## PART 2 PRODUCTS

- 2.1 PILE REQUIREMENTS
- 2.2 MATERIALS
  - 2.2.1 Cementitious Materials
    - 2.2.1.1 Cement
    - 2.2.1.2 Fly Ash and Pozzolan
    - 2.2.1.3 Ground Iron Blast-Furnace Slag

- 2.2.1.4 Silica-Fume
    - 2.2.1.5 Supplemental Cementitious Materials (SCM) Content
  - 2.2.2 Water
  - 2.2.3 Aggregates
    - 2.2.3.1 Alkali-Silica Reactivity (ASR)
  - 2.2.4 Admixtures
  - 2.2.5 Prestressing Steel
  - 2.2.6 Reinforcing Steel
  - 2.2.7 Ties and Spirals
  - 2.2.8 Anchorages and End Fittings
  - 2.2.9 Grout
  - 2.2.10 Epoxy Coating
  - 2.2.11 H-Pile Extensions
  - 2.2.12 Pile Driving Points
- 2.3 CONCRETE MIX DESIGN
- 2.4 FABRICATION
  - 2.4.1 Formwork
  - 2.4.2 Pretensioning
  - 2.4.3 Casting
    - 2.4.3.1 Conveying
    - 2.4.3.2 Placing and Casting
  - 2.4.4 Curing of Piles
    - 2.4.4.1 Moist Curing
    - 2.4.4.2 Accelerated Curing
  - 2.4.5 Detensioning
- 2.5 PRODUCT QUALITY CONTROL
  - 2.5.1 Piles
  - 2.5.2 Silica Fume Manufacturer's Representative
  - 2.5.3 Aggregate Tests
  - 2.5.4 Slump and Strength Tests
  - 2.5.5 Changes in Proportions
  - 2.5.6 Compressive Strength Test Results
  - 2.5.7 Chloride Ion Concentration
  - 2.5.8 Chloride Ion Penetration
  - 2.5.9 Precasting Manufacturer's Quality Control Procedures
- 2.6 MATERIAL SUSTAINABILITY CRITERIA
- 2.7 PILE DRIVING EQUIPMENT
  - 2.7.1 Pile Hammers
  - 2.7.2 Driving Helmets and Cushion Blocks
    - 2.7.2.1 Driving Helmets or Caps and Pile Cushions
    - 2.7.2.2 Hammer Cushion or Capblock

## PART 3 EXECUTION

- 3.1 PRELIMINARY WORK
  - 3.1.1 Wave Equation Analysis of Pile Drivability
  - 3.1.2 Pile Length Markings
- 3.2 PILE DRIVING
  - 3.2.1 Driving Piles
  - 3.2.2 Protection of Piles
  - 3.2.3 Pile Placement and Tolerances in Driving
  - 3.2.4 Rejected Piles
  - 3.2.5 Jetting of Piles
  - 3.2.6 Predrilling of Piles
  - 3.2.7 Pile Splices
  - 3.2.8 Build-Ups
  - 3.2.9 Pile Cut-Off
  - 3.2.10 As-Driven Survey
  - 3.2.11 Protection of Existing Structures

- 3.2.12 Pile Shoe
- 3.3 FIELD QUALITY CONTROL
  - 3.3.1 Test Piles
  - 3.3.2 Dynamic Pile Analysis
    - 3.3.2.1 Pile Analysis
    - 3.3.2.2 Pile Drivability
    - 3.3.2.3 CAPWAP
    - 3.3.2.4 Dynamic Load Test Reporting
  - 3.3.3 Static Load Tests
    - 3.3.3.1 Safe Design Capacity
  - 3.3.4 Tensile Load Test
  - 3.3.5 Lateral Load Test
  - 3.3.6 Pile Records
  - 3.3.7 Testing Agency Qualifications
- 3.4 SPECIAL INSPECTION AND TESTING FOR SEISMIC-RESISTING SYSTEMS
- 3.5 VIBRATION CONTROL
- 3.6 NOISE CONTROL
- 3.7 PRECONSTRUCTION CONDITION SURVEY
- 3.8 CONSTRUCTION INSTRUMENTATION AND MONITORING PROGRAM

## UNIFIED FACILITIES GUIDE SPECIFICATIONS

References are in agreement with UMRL dated July 2022

\*\*\*\*\*

### SECTION 31 62 13.20

#### PRECAST/PRESTRESSED CONCRETE PILES 11/20, CHG 1: 05/22

\*\*\*\*\*

NOTE: This guide specification covers the requirements for precast, prestressed piles.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

\*\*\*\*\*

\*\*\*\*\*

NOTE: To download UFGS Forms, Graphics, and Tables, go to: <http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-tables>

\*\*\*\*\*

\*\*\*\*\*

NOTE: The extent and location of the work to be accomplished should be indicated on the project drawings or included in the project specification.

\*\*\*\*\*

\*\*\*\*\*

NOTE: Show the following information on the drawings:

1. Locations and design loads of piles. If both tension and compression piles are contained in

design, identify by type.

2. Size, shape, and length of piles.

3. Locations, sizes, and number of prestressing steel strands. Unit stresses for prestressing strands.

4. Details of reinforcement.

5. Details of splices, if required.

6. Locations of test piles, if required.

7. Soil data, where required.

8. Identify piles as vertical or battered.

\*\*\*\*\*

## PART 1 GENERAL

\*\*\*\*\*

NOTE: Structural engineer must confirm the structural capacity of piles and provide specific bending moments, lateral loads and other design requirements for pile design.

\*\*\*\*\*

### 1.1 DESCRIPTION

Design, furnish, install and test precast prestressed concrete piles at the locations indicated on the drawings and specified herein.[ Assume test pile[s] will be directed to be placed in [a ]location[s] that can be incorporated into the work.][ Test piles that meet performance requirements can be incorporated into the permanent work.]

### 1.2 REFERENCES

\*\*\*\*\*

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

\*\*\*\*\*

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

### [1.3 SUBSURFACE DATA

Subsurface soil data logs are [indicated][appended to the special contract requirements][provided on the project drawings]. [ The subsoil investigation report may be examined at [\_\_\_\_]. ]

### ]1.4 BASIS OF BID

\*\*\*\*\*

**NOTE: Select one of the following options:**

\*\*\*\*\*

\*\*\*\*\*

NOTE: Use "Lump Sum" paragraph below for lump (principal) sum bidding of piles. Use this in all projects except those where exact pile lengths cannot be practically determined prior to the actual work. Clearly show number of piles, pile capacity, pile locations, and tip and cutoff elevations on the drawings.

Use "Unit Price" paragraph for unit price bidding of piles. Specify unit price bid items for piles only for projects where exact quantities cannot be practically determined prior to the actual work. Lengths of piles must be determined as accurately as possible, prior to bidding, since the unit price per meter foot of the piles varies as the length increases or decreases. Refer to Standard Test Method for High-Strain Dynamic Testing of Deep Foundations (ASTM D4945).

\*\*\*\*\*

#### 1.4.1 Production Pile Acceptance Criteria

Safe design capacity for piles is [\_\_\_\_\_] KN [\_\_\_\_\_] kips. Drive piles to [minimum tip elevation][a minimum depth of [\_\_\_\_\_] m [\_\_\_\_\_] feet below cut-off elevation], and to such additional depth as required to obtain a bearing capacity of not less than [\_\_\_\_\_] KN [\_\_\_\_\_] kips. The Contractor's Geotechnical Consultant will determine the terminal driving criteria based on results of [dynamic pile driving tests at end of drive or restrrike][static load tests][wave equation analysis].

The following formulas can be used in cases where allowable pile loads are less than 355 kN 80 kips (determined using a factor of safety of 3 for individual piles and 4 for pile groups) and are presented only as a guide to aid in establishing the controlling penetration per blow, which, together with the minimum depth of penetration will serve to determine the required minimum depth of penetration of each individual pile:

$$R = \frac{2E}{S \text{ plus } 0.1} \quad \text{For double acting hammers}$$

$$R = \frac{2WH}{S \text{ plus } 0.1} \quad \text{For single acting hammers}$$

Where R is the approximate allowable pile load in kips; E equals the energy in foot-kips per blow based on an acceptable certified statement from the manufacturer of the hammer; W equals the weight of the hammer or ram in kips; H equals the height of fall of the hammer or ram in feet; and S equals the average inches of penetration per blow for the last three blows. An allowance will be made for reduced penetration caused by shock absorption of the cushion or cap blocks.

#### [1.5 LUMP SUM PAYMENT

\*\*\*\*\*

NOTE: Use this paragraph for lump-sum contracts, consult with Contracting Officer's Technical

Representative (Geotechnical Branch) on applicability of use prior to selection. This paragraph will be typically used when there are 1) relatively small quantity of piles, 2) allowable pile loading is less than 355 kN 80 kips, and 3) the subsurface conditions are well defined. Fill in Table I as required selecting columns applicable to project. Generally, pile capacity, location, and minimum tip elevation are shown on plans. Test piles and load tests are not incorporated on lump sum contracts. Delete this paragraph for unit-price contracts.

\*\*\*\*\*

Base bids upon providing the number, size, capacity, and length of piles as indicated on the [drawings.] [following Table I:

Table 1						
[Location]	Number	Size	[Capacity]	Length (tip to cut-off)	[Maximum Bending Moment]	[Maximum Shear Force]

]

Include the cost of all necessary equipment, tools, material, labor, and supervision required to: deliver, handle, install, cut-off, dispose of any cut-offs, and meet the applicable contract requirements. Include mobilization, pre-drilling, and redriving heaved piles. If, in redriving, it is found that any pile is not of sufficient length to provide the capacity specified, notify the Contracting Officer, who reserves the right to increase or decrease the total length of piles to be provided and installed by changing the pile locations or elevations, requiring the installation of additional piles, or directing the omission of piles from the requirements shown and specified. If total number of piles or number of each length vary from that specified as the basis for bidding, an adjustment in the contract price or time for completion, or both, will be made in accordance with the contract documents. Payment for piles will be based on successfully installing piles to both the minimum tip elevation and satisfying the acceptance criteria identified herein. No additional payment will be made for: damaged, rejected, or misplaced piles; withdrawn piles; any portion of a pile remaining above the cut-off elevation; backdriving; cutting off piles; splicing; build-ups; any cut-off length of piles; or other excesses beyond the assumed pile length indicated for which the Contractor is responsible.[ Include payments for vibration monitoring, sound monitoring and precondition construction surveys.]

#### ][1.6 UNIT PRICE

\*\*\*\*\*

NOTE: This paragraph is tailored for Navy.

Delete this paragraph for lump-sum contracts.

For NAVFAC PAC projects: Where there is unit pricing for piles, use this paragraph and edit applicable attachments for inclusion in Standard Form 1442, "Solicitation, Offer and Award" and "Schedule of Bid Items." Select first bracketed

text.

For NAVFAC Southeast projects, where there is a need for unit pricing of piles, include this paragraph. Refer to NAVFAC SE Instruction 00010, "Instructions for Preparing Basis of Bid Statement With Unit-Priced Items," for method of specifying unit price bid items. Select first bracketed text.

\*\*\*\*\*  
[ For unit price bid, see SF 1442, "Solicitation, Offer and Award" and  
"Schedule of Bid Items."  
]

\*\*\*\*\*  
NOTE: For NAVFAC LANT projects, use the following  
paragraph for measurement and payment and subsequent  
sub-parts.  
\*\*\*\*\*

Requirements of FAR 52.211-18 Variation in Estimated Quantity do not apply to payment for piling. Each pile and test pile acceptably provided will be paid for at the bid unit price per unit length, which will include items incidental to furnishing and driving the piles including mobilization and demobilization,[ jetting][ predrilling][ probing], redriving uplifted piles, [an additional 1.5 m 5 feet in furnished length for any test pile not driven beyond estimated pile length,] and cutting off piles at the cut-off elevation.[ Include the cost for additional length for the test piles in the total unit price cost for the job.] Payment will be made for production [and test piles] at the bid unit price for the length of pile, from tip to final cut-off, actually provided, excluding buildups and splices directed by the Contracting Officer to be made. If the actual cumulative pile length driven (tip to cut-off) vary more than 25 percent from the total pile length specified as a basis for bidding, at the direction of the Contracting Officer, the unit price per unit length will be adjusted in accordance with provisions of FAR 52.236-2 Differing Site Conditions.[ Payments will be made per each at the respective bid unit price for pile cut-offs, pile build-ups, pile loads tests and pile splices.][ Include payments for vibration monitoring, sound monitoring, construction instrumentation and monitoring, and precondition construction surveys.]

][1.7 PAYMENT

\*\*\*\*\*  
NOTE: This paragraph is tailored for Army.  
  
Delete this paragraph for lump-sum contracts.  
  
If Section 01 20 00 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 20 00 PRICE AND PAYMENT PROCEDURES.  
\*\*\*\*\*

### 1.7.1 Furnishing and Delivering Prestressed Concrete Piles

#### 1.7.1.1 Payment

Payment will be made for costs associated with furnishing and delivering the required lengths of permanent prestressed concrete piles,[ including H-pile extensions,] which includes costs of furnishing and delivering piles to the work site. No payment will be made for the driving head or lengths of piles exceeding required lengths. No payment will be made for piles damaged during delivery, storage, or handling to the extent that they are rendered unsuitable for the work, in the opinion of the Contracting Officer.

#### 1.7.1.2 Measurement

Furnishing and delivering permanent prestressed concrete piles will be measured for payment by the linear meter foot of piles required below the cut-off elevation as [determined by the Contracting Officer and furnished to the Contractor] [indicated].

#### 1.7.1.3 Unit of Measure

Unit of measure: linear meter foot.

### 1.7.2 Driving Prestressed Concrete Piles

#### 1.7.2.1 Payment

Payment will be made for costs associated with driving permanent prestressed concrete piles, which includes costs of handling, driving, [and splicing of piles,] [performing dynamic testing, interpreting data and submitting reports,] measuring heave, redriving heaved piles, removal of [build-ups] driving heads or cutting off piles at the cut-off elevation and removing from the work site, compiling and submitting pile driving records, backfilling voids around piles, and any other items incidental to driving piles to the required elevation.

#### 1.7.2.2 Measurement

Permanent prestressed concrete piles will be measured for payment for driving on the basis of lengths, to the nearest hundredth tenth of a linear meter foot, along the axis of each pile acceptably in place below the cut-off elevation shown.

#### 1.7.2.3 Unit of Measure

Unit of measure: linear meter foot.

### 1.7.3 Pulled Prestressed Concrete Piles

#### 1.7.3.1 Payment

Payment will be made for costs associated with piles pulled at the direction of the Contracting Officer and found to be undamaged. The cost of furnishing and delivering pulled and undamaged piles will be paid for at the applicable contract unit price for payment item "Furnishing and Delivering Prestressed Concrete Piles". The cost of driving pulled and undamaged piles will be paid for at the applicable contract unit price for payment item "Driving Prestressed Concrete Piles". The cost of pulling

undamaged piles will be paid for at twice the applicable contract unit price for payment item "Driving Prestressed Concrete Piles", which includes backfilling any remaining void. The cost of redriving pulled and undamaged piles will be paid for at the applicable contract unit price for payment item "Driving Prestressed Concrete Piles". No payment will be made for furnishing, delivering, driving, pulling, and disposing of piles, including pile driving points, pulled and found to be damaged and backfilling voids. New piles replacing damaged piles will be paid for at the applicable contract unit price for payment items "Furnishing and Delivering Prestressed Concrete Piles" and "Driving Prestressed Concrete Piles".

#### 1.7.3.2 Measurement

Furnishing and delivering pulled and undamaged permanent prestressed concrete piles will be measured for payment as specified in paragraph UNIT PRICES, subparagraph FURNISH AND DELIVER PRESTRESSED CONCRETE PILES. Pulling undamaged prestressed concrete piles will be measured for payment as specified in paragraph UNIT PRICES, subparagraph DRIVING PRESTRESSED CONCRETE PILES. Redriving pulled undamaged prestressed concrete piles will be measured for payment as specified in paragraph UNIT PRICES, subparagraph DRIVING PRESTRESSED CONCRETE PILES. New piles replacing damaged piles will be measured for payment as specified in paragraph UNIT PRICES, subparagraphs FURNISH AND DELIVER PRESTRESSED CONCRETE PILES and DRIVING PRESTRESSED CONCRETE PILES.

#### 1.7.3.3 Unit of Measure

Unit of measure: linear meter foot.

### [1.7.4 Prestressed Concrete Pile Driving Tests

#### 1.7.4.1 Payment

Payment will be made for costs associated with furnishing, delivering, driving, pulling, and disposing of driven test piles,[ including [pile driving points] [and] [splices];] conducting pile driving tests; backfilling voids around piles; compiling pile driving test records[; performing dynamic testing; interpreting data; and submitting reports].

#### 1.7.4.2 Measurement

Prestressed concrete pile driving tests will be measured for payment on the basis of the applicable contract unit price per pile driving test.

#### 1.7.4.3 Unit of Measure

Unit of measure: each.

### ]1.7.5 Prestressed Concrete Piles for Load Tests

#### 1.7.5.1 Payment

Payment will be made for costs associated with furnishing, delivering, driving, pulling, and disposing of load test piles[ including [pile driving points] [and] [splices];] backfilling voids around piles; compiling pile driving records[; furnishing, fabricating, and mounting of strain rods and protective assembly][; furnishing, fabricating, and mounting of inclinometer and inclinometer protective assembly][;

performing dynamic testing; interpreting data; and submitting reports]. No additional payment will be made for load test piles incorporated in the permanent work other than as provided.

#### 1.7.5.2 Measurement

Prestressed concrete piles for load tests will be measured for payment on the basis of the applicable contract unit price per load test pile.

#### 1.7.5.3 Unit of Measure

Unit of measure: each.

### ][1.7.6 Prestressed Concrete Pile Static Axial Compressive Load Tests

#### 1.7.6.1 Payment

Payment will be made for costs associated with prestressed concrete pile static axial compressive load tests in accordance with [ASTM D1143/D1143M](#), including material and labor for fabricating and furnishing load frames; calibrating load cells and hydraulic jacks; furnishing specified test equipment; installing strain rods; placing and removing test loads and test equipment; recording, reducing, and submitting test data; and compiling and submitting pile static axial load test reports. No payment will be made for rejected pile compressive load tests.

#### 1.7.6.2 Measurement

Prestressed concrete pile static axial compressive load tests will be measured for payment on the basis of the applicable contract unit price per load test.

#### 1.7.6.3 Unit of Measure

Unit of measure: each.

### ][1.7.7 Prestressed Concrete Pile Static Tensile Load Tests

#### 1.7.7.1 Payment

Payment will be made for costs associated with prestressed concrete pile static tensile load tests in accordance with [ASTM D3689/D3689M](#), including material and labor for fabricating and furnishing load frames; calibrating load cells and hydraulic jacks; furnishing specified test equipment; installing strain rods; placing and removing test loads and test equipment; recording, reducing, and submitting test data; and compiling and submitting pile load test reports. No payment will be made for rejected pile static tensile load tests.

#### 1.7.7.2 Measurement

Prestressed concrete pile tensile load tests will be measured for payment on the basis of the applicable contract unit price per number of tensile load test.

#### 1.7.7.3 Unit of Measure

Unit of measure: each.

#### ][1.7.8 Prestressed Concrete Pile Lateral Load Tests

##### 1.7.8.1 Payment

Payment will be made for costs associated with prestressed concrete pile lateral load tests in accordance with ASTM D3966/D3966M, including material and labor for fabricating and furnishing load frames; calibrating load cells and hydraulic jacks; furnishing specified test equipment; installing inclinometers; placing and removing test loads and test equipment; recording, reducing, and submitting test data; and compiling and submitting pile load test reports. No payment will be made for rejected pile lateral load tests.

##### 1.7.8.2 Measurement

Prestressed concrete pile lateral load tests will be measured for payment on the basis of the applicable contract unit price per lateral load test.

##### 1.7.8.3 Unit of Measure

Unit of measure: each.

#### ][1.7.9 Pulled Load Test Prestressed Concrete Piles

##### 1.7.9.1 Payment

Payment will be made for costs associated with load test prestressed concrete piles pulled prior to load testing at the direction of the Contracting Officer and found to be undamaged. The cost of furnishing, delivering, driving, and pulling undamaged load test piles will be paid for at the applicable contract unit price for payment item "Prestressed Concrete Piles for Load Tests". The cost of pulling undamaged load test piles the second time after re-driving and testing will be paid for at twice the applicable contract unit price for payment item "Driving Prestressed Concrete Piles". The cost of re-driving pulled undamaged load test piles will be paid for at the applicable contract unit price for payment item "Driving Prestressed Concrete Piles". No payment will be made for furnishing, delivering, driving, pulling, and disposing of load test piles pulled at the direction of the Contracting Officer and found to be damaged. New load test piles replacing damaged piles will be paid for at the applicable contract unit price for payment item "Prestressed Concrete Piles for Load Tests".

##### 1.7.9.2 Measurement

Pulled undamaged load test prestressed concrete piles will be measured for payment as specified in paragraph UNIT PRICES, subparagraph PRESTRESSED CONCRETE PILES FOR LOAD TESTS. Pulling undamaged load test prestressed concrete piles the second time after re-driving and testing will be measured for payment as specified in paragraph UNIT PRICES, subparagraph DRIVING PRESTRESSED CONCRETE PILES. Re-driving pulled undamaged prestressed concrete piles will be measured for payment as specified in paragraph UNIT PRICES, subparagraph DRIVING PRESTRESSED CONCRETE PILES. New load test prestressed concrete piles replacing damaged piles will be measured for payment as specified in paragraph UNIT PRICES, subparagraph PRESTRESSED CONCRETE PILES FOR LOAD TESTS.

#### 1.7.9.3 Unit of Measure

Unit of measure: as specified in paragraph UNIT PRICES, subparagraphs DRIVING PRESTRESSED CONCRETE PILES and PRESTRESSED CONCRETE PILES FOR LOAD TESTS, respectfully.

#### ][1.7.10 Pile Driving Shoes

##### 1.7.10.1 Payment

Payment will be made for costs associated with pile driving shoes, including furnishing, delivering, and installing.

##### 1.7.10.2 Measurement

Pile driving shoes will be measured for payment on the basis of the number of pile driving shoes required.

##### 1.7.10.3 Unit of Measure

Unit of measure: each.

#### ][1.7.11 Prestressed Concrete Pile Splices

##### 1.7.11.1 Payment

Payment will be made for costs associated with prestressed concrete pile splices, including all plant, labor, and material required to make the splice.

##### 1.7.11.2 Measurement

Prestressed concrete pile splices will be measured for payment on the basis of the applicable contract unit price per pile splice.

##### 1.7.11.3 Unit of Measure

Unit of measure: each.

#### ][1.7.12 Vibration Monitoring

##### 1.7.12.1 Payment

Payment will be made for costs associated with vibration monitoring.

##### 1.7.12.2 Measurement

Vibration monitoring will be measured for payment on the basis of the applicable contract unit price per vibration monitoring point.

##### 1.7.12.3 Unit of Measure

Unit of measure: each.

#### ][1.7.13 Sound Monitoring

##### 1.7.13.1 Payment

Payment will be made for costs associated with sound monitoring.

#### 1.7.13.2 Measurement

Sound monitoring will be measured for payment on the basis of the applicable contract unit price per vibration monitoring point.

#### 1.7.13.3 Unit of Measure

Unit of measure: each.

### ][1.7.14 Preconstruction Condition Survey

#### 1.7.14.1 Payment

Payment will be made for costs associated with preconstruction condition surveys.

#### 1.7.14.2 Measurement

Preconstruction condition survey will be measured for payment on the basis of the applicable contract unit price per structure to be surveyed.

#### 1.7.14.3 Unit of Measure

Unit of measure: each.

### ][1.7.15 Construction Instrumentation and Monitoring

#### 1.7.15.1 Payment

Payment will be made for costs associated with construction instrumentation and monitoring.

#### 1.7.15.2 Measurement

Construction instrumentation and monitoring will be measured as a single pay item.

#### 1.7.15.3 Unit of Measure

Unit of measure: one.

### ]]1.8 SUBMITTALS

\*\*\*\*\*

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list, and corresponding submittal items in the text, to reflect only the submittals required for the project. The Guide Specification technical editors have classified those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.

For Army projects, fill in the empty brackets

following the "G" classification, with a code of up to three characters to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" classification indicates submittals required as proof of compliance for sustainability Guiding Principles Validation or Third Party Certification and as described in Section 01 33 00 SUBMITTAL PROCEDURES.

Choose the first bracketed item for Navy, Air Force, and NASA projects, or choose the second bracketed item for Army projects.

\*\*\*\*\*

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are [for Contractor Quality Control approval.][for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

#### 1.9 DELIVERY, STORAGE, AND HANDLING

Store, handle, and transport piles in accordance with **PCI MNL-116** except as follows. Use methods for handling and storage of piles such that the piles are not subjected to excessive bending stress, cracking, spalling, or other damage. Follow the lifting instructions of the precaster.

### 1.9.1 Damaged Piles

Inspect each pile for sweep and structural damage such as cracking and spalling before transporting them to the project site and immediately prior to placement in the driving leads. Bring any cracks (cracks other than crazing, surface drying, shrinkage cracks and end cracks) to the attention of the Contracting Officer. Piles which are damaged during delivery, storage, or handling to the extent they are rendered unsuitable for the work, in the opinion of the Contracting Officer, will be rejected and removed from the project site, or may be repaired, if approved, at no cost to the Government.

Any pile damaged by reason of internal defects or by improper driving must be corrected by one of the following methods approved by the Engineer for the pile in question and the project Structural Engineer:

The pile is withdrawn, if practicable, and replaced by a new and, if necessary, longer pile.

One or more replacement piles are driven adjacent to the defective pile.

A Pile Dynamic Analysis and low integrity testing must be performed by the Contractor's Geotechnical Consultant to assess the structural integrity of the driven pile(s).

A pile driven below the specified butt elevation must be corrected by one of the following methods approved by the Engineer:

The pile is spliced (if approved).

A sufficient portion of the footing is extended down to properly embed the pile.

A pile driven out of its proper location or out of plumb as approved by the Engineer, must be corrected by one of the following methods approved by the engineer:

One or more replacement piles are driven next to the pile in question.

As directed by the structural engineer.

### 1.9.2 Repairable Cracks

Reject or repair piles with cracks equal to or greater than 0.15 mm 0.006 inches but less than 1.5 mm 0.06 inches. As an alternate to pile rejection, the Contractor may submit a proposal to repair deficient piles, which must be restored prior to driving to provide its required design capacity, perform its intended function in the structure, and take into consideration long term durability in corrosive environment.

### 1.9.3 Non-Repairable Cracks

Piles with cracks equal to or greater than 1.5 mm 0.06 inches will be rejected.

\*\*\*\*\*

**NOTE: Sweep and camber typically apply to steel piles. In special cases, this paragraph may apply**

to precast/pre-stressed concrete piles.

\*\*\*\*\*

#### [1.9.4 Pile Sweep

Limit sweep to 3 mm per 3 M 1/8 inch per 10 feet over the length of the pile. Piles having excessive sweep will be rejected.

#### ]1.10 QUALITY CONTROL

##### 1.10.1 Piles

Prepare in accordance with ACI SP-66. Indicate placement of reinforcement including tendons. Indicate location of special embedded or attached lifting devices, employment of pick-up points, support points other than pick-up points, and any other methods of pick-up. Provide certification of a Professional Engineer registered in any jurisdiction of the U.S. or its territories, that layout and details of reinforcement and tendons conform with that shown on the structural design drawings.

##### 1.10.2 Quality Control Procedures

Submit the precasting manufacturer's quality control procedures and inspection records established in accordance with PCI MNL-116.

##### 1.10.3 Installation Procedures

- a. Submit information on the type of equipment proposed to be used, proposed methods of operation, pile driving plan including proposed sequence of driving, and details of all pile driving equipment and accessories.
- [ b. Provide details of pile driving equipment and a Wave Equation Analysis of pile drivability for selection of the hammer along with a statement of driving procedures. The Wave Equation Analysis is to be completed by the Contractor's Geotechnical Consultant for each test pile location where different subsurface conditions exist and is to include the following information pertaining to the proposed pile driving equipment:
  - (1) Complete Pile and Driving Equipment Data Form, (which can be downloaded at: <http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-tables>) for each proposed pile hammer and pile type combination.
  - (2) Copies of computer input and output sheets and graphs showing soil resistance versus blow count as well as maximum tension and compression stresses versus blow count. Analysis must be run at the estimated tip elevation as well as other required elevations to define maximum stress levels in the pile during driving.
- c. Provide detailed procedures for conducting the dynamic pile load test and equipment to be used for conducting the load test. The detailed description must explain how specific information of pile performance will be evaluated.

##### ]1.10.4 Contractor's Geotechnical Consultant Documentation

Hire the services of an independent, Registered Professional Geotechnical

Engineer, experienced in soil mechanics and Pile Dynamic Analysis, to observe test pile installation and production pile installation as specified herein. The Contractor's Geotechnical Consultant must be independent of the Contractor and must have no employee of employer relationship which could constitute a conflict of interest.

Provide instructions and procedures on how the Contractor will assist the Government in the processes of[ Dynamic Pile Testing,] Inspection and Monitoring of piles during installation and testing.

#### 11.10.5 Concrete Mix Design

Certify, using a Government-approved independent commercial testing laboratory, that proportioning of mix is in accordance with ACI 211.1 or ACI 318M ACI 318 for specified strength and is based on aggregate data which has been determined by laboratory tests during last twelve months. Submit a complete list of materials including type; brand; source and amount of cement, fly ash, pozzolan, ground slag, and admixtures; and applicable reference specifications. Submit additional data regarding concrete aggregates if the source of aggregate changes. Submittal must clearly indicate where each mix design will be used when more than one mix design is submitted. Submit a concrete mix design before concrete is placed, for each type of concrete used for the piles. Submit concrete cylinder compressive strength test results.

#### 11.10.6 Load Test Supporting Data

Submit Jack calibration records, a testing arrangement description and diagram, and the proposed loading sequence.

#### 11.10.7 Silica Fume Manufacturer's Representative

Provide statement that the manufacturer's representative will be present at plant to ensure proper mix, including high range water reducer (HRWR), and batching methods.

### PART 2 PRODUCTS

#### 2.1 PILE REQUIREMENTS

\*\*\*\*\*  
**NOTE: Delete sentence in brackets when test piles are not required. Government requires the Contractor to employ a Geotechnical Consultant to determine the calculated tip elevation and provide oversight of piling installation and testing.**  
\*\*\*\*\*

Provide precast prestressed concrete piles per PCI Journal Volume 38, Number 2 (PCI JR-382). Production of piles must be in accordance with PCI MNL-116.[ Order test piles [3] [ ] meters [10] [ ] feet longer in length than production piles.[ Drive the additional test pile length only when based upon the recommendation of the Contractor's Geotechnical Consultant and approved by the Contracting Officer.] The [Contractor's Geotechnical Consultant][Contracting Officer] will use test pile data to determine "calculated" pile tip elevation and necessary driving resistance. This information will be given to the Contractor no later than 7 days from receipt of complete test data. Use this list as the basis for ordering the piles. Do not order piles until list is

provided by the [Contractor's Geotechnical Consultant][Contracting Officer].][ Provide test piles [1.5] [\_\_\_\_\_] meter [5] [\_\_\_\_\_] feet longer than the bid length.]

## 2.2 MATERIALS

### 2.2.1 Cementitious Materials

Cementitious materials must be portland cement, [blended cement ]or portland cement in combination with natural pozzolan or fly ash[ or ground granulated blast furnace slag] and conforms to appropriate specifications listed below.

#### 2.2.1.1 Cement

\*\*\*\*\*

NOTE: Insert type of cement required. Generally, Types II, or I/II, is preferred. Type I, or Type III with 8 percent maximum C3A and "low alkali", may be used. Do not use Type III in conjunction with silica fume. In very special cases, Type V, "low alkali," which has limited availability, may be used.

\*\*\*\*\*

\*\*\*\*\*

NOTE: Cement type and quantity of cement required in mix design is dependent upon the environment, soil conditions, need for corrosion protection, and location of piling:

##### (a) CHLORIDE PROTECTION:

Normal Use. In fresh water or air environment, specify Type I or Type II cement. Type III may be permitted provided tricalcium aluminate (C3A) content is limited to 8 percent and it is low alkali.

Marine Use. In soil or water environments, subject to chlorides above 1,000 ppm, within about 300 m 1000 feet of the ocean or tidal water, specify Type II or Type III (with a maximum tricalcium aluminate (C3A) content of 8 percent and low alkali) cement, a minimum cementitious materials content of 335 kilograms per cubic meter 564 pounds per cubic yard and a maximum water to cementitious materials ratio of 0.40.

Seawater Exposure. In direct contact with ocean water, specify Type II or Type III (with a maximum tricalcium aluminate (C3A) content of 8 percent and low alkali) cement, a minimum cementitious materials content of 390 kilograms per cubic meter 658 pounds per cubic yard and a maximum water to cementitious materials ratio of 0.40.

(b) SULFATE RESISTANCE minimum cementitious materials content of 335 kilograms per cubic meter 564 pounds per cubic yard is recommended.

Normal Use. In soils with negligible amount of sulfate, specify Type I or Type II cement. Type III cement may be permitted provided tricalcium aluminate (C3A) content is limited to 8 percent and it is low alkali.

Moderate Sulfate Exposure. In exposures with moderate sulfate content (between 0.10 and 0.20 percent in soil and less than 1500 ppm in water), specify Type II or Type III (with a maximum tricalcium aluminate (C3A) content of 8 percent and low alkali) cement and a maximum water to cementitious materials ratio of 0.40. Do not use Class C fly ash, blast furnace slag, or silica fume for cement replacement.

Severe Sulfate Exposure. In exposures with high sulfate content (exceeds 0.20 percent in soil or 1500 ppm in water), specify Type V or Type II (with a maximum tricalcium aluminate content of 5 percent) cement, and a maximum water to cementitious materials ratio of 0.40. Do not use Class C fly ash, blast furnace slag, or silica fume for cement replacement.

Alkali-Silica Reactivity. When alkali-silica reactivity is a concern, it is recommended to limit the maximum alkali content of cement to 0.40 or 0.50, when it is locally available, otherwise use 0.60.

\*\*\*\*\*

ASTM C150/C150M, [Type I, II, or III [\_\_\_\_\_] with a maximum alkali content of [0.40] [0.60] percent][; or] [ASTM C595/C595M, Type [IP(MS) or IS(MS)] [\_\_\_\_\_] blended cement except as modified herein. The blended cement must consist of a mixture of ASTM C150/C150M cement (with alkali content not exceeding [0.40] [0.60] percent) and one of the following materials: ASTM C618 pozzolan or fly ash, or ASTM C989/C989M ground iron blast-furnace slag, or ASTM C1240 silica fume. Use cement with a maximum of 0.60 percent alkali if no satisfactory test results are available (made within the past six months) to prove that the cement alkali content is less than 0.40 percent. Cement certificates must include test results in accordance with ASTM C150/C150M, including equivalent alkalies indicated in the optional chemical requirements.[ Use cement with a tricalcium aluminate (C3A) content of less than [8] [5] percent.] Do not use Type III cement in conjunction with silica fume.

\*\*\*\*\*

NOTE: Fly ash, pozzolan, and ground iron blast-furnace slag increase durability. They may produce uneven discoloration of the concrete during the early stages of construction, depending upon the type of curing provided. Use Fly ash/pozzolan (loss on ignition not exceeding 3 percent) for frost areas to reduce carbon interference with air entraining admixture. Straight replacement with fly ash or natural pozzolan beyond 15 percent may decrease the concrete's strength gain rate. The following options can help mitigate this slower gain rate: (1)

a lower water/cement ratio may be used, (2) partial cement replacement can be completed, e.g., one sack of cement can be replaced by 1.5 sacks of fly ash, as long as the final replacement ratio meets the requirements, and (3) very fine fly ashes or pozzolans (e.g. with average particle sizes below 5 microns) can be used.

\*\*\*\*\*

#### 2.2.1.2 Fly Ash and Pozzolan

\*\*\*\*\*

NOTE: Loss on ignition greater than 3 percent may result in significant variations in air content. The air entrainment admixture content may need to be varied often to maintain the same level of entrained air.

\*\*\*\*\*

ASTM C618, Class N, or F except that the maximum total alkalis must be 3.0 percent, and the maximum allowable loss on ignition must be [3] [6] percent. If the aggregates are reactive, the maximum calcium oxide content must be 13.0 percent. Do not use Class C.

#### 2.2.1.3 Ground Iron Blast-Furnace Slag

ASTM C989/C989M, Grade 120.

#### 2.2.1.4 Silica-Fume

\*\*\*\*\*

NOTE: Use silica fume concrete for marine structures where low permeability and enhanced durability are necessary. The silica fume and HRWR additive should be from the same manufacturer. The Contractor and batch plant may need help from the manufacturer. Select weight percentage based on performance required. If used, a replacement of 7 percent is recommended.

\*\*\*\*\*

\*\*\*\*\*

NOTE: Use for high durability and low permeability. The initial cost of the concrete will increase, and supervision at the batch plant, finishing, and curing is necessary. A HRWR must be used with silica fume. The slump can be increased 50 to 125 mm 2 to 5 inches without reducing strength. Finishing may be more difficult. Proper curing is essential because there is a tendency for plastic shrinkage cracking.

\*\*\*\*\*

ASTM C1240, provide silica fume that is a by-product of silicon or ferrosilicon production. Provide percent by weight of the total cementitious materials as indicated in the table below.

#### 2.2.1.5 Supplemental Cementitious Materials (SCM) Content

The concrete mix must contain one of the SCMs listed below, or a linear combination thereof.

SUPPLEMENTARY CEMENTITIOUS MATERIALS CONTENT		
SCM	Minimum Content	Maximum Content
Class N Pozzolan or Class F Fly Ash with SiO <sub>2</sub> plus Al <sub>2</sub> O <sub>3</sub> plus Fe <sub>2</sub> O <sub>3</sub> greater than 70 percent	25 percent	35 percent
Class N Pozzolan or Class F Fly Ash with SiO <sub>2</sub> plus Al <sub>2</sub> O <sub>3</sub> plus Fe <sub>2</sub> O <sub>3</sub> greater than 80 percent	20 percent	35 percent
Class N Pozzolan or Class F Fly Ash with SiO <sub>2</sub> plus Al <sub>2</sub> O <sub>3</sub> plus Fe <sub>2</sub> O <sub>3</sub> greater than 90 percent	15 percent	35 percent
GGBF Slag	30 percent	50 percent
Silica Fume	5 percent	10 percent

#### 2.2.2 Water

Water must be fresh, clean, and potable; free from injurious amounts of oils, acids, alkalis, salts, organic materials, or other substances deleterious to concrete or steel.

#### 2.2.3 Aggregates

\*\*\*\*\*

NOTE: For exposed piles in areas where reactive aggregates are likely to be supplied, provide for additional tests and certification to insure that reactive aggregates will not be used. While not wholly conclusive, petrographic examination (ASTM C295/C295M), chemical test (ASTM C289/C289M), and mortar bar method (ASTM C227) are valuable indicators.

While more reliable, the concrete prism test (ASTM C1293) takes 1 to 2 years to complete and is not practical. The accelerated mortar bar method (ASTM C1260) is similarly reliable and takes only 16 days to yield results. In areas where reactive aggregates can not be avoided, specify use of low alkali cement, and cements modified to mitigate alkali-silica reactivity. Service records of concrete made with these materials along with tests should be used in evaluating these materials.

\*\*\*\*\*

\*\*\*\*\*

NOTE: Include modification to ASTM C33/C33M when

reactive aggregates could be encountered. More modifications may be required. Additional tests and certifications may be required in the submittal paragraphs.

\*\*\*\*\*

ASTM C33/C33M[, except as modified herein. Provide aggregate free from any substance which may be deleteriously reactive with alkalies in cement in an amount sufficient to cause excessive expansion of concrete]. Do not mix, store in same stockpile, or use fine aggregates from different sources of supply in same concrete mix or same structure without approval. The fineness modulus of fine aggregate must be not less than 2.40 or greater than 3.0. For piles that will be exposed to freezing and thawing, fine and coarse aggregate subjected to five cycles of the sodium sulfate soundness test must show a loss not greater than 10 percent. If the selected aggregates fail the soundness test, the Contractor may use the aggregate source, provided concrete specimens made with the aggregates to be used for the piles must have a durability factor of not less than 80 based on 300 cycles of freezing and thawing when tested in accordance with ASTM C666/C666M. Prior to pile fabrication, submit certified test reports for the following tests specified in ASTM C33/C33M[, in addition, test the gradation of each size of aggregate in accordance with ASTM C136/C136M], [twice] [\_\_\_\_\_] during each shift when the concrete plant is operating:

- a. Grading
- b. Amount of material finer than 75 micrometers No. 200 sieve
- c. Organic impurities
- d. Soundness
- e. Clay lumps and friable particles
- f. Coal and lignite
- g. Weight of slag
- h. Abrasion of coarse aggregate
- i. Fineness modulus
- j. Reactive aggregates
- k. Freezing and thawing

#### 2.2.3.1 Alkali-Silica Reactivity (ASR)

Evaluate and test fine and coarse aggregates to be used in all concrete for alkali-aggregate activity.

Separately evaluate the fine and coarse aggregates using ASTM C1260. Test results of the individual aggregates must have a measured expansion equal to or less than 0.08 percent at 14 days after casting per ASTM C1260. If the test data indicates an expansion of greater than 0.08 percent, reject the aggregate(s) or perform additional testing, using ASTM C1567, as follows: utilize the Contractor's proposed low alkali portland cement [blended cement] and SCM in combination with the proposed aggregate for the test portioning. Determine the SCM quantity that will meet all the

requirements of these specifications and that will lower the **ASTM C1567** expansion to equal or less than 0.08 percent at 14 days after casting.

If the above option does not lower the expansion to less than 0.08 percent at 14 days after casting, reject the aggregate(s) and submit new aggregate sources for retesting. Submit the results of testing to the Contracting Officer for evaluation and acceptance.

#### 2.2.4 Admixtures

\*\*\*\*\*  
NOTE: For guidance in use of either water-reducing admixtures, set retarding admixtures, or combination of admixtures, see ACI 543R-74, "Recommendations for Design, Manufacture, and Installation of Concrete Piles."  
\*\*\*\*\*

Chemical admixtures must conform to **ASTM C494/C494M**, [Type A] [Type B]. [Air-entraining admixture must conform to **ASTM C260/C260M**.] Do not use admixtures containing chlorides.

#### 2.2.5 Prestressing Steel

Use seven-wire stress-relieved or low-relaxation strand conforming to **ASTM A416/A416M**, Grade 270. Use prestressing steel free of grease, oil, wax, paint, soil, dirt, and loose rust. Do not use prestressing strands or wire having kinks, bends, or other defects.

#### 2.2.6 Reinforcing Steel

\*\*\*\*\*  
NOTE: Minimum cover for reinforcing steel in concrete structures is dependent upon the environment, soil conditions, need for corrosion protection, and location of piling. For normal exposure minimum cover is **50 mm 2 inches**. For piles exposed to marine conditions (chloride content above 1000 ppm) in or within about **300 m 1000 feet** of the ocean or tidal water, use **75 mm 3 inches** minimum cover, including the chamfered corners. For additional detailed guidance, see following publications: ACI 543R, "Recommendations for Design, Manufacture and Installation of Concrete Piles" (ACI Manual, Part 3); State of California, Department of Public Works, Design Specifications, Volume 1, Bridge Planning and Design Manual, Chapter 6. Piles to be used in a marine environment may receive a protective coating, particularly if the piles are steam cured. The protective coating should be applied to that portion of pile which remains aboveground or water line. Show areas to be protected on drawings.  
\*\*\*\*\*

\*\*\*\*\*  
NOTE: Insert grade of reinforcement. Specify **ASTM A706/A706M** reinforcing where welding or bending of reinforcement bars is important. In addition, **ASTM**

A934/A934M may be specified where extra reinforcement protection is required.

\*\*\*\*\*

ASTM A615/A615M, Grade [300][420] [40][60]; [ASTM A706/A706M, Grade [420] [60];] or ASTM A996/A996M, Grade [350][420] [50][60].[ Weld reinforcing steel in accordance with AWS D1.4/D1.4M.]

#### 2.2.7 Ties and Spirals

\*\*\*\*\*

NOTE: If project has been designed for epoxy rebar, add ASTM A934/A934M, "Epoxy-Coated Prefabricated Steel Reinforcing Bars" in this paragraph and in the paragraph REFERENCES.

\*\*\*\*\*

Steel, ASTM A1064/A1064M for spirals and ASTM A615/A615M [ASTM A706/A706M] for ties.

#### 2.2.8 Anchorages and End Fittings

ACI 318M ACI 318.

#### 2.2.9 Grout

Provide cement grout for prestressed piles using materials conforming to requirements stipulated herein for concrete mixes. Use admixtures, if required, known to have no injurious effects on steel or concrete. Do not use calcium chloride.

##### [2.2.10 Epoxy Coating

[EP-3][\_\_\_\_\_] conforming to Section [\_\_\_\_\_] , "Epoxy-Resin Systems" of [\_\_\_\_\_]DOT RBS. Coat the top 7500 mm 25 feet of piles.

##### ]2.2.11 H-Pile Extensions

Use H-pile extensions for composite prestressed concrete-steel piles of steel conforming to the requirements of [ASTM A36/A36M] [ASTM A572/A572M].

##### ]2.2.12 Pile Driving Points

Use pile driving points of steel conforming to the requirements of ASTM A27/A27M or [ASTM A36/A36M] [ASTM A572/A572M], of the [type] [details] indicated.

#### ]2.3 CONCRETE MIX DESIGN

\*\*\*\*\*

NOTE: Insert the minimum 28 day compressive strength required by the design. A minimum of 35 MPa 5000 psi is generally required. Insert aggregate size, either 19 mm 3/4 inch or 25 mm one inch is generally maximum. For marine exposure, (or moderate and severe sulfate exposure) include last bracketed sentence, which limits the water-cement ratio to a maximum of 0.40.

\*\*\*\*\*

\*\*\*\*\*

NOTE: Air-entrainment may be considered optional  
only in regions that do not experience freezing  
temperatures.

\*\*\*\*\*

ACI 211.1 or ACI 318M ACI 318, Chapter 4. Concrete must have a minimum compressive strength of [35] [\_\_\_\_\_] MPa [5000] [\_\_\_\_\_] psi at 28 days and a maximum size aggregate of [\_\_\_\_\_] mm inches. Concrete must be air entrained with a minimum of 4.5 percent and a maximum of 7.5 percent. Mix must contain fly ash, ground iron blast furnace slag or silica fume to meet the requirements specified herein to mitigate Alkali-Silica Reactivity (ASR).[ For marine exposure, ensure a dense concrete free of shrinkage cracks, with a minimum degree of permeability. The maximum water cement ratio must be 0.40.]

## 2.4 FABRICATION

### 2.4.1 Formwork

Formwork and dimensional tolerances must be in accordance with PCI MNL-116, PCI MNL-135, and as specified herein. Provide forms of metal, braced and stiffened against deformation, accurately constructed, watertight, and supported on unyielding casting beds. Forms must permit movement of pile without damage during release of prestressing force. Form precast dowel holes with galvanized flexible metal conduit.[ Inside forms or void tubes not to be grouted may be treated cardboard, plywood, or other material.]

### 2.4.2 Pretensioning

Perform pretensioning in accordance with PCI MNL-116, and as specified herein. Use gage calibrated within last [6 months][\_\_\_\_\_] by a laboratory approved by Contracting Officer. Provide means for measuring elongation of steel to nearest 3 mm 1/8 inch. Give tensioning steel a uniform prestress prior to being brought to design prestress. Induce same initial prestress in each unit when several units of prestressing steel in a pile are stretched simultaneously.

### 2.4.3 Casting

#### 2.4.3.1 Conveying

Convey concrete to formwork in accordance with PCI MNL-116, and as specified herein. Clean conveying equipment thoroughly before each run. During placing, make any free vertical drop of the concrete less than 0.91 m 3 feet. Remove concrete which has segregated in conveying or placing.

#### 2.4.3.2 Placing and Casting

\*\*\*\*\*

NOTE: Select the size of chamfer required. Consult  
with local producers. Where project requires a  
large quantity of piling a specific value may be  
specified, otherwise, use a minimum or a range of  
values.

\*\*\*\*\*

Perform concrete casting within 3 days after pretensioning steel; however,

do not deposit concrete in forms until placement of reinforcement and anchorages has been inspected and approved by pile manufacturer's quality control representative. Produce each pile of dense concrete straight with smooth surfaces with reinforcement retained in its proper position during fabrication. Use vibrator with heads smaller than the minimum distance between steel for pretensioning. Make surface of pile ends perpendicular to axis of pile. Chamfer, [ a minimum of 19 mm 3/4 inch, ][ [\_\_\_\_\_] mm [\_\_\_\_\_] inch, ][ between 19 mm and 31 mm 3/4 inch and 1 1/4 inch, ] ends of piles and corners of square piles.

#### 2.4.4 Curing of Piles

Cure piles using moist or accelerated curing in accordance with the PCI MNL-116 except as follows. [\_\_\_\_\_]

##### 2.4.4.1 Moist Curing

Moist cure using moist burlap coverings, plastic sheeting, or membrane curing compound until minimum strength to detension is achieved.

##### 2.4.4.2 Accelerated Curing

After placement of concrete, moist cure for a period of 4 hours. Follow by accelerated curing until concrete has reached specified release strength. Enclose casting bed for accelerated curing with a suitable enclosure. During application of steam or heat, increase the air temperature at a rate not to exceed 22 degrees C 40 degrees F per hour. Cure at a maximum temperature of 65 degrees C 150 degrees F until concrete has reached specified release strength. Reduce temperature at a rate not to exceed 11 degrees C 20 degrees F per hour until a temperature of 11 degrees C 20 degrees F above ambient air temperature is reached. After accelerated curing, moist cure using either water or membrane curing until a total accelerated and moist curing time of 72 hours is achieved.

#### 2.4.5 Detensioning

\*\*\*\*\*  
NOTE: Specify "release strength." Release strength of 30 MPa 4000 psi (Design strength) of 35 MPa 5000 psi or 0.8 of the 28 day design strength is desirable; however, some regions use 0.7 of the design strength 25 MPa 3500 psi for design strength of 35 MPa 5000 psi. A minimum release strength of 0.6 of the design strength is required. Check with local pile manufacturers.  
\*\*\*\*\*

Perform detensioning in accordance with PCI MNL-116, and as specified herein. Gradually release tension in strands from anchorage. Detension after approval by pile manufacturer's quality control representative. Perform transfer of prestressing force when concrete has reached a minimum compressive strength of [\_\_\_\_\_] MPa psi.

#### 2.5 PRODUCT QUALITY CONTROL

Where piling is manufactured in a plant with an established quality control program as attested to by a current certification in the PCI "Certification Program for Quality Control" perform product quality control in accordance with PCI MNL-116. Where piling is manufactured by

specialists or in plants not currently enrolled in the PCI "Certification Program for Quality Control," set-up a product quality control system in accordance with [PCI MNL-116](#) and perform concrete and aggregate quality control testing using an independent commercial testing laboratory approved by the Contracting Officer in accordance with the following.

#### 2.5.1 Piles

Prepare shop drawings in accordance with [ACI SP-66](#). Indicate placement of reinforcement including tendons. Indicate location of special embedded or attached lifting devices, employment of pick-up points, support points other than pick-up points, and any other methods of pick-up.[ Provide certification of a Professional Engineer registered in any jurisdiction of the U.S. or its territories, that layout and details of reinforcement and tendons conform with that shown on the structural design drawings.]

#### [2.5.2 Silica Fume Manufacturer's Representative

Provide statement that the manufacturer's representative will be present at plant to ensure proper mix, including high range water reducer (HRWR), and batching methods.

#### ]2.5.3 Aggregate Tests

Take samples of fine and coarse aggregate at concrete batch plant and test. Perform mechanical analysis (one test for each aggregate size) in accordance with [ASTM C136/C136M](#). Tabulate results of tests in accordance with [ASTM C33/C33M](#).

#### 2.5.4 Slump and Strength Tests

Sample concrete in accordance with [ASTM C172/C172M](#) at time concrete is deposited for each production line. Perform slump tests in accordance with [ASTM C143/C143M](#). Mold cylinders in accordance with [ASTM C31/C31M](#). Mold at least six cylinders per day or one for every [\[15\] \[45\] cubic meter](#) [\[20\] \[60\] cubic yards](#) of concrete placed, whichever is greater. Cure cylinders in same manner as piles and for accelerated curing, place at coolest point in casting bed. Perform strength tests in accordance with [ASTM C39/C39M](#). Test two cylinders of each set at 7 days or 14 days, or at a time for establishing transfer of prestressing force (release strength) and removal of pile from forms. Test remaining cylinders of each set 28 days after molding.

#### 2.5.5 Changes in Proportions

If, after evaluation of strength test results, compressive strength is less than specified compressive strength, make adjustments in proportions and water content and changes in temperature, moisture, and curing procedures as necessary to secure specified strength. Submit changes in mix design to Contracting Officer in writing.

#### 2.5.6 [Compressive Strength](#) Test Results

Evaluate compressive strength test results at 28 days in accordance with [ACI 214R](#) using a coefficient of variation of 10 percent. Evaluate strength of concrete by averaging test results of each set of standard cylinders tested at 28 days. Not more than 10 percent of individual cylinders tested must have a compressive strength less than specified design strength.

#### 2.5.7 Chloride Ion Concentration

Sampling and determination of water soluble chloride ion content in accordance with [ASTM C1218/C1218M](#). Maximum water soluble chloride ion concentrations in hardened concrete at ages from 28 to 42 days contributed from the ingredients including water, aggregates, cementitious materials, and admixtures must not exceed 0.06 percent by weight of cement.

#### 2.5.8 Chloride Ion Penetration

Proportion concrete to have the chloride ion penetration test in accordance with [ASTM C1202](#) to ensure the durability of concrete in marine environment, and be below 3000 coulombs for concrete specimens tested at 56 days.

#### 2.5.9 Precasting Manufacturer's Quality Control Procedures

Submit the precasting manufacturer's quality control procedures and inspection records established in accordance with [PCI MNL-116](#).

### 2.6 MATERIAL SUSTAINABILITY CRITERIA

For materials used, where applicable and to extent allowed by performance criteria, provide and document the following in accordance with Section [01 33 29](#) SUSTAINABILITY REQUIREMENTS AND REPORTING:

- a. Recycled content for fly ash and pozzolan.
- b. Recycled content for Ground Iron Blast-Furnace Slag.
- c. Recycled content for Silica Fume.
- d. Minimum [75 percent] [\_\_\_\_\_] recycled content for steel used for stressed tendon reinforcing.

### 2.7 PILE DRIVING EQUIPMENT

Submit descriptions of pile driving equipment, including hammers, power packs, driving helmets, hammer cushions, pile cushions, leads, extractors, jetting equipment, and preboring equipment at least 30 days prior to commencement of work.

Provide Pile Driving Equipment as mentioned in this section.

#### 2.7.1 Pile Hammers

Provide a hammer capable of developing the indicated ultimate pile capacity at blow count less than 100 per [300 mm foot](#) considering hammer impact velocity; ram weight; stiffness of hammer and pile cushions; cross section, length, and total weight of pile; and character of subsurface material to be encountered.[ Use the same pile hammer, operating at the same rate and in the same manner, as that used for driving test piles.] Use wave equation analysis to verify that the hammer will develop stresses within acceptable limits in the piles. At final driving, operate pile hammer in accordance with manufacturer's recommendation. Provide the plant and equipment for air hammers that have sufficient capacity to maintain, under working conditions, the pressure at the hammer specified by the manufacturer. The hose connecting the compressor with the hammer

must be at least the minimum size recommended by the Manufacturer. Evaluate hammer performance at the end of driving by measuring blows per minute and comparing with the manufacturer's recommendations. Measure impact velocity of open-end (single acting) diesel hammers at all times during pile driving operations with a device for this purpose. If such a device is not available, obtain the stroke by measuring the speed of operation either manually or with a device that makes the measurement automatically. Equip closed-end (double acting) diesel hammers with a bounce chamber pressure gauge in good working order, mounted near ground level so as to be easily read by the Contracting Officer. Provide a correlation chart of bounce chamber pressure and potential energy. Equip hydraulic hammers with a system for measurement of ram energy. The system must be in good working order and the results must be easily and immediately available to the Engineer.

## 2.7.2 Driving Helmets and Cushion Blocks

### 2.7.2.1 Driving Helmets or Caps and Pile Cushions

Use a steel driving helmet or cap including a pile cushion between top of pile and driving helmet or cap to prevent impact damage to pile. Use a driving helmet or cap and pile cushion combination capable of protecting pile head, minimizing energy absorption and dissipation, and transmitting hammer energy uniformly over top of pile. Provide driving helmet or cap that fits sufficiently loose around top of pile so that pile may be free to rotate without binding within driving helmet.[ During test pile installation, demonstrate to satisfaction of Contracting Officer that equipment to be used on project performs specified function.] Use pile cushion of solid wood or of laminated construction using plywood, softwood or hardwood boards with grain parallel to end of pile. Select the pile cushion thickness placed on the pile head prior to driving by wave equation analysis so that the limiting driving stresses are not exceeded. Replace pile cushion at the start of driving of each pile and when it becomes highly compressed, charred or burned, or has become spongy or deteriorated in any manner. Show details of driving helmets, capblocks (hammer cushions), and pile cushions. Submit 2 weeks prior to [test] pile installation.

### 2.7.2.2 Hammer Cushion or Capblock

\*\*\*\*\*  
**NOTE: Select either wood or aluminum/micarta capblock. Delete inappropriate sentences. An aluminum/micarta capblock is recommended because of its consistent elastic properties and long life. If final pile penetration resistance is based on a Wave Equation analysis, the type of capblock used should be the same as that used in the analysis.**  
\*\*\*\*\*

Use a hammer cushion or capblock between driving helmet or cap and hammer ram consisting of[ a solid hardwood block with grain parallel to the pile axis and enclosed in a close-fitting steel housing][ aluminum and micarta (or equal) discs stacked alternately in a steel housing or a suitable polymer designed for this specific purpose as indicated by the hammer manufacturer]. Use steel plates at top and bottom of capblock (hammer cushion).[ Replace wood capblock (hammer cushion) when it becomes highly compressed, charred or burned or becomes spongy or deteriorated in any manner.][ Replace aluminum, micarta or polymer discs that have become

damaged, split or deteriorated in any manner.][ Do not replace wood capblock (hammer cushion) during final driving of any pile.] Do not use small wood blocks, wood chips, rope or other materials that permit excessive loss of hammer energy.

### PART 3 EXECUTION

#### 3.1 PRELIMINARY WORK

##### [3.1.1 Wave Equation Analysis of Pile Drivability

- a. Prior to driving any pile, submit a pile Wave Equation Analysis, performed by Contractor's Geotechnical Consultant, for each size pile and distinct subsurface profile condition. These analyses must take into account the proposed hammer assembly, pile cap block and cushion characteristics, the pile properties and estimated lengths and the soil properties anticipated to be encountered throughout the installed pile length based on static capacity analysis with consideration of driving gain/loss factors. Only one specific model of pile hammer may be used for each pile type and capacity.
- b. Demonstrate using the Wave Equation Analysis that the piles will not be damaged during driving, must indicate that the driving stresses will be maintained within the limits below and indicate the blow count necessary to achieve the required ultimate static pile capacities.

#### Allowable Driving Stresses

##### Concrete

Compression - 0.85 f'c minus UPL  
Tension - (3 times (the square root of f'c)) plus UPL

f'c is compressive strength of concrete  
UPL = Unit Prestress after Losses  
(Obtain values from pile manufacturer)

- c. Perform a refined Wave Equation Analysis upon completion of the dynamic and static testing programs outlined in this specification section, taking into consideration the evaluated capacities, gain/loss factors and recommended production pile lengths.[ Develop production pile driving criteria based on the results of the refined Wave Equation Evaluations.]
- d. All pile driving equipment provided by the Contractor will be subject to the approval of the Contractor's Geotechnical Consultant. Complete the attached pile and driving equipment data form, including hammer information, in full as part of the submittal of the results of the Wave Equation Analyses.
- e. Pay for the cost of performing the Wave Equation Analyses and include in the base bid.

##### ]3.1.2 Pile Length Markings

Mark each pile prior to driving with horizontal lines at 305 mm one foot intervals. Mark the interval number on pile every 1.5 2m 5 feet from pile tip.

## 3.2 PILE DRIVING

### 3.2.1 Driving Piles

\*\*\*\*\*

NOTE: Delete bracketed option for foundation excavation when not required. Delete items in brackets dealing with tip elevation and driving resistance when test piles or load tests are not used. Delete item in brackets regarding predrilling or jetting when procedure is not used. If needed, insert maximum hammer energy for no tip resistance. This can be determined by comparing tensile stresses in pile resulting from a Wave Equation Analysis with effective prestress in pile.

\*\*\*\*\*

Notify Contracting Officer 10 days prior to driving of [test] piles[ and load test]. [ Stop foundation excavation at 300 mm one foot above foundation grade before piles are driven. Do not drive piles within 30 meter 100 feet of concrete less than 7 days old. Complete excavation to lines and grades shown when pile driving is completed.] Piles may be driven when the specified 28-day concrete strength has been achieved but not less than 7 days after casting. [ The Contractor's Geotechnical Consultant will determine the terminal driving criteria based on results of [dynamic pile driving tests at the end of drive or restrrike] [static load tests] [wave equation analysis].] Drive piles to [the terminal driving criteria ][or below "calculated"] [indicated tip elevation] [to reach a driving resistance established by the [dynamic pile driving tests at the end of drive or restrrike] [static load tests] [wave equation analyses (WEAP)] in accordance with the schedule which the [Contractor's Geotechnical Consultant] [Contracting Officer] will prepare from the test-pile driving data]. During initial driving and until pile tip has penetrated beyond layers of very soft soil[ or below bottom of predrilled or prejetted holes], use a reduced driving energy of the hammer as required to prevent pile damage. Refusal criteria will be established by the Contracting Officer. If a pile fails to reach ["calculated"] [indicated] tip elevation,[ or if a pile reaches ["calculated"] tip elevation without reaching required driving resistance,] notify Contracting Officer and perform corrective measures as directed. Provide hearing protection when noise levels exceed 140 dB. Do not handle or move piles or pile sections in any manner that would result in cracking or permanent damage to the concrete or to the grout surrounding the prestressing cables. Piles may be driven without pile guides or leads providing a hammer guide frame is used to keep the pile and hammer in alignment.

### 3.2.2 Protection of Piles

\*\*\*\*\*

NOTE: Delete references to batter piles when not applicable to the project. Use more stringent criteria as necessary based on the application. Confirm with the structural engineer.

\*\*\*\*\*

Take care to avoid damage to piles during handling, placing pile in leads, and during pile driving operations. Support piles laterally during driving, but allow rotation in leads. [ Where pile or projecting

reinforcement orientation is essential, take precautionary measures to maintain the orientation during driving.]] Take special care in supporting battered piles to prevent excessive bending stresses in pile.]] Square top of pile to longitudinal axis of pile. Maintain axial alignment of pile hammer with that of the pile. If the Contractor elects to use a pile head with projecting strands or mild steel reinforcement, prevent direct impact forces from being transmitted through the reinforcement, by using a special driving head.

### 3.2.3 Pile Placement and Tolerances in Driving

\*\*\*\*\*  
**NOTE: Omit references to batter piles when not applicable to the project. Select appropriate tolerances for type of pile.**  
\*\*\*\*\*

Submit pile placement plans at least 30 days prior to delivery of piles to the job site.

Drive piles with a variation of not more than 2 percent from vertical for plumb piles or more than 4 percent from required angle for batter piles. Maintain and check axial alignment of pile and leads at all times. If subsurface conditions cause pile drifting beyond allowable axial alignment tolerance, notify Contracting Officer and perform corrective measures as directed. Place butts within 100 mm 4 inches of location indicated.]] Manipulation of piles within specified tolerances]] will not be permitted.]] will be permitted, to a maximum of 1 1/2-percent of their exposed length above ground surface or mudline.]] In addition to specified tolerances, maintain a location to provide a clear distance of at least 125 mm 5 inches from butt to edge of pile cap. If clear distance can not be maintained, then notify Contracting Officer. Check each pile for heave. Redrive heaved piles to required point elevation.

### 3.2.4 Rejected Piles

Withdraw piles damaged or impaired for use during handling or driving, mislocated, or driven out of alignment beyond the maximum tolerance. Replace with new piles or cut-off and abandon damaged or impaired piles and drive new piles as directed. Remove excess cut-off from piles and unacceptable piles from the work site. Perform all work in connection with withdrawing and removing rejected piles from the site at no additional cost to the Government.

### 3.2.5 Jetting of Piles

\*\*\*\*\*  
**NOTE: Jetting should generally not be permitted for piles:**  
  
1. Dependent on side friction in fine-grained low permeability soils (high clay or silt content) where considerable time is required for the soil to reconsolidate around the piles.  
  
2. Subject to uplift or lateral forces.  
  
3. Adjacent to existing structures.

**4. In closely spaced clusters unless the load capacity is confirmed by test.**

\*\*\*\*\*

Water jets will[ not] be permitted.[ Use jetting to assist driving piles through strata that cannot be penetrated practicably by use of the hammer alone.[ Restrict driving to a static weight while water is being injected to prevent inducing tensile stresses in the piles which damage the concrete.] Discontinue jetting and resume hammer driving after the penetration of the strata requiring jetting has been accomplished.][ Discontinue jetting when the pile tip is approximately 1.5 m 5 feet above the [calculated] [indicated] pile tip elevation. Drive pile the final 1.5 m 5 feet of penetration or more to meet the required driving criteria.][ Take adequate measures for collecting and disposing of runoff water.][ Jetting method and equipment must be approved by the Contracting Officer prior to commencing jetting operation.] Before starting final driving, firmly seat piles in place by application of a number of reduced energy hammer blows.[ Employ measures, including use of a silt curtain, to contain turbid water created by jetting piles.]

**3.2.6 Predrilling of Piles**

\*\*\*\*\*

**NOTE: Predrilling should generally not be permitted for piles:**

1. Dependent on side friction in fine-grained low permeability soils (high clay or silt content) where considerable time is required for the soil to reconsolidate around the piles.
2. Subject to uplift or lateral forces.
3. Located in cohesionless soils.
4. In closely spaced clusters unless the load capacity is confirmed by test.

\*\*\*\*\*

Predrilling to remove soil or other material representing the bulk of the volume of the pile to be driven[ will[ not] be permitted][ must be provided].[ The diameter of the hole must not exceed two-thirds the width of the pile.][ Predrill only to a depth of [\_\_\_\_\_] meters feet below cut-off elevation prior to setting piles.][ Discontinue drilling when the pile tip is approximately 1.5 m 5 feet above the [calculated] [indicated] pile tip elevation. Drive pile the final 1.5 m 5 feet of penetration or more to meet the required driving criteria.]

**3.2.7 Pile Splices**

\*\*\*\*\*

**NOTE: Splicing of piles normally should not be permitted except where extremely long or heavy piles are required. If splices are permitted, drawings should indicate splice details. (See PCI standard drawings for typical splice details).**

\*\*\*\*\*

[Splicing of piles is not permitted.] [Make splices as indicated. Splices

must be capable of developing the full strength of the member in compression, tension, shear, and bending. Submit detail drawings of splices and design calculations demonstrating the strength of the splice for approval. Submit information for shop and field pile splices prior to fabrication.]

### 3.2.8 Build-Ups

\*\*\*\*\*  
**NOTE: Insert compressive strength required by design, usually a minimum of 35 MPa 5,000 psi. Insert maximum percent of build-ups permitted for project. The percent will depend on criticality of pile failure at build-up; whether the top of the pile is designed as a moment connection; exposure of piles to external physical or corrosive damage. Normally, for piles supporting piers exposed to seawater, limit percentage of build-ups to 10 percent.**  
\*\*\*\*\*

Where required, pile section may be extended to cut-off elevation by means of a cast-in-place reinforced concrete build-up. Make build-up in accordance with PCI BDM. Construct build-ups made after completion of driving in accordance with detail, "Build-Up Without Driving." Make build-ups to be driven in accordance with detail "Build-Up With Driving." Have details of means for protecting joints by a suitable mortar or epoxy approved by Contracting Officer. Where build-ups are exposed to water, protect cast-in-place section from water during curing period. Concrete in build-up must have a minimum compressive strength of [\_\_\_\_\_] MPa psi. Build-ups will not be permitted on more than [\_\_\_\_\_] percent of total number of piles. If this percent figure is exceeded, or if in the judgment of the Contracting Officer, the clustered location of build-ups is undesirable, withdraw piles of insufficient length and replace with longer piles. Payment for such withdrawal and replacement will be made as an adjustment to the contract price.

### 3.2.9 Pile Cut-Off

Cut-off piles with a smooth level cut using pneumatic tools, sawing, or other suitable methods approved by Contracting Officer. Use of explosives for cutting is not permitted. Remove cut-off sections of piles from the site and off government property upon completion of the work.

### 3.2.10 As-Driven Survey

After the driving of each pile group is complete and before concrete is placed, provide the Contracting Officer with an as-driven survey showing actual location and top elevation of each pile. Do not proceed with placing concrete until the Contracting Officer has reviewed the survey and verified the safe load for the pile group driven. Present a survey in such form that it gives deviation from plan location in two perpendicular directions and elevations of each pile to nearest 13 mm half inch. Survey must be prepared and certified by a licensed land surveyor.

### 3.2.11 Protection of Existing Structures

\*\*\*\*\*  
**NOTE: Include this paragraph only when protection**

of existing structures from pile driving activities is required.

The designer must indicate on the drawings all structures and facilities for which protection is required. The designer must also provide a project specific document that details design criteria, requirements for preconstruction condition surveys, post construction condition surveys, geotechnical instrumentation to measure ground movements and any other requirements.

Add any additional requirements as necessary.

\*\*\*\*\*

Mitigate impact on existing facilities due to pile driving activities in accordance with the [project specific document] [\_\_\_\_\_].

### 3.2.12 Pile Shoe

Submit details about pile shoe used, if any. Where indicated or directed, securely attach pile shoes of an approved design to the piles in a manner described in the detail drawings.

## 3.3 FIELD QUALITY CONTROL

### 3.3.1 Test Piles

\*\*\*\*\*

NOTE: Select the second bracketed option when soil conditions dictate the use of a test pile longer than production piles. The ordered pile length for test piles should be 1.5 m 5 feet longer than ordered length for production piles to allow additional penetration if driving conditions dictate. Indicate location and number (if required) of test piles on plans, or list appropriate soil boring test hole numbers.

\*\*\*\*\*

[Use test piles of type, and drive as specified for piling elsewhere in this section. ][Order test piles [\_\_\_\_\_] meters feet longer in length than production piles. Drive the additional test pile length only at the direction of the Contracting Officer. ]The [Contractor's Geotechnical Consultant][Contracting Officer] will use test pile data to determine "calculated" pile tip elevation or necessary driving criteria. Drive test piles [at the locations indicated] [in vicinity of soil boring test holes Nos. [\_\_\_\_], [\_\_\_\_], and [\_\_\_\_]]. Drive test piles to [indicated tip elevation] [indicated bidding lengths] [required driving criteria]. Use test piles, if located properly and offering adequate driving resistance in finished work.[ Pre-drilling or jetting is permitted only when test piles clearly establish validity of its use, or as directed by the Contracting Officer.][ Provide and operate a pile driving analyzer as specified in paragraph DYNAMIC PILE ANALYSIS during the driving of each test pile. Modify driving as required based upon recommendation of [Contracting Officer] [Contractor's Geotechnical Consultant and approval of the Contracting Officer].]

### [3.3.2 Dynamic Pile Analysis

Submit a performance report summarizing dynamic test results for test piles within [7][\_\_\_\_\_] calendar days of completing field work.[ For production piles, submit a performance report within one day of testing. Submit a typed report summarizing the results of dynamic testing of production piles on a monthly basis.]

Dynamic testing provides supplemental information for evaluating pile integrity, hammer and drive system performance, assess pile installation driving stresses, and pile capacities. Perform dynamic testing on [\_\_\_\_\_] percent of the[ test] piles during the full length of the pile driving and during restrike a minimum of [\_\_\_\_\_] days after initial driving. Dynamic pile testing must also be performed on [\_\_\_\_\_] production piles as chosen by the Contracting Officer. Use[ test] piles of type as specified elsewhere in this section. Provide equipment to obtain dynamic measurements, record, reduce and display its data that meet the requirement of [ASTM D4945](#). The equipment must have been calibrated within [6][\_\_\_\_\_] months prior to the start of the testing operations and thereafter throughout the contract duration. Drive[ test] piles at the locations indicated or at the locations selected by the Contracting Officer. Employ an independent inspection firm, hereinafter referred to as the "Contractor's Geotechnical Consultant", experienced in the pile driving process[, monitoring of test pile installation,] and in the use of the Pile Driving Analyzer and its related equipment. Perform dynamic pile analysis as follows:

#### 3.3.2.1 Pile Analysis

[\_\_\_\_\_] working days prior to driving the[ test] piles, submit the pile and complete driving equipment data to the Contracting Officer. The Contractor's Geotechnical Consultant must use the submitted information to perform wave equation analyses and must prepare a summary report of the wave equation results. The wave equation analysis using GRLWEAP software by Pile Dynamics, Inc. or equivalent must be used to assess the ability of the proposed driving system to install the pile to the required capacity and desired penetration depth within the allowable driving stresses. Approval of the proposed driving system by the Contracting Officer must be based upon the wave equation analyses indicating that the proposed driving system can develop a pile capacity of [\_\_\_\_\_] [kN](#) [kips](#) at a driving resistance not greater than [\_\_\_\_\_] [mm/blow](#) [blows per inch](#) within allowable driving stress limits. The hammer must also be sized or adjustable such that the penetration per blow at the required ultimate capacity does not exceed [12 mm](#) [0.5 inches](#).

#### 3.3.2.2 Pile Drivability

Perform each dynamic pile analysis in two steps. The first step is to check the hammer, pile and soil performance, and to determine the suitability of the proposed hammer for the size, length and type of pile being installed for the soil types encountered as the piles are driven. This initial monitoring must determine whether pre-augering or jetting is appropriate, efficiency of the hammer relative to specified efficiency, effectiveness of cushion, level of compressive and tensile stress in pile and extent/location of any pile damage caused by the initial driving. With each blow of the pile, record the information listed below electronically and analyze the information using the Pile Driving Analyzer:

- (1) Blow number

- (2) Blow rate per minute and stroke.
- (3) Input and reflected values of force and velocity.
- (4) Value of upward and downward traveling force wave with time.
- (5) Maximum and final transferred energy to pile, hammer system efficiency.
- (6) Maximum compressive stress, velocity, acceleration and displacement.
- (7) Maximum tensile stress in pile.
- (8) Pile structural integrity, damage detection, extent and location.
- (9) Bearing capacity of pile by Case method.

If the pile, hammer and soil performance evaluation recommends changes to the hammer stroke, pile cushioning, augering or any other aspect for the pile driving operation, incorporate these changes into production pile driving in an effort to control excessive stresses and pile damage. Replace test piles damaged or broken during installation incorporating driving modifications as determined by the Contractor's Geotechnical Consultant and reviewed and approved by the Contracting Officer. Repeat this procedure until allowable tensile and compressive stresses are achieved in the pile and/or pile damage is minimized. Subject selected initial driving records to rigorous computer analysis by the Case Pile Wave Analysis Program (CAPWAP) for determination of resistance distribution, soil resistance and properties, and estimation of anticipated gain/loss factors.

#### 3.3.2.3 CAPWAP

Signal matching analysis by CAPWAP® software of the dynamic pile testing data must be performed on data obtained from the end of initial driving and the beginning of restrike of all control piles. CAPWAP analyses must be performed by an engineer who has achieved Advanced Level or better on the PDI / PDCA Dynamic Measurement and Analysis Proficiency Test for Providers of PDA Testing Services.

Upon completion of [ test ] pile driving, allow the piles to set-up for at least [ 72 hours ] [ \_\_\_\_ days ]. After evaluation of pile, hammer and soil performance by the Contractor's Geotechnical Consultant, the second step of the dynamic pile analysis may proceed. This portion of the evaluation requires striking the set-up piles a minimum of 20-50 times, or as directed by the Contractor's Geotechnical Consultant using the same hammer which was used for the [ test ] pile driving and which will be used for production pile driving. "Warm up" the hammer and make it optimally ready prior to restriking, in order to avoid capacity losses during evaluation of restrike data. Apply maximum hammer energy during restrike in order to fully mobilize the soil resistance. However, exercise care so as to not overstress the pile. In addition to those items listed above, selected restrike driving records (as directed by the Contractor's Geotechnical Consultant are to be subjected to rigorous computer analysis by the Case Pile Wave Analysis Program (CAPWAP) for determination of resistance distribution, soil resistance and properties, and plot of applied load vs. average pile displacement based on the calculated soil properties.

#### 3.3.2.4 Dynamic Load Test Reporting

Upon satisfactory completion of each dynamic load test, submit[ a minimum of three copies of] a Pile Performance Report for the Contractor by the Contractor's Geotechnical Consultant. The submittal must be prepared and sealed by a Professional Engineer registered in [\_\_\_\_\_].

The report for the Dynamic Pile Analysis must contain the following information:

- a. Capacity of pile from Case Pile Wave Analysis Program (CAPWAP). Information resulting from analysis of a selected restrike blow.
- b. Maximum and final transferred energy, hammer system efficiency during pile installation.
- c. Maximum compressive stress, velocity, acceleration and displacement.
- d. Maximum tensile stress in pile.
- e. Pile structural integrity, damage detection, extent and location.
- f. Blows per minute and blow number.
- g. Input and reflection values of force and velocity, upward and downward traveling force wave with time.
- h. Pile skin friction and toe resistance distribution.
- i. Maximum energy transferred to pile.

The maximum allowable pile design load must be proposed by the Contractor's Geotechnical Consultant based upon the results of a satisfactory pile load test conducted on a pile driven as specified herein and must include the effects of load transfer to the soil above the foundation stratum.

Use either a model 8G or PAX Pile Driving Analyzer as manufactured by Pile Dynamics, Inc., of Cleveland Ohio or approved equivalent, for dynamic testing of the pile hammer and for dynamic load testing of the test pile. All equipment necessary for the dynamic monitoring such as sensors, cables or wireless transmitters, etc., must be furnished by the Contractor's Geotechnical Consultant. The equipment must conform to the requirements of **ASTM D4945**.

Pay for all services of the Contractor's Geotechnical Consultant. The Contractor's Geotechnical Consultant must be available throughout the pile driving operation to consult with the Contracting Officer when required by the Contracting Officer. The cost of changes in the Contractor's procedure, as required by evaluation of the results of the Pile Driving Analysis, will be at the Contractor's expense.

#### 13.3.3 Static Load Tests

\*\*\*\*\*

**NOTE: If pile load tests are required and approved by the Contracting Officer, specify number and location of piles. Select method of load test. In**

ASTM D1143/D1143M, permit anchor piles only if approved by the Contracting Officer's Technical Representative (Geotechnical Branch). Insert figure **kN kips** corresponding to 200 percent of the design load. Select appropriate acceptance criteria. The offset method (first option) is usually recommended.

\*\*\*\*\*

Submit test set-up and procedures.

Perform compressive load tests on [\_\_\_\_\_] test piles in accordance with **ASTM D1143/D1143M** (standard loading procedure) as modified herein.[ Allow a minimum of [72 hours][\_\_\_\_\_]days] following final test pile driving for pile set-up prior to load testing.][ Do not use anchor piles.] Provide apparatus for applying vertical loads as required by method, using load from weighted box or platform [or reaction frame attached to sufficient uplift piles to safely take required load] applied to pile by hydraulic jack. Increase load in increments until rapid progressive settlement takes place or until application of total compressive load of [\_\_\_\_\_] **kN kips** for compressive load tests . Consider load test satisfactory when [after one hour at full test load gross settlement of pile butt is not greater than gross elastic pile compression plus **4 mm 0.15 inch** plus one percent of pile tip diameter or width in [\_\_\_\_\_] **mm inches**,] [slope of gross load-settlement curve under full test load does not exceed **1.5 mm per metric ton 0.05 inches per ton**,] [net settlement after removal of test load does not exceed **19 mm 3/4 inch**]. Perform load tests at locations[ as proposed by the Contractor's Geotechnical Consultant and] as directed by the Contracting Officer. Additional load tests, at Government expense, may be required by the Contracting Officer. Perform the loading, testing, and recording and analysis under the direct supervision of a Registered Professional Engineer, registered in the state of project location, and provided and paid for by the Contractor.[ Submit test pile records][ and ][load test data] within [7] [\_\_\_\_\_] calendar days of test completion.

#### [3.3.3.1 Safe Design Capacity

Determine the safe design capacity of a test pile as determined from the results of load tests according to **UFC 3-220-01**.

#### ][3.3.4 Tensile Load Test

Perform tensile load tests on [\_\_\_\_\_] test piles in accordance with **ASTM D3689/D3689M**, as modified [and ]in paragraph LOAD TESTS. Apply a tensile load of [\_\_\_\_\_] **kN kips** to each tensile load test pile. In performing the tension load test, apply the ultimate load equal to one and one-half times the safe tension capacity, and employ the Standard Loading Procedure.

Perform dynamic measurements on [\_\_\_\_\_] piles designated as dynamic test piles in accordance with **ASTM D4945** during driving. During easy driving, ensure that damaging tension stresses do not develop in the pile. Signal matching must be performed by the Contractor's Geotechnical Consultant on representative data collected at the end of the initial driving and at the beginning of all restrike events. Additional signal matching analysis must be performed as determined by the Engineer.

#### ][3.3.5 Lateral Load Test

Perform lateral load tests on [\_\_\_\_\_] piles in accordance with

ASTM D3966/D3966M, as modified [and ]in paragraph LOAD TESTS. Lateral load tests must consist of jacking two piles apart with a hydraulic jack, with one pile serving as the reaction pile for the other. Apply a lateral load of [\_\_\_\_\_] kN kips to each pair of lateral load test piles. Record required movement readings for each pile.

#### ]3.3.6    **File Records**

\*\*\*\*\*  
NOTE: Omit reference to load test when not required in project. Omit reference to test piles and "calculated tip elevation" when test piles are not driven. Where special or unusual soil conditions are expected, consultation with the Contracting Officer's Technical Representative (Geotechnical Branch) regarding special engineering supervision of driving, testing, recording and analysis of data for project may be useful.  
\*\*\*\*\*

\*\*\*\*\*  
NOTE: The Specifier must attach the specifications pile driving log graphic (for all pile driving projects) and the pile driving equipment data form (for projects using PDA) to the end of this specification section.  
\*\*\*\*\*

Submit pile [and test pile] records.[ Submit load test data and results.]

Keep a complete and accurate record of each pile driven. Indicate the pile location, deviations from pile location, cross section shape and dimensions, original length, ground elevation, tip elevation, cut-off elevations, [batter alignment,] number of blows required for each 300 mm foot of penetration and number of blows for the last 150 mm 6 inches penetration or fraction thereof [as required] for the "calculated" [driving resistance]. Include in the record the beginning and ending times of each operation during driving of pile, type and size of hammer used, rate of operation, stroke or equivalent stroke for diesel hammer, type of driving helmet, and type and dimension of hammer cushion (capblock) and pile cushion used. Record retap data and unusual occurrences during pile driving such as re-driving, heaving, weaving, splicing, obstructions, [jetting,] and any driving interruptions.[ Install an energy monitor on the hammers and record readings every 250 mm of pile installation.] A preprinted pile driving log for recording pile driving data[ and pile driving equipment data form], which can be downloaded at:

<http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphics-tables>.

#### [3.3.7    **Testing Agency Qualifications**

Engage an independent testing agency qualified according to ASTM C1077 and ASTM E329 for testing indicated. Submit testing agency qualifications to the Contracting Officer for approval.

#### ]3.4    **SPECIAL INSPECTION AND TESTING FOR SEISMIC-RESISTING SYSTEMS**

\*\*\*\*\*

NOTE: Include this paragraph only when special inspection and testing for seismic-resisting systems is required by the International Building Code (IBC).

This paragraph will be applicable to both new buildings designed and to existing building seismic rehabilitation designs done according to UFC 1-200-01, "General Building Requirements" and UFC 3-310-04, "Seismic Design for Buildings".

The designer must indicate on the drawings all locations and all features for which special inspection and testing is required in accordance with Chapter 17 of the IBC. This includes indicating the locations of all structural components and connections requiring inspection.

Add any additional requirements as necessary.

\*\*\*\*\*

Perform special inspections and testing for seismic-resisting systems and components in accordance with Section 01 45 35 SPECIAL INSPECTIONS.

#### ] [3.5 VIBRATION CONTROL

\*\*\*\*\*

NOTE: Include this paragraph when vibration monitoring is required. Add any additional criteria or requirements as necessary to the particular project.

\*\*\*\*\*

Perform vibration monitoring at the locations [shown in the plan] [decided by the Contracting Officer] during the pile driving operations. Perform vibration monitoring [using] [seismographs] [and geophones] within a distance of [61] [\_\_\_\_\_] meters [200] [\_\_\_\_\_] feet from the pile driving activity. [Engage the services of a qualified, independent vibration consultant, acceptable to the Government, to conduct the vibration monitoring. The vibration consultant must have minimum of [five] [\_\_\_\_\_] years of experience in vibration monitoring. A minimum of [28] [\_\_\_\_\_] days before the installation of vibration monitors, submit to the Government the name of the vibration consultant and a list of at least [three] [\_\_\_\_\_] previously completed projects of similar scope and purpose.]

Prior to the pile driving activities, obtain baseline readings of ambient vibrations. The vibration during the pile driving activities must be limited to [a peak particle velocity of not more than [5] [\_\_\_\_\_] cm [2.0] [\_\_\_\_\_] inches per second.] [the limits mentioned in the [contract documents] [\_\_\_\_\_] ]. [Determine appropriate vibration limits as per [US Bureau of Mines] [American Association of State Highway and Transportation Officials (AASHTO)] guidelines.] During pile driving activities, monitor the vibrations to ensure the limits are not exceeded. If the limits are exceeded, cease the pile driving activity causing the vibration until [the Vibration consultant and the Contracting Officer] [\_\_\_\_\_] are on site to observe the structures nearest to the vibration monitor which has exceeded the limits.

The Contractor must be responsible for all damages resulting from the pile driving operations and must take whatever measures necessary to maintain

peak particle velocity within the specified limit. After completion of the project, remove the vibration monitors off the site and off Government property and restore the monitoring locations back to their original condition.

][3.6 NOISE CONTROL

\*\*\*\*\*  
**NOTE: Include this paragraph when noise monitoring is required. Add any additional criteria, references or requirements as necessary to the particular project.**  
\*\*\*\*\*

Perform noise monitoring at the locations [shown in the plan] [decided by the Contracting Officer] [at noise sensitive public areas] during the pile driving operations.[ Perform noise monitoring using [noise meters][, and][\_\_\_\_].][ Engage the services of a qualified, independent noise consultant, acceptable to the Government, to conduct the noise monitoring. The noise consultant must have minimum of [five] [\_\_\_\_] years of experience in noise monitoring. A minimum of [28] [\_\_\_\_] days before the installation of noise monitors, submit to the Government the name of the noise consultant and a list of at least [three] [\_\_\_\_] previously completed projects of similar scope and purpose.]

Prior to the pile driving activities, obtain baseline readings of ambient noise levels.[ The noise limits are mentioned in the [plan] [contract documents].][ Determine appropriate noise limits as per [local agency] [Occupation Safety and Health Administration] guidelines.] During pile driving activities, monitor the noise to ensure the limits are not exceeded. If the limits are exceeded, cease the pile driving activity and install noise mitigation measures.

The Contractor must be responsible for all damages resulting from the pile driving operations and must take whatever measures necessary to maintain noise within the specified limit. After completion of the project, remove the noise monitors off the site and off Government property and restore the monitoring locations back to their original condition.

][3.7 PRECONSTRUCTION CONDITION SURVEY

\*\*\*\*\*  
**NOTE: Add any additional criteria, references or requirements as necessary to the particular project.**  
\*\*\*\*\*

Perform preconstruction condition survey of [structures][and utilities] [within [61] [\_\_\_\_] meters [200] [\_\_\_\_] feet of the pile driving activity][specified in the plans][decided by the Contracting Officer]. Perform outreach to the owner of the structures [28] [\_\_\_\_] days before performing the preconstruction condition survey. The Contractor must obtain written permission from the owner of the structure prior to accessing the structure. The preconstruction condition survey must include video and photographic documentation of the exterior and interior of above ground structures and of the interior of underground structures. Video documentation must be in high definition, and show existing conditions and highlight, where possible, existing cracks, deteriorated concrete, exposed and corroded reinforcement, cracked or broken brick or mortar, and other signs of distress. For utilities, perform the survey when the greatest extent of the interior is exposed. Provide supplementary artificial lighting as needed. The video must include

annotation with location and structure nomenclature which describes any areas of distress over the video and time code superimposed on the video. Photographs must be accompanied by sketches or descriptions that indicate the location and direction of each photograph. For each structure surveyed, provide a Pre-Construction Condition Survey Report following completion of the survey. The report must contain all documentation associated with the survey including DVD copies. In the report, include notes, sketches, photographs, and videos. Provide general information, such as location details and structure type, as well as particular information on materials, condition, existing damage, aperture and persistence of cracks, and disrepair observed during visual survey. Provide a graphical depiction of locations of damage or other features of concern. Submit the Preconstruction Condition Survey Reports no later than [28] [\_\_\_\_] days before the commencement of pile driving activity. Accept responsibility for damages to existing adjacent or adjoining structures created by pile driving work, and repair any damages to these structures without cost to the Government.

] [3.8 CONSTRUCTION INSTRUMENTATION AND MONITORING PROGRAM

\*\*\*\*\*

**NOTE: Include this section if instrumentation is to be installed due to concerns about vibration, settlement, lateral movement, etc. during pile driving activities. Instrumentation should be specified and included in the specification. This section can be deleted if there are no instrumentation requirements.**

**Add any additional criteria or requirements as necessary for the particular project.**

\*\*\*\*\*

Prepare a geotechnical instrumentation program to monitor settlement[ and lateral movement] of temporary and permanent structures, utilities, [embankments] [and excavations] during pile driving. The design and distribution of instrumentation must demonstrate an understanding of the need, purpose and application of each proposed type.[ Perform noise and vibration monitoring in accordance with NOISE CONTROL and VIBRATION CONTROL sections.]

Monitoring must extend before, during and for a period after completion of construction activities related to pile driving when long-term performance issues are a concern. The monitoring plan must be designed to protect adjacent structures and utilities against damage due to the pile driving activities. Establish limiting values of vertical [and horizontal] movement [and angular distortion] [and vibration] for each structure and utility within the zone of influence, subject to review by the Government.

Prepare a [Instrumentation and Monitoring Program Report](#) detailing the proposed program of instrumentation and monitoring, establishing threshold values of monitored parameters, and describing the response plans that will be implemented when threshold parameters are exceeded. The report must include details about instrumentation consultant's experience, appropriate types, quantities, locations and monitoring frequencies of the instruments.

Upon acceptance of the instrumentation and monitoring program, provide, install and monitor the instrumentation and interpret the data. Submit instrumentation data reports not less than every [\_\_\_\_\_] days after the monitoring program has begun. Take corrective actions, as necessary, based on the field instrumentation data and as defined in the instrumentation and monitoring program.

]           -- End of Section --
