Support piping system using [aluminum] [galvanized] [alloy] [_____] steel units, integrally padded with [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____], [_____] piping supports conforming to MSS SP-58. Do not use conventional steel and galvanized pipe hangers for aluminum piping systems.
2.9 COPPER PIPING SYSTEM

**************************************************************************
NOTE: This paragraph covers copper pipe that may be used for corrosive services, and tubing used for noncorrosive water; refrigerant, and sample lines, etc. Copper is rapidly corroded by oxidizing acids such as chromic and nitric acids. The most common copper alloy is alloy 122 (C12200); however, other alloys may also be suitable for use. These include C10200, C10300, C10800 and C12000.

Thin walled piping systems (ASTM B302) can only be assembled using brazed joint pipe fittings. However, for high pressure and Class 'M' fluid services soldered or brazed joints and fittings are not permitted pursuant to ASME B31.3.
**************************************************************************

2.9.1 Copper Pipe

Seamless [C12200] [_____] copper alloy pipe, must be a [O61 (annealed) H55 (light-drawn)] [or] [H80 (hard-drawn)] Temper with [regular] [extra strong] standard dimensions conforming to ASTM B42 [H (drawn) Temper with standard dimensions conforming to ASTM B302].

2.9.2 Copper Tubing

Provide seamless copper alloy tubing conforming to [ASTM B88M ASTM B88 alloy C12200, Type [K] [L] [or] [M], with a [O60 (annealed)] [H (drawn)] temper] [ASTM B75/B75M alloy [C12200] [_____] with a [O60 (soft-annealed)] [_____] temper]. Specifications for applications include: [refrigerant tubing - Type L, hard drawn] [P-trap priming connection - Type L, soft Temper] [sample lines - Type L, hard drawn] [____].

2.9.3 Copper Joints

Join pipe using [threaded] [soldered] [or] [brazed] fittings and [flanged] [_____] connections to equipment. Join tubing using [solder] [flared] [or] [press] [compression] fittings. Provide dielectric fittings or isolation joints between all dissimilar metals.

2.9.4 Copper Fittings

Provide component castings of flanges and fittings consisting of copper alloy [C92200, Temper [_____] conforming to ASTM B61] [C83600 (also known as alloy 85-5-5-5), Temper [_____] in accordance with ASTM B62]. Provide solder joint fittings conforming to ASME B16.22 and ASME B16.18. Provide fittings for flared copper tube conforming to ASME B16.26. Provide cast bronze threaded fittings conforming to ASME B16.15 and are threaded in accordance with ASME B1.20.2MASME B1.20.1. Ensure flanges and flanged fittings are faced and drilled Class [150] [300] [_____] in accordance with ASME B16.26. Provide copper and bronze press fittings conforming to material requirements of ASME B16.18 or ASME B16.22 and performance criteria of IAPMO PS 117. Sealing elements must be of EPDM and factory installed or an alternative supplied by fitting manufacturer. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Tubing compression fittings must be [forged brass alloy...
C37700, conforming to ASTM B124/B124M [____], nuts, ferrules and bodies rated to a minimum [____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.9.4.1 Bolting For Copper Piping

Provide bolting materials that meet the requirements of ASME B31.1 and consist of [ASTM B98/B98M alloy [C65100] [C66100]] [ASTM B150/B150M alloy [C63000] [C64200]] [ASTM B164 alloy [N04400] [N04405]] [____] materials. Provide bolts with washers of the same material as the bolts.

2.9.4.2 Gaskets For Copper Piping

[Gaskets listed in ASME B16.5, Annex E, Group [1a] [1b] may be used with any flange rating class and bolting.] [Provide nonmetallic, full faced gaskets used with low strength or non-ferrous bolting with a seating pressure less than 11.0 MPa 1,600 psi.] Ensure gasket dimensions conform to [ASME B16.21] [ASME B16.20].

2.9.5 Solder For Copper Piping

**************************************************************************
NOTE: Solder compositions can be selected from Table 5 contained in ASTM B32. Common solder types are Sb5 and SN95. Selection should be made based on suitability to the application considering temperature and corrosivity.
**************************************************************************

Use solder [and flux] conforming to ASTM B32 [and AWS A5.8/A5.8M]. The solder alloy must [be [____]] [contain less than 0.2 percent lead]. [Ensure the flux type is [R] [RMA] [RA] [OA] [OS] [IS] and conforms to ASTM B813.]

2.9.6 Copper Piping Supports

**************************************************************************
NOTE: Galvanic corrosion must be prevented from occurring to piping support systems; conventional and galvanized steel hangers should not be used.
**************************************************************************

Support piping system using [copper] [brass] [padded steel] [____] piping supports that conform to MSS SP-58. Do not use conventional steel and galvanized pipe hangers for copper piping systems. Ensure all valves, instruments and other equipment attached to the piping system are individually supported.

2.10 PLASTIC PIPING SYSTEM

**************************************************************************
NOTE: Plastic Piping Systems - Many of the thermoplastic piping systems are available in both a nominal pipe schedule dimension or in a standard dimension rating (SDR). Schedule based piping has the same dimensions, outer diameter and wall thickness, as steel pipe but the pressure rating decreases with increasing pipe diameter. For SDR pipe, the pressure rating is kept uniform for all
nominal pipe sizes of a given material and SDR value by increasing wall thickness. Refer to ASTM D2241 and ASTM D1785 for PVC SDR piping.

Backing flanges for plastic piping systems can be stainless steel, ductile iron, steel (galvanized and plain), or aluminum, depending on the application. Change the flange subparagraphs accordingly. Similarly, change the gasket material selections as required by the liquid application.

Use PVC for selected chemical services, where pipelines may be subjected to exterior corrosion, and liquid processes of 60 degrees C 140 degrees F or below.

Schedule 40 pipe should not be threaded at all. Schedule 80 pipe should not be threaded in sizes larger than 100 mm 4 inch. Schedule 80 threaded joints larger than 50 mm 2 inch must be back-welded to achieve fully rated maximum operating pressures.

Submit documentation certifying that the manufacturer of each thermoplastic piping system is listed with the Plastic Pipe Institute as meeting the recipe and mixing requirements of the resin manufacturer for the resin used to manufacture each of the respective thermoplastic pipe systems.

2.10.1 PVC Pipe

PVC, ASTM D1784, minimum cell classification [12545-C] [____], pipe must be [Schedule [40] [80] [____] conforming to ASTM D1785] [manufactured to an SDR rating in accordance with ASTM D2241], so that the pressure rating of the pipe is consistent for all pipe sizes. Provide SDR [____] pipe with a pressure rating of [____] MPa psig at [____] degrees C degrees F [____].

2.10.2 PVC Tubing

Provide flexible and clear tubing with nominal size and wall thickness [in accordance with Pipe Schedule] [____] [and reinforcement].

2.10.3 PVC Joints

Join piping system by [socket-weld] [flanged] [or] [mechanical] connections except where connecting to unions, valves, and equipment with threaded connections that may require future disassembly. Ensure connections at those points are threaded and back-welded. Tubing connections must use compression fittings.

2.10.4 PVC Fittings

**************************************************************************
NOTE: Specify ASTM D2464 for Schedule 80 threaded type; ASTM D2466 for Schedule 40 socket type; ASTM D2467 for Schedule 80 socket type.
**************************************************************************

Ensure the schedule rating for the fittings is not less than that for the associated pipe. Fittings must be ASTM D1784, minimum cell classification.
[____], PVC conforming to the requirements of [ASTM D2464, threaded in accordance with ASME B1.20.2/ASME B1.20.1] [ASTM D2466, socket type] [ASTM D2467, socket type]. [[No] [_____] thread lubricant is required.]

2.10.4.1 Push-on Joints

Seal push-on type joints with [ethylene propylene rubber (EPR)] [_____] gaskets in accordance with ASTM F477.

2.10.4.2 Flanged Fittings

Provide flanges and flanged fittings that are Class [125] [_____], [one piece, molded hub type, flat faced, and conform to [ASME B16.1] [ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Provide flanges complete with one-piece, molded PVC stub ends. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3] [_____] mm [1/8] [_____] inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the PVC flange from bolting moment.

2.10.4.3 Tubing Fittings

Provide compression type fittings comprised of [forged brass alloy C37700, conforming to [ASTM B124/B124M] [_____], nuts, ferrules and bodies] [[acetal] [polypropylene] [polyvinylidene fluoride (PVDF)] [_____] nuts and bodies, with elastomeric O-ring seals] [[polypropylene] [_____] bodies, barb and holding nut] [_____], rated to a minimum [_____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.10.5 PVC Solvent Cement

Join socket connections with PVC solvent cement conforming to ASTM D2564. Ensure manufacture and viscosity is as recommended by the pipe and fitting manufacturer to assure compatibility. [Prepare joints with primers conforming to ASTM F656 prior to cementing and assembly.]

2.11 CHLORINATED POLYVINYL CHLORIDE (CPVC)

*************************************************************************
NOTE: Use CPVC for chemical or corrosive services that are between 60 degrees C 140 degrees F and 99 degrees C 210 degrees F.

Like PVC, CPVC Schedule 40 pipe should not be threaded at all. Schedule 80 pipe should not be threaded in sizes larger than 100 mm 4 inch.
Schedule 80 threaded joints larger than 50 mm 2 inch must be back-welded to achieve fully rated maximum operating pressures.
*************************************************************************
2.11.1 CPVC Pipe

CPVC, ASTM D1784, minimum cell classification [23447] [____], pipe must be [Schedule [40] [80] conforming to ASTM F441/F441M] [manufactured to an SDR rating in accordance with ASTM F442/F442M], so that the pressure rating of the pipe is consistent for all pipe sizes. Provide SDR [_____] pipe with a pressure rating of [_____] MPa psig at [_____] degrees C degrees F] [____].

2.11.2 CPVC Joints

Join piping system by [socket-weld] [flanged] [or] [mechanical] connections except where connecting to unions, valves, and equipment with threaded connections that may require future disassembly. Ensure connections at those points are threaded and back-welded.

2.11.3 CPVC Fittings

**************************************************************************
NOTE: Specify ASTM F437 for Schedule 80 threaded type; ASTM F438 for Schedule 40 socket type; ASTM F439 for Schedule 80 socket type.
**************************************************************************

Ensure the schedule rating for the fittings is not less than that for the associated pipe. Fittings must be ASTM D1784, cell classification [23447] [____], CPVC conforming to the requirements of [ASTM F437, threaded in accordance with ASME B1.20.2M ASME B1.20.1] [ASTM F438, socket type] [ASTM F439, socket type]. [No] [_____] thread lubricant is required.

2.11.3.1 Push-on Joints

Seal push-on type joints with [ethylene propylene rubber (EPR)] [_____] gaskets in accordance with ASTM F477.

2.11.3.2 Flanged Fittings

Provide flanges and flanged fittings that are Class [125] [____], [one piece, molded hub type, flat faced, and conforming to [ASME B16.1] [ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Provide flanges complete with one-piece, molded CPVC stub ends]. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3.2 mm 0.125 inch] [_____] mm inch] thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the CPVC flange from the bolting moment.

2.11.4 Solvent Cement

Join socket connections with PVC solvent cement conforming to ASTM F493. Ensure manufacture and viscosity is as recommended by the pipe and fitting manufacturer to assure compatibility.
2.12 POLYVINYLIDENE FLUORIDE (PVDF)

**************************************************************************
NOTE: PVDF pipe is chemically resistant to most acids, bases and organics, and can transport liquid halogen solutions of chlorine or bromine. PVDF should not be used with strong alkalis, fuming acids, polar solvents, amines, ketones or esters. PVDF does not degrade in sunlight; therefore, PVDF does not require UV stabilizers or antioxidants. Use on liquids above 49 degrees C 120 degrees F require continuous support. Care must be used in using PVDF piping under suction.
**************************************************************************

2.12.1 PVDF Pipe

[High Purity] PVDF, conforming to ASTM D3222, pipe must be [Schedule [40] [80]] [manufactured to a SDR rating so that the pressure rating of the pipe is consistent for all pipe sizes. The pipe must be SDR with a pressure rating of [1.03 MPa 150 psig at 23 degrees C 73.4 degrees F] [1.6 MPa 232 psig at 23 degrees C 73.4 degrees F]] [______].

2.12.2 PVDF Tubing

Provide flexible tubing with nominal size and wall thickness [in accordance with Pipe Schedule] [______].

2.12.3 PVDF Joints

**************************************************************************
NOTE: Fusion welding is the preferred method for joining PVDF pipe. Threading can only be accomplished on Schedule 80 pipe.
**************************************************************************

Join PVDF pipe by [thermal butt-fusion] [socket heat fusion] [or] [socket electric-resistance fusion], except where connecting to valves and equipment that may require future disassembly, provide [threaded] [or] [flanged] joints. Tubing connections must use compression fittings.

2.12.4 PVDF Fittings

Provide molded PVDF fittings. Provide fittings with the same or higher pressure rating as the pipe when installed in accordance with the latest technical specifications. Provide flanges and flanged fittings that are Class [125] [______], [one piece, molded hub type, flat faced, and conforming to [ASME B16.1] [ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [______] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Provide flanges complete with one-piece, molded PVDF stub ends]. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [______] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [______] hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3] [______] mm [1/8] [______] inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [______] in accordance with ASME B16.21. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between outer diameter of the raised face and the
flange outer diameter to protect the PVDF flange from bolting moment. Provide compression type tubing fittings comprised of [forged brass alloy C37700, conforming to ASTM B124/B124M [____], nuts, ferrules and bodies] [[acetal] [polypropylene] [polyvinylidene fluoride (PVDF)] [_____] nuts and bodies, with elastomeric O-ring seals] [[polypropylene] [_____] bodies, barb and holding nut] [____], rated to a minimum [____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.13 ACRYLONITRILE-BUTADIENE-STYRENE (ABS) Piping

**************************************************************************
NOTE: ABS piping is resistant to many chemicals, however, for mixed waste systems chemical analyses and corrosion testing may be necessary to properly select the piping system. The recommended maximum temperature for continuous liquid applications is 82 degrees C 180 degrees F.
Verify acceptance and installation of ABS piping systems with local code enforcement authorities having jurisdiction.
**************************************************************************

2.13.1 ABS Pipe

ABS, ASTM D3965, minimum cell classification [42222][____], pipe must be Schedule [40][80] conforming to ASTM D1527, so that the pressure rating of the pipe is consistent for all pipe sizes. Provide SDR [____] pipe with a pressure rating of [____] MPa psig at [____] degrees C degrees F. Where ABS pipe is subjected to severe temperature fluctuations, provisions for expansion and contraction must be provided. Accomplish this with the use of expansion joints and offset piping arrangements.

2.13.2 ABS Joints

Join pipe by solvent cementing, except where connecting to valves and equipment that may require future disassembly, then provide [flanged] [____] joints.

2.13.3 ABS Fittings

Provide molded ABS fittings. Ensure fittings have the same or higher pressure rating as the pipe when installed in accordance with the specifications. Provide flanges and flanged fittings that are Class [125][____], [one piece, molded hub type, flat faced, and conform to [ASME B16.1][ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [____] backing flanges with [ASME B16.1][ASME B16.5] drilling. Provide flanges complete with one-piece, molded ABS stub ends]. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8][B8M][____] hex head bolts and ASTM A194/A194M, Grade [B] [8M] [____] hex head nuts. Bolts Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3.2 mm 0.125 inch] [____] mm inch] thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [____] in accordance with ASME B16.21. When the mating flange has a raised face, supply flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the ABS flange from bolting moment.
2.13.4 ABS Solvent Cement

Join socket connections with ABS solvent cement conforming to ASTM D2235. Use viscosity as recommended by the pipe and fitting manufacturer to assure compatibility.

2.14 POLYETHYLENE (PE)

**************************************************************************
NOTE: The requirements listed below are for normal pressure applications, and where operating temperatures will not exceed 38 degrees C 100 degrees F. For more difficult installations and/or higher temperatures, the ASTM D3350 cell classification should be carefully chosen. In addition, use the cell classification to specify UV stabilizers and color additives.
**************************************************************************

2.14.1 PE Pipe

Ensure pipe is extruded from PE, ASTM D3350 with a minimum cell classification of [32433-C] [____]. The PE pipe must be [Schedule [40] [80]] [manufactured to an SDR rating in accordance with ASTM D3035 for piping systems less than 100 mm 4 inch in diameter, or in accordance with ASTM F714 for piping systems with a diameter equal to or greater than 100 mm 4 inch] [manufactured to an SDR rating in accordance with ASTM D2239 for use with insert fittings], so that the pressure rating of the pipe is consistent for all pipe sizes. Provide SDR [_____] pipe with a pressure rating of [_____] MPa psig at [_____] degrees C degrees F [Schedule 40 conforming to ASTM D2239 for use with insert fittings] [____].

2.14.2 PE Tubing

Tubing must be flexible [low-density PE conforming to ASTM D3350, minimum cell classification [____], and dimensioned in accordance with ASTM D2737] [crosslinked PE conforming to ASTM D3350, minimum cell classification [35400] [____], and dimensioned in accordance with ASTM F876 with nominal size [in accordance with Pipe Schedule] [____]].

2.14.3 PE Joints

Join PE pipe by [thermal butt-fusion] [socket heat fusion] [and/or] [socket electrofusion], except where connecting to valves and equipment that may require future disassembly, use [threaded [polystyrene] [____] fittings] [or] [flanged] joints.

2.14.4 PE Fittings

Provide PE fittings with the same or higher pressure rating as the pipe when installed in accordance with the latest technical specifications. Provide molded PE fittings. Provide butt-fusion fittings conforming to ASTM D3261. Provide socket-fusion fittings conforming to ASTM D2683 with tools meeting the requirements of ASTM F1056. Provide insert fittings conforming to ASTM D2609.

2.14.4.1 Couplings

Join couplings and saddle joints by electrofusion in accordance with
2.14.4.2  Flanged Fittings

Provide flanges and flanged fittings that are [Class [125] [_____]}, [ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Provide flanges complete with one-piece, molded PE stub ends. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum [3] [_____] mm [1/8] [_____] inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21.

2.14.4.3  Tubing Fittings

Provide compression type fittings comprised of [forged brass alloy C37700, conforming to ASTM B124/B124M [_____]}, nuts, ferrules and bodies] [[acetal] [polypropylene] [polyvinylidene fluoride (PVDF)] [_____] nuts and bodies, with elastomeric O-ring seals] [[polypropylene] [_____] bodies, barb and holding nut] [_____]}, rated to a minimum [_____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.15  RUBBER/ELASTOMER PIPING SYSTEM

**************************************************************************
NOTE: Rubber/elastomer piping systems are generally useful in applications requiring unusual flexing, resilience and abrasion service.
**************************************************************************

2.15.1  Elastomeric Hose

2.15.1.1  Elastomeric Tube

Provide hose tube composed of [fluoro-elastomer] [isobutylene isoprene] [butadiene acrylonitrile] [chloroprene] [natural polyisoprene] [_____{], [ASTM D2000 Grade [_____]}, Type [_____{], Class [_____] base requirements] [_____] materials.

2.15.1.2  Tube Reinforcement

[Strengthen the tube with [[one] [_____] wire-braid] [two spiral wire and one wire-braid] [two rayon-braid] [one textile-braid and one wire-braid] [synthetic-fiber] [[four] [six] -ply, [light] [heavy] spiral-wire] [_____] reinforcement.} [Do not reinforce the tube.]
2.15.1.3 Hose Cover

[Protect the hose with a [synthetic rubber] [thin, nonskive] [textile-braid] [thermoplastic] [_____] cover.] [The hose must not have a cover.]

2.15.2 Hose Joints

[Hose must be continuous, without joints] [Hose must be supplied cut to length with integral end connections] [Join hose using [swaged] [crimped] [insert] [internally expanded - full flow] [_____] fittings]. [_____].

2.15.3 Fittings For Elastomeric System

Ensure all fittings are supplied by the same manufacturer. Join fittings to the hose assembly as specified. Ensure fittings are [supplied in accordance with the Pipe Schedule in the contract drawings and] constructed of [aluminum] [TP304 stainless steel] [TP316 stainless steel] [____]. Accomplish interconnections through integral couplers configured as [ASME B1.20.7 threaded] [quick connect interlocking] [compression ring] [_____] couplings.

2.16 FIBERGLASS REINFORCED PLASTIC (FRP) PIPING SYSTEM

******************************************************************************
NOTE: Consult a reputable manufacturer to determine the FRP type for given application and temperature.
Temperature is ambient if unlisted.
******************************************************************************

Submit the name and qualifications of the manufacturer's representative and written certification from the manufacturer stating that the representative is technically qualified to supply and install FRP piping systems. Provide all FRP pipe, fittings, and flanges for each system complete by one manufacturer and with a design internal pressure rating [in accordance with the Pipe Schedule in the contract drawings] of [0.69 MPa 100 psig] of [_____] MPa psig], as specified in ASTM D2310 and ASTM D2992.

2.16.1 FRP Pipe

Provide FRP pressure pipe conforming to ASTM D3754 Type [1] [2] [3] [4], liner designation [____], surface layer grade [____], pressure Class [____], pipe stiffness [____]. Provide size [in accordance with the Pipe Schedule in the contract drawings] of [_____ mm inches] [____]. Ensure the inside diameter of the pipe is consistent with the inside diameter of the fittings.

2.16.2 FRP Joints

Join the pipe using [axially unrestrained bell and spigot gasket joints, conforming to ASTM D4161, with elastomeric gaskets meeting the requirements of ASTM F477] [butt-joints with laminated overlays in accordance with ASTM D3754] [bell and spigot joints with laminated overlays in accordance with ASTM D3754] [adhesive bonded bell and spigot joints in accordance with ASTM D3754] [flanged] [____].

2.16.3 FRP Fittings

Provide fittings, other than flanges, conforming to [ASTM D5685] [____].
Provide filament wound fittings of the same thickness specified for adjoining pipe or duct. Provide other fitting types of the minimum pipe wall thickness required for the specified pressure class. Provide contact molded flanges and flanged fittings conforming to ASTM D5421 Type [A] [B], Grade [____], Class [I] [II], pressure rating [____]. All other flange types must conform to ASTM D4024 Type [____], Grade [____], Class [____], pressure rating [____]. Flanges mating with flanges on thermoplastic-lined steel pipe must be ductile iron castings, ASTM A395/A395M or cast steel, ASTM A216/A216M Grade WCB, Van Stone type, conforming to [ASME B16.1] [ASME B16.5] Class [150] [____].

2.16.3.1 FRP Bolting

With flat ring gaskets, the bolting must be stainless steel, ASTM A193/A193M Grade [B8] [B8M] [____], hex head bolts and, ASTM A194/A194M Grade [8] [8M] [____], hex head nuts. Provide bolts with washers of the same material as the bolts.

2.16.3.2 FRP Gaskets

Gaskets must be full-faced, maximum [3.2 mm 0.125 inch] [____] mm inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [____]. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between the outer diameter of the raised face and the flange outer diameter in order to protect the FRP flange from the bolting moment. When mating a FRP flange, Van Stone type, to a thermoplastic-lined steel pipe, use a [polytetrafluoroethylene (PTFE)] [____] enveloped, flat ring type gasket in accordance with ASTM F336.

2.17 DOUBLE CONTAINMENT PIPING SYSTEM

**************************************************************************
NOTE: Due to the difficulty of proper installation of double containment pipe, double containment piping should only be specified when it is absolutely required. Refer to the Handbook of Double Containment Piping Systems, Christopher G. Ziu, McGraw-Hill, NY, 1995, for the design and selection of a double containment piping system. According to Ziu, page 71, many pre-engineered double containment piping systems have only been conceptualized and not engineered.
**************************************************************************

Submit manufacturer's engineering end load calculations for anchors in double containment piping systems. Provide double containment piping systems conforming to the requirements of ASME B31.3.

2.17.1 Primary (Carrier) Pipe

The primary, or carrier, pipe of the double containment piping system must be [[PVC][CPVC][PVDF][PE][____], [Schedule [40] [80] [____]] [SDR [____]]][TP304 stainless steel, Schedule [10] [40] [____]][[FRP], pressure class [____]] [____], as specified elsewhere in this Section. Ensure the primary piping is rated at a working pressure of at least [____] MPa psig at a maximum operating temperature of [____] degrees C degrees F. Provide piping that is free of flanges and other joints that are not compatible with the secondary piping installation. Equip piping with
expansion loops, offsets, or direction changes as necessary to counter thermal expansion and contraction, which must be coordinated with the secondary piping.

2.17.2 Secondary (Containment) Pipe

The secondary, or containment, pipe of the double containment piping system must be [PVC][CPVC][PVDF][PE][_____], [Schedule [40] [80] [_____]] [SDR [_____]] [carbon steel, Schedule [40] [80] [_____]] [TP304 stainless steel, Schedule [10] [40] [_____]] [_____], as specified elsewhere in this Section. Provide secondary piping that is resistant to weathering, impacts, and ambient temperature variations, and rated at a working pressure of at least [_____] MPa psig at a maximum operating temperature of [_____] degrees C degrees F. Equip piping with expansion joints, expansion loops, offsets, or direction changes as necessary to counter thermal expansion and contraction. Coordinate equipment for addressing thermal movement with the primary piping. Ensure secondary piping is drainable and dryable [, and capable of being tested using air pressure]. The secondary piping system must be [compartmentalized] [continuous] and equipped with drains at all low points and vents at all high points. Equip pressurized secondary piping systems with pressure relief devices. Provide drains, vents and pressure relief devices as specified elsewhere in this Section. Design piping to allow pulling of the leak detection cable into the containment pipe both during and after piping installation. Minimum annular clearance must be [19] [_____] mm [0.75] [_____] inch. Locate containment pull ports a maximum of [150] [_____] m [492] [_____] feet apart for straight runs and reduced by [45] [_____] m [148] [_____] feet for every 90 degree change in direction.

2.17.3 Cathodic Protection For Double Containment System

Buried ferrous piping must have cathodic protection.

2.17.4 Connections and Fittings For Double Containment System

All fittings must be factory manufactured of material compatible with the process fluids and associated piping. [All secondary contained fittings must be of unitized construction with the carrier and containment integrally anchored together to prevent the movement of the carrier relative to the containment within the fitting.] Provide anchors of sufficient thickness to withstand the maximum possible end loads that will be generated by the carrier pipe during the life of the system. [Elbows must be anchored on both ends.] [Tees must be anchored on both the run and the branch.]

2.17.4.1 Fitting Pressure Rating

Ensure pressure rating of connections and fittings is greater than or equal to the design pressure of the system with a minimum safety factor of [five] [_____].

2.17.4.2 End Seals

Provide dnd seals and other subassemblies which are designed and factory prefabricated to prevent the ingress of moisture into the system. Design subassemblies to allow for complete draining of the secondary containment.
2.17.5 Leak Detection

Provide a [cable detection] [sensing probe] [visual detection] leak detection system. [Equip the leak detection system with an electronic monitoring and control unit.]

2.17.5.1 Leak Detection Monitoring Unit

Provide a microprocessor based monitoring unit. The monitoring unit must indicate when any liquid leaks into the secondary containment piping by sounding an alarm, actuating output relays, displaying a message that a leak has been detected and the location of that leak. Ensure the unit is capable of monitoring [sensor cables] [probe sensors] [and] [switch sensors]. The monitoring unit power requirements must be [120] [240] [_____] VAC, [60] [_____] Hz, [single] [_____] phase. Equip monitoring units with [an RS-232 communication port] [and] [one common and one SPDT output relay per cable, rated for 250 VAC, 10 amp]. [Furnish a complete cable-type leak detection and location system consisting of a microprocessor based monitoring unit, sensor cable, probes, system layout map and auxiliary equipment required to provide continuous monitoring of the sensing strings for leaks, shorts, breaks and probe activation. If any of these conditions should occur at any point along the cable, sound an alarm, clearly identify type of condition and clearly display the location. Monitor the interstitial space of double contained piping.]

2.17.5.1.1 Enclosure

Enclose monitoring unit in a NEMA 250 Type [12] [_____] enclosure. [The unit must be Underwriters Laboratory (UL) listed and Factory Mutual approved to provide connections for intrinsically safe sensor circuits for use in Class [1] [_____] , Division [I] [_____] , Groups [C and D] [_____] hazardous locations.] Ability to locate a leak must not depend on battery backed up functions. In the event of power failure, ensure system conditions and parameters are stored in nonvolatile memory allowing the unit to automatically resume monitoring, without resetting, upon restoration of power. Provide an on-off switch in the panel for servicing. [Furnish a NEMA 250 Type 4X outer enclosure with a viewing window for mounting outdoors] [Furnish a NEMA 250 Type 7 explosion proof outer enclosure] [_____] .

2.17.5.1.2 Relay Outputs

Provide relays for remote indication of an alarm condition. The relays must provide indication that no alarm conditions exist, an alarm condition exists but has not yet been acknowledged, and an alarm condition exists and has been acknowledged. [Ensure communications are available via RS-232 and ASCII communication protocols to allow central point monitoring and control via a remote computer.]

2.17.5.1.3 Storage Memory

Record significant events in permanent memory. Store a minimum of [_____] events. When the memory becomes full, delete the recorded events from memory in sequential order beginning with the oldest event. Include the time and date that the event occurred for each recorded event. [Ensure archives are retrievable through RS-232 and ASCII communication protocols.]
2.17.5.1.4 Status Indication

The system must continuously provide positive indication that it is monitoring the sensing string and the status of the sensing string.

2.17.5.1.5 Security

The system must have assignable password security. Ensure the system has multilevel security passwords for access to operating functions with recording of all password entries to nonvolatile memory. Do not allow the system to permit unauthorized modifications to the sensing string without causing an alarm condition.

2.17.5.2 Cable System

Submit an as-built location map for the cable leak detection system in double containment piping systems indicating the as installed system configuration and sensing string layout. Provide marks in meters feet along the length of the cable as references to locate leaks. Ensure sensor cable, connectors, probes and jumpers are supplied by the manufacturer of the monitoring unit. The cable sensing principle must provide for continuous monitoring while short lengths of the cable are in contact with liquids, without altering the system's sensitivity and/or accuracy. The cable system must be a conductance or impedance type system.

2.17.5.2.1 Requirements

Locate the point of origin of the first liquid leak within 0.1 percent of the sensor string length. Identify the type of alarm as well as the location. Ensure system is able to monitor (detect and locate) with up to 30 m 98.4 feet of wetted cable without significant inaccuracy in location. Ensure system is capable of monitoring up to 600 m 1,970 feet of cable per sensor string from a single monitoring unit. The system must be capable of monitoring (detecting and locating) for multiple leaks or additional liquid on the sensor cable.

2.17.5.2.2 Detection Capabilities

The system must be capable of detecting all liquids, including, but not limited to aqueous, hydrocarbon, and conductive and nonconductive liquids. Furnish two cables to detect and differentiate between hydrocarbons/solvents and aqueous liquids. Only hydrocarbons are to be detected. Provide system with field adjustable sensitivity to increase or decrease the amount of wetted cable needed to cause an alarm from several mm to inches to feet. Ensure system is capable of identifying the location of breaks and shorts on the cable. When either of these faults occur, an alarm must sound and a display visible on the front of the monitoring unit must clearly indicate the type of fault and display the location of the fault.

2.17.5.2.3 Materials

Provide sensor cables suitable for use with the monitoring unit. Provide sensor cables of coaxial construction consisting of an insulated center conductor, a suitable spacer material, and an outer braid. Provide center conductors that are no less than twenty AWG for mechanical strength. Cables must be capable of field installation of connectors by trained technicians. Ensure cable is available in bulk...
spools. All cables must be field repairable by trained technicians.

2.17.5.3 Sensing Probes

Sensing probes for the leak detection system must be [pH probes] [conductivity probes] [liquid level switches] [specific ion probes] [or] [pressure transducers].

2.17.5.4 Visual Leak Detection System

Equip all low points of the secondary piping system with sample valves meeting the requirements specified in paragraph [SAMPLE PORTS] [_____] of this Section.

2.17.6 Supports

Design and supply supports for the conveyance and containment piping to prevent distortion of the pipes and strain on joints and fittings. Design supports by the double containment piping system manufacturer. No field fabricated supports will be allowed. Design and fabricate the system taking into account pressure and temperature requirements when placing the pipe supports. [Double supports are required throughout the system to minimize stresses due to point loading.] [Support clips are not allowed.]

2.18 ISOLATION JOINTS AND COUPLINGS

**************************************************************************
NOTE: Isolation joints and couplings require gaskets for isolating and/or sealing. The gaskets are typically shaped to meet each particular manufacturer’s coupling requirements and may not be interchangeable. Refer to manufacturers’ catalogs for material compatibility and selection.
**************************************************************************

2.18.1 Dielectric Fittings

Provide dielectric fittings between threaded ferrous and nonferrous metallic pipe, fittings and valves. Provide dielectric fittings, suitable for the required working pressure, temperature and corrosive application, to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.18.2 Isolation Joints

Provide isolation joints between nont threaded ferrous and nonferrous metallic pipe fittings and valves. Provide isolation joints consisting of an isolation gasket of the dielectric type, isolation washers and isolation sleeves for flange bolts. Provide full faced isolation gaskets with an outside diameter equal to the flange outside diameter. Bolt isolation sleeves must be full length. Units must be of a shape to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.18.3 Metallic Piping Couplings

Provide thrust ties where shown on the contract drawings and where required to restrain the force developed by [1.5] [_____] times the maximum allowable operating pressures specified. For metallic pipe other than ductile iron, attach thrust ties with fabricated lugs. For ductile iron pipe, attach thrust ties with socket clamps against a grooved joint
coupling or flange. For exposed installations, use zinc-plated nuts and bolts. However, high-strength, low-alloy steel, in accordance with AWWA C111/A21.11, may be substituted for use on cast iron and ductile iron couplings. For buried and submerged installations, provide [TP304] [_____] stainless steel bolts and nuts. Use steel middle rings and followers that are [fusion bonded epoxy-lined and coated in accordance with Section 09 90 00 PAINTS AND COATINGS and] pressure tested beyond yield point.

2.18.3.1 Sleeve-Type Couplings

Use sleeve-type couplings for joining plain end pipe sections in a flexible manner with a diameter to properly fit the pipe. A coupling consists of one [steel] [ductile iron] middle ring, two [steel] [ductile iron] followers, two elastomeric [wedge] [_____] section gaskets and elliptic-neck, track-head steel bolts designed to properly compress the gaskets. For pipe sizes between 13 through 40 mm 0.5 through 1.5 inch, ensure the followers are [ductile iron] [malleable iron], and the middle ring is in accordance with [ASTM A513/A513M] [ASTM A395/A395M] with AWWA C111/A21.11 bolting, [light pattern coupling]. For pipe sizes 50 mm 2 inch and larger, ensure the followers are [ASTM A395/A395M] [_____] and the middle ring is [ASTM A513/A513M] [ASTM A395/A395M] [_____] with AWWA C111/A21.11 bolting, [light pattern coupling]. Gaskets must be [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____] [wedge] [insulated] gaskets. Size the coupling to match the associated piping.

2.18.3.2 Transition Couplings

Transitional couplings may be used to connect two pipes of the same material that have small differences in outside diameter. Size a fully assembled transitional coupling to properly fit pipe diameters. The coupling must consist of one [steel] [ductile iron] [_____] middle ring, two [steel] [ductile iron] [malleable iron] [_____] followers, two elastomeric [wedge] [_____] section gaskets and elliptic-neck, track-head steel bolts designed to properly compress the gaskets. The coupling must use [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____] [wedge] [insulated] gaskets. Size the coupling to match the associated piping.

2.18.3.3 Flanged Coupling Adapters

Provide flanged coupling adapters consisting of fully assembled units manufactured to meet [ASTM A126 Class [B] [_____] cast iron]. The flanges must mate with [ASME B16.1] [ASME B16.5] [AWWA C207] Class [_____] flanges of the same nominal size. [Apply a factory applied corrosion resistant coating.] The coupling must use [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____] [wedge] [insulated] gaskets. Where pipe movement out of the adaptor may occur, provide proper anchorage of the pipe [and furnish couplings with lock pins]. Size the coupling to match the associated piping.
2.18.4 Couplings for Nonmetallic Piping

2.18.4.1 Bellows Coupling

Provide a bellows coupling with a minimum of two [polytetrafluoroethylene (PTFE)] [_____] convolutions unless otherwise shown, with [[ductile iron] [_____] flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [125] [150] [300] [_____]}, [_____] end connections, and metal reinforcing bands. The maximum allowable working pressure is [960 kPa 140 psig] [_____] at [49] [_____] degrees C [120] [_____] degrees F. Limit bolting to restrain the force developed by [1.5] [_____] times the specified maximum allowable operating pressure. Size the coupling to match the associated piping.

2.18.4.2 Compression Coupling

A compression coupling consists of one [steel] [_____] middle section, two [steel] [_____] mechanical nuts, two elastomeric gaskets and two machined steel lock rings. The coupling must use [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____] [wedge] [insulated] gaskets. The maximum allowable working pressure is [1.03 MPa 150 psig] [_____] at [49] [_____] degrees C [120] [_____] degrees F. Size the coupling to match the associated piping.

2.19 VALVE BOXES[, SERVICE BOXES][, VALVE MANHOLES][ AND VALVE PITS]

******************************************************************************
NOTE: Construction of valve manholes is to be avoided where feasible because of problems with dewatering/drainage and frostproofing. Use manually operated gate and butterfly valves suitable for direct burial and fitted with valve boxes in lieu of valves in manholes whenever possible. Review project-specific valve box requirements. Select and modify as required or refer to Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES.
******************************************************************************

The box length must adapt [to the length required for the depth of the line] [to the depth of cover required over the pipe at the valve location] without full extension. Boxes must be cast iron or concrete, except that concrete boxes may be installed only in locations not subjected to vehicular traffic. Provide boxes with housings of sufficient size to completely cover the valve or service stop and complete with covers.

2.19.1 Valve Boxes

Provide cast-iron valve boxes with minimum metal thickness of 5 mm 3/16 inch and of the extension type with slide-type adjustment and flared base. Provide concrete boxes that are the standard product of a manufacturer of precast concrete equipment.

2.19.2 Service Boxes

Provide extension service boxes with either screw or slide-type adjustment.
2.19.3 Valve [Manholes] [or Pits]

Construct valve [manholes] [or pits] for automatic valves and meters installed below grade in accordance with Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES.

2.20 VALVES

**************************************************************************
NOTE: This paragraph will be coordinated with Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES. Material selection based on piping materials and liquid characteristics is also provided. For critical or hazardous applications, insert specific material requirements, grades and alloys, and standards rather than a general material name.

Valves are grouped together by type. If a valve is required for your application that is not listed, insert the valve specification and notify the Contracting Officer. Check manufacturer's catalogs to make sure valves selected are current. Operator options vary by both manufacturer and valve size.
**************************************************************************

2.20.1 General Requirements For Valves

Valves include operator, actuator, handwheel, chain wheel, extension stem, floor stand, worm and gear operator, operating nut, chain, wrench, and all other accessories required for a complete operation. Ensure valves are suitable for the intended service. Renewable parts are not to be of a lower quality than those specified. [Provide valves that are the same size as adjoining pipe]. Ensure valve ends are compatible with adjacent piping system. Size an operator to operate the associated valve for the full range of pressures and velocities. Valves will open by turning [counterclockwise] [____]. Provide factory mounted operators, actuators, and accessories.

2.20.2 Valve Schedule

**************************************************************************
NOTE: Verify that the schedules are included in the contract drawings. Delete this subparagraph if the valve schedule is not used.
**************************************************************************

Submit a list of valve materials, pressure ratings, valve operator's materials, air supply pressure, electrical service, location, source of supply, and reference identification as indicated in the contract drawings. Provide a list of any special tools necessary for each valve type and appurtenances furnished for adjustment, operation, maintenance and disassembly. Requirements relative to this paragraph are shown on the [Valve Schedule] [and Operator Schedule] located [in the contract drawings] [____].

2.20.3 Factory Finishing

[Provide valves with an epoxy [lining and] coating in accordance with
AWWA C550 unless otherwise specified. Ensure the epoxy is either a two-part liquid material or a heat-activated (fusion) material except that only a heat-activated material applies if a valve coating is specified as "fusion" or "fusion bonded" epoxy. Provide epoxy lining and coating with a minimum [0.180 mm 7.0 mils] dry film thickness except where it is limited by valve operating tolerances. Finish exposed valves in accordance with Section 09 90 00 PAINTS AND COATINGS. [Paint safety isolation valves and lockout valves with handles, handwheels, or chain wheels "safety yellow."

2.20.4 Check Valves

**************************************************************************

NOTE: "Check valves" are generally service oriented. Specific types of check valves should be specified for the specific applications; for example, the ball check valve is capable of passing solids. Rated operating pressures vary based on body and seat materials, size and other parameters such as wafer class. Consult manufacturer's information to select the appropriate rating for the application.

Piping plane and valve orientation may affect check valve performance. Certain types of check valves will only operate under specific conditions; for example, lift check valves can only operate in horizontal lines, and swing check valves can operate in either horizontal or vertical (flow up) positions.

**************************************************************************

2.20.4.1 Swing Check Valves

**************************************************************************

NOTE: The requirements on subpart c. below are based on general water service and AWWA ratings.

**************************************************************************

Provide swing check valves conforming to the following:

a. Provide swing check valves, 50 mm 2 inches and smaller, with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] body, in accordance with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.18 solder joint] ends. Provide valves with a swing type, replaceable [butadiene acrylonitrile] [polytetrafluoroethylene (PTFE)] disc. Ensure valves are rated for [1.4 MPa 200 psig] service.

b. Provide swing check valves, 65 mm 2.5 inches through 300 mm 12 inch, with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] body, in accordance with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.18 solder joint] ends. Provide valves with a bronze-mounted swing type, [bronze] disc, [solid bronze] hinges, and stainless steel hinge shaft [with outside lever and [weight] [spring]]. Ensure valves are rated for [1.4 MPa 200 psig] service.
c. Provide swing check valves, 50 mm 2 inch through 900 mm 36 inch, conforming to AWWA C508, and have [ASME B16.1 Class [_____] flanged], [welding], [mechanical joint] [grooved] [_____] end connections.

Provide valves with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, [bronze] [_____] -mounted disc, solid [bronze] [ductile iron] [_____] hinges, and a stainless steel hinge shaft. Provide valves 50 mm 2 inch through 300 mm 12 inch rated for [1.2 MPa 175 psig] [_____] MPa psig] service and valves 350 through 900 mm 14 through 36 inch rated for [1.03 MPa 150 psig] [_____] MPa psig] service at 60 degrees C 140 degrees F. Fit valves with an [adjustable outside lever and spring] [adjustable outside lever and weight]. An increasing-pattern body valve may be used where increased outlet piping size is shown.

2.20.4.2 Thermoplastic Check Valve

Provide thermoplastic check valves, 8 mm 0.25 inch through 400 mm 16 inch, of a [Y-check] [ball-check] design, manufactured of [polyvinyl chloride (PVC)] [chlorinated polyvinyl chloride (CPVC)] [polypropylene (PP)] [polyvinylidene fluoride (PVDF)] [_____] with [flanged] [socket] [threaded, in accordance with ASME B1.20.2M ASME B1.20.1] end connections. Use valves that are rated for [1.03 MPa 150 psig] [_____] MPa psig] service. Provide valves with [fluoro-elastomeric O-ring] [_____] seals and seats. [Fit discs with a polyvinyl chloride (PVC) coil guide.] [Caps must be of hex design.]

2.20.4.3 Double Disc Swing Check Valve

Double disc swing check valves, 50 mm 2 inch through 1300 mm 52 inch, must be wafer style, spring loaded swing check valve, with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, a [aluminum-bronze] [ductile iron] [stainless steel] [carbon steel] [_____] disc, resilient seats, stainless steel hinge pin, and a stainless steel stop pin spring. Ensure valves 50 mm 2 inch through 300 mm 12 inch are rated for [1.4 MPa 200 psig] [_____] MPa psig] service at 60 degrees C 140 degrees F and valves 350 mm 14 inch through 1300 mm 52 inch are rated for [1.03 MPa 150 psig] [_____] MPa psig] service at 60 degrees C 140 degrees F.

2.20.4.4 Slanting Disc Check Valve

Slanting disc check valves, 50 mm 2 inch through 1500 mm 60 inch, must be of a slanting or tilting disc design, with off-center pivot. Provide valve bodies consisting of [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] and of a [two-piece] [wafer-style] design. Seats must be [bronze] [stainless steel] [_____] set on a 55 [_____] degree angle. Discs must be [bronze] [ductile iron] [cast iron] [stainless steel] with pivot pin and bushing constructed of [TP304 stainless steel] [aluminum bronze] [_____] , [butadiene acrylonitrile] [_____] disc seal, [TP316 stainless steel] [Monel] [_____] spring, [bottom mounted buffer cylinder for cushion closing] [and] [valve disc position indicator]. Use valves that are rated for [1.03 MPa 150 psig] [_____] MPa psig] service [and have [ASME B16.5] [ASME B16.1] Class [_____] flanged end connections].

2.20.4.5 Silent Check Valve

Provide silent check valves conforming to the following:
a. Silent check valves, 50 through 250 mm 2 through 10 inch, must be wafer style, center guided valve with a [cast iron] [cast steel] [bronze] [TP316 stainless steel] [_____] body, [bronze] [stainless steel] [_____] trim, [butadiene acrylonitrile] [_____] seat, and [bronze] [stainless steel] [_____] springs. Ensure valves are rated for [1.4 MPa] [200 psig] [_____] MPa psig] service at 60 degrees C 140 degrees F.

b. Silent check valves, 65 through 1050 mm 2.5 through 42 inch, must be globe style, center guided valve with [ASME B16.1] [ASME B16.5] Class [125] [250] [_____] flanged end connections, a [cast iron] [ductile iron] [cast steel] [bronze] [TP316 stainless steel] [_____] body, [bronze] [stainless steel] [_____] trim, [butadiene acrylonitrile] [_____] seat, and [bronze] [stainless steel] [_____] spring. Ensure valves are rated for [1.03 MPa] [150 psig] [_____] MPa psig] service.

2.20.4.6 Ball Check Valve

Provide ball check valves, 25 mm 1 inch and larger, in accordance with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] ends, and [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [polyvinyl chloride (PVC)] [_____] bodies with a cleanout and [floating] [sinking] type [hollow steel] [phenolic] [butadiene acrylonitrile covered metal] ball. [Flanges must be ASME B16.1 Class [125] [_____] ] Ensure valves are rated for [690 kPa 100 psig] [_____] MPa psig] service and are suitable for vertical or horizontal flow.

2.20.5 Ball Valves

**************************************************************************
NOTE: Top or bottom entry bronze ball valves are not readily available. An end entry valve requires additional unions or ability to spring pipe clear in order to service valve. Flanged and wafer style valves can be readily removed.
**************************************************************************

2.20.5.1 General Purpose Ball Valves

Provide general purpose ball valves conforming to the following:

a. Ball valves, 50 mm 2 inch and smaller, must be end entry type with [bronze] [brass] [_____] bodies and [threaded, in accordance with ASME B1.20.2MASME B1.20.1,] [soldered] [_____] [full bore] [regular] ports. Provide valves with [polytetrafluoroethylene (PTFE)] [_____] seats and packing, [chrome plated] [brass] [stainless steel] [_____] balls and [hand lever] [tee-handle] [hand wheel] [pneumatically actuated] [electrically actuated] [_____] operators. Ensure valves are rated for [2.76 MPa 400 psig] [_____] MPa psig] service at 66 degrees C 150 degrees F and conform to ASME B16.34 Class [_____] . [Install a union adjacent to the valves to provide access to the seat.]

b. Ball valves, 65 mm 2.5 inch and larger, must be end entry type with [bronze] [cast iron] [_____] bodies and [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.18 solder joint] [_____] ends. Provide valves with [polytetrafluoroethylene (PTFE)] [_____] packing and seats, a [chrome plated] [brass] [stainless steel] [_____] ball, [regular] [full bore] ports, and [hand lever] [tee-handle] [hand wheel] [pneumatically actuated] [electrically actuated] [_____] operators. Ensure valves are
rated for [2.76 MPa 400 psig] [_____] MPa psig] service at 66 degrees C 150 degrees F and conform to ASME B16.34 Class [____].

c. Provide ball valves, 50 to 300 mm 2 to 12 inch, conforming to ASME B16.34 Class [____], and with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, stainless steel ball and stem, polytetrafluoroethylene (PTFE) packing and gasket, and [flanged] [welding] [_____] ends, full port. Ensure valves are rated for [1.38 MPa 200 psig] [_____] MPa psig] service, and have [hand lever] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.5.2 Multiple Piece Body Ball Valves

Provide multiple piece body ball valves, 40 to 150 mm 1.5 to 6 inch, with [three] [_____] piece bodies constructed of [stainless steel ASTM A276/A276M Grade [TP316] [_____]] [cast steel ASTM A351/A351M Grade [CF8M] [_____]] [ASTM A216/A216M] [_____] stainless steel. Valves must have a [TP316] [_____] stainless steel ball, and [ASME B16.11 threaded] [ASME B16.5 flanged] [_____] end connections. Ensure valves are rated for [6.89 MPa 1000 psig] [_____] service and conform to ASME B16.34 Class [____].

Provide valves with [reinforced polytetrafluoroethylene (PTFE)] [_____] seats and stem packing, that are [full] [standard] bore, equipped with [handwheel] [hand lever] [tee-handle] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.5.3 Thermoplastic Ball Valve

Provide thermoplastic ball valves, 150 mm 6 inch and smaller, rated for [1.03 MPa 150 psig] [1.55 MPa 225 psig] [_____] MPa psig] service at 49 degrees C 120 degrees F, and have ASTM D1784, minimum cell classification [_____], [polyvinyl chloride (PVC)] [chlorinated polyvinyl chloride (CPVC)] [ASTM D3222 polyvinylidene fluoride (PVDF)] [_____] bodies, balls, and stems. Provide valves of end entry, double union design, with [solvent-weld socket] [threaded, in accordance with ASME B1.20.2M ASME B1.20.1] [flanged] [butt] [_____] ends connections, a [ethylene propylene diene monomer (EPDM)] [fluoro-elastomer] [_____] seat, and [fluoro-elastomer] [polytetrafluoroethylene (PTFE)] [ethylene propylene diene monomer (EPDM)] [_____] O-ring stem seals. Provide valves with [hand lever] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.6 Gate Valves

2.20.6.1 General Service Gate Valves

**************************************************************************

NOTE: The requirements on subpart b. below are based on general water service and AWWA ratings.
**************************************************************************

Provide general service gate valves conforming to the following:

a. Provide gate valves, 50 mm 2 inch and smaller, with [bronze] [_____] bodies and stems, [screwed] [union] [bolted] [yoke] bronze [_____] bonnets, single [solid] [split] wedge bronze discs, and [rising] [non-rising] stems. Provide valves rated for [1.2 MPa 175 psig] [_____] MPa psig] service and conforming to ASME B16.34 Class [_____]. End connections must be [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.11 threaded] [_____]. Equip valves with [handwheel]
b. Provide gate valves, 65 mm 2.5 inch and larger, with [Ni-resistant] [3 percent nickel-iron] [cast-iron] [bronze] [Ni-resistant stainless steel] [_____] bodies with [iron] [bronze] [_____] trim. Provide valves meeting the requirements of [AWWA C500] [AWWA C509] and have Class [125] [250] [_____] [flanged] [welding] [threaded, in accordance with ASME B1.20.2M ASME B1.20.1] [mechanical joint] [push-on] [_____] end connections. Provide a [clamp] [OS&Y Bolted] [NRS Bolted] type bonnet. Discs must be [wedge] [double] type of [iron] [bronze] [ductile iron] [bronzefaced iron] [rubber coated ductile iron] [_____] construction, and have [nonrising] [rising] stems [with backseats]. Include a by-pass of the same materials as the gate valve for each gate valve, 400 mm 16 inch and larger. Provide bypass meeting the requirements of AWWA C500. Use valves rated for [1.4 MPa 200 psig] [_____ MPa psig] service. Equip valves with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.6.2 Thermoplastic Gate Valve

Provide thermoplastic gate valves, 13 mm 1/2 inch and larger, with [ASTM D1784 polyvinyl chloride (PVC), minimum cell classification [_____],] [ASTM D1784 chlorinated polyvinyl chloride (CPVC), minimum cell classification [_____],] [_____] bodies, [bolted] [_____] bonnets, single [styrene butadiene rubber] [polypropylene] [_____] wedge discs, [non-rising] [rising] stems, and [flanged] [threaded, in accordance with ASME B1.20.2M ASME B1.20.1] [_____] end connections. Provide valves rated for [1.03 MPa 150 psig] [_____ MPa psig] service at 60 degrees C 140 degrees F. Equip valves with [handwheel] [_____] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.7 Globe Valves

2.20.7.1 General Requirements For Globe Valves

Provide globe valves, 80 mm 3 inch and smaller, that are [angle pattern] [globe style] valve with [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] bodies, with [brass] [brass] [stainless steel] [_____] trim, and [bronze] [brass] [_____] bonnets. Provide valves conforming to ASME B16.34 Class [_____], and with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.18 solder joint] [_____] end connections. Include [union] [threaded] [OS&Y] bonnets, inside screws, rising stems, [plug] needle [conventional] discs constructed of [polytetrafluoroethylene (PTFE)] [butadiene acrylonitrile] [bronzefaced iron] [ _____], and [brass] [ _____] rings. Ensure valves are rated for [1.4 MPa 200 psig] [ _____ MPa psig] service. Equip valves with [handwheel] [_____] [pneumatically actuated] [electrically actuated] [ _____] operators.

2.20.7.2 Needle Valve

Provide globe valves, 25 mm 1 inch and smaller, that are of a [straight] [angle] [cross] pattern and must have [brass] [TP316 stainless steel] [_____] bodies and trim. Provide valves [conforming to ASME B16.34 Class [_____] with ASME B16.11 [male] [female] threaded, in accordance with ASME B1.20.2M ASME B1.20.1] [have tubing compression fittings, that match associated tubing fittings,] [ _____] end connections. Ensure valves include [threaded] [integral] [union] [ _____] bonnets, [TP316 stainless steel]
[_____] stems, [plug] [soft tip] [non-rotating ball] [_____] stem tips constructed of [polytetrafluoroethylene (PTFE)] [butadiene acrylonitrile] [brass] [stainless steel] [_______], [fluoro-elastomer] [polytetrafluoroethylene (PTFE)] [ethylene propylene diene monomer (EPDM)] [_______] packing [and O-ring stem seals]. Ensure valves are rated for [2.07 MPa 300 psig] [_____] MPa psig] service. Equip valves with [toggle-handle] [handwheel] [tee-handle] [pneumatically actuated] [_____] operators.

2.20.7.3 Hose Valve

Hose valves, 20 through 80 mm 0.75 through 3 inch, must be [globe style] [angle pattern] hose valves with [cast iron] [ductile iron] [carbon steel] [brass] [TP316 stainless steel] [_______] bodies, [bronze] [stainless steel] [_______] trim, inside screws, rising stems, and [polytetrafluoroethylene (PTFE)] [rubber] [_______] disc. The outlet ports must be [cast brass] [_______] in accordance with [ASME B1.20.2MASEME B1.20.1 pipe threads, male by male, nipple adapter with hexagonal wrench feature [and brass cap with chain]] [_______]. Provide valves rated for [860 kPa 125 psig] [_____] MPa psig] service.

2.20.8 Plug Valves

2.20.8.1 Eccentric Valve

Provide nonlubricated type eccentric valves, 80 mm 3 inch and smaller, rated for [1.2 MPa 175 psig] [_____] MPa psig] service at 60 degrees C 140 degrees F. Valves must have drip-tight shutoff with pressure from either direction, and [cast iron] [bronze] [Ni-resistant] [acid resistant bronze] [aluminum] [carbon steel] [stainless steel] [nickel] [_______] bodies, in accordance with [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.11 threaded] [AWWA C606 grooved] [_______] end connections, [all metal, matching body] [rubber lined] [_______] plugs with [round] [rectangular] ports, [stainless steel] [nickel] [_______] seats, self-lubricating [stainless steel] [Monel] [nickel] [_______] stem bearings, and [butadiene acrylonitrile] [polytetrafluoroethylene (PTFE)] [filled polytetrafluoroethylene (PTFE)] [fluoro-elastomer filled polytetrafluoroethylene (PTFE)] [_______] [U-cup] [_______] seals. [Provide valves conforming to ASME B16.34 Class [_______].] Equip valves with [handwheel] [pneumatically actuated] [electrically actuated] [_______] operators.

2.20.8.2 Lined Eccentric Valve

Provide nonlubricated type eccentric valves, 80 through 1350 mm 3 through 54 inch, rated for [1.2 MPa 175 psig] [_____] MPa psig] service at 60 degrees C 140 degrees F. Provide valves with drip-tight shutoff with pressure from either direction, and [cast iron] [bronze] [Ni-resistant] [aluminum] [carbon steel] [stainless steel] [nickel] [_______] bodies in accordance with [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.11 threaded] [AWWA C606 grooved] [AWWA C111/A21.11 mechanical joint] [_______] end connections. Provide cast iron plugs with [round] [or] [rectangular] ports of no less than [80] [_______] percent of the connecting pipe area [and coated with] [butadiene acrylonitrile] [chloroprene] [fluoro-elastomer] [hard natural rubber] [_______]. Provide valves with [stainless steel] [nickel] [_______] seats, self-lubricating [stainless steel] [reinforced polytetrafluoroethylene (PTFE)] [_______] stem bearings, and [multiple V-rings] [U-cups] [O-rings] stem seals [nitrite rubber] grit seals on the stems]. [Equip valves with [handwheel] [pneumatically actuated]
[electrically actuated] [_____] operators. [Provide valves 150 mm 6 inch and smaller with a wrench lever manual operator and valves 200 mm 8 inch and larger with a totally enclosed, geared, manual operator with handwheel, 2-inch nut, or chain wheel.] [Ensure valves conform to ASME B16.34 Class [_____].]

2.20.9 Butterfly Valves

**************************************************************************
NOTE: Refer to AWWA C504 and manufacturers' data for valve selection and torque calculation data. Only valves with high velocities, heavy grit loads, or severe throttling service should be specified with a seat in the body.
**************************************************************************

2.20.9.1 Standard Service Butterfly Valve

Provide butterfly valves, 50 mm 2 inch and larger, with [ASTM A126 cast iron] [ductile iron] [carbon steel] [stainless steel] [_____] bodies, [[wafer] [lugged styled] [with] [ASME B16.5 flanged] [ASME B16.1 flanged] [AWWA C111/A21.11 mechanical joint] [_____] end connections]. Provide valves conforming to [AWWA C504 Class [125] [150] [_____]] [ASME B16.34 Class [_____]]. Discs must be contoured [ASTM A436 Type 1 Ni-resist cast iron with maximum lead content of 0.003 percent] [ASTM A536 Grade 65-45-12 ductile iron] [stainless steel] [polyvinylidene fluoride (PVDF) coated ductile iron] [bronze] [_____]. Provide [carbon steel] [stainless steel] [_____] valve shafts with self-lubricating, corrosion-resistant sleeve type bearings. Provide valve seats, constructed of [chloroprene] [_____], for [600 mm 24 inch] [_____] and smaller valves and attach to either the valve body or the disc. Provide valve seats for valves larger than [750 mm 30 inch] [_____ mm inch] which are field replaceable in accordance with AWWA C504. Provide valves with [manual, locking hand lever] [hand wheel] [crank] [chain wheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.9.2 Thermoplastic Butterfly Valves

Provide thermoplastic butterfly valves, 40 mm 1.5 inch and larger, with [wafer] [lugged] style bodies constructed of [polyvinyl chloride (PVC)] [polyvinylidene fluoride (PVDF)] [polypropylene (PP)] [polyvinylidene fluoride (PVDF) coated ductile iron] [_____]. Provide valves with [polyvinyl chloride (PVC)] [polyvinylidene fluoride (PVDF)] [polypropylene (PP)] [polytetrafluoroethylene (PTFE)] [_____] discs, [ethylene propylene diene monomer (EPDM)] [fluoro-elastomeric] [butadiene acrylonitrile] [natural rubber] [ethylene propylene diene monomer (EPDM) backed] [_____] seats, [ethylene propylene diene monomer (EPDM)] [polytetrafluoroethylene (PTFE)] [same material as seats] [_____] seats, and [lever] [gear] [_____] pneumatically actuated] [electrically actuated] operators. Ensure valves are rated for [1.03 MPa 150 psig] [_____ MPa psig] service at 60 degrees C 140 degrees F.

2.20.10 Pinch Valves

**************************************************************************
NOTE: Pinch valves are commercially available in sizes ranging from 50 mm 2 inch to 1500 mm 60 inch. Consider using an enclosed bevel gear operator for valves 150 mm 6 inch and larger and above 500 kPa
**************************************************************************
The pinch valve included is illustrative, consult manufacturers' catalogs for other styles, pressure ratings, and operators.

Provide pinch valves with [aluminum] [stainless steel] [carbon steel] [ductile iron] [cast iron] [_____] bodies, in accordance with [ASME B16.1] [ASME B16.5] flanged end connections, [natural rubber] [chloroprene] [chlorobutyl] [butadiene acrylonitrile] [fluoro-elastomeric] [ethylene propylene diene monomer (EPDM)] [_____] seats, [full port] [double wall] [reduced port] [cone] [variable orifice] sleeves, and [manual] [pneumatically actuated] [electrically actuated] [upper] [and] [lower] pinch bars.

2.20.11 Diaphragm Valves

Diaphragm valves are commercially available in sizes ranging from 15 mm 0.5 inch to 250 mm 10 inch depending upon the materials of construction. Contact manufacturers to confirm availability based upon size and material.

Provide diaphragm valves, 13 mm 1/2 inch and larger, with [aluminum] [stainless steel] [carbon steel] [ductile iron] [cast iron] [_____] bodies, [ASME B16.1] [ASME B16.5] Class [125] [150] [_____] end connections and [natural rubber] [chloroprene] [chlorobutyl] [butadiene acrylonitrile] [fluoro-elastomeric] [ethylene propylene diene monomer (EPDM)] [_____] seals, and are [manually] [pneumatically] [_____] actuated. Provide position indicators to indicate diaphragm position. Valves must be rated for [1.03 MPa 150 psig] [_____] MPa psig] service at 60 degrees C 140 degrees F.

2.20.12 Self-Contained Automatic Valves

Pressure-reducing valves, 13 mm 1/2 inch and larger, must be [direct]
[hydraulically] operated, diaphragm actuated, [pilot] [spring] controlled angle globe valves with [cast iron] [ductile iron] [steel] [aluminum] stainless steel [bronze] [_____] bodies. End connections must be [ASME B16.1] [ASME B16.5 Class [150] [_____] flanged] [ASME B16.11 threaded] [socket-welded]. Provide [stainless steel] [_____] trim and stem. Valves must be normally [open] [closed] to maintain a constant downstream pressure regardless of fluctuations in flow or upstream pressure [ , and prevents backflow,] [and have externally mounted strainers with cocks]. Use valves sizes and ratings as [shown in the Valve Schedule on the contract drawings.] [as follows.] PCV [_____] mm inch, maximum flow of [_____] cubic m/s gpm with inlet pressure of [_____] MPa psig. Outlet pressure set at [_____] MPa psig.

2.20.12.2 Pump Control Valve

Provide pump control valve which is [hydraulically operated, diaphragm actuated, pilot controlled globe valve with [cast iron] [ductile iron] cast steel [_____] bodies, [ASME B16.1] [ASME B16.5] Class [_____] flanged end connections, [bronze] [stainless steel] [_____] trim, stainless steel stems, and externally mounted strainers with cocks] [______]. Design valves to eliminate pipeline surge caused by pump startup and shutdown, and include automatic check features.

2.20.13 Operators

2.20.13.1 Operator Schedule

**************************************************************************
NOTE: Verify that the operator schedule is included in the contract drawings. Delete this subparagraph if an operator schedule is not used.
**************************************************************************

Requirements relative to this paragraph are shown on the Operator Schedule located [in the contract drawings] [______].

2.20.13.2 Manual Operator

The force in a manual operator is not allowed to exceed [175 N 39.3 pound] [_____] N pound under any operating condition, including initial breakaway. Equip the operator with gear reduction when force exceeds [175 N 39.3 pound] [_____] N pound. Provide a self-locking type manual operator or equip with a self-locking device. Supply a position indicator on quarter-turn valves. Provide worm and gear operators consisting of a one-piece design with worm-gears of gear bronze material. Worm must be hardened alloy steel with the thread ground and polished. Provide traveling nut type operators with threader steel reach rods with an internally threaded bronze or ductile iron nut.

2.20.13.2.1 Exposed Operators

Provide exposed operators with galvanized and painted handwheels. Lever operators are allowed on quarter-turn valves [200 mm 8 inch] [_____] mm inch and smaller. Supply cranks on gear type operators. If located off of the operator floor, provide chain wheel operator with tiebacks, extension stem, floor stands, and other accessories to permit operation from normal operation level. Ensure valve handles are capable of padlocking, and provide wheels that are lockable with a chain and padlock.
2.20.13.2.2 Underground Operators

Buried service operators on valves larger than [65 mm 2.5 inch] must have a [50 mm 2 inch] operating nut. Buried operators on valves [50 mm 2 inch] and smaller must have a cross handle for operation by a forked key. Enclose the moving parts of valve and operator in housing to prevent contact with the soil. Design buried service operators for quarter-turn valves to withstand an input torque of [^610 N·m (450 foot-pound) of input torque at the fully open or fully closed positions, and grease pack and gasket to withstand a submersion in water to [70 kPa 10.2 psig] [_____] MPa psig]. Provide buried valves with extension stems, bonnets, and valve boxes.

2.20.13.3 Pneumatic Operator

**************************************************************************
NOTE: Associated transducers must pneumatically provide the same pressure range as used by the actuator. Do not use piston actuators at less than 275 kPa 40 psig supply pressure. Include a safety vented isolation valve in the operator paragraph for use on air sets.
**************************************************************************

Provide pneumatic operators complete with actuators, air sets, exhaust mufflers, speed controls, pilot solenoids, safety vented isolation valves, and accessories. Ensure pneumatic operators are suitable for full operation range of valve at air supply pressure indicated. Use actuators to return the valve to the closed position upon loss of signal unless otherwise indicated. Use springs to return valve to this failed position.] Furnish pneumatic operators with features noted on the [Operator Schedule] [Valve Schedule] in the contract drawings. [Provide limit switches on all actuators.]

2.20.13.3.1 Cylinder Actuators

Provide cylinder actuators conforming to ANSI/AWWA C541 and ANSI/AWWA C542, and operate with an air supply pressure of [550 kPa 80 psig] [_____] MPa psig]. Totally enclose the nonswivel type with travel stops and position indicator, and factory lubricate and seal, requiring no additional lubrication. The double acting type must be nonmetallic for operation on nonlubricated air and must have a [manual] override independent of the cylinder. Locate the manual override [_____].

2.20.13.3.2 Diaphragm Actuators

Provide diaphragm actuators with a spring return with a [steel or aluminum] diaphragm case and spring barrel, steel spring and actuator stem, and [fabric-reinforced chloroprene] diaphragm. Use actuators on quarter-turn valves which include a totally enclosed valve actuating mechanism with adjustable travel stops and valve position indicator with manual override if indicated. The actuating mechanism must factory lubricated and sealed. Size and configure diaphragm actuators for the service indicated and an air supply pressure of [240 kPa 35 psig] [_____] MPa psig].
2.20.13.3 Air Sets

Include a pressure regulator with internal relief, filter, outlet pressure gauge, and adjustable reduced pressure range as required by the valve actuator. The air set must have an aluminum body and handwheel, safety vented lockout isolation valve, and gauge range [1.33 to 2] [_____] times maximum operating pressure.

2.20.13.4 Limit Switches

Provide single-pole, double-throw (SPDT) type limit switches, rated 10 amps at 120 volts ac, housed in a NEMA 250 Type [4] [_____] enclosure, and adjustable for open and closed valve positions.

2.20.13.5 Positioners

The positioners for modulating actuators must be pneumatic force balance instruments to control valve positions as a function of the input signals. The positioners must accomplish positive positioning of valve by a mechanical feedback connection from the valve actuating mechanism. Provide position feedback through a characterized linear cam to allow adjustment of valve positioning and input signal. Provide positioner suitable for either a double acting or spring return actuator. Provide positioner with zero and span adjustment and field reversible for direct or reverse action. Include gauges for supply and output pressure and for input signal pressure. Operate modulating valve positioners on a [21 to 103 kPa 3 to 15 psig pneumatic] [or] [(4 to 20 mA) [1 to 5 v dc] electric] input signal unless otherwise indicated. [A positioner for dc input signal with transducers must convert the electrical signal to the appropriate pneumatic signal. Ensure transducer is [integral with the positioner] [or] [a separate component]. If separate, factory mount the transducer on the pneumatic operator. Line electric power is not required for transducer operation.] Corrosion-resistant enclosures for positioners and transducers must be splash- and moisture-proof with gasketed covers.

2.20.13.6 Solenoid Valve

Use a solenoid valve to pilot the control actuator in the appropriate configuration for the type of actuator being controlled. Provide a pilot operated diaphragm type solenoid valve consisting of a [brass] [_____] body and resilient seat and operate with minimum operating pressure differential no greater than [70 kPa 10.2 psi] [_____] kPa psi and maximum operating pressure differential no less than [1.03 MPa 150 psi] [_____] MPa psi. Provide corrosion-resistant internal parts. Provide solenoid valve with Class F molded coils for operation on 120 volts, 60-Hz, ac, unless otherwise indicated. Provide solenoid enclosure conforming to NEMA 250 Type [4] [______]. Solenoids on double acting cylinders for open-close and throttling valves must be four-way with dual coils. Solenoids on spring return cylinders for open-close and throttling valves must be three-way, spring return. Furnish an air exhaust muffler in the exhaust port of all actuator pilot solenoid valves.

2.20.13.4 Electric Operator

Provide electric operators complete with actuators, speed controls and accessories. Operate actuators on [120 VAC, 60 Hz] [_____] with a [75] [_____] percent duty cycle and equip with an AC thermal overload protector with automatic rest, reversing (bi-directional) operation for use with quarter-turn valves, or rotating equipment to full rotation. Gearing must
be a two-stage planetary, permanently lubricated self-locking gear train with self-lubricating bearings; connections via male output staff. Use start-up torque of [163 N-m 120 foot-pound] [[_____] N-m foot-pound]. Use stall torque of [203 N-m 150 foot-pound] [[_____] N-m foot-pound]. Mount [two] [[_____] travel stop limit switches with cams, internal, independent, adjustable, and actuated by cams, on the drive shaft. Provide a side mounted hand turn wheel for a manual override. Ensure actuators have a NEMA 250 Type [4] [[_____] enclosure with a corrosion resistant, baked epoxy finish as standard. Operate actuator in a temperature range of -40 to plus 65 degrees C -40 to plus 150 degrees F. Actuators must fail in last position unless otherwise indicated. Furnish electric operators with features noted on the [Operator Schedule] [Valve Schedule] in the contract drawings. [Provide limit switches on all actuators.]

2.20.13.4.1 Limit Switches

Limit switches must be single-pole, double-throw (SPDT) type, rated 10 amps at 120 volts ac, housed in a NEMA 250 Type [4] [[_____] enclosure, and adjustable for open and closed valve positions.

2.20.13.4.2 Positioners

Provide positioners for modulating actuators to control valve positions as a function of the input signals. Operate positioner on [120 VAC, 60 Hz.] [[_____] voltage. The mode of operation must be [direct acting] [reverse acting]. Operate modulating valve positioners on a [4 to 20 mA] [1 to 5 v DC] [[_____] input signal unless otherwise indicated. Provide splash-and moisture-proof corrosion-resistant enclosures with gasketed covers for positioners.

2.20.14 Valve Accessories

2.20.14.1 Extension Bonnet for Valve Operator

Provide all extension bonnets as necessary, complete with stem and accessories applicable to the specific valve and operator.

2.20.14.2 Floor Stand and Extension Stem

Provide the nonrising, indicating type floor stand and extension stem, complete with stem, coupling, handwheel, stem guide brackets, and yoke attachment. Space stem guide such that stem L/R ratio does not exceed [200] [[_____. Supply anchors as required.

2.20.14.3 Floor Box and Stem

Provide the plain type floor box and stem for support of nonrising type stem; complete with stem, operating nut, and stem guide brackets. Space stem guide such that stem L/R ratio does not exceed [200] [[_____. Supply anchors as required.

2.20.14.4 Chain Wheel and Guide

Provide the handwheel direct-mount type chain wheel and guide, complete with galvanized or cadmium-plated chain.

2.21 DRAINS

Valved drains may not be shown on the detailed drawings for individual
pipelines; their absence will not relieve the Contractor of the responsibility for providing and installing them as indicated in the piping and instrumentation diagrams to complete the piping system for the use intended.

2.21.1 Locations

[Locate drains as indicated on the contract drawings] [Drain all pipeline low points] [______].

2.21.2 Sizes

For pipelines 65 mm 2.5 inch and larger, provide [20 mm 0.75 inch] [[_____] mm inch] drains equipped with [gate valves] [globe valves] [ball valves] [______]. For pipelines 50 mm 2 inch [[_____] mm inch] and smaller, provide [13 mm 1/2 inch] [[_____] mm inch] drains equipped with [gate valves] [globe valves] [ball valves] [______].

2.22 SAMPLE PORTS

**************************************************************************
NOTE: Sample port materials of construction typically match the piping system.
For highly critical situations where the materials being sampled are very hazardous or where valves may tend to clog or leak, the first sampling valve option is used to specify a sampling valve. Otherwise, the second option is used to specify the sampling configuration.
**************************************************************************

[Sample ports, shown on the flow diagrams and piping and instrument diagrams of the contract drawings, may not be shown on the detailed drawings of the individual pipelines; their absence does not relieve the Contractor of the responsibility for providing them.] [Provide sample ports as indicated in the piping and instrument diagrams to complete the piping systems for the use intended.] Locate sample ports in easily accessible locations, and avoid potential stagnant points and/or areas where material could collect. [Provide a plug-type sampling valve with a stainless steel piston that extends beyond the inner surface of the pipe when closed at [all the sampling ports] [the sampling ports indicated]. Seal piston by two compressible replaceable [polytetrafluoroethylene (PTFE)] [______] rings, one above the discharge port, the other below the discharge port. Provide valve body consisting of stainless steel Class [150] [______] with a [male ASME B1.20.2MASME B1.20.1 pipe threads] [______] inlet connection and [female ASME B1.20.2MASME B1.20.1 pipe threads] [______] outlet connection] [Provide sampling ports comprised of pipe fittings, pipe, and [ball] [gate] [______] valves which comply with material, temperature, and pressure requirements of the associated piping system as specified elsewhere in this Section.] [Provide a double block and bleed configuration] [______].

2.23 MISCELLANEOUS PIPING COMPONENTS

2.23.1 Air Release and Vacuum Breakers

**************************************************************************
NOTE: For air and vacuum, vacuum, air release and
combination valves, check trim materials for compatibility with service. In addition, discharge points should be designed to be safe for both the environment and personnel.

Locate air release vents, and vent such that a hazardous atmosphere will not be created upon operation.

2.23.1.1 Locations

[Locate air release and vacuum breakers as indicated on the contract drawings.] [Ensure all pipeline high points have air release vents [and vacuum breakers].] [______]. [Provide vacuum breakers on all tanks and process equipment.]

2.23.1.2 Vacuum Breakers

Provide vacuum breakers [50] [______] mm [2] [_____] inch and smaller of an angle type with all [bronze] [cast iron] [semi-steel] [_____] bodies and bonnets, and [install at least [152] [_____] mm [6] [_____] inch above the flood line of associated equipment] [and] [conforming to ASSE 1001 for pipe applied units].

2.23.1.3 Air and Vacuum Valve Suitable for Corrosive Service

Provide air and vacuum valve conforming to [ASSE 1001] [ASSE 1020] [_____], and automatically exhaust air during the filling of a system while allowing air to re-enter during draining or when vacuum occurs. Ensure valve is rated for [1.03] [______] MPa [150] [_____] psig working pressure and built with [a special short body] [a standard elongated body]. Provide valve consisting of a [cast iron] [ductile iron] [semi-steel] [_____] body and cover, with [stainless steel] [_____] float and trim. Provide end connections as follows: for 13 through 80 mm 1/2 through 3 inch ASME B1.20.2MASME B1.20.1 pipe threaded inlet and outlet, for 100 mm 4 inch and larger [ASME B16.5] [ASME B16.1] Class [______] flanged inlet with outlet. Fit air and vacuum valve with blowoff valve, quick disconnect couplings, and a minimum [2] [_____] m [6.6] [_____] feet of hose in order to permit back flushing after installation without dismantling the valve.

2.23.1.4 Air Release Valve Suitable for Corrosive Service

Use [Factory Mutual listed] [ASSE approved] [_____] air release valve to automatically exhaust entrained air that accumulates in a system. Ensure valve is rated for [1.03] [______] MPa [150] [_____] psig working pressure and built with [a special short body] [a standard elongated body]. Provide valve consisting of a [cast iron] [ductile iron] [semi-steel] [_____] body and cover, with [stainless steel] [_____] float and trim. Ensure valve end connections are [ASME B1.20.2MASME B1.20.1 pipe threaded] [[ASME B16.5] [ASME B16.1] Class [______] flanged] [______]. Fit air and vacuum valve with blowoff valve, quick disconnect couplings, and a minimum 2 m 6.6 feet of hose in order to permit back flushing after installation without dismantling the valve.

2.23.1.5 Combination Air Valve Suitable for Corrosive Service

The valve combines the operating functions of both an air and vacuum valve and an air release valve. The air and vacuum portion must automatically exhaust air during filling of a piping system and allow air to re-enter.
during draining or when a vacuum occurs. Air release portion must automatically exhaust entrained air that accumulates in the piping system. Provide valve consisting of a [single body unit] [or] [an individual air and vacuum valve and an air relief valve mounted on a common header]. Ensure valve is rated for [1.03] [_____] MPa [150] [_____] psig working pressure and built with [a special short body] [a standard elongated body]. Provide valve with a [cast iron] [ductile iron] [semi-steel] [_____] body and cover, with [stainless steel] [_____] float and trim. Ensure valve end connections are [ASME B1.20.2] [ASME B1.20.1] pipe threaded) [_____] flanged) [_____] flanged). [The air and vacuum valve to be fitted with a blowoff valve, quick disconnect couplings, and a minimum [2] [_____] m [6.6] [_____] feet of hose in order to permit back flushing after installation without dismantling the valve.]

2.23.2 Backflow Preventer

**************************************************************************
NOTE: Under process conditions, backflow prevention can be handled with either a double check valve assembly or a backflow preventer specifically manufactured for that purpose. The backflow preventer should be used if pressure loss is a concern. However, if the backflow prevention device is to be installed on a potable water line at a treatment plant and the potential for contamination of the potable water line exists, a backflow preventer specifically manufactured for that purpose must be used.

The reduced pressure backflow preventer can be used on continuous duty systems only. The other backflow preventer can be used on either continuous or intermediate services.
**************************************************************************

The backflow preventer must be identical in size to pipe. Do not allow total head loss through the complete backflow assembly to exceed [70] [_____] kPa [10.1] [_____] psi at rated flow.

2.23.2.1 Double Check Valve Assembly

Provide backflow preventer consisting of two [check valves] [independently operating, spring loaded, "Y" check valves] rated for [1.25] [_____] MPa [175] [_____] psig service at 60 degrees C 140 degrees F, with [one isolation gate valve] [one isolation ball valve], [one differential relief valve], [and testing cocks]. Use port size of [25] [_____] mm [1] [_____] inch and [ASME B1.20.2] [ASME B1.20.1] threaded, [female] [male]. Ensure check valve assembly is rated for [1.03] [_____] MPa [150] [_____] psig working pressure at 65 degrees C 150 degrees F. Provide assembly meeting the requirements of [ASSE 1015] [AWWA C510].

2.23.2.2 Reduced Pressure Backflow Preventer

Provide assembly body consisting of two independent [bronze] [epoxy coated cast iron] [_____] body check valves rated at [1.2][_____] MPa [150] [_____] psig at 60 degrees C 140 degrees F, with an intermediate relief valve, and [isolation gate valve], [full-ported [ball valves] [gate valves] [_____] as testing cocks. [Ensure all internal parts are serviceable in-line.] Use port sizes of [25] [_____] mm [1] [_____] inch and
ASME B1.20.2MASME B1.20.1 threaded, [female] [______]. Ensure reduced pressure backflow prevention assembly is rated for [1.03] [______] MPa [150] [______] psig working pressure at 65 degrees C 150 degrees F. Provide assembly body in accordance with [AWWA C511] [ASSE 1013].

2.23.2.3 Backflow Preventer with Intermediate Vent

Provide assembly body consisting of two independent [bronze] [epoxy coated cast iron] [______] body check valves rated at [1.2] [______] MPa [175] [______] psig at 60 degrees C 140 degrees F, with an intermediate atmospheric vent, and [isolation gate valve,] [full-ported [ball valves] [gate valves] [______]] as testing cocks. Use port sizes of [25] [______] mm [1] [______] inch and ASME B1.20.2MASME B1.20.1 threaded, [female] [______]. Ensure backflow prevention assembly is rated for [1.03] [______] MPa [150] [______] psig working pressure at 65 degrees C 150 degrees F. Provide assembly body in accordance with [AWWA C511] [ASSE 1012].

2.23.3 Strainers

2.23.4 Indicating Devices

**************************************************************************
NOTE: This subparagraph will be coordinated with requirements for remote or control instrumentation. The devices specified by this section may be in addition to the control instrumentation.
**************************************************************************

2.23.4.1 Pressure and Vacuum Gauges

Pressure and vacuum gauges must be [stem] [flush] [semi-flush] [panel] [______] mounted, with [phenolic] [aluminum] [glass filled nylon] [glass filled polypropylene (PP)] [stainless steel] [brass] [acrylonitrile-butadiene-styrene (ABS)] [______] cases [equipped with safety pressure blowout backs] and [dry] [[glycerine] [______] -filled] [______] dials. The gauge sensors must be [diaphragm] [C-Type Bourdon tube] [helical Bourdon tube] [bellows] [______] actuated and constructed of [phosphor bronze] [stainless steel] [Monel] [silicone rubber] [Inconel] [beryllium-copper] [______]. Equip gauges with [brass] [Monel] [TP316L stainless steel] [alloy steel] [______] threaded [8] [______] mm [0.25] [______] inch [male] [female] connections. The dials of the gauges must be [114] [152] [______] mm [4.5] [6] [______]inch in diameter with scale readings in [MPa and mm of mercury psig and inches of mercury] [______] ranging from zero to approximately twice the anticipated process operating or equipment pressure. Provide a slotted adjustable pointer with accuracy to conform to [ASME B40.100, Grade A] [______]. [Provide a lever handled gauge cock and filter type snubber.] [Install snubber between the pipeline and the gauge.] [Isolate the gauges from the process fluids using remote corrosion resistant diaphragm seals. Construct the housing of the corrosion
resistant seals of [stainless steel] [Monel] [tantalum] [titanium] [polytetrafluoroethylene (PTFE)] [polypropylene (PP)] [polyvinyl chloride (PVC)] [Inconel] [Hastelloy] [_____] . Compose seals of [stainless steel] [Monel] [Hastelloy] [nickel] [polytetrafluoroethylene (PTFE)] [_____] .

2.23.4.2 Thermometers

Provide bi-metal actuated thermometers, with [127] [_____] mm [5] [_____] inch dished anti-parallax dials that have [external] [_____] calibration adjustment and [stainless steel] [_____] cases. Do not use mercury in thermometers. Use thermometers with [stainless steel] [_____] stems, [adjustable angle] [back-connection] [left side-connection] [or] [right side-connection] type for the correct viewing angle. Include union connections with associated thermowells. Scale must be [-5 to plus 50 degrees C] [25 to 125 degrees F] [_____] to [_____] degrees C degrees F] with accuracy within one scale division.

2.23.4.3 Thermowells

Provide [TP316 stainless steel] [brass] [steel] [_____] thermowells with a diameter of [25] [_____] mm [1] [_____] inch. Use length as shown on the contract drawings and coordinate with the associated temperature element. Construct process connections of [stainless steel] [_____] with [flanges, faced and drilled to ASME B16.5 Class [150] [300] [_____]] [fixed hex nipples male ASME B1.20.2M ASME B1.20.1 threaded] [female ASME B1.20.2M ASME B1.20.1 threaded sockets]) [_____]. Use thermowells, equipped with terminal connection heads rated NEMA 250 Type [4X] [4] [7] [_____], with thermocouples or RTDs.

2.23.5 Static Mixer

Design static mixer to disperse the design flow, [_____] cubic m/s gpm of added chemicals in a process flow stream with flows ranging from [_____] to [_____] cubic m/s gpm. The minimum allowable pressure drop is [_____] kPa feet of water column. The maximum allowable pressure drop for the static mixer is [_____] kPa feet of water column in accordance with the requirements of the process stream pumping system. Size diameter of the mixer housing identical to the process piping. Use length in accordance with the number of mixing elements required. Provide [TP316 stainless steel] [_____] housing materials, providing chemical resistance to both the chemical additives and process stream. [Ensure coatings on coated components are factory spark-tested to verify that the coating is free from pinholes.] Ensure end configurations are [plain ends] [ends prepared for welding] [ASME B1.20.2MASME B1.20.1 threaded ends] [forged steel, [ASTM A105/A105M] [ASTM A727/A727M]] [_____], flanged faced and drilled to [ASME B16.5] [ASME B16.1] Class [150] [300] [_____]) [_____] and compatible with the piping system. Provide injection ports of the same materials as the mixer housing in the number, dimensions, and positions shown on drawings, and with [female ASME B1.20.2MASME B1.20.1 threaded] [flanged] [_____] connections compatible with the chemical feed piping system. Supply each housing with a name plate which at a minimum provides the manufacturer's name and address, part model number, and direction of flow. Construct mixing elements of [TP316 stainless steel] [_____] providing resistance to both the chemical additives and process stream. Install elements consecutively, with the number required designed to provide mixing with a homogeneity of the final mix of less than or equal to [0.05] [_____] by the end of the static mixer.
2.23.6 Expansion Joints

NOTE: Thermal expansion of the piping systems must be taken into account. One of the most common methods to accommodate thermal expansion, the incorporation of expansion loops into the piping system, should be carefully investigated when corrosive materials are handled due to the potential of inducing stress corrosion. Alternatives are expansion joints and flexible connections or sections. Calculate maximum expansion compensation based on maximum pipeline temperature and pressure.

Provide all structural work and equipment required to control expansion and contraction of piping. Verify that the anchors, guides, and expansion joints provided, adequately protect the piping systems.

2.23.6.1 Expansion Joint for Metallic Pipe

The expansion joint must be a [single slip] [double slip] [ball] [bellows] [elastomer sleeve] [_____] type with [stainless steel] [_____] wetted materials of construction. Size expansion joint to match the associated piping. The maximum allowable working pressure is [1.03] [_____] MPa [150] [_____] psig at [48.9] [_____] degrees C [120] [_____] degrees F. Size expansion joint for a maximum axial [compressing] [expanding] deflection of [_____] mm inches, a lateral movement of [_____] mm inch, [and] an angular rotation of [15] [_____] degrees. End connections must be [as specified for the associated pipe joints] [[ASME B16.5] [ASME B16.1] Class [_____] flanged] [ASME B16.11 [threaded] [welding]]. Provide required accessories for a complete assembly including: [swivel joints,] [limit stops,] [internal guides,] [anti-torque device,] [internal flow liners,] [control rods,] [control cables,] [______].

2.23.6.2 Expansion Joint for Nonmetallic Piping

Provide a bellows expansion joint with a minimum of [_____] convolutions to accommodate an axial deflection of [_____] mm inch, [a lateral movement of [_____] mm inch,] [and] [an angular rotation of [_____] degrees,] with [ductile iron] [_____] flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [125] [150] [300] [_____], [_____] end connections, and metal reinforcing bands. The maximum allowable working pressure is [960] [_____] kPa [140] [_____] psig at [49] [_____] degrees C [120] [_____] degrees F. Limit bolting to restrain the force developed by [1.5] [_____] times the specified maximum allowable operating pressure. Size expansion joint to match the associated piping.

2.23.7 Pressure Relief Devices

NOTE: Pressure relief devices must discharge to a safe location that does not endanger either operators or the environment. Discharge piping and the supports for the discharge piping must be carefully designed to prevent failure during a pressure relief event. Select all materials based upon the application; refer to manufacturers' catalogs.
Provide pressure relief devices conforming to the requirements of ASME B31.3.

2.23.7.1 Pressure-Relief Valve

**NOTE: Verify that the valve schedule is included in the contract drawings.**

Provide pressure-relief valves conforming to the following:

a. Pressure-relief valves, 50 mm (2 inch) and smaller, must be a direct diaphragm, spring controlled type with [cast iron] [_____] bodies and spring cases. Trim must be [bronze] [stainless steel] [_____] and seats, [nitrile] [______]. Diaphragms must be elastomeric, [chloroprene] [nylon reinforced butadiene acrylonitrile rubber] [or] [______]. Ensure miscellaneous parts such as the valve stems, nuts, and springs are [stainless steel] [______]. Ensure end connections are [flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [150] [300] [_____] [ASME B16.11] [threaded] [welding]] [______]. The valves must open when the upstream pressure reaches a maximum set point. Sizes and ratings [as shown in the Valve Schedule in the contract drawings.] [as follows: PSV- [_____] [_____] mm inch, maximum flow of [_____] cubic m/s gpm with inlet pressure of [_____] MPa psig. Outlet pressure set at [_____] MPa psig].

b. Pressure relief valves, 65 mm (2.5 inch) and larger, must be hydraulically operated, diaphragm actuated, pilot controlled [globe] [angle] valves with externally mounted strainers and test cocks. Provide bodies consisting of [cast iron] [ductile iron] [forged steel] [_____] and trim consisting of [bronze] [stainless steel] [______]. Stem must be [stainless steel] [______]. Ensure end connections are [flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [150] [300] [_____] [ASME B16.11] [threaded] [welding]] [______]. The valves must open when the upstream pressure reaches a set point. Sizes and ratings [as shown in the Valve Schedule in the contract drawings.] [as follows: PSV- [_____] [_____] mm inch, maximum flow of [_____] cubic m/s gpm with inlet pressure of [_____] MPa psig. Outlet pressure set at [_____] MPa psig].

2.23.7.2 Rupture Discs

**NOTE: Verify that the rupture discs are sized and rated in the contract drawings.**

Provide [tension loaded] [compression loaded] type rupture discs [as indicated in contract drawings]. Provide discs consisting of [copper] [aluminum] [stainless steel] [dual element with a seal composed of [metal] [plastic] [_____] conforming to piping system] with a maximum operating ratio of [70] [85] [90] [_____] percent. [Provide vacuum support, if required, by the manufacturer.] [Knife blades are not necessary for initiating rupture.] The discs must rupture when the upstream pressure reaches a set maximum. Sizes and ratings [as shown in the contract drawings.] [as follows: PSE- [_____] [_____] mm inch, diameter. Rupture pressure is [_____] MPa psig].
2.24 PIPE SUPPORTS AND PENETRATIONS

**************************************************************************
NOTE: Pipe-support is a major design consideration of any process piping system; carefully design and edit the following paragraphs.
**************************************************************************

Provide auxiliary steel where the support of piping systems and equipment is required between building structural elements. Provide light gauge and structural steel shapes conforming to the requirements of ASTM A36/A36M. The Contractor has the option to use pre-engineered support systems of electrogalvanized steel products. However, a mixture of support system manufacturers products is not permitted. Where auxiliary steel is indicated as stainless steel, provide [TP304] [_____] stainless steel conforming to [ASTM A167, No. 1 Finish] [____].

2.24.1 Pipe Supports

Provide pipe supports conforming to the requirements of MSS SP-58. Where pipe supports contact bare piping or in-line devices, provide supports of compatible material so that neither has a deteriorating action on the other.

2.24.1.1 Beam Clamps

For upper attachments on structural steel, provide beam clamps of [ASTM A36/A36M carbon steel] [or] [ASTM A181/A181M forged steel] [_____] and MSS SP-58 Types [19 through 23, 25 or 27 through 30] [_____]. Holes drilled in structural steel for hanger support rods will not be permitted. Provide clamps with hardened steel cup-point set screws and lock-nuts for anchoring in place. Base clamp size selection only on the support of the required load.

2.24.1.2 Riser Clamps

Support vertical runs of piping at each floor, or closer where required, with [ASTM A36/A36M carbon steel] [_____] clamps bolted around pipes and attach to the building construction. [Provide copper plated clamps for copper tubing support.] [Use two bolt-type clamps designed for installation under insulation on insulated pipe runs.]

2.24.1.3 Brackets

Where piping is run adjacent to walls or steel columns, provide welded [ASTM A36/A36M steel] [_____] brackets, pre-punched with a minimum of two fastener holes.

2.24.1.4 Offset Pipe Clamp

Where pipes are indicated as offset from wall surfaces, supply a double-leg design two-piece pipe clamp.

2.24.1.5 Racks

Fabricate multiple pipe racks or trapeze hangers from [ASTM A36/A36M steel] [____], and design to suit the conditions at the points of installation. Keep pipes in their relative positions to each other by the use of clamps or clips. Pipelines subject to thermal expansion must be free to slide or

SECTION 40 05 13 Page 88
2.24.1.6 Hangers

Fabricate hangers of [malleable iron, ASTM A47/A47M] [or] [ASTM A36/A36M carbon steel] [______]. Ensure all hangers are of a uniform type and material for a given pipe run and application. Use coated or plated hangers to isolate steel hangers from dissimilar metal tube or pipe. Ensure hangers for pipe sizes 65 mm 2.5 inch or larger incorporate a means of vertical adjustment after erection while supporting the load. For piping systems with operating temperatures from 50 to 230 degrees C 122 to 446 degrees F, use the following: [MSS SP-58 Type [1] [or] [3 through 12] [______] hangers with overhead support and appropriate saddle of MSS SP-58 Type [40] [______] for insulated pipe;] [MSS SP-58 Types [41] [or] [43 through 46] [______] hangers or supports with roller support and appropriate saddle of MSS SP-58 Type [39] [______] on insulated pipe;] [MSS SP-58 Types [35 through 38] for sliding support]. For piping systems with liquid temperatures up to 50 degrees C 122 degrees F, use the following: MSS SP-58 [Types 1,3 through 12,] [Types 24 and 26 with overhead support,] [or] [Types 35 through 38 with support from below].

2.24.1.7 Hanger Rods

Provide carbon steel hanger rods conforming to ASTM A576. The diameter of the rods for piping system support must conform to [the contract drawings] [ASME B31.1].

2.24.2 Pipe Guides

2.24.2.1 Intermediate Guides

For piping [150 mm 6 inch] [______] mm inch and smaller, provide a pipe clamp with an oversize pipe sleeve for a minimum [4 mm 0.16 inch] [______] mm inch] clearance. For piping [200 mm 8 inch] [______] mm inch] and larger, use U-bolts with double nuts that are manufactured for the purpose to provide a minimum [7 mm 0.28 inch] [______] mm inch] clearance around pipe. The stock sizes for the U-bolts are as follows: for a [200 mm 8 inch ] [______] mm inch] pipe use a [16 mm 0.625 inch] [______] mm inch] U-bolt; for a [250 mm 10 inch] [______] mm inch] pipe, use a [19 mm 3/4 inch] [______] mm inch] U-bolt; for a [300 mm 12 inch] [______] mm inch] to [400 mm 16 inch] [______] mm inch] pipe, use a [24 mm 0.875 inch] [______] mm inch] U-bolt; and for [450 mm 18 inch] [______] mm inch] to [750 mm 30 inch ] [______] mm inch] pipes use [25 mm 1 inch] [______] mm inch] U-bolts.

2.24.2.2 Alignment Guides

For piping, [200 mm 8 inch] [______] mm inch] and smaller, ensure alignment guides are [galvanized steel] [______], [spider] [or] [sleeve] [______] type. For piping, [250 mm 10 inch] [______] mm inch] and larger, ensure alignment guides are [galvanized steel] [______], [roller] [______] type guides.

2.24.3 Flashing Sleeves

[Install[galvanized steel] [______] flashing sleeves wherever piping passes through concrete roof structures.] [Where piping penetrates roofs, provide [2 kg 4 lb.] [______] kg lb.] [lead] [______] flashing.] Extend flashing [200 mm 8 inches] [______] mm inches] from the pipe in all directions, extend up the pipe, and fit with double-threaded flashing for pipes [75 mm
3 inches] [[_____] mm inches] and smaller. Turn down flashing inside the pipe for [100 mm 4 inch] [[_____] mm inch] and larger pipes.

2.24.4 Wall Penetrations

2.24.4.1 Above Grade Wall Penetrations

Provide piping which passes through fire-rated or smoke-rated walls, floors, or ceilings with insulated and encased pipe sleeves. Seal penetrations through an existing fire or fire barrier wall with a fire stop system that has an "F" rating no less than the required fire resistance rating of the penetrated wall. The fire stopping sealant for metal piping systems must be [[a water based] [vibration resistant, polysiloxane (also known as silicone) based,] nonslumping, premixed sealant with intumescent properties] [____], that is rated for [3] [____] hours pursuant to ASTM E814 and UL requirements. The fire stopping sealant for plastic and insulated piping systems must be a [polysiloxane (also known as silicone) based, nonslumping, premixed sealant with intumescent properties] [acrylic based, nonslumping, premixed sealant with intumescent properties] [____], that is vibration and moisture resistant, and is rated for [3] [____] hours pursuant to ASTM E814 and UL requirements with metal collars. Fit vented plastic pipe penetrations with galvanized steel collars that have intumescent inlays.

2.24.4.2 Below Grade Wall Penetrations

**************************************************************************
NOTE: For critical systems, use the interlocking rubber link system. In other instances, a nonslumping water-resistant elastomeric based sealant with intumescent properties may be used.
**************************************************************************

Provide below-grade wall penetrations with [hydrostatic seals designed to seal opening between pipe or conduit and a through-structure opening. The seals must be modular mechanical type consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe and wall opening] [polysiloxane (also known as silicone) based, nonslumping, vibration and water resistant sealant with intumescent properties] [____].

2.24.4.3 Galvanizing

Galvanizing must be [hot-dip applied and meet the requirements of ASTM A153/A153M] [or] [zinc or cadmium plating]. Stainless steel components may be substituted where galvanizing is specified.

2.25 MISCELLANEOUS MATERIALS

**************************************************************************
NOTE: In cold climates, exposed pipe, valves, and equipment should be insulated and potentially heat traced to prevent freezing. Method of heat trace will be dictated by hazard classification and site conditions.
**************************************************************************
2.25.1 Pipe Insulation Material

Provide insulation for pipes, valves, instrumentation and controls, and other equipment [in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS] [consisting of 25 mm one inch ASTM C552 cellular glass and integral moisture barriers].

2.25.2 Heat Trace

**************************************************************************
NOTE: Delete subparagraphs a. b. and c. below if steam heat trace is used.
**************************************************************************

Heat trace must be [steam] [electrical] with materials selected for compatibility with transported liquids and ambient environment. The heat trace must be capable of maintaining the liquid process design temperature at [27] [_____] degrees C [80] [_____] degrees F maximum when subjected to an exterior temperature of [-29] [_____] degrees C [-20] [_____] degrees F. Provide steam piping in accordance with Section 23 58 00.00 10 CENTRAL STEAM HEATING AND UTILITIES SYSTEMS. Ensure electrical work is in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, and UL listed, and includes all terminations, junction boxes, and automatic controls. Perform work in conformance to hazard classifications indicated on the drawings[, and implement in accordance with NFPA 70, Section 427].

a. Provide UL listed parallel conduction type heat tape, with adjustable thermostat for outdoor aboveground winterized piping. Ensure tape is not affected by direct sunlight, ambient temperature, operating temperature, rain, or salt laden atmosphere. Provide flexible, parallel circuit construction consisting of a continuous self-limiting resistance, conductive inner core material between two parallel copper bus wires, designed for cut-to-length at the job site and for wrapping around valves and complex fittings. Self-regulation must prevent overheating and burnouts even where the cable overlaps itself.

b. Provide end seals for ends of circuits. Wire at the ends of circuits are not to be tied together.

c. Provide sufficient cable, as recommended by the manufacturer, to keep the pipe surface at [1.1] [_____] degrees C [34] [_____] degrees F minimum during winter outdoor design temperature as indicated, but not less than the following: 80 mm 3 inch pipe and smaller with 25 mm one inch thick insulation, 4 watts/0.3 m 4 watts/feet; and 100 mm 4 inch pipe and larger 38 mm 1.5 inch thick insulation, 8 watts/0.3 m 8 watts/feet of pipe.

PART 3 EXECUTION

3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.
3.2 PREPARATION

3.2.1 Protection

Close pipe and equipment openings with caps or plugs during installation. Protect equipment from dirt, water, and chemical or mechanical damage.

3.2.2 System Preparation

3.2.2.1 Pipe and Fittings

Inspect pipe and fittings before exposed piping is installed or buried piping is lowered into the trench. Clean the ends of pipes thoroughly, remove foreign matter and dirt from inside of pipes, and keep piping clean during and after laying.

3.2.2.2 Damaged Coatings

Repair damaged coating areas in the field with material equal to the original coating, except promptly remove damaged glass-lined pipe from the site. Do not install damaged piping materials. Field repair damaged and uncoated areas of galvanized piping conforming to ASTM A780/A780M.

3.2.2.3 Field Fabrication

Notify the Contracting Officer at least [2] [_____] weeks prior to the field fabrication of pipe or fittings and at least [3] [_____] days prior to the start of any surface preparation or coating application work. Perform field welding in accordance with Section 40 05 13.96 WELDING PROCESS PIPING. Provide welding electrodes in accordance with [Table 3.1 of AWS D1.1/D1.1M] [_____] as required for the applicable base metals and welding process. Fabricate fittings in accordance with the manufacturer's instructions.

3.3 EXPOSED PIPING INSTALLATION

Run exposed piping as straight as practical along the alignment shown on the contract drawings and with a minimum of joints. Install piping and appurtenances in conformance with reviewed shop drawings, manufacturer's instructions and ASME B31.3. Install piping without springing or forcing the pipe.

3.3.1 Anchors and Fasteners

Impact expansion (hammer and explosive charge drive-type) anchors and fastener systems are not acceptable. Lead shields, plastic or fiber inserts, and drilled-in plastic sleeve/nail drive systems are also not acceptable.

3.3.1.1 Drilled-In Expansion Anchors and Fasteners

**************************************************************************
NOTE: This subparagraph addresses anchors and fasteners that are used with concrete or masonry applications. The first option is used for masonry brick and precast concrete hollow-core block anchoring/fastening systems and the second is suitable for cast-in-place concrete and solid precast concrete structural elements.
[Design anchors to accept both machine bolts and/or threaded rods. Such anchors must consist of an expansion shield and expander nut contained inside the shield. Fabricate and design the expander nut to climb the bolt or rod thread and simultaneously expand the shield as soon as the threaded item, while being tightened, reaches, and bears against the shield bottom. Provide shield body consisting of four legs, taper the inside of each toward shield bottom (or nut end). Elongate the end of one leg and turn across shield bottom. Rib the outer surface of shield body for grip-action. The expander nut must be of square design with sides tapered inward from bottom to top. The anchor materials of construction must be [zinc plated steel] [TP304 stainless steel] [_____] of [300 MPa 43,541 psi] [[_____] MPa psi] minimum tensile strength. Provide fasteners consisting of machine bolts for use with above anchors; provide nuts and washers conforming to ASTM A194/A194M. Ensure the anchor length, diameter, and embedment depth meet the manufacturer's requirements for the maximum allowable working load of the application.] [Provide anchor/fastener assembly which is UL listed with a one-piece stud (bolt) that has integral expansion wedges, nuts and washers. [Construct stud of [TP304] [_____] stainless steel, and nut and washer of [ASTM A194/A194M alloy-steel] [TP316 stainless steel] [_____]. Use anchor length, diameter, and embedment depth meeting the manufacturer's requirements for the maximum allowable working load of the application.]]

3.3.1.2 Drilled-In Adhesive Anchors

[Do not use drilled-in adhesive anchors for overhead applications.] Compose anchors of an anchor rod assembly and an anchor rod adhesive cartridge. Provide anchor rod assembly composed of a chamfered and threaded stud rod of [zinc plated ASTM A36/A36M steel] [TP304 stainless steel] [_____] with a nut and washer of [ASTM A194/A194M alloy-steel] [TP316 stainless steel] [_____]. Use anchor length, diameter, and embedment depth meeting the manufacturer's requirements for the maximum allowable working load of the application. Ensure the adhesive cartridge is a sealed capsule containing premeasured amounts of resin, quartz sand aggregate, and a hardener contained in a separate vial within the capsule. Activate the capsule ingredients by the insertion procedure of the anchor rod assembly.

3.3.2 Piping Expansion and Contraction Provisions

Install piping to allow for thermal expansion and contraction resulting from the difference between installation and operating temperatures. Design for installation of plastic pipe exposed to ambient conditions or in which the temperature variation of the contents is substantial must have provisions for movement due to thermal expansion and contraction documented to be in accordance with PPI TR-21. Install anchors as shown in the contract drawings to withstand expansion thrust loads and to direct and control thermal expansion. Install an intermediate pipe guide for every pipe at each metal channel framing support not carrying an anchor or alignment guide. Where pipe expansion joints are required, install pipe alignment guides adjacent to the expansion device and within [four] [_____] pipe diameters. Install expansion devices in accordance with the manufacturer's instructions [and at the locations shown in the contract drawings].

3.3.3 Piping Flexibility Provisions

Provide thrust protection as required. Install flexible couplings and
expansion joints at connections to equipment, and where shown on the contract drawings. Provide additional pipe anchors and flexible couplings, beyond those shown on the contract drawings, to facilitate piping installation, in accordance with reviewed shop drawings.

3.3.4 Couplings, Adapters and Service Saddles

Thoroughly clean pipes of oil, scale, rust, and dirt in order to provide a clean seat for gaskets. Wipe gaskets clean prior to installation. Lubricate flexible couplings and flanged coupling adapter gaskets with [soapy water] [or] [the manufacturer's standard lubricant] before installation on the pipe ends. Install couplings, service saddles, and anchor studs in accordance with manufacturer's instructions. Tighten bolts progressively, drawing up bolts on opposite sides a little at a time until all bolts have a uniform tightness. Use torque-limiting wrenches to tighten bolts.

3.3.5 Piping Equipment/Component Installation

Install piping components and indicators in accordance with manufacturer's instructions. Provide required upstream and downstream clearances, isolation valves, and miscellaneous devices for an operable installation. [Make straight runs of piping upstream and downstream of flow measuring devices as shown in the contract drawings.] [Use upstream and downstream lengths of undisturbed piping in accordance with flow indicator manufacturer's recommendations.]

3.3.5.1 Backflow Preventers

**************************************************************************
NOTE: Discharge to an open drain with an air gap is required on potable water lines.
**************************************************************************

Install backflow preventers with nameplate and test cocks accessible from front of unit, and with a minimum clearance of [310 mm 12.2 inches] [_____] mm inches] between the port and grade. Install assemblies in accordance with local codes [and discharge to an open drain with an air gap]; vertical installation [must be avoided] [is prohibited].

3.3.5.2 Local Indicators

Install all direct-reading indicator devices, thermometers, and pressure gauges so that they can be easily read from floor level, and are readily accessible for maintenance and service. Coat all temperature sensing bulbs with a [silver base heat transfer grease] [_____] prior to insertion into the thermowell. Install pressure gauges and thermometers where indicated in the contract drawings. [Field calibrate all indicators at time of installation to ensure measuring and reading accuracy.] Install differential pressure gauges [across all process equipment] [across the process equipment indicated in the contract drawings], in accordance with the manufacturer's recommendations, and arranged for easy observation.

3.3.6 Pipe Flanges

**************************************************************************
NOTE: Specify the requirement for bolting to straddle the vertical centerline of the pipe for the installation of orientation sensitive devices such
as some types of flow meters.

Pipe flanges must be set level, plumb, and aligned. Install flanged fittings true and perpendicular to the axis of the pipe. Ensure bolt holes are concentric to the centerline of the pipe [and straddle the vertical centerline of the pipe].

3.3.7 Valve Locations

Locate valves in accordance with the contract drawings where actuators are shown. Where actuators are not shown, locate and orient valves to permit easy access to the valve operator, and to avoid interferences.

3.3.8 Pipe Tap Connections

Taps to pipe barrels are unacceptable. Make taps to ductile iron piping only with a service saddle or at a tapping boss of a fitting, valve body, or equipment casting. Make taps to steel piping only with a welded threadolet connection.

3.3.9 Plastic Pipe Installation

Submit a statement signed by the [reinforced thermosetting resin pipe] [and] [plastic pipe] manufacturer's representative certifying that the Contractor's personnel are capable of properly installing the piping system on the project. Cut, make up, and install all plastic pipe in accordance with the pipe manufacturer's recommendations.

a. Perform heat joining in accordance with ASTM D2657. Perform electrofusion joining in accordance with ASTM F1290. Do not thread Schedule 40 pipe. Use Schedule 80 threaded nipples where necessary to connect to threaded valves or fittings. Use strap wrenches for tightening threaded plastic joints, and do not over tighten these fittings.

b. Do not lay pipe when the temperature is below [4.5 degrees C 40.1 degrees F] [[_____] degrees C degrees F], nor above [32 degrees C 90 degrees F] [[_____] degrees C degrees F] when exposed to direct sunlight. Ensure any plastic pipe installed above grade and outdoors is ultraviolet (UV) protected or UV resistant.

c. Shield pipe ends that are to be joined from direct sunlight prior to and during the laying operation. Provide adequate ventilation when working with pipe joint solvent cement and handle solvent cements, primers and cleaners in accordance with ASTM F402.

d. Provide and install supports and hangers [in accordance with the manufacturer's recommendations] [as specified and indicated] [[_____]]. Where plastic pipe is subjected to severe temperature fluctuations, provisions for expansion and contraction must be provided. Accomplish this with the use of expansion joints and offset piping arrangements. Hydrostatically test all lines [at the maximum operating pressures] [at the pressures listed in the Pipe Schedule shown on the contract drawings].

Submit [6] [[_____] copies each of operation and maintenance manuals in indexed booklet form. Detail in the Operation Manuals the step-by-step procedures required for specialized startup, operation and shutdown of
piping systems, and include the manufacturer's name, model number, parts list and brief description of piping equipment such as valves and other appurtenances and their basic operating features. List in the Maintenance Manuals routine maintenance procedures and troubleshooting guides for the equipment, and include piping layout and valve locations.

3.3.9.1 PVC Piping

Construct solvent-cemented joints in accordance with ASTM D2855.

3.3.9.2 FRP Piping

Cut, fabricate, and install pipe, duct, and fittings in strict accordance with the pipe manufacturer's written recommendations and as shown on the contract drawings. Ensure all FRP pipe and fittings have interior surfaces which are highly polished, with no exposed fibers. Cure field joints as recommended by the manufacturer. [Where it is absolutely necessary to make a field weld on pipe specified to be field flanged only, make the weld only under direct supervision of the pipe manufacturer's field representative, who is experienced in FRP pipe lay-up techniques.]

3.3.10 Double Containment Piping Installation

Factory trained field representatives of the piping supplier must provide technical field support during critical periods of piping [and leak detection system installation including final check out of the leak detection/location system, and end user training].

3.3.11 Insulation

Install insulation on piping as indicated [on the Pipe Schedule] [in the contract drawings in accordance with the provisions of Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.]

3.4 BURIED PIPE PLACEMENT

[Install thermoplastic piping systems underground in accordance with ASTM D2774.] [Install thermosetting resin and reinforced plastic mortar piping systems underground in accordance with ASTM D3839.]

3.4.1 Excavation and Backfilling

Perform earthwork as specified in Section 31 00 00 EARTHWORK. Accomplish backfilling after inspection by the Contracting Officer. Exercise care when lowering pipe into the trench to prevent damage or twisting of the pipe.

3.4.2 Fittings

Make press connections in accordance with manufacturer's installation instructions using tools approved by the manufacturer. Insert tubing fully into the fitting and then mark at the shoulder of the fitting. Check fitting alignment against the mark on the tubing to ensure the tubing is fully inserted before the joint is pressed. At valves and connections, dig out the trench bottom with sufficient length, width, and depth to ensure clearance between the undisturbed trench bottom and the valves and such connections.
3.4.3 Thrust Restraint

Thrust restraint devices are generally not shown in the contract drawings; their absence will not relieve Contractor of the responsibility for providing them as required to provide complete systems for the use intended. Provide thrust blocks and ties where required, whether or not shown on the contract drawings. At a minimum, provide thrust restraint at pipeline tees, plugs, caps, bends, and other locations where unbalanced forces exist.

3.4.3.1 Thrust Blocks

Thrust blocking must be concrete of a mix not leaner than [1] [_____] cement, [2.5] [_____] sand and [5] [_____] gravel, and have a compressive strength of not less than [14 MPa 2000 psi] [[_____] MPa psi] after [28] [_____] days. Place blocking between solid ground and the fitting to be anchored. Unless otherwise indicated or directed, pour the base and thrust bearing sides of the thrust blocks against undisturbed earth. The sides of thrust blocks not subject to thrusts may be poured against forms. Provide area of bearing as shown or directed. Place blocking so that fitting joints are accessible for repair. Use steel rods and clamps, protected by galvanizing or a coating of bituminous paint, to anchor vertical down bends into gravity thrust blocks.

3.4.3.2 Restrained Joints

******************************************************************************
NOTE: When the restrained pipe length is specified, this paragraph will be modified in accordance with the design requirement. Use UFC 3-230-01 for guidance.
******************************************************************************

[The restrained pipe length is [_____] m feet]. [For ductile iron pipe, design restrained joints in accordance with DIPRA TRD.]

3.4.4 Marking Tape

Provide and install pipe marking tape in accordance with the requirements of Section 31 00 00 EARTHWORK.

3.4.5 Plastic Pipe Installation

******************************************************************************
NOTE: Thrust blocking should be used only where slip joints are used. Otherwise, piping will be designed to withstand compression or expansion forces imposed by trench conditions.
******************************************************************************

Cut, fabricate, and install plastic pipe in strict conformance with the pipe manufacturer's recommendations. Provide offset loops from the trench centerline as recommended by the manufacturer for the maximum temperature variation between the pipe temperature at the time of solvent welding and operating temperature. Design for installation of plastic pipe exposed to ambient conditions or in which the temperature variation of the contents is substantial must have provisions for movement due to thermal expansion and contraction documented to be in accordance with PPI TR-21. Support flexible plastic pipe connected to heavy fittings, manholes, and rigid
structures in such a manner that no subsequent relative movement between the plastic pipe at the flanged joint and the rigid structures is possible. [Do not use thrust blocking for flexible plastic piping. Design and install piping to withstand the compression and expansion forces imposed by the trench conditions.] [Construct concrete thrust blocks where shown in the contract drawings] [____].

3.5 CONNECTING DISSIMILAR PIPE

Install flexible transition couplings, dielectric fittings and isolation joints in accordance with the manufacturer's instructions.

3.6 EXTERNAL CORROSION PROTECTION

Protect all pipe and piping accessories from corrosion and adverse environmental conditions.

3.6.1 Underground Metallic Piping

Protect buried metallic piping from corrosion using [protective coatings] [and] [cathodic protection]. Provide cathodic protection for metallic underground piping systems as specified in [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM]. Where dissimilar metals are joined underground, use gas-tight isolation joints. [Provide insulating joint material where shown to control galvanic or electrical action.]

3.6.2 Above Grade Metallic Piping

Do not paint nonferrous and stainless steel piping except for aluminum alloy piping. Where dissimilar metals are joined, use isolation joints.

3.6.2.1 Ferrous Piping

Touch up shop primed surfaces with ferrous metal primer. Solvent clean surfaces that have not been shop primed. Clean surfaces that contain loose rust, mill scale or other foreign substances mechanically by [power wire brushing] [commercial sand blasting conforming to SSPC SP 6/NACE No.3] and prime with a [ferrous metal primer] [vinyl type wash coat] [____]. Finish primed surfaces with two coats of exterior [oil] [vinyl] [____] paint in accordance with Section 09 90 00 PAINTS AND COATINGS. Provide cathodic protection as shown in the contract drawings for above ground ferrous piping systems as specified in [Section 26 42 13 GALVANIC (SACRIFICIAL) ANODE CATHODIC PROTECTION (GACP) SYSTEM] [Section 26 42 17 IMPRESSED CURRENT CATHODIC PROTECTION (ICCP) SYSTEM].

3.6.2.2 Aluminum Alloy Piping

Paint surfaces of aluminum alloy pipe and fittings to protect against corrosion where they contact masonry, plaster, insulation, or are subject to repeated wettings by water, detergents or chemicals. Solvent clean surfaces must be solvent and treat with a [vinyl type wash coat] [____]. Apply a first coat of aluminum paint and a second coat of [alkyd gloss enamel] [silicone alkyd copolymer enamel] [____] in accordance with Section 09 90 00 PAINTS AND COATINGS.
3.7 DOUBLE CONTAINMENT PIPING LEAK DETECTION SYSTEM

a. Install the system in accordance with the manufacturer's recommended installation procedures. Follow all local, state and federal codes and requirements. Install system by properly trained personnel. Provide a location map with the system by the Contractor indicating the "as built" system configuration and sensing string layout. Provide markings along the cable length as references to locate leaks. Base markings upon calibration points. Take and record calibration points along the sensing string in accordance with the manufacturer’s recommended procedures. Provide cable not in containment piping with cable tags every [15 m 49.2 feet] [[_____] m feet].

b. Perform tests to demonstrate the ability of the system to detect and locate breaks, shorts and probes on the sensor string. Perform leak testing pursuant to the following procedure in order to verify operation and the ability to work with condensation pools or other static moisture. The double containment piping system leak detection field test procedures are as follows:

(1) Wet the sensor cable near the start of the sensor string and acknowledge the detection/location alarm and remap the system.

(2) Wet the sensor cable near the end of the sensor string with the first location still wetted and acknowledge the detection/location alarm and remap the system.

(3) Wet the sensor cable in three additional locations between the first and second leak locations with each detection/location alarm being acknowledged and with all prior leak locations still wetted.

(4) Prepare and submit a report verifying each leak location and detection accuracy. Furnish a hard copy report of the test results.

3.8 FLEXIBLE JOINTS AT CONCRETE STRUCTURES

Provide flexible joints at the face of all structures, whether or not shown on the contract drawings. Rubber ring joints, mechanical joints, flexible couplings, and proprietary restrained ductile iron pipe joints are considered flexible joints; welded pipe joints are not. Joints may be flush with the structure face or may be located up to [1] [[_____] pipe diameter away from face], but not further than [450 mm 17.7 inches] [[_____] mm inches] away from face. [For pipelines larger than [450 mm 18 inch] [[_____] mm inch] in diameter the first joint must be within [1] [[_____] pipe diameter].]

3.9 CLOSURES

Install closure pieces as necessary to end pipe runs and conforming to ASME B16.9 or ASME B16.11. Elastomer sleeves bonded to pipe ends are not acceptable. Provide pressure piping with closures of [butt-welded caps] [blind flanges] [threaded plugs] [plain end pieces, with thickness matching the nominal wall thickness of the associated pipe, mounted on double flexible couplings], unless otherwise shown on contract drawings or approved by the Contracting Officer. Ensure pipes with restrained joints have pipe closures installed with thrust tie-rod assemblies [as shown in contract drawings].
3.10  PENETRATIONS

Steel pipe sleeves must be hot-dipped galvanized after fabrication for above grade applications in nonsubmerged areas. For below grade, or in submerged and damp environments, line and coat steel pipe sleeves as specified in Section 09 90 00 PAINTS AND COATINGS. Isolate embedded metallic piping from concrete reinforcement using coated pipe penetrations. Coatings must be as specified in Section 09 90 00 PAINTS AND COATINGS. Support wall pipes securely by form work to prevent contact with reinforcing steel and tie-wires. Ensure joints are [caulked with rubber sealant] [or] [sealed with a wall penetration seal]. For existing concrete walls, rotary drilled holes may be provided in lieu of sleeves.

3.11  VALVE INSTALLATION

Install flanged valve bolt holes so as to straddle the vertical centerline of pipe. Clean flanged faces prior to inserting the gasket and bolts, and then tighten the nuts progressively and uniformly. Clean threads of threaded ends by wire brushing or swabbing prior to installation.

3.11.1  Valve Orientation

Install operating stem of a manual valve in a vertical position when the valve is installed in horizontal runs of pipe having centerline elevations \[1.37 \text{ m} \text{ 4.5 feet}\] \[\ldots\] or less above finished floor, unless otherwise shown on contract drawings. Install operating stem of a manual valve in a horizontal position in horizontal runs of pipe having centerline elevations between \[1.37 \text{ m} \text{ 4.5 feet}\] \[\ldots\] and \[2.05 \text{ m} \text{ 6.75 feet}\] \[\ldots\] above finish floor, unless otherwise shown on contract drawings. Install automatic valves in accordance with [the manufacturer's instructions] [and] [approved drawings].

3.11.1.1  Butterfly Valves

Orientation of butterfly valves must take into account changes in pipe direction. Orient valve shafts so that unbalanced flows caused by pipe direction changes or other disturbances are equally divided to each half of the disc.

3.11.1.2  Plug Valves

If a plug valve seat position is not shown in the contract drawings, locate the seat position as follows: for horizontal flow, the flow must produce an "unseating" pressure, and the plug must open into the top half of valve; and for vertical flow, install the seat in the highest portion of the valve.

3.11.2  Line Size Ball Valves

Install a line size ball valve and union upstream of each solenoid valve, in-line flow switch, or other in-line electrical device, excluding [magnetic flowmeters] \[\ldots\], for isolation during maintenance.

3.11.3  Isolation Valve

Install safety isolation valves on compressed air supplies. Locate valve to provide accessibility for control and maintenance. If necessary, install access doors in finished walls and plaster ceilings for valve access.
3.11.4 Operator Extension Stems

Where the depth of the valve is such that its centerline is more than \([925 \text{ mm } 3 \text{ feet}] \) below grade, furnish an operator extension stem with a \([50 \text{ mm } 2 \text{ inch}] \) operating nut to bring the operating nut to a point \([150 \text{ mm } 5.9 \text{ inches}] \) below the surface of the ground and/or box cover. Locate operating nut in a floor box.

3.11.5 Torque Tube

Where the operator for quarter-turn valve is located on a floor stand, furnish an extension stem torque tube, properly sized for the maximum torque capacity of the valve.

3.11.6 Chain Wheel and Guide

Install chain wheel and guide assemblies or chain lever assemblies on manually operated valves located over \([2.05 \text{ m } 6.73 \text{ feet}] \) above finished floor elevation. Where chains hang in normally traveled areas, use appropriate "$L" type$ tie-back anchors.

3.12 AIR RELEASE, DRAINS AND SAMPLE PORTS

Provide sample ports where indicated on the contract drawings. Install specified vents at piping high points for entrapped air release and install drains in the low points of pipelines regardless of whether shown on contract drawings.

3.13 PIPING SUPPORT SYSTEMS INSTALLATION

The absence of pipe supports and details on the contract drawings does not relieve the Contractor of responsibility for sizing and providing supports throughout plant.

3.13.1 General Support Requirements

Provide pipe support systems meeting the requirements of MSS SP-58. Install Contractor-designed and selected support systems in accordance with MSS SP-58, and as specified herein. Support piping connections to equipment by pipe supports and not off the equipment. Support large or heavy valves, fittings, and/or equipment independently of associated piping. Do not support pipes off other pipes. Provide supports at piping changes in direction or in elevation, adjacent to flexible joints and couplings, and where otherwise shown on the contract drawings. Do not install pipe supports and hangers in equipment access areas or bridge crane runs. Brace hanging pipes against horizontal movement by both longitudinal and lateral sway bracing. At each channel type support, provide every pipe with an intermediate pipe guide, except where pipe anchors are required. Existing support systems may be used to support additional new piping only if the Contractor can demonstrate that the existing support systems are adequate for the additional loads, or if the existing systems are strengthened to support the additional loads. Provide pedestal type pipe supports under base flanges adjacent to rotating equipment and where required to isolate vibration. Brace piping \([65 \text{ mm } 2.5 \text{ inch}] \) in diameter and larger for seismic forces. Install lateral supports for seismic loads at all changes in direction.
3.13.2 Support of Insulated Piping

Install oversized supports to fit the insulation inserts. Provide supports with galvanized or stainless steel protection shields and oversized rollers.

3.13.3 Dielectric Barriers

Install dielectric barriers between supports and copper or stainless steel piping, and between stainless steel supports and non-stainless steel ferrous piping.

3.13.4 Support Spacing

**************************************************************************
NOTE: Calculate spans and rod sizes pursuant to MSS SP-58. Coordinate with manufacturers data and/or other standards for guidance in determining maximum support spans. Duplicate the following subparagraphs as required.
**************************************************************************

3.13.4.1 Acceptable Limits for Metallic Piping

[Stainless steel] [_____] [Schedule [10S] [____]] with a wall thickness of [_____] mm inch, diameter [_____] mm inch, must have a maximum span of [_____] mm inch and a minimum rod size for single rod hangers of [_____] mm inch.

3.13.4.2 Acceptable Limits for Thermoplastic Piping

[PVC] [_____], [Schedule [40] [____]] [SDR [21] [____]], diameter [_____] mm inch, must have a maximum span of [_____] mm inch and a minimum rod size for single rod hangers of [_____] mm inch.

3.13.4.3 Acceptable Limits for Rubber/Elastomer Piping

[Chloroprene] [_____], internal diameter [_____] mm inch, must have a maximum span of [_____] mm inch and a minimum rod size for single rod hangers of [_____] mm inch.

3.13.5 Support Methods

Provide piping support as specified and as shown in the contract drawings. Support single horizontal suspended piping by [adjustable swivel-ring,] [split-ring,] [or] [clevis] [_____] hangers. Support multiple horizontal suspended piping by [trapeze hangers with channel type supports] [_____] . Provide horizontal pedestal mounted piping with [saddle] [_____] type supports. Provide horizontal wall mounted piping with [wall brackets] [_____] . Support vertical piping by [wall brackets,] [base elbows,] [or] [riser clamps on floor penetrations] [_____] .

3.13.6 Supports and Hangers for Stainless Steel Piping

Provide all hanger-pipe contact surfaces with a dielectric barrier consisting of [chloroprene rubber] [_____] wrapping [or plastic coated hangers]. The load rating of universal concrete inserts is not allowed to be less than that of the hanger rods they support.
3.14 PIPE IDENTIFICATION, PAINTING AND COLOR CODING

NOTE: Color coding for piping identification as required by the using agency will be developed and inserted in the Color Code Schedule (Table I) in Section 09 90 00 PAINTS AND COATINGS. For Air Force installations, piping will be color coded in accordance with Attachment 4 of Air Force Regulation 88-15.

Ensure color, coating, and lettering requirements for exposed piping are in accordance with Section 09 90 00 PAINTS AND COATINGS. [Except where piping is required to be completely painted in its code color, piping or its insulation covering may be banded either with plastic adhesive tapes or painted stripes around pipe designating piping contents [in accordance with following options and requirements].] [Provide a single individual band, of plastic adhesive tape or paint, designating pipe contents with sufficient length to permit the stenciling of pipe contents in letters.] [Provide identification at branch connections, inlets and outlets of equipment, every [6 m 19.7 feet] [_____] m feet of straight run, upstream of valves, and within [1 m 3.3 feet] [_____] m feet of entrance to or exit from wall curtains, or other similar type barrier.]

3.15 FIELD QUALITY CONTROL

NOTE: The general pipe testing requirements are basically taken from ASME B31.3 for Chemical and Petroleum Refinery Piping. Test pressure for hydrostatic pressure and leakage tests will be the working pressure multiplied by 1.33. For a working pressure of 1.03 MPa 150 psig, the test pressure will be 1.38 MPa 200 psig. For other working pressures the test pressure will be adjusted accordingly.

Pneumatic testing should be avoided if possible. Specify pneumatic testing on systems where residual moisture in the lines could be a problem (such as with anhydrous liquid chlorine and hydraulic fluid), and where the use of another nontoxic liquid is not feasible. ASME B31.3 methods should be used.

3.15.1 Hydrostatic Tests

Where any section of a pipeline is provided with concrete thrust blocking for fitting, do not make the hydrostatic tests until at least [5] [_____] days after the installation of the concrete thrust blocking, unless otherwise approved by the Contracting Officer.

3.15.1.1 Buried Piping

After the pipe is laid, the joints completed and the trench partially backfilled leaving the joints exposed for examination, subject the newly laid piping or any valved section of piping, unless otherwise specified, for [1] [_____] hour to a hydrostatic test pressure [of [_____] MPa psig]
[as listed in the Pipe Schedule in the contract drawings]. Open and close each valve several times during the test. Carefully examine exposed pipe, joints, fittings, and valves during the partially open trench test. Replace joints showing visible leakage as necessary. Remove defective pipe, joints, fittings, and valves found during the pressure test and replace with new material, and repeat the test until the test results are satisfactory. The requirement for the joints to remain exposed for the hydrostatic tests may be waived by the Contracting Officer when one or more of the following conditions are encountered: (1) wet or unstable soil conditions in the trench; (2) compliance would require maintaining barricades and walkways around and across an open trench in a heavily used area that would require continuous surveillance to assure safe conditions; or (3) maintaining the trench in an open condition would delay completion of the Contract. The Contractor may request a waiver, setting forth in writing the reasons for the request and stating the alternative procedure proposed to comply with the hydrostatic tests. Place backfill placed prior to the tests in accordance with the requirements of Section 31 00 00 EARTHWORK.

3.15.1.2 Exposed Piping

Conduct hydrostatic testing in accordance with ASME B31.3. Test piping systems under normal service conditions (as indicated in the Pipe Schedule in the contract drawings) to demonstrate compliance. Test pressure less than [1.5] [_____] times the design pressure is prohibited. Use [water] [_____] as the hydrostatic test fluid. Provide clean test water of such quality to prevent corrosion of the piping system materials. Open air release vents at all high points of the piping system in order to purge air pockets while the piping system is filling.

3.15.1.2.1 Rigid Piping

For rigid piping hydrostatic testing, calculate the maximum test pressure according to ASME B31.3, but do not exceed the yield strength of the piping system. The maximum velocity during filling is [[0.075 m/s 0.25 fps] [_____] m/s fps] applied over full area of pipe [in accordance with the manufacturer's instructions]. [Venting during filling may also be provided by loosening flanges with a minimum of four bolts or by the use of equipment vents.] Test all parts of the piping system. Maintain hydrostatic test pressure continuously for [30] [_____] minutes minimum and for such additional time as necessary to conduct examinations for leakage. Examine all joints and connections for leakage. Ensure piping system, exclusive of possible localized instances at pump or valve packing, shows no visual evidence of leaking. Correct visible leakage and retest. Unless otherwise directed by the Contracting Officer, leave the piping system full of water after leaks are repaired.

3.15.1.2.2 [Non-Rigid, Non-Metallic Piping] [and] [Metallic Piping with a Non-Metallic Liner]

For [non-rigid, non-metallic piping] [and] [metallic piping with a non-metallic liner] hydrostatic testing, calculate the maximum test pressure according to ASME B31.3, but do not exceed [1.5] [_____] times the maximum pressure rating of the lowest rated component in the piping system. The maximum velocity during filling is [[0.075 m/s 0.25 fps] [_____] m/s fps] applied over full area of pipe [in accordance with the manufacturer's instructions]. Pressurize the system initially to [50] [_____] percent of the normal service conditions and inspect. Repair any leaks. Then pressurize the system to the test pressure. Add small
amounts of [water] [_____] as required on a hourly basis for a maximum of [3] [_____] hours in order to maintain the test pressure. After [4] [_____] hours, lower the test pressure by [70 kPa 10.2 psi] [_____] kPa psi. If the hydrostatic pressure remains steady for [1] [_____] hour, then no leakage is indicated. Inspect for leaks, repair and retest if necessary. Allow piping system to relax for [8] [_____] hours before retesting.

3.15.1.3 Double Containment Primary Piping

Test the primary piping of a double containment piping system in accordance with Subparagraph [Buried Piping] [Exposed Piping] of this paragraph. Pneumatically pressure test secondary containment piping of a double containment piping system in accordance with Subparagraph Double Containment Secondary Piping. Pressure test at the maximum test pressure of [5 psi] [_____] or manufacturer's recommended maximum, [_____] times the maximum pressure rating of the lowest rated component in the piping system. The maximum velocity during filling is [[0.075 m/s 0.25 fps] [_____] m/s fps] applied over full area of pipe [in accordance with the manufacturer's instructions]. Pressurize the system initially to [50] [_____] percent of the normal service conditions and inspect. Repair any leaks. Then pressurize the system to the test pressure. Add small amounts of [water] [_____] as required on a hourly basis for a maximum of [3] [_____] hours in order to maintain the test pressure. After [4] [_____] hours, lower the test pressure by [70 kPa 10.2 psi] [_____] kPa psi. If the hydrostatic pressure remains steady for [1] [_____] hour, then no leakage is indicated. Inspect for leaks, repair and retest if necessary. Allow piping system to relax for [8] [_____] hours before retesting.

3.15.1.4 Time for Making Test

Except for joint material setting or where concrete thrust blocks necessitate a delay, underground piping jointed with rubber gaskets, mechanical or push-on joints, or couplings may be subjected to hydrostatic pressure, inspected, and tested for leakage at any time after partial completion of backfill. Conduct tests for above ground pressure piping after the piping has been completely installed, including all supports, hangers, and anchors, and inspected for proper installation but prior to installation of insulation.

3.15.2 Pneumatic Tests

******************************************************************************
NOTE: Do not use pneumatic tests for primary piping of double containment piping systems.
******************************************************************************

Prepare for and conduct pneumatic testing in accordance with the requirements of ASME B31.3. Care must be taken to minimize the chance of a brittle fracture or failure during a pneumatic leak test. Use only non-toxic, nonflammable, inert gases or air.

3.15.2.1 Pressure Relief Device

During pneumatic testing, provide a pressure relief device for each piping section being tested. The device must have a set pressure no higher than the test pressure plus the lesser of [10] [_____] percent of the test pressure or [350 kPa 50.8 psi] [_____] kPa psi.
3.15.2.2 Pneumatic Testing Procedures

The test fluid must be [air] and the test pressure must be [110 percent] percent of the design pressure. Increase test pressure incrementally until the gage pressure reaches the lesser of [50 percent] percent of the test pressure or [170 kPa 25 psig] kPa psig. Examine piping joints for leakage. If no leakage is occurring, continue to increase the pressure incrementally, while maintaining each incremental increase long enough to equalize pipe strains, until the test pressure is reached. Then reduce the test pressure to the design pressure and maintain for [10 minutes] minutes without additional energy expenditure. If the pneumatic pressure remains steady, then no leakage is indicated. Insp ect for and repair leaks, and retest if necessary.

3.15.2.3 Double Containment Secondary Piping

Hydrostatically test the primary piping of a double containment piping system in accordance with Subparagraph [Buried Piping] [Exposed Piping]. Pneumatically pressure test secondary containment piping of a double containment piping system at the maximum test pressure of [5 psi] or manufacturer's recommended maximum. The test fluid must be [air]. [Testing procedures must be in accordance with manufacturer's recommendations.] Increase the test pressure incrementally until the gage pressure reaches [50 percent] percent of the test pressure. Examine piping joints for leakage. If no leakage is occurring, continue to increase the pressure incrementally, while maintaining each incremental increase long enough to equalize pipe strains, until the test pressure is reached. Then reduce the test pressure to the design pressure and maintain for [10 minutes] minutes without additional energy expenditure. If the pneumatic pressure remains steady, then no leakage is indicated. Insp ect for and repair leaks, and retest if necessary.

3.15.3 Pipe Leakage Tests

Unless approved by the Contracting Officer, conduct leakage testing after the pressure tests have been satisfactorily completed. The duration of each leakage test is at least [2] hours, and during the test, subject the piping to no less than [1.38 MPa 200 psig] MPa psig pressure. Leakage is defined as the quantity of the test liquid, [water], that is supplied to the piping system, or any valved or approved section thereof, in order to maintain pressure within [34.5 kPa 5 psi] kPa psi of the specified leakage test pressure after the piping has been filled with the test liquid and all air is expelled. No piping installation will be accepted if leakage exceeds [the values listed in the Pipe Schedule in the contract drawings] [or, if applicable,] [the allowable leakage determined by the following formula:

\[ L = \text{Cf} \times N \times D \times 0.5 \]

<table>
<thead>
<tr>
<th>Cf</th>
<th>conversion factor</th>
<th>10.786 0.0001351</th>
</tr>
</thead>
<tbody>
<tr>
<td>L</td>
<td>allowable leakage</td>

<td></td>
</tr>
<tr>
<td>D</td>
<td>nominal pipe diameter</td>
<td>mm inches</td>
</tr>
</tbody>
</table>
\[ L = C_f \times N \times D \times P^{0.5} \]

<table>
<thead>
<tr>
<th>( P )</th>
<th>average test pressure during the test</th>
<th>MPa psig</th>
</tr>
</thead>
</table>

Should any test disclose leakage greater than that allowed, locate the leaks and repair until the leakage is within the specified allowance, without additional cost.

3.15.4 Testing New to Existing Connections

Test new piping connected to existing pipe, existing equipment, existing treatment systems, or tanks and treatment systems furnished under other Sections. Isolate the new piping with pipe caps, spectacle blinds, or blind flanges. Test the joint between new piping and existing piping by methods that do not place the entire existing system under the test load. Proceed, then, with the testing of new piping systems as specified herein.

3.15.5 Valve Testing

Submit copies of all field test reports within \([24]\) hours of the completion of the test. Valves may either be tested while testing pipelines, or as a separate step. Demonstrate that valves open and close smoothly with operating pressure on one side and atmospheric pressure on the other, and in both directions for two-way valve applications. Count and record the number of turns required to open and close each valve, and account for any discrepancies with manufacturer's data. Examine air and vacuum relief valves as the associated pipe is being filled to verify venting and seating is fully functional. Set, verify, and record set pressures for all relief and regulating valves. Test self-contained automatic valves at both maximum and minimum operating ranges, and reset upon completion of test to the design value. [Test automatic valves that are not self-contained in conjunction with control system testing.]

3.16 FINAL CLEANING

3.16.1 Interim Cleaning

Prevent the accumulation of weld rod, weld spatter, pipe cuttings and filings, gravel, cleaning rags, and other foreign material within piping sections during fabrication. Examine the piping to assure removal of these and other foreign objects prior to assembly and installation.

3.16.2 Flushing

Following assembly and testing, and prior to final acceptance, flush piping systems with \([\text{water}]\) to remove accumulated construction debris and other foreign matter. Flush piping until all foreign matter is removed from the pipeline. Provide all hoses, temporary pipes, ditches, and other items as required to properly dispose of flushing water without damage to adjacent properties. The minimum flushing velocity is \([0.76 \text{ m/s } 2.5 \text{ fps}]\) \([\text{_____] m/s fps}]\). For large diameter pipe where it is impractical to flush the pipe at the minimum flushing velocity, clean the pipeline in-place from the inside by brushing and sweeping, then flushing the pipeline at a lower velocity. Install cone strainers in the flushing connections of attached equipment and leave in place until cleaning is completed. Remove accumulated debris through drains, or by removing spools or valves.
3.16.3 Disinfection

**************************************************************************
NOTE: Selectively require the Contractor to perform disinfection work for liquid process piping. This should be limited only to processes where bacteriological interferences could damage process equipment.
**************************************************************************

Disinfect the [pipelines so noted in the Pipe Schedule in the contract drawings] [following pipelines: [_____]] [______]. Before acceptance of piping system operation, disinfect each section of completed pipeline [in accordance with AWWA C651] [as specified herein]. After pressure tests have been made, thoroughly flush the piping section to be disinfected with water until all entrained dirt and mud have been removed before introducing the chlorinating material. The chlorinating material must be [liquid chlorine] [calcium hypochlorite] [or] [sodium hypochlorite] [______]. Ensure the chlorinating material provides a dosage of no less than [50] [_____] ppm and introduce into the piping in an approved manner. [Chlorinate PVC pipe lines using only the above specified chlorinating material in solution.] Do not introduce the agent into the line in a dry solid state. Retain the treated water in the pipe long enough to destroy all non-spore-forming bacteria. Except where a shorter period is approved, the retention time is at least 24 hours and produce no less than 25 ppm of free chlorine residual throughout the line at the end of the retention period. Open and close all valves on the lines being disinfected several times during the contact period. Then flush the line with clean water until the residual chlorine is reduced to less than 1.0 ppm. During the flushing period, open and close each outlet on the line several times. From several points in the pipeline section, [the Contracting Officer will take samples of water in sterilized containers for bacterial examination] [Contractor personnel, approved by the Contracting Officer, must take samples in sterilized containers and have a bacterial examination performed by a commercial laboratory in accordance with state approved methods. The commercial laboratory must be certified by the state's approving authority for examination of potable water.] Repeat the disinfection until the piping system passes the bacterial examination for [2] [_____] consecutive days. The piping system will not be accepted until satisfactory bacteriological results have been obtained.

3.17 WASTE WATER DISPOSAL

Submit the method proposed for disposal of waste water from hydrostatic tests and disinfection, and all required permits, prior to performing hydrostatic tests. Dispose of water used for testing, cleaning, flushing and/or disinfection in accordance with all applicable regulations. Disposal is solely the responsibility of the Contractor. Provide the method proposed for disposal of waste water to the Contracting Officer for approval prior to performing any testing, cleaning, flushing and disinfection activities.

3.18 TABLES

**************************************************************************
NOTE: The intention of the Table is to give the designer a structure to specify the most suitable piping system materials for a project. The designer
will edit or delete this table to fit the project. Verify that each pipeline designation is identified for the Contractor and the Contracting Officer on the drawings. Consult EM 1110-1-4008 Liquid Process Piping to determine acceptable materials for each application. Allow the Contractor selection of the most economical of the acceptable systems. Table may be shown on the drawings and deleted from this section of the specifications.

As indicated in paragraph 2.16, Double Containment pipe is supplied in different materials of construction. Selection of which depends upon the fluids being handled and other conditions of installation; i.e., underground, above ground, and temperature.

**3.19 MANUFACTURER'S FIELD SERVICES**

Submit a signed statement certifying that the installation is satisfactory and in accordance with the contract drawings and specifications and the manufacturer's prescribed procedures and techniques, upon completion of the project and before final acceptance. Obtain manufacturer's technical assistance for Contractor training, installation inspection, start up, and owner operating and maintenance training. Follow manufacturer's instructions for installation.

NOTE: This guide specification covers the requirements for welding of piping and piping system components used for fluids and gases under pressure, including hydraulic systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

Definitions are in accordance with AWS A3.0M/A3.0. Symbols are in accordance with AWS A2.4.

1.3 PERFORMANCE REQUIREMENTS

**************************************************************************

NOTE: If quality control is to be the responsibility of the Government, delete this paragraph.

The paragraphs will be edited and bracketed portions inserted if necessary to ensure proper implementation of the CONTRACTOR QUALITY CONTROL PROGRAM. The specification writer or design engineer must indicate how much quality control of welding is needed for each project and who is to be responsible; i.e., primarily the Contractor or the Government.

In many cases a project may not require 100 percent testing of welds by NDE methods. The designer must determine the required methods and the extent of inspection and testing, and must indicate the extent in this or other sections of the project specifications or on the project drawings by notes, NDE symbols, or other means. The referenced applicable publications will be used for guidance in determining inspection and testing requirements.

The specifications or drawings must clearly indicate which joints require 100 percent NDE inspection, which joints require random NDE inspection, and which NDE methods are to be employed for each joint. For random inspection, the drawings must indicate the location, number of joints, and minimum
increment length of weld that will be NDE inspection without predisclosing the exact spots to be examined. Joints not indicated to be tested by NDE methods must be subject to visual inspection only. In cases where the nature of the welding is such as to require visual inspection only, the requirements for NDE should be deleted from these paragraphs and from paragraph Inspection and NDE Personnel.

Quality of all joint preparation, welding, and examination is the Contractor's responsibility for. Clearly identify and record all materials used in the welding operations. The inspection and testing defined in this specification are minimum requirements. Additional inspection and testing is the responsibility of the Contractor when it is deemed necessary to achieve the quality required.

1.4 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a
Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Pressure Piping; G[, [_____]]

SD-03 Product Data
Welding Operations

SD-07 Certificates
Qualifications

1.5 QUALIFICATIONS

Welding procedures, welders, and welding operators previously qualified by test may be accepted for the work without requalification, provided that all of the following conditions are fulfilled:

a. Copies of the welding procedures, the procedure qualification test records, and the welder and welding operator performance qualification test records are submitted and approved in accordance with paragraph SUBMITTALS.

b. Testing was performed by an approved testing laboratory or technical consultant or by the Contractor's approved quality assurance organization.

c. The welding procedures, welders, and welding operators were qualified in accordance with ASME BPVC SEC IX, or AWS B2.1/B2.1M, AR-2 level; and base materials, filler materials, electrodes, equipment, and processes conformed to the applicable requirements of this specification.

d. The requirements of paragraph "Renewal of Qualification" below are met and records showing name of employer and period of employment using the process for which qualified are submitted as evidence of conformance.

1.5.1 Welding Procedures Qualification

Record in detail and qualify the Welding Procedure Specifications for every proposed welding procedure. Qualification for each welding procedure must conform to the requirements of [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8,] and to this specification. Specify end preparation for butt welds including cleaning, alignment, and root openings. Provide preheat, interpass temperature control, and postheat treatment of welds as required by approved welding procedures, unless otherwise indicated or specified. Describe the type of backing rings or consumable inserts, if used, and if they are to be removed, describe the removal process. Submit copies of the welding procedure specifications and procedure qualification test results for each type of welding required in accordance with paragraph SUBMITTALS. Approval of any procedure does not relieve the Contractor of the sole responsibility for producing acceptable welds. Identify welding procedures individually and reference on the detail drawings or key to the contract drawings.
1.5.2 Welder and Welding Operator Performance

Provide qualified welder and welding operator assigned to work in accordance with [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8].

1.5.2.1 Certification

Before assigning welders or welding operators to the work, provide the Contracting Officer with their names together with certification that each individual is performance-qualified as specified. State the type of welding and positions for which each is qualified, the code and procedure under which each is qualified, date qualified, and the firm and individual certifying the qualification tests.

1.5.2.2 Identification

Identify each particular weld with the personal number, letter, or symbol assigned to each welder or welding operator. To identify welds, submit written records indicating the location of welds made by each welder or welding operator, and each welder or welding operator must apply the personal mark adjacent to the welds using a rubber stamp or felt-tipped marker with permanent, weatherproof ink or other methods approved by the Contracting Officer that do not deform the metal. For seam welds, place identification marks adjacent to the welds at 1 m 3 foot intervals. Identification by die stamps or electric etchers will not be allowed.

1.5.2.3 Renewal of Qualification

Requalification of a welder or welding operator is required under any of the following conditions:

a. When a welder or welding operator has not used the specific welding process for a period of 3 months; the period may be extended to 6 months if the welder or welding operator has been employed on some other welding process.

b. When a welder or welding operator has not welded with any process during a period of 3 months, all the personal qualifications are considered expired, including any extended by virtue of a., above.

c. There is specific reason to question the person's ability to make welds that will meet the requirements of the specifications.

d. The welder or welding operator was qualified by an employer, other than those firms performing work under this contract, and a qualification test has not been taken within the preceding 12 months.

e. Renewal of qualification for a specific welding process under conditions a., b., and d., above, needs to be made on only a single test joint or pipe of any thickness, position, or material to reestablish the welder's or welding operator's qualification for any thickness, position, or material covered under previous qualification.

1.5.3 Inspection and NDE Personnel

**************************************************************************
NOTE: If quality control is to be the responsibility of the Government, delete these
All inspection and NDE personnel must be qualified in accordance with the following requirements.

1.5.3.1 Inspector Certification

Welding inspectors must be qualified in accordance with AWS QC1.

1.5.3.2 NDE Personnel

Furnish certified NDE personnel, and establish a written procedure for the control and administration of NDE personnel training, examination, and certification. Base the procedures on appropriate specific and general guidelines of training and experience recommended by ASNT SNT-TC-1A, [ASNT SNT-TC-1A Q&A Bk A] [ASNT SNT-TC-1A Q&A Bk B] [ASNT SNT-TC-1A Q&A Bk C] [and] [ASNT SNT-TC-1A Q&A Bk D].

1.6 REGULATORY REQUIREMENTS

NOTE: The drawings should be checked to ensure that any supplementary information required has been shown and that there is no conflict between the drawings and the specifications.

Project drawings must indicate, or text of project specifications must specify, the welding procedures, and size, length, type, and location of the welds, as necessary.

This section covers the welding of pressure piping systems. Submit detail drawings showing location, length, and type of welds; and indicating postweld heat treatment and NDE as required. Deviations from applicable codes, approved procedures, and approved detail drawings will not be permitted without prior written approval. Materials or components with welds made offsite will not be accepted if the welding does not conform to the requirements of this specification, unless otherwise specified. Develop procedures for welding all metals included in the work. Do not start welding until welding procedures, welders, and welding operators have been qualified. Perform qualification testing by an approved testing laboratory, or by the Contractor if approved by the Contracting Officer. Notify the Contracting Officer at least 24 hours in advance of the time and place of the tests. When practicable, perform the qualification tests at or near the worksite. Maintain current records of the test results obtained in the welding procedure, welding operator, welder performance qualifications, and nondestructive examination (NDE) procedures readily available at the site for examination by the Contracting Officer. Qualify the procedures for making transition welds between different materials or between plates or pipes of different wall thicknesses. [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8] requirements for branch connections may be used in lieu of detailed designs. Unless otherwise specified, the choice of welding process is the responsibility of the Contractor. Safety precautions must conform to AWS Z49.1.
1.7 DELIVERY, STORAGE, AND HANDLING

Deliver all filler metals, electrodes, fluxes, and other welding materials to the site in manufacturers' original packages and stored in a dry space until used. Properly label and design packages to give maximum protection from moisture and to insure safe handling.

1.7.1 Material Control

**************************************************************************
NOTE: If additional requirements are necessary regarding limits on out-of-oven exposure time, refer to AWS D1.1/D1.1M.
**************************************************************************

Store materials in a controlled access and clean, dry area that is weathertight and maintained at a temperature recommended by the manufacturer. The materials must not be in contact with the floor and store on wooden pallets or cribbing.

1.7.1.1 Damaged Containers

Store low-hydrogen steel electrodes in their sealed shipping container. If the seal is damaged during shipment or storage, and the damage is not immediately detected, rebake the covered electrodes in that container in accordance with the manufacturer's instructions prior to issuance or discard. If a container is damaged in storage and the damage is witnessed, immediately place the electrodes from that container in a storage oven. Provide storage oven temperature as recommended by the manufacturer or the welding material specification.

1.7.1.2 Partial Issues

When a container of covered electrodes is opened and only a portion of the content is issued, place the remaining portion, within 1/2 hour, in a storage oven.

1.7.2 Damaged Materials

Discard damaged materials. Discard covered electrodes which are oil or water-soaked, dirty, or on which the flux has separated from the wire.

PART 2 PRODUCTS

2.1 MATERIALS

**************************************************************************
NOTE: Normally, selection of the electrodes is done by the Contractor. In special cases, if the selection of the proper electrode is critical to the design, the designer may specify the electrodes to be used. In special cases it also may be necessary to specify the welding process.
**************************************************************************

Provide welding materials which comply with ASME BPVC SEC II-C. Provide welding equipment, electrodes, welding wire, and fluxes capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.
PART 3   EXECUTION

3.1   WELDING OPERATIONS

Perform welding in accordance with qualified procedures using qualified welders and welding operators. Submit detailed procedures which define methods of compliance to contract drawings and specifications. Inspection and material procurement records. System and material testing and certification records. Written records and drawings indicating location of welds made by each welder or welding operator.

Do not perform welding when the quality of the completed weld could be impaired by the prevailing working or weather conditions. The Contracting Officer will determine when weather or working conditions are unsuitable for welding. Welding of hangers, supports, and plates to structural members must conform to Section 05 05 23.16 STRUCTURAL WELDING.

3.1.1   Base Metal Preparation

Do not use oxy-fuel cutting on austenitic stainless steel or nonferrous materials.

3.1.2   Weld Joint Fit-Up

Fit, align, and retain parts that are to be joined by welding in position during the welding operation by the use of bars, jacks, clamps, or other mechanical fixtures. Do not use welded temporary attachments except when it is impractical to use mechanical fixtures. When temporary attachments are used, they must be the same material as the base metal. Completely remove by grinding or thermal cutting after the welding operation is completed. If thermal cutting is used, cut the attachment no less than 6 mm 1/4 inch from the member and remove the balance by grinding. After the temporary attachment has been removed, visually examine the area.

3.1.3   Preheat and Interpass Temperatures

Provide preheat temperatures meeting the requirements specified by [ASME B31.1], [ASME B31.3], [ASME B31.4], [ASME B31.5], [ASME B31.8]. However, preheat below 10 degrees C 50 degrees F for ferritic steel or austenitic stainless steel, or 0 degrees C 32 degrees F for nonferrous alloys is not acceptable. Do not exceed maximum interpass temperatures of 149 degrees C 300 degrees F for austenitic stainless steels, nickel alloys, and copper alloys; and 260 degrees C 500 degrees F for carbon steels. Use preheat techniques to ensure that the full thickness of the weld joint preparation and/or adjacent base material, at least 75 mm 3 inches in all directions, is at the specified temperature. Preheating by induction or resistance methods is preferred. When flame heating is used, employ only a neutral flame. Do not use oxy-fuel heating on austenitic stainless steel or nickel-alloy materials; however, air-fuel heating is acceptable if controlled to insure that the surface temperature does not exceed 66 degrees C 150 degrees F. Check interpass temperatures on the surface of the component within 25 mm 1 inch of the weld groove and at the starting location of the next weld pass, and for a distance of about 150 mm 6 inches ahead of the weld, but not on the area to be welded.

3.1.4   Production Welding Instructions

a. Do not perform welding when the ambient temperature is lower than minus
b. Welding is not permitted on surfaces that are wet or covered with ice, when snow or rain is falling on the surfaces to be welded, or during periods of high winds, unless the welders and the work are properly protected.

c. Provide welding grade gases for purging and shielding with a dew point of minus 40 degrees C minus 40 degrees F or lower.

d. Back purges are required for austenitic stainless steels and nonferrous alloys welded from one side and set up such that the flow of gas from the inlet to the outlet orifice passes across the area to be welded. The oxygen content of the gas exiting from the purge vent must be less than 2 percent prior to welding.

e. Maintain the purge on groove welds for at least three layers or 5 mm 3/16 inch.

f. Furnish removable purge dam materials made of expandable or flexible plugs, such as plexiglass, plywood (which must be dry when used), etc. Provide wood dams of kiln-dried quality. Provide nonremovable purge dams and purge dam adhesives made of water soluble materials. Purge dams made of polyvinyl alcohol are not permitted.

g. Do not perform any welding process which requires the use of external gas shielding in a draft or wind unless the weld area is protected by a shelter. This shelter must be of material and shape appropriate to reduce wind velocity in the vicinity of the weld to a maximum of 8 km/hour 5 mph (440 fpm).

h. Welding of low-alloy and hardenable high-alloy steels may be interrupted provided a minimum of at least 10 mm 3/8 inch thickness of weld deposit or 25 percent of the weld groove is filled, whichever is greater, and the preheat temperature is maintained during the time that welding is interrupted. If the temperature falls below the minimum preheat temperature before all welding has been completed on a joint, or, where required, before post weld heat treatment, perform a liquid penetrant or magnetic particle examination to insure sound deposited metal before reheating. Welding of other materials may be interrupted without restriction provided a visual inspection is performed before welding is resumed.

i. Taper the ends of tack welds to be incorporated in the final welds by grinding or welding technique. Remove tack welds that are cracked or defective and retack the groove prior to welding. Remove temporary tack welds, ground the surface smooth, and visually inspect. For low-alloy and hardenable high-alloy steels, the area must be magnetic particle examination inspected.

j. When joining ferritic steel pressure piping components to austenitic stainless steel pressure piping components and postweld heat treatment is required, the following requirements apply:

(1) Butter the weld-end preps of ferritic steel components, which are to be welded to austenitic stainless steel, with one of the following weld filler metals conforming to the specified requirements: ASME BPVC SEC II-C, SFA 5.14, Classification ERNiCr-3; or ASME BPVC SEC II-C, SFA 5.11, Classification
ENiCrFe-2.

(2) Butter the ferritic steel weld-end prep, apply a postweld heat treatment as required by [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8] and then machine with the applicable weld-end preparation. After machining, the buttered layer must be a minimum of 6 mm 1/4 inch thick.

(3) Complete pressure piping transition joints using ERNiCr-3 or ENiCrFe-2 weld filler metals. Do not perform further postweld heat treatment.

k. When joining ferritic steel pressure piping components to austenitic stainless steel pressure piping components and postweld heat treatment is not required, prepare and weld the joint using either ERNiCr-3 or ENiCrFe-2 filler metals. For service temperatures of 93 degrees C 200 degrees F or less, stainless filler metal 309 ASME BPVC SEC II-C, SFA 5.4 or 5.9 is permissible in lieu of the nickel-based alloys.

l. Grinding of completed welds is to be performed only to the extent required for NDE, including any inservice examination, and to provide weld reinforcement within the requirements of [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8]. If the surface of the weld requires grinding, avoid reducing the weld or base material below the minimum required thickness. Provide minimum weld external reinforcement flush between external surfaces.

3.1.5 Postweld Heat Treatment

a. Perform postweld heat treatment in accordance with [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8]. Measure temperatures for local postweld heat treatment continuously by thermocouples in contact with the weldment.

b. Perform postweld heat treatment of low-alloy steels, when required, immediately upon completion of welding and prior to the temperature of the weld falling below the preheat temperature. However, postweld heat treatment may be postponed after the completion of the weld, if, immediately after the weld is completed, it is maintained at a minimum temperature of 149 degrees C 300 degrees F or the preheat temperature, whichever is greater, for 2 hours per 25 mm inch of weld thickness.

c. For low-alloy steels, use cooling rates that avoid temper embrittlement.

3.2 EXAMINATIONS, INSPECTIONS, AND TESTS

**************************************************************************
NOTE: Coordinate with paragraph Performance.

Information based on the table must be developed and included in each project specification. The table must clearly define the systems to be inspected and the type of NDE required. The information presented in TABLE I is based on ASME B31.1. Specific project requirements may necessitate revision or expansion. In no case must the degree of testing and type of NDE be less than that required by the standard applicable to the work.
Visual and NDE must be performed [by the Government] [by the Contractor] to
detect surface and internal discontinuities in completed welds. [Employ
the services of a qualified commercial inspection or testing laboratory or
technical consultant approved by the Contracting Officer.] Visually
inspect all tack welds, weld passes, and completed welds. In addition,
perform [magnetic particle] [liquid penetrant] examination on root passes.
[Radiographic] [Liquid penetrant] [Magnetic particle] [or] [Ultrasonic]
examination is required as indicated in TABLE I. When inspection and
testing indicates defects in a weld joint, repair the weld by a qualified
welder in accordance with paragraph CORRECTIONS AND REPAIRS.

**TABLE I. MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS**

<table>
<thead>
<tr>

</tbody>
</table>

**NOTES TO TABLE I**

(1) All welds must be given a visual examination in addition to type of
specific nondestructive examination specified.

(2) NPS - nominal pipe size.

(3) RT - Radiographic examination; MT - magnetic particle examination;
PT - liquid penetrant examination.
TABLE I. MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS

<table>
<thead>
<tr>
<th>Type Weld</th>
<th>Piping Service Conditions and Nondestructive Test</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Table continues with mandatory requirements.</td>
</tr>
</tbody>
</table>

- (4) RT of branch welds must be performed before any nonintegral reinforcing material is applied.
- (5) The thickness of butt welds is defined as the thicker of the two abutting ends after end preparation.
- (6) Temperatures and pressures shown are design.
- (7) In lieu of radiography of welded branch connections when required above, liquid penetrant or magnetic particle examination is acceptable and, when used, must be performed at the lesser of one half of the weld thickness or each 13 mm 1/2 inch of weld thickness and all accessible final weld surfaces.
- (8) For nondestructive examination of the pressure retaining component, refer to the standards listed in applicable code or the manufacturing specifications.
- (9) Fillet welds not exceeding 6 mm 1/4 inch throat thickness which are used for the permanent attachment of nonpressure retaining parts are exempt from the PT or MT requirements of the above table.

3.2.1 Random NDE Testing

**************************************************************************
NOTE: Coordinate with paragraph Performance.
**************************************************************************

This paragraph will be deleted when the Contractor is not required to perform random inspection. Edit to delete any listed NDE method which is inapplicable. Insert a number from 1 to 99 for percent of welds to be random inspected; 10 percent is recommended for most projects.

**************************************************************************

When random [radiographic] [liquid penetrant] [magnetic particle] [or] [ultrasonic] examination is required, test a minimum of [_____] percent of the total length or number of piping welds. Randomly select welds for inspection, but include an examination of welds made by each welding operator or welder in the selection. If the random testing reveals that any welds fail to meet minimum quality requirements, inspect an additional [_____] percent of the welds in that same group. If all of the additional welds inspected meet the quality requirements, accept the entire group of welds represented and repair the defective welds. If any of the additional welds inspected also fail to meet the quality requirements, reject that entire group of welds. Remove and reweld the rejected welds, or 100 percent inspect the rejected welds and remove and reweld all defective weld areas.

3.2.2 Visual Inspection

Visually inspect weld joints as follows:

3.2.2.1 Before Welding

For compliance with requirements for joint preparation, placement of backing rings or consumable inserts, alignment and fit-up, and cleanliness.
3.2.2.2 During Welding

For cracks and conformance to the qualified welding procedure.

3.2.2.3 After Welding

For cracks, contour and finish, bead reinforcement, undercutting, overlap, and size of fillet welds.

3.2.3 NDE Testing

**************************************************************************
NOTE: Delete any NDE method not required. If
magnetic particle inspection is required, specify
whether wet or dry particle method is appropriate.
**************************************************************************

Perform NDE in accordance with written procedures. Procedures for [radiographic] [liquid penetrant] [magnetic particle] [or] [ultrasonic] tests and methods must conform to ASME BPVC SEC V. Demonstrate the approved procedure to the satisfaction of the Contracting Officer. In addition to the information required in ASME BPVC SEC V, include the timing of the NDE in relation to the welding operations and safety precautions.

3.2.4 Inspection and Tests by the Government

The Government will perform inspection and supplemental nondestructive or destructive tests as deemed necessary. The cost of supplemental NDE will be borne by the Government. Correct and repair defects and reexamine weld repairs at no additional cost to the Government. Inspection and tests will be performed as required for visual inspection and NDE, except that destructive tests may be required also. When destructive tests are ordered by the Contracting Officer and performed by the Contractor, and the specimens or other supplemental examinations indicate that the materials and workmanship do not conform to the contract requirements, the cost of the tests, corrections, and repairs are borne by the Contractor. When the specimens or other supplemental examinations of destructive tests indicate that materials or workmanship do conform to the specification requirements, the cost of the tests and repairs will be borne by the Government. When destructive tests are made, repairs must be made by qualified welders or welding operators using welding procedures which will develop the full strength of the members cut. Welding is subject to inspection and tests in the mill, shop, and field. When materials or workmanship do not conform to the specification requirements, the work may be rejected at any time before final acceptance of the system containing the weldment.

3.3 ACCEPTANCE STANDARDS

**************************************************************************
NOTE: These acceptance standards were taken from
ASME B31.1 and are suitable for most jobs.
Evaluations of indications, as given in ASME B31.1, are applicable to these standards. Specific project design requirements may necessitate revision or expansion to cover different items of work and varying standards of acceptance. In no case must the acceptance criteria be less conservative than the criteria specified by the standard applicable to
the work. The 5 mm 3/16 inch dimension specified in sub item c is based on TABLE 127.4.2 of ASME B31.1 for temperatures less than 177 degrees C 350 degrees F and thicknesses less than 25 mm 1 inch. If actual conditions exceed these limits, this requirement must be expanded or revised as required.

3.3.1 Visual

The following indications are unacceptable:

a. Cracks.

b. Undercut on surface which is greater than 1 mm 1/32 inch deep.

c. Weld reinforcement greater than 5 mm 3/16 inch.

d. Lack of fusion on surface.

e. Incomplete penetration (applies only when inside surface is readily accessible).

f. Convexity of fillet weld surface greater than 10 percent of longest leg plus 0.76 mm 0.03 inch.

g. Concavity in groove welds.

h. Concavity in fillet welds greater than 2 mm 1/16 inch.

i. Fillet weld size less than indicated or greater than 1.25 times the minimum indicated fillet leg length.

3.3.2 Magnetic Particle Examination

The following relevant indications are unacceptable:

a. Any cracks and linear indications.

b. Rounded indications with dimensions greater than 5 mm 3/16 inch.

c. Four or more rounded indications in a line separated by 2 mm 1/16 inch or less edge-to-edge.

d. Ten or more rounded indications in any 3870 square mm 6 square inches of surface with the major dimension of this area not to exceed 150 mm 6 inches with the area taken in the most unfavorable location relative to the indications being evaluated.

3.3.3 Liquid Penetrant Examination

Indications with major dimensions greater than 2 mm 1/16 of an inch are considered relevant. The following relevant indications are unacceptable:

a. Any cracks or linear indications.

b. Rounded indications with dimensions greater than 5 mm 3/16 inch.

c. Four or more rounded indications in a line separated by 2 mm 1/16 inch
or less edge-to-edge.

d. Ten or more rounded indications in any 3870 square mm 6 square inches of surface with the major dimension of this area not to exceed 150 mm 6 inches with the area taken in the most unfavorable location relative to the indications being evaluated.

3.3.4 Radiography

Welds that are shown by radiography to have any of the following discontinuities are unacceptable:

a. Porosity in excess of that shown as acceptable in ASME BPVC SEC I, Appendix A-250.

b. Any type of crack or zone of incomplete fusion or penetration.

c. Any other elongated indication which has a length greater than:

   (1) 6 mm 1/4 inch for "t" up to 19 mm 3/4 inch inclusive. Where "t", here and below, pertains to the thickness of the weld being examined; if a weld joins two members having different thickness at the weld, "t" is the thinner of these two thicknesses.

   (2) 1/3 "t" for "t" from 19 mm 3/4 inch to 57 mm 2-1/4 inch, inclusive.

   (3) 19 mm 3/4 inch for "t" over 57 mm 2-1/4 inch.

d. Any group of indications in line that have an aggregate length greater than "t" in a length of "12t", except where the distance between the successive indications exceeds 6L where L is the longest indication in the group.

3.3.5 Ultrasonic Examination

Where discontinuities are interpreted to be cracks, lack of fusion, and incomplete penetration, they are unacceptable regardless of length. Linear-type discontinuities are unacceptable if the amplitude exceeds the reference level and discontinuities have lengths which exceed the following:

a. 6 mm 1/4 inch for "t" up to 19 mm 3/4 inch. Where "t", here and below, is the thickness of the weld being examined; if the weld joins two members having different thicknesses at the weld, "t" is the thinner of these two thicknesses.

b. 8 mm 1/3 inch for "t" from 19 to 57 mm 3/4 to 2-1/4 inch.

c. 19 mm 3/4 inch for "t" over 57 mm 2-1/4 inch.

3.4 Corrections and Repairs

Remove and repair defects as specified in [ASME B31.1,] [ASME B31.3,] [ASME B31.4,] [ASME B31.5,] [ASME B31.8] unless otherwise specified. Repair disqualifying defects discovered between weld passes before additional weld material is deposited. Wherever a defect is removed, and repair by welding is not required, blend the affected area into the surrounding surface eliminating sharp notches, crevices, or corners. After defect removal is complete and before rewelding, examine the area by the same test method.
which first revealed the defect to ensure that the defect has been eliminated. After rewelding, reexamine the repaired area by the same test method originally used for that area. Regard any indication of a defect as a defect unless reevaluation by NDE or by surface conditioning shows that no disqualifying defects are present. The use of any foreign material to mask, fill in, seal, or disguise welding defects will not be permitted.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for welding of piping and piping system components which will contain fluids under pressure including hydraulic systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: Piping materials, components, and supports are specified in other sections of the project specifications.

NOTE: The following information shall be shown on the project drawings:

1. Tensile strength, elongation, shear strength, size, length, type, and location of the welds, as necessary.

2. The project drawings should be checked to ensure that any supplementary information required by the
paragraphs has been shown and that there is no conflict between the drawings and the specifications. See also Note in paragraph entitled "Definitions." The project drawings must indicate, or text of the project specifications must specify, the tensile strength, elongation, shear strength, size, length, type, and location of the welds, as necessary.

**************************************************************************

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies to this section with the additions and modifications specified herein.
1.3 DEFINITIONS

**************************************************************************
NOTE: Insert the applicable ANSI piping codes. ANSI B31.2, "Fuel Gas Piping," and ASME B31.8, "Gas Transmission and Distribution Piping Systems," not listed under paragraph entitled "References," may be used.
**************************************************************************
AWS A3.0M/A3.0 [and applicable ANSI piping documents].

1.4 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.
**************************************************************************
Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:
SD-02 Shop Drawings

Welding pressure piping

SD-07 Certificates

Welding procedures qualification
Nondestructive examination (NDE) procedures
NDE personnel certification procedures
Inspector certification

Submit inspector certification and NDE personnel certification for record.

SD-11 Closeout Submittals

Weld identifications

1.5 QUALITY ASSURANCE

1.5.1 Welding Pressure Piping

Show location, length, and type of welds, and indicate postweld heat treatment and nondestructive testing as required.

1.5.2 Procedures

**************************************************************************

NOTE: Insert the applicable ANSI piping codes.
**************************************************************************

Develop and qualify procedures for welding metals included in the work. Do not start welding until welding procedures, welders, and welding operators have been qualified. Perform qualification testing by an approved testing laboratory, or by the Contractor if approved by the Contracting Officer in accordance with the qualified procedures. Notify the Contracting Officer at least 24 hours in advance of the time and place of the tests. When practicable, perform the qualification tests at or near the work site. Maintain current records of the test results obtained in welding procedure, welding operator/welder performance qualifications, and nondestructive examination (NDE) procedures. These records shall be readily available at the site for examination by the Contracting Officer. Qualify the procedures for making transition welds between different materials or between plates or pipes of different wall thicknesses. [ANSI Piping] [_____] requirements for branch connections may be used in lieu of detailed designs. Unless otherwise specified, the choice of welding process shall be the responsibility of the Contractor.

1.5.2.1 Previous Qualifications

Welding procedures, welders, and welding operators previously qualified by test may be accepted for the work without requalification provided that the

SECTION 40 17 26.00 20  Page 7
following conditions are fulfilled:

a. Copies of welding procedures, procedure qualification test records, and welder and welding operator performance qualification test records are submitted and approved in accordance with the paragraph entitled "Submittals."

b. Testing was performed by an approved testing laboratory or technical consultant or by the Contractor's approved quality control organization.

c. The welding procedures, welders, and welding operators were qualified in accordance with ASME BPVC SEC IX or AWS B2.1/B2.1M, AR-2 level; and base materials, filler materials, electrodes, equipment, and processes conformed to the applicable requirements of this specification.

d. The requirements of paragraph entitled "Welder and Welding Operator Performance Qualification" for renewal of qualification were met, and records showing name of employer and period of employment using the process for which qualified are submitted as evidence of conformance.

1.5.2.2 Performance

**************************************************************************
NOTE: The paragraphs will be edited and inserted if necessary to ensure proper implementation of the "CONTRACTOR QUALITY CONTROL PROGRAM." The specification writer or design engineer must indicate how much quality control of welding is needed for each project and who is to be responsible, i.e., primarily the Contractor or the Government. If quality control is to be the responsibility of the Government, delete paragraphs entitled "Performance" and "Qualification of Inspection and Nondestructive Examination (NDE) Personnel" through "NDE Personnel Qualification" and renumber paragraphs as necessary. Rarely will a project require 100 percent testing of welds by NDE methods. The designer must determine the required methods and the extent of inspection and testing and must indicate the extent in this or other sections of the project specifications or on the project drawings by notes, nondestructive test symbols, or other means. The specifications or project drawings must clearly indicate which joints require 100 percent NDE inspection, which joints require random NDE inspection, and which NDE methods are to be employed for each joint. For random inspection, the project drawings must indicate the location, number of joints, and minimum increment length of weld that will be subject to NDE inspection without predisclosing the exact spots to be examined. Joints not indicated to be tested by NDE methods shall be subject to visual inspection only. In cases where the nature of the welding is such as to require visual inspection only, the requirements for nondestructive examinations should be deleted from these paragraphs and from paragraph entitled "Qualification of Inspection and Nondestructive Examination (NDE) Personnel."
The Contractor shall be responsible for the quality of joint preparation, welding, and examination. Clearly identify and record materials used in the welding operations. The examination and testing defined in this specification are minimum requirements. Provide additional examination and testing as necessary to achieve the quality required.

1.5.3 Welding Procedures Qualification

---

**NOTE:** The project drawings must indicate, or text of the project specifications must specify, the tensile strength, elongation, shear strength, size, length, type, and location of the welds, as necessary.

---

**NOTE:** Insert the applicable ANSI piping codes. ANSI B31.2, "Fuel Gas Piping," and ASME B31.8, "Gas Transmission and Distribution Piping Systems," not listed under paragraph entitled "References," may be used.

---

Qualification of the welding procedures for each group of materials to be welded is required as indicated in ASME BPVC SEC IX. Record in detail and qualify the "Welding Procedure Specifications" for every welding procedure proposed. Qualification for each welding procedure shall conform to the requirements of ANSI Standards and to this specification. The welding procedures shall specify end preparation for welds, including cleaning, alignments, and root openings. Preheat, interpass temperature control, and postheat treatment of welds shall be as required by ANSI Piping documents, unless otherwise indicated or specified. Describe the type of backing rings or consumable inserts, if used, and, if they are to be removed, the removal process. Welding procedure qualifications shall be identified individually and referenced on the shop drawings or suitably keyed to the contract drawings.

1.5.4 Welder and Welding Operator Performance Qualification

---

**NOTE:** Insert the applicable ANSI piping codes. ANSI B31.2, "Fuel Gas Piping," and ASME B31.8, "Gas Transmission and Distribution Piping Systems," not listed under paragraph entitled "References," may be used.

---

Qualify each welder and welding operator assigned to work covered by this specification by performance tests using equipment, positions, procedures, base metals, and electrodes or bare filler wires from the same specification, classification, or group number that will be encountered on his assignment. Welders or welding operators who make acceptable procedure qualification tests will be considered performance-qualified for the welding procedure used. Determine performance qualification in accordance with [ASME BPVC SEC IX, [ANSI Piping Standards]] [_____] and as specified.
1.5.5 Renewal of Qualification

Requalification of a welder or welding operator shall be required under one or any combination of the following conditions:

a. When a welder or welding operator has not used the specific welding process for a period of 3 months. The period may be extended to 6 months if the welder has been employed on another welding process.

b. There is specific reason to question the welder's ability to make welds that will meet the requirements of the specifications.

c. The welder or welding operator was qualified by an employer other than those firms performing work under this contract and a qualification test has not been taken within the preceding 12 months. Renewal of qualification under this condition need be made on only a single test joint or pipe of any thickness, position, or material to reestablish qualification for any thickness, position, or material for which the welder or welding operator had qualified previously.

1.5.6 Qualification of Inspection and (NDE) Personnel

Qualification of Inspection and Nondestructive Examination (NDE) Personnel:

Qualify inspection and nondestructive examination personnel in accordance with the following requirements:

1.5.6.1 Inspector Certification

Qualify welding inspectors in accordance with AWS QC1.

1.5.6.2 NDE Personnel Certification Procedures

**************************************************************************

NOTE: The paragraphs will be edited and inserted if necessary to ensure proper implementation of the "CONTRACTOR QUALITY CONTROL PROGRAM." The specification writer or design engineer must indicate how much quality control of welding is needed for each project and who is to be responsible, i.e., primarily the Contractor or the Government. If quality control is to be the responsibility of the Government, delete paragraphs entitled "Performance" and "Qualification of Inspection and Nondestructive Examination (NDE) Personnel" through "NDE Personnel Qualification" and renumber paragraphs as necessary. Rarely will a project require 100 percent testing of welds by NDE methods. The designer must determine the required methods and the extent of inspection and testing and must indicate the extent in this or other sections of the project specifications or on the project drawings by notes, nondestructive test symbols, or other means. The referenced applicable publications and Army Technical Manual, "Welding Design, Procedures and Inspection," TM-5-805-7, will be used for guidance in determining inspection and testing requirements. The specifications or project drawings must clearly indicate which joints require 100 percent NDE inspection, which joints require
random NDE inspection, and which NDE methods are to be employed for each joint. For random inspection, the project drawings must indicate the location, number of joints, and minimum increment length of weld that will be subject to NDE inspection without predisclosing the exact spots to be examined. Joints not indicated to be tested by NDE methods shall be subject to visual inspection only. In cases where the nature of the welding is such as to require visual inspection only, the requirements for nondestructive examinations should be deleted from these paragraphs and from paragraph entitled "Qualification of Inspection and Nondestructive Examination (NDE) Personnel."

**************************************************************************

Certify NDE personnel and establish a written procedure for the control and administration of NDE personnel training, examination, and certification. Base procedures on appropriate specific and general guidelines of training and experience recommended by ASNT SNT-TC-1A, [Supplement A-Radiographic] [Supplement B-Magnetic particle] [Supplement C-Ultrasonic] [and] [Supplement D-Liquid Penetrant].

1.5.6.3 Welding Procedures and Qualifications

a. Specifications and Test Results: Submit copies of the welding procedure specifications and procedure qualification test results for each type of welding required. Approval of any procedure does not relieve the Contractor of the responsibility for producing acceptable welds. Submit this information on the forms printed in ASME BPVC SEC IX or their equivalent.

b. Certification: Before assigning welders or welding operators to the work, submit their names, together with certification that each individual is performance qualified as specified. Do not start welding work prior to procedure qualification. The certification shall state the type of welding and positions for which each is qualified, the code and procedure under which each is qualified, date qualified, and the firm and individual certifying the qualification tests.

1.5.7 Symbols

Conform to AWS A2.4.

1.5.7.1 Weld Identifications

Submit a list of the welders' names and symbol for each welder. To identify welds, submit written records indicating the location of welds made by each welder or welding operator.

1.5.8 Safety

1.6 ENVIRONMENTAL

Do not perform welding when the quality of the completed weld could be impaired by the prevailing working or weather conditions. The Contracting
Officer will determine when weather or working conditions are unsuitable for welding.

1.7  DELIVERY AND STORAGE

Deliver filler metals, electrodes, fluxes and other welding materials to the site in manufacturers' original packages and store in a dry space until used. Label and design packages properly to give maximum protection from moisture and to assure safe handling.

PART 2  PRODUCTS

2.1  WELDING MATERIALS

********************************************************************************
NOTE: Normally, selection of the electrodes is done by the Contractor as part of his qualified welding procedure. In special cases, if the selection of the proper electrode is critical to the design, the designer may specify the electrodes to be used. In special cases it also may be necessary to specify the welding process.
********************************************************************************

Comply with ASME BPVC SEC II-C. Welding equipment, electrodes, welding wire, and fluxes shall be capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

PART 3  EXECUTION

3.1  WELDING

Do not deviate from applicable codes, approved procedures and approved shop drawings without prior written approval from the Contracting Officer. Materials or components with welds made off the site will not be accepted if the welding does not conform to the requirements of this specification unless otherwise specified. Assign each welder or welding operator an identifying number, letter, or symbol that shall be used to identify his welds. Each welder or welding operator shall apply his mark adjacent to his weld using an approved rubber stamp or felt-tipped marker with permanent, weatherproof ink or other approved methods that do not deform the metal. For seam welds, place identification marks adjacent to the welds at one meter 3 foot intervals. Confine identification by die stamps or electric etchers to the weld reinforcing crown, preferably in the finished crater.

3.2  WELDING OPERATORS

Perform welding in accordance with qualified procedures using qualified welders and welding operators.

3.3  SUPPORTS

Welding of hangers, supports, and plates to structural members shall conform to AWS D1.1/D1.1M.
NOTE: The paragraphs will be edited and inserted if necessary to ensure proper implementation of the "CONTRACTOR QUALITY CONTROL PROGRAM." The specification writer or design engineer must indicate how much quality control of welding is needed for each project and who is to be responsible, i.e., primarily the Contractor or the Government. If quality control is to be the responsibility of the Government, delete paragraphs entitled "Performance" and "Qualification of Inspection and Nondestructive Examination (NDE) Personnel" through "NDE Personnel Qualification" and renumber paragraphs as necessary. Rarely will a project require 100 percent testing of welds by NDE methods. The designer must determine the required methods and the extent of inspection and testing and must indicate the extent in this or other sections of the project specifications or on the project drawings by notes, nondestructive test symbols, or other means. The referenced applicable publications and Army Technical Manual, "Welding Design, Procedures and Inspection," TM-5-805-7, will be used for guidance in determining inspection and testing requirements. The specifications or project drawings must clearly indicate which joints require 100 percent NDE inspection, which joints require random NDE inspection, and which NDE methods are to be employed for each joint. For random inspection, the project drawings must indicate the location, number of joints, and minimum increment length of weld that will be subject to NDE inspection without predisclosing the exact spots to be examined. Joints not indicated to be tested by NDE methods shall be subject to visual inspection only. In cases where the nature of the welding is such as to require visual inspection only, the requirements for nondestructive examinations should be deleted from these paragraphs and from paragraph entitled "Qualification of Inspection and Nondestructive Examination (NDE) Personnel."

NOTE: Information based on the two tables must be developed and included in each project specification. Tables must clearly define the systems to be inspected and the type of NDE required. Specify 100 percent NDE when required by UFC 3-460-01, "Design: Petroleum Fuel Facilities" and 49 CFR 195, as covered by paragraph entitled "Piping Subject to 100 percent NDE."

Visual and nondestructive examinations shall be performed [by the Government] [by the Contractor] to detect surface and internal discontinuities in completed welds. [Employ the services of a qualified
commercial inspection or testing laboratory or technical consultant
approved by the Contracting Officer.] Visually examine welds
[Radiographic,] [Liquid penetrant,] [Magnetic particle,] [or] [Ultrasonic]
examination shall be required as indicated in Tables [IV] [and] [V]
attached to this section [or in accordance with other sections where
detailed requirements are specified]. Random NDE testing applies to
ASME B31.3 and ASME B31.4 piping unless specified otherwise. When
examination and testing indicates defects in a weld joint, a qualified
welder shall repair the weld in accordance with the paragraph entitled
"Corrections and Repairs" of this section.

3.4.1 Random NDE Testing

**************************************************************************
NOTE: The paragraphs will be edited and inserted if
necessary to ensure proper implementation of the
"CONTRACTOR QUALITY CONTROL PROGRAM." The
specification writer or design engineer must
indicate how much quality control of welding is
needed for each project and who is to be
responsible, i.e., primarily the Contractor or the
Government. If quality control is to be the
responsibility of the Government, delete paragraphs
entitled "Performance" and "Qualification of
Inspection and Nondestructive Examination (NDE)
Personnel" through "NDE Personnel Qualification" and
renumber paragraphs as necessary. Rarely will a
project require 100 percent testing of welds by NDE
methods. The designer must determine the required
methods and the extent of inspection and testing and
must indicate the extent in this or other sections
of the project specifications or on the project
drawings by notes, nondestructive test symbols, or
other means. The referenced applicable publications
and Army Technical Manual, "Welding Design,
Procedures and Inspection," TM-5-805-7, will be used
for guidance in determining inspection and testing
requirements. The specifications or project
drawings must clearly indicate which joints require
100 percent NDE inspection, which joints require
random NDE inspection, and which NDE methods are to
be employed for each joint. For random inspection,
the project drawings must indicate the location,
number of joints, and minimum increment length of
weld that will be subject to NDE inspection without
predisclosing the exact spots to be examined. Joints
not indicated to be tested by NDE methods shall be
subject to visual inspection only. In cases where
the nature of the welding is such as to require
visual inspection only, the requirements for
nondestructive examinations should be deleted from
these paragraphs and from paragraph entitled
"Qualification of Inspection and Nondestructive
Examination (NDE) Personnel."
**************************************************************************

**************************************************************************
NOTE: This paragraph will be deleted when the
Contractor is not required to perform random
3.4.1 Visual Examination

Visually examine welds as follows:

a. Before welding -- for compliance with requirements for joint preparation, placement of backing rings or consumable inserts, alignment and fit-up, and cleanliness.

b. During welding -- for conformance to the qualified welding procedure.

c. After welding -- for cracks, contour and finish, bead reinforcement, undercutting, overlap, and size of fillet welds.

3.4.2 Nondestructive Examination

NOTE: Delete any nondestructive test method not required. If magnetic particle inspection is required, specify whether wet or dry particle method is appropriate.

NDE shall be in accordance with written procedures. Procedures for radiographic, liquid penetrant, magnetic particle, or ultrasonic tests and methods shall conform to ASME BPVC SEC V. The approved procedure shall be demonstrated to the satisfaction of the Contracting Officer's QA personnel. In addition to the information required in ASME BPVC SEC V, the written procedures shall include:

a. Timing of the nondestructive examination in relation to the welding operations.

b. Safety precautions.

3.4.4 Examinations and Tests by the Government

Examinations and tests will conform to paragraphs "Visual Examination" and "Nondestructive Examination" of this section, except that destructive tests may be required also. When destructive tests are made, qualified welders
or welding operators shall make repairs using welding procedures which will develop the full strength of the members cut. Welding shall be subject to examination and tests in the mill, shop, and field.

3.4.5 Piping Subject to 100 Percent NDE

ASME B31.4 [and ASME B31.3] Piping Subject to 100 Percent NDE: 100 percent of each day's girth welds installed in the following locations shall be nondestructively examined 100 percent by radiographic, magnetic particle, or liquid penetrant examination unless impracticable, in which case at least 90 percent must be examined. Nondestructive examination must be impracticable for each girth weld not examined.

a. At onshore locations where a loss of hazardous liquid (petroleum, petroleum products, or anhydrous ammonia) could reasonably be expected to pollute stream, river, lake, reservoir, or other body of water, and any offshore area;

b. Within railroad or public road rights-of-way;

c. At overhead road crossings and within tunnels;

d. Within the limits of any incorporated subdivision of a State government; and

e. Within populated areas, including, but not limited to, residential subdivisions, shopping centers, schools, designated commercial areas, industrial facilities, public institutions, and places of public assembly.

3.5 ACCEPTANCE STANDARDS

**************************************************************************
NOTE: These acceptance standards are taken from ASME B31.1 and are suitable for most jobs. Evaluations of indications as given in ASME B31.1 are applicable to these standards. Visual acceptance standards are given for some other piping codes. It should be noted that specific project design requirements may necessitate revision or expansion to cover different items of work and varying standards of acceptance.
**************************************************************************

3.5.1 Visual

The following indications are unacceptable:

a. Cracks--external surface.

**************************************************************************
NOTE: In the text below, if only ASME B31.3 is applicable, delete all text in brackets. For ASME B31.3 under normal service conditions, use 25 percent with text in brackets and omit last sentence in brackets. For ASME B31.4 use 12.5 percent, and add the material in brackets pertaining to B31.4. Consider use of ASME B31.1 acceptance standard for codes other than B31.3 and B31.4.
**************************************************************************
b. Undercut on surface which is greater than 1.00 mm 1/32 inch deep [or [25 percent for ASME B31.3] [and] [12.5 percent for ASME B31.4 and ASME B31.9] of the wall thickness, whichever is less,] provided that the remaining wall thickness is not less than the minimum design thickness. [For ASME B31.4 and in accordance with API Std 1104, undercuts over 0.40 mm through 0.80 mm 1/64 inch through 1/32 inch or over 6 to 12.5 percent of the pipe wall thickness, whichever is smaller, shall not exceed 51 mm 2 inches in a continuous weld length of 305 mm 12 inches or 1/6 the length of the weld, whichever is smaller; and undercuts 0.40 mm 1/64 inch or 6 percent of the wall thickness, whichever is smaller, are acceptable regardless of length.]

NOTE: Include Tables I, II, or III below as applicable to project.

b. Undercut on surface which is greater than 1.00 mm 1/32 inch deep [or [25 percent for ASME B31.3] [and] [12.5 percent for ASME B31.4 and ASME B31.9] of the wall thickness, whichever is less,] provided that the remaining wall thickness is not less than the minimum design thickness. [For ASME B31.4 and in accordance with API Std 1104, undercuts over 0.40 mm through 0.80 mm 1/64 inch through 1/32 inch or over 6 to 12.5 percent of the pipe wall thickness, whichever is smaller, shall not exceed 51 mm 2 inches in a continuous weld length of 305 mm 12 inches or 1/6 the length of the weld, whichever is smaller; and undercuts 0.40 mm 1/64 inch or 6 percent of the wall thickness, whichever is smaller, are acceptable regardless of length.]

NOTE: Include Tables I, II, or III below as applicable to project.

c. Weld reinforcement:

(1) ASME B31.1, conform to Table I.

<table>
<thead>
<tr>
<th>Thickness of Base Metal, millimeters (mm)</th>

<th>Reinforcement Thickness, mm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Over 25.40</td>
<td>4.80</td>
</tr>
</tbody>
</table>

(5) ASME B31.9: Thickness of weld reinforcement shall not exceed 4.80 mm 3/16 inch.

d. Lack of fusion on surface.

e. Incomplete penetration (applies only when inside surface is readily accessible).

f. Convexity of fillet weld surface greater than 10 percent of longest leg plus 1.0 mm 0.03 inch.

g. Concavity in groove welds.

h. Concavity in fillet welds greater than 2.0 mm 1/16 inch.

i. Fillet weld size less than indicated or greater than 1 1/4 times the minimum specified fillet leg length.

3.5.2 Magnetic Particle Examination

The following relevant indications are unacceptable:

a. Any cracks and linear indications.

b. Rounded indications with dimensions greater than 5.0 mm 3/16 inch.

c. Four or more rounded indications in a line separated by 2.0 mm 1/16 inch or less edge-to-edge.

d. Ten or more rounded indications in any 3870 square mm 6 square inches of surface, with the major dimension of this area not to exceed 150 mm 6 inches, with the area taken in the most unfavorable location relative to the indications being evaluated.
3.5.3 Liquid Penetrant Examination

Indications whose major dimensions are greater than 2.0 mm 1/16 inch shall be considered relevant. The following relevant indications are unacceptable:

a. Any cracks or linear indications.

b. Rounded indications with dimensions greater than 5.0 mm 3/16 inch.

c. Four or more rounded indications in a line separated by 2.0 mm 1/16 inch or less edge-to-edge.

d. Ten or more rounded indications in any 3870 square mm 6 square inches of surface, with the major dimension of this area not to exceed 150 mm 6 inches, with the area taken in the most unfavorable location relative to the indications being evaluated.

3.5.4 Radiography

Welds that are shown by radiography to have any of the following discontinuities are unacceptable:

a. Any type of crack or zone of incomplete fusion or penetration.

b. Any other elongated indication which has a length greater than:

   (1) 6.0 mm 1/4 inch for t up to 19.0 mm 3/4 inch, inclusive;

   (2) 1/3 t for t from 19.0 mm 3/4 inch to 57.00 mm 2 1/4 inches, inclusive;

   (3) 19.00 mm 3/4 inch for t over 57.00 mm 2 1/4 inches where t is the thickness of the thinner portion of the weld.

   ("t" pertains to the thickness of the weld being examined. If a weld joins two members having different thickness at the weld, "t" is the thinner of these two thicknesses.)

c. Any group of indications in line that have an aggregate length greater than t in a length of 12t, except where the distance between the successive indications exceeds 6L where L is the longest indication in the group.

d. Porosity in excess of that shown acceptable in Appendix A-250, Acceptance Standard for Radiographically Determined Rounded Indications in Welds, ASME BPVC SEC I.

3.5.5 Ultrasonic Examination

Permitted for ASME B31.3 and ASME B31.4 piping only. Linear type discontinuities are unacceptable if the amplitude exceeds the reference level and discontinuities have lengths which exceed the following:

a. 6.0 mm 1/4 inch for t up to 19.0 mm 3/4 inch

b. 1/3 t for t from 19.0 mm 3/4 inch to 57.0 mm 2 1/4 inches

c. 19.0 mm 3/4 inch for t over 57.0 mm 2 1/4 inches
("t" is the thickness of the weld being examined. If the weld joins two members having different thickness at the weld, "t" is the thinner of these two thicknesses. Discontinuities are interpreted to be cracks, lack of fusion, and incomplete penetration are unacceptable regardless of length.)

3.6 CORRECTIONS AND REPAIRS

**************************************************************************
NOTE: Insert the applicable ANSI piping codes. ANSI B31.2, "Fuel Gas Piping," and ASME B31.8, "Gas Transmission and Distribution Piping Systems," not listed under paragraph entitled "References," may be used.
**************************************************************************

Remove defects and replace welds as specified in [ANSI Piping Standards] [____], unless otherwise specified. Repair defects discovered between weld passes before additional weld material is deposited. Wherever a defect is removed, and repair by welding is not required, the affected area shall be blended into the surrounding surface eliminating sharp notches, crevices, or corners. After defect removal is complete and before rewelding, reexamine the area by the same test methods which first revealed the defect to ensure that the defect has been eliminated. After rewelding, reexamine the repaired area by the same test methods originally used for that area. For repairs to base material, the minimum examination shall be the same as required for butt welds. Indication of a defect shall be regarded as a defect unless reevaluation by NDE or by surface conditioning shows that no unacceptable indications are present. The use of foreign material to mask, fill in, seal, or disguise welding defects will not be permitted.

**************************************************************************
NOTE: Regarding Table IV, information based on the table must be developed and included in each project specification. Tables must clearly define the systems to be inspected and the type of NDE required. Specify 100 percent NDE when required by UFC 3-460-01, "Design: Petroleum Fuel Facilities" and 49 CFR 195, as covered by paragraph entitled "Piping Subject to 100 Percent NDE." Where appears, select 100 percent or random but not both.
**************************************************************************

<p>| TABLE IV - EXAMINATIONS AND TESTS FOR VARIOUS MATERIALS AND SERVICES |
|-------------------------------------------------|-----------------|-----------------|-----------------|
| Examinations or Tests Required                  | Visual          | Radiographic    | [Magnetic Particle] or [Liquid Penetrant] | Ultrasonic |
| Material or Application                         |                  |                 |                                              |            |
| High-alloy austenitic or nickel steels or nickel alloys for cryogenic service and vacuum service |                  |                 |                                              |            |

</tr>
</tbody>
</table>

#### NOTES:

1. Thickness refers to pressure boundary wall thickness (such as pipe wall, fitting wall, or nozzle wall thickness).

2. All welds must be given a visual examination in addition to type of specific nondestructive examination specified.

3. NPS-Nominal Pipe Size.

4. RT-Radiographic examination; MT-magnetic particle examination; PT-liquid penetrant examination.

5. RT of branch welds shall be performed before any nonintegral reinforcing material is applied.

6. The thickness of buttwelds is defined as the thicker of the two abutting ends after end preparation.

7. Temperatures and pressures shown are design.

8. In lieu of radiography of welded branch connections when required above, liquid penetrant or magnetic particle examination is acceptable and, when used, shall be performed at the lesser of one-half of the weld thickness or each 50 mm of weld thickness and all accessible final weld surfaces.

9. For nondestructive examination of the pressure retaining component, refer to the standards listed in applicable code or the manufacturing specifications.

3.8.4.2 Specialized Sensor Training
3.9 OPERATION AND MAINTENANCE DATA REQUIREMENTS

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for process instrumentation and control systems.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets following the "G" classification, with a code of up to three characters to indicate the approving
authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy and Air Force projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy and Air Force projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Contractor Design Drawings; G[, [_____]]

1.3 SITE ENVIRONMENTAL CONDITIONS

The expected site environmental conditions are a minimum of [_____] degrees C [_____] degrees F and a maximum of [_____] degrees C [_____] degrees F.

1.4 SEQUENCING

**************************************************************************
NOTE: Provide Table I provides bracketed text in which the following site number of days between items may be specified. In many cases this information will be specified elsewhere. When project schedule is specified elsewhere remove bracketed text and Table I will provide sequencing but not specific intervals. If time intervals are to be specified here keep the bracketed text and enter the number of days in the space provided.
**************************************************************************

TABLE I: PROJECT SEQUENCING specifies the sequencing of submittals as specified in paragraph SUBMITTALS (denoted by an 'S' in the 'TYPE' column) and activities as specified in PART 3 EXECUTION (denoted by an 'E' in the 'TYPE' column).

1.5.1 Sequencing for Submittals

The sequencing specified for submittals is the deadline by which the submittal must be initially submitted to the Government. Following submission there will be a Government review period as specified in Section 01 33 00 SUBMITTAL PROCEDURES. If the submittal is not accepted by the Government, revise the submittal and resubmit it to the Government within [14] [_____] days of notification that the submittal has been rejected. Upon re-submittal there will be an additional Government review period. If the submittal is not accepted the process repeats until the submittal is accepted by the Government.
1.5.2 Sequencing for Activities

The sequencing specified for activities indicates the earliest the activity may begin.

1.5.3 Abbreviations

In TABLE I the abbreviation AAO is used for 'after approval of' and 'ACO' is used for 'after completion of'.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

**************************************************************************
NOTE: Add site specific requirements. Supplement this specification with drawings which include a piping and instrumentation diagram (P&ID) and a comprehensive control diagram showing devices, a sequence of operations, and a points schedule.
**************************************************************************

The process control system must be used to monitor and control the operation of process equipment as specified and in accordance with the sequence of operation and control schematics shown on the drawings. The process control system must provide for operator interaction, overall process control system supervision, and process equipment control and monitoring. The system must adhere to Section 25 05 11 CYBERSECURITY OF FACILITY-RELATED CONTROL SYSTEMS. Provide hardware configured and sized to support expansion as specified and shown on the drawings.

The process control system must be complete including sensors, field preamplifiers, signal conditioners, offset and span adjustments, amplifiers, transducers, transmitters, control devices, engineering units conversions and algorithms for the applications; and must maintain the specified end-to-end process control loop accuracy from the sensor to display and final control element. Connecting conductors must be suitable for installed controls. Enclosers must be rated for NEMA [1] [4] [_____].

2.1.1 Operation

**************************************************************************
NOTE: Show the number of control panels to be provided on the drawings. Provide setpoint ranges, alarm settings and other parameters not addressed in the sequence of control in a points schedule on the drawings.
**************************************************************************

The process control system provided under this specification must operate using a combination of sequential function charts, function block diagrams, structured text, instruction, and ladder logic type as defined in IEC 61131-3 and supervisory control to provide the required sequences of operation. Input data to the controller must be obtained by using instruments and controls interfaced to mechanical, electrical, utility systems and other systems as shown and specified. All required setpoints, settings, alarm limits, and sequences of operation must be as identified [in the database/ settings tables] [and] [or] [sequences of operation]
2.1.2 Points

**************************************************************************
NOTE: Provide an input/output (I/O) summary table on the drawings. List all inputs to and outputs from the process control system. Identify each point type, analog, binary, pulse accumulator; input, output, control, monitoring, etc. Identify alarms, trends, software and failure mode setting associated with each point in the table. Label each point so that it can be easily referenced to the process control system schematic drawings or process and instrumentation drawings.
**************************************************************************

Provide inputs to and outputs from the process control system in accordance with the Input/Output (I/O) Summary Table indicated. Each connected analog output (AO), analog input (AI), binary output (BO), binary input (BI), pulse accumulator (PA) input and other input or output device connected to the control system must represent a "point" where referred to in this specification.

2.1.3 Building Telecommunications Cabling (BTC)

**************************************************************************
NOTE: Include in the project specification any of the following UFGS for the appropriate BTC: Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM, Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP).
**************************************************************************

Provide data transmission systems for communication [between PLCs] [and] [between PLCs and the central station] [and] [server] as specified in [Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM][Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP)] and as indicated.

2.1.4 System Reliability

The system must be designed for maximum reliability, safety and integrity while maintaining an availability of [99.99%] or better.

2.2 MATERIALS AND EQUIPMENT

2.2.1 Product Certifications

**************************************************************************
NOTE: Note: FCC part 15 does not apply to many of the computing devices used for industrial applications. Title 47 Part 15 provides for exemption of unintentional radiators considered "digital devices used exclusively as an electronic control" or power system utilized by a public utility or in and industrial plant.
**************************************************************************

Computing devices, as defined in FCC Part 15, supplied as part of the
process control system must be certified to comply with the requirements of Class B computing devices.

2.2.2 Standard Products

Materials and equipment must be standard unmodified products of a manufacturer regularly engaged in the manufacturing of such products. Units of the same type of equipment must be products of a single manufacturer. Items of the same type and purpose must be identical and supplied by the same manufacturer, unless replaced by a new version approved by the Government.

2.2.3 Nameplates

Each major component of equipment must have the manufacturer's name and address, and the model and serial number in a conspicuous place. Laminated plastic nameplates must be provided for equipment devices and panels furnished. Each nameplate must identify the device, such as pump "P-1" or valve "VLV-402". Labels must be coordinated with the schedules and the process and instrumentation drawings. Laminated plastic must be 3 mm 1/8 inch thick, white with black center core. Nameplates must be a minimum of 25 by 75 mm 1 by 3 inches with minimum 6 mm 1/4 inch high engraved block lettering. Nameplates for devices smaller than 25 by 75 mm 1 by 3 inches must be attached by a nonferrous metal chain. All other nameplates must be attached to the device.

2.3 GENERAL REQUIREMENTS

**************************************************************************
Show hazardous area classification on the drawings.
**************************************************************************

Equipment located outdoors, not provided with climate controlled enclosure, must be capable of operating in the ambient temperature range. Electrical equipment will conform to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Equipment and wiring must be in accordance with NFPA 70, with proper consideration given to environmental conditions such as moisture, dirt, corrosive agents, and hazardous area classification.

2.4 SENSORS

**************************************************************************
NOTE: Provide a schedule on the drawings that includes all required instrumentation. Provide device information such as: Alpha-Numeric designator, the operating range (pressure, temperature, flow) of construction material, media to be monitored or controlled, control signal, valve type (2-way, 3-way, normally open, normally closed, etc.). Include automatic control valves and manually operated control valves.

It may be appropriate to defer the enclosure requirements to the electrical section or to provide different enclosures for different areas: indoor, outdoor, areas with hazard classification indicated on the drawings, etc. Within an area, the requirements should be consistent.
**************************************************************************
2.4.1 Transmitter

**************************************************************************
NOTE: Show all panels on the drawings. Distance between transmitter and sensor is critical. Specifying the digital communication of sensors opens up the possibility of proprietary sensors.
**************************************************************************

Unless indicated otherwise, each sensor must be provided with a transmitter, selected to match the sensor. Except where specifically indicated otherwise on the drawings, the transmitter must be provided with a [four] [_____] digit or analog visual display of the measured parameter and with a [4 to 20 mAdc] [binary] [0-10 vdc] [_____] output signal proportional to the level of the measured parameter. Accuracy must be plus or minus [0.5] [1] [2] [5] [_____] percent of full scale reading with output error not exceeding plus or minus [0.25] [0.5] [_____] percent of [the calibrated measurement] [full scale]. Transmitter must be located where indicated, mounted integrally with the sensor, pipe mounted, wall mounted or installed in the control panel. The distance between the sensor and transmitter must not exceed the manufacturer's recommendation. Field preamplifiers and signal conditioners must be included when necessary to maintain the accuracy from sensor to the programmable logic controller or recorder.

2.4.2 Off-Gas or Vapor Service

**************************************************************************
NOTE: If there are substantial temperature or pressure changes across a blower or unit process, it may be cost effective to specify differing requirements upstream and downstream of the process.
**************************************************************************

Sensors and meters in [off-gas] [or] [vapor] service must be rated for continuous duty service at fluid approach velocities from 2.5 to 25 m/s 500 to 5000 fpm with correspondingly higher constriction velocities over a fluid temperature range from minus [18] [25] [_____] degrees C to [40] [50] [66] [_____] degrees C minus [0] [15] [_____] degrees F to [105] [120] [150] [_____] degrees F at pressures from minus [50] [_____] kPa gage up to [100] [700] [_____] kPa gage minus [7.2] [_____] psi gage up to [15] [100] [_____] psi gage.

2.4.3 Liquid Service

**************************************************************************
NOTE: If there are substantial temperature or pressure changes across a pump or unit process, it may be cost effective to specify differing requirements upstream and downstream of the process.
**************************************************************************

Sensors and meters in liquid service must be rated for continuous duty service at fluid approach velocities from [0.1] [0.75] [_____] m/s to [2] [3] [_____] m/s [0.327] [2.5] [_____] ft/s to [7] [10] [_____] ft/s with correspondingly higher constriction velocities over a fluid temperature range from [0] [-50] [_____] degrees C to [40] [50] [250] [_____] degrees C [32] [-58] [_____] degrees F to [105] [120] [482] [_____] degrees F at
pressures up to [70] [350] [700] [1000] [_____] kPa [10] [50] [100] [150] [_____] psi gage.

2.4.4 Flow Rate Sensors and Meters

**************************************************************************
NOTE: Most flow meters need straight unobstructed piping of 10 pipe diameters upstream and 5 pipe diameters downstream. Verify that the location will allow installation meeting the criteria or that the accuracy of type of flow meter selected is not affected by the location. Design includes attendant elements such as mounting devices, differential pressure transmitter and interpretive ancillary components in this and other sections and on the drawings to complete the system.
**************************************************************************

Liquid flow indication must be provided in [L/s] [gpm]. [Off-gas] or [Vapor] flow indication must be provided in [cubic m/second] [cubic feet per minute]. Pressure taps must incorporate appropriate snubbers. Unless indicated otherwise, the flow transmitter must produce a signal that is proportional to the volumetric flow rate, compensated for fluid temperature, and must have an accuracy of plus or minus [1] [3] [_____] percent of [full flow] [the actual flow]. Flow transmitter must be located within [5 m] [15 feet] of the flow element. The flow transmitter must include a [digital] [_____] readout of the volumetric flow rate to [3] [_____] significant figures. [The controller must be provided with a minimum of three alarm lights. The first alarm light must indicate when the lower (warning) detection level has been exceeded. The second alarm light must indicate when the upper (alarm) detection level has been exceeded. The third alarm light must indicate a controller malfunction, including loss of power or loss of sensor input.] [The controller must be provided with a minimum of three sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input.] The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a [4-20 mA] [_____] output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost. Flow rate must be controlled to within plus or minus [5] [_____] percent of the design flow.

2.4.4.1 Flow Nozzle

Flow nozzle must be made of austenitic stainless steel. The inlet nozzle form must be elliptical and the nozzle throat must be the quadrant of an ellipse. The thickness of the nozzle wall and flange must be such that the accuracy will not be degraded by distortion of the nozzle throat from strains caused by the pipeline temperature and pressure, flange bolting, or other methods of installing the nozzle in the pipeline. The outside diameter of the nozzle flange or the design of the flange facing must be such that the nozzle throat is centered accurately in the pipe.
2.4.4.2 Flow Switch

Flow switch must have a repetitive accuracy of plus or minus [10] percent of actual flow setting. Switch actuation must be adjustable over the operating flow range. Flow switch for use in [water] [contaminated groundwater] [sewage] [air] [vapor] [gas] [hot gas] [corrosive vapor] system must be rated for use and constructed of suitable materials for installation in the environment encountered. The flow switch must have non flexible [paddle] [shuttle/piston] [thermal] [pezo] with Form C snap action contacts, rated in accordance with NEMA ICS 1.

**************************************************************************
NOTE: Magnetic flowmeters are to be used only for conductive fluids.
**************************************************************************

2.4.4.3 Magnetic Flowmeter

Magnetic flowmeter must be [non-intrusive,] DC pulse type and must measure fluid flow through the use of a self generated magnetic field. The meter must have automatic zeroing circuitry. The magnetic flow element must be encapsulated in [type 300 stainless steel] [anodized aluminum]. Flowmeter must be capable of measuring up to a maximum flow velocity of [3] [m/s] [10] [fps]. The metering tube must be constructed of [316 stainless steel] [anodized aluminum]. The meter must be rated for a process temperature range of [32 to 212 F] [0 to 100C] and [0 to 149F] [-18 to 65C] ambient. The maximum pressure drop across the meter and appurtenances must be 34 kPa 5 psi at the maximum flow rate.

2.4.4.4 Natural Gas or Propane Flow Meter

Flowmeter for natural gas or propane flows, corrected to standard conditions, of up to 19.7 L/sec 2500 SCFH must be of the positive displacement diaphragm or bellows type and for flows above 0.02 cu. m/sec 2500 cfh, must be of the axial flow turbine type. Meters must be specifically for natural gas or propane supply metering and rated for the pressure, temperature and flow rates of the installation. Permanent meters must be suitable for operation in conjunction with an energy monitoring and process control system. Meter body must be constructed of [316 stainless steel]. Meter must have a minimum turndown ratio of [10] to [1] with an accuracy of plus or minus [1] percent of actual flow rate. The meter index must include a direct reading mechanical totalizing register and electrical impulse dry contact output for remote monitoring. The electrical impulse dry contact output must provide not less than 1 pulse per 2.8 cubic meters 100 cubic feet of gas and must require no field adjustment or calibration. The highest electrical impulse rate available from the manufacturer, not exceeding [15] pulses per second, for the installed application must be provided.

2.4.4.5 Orifice Plate

**************************************************************************
NOTE: Show the operating ranges and ratings on the drawings for operating pressures and flow.
Differential pressure output ranges for flow conditions are to be coordinated. Accuracy of computed flow will be improved with inclusion of temperature and pressure of upstream conditions.
**************************************************************************
Orifice plate must be made of [304] [316] series stainless steel sheet. The outlet side of the bore must be beveled at a 45 degree angle. The thickness of the cylindrical face of the orifice must [not exceed one-fiftieth of the pipe inside diameter or one-eighth of the orifice bore, whichever is smaller] [be 3.3 mm 0.125 inch nominal]. The orifice plate must be flat within 0.10 mm 20 mils. The orifice surface roughness must not exceed 0.5 micron 0.02 mils. Orifice plates must be concentric plates with a square and sharp upstream edge of the orifice. Orifice bore must be designed to match the operating parameters stated in the drawings. Plate must be permanently identified with line size, flange rating, orifice bore diameter, plate thickness and material. The accuracy must be plus or minus [1] [_____] percent of full flow.

2.4.4.6 Paddle Type Flowmeter

Sensor accuracy must be plus or minus [1] [_____] percent of rate of flow, minimum operating flow velocity must be [0.3] [_____] m/s [1.0] [_____] fps. Sensor repeatability and linearity must be plus or minus [1] [_____] percent. Sensor must be non-magnetic, with forward curved impeller blades designed for water containing debris. Wetted materials must be made from non-corrosive materials and must not contaminate water. The sensor must be provided with isolation valves. The transmitter housing must be a NEMA 250 Type 4 enclosure. The sensor must be rated for installation in pipes of 76 mm to 1 m 3 to 40 inch diameters.

2.4.4.7 Pitot Tube Air Flow Measurement Array (AFMA)

Each Pitot Tube AFMA must contain an array of velocity sensing elements. The velocity sensing elements must be of the multiple pitot tube type with averaging manifolds. The sensing elements must be distributed across the duct cross section in the quantity and pattern specified or recommended by the published installation instructions of the AFMA manufacturer.

a. Pitot Tube AFMAs for use in airflows over 3.0 m/s 600 fpm must have an accuracy of plus or minus [5] percent over a range of 2.5 to 12.5 m/s 500 to 2500 fpm.

b. Pitot Tube AFMAs for use in airflows under 3.0 m/s 600 fpm must have an accuracy of plus or minus [5] percent over a range of 0.6 to 12.5 m/s 125 to 2500 fpm.

2.4.4.8 Annular Pitot Tube

**************************************************************************
NOTE: Annular pitot tubes should not be used where the flow is pulsating or where pipe vibration is allowed. Pulse flow is characteristic of positive displacement pumps and blowers.
**************************************************************************

Sensor must have an accuracy of plus or minus [2] [_____] percent of full flow and a repeatability of plus or minus [0.5] [_____] percent of measured value. Annular pitot tube must be averaging type differential pressure sensors with no less than four total head pressure ports with an averaging manifold and at least one static port made of austenitic stainless steel. The total head pressure ports must extend diametrically across the entire pipe.
2.4.4.9 Electronic AFMA

Each electronic AFMA must consist of an array of velocity sensing elements of the resistance temperature detector (RTD) or thermistor type. The sensing elements must be distributed across the duct cross section in the quantity and pattern specified or recommended by the published application data of the AFMA manufacturer. Electronic AFMAs must have an accuracy of plus or minus [5] percent over a range of [.6] [_____] m/s to [25][50] m/s [120] [_____] fpm to [5,000] [10,000] fpm and the output must be temperature compensated over a range of 0 to 100 degrees C 32 to 212 degrees F.

2.4.4.10 Positive Displacement Flowmeter

Output accuracy must be plus or minus [2] percent of the flow range. The flow meter must be a direct reading, gerotor, nutating disc or vane type displacement device rated for liquid service. A counter must be mounted on top of the meter, and must consist of a non-resettable mechanical totalizer for local reading, and a pulse transmitter for remote reading. The totalizer must have a six digit register to indicate the volume passed through the meter in L gallons. A sweep-hand dial will indicate down to 5 L 1 gallon. The pulse transmitter must have a hermetically sealed reed switch which is activated by magnets fixed on gears of the counter. The meter must have a bronze body with threaded or flanged connections as required for the application. The maximum pressure drop at full flow must be 35 kPa 5 psi gage.

2.4.4.11 Turbine Meters

**************************************************************************
NOTE: Verify that the location will allow installation with the minimum straight unobstructed piping of 10 pipe diameters upstream and 5 pipe diameters downstream.
**************************************************************************

Turbine meters wetted metal components must be [nickel plated brass][series 300 stainless steel][series 316 stainless steel][bronze] with an accuracy of plus or minus [1] [_____] percent from [30] [_____] percent to 100 percent of actual flow.

2.4.4.12 Turbine Flowmeter

**************************************************************************
NOTE: Verify that the location will allow installation with the minimum straight unobstructed piping of 10 pipe diameters upstream and 5 pipe diameters downstream. Placement downstream of the blower or pump is preferable for head loss considerations.
**************************************************************************

Design of the flowmeter probe assembly must incorporate integral flow, temperature, and pressure monitoring. The meter flow sensing element must be [single][double] turbine and operate over the temperature range with a pressure loss limited to [1] [_____] percent of operating pressure at maximum flow rate. The internal temperature transmitter must monitor the full temperature range of the fluid. The integral pressure transmitter must monitor the pressure range with end limits of [0] [_____] MPa [0]
